1 Introduction

As president of the South African Institute for Computer Scientists and Information Technologists (SAIC-SIT), I have visited a number of campuses and companies, in an attempt at arriving at a general assessment of the state of our subjects in South Africa.

An issue which I consistently pick up is that while everyone seems to think that computer-related skills are extremely important and in short supply, our academic departments are also extremely underresourced.

At the last Southern African Computer Lecturers Association (SACLA) conference (28-29 June, Golden Gate), I had the opportunity to discuss the problems other academics see. This editorial lists some of the problems reported at SACLA, and proposes a way forward.

2 Problems

At SACLA, I led a discussion of problems seen in our academic departments.

There was wide agreement that both Computer Science (CS) and Information Systems (IS) departments were under pressure to increase student numbers (massification), and were seen as cash cows to prop up less popular subjects. It was broadly agreed that staffing was a critical issue: too few posts for the workload, salaries way out of line with industry (half or less, as compared to the US, where an academic salary may be 80% of an industry salary). Recent graduates often make more than professors which makes it hard to persuade our students to become academics even to do higher degrees. Attracting a recent PhD with a sense of adventure may be possible, but attracting experienced people used to earning a salary in a strong currency is hard. IS jobs are worse than CS, as the skills required are more like those in business. Support staff salaries are an even harder issue: their skills relate even more directly to job descriptions in industry.

A problem in addressing our concerns is that we are so overworked that we don’t have time for "politics": academics with no students have time on their hands, but we don’t. More industry support not only with directly addressing problems but with taking on university administrations would be useful, but they too have major problems and don’t have free time.

3 Solutions?

Solutions are harder to identify than problems.

The SACLA session ended with a proposal that we conduct surveys of our institutions and businesses, to find out what the problems are, as a starting point for going to university administrations, government and business.

Another idea was to attempt to find common cause with business in taking on problems they have in common with academia, including the skills shortage, the insufficient capacity of our education system, and dealing with employment equity.

One of our biggest difficulties is to free up time to deal with issues such as resource allocation within our universities. The “competition” is frequently other academics with time on their hands, since they have too few students, and therefore are in a position to spend time looking after their interests.

What is needed now is some thought about how to pull ourselves out of the mess we are in. In particular, we need strategies to exploit our strengths: our high demand among students, the high demand for the skills we produce and the ubiquitous applicability of computer technology.

Given the wide use of computers, it would seem obvious that our areas should be strongly supported by a range of role players, yet the fact that so many different groups are interested in computer technology in one way or another has tended to fragment efforts to enhance our industry and academic institutions.

Clearly, from conversations I have held, some departments are in much better shape than others. Even so, some kind of collective effort is likely to achieve more results than if we allow ourselves to be pushed around as individuals. Addressing the fragmentation of efforts seems a worthy goal in itself, to reduce duplication and contradictory goals.

I appeal to anyone who has constructive ideas on how to take our subjects forward to contact me. Let us work on building ourselves up. The economy depends on us, much more than on most other academic disciplines. It’s time we made that point, and made it strongly.

Abstract

We introduce FMOB: a formal model for Objectbases. The term "Objectbase" represents better the widely used "object-oriented database". FMOB consists of (1) objects (classes and their instances) with extended encapsulation capabilities, (2) second-order objects (respectively 2-classes and 2-instances) for supporting the structural relations specialization, association, aggregation and grouping. Every 2-object encapsulates a two-level-hierarchy (t-1-h) of objects formally defined. The inheritance notion is generalized and replaced by the link concept, which allows, in a uniform way, the proper reusability of data, methods and other object-properties across one or more 2-object of the above type. (3) FMOB also supports complex objects through an appropriate composition of 2-objects. The model is based on a universal algebra of words and appropriate extensions. Every building block of the objectbase has its corresponding algebra. The algebra of abstract words is functionally complete. The modified greedy algorithm optimizes all linear objective functions over the search (or branching) greedoid defined on the underlying digraph of a second order-object.

Keywords: FMOB (formal model for objectbases), universal algebra of words, functionally complete algebra, two-level hierarchy of objects, 2-class, 2-object, digraphs, accessible set-systems, greedoids.

Computing Review Categories: H.2.2, H.2.4

1 Introduction

The Object-Oriented Systems are continuously gaining popularity as the most promising powerful "vehicles" for the design and implementation of complex real-world applications. The reason for this is the entirely different approach in modelling the real-world entities as objects. An object is characterized by the notions of the unique object identity \cite{9}, considered distinct from the object's contents, and of encapsulation. The latter is a property through which the data and the operations (acting on these data) reside in the object to which they belong. From this point of view, the "internal contents" of an object are totally hidden from its outside world. Thus, the behaviour of an object is captured in messages to which it responds \cite{2}, while its active nature allows it to send messages to other objects. Furthermore, the most essential features of object-orientation are the notions grouped under the general term: "reusability mechanisms" (instantiation and inheritance). Inheritance is closely related to the notion of class hierarchy \cite{2}. Since the mid 80's a considerable amount of research has been done on all aspects of object-orientation at different levels (semantic modelling, systems design, programming languages, databases) by unveiling its power and its perspectives and inspiring new researchers to carry on. Our main focus lies in the field of database technology (the term, generally used, refers to all existing database types including the object-oriented databases). The main problems in shifting from the classical approach (Codd's work) are found in Malcolm Atkinson et al \cite{3}. In \cite{3} it is stated that no analogous specification, with respect to Codd's work, exists for the object-oriented databases (OODBs). The field of OODBs has three weak points:

(a) the lack of a common data model,

(b) the lack of formal foundations and

(c) strong experimental activity.

We put strong emphasis on the point (b), since the need for a solid underlying theory is the only way to lead to consensus on what is the commonly accepted object model. That theory does not facilitate the experimental work which is underway (in object-oriented programming languages and OODBs), since there is no common denominator for comparisons and uniform evaluation.

However, the experimental activities provide a huge amount of feedback and relative freeness in exploring different prototypes (and ideas developed in them) but in that sense we inevitably follow the Darwinian approach \cite{3} by hoping that from those prototypes a fit model will emerge. Further, in a commonly accepted approach, the lifting of the confusion caused by concepts coming from other disciplines (like encapsulation and inheritance originated in biological sciences) is considered as crucial. We should therefore, provide a crisp boundary between the terms object and data as well as a proper definition of what is an Objectbase. As in \cite{6}, Objectbases were initially called object-oriented databases. It has been pointed out that
the juxtaposition of "object" and "data" is essentially self-contradictory and the new name appears to be clearer and more appropriate. The requirement for development of an Objectase Management System (OBMS) can be done by following one of three approaches:

1. extending an Object-Oriented Programming Language (OOPL) by adding persistence, data sharing control and a query facility,
2. to rework relational DBMS to support object-oriented structures and
3. to design an OBMS totally on object-oriented principles.

For a successful OBMS, five areas are considered of special interest:

(a) unique object identifiers,
(b) support for the object model,
(c) compatible database and programming language representations,
(d) efficient system performance and
(e) representation of ordered aggregates [4],[13].

