Validation for work engagement

The results of the factor loadings are based on a principal component extraction with Oblimin and Kaiser normalisation rotation for the WES showed eight items loaded onto Factor 1, measuring employee dedication; six items loaded onto Factor 2, measuring employee absorption; and three items loaded onto Factor 3, measuring employee vigour. Compared to the WE scale developed by Schaufeli and Bakker (2004), the factor loadings and the research reported on are similar in structure; however, the item loadings differ. A comparison of the two scales is depicted in Table 14.

Table 14: Comparison of WE factors and item loadings

WE scale (Schaufeli & Bakker, 2004)	This study
Vigour	Vigour
At my work, I feel bursting with energy	I am proud of the work that I do.
At my job, I feel strong and vigorous	At my work, I always persevere, even when things do not go well.
When I get up in the morning, I feel like going to work	Time flies when I am working.
I can continue working for very long periods at a time	
At my job, I am very resilient, mentally	
At my work, I always persevere, even when things do not go well	
Dedication	Dedication
I find the work that I do full of meaning and purpose	When I get up in the morning, I feel like going to work.
I am enthusiastic about my job	At my job, I feel strong and vigorous.
My job inspires me	My job inspires me.
I am proud of the work that I do	I find the work that I do full of meaning and purpose.
To me, my job is challenging	I am enthusiastic about my job.
	At my work, I feel bursting with energy.
	When I am working, I forget everything else around me.
	I feel happy when I am working intensely.
Absorption	Absorption
Time flies when I am working	To me, my job is challenging.
When I am working, I forget everything else around me	I get carried away when I am working.
I feel happy when I am working intensely	It is difficult to detach myself from my job.
I am immersed in my work	At my job, I am very resilient, mentally.

WE scale (Schaufeli & Bakker, 2004)	This study
I get carried away when I am working	I can continue working for very long periods at a time.
It is difficult to detach myself from my job	I am immersed in my work.

Validation for OC

Regarding OC, the scale factor loadings based on a principal component extraction with Oblimin and Kaiser normalisation rotation showed that eight items loaded onto Factor 1 measuring CC, six items loaded onto Factor 2 measuring AC, and seven items loaded onto Factor 3 measuring NC. The factor structure was compared to Allen and Meyer's OC scale developed in 1996 and validated by Maqsood *et al.* (2012), and the results reported on are similar, howbeit the item loadings differ. A comparison of the two scales is depicted in Table 15.

Table 15: Comparison of OC factors and item loadings

Allen and Meyer's original OC scale (1996), as validated by Maqsood <i>et al.</i> (2012)	This study
AC	AC
I would be very happy to spend the rest of my career with this organisation.	I enjoy discussing my organisation with people outside it
I enjoy discussing my organisation with people outside it.	I would be very happy to spend the rest of my career with this organisation
I really feel as if this organisation's problems are my own.	I do not feel a strong sense of belonging to my organisation
I think that I could easily become as attached to another organisation as I am to this one.	I do not feel like 'part of the family' at my organisation
I do not feel like 'part of the family' at my organisation.	This organisation has a great deal of personal meaning for me
I do not feel 'emotionally attached' to this organisation.	I think that I could easily become as attached to another organisation as I am to this one
This organisation has a great deal of personal meaning for me.	
I do not feel a strong sense of belonging to my organisation.	
CC	CC
I am not afraid of what might happen if I quit my job without having another one lined up.	Too much in my life would be disrupted if I decided I wanted to leave my organisation now
It would be very hard for me to leave my organisation right now, even if I wanted to.	Things were better in the days when people stayed with one organisation for most of their careers
Too much in my life would be disrupted if I decided I wanted to leave my organisation now.	It would be very hard for me to leave my organisation right now, even if I wanted to
It wouldn't be too costly for me to leave my organisation now.	Right now, staying with my organisation is a matter of necessity as much as desire
Right now, staying with my organisation is a matter of necessity as much as desire.	If I got another offer for a better job elsewhere I would not feel it was right to leave my organisation
I feel that I have too few options to consider leaving this organisation.	One of the major reasons I continue to work for this organisation is that I believe that loyalty is important and therefore feel a sense of moral obligation to remain

Validation of CWB

The factor loadings based on a principal component extraction with Oblimin and Kaiser normalisation rotation for CWB revealed that 27 items loaded onto Factor 1 measuring CWB aimed at an individual, while 14 items loaded onto Factor 2 measuring CWB towards the organisation. Both scales consist of two factors, but the item loadings differ (see Table 16).

Table 16: Comparison of CWB factors and item loadings

CWB scale Spector <i>et al.</i> (2006)	This study
Factor 1: CWB – individual	Factor 1: CWB – individual
Started or continued a damaging or harmful rumour at work	Took money from your employer without permission
Insulted someone about their job performance	Threatened someone at work with violence
Made fun of someone's personal life	Played a mean prank to embarrass someone at work
Ignored someone at work	Hit or pushed someone at work
Refused to help someone at work	Made an obscene gesture (the finger) to someone at work
Withheld needed information from someone at work	Stole something belonging to someone at work
Purposely interfered with someone at work doing his/her job	Purposely dirtied or littered your place of work
Blamed someone at work for error you made	Destroyed property belonging to someone at work
Started an argument with someone at work	Started or continued a damaging or harmful rumour at work
Stole something belonging to someone at work	Verbally abused someone at work
Verbally abused someone at work	Did something to make someone at work look bad

CWB scale Spector <i>et al.</i> (2006)	This study
Made an obscene gesture (the finger) to someone at work	Put in to be paid for more hours than you worked
Threatened someone at work with violence	Withheld needed information from someone at work
Threatened someone at work, but not physically	Looked at someone at work's private mail/property without permission
Said something obscene to someone at work to make them feel bad	Threatened someone at work, but not physically
Hid something so someone at work couldn't find it	Hid something so someone at work couldn't find it
Did something to make someone at work look bad	Said something obscene to someone at work to make them feel bad
Played a mean prank to embarrass someone at work	Made fun of someone's personal life
Destroyed property belonging to someone at work	Stolen something belonging to your employer
Looked at someone at work's private mail/property without permission	Blamed someone at work for error you made
Hit or pushed someone at work	Refused to help someone at work
Factor 2: CWB – organisation	Insulted or made fun of someone at work
Purposely wasted your employer's materials/supplies	Took supplies or tools home without permission
Daydreamed rather than did your work	Refused to take on an assignment when asked
Complained about insignificant things at work	Purposely did your work incorrectly
Told people outside the job what a lousy place you work for	Ignored someone at work
Purposely did your work incorrectly	Started an argument with someone at work
Came to work late without permission	Factor 2: CWB – organisation
Stayed home from work and said you were sick when you were not	Left work earlier than you were allowed to
Purposely damaged a piece of equipment or property	Daydreamed rather than did your work
Purposely dirtied or littered your place of work	Told people outside the job what a lousy place you work for
Stolen something belonging to your employer	Purposely wasted your employer's materials/supplies
Purposely worked slowly when things needed to get done	Tried to look busy while doing nothing
Refused to take on an assignment when asked	Purposely failed to follow instructions
Purposely came late to an appointment or meeting	Purposely came late to an appointment or meeting
Failed to report a problem so it would get worse	Stayed home from work and said you were sick when you were not
Taken a longer break than you were allowed to take	Purposely worked slowly when things needed to get done
Purposely failed to follow instructions	Purposely interfered with someone at work doing his/her job
Left work earlier than you were allowed to	Failed to report a problem so it would get worse

Took money from your employer without permission	

Source: Own compilation

Based on the results, the alternative hypothesis H_{1A} that the PSM, JS, OC, WE, and CWB scales will be reliable and valid within the South African public-sector context fails to be rejected.

The second objective was to investigate the relationships between PSM, JS, OC, WE and CWB. A Pearson product-moment correlation was used to determine the strength of the relationship among the variables. The results revealed that JS had a statistically significant small correlation with PSM, as seen from the r -value of 0.106 in the 99th percentile. Moreover, the correlation was positive; therefore, there would be a concomitant increase in the other as one increased. Bright (2021) investigated how perceptions of organisational prestige (POP) affect the link between PSM and public employee JS and intention to leave. Similarly, Bright (2021) also discovered beneficial associations between PSM and various work attitudes. Although PSM was a significant factor in POP perspectives and JS, POP somewhat moderated its effects and was the most significant predictor of JS. In addition, persons with high levels of PSM were more likely to hold positive POP perspectives, which increased their JS and decreased their intention to leave the organisation (Bright, 2021). Furthermore, Bright (2021) postulates that PSM maintains a direct and indirect association with JS. In other words, respondents with high levels of PSM were much more content with their occupations than those with lower levels of PSM, regardless of their perceptions of how residents evaluated their employer.

Regarding JS, a recent meta-analysis by Boyd and Nowell (2020) revealed a moderately significant relationship between PSM and JS and evidence that job factors may modify the relationship. Most studies have proven that the relationship between PSM and JS is contingent on SIP via job and organisational type. Boyd and Nowell (2020) emphasise that other researchers discovered a substantial positive correlation between PSM and JS in a sample of Chinese MPA students with full-time public-sector employment. The findings correlate with the findings of Boyd and Nowell (2020), Stefurak *et al.* (2020), Homberg *et al.* (2015), Crucke *et al.* (2021), Palma (2016), Kim *et al.* (2013), Prysmakova and Vandenabeele (2020), and Breugh *et al.* (2018), who all found a positive relationship between PSM and JS.

Organisational commitment similarly had a weak statistically significant correlation with PSM ($r = 0.137$; $p = 0.000^{**}$) and a medium statistically significant correlation with JS ($r = 0.430$; $p = 0.000^{**}$). The relationship was positive. According to Boyd and Nowell (2020), OC and identification and PSM predict employee engagement and wellbeing indicators. The researcher investigates whether PSM is a direct or indirect predictor of employee metrics. Regarding organisational citizenship behaviours in the Korean setting, the researcher observed PSM, work satisfaction and OC to explain organisational citizenship. The researcher discovered a significant direct relationship between PSM and OC and organisational citizenship. Similarly, a study of people in the UK prison system revealed a significant positive association between PSM and OCB after controlling for perceived organisational support and fairness (Boyd & Nowell, 2020).

Moreover, given the interest in the immediate work surroundings surrounding high-PSM individuals, the researchers propose that the relationship between PSM and OC would depend on the characteristics of their leaders (Potipiroon & Ford, 2017). The relationship between PSM and OC is more nuanced than commonly believed. The strength of this relationship depends on how much one enjoys and finds interest in their profession. Potipiroon and Ford (2017) found that the link between PSM and OC was significantly favourable when intrinsic motivation was strong. The positive effects of PSM on OC were greatest when intrinsic motivation and ethical leadership were high. Without intrinsic motivation and/or ethical leadership, the PSM–OC connection tended to be negative but non-significant (Potipiroon & Ford, 2017). This positive relationship between PSM and OC was confirmed in studies by Boyd and Nowell (2020), Castaing (2006) and Potipiroon and Ford (2017).

Work engagement had medium associations with both PSM ($r = 0.417$; $p = 0.000^{**}$) and OC ($r = 0.368$; $p = 0.000^{**}$), while the same had a large statistically significant correlation with JS ($r = 0.675$; $p = 0.000^{**}$). In line with the study's findings, Mussagulova (2021) found that PSM increases the positive relationship between job resources, and WE has garnered the most attention and relevance. Moreover, the published study on the relationship between WE and PSM within the context of JDR uses both job demands and resources and focuses initially on the moderating effect of PSM by conceptualisation (Mussagulova, 2021). However, Mussagulova (2021) emphasises that the theorisation of PSM's role in mitigating the link between job resources and WE gives public employees an incentive to organise their job resources to remain engaged, leading to improved performance. The study by Mussagulova (2021) found that public servants with a low level of PSM experience the negative association between red tape and WE more strongly, possibly because their level of PSM is not high enough to absorb the shocks of procedural constraints (Mussagulova, 2021). Mussagulova (2021) described the relationship between PSM and WE and the role of PSM in enhancing the positive effect of job resources and mitigating the negative effect of job demands on the desired individual and organisational work outcomes. However, the association between PSM and WE are poorly supported. Ugaddan and Park (2017) and Mussagulova (2021) also found a positive relationship between PSM and WE.

CWB reverted negative small correlations with PSM ($r = -0.289$; $p = 0.000$), JS ($r = -0.127$; $p = 0.000^{**}$) and WE ($r = -0.223$; $p = 0.000^{**}$). Therefore, CWB would decrease with increased JS, PSM and WE. However, CWB had a small statistically significant positive relationship with OC ($r = 0.085$; 0.006^{**}). Numerous researchers have attempted to link counterproductive behaviour with negative emotions, namely rage and violence, caused by stress and unpleasant work settings. It involves breaching both rules and laws and social conventions. The link between JS and CWB should therefore be negative. In line with the current study, numerous studies have shown a negative correlation between this behaviour and work satisfaction, speculating that the absence of work satisfaction – and the subsequent urge to “get even” with the employer – are the seeds of workplace deviance (Czarnota-Bojarska, 2015). Additionally, Czarnota-Bojarska (2015) found a negative association between JS and CWB. Despite relatively high levels of JS, the study indicates a propensity for CWB. The study further revealed relatively low JS levels and elevated CWB levels. According to Baysal *et al.* (2020), the relationship between CWB and OC is one of the most common challenges businesses encounter. The relationship between AC, NC and CC, as characteristics of OC, and abuse, production deviation, sabotage, theft and disengagement from CWB was investigated. In addition, Baysal *et al.* (2020) found that AC and NC have a negative direction and significant link with the dimensions of withdrawal and abuse. Vogel *et al.* (2016) and Koumenta (2015) also found a negative association between PSM and CWB. Czarnota-Bojarska (2015) found a negative association between JS and CWB. Baysal *et al.* (2020) found that AC and NC have a negative direction and significant link with the dimensions of withdrawal and abuse, and negative direction and strong correlations exist between the dimensions of commitment, withdrawal, abuse and theft.

The results confirmed the alternative hypothesis H_{2A} that there is a positive relationship between PSM, JS, OC and WE, and a negative relationship between PSM and CWB cannot be rejected.

9. Managerial implications

This research developed a framework to evaluate the impact of PSM on core work evaluation (JS, OC, WE) and CWB. The link between PSM, JS, OC, WE and CWB was also investigated. This study provides a theoretical and conceptual framework that public-sector managers can use to assess the impact of PSM on CWE and CWB. Furthermore, public-sector managers could use the validated instruments to assess these critical behavioural outcomes within the public service context. Public managers should understand how PSM influences CWE and CWB. The results revealed a positive correlation between PSM and JS, which is also confirmed by similar studies. In addition, OC had a positive relationship with PSM. Furthermore, work engagement, PSM, OC and JS are positively related.

The study's results confirmed public service motivation's potential positive outcomes or consequences. For example, high levels of public service motivation led to high levels of job satisfaction, organisational commitment, work engagement and low levels of counterproductive work behaviour. Therefore, motivated public service employees will have high job satisfaction, organisational commitment, and work engagement, and these positive work behaviours will help prevent counterproductive behaviour (including corruption), which is necessary for effective corporate governance, service delivery, policy formation, and implementation.

10. Conclusion

Low levels of PSM led to decreased core work evaluations (JS, OC, WE) and increased CWB. This study's primary aim was to develop a framework to assess the influence of PSM on CWE (JS, OC, WE) and CWB. No previous research has investigated the influence of PSM (independent variable) on core work evaluations such as JS, OC, WE and CWB (dependent variables) within the South African public service context. Therefore, this study filled the gap by developing a framework to assess the influence of PSM on CWE (JS, OC, WE) and CWB of employees in the North West provincial government departments.

The study was conducted within the quantitative research paradigm using a cross-sectional correlational survey design. The sample comprised 2 250 public service employees representing all categories of professionals within the 11 provincial government departments. The study used a stratified random sampling method consisting of four subgroups. A total of 1 546 questionnaires were distributed, and 1 031 were completed and returned.

The measuring instruments were reliable and valid within the South African public service context. The results revealed a positive correlation between PSM and JS, while OC positively correlated with PSM. Work engagement, PSM, OC and JS are positively related, while CWB negatively affects PSM, JS and WE. Work engagement and JS significantly predict PSM. The primary managerial implication is that this study provides a theoretical and conceptual framework that public-sector managers can use to assess the impact of PSM on CWE and CWB. Ultimately, this research contributes to the theory, conceptualisation and relationships between organisational behavioural dimensions such as PSM, JS, OC, WE and CWB.

experiences

Abstract

This paper seeks to analyse the lived mentoring experiences of black managers. The study makes use of an Interpretative Phenomenological Analysis to achieve this aim. The participants were all from the petrochemical industry, as well as service companies or service providers within the industry.

The high levels of inequality in South Africa, diverse backgrounds, dissimilar opportunities, and varying levels of education makes for entirely different mentoring views and experiences as presented by the participants taking part in this study through semi-structured interviews. In assessing these lived experiences, the researchers investigated concepts such as employment equity, affirmative action and broad-based black economic empowerment, and aspects of mentorship.

The results showed that some organisations and mentors are mentoring their mentees in accordance with transformational policies, whereas others are not. The Ubuntu principles of care, respect, responsiveness, and interconnectedness are evident throughout the positive lived experiences of the participants and absent during the negative experiences. This confirms that Ubuntu is playing an important role in mentoring.

1. Introduction

Due to apartheid and South Africa's history, organisations need to, and are in a position (Cloete, Bunting, & Maassen, 2015) to eradicate the racial and gender inequalities that form part of the organisational framework (Mayer, Oosthuizen & Tonelli, 2019). Most of these inequalities are also still prevalent across society today. Organisations demonstrating inequality and a lack of diversity regarding management are most likely to experience problems when allocating the right mentors to mentees relating to race, gender, and background.

Mentees get allocated to mentors that are white or not of the same race, as companies do not necessarily have alignment between mentors and managers in terms of race. The previous generation's managerial composition does not yet align with that of the younger generation coming through the system. Even the younger generation's composition across all employment levels within organisations does not yet align to the demographics of the country. South African organisations still need much work to do in this regard. White, middle-aged mentors who have spent a part of their working life in apartheid may be resistant or ignore the benefits that may arise from being a mentor to a black manager due to their own lived experiences. In contrast to this, a black manager may want to embrace the opportunity. Many managerial positions are still filled by older white managers. It should be seen as a threat to organisations when it comes to transformation. This can create a risk in the

² E-mail address: 11037220@mygibs.co.za

workplace or within a certain sector or industry, as the next generation might lack the necessary skills or experience required to do the job.

Almost three decades into democracy, South African organisations are under more pressure than ever to improve the position of previously disadvantaged groups. Mentorship strategies and programs have become essential for transformative policies and practices. Black managers have the potential to successfully develop into better managers and eventually executives, to improve and transform the position of previously disadvantaged groups in South Africa. Not having the right mentor allocated to the right black manager may have a negative affect or slow down transformation in the workplace as these relationships are sometimes forced, unnatural and unproductive.

The researchers need to get a better understanding of the lived experiences of black managers under mentorship to understand (1) the progress made to present, regarding mentorship, (2) the progress and changes that still need to be made, and (3) the extent of the progress that needs to be made. For the purposes of this study, the term black is defined by the B-BBEE (Broad-Based Black Economic Empowerment) Amendment Act of 2013. It defines the term “black” as follows: “The term ‘Black people’ is a generic term which means Africans, Coloureds and Indians— (a) who are citizens of the Republic of South Africa by birth or descent; or (b) who became citizens of the Republic of South Africa by naturalisation— (i) before 27 April 1994; or (ii) on or after 27 April 1994 and who would have been entitled to acquire citizenship by naturalisation prior to that date” (Coetsee, 2021).

Organisations have implemented very few policies and practices to assist black managers with mentoring in the workplace. Mentorship is a mechanism which can be used to accommodate and meet transformation policies and targets successfully across various types of organisations and sectors. Through research and practice, mentoring has emerged as the best strategy to transmit know-how in a mutually beneficial relationship for both the senior and junior manager (Santos, Pereira, Silva, Cadilhe & Cunha, 2019).

Mentoring across different races is not a natural act in South Africa due to its history of segregation. According to Thomas (2001), there are four major obstacles, namely: (1) negative stereotypes, (2) difficulty identifying with the other person, (3) protective hesitation, and (4) fear or scepticism of intimacy. A mentor who has a negative stereotype about someone based on race, will hold on to that stereotype until the individual has proven that they do not fit that stereotype. According to Thomas (2001), close mentoring relationships are much more likely to develop when both parties can identify with one another based on race, culture, age, or gender. If the mentor has trouble identifying with their mentee based on race, they might not see beyond their mistakes or weaknesses. South African companies that lack diversity might instil a sense of mistrust with mentees, as they might question whether the relations are authentic or even possible. This might have the opposite impact than what is expected from a valuable mentor and mentee relationship. The mentee might question whether the mentor is genuine or have an ulterior motive (Thomas, 2001). Mentors and mentees from the same race and background, will relate easier to each other when they have similar lived experiences, opportunities, culture, and fewer language barriers. These practices need to be continuously improved and reflect South Africa’s democratic principles based on recognising and implementing individual human rights in mind and practice in an equal manner (Ebrahim, 2018).

Historically, in South Africa, labour laws discriminated against people of colour (Joubert, 2017). Since democracy and the demolishment of Apartheid in 1994, things have changed significantly. The South African government has since introduced legislation that seeks to enact equal opportunities between South Africans and subsequently reversing the effects of Apartheid. Examples of these acts are The Labour Relations Act, 66 of 1995; Employment Equity Act, 55 of 1998; and Broad-Based Black Economic Empowerment Act, 53 of 2003 (BBBEE Act) (Joubert, 2017). The BBBEE Act seeks to economically include black South Africans through diverse and integrated entrepreneurial promotion and employment strategies.

The Broad-Based Black Economic Empowerment Act 53 of 2003 is an example of legislation which aims to not only correct racial inequality but also empower communities (Esser and Dekker, 2008). All South African organisations that want BBBEE classification need to reach employment equity targets. As a result, black managers need mentoring to accommodate the radical shift. If this is neglected, it could lead to negative economic downturns in the future, as the mentors do not share the necessary skills.

Employment relations in SA organisations will continue to be heavily influenced by EE and AA developments. The implementation of AA, as set out by the Employment Equity Act will continue to have an impact on employee relations practice and more particularly mentor-mentee relationships across different races (Mayer & Oosthuizen, 2019). Section 15(1) of the EE Act describes AA as a means to guarantee that qualified individuals from designated groups are granted access to equal employment opportunities throughout all levels and categories within organisations (Mayer & Oosthuizen, 2019). Legislative mechanisms by themselves will not reach EE in South Africa. According to Mayer and Oosthuizen (2019), employment relations departments within organisations need to implement programmes aimed at black advancement (e.g., literacy training), quality education for employees and the community in which the organisation functions, mentorship, and coaching programmes that aim to achieve equality, which ultimately overflows into the broader society.

1.1.1 Research Questions

The main research question to address the problem statement was: What are the lessons learned for future mentoring relationships to facilitate the transformation process within South Africa?

Three secondary research questions were addressed:

- Sub-question one: How do black managers view mentoring in South Africa?
- Sub-question two: What are the lived experiences of black managers of being mentored by white and/or black mentors?
- Sub-question three: What is the significance of having a black mentor for black managers in South Africa?

1.1.2 Purpose Statement

This paper presents an interpretative phenomenological analysis of the in-depth lived experiences of black managers regarding mentoring within various South African organisations or departments of organisations operating in the petrochemical industry, where the research has been done.

It is necessary to consider and advocate mentoring models that makes sense for Africa and Africans (Sikirivwa, Nyarwath & Muhenda, 2021). Such a model needs to be holistic and apply the best practices of Ubuntu (A Nguni term meaning humanity towards others) so that it is less focused on the individual and more inclusive and culturally aligned with the African context (Geber & Keane, 2016). South African mentors, such as the middle-aged white male or someone that is of a different culture than the black employee, may interact with the mentee in an unconsciously biased manner, which may have a negative impact on the mentee. When these managers mentor younger black managers, it is essential to remain aware of any mentoring that may contribute to “colonisation of the mind” (Geber & Keane, 2016, p. 502). Optimistically, issues of race in the future will gradually decrease as transformational mentoring and the application of Ubuntu are applied.

The current management and mentorship spread of organisations need to be aligned with the next generation of management regarding race and gender for mentorship programmes to make sense and be effective. The more diverse a company is, the more a mentor and mentee programme are likely to be aligned and successful which benefits the organization in the process. Okawa (2002) noted the significance of cultural similarity in mentoring. Mentoring may feel more natural when the mentor and mentee are of the same race and culture (Athey, Avery & Zemsky, 2000).

This paper primarily focuses on (1) how black managers define mentoring, (2) their lived mentoring experiences, and (3) the importance attached to having a black manager as a mentor. In studying these

three aspects, lessons can be identified that may facilitate the transformation process that is a matter of urgency in South Africa given its extremely unequal society.

1.2 Methodology

Qualitative studies normally follow an interpretive philosophy approach. This is due to the researcher needing to comprehend the subjective and socially constructed meanings that present themselves within the phenomenon being studied (Saunders & Lewis, 2018). Phenomenology was first introduced by Husserl (1931) as a means to comprehend the lived experiences of participants and to give meaning to their experiences. Interpretative Phenomenological Analysis (IPA) came into its own with the publication of Smith's (1996) paper in *Psychology and Health* which argued for an approach that was able to capture the experiential and qualitative and that could still dialogue with psychology. According to Smith, Flowers and Larkin (2009), IPA is a qualitative research approach committed to examining how people comprehend life experiences. It is seen by many as the most inclusive qualitative research approach with a sensitivity to the lived experiences of the participants (Alase, 2017). For the participants' stories to make sense, the interpreters needed to have a deep understanding of their lived experiences by putting themselves in the participants' shoes. The researchers needed to try and envision the lives of the participants and see the world and their experiences through their eyes. A combination of Burrell and Morgan's (1979) interpretative paradigm and Guba's (1990) critical theory paradigm was used for this research. Using these two paradigms made it possible to critically interpret the lived experiences of the participants. Guba's (1990) critical theory paradigm sets out the exploration platform of the phenomenon, whereas Burrell and Morgan's (1979) interpretative paradigm form the basis for the narrative of the lived experiences of those impacted. It was important to find a qualitative methodology that is participant-orientated and flexible to capture the real lived experiences of the managers that participated in the study (Alase, 2017).

This study focussed on the individual's perspective on the mentoring experience of the participant as a black manager. Experiences are likely to differ between participants due to the unique and potentially complex situation faced in South Africa.

1.2.1 Strategy and interview questions

The researcher conducted open-ended, semi-structured interviews lasting roughly forty-five to sixty minutes with each manager. Six questions were used as conversation framework or interview schedule. Each question contains a motive as to why the question was asked.

- Question 1: What is your current management role? This question assisted in describing the sample group.
- Question 2: How would you define mentoring? Motive: This question allowed insight into the way black managers viewed mentoring in South Africa, whether they had different views and whether their views were from those held in the Western Academic World.
- Question 3: What are your lived mentorship experiences as a black manager? Motive: This could give insight into the lived mentoring experiences of mentees through practical examples by the participants. It would enable a judgement on the presence of elements of Ubuntu in the mentoring experience of black mentors and mentees, as evidence of transformational mentoring.
- Question 4: What are your lived experiences in having a white manager as a mentor? Motive: In studying black managers' lived experiences in having a white manager as mentor, the researchers seek to better understand how mentoring in this type of relationship has progressed since the ending of Apartheid. This question also helps to gain insight into how employment equity and B-BBEE has contributed to the situation. Evidence of personal barriers between black and white South Africans could complicate mentoring and prevent transformation.
- Question 5: What is the significance of having a black manager as a mentor? Motive: This question gives the researchers a comprehensive view on how significant race still is in South Africa. The more transformed and developed a society, the less significant race should be.
- Question 6: What would you have done differently if you were the mentor? Motive: After a participant has reflected on and re-lived their mentoring experiences, it might have allowed the

participants to form a new view on what they could expect differently from mentorship. This question also targets the breaking down of personal barriers and its potential to transformation.

The research was cross-sectional in nature due to time constraints.

1.2.1 Population, unit of analysis, and sample

The target population was black managers, male and female, within the petrochemical industry that worked at a refinery or at surrounding service providers. For this study, the participants were selected from various departments within the selected companies. The unit of analysis included the lived experiences of mentoring of black managers. The purposive sampling technique was based on management status.

The traditional sample size for phenomenological research is between 2-25 participants. The researchers conducted ten interviews with black managers when saturation was attained.

1.2.2 Analysis Approach

Each interview was transcribed and analysed. The analysis of the interviews served as an open coding tool to identify and recognise patterns among the participants. The researchers used colour-coding to identify common themes. The patterns were grouped into thematic categories.

The transcripts of the semi-structured interviews were sent to the participants for verification and approval. A code was used to protect the identity of the participants (Alase, 2017).

2. Literature Review

Since mentorship of black managers is the focus of the paper, mentorship as a phenomenon is explored in the literature review. Sometimes mentoring and coaching are used as interchangeable terminology, although the approaches differ in many ways. Therefore, the concept of coaching is also explored.

2.1 Creating context

During the first thirty years of South African democracy, the discourse of heritage has been essential in correcting the wrongs of the past regarding the black majority who was deprived of their basic human rights. The rights of the black majority were systematically erased by the devastating effects of colonialism and, more specifically, Apartheid in a South African context (Geber & Keane, 2016). The Apartheid Government, with the main architect being Hendrik Verwoerd (Former Prime Minister of South Africa), created tribal homelands and Bantustans. These homelands were politically constructed based on fear, paranoia, and social and geographical exclusion of Africans from mainstream economic activity (Meskell, 2005).

Prior to 1994 and before the first democratic election of South Africa, black South Africans had to live with enforced separation from white cultural groups. Black South Africans were excluded from certain jobs, industries and positions. This created a vacuum in the country regarding aspects such as mentorship and coaching because black South Africans may have lacked knowledge and experience. Consequently, indigenous cultural values, norms and worldviews are still excluded from organisational and corporate practices (Geber & Keane, 2016).

2.2 Integration Programs and Policies

The ANC government introduced laws to promote equity and socio-economic development of groups disadvantaged by Apartheid which give rise to integration policies in organisations. The three integration laws investigated here, are (1) Employment Equity (EE) which is governed by the Employment Equity Act (EEA), (2) the Broad-Based Black Economic Empowerment (B-BBEE) which is governed by the Broad-Based Black Economic Empowerment Act (BEE Act), and (3) Affirmative Action (AA). The EEA focusses on implementing policies and strategies to rectify the disadvantages to ensure non-discriminatory portrayal in various levels of the workplace (Millers, 2015). This does include not only race, but also various other factors such as people with disabilities.

The B-BBEE objectives differ from the EEA in the sense that it has a stronger focus on the participation of black people in the economy and does not only focus on the employment relationship (Millers, 2015).

2.3 Employment Equity (EE)

The Employment Equity Act of 1998 (EEA) prohibits unfair discrimination against anyone on the grounds of (amongst others) race, gender, ethnic or social origin, colour, culture or language. The act requires employers to put affirmative action measures in place, ensuring equal treatment of previously disadvantaged groups within a public- or private entity. This often leads to a simple qualifying of numbers of certain groups, which subsequently lacks meaningful transformation (Geber & Keane, 2016).

Once the balances had been restored in the future, legislation will have to be revised to protect the rights of minorities such as people of mixed race, white people, Asians, females, and people with disabilities (Mayer, Oosthuizen & Tonelli, 2019). Reaching these targets is likely to benefit an organisation's B-BBEE score or improve its culture and dynamics. Improved B-BBEE scores may give access to other opportunities for an organisation such as government tenders. Improving the culture or the dynamics between different races within an organisation may lead to increased productivity, improved customer services, increased employee satisfaction and a more competitive organisation (Mayer et al., 2019). If employees are happy with their work culture, they are likely to stay. The organisation is also more likely to attract top talent when the current employees are already satisfied with their working conditions.

Negative viewpoints in South Africa towards EE and AA are slowing down the effectiveness of these laws across organisations (Stoffels, 2015). This is evident in the case for both women and men, who react negatively in fear of affecting their self-image because the perception exists that they were appointed in the position, not because of skills, but because of race (Mayer et al., 2019). Those who benefit from EE fear marginalisation, being victims of white manipulation or being sold out when appointed to these positions (Stoffels, 2015). According to Heilman, Block and Stathatos (1997), the stigmatisation argument indicates that professional employees believe in merit and are not comfortable with labels associated with EE such as being "incompetent" and "less qualified". White employees may still question the political and ethical legitimacy of policies flowing from the EEA, especially white middle-aged men, who spent a significant amount of their lived years in the Apartheid Era. White managers predominantly featured as "mentors" for black employees over the last 30 years due to the country's past. White employees have in the past and at present, fear retribution or revenge from members of previously disadvantaged groups, reduced living standards, unfair taxation, and reduction of career opportunities for themselves as well as their offspring (Leonard & Grobler, 2006). White employees associate B-BBEE, AA and EE with a reversed form of Apartheid.

2.4 Affirmative Action (AA)

Affirmative action is defined as, "a range of governmental and private initiatives that offer preferential treatment to members of designated racial or ethnic groups... usually as a means of compensating them for the effects of past and present discrimination" (Swain, 1996, p. 1). The aim of EE is to correct the unfair discrimination practices of the past, through creating equal opportunities for those that were previously discriminated against. The employer has a responsibility to apply these AA regulations (Stoffels, 2015). Applying AA in practice is very complex, often generating conflicting opinions on whether the policy is fair or not. Whilst many South Africans claim to be supportive of AA, it still receives criticism, especially from those it does not favour. South Africa's democracy is faced with the political uncertainty of how to correctly address the wrongs of the past at the same time, while building a nation with a single national identity (Reuben & Bobat, 2014). Similar efforts should be made with mentoring in that South Africa must establish a mentoring system that is authentically African, which encourages growth and development.

2.5 Broad-Based Black Economic Empowerment (B-BBEE)

Policies such as B-BBEE are aimed at rectifying the wrongs of the Apartheid legacy. The Department of Trade and Industry's (DTI) strategy in this regard is to ensure that these wrongs of the past are indeed rectified by ensuring that there is a radical increase of black individuals owning and managing current, as well as new businesses (Pike, Puchert & Chinyamurindi, 2018). The strategy further aims to increase the number of black representatives in executive and board positions and the increase in income levels to go along with it.

The DTI stipulates that all organisations who qualify must comply with the legislative requirements set out by the B-BBEE Act. The B-BBEE scorecard is a mechanism that presents the weightings that certain behaviours and ownership structures contribute to organisations' B-BBEE score, ultimately contributing to social justice. In complying with B-BBEE, organisations are set to gain more tenders from both the private and public sectors (Pike et al., 2018). One of the disadvantages of B-BBEE is that it requires a significant amount of administrative effort from organisations to monitor the compliance (Oosthuizen & Naidoo, 2010). Organisations who participate in B-BBEE practices need a B-BBEE certificate to prove that they are indeed complying to these policies. This certificate is issued by an accredited third party specialising in these compliance audits.

Reuben and Bobat (2014), noted that the most popular research topics on B-BBEE rarely only discuss B-BBEE but comprise of EE and AA as well. It is essential to qualitatively understand the role of B-BBEE legislation and to understand experiences holistically, to subsequently gain a better and deeper understanding thereof (Chinyamurindi, 2017).

According to the DTI, B-BBEE includes all black people in South Africa. The term 'black people' in this instance does not refer to the black race. It also includes people of mixed race as well as Indians (Van Wyk, 2010). Women, youth, workers and citizens living with disabilities are also included, especially those living in rural areas and the term 'black people' is specifically aimed at citizens affected by and excluded as a result of Apartheid (Pike et al., 2018). Under the rule of the African National Congress (ANC), the government of South Africa implemented B-BBEE to transform the economic makeover in the country radically. Issues like fronting and unequal pay based on race is holding back the rate of transformation required to see the economy flourish (Tait, 2012).

There may be a perception that the white minority in South Africa are disadvantaged through a reversed form of Apartheid (King, 2013). This may be a contributing factor to why white managers may not be the ideal mentors for black employees. They might feel that they are being disadvantaged through the process and therefore have a negative attitude towards the mentee. Even though there are many shortfalls when it comes to B-BBEE and its legislation, the government is more determined than ever to implement the policy more fiercely (Jeffery, 2013).

2.6 Mentorship and Coaching

Most managers and other employees use mentoring or coaching to become more effective at their work (Stambaugh & Mitchell, 2018). Even though these terms are not new, academic interest in these terms grew considerably over the last few decades to such an extent that it is believed that a manager's success depends on mentorship and coaching (Koopman, Englis, Ehgrenhard & Groen, 2021).

2.6.1 Mentorship

According to Johnson (2015), mentoring is an interpersonal relationship between a mentor and mentee, where the mentor guides, counsels and supports the mentee. The experience can be mutually beneficial and not only beneficial to the mentee, as with traditional mentoring (Malin & Hackmann, 2016). Mentorship can be provided through educational programs that are experienced at professional organisations or it may occur in an informal manner in an individual's daily life. Mentors are anyone from a manager or senior at work, a friend, family member or someone who guides, counsels, or supports.

Mentorship is a concept that is often difficult to define. According to Peiser, Ambrose, Burke and Davenport (2018), traditional organisational mentoring can be defined as the transmission of organisational cultures and values. This form of mentoring promotes the identity of the mentee as well as the company. It differs from traditional mentoring in that it is more collaborative in nature. Transformational mentoring allocates more fluid roles to both the mentor and mentee. This form of mentoring focuses on development and growth for both parties (Peiser et al., 2018). An indigenous transformational mentoring programme combines Western and indigenous perspectives in that mentors need to incorporate reciprocal learning, as well as implement applicable elements of Ubuntu (Geber & Keane, 2016).

Peretomode and Ikova (2019) explained that a mentor is a more experienced and trusted person, who gives mostly advice to younger people, over a certain period. Mentorship has also been identified as a personal enhancement strategy where one individual develops another by sharing ideas, expertise, values, skills, perspectives, proficiencies and attitudes. Mentoring has various benefits including career advancement, increased pay and job satisfaction (Ellis, 1992; Allen, Jacobson & Lomotey, 1995; Johnson & Nelson, 1999; Bova, 2000). According to Crawford and Smith (2005), the quintessence of mentoring is individuals' personal and professional development. Crawford and Smith (2005) continued to explain that a mentor is someone who can “afford the protégé with opportunities to learn and practice, as well as to reward him or her so that acquired knowledge, performance, and motivation can increase” (p.64). According to Darwin (2000), mentoring relationships have been enclosed in a language of dependence and paternalism which originates from a power-dependent, hierarchal relationship, aimed at continuing the status quo.

Harris (1999) stated that if mentoring is based on a single definition, then the personal, complex nature of the mentoring experience by under-represented groups, such as black management or individuals that do not fit into a certain profile, are often excluded. Even though there has been an increase in research on mentoring, more research needs to be done when it comes to previously disadvantaged groups and their mentorship or coaching experiences. It is important not to exclude coaching as a managerial development and transformation method in the workplace.

2.6.2 Coaching

According to Zuñiga-Collazos, Castillo-Palacio, Montaña-Narváez and Castillo-Arévalo (2020), managerial coaching looks at enhancing the skills of employees through a practical method. This improves the skills of an individual employee to inspire those around them, improve their communication, encourage, and manage new talent towards the same desired results. The possible benefit to the company is that the coaching influences the commitment of the individual at a personal level as well as at a team level. Presently, more managers, executives and companies are starting to realise the benefit of managerial coaching, to improve individual and company performances (Zuñiga-Collazos et al., 2020). The use of practical methods to enhance the skills of Africans through managerial coaching makes more sense for Africans and African businesses as access to formal education remains a problem. The literacy rate of Africans is poor compared to the rest of the world. Most of these problems can be attributed to colonisation and decolonisation.

Managerial coaching consists of a relationship between two individuals, namely the manager and the coach, where the main goal is to create a sustained and positive change in the behaviour of the manager being coached. This should ultimately improve the quality of the professional and personal life of the manager. Sustained change through managerial coaching mainly focuses on the employee's working life, whereas those benefits can be transferred to their personal lives too (Zuñiga-Collazos et al., 2020). Mentorships should not only apply to the professional side of relationships but should also seek to develop and make connections with the personal side. Personal issues should not be viewed separately from professional issues, as they impact each other.

According to Lawrence (2017), most definitions of managerial coaching highlight the important role of the leader needing to oversee the development of their subordinates. McCarthy and Milner (2020) expand on this by mentioning that coaching consists of various sets of skills. These skills are

observing, tentative listening, questioning, setting goals, and giving the right feedback (McCarthy, 2014). Managerial coaching can be seen as a form of management approach which aims to improve the current position of subordinates, inspire innovative thinking, and maximise an individual's potential (Wagstaff, Arthur & Hardy, 2018). The main goal of managerial coaching is to improve the subordinate's overall confidence, development and performance (Woo, 2017). Clear communication and appropriate feedback can broaden perspectives and be achieved (Ellinger, Ellinger, Bachrach, Wang & Elmadağ Baş, 2011).

There are some useful examples of literature on coaching in the South African context, where coaches are encouraged to remain conscious of, as well as apply African values such as Ubuntu to these coaching practices. Geber and Keane (2016) provide some relevant studies that reflect cultural values, particularly focusing on using coaching in cross-cultural scenarios. There is a general lack of research on coaching that is based on African values.

It is important to coach leaders and base their training on deeper cultural knowledge, as this will improve the cultural intelligence (CQ) within an organisation or society. If individuals gain a better understanding of each other's cultures, norms and backgrounds, they are likely to become more tolerant and accepting of one another. To achieve CQ within an organisation, it is paramount to comprehend management and leadership issues which are unique to Africa and South Africa.

African values such as Ubuntu are generally not valued enough in South African businesses or by South Africans who are white. Additionally, coaching does not necessarily address these shortfalls accordingly (Myres, 2013). A study done on the top hundred South African companies found that multiple companies use coaching as a means of leadership development for black talent. This is, however, not incorporated into the business strategy and is largely based on Western values and norms, with little to no reference to Ubuntu (Geber & Keane, 2016). Businesses need to revise their business strategy when it comes to coaching to incorporate African values such as Ubuntu to give coaching by South African businesses an African identity.

2.6.3 Mentoring vs Coaching

Mentoring can be defined as a guard, advisor and friend (Koopman et al., 2021). The mentor is responsible to provide numerous functions which support, counsel or guide the mentee as the project or work is performed (Kram, 1983). St-Jean, Radu-Lefebvre and Mathieu (2018), define that the goal of mentoring programs is to strengthen the mentees' self-efficacy. These definitions are evidence of the change of mentoring, initially serving a widened focus on skills development, to now, also including personal development as mentee by a mentor or more experienced person (Koopman et al., 2021). Coaching can be defined as the process of on-going, on-the-job training carried out regularly by a person with the intent of developing another person's skills. Feldman (2005), describes coaching as the facilitating of the learning process. The transition of these definitions proves that a shift occurred in the meaning of coaching. A shift from instructing to facilitating development.

2.7 Ubuntu Philosophy

The isiZulu definition of Ubuntu is 'Umuntu ngumuntu ngabantu' which translates to 'a person is a person through other people' (Geber & Keane, 2016, p.502). According to Msila (2015), applying the spirit of Ubuntu, allows for cohesiveness, teamwork, caring for each other within the collective vision of the group, organisation or country. Geber and Keane (2016), explains that Ubuntu is a nature of being and a way of living, that differs significantly to the way of being and living in the West. This does not mean that the West lacks humanism and empathy but rather that it focusses on individual interconnectedness, whereas the way of Ubuntu is deeply rooted in connection to community. Ubuntu can be defined as "I am a human being because I belong" (Geber & Keane, 2016, p. 502).

According to Madise and Isike (2020), Ubuntu is relied on to bring unity, healing and continuity within a society. Spalthof (2013), stated that Ubuntu serves as "the force which defends against further collapse of society" (p. 4). Ubuntu is considered a social construct, meaning that the definition is not static (Madise & Isike, 2020). According to Swanson (2007), "it makes a fundamental contribution to indigenous 'ways of knowing and being.' With differing historical emphasis and (re)

contextualization over time and place, it is considered a spiritual way of being in the broader socio-political context of Southern Africa” (p. 53).

