SUMMARY

Educator stress is a major problem worldwide. This study focuses on the role of the principal in the secondary school in providing support and assisting educators manage work-related stress, with particular reference to schools in Kwa-Zulu Natal, South Africa. The problem was investigated by means of a literature study and empirical investigation. The literature identified perspectives on educators' stress, the stress process of the educator and the principal, causes of work-related stress in educators and coping strategies. Furthermore, principals' leadership styles, theories of motivation and causes of principals' stress were discussed. A qualitative inquiry using focus group interviews was undertaken with a small sample of secondary school educators selected by purposeful sampling. Findings suggested that educator stress was caused by a lack of learner discipline; deterioration in educational standards; workload; policy changes; promotion procedures and the principal's leadership style. Based on the findings, recommendations were made for improvement of practice.

Key terms

Stress management; work-related stress; secondary school educators; principal's support; leadership style; shared decision-making; motivation; Kwa –Zulu Natal; qualitative research; and focus groups.