An OBMS requires the interaction of an object manager (for the definition, management and manipulation of the objectbase), an object server for the management of the traffic whenever the objectbase is implemented across a number of sites and an object store (for the actual persistent storage of objectbase's various information units like objects, their classes etc.). Three languages are conventionally required: an Object Definition Language for the definition of classes, an Object Manipulation Language for general manipulation and management of the object base and an Object Control Language to support the integrity constraints. However, in most cases of object-oriented databases, there exists an OOPL (or an appropriate extension of an OOPL) that plays all three roles above.

An understanding of what objectbases actually are is still evolving. Some of the features required for an OBMS are:

1. Transaction properties,
2. Security Authorization,
3. Query capability
4. Data Independence/Schema Modification,
5. Distributed Database Systems,
6. Object Model and
7. Architectural features.

Further analysis of these features are listed in [6]. However we provide here additional details for (6):

In order to evaluate the existing object models of both OOPLs and existing OODBs, we also have to take into account the additional features of Versioning (referring to all the types of objects, i.e. classes or instances as well as simple or complex objects), Persistence (the mechanism through which every created object is permanently stored in the objectbase) and Query facilities i.e. the possibility to query

(i) the internal structure of one or more objects of the same class;
(ii) objects, 2-objects and complex objects.

Table 2 shows different important features of well known object-oriented database management systems. These features characterize the quality of the OODBMs and therefore, their underlying object models (cf. [8]).

2 THE FORMAL OBJECT MODEL

Our model is based on word algebras. In 2.2 we introduce two word algebras, namely the algebras of abstract/concrete words. In an implementation abstract words correspond to object-properties which correspond to parts of the internal structure of classes (abstract objects) and concrete words correspond to object-properties which correspond to parts of the internal structure of instances of classes. The basic operations of the abstract word algebra are used to model the standard objectbase operations (see 2.5: An algebra of objects)

2.1 Some Preliminaries

We here recall several basic concepts. Let X be a non-empty set and T an arbitrary set of (basic) operations. The concept of a word is defined inductively (cf.[11]):

(i) all elements of X and all symbols of nullary operations are words;
(ii) if $w_1,\ldots,w_n$ are words, then for an arbitrary $n$-ary operation $\tau \in \Lambda$, where $n \geq 1$, the formal expression $\tau w_1\ldots w_n$ is also a word.

If $w = \tau w_1\ldots w_n$ then $w_1,\ldots,w_n$ are called subwords of the word $w$. The property of being a subword is transitive. In particular all elements of $X$ and symbols of nullary operations occurring in the expression for $w$ are subwords of $w$.

The set of all possible words relative to a system of operations $\Lambda$ and a set $X$ can be regarded as a universal algebra with $\Lambda$ the set of basic operations. We denote this algebra of words by $W_{A}(X)$.

Table 2: Comparative evaluation of object-oriented database, management systems' features

Before considering particular word algebras we recall the following definitions for an arbitrary universal algebra \( A = (A,F) \): A composition of operations in \( F \) is the construction of an \( n \)-ary opera-
tion $f$ from $k$ given $n$-ary operations $f_1, \ldots, f_k$ and a $k$-ary operation $g$ through the defining formula $f(a_1, \ldots, a_n) := g(f_1(a_1, \ldots, a_n), \ldots, f_k(a_1, \ldots, a_n))$. A clone on the set $A$ is the set of operations on $A$ that is closed under all compositions and contains the $n$-ary projections $p_i^a$. (for all $n$ and $i$ satisfying $1 \leq i \leq n$). The clone of algebraic operations on $A$ denoted by $\text{Clo}A$, is the clone on $A$ generated by the basic operation and projections. Those operations in the clone on $A$ generated by the basic and constant operations on $A$ together with the projections are called algebraic functions. Often one obtains the algebraic functions from the algebraic operations by substituting some variables by constants. $A$ is functionally complete if it is finite and all operations on $A$ are algebraic functions.

An algebra $A = (A, F)$ is a reduct of the algebra $B = (B, G)$ if $A = B$ and $\text{Clo}A \subseteq \text{Clo}B$. For the basic notions of subalgebra of an algebra, of homomorphism or isomorphism between two similar algebras, of congruence of an algebra, of quotient algebra, and of direct product of a system of similar algebras see for example [5].

### 2.2 Particular Word Algebras

We now fix two alphabets $\Gamma_a$ and $\Gamma_c$. The elements of $\Gamma_a$ are called abstract elements and those of $\Gamma_c$ concrete elements. We consider the following set of basic operations $T = \{\delta, 1, >, <, \cap, \cup, -, \wedge, \vee\}$ and the set of all words $\Lambda_a$ relative to $T$ and $\Gamma_a$. The results of applying each of the operations in $T$ to the elements of $\Lambda_a$ are given in Table 3.

#### Remarks

1. We define $\llangle w_1, \delta \rrangle := w_1$ and $\llangle \delta, w_2 \rrangle := w_2$. So, $w_1 \delta \equiv w_1$ and $\delta w_2 \equiv w_2$ and as a result $\delta$ is not a subword of any word.

2. In the definitions of $\cap$ and $-$ the subwords $v_1, \ldots, v_n$ are obtained by "scanning" $w_1$ from left to right, e.g. if

$$w_1 = \llangle (\diamond x) (\diamond y_1 y_2) (\triangleright z)$$

and

$$w_2 = \llangle (\triangleright z) (\diamond x x)$$

then

$$\cap w_1 w_2 = \llangle (\diamond x x) (\triangleright z) > \llangle x \delta = x$$

and

$$w_1 w_2 = \llangle y_1 y_2$$

3. The ternary operation $\triangleleft$ is Mal'cev [7] i.e. $\triangleleft(w_1, w_1, w_2) = w_2 = \triangleleft(w_2, w_1, w_1)$ for all $w_1, w_2 \in \Lambda_a$.

We denote the algebra of abstract words $W_T(\Gamma_a)$ by $\Lambda_a$.

We show that $\Lambda_a$ is functionally complete (Theorem 2.2.1), using a characterization of functionality complete algebras in terms of the ternary discriminator function $t(x, y, z) = z$ if $x = y$ and $x \neq y$.

A finite algebra $A = (A, F)$ is functionally complete if and only if the ternary discriminator is an algebraic function of $A$ [17].

#### 2.2.1 Theorem

The abstract word algebra $\Lambda_a$ is functionally complete.

**Proof**

The ternary discriminator $t : \Lambda_a^3 \to \Lambda_a$ is an algebraic operation of $A$:

$$t(w_1, w_2, w_3) = t(w) = \llcorner \llcorner(p_1^3(w), p_2^3(w), p_3^3(w))$$

Since this expression, after replacing the projections with their results, becomes

$$\llcorner \llcorner(w_1, \llcorner(w_1, w_2) w_3) = \begin{cases} \llcorner \llcorner(w_1, w_1, w_3) = w \quad \text{if } w_1 = w_2 \\ \llcorner \llcorner(w_1, \delta, w_1) = w_1 \quad \text{if } w_1 \neq w_2 \end{cases}$$

#### 2.2.2 Corollary

$\Lambda_a$ is simple, i.e. has only two congruences.