Personhood is obtained and the idea that it needs to be obtained in a community could naturally challenge Western thinking which tends to focus on the individual and individual performance rather than the community. Ramose (1999) further explains that the significance of initiation into a community is not purely to obtain personhood but creates a link between those initiated and their ancestor which may further challenge Western thinking which has different views in this regard. Therefore, business leaders must avoid trivialising world views from third world countries, particularly African countries.

It is necessary to seek a balance through applying and testing an integrated value system, where values from the West and African values such as Ubuntu are integrated in a way that best suits South Africans. Multiculturalism has in many instances become the desired outcome, resulting in the neglect of considerations of complex issues and their alignment, and in this respect Ubuntu cannot merely be a buzzword (Geber & Keane, 2016). Therefore, self-awareness practices and exposure to different perspectives will assist businesses in keeping organisational culture constructive and dynamic.

2.8 Ubuntu in Mentoring

Individual rights and individualism are not always upheld when it comes to Ubuntu, which differs from pure Western thinking. Therefore, some of Ubuntu's values need to be excluded, as it may differ too greatly from modern day society entirely. Ubuntu values which are still relevant can be applied more directly to mentoring programmes (Geber & Keane, 2016). According to Nobel Peace Prize laureate, Maathai (2005), “p[Pe]ople without culture feel insecure and are obsessed with the acquisition of material things, which give them a temporary security. Without culture, a community loses self-awareness and guidance and grows weak and vulnerable. It disintegrates from within as it suffers a lack of identity, dignity, self-respect and a sense of destiny” (p. 24). Organisations and the South African society should preserve cultural identity by allocating mentors to mentees that are from the same race or background and who share a common value system, e.g., Ubuntu. There should be balance in the implementation of Western and African values to progress as a society as well as within organisations, whilst staying true to African identity and preserving the right values.

The philosophy of Ubuntu can play an important role in a work environment. According to Munir (2020), when employees are treated like humans through respecting their socio-cultural values and listening to them, they tend to perform better. The needs and rights of others need to be respected when it comes to implementing Ubuntu. According to Khomba (2011), “Ubuntu philosophy also implies that if people are treated well, they are likely to perform better” (p.17).

The Ubuntu characteristics of identity, dignity, self-respect, and destiny relates to mentoring goals and interactions (Geber & Keane, 2016). This relation is especially important in a country with a history of the exclusion of the majority of its population in an unfair and inhumane manner. It is important to be conscious of the different features of Ubuntu and how this opposes the Western worldview in many ways. Acknowledgement needs to be made that there are adjacent elements across these worldviews and that there are often more similarities than not. This can result in a future where leaders, mentors and coaches can affiliate with worldviews from different cultures, ultimately breaking walls down between South Africans.

According to Geber and Keane (2016), certain worldviews, such as the African worldview and more particularly Ubuntu, tend to receive hostile treatment from the West. Westerners tend to be overly biased towards their practised worldviews and tend to see their views as being superior to that of third world nations. This sort of mindset is likely to overflow to business and society. This ultimately reflects on mentor-mentee relationships, where either the mentor or mentee may be biased towards one view or the other, especially if they are from different races, cultures, or backgrounds. Mentors and coaches should embrace best practices from other cultures instead of opposing them.

2.9 Transformational Mentoring

Mentoring and coaching with different worldviews in mind can bring about change at a macro level within companies (Ivey, 2013). This is beneficial for a society like South Africa's, that is undergoing and still needs to undergo further changes in the workplace regarding the composition, policies, and practices of its organisations (Geber & Keane, 2016). By applying a Western worldview, the world is categorised into dualities such as mind and matter, living and non-living. In contrast to this, through Ubuntu the world is seen as holistic, an attribution of human motivation or behaviour.

Hierarchy in Ubuntu is valued as normal, whereas the West is constantly aiming for equality, being a universal value. Some of the other differences are that Ubuntu sees success as (1) belonging to the collective, (2) encouragement of working together, (3) being modest, and (4) harmony with others and the community. The Western worldview on the other hand encourages success through (1) competition, and (2) individual achievement even if it is through critique or conflict. Indigenous transformational mentoring combines both indigenous and Western worldviews into a typical mentoring programme (Geber & Keane, 2016). Mentors need to be willing to learn about Ubuntu's principles and apply them to their mentoring practices. Respect and awareness of different worldviews need to be applied in mentoring across different cultures and races.

2.10 Social identification and choice of mentor

Based on social identification theory (Tolman, 1943) individuals tend to identify themselves with different social categories such as religion, gender and age, and in South Africa specifically with race due to the historical past that used race as a basis for segregation. Ashforth and Mael (1989) state that social classifications firstly enables an individual to cognitively segment the social environment, enabling the individuals to define others and ascribed characteristics of the category to those associated with the category. Secondly, it enables individuals to define themselves in the social environment. Social identification is to belong to some human aggregate.

Ashforth and Mael (1989) identified four principles relevant to group and social identification, used interchangeably in this regard. Firstly, social identification is a perceptual cognitive construct that is not linked to any specific behaviours or the experience of feeling the underlying emotional state. The individual identifies with a group because they are psychologically entwined with the fate of the group. Secondly, social identification is linked to the personal experience of successes or failures of the group. Thirdly, social identification is distinguishable from internalisation. Identification refers to the self regarding social categories, whereas internalisation refers to the implementation of values and attitudes within the self as guiding principles. Even if an individual defines themselves in terms of the category, group, or an organisation, they may not necessarily agree with the values, attributes, authority or characteristics of the applicable category, group or organisation.

Lastly, identifying with a group is like identifying with a person, such as mentor-mentee, doctor-patient, and husband-wife (Ashforth & Mael, 1989). Organisations often promote generalised identification of an individual with the organisation through the routinisation of charisma. This could be prevalent in the mentor-mentee relationships proving ineffective in dealing with black and previously disadvantaged mentees.

3. Results and Findings

3.1 Understanding of mentorship

The first theme investigated was the mentees' understanding of mentorship. The results revealed that black managers had a similar and fairly accurate understanding of what is meant by mentorship. Participant A, B, C, F and I cited the following: to give assistance, support, or guidance to the mentee. The assistance, support or guidance was mostly given to assist the mentee to grow or reach their goals. Three participants (Participant A, B & H) viewed mentoring as "the assistance you give to your team members whether it be a senior or the lowest team member - you have to assist them" and subsequently they have to assist you.

Participant F made a statement on how he perceived guidance in the context of mentoring: "Mentoring is standing on the shoulders of someone who is currently seeing further than you in

pursuit of your interests.” Participant A, G and J understand mentoring as the training or coaching of mentees so that they can develop and improve their skills and expertise. Participant G and A stated that mentoring is about unlocking the “special expertise” of the mentee.

Participant A and H considered a mentee’s needs and expertise as central in their understanding of mentoring. Participant H, I and J further viewed mentoring as encouraging growth on the mentee's side. According to Participant I, his “job is to enable them and maximize their potential so that they can be able to grow up to a level that is required”. Participant D made a single statement around mentorship being the impartment or sharing of information with those being mentored. Participant G and J explained mentorship as developing others. All the understandings and explanations of mentoring given by the participants can be linked to the mentee's development as single thematic category.

3.2 Lived Mentoring Experiences of Black Managers

Two of the participants (Participants A & E) had lived mentorship experiences by mostly being mentored by white mentors. Both these participants mentioned that they had supportive white mentors and a generally positive experience. Participant A stated: “I knew that he wanted the best for me.” Participant E mentioned that his white mentor would even call him during the night to find out if he was safe. Although both participants experienced compassion, their experiences were somewhat different. Both stated that the white mentors entrusted them with responsibility to perform tasks, whilst installing belief in them simultaneously. Participant E adds that the mentors “trusted” him and “liked” him, which made him believe more in himself. Participant A mentioned that her white mentor pointed out that in comparison to other mentees she may not have had the necessary “competencies or education”, but that he (the mentor) still wanted to see her excel in life. This comment by her white mentor installed trust and belief in the participant to go far in life. Participant E had mostly positive mentoring experiences, while Participant A had some negative experiences as well with regard to the mentors who were responsible for her positive experiences.

In Participant A’s first mentoring experience of having a white manager as a mentor, she experienced a lack of respect from the mentor in the initial stages of their relationship. The participant stated that during a meeting with a client, the mentor started “swearing” at the participant. The participant excused herself and left the meeting. She further told him if he “cannot respect” her, she will put in a “grievance or report” against him. Another white mentor took her “under her wing” and taught her a lot. This mentor seemed to be very possessive towards the mentee participant, which added another negative aspect to the lived mentoring experiences. The mentor did not allow her to communicate or work with anyone except herself, as it seemed that she might have been intimidated by her.

There were some unfortunate racist behaviours towards Participant A on two occasions during her lived mentoring experiences as a black manager. The first incident was when a mentor called her “bushy” (i.e. a bushy afro hairstyle) and although she “never saw it as a racist comment”, it should be noted that others are likely to view such a statement differently. The second incident was when the participant was assigned to a project in a different part of the country. She stated that: “When I got there, I had a bit of trouble with some of my colleagues that didn’t accept us. As a different race, they didn’t accept us.”

Participants C and J mentioned only having white mentors during their lived mentoring experiences, with no mention of a black mentor from either participant. Participant J mentioned that a white manager gave him guidance and taught him “that you have to stand up for yourself”. He further adds that the same white mentor taught him “solve the problems, do not run away from problems”.

Participant J recalled lived experiences of a white mentor who instilled belief in him and encouraged him to take opportunities when they arise. He stated that this particular mentor told him: “You are not destined. So, you should always look for opportunities.” This was followed by another statement: “Where you see an opportunity, where you see you can make a difference, then that is what you should strive for.”

In contrast to the participant that only had white mentors, there were also participants (Participant D & G) who were in their lived experiences predominantly mentored by black mentors up to this point in their lives. Participant D mentioned that he learned a lot from the black managers he previously worked with. These colleagues fulfilled a mentorship role for him during his tenure.

Participant G spoke highly of an inspirational black mentor who has given him guidance and made him believe in himself. "He was inspiring," as he taught him "how to achieve the goals that you want". He continued to mention that: "The most important thing that mentors need to do is to unlock people's awareness within themselves." Participant G made a comprehensive point around why mentorship was not a formally introduced concept throughout his lived experiences. He argued that mentoring was a natural relationship that forms between a mentor and mentee. He explained further by saying that the idea of mentorship should form naturally and had never been formally introduced during his lived experiences. He argued that a mentee is likely to form a relationship with a mentor who shared similar "attributes" with him.

There were certain participants (Participant F, H & I) that have had significant mentorship experiences from both black and white mentors during their lifetimes on both a personal and professional level. Participant F stated, "I was very fortunate to be mentored by the best people in the industry that are currently holding senior positions." He added that "the nice thing about being mentored by those guys is that they understand the industry". As a result, there were insights shared with him on how to make his business succeed within the industry. Participant H spoke highly of a white mentor that installed belief in him through one memorable act. He got himself into trouble at work whereafter his mentor approached him and told him: "Face whatever happens here today, as you are one of my stars." Instead of breaking him down, the mentor gave him an "opportunity to prove everyone wrong". She (the mentor) motivated him (the participant) that day to turn his career around in giving him the necessary emotional and physical support. He confirms this by stating: "that was the turning point in my career". It is worthwhile to note that the relationship was not only professional but personal too. Participant I mentioned a positive mentoring experience from a white mentor, where this mentor gave him the necessary guidance and training on how to perform his work successfully. As confirmed by the participant, "she took me through the process, and I actually learned a lot under her". He further mentioned a similar positive mentoring experience from a black mentor, who gave him the guidance and training required to be a safety officer. He stated: "So he took me throughout the whole thing, the site-based safety, risk assessments, toolbox talks, tools, and equipment inspections."

Participant B was the only participant who had negative mentoring experiences from mostly white mentors, as well as a single negative experience from a black mentor. At one of the previous companies he worked, he confirmed that "it was difficult as a black man". From the interview, it was evident that there was racist behaviour by the predominantly white management, as he was "looked down on as a black person" and "no one took him seriously". This oppressive culture has created a negative mentoring culture within this organisation where white mentors could still be resistant to change.

3.3 The Significance of a White Manager as a Mentor

Two participants had limited to no white mentors in their lived mentoring experiences and could not fully contribute as a result. After analysing the codes and noting the frequencies it is evident that there were both positive and negative lived experiences of having a white mentor as experienced by the participants. It is important to note that the majority of these experiences were positive. Three of the participants (Participant A, E & H) mostly had white mentoring experiences. Although mostly positive, there were certain negative mentoring experiences as experienced by Participant A that should be noted under this sub-section. As stated earlier, the participant had a white mentor who became overly controlling and allowed her very little freedom or interaction with others. She capitalised on the participant's hard work. The situation got to the extent where the company sent the mentor back to the head office, where the mentor initially came from, after the company conducted a performance evaluation.

Participant E spoke highly of his mentors who were predominantly white. It is evident that these mentors were supportive and entrusted the participant with responsibility on numerous occasions. The mentors would show the participant how to do the job correctly and then trusted him to perform it safely.

Participant H mentioned an important relationship that he had with a white mentor in discussing his lived experiences. The participant recalled that this mentor was and still is a relevant figure in his life. The participant goes on to mention another white mentor who entrusted him with responsibility to get tasks done as this person gave him the ability to make decisions.

As stated earlier, Participant A experienced an unfortunate incident whereby a white mentor started swearing at her in front of a client. The same mentor also referred to her as “bushy”, which many women of colour would deem racist. Given how close their relationship was, she forgave the mentor for swearing at her as well calling her “bushy”. The following experience may give further insight as to why she may be so accepting and forgiving. This participant “grew up with white people being owners of companies, businesses, running businesses and being managers”. So, to her it has been the norm for “the boss of the company to be white” and “the manager to be white”. These are circumstances that the participant was used to.

As mentioned earlier, Participant B mostly had negative experiences of mentoring by white mentors. He mentioned that the experience “wasn’t good, as it basically was just dictatorship”. He felt that black people had no say within the organisation.

Participant C and Participant I both had one white mentor who gave them guidance or support to solve problems. Participant C’s mentor taught him to “solve the problems” and “not run away from problems”. He also taught the participant to be independent and “stand up for yourself”. Participant I had positive mentoring experiences from various white mentors during his attendance at university. He formed good and lasting relationships with some of his lecturers and professors.

Participant F had a unique story to tell, as he was greatly influenced in his youth on a personal level by a white mentor. Golf was introduced to him by a white person, who after a few months invited the participant to stay with the mentor and his family for a few months. He was fourteen years old at the time and “lived with them for a good eight years”. The white family was very supportive of him emotionally and physically. They kept close contact after the family had to relocate and remain in contact up to today. He experienced love from this family. He was “helped and encouraged” by this white mentor and his family and “considered them as his own family”. They treated him with “respect and dignity”, and “they were willing to share not only their experiences but their resources as well”, something he also strives to do as a mentor for his mentees in the present.

Participant G and J each had a single positive lived experience with a white mentor. According to Participant G, the manager thoroughly coached him, as he confirmed in the following statement: “he actually coached me that for us to achieve what we want, is superb”. The white mentor was also a significant motivator in the participant’s life. The participant confirmed this when he stated that: “he is the one who actually motivated me to do my postgraduate.” He also confirmed that it was “very informal how he mentored” as well as “natural”. This white mentor also entrusted him with responsibility, as he would give him tasks “and then he would just watch from a distance”. The mentor also taught him sustainability through integrity. This mentor factored in sustainability in his decision-making process. The participant further stated that sustainability “does not go hand in hand with dishonesty” and that you cannot separate sustainability from integrity. According to the participant, many organisations have failed as “they are not honest or do not have integrity”.

According to participant J, his experience was very positive, mostly due to the equal and consistent treatment he received from this white mentor. According to the participant, it did not matter to the mentor whether you are “black or white, any colour, he was handling us the same”. The consistent treatment was another admirable trait portrayed by this white mentor. Participant J confirmed this trait

when he stated that, “even when there are ups and downs in our country, we always talk”. The relationship between participant J and the white mentor was not solely professional, but personal as well. According to participant J, “even like today. He is on pension, but we still talk”. The participant continued saying, “the mentorship is always carrying on, I would think, say a lifetime”. These statements yet again confirmed the importance of these mentor-mentee relationships stretching beyond a professional one. These relationships seem to leave a lifelong mark on both the mentor and mentee.

3.4 The Significance of a Black Manager as a Mentor

A split in opinions by the participants was evident regarding the significance of having a black mentor. Three of the participants (Participant A, B & E) stated that race had no significance for them, whereas five participants (Participant C, F, G, H & J) stated that it was indeed significant. It is also important to note that two of the participants (Participant D & I) were undecided on whether race was significant for them and made additional comments as to why they were undecided.

Participant A and E gave similar responses on the matter, as they were both adamant that race was not significant. This is important for the researchers to note as both participants predominantly had positive mentoring experiences in having white managers as mentors throughout their careers. According to Participant A it did not matter whether “it is a black or white manager”, as long as that mentor has respect. She also mentioned that “I feel that as a leader, you need to mentor people and as a manager you must be a people’s person. So, whether you are black or white makes no difference.” To this participant other attributes, like showcasing respect, is more significant than race. Participant A stated that as a coloured woman, she felt that they “are always in the middle” compared to other races. “So, whether your manager is black or white, you need to fit in with them”.

Participant E stated that he does not “have a problem working under the black, the whites, the Indians or the coloureds” as race is not significant to him. What he does find significant is that there needs to be mutual respect between a mentor and mentee.

As seen throughout the interviews, Participant B mostly had negative experiences from both black and white mentors. Subsequently, he viewed race as not being significant when it comes to mentoring. He said that having a black or white mentor would “not have made a difference, as it depends on the mindset of the person”. Most participants (Participants C, F, G, H & J) agreed race was indeed significant in the relationship between the mentor and mentee. It is also worth noting that four of the participants (Participants C, F, G & H) had both black and white mentors during their lived mentoring experiences. Participant J is the only exception in this regard, as he only mentioned a positive mentoring experience from a white mentor. Participant C stated that “previously there were no black mentors or managers. Now everything is quite easier for us to be leaders”.

The participant argued that the younger generation should be able to see opportunities for themselves and take necessary action to capitalise on it. Participant C and F gave a comprehensive overview as to why having a black manager was significant to them. They both believed that things had changed for the better in the South African society and that black individuals had much better opportunities now than in the past. Participant F stated that “we as blacks, we understand our struggle better than anyone else and being mentored by a black person who is open minded” makes the process more effective, resulting in a more positive outcome for both the mentor and mentee. Participant F continued to build on this statement when he confirmed that, “given our history, black people were not given opportunities”, so it is encouraging for him to see that “South Africa has changed and is busy transforming for the better.” Participant G says that “there is still a barrier between relationships, especially personal relationships between people of colour and whites”. “There is still that grey area, whereby that relationship ends only on a professional level”, and rarely overflows to a personal level, especially if the mentor and mentee are not of the same race. Participant G mentioned that when one talks about a personal relationship, it must be “guided by respect” and can result in wonderful outcomes. This is important for the mentor and mentee relationship so that the relationships form “on a personal level not only on a professional level”.

Participant J said that race was indeed significant as black people understood each other's culture and their way of doing things. This participant also mentioned that it was easier for a black mentor to relate to certain situations in comparison to a white mentor. He continued by saying, "to a white mentor, you have to explain and make him understand" which is not the case with a black mentor. According to Participant D, the race is not significant. Whether a mentor is black or white, it has no impact on him. He did, however, mention that in terms of communication, "it is better because of the language barrier" as people of the same culture are likely to "understand each other better". He went on to make an interesting point on the lack of support between black people, stating that "there is those notions that with us as blacks we don't give one another the necessary support". He further mentioned that when a black mentor feels that a black mentee "can do better than him, he will make sure that he doesn't get the necessary attention to maybe be promoted to the position where he is supposed to be". Lastly, he elaborated further on this point by highlighting black mentors "become cautious when giving out information", as they feared information they were sharing "might come up against them", making them reserved to share information with their fellow black mentors, mentees or colleagues. Similar to Participant D, Participant I made additional statements on the matter in which it seemed that he agreed with the importance of race in EE, BBBEE and equity, but that once a black person is appointed, race should not be an issue, as equity had been attained in terms of race. However, on a personal note he believes "that goals and standards are the same" in terms of mentoring and that a mentor needs to comprehend these goals and standards. Based on the latter, the participant confirmed that he "won't go with a white or black manager who does not understand the goals and standards, as the objectives remain the same at the end of the day". To conclude, this participant felt that regardless of race, the objectives of mentorship should be reached.

3.5 Black Managers' Perspectives on lessons learned for future mentoring

There are various views from the participants on what they would do differently as mentors going forward. Some of the themes that stood out were: (1) forming personal relationships with mentees, (2) instilling belief, (2) addressing shortfalls, (3) increased interaction, and (4) encourage authenticity and developing others. Participant G and Participant I both emphasised that going forward, they would focus on the personal aspects of mentoring. Participant I was adamant when it came to future mentoring relationships. He would "not just keep it professional", by getting to know different mentees from different races in a social context. It should become a mutually beneficial friendship for both the mentor and mentee. He further stated that he would be focussing on one-on-one sessions so that he "can be able to go deeper". The participant further added that by crossing this personal barrier, the mentor and mentee were likely to confide in each other. Participant G and Participant I also mentioned the importance of understanding each mentee's aspirations, and shortfalls, as well as encouraging authenticity. Participant I confirmed that going forward as a mentor, he would try to understand that people are authentic in that they "have different aspirations and different ways of looking at things". The mentor needs to identify weaknesses and strengths and build on them. He mentioned that this needs to be done to maximize the potential of the mentees. Participant G also highlighted that going forward, he would encourage his mentees to follow their own dreams, so that they do not become a mutation of him, ultimately striving towards authenticity. Another sub-theme that arose from the interviews was that going forward, increased interaction and communication with their mentees was important. According to Participant D, he would give mentees more information in terms of professional career development, as well as giving personal advice on issues such as using their money wisely. Participant H stated that going forward, he would increase his interaction with mentees, as well as form closer bonds by having one-on-one sessions. The feedback given by Participant D and H, indirectly indicated that they also understood the importance of a mentoring relationship being both professional and personal.

Participant B and Participant I stated that going forward, they would focus on the development of mentees, which encapsulated codes such as giving guidance to mentees as well as encouraging growth. According to Participant B, he would "make sure guys are given room to grow and guidance as well". According to Participant H, "we all have our skills and at the end of the day I want to help you take your skills and make it your strength". Participant I contributed to this view and added that "one need to look at the weaknesses and strengths and build on them".

3.6 Discussion

3.6.1 Understanding mentoring

There are significant similarities between the definitions of mentoring as given in the literature and how the black managers from the interviews understand it. As the literature states, mentoring is where the mentor guides, counsels and supports the mentee (Johnson, 2015). The majority of the participants (Participant A, B, C, F & I) viewed mentoring as giving assistance, supports or guidance to the mentee. Participant A, G and J had very similar views on mentoring. They explained mentoring as the training or coaching of mentees to develop skills and expertise. Identifying the mentee's needs and expertise are central in Participant A and H's understanding of mentoring. Participant D experienced mentoring as the impartment or sharing of information with the mentee. According to Participant G and J mentoring is to develop others. The researcher found this view significant, as it aligns with all other definitions. It can possibly serve as a summarised definition for mentoring.

There are various different views from the participants on what they would do differently as mentors going forward. Some of the themes that stood out were: forming personal relationships with mentees, installing belief, addressing shortfalls, increased interaction, encouraging authenticity and developing others. The literature mentions the significance of having both a personal and professional relationship within a mentoring relationship (Crawford and Smith, 2005). This highlights the significance of this factor when it comes to successful mentoring. It is also mentioned on multiple occasions under the participants' lived mentoring experiences, confirming this factor's significance. The main themes that arose on the understanding of mentoring is that mentoring is the development of others, followed by assistance and guidance given to the mentee. Training and coaching are the next set of themes, which were each mentioned twice by Participants A and J and Participant C and G respectively.

3.6.2 Lived Mentoring Experiences of Black Managers

In assessing the codes as presented by the data analysis, it is evident that the lived mentoring experiences between participants differ significantly. It confirms that white and black people, as well as mentors and mentees, still have different views as South Africans on mentoring relationships. There is also a difference in behaviour between how black and white mentors treat their mentees, as they most likely had their own mentoring experiences. South Africa's high levels of inequality, diverse upbringings, unequal opportunities, and differing levels of education makes for entirely different mentoring views and experiences.

It is evident that there were positive as well as negative experiences from both black and white mentors. The positive experiences were linked to themes such as, emotional, and physical support from a black or white mentor, instilling belief, guidance or assistance, solving problems, training, mutual respect, and sharing of information. In contrast, there were also negative experiences. These negative experiences were linked to themes such as, racist behaviour by white mentors as well as lack of respect from white mentors. As stated in the literature, negative attitudes towards EE by white mentors slow down progress within South African organisations in the fear of affecting self-image (Mayer et al., 2019).

According to Geber and Keane (2016), to achieve cultural intelligence (CQ) within an organisation, it is important to consider management and leadership issues unique to South Africa and find unique South African ways of dealing with those issues, especially between different races. The training and coaching of leaders need to be based on gaining a better cultural knowledge, especially in a multicultural society like South Africa. Sharing these different worldviews and perspective, allow for a higher level of thinking within society and organisations. Several CQ principles are already present in the participants' lived mentoring experiences from white and black mentoring experiences. Respect is one principle that is evident in the positive mentoring experiences of the participants. However, to culturally integrate the other principles, the relationship between mentor and mentee needs to be personal and not merely professional, so that concepts such as Ubuntu can effectively be incorporated.

The literature confirms that mentoring is an interpersonal relationship between a mentor and mentee (Johnson, 2015). Other literature states that the essence of mentoring is the development of individuals on both a professional and personal level (Crawford & Smith, 2005). Participant G made a valuable contribution on the importance of a mentoring relationship needing to be both personal and professional to break down the barriers between people of different races, as these mentoring relationships rarely overflow onto a personal level.

Participant G also argued that a mentee is likely to form a relationship with someone who shares similar attributes with them. As Thomas (2001) confirms this in the literature, close mentoring relationships form easier when parties share attributes such as race, culture, age, or gender. According to Athey et al. (2000), mentoring may feel more natural when the mentor and mentee are of the same race or culture.

Black mentors can relate more easily with black mentees regarding cultural issues, as African cultures share similar attributes. This allows for the relationship between mentor and mentee to form more naturally. It is important to note that although the relationship has the potential to form naturally, there is still a personal element required for a mentoring relationship to be mutually beneficial, even between a black mentor and mentee. According to the literature, mentoring is the best strategy to share knowledge in a mutually beneficial relationship for both the mentor and mentee (Santos et al., 2019). Malin and Hackmann (2016) add that the experience can be beneficial to the mentor and mentee, and not only beneficial to the mentee as with traditional mentoring.

The researchers have noted that most positive experiences by black managers in having white mentors had a personal aspect to their relationship, i.e., the relationship was both personal and professional. Five of the participants (participants A, E, F, G & J) had positive experiences where they had strong personal relationships with their mentor. Participant A, E, G and J formed friendships with their white mentors that took the relationship far beyond their professional relationships. The researchers recognised that there is a strong connection between a positive relationship experience and how personal it is. The mentoring relationship experienced by Participant F was at the extreme end of personal, as a family relationship formed between the mentor and mentee.

To improve CQ, the organisation needs to further create awareness to prevent mentors from being culturally exclusive and making explicit cultural references on how certain cultures do things. They should strive to be inclusive and aim to create a caring culture by telling each other stories so individuals can learn, relate, share, and explore (Geber & Keane, 2016). To integrate these principles, the relationship between the mentor and mentee needs to be personal, as the integration of these principles are personal. The researchers argue that to drive a culturally integrated mentoring response, the relationship between mentor and mentee needs to be personal. If not, the implantation of such principles will be artificial and short-lived.

The lived mentoring experiences in having a white manager as mentor has delivered a mixed set of results. Three of the participants predominantly had positive mentoring experiences from white mentors. Participant A however highlighted some negative traits displayed by two white mentors with whom she had a positive mentoring experience in general, as well as a separate incident where colleagues did not accept them based on race. The two isolated negative incidents experienced by participants A and B are evidence that there were still white managers living in the past, as they are resistant to transformation and progress. The behaviour by the white mentor who was overly controlling and restrictive was evidence of a white mentor who perhaps feared retribution from previously disadvantaged groups, reduced living standards and job losses (Leonard & Grobler, 2006). The same can be said about the organisation responsible for the all-round negative mentoring experiences as experienced by Participant B. The way the mentor swore and spoke to the mentee and the racist nick name given to her is evidence of white mentors who still had negative attitudes towards EE. These behaviours are slowing down progress within South African organisations in the fear of affecting self-image as white South Africans (Ivey, Geber, and Nänni. 2013).

3.6.3 The Significance of Having a Black Manager as a Mentor

The majority of the black managers agreed that having a mentor of the same race was indeed significant, as mentoring across different races was not a natural act especially in South Africa with its past of segregation. Close mentoring relationships are much more likely to form when the mentor and mentee can relate with each other based on race, culture, age, or gender (Thomas, 2001). Three of the participants convincingly agreed with the literature.

Even though Participant D did find race significant on a personal level, he also viewed language as a possible hinderance to communication when it comes to mentoring across differences. According to Participant F, black mentors and mentees get along more easily, as they understand each other's struggles. "Struggle" in this instance refers to the economic hardships that the majority of black South Africans faced daily. Participant J believes that race is indeed significant when it comes to culture and beliefs. African traditions and beliefs are often difficult for white South Africans to comprehend and incorporate into organisations. It is much more convenient and fairer to have a black mentor who understand these traditional or cultural situations, as they are likely to have experienced it themselves at some point.

Another main theme as expressed by the participants on the significance of having a black manager as mentor is that it encourages the realisation of better opportunities for black South Africans post-Apartheid. Participant F was encouraged by the progress South Africa has made in providing opportunities for black South Africans through transformation. Black people did not have the same opportunities in the past as they do in the present. This is largely due to transformative laws such as B-BBEE, EE and AA, which has the main function of correcting the wrongs of the past and addressing issues like inequality and lack of opportunities as experienced by black South Africans. Participant C added that there are more opportunities now for black people to be leaders. Strategies like B-BBEE aims to increase black representation at the executive and board level.

4. Conclusion

Although there are numerous positive examples in the data, certain South African organisations still lack equality and diversity as seen in the analysis, where certain organisations still have an oppressive culture toward black employees. These problems create a degree of mistrust between individuals of different races within such an organisation. This level of mistrust is likely to also have a negative effect on mentoring relationships, especially between employees of different races. White, middle-aged mentors who still have the mentality of Apartheid are still resistant to mentoring relationships and the benefits that may arise from it. It should be seen as a threat to organisations and society when it comes to transformation as it will hinder progress within organisations. Although significant progress has been made as seen with some of the participants, much more still needs to be done.

It is evident in the way certain mentors, black or white, treated their mentees that some companies are indeed on track regarding implementing policies (from EE, AA & B-BBEE legislation) and mentorship programmes that support transformation in applying best practices such as Ubuntu. The Ubuntu principles of care, respect, responsiveness, and interconnectedness are evident throughout the feedback given by the participants. This applies particularly to business sectors where focus needs to be placed on gaining a better understanding on cultural aspects in the workplace to allow for a more inclusive organisation, and better relationships between employees of different backgrounds and races. The researchers noted that the mentoring participants' understanding aligned with the Western view of mentoring. Most of the participants viewed mentoring as giving assistance, support, or guidance to the mentee, whereas literature defines mentoring as a personal enhancement strategy where the mentor develops the mentee by sharing ideas, expertise, values, skills, perspectives, proficiencies and attitudes.

The lived mentoring experiences as presented by the data analysis differ vastly between participants. It confirmed that South Africans, black and white, differed positively and negatively. The way a white mentor treats or handles a black employee differs significantly between individuals and organisations. The same can be said about black mentors. South Africa's democracy is still facing the same issue of correctly using policies following legislation such as EE, AA & B-BBEE, to correct the wrongs of the

past, whilst building a nation with a single identity (Rueben & Bobat, 2014). Similarly, South Africans should find a single identity when it comes to addressing the shortfalls posed by mentoring. The more transformed and developed a society is, the less significant race ought to be. It is evident from the data that the majority of the participants still view race as being significant given the history of South Africa. Factors which contribute to this are that black people share similar or related cultures, languages, backgrounds, and the history of one or other form of struggle against inter alia Apartheid. It is also easier for a black mentor to form personal relationships with a black mentee because they share some of these elements just mentioned.

4.1 Theoretical Contribution

South Africa is a very diverse and complex society. A society that is constantly faced with enormous social-economic issues and the complexities of correcting these issues. Transformational mentoring allocates more fluid roles to both mentor and mentee, focussing on the growth of both parties (Peiser et al., 2018). In conjunction with concepts such as Ubuntu, transformational mentoring can assist South African organisations in finding a single identity for mentoring. Mentoring that combines Western and indigenous views into an authentic South African view. This process should not be forced, but handled with the correct intent, urgency, and desired outcome in mind, so that past mistakes are not repeated. Multiculturalism has, in many instances, become the desired goal, resulting in neglect of certain issues and how they are resolved so that terms such as Ubuntu lose its depth and value (Geber & Keane, 2016).

5. Managerial Implications

Management and stakeholders need to do more to create an inclusive society in an organisational culture that allows for better understanding of cultural differences and encourages improved relationships between employees of different races. Organisations need to improve on CQ by dealing with issues when it comes to diversity (Geber & Keane, 2016). Leaders, managers, and mentors need to be coached on deeper cultural knowledge to improve the CQ within an organisation or society, especially in a complex society like South Africa. If individuals gain a better cultural knowledge of each other, individuals will become more tolerant and accepting, ultimately forming a single identity.

Based on the results of the study, mentoring should be used more in a transformational manner within organisations, where the mentee learns from the mentor and the mentor from the mentee. They should also develop more of a personalised relationship, The mentor must also take a keen interest in the personal career and life aspirations of the mentee. Mentees should be encouraged to have agency to identify their own development opportunities as well, with the mentor providing support for this.

Factors Influencing the Work Engagement of Human Resource Practitioners

Mr Sathasiven Naidoo¹, Professor Amanda Werner*²

Keywords

HR practitioners; work engagement; meaningful work; leadership; communication

Abstract

Human Resource (HR) practitioners are perceived as custodians of work engagement in organisations, but there is a paucity of research conducted among the work engagement of HR practitioners themselves. The purpose of this study was to explore factors influencing the work engagement of HR practitioners. An on-line survey was conducted among HR practitioners in the Nelson Mandela Bay area, selected via convenience and snowballing sampling. It was established that Meaningful Work, and Rewards and Recognition, predicted work engagement among this group of HR practitioners. Recommendations with regards to these factors are presented to managers of HR practitioners, as well as to line and senior managers across all functions in organisations.

1. Introduction

The Human Resources (HR) department is a strategic role player and key enabler in organisations, with proven evidence of the value that strategic human resource management (SHRM) provides to organisational performance (Oh et al., 2017). Dave Ulrich (1996), renowned for seminal work in SHRM, identified Strategic Business Partner, Change Agent, Administrative Expert and Employee Champion as crucial HR roles in ensuring the alignment of human resources with organisational vision, values and strategy, and in establishing HR as a business partner (Ulrich, 1996). A qualitative study by Fareed et al. (2022), conducted in an information and technology environment in Pakistan, identified eight important areas in which HR needs to demonstrate effectiveness to make a meaningful contribution to the organisation. These include strategic recruitment, provision of support and services, communication, compliance to policy, proactive HR practices, responsiveness to employee needs, support of careers and fulfilling HR responsibilities. In South Africa, these roles are amplified as human resource practitioners are not only concerned with the achievement of organisational goals and the goals of the HR function itself, but also subscribe to the national agenda of transformation through ensuring compliance to labour law and upholding social justice and equality, while promoting inclusivity and employee empowerment within organisations. However, even the best developed bundles of HR practices cannot meet their intended purposes if they are not implemented by competent and committed HR practitioners (Oh et al., 2017). In this respect, the South African Board for People Practices (SABPP, 2022a) identified pillars of professionalism and core competencies required by HR practitioners to ensure that they make an impact in the organisation. HR practitioners need to understand and support the HR objectives and strategies of the organisation, while recognising their rationale and the outcomes that are expected. Practicing HR is therefore not a mechanical function. For HR practitioners to be effective, they need to be engaged in what they do, demonstrate passion for the profession and deal competently with the challenges associated with the profession.

HR practitioners operate in a fast moving, pressurised environment and are exposed to many stressors (Abdalmajeed Alshibli & Alzu'bi, 2019; Fareed et al., 2022). In South Africa, HR practitioners do not

² E-mail address: amanda.werner@mandela.ac.za

only have to interact with senior managers, mid-level managers, supervisors, employees and trade union representatives across various organisational departments, but they have to also deal with external stakeholders and service providers such as the Department of Labour (DOL), SETAs, pension and provident funds, and medical insurance institutions. Further challenges relate to diversity, labour turnover, skill shortages, technology, employee development and adjustment to change (Dlamini et al., 2021). Stress-related challenges typically encountered by HR practitioners are changing industry and business conditions, opposing needs of employers and employees, complex administrative requirements, communication breakdowns, conflict, employee grievances and disciplinary inquiries. Ironically, HR is also the custodian of health and safety, and employee wellness in an organisation (Saks, 2022; Tran et al., 2022), a role which became especially prominent during the Covid-19 pandemic (CIPD, 2021). In addition to these factors, HR practitioners often feel under-recognised in an organisation, having to quantify the impact of people practices in the organisation and being referred to as a service rather than a core function (Fareed et al., 2022). Not being able to cope with these challenges and demands place HR practitioners at risk (Warnich et al., 2021) and their work engagement could be threatened (Kwon et al., 2019).

Work engagement is a positive and satisfying state of mind resulting in the employee being energised, absorbed and dedicated to their job as well as the broader work environment (Schaufeli & Bakker, 2003; Joubert & Roodt, 2019). Work engagement therefore contains a physical, cognitive and emotional component (Taghavi, 2019). Work engagement is associated with constructive relationship building, commitment, loyalty and productivity (Chalermjirapas et al., 2019; Moletsane et al., 2019). Facilitating work engagement is one of the greatest challenges for contemporary organisations and specifically for HR as a custodian of the HR function in organisations (Gyensare et al., 2019; Saks, 2022). It is therefore vital that HR practitioners themselves are engaged in their roles to have an exponential effect on the work engagement of other members of the organisation, including leaders and employees. While most studies on work engagement focus on employees or the role of HR practices in work engagement (Saks, 2022), this study specifically focused on the work engagement of HR practitioners themselves. The study was conducted in the Nelson Mandela Bay region, in the Eastern Cape of South Africa, and was done in partial fulfilment of the requirements for the degree of Masters in Business Administration.

2. Problem Investigated

Strategic HRM is crucial for attaining organisational goals (Oh et al., 2017) and in South Africa the HR department in any organisation also contributes to economic and social transformation. Human resources practitioners should be exemplary HR administrators, act as strategic partners and change agents, while protecting the interests of employees (Ulrich, 1996). HR practitioners often work under challenging circumstances (Abdalmajeed Alshibli & Alzu'bi, 2019; Dlamini et al., 2021). In the face of these challenges, the work engagement of HR practitioners is essential for them to make meaningful contributions to the organisation in pursuit of vision and strategy, interact positively with various stakeholders and act as role models to both leaders and employees. While much research had been conducted on work engagement or the role of bundles of HR practices on engagement, the work engagement of HR practitioners themselves has been neglected in research. Neglecting the engagement of HR practitioners in the organisation will have dire results as HR has a cross-functional influence in the organisation. In addition, Schultz (2021), concluded that HR practitioners need self-leadership to navigate and design the future of HRM, and that engagement influences their ability to have an impact in this respect. As such, the results of the study have relevance for industry, and specifically HR leaders and senior managers that are concerned with the optimisation of HR departments and the future of the HR function in the organisation. From an academic perspective, the results contribute to knowledge of the drivers of engagement in organisations, and specifically from the perspective of the HR practitioner.

Results from this study are of therefore of value to the HR profession and the field of knowledge in Human Resource Management (HRM), as well as managers and leaders responsible for and involved with HR practitioners and to HR practitioners themselves.

3. Research Aim

The aim of the study was to describe the role of HR practitioners in South African organisations, identify factors influencing work engagement and specifically factors influencing the work engagement of HRM practitioners. To achieve this aim, HR practitioners were surveyed to determine their levels of engagement, and the extent to which communication, meaningful work, leadership support, rewards and recognition influenced their work engagement.

4. Literature Review

4.1. The role of HR Practitioners in Contemporary South African Organisations

Human Resources are both a means and an end to achieving organisational strategic goals (Taylor et al., 2012). In this respect, the HR department in an organisation needs to ensure the supply and maintenance of talent in the organisation and at the same time ensure that the organisation operates as a humane community in which employees thrive while optimally contributing to organisational strategy (Melé, 2013).

The South African Board for People Practices (2022) encapsulates five capabilities of HR: strategy, talent management, HR governance, risk and compliance, analytics and measurement, and HR service delivery. HR practitioners are expected to be leaders, problem solvers and communicators with excellent HR and business knowledge and display high levels of integrity and professionalism. They are not only responsible for the HR function across the HR value chain, but also for enabling leaders and line managers in managing employees successfully in a changing and diverse environment. In this respect, HR practitioners fulfil a role as agents of change and transformation. In addition to these roles, HR practitioners ensure compliance to labour legislation, such as the Employment Equity Act (EEA) of 1998, the Affirmative Action (AA) Act of 1998, the Skills Development Act (SDA) of 1998 and the Skills Development Levy Act (SDLA) of 1999, as well as the Labour Relations Act of 1995 (Nel et al., 2021).

The responsibilities of HR practitioners are broad and if they are not engaged in terms of their roles and functions, they will not be able to deliver the mandate that they are entrusted with by the government, organisation, management and employees. As such, the focus of this study is on work engagement and specifically the work engagement of HR practitioners.

4.2. Work Engagement

Kahn (1990, p. 694) defines work engagement as the harnessing of organisational members' selves to their work roles and state that engaged employees are those who apply themselves physically, cognitively and emotionally while performing in a role. Work engagement is characterised by vigour, dedication and absorption (Schaufeli et al., 2002). An engaged workforce is essential for organisations to attain competitive advantage in a dynamic world (Shrotryia & Dhanda, 2020; Vermeulen & Scheepers, 2020). Employees who are engaged expend extra effort in their work. They experience mental and emotional connection with their work, teams and the organisation (Bakker & Albrecht, 2018). However, disengaged employees exhibit less commitment, exhaustion, distrust and low performance (Lin, 2010). Employees differ in terms of various levels of work engagement. In this respect, Kwon et al. (2019) categorised four employee engagement profiles: the disengaged, barely engaged, moderately engaged and highly engaged employee. The highly engaged employee puts in extra effort, influences others positively, remains with the organisation and advocates for the organisation. Such a person is open to learning and performance improvement, which are essential aspects of continuous improvement and adjustment to change. Rothbard and Patil (2011), in their framework of work engagement, highlighted in-role and extra-role performance, proactivity, adaptivity, creativity and client satisfaction, as well as organisational commitment as the outcomes of work engagement. It can therefore be expected that HR practitioners who are engaged will find purpose and meaning in what they do, feel enthusiastic and immerse themselves in their roles. However, as postulated by the Job Demands-Resources (JD-R) model, for work engagement to take effect, the right organisational and job conditions need to be provided, and these can come from the organisation, the task itself, interpersonal relations and the organisation of work (Saks, 2022). In this study, four work engagement factors were investigated in relation to the engagement of HR

practitioners within the organisation, namely Communication, Leadership Support, Meaningful work, and Rewards and Recognition. These are discussed in the subsequent section.

