DECLARATION

“I declare that Perceptions and Knowledge Regarding Indigenous Knowledge and Environmental Education in the Natural Science Curriculum is my own work and that all the sources that I have used or quoted have been indicated and acknowledged by means of complete references.”

ABSTRACT

Human activities that involve interactions amongst three players i.e. nature, humans and technology, continue to impact negatively on the Earth's biosphere.

The impact is tremendous: consumption of resources at an unsustainable level leading to rapid loss of natural resources and biodiversity. The plea to reverse this negative trend is as valid now as it were many years ago.

While some progress has been made to develop strategies to wisely manage and protect the Earth's resources, the state of the environment is still fragile. Strategies are far from satisfactory: hence the grounds for a new commitment in a manner best suited to a country's needs and resources. In recent years, research in indigenous knowledge systems has been pursued in an attempt to develop a deeper understanding of its complex linkages with the environment. Incorporating some of these linkages in the science curricula provides opportunities for learners to make informed choices to address individual and society's needs by extracting relevant elements from Western science and indigenous knowledge systems.

This research focuses on the use of indigenous knowledge in science education offered to grade eight and nine learners in South African schools. As part of this education, science curricula, teaching methodologies and resources therefore should be developed in response to the changing needs of learners and their communities.

A close look at the natural science learning area of Curriculum 2005 shows that the South African curriculum developers have under-used indigenous knowledge in the teaching and learning of science at school level. The conceptualization of an inclusive and just science education has been evaded.

Perceptions elicited from a small group of academics, well versed in IK, indicate that the majority of South African science teachers will embrace the inclusion of indigenous knowledge in the natural science learning area but will require significant assistance from the Department of Education. The key to deal with this daunting task is for the relevant role players to establish partnerships with the knowers and holders of indigenous knowledge and to operate in a neutral, noble and altruistic manner and that in itself in the present context is highly problematic.

Key terms

Western science; Indigenous Knowledge; Environment; Curriculum 2005; Outcomes Based Education; Natural Sciences Learning Area; Teaching Methodologies and Resources; South African Schools; Inclusive and Just Science Education.

TO BRIAN, NEIL, KAMSHEEL AND TASVIR

ACKNOWLEDGEMENTS

In presenting this thesis I wish to express my sincere gratitude and deep sense of appreciation for the help received from each of the following:

1. Professor C.P. Loubser and Dr J M Dreyer, my supervisors, for their guidance, constant encouragement and personal interest shown from the initial design of the investigation through to the final preparation of the thesis.
2. The University of South Africa who provided financial assistance.
3. The interviewees, who found time to participate in the research.
4. Amanda Jitsing for providing web site references, interesting books and articles relating to IK.
5. My son, Neil and my nephews, Kamsheel and Tasvir for their assistance when transcribing the interviews, doing the audit trail, analyzing the data, presenting the data in graphical forms and typing the final thesis.
6. Demla Vinden for proof reading the thesis.
7. My husband, Brian, my sister, Avasha, and my mother, without, whose support and help, this research would not have been possible.