Let $\Gamma_c$ be an alphabet disjoint from $\Gamma_a$ and $\Lambda_c$ be the set of all words relative to $T' = \{\delta, <\}$ (a nullary operation and $\llangle : \Lambda_c^2 \to \Lambda_c$ defined in Table 3) and $\Gamma_c$. We denote the word algebra $W_{T'}(\Gamma_c)$ by $\Lambda_c$, and call it the algebra of concrete words.

We now define a classification homomorphism between $\Lambda_c$ and a reduct of $\Lambda_a$ as follows: let $\Lambda_c^R = (\Lambda_a, T')$ and let $\varphi : \Gamma_c \to \Gamma_a$ be a given function.

The **classification homomorphism**

$$\text{cl} \varphi : \Lambda_c \to \Lambda_a$$

with respect to $\varphi$ is defined as the unique homomorphic extension of $\varphi$, i.e.

$$\text{cl}\varphi(w) = \begin{cases} w & \text{if } w \in \Gamma_c \\ \llcorner \llcorner \llcorner\llcorner(\varphi(w_1) \llcorner \llcorner\llcorner\llcorner(w_2) & \text{if } w = \llcorner w_1 w_2 \\ \varphi & \text{if } w = \delta \end{cases}$$

E.g. if

$$\Gamma_c = \{1, 2, 12, a, k, z\},$$

$$\Gamma_a = \{\text{integer, char}\}$$

and $\varphi : \Gamma_c \to \Gamma_a$ the "type-of" function. Then, for example,

Table 3: Definitions of operations in $T$

Since $\text{clf}_q: \mathfrak{m} \rightarrow \mathfrak{m}_a$ is a homomorphism, $\text{ker}(\text{clf}_q) = \{ (w_1, w_2) \in \mathfrak{m} \cap \text{clf}_q(w_1) = \text{clf}_q(w_2) \}$ is a congruence of $\mathfrak{m}_a$, and we have

$$\mathfrak{m}_a^R \cong \mathfrak{m}_a / \text{ker}(\text{clf}_q)$$

if $\text{clf}_q$ is onto.

2.3 The $m$-word Algebra

Our immediate aim is to describe an algebra where the elements of the carrier are objects (see 2.4, 2.5). In order to describe the internal structure of an object we introduce the notion of an $m$-word:

Consider $n$ alphabets $\Gamma_1, \ldots, \Gamma_n$ (not necessarily distinct) of abstract elements and the finite set $T$ of basic operations as defined in 2.2. Let $\mathfrak{m}_i = W(\Gamma_i), i = 1, \ldots, n$, and let $U_a = \langle U_a = \prod_{i=1}^n \Lambda_i, T \rangle$, the direct product of the $\Lambda_i$.

So, if $\tau$ is an $m$-ary operation in $T$ and $u^1 = (u^1_1, \ldots, u^1_n), \ldots, u^m = (u^m_1, \ldots, u^m_n) \in U_a$ then

$$\tau(u^1, \ldots, u^m)(j) := \tau(u^1_j, \ldots, u^m_j).$$

The elements of $U_a$ are called ordered multi-origin abstract words (or simply, abstract $m$-words) and $U_a$ the algebra of abstract $m$-words.

Similarly, we define a concrete $m$-word algebra with $T'$ (as in 2.2) the set of basic operations. This algebra is denoted by $U_c$. We write $\delta^n$ for the abstract/concrete $m$-word $(\delta, \delta, \ldots, \delta)$.

If $u = (u_1, \ldots, u_n)$ and $u' = (u'_1, \ldots, u'_n) \in U_a(U_c)$ then $u'$ is a sub-$m$-word of $u$ if and only if $u'_j$ is a subword of $u_j$ in $\mathfrak{m}_j$ for each $j = 1, \ldots, n$.

Let $\Gamma_1, \ldots, \Gamma_n$ be alphabets of abstract elements and $\Gamma'_1, \ldots, \Gamma'_n$ alphabets of concrete elements. Suppose, for each $i = 1, \ldots, n$, we have $\varphi_i: \Gamma'_i \rightarrow \Gamma_i$, let $\mathfrak{m}_a^R = W'_T(\Gamma'_i)$, and $\Lambda'_2 = W'_T(\Gamma'_i), i = 1, \ldots, n$. We define a classification homomorphism, $\text{clf}_R: U_c \rightarrow U_a^R$, where $U_c$ is the direct product of the $\mathfrak{m}_i$ and $U_a^R$ the direct product of the $\Lambda'_2$ as follows: for $u = (u_1, \ldots, u_n) \in U_c$, $\text{clf}_R(u) := (\text{clf}_q(u_1), \ldots, \text{clf}_q(u_n))$.

SACJ / SART, No 23, 1999
2.4 Objects

An object is a pair \((O,u) \equiv O[u]\) where \(O\) is an element of
a given set \(O^{(id)}\) of identifiers, called the object-id, and
\(u\) is an \(m\)-word, called the internal structure of the object.
The set of objects is denoted by \(O_a^{(1)}\) if \(u \in U_a\) and by \(O_c^{(1)}\)
if \(u \in U_c\). Objects in \(O_a^{(1)}\) are called classes and those in
\(O_c^{(1)}\) instances. Any \(u \in U_a(U_c)\) can be considered as an
object with nil object-id \(0\), i.e. \(u \equiv 0[u]\). These objects
are called pre-objects and denoted by \(O_a^{(0)}(O_c^{(0)})\). Thus
\(U_a \equiv O_a^{(0)} \subseteq O_a^{(1)}\) and \(U_c \equiv O_c^{(0)} \subseteq O_c^{(1)}\).
By identifying each \(O \in O^{(id)}\) with \(O[\delta^n]\) we can consider
\(O^{(id)} \subseteq O_a^{(1)}(O_c^{(1)})\).

Two objects \(O_1[u^1]\) and \(O_2[u^2]\) are called equivalent if
\(u^1 = u^2\). We write \(O_1[u^1] \approx O_2[u^2]\).

2.4.1 Object Properties

The alphabets \(\Gamma_1, \ldots, \Gamma_n\) are chosen in such a way that
the coordinates of an \(m\)-word \(u = (u_1, u_2, \ldots, u_n)\) correspond
to certain object properties. We distinguish the following
object-properties:

- The first word \(u_1\) corresponds to the first object-property
which consists of data definitions, each one being of a certain data type or of variables' values depending on whether the object is a class or an instance. We call this the data object-property.

- The second word \(u_2\) corresponds to the second object-property
which consists of functions, called methods, acting upon the values of the above-mentioned data types of the instance objects. This is called the methods object-property. Note that a method is a string specifying its name and number of parameters (as function headings are defined in most programming languages). The actual implementation of a method is not encapsulated in the object.

- The third word \(u_3\) corresponds to the third object-property
and contains the object-id of the class from which this object under consideration has been instantiated. The class of all classes is the single meta class under the name OBMS. The meta class is denoted by OBMS(obms). Thus for every class \(O[u]\) we write \(u_3 = OBMS\). We call this the class object-property.

- The fourth word corresponds to the fourth object-property
which consists of the (functional) relations that can be established between the different classes (respectively instances). The alphabet of that object-property includes functional relations \([1] [12] [15] [16]\) of any (finite) arity established among the object identities. We call this the relations object-property.