4.3 Work Engagement Factors

Communication is no longer an after-thought, as it is understood to be essential in achieving superior outcomes (Vora & Patra, 2017). Through communication, organisational vision and strategy are clarified, and this provides rationale for job and role expectations. Communication is a vital factor in the engagement of employees as it is entwined with leadership and relationship building (DeKay, 2012; Kelly & MacDonald, 2019). Communication influences knowledge, attitudes and behaviour, and as such, needs to be intentional, inclusive, clear and not fear-inducing. When more time and resources are spent on internal communication tools and channels, employees engage more readily with each other and with senior managers (Vora & Patra, 2017). Effective and efficient communication leads to involvement, motivation, innovation, higher productivity and work engagement (Vora & Patra, 2017). In the context of this study, Communication as a factor is operationalised as HR practitioners being informed of the organisational vision and strategy, understanding how HR vision is aligned with organisational vision, having clarity about their role in HR, receiving information that enables effectiveness and efficiency and being able to voice opinions about how to improve HR work in the organisation.

Leadership and leadership support emerge as important factors in work engagement (Sahban, 2019; Vermeulen & Scheepers, 2020), career development and employee wellbeing (Tafvelin et al., 2019; Allan, 2020). Leaders need to be value-based and authentic to be trusted by employees, while leaders also play an integral role in the development of employees through serving as coaches and mentors (De Oliveira et al., 2019). In a changing environment, transformational leaders elicit extraordinary results from employees and teams (Iqbal et al., 2015). Saks (2022) highlights that caring leadership and management results in employees caring for the organisation, which subsequently enhances employee work engagement. This is perceived to be in line with the social exchange theory which postulates that positive behaviours are reciprocated in kind. For the purpose of this study, Leadership as a factor is operationalised as the leader playing an integral part in the career development of the HR practitioner, seeking the practitioner's input, having regular performance conversations with the practitioner, helping the practitioner solve problems, and the leader being seen as credible with a meaningful impact on the organisation's success.

Tan et al. (2019) identified meaningful work as a key driver of work engagement, while Matsuo, Arai and Matsuo (2019) linked meaningful work to job satisfaction, life satisfaction and work engagement. Employees who experience meaning, transcend their personal needs and pursue external issues they consider worthwhile in their pursuit towards a greater purpose in life (Tan et al., 2019). Meaning in work emerges when employees have a clear understanding of their expectations, abilities and objectives, both in terms of the organisation and society (Nair, 2020) which drives them to connect with their own self, others and humankind. Job characteristics, as explained by the job demands-resources (JD-R) theory is relevant to the concept of meaning (Tan et al., 2019), however without the necessary resources, employees could experience exhaustion and burnout. Allan (2020) posits that meaningful work is a buffer against negative factors that cause stress and anxiety and that it is a crucial element in quality work performance. For the purpose of this study, Meaningful Work as a factor is operationalised as the HR job having personal meaning to the HR practitioner, the practitioner being able to add real value to the organisation, while having a sense of contributing to transformation in South Africa, experiencing growth on a personal level in the job and having a sense of making a difference.

Many authors, Das (2013), Mehta et al. (2017), Majumdar (2019) and Saunderson (2019), as well as Sidhu and Nizam (2020) emphasise rewards and recognition as factors in employee satisfaction, engagement and retention. Rewards and recognition constitute private or public acknowledgement of achievement and can be monetary or non-monetary. Monetary rewards give material wealth and social status (Mehta et al., 2017), but do not affect satisfaction or performance if not aligned with the needs of the individual. It could therefore be posited that a high need for meaningful work (purpose

that transcends personal needs) may reduce a concern for rewards and recognition. Increasing an employee's responsibility and sharing their innovative ideas are forms of recognition. However, Sidhu and Nizam (2020) opine that non-monetary rewards are often overlooked and should therefore also be used as a factor in employee engagement. For the purpose of this study, Rewards and Recognition is operationalised as the HR practitioner feeling valued for the contribution made to the HR department, as well as to the broader organisation, and being recognised for performance-related achievements by the direct manager, line managers, colleagues and employees for the contribution made to HR, support given to managers and the delivery of HR services within the organisation.

5. Research Methodology

For this study, a positivistic paradigm was adopted. A positivistic paradigm assumes that research can and should be done objectively, and that the reality about a phenomenon is revealed through probing the perceptions or observations of a larger group of subjects (Park et al., 2020). The positivistic paradigm contrasts with the interpretivist paradigm which seeks to uncover rich meaning from the unique experiences of purposefully selected individuals through intensive interrogation methods such as interviews or focus groups and narrative analysis (Davies & Fisher, 2018). The positivistic paradigm is aligned with quantitative approaches while interpretivism is aligned with qualitative approaches. For this study, a quantitative approach was adopted, in the form of an on-line survey with a questionnaire as data collecting tool to measure the work engagement levels of HR practitioners in the Nelson Mandela Bay area and the extent to which the identified factors influenced their work engagement levels. A quantitative approach determines cause and effect connections amongst variables in a structured manner and provides an indication of the predictive value of variables (Grover, 2015).

The population for the study comprised HR practitioners in the Nelson Mandela Bay (NMB) region. Due to limited time available for conducting the study, convenience and snowball sampling were adopted as the most practical sampling techniques for the study (Meadows, 2003). To ensure trustworthiness in terms of diverse representation, the NMB HR Forum was approached to distribute the questionnaire to HR practitioners. Members of the forum were informed via email of the purpose of the survey and had to indicate their willingness to participate in the study, thereafter another email was forwarded to them with a link to the questionnaire. The questionnaire was accompanied by an introductory letter, providing information on the focus and purpose of the study, aspects of anonymity, voluntary participation and the approximate time required for completion. The questionnaire was administered on QuestionPro, a web-based survey solution. Advantages of this approach involved providing anonymity, privacy and convenience to the participants, but also it is a less costly and time-effective method to use. The questionnaire consisted of three sections. The first section elicited biographical data via closed-ended answer options. The second section measured work engagement factors on a Likert-type scale, ranging from strongly disagree (5) to strongly agree (1). This section was self-developed but was informed by the literature review and reliability was established. The third section, also a Likert-scale, consisted of the Utrecht Work Engagement Scale (UWES), which was developed by Shaufeli and Bakker (2003) and is known for obtaining Cronbach's alphas of between .80 and .90 (Vallières et al., 2017). In this study, the Cronbach alpha coefficients obtained for the scales varied between 0.85 and 0.92 which confirmed reliability (Olvera Astivia et al., 2020). Before distribution, ethics clearance was obtained. The study was conducted while the country was on Alert Level 3 during Covid-19 and 42 useable, completed questionnaires were received. The responses were representative of HR practitioners who were mostly responsible for salary, wages and benefits (14.3%), training and development (31.1%), HR generalist work (17.9%), and employee relations (17.9%), with 7.1% focusing on HR administration or other related aspects (10.7%). The profile of the respondents was 70% female, 32% Black, 32% White, 19% Indian and 14% Coloured, while respondents were mostly aged between the ages of 30 and 59 (76%), and with either Grade 12 (15%), diploma (18%), Advanced Diploma/degree/B.Tech (33%), postgraduate diploma/honours degree (27%) or masters/doctoral degree (6%) as the highest qualification. A large proportion (40%) of the sample had a length of service of ten years or more, and a further 33% had a length of service of between four and 10 years, an indication of most respondents being relatively established in their organisations.

IBM SPSS Statistics 27 software was employed for the statistical analyses. Other than descriptive statistics (mean scores and standard deviation), results for confirmatory factor analysis (CFA), reliability analysis, correlation analysis and regression analysis are presented.

6. Results and Findings

Table 1 presents descriptive statistics for statements relating to the engagement levels of the respondents. The aggregate mean score for the Engagement Scale is 3.78, leaning towards agree responses and the aggregate standard deviation is 0.88, showing a narrow spread of responses (0.55 – 1.07) and therefore relative consistency among the responses.

Table 1: Work Engagement levels of HR practitioners

Work Engagement	Mean	SD
At work, I feel bursting with energy	3.49	0.96
I feel the work that I do is full of purpose and meaning	4.06	0.55
While I am at work, time tends to fly	4.14	0.65
I feel strong and vigorous doing my job	3.89	0.77
I am enthusiastic doing my job	3.94	1.07
I forget everything around me while I am working	3.22	0.89
My job inspires me	3.88	1.04
I feel like going to work when I get up in the morning	3.69	0.99
I feel happy when I work intensely	3.84	0.81
I feel proud of the work that I do	4.13	0.79
I am fully immersed in my work	3.89	0.82
I am content working for long periods of time	3.79	0.96
My job is challenging	3.94	0.89
When I am working, I get carried away	3.44	0.94
I am very mentally resilient at performing in my job	3.78	1.04
It is difficult to detach myself from my job	3.14	1.00
I always persevere, even when things do not go well	4.04	0.76
Aggregate mean score and standard deviation	3.78	0.88

CFA (presented in Table 2) was used to determine whether the factor structure employed in this study fitted the data and could therefore be considered valid (Wegner, 2012). The factors measured were Communication, Meaningful Work, Leadership Support, Rewards and Recognition, and Workplace Engagement. All of the parameter estimates were found to be statistically significant with a p-value of above 0.5 and as such the model fit could be assessed. This was done through a combination of goodness-of-fit indices. In cases where the modification indices showed that two items were highly related ($MI > 20$), pathways between them were opened to enable them to correlate. All of the factors retained their statements, except for the factor Work Engagement, for which two insignificant items had to be removed. Interestingly, the one statement that had to be removed referred to ‘being carried away when working’ and the other to ‘finding it difficult to detach from work’. Both of these statements reflect absorption, even though the concept of Work Engagement was holistically considered in this study. Table 2 presents the results for the CFA and the final factor structure.

Table 2: CFA and Final Factor Structure

Factor	Parameters sig	CMIN/df	CFI	SRMR	RMSEA
Communication	all significant (p<0.1)	1.634	0.911	0.0802	0.133
Meaningful Work	all significant (p<0.05)	1.096	0.988	0.0817	0.052
Leadership Support	all significant (p<0.05)	1.202	0.972	0.0746	0.075
Reward and Recognition	all significant (p<0.05)	1.356	0.956	0.0719	0.099
Workplace Engagement	all significant (p<0.05)	1.215	0.937	0.0883	0.077
Cut-off for Good model fit: CMIN/df <3.00 CFI >0.95 SRMR <0.05 RMSEA <0.08					

Cronbach alpha coefficients were calculated for the factors confirmed via the CFA. As indicated in Table 3, the alpha coefficients were 0.85 or higher, indicating very good internal consistency/reliability (Olvera Astivia et al., 2020).

Table 3: Cronbach Alpha Coefficients

Factor	N of items	Cronbach alpha
Communication	7	0.85
Meaningful Work	7	0.89
Leadership Support	9	0.92
Reward and Recognition	7	0.90
Engagement	15	0.91

Table 4 presents descriptive statistics for the factors measured in this study. The standard deviations are all low, ranging between 0.53 and 0.73, indicating consistency in the responses to these factors and provide a solid base for reporting. The highest mean score is 4.1 for Meaningful Work, and the lowest is 3.70 for Rewards and Recognition, with all leaning towards agree responses.

Table 4: Descriptive Statistics for the Factors extracted via CFA

Descriptive Statistics					
	N	Minimum	Maximum	Mean	Std. Deviation
Communication	37	2.14	5	3.99	0.56
Meaningful Work	37	2.57	5	4.19	0.53
Leadership Support	37	2	5	3.85	0.66
Reward and Recognition	37	2	4.86	3.70	0.73
Work Engagement	37	1.93	4.87	3.85	0.56

Correlation analysis (Table 5) provides an indication of the extent (significance) to which the factors are related, with a positive correlation (direction) indicating that if a factor increases, the related factor will also increase. A correlation greater than 0.5 indicates a strong relationship, while a correlation greater than 0.3, but smaller than 0.5 indicates a moderate relationship, and a correlation lower than 0.3 indicates a weak relationship. All of the factors measured in this study are positively correlated, with the relationship between Meaningful Work and Work Engagement ($r=0.752$), Rewards and Recognition and Work Engagement ($r=0.710$), and Leadership Support and Engagement (0.517) showing the strongest relationships. However, it should be noted that a correlation does not depict influence. To establish influence, regression analysis could be utilised, as was done in this study.

Table 5: Correlation Analysis

Correlations between factors measured in the study					
	Communication	Meaningful Work	Leadership Support	Rewards and Recognition	Work Engagement
Communication	1	0.502**	0.740**	0.659**	0.474**
Meaningful Work		1	0.410*	0.592**	0.752**
Leadership Support			1	0.673**	0.518**
Rewards and Recognition				1	0.710**
Work Engagement					1
** Correlation is significant at the 0.01 level (2-tailed)					
* Correlation is significant at the 0.05 level (2-tailed)					

To establish if the engagement factors measured in this study had an influence on Work Engagement, a linear regression analysis was conducted (Table 6). Regression analysis is used to measure the relationship between independent variables and a dependent variable and gives an indication of how the dependent variable changes in relation to change in the independent variables (Wegner, 2012). The regression analysis was done in three steps. In the first step, it was determined that the independent or predictor factors (Communication, Meaningful Work, Leadership Support and Reward and Recognition) explained 68.7% of the variation in the dependent variable, Work Engagement.

Table 6: Regression Analysis Assess Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson
1	.829a	0.687	0.648	0.33309	2.108
a Predictors: (Constant), Reward and Recognition, Meaningful Work, Leadership Support, Communication					
b Dependent Variable: Work Engagement					

In the second step of the regression analysis, significance was established. The overall model was found to be significant ($F=17.58$, $df=4$, $p=0.000$), as illustrated in Table 7.

Table 7: Regression Analysis

ANOVA: Engagement and factors of engagement						
Model	Sum of Squares	df	Mean Square	F	Sig.	
1	Regression	7.802	4	1.95	17.58	.000b
	Residual	3.55	32	0.111		
	Total	11.352	36			
a Dependent Variable: Work Engagement						
b Predictors: (Constant), Rewards and Recognition, Meaningful Work, Leadership Support, Communication						

In the third step of the regression analysis, the significance of predictor factors was determined, as indicated in Table 8. Meaningful Work ($p=0$) and Reward and Recognition ($p=0.014$) emerged as significant predictors of Work Engagement for the HR practitioners surveyed in this study. Meaningful Work is responsible for 53.8% and Reward and Recognition for 40.1% variation in Work Engagement. An analysis of the residuals delivered a mean residual of 0 and a histogram with a normal distribution, giving confidence in the results obtained.

Table 8: Significance of Predictor Factors

Coefficients ^a								
Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics		
	B	Std. Error	Beta			Tolerance	VIF	
1	(Constant)	0.497	0.505		0.985	0.332		
	Communication	-0.18	0.16	-0.178	-1.124	0.269	0.388	2.58
	Meaningful Work	0.576	0.134	0.538	4.293	0	0.622	1.609
	Leadership Support	0.136	0.135	0.159	1.003	0.323	0.388	2.577
	Rewards and Recognition	0.307	0.118	0.401	2.597	0.014	0.409	2.443
a	Dependent Variable:							
	Work Engagement							

7. Discussion

The role and strategic function of HRM in co-creating, enabling and supporting organisational vision, values, strategy, culture and ultimately team and individual effectiveness, has been firmly established (Ulrich, 1996; Oh et al., 2017; Fareed et al., 2022). In addition, in South Africa, where change and transformation emanating from global, national and local forces are paramount, the role and function of HRM cannot be separated from the national mandate for creating a fair and equal society, therefore ensuring social justice. These challenges require HR practitioners who are competent, committed and effective (Oh et al., 2017; Fareed et al., 2022) with extensive knowledge of HR best practice, a deep understanding of the role of HRM, passion for the profession as well as resilience (Kwon et al., 2019; Warnich et al., 2021), therefore HR practitioners who are engaged. Using the definition of work engagement postulated by Khan (1990), this would imply that HR professionals harness their self to their role in HR, and apply themselves physically, cognitively and emotionally while performing in this role.

This study therefore probed the work engagement levels of HR practitioners and determined the extent to which communication, meaningful work, leadership support and rewards and recognition influenced the engagement of these practitioners. Knowing which factors drive the engagement of HR practitioners will assist HR directors in creating an environment in which HR practitioners can optimally function, in accordance with their role. The literature review emphasised that communication is vital for leadership and relationship building (Kelly & MacDonald, 2019) as well as sustainable competitive advantage and feedback, but that communication needs to be purposeful, consistent and transparent (Fareed et al., 2022). Leadership support implies leaders are concerned with the career development of HR practitioners as well as their wellbeing (Sahban, 2019; Tafvelin et al., 2019; Allan, 2020; Vermeulen & Scheepers, 2020). The experience of meaningful work is considered to be a key driver of engagement and will ensure that HR practitioners feel connected to a higher purpose in their work role (Tan et al., 2019). The last factor, rewards and recognition has been associated with persistence, satisfaction and engagement, but needs to meet individual preference and must be linked to performance and therefore have an element of authenticity (Mehta et al., 2017).

The results from the study showed that the HR practitioners surveyed self-reported high levels of engagement, with the descriptive results revealing an aggregate mean score of 3.78 and an aggregate standard deviation of 0.88. Considering that the study was conducted in 2021, during the disruptive Covid-19 period, and HR having had to take a lead in managing the resulting employee-related issues in organisations, the results can be considered as satisfactory and reflect resilience. HR practitioners reported purpose and meaning, being absorbed (time flies), feeling proud of the work that they were doing, with higher levels of perseverance, among others.

The factor structure for the study was confirmed by the CFA, giving validity to the results (Wegner, 2012). Correlation analyses revealed that all of the factors correlated positively, with the strongest relationship between Meaningful Work and Work Engagement, and Rewards and Recognition and Work Engagement. The mean scores for the factors ranged between 3.70 and 4.19, sketching a positive picture of the environment in which the HR practitioners operated. It is therefore not surprising that the respondents reported relatively high levels of work engagement, with the aggregate mean score of 3.85 for the factor of Employee Engagement reflecting agreement. The results from the regression analysis showed that, of the factors measured, Meaningful Work and Rewards and Recognition were significant predictors of the engagement levels of HR practitioners. These are therefore factors that should get attention within organisations to maintain higher engagement levels of HR practitioners and to gain performance, constructive relationship while building, innovation, loyalty and involvement.

Communication and Leadership Support, however, did not materialise as predictors of Work Engagement. Since the correlation analyses revealed positive relationships among all of the factors, it can be considered a reasonable observation that Leadership Support and Communication are also important in establishing Meaningful Work and providing Rewards and Recognition. Leaders and managers are able, by virtue of their position, to clarify vision, explain the rationale for decisions and empower employees to provide meaning, and then reward and recognise employees for their performance. This power to share knowledge and information and reward HR practitioners, should not be limited to direct supervisors, but should be a collective management strategy in the organisation. The reason for this remark is that HR practitioners deliver services across all functions within the organisation and if there is a culture of recognition, HR service delivery will continuously improve. The influence of leaders on the work engagement of HR practitioners, through communication, creating meaning, and rewarding and recognising achievement, therefore cannot be minimised.

8. Managerial Implications

The study has implications for management, not only for the direct managers of HR practitioners but also for line managers and senior managers across the organisations. Firstly, organisational leaders need to reflect on the strategic role HR practitioners fulfil in the organisation and understand why the engagement of this cohort of employees is essential. In this respect, the SABPP 2022 presents both the South African HRM systems standards and HR competency model to demonstrate the strategic role of HR across the HR value chain in organisations and the expectations that are placed on HR practitioners to fulfil strategic, change agent, administrative and employee champion roles (Ulrich, 1996).

In this study, two factors were extracted that specifically predicted the work engagement of HR practitioners. The first factor was Meaningful Work. To provide meaning, HR practitioners need to understand that they fulfil a crucial role within the organisation and that their influence also stretches outside of the organisation in terms of supporting transformation in South Africa. As such, senior management should expose all HR practitioners, irrespective of their rank in the organisation, to discourse on the organisational vision, mission, values and strategy. The conversations should be continued within their respective HR teams, and then be drilled down to an individual level, for each HR practitioner to understand how his/her role, knowledge and behaviour affect overall organisational success and contribute to creating a humane organisation that promotes justice and fairness for all employees, thus contributing to a greater good. In addition, HR practitioners should be enabled and

challenged to craft their own roles within the organisation, as this may lead to creating meaning in-line with their personal values and strengthen extra-role performance. HR departments should digitalise HR tasks that have become repetitive to prevent the under-stimulation and underutilisation of HR practitioners. They should enable HR practitioners to fulfil their change agent and strategist roles by structuring formal and informal engagement with line managers and as such activate a true business partner relationship.

The study revealed that the HR practitioners surveyed experienced high levels of work engagement. Since this study was conducted during an especially tiring Covid-19 lockdown period, it provided evidence of the work engagement and commitment of HR practitioners to goals that transcend self-interest. This observation is especially important in terms of the second main factor that emerged in this study as a predictor of the engagement of HR practitioners, namely Rewards and Recognition. HR managers, senior managers and line managers, across all functions within the organisation, play an important role in the continuous engagement of HR practitioners. HR practitioners should be recognised and praised for their contributions to the organisation. Praise is a value in African culture, and this custom should be established within organisations. This can be done in gratitude rounds during or at the conclusion of meetings. As such, a positive lens on problems and challenges should be adopted, to reinforce high levels of positive energy and positive experiences. There is also place for tangible rewards, in the form of tokens of appreciation that are intermittently given for exceptional and consistent good service delivery.

While leadership support and communication did not emerge as main drivers of work engagement, the correlation analysis in this study clearly showed that these two factors cannot be discounted, and managers should ponder how their support and communication relate to perceptions that HR practitioners have of the meaning of their work and whether their work and contributions are appreciated. Senior leaders, HR practitioners and line managers should communicate purposefully, considering what the most pivotal messages are and how these messages should be delivered. Leaders, through positive communication, providing feedback and building constructive relations, contribute to meaning experienced by employees, and in the context of this study, the meaning experienced by HR practitioners. For effective communication, multiple media, ranging from face-to-face meetings, electronic chat platforms, email and personal contact can be used. On a more personal level, inclusivity and mindfulness should be practiced, breaking down personal barriers which could be caused by authority and status differences, and diverse backgrounds. Opportunities for bottom up rather than top-down feedback should be created. When this is done within a group or team context, everyone is made aware of the broader context, and collaborate problem-solving and mutual learning are likely to occur more naturally.

9. Conclusion

HR practices are considered important in enhancing the work engagement of all employees and HR practitioners are seen as custodians of employee work engagement in organisations. However, it has become evident that in terms of research, very little attention had been focused on the work engagement of HR professionals themselves. This study therefore only represents a beginning in the exploration of the engagement of HR practitioners. The results of the study are encouraging, indicating that the HR practitioners surveyed do perceive their roles as meaningful and that they are engaged. As such, these HR practitioners serve as exemplary role models to leaders and employees within their organisations in terms of work engagement. Recognising the strategic role that HR practitioners play in their organisations and rewarding them for their contributions to goal achievement are vital for their continuous work engagement, especially during turbulent times.

Ethical organisational talent culture, Organisational commitment, Positive work outcomes, Productive energy, Talent management, Talent retention

Abstract

Talented employees are essential for delivering valuable services to the public. Botswana local government institutions should invest in a workplace culture that embraces talent management practices to achieve its Vision 2030 goals. The primary purpose of this research was to determine the antecedents and outcomes of talent management in a Botswana local government institution. A quantitative approach was followed, collecting data from a stratified random sample of employees at a Botswana local government institution (N=405). Various measurements were used to assess ethical organisational talent culture, talent management, job satisfaction, adult state hope, meaning in life, voluntary turnover, productive energy and organisational commitment. The results showed a poor ethical organisational talent culture and inadequate talent management practices. Ethical organisational culture predicted talent management. Talent management was related to positive individual outcomes (i.e. job satisfaction, adult state hope, meaning in life), productive energy and organisational commitment. Talent management mediated the relationship between organisational talent culture and voluntary turnover intentions and partially mediated the relationship between ethical organisational talent culture and productive energy. The results of the research highlight the importance of ethical organisational talent management cultures to promote positive individual and organisational outcomes. Recommendations for practice are made.

1. Introduction

The value of local government institutions to public welfare cannot be overstated (Masuku & Jili, 2019; Musekiwa & Mandiyanike, 2017). Worku (2020) refers to an extensive list of responsibilities that public sector officials must fulfil to meet the service demands of a diverse society, such as the “city, public and private companies, diplomatic missions, visitors, and entrepreneurs conducting day-to-day business activities”. Local government institutions require skilled and competent employees to meet the service needs (Mabope, 2018). A human capital shortage hampers the Botswana public sector from achieving its performance goals, resulting in public dissatisfaction (Tshukudu, 2020). Talent management can be used as a strategic tool by emerging markets, such as Botswana, to achieve service performance goals and competitive sustainability (Ambrosius, 2016; Ahammad et al., 2017).

This study focuses on applying talent management in a Botswana local government institution. More specifically, this paper explores the antecedents and outcomes of talent management practices for the selected Botswana local government institution. Botswana celebrated its 50th anniversary as an independent country in 2016 (Mogalakwe & Nyamnjoh, 2017). Despite being dubbed Africa's "new democratic hope," Botswana society is still plagued by high unemployment, poverty, anti-apartheid

spillovers from South Africa, revenue leakages, and poverty (see Mogalakwe & Nyamnjoh, 2017). According to the Global Competitiveness Report, Botswana is still ranked low in human capital development, despite some signs of economic growth (Scwab, 2019). In addition, Barkhuizen et al. (2014) found that Botswana local government institutions reported significantly poorer talent management applications than their South African counterparts.

According to Rudhumbu and Maphosa (2015), Botswana's poor talent management practice results from inadequate management knowledge and incompetence. Botswana's local government institutions will rely on talent to achieve the country's Vision 2030 sustainable development goals (Musekiwa & Mandiyanike, 2019). Vision 2030 requires implementing local economic strategies to empower communities, expand financial income-generating avenues, eradicate poverty, and reduce income inequalities. Talent is the most sustainable source of competitive advantage to achieve Vision 2030 goals (see Elegebe, 2019; Musekiwa & Mandiyanike, 2019).

As a result, research on the antecedents and outcomes of talent management for a Botswana local government institution is required. We hope that by providing a more holistic perspective on talent management within an emerging market context, we will fill a gap in talent management research (Gallardo-Gallardo et al., 2020; Theys & Schultz, 2020). Next, we unpack the variables considered for this study.

First, we will look at the antecedents of talent management in local government institutions. Much has been written about creating work environments that allow talent to flourish and grow (Redelinghuys et al., 2019). Organisations, it is argued, must foster a talent culture that promotes formal career development opportunities and career-oriented strategic plans (Mohan et al., 2015). From this viewpoint, we investigate how an ethical talent culture can improve talent management practices in local government institutions. Ethical talent cultures are critical to research as local government institutions in Sub-Saharan Africa continue to be scrutinised and criticised for mismanagement and corruption (Mudeme & Holtzhausen, 2018; Pillay, 2014). Moreover, poor ethical behaviour prevents local government institutions from reaching their performance objectives (Motshwane, 2018). Järvi and Khoreva (2020) encourage research into how cultural contexts can facilitate talent implementation processes, influencing the behaviours and attitudes of talent required for achievement and organisational performance.

Second, we concentrate on negative and positive individual talent management outcomes in the Botswana local government context. We investigate the possibility of voluntary turnover among local government employees as a negative outcome of talent management. According to Son et al. (2020, p. 2191), increased voluntary turnover rates result from inadequate talent management practices. Recent statistics show that voluntary turnover intentions among local government employees in Southern Africa are escalating (Mzezewa, 2019). Retaining a talent pool is a significant concern, as losing skilled employees is costly and undermines institutional performance (León & Garca-Saavedra, 2020). As a result, we concentrate on how talent management can contribute to positive work (i.e. job satisfaction) and personal outcomes (i.e. adult state hope and meaning in life). Job satisfaction is an essential attitudinal variable to investigate because it is directly related to the service performance of local government employees (Park, 2020). Local government institutions require competent and satisfied employees to provide skilled and effective services to the broader society (Worku, 2020). Unfortunately, local government employees are also subjected to physically, psychologically, and emotionally demanding work environments (Dubale et al., 2019; Bester & Hofisi, 2020). We investigate adult state hope as a resilience trait that individuals can use to overcome workplace adversity (Snyder, 2000). Adult state hope is also a valuable concept to investigate in talent management as an individual strength that fosters goal-directed behaviour in the workplace (see Bolander et al., 2017; Snyder et al., 1996). Meaningful work experiences are required for goal-directed behaviour (Van Wingerden & Van der Stoep, 2018). Prospective employers who provide meaningful work experiences can attract and retain talent (Claus, 2019). We investigate how a meaningful talent environment can influence the meaning in the life of employees in a local government institution, given the significant amount of time employees spend on their daily tasks.

Third, we consider how talent management can help to improve collective employee outcomes such as productive energy. Productive energy is concerned with how employees can achieve group and organisational objectives through collective behaviours and actions (Cole et al., 2012). The talent management field has been criticised for focusing on individual characteristics while ignoring the collective talent potential of groups and teams (Thunissen et al., 2013). Teamwork is vital for government institutions because it improves individual, group, and organisational performance (Mafini & Poee, 2013).

Finally, we look at organisational commitment as an organisational level outcome of talent management. Commitment is central to Ulrich and Smallwood's (2012) definition of talent. According to these authors, talent is the “competence [knowledge, skills, and values required for today's and tomorrow's jobs; right skills, right place, right job, right time] commitment [willingness to do the job] contribution [finding meaning and purpose in their job]” (see Ulrich & Smallwood, 2012). In public organisations, organisational commitment is essential for service efficiency and effectiveness to society (Lizote et al., 2017). Organisational commitment thus reflects the employee attitudes that translate into public sector performance (Berberoglu, 2018).

The following is the structure of this research article. We begin by defining the terms talent and talent management in the study context. Following that, we present the theoretical foundations and hypotheses for the variables identified for the study. Following that, we present the study's research design and findings. Finally, we conclude this study by discussing the findings and recommendations for practice and future research.

2. Theory and hypotheses development

2.1 Ethical organisational talent culture and talent management

Organisational culture is a concept derived from human resource management theory that describes how things are done in a company (Lundy & Cowling, 1996). Organisational culture reflects employees' underlying values, norms, principles, rules, and philosophy as demonstrated by what is considered acceptable workplace behaviour (Martins & Terblanche, 2003; Schein, 1990). Swailes (2020) recently elevated talent management practice by emphasising talent practices' ethical and socially responsible implementation. According to Swailes (2020), ethical talent management practices should include, among other things, fair talent identification practices, visible talent management programs, and processes for monitoring the progress and well-being of employees.

Local government institutions must foster a workplace culture that promotes ethical human capital practices while allowing public sector reform to improve services even further (Matsiliza, 2013; Yahiaoui et al., 2015). The type of organisational culture (e.g., bureaucratic, innovative, or supportive) influences workplace talent development initiatives (Musriha, 2013; Rasool et al., 2012). The more supportive the organisational culture, the more likely it is to advance development in the local government (Cloete, 2016). Talent review processes can help identify talent and guide them for advancement to higher management levels (Campbell & Hirsh, 2013). As a result, an organisational talent culture facilitates staffing levels (Shabankareh et al., 2015). Staffing levels remain a significant issue in government-owned and controlled departments (Salajagheh et al., 2014). To move forward with workforce planning initiatives, Goodman et al. (2013) recommend that local government institutions recognise the importance of training and development, information management, diversity management, and unions. A planning and development culture improves organisational competitiveness (Burma, 2014).

As a result, local government institutions must develop a high-performance culture that hires, rewards, and retains talent (Swinford, 2017). According to Zhou (2017), competitive rewards serve as key incentives for high-quality talent. Performance management systems should serve as the foundation of a talent management culture in which talent is recognised for adding value to the organisation (Kotbra et al., 2011). Nonetheless, performance evaluation processes appear not transparent and are not communicated to all stakeholders (Ndevu & Muller, 2018). Failure to train employees on performance

management and insufficient performance management knowledge and experience results in a misalignment of strategic and operational plans for local governments (Khalid et al., 2015).

Kaptein's (2008) Corporate Ethical Virtues Model is used in part in this study. The model consists of eight dimensions (i.e. clarity, congruency of supervisors, congruency of management, feasibility, transparency, discussability and sanctionability) representing the business ethics necessary to promote ethical behaviour while preventing unethical behaviour. Based on the context of this research, we were interested in leadership behaviour (i.e. ethical role modelling by leaders), feasibility (i.e. ethical behaviour based on available resources), supportability, share commitment to ethical behaviours through fairness) and discussability (i.e. opportunity to raise and discuss issues' (Cabana & Kaptein, 2019, p.3).

Ethical leadership and moral values are critical to Botswana's local government institutions (Cheteni & Shindika, 2017). According to Mbandlwa et al. (2020), ethical governance begins with leadership modelling ethical workplace behaviours. Leadership is also responsible for laying the groundwork for organisational resourceful and ethical performance (Grigoropoulos, 2019). Leadership commitment toward talent is essential in facilitating talent management in local government institutions, as documented (Magolego, 2013; Mpofu, 2013). According to Xuanhui and Wouter (2014), leadership is transmitted across the organisation through performance measurement, administrative ethics, and organisational learning, which significantly impacts organisational performance over time. Leadership can improve institutional performance by developing local government talent to help them keep up with changing conditions (Qhibi, 2017). Employee performance is enhanced by a culture that values human capital development (Mohamed & Abukar, 2013). Leaders who invest in employee training are 75% more likely to retain their talent through succession planning (Damer, 2020). According to Kontoghiorghes (2016), high-performance organisational cultures predict talent attraction and retention. In the latter study, high-performance cultures were defined by quality, technology-driven support for creativity, open communication, effective knowledge management, respect, and integrity. However, dominant government policies and structural arrangements stymie HR retention efforts (Kakumba & Fennell, 2014). Local government leaders must implement practical business strategies relating to employee development, engagement and empowerment, and a positive work experience to improve retention (Izard-Carroll, 2016).

According to Nzewi et al. (2016), operational dynamics are required in South African local municipalities to drive strategic intent and organisational learning. Operational dynamics is frequently a reflection of the administrative culture of local government, which is underpinned by the values that shape individuals' behaviour, motivation, and performance (Dwivedi, 2005; Kandula, 2006). Wan (2017) discovered that the Competing Values Framework's collaborative and competing values could be used to promote work community and customer-centricity. According to Andersson (2019), local government employees' ethics and integrity are the pinnacles of instilling public trust in service delivery. Organisational dynamics should foster a high-involvement work culture in which employees can participate in decision-making that affects government institutions' performance and productivity (Irawanto, 2015; Qi & Wang, 2016). As a result, organisations with established values and norms outperform those without established cultures (Chepngeno et al., 2012).

H 1: Organisational talent culture will be positively related to talent management

2.2 Talent management and positive individual outcomes

Talent management and job satisfaction: Job satisfaction is defined as an individual's pleasurable emotional experience resulting from a positive evaluation of one's job performance or values (Spector, 1998). Employee satisfaction with management support for talent management and talent compensation is a consistent predictor of public sector employees' job and institutional satisfaction (Lesenyeho et al., 2018a; Theron et al., 2014). Paadi et al. (2019) found that talent attraction, development, and retention predicted public sector interns' life, work, and organisational satisfaction. On the other hand, Maleka et al. (2016) discovered that poor supervisory support and a lack of employee involvement contributed to municipal employee dissatisfaction. According to Khoza (2019),

the leading dissatisfaction factors for local government employees were poor working conditions, a lack of promotion opportunities, and insufficient job security. Worku (2020) emphasises the importance of clear job descriptions and opportunities for training and development for local government employees to improve job satisfaction and service performance. According to Barkhuizen and Gumede (2021), job satisfaction mediated the relationship between talent mindset, talent deployment, talent engagement, and voluntary turnover intentions in a public sector institution.

Talent management and adult state hope: Hope is recognised as an essential psychological resource for various reasons, including career development and job performance (Yotsidi et al., 2018). According to Ashkar (2019), psychological hope can reshape organisational structures and foster vibrant organisational cultures. Clearly, hope is essential for both the individual and the organisation. We use the adult state hope theory (see Snyder et al., 1996) for this study, which defines hope in two central tenets: success agency and pathways to meet goals. As a motivational component of hope, agency refers to individuals' perceived ability to initiate and pursue essential goals. Pathways include individuals' perceived ability to generate plans and strategies to achieve these goals. Hopeful thinking requires agency and pathways (Martin-Krumm et al., 2014). According to the adult state hope theory, individuals with high hope have the perceived capacity, confidence, and motivation to use multiple pathways to achieve their goals, regardless of impediments (Nel & Boshoff, 2014).

Adult state hope is helpful for studying talent management because both constructs advocate goal achievement and performance (Youssef & Luthans, 2007). Dries (2013, p. 280) refers to theoretical perspectives that regard "talent as motivation" and a combination of "input" and "output" factors. From an input standpoint, talent emphasises aspects such as "effort, motivation, ambition, and career orientation," whereas talent as an output includes "performance, achievements, and results" (see Dries, 2013). According to the Resource-Based Theory, talented employees, as a unique resource, contribute to an organisation's competitive advantage through their competencies (Orlando et al., 2021). As a result, talent management is the strategic pillar that drives talent goals to pursue organisational performance and competitiveness (Kontoghiorghes, 2016). From a motivational perspective on talent, we argue that talent management can significantly contribute to government employees' adult state hope. There is some evidence of a link between talent management indicators (i.e. ethical leadership, organisational climate, organisational justice, skill variety, task significance, job feedback, job identity, and job autonomy) and psychological hope (Grobler & Joubert, 2020; Kong et al., 2018). Brouze (2013) found evidence that psychological hope moderated the relationships between job demands (i.e., work overload) and adverse individual outcomes like burnout. Psychological hope also mediated the relationships between job resources (for example, career advancement opportunities and supervisory support) and positive states like work engagement.

Talent management and meaning in life: Meaning is a concept that can be applied to both an individual's personal and professional life (Geldenhuys et al., 2014). Meaningfulness can be both dispositional and psychological, with employees taking responsibility for the psychological stability they experience in their personal and professional lives (Nierenberg et al., 2017). Steger's (2012) meaning in life theory is used in this study. According to Martela and Steger (2016), the meaning in life theory encompasses three key areas: coherence (i.e., "a sense of comprehensibility and one's life making sense"), purpose (i.e., "a sense of core goals, aims, and direction in life"), and significance (i.e., "a sense of life's inherent value and having a life worth living"). Meaning in life entails a sense of self-transcendence in which individuals feel the need to grow by transforming themselves and their surroundings while progressing towards a goal (Fairlie, 2011). Talented employees are perceived to be purposeful, goal-directed, and value-adding individuals attracted and developed through various talent management initiatives to realise organisations' strategic ambitions (Thunissen, 2015; Wiblen & McDonnell, 2020). According to Thompson (2013), meaningful work can entice talented employees to join organisations. Similarly, talent will remain in organisations offering personal and professional development opportunities and meaningful work (Al Rina & Atan, 2020). According to Claus (2019, p. 207), progressive organisations should focus on creating a meaningful employee experience to "attract and nurture the talent they require." As a result, local government institutions are tasked with creating meaningful work environments through talent management practices that will contribute to

the meaning in life that employees derive from their workplace. Meaning in life can then be achieved, according to HRD theory, by establishing meaningful workplace cultures that embrace “a sense of purpose, community, belonging, and inclusivity” (Bailey et al., 2019, p. 84). This idea supports the global push to create more talent-inclusive workplaces (see Meyer, 2020), in which all employees can add value to the organisation.

H 2: Talent management is significantly positively related to positive work-related outcomes (i.e. job satisfaction, adult state hope, meaning in life)

H 2.1 Talent management is significantly positively related to job satisfaction

H 2.2 Talent management is significantly positively related to adult state hope

H 2.3 Talent management is significantly positively related to meaning in life

2.3 Talent management and negative individual outcomes: Voluntary turnover intentions

The term "voluntary turnover intentions" refers to an employee's decision to leave an organisation of their own (Theron et al., 2014). Carmeli and Weisberg (2006) define turnover as three cognitive withdrawal processes: thoughts of leaving the job, intentions to look for another job, and finally, the intention to quit. The lack of talent management practices that promote career advancement will likely result in voluntary talent turnover (Schaap & Olckers, 2020). Local government institutions require talent to meet society's service expectations and contribute significantly to public welfare (Masuku & Jili, 2019; Tshukudu, 2020). A lack of talent management infrastructure, i.e. job resources, poor administrative and technological infrastructure, insufficient training, and poor performance management practices, all contribute to public sector employees' intentions to leave (Austen & Zachy, 2015; Fahim, 2018). Employee social relationships and coordination are critical to the performance of service-based economies in which local government institutions operate (Rosales, 2015). The nature of local government service delivery is people-centred, requiring continuous interactions with service recipients (Lues, 2016). Because of citizens' diverse and rapidly changing needs, providing service is not always an easy task (Nxumalo, 2017). Management and colleague social support can play an important moderating role between talent management and voluntary turnover intentions (Du Plessis et al., 2015).

H 3: Talent management is negatively related to voluntary turnover intentions of Botswana local government employees

2.4 Talent management and group-level outcomes: Productive energy

Much has been written about the value of a motivated workforce in job and organisational performance (Owens et al., 2016; Yongxing et al., 2017). Energetic people appear to achieve their goals in less time and derive more joy from the paths to their goals (Schippers & Hogenes, 2011). According to Järvi and Khoreva (2020), talented employees are the behavioural role models and strategic catalysts who energise and inspire their colleagues to exceed performance expectations. Productive energy, also known as collective energy, is essential in talent management because it considers employees' cognitive processes and affective and behavioural resources to pursue organisational goals (Cole et al., 2008). Talent management unleashes the passion, commitment and performance required from individuals to support the business vision, mission and goals (McArdle & Rademan, 2008). Talent management will necessitate the development of dynamic organisational capabilities in which employees will feel a sense of vitality and learning to sustain team innovation (Schiuma et al., 2007; Vivaz-López, 2014). Barkhuizen and Stanz (2010) discovered a significant positive relationship between organisational energy and talent management practices such as management talent mindset, talent review processes, talent deployment, workforce planning, career development, and performance management in a study. Mpofu (2013) discovered that talent management practices in local government institutions are significant predictors of productive energy. In the study, talent management and productive energy were related to employees' voluntary turnover intentions.

H 4: Talent management is significantly positively related to productive energy

2.5 Talent Management and Organisational Commitment

Gallardo-Gallardo et al. (2013) define the commitment perspective on talent as a dedication to the individual's work and the organisation. Organisational commitment is critical in facilitating the link between talent management and organisational performance (Almaaitah et al., 2020; Sarangal et al., 2020). According to Pa'wan and Said (2020), improving talent management can boost organisational commitment in developing countries. The relationship between talent management practices and organisational commitment is well established (Abazeed, 2018). According to Malkawi (2017), talent acquisition, development, and retention positively affect organisational commitment, with talent retention ranking highest among the other variables. Nobaricidishe et al. (2014) discovered a significant relationship between talent management and its sub-variables, such as talent attraction, retention, development, and organisational commitment.

H 5: Talent management is significantly positively related to organisational commitment

2.6 Talent management as a moderator-mediator between organisational talent culture and individual, group and organisational outcomes

In what follows, we discuss the variables' possible mediating, and moderating roles. In the absence of ethical organisational culture research in the talent management context, we will interchangeably focus on the outcomes of ethical culture and organisational culture.

2.6.1 Organisational talent culture, talent management and voluntary turnover intentions

The organisational culture can cause employees to consider staying or moving elsewhere (Hejase et al., 2016). According to Mzezewa (2019), organisational culture, among other things, determines whether local government institutions are appealing places to work and can retain staff. According to Kontoghiorghes (2016), high-performance organisational cultures predict talent attraction and retention. Dominant government policies and structural arrangements hamper HR retention efforts (Kakumba & Fennell, 2014). Local government leaders must implement practical business strategies for employee development, engagement and empowerment, and a positive work experience (Izard-Carroll, 2016). According to Biswas (2009), human resource practices mediate the relationship between organisational culture, leadership, and organisational performance and moderate the relationship between human resource practices and employee voluntary turnover intentions. Based on the above viewpoints, talent management can mediate or moderate the relationship between ethical organisational talent culture and voluntary turnover intentions.

