ABSTRACT

A qualitative study following a phenomenological approach was undertaken to explore voluntary counselling and testing nurses’ perception of educating HIV+ people about ARVs. Non-probability convenience sampling was used and in-depth semi-structured face-to-face interviews were conducted to collect data from 12 participants.

The most important results were:

- The need for extensive education on ARVs since it is a new technology used to curb the infection therefore clients need the information in order to use them effectively.
- Stumbling blocks encountered when educating HIV+ people about the drugs. The problems are mainly due to the nurses lack of current knowledge about the drugs; patients’ low economic status; severe side effects; difficulties in behaviour change; poor quality of life on ARVs and medical terminology.
- Inability of clients to comply to the regimen because of severe side effects, complex regimen, lack of support from family and friends, lack of motivation, depression, cultural beliefs, lack of knowledge on how to use them and financial constraints.
- Challenges for continuous education because of current nursing shortage, negative attitudes of some nurses, demotivation and inadequate funding for such activity.

Recommendations include provision of continuing education and the incorporation of ARV therapy knowledge in the basic nursing curriculum in nursing education.

Key words:

Antiretroviral drugs, HIV/AIDS, perceptions, qualitative research, voluntary counselling and testing.
Acknowledgements

First and foremost I would like to give God the honour and glory for his wonderful countless deeds. He is my source of strength, rock, fortress and deliverer. In Him alone I take refuge.

This study is the result of a combined effort of many individuals to whom I am deeply indebted. To name them all would be an endless task. Nevertheless, mention need to be made of a few individuals who have been so much a part of this effort and without whose support and encouragement this work would not have been completed.

I am deeply indebted to the following persons:

- My research supervisor, Professor TR Mavundla, for his expert advice, patience, guidance and encouragement as I navigated these difficult waters. Without you I do not think that I would have made it.

- My employer at the Nazarene College of Nursing, for allowing me to pursue my studies.

- Department of Health, administrators and supervisors of the VCT centres where data was collected.

- The participants who voluntarily took part in this study.

- Mrs Ncane Lukhele (Librarian), for all her untiring assistance in acquiring the necessary information, prompt action in availing requested material, typing this research, motivation, willingness to assist and most of all spiritual support.

- My dearest friend, Dumsile Simelane, for her encouragement in doing the Master’s Degree and also showing me the way to a brighter future. Friend, you were, you are and always will be a pillar of my strength.

- My colleague, Zanele Mhlongo, for encouragement through difficult times.

- Finally, to my family especially my father who is always supporting me and also my only daughter Nomkhosi Khoza, who supported me emotionally throughout my two year study. Thank you very much for your love, understanding, patience and support.
Dedication

This study is dedicated to all AIDS sufferers in the world, past, present and future, in the hope that it may contribute in some way to the relief of their suffering

and

To all the nurses in the world who have constituted the frontline health professionals in the common struggle against HIV/AIDS infection.