- The fifth word corresponds to the fifth object-property
and is defined as follows \([15] [16]\): The Arc Data is a

special data type defining the inter-objects connections (see in next section). The elements of the alphabet has the form \#O(F1F2F3) and is encapsulated in an object called “taker” specifying

(i) an object \(O\) (called “giver”) participating in the same hierarchical structure with the “taker”,

(ii) the scope of arc, i.e. how many data, methods and relationships are inherited by the filtering function F1F2F3 for data (F1), methods (F2) and relationships (F3) respectively. F1F2F3 takes values from the set AAA, AAN, ANA, ANN, NNN where “A” stands for “All” and “N” stands for “None”.

(iii) The multiplicity of the arc is defined by the optional prefix symbol “#”. It is used only in links of class-two-level-hierarchies (see 2.6.1) and defines whether an instance of the “taker” can be linked simultaneously with more than one instance of the “giver”.

The arcs between two objects constitute links. The links can be single (in this case there is only one “taker” and one “giver”) or double (both objects are “takers” and “givers”). The double links are not necessarily similar in terms of their filtering functions and their multiplicity.

In practice not all the elements of \(O^{(1)}\) are “active”, in the sense that, at a given moment, not all objects are in the Objectbase. Those objects in the Objectbase are called active. OBMS(obms) and \(\theta[\delta^n]\) are always active.

In Figure 1, we illustrate the object's structure.

2.4.2 Encapsulation and Instantiation Functions

We define two partial functions:

1. The encapsulation function, \(\text{enc} : O^{(id)} \times O^{(c)}_c \rightarrow O_c^{(1)}\). For \(O[\delta^n] \in O^{(id)}\) and \(\theta[u] \in O^{(c)}_c\) we have

\[
\text{enc}(O[\delta^n], \theta[u]) = \begin{cases} O[u] & \text{if } O \text{ is not in the object-id of an active class} \\ \theta[\delta^n] & \text{otherwise} \end{cases}
\]

2. The instantiation function, \(\text{ins} : O^{(id)} \times O^{(c)}_c \times O^{(c)}_c \rightarrow O_c^{(1)}\). For \(O[u] \in O^{(id)}\), \(\theta[\delta^n] \in O^{(c)}_c\), \(W[w] \in O^{(c)}_c\) and a given classification homomorphism \(cl_f\), we have

\[
\text{ins}(O[\delta^n], \theta[u], W[w]) = \begin{cases} O[u] & \text{if } O \text{ is not the object-id of an active object, } W[w] \\ \text{is an active class} \\ \text{and } cl_f(u) = w, & \text{otherwise} \end{cases}
\]
2.5 Algebras of Objects

We define using the operations $T$ of the abstract word algebra, a set of basic operations $F(\{\}) = \{\emptyset[\emptyset^n], 1, Dlo, Amo, Ino, Dfo, Cmo, U po\}$ on the set $O_a(\{\})$ and then consider the algebra $\mathcal{F}(\{\}) = (O_a(\{}), F(\{\}))$, called the algebra of abstract objects or the algebra of classes.

A detailed description of each operation is given below:

1. Nullary operation
   
   $0[\emptyset^n] : \{\} \rightarrow O_a(\{\}), 0[\emptyset^n](\emptyset) = 0[\emptyset^n].$

2. Unary operations

   - Identity
     
     $1$

   - Delete object
     
     $Dlo : O_a(\{\}) \rightarrow O_a(\{\})$

     $Dlo(O[u]) = \begin{cases} 
     0[\emptyset^n] & \text{if } O[u] \text{ is a class with no instances} \\
     O[u] & \text{otherwise}
     \end{cases}$

3. Binary operations

   Add object to object
   
   $Amo : \left( O_a(\{\}) \right)^2 \rightarrow O_a(\{\})$

   $Amo(O_1[u_1], O_2[u_2]) = \begin{cases} 
     O_1[\emptyset^n u_2^2] & \text{if } u_1 = \emptyset^n \text{ and } O_2 = \emptyset \\
     O_1[\emptyset^n u_2^2] & \text{if } u_1 = \emptyset^n, u_2^2 \neq \emptyset^n \text{ and } O_1 \neq \emptyset, O_2 \neq \emptyset \\
     O_1[\emptyset^n u_2^2] & \text{if } u_1 \neq \emptyset^n \text{ and } O_2 = \emptyset \\
     O_1[\emptyset^n u_2^2] & \text{if } O_1[u_1] \approx O_2[u_2] \\
     0[\emptyset^n] & \text{otherwise}
     \end{cases}$

   $Dfo(O_1[u_1], O_2[u_2]) = \begin{cases} 
     O_1[u_1] & \text{if } O_1[u_1] = O_2[u_2] \text{ or } O_1[u_1] \approx O_2[u_2] \\
     0[u_1 u^2] & \text{if } O_1 = O_2 = \emptyset \\
     0[\emptyset^n] & \text{otherwise}
     \end{cases}$
• Compare two objects

\[ Cmo : (O_u^{(1)})^2 \rightarrow O_u^{(1)} \]

\[ Cmo(O_1[u^1], O_2[u^2]) = \begin{cases} 
O_1[u^1] & \text{if } O_1[u^1] = O_2[u^2] \\
O_1[u^1] & \text{if } O_1[u^1] \approx O_2[u^2] \\
0\langle 0^u, 0^u \rangle & \text{if } O_1 \equiv O_2 = 0 \\
0\langle \emptyset^0 \rangle & \text{otherwise}
\end{cases} \]

4. Ternary operation

Update object \( Upo : (O_u^{(1)})^3 \rightarrow O_u^{(1)} \)

\[ Upo(O_1[u^1], O_2[u^2], O_3[u^3]) = \begin{cases} 
\emptyset^0 & \text{if } O_1 = O_2 = O_3 = 0 \\
O_1[u^1] & \text{if } O_1[u^1] = O_2[u^2] \\
O_3[u^3] & \text{if } O_1[u^1] = O_2[u^2] \\
O_1[u^1] & \text{if } O_1[u^1] = O_2[u^2] \\
0\langle 0^u, 0^u \rangle & \text{if } O_1 \neq \emptyset, O_2 = O_3 = 0 \\
O_1[u^1] & \text{otherwise}
\end{cases} \]

Note that in the last case all the possible remaining combinations of classes which cannot give us any updating capability are included. It is easy to see that this operation is Mal'cev.

Two algebras \( A = \langle A, F_A \rangle \) and \( B = \langle B, F_B \rangle \) are weakly isomorphic if there exists an isomorphism \( \phi : A \rightarrow B \), and for each \( m \)-ary operation \( f_A \in F_A \) and \( \alpha_1, \ldots, \alpha_m \) in \( A \), there is an \( m \)-ary operation \( f_B \in F_B \) such that \( \phi(f_A(\alpha_1, \ldots, \alpha_m)) = f_B(\phi(\alpha_1), \ldots, \phi(\alpha_m)). \) [5] [7].