H 6: Talent management mediates the relationship between ethical organisational talent culture and voluntary turnover intentions

H6a: Talent management moderates the relationship between ethical organisational talent culture and voluntary turnover intentions

2.6.2 Ethical organisational talent culture, talent management, positive individual outcomes and voluntary turnover intentions

There is currently a scarcity of empirical research to explain an ethical organisational talent culture's contribution to the positive individual work-related outcomes identified in the presented study. Cabana and Kaptein (2019) argue that ethical cultures are essential for achieving positive individual, team, and organisational outcomes. Ruiz-Palomino et al. (2013) discovered a link between ethical culture and employee satisfaction. Unfortunately, the bureaucratic work cultures of local government institutions impacted employee job satisfaction (Langer et al., 2019). Employee turnover in local government has been linked to dissatisfaction with working conditions (Mnukwa, 2008). According to Mzezewa (2019), municipalities can retain employees by improving their satisfaction with a pleasant work environment, opportunities for advancement and promotion, and effective rewards (i.e. market-related salaries and financial benefits). From this vantage point, we believe that talent management can bridge organisational talent culture and job satisfaction. Similarly, we believe that job satisfaction can moderate the relationship between talent management and voluntary turnover intentions as part of positive individual outcomes proposed by Barkhuizen and Gumede (2021).

A study on organisational talent culture and adult state hope are still in progress. Luo et al. (2017) discovered evidence for a link between corporate culture and psychological hope. Manchata and Sudhakar (2017) discovered, in particular, that organisational culture dimensions such as autonomy, interdepartmental relationships, and knowledge sharing are related to hope as a component of psychological capital. Valero et al. (2015) discovered that dispositional hope was negatively related to voluntary turnover intentions in the presence of motivational states, supervisor involvement in job performance, and autonomous goals. Gupta (2014, p. 656) proposes that psychological hope will mediate the relationships between high-performance work practices (i.e. coaching and mentoring, empowerment, selective staffing, induction, competency development, sound promotion practices, and flexible job designs) and positive individual outcomes such as employee creativity. Gupta and Shaheen (2017) discovered support for the role of hope as a personal resource in moderating the relationship between work engagement and turnover intentions. Employee-supervisor and employee-coworker relationships influenced engagement in this study. From this vantage point, we propose that talent management can bridge organisational talent culture and adult state hope (as a component of positive individual outcomes).

Another significant gap in the literature is the role of organisational culture in workplace meaningfulness and meaning in life. The Multiple needs mode of Cropezano et al. (2001) proposes that innovative and supportive cultures can foster a meaningful work environment for employees. Earlier in this article, we discussed the potential spillover effect of meaningful work on employees' sense of meaning in their lives (see Hatice & Mine, 2016). Workplace stress has a significant negative impact on life meaning (Allan et al., 2015). In adverse situations, Arnoux-Nicolas et al. (2016, p. 3) see the concept of meaning as a "framework or a protective firewall." According to Fletcher and Schofield (2019), meaning in life mediates the relationship between work meaningfulness and job-work engagement while controlling individual motivation, line management roles, and the socio-political environment. Saurombe (2015) discovered that academic staff's meaning in life was significantly related to talent retention practices in a public South African higher education institution. Their sense of purpose in life also influenced employees' intentions to leave their jobs. Based on the preceding, it is reasonable to believe that talent management can mediate the relationship between organisational talent culture and life meaning.

H 7: Talent management mediates the relationship between ethical talent culture and positive individual outcomes

2.6.3 Ethical organisational talent culture, talent management, productive energy and voluntary turnover intentions

According to Cabana and Kaptein (2019), ethical culture is an important concept to investigate in teamwork because it contributes to team performance. Available research indicates that organisational energy, as defined by an organisational climate (see Derman et al., 2011), predicts team productive energy (see Cuff, 2011). In the latter case, organisational energy was based on Tosey and Lewellyn's (2020) seven energies model (i.e. EnergyScapes Profile). It included inspiration, integration, meaning, community, control, activity, and existence. According to Preskar and Zizek (2020), organisational culture can boost organisational energy by providing work experiences that increase employees' positive emotions such as joy, pride, and enthusiasm. Ghorbanhosseini (2013) discovered that human capital practices mediated the relationship between organisational culture and the impact of organisational commitment on organisational development in a teamwork context.

H 8: Talent management mediates the relationship between ethical organisational talent culture and productive energy.

2.6.4 Ethical organisational talent culture, talent management, organisational commitment and voluntary turnover

It is well known that there is a link between organisational culture and organisational commitment (Said Al-Shurafat & Halim, 2018). Valentine et al. (2002) contend that ethical context positively impacts organisational commitment and person-job fit. Inanlou and Ahn (2017) discovered that

organisational cultures characterised by adequate communication, trust, and high innovation increased employees' organisational commitment. The latter study also supported human resource development's partial mediation effect in the relationship between organisational culture and organisational commitment. According to Hayat et al. (2019), human capital practices mediated the relationship between organisational culture, teamwork, organisational development, and organisational commitment. According to the findings, talent management may mediate the relationship between organisational culture and organisational commitment. In the absence of management commitment to talent, a lack of talent attraction and development practices, and dissatisfaction with institutional practices and structures, organisational commitment has been found to be negatively related to voluntary turnover intentions of public sector employees (see Lesenyeho et al., 2018b).

H 9: Talent management mediates the relationship between organisational culture and organisational commitment.

3. Research design

The researchers applied a quantitative research approach by distributing surveys to collect the data. Cross-sectional research was used to determine the interrelationships between the variables (Field, 2019). This research complies within the positivist research paradigm. The positivism paradigm falls within the objectivism epistemology (Crotty, 1998) and helps understand human behaviour through questionnaires and measurements (Cohen et al., 2011).

3.1 Sampling

A selected Botswana local government institution's employees were considered the target population for this study. A total of 650 questionnaires were distributed, with 405 questionnaires completed and returned. This represented a response rate of 62.30%. The respondents were primarily female (55,30%), married (51,34%) and Setswana speaking (99,80%). Most of the participants were aged between 40 and 49 years (66,40%), had a Certificate and Diploma as their highest level of educational qualification (48,63%) and were employed on an operational level (39,76%). The participants mainly had work experience between 14 and 29 years (39,76%). About 71.60% of the respondents did not have an opportunity to be promoted over the last five years. The vast majority of the respondents 90.6% worked between 31 and 40 hours per week (90.6%). The relevant local government authority granted permission for the study. The questionnaires were distributed in hardcopy to the respondents by the local government institution's supervisors and heads of departments. Before the study began, the researchers obtained ethical approval. Participation in the study was entirely voluntary, and strict confidentiality was upheld at all times.

3.2 Measuring instruments

The section below describes the measuring instruments that were used in the study. All measuring instruments used a response scale ranging from *Strongly Disagree* (1) to *Strongly Agree* (6). The results of the factor analyses, reliabilities and means scores obtained in the present study are reported per measure.

Ethical organisational talent culture: The researchers adapted the “Ethical organisational culture” measure (Kaptein, 2008). The adapted version measures 26 items and four factors: supervisor congruence, feasibility, supportability and discussability. Kaptein (2008) found Cronbach Alphas of above 0,90 for all the measurement factors. We developed and added a “Values” scale to assess the cultural values in the institution. The initial factor analyses resulted in four factors, Feasibility (mean = 2,8446; $\alpha = 0,961$), Institutional values (mean = 2,5935; $\alpha = 0,946$, Leadership (mean = 2,7379; $\alpha = 0,916$) and Discussability (mean = 3,1706; $\alpha 0,789$ ’ ‘ Measure of sample adequacy - MSA = 0,949, Total variance explained = 75,538%). A subsequent second-order factor analysis resulted in one factor labelled Ethical organisational culture (Variance explained = 72.492%; mean = 2,8157; $\alpha = 0,883$). On average, the respondents experience a poor ethical organisational talent culture.

Talent management measure: An adapted talent management measure of Barkhuizen (2018) was used to assess talent management practices in this study. The questionnaire consisted of 27 items and

measured six talent management practices: talent development, compensation and benefits, talent acquisition, talent performance management, talent workforce planning and talent retention strategies. Barkhuizen and Gumede (2021) obtained acceptable internal consistencies for the measure ranging from $\alpha = 0,732$ to $0,939$. The initial factor analyses resulted in five underlying factors, i.e. Compensation (mean = 2,1364; $\alpha = 0,916$), Development (mean = 2,6247; $\alpha = 0,896$), Performance (mean = 2,7320; $\alpha = 0,921$), Retention (mean = 2,1053; $\alpha = 0,922$) and Workforce Planning (mean = 2,5154; $\alpha = 0,860$) 'MSA = 0,939, Total variance explained = 80,775%). A second-order factor analysis was done to create the variable Talent management (Variance explained = 72.492%; mean = 2,4086; $\alpha = 0,904$) for moderating-mediating analyses. The results showed that, on average, the respondents experience a poor application of talent management practices in the government institution.

Positive individual outcomes

The Minnesota job satisfaction questionnaire – shortened, Adult state hope scale and Meaning in life questionnaire- were used to measure the study's positive work-related outcomes.

Job satisfaction: An adapted and shortened version of the Minnesota Job Satisfaction Questionnaire (Buitendach & Rothmann, 2009) measured the respondents' job satisfaction. The MSQ covers 13 aspects relating to the respondents' work. Buitendach and Rothmann (2009) obtained an internal consistency of $\alpha = 0,86$. In the present study, factor analyses revealed one underlying factor for job satisfaction (Measure of sample adequacy - MSA = 0,946, Total variance explained = 75,050%, Mean = 2,774) with a reliability of $\alpha = 0,964$. The respondents displayed average levels of job satisfaction.

Adult State Hope: An adapted version of the Adult state hope scale of Snyder et al. (1996) was used to assess the respondents' level of hope in the work context. The scale consists of six items and measures two dimensions: Agency and Pathways. Snyder et al. (1991) found acceptable internal consistencies ranging from $\alpha = 0,79$ to $0,95$. The factor analyses resulted in one factor for the Adult hope scale (MSA = 0,916, Total variance explained = 91,920%; Mean = 3,405) with a reliability of $\alpha = 0,982$. The results show a slightly above-average level of adult state hope.

Meaning in life: The ten-item Meaning in life questionnaire (MLQ) of Steger et al. (2006) assessed the presence of meaning in the respondents' life and the search for meaning among respondents. Steger et al. (2006) found acceptable consistencies for this questionnaire ranging from $\alpha = 0,82$ to $0,87$. The factor analyses in the present study resulted in one factor for the Meaning in life questionnaire (MSA = 0,917, Total variance explained = 80,517%, Mean = 3,530) with a reliability of $\alpha = 0,965$. The respondents displayed average levels of meaning in life. A second order factor analysis were done on the three measures above to developed the Positive individual work outcomes variable (Variance explained = 79,007%; mean = 3,1599; $\alpha = 0,863$).

Negative individual outcomes

Voluntary turnover: The employee retention scale of Cohen (1993) was used to assess the voluntary turnover intentions of employees. The questionnaire consisted of three items. Theron et al. (2014) obtained an acceptable $\alpha = 0,914$. In the present study, factor analyses revealed one underlying factor for job satisfaction (MSA = 0,761, Total variance explained = 85,944%, Mean = 4,4331) with a reliability of $\alpha = 0,918$. The results showed that about 60% of the respondents considered quitting their jobs.

Productive organisational energy: The productive energy measure of Cole et al. (2008) was used to measure the productive organisational energy of employees. The 14-item questionnaire measures three constructs: Affective, Cognitive and Behavioural energy. Responses are measured on a six-point Likert scale ranging from *Strongly disagree (1)* to *Strongly agree (6)*. Acceptable internal consistencies were obtained for the measure (Cuff, 2011). In the present study, factor analyses revealed two underlying factors for Productive Energy (MSA = 0,949, Total variance explained = 75,884%) labelled Affective energy and Behavioural energy. A second-order factor analysis was done to create the variable Productive Energy (Variance explained = 88,028%; mean = 3,1535; $\alpha = 0,863$)

for moderating analyses. The respondents demonstrated slightly above average levels of productive energy.

Organisational commitment: Meyer and Allen's (1991) organisational commitment questionnaire is used to measure organisational commitment. The questionnaire consists of 15 items and measures three factors: affective, normative and continuous commitment. Lesenyeho (2017) obtained an internal consistency of $\alpha = 0,857$. In the present study, factor analyses revealed two underlying factors for organisational commitment (MSA = 0,943, Total variance explained = 75,050%) labelled Affective commitment and Normative commitment. A second-order factor analysis was done to create the variable Organisational commitment (Variance explained = 74.020%; mean = 2,9728; $\alpha = 0,926$) for moderating-mediating analyses. The respondents demonstrated slightly below-average levels of commitment to the institution.

3.3 Statistical analyses

We used SPSS (SPSS In., 2021) to perform the statistical analyses for this research. The data analyses techniques included descriptive statistics (i.e. means, frequencies), exploratory factor analyses, reliability analyses and multiple regression analyses. The reliabilities of the measures were established using the guidelines of Cohen (1988), namely $\alpha \geq 0,70$. The guidelines of Cohen (2008) were used to determine the magnitude of the relationships between the variables identified for this study: $r \leq 0,29$, $p \leq 0,05$ (statistically significant relationship), $0,30 \leq r \leq 0,49$, $p \leq 0,05$ (practically significant, medium effect) and $r \geq 0,50$, $p \leq 0,05$ (practically significant, large effect). A series of multiple regression analyses were done to determine the mediation and moderating effects of variables in this study. Mediation analyses involve the first three steps of the moderation analyses (without centring the predictor and moderator variables). Complete mediation occurs when the independent variable no longer affects the dependent variable. Partial mediation occurs when the independent variable's influence on the dependent variable is reduced when controlling for the mediator (Baron and Kenny, 1986).

4. Results

4.1 Testing of Hypotheses

The research hypotheses for this study were tested by applying Pearson correlation analyses and multiple regression analyses. The results of the Pearson correlation analyses are reported in Table 1 below.

4.1.1 Results of the Pearson correlation analyses

The results showed that Ethical organisational talent culture and its dimensions (i.e. Feasibility, Values, Leadership, Discussability) are significantly positively related to Talent Management and its dimensions (i.e. Development, Compensation, Workforce planning, Performance management, Retention strategies). All effects were large except for the relationships between Discussability, Compensation, Workforce Planning, and Performance management which were all medium. These results confirm Hypothesis 1 that ethical organisational talent culture is significantly related to talent management. Talent management and its dimensions were significantly positively associated with job satisfaction. All effects were large. The results confirm hypothesis 2.1, that talent management would significantly positively affect job satisfaction. Likewise, talent management and its dimensions were significantly positively related to adult state hope. All effects were large, except for the medium relationship between retention strategies and adult state hope. The results confirm hypothesis 2.2 that a significant positive relationship exists between talent management and adult state hope. Talent management and its dimensions were also significantly positively related to meaning in life. All effects were large except for the relationship between compensation and retention strategies which were medium. These results confirm Hypothesis 2.3, that talent management is significantly related to meaning in life. Combined, we can conclude that talent management and its dimensions are significantly positively related to positive individual outcomes (i.e. job satisfaction, adult state hope and meaning in life), thus confirming hypothesis 2. Talent management and its dimensions were also significantly negatively related to voluntary turnover intentions. All effects were medium, except for the large relationship between talent development and voluntary turnover. These results confirm

hypothesis 3, that talent management is negatively related to voluntary turnover intentions. Talent management and its dimensions were significantly positively associated with Productive energy. All the effects were large, except for talent retention strategies and productive energy. All effects were large except for the relationship between retention strategies and productive energy, which was medium. The results confirm hypothesis 4, that talent management is significantly related to productive energy. Lastly, the results also showed that talent management and its dimensions are significantly positively related to organisational commitment. All effects were large. The results confirm hypothesis 5, that talent management positively relates to organisational commitment.

Table 1: Pearson correlations analyses

	Organisational Talent Culture	Feasibility	Institutional Values	Leadership	Discussability	Talent Management	Development	Compensation	Workforce Planning	Performance Management	Retention Strategies

$r \leq 0.29$, $p \leq 0.05$ (statistically significant relationship), $0.30 \leq r \leq 0.49$, $p \leq 0.05$ (practically significant, medium effect) and $r \geq 0.50$, $p \leq 0.05$ (practically significant, large effect).

Source: Author's own

4.2.1 Results of the mediation analyses

This section reports on the results of the mediation analyses as hypothesised earlier in this article.

Mediation analyses between ethical organisational talent culture, talent management and voluntary turnover

The results of the mediation analyses between organisational talent culture, talent management and voluntary turnover are reported in Table 2 below.

Table 2: Mediation analyses between ethical organisational talent culture, talent management and voluntary turnover

	Unstandardised Coefficients		Standardised Coefficients	t	Sig.	R	R ²	Δ R ²
	B	Std. Error	Beta					
Step 1: Ethical organisational talent culture and voluntary turnover								
(Constant)	6.536	0.248		26.345	0.000	.465 ^a	0.216	0.213
Ethical organisational talent culture	-0.742	0.084	-0.465	-8.815	0.000			
Step 2: Ethical organisational talent culture and talent management								
						.803 ^a	0.646	0.644
(Constant)	0.134	0.107		1.247	0.213			
Ethical organisational talent culture	0.818	0.037	0.803	22.297	0.000			
Step 3: Ethical organisational talent culture, talent management and voluntary turnover								
(Constant)	6.629	0.241		27.506	0.000	.531 ^a	0.281	0.276
Ethical organisational talent culture	-0.170	0.138	-0.107	-1.235	0.218			
Talent Management	-0.694	0.136	-0.441	-5.103	0.000			

Source: Author's own

The final step (3) in the mediation analyses showed that ethical organisational talent culture and talent management together explained 28,1% of the variance in voluntary turnover. The perceived effect on voluntary turnover in Step 3 ($R^2=0.281$; $p=0.00$), was smaller than in Step 2 ($R^2=0.646$; $p=0.00$). The effect showed a non-significant relationship between ethical organisational talent culture (the predictor variable) and voluntary turnover intentions. Talent management, therefore, mediates the relationship between ethical organisational talent culture and voluntary turnover. These results confirm hypothesis 6: talent management mediates the relationship between ethical organisational talent culture and voluntary turnover.

Mediation analyses: Ethical organisational talent culture, talent management practices and positive individual outcomes

The results of the mediation analyses between ethical organisational talent culture, talent management and positive individual outcomes are reported in Table 3 below.

Table 3 Mediation analyses between ethical organisational talent culture, talent management and positive individual outcomes

	Unstandardised Coefficients		Standardised Coefficients	t	Sig.	R	R ²	Δ R ²
	B	Std. Error	Beta					
Step 1: Ethical organisational talent culture and positive individual outcomes								
(Constant)	0.402	0.140		2.876	0.004	.781 ^a	0.611	0.609
Ethical organisational talent culture	0.994	0.047	0.781	20.955	0.000			
Step 2: Ethical organisational talent culture and talent management								
						.803 ^a	0.646	0.644
(Constant)	0.134	0.107		1.247	0.213			
Ethical organisational talent culture	0.818	0.037	0.803	22.297	0.000			
Step 3: Ethical organisational talent culture, talent management and positive individual outcomes								
(Constant)	0.279	0.125		2.228	0.027	.834 ^a	0.696	0.693
Ethical organisational talent culture	0.551	0.071	0.433	7.726	0.000			
Talent Management	0.560	0.070	0.446	7.965	0.000			

Source: Author's own

The final step (3) in the mediation analyses showed that ethical organisational talent culture and talent management together explained 69,6% of the variance in positive individual outcomes. The results showed that adding the mediator variable with the predictor variable showed a significant predictive relationship between the ethical organisational talent culture and positive individual outcomes. The perceived effect on positive individual outcomes in Step 3 ($R^2=0.696$; $p=0.00$), was larger than in Step 2 ($R^2=0.646$; $p=0.00$). Talent management, therefore, does not mediate the relationship between ethical organisational talent culture and positive individual outcomes. These results reject hypothesis 7, that talent management mediates the relationship between ethical organisational talent culture and positive individual outcomes.

Mediation analyses: Ethical organisational talent culture, talent management practices and productive energy

The results of the mediation analyses between ethical organisational talent culture, talent management practices and productive energy are reported in Table 4.

Table 4 Mediation analyses between ethical organisational talent culture, talent management and productive energy

	Unstandardised Coefficients		Standardised Coefficients	t	Sig.	R	R ²	Δ R ²
	B	Std. Error	Beta					
Step 1: Ethical organisational talent culture and productive energy								
(Constant)	0.607	0.152		4.007	0.000	.722 ^a	0.522	0.520
Ethical organisational talent culture	0.906	0.052	0.722	17.453	0.000			
Step 2: Ethical organisational talent culture and talent management								
						.803 ^a	0.646	0.644
(Constant)	0.134	0.107		1.247	0.213			
Ethical organisational talent culture	0.818	0.037	0.803	22.297	0.000			
Step 3: Ethical organisational talent culture, talent management and productive energy								
(Constant)	0.492	0.140		3.521	0.001	.778 ^a	0.606	0.603
Ethical organisational talent culture	0.485	0.079	0.387	6.100	0.000			
Talent Management	0.533	0.078	0.435	6.857	0.000			

Source: Author's own

The final step (3) in the mediation analyses showed that ethical organisational talent culture and talent management together explained 60,6% of the variance in productive energy. The perceived effect on voluntary turnover in Step 3 ($R^2=0.606$; $p=0.00$), was smaller than in Step 2 ($R^2=0.646$; $p=0.00$). The effect, however, remained significant for the predictor variable, indicating that talent management partially mediated the relationship between ethical organisational talent culture and productive energy. These results partially confirm hypothesis 8, that talent management mediates the relationship between ethical organisational talent culture and productive energy.

Mediation analyses: Ethical organisational talent culture, talent management practices and organisational commitment

The results of the mediation analyses between ethical organisational talent culture, talent management and organisational commitment are reported in Table 5 below.

Table 5 Mediation analyses between ethical organisational talent culture, talent management and organisational commitment

	Unstandardised Coefficients		Standardised Coefficients	t	Sig.	R	R ²	Δ R ²
	B	Std. Error	Beta					
Step 1: Ethical organisational talent culture and organisational commitment								
(Constant)	0.520	0.130		3.992	0.000	.760 ^a	0.578	0.577
Ethical organisational talent culture	0.869	0.044	0.760	19.624	0.000			
Step 2: Ethical organisational talent culture and talent management								
						.803 ^a	0.646	0.644
(Constant)	0.134	0.107		1.247	0.213			
Ethical organisational talent culture	0.818	0.037	0.803	22.297	0.000			
Step 3: Ethical organisational talent culture, talent management and organisational commitment								
(Constant)	0.425	0.121		3.514	0.001	.807 ^a	0.651	0.649
Ethical organisational talent culture	0.502	0.069	0.436	7.256	0.000			
Talent Management	0.466	0.068	0.414	6.882	0.000			

Source: Author's own

The final step (3) in the mediation analyses showed that ethical organisational talent culture and talent management explained 65,1% of the variance in organisational commitment. The perceived effect on organisational commitment in Step 3 ($R^2=0.651$; $p=0.00$), was slightly larger than in Step 2 ($R^2=0.646$; $p=0.00$). The effect for the predictor variable remained significant, indicating that talent management does not moderate the relationship between ethical organisational talent culture and organisational commitment. These results reject Hypothesis 9, that talent management mediates the relationship between ethical organisational talent culture and organisational commitment.

5. Discussion

The primary goal of this study was to identify the antecedents and outcomes of talent management in a Botswana local government institution. We investigated ethical organisational culture as a possible antecedent of talent management. Job satisfaction, adult state hope, and life meaning were identified as positive individual outcomes of talent management, whereas voluntary turnover intentions were identified as a negative outcome. Furthermore, as group and organisational level outcomes for talent management, we focused on productive energy and organisational commitment. The study's findings are discussed in the ensuing section.

According to our findings, talent management begins with an ethical organisational culture (see Musriha, 2013; Rasool et al., 2012; Swailes, 2020). The dimensions of talent management were significantly related to ethical organisational culture and its dimensions. As in previous studies (Mbandlwa et al., 2020), ethical leadership was important in determining the perceived level of talent management practice (i.e. Compensation, Development, Performance, Retention and Workforce Planning). In general, institutions were perceived to be using talent management practices ineffectively. Leadership is critical in developing local government talent to ensure long-term viability and performance (Qhibi, 2017). A culture that undermines human capital development is unlikely to meet the broader public's service expectations (Mohamed & Abukar, 2013). Furthermore, leaders who fail to invest in employee development risk jeopardising retention and succession

planning for future management levels (Damer, 2020). Similarly, the absence of high-performance cultures can contribute to the inability of local governments to attract and retain skilled employees (Kontoghiorghes, 2016). Inadequate performance management practice leads to a misalignment of local government's strategic and operational plans (Khalid et al., 2015).

Our findings also highlighted the areas of compensation that are problematic in the Botswana local government context (see Mogalakwe & Nyamnjoh, 2017). Employees perceived their compensation to be inadequate, not market-related, and insufficient to meet their basic living needs. According to Zhou (2017), it is critical to provide competitive rewards to attract and retain talent in local government institutions. Because of the current ethical organisational culture in the local government institution, workforce planning was another neglected area. Staffing is a critical issue in the local government, as many of these institutions face severe talent shortages to meet public service expectations (Salajagheh et al., 2014; Shabankareh et al., 2015). To ensure adequate staffing levels for institutional competitiveness, local government should embrace a planning and development culture (Burma, 2014; Goodman et al., 2013). This study's respondents also perceived a lack of sound cultural values in the institution. Values and norms are the cornerstones of ethical service and instil public trust in promoting customer-centricity (see Andersson, 2019; Dwivedi, 2005; Kandula, 2006). Chepngeno et al. (2012) highlight the importance of established values and norms to ensure sustainable performance.

It is not surprising, then, that talent management mediated the relationship between ethical organisational culture and staff voluntary turnover intentions in this study. According to Hejase et al. (2016), organisational culture can cause employees to consider staying or voluntarily leaving. In the current study, we discovered a direct relationship between a poor organisational ethical culture and talent management and between talent management and voluntary turnover. In the current study, nearly 60% of respondents voluntarily considered quitting their jobs. As a result, it is possible that voluntary turnover intentions occurred due to a poor ethical organisational culture due to talent management. Mzezewa (2019) stated that organisational culture is a significant determinant of whether local government institutions are appealing places to work for and retain employees.

The findings revealed that positive individual outcomes such as job satisfaction, adult state hope, and meaning in life were significantly related to talent management practices. Thus, talent management practices are important for achieving positive individual outcomes in local government institutions. The findings revealed that respondents were slightly dissatisfied with the talent management practices in the local government institution on average. Our findings support the notion that poor talent management practices reduce employee job satisfaction (see Lesenyeho et al., 2018a; Theron et al., 2014). This is an important finding because local government institutions rely on satisfying talent to deliver adequate service (Worku, 2020).

Talent management also emerged as a significant predictor of adult state hope among local government employees. This is a notable finding and fills the gap regarding the interactive relationship between talent management and adult state hope. Talent management can either play a resourceful (Orlando et al., 2019) or motivational role (Dries, 2013) to assist talented employees in navigating their environment towards the achievement of personal and local government goals (Martin-Krumm et al., 2014). Therefore, talent management can promote the individual strengths required for goal-directed behaviour in the local government (Bolander et al., 2017; Snyder et al., 1996). As such, the nature of talent management can have a spillover effect on adult state hope. From the results, it is plausible that insufficient levels of talent management cascaded into average levels of adult state hope.

In this study, we also uncover evidence that talent management contributed to a government employees' sense of purpose in life. This finding emphasises the importance of talent management as a meaningful work facilitator who can also contribute to individuals' personal lives (Al Rina & Atan, 2020; Hatice & Mine, 2016). This is a significant finding because meaningful work can attract and retain the necessary talent to local government institutions, allowing them to overcome a critical skills

shortage (Cropozano et al. 2001; Saurombe, 2015). As a result, our findings encourage local government institutions to be forward-thinking and to implement meaningful work practices that foster workplace talent (see Claus, 2019).

Furthermore, there was no support for talent management's potential mediating role between ethical organisational talent culture and positive work outcomes. Similarly, positive individual outcomes did not moderate the relationship between staff members' talent management and intentions to leave. It is important to note that adult hope and meaning in life are “work in progress” in talent management. More research is needed to investigate the roles of these two concepts in the relationship between talent management and its outcomes in the workplace, particularly in light of the employees' high voluntary turnover intentions in this study.

Talent management was positively related to productive energy, consistent with previous research (Mpofu, 2013). As a result, talent management is an essential catalyst for the team behaviour required to support local government institutions' strategic goals (Järvi & Khoreva, 2020). The findings also emphasise the significance of talent management in promoting social identity in the workplace as a driver of the individual, team, and organisational performance (Berber et al., 2020). To some extent, talent management mediated the relationship between ethical organisational culture and productive energy. Organisational culture can boost workforce energy by providing work experiences that increase positive emotions in employees (Preskar & Zizek, 2020). Our findings support Ghorbanhosseini's (2013) claim that human capital practices can mediate the relationship between organisational culture and positive work outcomes.

This study's findings emphasised the direct relationship between talent management and organisational commitment (see Malkawi, 2017; Nobarieidishé et al., 2014). According to Ulrich and Smallwood (2012), commitment is critical in workplace talent management. Organisational cultures characterised by adequate communication, trust, and high innovation, as mentioned by Inanlou and Ahn (2017), are essential for promoting the organisational commitment of local government employees. We found no support for a mediating or moderating effect for organisational commitment.

6. Management implications

In practice, the research emphasises organisational talent culture and management's problematic areas. Inadequate ethical leadership behaviour, in particular, has a significant impact on implementing talent management practices. Another troubling result is the absence of moral values in government institutions. As stated earlier in this paper, values are the foundation for effective public service delivery through employee behaviours. According to the findings, more emphasis should be placed on developing a solid ethical organisational talent culture that will contribute to desirable human capital practical, individual, group, and organisational outcomes. Another primary concern source is government employees' high voluntary turnover intentions. Local government institutions currently face a severe shortage of skilled and competent employees. The findings of this study can be used by logical government institutions to proactively address and mitigate the institutional factors that contribute to staff voluntary turnover intentions.

7. Limitations and Recommendations

We encountered several limitations in this study, as with any other research. The most notable limitation was the scarcity of empirical evidence on adult state hope and meaning in life in the workplace context. The researchers were challenged in establishing possible relationships between the variables from a theoretical point of view and the subsequent interpretation of the results. Future research should pay more attention to adult state hope and meaning in life in the workplace context. Our analysis yielded some promising results for these variables in the context of ethical organisational culture, talent management, and voluntary turnover intention. Similarly, there is little research on ethical organisational culture as a precursor to talent management. As a result, we had to draw on existing organisational culture research to establish potential theoretical relationships with the variables in this study. Future research could focus on delving deeper into the concept of ethical organisational culture in the African context, taking into account the characteristics of the unique national and political cultures and their influence on workplace culture. The delivery of services is at

the heart of local government institutions. Future research can benefit from evaluating service quality and performance in public sector contexts as a possible outcome of ethical organisational culture, talent management, positive individual outcomes, productive energy, and organisational commitment. We recommend conducting mixed-method research to investigate the quantitative findings obtained in this study. Employees in this study reported insufficient levels of ethical organisational culture and inadequate talent management practices. Qualitative research can provide a deeper understanding for interpreting the findings of this study.

8. Conclusions

Talent management is an important mechanism to facilitate the desired individual behaviours to accomplish the strategic objectives of local government institutions. An ethical organisational talent culture is the driver of any talent management initiatives. Without leadership commitment and sound values underpinning local government workplace cultures and ethical service behaviours of employees, no institutions will deliver its vital mandate to the broader society. Our research provides valuable inputs for establishing a conducive ethical talent management environment for local government employees considering cultural frameworks and talent management consequences.

Racial Microaggressions and Diversity Climate at Selected South African Organisations: The Role Of Ethnicity

Dr Sean McCallaghan^{1,*}, Prof Marita Heyns²

^{1,2} Optentia research focus area, North-West University, Vanderbijlpark, South Africa

Keywords

Racial microaggressions; diversity climate; ethnicity; South Africa

Abstract

This study proposed and tested a moderation model to determine if the interaction between racial microaggressions and ethnicity would have an impact on diversity climate. Existing literature suggests that majority of diversity climate examinations have largely explored related outputs. The present study therefore identified a research opportunity to investigate the racial microaggressions and ethnicity interaction in predicting a diversity climate in a unique, diverse environment such as South Africa. The quantitative cross-sectional study collected 230 responses from a convenience sample. Participants were from the financial and banking sector as well as the retail and industrial and manufacturing sectors based in the Gauteng Province in South Africa. Respondents completed measures to collect data on biographical information, racial microaggressions and diversity climate. Statistical analysis included descriptive statistics, correlations, a moderation model and ANOVAs. Findings indicate that the interaction between racial microaggressions and ethnicity would significantly predict diversity climate. The study also found evidence that African respondents experience more racial microaggressions when compared to their White counterparts. The study concludes that ethnic diversification is an important factor in creating conducive diversity climates.

1. Introduction

Research have indicated that employee composition within organisations are becoming more heterogeneous (Mor Barak & Travis, 2013). As awareness of diversity by both organisations and social environments increase, the need to effectively manage diversity has also increased. Changes in economic policy, the establishment of free-market systems and removal of trading barriers has created a situation where individuals and employees can move between areas/countries more freely (Roberson, 2019). Organisations are specifically attracted to the benefits associated with diversity, which would include benefits for individuals and working groups. The increased diversity and associated advantages have seen an increased interest amongst researchers, more specifically towards diversity conceptualisations, measures, effects, and circumstances (Roberson, 2019). Diversity climate is one of the areas within diversity management that has seen an increase amongst researchers. The seminal work from Mackay and colleagues (2008) describes diversity climate as the shared opinions of employees and how they assess their work milieu as fair and socially inclusive of all individuals (McKay et al., 2008). Early research on diversity climate found adequate evidence to suggest that diversity climate would benefit both the individual and organisation. Pivotal research showed diversity climate was associated with improved individual attitudes (improved job performance and reduced employee withdrawal) and enhanced organisational performance (Cox, 1994). Researchers have further agreed that the diverse composition of the specific organisation would affect how employees perceive diversity (Kosek & Zonia, 1993).

Although considerable effort has been made towards creating a prejudice-free South African society, reported discrimination remains a reality for some South Africans (Jaga et al., 2018). From a South African perspective, scholars have indicated that the future importance of South Africa's young

democracy will rely on “the development of harmonious race relations” (Jackson & van der Vijver, 2018a, p. 12). Unfortunately, racial microaggressions, which are also considered as subtle forms of discrimination, remain a reality for many employees and organisations. “Microaggressions are considered small, common, and sometimes ambiguous, yet stressful for those on the receiving end given their ubiquity and deniability” (Williams, 2020, p. 3). In certain scenarios and situations, racial microaggressions may cause psychological harm, which can lead to mental health issues. Therefore, racial microaggressions require directed actions in order to remove this form of subtle discrimination from organisations (Williams, 2020). Taking into consideration that ethnic composition affects the diversity climate, and South Africa still continues to demonstrate discrimination and prejudice within organisations, the current study aims to test whether or not the interaction of ethnicity and racial microaggressions would predict diversity climate. The study further aims at assessing ethnic views on racial microaggressions and diversity climate. The proposed conceptual model is depicted in Figure 1 below.

Figure 1: Conceptual model: Racial microaggressions and the interaction of ethnicity in predicting diversity climate

2. Problem Investigated

Diversity climate literature maintains that when an organisation is committed towards diversity and demonstrates that diversity is valued, employees, especially minorities will relate more to organisational efforts and would be reflected in the diversity climate (Hofhuis et al., 2012). The challenge within the South African context is that our labour market remains skewed, and individuals continue to report discrimination and prejudice (Statistics South Africa, 2019; Jaga et al., 2018)

Although diversity climate has seen new interest amongst researchers, diversity climate studies have been dominated by studies examining diversity climate consequences (McKay & Avery, 2015; Perry & Li, 2019). According to McKay and Avery (2015) researchers in the field of diversity climate have an opportunity to contribute towards diversity climate literature by examining non-traditional antecedents and how diversity climate operates in organisations. Furthermore, it is commonly known that an African environment requires more examination and understanding due to several subcultures, diverse ethnic groups, and challenges associated with these differences (George et al., 2016).

3. Research Objectives

The study will aim to contribute towards diversity climate knowledge by empirically testing racial microaggressions and ethnicity relations in order to predict diversity climate in a South African sample. Because of literature suggestions pertaining to the social identity theory, faultline theory, South African labour imbalances, continued reports of workplace discrimination and prejudice, the present study will also examine group perspectives on microaggressions and diversity climate. Therefore, the primary objective of the current study was to examine the moderating role of ethnicity in the relationship between racial microaggressions (RMAs) and Diversity climate. The secondary objectives were to examine the type and nature of the relationships between RMAs, diversity climate and ethnicity and to compare RMAs and diversity climate perspectives across ethnic groups.

4. Research questions

The following research questions were formulated in order to achieve the study objectives:

- What is the role of ethnicity in the relationship between RMAs and diversity climate?

- What is the type and nature of the relationship between RMAs, diversity climate and ethnicity?

5. Literature Review

To facilitate a better understanding of racial microaggressions and diversity climate, the following segment is devoted to reviewing literature pertaining to the variables under examination.

5.1. Diversity climate and ethnicity

Several researchers have aimed at defining a diversity climate. Consequently, the explanation from Hofhuis et al. (2012), and Perry and Li (2019) describes diversity climate in a more appropriate manner for the current study. According to Perry and Li (2019) a diversity climate refers to the “employees’ shared perceptions of the extent to which their organization values diversity as reflected in the policies, practices, and procedures that the organization rewards, supports, and expects” (p. 1). While Hofhuis et al. (2012), consider a diversity climate to be “the degree to which an organizational climate facilitates the presence of cultural differences, and views this diversity as a positive asset” (p. 969). Arguably, the perceptions of employees on how well an organisation is managing diversity would, to a large extent, rely on how well organisations are managing differences that distinguish employees (McKay & Avery, 2015). These differences may include gender, religion, sexual orientation, and ethnic differences. What is important to take into consideration for this study is that the majority of diversity climate views is pinned against the background of the fair treatment of employees (Dwertman et al., 2016).

Traditional antecedents of diversity climate may include inclusive human resource practices and policies (Boehm et al., 2014). However, ethnicity was a point of interest for the present study and how this relates to diversity climate. Previous examinations have found evidence that the composition of an organisation would have an impact on individual’s perspectives of the importance of diversity (Kosek & Zonia, 1993; Perry & Li, 2019). More specifically, Pugh et al., (2008) found evidence that the racial composition of an organisation would have an impact on the diversity climate observations of employees.

The challenge with managing diversity within organisations, and ultimately improving diversity climate, may be subject to group membership. The social identity theory is grounded on individuals being motivated to join and interact with individuals sharing common characteristics (gender, race and age) (Tajfel & Turner, 1986). The challenge for organisations in terms of the social identity theory and attempts to improve diversity climate, is that these individuals who form groups based on common interests or characteristics start to share perspectives amongst each other and could therefore create sub-climates (McKay & Avery, 2015).

The early focus on diversity climate research, was focused on sub-climate comparisons, mainly due to concerns raised with the social identity theory (Tajfel & Turner, 1986) and faultline theory (Lau & Murningham, 1998). The faultline theory proposes that individuals within groups are prone to developing sub-groups based on common demographic attributes. Sooner or later these individuals form strong allegiances with their sub-groups rather than the larger group (Lau & Murningham, 1998). Taking into consideration the social identity theory (Tajfel & Turner, 1986) and suggestions by the faultline theory (Lau & Murningham, 1998), researchers shifted their focus to the investigation of sub-climates. Initial research found that White employees reported higher positive observations of diversity climate when compared to their African colleagues (Mor Barak et al., 1998). Selected research has also found that females and minorities would report lower observations of diversity climate (Hicks-Clarke & Iles, 2000).

5.2. Racial microaggressions and its consequences

Microaggressions are considered “as deniable acts of racism that reinforce pathological stereotypes and inequitable social norms” (Williams, 2020, p. 4). Microaggressions are also considered as “subtle forms of discrimination, often unintentional and unconscious, which send negative and denigrating messages to various individuals and groups” (Nadal et al., 2015, p. 2). Microaggressions can also take

on several forms with several groups subjected to microaggressions, therefore racial microaggressions are subtle discriminations based on race or ethnicity.

Forms of microaggression may include exclusion or isolation, exoticisation and objectification, assumptions of monoracial or mistaken identity, denial of multiracial reality and pathologizing identity and experiences (Johnston & Nadal, 2010). Exclusion or isolation is considered a situation whereby a person may feel excluded based on their race, while exoticisation and objectification is when a person is dehumanised or treated like an object. Monoracial or mistaken identity occurs when a multiracial person is mistaken to be monoracial or from a different racial group. Denial of a multiracial reality is considered when a multiracial person's experiences are nullified by a monoracial person, while pathologising identity and experiences is when a person's identity or experiences are abnormal (Johnston & Nadal, 2010). For the purpose of this study, racial microaggression will be considered through the assessment of underestimation, isolation and assumption (Harrel, 1994). Previous research found these three variables to be an adequate indication of racial microaggressions (Torres et al., 2010). Racial microaggressions may hold several negative consequences for individuals (Williams, 2020). Personal consequences associated with racial microaggressions may include stress related concerns (Torres et al., 2010), anxiety, increased alcohol usage (Blume et al., 2012) and depression (Wong et al., 2014).

With regards to racial microaggressions and perspectives based on race, previous international examinations found evidence that multiracial individuals reported higher observations of microaggressions when compared to their White counterparts (Nadal et al., 2014). From a South African perspective, Jackson and van de Vijver (2018b) found in their study that White individuals self-reported higher opinions of subtle racism attitudes and tendencies. According to Jackson and van der Vijver (2018b), subtle racism was also associated with physical and psychological health.

5.3. The South African diversity context

Ideally, South African organisations should represent the demographical composition of the South African society. Unfortunately, recent labour statistics indicate slow progress in terms of redressing labour imbalances in post-apartheid South Africa. Certain demographical groups continue to dominate the South African labour environment (Statistics South Africa, 2019). Although advances have been made towards creating a prejudice free society as idealised in the South African constitution (1996) recent findings further indicate that discrimination remains part of the South African labour environment. A recent study found evidence that African women still experience gender and race discrimination in post-apartheid South Africa (Jaga et al., 2018). Reported discrimination is not restricted to only gender and race. A South African examination further reported that managers do not thoroughly understand disabilities within the workplace (Potgieter, Coetzee & Ximba, 2017). Individuals with disabilities reported that they have limited career advancing opportunities and that human resource practices discriminated against workers with disabilities. Discrimination against invisible disabilities also remains a reality (Potgieter et al., 2017). In terms of religion, South African Muslims reported that managers predominately from the apartheid era were less tolerant towards Muslims. In certain cases, Muslim employees reported that they would rather avoid conflict when not taken into consideration during work related gatherings (Carrim, 2017). With regards to sexual orientation, a South African study found that teachers would maintain heterosexism including microaggressions against the lesbian, gay, bisexual, transgender (LGBT) community (Francis & Reygan, 2016). According to Francis and Reygan (2016) "participants seemed to experience discomfort, disapproval and deep suspicion about LGBT identities (p. 192)".

6. Research Methodology

6.1. Research design and approach

A quantitative study with a cross-sectional design was considered as the most appropriate to achieve the study's objectives. The study was interested in obtaining opinions with regards to racial microaggressions and diversity climate at a single point in time.

6.2. Sampling, approach, and respondents

A non-probability convenience sample collected data from 230 respondents after an initial 820 questionnaires were distributed. The target organisations were based in the Gauteng Province and were in the financial and banking, retail, industrial and manufacturing sectors, respectively. Gatekeepers at organisations (heads of department, team leaders and human resource managers) were contacted to obtain permission to collect data. The anonymous nature of the study was emphasised on all questionnaires and informed consent documents. Questionnaires were delivered to one central point for distribution within the organisations and identified gatekeepers assisted with distribution. Completed questionnaires were collected at the same central point after the set time. Respondents were given 30 days to complete the questionnaire and to return the completed questionnaires at an agreed central point. A summary of the sample characteristics is depicted in Table 1.

