### **Summary**

The aim of this study was to investigate the role that humanistic techniques play in reducing feelings of language anxiety associated with oral communication in the TESOL classroom. Students in the experimental group attended classes which incorporated humanistic techniques such as journal writing and group work and where the affective needs of the students were taken into account. Students in the control group were provided with the normal course content along more traditional lines and their affective needs were not taken into account. Language anxiety was measured by means of questionnaires, journals and interviews. The results revealed that general feelings of anxiety about oral communication decreased in the experimental group. The experimental group achieved higher scores in the final written examination although there was no significant difference in the oral examination results between the two groups. The drop-out rate in the experimental group was lower than that of the control group.

### **Acknowledgements**

I would like to thank the management of Wits Language School for granting me permission to conduct my research in their classrooms. A particular debt of gratitude is owed to Alison Beynon for her words of advice and encouragement throughout the course of this dissertation and to Judy Sternberg whose example in the classroom has always served to inspire my own teaching. A special thank you is also due to my supervisor, Mr Peter Southey, whose guidance and encouragement went beyond the call of duty.

I would like to dedicate this dissertation to all the EFL students I have taught at Wits Language School and particularly to those who participated in this study.