2.5.1 Proposition

The \( m \)-word algebra \( U = \langle U_a, T \rangle \) and the algebra \( \langle O_u^{(0)}, F^{(1)} \rangle \) are weakly isomorphic.

Proof

Define \( \phi : O_u^{(0)} \rightarrow U_a \) by \( \phi(\emptyset[u]) = u \). For each \( m \)-ary operation \( f \in F^{(1)} \) there exists an operation of the same arity \( \tau \in T \) such that \( f(\emptyset[u^1], \ldots, \emptyset[u^m]) = \emptyset[\tau(u^1, \ldots, u^m)]. \)

Thus
\[ \phi(f(\emptyset[u^1], \ldots, \emptyset[u^m])) = \tau(\phi(\emptyset[u^1]), \ldots, \phi(\emptyset[u^m])). \]

2.5.2 Corollary

The \( m \)-word algebra \( U = \langle U_a, T \rangle \) is weakly embedded in the algebra \( \langle O_u^{(0)}, F^{(1)} \rangle \).

The algebra of concrete objects (algebra of instances) is the universal algebra with carrier \( O_c^{(1)} \) and set of basic operations \( \{0[\emptyset^0], Am_o\} \) where \( 0[\emptyset^0] \) is a nullary operation and \( Am_o : (O_c^{(1)})^2 \rightarrow O_c^{(1)} \) is defined as above for abstract objects.

2.6 SECOND-ORDER OBJECTS (2-OBJECTS)

2.6.1 Two-level-Hierarchies (t-1-hs) of Objects

We recall from [16]: A class (respectively instance) two-level hierarchy (t-1-h) is a special type of directed acyclic graph \( D \) whose vertices belong to the set \( O_0^{(1)} \) (respectively \( O_c^{(1)} \)) with the following properties:

1. If \( D \) consists of a single vertex then we say that \( D \) is an empty t-1-h.

2. A non-empty t-1-h \( D \) consists of at least two vertices, one is called Representative (REP) and the rest are called Components (COs). The REP-object in \( D \) is linked to every \( CO \), i.e. (\( REP, CO \)) belongs to \( E(D) \) which is the set of arcs of \( D \) for each \( CO \) in \( D \).

For any non-empty t-1-h \( D \), we write \( D = \langle O[u]; O_1[u^1], \ldots, O_n[u^n] \rangle \) where \( O[u] \) is the REP and \( O_1[u^1], \ldots, O_n[u^n] \) are the COs.

We use \( D_0 \) to denote \( \{0[\emptyset^0], 0[\emptyset^1], \ldots, 0[\emptyset^n]\} \) and if \( D \) is an empty t-1-h, we write \( D = \langle [0[u]]^{(2)} \rangle \).

If \( (CO, REP) \in E(D) \) for some \( CO \) in \( D \) then \( (CO, REP) \in E(D) \) for all \( COs \) in \( D \). There is no arc between any two \( COs \) in \( D \). The arc(s) between a \( REP \) and one of its \( CO \) constitute the link.

If \( D \in L^{(2)} \), the set of t-1-hs, and \( e \in E(D) \) then

3. \( e \) cannot belong to any other \( D \) in \( L^{(2)} \) and

4. Any two objects can only be linked by a unique (node disjoint) path where by path we mean the concatenation of arcs leading from one of the objects to the other.

In Figure 2, we illustrate the different types of two-level-hierarchies in a generic way.

2.6.2 2-objects

A second-order object (2-object) is a pair \( (H, D) \equiv H[D]^{(2)} \) where \( H \) is the object identity (unique) and \( D \) is a t-1-h encapsulated in \( H \). We call a 2-object \((H, D)\) empty if \( D \) is an empty t-1-h.

The set of 2-objects is denoted by \( O^{(2)} \). We write \( O^{(2)} \) if the set of vertices of \( D \), \( V(D) \subset O^{(1)} \) and \( O^{(2)} \) if \( V(D) \subset O^{(2)} \). The elements of \( O^{(2)} \) are called abstract 2-objects or 2-classes and those of \( O^{(2)} \) concrete 2-objects or 2-instances.
2.6.3 Definition of Complex Objects

Complex objects are derived by composing 2-objects as follows:

(i) Any 2-object is a complex object, called an elementary complex object.

(ii) Let \((H_1,D_1)\) and \((H_2,D_2)\) be 2-objects. If one or both are empty then they are non-composable.

For non-empty 2-objects

(a) if there exists an object \(O[u]\) that is a CO of \(\langle H_1,D_1 \rangle\), say and a REP of \((H_2,D_2)\), we define \(\langle H_1,D_1 \rangle \circ \langle H_2,D_2 \rangle = \langle F,D \rangle\) where \(F = (H_1,H_2)\) and \(D\) is the directed graph with \(V(D) = V(D_1) \cup V(D_2)\) and \(E(D) = E(D_1) \cup E(D_2)\).

(b) if there exists an object \(O[u]\) that is a CO of \(\langle H_1,D_1 \rangle\) and \(\langle H_2,D_2 \rangle\), we define \(\langle H_1,D_1 \rangle \circ \langle H_2,D_2 \rangle = \langle F,D \rangle\) where \(F = \{H_1,H_2\}\) and \(D\) as in (a).

2-objects \(\langle H_1,D_1 \rangle\) and \(\langle H_2,D_2 \rangle\) satisfying (a) or (b) are composable. Otherwise \(\langle H_1,D_1 \rangle\) and \(\langle H_2,D_2 \rangle\) are non-composable.

(iii) If \(\langle H_1,D_1 \rangle, \ldots ,\langle H_k,D_k \rangle\) are non-empty 2-objects that are pairwise non-composable, but each \(\langle H_i,D_i \rangle, i = 1, \ldots ,k\), is composable with a 2-object \(\langle H,D \rangle\) as in (ii)(a), then \(\langle H,D \rangle \circ \langle H_1,D_1 \rangle \ldots \langle H_k,D_k \rangle = \langle F,D_{k+1} \rangle\) is a complex object where \(F = \langle H,\{H_1,\ldots ,H_k\} \rangle\) and \(D_{k+1}\) is the directed graph with \(V(D_{k+1}) = V(D) \cup V(D_1) \cup \ldots \cup V(D_k)\) and \(E(D_{k+1}) = E(D) \cup E(D_1) \cup \ldots \cup E(D_k)\).

(iv) If \(C_1 = \langle F_1,D_1 \rangle\) and \(C_2 = \langle F_2,D_2 \rangle\) are complex objects then \(C_1\) and \(C_2\) are composable if there exists a pair of 2-objects \(\langle H_1,D_1 \rangle \in C_1\) and \(\langle H_2,D_2 \rangle \in C_2\) that are composable and we write \(C_1 \circ C_2 = \langle F,D \rangle\) for the resulting complex object where \(F = \langle F_1,F_2 \rangle\) if \(\langle H_1,D_1 \rangle\) and \(\langle H_2,D_2 \rangle\) are composable as in (ii)(a) and \(F = \{F_1,F_2\}\) if \(\langle H_1,D_1 \rangle\) and \(\langle H_2,D_2 \rangle\) are composable as in (ii)(b). Note that, by definition of a t-l-h, if such a pair of 2-objects exists then it is necessarily unique. Hence, we can compose two complex objects in only one way. Otherwise \(C_1\) and \(C_2\) are non-composable.