Table 1: Sample characteristics

Biographical element	Percentage
Date of birth	
1945-1950	2%
1951-1960	4.4%
1961-1970	17.4%
1971-1980	18.4%
1981-1990	38.1%
1990 and onward	19.7%
Gender	
Male	52.9%
Female	47.1%
Qualifications	
Matric/Grade 12	17.9%
Post-matric qualification (diploma)	17.5%
University degree (BA, BCom, BSc etc.)	29.2%
Postgraduate degree	35.4%

6.3. Measurements

The measuring instrument comprised three sections. The first section collected data on demographical variables of respondents, while the second and third sections collected data on racial microaggressions and diversity climate.

The racial microaggressions variable was determined with the Daily Life Experience Scale (DLE) which is a sub-scale from the Racism and Life Experiences Scale (RaLes) (Harrell, 1994). The fourteen-item scale makes use of a six-point Likert-scale and measures racial microaggressions through three sub-scales (underestimation, isolation and assumption) (Harrell, 1994). The DLE requests respondents to indicate the frequency at which they are exposed to racial microaggression where 1 = "never" and 6 = "once a week or more". A sample item would include: "Being observed or followed while in a public place". A higher score would be an indication that respondents are of the

opinion that they are exposed to racial microaggressions. The DLE previously recorded adequate reliability ($\alpha = 0.90$) (Torres et al., 2010).

The diversity climate variable was assessed through a diversity climate measuring instrument developed by McKay et al. (2007). The nine-item scale makes use of a five-point Likert-scale where 1 = “well below expectations and 5 = “well above expectations”. A sample item would include: “Top leaders visibly commit to diversity” (McKay et al., 2007). A higher recording would be an indication of a conducive diversity climate. The measuring instrument has previously reported adequate reliability ($\alpha = 0.91$) (McKay et al., 2007).

6.4. Statistical analysis

Data were cleaned, captured and analysed with Statistical Packages for Social Science (SPSS) and AMOS version 26 (IBM Corp, 2020). Statistical calculations included: reliability, descriptive, exploratory factor analysis (EFA), confirmatory factor analysis (CFA), Pearson’s correlations and a moderation model with PROCESS (Model 1) (Hayes, 2017). Ethnicity was restricted to only the White and African groups due to a lack of data from the remaining ethnic groups. The ethnicity variable was further considered as a dichotomous variable where 1 = White group and 2 = African group. Moderation models, especially determined in PROCESS, make provision for dichotomous variables to be considered as a moderator (Hayes, 2017).

Cronbach’s alpha (α) and inter-item correlations (r) were computed to account for reliability. Adequate reliability was considered at $\alpha = 0.70$ (Nunnally & Bernstein, 1994) and $r = 0.30$ (Field, 2013) respectively. Harmon’s single factor technique was conducted in order to examine common method bias. The Harmon’s single factor technique makes use of an exploratory factor analysis (EFA) and loads items onto a single factor. Should the single factor explain more than 50% of the variance, common method bias has occurred (Eichorn, 2014)

An initial exploratory factor analysis (EFA) was conducted on each individual variable. Sample adequacy was determined by calculating Kaiser-Meyer-Olkin (KMO) scores. Sample adequacy was considered acceptable at values close to one (1) (Field, 2013). The extraction method was the principle component analysis and only factors with eigenvalues greater than 1.00 were selected (Field, 2013). The next phase was to conduct a CFA by constructing the conceptual model in AMOS with the variables, racial microaggressions, ethnicity and diversity climate. Root Mean Square Error of Approximation (RMSEA) and relative/normed chi-square (χ^2/df) (Wheaton et al., 1977) was considered as absolute fit indices, while the Tucker-Lewis Index (TLI) and Comparative Fit Index (CFI) was considered as incremental fit-indices. The Chi-square statistic (χ^2 -statistic) was not considered as an absolute fit-index as the χ^2 -statistic has demonstrated to be sensitive to sample size in previous studies (Vandenberg, 2006). Acceptable model fit was considered at: RMSEA < 0.08 (Van de Schoot, Lugtig & Hox, 2012), $\chi^2/df < 2.0$ (Tabachnick & Fidell, 2007) CFI and TLI > 0.90 (Hooper et al., 2008; Wang & Wang, 2012).

Pearson’s correlations were calculated in order to determine the type and nature of the relationships between racial microaggressions, ethnicity and diversity climate. With regards to correlations, relationships were firstly analysed for statistical significance ($p < 0.01$; two tailed) followed by practical significance. Practical significance was considered at 0.10 = small effect, 0.30 = medium effect and 0.50 = large effect (Cohen, 1988).

The moderation analysis was computed with PROCESS (Model 1) which was installed in SPSS (Hayes, 2017). Significance within the moderation model was considered at ($p < 0.05$). The interactions were further considered as significant if the Lower Level Confidence Interval (LLCI) and Upper Level Confidence Level (ULCI) did not include zero (0). Racial microaggression was considered as the independent variable, the dichotomous ethnicity variable as the moderator and diversity climate as the dependant variable. A scatterplot was also computed in order to illustrate any possible interaction. According to Masur (2018) a scatterplot is a convenient figure to plot the interactions when using a dichotomous variable as a moderator.

The final analysis was conducted to inspect Analysis of Variances (ANOVAs). ANOVAs were computed in order to examine ethnic (White and African) perspectives on racial microaggressions and diversity climate. Due to the sampling technique, results from the group comparisons should be interpreted with care. Results from ANOVAs were firstly analysed for statistical significance ($p < 0.05$) and secondly for practical differences. According to Cohen (1988), d -values can be interpreted as follows: $d = 0.2$ – small effect, no practically significant difference; $d = 0.5$ – medium effect, practically significant difference; $d = 0.8$ – large effect, practically significant difference.

6.5. Ethical consideration

The institution with which the study was registered awarded ethical clearance and was attributed with the project number: NWU-00602-20-A4. The measurements applied in this study did not require any personal information. Names of participating organisations also remained confidential in order to comply with ethical requirements. Participation in the study was voluntary and at no stage were incentives offered to any respondent to complete a questionnaire.

7. Results and Findings

The results and findings will be presented in four main sections. The first section will focus on validity of the results. The second section will cover descriptive, reliability and results obtained from the correlation analysis. The third section depicts the results and findings obtained from the moderation model. The fourth and final section will report on findings pertaining to group comparisons on RMAs and diversity climate.

7.1. Validity

The results collected from individual EFAs with assessments of scree plots and eigenvalues revealed that all measurement scales applied in this study could be considered one-dimensional. For the diversity climate, the single factor extracted explained 60.60% of the variance with an eigenvalue of 5.45 (KMO = 0.90). With regards to underestimation, the first factor extracted explained 66.22% of the variance with an eigenvalue 3.97 (KMO = 0.87). The first factor extracted for isolation explained 62.57% of the variance with an eigenvalue of 2.50 (KMO = 0.73). With regards to assumption, the first factor extracted explained 65.14% of the variance with an eigenvalue of 2.60 (KMO = 0.79). A CFA model, which factored in racial microaggressions (as measured with underestimation, isolation and assumption), ethnicity and diversity climate, was constructed in AMOS in order to confirm the factors that resulted from the EFA. Results from the CFA calculations demonstrated adequate model fit (RMSEA = 0.06; $\chi^2/df = 1.92$; CFI = 0.93; TLI = 0.92). The results obtained from the EFA and CFA computations therefore confirm the validity of the variables under investigation.

7.2. Descriptive, reliability and Pearson's correlation results

The results from the descriptive, reliability and correlation calculations is depicted in Table 2. According to the information presented in Table 2, all of the variables under examination demonstrated adequate internal consistency. Based on the results obtained from the reliability and validity computations, the scales were considered valid and reliable. With regards to the central tendencies, the scores for the racial microaggressions variables were within the scale's "never" section, which is an indication that respondents did not really experience racial microaggression or any of its indicators (underestimation, isolation and assumption). The diversity climate score was within the scale's positive range, which was an indication that the sample considered their organisation diversity climate as conducive. With regards to common method bias, the Hermon's single factor technique applied, revealed the first single factor extracted only explained 28.68% of the variance. Subsequently, concerns with common method bias were dismissed.

In terms of the Pearson's correlation results, Table 2 indicates that ethnicity was statistically significant associated with microaggressions ($r = 0.19$; $p < 0.05$; small effect), isolation ($r = 0.17$; $p < 0.05$; small effect) and assumption ($r = 0.21$; $p < 0.05$; small effect). The relationship between ethnicity and diversity climate did not yield a significant result. The relationship between diversity climate and microaggression also did not yield a significant result, however there was an inverse relationship between diversity climate and underestimation ($r = -0.18$; $p < 0.05$; small effect).

Table 2: Descriptive, reliability and correlation results

	Variable	Mean (SD)	α	1	2	3	4	5	6
1	Ethnicity	1.34(0.47)	-	1					
2	Racial microaggressions	2.18(0.94)	0.90	0.19*	1				
3	Underestimation	2.45(1.22)	0.89	0.09	0.82**	1			
4	Isolation	2.01(1.06)	0.80	0.17*	0.83**	0.51**	1		
5	Assumption	2.07(1.14)	0.82	0.21*	0.84**	0.53**	0.67**	1	
6	Diversity climate	3.39(0.78)	0.92	-0.03	-0.10	-0.18*	-0.05	-0.02	1

* Correlation is significant at the 0.05 level (2-tailed)
** Correlation is significant at the 0.01 level (2-tailed)
Results were interpreted as: 0.1= small effect; 0.3 = medium effect; and 0.5 = large effect (Cohen, 1988).

Source: Own compilation

7.3. Moderation analysis

The study suggested that ethnicity, considered as a dichotomous variable, would moderate the relationship between racial microaggressions and diversity climate. All variables were considered mean-centred. The results from the moderation analysis, as indicated in Table 3, revealed a significant result ($F = 2.98, p = 0.03, R^2 = 0.04$). Although the tested moderation model only explained 4% of the prediction of diversity climate, ethnicity had an overall significant negative effect when predicting diversity climate ($b = -0.74; p = 0.01; LLCI = -1.28; ULCI = -0.19$). Racial microaggressions (RMA) also had a negative effect on diversity climate ($b = -0.50; p < 0.01; LLCI = -0.84; ULCI = -0.16$) as indicated in Table 4. Moreover, according to Table 6, racial microaggressions was negatively connected to diversity climate at the White (1) level ($b = -0.20; p = 0.01; LLCI = -0.35; ULCI = -0.05$). The impact of racial microaggressions on diversity climate at the African (2) level did not yield a significant result ($b = 0.10, p = 0.22, LLCI = -0.06; ULCI = 0.26$). Therefore, only the interaction between racial microaggressions and ethnicity at the White level could be considered as significant, as the LLCI and ULCI did not include zero. The interactive effect between racial microaggressions and ethnicity demonstrated a positive result when predicting diversity climate ($b = 0.30; p = 0.01; LLCI = 0.08; ULCI = 0.52$) as indicated in Table 4. The change in R-square resulting from the interaction was also significant ($F = 7.10; \Delta R^2 = 0.03; p = 0.01$) as indicated in Table 5.

Table 3: Interactive effect between racial microaggression and ethnicity in predicting diversity climate (model summary)

R	R ²	MSE	F	df1	df2	p

7.4. Group comparisons

The final section will focus on comparing observations for all variables under investigation between the White and African groups. Table 7 below contains the ANOVA results obtained from the computations. According to Table 7, statistically significant differences were present when comparing means between the White and African groups for racial microaggressions ($p < 0.01$; $d = 0.45$; medium effect), underestimation ($p < 0.01$; $d = 0.20$; small effect) and isolation ($p < 0.01$; $d = 0.42$; medium effect). Although not statistically different, the assumption variable yielded a medium practical difference ($p = 0.19$; $d = 0.55$). In all these cases, the African group reported higher observations of racial microaggressions, including for underestimation, isolation and assumption. The comparison between White and African groups for diversity climate did not yield a significant result.

Table 7: Ethnic comparisons, racial microaggressions (RMA) and diversity climate

	White		African		P-value	Cohen's d-value	Effect
	Mean	SD	Mean	SD			
RMA	2.03	0.83	2.46	1.07	0.00*	0.45	Medium
Underestimation	2.36	1.20	2.60	1.24	0.00*	0.20	Small
Isolation	1.86	0.94	2.30	1.18	0.00*	0.42	Medium
Assumption	1.86	0.94	2.50	1.37	0.19	0.55	Medium
Diversity Climate	3.41	0.72	3.33	0.89	0.43	0.10	Small

Note: $p < .05^*$ is significant
d-values were interpreted as: $d = 0.2$ – small effect, no practically significant difference; $d = 0.5$ – medium effect, practically visible difference; $d = 0.8$ – large effect, practically significant difference (Cohen, 1988).

6. Discussion

The primary objective of the study was to examine the interaction between racial microaggressions and ethnicity in predicting diversity climate. The study further aimed at assessing ethnic (White and African) views on racial microaggressions and diversity climate.

Literature suggests that the ethnic composition of an organisation would have an impact on the diversity related perceptions formed amongst employees (Kosek & Zonia, 1993; Pugh et al., 2008). Literature further indicates that prejudices and discriminations might also impact diversity climate (Cox, 1994). However, diversity climate examinations in a unique diverse environment such as South Africa is silent on what effect racial microaggressions and ethnicity would have on predicting diversity climate. The present study found evidence to suggest that ethnicity can be considered as a significant moderator for racial microaggressions when predicting diversity climate.

The study further found evidence that racial microaggressions had an inverse direct relationship with diversity climate. This result implies that a reduction in racial microaggressions would impact positively on diversity climate. Taking into consideration the direction of the measurements applied in this study, this result means that when racial microaggressions decrease there would an improvement of the diversity climate. This result should be considered as positive for the participating organisations. Climates for diversity that have been considered as toxic demonstrate signs of prejudice, stereotyping, cultural differences and even ethnocentrism (Cox, 1994). Furthermore, results from the present study indicate a significant interaction between racial microaggressions and ethnicity, when predicting a diversity climate. This result confirms that diverse groups have advantages over homogeneous groups (Roberson, 2019) and in the case of this study the advantage was a conducive diversity climate.

Finally, the study found evidence that African employees reported higher observations of racial microaggressions, opinions of isolation and assumption when compared to their White colleagues. These findings are consistent with previous international and South African studies (Nadal et al., 2014; Jackson & van de Vijver, 2018b). These results further indicate that previously reported discrimination and prejudice remains part of South African organisations. A positive finding indicated no statistical differences when comparing diversity climate observations between the White and African groups. This should be considered as an indication that employees are recognising and valuing the efforts made by their respective organisations in terms of diversity. The specific result should be considered as a positive result for South African organisations, as previous international diversity climate examinations reported substantial racial differences with regards to diversity climate observations (Mor Barak et al., 1998).

6.1. Managerial implications

Organisations who wish to create conducive diversity climates cannot merely rely on traditional diversity climate antecedents, for example human resource policies and practices (Boehm et al., 2014). Literature suggests that diverse composition also impacts on diversity climate and therefore organisations should strive to create a diverse work group as this will assist in improving the overall diversity climate. For this research, the interaction between ethnicity and racial microaggressions

predicted diversity climate. Diversity climate holds several individual and organisational benefits (Cox, 1994). Therefore, organisations should take note of the situations and environments that can influence a diversity climate including the diversification of organisations.

Organisations who further wish to improve diversity climate and benefit from the advantages associated with a conducive diversity climate, should also carefully align policies and practices with relevant legislation. According to Peterson (2008) the foundation of diversity management is the affirmative action legislation developed to govern diversity management. In the South African context, legislation was developed and implemented to improve representation, stimulate diversification and eliminate unfair discrimination and prejudice. The specific legislation that should be considered includes but is not limited to the Constitution (1996), Labour Relations Act 66 of 1995, Basic Conditions of Employment Act 75 of 1997, Employment Equity Act 55 of 1998 and the Broad-Based African Economic Empowerment Act 53 of 2003. Although legislation was developed to eliminate discrimination in South Africa and stimulate diversification, certain race groups might still experience forms of subtle discrimination. Organisations who wish to improve their diversity climate should develop, align and implement relevant policies and practices to eliminate racial microaggressions, more specifically eliminating opinions of isolation and assumption.

The present study found evidence that African respondents reported higher observations of isolation and assumption. African respondents were of the opinion that they are more excluded, avoided or treated differently when compared to their White colleagues. The results further indicate African respondents reported higher recordings of assumptions. This would translate to situations where African respondents are of the opinion that there are more offensive comments and insults directed at Africans in addition to being mistaken for someone who serves others when compared to the opinions of their White colleagues (Harrel, 1994). In this regard, to combat microaggressions, organisations could perhaps develop, adopt and invest in educating employees in line with the recent developed micro-intervention strategies as proposed by Sue et al. (2019). In majority of cases, perpetrators are not even aware that they are committing a microaggression and therefore the victim should perhaps remind the perpetrator that they are committing a microaggression (make the invisible visible). Victims could also deflect the microaggression by “showing disagreement, challenging what was said or done and/or pointing out its harmful impact” (disarm the microaggression) (Sue et al., 2019, p. 138). Victims could in such cases enter into discussion and educate the committer of the harm and how to improve his/her actions or behaviours (educate the perpetrator). When individual efforts to disarm a microaggression does not succeed, a victim should seek advice and support (seek external reinforcement or support) (Sue et al., 2019). Managers can consider awareness campaigns, identifying RMAs within their organisations and developing communication and education mechanisms to disarm microaggressions.

6.2. Limitations and recommended future research

The quantitative approach and cross-sectional study does not allow to determine causal effects of racial microaggressions, ethnicity and diversity climate, and a longitudinal study would be able to address this limitation. Although some results in the present study are concerning, recent research in the field of microaggressions have advised researchers and practitioners to look beyond the quantitative results (Fattoracci et al., 2020). This is especially due to intersectional implications and that not all marginalised groups may experience microaggressions in a similar way. What is required is a qualitative assessment in order for researchers and practitioners to understand why certain groups experience or report more racial microaggressions compared to other groups (Fattoracci et al., 2020).

The convenience sampling method further restricts conclusions to the sample group and results can therefore not be generalised. The ethnic variable was only represented by the White and African groups. A sample representing all race groups from South Africa should provide more clarity on how racial microaggressions and ethnicity interact when predicting a diversity climate. Distinguishing differences amongst individuals in organisations is not only restricted to race. Future research should also consider examining gender, religion and any other factor that might distinguish individuals and how these factors would impact on diversity climate. Additionally, the study was conducted in only

one of South Africa's provinces. Future examinations should extend data collection in order to obtain opinions from a wider South African audience.

7. Conclusion

The improvement of diversity climate cannot merely rely on the elimination of subtle discrimination behaviours. Careful attention should also be directed to the ethnic composition and diversification within organisations. While several advances have been made towards creating a prejudice-free society, individuals may still report forms of racial microaggressions. However, individuals are recognising the efforts organisations are introducing towards diversity climate by both the White and African ethnic groups. It is recommended that organisations develop policies and practices to improve diversity climate, while at the same time equipping managers with communication and education mechanisms to disarm RMAs.

Keywords

Engagement; The satisfaction of self-determination; Supervisor support; Managerial support; Emotional exhaustion and Turnover intentions

Abstract

The study sought to explore employee engagement, the satisfaction of self-determination needs, employee engagement, managerial support, emotional exhaustion, and intentions to leave in the South African contract research sector (CRO). The CRO is a demanding industry, and organizations must retain knowledgeable and experienced individuals. The quantitative, cross-sectional study collected 260 responses from a convenience sample ($n=260$). The statistical analysis included descriptive statistics, a confirmatory factor analysis, reliability statistics, correlation coefficients and Cohen's d effect sizes to compare observations across groups. Results show data to be valid and reliable. The correlation results show that satisfaction with self-determination needs is positively associated with employee engagement, supervisor support, and negative emotional exhaustion and turnover intentions. The study highlights the importance of satisfaction of self-determination needs and managerial support in the demanding CRO industry, primarily due to favourable work engagement levels and lower indications of emotional exhaustion and turnover intentions. The study offers valuable knowledge towards attraction and retention of staff with empirical evidence that satisfaction of self-determination needs, managerial support and employee engagement will benefit employee well-being.

1. Introduction

Contract research organizations (CROs) have recently become more popular due to being more cost-effective and efficient, contributing to more profitable pharmaceutical organizations in developing countries such as South Africa (Adobor, 2012; Gad et al., 2020). CROs are specifically established to provide research and conduct trials while at the same time attempting to be profitable. Furthermore, CROs are precisely positioned to deliver these services as cost-effective as possible. Therefore, CROs can offer their clients a cost-effective method to enhance products for an organization in the pharmaceutical, biotechnology, and medical devices industry.

To meet the demands of pharmaceutical companies, CROs have to recruit and retain highly competent and skilled individuals to remain competitive and efficient (Adobor, 2012). These skilled individuals who can gather, analyse, and interpret complex information are in high demand, especially those who have knowledge and experience of the local language, culture, and standards (Adobor, 2012). These skilled and experienced staff are valuable in creating a competitive advantage for CROs through innovative product development (Buvailo, 2020). Unfortunately, there has been an increase in employee turnover and a demand for scarcer talent, especially in organizations that require high-performing individuals who considerably contribute to strategic organizational objectives (McShane & Von Glinow, 2018). Talent scarcity and increased expenses to retain experienced talent are common problems in developing countries such as South Africa (Rothmann et al., 2013).

Demanding organizations such as CROs require experienced and productive talent, which should also be retained. The solution might be found in stimulating, supportive managerial and supervisor relations (Gordon et al., 2019). In short, managerial support is considered a manager's behaviour that develops subordinates' outlooks on personal development (Allen et al., 2003). Studies indicate that supportive practices can improve observed organizational support, which reduces turnover intentions (Allen et al., 2003; Rigby & Ryan, 2018). Additionally, environments characterized by supportive human resource practices also tend to make employees feel more valuable (Allen et al., 2003). Moreover, research indicates supervisor support is associated with positive engagement (Rigby & Ryan, 2018).

Work engagement and employee engagement are terms used interchangeably (Schaufeli et al., 2019) and are considered an employee's association with their occupation (Schaufeli et al., 2006). Besides employee engagement being associated with enhanced productivity (Cattueuw et al., 2007), literature has also shown that employee engagement is beneficial towards employee well-being (Shuck & Reio, 2014). Research from non-related industries has confirmed the importance of employee well-being, especially in reducing turnover intentions (Grant et al., 2019) and emotional exhaustion (Jeon et al., 2018). An employee's intentions to quit, also known as turnover intentions, is considered an employee's intention to purposefully find a new position with another organization (Lambert et al., 2001). In addition, emotional exhaustion refers to an individual that displays feelings of "being overextended and depleted of one's emotional and physical resources" (Maslach et al., 2001, p. 399). Both emotional exhaustion and intentions to leave have been proven as detrimental to the performance of individuals and organizations in CRO industries (Halbesleben & Bowler, 2007; Haque, 2020). Findings from non-related sectors on the negative role of emotional exhaustion and turnover intentions towards organizational and individual performance might be detrimental, primarily due to the high demand on individuals in the CRO environment. At this stage, a critical question arises? Besides a supportive supervisor and employee engagement, what is required to enhance employee well-being in a CRO environment? The answer might be found in motivation, more specifically in the field of satisfaction of self-determination needs.

The self-determination theory (SDT) is considered a "macro" theory of motivation. The SDT proposes that both "employees' performance and their well-being are affected by the type of motivation they have for their job activities" (Deci et al., 2017). The SDT depicts that individual health and wellness are enforced by an employee's ability to satisfy a natural need for autonomy, competence, and relatedness (Deci et al., 2017). The satisfaction of self-determination needs is imperative for organizations such as CROs which require high-performing, motivated individuals. The literature indicates that the satisfaction of self-determination needs is associated with and will enhance well-being and work performance (Deci et al., 2017). Equally, the opposite is also accurate, and organizations should attempt to create and sustain an environment that encourages satisfaction of one's self-determination needs (Deci & Ryan, 2000).

From an SDT perspective, managerial or supervisor support has been found to impact employee well-being, more specifically, emotional exhaustion and intention to leave (Deci & Ryan, 2008). This is an individual personal motivational observation for the present study, as it has been said that employees leave managers and not organizations (McCrae, 2020). Therefore, it would be imperative for CROs to retain highly motivated managers to enhance a reduction in emotional exhaustion turnover intentions. Besides, individual attitudes and behaviours have also been considered significant contributors to organizational performance (Wright & Haggerty, 2005).

The satisfaction of self-determination needs, supervisor support, engagement, emotional exhaustion, and turnover intentions are critical organizational behaviour concepts for CROs. Literature affirms that these essential variables are related, yet no significant exploratory studies amongst CROs could be found in an emerging and challenging economy such as South Africa. The study aimed at exploring this research problem.

1.1 Problem Investigated

South African managers are faced with challenges in attracting and retaining strategic talent, particularly in the South African pharmaceutical industry (Rothmann et al., 2013). Contributing to this managerial dilemma is a declining South African economy that deteriorated to a growth percentage of only 0.2% per annum in 2019 (Loewald et al., 2020). This decline was said to considerably contribute to a skill shortage (Shikweni et al., 2019). Skills shortage and constant change in crucial staff might be detrimental to a demanding CRO industry (Gad et al., 2020). Alarming research further indicates that highly competent staff recruitment and retention will be even more difficult in a struggling African economy (Pride & Tatenda, 2017).

An environment characterized by a drive for profits is known for regularly prioritizing the customer's demands and such environments are usually at the deprivation of employee well-being (McShane & Von Glinow, 2018). Regrettably, this also applies to the CRO environment. Teams in the CRO industry comprise skilled employees who are placed in low-cost sites, incorporated into faceless, worldwide business units, and expected to meet the demands of their clients (Adobor, 2012). Many businesses attempt to avoid high staff turnover as this is costly and can result in a loss of organizational knowledge and escalated replacement costs (McShane & Von Glinow, 2018). Indeed, a situation that CROs should manage and avoid in order to protect both knowledge, experience, and resources.

CROs have seen tremendous growth in recent years and are rapidly expanding and investing in emerging markets (R. Kumar & Paul, 2019). Unfortunately, a careful review of CRO literature reveals a lack of thorough examinations, especially amongst CROs in emerging markets. Therefore, the current study identified a research opportunity in the South African CRO industry and would contribute to the body of knowledge on CRO functions and operations.

One should keep in mind that, like other organizations, the South African CRO workforces are also widely diverse. Organizations in environments experiencing growth and development, such as CROs (R. Kumar & Paul, 2019), will also experience increased diversity. Organizations will experience a diverse range of organizational behaviours (Stone-Romero et al., 2003). As the present study is within the domain of organizational behaviour, the importance of the variables under investigation and that the South African environment is rich in diversity will be wise to examine observations across several demographical groups. This will give the organizations under investigation an accurate and valuable assessment of all observations at a single point in time and assist with future interventions (Spector, 2019).

1.2 Research Objectives

The SDT theory implies that self-determination needs are positively associated with employee engagement and supervisor support, while adversely related to emotional exhaustion and turnover intentions. Examining employee perspectives of engagement, supervisor support, emotional exhaustion, and turnover intentions (well-being) in the CRO industry is anticipated to enhance human behaviour knowledge in demanding organizations. In addition, a CRO perspective from an emerging and struggling economy such as South Africa on the satisfaction of self-determination needs, engagement, supervisor support, emotional exhaustion, and turnover intentions would further contribute to the organizational behaviour body of knowledge.

To resolve this research question, the study considered the following objectives:

- Empirically examine perspectives from the South African CRO sample on the satisfaction of self-determination needs, employee engagement, supervisor support, emotional exhaustion, and turnover intentions.
- Determine the type and nature of the relationships between the variables under investigation; and,

- Study and compare group observations (per demographical data) on the satisfaction of self-determination needs, employee engagement, supervisor support, emotional exhaustion, and turnover intentions.

2. Literature Review

The objective of the literature view is to understand the critical variables under investigation which will be briefly discussed in the sections to follow.

2.1 Satisfaction with self-determination needs

The SDT is regarded as one of the more comprehensive theories on motivation and satisfaction of basic psychological needs (Van den Broeck et al., 2016). The SDT distinguishes the objective contents and monitoring behaviour of goal pursuit by characterizing an individual's psychological needs to satisfy these needs. Research indicates that psychological needs of autonomy, competence, and relatedness are considered significant predictors of psychological development, integrity, and well-being (Deci et al., 2017). Moreover, the satisfaction of these shared needs is associated with effective functioning, ideal development, and well-being (Deci & Ryan, 2000). With the understanding that the SDT is pinned against human motivation, the view offers a theoretical opportunity to evaluate motivational aspects within an organizational environment (Deci et al., 2017).

Individuals within organizations need to experience a sense of autonomy (independence), and competence (capability) (Deci & Ryan, 2000). When an individual's environment is favourable for the satisfaction of psychological needs of autonomy, competence, and relatedness, the individual's intrinsic activity, and natural growth processes, which include motivation, are satisfied; one should experience positive psychological and behavioural outcomes. When the needs of the individuals are realistically satisfied, individuals participate in activities they find stimulating (intrinsic motivation) or significant (extrinsic motivation) (Meyer & Gagnè, 2008). One should keep in mind that the opposite is also a reality. Failure to satisfy the satisfaction of self-determination needs does lead to unfavourable employee well-being and even follow protective adaptations (Deci et al., 2017).

The satisfaction of self-determination needs has been associated with several individuals and beneficial organizational outputs, making the topic an essential managerial concept. Other outputs include reduced levels of turnover intentions (Eisenberger et al., 2002), lower indications of emotional exhaustion (Williams et al., 2014) individual performance and engagement (Alfes et al., 2013). More importantly, the satisfaction of self-determination needs has also been positively associated with a supportive manager or supervisor (Williams et al., 2014), which in return would improve related organizational performance (Manganelli et al., 2018).

2.2 Supervisor support

Supervisor support or managerial support is an essential contributor to both organizational and individual performance. Competence from an employee's perspective supported by the SDT can be considered an evaluation of an individual's interpretation of their ability or skill under autonomy-supportive and controlling situations (Williams & Deci, 1996). Moreover, managerial support includes the extent to which employees deem their supervisors to value their efforts, offer support, and demonstrate genuine concern about their well-being (Eisenberger et al., 2002). Supportive managerial features have been associated with environments that demonstrate supporting and enabling basic needs satisfaction and include enhanced motivation, leading to performance (Rigby & Ryan, 2018).

It is said that managerial support is such an important managerial function that those organizations that can enhance managerial support can reduce pressures experienced by frontline staff (Yue et al., 2017), quality of life (Baker & Kim, 2020), enhance job satisfaction, engagement, and reduced observations of turnover intentions (Kumar et al., 2018). It is especially employees from highly demanding professions to benefit the most from managers and supervisors who can sustain supportive environments (Kumar et al., 2018). Therefore, supervisor support would be advantageous for both the organization in the contract research industry and eventually the employee. From a non-related South

African perspective, scholars have found evidence to confirm the importance of supervisor support, especially from an SDT perspective. Results from the South African agricultural sector confirmed that manager relations characterized by supportive, trusting, and non-controlling behaviour are associated with positive organizational outcomes and lower turnover intentions (Rothmann et al., 2013).

2.3 Work engagement

Early research in the field of engagement described engagement as "harnessing of organization members' selves to their work roles: in engagement, people employ and express themselves physically, cognitively, emotionally, and mentally during role performances" (Kahn, 1990, p. 694). Academic authors consider work engagement and employee engagement as interchangeable concepts (W. B. Schaufeli et al., 2019). To conceptualize and operationalize work engagement, scholars focused their attention on characteristics that might best describe an employee who is considered to be engaged in their work. In this regard, the widely used conceptualization developed by Schaufeli et al. (2002) considered engagement as a psychological state characterized by vigour, dedication and absorption and was considered the framework to guide the present study's view on engagement.

Given the current study, work engagement is considered an essential antecedent for employee well-being (Bakker et al., 2008; Maslach et al., 2001; Schaufeli et al., 2001). On the opposite side of well-being, is burnout which in essence is considered the unwell-being end of the engagement (Maslach & Leiter, 2016). Burnout is detrimental to the functioning of any organization. Considered a state of mental exhaustion, burnout is descriptively considered a three-dimensional concept that encompasses "emotional exhaustion, cynicism and lack of professional efficacy with feelings of insufficiency and poor job-related self-esteem or a lack of personal accomplishment" (Maslach et al., 2001, p. 399). Previous South African examinations confirmed the importance of engagement, with results demonstrating a significant impact on burnout and turnover intentions (Du Plooy & Roodt, 2010).

2.4 Emotional exhaustion and intentions to leave

As part of a more multifaceted process, emotional exhaustion is central to burnout. Emotional exhaustion is considered "actions to distance oneself emotionally and cognitively from one's work" (Maslach et al., 2001, p. 403). Moreover, emotional exhaustion is considered as a real and persistent work-related pressure that reveals itself in employees who demonstrate lower concern for their responsibility, trust, and interest (Maslach & Leiter, 2016). Conceptualized as the first stage of burnout, emotional exhaustion provides a critical point for intervention and is widely considered an additional indicator of the working life in task-fatiguing conditions (Lee et al., 2020; Maslach & Leiter, 2016). Concerning the present study, previous examinations found that increased job demands are associated with higher reflections of emotional exhaustion, which in return can lead to increased turnover intentions (Azharudeen & Arulrajah, 2018). Turnover intentions or intentions to leave are considered one of the final steps in the organizational withdrawal process. The literature describes the intention to leave as the subjective estimation of an individual regarding the probability of permanently leaving an organization soon (Cho et al., 2009; Vandenberg & Nelson, 1999).

3. Research Methodology

The following section briefly highlights the methodology applied in the study.

3.1 Research method and design

The study made use of a quantitative method with a cross-sectional design. The method and design were considered the most appropriate to answer the study's research questions. No interventions were planned. The study applied for ethical clearance from the Ethics Committee of the North-West University (Potchefstroom Campus), South Africa. The study was assessed and accepted (EMS15/03/31-1/09). Once ethical clearance was obtained, permission was obtained from participating CROs with an information letter explaining the purpose and anonymous nature of the study. An informed consent letter based on sound clinical practice, was distributed with the questionnaires at the participating CRO offices. Questionnaires were distributed and collected in person with the assistance of a field worker. Participants were given seven (7) days to participate in the study.

3.2 Participants and sampling

A non-probability convenience sample targeted office-based employees from the contract research sector in South Africa. A total of 260 completed questionnaires were returned from the initial 311 distributed questionnaires, resulting in an 83.6% response rate. The sample consisted of 38% males and 62% females. Regarding age, 15% of respondents were between 18-25 years old, 50% were between 26 and 35 years, 25% between 36 and 45 years old, and only 3% indicated they were older than 56 years. In terms of education, 25% of respondents indicated they had a Matric or equivalent qualification, 37% a diploma, 20% a degree, and 17% indicated they had a postgraduate degree. The sample group was dominated by staff who worked for their organization between 3 to 5 years (35%), followed by six months to 2 years (28%), and finally 6 to 10 years' service (24%).

3.3 Measurements

The measuring instrument comprises a section collecting biographical information and responses from previously validated instruments on supervisor support, the satisfaction of self-determination needs, employee engagement, emotional exhaustion, and turnover intentions.

Supervisor support

The supervisor support variable was considered with a combination of the Supportive Supervisor Relations Scale (SSRS) (May et al., 2004) and modified statements from the Perceived Competence Scale (PCS) (Smith et al., 1995). The 10-item SSRS evaluates managerial support (6 items) and trust (4 items). A sample item includes: "Employees are treated fairly by my supervisor". The 4-item PCS is directed towards evaluating supervisor confidence, capability, ability, and achieving goals. Both scales used a 7-point Likert scale ranging from 1 (strongly disagree) to 7 (strongly agree). Both the SSRS and PCS previously reported adequate reliability (SSRS: $\alpha = 0.71$; $\alpha = 0.91$) (May et al., 2004) and (PCS: $\alpha = 0.82$ to $\alpha = 0.90$) (Smith et al., 1995).

Satisfaction with self-determination needs

The satisfaction of self-determination needs variable was assessed with the Work-related Basic Need Satisfaction Scale (WBNSS) (Van den Broeck et al., 2010). The scale comprised statements on autonomy (5 items), competence (6 items); and relatedness (6 items). A sample item includes: "I do not feel competent in my job" (Van den Broeck et al., 2010). The statements were evaluated on a 5-point Likert response scale ranging from 1 (strongly disagree) to 5 (strongly agree). Previous research found the WBNSS demonstrated adequate reliability in the three subscales of autonomy ($\alpha = 0.81$), competence ($\alpha = 0.85$), and relatedness ($\alpha = 0.82$) (Van den Broeck et al., 2010).

Work engagement

The work engagement variable was assessed with the Utrecht Work Engagement Scale (UWES) (Schaufeli & Bakker, 2004). The 17-item scale is a combination of three subscales, i.e., vigour (6 items), dedication (5 items); and absorption (6 items). A sample item includes: "I am enthusiastic about my job" (Schaufeli & Bakker, 2004). A South African sample demonstrated adequate reliability for the UWES with reliability scores ranging from $\alpha = 0.78$ to $\alpha = 0.78$ (Storm & Rothmann, 2003).

Emotional exhaustion

The emotional exhaustion variable was assessed using the emotional exhaustion subscale of the Maslach Burnout Inventory (MBI) (Maslach & Jackson, 1981). The 9-item scale evaluates emotional exhaustion on a 7-point scale varying from 0 (never) to 6 (every day). A sample item includes: "Working with people directly puts too much". Previous studies have reported a reliability score of $\alpha = 0.86$ for the emotional exhaustion variable (Schaufeli et al., 2001).

Turnover intentions (Intention to leave)

The turnover intentions variable was assessed with the Turnover Intention Scale (TIS) (Sjöberg & Sverke, 2000). The 3-item scale evaluates statements on a 5-point Likert scale varying from 1 (strongly disagree) to 5 (strongly agree). A sample item includes: "I feel that I could leave this job". A

South African application of the TIS reported adequate internal reliability ($\alpha = 0.83$) (Rothmann, 2013).

3.4 Statistical analysis

Data was captured and cleaned with Microsoft Excel and analysed with lavaan (Rosseel, 2018), installed in R (R Core Team, 2020). Internal consistency was determined by computing Cronbach's alpha scores with a set threshold of $\alpha = 0.70$ (Pallant, 2013). Confirmatory factor analysis (CFA) was conducted to assess the validity of the measures utilized in the study. The chi-square (χ^2) (test of absolute fit of the model), Root Mean Square Error of Approximation (RMSEA) and Standardized Root Mean Square Residual (SRMR) were assessed on how well the theory fits the data. Values lower than 0.08 for RMSEA and lower than 0.08, for SRMR are deemed an acceptable indication of the fit. (Hooper et al., 2008). The relative fit was assessed by examining the comparative fit index (CFI) and the Tucker-Lewis Index (TLI). Both the CFI and TLI should be above 0.90 (Wang & Wang, 2012).

With regard to descriptive statistics, means and standard deviations were calculated to determine central tendencies. In terms of inferential statistics, correlation coefficients were calculated to evaluate the type and nature of the relationships between the variables under investigation. Correlations were firstly analysed for statistical significance ($p < 0.01$) and after that for practical effect. Values of ± 0.1 represent a small effect, ± 0.3 a medium effect, and ± 0.5 a large effect (Steyn, 2002). The final statistical calculations were aimed at examining statistical and practical differences between demographical groups. The results were firstly analysed for statistically significant differences ($p < 0.05$) and after that for practical differences. Cohen's d-values were computed and practical differences were considered as follow: 0.2 = Small no practical significant difference; 0.5 = Medium practical visible difference; 0.8 = Large practical significant difference (Steyn, 2002).

4. Results and Findings

The results are presented in four sections. The first section reports on reliability and descriptive results, and the second section on validity. The second section reports on findings regarding the correlation analysis, and the final section reports on demographical group differences within the variables under examination.

4.1 Reliability and descriptive results

Table 1 below contains the reliability and descriptive results for all measures applied in this study.

Table 1: Reliability and descriptive results

Variables	Cronbach alpha (α)	Mean	Standard deviation
Satisfaction with self-determination needs	0.95	3.49	0.71
Autonomy	0.88	3.52	0.74
Competence	0.89	3.53	0.77
Relatedness	0.86	3.41	0.76
Work engagement	0.97	3.95	1.30
Vigour	0.91	4.00	1.36
Dedication	0.94	4.05	1.42
Absorption	0.92	3.82	1.28
Perceived managerial support	0.96	5.41	1.26
Supportive supervisor relations	0.97	5.20	1.33
Perceived competence	0.96	5.94	1.07
Emotional exhaustion	0.96	2.30	1.55
Intention to leave	0.93	2.62	1.23

Source: Authors

4.2 Confirmatory factor analysis

Once reliability was confirmed, a CFA was performed to investigate the fit between the measurement models of needs satisfaction, employee engagement, perceived managerial support and the obtained study data (Sun, 2005). The maximum likelihood (ML) estimator was used. In the specified model,

the satisfaction of self-determination needs was considered through the three factors, namely: autonomy, competence, and relatedness. Employee engagement, emotional exhaustion and turnover intentions were considered through the specified scale items for each respective measure. The results for the CFA model indicate the model to be considered valid ($\chi^2 = 315.18$; $df = 116$; TLI = 0.92; CFI = 0.93; RMSEA = 0.08; SRMR = 0.04).

4.3 Correlation analysis

Table 3 below summarises the correlation analysis for the main variables examined in the present study.

Table 3: Correlation results needs satisfaction, work engagement, and perceived managerial support

Nr	Variables	1	2	3	4	5
1	Satisfaction of self-determination needs predictor	1				
2	Work engagement	0.85*	1			
3	Perceived managerial support predictor	0.68*	0.67*	1		
4	Emotional exhaustion	-0.67*	-0.69*	0.62*	1	
5	Intention to leave	-0.65*	-0.63*	-0.62*	0.61*	1

* Note: $p < 0.01$ was considered significant
 Practical effect: ± 1 = small effect; ± 3 = medium effect; ± 5 = large effect (Steyn, 2002)

Source: Authors

The results as depicted in Table 3 indicate all variables under examination had a visible relationship. The satisfaction of self-determination needs variable was positively associated with work engagement ($r = 0.85$; $p < 0.01$: Large effect). In reality, this will result in a situation whereby respondents who report higher observations of satisfaction of self-determination needs will also be inclined to report higher observations of work engagement. The satisfaction of self-determination needs was also associated with supervisor support ($r = 0.68$; $p < 0.01$: Large effect). These results will translate into a situation whereby higher responses of satisfaction of self-determination needs will be related to higher reported observations of supervisor support. The results show an inverse relationship between satisfaction of self-determination needs and emotional exhaustion ($r = -0.67$; $p < 0.01$; Large effect) and with turnover intentions ($r = -0.65$; $p < 0.01$; Large effect). These results show that CRO employees who report higher observations of satisfaction of self-determination needs will most likely report lower observations of emotional exhaustion and turnover intentions. Work engagement was positively associated with supervisor support ($r = 0.67$; $p < 0.01$; Large effect). Therefore, employees who report higher work engagement will also be inclined to report higher supervisor support observations. Inverse relationships were recorded between employee engagement and emotional exhaustion ($r = -0.69$; $p < 0.01$; Large effect) and turnover intentions ($r = -0.63$; $p < 0.01$; Large effect). This result means employees who report higher observations of work engagement will also report lower observations of emotional exhaustion and turnover intentions. Finally, the correlations show supervisor support is negatively associated with emotional exhaustion ($r = -0.61$; $p < 0.01$; Large effect) and intention to leave ($r = -0.62$; $p < 0.01$; Large effect). In reality, CRO employees who report higher observations of supervisor support will also report lower observations of emotional exhaustion and turnover intentions.

4.4 Group comparisons

The final section will report gender comparisons, age-interval comparisons, level of education comparisons, and work duration comparisons.

Table 4 below contains the results obtained from comparing observations in the present study between the male and female groups.

