STATEMENT OF DECLARATION

“I declare that **OPTIMISING MIXED-ABILITY GROUPING FOR EFFECTIVE INSTRUCTION AT THE JUNIOR SECONDARY SCHOOL LEVEL IN BOTSWANA** is my own work and that all the sources that I have used or quoted have been indicated and acknowledged by means of complete references”.

(Mr. O. Mafa)

November 2003.

ACKNOWLEDGEMENTS

I am indebted to the following individuals for the successful completion of this thesis; my promoter, Prof. MM Nieman, for her scholarly advice, constructive criticism, guidance and encouragement throughout the duration of the study, my wife Esther for her unwavering support, encouragement and for editing and proof reading the script, the Chief Education Officer (North), for according me permission to conduct the study in the schools in the Northern Region of Botswana and teachers who took part in the focus group interviews. I am also indebted to Ms. Jowa for her assistance in the translation of some information from Setswana into English in the focus group interview transcripts.

**OPTIMISING MIXED-ABILITY GROUPING FOR EFFECTIVE INSTRUCTION
AT THE JUNIOR SECONDARY SCHOOL LEVEL IN BOTSWANA**

by O MAFA

DEGREE: DOCTOR OF EDUCATION

SUBJECT: DIDACTICS

PROMOTER: PROF. MM NIEMAN

Summary of the study

Mixed-ability classes are now the norm at the junior secondary school level in Botswana as a result of annexing this level to the primary school level in pursuance of the goal of basic education. This has pedagogic and didactic implications. Literature reviewed on grouping revealed that there is no consensus regarding how students of different abilities should be grouped and taught in schools. Proponents of ability grouping base their argument on academic excellence, while exponents of mixed-ability grouping draw support from egalitarian concepts of equity, equality, fairness and social justice. Their argument is that ability grouping is unfair since it denies a section of students some worthwhile educational opportunities. The reviewed literature also revealed that there is an emerging trending in the realm of education, which views learner diversity as offering teachers opportunities to bring about effective instruction. There is unequivocal evidence from research that mixed-ability grouping complemented by student-centred teaching strategies, results in improved academic, social and affective outcomes across the ability levels. The empirical phase of the investigation made use of focus group interviews, follow-up interviews and lesson observations for data collection. The major findings were that teachers are not currently optimising mixed-ability grouping for effective instruction. Frequently cited reasons by teachers were: the need to cover the syllabi before examinations, content-laden syllabi, the mode of assessment which seem to reward rote learning, lack of skills by teachers in the use of mixed-ability teaching strategies, class sizes and students' lack of proficiency in English (language of instruction). Mixed-ability grouping could be optimised through the use of teaching strategies that capitalise on students' individual differences as well as adopting the concept of differentiation in teaching.

ABSTRACT

The debate on how students of different abilities should be organised and taught is probably as old as the introduction of formal schooling. It has generated a lot of debate in the past and continues to do so in the present millennium. This debate has invariably divided the world of educational research into two distinct camps. On one hand are proponents of ability grouping who claim that this grouping approach creates homogeneity which make it possible to tailor teaching to individual needs and thus raise achievement. On the other hand, are the exponents of mixed-ability grouping, who argue that ability grouping denies equality of educational opportunities to many young people, limiting their life chances and increasing social segregation. However, there is an emerging trend which posits that teachers should view students' mixed-abilities as an asset, which if properly exploited can result in effective instruction for the benefit of all students regardless of their many individual differences. This emanates from the realisation that there are different types of intelligences, and that it is not always possible for an individual student to possess all the types of intelligences. Therefore, students from diverse backgrounds, endowed with multiple intelligences, can help one another understand the content better as they will perceive the content from their diverse experiential backgrounds.

This qualitative study concerned itself with investigating how mixed-ability grouping can be optimised for effective instruction at the junior secondary school level in Botswana. The study made use of literature study, focus groups, follow-up interviews and lesson observations. Major findings were that teachers are not optimising mixed-ability grouping for effective instruction. Instead, teachers have problems in teaching mixed-ability classes, with most of their teaching being teacher-centred. However, teachers can optimise mixed-ability grouping through the use of student-centred instructional strategies such as cooperative learning, small-group instruction, peer teaching and student research. Gifted students could be catered for through curriculum compaction, enrichment and extension work, while mentally challenged students could be offered remedial work. These cited teaching strategies are differential and they make use of the diverse abilities found in mixed-ability classes.

Key terms: optimising, grouping, mixed-ability grouping, ability grouping, effective instruction, Botswana, junior secondary schools, teaching strategies, differentiation, equality of educational opportunities.

DEDICATION

This thesis is dedicated to my wife Esther, and our children Noah, Tariro and Tatenda.