(v) If \(C_1 = \langle F_1,D_1 \rangle, \ldots ,C_k = \langle F_k,D_k \rangle\) are pairwise non-composable complex objects and each \(C_i, i = 1, \ldots ,k\), is composable with a complex object \(C = \langle F,D \rangle\) then we define the composition \(C \circ \langle C_1,\ldots ,C_k \rangle\) analogous to (iii). The object identity of the composition is \(\langle F,\{F_1,\ldots ,F_k\} \rangle\).

A collection of complex objects (classes and their instances) form an object-base.

2.6.4 2-Objects and Complex Objects as Greedoids

In this section we show that we can associate every 2-object and every complex object with a greedoid. Greedoids have been introduced to provide a structural framework for the greedy algorithm [10].

A set system \((E, \mathcal{F})\) (with \(E\) finite and \(\mathcal{F} \subseteq 2^E\)) is a greedoid if
(i) \( \emptyset \in \mathcal{F} \)

(ii) for all \( X \in \mathcal{F} \) there exists an \( a \in X \) such that \( X - \{a\} \in \mathcal{F} \)

(iii) if \( X, Y \in \mathcal{F} \) and \( |X| = |Y| + 1 \) then there exists an \( a \in X - Y \) such that \( Y \cup \{a\} \in \mathcal{F} \).

A set system \( (E, \mathcal{F}) \) satisfying (i) and (ii) is called an accessible set system and the elements of \( \mathcal{F} \) are called feasible sets.

Informally, the greedy algorithm when run on a set of system, builds a solution by beginning with the empty set and successively adding the best remaining element while containing feasibility. For completeness we recall (cf.[14]) a modified version of the greedy algorithm for accessible set systems: let \( (E, \mathcal{F}) \) be an accessible set system and \( f : 2^E \rightarrow \mathbb{R} \) is an objective function and consider the optimization problem

\[
\max \{ f(F) : F \in \mathcal{F} \}.
\]

The modified greedy algorithm goes as follows:

(1) Take \( F^* = \emptyset \) as the initial feasible solution and set \( F = \emptyset \);

(2) choose \( x \in E \setminus F \) such that \( F \cup \{x\} \in \mathcal{F} \) and \( f(F \cup x) \geq f(F \cup y) \) for all \( y \in E \setminus F \) with \( F \cup y \in \mathcal{F} \); if no such \( x \) exists - STOP \( (F^* \) is the greedy solution);
Figure 5: \( (H, D) \circ (\langle H_1, D_1 \rangle, \ldots, \langle H_k, D_k \rangle) \)

Figure 6: The classes of the above objectbase are denoted by \( O_1, \ldots, O_{16} \) while the 2-classes’ object identities are: \( H_1, \ldots, H_7 \), and their t-hs: \( D_1, \ldots, D_7 \) (the class \( O_{14} \) is considered an empty 2-class). The complex objects' identities are: \( CL_1 = (H_1, \{H_2, H_3\}, H_4), CL_2 = (H_5, H_6), \) and \( CL_3 = H_7 \).

(3) if \( f(F \cup x) > f(F^*) \) then replace \( F^* \) by \( F \cup x \);

(4) replace \( F \) by \( F \cup x \) and \( \text{GOTO}(2) \).

In [14] Goecke, Korte and Lovász characterize those structures for which the modified greedy algorithm computes an optimal solution for every linear objective function:

**Theorem**

Let \((E, \mathcal{F})\) be an accessible set system, then the following are equivalent:

(i) For every linear objective function \( f : 2^E \to \mathbb{R} \) the modified greedy algorithm determines an optimal solution for the problem

\[ \max \{ f(F) : F \in \mathcal{F} \} . \]

(ii) \((E, \mathcal{F})\) is a greedoid and no \( B \subseteq E \) has the following property:

\[
\begin{align*}
& z \in B, x, y \not\in B \text{ such that } B \in \mathcal{F}, \\
& B - z \cup \{x, y\} \notin \mathcal{F}, \\
& B - z \cup \{y\} \notin \mathcal{F} \\
& \text{and } B \cup \{y\} \notin \mathcal{F}
\end{align*}
\]

For a 2-object (or complex object) \((H, D)\) we consider the search (or branching) greedoid defined on the directed graph \(D\): A vertex \( P_0 \in V(D) \) is marked and called “root”. The ground set for the greedoid is \( E = E(D) \), the set of arcs of \( D \), and \( \mathcal{F} \) is the collection of trees in \( D \) rooted at \( P_0 \).

It is easy to see that property (*) holds for the greedoid defined on the underlying directed graph of a 2-object \((H, D)\): e.g.

If \( P_0 = \text{REP}(H, D) \), then \( \mathcal{F} = 2^{E(D)} \).

If \( P_0 = \text{a component} \), then \( \mathcal{F} = \{ \emptyset \} \).
Figure 7: \((H,D)\) where \(D\) is of type 1.

Figure 8: \((H,D)\) where \(D\) is of type 2.

If \(P_0 = REP_{(H,D)}\), see Figure 9.
If \(P_0 = CO_1\) (say), see Figure 10.

However it is not the case for complex objects, for example: let \(C = (H,D) \circ (H',D') = (F,D'')\), a composition of 2-objects \((H,D)\) and \((H',D')\). Suppose \(D\) is of type 1, say \(D\) (See Figure 11) and \(D'\) is of type 2, say \(D'\) (See Figure 12).

then \(D''\) becomes (See Figure 13).

If we choose \(P_0 = REP_{(H,D)}\), then (*) is not satisfied: let \(B = \{e_1, e_2\}\), \(z = e_1\), \(x = e_3\), \(y = e_5\). Then \(B \in \mathcal{F}, B - z \cup \{x,y\} = \{e_2, e_3, e_5\} \in \mathcal{F}, B - z \cup \{y\} = \{e_2, e_5\} \notin \mathcal{F}\) and \(B \cup \{y\} = \{e_1, e_2, e_5\} \notin \mathcal{F}\).

In an implementation the weight function \(w: E(D) \rightarrow \mathbb{R}\) can be defined in such a way that it depends on the filtering function of the arc. The induced linear objective function \(f: 2^{E(D)} \rightarrow \mathbb{R}\) with \(f(A) := \sum_{e \in A} w(e)\) also depends on the message's features (i.e. how many datatypes should be properly instantiated during the message resolution process).

2.7 An Algebra of 2-Objects

2.7.1 Active 2-Objects

The active 2-objects are defined analogously to the active objects in Section 2.4. To describe the specific types of an active 2-object, i.e. the structural relationship that specifies the detailed types of the links of its internal structure \(D\), we use subscripts on the object-id. Let \(H_i[D]^2\) be an active 2-object:
Figure 9: \( \mathcal{F} = \) the set of subtrees of the above tree (root \( REP \)).

Figure 10: \( \mathcal{F} = \) the set of subtrees of the above tree (root \( CO_1 \)).