Table 4: Gender comparisons, needs satisfaction, work engagement, and perceived managerial support

Construct	Males			Females			Cohen's d
	Mean	Var	SD	Mean	Var	SD	
Satisfaction of self-determination needs*	3.18	0.64	0.80	3.67	0.34	0.58	0.45
Work engagement*	3.37	2.19	1.48	4.30	1.07	1.04	0.46
Supervisor support*	6.94	9.27	3.04	5.85	1.03	1.01	0.31
Emotional exhaustion*	2.81	2.66	1.63	1.99	2.02	1.42	0.35
Turnover intentions*	3.10	1.46	1.21	2.33	1.31	1.15	0.43

Note: * p-value was considered significant at $p < 0.05$.
 Var = Variance, SD = standard deviation.
 Cohen's d: ± 0.2 = small effect, not practical significant difference; ± 0.5 = medium effect, practical visible difference; ± 0.8 = large effect, practical significant difference (Steyn, 2000).

Source: Authors

Medium practical visible difference was observed for the satisfaction of self-determination needs ($d = 0.45$) and work engagement ($d = 0.46$). In both cases, females reported higher observations when compared to their male counterparts. Medium practical differences were also observed for supervisor support ($d = 0.31$), emotional exhaustion ($d = 0.35$) turnover intentions ($d = 0.43$). In this case, males recorded higher observations of perceived managerial support, emotional exhaustion, and turnover intentions when compared to female respondents.

Table 5 below contains the results from comparing observations for the age-interval demographical variable.

Table 5: Age interval comparisons, needs satisfaction, work engagement, and perceived managerial support

Construct	Age interval 26-35 years			All other age intervals			Cohen's d
	Mean	Var	SD	Mean	Var	SD	
Satisfaction of self-determination needs	3.50	0.45	0.67	3.47	0.56	0.75	0.03
Work engagement	3.98	1.52	1.23	3.92	1.88	1.37	0.03
Supervisor support	5.60	0.94	0.97	5.54	1.31	1.14	0.03
Emotional exhaustion	2.23	2.03	1.43	2.37	2.80	1.67	0.06
Turnover intentions	2.74	1.43	1.20	2.50	1.56	1.25	0.13

Note: * p-value was considered significant at $p < 0.05$.
 Var = Variance, SD = standard deviation.
 Cohen's d: ± 0.2 = small effect, not practical significant difference; ± 0.5 = medium effect, practical visible difference; ± 0.8 = large effect, practical significant difference.

Source: Authors

Only a small effect was observed for the turnover intentions' variable ($d = 0.13$), with the Age interval of 26-35 years reporting a slightly higher intention to leave. Based on the results of age comparisons, it can be argued that there are no practically significant differences in the age group for the constructs under investigation.

Table 6 contains the comparison results for the level of education demographical variable.

Table 6: Tertiary and all other qualifications comparisons, needs satisfaction, work engagement, and perceived managerial support

Construct	Tertiary			All other qualifications			Cohen's d
	Mean	Var	SD	Mean	Var	SD	
Satisfaction of self-determination needs*	3.54	0.44	0.66	3.34	0.66	0.81	0.19
Work engagement	4.01	1.52	1.23	3.46	2.17	1.47	0.13
Supervisor support*	5.68	0.90	0.95	5.26	1.66	1.29	0.26
Emotional exhaustion	2.25	2.25	1.50	2.43	2.89	1.70	0.08
Turnover intentions	2.59	1.52	1.23	2.71	1.47	1.21	0.07

Note: * p-value was considered significant at $p < 0.05$.
 Var = Variance, SD = standard deviation.
 Cohen's d: ± 0.2 = small effect, not practical significant difference; ± 0.5 = medium effect, practical visible difference; ± 0.8 = large effect, practical significant difference.

Source: Authors

Small effects, no practical differences were observed for satisfaction of self-determination needs ($d = 0.19$), employee engagement ($d = 0.13$), emotional exhaustion ($d = 0.08$) and turnover intentions ($d = 0.07$). A medium practical difference was observed for the supervisor support variable ($d = 0.26$), with the Tertiary qualifications group recording a higher observation compared to All other qualifications groups.

The final group comparison was conducted for the work duration demographical variable. Table 7 contains the results of the work duration comparison.

Table 7: Work duration comparisons, needs satisfaction, work engagement, and perceived managerial support

Construct	Work duration Five or fewer years			All other work duration levels			Cohen's d
	Mean	Var	SD	Mean	Var	SD	
Satisfaction of self-determination needs*	3.38	0.51	1.33	3.71	0.41	0.64	0.20
Employee engagement*	3.75	1.76	1.33	4.37	1.32	1.15	0.33
Supervisor support*	5.43	1.13	1.06	5.86	0.97	0.99	0.28
Emotional exhaustion*	2.52	2.40	1.55	1.82	2.12	1.46	0.31
Turnover intentions*	2.84	1.49	1.22	2.15	1.22	1.11	0.39

Note: * p-value was considered significant at $p < 0.05$.
 Var = Variance, SD = standard deviation.
 Cohen's d: ± 0.2 = small effect, not practical significant difference; ± 0.5 = medium effect, practical visible difference; ± 0.8 = large effect, practical significant difference.

Source: Authors

Medium effects of visible practical difference were observed between work duration of 5 or fewer years and all other work duration levels for needs satisfaction ($d = 0.20$), work engagement ($d = 0.33$), and supervisor support ($d = 0.28$). In all of these differences, the All-other work duration group recorded higher observations. These results imply that all employees working longer than five years at the organization under investigation reported higher satisfaction of self-determination needs, work engagement, and perceived managerial support. Medium effects were also observed for the emotional exhaustion ($d = 0.31$) and intention to leave ($d = 0.39$) variables. For the emotional exhaustion and intention to leave variables, respondents from the specific CRO, respondents working at the organization for less than five years, were more inclined to report emotional exhaustion and increased turnover intentions.

5. Managerial Implications

South African managers face several challenges, including recruiting and retaining critical staff. The excess talent demand in the pharmaceutical industry with an apparent shortage further contributes to these challenges. Therefore, knowledge of features that will assist with crucial staff retention will be valuable towards solutions. The current study aimed at providing such information with an

examination of the satisfaction of self-determination needs, supervisor support, employee engagement, and well-being in the highly demanding CRO industry.

In general, respondents were in agreement with the satisfaction of self-determination needs (Mean = 3.49), with the highest recorded observation on the competence variable. The majority of respondents reported employee engagement (Mean = 3.95) experiences at least once a week, with the elements of both vigour and dedication being dominant. Respondents were further of the opinion that their managers are supportive (Mean = 5.41). Furthermore, respondents reported emotional exhaustion at least once a month or less, while most participants disagreed on experiencing turnover intentions (Mean = 2.62).

The study found evidence to indicate significant relationships between the variables under investigation. Satisfaction of self-determination needs was positively associated with work engagement, positively associated with supervisor support, and negatively associated with emotional exhaustion and turnover intentions. The results further show that work engagement is positively associated with supervisor support, while an inverse relationship was observed for both emotional exhaustion and turnover intentions. Supervisor support also had an inverse relationship with both emotional exhaustion and turnover intentions.

In terms of group comparisons, a practical effect was found when comparing observations of satisfaction of self-determination needs, work engagement and supervisor support between males and females. Females reported higher satisfaction of self-determination needs and employee engagement, while Males reported higher observations for supervisor support, emotional exhaustion and turnover intentions. There was no statistical or practical difference when comparing observations between age groups. In terms of qualifications, statistical and practical differences were observed to satisfy self-determination needs and supervisor support, with the group reporting tertiary qualifications reporting higher observations. Regarding the duration of employment, statistical and practical differences were observed for all variables under investigation when comparing groups that have reported less than five years of work duration and All other work duration groups. The group with less than five years of work duration reported higher observations for emotional exhaustion and turnover intentions. All other work duration groups (more than five years) reported higher observations of the satisfaction of self-determination needs, work engagement and supervisor support. It would be advisable for organisations from this sector to develop an induction program for newly appointed employees on coping strategies, especially during high workload periods.

6. Conclusion

The study found evidence to support satisfaction of self-determination needs has a positive relationship with employee work and supervisor support. These findings confirm previous findings from unrelated industries on the importance of satisfaction of self-determination needs related to employee outputs, well-being, and supervisor support (Van den Broeck et al., 2016).

According to Baard and colleagues (2004), supervisor support is significantly related to satisfying employees' intrinsic needs for autonomy, competence, and relatedness. Previous findings from Williams et al. (2014) propose that supervisors' essential role in needs satisfaction is a sense of belonging for employees, acknowledgement, and appreciation. In addition, May et al. (2004) found evidence that supervisor support is positively associated with psychological safety, demonstrating the importance of a supportive supervisor. The literature further indicates that due to the supportive supervisor's ability to provide for feelings of psychological safety, subordinates experience a general willingness to dedicate themselves to work (Deci et al., 2017; May et al., 2004).

The lack of employee engagement could have detrimental financial implications, and both practitioners and researchers should not underestimate the importance. The absence of work engagement may also impact productivity and efficiency, especially in organizations that require skilled and efficient employees. There is growing evidence to confirm that employee engagement will improve productivity, organizational commitment, performance, and employee well-being while

reducing turnover intentions (Alfes et al., 2013). Work engagement has also been associated with higher customer satisfaction ratings, employees who stay longer with organizations, increased sales, and cost reductions (Shuck, 2011). Therefore, work engagement is fundamental to employee behaviour that should be enhanced to capitalize on all related benefits.

It seems that males report higher observations of supervisor support, emotional exhaustion and turnover intentions. The results imply that although males seem to be receiving more support (according to themselves), they have greater feelings of emotional exhaustion and turnover intentions. This specific result will require further investigation on the possible reasons for this observation. The results further demonstrate that employees with tertiary qualifications self-report higher satisfaction with self-determination needs and supervisor support. Therefore, CROs can benefit from developing and supporting the improvement of the qualification levels amongst employees.

Furthermore, groups with less than five years of work duration reported higher observations of emotional exhaustion and turnover intentions. Although CROs can benefit from employing younger staff, this might be at the cost of staff with less work duration, demonstrating higher emotional exhaustion and turnover intentions. Staff in this work duration group will require enhanced support.

Findings from this study provide insight into the productivity and value of CROs. With evidence of the association between satisfaction of self-determination needs and work-related outputs, managers and supervisors can focus their attention on encouraging the satisfaction of autonomy, competence, and relatedness. Enhanced levels of satisfaction with self-determination needs will, in return, be associated with higher observations of supervisor support and employee well-being. The results further confirm the inherent value of the SDT for understanding the relationships between employee engagement, supervisor support, emotional exhaustion and turnover intentions. Supportive supervisors in the CRO industry will attract and retain critical talent. Finally, CRO industries will also experience additional organizational benefits associated with enhanced employee engagement, reduced emotional exhaustion and turnover intentions. These organizational benefits can include enhancing productivity, reduced costs and eventually improved profitability.

7. Limitations and recommend future research

The study only collected data from office-based employees from the CRO industry. Future studies might consider collecting information on specific service areas. Given the significant differences discovered between male and female respondents, a qualitative examination might explain why females report higher observations of satisfaction of self-determination needs and employee engagement and males reported higher observations of supervisor support, emotional exhaustion and turnover intentions.

The convenience sampling does not allow for the generalization of results, and an alternative sampling strategy should be considered to allow the generalization of results. The quantitative cross-sectional design does not allow for conclusions on causality, and a longitudinal study will assist both practitioners and researchers in long-term solutions for the CRO industry. Due to the similarity in specific scales applied, common method bias will remain a possible limitation. Future studies should consider additional statistical reports (Harman's single-factor analysis) to eliminate this specific limitation (MacKenzie & Podsakoff, 2012).

It is known that the CRO and pharmaceutical industry, and in particular the contract research sector, regularly goes through events of stringent organizational restructuring to contain costs. An examination of the inherent leadership styles, including leadership styles required to manage staff in the CRO industry optimally, would further advance the topic of organizational behaviour.

Abstract

Employee empowerment catalyses employee motivation, and it is in that context that this research evaluates the concept of employee empowerment as a catalyst for employee motivation, job satisfaction, a better quality of customer services and productivity at Company X. The study used the qualitative research method with the effect that a sample of 40 participants comprising 20 managers and 20 employees were interviewed. Findings indicated that employee empowerment influences improved employee motivation. It was shared across the forty participants' views that empowerment gives employees the power to determine their destiny. All these have impacted positively on the improvement of the motivation of the employees of Company X. It was evident that apart from catalysing improved employee motivation, employee empowerment also improves job satisfaction, a better quality of customer services and productivity. Therefore, to ensure that employee empowerment catalyses employee motivation, job satisfaction, quality of customer services and productivity, it is recommended that the management of Company X should consider adopting strategies that encompass training and development, appropriate job design, the delegation of functions, employee involvement, and allocation of sufficient resources and top management support and commitment. Future research can explore the impact of employee empowerment on a firm's productivity.

1. Introduction

Employee empowerment is a catalyst for employee motivation. Employee empowerment offers employees significant autonomy and freedom (Dessler, 2015). Through employee empowerment, employees are allocated enormous discretion and powers to make critical decisions on how different tasks must be executed. Such a level of discretion and powers induce high employee motivation to accomplish all activities designated in the operational plan (Girdwichai & Sriviboon, 2020). Highly motivated employees tend to exhibit a high level of satisfaction and productivity. These, in turn, catalyse a business' overall effective performance.

Improved performance of a business arises from the fact that highly satisfied and motivated employees tend to be more creative and innovate better ways through which the allocated tasks must be accomplished (Mustafa & Bon, 2012). This improves not only operational efficiency, but also the quality of products and the quality of customer services. Highly empowered employees are often more satisfied and motivated to induce positive change in their attitudes and behaviours to handle customers in the way that spawns the overall quality of a business' customer services (Paais & Pattiruhu, 2020).

Yet, as the quality of customer services improves, a business' overall capabilities to attract and retain new customers tend to be enhanced. If combined with a business's existing customer base, this induces a rise in sales, revenue and the improvement of a business's overall financial bottom-line. Certainly, all these imply that the positive effects of employee empowerment are significantly associated with improved employee motivation, satisfaction and productivity that in turn spur a

¹ E-mail address: nomfundonkabindenzuza@gmail.com

² E-mail address: lsnngcobo@uj.ac.za

business' overall effective performance. Unfortunately, even if that is the case, facts from Company X suggest there is still less commitment and effort to ensure that the concept of employee empowerment is integrated as part of the strategies for leveraging its productivity and effective performance (Company X, 2018).

As Company X focuses on improving the efficiency of types of machinery rather than initiatives that bolster employee empowerment to catalyse employees' efficiency, such an approach has undermined quests of utilising employee empowerment as part of the performance improvement strategies. Thus, it is in that context that this research evaluates the impact of employee empowerment as a catalyst of employee motivation, job satisfaction, better quality services and productivity at Company X so as to identify its impediments and the remedial improvement initiatives that Company X can adopt. In other words, the notion that employee empowerment is still a challenge at Company X is reflected in the background information on Company X's approaches to business management and employee empowerment.

2. Problem Investigated

The research problem statement reflects the background and problems of employee empowerment, and motivation, job satisfaction, quality service, and productivity in Company X that motivate this research.

Company X is faced with a challenge of recognising employee empowerment as one of the strategies for improving employee motivation (Company X, 2019). Instead, management tends to use other motivation strategies like improvement of remuneration and usage of more efficient machineries to render work easier for employees, but without paying attention to the importance of employee empowerment (Company X, 2019). As Company X decentralises structures without cascading authority and power to make critical decisions to the lower-level employees, it has resulted in demotivation, job dissatisfaction, poor service delivery and decreasing productivity.

The implication is that Company X has not been able to achieve the desired productivity levels from the employees. It has also undermined its effective performance with the effect that although Company X continues to register annual turnover around R16 million, it has since 2011 failed to score its target of R20 million (Company X, 2019). At the same time, Company X's (2020) records imply that the overall performance of the employees has declined from 86% to 77%. To reverse this trend and turnaround the business' performance, Company X's management has opted to invest in heavy and more efficient machineries and equipment. It has also adopted the approach of intense monitoring and evaluation of employees' activities in conjunction with increasing employees' remunerations (Company X, 2019).

But as Company X uses such performance improvement measures, they have only induced little positive impacts on improving employees' productivity and performance. Reasons for poor performance is caused by the employees' perceptions that management seems not to care much about the wellbeing of the employees. Some employees also express dissatisfactions with the way things are done as well as the overall centralisation of decision-making. Combined with poor communication, this affects the overall good interpersonal relationship between the ordinary employees and top management.

There is an implication that employee empowerment is significantly associated with improved employee motivation and a firm's performance. But even if that is true, only a few studies have examined the impact of employee empowerment on employee motivation, job satisfaction, high service quality and productivity (Kemal, 2010; Dahou & Hacini, 2018:49). The same challenge is also reflected in Company X with the effect that, no study has ever examined how such challenges can be addressed to improve employee empowerment. Despite Kemal's (2010) research exploring the effects of employee empowerment on organisational performance, the nexus between employee empowerment and employee motivation is still to be examined. Similar gaps are also evident in Dahou and Hacini's (2018) study that examined the prerequisites of employee empowerment without

evaluating impact on employee motivation. Such approach limits the extent to which Company X can be motivated to embrace employee empowerment as a catalyst of employee motivation that in turn also leverages a business' effective performance

3. Main Research Objectives

- To analyse the impact of employee empowerment as a catalyst for employee motivation, job satisfaction, a better quality of services and productivity at Company X.

To accomplish the above indicated main research objective, the entire research process will be guided by the sub- research objectives which are to:

1. Examine the impact of employee empowerment on employee motivation, job satisfaction, a better quality of services and productivity at Company X
2. Develop strategies for improving the implementation of employee empowerment as a catalyst for employee motivation, job satisfaction, a better quality of services and productivity at Company X.

4. Research Question

4.1. Main Question (MQ)

MQ: What is the impact of employee empowerment on employee motivation, job satisfaction, a better quality of services and productivity at Company X?

4.2. Sub-questions (SQ)

While drawing from the research objectives and the main research question, the sub-questions that will guide this research are:

SQ1: What are the impacts of employee empowerment on employee motivation, job satisfaction, a better quality of services and productivity at Company X?

SQ2: Which strategies can be recommended for improving the implementation of employee empowerment as a catalyst for employee motivation, job satisfaction, a better quality of services and productivity at Company X?

As the study seeks to respond to these critical research objectives and questions, it will be guided by the fundamental reasoning of the theories and literature evaluated below.

5. Literature Review

The following sections provide a critical analysis of literature and theories that are relevant to the study. The first section examined the theories and literature on employee empowerment. It evaluated the approaches to employee empowerment, employee empowerment strategies and critical success factors for employee empowerment. The second section analysed theories on employee motivation. The theories which were examined encompass Maslow's (1979:44) hierarchy of needs, Herzberg's two-factor theory, Adam's equity theory, McClelland's theory of needs and McGregor's theory x and y. Such theories were evaluated against Company X's Policy on Employee Empowerment and Motivation prior to examining the impact of employee empowerment on the business's performance.

5.1. Employee Empowerment

Employee empowerment is a strategic process of granting employees with the necessary autonomy and powers to make critical decisions on how the allocated tasks and activities must be accomplished with minimal management intervention to achieve the desired business goals and objectives. It requires businesses to provide employees with the necessary skills and competencies. Decentralised structures, resources and decision-making powers needed to complete work must also be established (Alagarsamy, Mehrolia & Aranha, 2020). Employee empowerment enhances and builds trust between management and the ordinary employees. Besides leveraging job satisfaction, it also motivates and increases the rate of employees' productivity (Al-Makhadmah, Al Najdawi & Al-Muala, 2020).

Employee empowerment bolsters the overall degree of collaboration and liaison between management, supervisors and ordinary employees (Meyerson & Dewettinck, 2012). It aids smooth accomplishment

of operational activities and improves organisational performance. Employee empowerment induces “higher level of team spirit, self-confidence, innovation, independent thinking and entrepreneurship among the employees” (Insan, Astuti, Raharjo & Hamid, 2013).

Employee empowerment also induces the need for employees to act responsibly and accountably (Ibrahim, 2020). It allows management to develop equitable and performance-based reward systems. Thomas and Velthouse (1990) posit that employee empowerment connotes “an improvement in intrinsic motivation manifested in a set of four cognitions reflecting individual employee’s improved orientation towards the allocated tasks”. It creates an environment in which management and ordinary employees seamlessly collaborate and cooperate to ensure efficient accomplishment of organisational activities. This aids efficient and speedy achievement of organisational goals. Although employee empowerment is often associated with the redistribution of power, the utilisation of relevant employee involvement initiatives stimulates the desired level of commitment from the ordinary employees (Dahou & Hacini, 2018). The involvement of ordinary employees in management activities enables employee learning and feeling of empowerment.

Baumgartner (2014) points out that employee empowerment is analogous in that it grants ordinary employees decision-making powers, authority, and responsibility to utilise their skills in the accomplishment of the required activities. It also requires management to avail the employees with the necessary resources as well as physical and psychological support (Al-Dmour, Yassine & Al-Dmour, 2019).

Psychological empowerment is the “process of creating the mindset and feelings that support empowerment” (Raub & Robert, 2010:1743). To accomplish that, psychological empowerment requires embracement of meaningfulness of the job, competence, choice and impact as the four critical determinants for effective psychological empowerment. The higher an individual employee scores in each of these elements, the greater the sense of empowerment (Raub & Robert, 2010). However, to attain the desired positive outcomes on organisational performance, the overall process of employee empowerment often requires the utilisation of certain approaches for employee empowerment.

5.1.1. Approaches to Employee Empowerment

Employee empowerment process may require the utilisation of four main approaches that include “mechanical, organic, socio-structural and psychological approaches” (Hanaysha & Tahir, 2016)

5.1.1.1. Mechanic Approach to Employee Empowerment

Mechanical approach demands that top management to clearly share, delegate and cascade decision-making power and authority to the employees at the lower levels of the organisational structures (Varma & Chavan, 2020). This should be accompanied with measures for enhancing accountability and control to ensure activities are accomplished as planned (Sandhya & Sulphrey, 2019).

5.1.1.2. Organic Approache to Employee Empowerment

In this approach, lower-level employees are first empowered before allocating power and authority to the top management. The risk with the application of the organic approach is that it reduces managerial control over lower-level activities (Yuliandi, 2019). It is based on the belief that each employee has abilities and capabilities to accomplish the allocated tasks (Yuliandi, 2019). Hence, by adopting bottom-up empowerment approach it reinforces such a belief to stimulate the desired level of commitment and performance. However, for organic approach to empowerment to be successful, it must be applied in conjunction with the socio-structural approach (Yuliandi, 2019).

5.1.1.3. Socio-structural Approach

Socio-structural approach emphasises the requirement for establishing the structure that enable employee empowerment.(Orgambidez, Millan, Dominguez & Barrego, 2021:33). To achieve this, “socio-structural approach focuses on establishing or re-structuring the existing organisational structures, policies and practices to offer employees the necessary power and authority as well as

influence over their work roles”. However, for the application of socio-structural approach to be effective, it must be accompanied with the use of the psychological approach.

5.1.1.4. Psychological Approach

Psychological approach emphasises the need for the development and application of the strategies that enable the employees to feel empowered (Bindurani, 2015). It deals with the preparation of the mindset of the employees to feel empowered.

Other employee empowerment approaches include empower, enhance, engage and enable.

- *Empower* requires the delegation of relevant decision-making power and authority as well as access to resources and information (Martine, Pascale, Blomme & Jaap, 2021).
- *Enhance* is the process of creating relevant degree of autonomy to enable employees accomplish the allocated tasks with minimal intervention from management (Sharma & Bhati, 2017).
- *Engage* is the process of providing the necessary support to employees by encouraging them to use all their capabilities to achieve the desired outcomes (Sharma & Bhati, 2017).
- *Enable* deals with the establishment of relevant management framework that aids the empowered employees to achieve the outlined organisational goals and objectives (Wadhwa & Verghese, 2015).

5.2. Employee Empowerment and Motivation

Employee empowerment creates a framework through which individual employees are able to work independently of their managers (Voegtlin, Boehm & Bruch, 2015). This enables ordinary employees to utilise their skills and competencies with minimum supervision. In this regard, employees feel valued and they develop positive perception about their jobs. In the long-run, this catalyses improved employee motivation (Hanaysha & Tahir, 2016). Employee motivation is the high level of commitment, desire and effort that employees place in the accomplishment of tasks to enable achievement of organisational goals.

Yets employee empowerment positively influences motivation, employee job satisfaction, efficiency, productivity, product quality and the quality of customer services may also improve (Dahou & Hacini, 2018). Improved productivity arises from the fact that as employees are granted the discretion to execute their duties work they may choose to work for extra hours. Such increased level of commitment edifies the unit of output that a business produces per unit of labour (Busara, 2016). Better product quality and improved customer services create a bundle of value offerings that sets a business apart from its rivals (Sakapas, Parinya & Kittisak, 2019). This contributes to increased sales, revenue, market share and profitability (Gazzoli, Hancer & Park, 2010).

Employee motivation is the feelings and perceptions that drive employees to commit more effort in the accomplishment of tasks in order to attain the desired performance targets (Chen & Wang, 2019). In the event of successful implementation of employee empowerment programmes, employees perform more effectively. Several theories explain the notion of employee motivation (Ganji & Johnson, 2020). Such theories include Maslow’s (1979:44) “hierarchy of needs”, Herzberg’s “two-factor theory”, Adam’s “Equity Theory”, McClelland’s “theory of needs” and McGregor’s “theory X and Y” (Sahoo, Behera & Tripathy, 2010).

Abraham Maslow’s (1979) “hierarchy of needs theory” places human needs in a hierarchy, namely physiological, safety, affection and belongingness, esteem and self-actualisation needs (Li, Zhang, Xiao, Chen & Lu, 2019). Employee motivation is at the center of empowerment through fulfilling employees need to belonging, affection and the feeling of being a valued member of the organisation. This notion is supported by Herzberg’s “two-factor theory”, which heralds job satisfaction and motivation to be influenced by a combination of certain satisfiers and dissatisfiers. Satisfiers are

variables that induce improved job satisfaction and motivation whereas dissatisfiers are factors that often instigate job dissatisfaction and low motivation (Hunjra, UIHaq, Akbar & Yousaf, 2011:680).

As Herzberg notes, these satisfiers and dissatisfiers are often reflected in a combination of certain motivation and hygiene factors. Motivational factors are achievement, recognition, the work itself, responsibility, and advancement and growth (Hunjra *et al.*, 2011). The hygienic factors include supervision, working condition, interpersonal relationship, pay and job security and company policies. But contrary to Abraham Maslow's (1979:44) "hierarchy of needs theory", and Herzberg's "two-factor theory", Adams' "Equity Theory" argues that employees are often motivated and satisfied with their jobs depending on the fairness and equity at which they are treated in relation to their colleagues. In the event that employees feel that they are treated impartially and unfairly in relation to their colleagues, job dissatisfaction and low motivation may tend to set in. This contrasts with the situation where they perceive to be treated fairly and equitably (Lyu, Ji, Zheng, Yu & Fan, 2019).

Employees tend to evaluate fairness in terms of their contribution to their organisation and the rewards received vis-à-vis the contribution and rewards received by his colleagues. In that regard, Adams' "Equity Theory" notes that input applies not only the hours worked, but also to skill, tolerance, determination, enthusiasm, assistance to other employees, experience and sacrifice (Nurtati, Yanti & Untari, 2020). Output connotes the reward received that can be financial or non-financial like recognition, appreciation and promotions (Sharma & Bhati, 2017). Thus, to instigate improved employee job satisfaction and motivation, it is critical to balance input and output to employees across the organisation. This is because any form of imbalance can induce job dissatisfaction, low motivation and an array of undesired consequences that can affect a business' effective performance (Hanaysha & Tahir, 2016).

Even though such explanation elucidates on how job satisfaction and motivation or dissatisfaction and low motivation arise, in his book titled "The Achieving Society", McClelland still notes that employees are often motivated by three forms of needs that include need for achievement, affiliation and power (Putra, Dharmanegara & Yas, 2019). Need of achievement often arises from the challenge of success that drives one to work to achieve more and more as well as fear of failure that drives one to work hard in order to avoid failure. Employees that are motivated by the need for achievement are analytical and tend to take all risks and put extra efforts and commitment to exceed expectations.

But McClelland points out that as such employees achieve more and more to advance in the hierarchy, the need for achievement and power tend to be more valued than the need for affiliation (Batool & Akhorshaideh, 2017). Need for power is often associated with quests for career advancement and such employees tend to be aggressive, manipulative, demanding, ambitious, motivated and high performers when assigned vital tasks in an organisation. This contrasts with the employees with need for affiliation that tend to cherish and be motivated by the good relationship between him or her and fellow employees. As thus, such employees tend to be more motivated by the recognition and appreciation from fellow employees for the tasks accomplished (Harazneh, Adaileha, Thbeitatb, Afaneha & Khanfara, 2020). Such views however differ from the articulations in McGregor's "theory x and y" that emphasises that employees must be availed with the opportunity to utilise and apply the skills and competencies in the best way possible for the organisation to achieve the greatest good. In turn, such approach influences the overall improved employee motivation and effective performance of an organisation. Such reasoning is certainly also echoed in most policy documents on employee motivation.

5.3. Policy Document on Employee Empowerment

Employee empowerment documents stress the importance for the development and use of policies that integrate structural empowerment with psychological empowerment (Seyedeh, Lester, Vahid & Babak, 2021). In terms of the structural empowerment, such policy documents emphasise the need for the creation of systems, structures, regulations and policies that promote the structural employee empowerment. For psychological empowerment, policy documents require business managers to

develop and apply systems that would create a feeling of empowerment among the employees (Albalawi, Naughton, Elayan & Sleimi, 2019).

To enhance employee empowerment, the management of Company X have developed and used strategies that encompass training and development, delegation of duties to lower employees, development of workgroups, development of the human resource manual for employee empowerment, coaching and mentoring, and employee involvement. However, implementation has been a challenge. The policy is more on paper than practice.

5.4. Employee Empowerment and Productivity

Improved level of organisational productivity is one of the positive outcomes of successful implementation of employee empowerment initiatives. Capabilities of employee empowerment initiatives such as the establishment of decentralised structures in which employees plan and determine how they should accomplish their tasks positively leverages productivity (Ahmad, 2020). Due to the shared responsibility and accountability between management and ordinary employees, some of the employees may be tempted in such circumstances to even work extra hours to get the work done and achieve the desired results (Suriadnyana, 2020). This improves productivity. Productivity may also result from the tendency of employee empowerment to create autonomous and independent structures that render it possible for each employee to focus on his or her allocated tasks. This eliminates the duplication of tasks where managers and supervisors leave their allocated work and get involved in aiding the accomplishment of tasks allocated to ordinary employees (Singh & Singh, 2019).

As employees have the discretion to make critical decisions, they feel motivated and satisfied with jobs. This makes them to put more effort in the execution of their duties (Sakapas, Parinya & Kittisak, 2019: 734). With time, such consistent efforts may translate into high level of employee productivity, which bolsters overall organisational productivity. Unfortunately, Company X has not yet embraced employee empowerment.

5.4.1. Employee Empowerment and Quality of Product and Services

Improved quality of products and services are most likely to result from the implementation of employee empowerment initiatives. Granting employees power to make decisions as well as the necessary information and resources to discharge their duties may improve the overall level of creativity and innovation that improve the quality of products or services an organisation produces (Shakirah & Shah, 2020).

As a result of employee empowerment, motivated and committed employees are less likely to make mistakes and errors that negatively affect product quality (Iman *et al.*, 2020). Employee empowerment reduces employee frustrations and dissatisfactions at work. This contributes to the provision of better quality products and services (Eliyana, Ma'arif & Muzakki, 2019). However, facts from Company X imply that employee empowerment is less adopted strategy.

5.4.2. Employee Empowerment and Job Satisfaction

Employee empowerment may positively influence job satisfaction (Orgambidez *et al.*, 2021). If employees are given the autonomy to make critical decisions as well as power to access relevant information and resources, it improves their job satisfaction (Kumar & Kumar, 2017). High employee job satisfaction contributes to improved productivity and quality of products and services (Alhozi *et al.*, 2021). Unfortunately, at Company X decision-making and distribution of resources is centralised at the top.

In summary, as stated at the beginning of the literature review, empowerment literature was evaluated against employee empowerment, employee empowerment strategies and critical success factors for employee empowerment. And the second section analysed theories on employee motivation utilising Maslow's (1979) hierarchy of needs, Herzberg's two-factor theory, Adam's equity theory, McClelland's theory of needs and McGregor's theory x and y. These theories were reviewed against

Company X's Policy on Employee Empowerment and Motivation prior to examining the impact of employee empowerment on the business's performance. The literature review was guided by the secondary research questions (SRQs). SQ1 seek to understand the impact of employee empowerment on the employee motivation, job satisfaction, a better quality of services and productivity at Company X; and SQ2 seek to identify strategies that can be recommended for improving the implementation of employee empowerment as a catalyst for employee motivation, job satisfaction, better quality of services and productivity at Company X?

6. Research Design and Methodology

This section explains the research design and methodology used in the collection and analysis of primary data from the sample employees at Company X. To accomplish this, the study used the phenomenological research paradigm/the deductive reasoning, case study research strategy and qualitative research approach. In this section, the sampling approaches and relevant measures that were undertaken to bolster validity and reliability of the study will be explained.

, This study adopted a qualitative research approach and a case study research design to aid critical analysis of the specific situation of employee empowerment and its impact on employee motivation at Company X. The data collection instrument used was interviews. Thus, by using case study research design, the study will be able to undertake in-depth specific analysis of employee empowerment at Company X for necessary generalisation to be made on the impact, challenges and improvement strategies for any other company that may be facing similar issues. Also, the utilisation of case study research design was opted on the basis that it is time constrained and as thus use of lengthy research designs like experimental research design and the longitudinal research design would not render the study to be completed within the prescribed time. Qualitative research approach enables eliciting of in-depth rich narratives from the participants about the phenomenon being investigated (Saunders et al., 2009). Thus, it was interpreted that the case study as blended with qualitative research would aid thorough in-depth analysis to extract rich information that accurately responds to the following critical research questions:

- What are the impacts of employee empowerment on the employee motivation at Company X?
- Which strategies can be recommended for improving the implementation of employee empowerment as a catalyst for employee motivation, job satisfaction, better quality customer services and productivity at Company X?

In other words, all these will enable the study to achieve its overriding aim which is to evaluate the impact of employee empowerment on employee motivation at Company X so as to identify the challenges and the improvement strategies that can be adopted.

6.1. Target Population and Sampling

The population for study included all the 982 employees of Company X (Company X's Human Resource Policy, 2020). But drawing the sample population from this target population of 982 employees required the use of purposive sampling as a non-probability sampling technique. Data were collected from a sample of 40 participants from Company X. The participants comprised 20 managers and 20 employees. Since the objective of this research was to evaluate the impact of employee motivation at Company X, it was deemed that the use of a larger sample of 40 employees would offer critical insights on the dimensions and magnitude of the impact of employee empowerment on employee motivation at Company X. At the same time, the use of a larger sample of 40 employees also aided assessment of the dimension and magnitude of the effects of lack of employee empowerment on employee motivation if it is not adopted by Company X.

Use of a larger sample of 40 employees therefore reduced risks of biasness that would emerge from the opinions of different employees due to the variations of the impact of employee motivation on different employees or groups of employees. At the same time, use of a larger sample of 40 employees was also influenced by the fact that authors like (Wadhwa & Verghese, 2015; Bindurani, 2015; Hanaysha, 2016)., Bindurani (2015) and Hanaysha (2016) also used larger samples in the

range of 30 to 60 participants when examining the process for the implementation of employee empowerment. Nonetheless, non-probability sampling differs from probability sampling on the basis that it does not use chance and randomness in the process of determining the participants that must or must not be included in the sample population (Etikan & Kabiru, 2017).

6.2. Data Collection

Primary data from each of the 40 participants from Company X was collected using the semi-structured interviews. The semi-structured interviews were based on a pre-designed interview guide. However, further questions were still allowed to probe new issues emerging from the participants' responses. Design of the interview guide for semi-structured interviews was aligned with three research objectives and questions for this study. It comprised three sections. Section A assessed the strategies for improving employee empowerment at Company X. Section B evaluated the impact of employee empowerment on employee motivation at Company X. Section C examined the limitations of employee empowerment as a catalyst for employee motivation at Company X. Interviews were accomplished through face-to-face interactions with each of the 40 sample participants that included 20 managers and 20 employees from Company X until all the required data was collected..

6.3. Data Analysis

The data analysis method used in this study is thematic analysis. Thematic analysis is structured systematic process of evaluating the collected data to extract meaningful information that offers critical insights on the concept being researched. It is an iterative process of evaluating, extracting and reporting information about the issues being researched (Braun & Clarke, 2016). Thus, while using thematic analysis, the study used four steps to accomplish the data analysis. First step entailed data cleaning and reading and re-reading the interview text to familiarise with the concepts unfolding in the recorded participants' narratives. Second step entailed analysing the interview text and extracting main themes that are relevant to the studied phenomenon. The third step involved sub-subthemes as well as the accompanying narratives that elaborate on the main themes. Fourth step entailed drawing a thematic framework that links all the main themes to the sub-subthemes and their accompanying narratives to discern how the overall outcomes of thematic analysis offer coherent explanations on the impact of employee empowerment on employee motivation at Company X, its limitations and the improvement measures that Company X can adopt. Certainly, the use of thematic analysis aided effective response to the overriding research aim, objectives and questions of the study.

6.4. Validity and Reliability

Validity refers to the overall veracity and truthfulness of the research findings (Tashakkori & Teddlie, 2010). Reliability is the extent to which the outcomes of the research can be relied on to make relevant decisions (Tashakkori & Teddlie, 2010). To improve validity and reliability of this research, credibility is enhanced by comparing and contrasting the emerging qualitative research findings with theories. This aided evaluation of the extent to which the findings are supported or disputed by theories.

At the same time, credibility was enhanced by comparing and contrasting the views of each participant about employee empowerment on employee motivation at Company X with each other. This aided elimination of biasness as well as lack of truthfulness that could have been integrated in some of the responses of some participants. Credibility was further enhanced by ensuring that the sample population constituted of only the employees of Company X that are knowledgeable of the dynamics and complexities of employee empowerment issues at Company X. The Interview Research Guide used was also designed based on the research objectives and questions for the study. , During the analysis, interpretation and presentation of interview findings, verbatim quotes from the interview findings were also inserted in the presentation and discussions of the findings to ensure that the information that the participants from Company X conveyed was not distorted.

Design of the Interview Guide was accompanied with quests for ensuring that all statements and questions contained therein are unambiguous and simple for the participants to respond with relative ease. Further quests of ensuring the suitability of the Interview Guide entailed pilot testing on at least

three participants to discern the overall effectiveness of the Interview Guide. Issues that were highlighted by participants during the pilot testing were corrected prior to the commencement of the actual interviews.

Measures were also integrated to bolster the overall research ethics. A code of ethics is primary to ensure that the research community safeguards and protects the research participants involved in the research. Ethical behaviour on the part of the researcher is essential in any inquiry. An ethics application was lodged at the University of Johannesburg Business Management ethics committee, and ethics clearance was issued for the study.

7. Results and Findings

The results of the interviews are presented and discussed in this section. Results are presented and discussed based on the objectives, questions, and demographics of the study. In evaluating employee empowerment, it was determined whether it impacted motivation. The interview results are also discussed and contrasted with the theories and literature of the study to determine whether theories substantiate or refute the findings.

7.1. Demographical Information of Participants

Demographical information is reflected in the fact that whereas 23 participants were females, 17 were males. This is attributable to the fact that while using purposive sampling, the study mainly focused on interviewing the employees in the managerial positions that were considered to be well abreast with the issues of employee empowerment and motivation at Company X. Thus, with Company X being a labour intensive business, most of the managers are females as contrasted to the lower level employees and shop floor employees that are largely male. This explains the disparity in the females and males that participated in the study. The participants who participated in the interviews comprised 23 females and 17 males drawn from different functional departments. Thus, 12 were from human resource, 8 from manufacturing and production, 5 from marketing and sales, 10 from logistics and transportation, 5 communication and public relations and 10 from finance and accounts. Out of these, 15 had the work experience of 5-10 years, 20 had the work experience of 10-20 years, 10 had the work experience of 20-30 years, 3 had experience of 30-40 years and finally 2 had the experience of 40-50 years. Generally, these demonstrate that the participants in this study had the relevant experience and knowledge to participate in this study and offer critical insights that can be used for making decisions on employee empowerment issues. Thus, from these participants, the results of the interviews are as follows.

What are the impacts of employee empowerment on employee motivation at Company X?

Findings imply that apart from catalysing improved employee motivation, employee empowerment also improves job satisfaction, better quality of customer services and productivity.

Employee Motivation

Findings suggest that employee empowerment improves employee motivation. It was common across the views of the forty participants that empowerment provides employees with the power to determine their own destiny. This motivates the employees. Some of the participants explained that employee empowerment provides employees with the freedom to do what?. As compared to when there is frequent management intervention, they stated that empowerment motivates them to work even harder. Such a view is corroborated in the opinions of one of the interviewed employees who argued that:

“Empowerment provides us with the freedom to determine how the allocated tasks must be accomplished. As compared to when management intervenes quite frequently, this tends to motivate us to work even harder.”

In other words, the participants reiterated that they enjoy the freedom of working without frequent unnecessary management intervention and this motivates them. However, elements that motivate and empower employees were lacking in most of the employee empowerment and motivation initiatives at Company X. Literature considers critical elements for motivation, namely rewards/promotion, friendly environment, opportunity to grow, supportive management and challenging goals (Sharma &

Sahoo, 2014:174; Jones, 2013:190; Batool & Akhorshaideh, 2017:87; Kim, Murrmann, Gyumin & Thomas, 2012:10).

For example, reward requires the use of the appropriate financial or non-financial measures for rewarding employees (Sharma & Sahoo, 2014:174). The extent to which employees are availed with the opportunities to grow in their career often motivates them. Opportunity to grow can be availed by providing excelling employees with special assignments (Jones, 2013:190), and providing equal promotional opportunities to all employees (Jones, 2013:190). Some of the participants stated that as employees are empowered; it exposes them to more challenging tasks. In effect, they take such challenges as an opportunity to learn new things and develop.

Employee empowerment enables employees to self-manage themselves. This is stimulating and motivating as compared to working under the direct supervision of the management. Such a view is substantiated in the opinions of one of the employees who stated that:

“Empowerment is good. One becomes his or her own boss and it is motivating because there is no direct management supervision and interference. This motivates me as an employee.”

Job Satisfaction

It emerged from the findings that employee empowerment improves job satisfaction. The participants explained that empowerment contributes to improved job enlargement. This in turn increases the level of job satisfaction among the employees.. Such a view is accentuated in the opinions of one of the employees who stated that:

“Employee empowerment has motivated me a lot. Before I was working under direct management supervision and I could not contribute anything on how my work must be done. This affected my job satisfaction. However, after the implementation of empowerment initiatives, I was able to contribute to how my work must be done. This contributed a lot to my job satisfaction as well as motivation.”

Employee empowerment enables employees to feel their valued in the organisation. It improves job enrichment that in turn eliminates boredom that often cause stress to undermine effective activities' accomplishment. High level of autonomy to make critical decisions as well as power to access relevant information and resources enhances job satisfaction (Kumar & Kumar, 2017:33).

Quality of Customer Services

Findings imply that empowerment improves quality of customer services. The participants explained that empowerment makes them work more efficiently. This improves quality of customer services. Such a view is corroborated in the opinions of one of the employees who stated that:

“Since I am in charge of how the activities must be done, I will definitely work more efficiently. This will enable me to effectively respond to customer needs, which is good for the realisation of the effective performance of the business.”

Productivity

Findings indicated that employee empowerment improves productivity. Employee empowerment eliminates unnecessary interruptions from management as employees are discharging their duties. This speeds up accomplishment of tasks. Such a view is corroborated in the opinions of one of the employees who stated that:

“Empowerment has eliminated the need for frequent management intervention in the process of activities' accomplishment. This has caused the increment in the speed of activities' accomplishment. Most of the employees feel inconvenienced by frequent unnecessary management intervention in the process of activities' accomplishment. Hence, the elimination of such unnecessary interventions cause increment in speed and subsequently improved productivity.”

Such interview findings support theoretical reasoning that decentralised structures in which employees plan and determine how the organisational activities must be accomplished improves productivity (Kim *et al.* 2012:10).

Certainly, it is evident that apart from catalysing improved employee motivation, employee empowerment also influences improvement of job satisfaction, better quality of customer services and productivity.

Even though findings indicated employee involvement enhances employee empowerment, some of the participants still pointed out that employee involvement is ineffective. They explained that although management encourages everyone to contribute through the suggestion box, such views are not considered. As they explained, the implications are latent in the fact that it is not surprising to suggest one thing and find out that the decision made did not take into consideration the suggestion made by the employees. This according to most of the participants affects the use of employee involvement as an empowerment tool. Besides such a limitation, some of the participants also noted that the representatives who sit in the top management decision-making bodies do not do much because they sit as subordinates and not as managers. This affects their capabilities to effectively contribute. Nevertheless, despite such a view, it was still evident that findings indicated that the strategies which are used for improving the implementation of employee empowerment at Company X encompass training and development, delegation of duties to lower employees, development of workgroups, integration of empowerment issues in human resource manual, coaching and mentoring, and employee involvement. All these have impacted positively on the improvement of the motivation of the employees of Company X. It is evident that apart from catalysing improved employee motivation, employee empowerment also influences improvement of job satisfaction, better quality of customer services and productivity. However, despite such a finding, quests to ensure that employee empowerment influence improved motivation seem undermined by a combination of certain limitations. Findings indicate that the limitations of employee empowerment as a catalyst for employee motivation at Company X encompass fear of the disastrous effects of empowerment, lack of management commitment, poor skillfulness of the employees, lack of resources and high level of labour turnover. Against this backdrop, the discussions in the next chapter document the general conclusion and recommendations of the study.

8. Managerial Implications

This research suggests that employee empowerment is one of the pivotal strategies that can be employed by organisations that seek to improve employee motivation and performance. To ensure the successful implementation of employee empowerment as a catalyst for employee motivation, it is recommended that the management of Company X must consider adopting the strategies that encompass:

- It is critical that the management of Company X adopts training and development as part of the strategies for ensuring the successful implementation of employee empowerment initiatives. This is attributable to the fact that findings indicated that poor skillfulness of the employees is one of the challenges marring the successful implementation of employee empowerment initiatives at Company X. Training will have to focus on building the management competencies of the selected employees. It will also focus on improving the decision-making competencies of the employees such as supervisors who are in key management positions. Training and development must also be accompanied with the use of coaching and mentoring. In terms of coaching and mentoring, the management can select employees who are given coaches and mentors. Such training and development programmes will prepare the employees for assignment of more complex tasks. This would improve the successful implementation of employee empowerment initiatives. However, as training and development is being undertaken, it must be accompanied with the initiatives for ensuring that jobs are appropriately designed.
- To enhance the successful implementation of employee empowerment measures, the management of Company X must also ensure that there is appropriate job redesign. Jobs must be redesigned in the way that they allow the empowerment of the employees. To accomplish this, jobs must be designed in the way that do not only facilitate the effective accomplishment of the allocated tasks, but also provide powers over decision-making. This would require the management of Company X to integrate the principles of job enlargement and job enrichment

to make the job more interesting. Such a view is accentuated in the fact that it was pointed out in the findings that there is a challenge of employee retention. The application of the principles of job enlargement and job enrichment will expand a variety of the tasks that the employees are expected to accomplish. This will improve the effectiveness of the empowerment process. However, the application of such measures must be accompanied with the delegation of functions.

- The management of Company X will have to adopt delegation of management functions if they are to ensure the successful implementation of employee empowerment. Delegation of functions will enable management to watch if the employees can be allowed to work independently and autonomously. This can be accomplished by delegating management functions to the lower-level managers and employees. This will improve Company X's quests to empower their employees. However, such initiative will have to be accompanied with the use of the concept of employee involvement.
- The use of employee involvement is the other strategy that the management of Company X can apply to ensure the successful implementation of employee empowerment. This can be accomplished by appointing representatives of the employees' workgroups that participate in management decision-making processes. It may also require the development and use of suggestion box to ensure that each and every employee contributes to the decision-making processes. These would improve the empowerment of the employees. However, as such initiatives are being undertaken, it must be accompanied with the initiatives for ensuring that sufficient resources are allocated for the implementation of employee empowerment measures.
- The management of Company X must also ensure that sufficient resources are allocated for the implementation of the empowerment measures. This is attributable to the fact that findings indicated that there is a challenge of lack of resources for the implementation of empowerment measures. To reverse this, the management of Company X must not treat expenditure on employee empowerment initiatives as expenditure. Instead, they should treat it as an investment because the implementation of employee empowerment initiatives is associated with enormous values such as improved motivation, better quality of customer services and improved productivity and job satisfaction. All these would impact positively on the performance of Company X if they were to invest in employee empowerment. Yet, as such measures are being implemented; management must also provide the necessary support and commitment.
- Top management of Company X must also provide the necessary support and commitment to ensure the successful implementation of employee empowerment measures. Such a view is attributable to the fact that findings revealed that there is a challenge of top management support and commitment. Instead of viewing employee empowerment as a waste of time, the top managers at Company X must view it as a performance improvement measure. They need to provide the necessary support and commitment to ensure that the implementation of employee empowerment measures is successful.
- Future research can explore the impact of employee empowerment on a firm's productivity. This is attributable to the fact that most of the previous and existing studies only focus on examining the process for the implementation of employee empowerment. On the otherhand, other studies only evaluate the effects of employee empowerment on the general organisational performance. Even though such studies have enriched the existing theories and literature on employee empowerment, they have still not gone into details to examine how employee empowerment directly edifies specific areas of concern like employee motivation, productivity and product quality. Since, this research has already explored the direct impact of employee empowerment on motivation; future research can deal directly with the impact of employee empowerment on specific areas like productivity. Such studies must not only examine the direct effects of employee empowerment on employee productivity, but also how it translates into improved overall organisational productivity. Combined with the outcome of this research, such future studies will influence companies like Company X to treat employee empowerment issues seriously.

- Once company executives recognise and gain insights into the fact that employee empowerment is actually one of the critical influencers of productivity, lower operational costs, better quality, motivation and better organisational performance that translate into increased profitability, they will not be reluctant anymore to successfully implement employee empowerment programmes in their organisations. In other words, company executives' recognition of the significant values of employee empowerment will improve company executives and top management's buy-in to eliminate the politics and scepticisms at the company executive level and senior management that often undermine successful implementation of employee empowerment programmes. However, to achieve that, future research must focus on evaluating the direct impact of employee empowerment on productivity because it is productivity that most of the company executives are often concerned about. In other words, such reasoning is further echoed in the managerial implications of this research. In that context, future research may also evaluate management's take on employee empowerment and its impact on motivation/productivity.

9. Conclusion

In this section, the study's general conclusions and recommendations are presented. The conclusion section offers insights into the critical primary and secondary research findings. Against the vital preliminary findings in the conclusions, recommendations are detailed to high the improvement strategies that Company X must adopt to improve the implementation of its employee empowerment as an influencer of employee motivation, job satisfaction, better quality customer services and productivity.

Findings imply that apart from catalysing improved employee motivation, employee empowerment also influences improvement of job satisfaction, better quality of customer services and productivity. It was common across the views of the forty participants that empowerment provides employees with the power to determine their own destiny. This tends to motivate the employees. Some of the participants explained that employee empowerment provides employees with the freedom. As compared to when there is frequent management intervention, they stated that this motivates them to work even harder. In other words, findings imply that the fact that empowerment provides the ordinary employees with the power and decision-making authority tends to motivate the employees. Yet, as the employees are motivated, findings indicated that they also tend to realise improved level of job satisfaction. It emerged from the findings that employee empowerment influences improved job satisfaction. The participants explained that empowerment contributes to improved job enlargement. As they stated, this causes a variety of tasks that eliminate boredom. They revealed that this renders the work more interesting to increase the level of job satisfaction among the employees. Meanwhile, some of the participants stated that the fact that employees are granted power and authority over decision-making tends to render the work more motivating and satisfying. They explained that empowerment makes an employee becomes his or her own boss in determining how the allocated tasks must be accomplished.

Yet, as job satisfaction improve; it also tends to impact positively on improved quality of customer services. The participants explained that as employees become satisfied and motivated as a result of empowerment, it tends to render them to work more efficiently. As they stated, improved efficiency impacts on the quality of customer services. In turn, they explained that this causes the attraction and retention of customers from the competitors. Improved efficiency renders it possible for the business to effectively meet customer needs. This influences the overall improvement of an organisation's effective performance. However, despite such a finding, quests to ensure that employee empowerment influence improved motivation seem undermined by a combination of certain limitations.

Findings indicate that the limitations of employee empowerment as a catalyst for employee motivation at Company X encompass fear of the disastrous effects of empowerment, lack of management commitment, poor skillfulness of the employees, lack of resources and high level of labour turnover. The participants explained that management fear that granting the ordinary employees control and power over decision-making authority would distort the effective process for

activities' accomplishment. They reiterated that management feels that granting powers to the ordinary employees would affect the capabilities of the business to achieve its strategic goals and objectives. In other words, findings imply that management fear losing control. This would affect the performance of the business. Findings suggest that some of the managers feel that empowerment in practical sense cannot work. This has affected the implementation of empowerment measures at Company X. In other words, there is a challenge of management commitment.

As findings indicated, some of the managers were found to state that empowerment cannot work. In effect, it was common across the views of most participants that issues of employee empowerment are only raised by management as a formality without real effort to ensure that it is implemented. As the participants noted, this affects the successful implementation of employee empowerment initiatives at Company X. The participants explained that this is reflected in the fact that although empowerment issues are integrated in the human resource manual, there is little effort to ensure that it is implemented.

However, besides lack of management commitment, findings indicated that challenges are arising from the poor skillfulness of the employees. Most of the managers stated that even if management is committed to enforce the implementation of empowerment, the challenge remains the poor skillfulness of most of the employees. They explained that the challenge is that Company X employees a large number of semi-illiterate employees that cannot be entrusted with powers over decision-making. Even though efforts have been undertaken to train them, the managers noted that there is still a large number of semi-illiterates who are mainly employed in the farms and factory. This undermines the successful implementation of empowerment initiatives. Yet, as findings indicated, this is further compounded by lack of the required resources. In other words, the employee empowerment and motivation approach being used at Company X contradicts the approach articulated in theories and literature on employee empowerment and motivation.

Servant Leadership and Engagement: The Role of Trust in Selected South African Universities

Mr Janico Louw^{1,*}, Prof Leon Jackson²

^{1,2} NWU Business School, North-West University, Potchefstroom, South Africa

Keywords

Servant leadership; work engagement; trust; academic staff; South Africa, university; higher education institutes

Abstract

The study aimed to assess the role of trust in the relationship between servant leadership and work engagement of academic staff in four selected South African universities. A cross-sectional survey design was employed, using non-probability sampling (N=206). The Servant Leadership scale, Utrecht Work Engagement Scale and the Trust In/Loyalty to the Leader scale were utilised to measure the study constructs. Results indicated that servant leadership was related to trust, while both servant leadership and trust serve as predictors for work engagement. Recommendations for practical implantation and future studies are provided, after addressing the limitations of the study.

1. Introduction

Reports in both print and electronic media are indicative of moral bankruptcy in contemporary South African society. In addition to the economic and political crisis faced in the country, the prevalence of disturbing pathologies renders South Africa an ailing society (Sekhauelo, 2021:1). Taking into account the endemic spread of corruption (De Klerk & Solomon, 2019:69-73; Odeku, 2018:44-45; Sekhauelo, 2021:5-6) and the increase in voter apathy (Wolhuter *et al.*, 2020:1), it can be argued that voters have lost faith in leadership to serve the interest of the general public instead of their own. Unfortunately, the higher education sector has not remained untainted by acts of crime and corruption (Hunter, 2017; Pijoos, 2022; Pityana, 2020; Singh, 2020). Recent breakdowns in leadership and governance in three South African universities are indicators of pervasive corruption that has infiltrated key management structures (Kobokana, 2022; Pityana, 2020).

Servant leadership can be described as a serving-oriented, people-centred and morally-inclined approach to leadership (Liden *et al.*, 2014a:6; Sendjaya *et al.*, 2008:405; Van Dierendonck, 2011:1228), as first introduced by Greenleaf (1970:1-28) in the 1970s. Fundamental to this concept is the willingness to serve, prioritise the needs of others (Eva *et al.*, 2019:114) and behave ethically (Liden *et al.*, 2015:255). The focus on service and morality offers a solution to address the problem of a lack of integrity and the moral decay experienced in South African higher education.

Fostering a positive psychological perspective instead of focusing on the negative can help stakeholders in higher education to generate constructive outcomes to address problems (Seligman and Csikszentmihalyi, 2000:7). The other-centred perspective of servant leadership is suggested to have a positive influence on the work engagement of academic staff (Aboramadan *et al.*, 2020b:626). Thereby, this perspective provides not only a remedy for the spread of crime and corruption (Kgatle, 2018:7; Manala, 2014:262) in the higher education sector but also a way to counteract its adverse effects on work engagement (Friesenbichler *et al.*, 2018:71).

This paper aims to assess whether servant leadership behaviours exhibited by academic managers have a positive impact on the work engagement of academic staff and to determine the role of trust in this relationship. The remainder of this paper follows the following structure: The next section clarifies the research problem, followed by the literature review of the constructs examined in the study. The succeeding section introduces the research questions and objectives. The paper continues with a description of the research method, after which the results and findings of the study are

presented and discussed. The paper concludes with theoretical contributions, practical recommendations, limitations and the identification of potential future research.

2. Problem Statement

Systemic corruption in private and public institutes, moral decay, voter apathy, failing NDP objectives for Higher Education and significant levels of dropout rates are rampant in South Africa (Bureau for Economic Research, 2020:18; De Klerk & Solomon, 2019:69-73; Mkhize & Otu, 2018:161; Odeku, 2018:44-45; Sekhaulelo, 2021:5-6; Wolhuter *et al.*, 2020:1). These problems beg the question of what is causing these negative social phenomena and what can be done to stop these occurrences. The lack of moral leadership in the South African social fibre and the serving of self-interest are possible explanations for the pervasiveness of these negative impacts (Ebekozi, 2019:52; Hope, 2017:4). Further to the argument is the prevalence of leadership in serving the best interest of others, empowering communities and prioritising ethical behaviour to offer a solution to combat and reverse the adverse effects of these elements (Kgatle, 2018:7; Manala, 2014:262; Manara *et al.*, 2020:11).

It is also important to consider how inefficiencies in the Higher Education system and the arguable lack of servant leadership at universities affect the personnel working at higher education institutions and their willingness to engage in their work optimally. Even though the relationship between servant leadership and work engagement in the context of Higher Education has previously been confirmed (Aboramadan *et al.*, 2020b:626), it remains to be examined in the South African Higher Education context, a gap this research paper aims to address. Likewise, the positive relationship between servant leadership and trust has been well established in previous research, but not necessarily in the context of Higher Education. The same goes for the positive relationship between trust and work engagement.

It is worth considering whether trust can be used as a mechanism to facilitate work engagement in academic staff through the presence of servant leadership behaviour in academic leaders. In other words, the question can be posed: what role does trust in the academic leader have in the relationship between servant leadership characteristics displayed by the leader and the extent to which academic staff are fully engaged in work?

The main purpose of this study was to investigate the role of trust in the leader in the relationship between servant leadership characteristics displayed by academic leaders and the work engagement of academic staff. The study followed two conceptual frameworks. The first model assumed a unidimensional perspective of study variables, as illustrated in Figure 1 below.

Figure 1: The proposed conceptual framework, based on global constructs

The second model investigated the role of trust in the relationship between servant leadership and work engagement by breaking down work engagement into the sub-variables of vigour, dedication and absorption, as demonstrated in Figure 2 below. The study also aimed to make recommendations for future research and higher education institutes regarding ways to improve the work engagement of academic staff through the employment of strategies that build servant leadership and trust.

Figure 2: The proposed conceptual framework, based on the sub-variables of work engagement

3. Research Questions

The primary question of this study concerns itself with the following: What is the role of trust in the relationship between servant leadership and the work engagement of academic staff in South African universities?

The following secondary questions were formulated to support the answering of the primary research question:

- What is the relationship between servant leadership and work engagement and its components in academic staff in South African universities?
- What is the relationship between servant leadership and trust in academic staff in South African universities?
- What is the relationship between trust and work engagement and its components in academic staff in South African universities?
- Does trust serve as a mediator in the relationship between servant leadership and engagement and its components amongst academic staff in South African universities?
- Does trust serve as a moderator in the relationship between servant leadership and engagement and its components amongst academic staff in South African universities?
- Do servant leadership and trust serve as significant predictors of engagement and its components amongst academic staff in South African universities?

4. Research Objectives

The primary objective of the study was to determine the role of trust in the relationship between servant leadership and the work engagement of academic staff in South African universities. The following secondary objectives were formulated to support the achievement of the primary objective:

- To evaluate the relationship between servant leadership and work engagement and its components in academic staff in South African universities.
- To determine the relationship between servant leadership and trust in academic staff in South African universities.
- To establish the relationship between trust and work engagement and its components in academic staff in South African universities.
- To determine the mediating role of trust in the relationship between servant leadership and engagement amongst academic staff in South African universities.
- To determine the moderating role of trust in the relationship between servant leadership and engagement and its components amongst academic staff in South African universities.
- To determine if servant leadership and trust serve as significant predictors of engagement and its components amongst academic staff in South African universities.

5. Literature Review

5.1. Servant leadership

5.1.1. The conceptualisation of servant leadership

Many prominent business and leadership theorists regard service as one of the most critical attributes contemporary leaders require in the 21st century (Dannhauser, 2007:19). Although power is inherently associated with leadership, according to Nair (1994:59), it exists only to serve. Servant leadership as first introduced by Greenleaf (1970:1-28) is a people-centred, serving-oriented and morally-inclined leadership perspective (Liden *et al.*, 2014a:6; Sendjaya *et al.*, 2008:405; Van Dierendonck, 2011:1228). Greenleaf (1977:13) describes the servant leader as a servant first, from which a conscious decision is made to lead in selfless service to others. The servant leader's responsibility extends beyond prioritising the needs of individual followers to serving society as a whole (Liden *et al.*, 2008:162). Parris and Peachey (2013:378) summarise servant leadership theory as a focus on serving others through recognising that the purpose of organisations is not to achieve the self-interest of its leaders but to develop people who foster the building of a brighter future for the greater community.

In a recent systematic review of the core characteristics of servant leadership, Eva *et al.* (2019:114) offer an integrative definition consisting of the motive, mode and mindset of the servant leader. In this three-feature definition, servant leadership is defined as (1) an other-oriented approach to leadership (2) established through the individualised prioritising of follower needs and interests, (3) and the outward reorientating of the leader's concern for self towards a concern for others within the organisation and the wider community (Eva *et al.*, 2019:114). Importantly, an additional undertaking of the servant leader is to nurture followers into becoming servant leaders, through the behavioural modelling of serving others (Greenleaf, 1977:14; Xu *et al.*, 2020:46).

Drawing on the key foundational elements of servant leadership laid by Greenleaf, Spears (1995:4-7) offers elaborated explanations of the ten servant leadership characteristics of listening, empathy, healing, awareness, persuasion, conceptualisation, foresight, stewardship, commitment to the growth of people and building community (Spears, 2010:27-29). The first generally accepted servant leadership measure was designed by Ehrhart (2004:93), which consists of 14 items and measures the seven dimensions proposed by Ehrhart (Eva *et al.*, 2019:112; Liden *et al.*, 2014a:3; Xu *et al.*, 2020:51). The seven dimensions comprise: putting followers first, possessing conceptual skills, ethical behaviour, assisting followers to succeed and grow, forming relationships, empowering followers and creating value for the community (Ehrhart, 2004:67-70). Another prominent conceptual framework proposed by Sendjaya *et al.* (2008:406-409) identifies six dimensions of servant leadership, consisting of voluntary subordination, authentic self, covenantal relationship, responsible morality, transcendental spirituality and transforming influence. Based on a literary analysis and interviews conducted with servant leaders, Van Dierendonck and Nuijten (2011:251-252) selected eight elements deemed most appropriate to indicate servant leadership, namely empowerment, accountability, standing back, humility, authenticity, courage, interpersonal acceptance and stewardship.

Based on the existing taxonomies of servant leadership (Barbuto & Wheeler, 2006:300-326; Page & Wong, 2000:69-110; Spears & Lawrence, 2002:1-414), Liden *et al.* (2008:162) initially identified nine characteristics of servant leaders, but subsequently reduced the dimensions to seven (Liden *et al.*, 2008:169; Liden *et al.*, 2015:255). The first taxonomy, emotional healing, is the degree to which a leader shows concern for the well-being and personal matters of subordinates. The second, creating value for the community, indicates the extent to which the leader promotes and assists in community participation. Thirdly, conception skill refers to the problem-solving ability of a leader and the competency to conceptualise organisational objectives. Fourthly, empowering reflects the degree to which a leader creates opportunities for followers to possess autonomy, responsibility and influence, through the manifestation of trusting relationships. Fifthly, helping subordinates grow and succeed indicates the commitment of a leader to empowering subordinates to reach their full career potential. Sixthly, putting subordinates first shows how a leader prioritises the needs and pursuits of followers above their own. Lastly, behaving ethically infers that a leader serves by building trust, modelling integrity and acting with honesty.

5.1.2. Consequences of servant leadership

Since the conceptualisation and measurement of servant leadership are well established, researchers have turned to investigate the consequences of servant leadership (Xu *et al.*, 2020:52). Servant leadership has the potential to provide positive consequences to a variety of stakeholders, namely employees, the organisation, customers and the community (Xu *et al.*, 2020:55). The importance of servant leadership, especially in South African Higher Education's current corruption climate, is found in its association with positive psychological employee and organisational outcomes to reverse the adverse effects of corruption. In other words, corruption is less likely to occur when employees are, for instance, engaged (Schaufeli, 2018:103), satisfied (Tafolli & Grabner-Kräuter, 2020:1360) and committed to the organisation (Fu, 2014:141; Okpara & Wynn, 2008:946).

Servant leadership has been found to enhance job performance (Bayram & Zoubi, 2020:1775; Chiniara & Bentein, 2016:135; Liden *et al.*, 2014b:1445; Van Dierendonck, 2011:1249), increase job satisfaction (Aboramadan *et al.*, 2020a:575; Barbuto & Wheeler, 2006:316; Cerit, 2009:615; Chan & Mak, 2014:281; Mayer *et al.*, 2008:192), lead to more engaged employees (Aboramadan *et al.*, 2020b:627; Carter & Baghurst, 2014:461; Coetzer *et al.*, 2017:19; De Clercq *et al.*, 2014:201; De Sousa & Van Dierendonck, 2017:21), foster organisational commitment (LaPointe & Vandenberghe, 2018:109; Liden *et al.*, 2008:174; Miao *et al.*, 2014:738; Van Dierendonck *et al.*, 2014:559) and reduce stress levels (Babakus *et al.*, 2011:25; Jaramillo *et al.*, 2009b:269). The most common examined follower behavioural outcome associated with servant leadership is likely that of organisational citizenship behaviours (OCB), which have been found to yield a positive relationship in numerous studies (Chiniara & Bentein, 2016:135; Hunter *et al.*, 2013:325; Liden *et al.*, 2015:264-265; Mahembe & Engelbrecht, 2014:8; McCallaghan *et al.*, 2020:381; Newman *et al.*, 2017:58; Panaccio *et al.*, 2015:670; Shim *et al.*, 2016:15; Walumbwa *et al.*, 2010:526; Zhao *et al.*, 2016:909). Findings have also indicated a positive relationship between servant leadership and the reduction of negative employee attitudes, such as intentions to quit (Hunter *et al.*, 2013:327; Jang & Kandampully, 2018:135; Jaramillo *et al.*, 2009a:358; Liden *et al.*, 2014b:1446), burnout (Babakus *et al.*, 2011:25; Upadyaya *et al.*, 2016:106), workplace deviant behaviour (Sendjaya *et al.*, 2019:950; Verdorfer *et al.*, 2015:245) and job cynicism (Bobbio *et al.*, 2012:239; Chi *et al.*, 2020). According to Xu *et al.* (2020:59), the lessening of negative employee outcomes can be explained through the impact of fundamental processes associated with servant leadership, such as its ability to foster a serving culture (Liden *et al.*, 2014b:1446), build a climate of trust (Ling *et al.*, 2017:64) and satisfy the basic psychological needs of followers, including that of autonomy, competence and relatedness (Chiniara & Bentein, 2016:135; Mayer *et al.*, 2008:192; Van Dierendonck *et al.*, 2014:559).

Despite the many positive aspects that have been identified, servant leadership also possesses potentially harmful consequences. Less researched than the benefits, the dark side of servant leadership can be experienced by followers, the leader and the organisation. For followers, servant leadership is not the leadership style by which all prefer to be led. Especially in cultures prone to high power distance, the close-relationships servant leaders form with followers might result in discomfort in followers (Xu *et al.*, 2020:64). In a recent study, Lacroix and Verdorfer (2017:8) identified a small but significant tendency in servant leadership followers to experience leadership avoidance, possibly due to the perception that leadership standards are too overwhelming. Followers might also be manipulated by disingenuous leaders portraying servant leadership attributes, but only as a means of selfish gain (Stone *et al.*, 2004:358) and, in doing so, fail to meet the servant-first essence of servant leadership.

For servant leaders, the potential harm is found in experiences of emotional fatigue, work overload, role ambiguity and role conflict (Liden *et al.*, 2014a:5) caused by indicators of short- and long-term strain associated with servant leadership characteristics (Rivkin *et al.*, 2014:67-68). In contrast to the improved quality of family life found in followers (Wang *et al.*, 2017:399; Zhang *et al.*, 2012:761), servant leaders experience an increase in work-life conflict, brought on by emotional exhaustion (Liden *et al.*, 2014a:5; Tang *et al.*, 2016:293; Zhou *et al.*, 2020:7). Engaging in daily servant leadership behaviour may result in experiences of self-control depletion for leaders and consequently a disengagement from leadership responsibilities (Liao *et al.*, 2021:1207). For organisations, the

potential harm is associated with the high regard servant leaders place on enhancing the well-being of all stakeholders served. The balancing of needs, interests and desires from multiple stakeholders can be troublesome, particularly in instances where needs, interests and desires are conflicting (Xu *et al.*, 2020:66). Scenarios where servant leaders prioritise the well-being of others over that of the organisation raise concern for the adverse consequences of servant leadership in organisations (Andersen, 2009:11-12).

5.2. Work engagement

5.2.1. The conceptualisation of work engagement

Work engagement stems from the increased attention positive psychology has received over the last two decades. Positive psychology moves beyond the traditional perspective of disease, disorder, damage and disability; it also examines the strength and virtues of human beings (Seligman & Csikszentmihalyi, 2000:7). The purpose of which is to study the strengths and optimum performance of individuals, exploring the human resources that positively affect psychological capabilities (Barkhuizen & Rothmann, 2006:38).

The first proposal toward a conceptualisation of engagement at work was put forward by Kahn (1990:694), who defines engagement as the act of harnessing oneself to a work role through the expression and application of the individual physically, emotionally and mentally while performing work. Otherwise stated, engaged employees are driven to put additional effort into their job for the reason that they identify with it (Schaufeli & Bakker, 2010:12). Kahn (1990:700) continues by explaining personal engagement as the concurrent employment and expression of an individual's ideal self in activities that facilitate personal presence, active job performance and connection with work. Engagement is therefore a motivational concept driven by the investment of personal resources that results in physical, emotional and cognitive dimensions, creating a connection between employees and their work roles (Rich *et al.*, 2010:617).

The opposite of personal engagement is personal disengagement and is described as an individual's withdrawal from the behaviours that facilitate the connection with work, consequently leading to performing work activities at an emotional and cognitive distance (Kahn, 1990:702). Based on the foundation of Kahn, Rothbard (2001:656) presents engagement as a two-dimensional construct that consists of attention and absorption. Attention refers to the intellectual capacity and amount of time spent thinking about work, while absorption represents the extent to which a person is engrossed in their work and the intensity of their focus (Rothbard, 2001:656). In an attempt to measure engagement, May *et al.* (2004:31) propose engagement to consist of three components, namely physical, emotional and cognitive. An alternative perspective on engagement is offered by scholars who view work engagement as the positive antithesis of burnout (Maslach *et al.*, 2001:416). According to Maslach and Leiter (1997:34), engagement is characterised by energy, involvement and efficacy, which are considered opposites to the three burnout dimensions of exhaustion, cynicism and professional efficacy (Maslach *et al.*, 2001:402-403).

A third perspective and arguably the most widely held, is that work engagement is an independent and distinct concept and, although negatively related to burnout, should be measured separately (Schaufeli *et al.*, 2002:74). According to Schaufeli *et al.* (2002:74), work engagement is defined as a positive and gratifying psychological state related to work that is identifiable through the three dimensions of vigour, dedication and absorption. Vigour refers to the display of high levels of energy and psychological resilience in the workplace, investments of effort in work and persistence when faced with challenges. Dedication refers to the experience of a strong sense of pride or importance for being involved in work which serves as a source of enthusiasm and feelings of significance. Lastly, absorption refers to the pleasant state of being fully engrossed in work, characterised by the quick passing of time and application of significant concentration effort and the extent to which it is difficult to detach from work. Rather than being directed at a specific task, person, item or event, engagement is considered a persistent and universal affective-cognitive state (Schaufeli & Bakker, 2004:295).

According to Bakker (2011:265), work engagement can be viewed as different from job satisfaction to the extent that it merges the pleasure of work with high levels of activity, whereas job satisfaction is considered a passive form of employee well-being. Even though a significant correlation between engagement and satisfaction exists, engagement has been found to offer increased task and contextual performance (Christian *et al.*, 2011:120). Engagement differs from motivation in its association with effect and cognition beyond mere dedication (Bakker, 2011:265). Engagement also differs from work-related flow in duration, as flow is typically viewed as a short peak in performance and engagement as a longer performance episode (May *et al.*, 2004:13). Workaholism is a result of over-absorption and can explain why workaholism is characterised by an inability to disengage from work (Schaufeli *et al.*, 2008:193). The fundamental difference between engaged employees and workaholics is that engaged employees work hard because they find their work challenging and pleasurable, unlike their counterparts who display an inability to resist an inner urge (Schaufeli & Bakker, 2010:15). Schaufeli *et al.* (2008:189) also found a positive relationship between workaholism and burnout, where burnout shares a negative relationship with work engagement.

5.2.2. Consequences of work engagement

Work engagement is considered a positive experience related to positive behaviour and the well-being of employees (Schaufeli, 2002:74) but has also been found to have positive impacts on organisational outcomes and the experience of the customer. Considering the endemic nature of corruption in higher education in contemporary South Africa, work engagement might play an important role in combating its prevalence, as it has been found to have a direct negative effect on corruption (Schaufeli, 2018:103) and a potential indirect effect through other positive employee and organisational outcomes (Fu, 2014:141; Okpara & Wynn, 2008:946; Tafolli & Grabner-Kräuter, 2020:1360).

Work engagement has been found to promote job satisfaction (Cole *et al.*, 2012:1569; Diedericks & Rothmann, 2013:230-231; Karanika-Murray *et al.*, 2015:1026; Saks, 2006:613; Yeh, 2013:229), facilitate organisational commitment (Aboramadan *et al.*, 2019:162; Cole *et al.*, 2012:1569; Hakanen *et al.*, 2006:507; Saks, 2006:613; Taba *et al.*, 2014:7), foster OCB and extra-role behaviour (Babcock-Roberson & Strickland, 2010:322; Eldor & Harpaz, 2016:227-228; Saks, 2006:613; Shantz *et al.*, 2013:2620-2621; Sulea *et al.*, 2012:200), increase job performance (Bakker & Bal, 2010:200; Christian *et al.*, 2011:116; Lin *et al.*, 2016:153; Rich *et al.*, 2010:628; Van Wingerden & Van Der Stoep, 2018:7), improve health and well-being (Cole *et al.*, 2012:1569; Radic *et al.*, 2020:5; Tesi *et al.*, 2019:133). On an organisational level, engagement has been found to have a significant impact on team performance, financial indicators and customer satisfaction (Harter *et al.*, 2002:275; Schneider *et al.*, 2018:13; Xanthopoulou *et al.*, 2009b:197), as well as entrepreneurial performance, innovative behaviour and business growth (Gorgievski *et al.*, 2014:115). Work engagement is also known to reduce negative employee outcomes, such as intentions to quit (Chen & Chen, 2012:54; Saks, 2006:613; Schaufeli & Bakker, 2004:310), hindrance demands (Crawford *et al.*, 2010:842-843) and deviant behaviour (Shantz *et al.*, 2013:2620-2621; Sulea *et al.*, 2012:200).

Despite the many known positive effects of work engagement, it also has the potential for negative consequences. Bakker *et al.* (2011:18) and Sonnentag (2011:33) propose that being over-engaged could have negative costs, detrimental to performance and work-life balance. According to Halbesleben *et al.* (2009:1460), work engagement is positively related to work interference with family, with OCB mediating the relationship, while conscientiousness engaged employees fare better in balancing work and family obligations. A recent study suggests that work engagement holds a curvilinear relationship with health and performance (Shimazu *et al.*, 2018:10). In the short term, high levels of engagement are found to yield high levels of psychological distress but diminish over a longer period. According to Shimazu *et al.* (2018:10), over time employees craft their job roles in such a manner as to accumulate additional job resources, which reduces job demand and improves mental health

5.3. Trust

5.3.1. The conceptualisation of trust

Trust has largely been considered a complex topic, difficult to decisively define and not comfortability studied empirically (Hay, 2002:43; Reinke, 2004:50). Despite the confusion surrounding a universal definition and conceptualisation, trust remains one of the most frequently investigated constructs in contemporary organisational literature (Burke *et al.*, 2007:607; Ferrin, 2013:149; Kim *et al.*, 2018:946). Moving toward a definition in terms of Human Resources and Psychology research, trust is generally concerned with two issues (Nienaber *et al.*, 2015:568). Firstly, trust is viewed as the extent to which a person is prepared to rely on another person in whom confidence is kept (Mayer *et al.*, 1995:712; Moorman *et al.*, 1992:315). Secondly, trust expects that the person in whom trust is placed will behave in a mutually acceptable manner (Sako & Helper, 1998:388). Sheppard and Sherman (1998:422) define trust as the accepting of risks inherent to the interdependence of all relationships. For Rousseau *et al.* (1998:395), trust is a psychological state in which a person accepts vulnerability built on the expected behaviour or intentions of another.

According to Hay (2002:50), the definition of trust largely depends on the context within which it is applied. Definitions of trust can therefore be classified based on the fundamental perspective of what trust is (unchanging trait, process or emergent state), who is trusted and at what level (individual, group or organisational level) (Bunker *et al.*, 2004:413; Burke *et al.*, 2007:610). Interpersonal trust is defined as the extent to which a person has faith in the positive expressions of another person (McAllister, 1995:25). In a conceptual model proposed by McAllister (1995:25-26) and later supported by Gillespie and Mann (2004:589), interpersonal trust has two separately measurable dimensions namely, cognitive and affective trust. Cognitive trust is explained as trust based on reasoning after analysing the evidence of the trustworthiness presented. Affective trust describes the element of trust associated with an emotional response based on the bond that exists in the relationship between two people and the perception of genuine concern for each other.

Group trust is defined as the shared belief by a member of a group about the extent to which the group is collectively willing to be vulnerable to another group (Serva *et al.*, 2005:627). The significance of group trust is found due to the normality and prevalence of group formation in the contemporary business environment and its criticality for business performance. Serva *et al.* (2005:627) also highlight the finding that groups are not merely collections of individuals, but that groups exist as separate entities which demonstrate traits of their own, as a representation of the group as a whole. Within the context of organisational trust, trust is described as the orientation of the collective trust held by the focal members of an organisation toward the partner organisation (Zaheer *et al.*, 1998:142).

Within the context of leader-follower relationships, it can be argued that the relationship represents a combination of interpersonal and interorganisational trust, since the leader may be considered an extension of the organisation while also being an embodiment of an individual. To adapt the definition of organisational trust as proposed by Mayer *et al.* (1995:712) to the context of leader-follower relationships, trust can be explained as the preparedness of a person to be vulnerable to the behaviour of a leader, carrying the expectation that the leader will perform a specific action of significance to the follower, without the need to control or monitor the actions of the leader. Podsakoff *et al.* (1990:113-114) simply defined trust in the leader as the expression of faith and loyalty by followers toward the leader.

In this paper, trust is viewed based on the conceptualisation that trust comprises interpersonal relationships and leadership characteristics which include ability, integrity, benevolence, responsibility and loyalty (Colquitt *et al.*, 2007:910; Mayer *et al.*, 1995:717; McAllister, 1995:25; Podsakoff *et al.*, 1990:115). Ability refers to the level of skills, competency and characteristics required within a particular area of expertise to enable the ability to exercise influence (Mayer *et al.*, 1995:717; McAllister, 1995:25). Integrity refers to the follower's perception that the leader believes in and behaves according to a set of principles that is acceptable to the follower (Mayer *et al.*, 1995:719-720; Podsakoff *et al.*, 1990:115). Benevolence refers to the extent to which the follower believes the

leader will perform in the follower's best interest, putting aside any self-centred motive (Mayer *et al.*, 1995:718-719). Responsibility refers to the extent to which the leader meets the obligations of their role (McAllister, 1995:25). Loyalty refers to the extent to which followers express support and possesses a strong sense of alliance with their leader (Podsakoff *et al.*, 1990:115).

5.3.2. Consequences of trust

The consequences of trust can be summarised based on two levels of outcomes. Behavioural and performance outcomes found to be positively associated with trust are OCB (Dirks & Ferrin, 2002:621; Flavian *et al.*, 2018:15; McAllister, 1995:48; Nohe & Michaelis, 2016:891; Podsakoff *et al.*, 1990:129), knowledge sharing (Abrams *et al.*, 2003:65; Burke *et al.*, 2007:624; Kim, 2019:346; Wickramasinghe & Widyaratne, 2012:229) and job performance (Colquitt *et al.*, 2007:921; Dirks & Ferrin, 2002:621; Kim *et al.*, 2018:954; McAllister, 1995:48; Saleem *et al.*, 2020:11). Job attitude and intention outcomes as a result of trust are job satisfaction (Cho & Park, 2011:564; Cook & Wall, 1980:47; Dirks & Ferrin, 2002:621; Lambert *et al.*, 2021:203; Palupi *et al.*, 2017:405), organisational commitment (Chen *et al.*, 2015:9; Cook & Wall, 1980:47; Flavian *et al.*, 2018:15; Miao *et al.*, 2014:737; Ndlovu *et al.*, 2021:7) and work engagement (Ahamed *et al.*, 2013:168; Buckley, 2011:320-321; De Beer *et al.*, 2018:7; Engelbrecht *et al.*, 2017:374; Lin, 2010:526). Trust is also associated with a negative relationship with deviant behaviour (Colquitt *et al.*, 2007:921; Demir, 2011:216; Litzky *et al.*, 2006:98) and intentions to quit (Dirks & Ferrin, 2002:620; Kim, 2019:346; Tan & Tan, 2000:255; Yurtkoru *et al.*, 2018:20).

5.4. The relationship between servant leadership, work engagement and trust

5.4.1. Servant leadership and trust

Although the selected variables of this study are yet to be investigated within the higher education context in South Africa, numerous studies have been conducted to establish the direct relationship between these variables. Trust resonates with the confidence a follower possesses based on the perception of the leader's competence and willingness to behave fairly and ethically (Mayer *et al.*, 1995:720; Tschannen-Moran & Hoy, 2000:551). Based on the underpinnings of social exchange theory, researchers have identified that a positive psychological state emerges in followers when leaders display sincere concern for their well-being. This concern is then reciprocated by followers through the expression of gratitude and increased trust (Kelloway *et al.*, 2012:42; Zhang & Zhou, 2014:152). According to Kalshoven and Den Hartog (2009:113), trusted leaders display higher leadership effectiveness in improving the performance of subordinates. As expressed by Martin (1998:48), "trust is the root of all great leadership".

The concept of servant leadership has been closely associated with trust through the display of leader integrity and ethical behaviour, which translates into organisational fidelity (De Pree, 1997:127). Greenleaf (1977:25) believed trust to be the primary antecedent and the cornerstone of servant leadership. Several other researchers agree with the importance of building trust among followers as being an integral component of effective servant leadership (Farling *et al.*, 1999:60; Joseph & Winston, 2005:11; Russell & Stone, 2002:148; Sendjaya & Pekerti, 2010:645-646; Van Dierendonck, 2011:1246). While the servant leader's ability to exert influence on followers stems from the existence of trusting relationships (Beck, 2014:304), the relationship is suggested to be circular as servant leadership consequently increases trust through the creation of a trust climate (Ling *et al.*, 2017:62-63). Further evidence exists to support the positive influence of servant leadership on trust (Chatbury *et al.*, 2011:60; Joseph & Winston, 2005:15; Saleem *et al.*, 2020:9-11; Sendjaya & Pekerti, 2010:654; Zargar *et al.*, 2019:2264).

This study not only focused on the relationship between trust and the other study variables but also investigated whether trust mediates and moderates the relationship between servant leadership and work engagement. A mediator or mediating variable can be explained as the variable situated between other variables that imparts the impact of the independent variable onto the dependent variable (Saunders *et al.*, 2019:808). Existing literature provides evidence that trust in the leader mediates the effects of leadership on employee outcomes such as job performance (Zhu *et al.*, 2013:102), OCB (Rubin *et al.*, 2010:405) and well-being (Kelloway *et al.*, 2012:50). Recent studies have also

confirmed the mediating role of trust in the relationship between servant leadership and other work-related outcomes such as job satisfaction (Chan & Mak, 2014:281; Ilkhanizadeh & Karatepe, 2018:3567-3568; Zargar *et al.*, 2019:2264-2265), team performance (Schaubroeck *et al.*, 2011:866), organisational commitment (Ling *et al.*, 2017:62; Miao *et al.*, 2014:737), OCB (Shim *et al.*, 2016:15), organisational health (Tasker-Mitchell & Attoh, 2020:332), employee creativity (Jaiswal & Dhar, 2017:14) and work engagement (Ling *et al.*, 2017:62).

5.4.2. Trust and work engagement

Trust in the leader is explained as the willingness of an employee to be vulnerable to the effects of a leader's behaviour (Schoorman *et al.*, 2007:347). Trust is seen as a critical ingredient required to sustain organisations in the long term and ensure the well-being of their employees (Lin, 2010:521; Tan & Tan, 2000:255). According to Lin (2010:521-522), trust signifies the confidence and positive expectation followers hold toward the actions of their leader, while work engagement echoes their subsequent enthusiasm and participation in work activities. This implies the potential influence of trust on work engagement and can be linked to the three dimensions of dedication, vigour and absorption. Firstly, followers are dedicated to the objectives of an organisation for the time a trusting relationship with the leader is enjoyed (Gill, 2008:101). Secondly, in the presence of trust, employees become energised and motivated to perform (Dong & Howard, 2006:381). Lastly, trust provides a foundation for employees to be absorbed and improve all aspects of the organisation continually (Townsend & Gebhardt, 2008:24).

Research conducted by Brower *et al.* (2009:338) suggests that the positive impact of trust may rest in reciprocated trust. When leaders display high levels of trust in the abilities of employees, coupled with trust in the leader, followers have shown to deliver optimal commitment. When followers trust in the ability and expertise of their leader, the leader is seen as a resource to assist in delivering on work objectives, which provides the confidence to exercise more effort in their work (Chughtai & Buckley, 2008:57). Feelings of mutuality and psychological safety make an employee feel less vulnerable, potentially leading to greater work engagement (Koçak & Küçük, 2021:184). Leaders who have demonstrated thoughtfulness and support for their subordinates have been shown to build trust and increase work engagement (Cooper-Thomas *et al.*, 2018:338).