(1) \( i = "m" \) if \( D \) is of type 2 and the filtering function equals “AAA” for all links. These 2-objects correspond to the “member-of” structural relationship supported by the association operation \( ASC \) (the operations are defined and analysed below),

(2) \( i = "p" \) if \( D \) is of type 2 and the filtering function on each \((REP,CO)\) in \( D \) equals “AAA” and on each \((CO,REP)\) in \( D \) equals “ANA”. These 2-objects correspond to the “part-of” relationship supported by the aggregation operation \( AGG \),

(3) \( i = "g" \) if \( D \) is of type 1 and the filtering function equals “ANN”. These 2-objects correspond to the “group-of” structural relationship supported by the grouping operation \( GRP \),

(4) \( i = "s" \) if \( D \) is of type 1 and the filtering function equals “AAN”. These 2-objects correspond to the “is-a” structural relationship supported by the specialization operation \( SPE \) and

(5) \( i = "H_j[D']" \) if \( D \) is an instance t-l-h of type \( j \) (as defined in the above four cases) created (instantiated) from the active 2-class \( H_j[D'] \).

Classes (1) - (4) are used to characterize the 2-classes. In the fifth case every 2-instance is characterized through its own 2-class.

In Figure 14 we give an example of a simple object-base’s model, where we explain the various 2-classes and the values that the links are taking:
Figure 11: \((H,D), \text{ } D \text{ of type } 1\).

Figure 12: \((H',D'), \text{ } D' \text{ of type } 2\).

We now have an algebra of 2-objects \(\Omega^{(2)} = \{O^{(2)}, F^{(2)}\} \) where \(F^{(2)} = \{0[D_0]^{(2)}, I, DL20, SPE, ASC, AGG, XSPE, RSPE, XASC, RASC, XAGG, RAGG, XGRP, RGRP, CR21\} \).

Before giving a description of each operation in \(F^{(2)}\) we first specify different categories of constraints:

**Constraint-A:** For every pair of 2-classes \(H[D]^{(2)}, H'[D']^{(2)}\) we have \(H \neq \emptyset, H' = \emptyset, D = D_0\) and \(D' = [O[u]; O_1[u^1]\ldots O_n[u^n]]^{(2)}\).

**Constraint-B:** For every pair of 2-classes \(H_i[D]^{(2)}, H'[D']^{(2)}\) where \(i \in \{m, p, g, s\}\), we have \(H_i \neq \emptyset, H_i' = \emptyset, D = D_0\) and \(D' = [O[u]; O_1[u^1]\ldots O_n[u^n]]^{(2)}\) and \(D'' = [O'[u^1]; O_1'[u'^1]\ldots O_n'[u'^n]]^{(2)}\).

**Constraint-C:** For every pair of 2-classes \(H_i[D]^{(2)}, H_i'[D'_i]^{(2)}\) where \(i \in \{m, p, g, s\}\), we have \(H_i \neq \emptyset, H_i' = \emptyset, D = D_0\) and \(D'' = [O'[u^1]; O_1'[u'^1]\ldots O_n'[u'^n]]^{(2)}\).

**Constraint-D:** For every pair \(H[D]^{(2)}, H''[D'']^{(2)}\) where \(i \in \{m, p, g, s\}\), we have \(H_i \neq \emptyset, H_i' = \emptyset, D = D_0, D' = [O[u]; O_1[u^1]\ldots O_n[u^n]]^{(2)}\) and \(D'' = [O''[u''^1]; O_1''[u''^1]\ldots O_n''[u''^n]]^{(2)}\).
one of $O_m[u^n](1 \leq m \leq n + k)$. 3. Delete

1. Nullary operation

$\emptyset[D_0]^{(2)} : \emptyset \rightarrow O^{(2)}, \emptyset[D_0]^{(2)}(\emptyset) = \emptyset[D_0]^{(2)}$

2. Identity

$1 : O^{(2)} \rightarrow O^{(2)}$

$DL2O : O^{(2)} \rightarrow O^{(2)},
DL2O(H[D^{(2)}]) = $
4. Specialization
\[ \text{SPE} : O^{(2)} \times O^{(2)} \rightarrow O^{(2)}, \]
\[ \text{SPE}(H[D^{(2)}], H'[D']^{(2)}) = \]
\[ \begin{cases} H[D']^{(2)} & \text{if constraint-A holds,} \\ 0[D_0]^{(2)} & \text{otherwise} \end{cases} \]

5. Association
\[ \text{ASC} : O^{(2)} \times O^{(2)} \rightarrow O^{(2)}, \]
\[ \text{ASC}(H[D^{(2)}], H'[D']^{(2)}) = \]
\[ \begin{cases} H[D']^{(2)} & \text{if constraint-A holds,} \\ 0[D_0]^{(2)} & \text{otherwise} \end{cases} \]

6. Aggregation
\[ \text{AGG} : O^{(2)} \times O^{(2)} \rightarrow O^{(2)}, \]
\[ \text{AGG}(H[D^{(2)}], H'[D']^{(2)}) = \]
\[ \begin{cases} H[D']^{(2)} & \text{if constraint-A holds,} \\ 0[D_0]^{(2)} & \text{otherwise} \end{cases} \]

7. Grouping
\[ \text{SPE} : O^{(2)} \times O^{(2)} \rightarrow O^{(2)}, \]
\[ \text{SPE}(H[D^{(2)}], H'[D']^{(2)}) = \]
\[ \begin{cases} H[D']^{(2)} & \text{if constraint-A holds,} \\ 0[D_0]^{(2)} & \text{otherwise} \end{cases} \]

8. Expanding Specialization
\[ \text{XSPE} : O^{(2)} \times O^{(2)} \rightarrow O^{(2)}, \]
\[ \text{XSPE}(H[D^{(2)}], H'[D']^{(2)}) = \]
\[ \begin{cases} H[D']^{(2)} & \text{if } H[D^{(2)}] = H[D_0]^{(2)} \text{ and constraint-B holds,} \\ \text{and } \text{constraint-B holds,} \\ \text{where } D' = [O[u_1], O_{j-1}[u_{j-1}]], \\ \ldots, O_{n+1}[u_{n+1}], O_{n}[u_n]]^{(2)}, \\ H[D^{(2)}] & \text{otherwise} \end{cases} \]

9. Reducing Specialization
\[ \text{RSPE} : O^{(2)} \times O^{(2)} \rightarrow O^{(2)}, \]
\[ \text{RSPE}(H[D^{(2)}], H'[D']^{(2)}) = \]
\[ \begin{cases} H[D']^{(2)} & \text{if constraint-C holds and} \\ H[D'^{(2)}] = H[D_0]^{(2)} \\ \text{where } D' = [O[u_1], O_{j-1}[u_{j-1}]], \\ \ldots, O_{n+1}[u_{n+1}], O_{n}[u_n]]^{(2)}, \\ H[D^{(2)}] & \text{otherwise} \end{cases} \]

10. Expanding Association
\[ \text{XASC} : O^{(2)} \times O^{(2)} \rightarrow O^{(2)}, \]
\[ \text{XASC}(H[D^{(2)}], H'[D']^{(2)}) = \]
\[ \begin{cases} H[D']^{(2)} & \text{if constraint-A holds and} \\ H[D'^{(2)}] = H[D_0]^{(2)} \text{ and} \\ \text{constraint-B holds, where} \\ D' = [O[u_1], O_{j-1}[u_{j-1}]], \\ \ldots, O_{n+1}[u_{n+1}], O_{n}[u_n]]^{(2)}, \\ H[D^{(2)}] & \text{otherwise} \end{cases} \]

11. Reducing Association
\[ \text{RASC} : O^{(2)} \times O^{(2)} \rightarrow O^{(2)}, \]
\[ \text{RASC}(H[D^{(2)}], H'[D']^{(2)}) = \]
\[ \begin{cases} H[D']^{(2)} & \text{if constraint-C holds} \\ \text{and } H[D'^{(2)}] = H[D_0]^{(2)} \text{ and} \\ \text{constraint-B holds, where} \\ D' = [O[u_1], O_{j-1}[u_{j-1}]], \\ \ldots, O_{n+1}[u_{n+1}], O_{n}[u_n]]^{(2)}, \\ H[D^{(2)}] & \text{otherwise} \end{cases} \]

12. Expanding Aggregation
\[ \text{XAGG} : O^{(2)} \times O^{(2)} \rightarrow O^{(2)}, \]
\[ \text{XAGG}(H[D^{(2)}], H'[D']^{(2)}) = \]
\[ \begin{cases} H[D']^{(2)} & \text{if constraint-B holds} \\ \text{and } H[D'^{(2)}] = H[D_0]^{(2)} \text{ and} \\ \text{constraint-B holds, where} \\ D' = [O[u_1], O_{j-1}[u_{j-1}]], \\ \ldots, O_{n+1}[u_{n+1}], O_{n}[u_n]]^{(2)}, \\ H[D^{(2)}] & \text{otherwise} \end{cases} \]
13. Reducing Aggregation

\[ RAGG : O^{(2)} \times O^{(2)} \rightarrow O^{(2)}, \]
\[ RAGG(H[D]^{(2)}, H'[D']^{(2)}) = \]
\[ \begin{cases} 
H_p[D']^{(2)} & \text{if constraint-C holds and} \\
H[D]^{(2)} = H_p[D]^{(2)} \text{ where} \\
D' = [O[u]; O_1[u_1], \ldots, O_j[u_j], O_{j+1}[u_{j+1}], \ldots, O_n[u^n]]^{(2)}, \\
H[D]^{(2)} & \text{otherwise} 
\end{cases} \]

14. Expanding Grouping

\[ XGRP : O^{(2)} \times O^{(2)} \rightarrow O^{(2)}, \]
\[ XGRP(H[D]^{(2)}, H'[D']^{(2)}) = \]
\[ \begin{cases} 
H_p[D']^{(2)} & \text{if constraint-B holds and} \\
H[D]^{(2)} = H_p[D]^{(2)} \text{ where} \\
D' = [O[u]; O_1[u_1], \ldots, O_j[u_j], O_{j+1}[u_{j+1}], \ldots, O_n[u^n]]^{(2)}, \\
H[D]^{(2)} & \text{otherwise} 
\end{cases} \]

15. Reducing Grouping

\[ RGRP : O^{(2)} \times O^{(2)} \rightarrow O^{(2)}, \]
\[ RGRP(H[D]^{(2)}, H'[D']^{(2)}) = \]
\[ \begin{cases} 
H_p[D']^{(2)} & \text{if constraint-C holds and} \\
H[D]^{(2)} = H_p[D]^{(2)} \text{ where} \\
D' = [O[u]; O_1[u_1], \ldots, O_j[u_j], O_{j+1}[u_{j+1}], \ldots, O_n[u^n]]^{(2)}, \\
H[D]^{(2)} & \text{otherwise} 
\end{cases} \]

16. Create 2-instance

\[ CR21 : O^{(2)} \times O^{(2)} \rightarrow O^{(2)}, \]
\[ CR21(H[D]^{(2)}, H'[D']^{(2)}) = \]
\[ \begin{cases} 
H_p[D']^{(2)} & \text{if constraint-D holds} \\
H_{p'[2]}[D']^{(2)} & \text{and constraint-D holds} \\
\emptyset[D_b]^{(2)} & \text{otherwise} 
\end{cases} \]

Conclusion

In this work we introduced FMOB: a formal model for objectbases. FMOB is based on a universal algebra of words and appropriate extensions, while it supports objects, 2-objects and complex objects. The inheritance notion is replaced by the link concept, thus allowing to introduce additional structural relations (association, aggregation, and grouping). The algebra of the abstract words is functionally complete, as well as the modified greedy algorithm optimizes all linear objective functions over the branching greedoid associated with a 2-object.

Notes for Contributors

The prime purpose of the journal is to publish original research papers in the fields of Computer Science and Information Systems, as well as shorter technical research notes. However, non-refereed review and exploratory articles of interest to the journal's readers will be considered for publication under sections marked as Communications of Viewpoints. While English is the preferred language of the journal, papers in Afrikaans will also be accepted. Typed manuscripts for review should be submitted in triplicate to the editor.

Form of Manuscript
Manuscripts for review should be prepared according to the following guidelines:

- Use wide margins and 1½ or double spacing.
- The first page should include:
  - the title (as brief as possible)
  - the author's initials and surname
  - the author's affiliation and address
  - an abstract of less than 200 words
  - an appropriate keyword list
  - a list of relevant Computing Review Categories
- Tables and figures should be numbered and titled.
- References should be listed at the end of the text in alphabetic order of the (first) author's surname, and should be cited in the text according to the Harvard method. References should also be according to the Harvard method.

Manuscripts accepted for publication should comply with guidelines as set out on the SACJ web page,

http://www.cs.up.ac.za/sacj

which gives a number of examples.

SACJ is produced using the \LaTeX\ document preparation system, in particular \LaTeX~2e. Previous versions were produced using a style file for a much older version of \LaTeX, which is no longer supported. Please see the website for further information on how to produce manuscripts which have been accepted for publication.

Authors of accepted publications will be required to sign a copyright transfer form.

Charges
Charges per final page will be levied on papers accepted for publication. They will be scaled to reflect typesetting, reproduction and other costs. Currently, the minimum rate is R30.00 per final page for contributions which require no further attention. The maximum is R120.00, prices inclusive of VAT.

These charges may be waived upon request of the author and the discretion of the editor.

Proofs
Proofs of accepted papers may be sent to the author to ensure that typesetting is correct, and not for addition of new material or major amendments to the text. Corrected proofs should be returned to the production editor within three days.

Letters and Communications
Letters to the editor are welcomed. They should be signed, and should be limited to about 500 words. Announcements and communications of interest to the readership will be considered for publication in a separate section of the journal. Communications may also reflect minor research contributions. However, such communications will not be refereed and will not be deemed as fully-fledged publications for state subsidy purposes.

Book Reviews
Contributions in this regard will be welcomed. Views and opinions expressed in such reviews should, however, be regarded as those of the reviewer alone.

Advertisement
Placement of advertisements at R1000.00 per full page per issue and R500.00 per half page per issue will be considered. These charges exclude specialised production costs, which will be borne by the advertiser. Enquiries should be directed to the editor.