Alternatively, events that cause a breach in the psychological contract between leaders and followers, such as downsizing, result in a reduction of work engagement based on dwindling trust (Buckley, 2011:320-321). In the absence of trust, employees tend to spend their time protecting themselves instead of investing their efforts to support the organisation (Agarwal, 2014:53). Similarly, followers who feel they can trust their leader are inclined to go beyond what is required or expected in their work (Engelbrecht *et al.*, 2017:370). Moving beyond the traditional JD-R model to explain work engagement, Chughtai and Buckley (2008:51) argue that other psychological variables also induce work engagement, such as trust. Present literature supports the notion that trust is a significant predictor of work engagement (Agarwal, 2014:59; Engelbrecht *et al.*, 2017:375; Håvold *et al.*, 2021:153; Koçak & Küçük, 2021:188; Wong *et al.*, 2010:897).

5.4.3. Servant leadership and work engagement

Work engagement is regarded as a positive job attitude, primarily predicated on the two individual aspects of job and personal resources (Bakker & Demerouti, 2007:319). Job resources represent aspects such as organisational support, management feedback and level of autonomy. Personal resources include individual attributes of self-esteem, self-efficacy and optimism (Bakker & Demerouti, 2007:323). Reflecting on these antecedents, it is possible to identify the potential influence of servant leadership in creating optimal conditions required for work engagement to flourish (De Sousa & Van Dierendonck, 2017:16). Servant leadership focuses on the needs and development of followers by creating an environment aimed to foster personal growth and provide individual support (Van Dierendonck, 2011:1229). This produces the impression among followers that the leader cares about them and their development. According to Schaufeli and Bakker (2004:296), the creation of a social supportive work environment assists in reducing job demands, encourages the achievement of work objectives and promotes personal growth, learning and

development. Aspects of servant leadership that distinguish it from other leadership approaches are its focus on motivational and aspirational characteristics and, recognising the need for psychological support to assist in mitigating the challenges presented by modern work (Aboramadan *et al.*, 2020b:618; Xu *et al.*, 2020:49).

Although leadership has historically been neglected as a primary job resource considered to facilitate work engagement, recent studies have indicated a positive relationship between work engagement and leadership styles that share common characteristics with servant leadership. Examples of such styles are empowering leadership (Cai *et al.*, 2018:7; Tuckey *et al.*, 2012:22), authentic leadership (Giallonardo *et al.*, 2010:999; Oh *et al.*, 2018:283), transformational leadership (Monje Amor *et al.*, 2020:174; Zhu *et al.*, 2009:608-609), engaging leadership (Rahmadani *et al.*, 2019:464) and ethical leadership (Den Hartog & Belschak, 2012:42; Engelbrecht *et al.*, 2017:375). Recent studies to determine the relationship between servant leadership and work engagement have found servant leadership to impact work engagement positively and significantly (Aboramadan *et al.*, 2020b:627; Bao *et al.*, 2018:412; De Clercq *et al.*, 2014:201; De Sousa & Van Dierendonck, 2014:892; Kaur, 2018:82; Khan *et al.*, 2021:934).

6. Research methodology

6.1. Research approach, sample and procedure

The study adopted a positivistic research philosophy where the researchers assumed an objective position (Bryman *et al.*, 2014:12). Since this study aimed not to generate original theory but to test the existing theoretical frameworks of servant leadership, work engagement and trust, the research design followed a deductive approach (Bryman *et al.*, 2014:31). Considering the objectives of the study were to quantify the relationships between servant leadership behaviour, work engagement and trust, a mono-method quantitative research approach was selected (Bryman *et al.*, 2014:107). The study followed a cross-sectional survey research strategy, using a non-probability convenience sample to collect data at a single point in time. The study sample was employees from four selected higher education institutions in South Africa.

A web-based survey platform was used to collect research data. Respondents were issued a hyperlink with access to the online survey via an email sent by the research host of each of the higher education institutions. From this email, the respondent navigated to the website, where informed consent was provided, and demographic information of the sample was collected. The online survey proceeded to the questions on the measuring instruments of the study variables. To counter low response rates associated with web-based surveys, the researchers kept the items of the questionnaire to a minimum without compromising on validity.

Research conducted on the employees of the four public universities selected for this study required approval from a gatekeeper committee before the sample group was made accessible to the researcher. Once permission was obtained to conduct research at the selected institutions, a research host to whom the sample population was easily accessible was identified within the organisation. The researchers did not have direct access to the study sample but were made accessible through the liaising research host. Informed consent was obtained from respondents before allowing access to the research questionnaire. The informed consent letter explained the purpose, voluntary and confidential nature of the study. The respondents' confidentiality was respected and upheld during the collection, analysis and dissemination of data, by assigning each respondent a code instead of using personally identifiable characteristics.

All academic staff members working at South Africa's 26 public universities were included in this study's population; however, the target population for this study consisted of the academic staff of four public tertiary institutions in selected provinces. These institutions are the North-West University, Central University of Technology, University of the Free State and Stellenbosch University. These were chosen based on the researcher's current or prior involvement with these institutions.

The inclusion criteria for the study population were all academic employees of the four selected South African higher education institutions. Eligible participants had to be employed in an academic capacity and report to a direct supervisor or leader. The exclusion criteria included all administrative personnel from the four South African higher education institutions.

Invitations to participate in the study reached approximately 3 000 potential respondents, of which the questionnaire was viewed 1 315 times and 246 responses were initiated. After eliminating incomplete responses, the dataset was narrowed down to 206 complete responses appropriate for data analysis. With the sole objective of profiling the sample, respondents were requested to provide demographic information, such as age, gender, higher academic qualification, institution location, faculty and years of experience in their current position. The demographic profile of respondents is featured in Table 1 below.

Table 1: Demographic profile of respondents

<i>Category</i>	<i>Class</i>	<i>n</i>	<i>%</i>
Age of respondent	18 to 24 years	2	0.97%
	25 to 34 years	37	17.96%
	35 to 44 years	47	22.82%
	45 to 54 years	65	31.55%
	55 to 64 years	48	23.30%
	Older than 64 years	7	3.40%
Institution location	Free State	77	37.38%
	Gauteng	11	5.34%
	North West	43	20.87%
	Western Cape	75	36.41%
Faculty	Economic and Management Sciences	68	33.01%
	Education	10	4.85%
	Engineering	18	8.74%
	Health Sciences	21	10.19%
	Humanities	45	21.84%
	Natural and Agricultural Sciences	33	16.02%
	Theology	1	0.49%
	Other	10	4.85%
Gender	Female	120	58.25%
	Male	84	40.78%
	Other	2	0.97%
Highest academic qualification	National certificate	2	0.97%
	Bachelor's degree	7	3.40%
	Honours degree	13	6.31%
	Master's degree	65	31.55%
	Doctoral degree	119	57.77%
Years of experience in current position	0 to 3 years	30	14.56%
	4 to 5 years	15	7.28%
	6 to 10 years	52	25.24%
	11 years and more	109	52.91%

Inspection of Table 1 suggests that the majority of the sample consisted of female respondents (58.25%) between the age of 45 to 54 (31.55%) holding doctoral degrees (57.77%) from the

Economic and Management Sciences faculty (33.01%) and have been employed in their current position for more than 11 years (52.91%). Respondents were employed by institutions predominantly located in the Free State province (37.38%), mainly attributable to the fact that two of the four universities in the target population are located in this province.

6.2. Measuring instruments

The study adopted existing questionnaires to measure each construct that has been designed and tested by expert researchers. Since the measuring instruments are predeveloped, the reliability and validity of the questionnaires have previously been determined. The study questionnaire consisted of the following four sections:

Demographical information

This study collected demographical information of the respondent of the following nature: age, institute location, faculty, gender, academic qualification and years of experience in their current position. The collection of demographical data served the purpose of describing the sample and has been excluded from further analysis and use for drawing comparisons between groups.

Servant leadership

Several measuring instruments have been designed to assess the prevalence and extent of servant leadership behaviour within the context of organisations. For this study, the shortened seven-item version scale (SLQ7) developed by Liden *et al.* (2015:254-269) was selected as the measuring instrument for servant leadership. This scale was created as a shortened adaptation of a 28-item instrument developed by Liden *et al.* (2008:161-177). Shorter instruments, as suggested by Credé *et al.* (2012:875), might reduce the respondent's fatigue and improve the integrity of the instrument.

The shortened seven-item scale comprises the same seven dimensions introduced by Liden *et al.* (2008:169), namely emotional healing, creating value for the community, conception skills, empowering, helping subordinates grow and succeed, putting subordinates first and behaving ethically. Each dimension consists of one item measured on a five-point Likert scale and is represented by the following questions: "My leader can tell if something work-related is going wrong" (conception skills), "My leader makes my career development a priority" (helping subordinates grow and succeed), "I would seek help from my leader if I had a personal problem" (emotional healing), "My leader emphasises the importance of giving back to the community" (creating value for the community), "My leader puts my best interests ahead of his or her own" (putting subordinates first), "My leader gives me the freedom to handle difficult situations in the way that I feel is best" (empowering) and "My leader would not compromise ethical principles in order to achieve success" (behaving ethically).

The shortened scale was tested for reliability and validity by Liden *et al.* (2015:256), who found Cronbach's alpha of 0.80, 0.81 and 0.89 in three separate samples of the scale, including satisfactory results from the confirmatory factor analysis conducted. This seven-item scale was also tested by Flotman and Grobler (2020:7-8) for its validity to be used in South African contexts and found the instrument to be of practical and scientific value, with Cronbach's alpha demonstrated at 0.88. Convergent validity was also assessed with the use of composite reliability and found to be acceptable (Flotman & Grobler, 2020:6).

Work engagement

For this study, the shortened nine-item version (UWES9) of the Utrecht work engagement scale by Schaufeli *et al.* (2006:707-716) was selected as the measuring instrument for work engagement. This scale was adapted from the original 17-item Utrecht work engagement scale developed by Schaufeli *et al.* (2002:85).

The items of the scale represent the work engagement dimension as identified by Schaufeli *et al.* (2002:74) of vigour, dedication and absorption. It contains three items proposed to reflect each of the three underlying work engagement dimensions and will be measured on a five-point Likert-type scale from one to five. Sample items for each dimension are: "At my job, I feel strong and vigorous"

(vigour), “My job inspires me” (dedication) and “I am immersed in my work” (absorption). Higher scores selected by respondents indicate a larger extent of work engagement experience.

The shortened scale was originally tested for validity and reliability across 10 countries during its development, of which South Africa was one (Schaufeli *et al.*, 2006:708-709). Cronbach’s alpha for each of the three constructs varied between the 10 countries. However, the median of Cronbach’s alpha across all 10 countries was found to be 0.92.

Trust

To achieve the aim of investigating the role of trust in the relationship between servant leadership and work engagement, the six-item Trust in/Loyalty to the Leader scale (TLLS) developed by Podsakoff *et al.* (1990:107-142) was selected. The scale was originally designed to investigate the role of trust in the direct leader in the relationship between transformational leadership and organisational citizenship. It is therefore deemed appropriate to examine other conceptualisations of leadership using this instrument, specifically measuring trust in a direct leader from the perspective of the followers.

In this six-item scale, trust is conceptualised using two sections. The extent to which a follower’s faith in their leader is expressed is represented by three items, an example of which is: “My manager would never try to gain an advantage by deceiving workers”. The degree to which a sense of loyalty is experienced by followers toward their leader is also represented by three items, an example of which is: “I have a strong sense of loyalty toward my leader”. All six items are measured on a five-point Likert scale.

Confirmatory factor analysis was conducted on the trust in the leader scale by Podsakoff *et al.* (1990:117) and found all six items to be satisfactory in representing trust. A reliability test of this scale conducted by Sendjaya and Pekerti (2010:652) rendered a Cronbach’s coefficient alpha of 0.81.

6.3. Statistical analyses

The research objectives the study aimed to achieve determined the data analysis techniques. Given this study’s focus on the investigation of the relationship between study variables, quantitative techniques were used to analyse the primary research data.

Data collected from the web survey platform QuestionPro was extracted and exported to IBM Statistical Package for the Social Sciences (SPSS) and Jamovi for statistical analysis. Data analysis was initiated with frequencies to describe the demographical data, followed by exploratory factor analysis (EFA). This analytical technique was used to explore the factorial structure of the measured variables in the study. Cronbach’s alpha coefficient was utilised to assess the reliability of measuring instruments used in the context of this study.

Next, descriptive statistics were performed comprising an array of quantitative instruments used to describe and interpret raw data (Modipane *et al.*, 2019:6). Descriptive statistics are classified into four major categories: measures of frequency (per cent and frequency), measures of central tendency (mean, mode and median), measures of dispersion (variance and standard deviation) and distribution measures (kurtosis and skewness) (Mishra *et al.*, 2019:68). Procedures that were selected for data analysis in this study included mean, median, standard deviation, skewness and kurtosis.

Data analytics continued with the use of correlation analysis to determine the relationships between variables and to establish the strength and direction of the relationship between variables. Simple mediation and moderation modelling were conducted using PROCESS macros version 4 of Hayes (2017), installed as an add-on in IBM SPSS to analyse how and when or under which conditions trust plays a role in the relationship between servant leadership and work engagement and its components. To investigate the predictive value (validity) of the independent variables (servant leadership and trust) on the dependent variables (work engagement and its components) of this study, a standardised regression analysis was conducted.

7. Results

The findings of this study are presented in five sections discussed below. The results are introduced by the findings of the exploratory factor analysis, followed by descriptive statistics of the measuring instrument utilised in the study and the presentation of correlations found between the study constructs. It continues by revealing the findings of the confirmatory factor analysis and regression analysis. The section concludes with an unveiling of the outcome of the mediation analysis.

7.1. Exploratory factor analysis

Exploratory factor analysis (EFA) was conducted using a simple principal component analysis on the items of the of the individual scales [Servant leadership scale (SLQ7); (eigenvalue = 4.36; variance explained = 62.31%); KMO =.91], Trust in/Loyalty to the Leader scale (TLLS); (eigenvalue = 4.23; variance explained = 70.45%; KMO =.89) and Utrecht Work Engagement Scale (UWES9); (eigenvalue = 5.62; variance explained = 62.43%; KMO =.89)]. The results (eigenvalues and scree plots) confirm that servant leadership, trust and work engagement were unidimensional constructs. The analysis also considered and validated the subscales of work engagement [Vigour; (eigenvalue = 2.5; variance explained = 83.39%; KMO =.91), Dedication; (eigenvalue = 2.29; variance explained = 76.40%; KMO =.65) and Absorption; (eigenvalue = 2.11; variance explained = 71.20%; KMO =.69)] as unidimensional constructs respectively.

7.2. Descriptive statistics and correlation analysis

This section exhibits the findings of descriptive statistics and the correlation analysis of the constructs investigated in the study. The descriptive statistics are presented in Table 2 below, including the internal consistency calculations using Cronbach's alpha, skewness and kurtosis. The findings of Pearson's correlation coefficients between the study variables are presented in Table 3.

Table 2: Descriptive statistics (N=206) and Cronbach's alpha coefficients

<i>Variables</i>	<i>α</i>	<i>Mean</i>	<i>SD</i>	<i>Skewness</i>	<i>Kurtosis</i>
1. Servant leadership	.90	3.38	.94	-.42	-.42
2. Trust	.77	3.59	.80	-1.01	1.08
3. Work engagement	.92	5.54	1.19	-.83	-.18
4. Vigour	.90	5.11	1.56	-.81	-.25
5. Dedication	.84	5.71	1.28	-.94	-.08
6. Absorption	.77	5.81	1.13	-1.24	1.27

An observation of Table 2 indicates that Cronbach's alpha of all scales falls within the acceptable range of 0.70 and above (Drost, 2011:114), required for data to be useable in research of a similar nature. Mean scores above the mid-point for each of the study variables indicate a prevalence of these variables in the experiences of the respondents. Table 2 also confirms that the data extracted from the measuring instruments of the study were normally distributed given the guidelines of 2.00 for skewness and 7.00 for kurtosis (Finch & West, 1997:454).

Table 3: Correlation coefficients (N=206) between servant leadership, trust and work engagement

<i>Constructs</i>	<i>1</i>	<i>2</i>	<i>3</i>	<i>4</i>	<i>5</i>
1. Servant leadership	-				
2. Trust	.83**	-			
3. Work engagement	.45**	.39**	-		
4. Vigour	.49**	.42**	.92**	-	
5. Dedication	.44**	.37**	.95**	.85**	-
6. Absorption	.24**	.24**	.81**	.55**	.68**

**Coefficient is statistically significant at the .01 level (one-tailed) / The practical significance of the results was interpreted as .10 (small effect), .30 (medium effect) and .50 (large effect) (Steyn, 2002:12).

The findings in Table 3 indicate that servant leadership was found to be practically significantly related to trust ($r = .83$; $p < 0.01$; large effect) and work engagement as a unidimensional construct ($r = .45$; $p < 0.01$; medium effect). Additionally, servant leadership seems practically significantly related to two of the subconstructs of work engagement, vigour ($r = .49$; $p < 0.01$; medium effect) and dedication ($r = .44$; $p < 0.01$; medium effect). Trust was also found to be practically significantly related work engagement ($r = .39$; $p < 0.01$; medium effect) and two of its subconstructs, vigour ($r = .42$; $p < 0.01$; medium effect) and dedication ($r = .44$; $p < 0.01$; medium effect). Work engagement is indicated as practically significantly related to all three of the subconstructs to a great extent ($r = .92, .95$ & $.81$; $p < 0.01$; large effect) and signifies the interrelated nature of the relationship between the construct as a unidimensional construct and the broken down subconstructs. Vigour seems practically significantly related to the subconstructs of dedication ($r = .85$; $p < 0.01$; large effect) and absorption ($r = .55$; $p < 0.01$; large effect). Dedication was found to be practically significantly related to absorption ($r = .68$; $p < 0.01$; large effect).

7.3. Mediation and moderation analysis

This study was also interested in determining the mediating and moderating role of trust in the relationship between servant leadership and work engagement and its components separately. This was done to describe how and when trust will impact the relationship between servant leadership and work engagement and its components. The results of the mediation and moderation analysis are presented in Tables 4 and 5 below.

Table 4: Indirect effects of servant leadership on work engagement through trust

<i>Constructs</i>	<i>Estimate</i>	<i>SE</i>	<i>Bootstrapping BC 95% CI</i>	
			<i>Lower</i>	<i>Upper</i>
1. Work engagement	.06	.12	-.19	.30
2. Vigour	.04	.17	-.29	.37
3. Dedication	.02	.13	-.24	.29
4. Absorption	.12	.12	-.12	.34

Table 5: Interaction effects of servant leadership and trust (Servant leadership * Trust) to predict work engagement

<i>Constructs</i>	<i>Estimate</i>	<i>SE</i>	<i>Bootstrapping BC 95% CI</i>	
			<i>Lower</i>	<i>Upper</i>
1. Work engagement ($p=.82$)	-.02	.09	-.20	.16
2. Vigour ($p=.43$)	-.09	.12	-.32	.14
3. Dedication ($p=.76$)	-.03	.10	-.22	.16
4. Absorption ($p=.51$)	.06	.09	-.12	.25

To determine mediation effects, bootstrap confidence intervals of the indirect effects were considered. The inclusion of 0 in the confidence intervals of the indirect effects suggests the absence of significant indirect effects and therefore means that the mediation role of trust could not be confirmed. Inspection of Table 4 suggests that the mediating role of trust could not be confirmed in any of the models with servant leadership as an independent variable and work engagement and its dimensions separately as dependent variables.

Next, the focus was on the possible moderating role of trust in the relationship between servant leadership and engagement and its dimensions separately. To determine moderation effects, the significance and confidence intervals of the interaction effects (Servant leadership * Trust) were considered. Inspection of Table 5 suggests that the moderating role of trust could not be confirmed in any of the models tested because of the insignificant effects and the inclusion of 0 in the confidence intervals. After failing to confirm mediation or moderating effects of trust in the relationship between servant leadership and work engagement and its dimension, the analysis considered the role of servant leadership and trust in explaining the variance in work engagement and its dimensions. The next section focuses on this analysis.

7.4. Regression analysis

The study aimed to determine the significant predicting value of servant leadership and trust on the dependent variable of work engagement and its components. This was done to describe the predictive value of servant leadership and trust in work engagement and its components. A regression analysis was conducted using servant leadership and trust as independent variables to determine the predictability of the dependent variable of work engagement, as well as each of the three subconstructs of vigour, dedication and absorption. The results of the regression analysis are presented in Table 6 below.

Table 6: Regression analysis with work engagement, vigour, dedication and absorption as dependent variables (N=206)

Independent Variables	Work Engagement		Vigour		Dedication		Absorption	
	β	t	β	t	β	t	β	t
1. Servant leadership	.51	3.61**	.78	4.321**	.58	3.751**	.17	1.17
2. Trust	.09	.54	.06	.28	.04	.16	.17	1.02
<i>F</i>	26.3		33		24.2		6.93	
<i>p</i>	<.001		<.001		<.001		<.001	
<i>R</i>	.45		.5		.44		.25	
<i>R</i> ²	.21		.25		.19		.06	
<i>Adjusted R</i> ²	.20		.24		.18		.05	
<i>f</i> ²	.25		.32		.22		.05	
<i>Effect size</i>	medium		medium		medium		small	

**Coefficient is statistically significant at the .01 level (one-tailed). The parameters for *f*² are set for practical significance: .01 ≥ small effect, .10 ≥ medium effect, .35 ≥ large effect (Steyn, 2002:12).

A close inspection of Table 6 revealed that a combination of servant leadership characteristics and trust in the leader accounted for 20 per cent (medium practical significance) of the variance in work engagement, with servant leadership ($\beta = .51 / t = 3.61$) proving to be the only statistically significant predictor of work engagement.

The combination of servant leadership and trust also explained 24 per cent (medium practical significance) of the variance in vigour, with servant leadership ($\beta = .78 / t = 4.321$) proving to be the only statistically significant predictor of work engagement. The collective variance of 18 per cent (medium practical significance) in dedication was primarily driven by the statistically significant predictor of servant leadership ($\beta = .58 / t = 3.751$).

8. Discussion

This study's primary objective examined the relationship between servant leadership, trust and work engagement in academic staff at four universities in South Africa. Data collected from 206 respondents were analysed and investigated for direct relationships between study constructs, as well as the mediating and moderating effect of trust in the relationship between servant leadership and work engagement. The findings suggest that servant leadership and trust were both positively and significantly related to work engagement, as well as to each component of work engagement, vigour, dedication and absorption. Results also validated the interrelatedness of these three dimensions. This is consistent with previous findings that suggest significant correlations between the three dimensions of work engagement (Demerouti *et al.*, 2001:282; Kibatta & Samuel, 2021:1048; Schaufeli *et al.*, 2002:80).

The study's first secondary objective was to confirm the relationship between servant leadership and work engagement in academic staff in South African universities. In line with previous empirical studies (Aboramadan *et al.*, 2020b:627; Bao *et al.*, 2018:412; De Clercq *et al.*, 2014:201; De Sousa & Van Dierendonck, 2014:892; Kaur, 2018:82; Khan *et al.*, 2021:934), the findings of this study suggest a significantly positive correlation between servant leadership and work engagement, including the three dimensions of vigour, dedication and absorption. The results suggest that when academic leaders exhibit servant leadership characteristics, academic staff are more likely to display higher levels of energy spent on work and experience a sense of importance associated with work. Additionally, academic staff are immersed in job activities and easily get carried away when engaged in work.

The study's second objective was to determine the relationship between servant leadership and trust in academic staff in South African universities. The results indicated that servant leadership is highly connected to trust, having a positive effect on a leader's ability to build trust. This is consistent with previous findings that report a similar direction and intensity to the relationship between these variables (Chatbury *et al.*, 2011:60; Joseph & Winston, 2005:15; Saleem *et al.*, 2020:9-11; Sendjaya & Pekerti, 2010:654; Zargar *et al.*, 2019:2264). Servant leadership behaviours displayed by academic leaders, such as not compromising on ethical principles, prioritising the best interest of academic staff and being concerned for their well-being, are suggested to generate a sense of loyalty and confidence that the leader will treat followers fairly with integrity.

The third objective of the study was to establish the relationship between trust and work engagement in academic staff in South African universities. The study's findings confirm trust in the leader to be an antecedent of work engagement, with a significantly positive relationship existing between the two constructs. This supports the findings of previous empirical research that found established similar associations (Agarwal, 2014:59; Engelbrecht *et al.*, 2017:375; Håvold *et al.*, 2021:153; Koçak & Küçük, 2021:188; Wong *et al.*, 2010:897). It can be deduced that a sense of trust and loyalty toward an academic leader successfully brings on feelings of enthusiasm and inspiration about work, producing the ability for academic staff to be immersed in their work. Since a trusting relationship exists, academic staff members spend no energy determining whether their leader is trying to take advantage of them and allow followers to pay full attention to their work instead.

The fourth and fifth objectives were to determine the mediating and moderating role of trust in the relationship between servant leadership and engagement amongst academic staff in South African universities. The results did not confirm the mediating or moderating role of trust in relation to servant leadership and positive employee outcomes found in previous studies (Jaiswal & Dhar, 2017:14; Ling *et al.*, 2017:63; Miao *et al.*, 2014:737; Shim *et al.*, 2016:15; Tasker-Mitchell & Attoh, 2020:332). These results illustrate the distinctive setting in which South African university faculty members work

and provide information on the uniqueness of the working environment. Servant leadership is adequate to affect work engagement in the South African higher education context. While trust separately positively impacts work engagement, its effect on the relationship between servant leadership and engagement was found to be insignificant within the South African higher education environment. This is a contradicting result with the findings of Ling *et al.* (2017:63), who confirmed the mediating effect of trust between servant leadership and work engagement.

The final secondary objective was to determine if servant leadership and trust serve as significant predictors of engagement amongst academic staff in South African universities. A combination of servant leadership and trust was confirmed to predict the outcome of work engagement, with servant leadership having a larger influence on the outcome. The findings of this study confirm the display of servant leadership attributes increases trust in the academic leader. In addition, while both successfully contributed to the explanation of why certain academic staff are more engaged than others, servant leadership plays the dominant role in achieving work engagement in academic staff members.

9. Theoretical Contribution

This study's theoretical contribution is based on the importance of servant leadership in the facilitation of improved work engagement, specifically in the context of South African higher education. As a result, the need exists for short and valid measures of servant leadership and work engagement. This allows the measurement and monitoring of these constructs' existence and magnitude in higher education institutions in South Africa. This study confirmed the validity and reliability of the shortened 7-item servant leadership scale (SL-7) and the shortened 9-item Utrecht Work Engagement Scale (UWES-9) within the context of South African Higher Education. These findings contribute to the achievement of the objective of the shortened leadership scale to be viewed as a concise scale intended to assess servant leadership globally and, as a result, expedite the testing of servant leadership theory (Liden *et al.*, 2015:266). Confirming these shortened scales' applicability in a new context improves the ability of the results of the scales to be generalised across further contexts.

Furthermore, this study builds on the foundation laid by Aboramadan *et al.* (2020b:628) to empirically examine the relationship between servant leadership and work engagement in the context of higher education. This study expands current research on servant leadership and work engagement. In addition, this study elaborates on the research by Aboramadan *et al.* (2020b:628) by investigating the mediating role of trust in the relationship between servant leadership in this context.

10. Practical recommendations

Based on the developments in the South African higher education context, a dire need exists for the implementation of practical measures to improve the work engagement of academic staff. Higher education institutes are knowledge-intensive organisations and require highly vigorous, dedicated and absorbed academic staff for academic success. For this reason, a focus should be placed on mechanisms that enhance the work engagement of academic staff. Since this study confirms the positive impact of trust and servant leadership on work engagement, the study's practical recommendations suggest manners in which to improve servant leadership and trust among academic leaders.

This paper provides insight into the importance of servant leadership in its ability to result in positive employee outcomes and highlights the need for Human Resources practitioners and managers to pay attention to recruiting candidates with servant leadership characteristics. Psychometric assessments can assist in identifying candidates with servant leadership attributes and competencies when selecting new managers. Servant leaders can be developed internally through academic leadership development programmes, with a focus on training managers on servant leadership behaviours. Performance assessments and reward systems should be aligned with the display of servant leadership characteristics and promote future servant leadership behaviour. These could include 360-degree leadership evaluations and work engagement surveys to assess the portrayal of servant leader behaviour in institutions of higher learning. From an organisational perspective, servant leadership

values are recommended to be instilled into the values of the institute to create a general climate and organisational culture conducive to servant leadership behaviour. As servant leaders, managers are required to pay close attention and be responsive to the basic needs of subordinates (De Clercq *et al.*, 2014:203). It is recommended that leaders ensure clarity in role-related expectations and provide continuous developmental feedback and support to subordinates.

Considering the established positive impact of trust on the work engagement of academic staff, leaders should spend time directing their attention to activities, procedures, systems and policies that facilitate increased trust in the leader. On an organisational level, if subordinates believe that organisational policies and procedures are implemented in their best interest and directed toward their well-being, they are more likely to trust their leaders. Hence, it is recommended that leaders be trust-conscious when devising and implementing new organisational policies and procedures. The implementation of trust-sensitive policies, such as job security, performance-based remuneration, training opportunities, development appraisal and selective staffing, are aimed at the sustenance and care of academic staff (Chughtai & Buckley, 2013:414) and have the potential to enable a trusting relationship between academic managers and staff. On an interpersonal level, trust can be facilitated through regular team-building exercises, encouraging the managers and subordinates to engage in trust-enhancing activities, such as collaborative problem-solving, contribution recognition and information sharing. Additionally, reshaping the workplace, job responsibilities and work tasks to allow for increased interaction between managers and subordinates may facilitate the development of a closer bond that could potentially strengthen the trust relationship between parties.

11. Limitations

As with other empirical studies, this research paper contains certain limitations. Firstly, the cross-sectional design of the study prevents the ability for causal inferences to be made. For example, trust in the leader may exist independently from servant leadership characteristics displayed by the leader, resulting in the presence of work engagement. However, due to the well-established positive impact of servant leadership on trust, it is believed that causal direction, as exemplified in the study's conceptual model, is more likely an occurrence.

Secondly, the findings of this study were derived from a single data source, self-administered questionnaires, which potentially introduce common method bias. Common method bias refers to the systematic error variance that is associated with the use of a common method to measure the constructs of a study (Kock *et al.*, 2021:1). This study is exposed to common method bias in two manners. Due to the self-administered approach to capturing the questionnaire data, the study potentially suffers from respondent-related method bias inferred by the individual characteristics of the respondents. For example, research by Baumgartner and Steenkamp (2001:145) indicated that different personality traits could result in stylistic responses.

Furthermore, measurement-related method bias could also cause potential systematic error variances. The fact that the scale was only presented in English, while it is likely in the South African context that English might not be the first language for most of the respondents, may cause a variance in the interpretation of scale items. Due care was taken to mitigate other measurement-related biases. The study makes use of shortened scales to reduce fatigue commonly associated with lengthy questionnaires. The study also utilised measuring instruments designed by research experts, with well-known reliability and validity and tested the applicability and suitability of these scales within the study context as part of the data analysis performed. However, the fact that all study variables were measured simultaneously can still present a degree of common method bias (Podsakoff *et al.*, 2003:885).

Thirdly, due to the nature of the sampling technique, the findings of this study may not characterise the consensus across the wider population. Since the study uses non-probability sampling to select the members of the study population, it introduces a sampling bias that does not allow all members of the population with the same statistical probability to be selected for the study. Consequently, the study

sample might not be representative of the population and care needs to be taken to infer generalisations from the results of the study.

Lastly, the response rate for this study is fairly low, estimated to be 6.25 per cent, and introduces the likelihood of non-response bias. Employees at universities are likely experiencing survey fatigue, as they are bombarded with daily requests from researchers to complete questionnaires. A low response rate for the study was expected and designed to mitigate, but still raises the question of whether the findings of the study would remain unchanged if 100 per cent of the sample completed the survey and further deducts from the ability to generalise the results (Lindner *et al.*, 2001:50).

12. Recommendations for future studies

Based on the results and limitations of this study, various opportunities for future research exist. While this confirmed the importance of trust in explaining the occurrence of work engagement, other constructs have also been identified to influence the relationship between servant leadership and work engagement. For example, goal congruence moderates the effect of servant leadership on work engagement at higher levels of social interaction (De Clercq *et al.*, 2014:197), while intrinsic motivation, psychological ownership and empowerment mediate this relationship (Aboramadan *et al.*, 2020b:627; De Sousa & Van Dierendonck, 2014:892). Since this study was unable to confirm the mediating role of trust, future studies could re-examine the nature of this relationship to determine its consistency. Expanding the area of mediator and moderator research would provide better clarification into the importance of other constructs in determining the outcome of work engagement in relation to servant leadership behaviour.

Another direction for future research is to establish the generalisability of the results of the study by addressing some of its limitations. Sampling bias can be reduced by utilising a probability sampling method that allows a greater chance for population representation to be researched. This can be achieved by increasing the study population to include the academic staff at all South African universities. Similarly, restricting non-response variance through improved participation would also enhance the representativeness of the findings. This may be achieved through the introduction of incentives (Smith *et al.*, 2019:11). However, due care needs to be taken for the ethical considerations associated with providing incentives to participate in academic research.

An additional limitation for future research to alleviate is the ability of causal inferences to be concluded. It is recommended that future research adopt a longitudinal research methodology to assess the prevalence of the study constructs over an extended period. The result might prove to verify the relational direction of trust as a consequence of servant leadership in its association with work engagement. To reduce the common method bias associated with the measuring instruments only being presented in English, future studies could consider the respective demographic profile of the study population and provide options for various language translations for the scales to assess the study variables.

13. Conclusion

This study aimed to assess the role of servant leadership and trust in the respective relationships with the work engagement of academic staff at universities in South Africa. The results suggest that these three constructs are significantly related, both statistically and practically. The data analysis could not confirm the mediating or moderating role of trust in the relationship between servant leadership and work engagement but found a combination of servant leadership and trust to have a positive influence on work engagement. This offers evidence to suggest that servant leadership behaviours tend to improve work dedication and increase the amount of energy spent on work-related tasks. The findings also suggest that servant leaders generate trust-based relationships with followers, which can be utilised to enhance the work engagement of academic staff.

Positive Organisational Behaviour;
Psychological Capital;
Work Engagement; Job Satisfaction; Intention To Leave

Abstract

The struggle for survival in the mining industry has intensified in recent times. Organisations in this competitive industry that can retain satisfied, fully engaged employees, may create a competitive advantage and increased profits due to optimized employee outputs. The present study examined underlying mechanisms through which psychological capital affects intention to leave by employing a serial multiple mediation model to test the independent and combined interactive effects of work engagement and job satisfaction as underlying processes in a convenience sample of employees (N=399) from a South African ferrochrome mining company. Structural equation modelling was used to examine relations among variables. Psychological capital was positively associated with work engagement and job satisfaction, and inversely related to intention to leave. Psychological capital had a significant indirect, diminishing effect on intention to leave via job satisfaction. This effect was further amplified through a serial multiple mediation process where psychological capital promoted work engagement, which had a serial interactive effect on job satisfaction that showed an even more striking waning effect on intention to leave. Managers could create a competitive advantage by developing employees' psychological capital and by removing obstacles that may hinder employees to be fully engaged and experience satisfaction with their jobs.

1. Introduction

Since the 1980s the world economy entered a period of increased free trade, commonly known as globalisation (Madhok, 2021). At its peak around the 2000s, globalization became characterised by organisations' relentless drive towards maximising shareholder value, the pursuit of profit at all costs, and the tendency from governments toward increased spending and deregulation in support of these pursuits (Anderson & Obeng, 2021). Globalisation appeared to bring with it numerous benefits for many nations; particularly developing countries such as South Africa in the form of higher revenues from international markets and increased foreign direct investment. Despite this, the economic impact of the recent COVID-19 pandemic has also highlighted some of the weaknesses of globalisation, such as over concentrated value chains leading to increased costs and delays in the delivery of products. This, in turn, could spark a move towards de-globalisation by some countries in the future, but for

now, most nations remain embedded within the existing globalised world economic system (Madhok, 2021; Anderson & Obeng, 2021).

South Africa has become one of the world's largest producers and exporters of ferrochrome. As such, its ferrochrome producing organisations do not function as islands as they also form part of the globalised economy. These organisations, just as all others, operate within a given context and from a strategic perspective, therefore it is imperative for them to analyse and understand the possible effects that global and macro external events might have on their futures (Ungerer et al., 2016). A competitive advantage within this landscape can be achieved by strategically recruiting, empowering, and maintaining highly skilled employees (Thompson et al., 2017). This study therefore focused on the potential competitive advantage that employees could harness for the mining company, one of the world's largest integrated ferrochrome producers. Based in the North-West Province of South Africa, the company mines one of the world's largest chrome ore deposits, also referred to as the western limb of the Bushveld Complex. HFC has benefitted from globalization but faces the possibility of losing some of its customers due to the international economic climate (Sengül et al., 2015, Anderson & Obeng, 2021).

Therefore, the recruitment, development and maintenance of skilled employees who are also emotionally equipped to perform better under the pressure of the current economic climate whilst maintaining high levels of work engagement (WE) and job satisfaction (JS) can potentially create a unique competitive advantage for the organization. Although numerous ferrochrome producers might view engagement as a competitive advantage, more employees have been found to be disengaged (Kular et al., 2008). Employees who are disengaged are also likely to experience lower levels of job satisfaction and more inclined to leave the organization. Psychological capital (PsyCap) affects employee attitudes in positive ways (Du Plessis & Barkhuizen, 2011; Fredrickson, 2013; Heyns & Badenhorst, 2015; Malik, 2013; Mcshane & Von Glinow, 2015; Seo & Chung, 2019; Songshan et al., 2021). However, more research is necessary to develop a clearer understanding of the underlying processes that enhance the positive effect of psychological capital on desirable employee attitudes and performance outcomes.

2. Problem Investigated

To the best of our knowledge, previous literature that investigated the relationships between PsyCap and either WE, JS, or intentions to leave (ITL) was not carried out in the smelter industry of South Africa. In addition, no study could be found that examined the combination of these variables within the same study. It was against this background that the research question arose of what are the relationships were between PsyCap, WE, JS & ITL among employees of this ferrochrome producing mining company? More specifically, this study investigated whether work engagement and job satisfaction would serve as mediators in the relationship between PsyCap and ITL. If so, in what fashion? Would their effect be best amplified if work engagement and job satisfaction were considered as independent facilitative processes, or is it possible that the two mediators might interact to have a compounding effect if they operate simultaneously in a serially related fashion? Obtaining clarity on this might serve to reduce ITL and can benefit managers and employees alike in that more specific development strategies and initiatives can be identified and implemented to manage resources in a more cost-effective manner and promote better job fit.

3. Research Objectives

The main objective of this study is to empirically assess the relationships between PsyCap, WE, JS and ITL among employees of the ferrochrome mining company. The following are the sub-research objectives of this study:

- I. To test the effects of WE and JS as potential mediators that operate separately and independently of each other.
- II. To test the potential effect of WE and JS as potential mediators if considered as simultaneously operating processes that may interact in a serial fashion to obtain a compounding effect on the relationship between PsyCap and ITL.

4. Hypotheses

The following hypotheses were formulated for this study:

H1: PsyCap has positive effect on WE (1a) and JS (1b) but has a diminishing effect on ITL (1c).

H2: PsyCap affects intention to leave through WE (2a) and JS (2b) as separate facilitative mechanisms that operate independently of each other.

H3: WE and JS serve as two mediators that interact in a serially dependent fashion where WE promotes JS which, in turn, indirectly affects the relationship between PsyCap and ITL.

5. Literature Review

In the following sections, literature pertaining to PsyCap, WE, JS and ITL is discussed.

5.1 Psychological capital

One avenue towards building a competitive advantage and minimising the risk of an organisation such as this from potentially losing its customers is through human capital investment in the form of a Positive Organisational Behavioural (POB) approach. Within this approach, leaders emphasise building on strengths of their employees instead of only addressing or rectifying their weaknesses (Fineman cited by Luthans & Youssef, 2007; Luthans et al., 2007b).

PsyCap is rooted within this POB approach and emphasises the instillation and enhancement of hope, efficacy, resilience, and optimism (Luthans et al., 2007b) - four positive psychology constructs that are directly related to well-being (Youssef & Luthans, 2010), and which can be linked to strengths needed for overcoming difficulties or setbacks and for recovery from any adverse circumstance (Jerling & Heyns, 2020).

PsyCap can be defined as “an individual’s positive state of development that is characterized by (1) having confidence (self-efficacy) to take on and put in the necessary effort to succeed at challenging tasks; (2) making a positive attribution (optimism) about succeeding now and in the future; (3) persevering toward achieving goals and, when necessary, redirecting paths to goals (hope) in order to succeed; and (4) when beset by problems and adversity, sustaining and bouncing back and even beyond (resiliency) to attain success” (Luthans *et al.*, 2007b p.3).

PsyCap is a higher order construct with state-like qualities, which indicates that its sub-components – hope, optimism, efficacy, and resilience – are not static but can be developed (Yousseff & Luthans, 2013). Furthermore, each of these four sub-components entails unique cognitive and motivational factors that are compounded when combined (Luthans et al., 2007; Luthans & Youssef-Morgan, 2017).

Previous research, including South African study samples, linked PsyCap to increased employee productivity, job satisfaction and lower intentions to leave (Du Plessis & Barkhuizen, 2011, Heyns & Badenhorst, 2015, Seo & Chung, 2019, Songshan et al., 2021). A study by Amunkete and Rothmann (2015) which was done in Namibia also highlighted PsyCap as a positive catalyst for job satisfaction and employee retention and another study by Ngwenya and Pelser (2020) which was performed in Zimbabwe revealed that PsyCap positively influenced optimal employee engagement, job satisfaction and employee performance. These findings demonstrate the value of PsyCap for the reduction of costs associated with negative organizational influence such as intentions to leave, and its conducive effect on positive workplace outcomes across different countries in Africa.

5.2. Work engagement

Closely related to PsyCap, is WE. According to Shuck (2011), WE consists of four major approaches, namely the need-satisfying approach (Kahn, 1990), the burnout-antithesis approach (Maslach et al., 2001), the satisfaction-engagement approach (Harter et al., 2002) and the multidimensional approach (Saks, 2006). In this study, the definition proposed by Shaufeli et al., (2002, p. 70) will be used. The authors defined engagement slightly differently from Maslach namely, as a positive, fulfilling, work-

related state of mind consisting of three sub-dimensions, namely, (a) vigor, signifying “high levels of energy and mental resilience while working, the willingness to invest effort in one’s work, and persistence even in the face of difficulties”; (b) dedication, characterized by “feelings of a sense of significance, enthusiasm, inspiration, pride; and (c) absorption, considered as “being fully concentrated and deeply engrossed in one’s work, whereby time passes quickly and one has difficulties with detaching oneself” (Schaufeli et al., 2002, pp. 74–75; Schaufeli et al., 2019, p. 577).

Employees who are highly engaged in their work tend to be more optimistic, energised and more closely connected to their work-related activities (Schaufeli et al., 2002). As such, they also tend to perform better at their jobs and better than their less engaged counterparts, mostly due to the positive emotions they tend to experience such as joy, happiness, and enthusiasm (Bakker & Demerouti, 2008). Schaufeli and Bakker (2006) found that vigour, absorption and dedication dimensions are negatively correlated to burnout as engaged employees tend to negotiate job demands more optimally due to their sense of connectedness and energy, which in turn make them less likely to experience burnout.

Numerous South African employees have unfortunately been found to experience low levels of work engagement. For instance, a study by Gallup (2013) as cited by Rothmann (2017) found that South Africa had the highest level of actively disengaged employees amongst the group of 26 countries included in the survey. In the South African mining industry low levels of employee engagement manifested through high levels of labour unrest (Rothmann, 2017). World figures indicate that actively disengaged employees had been found by some researchers to outnumber engaged employees at a ratio of 3 to 1. Organisations with higher engaged employees have been found to experience higher earnings per share. This means that work engagement is also directly related to the profitability of the organisation (Rothmann, 2017).

5.3. Job satisfaction

Another central concept to the present study was JS, commonly defined as “a pleasurable or positive emotional state resulting from the appraisal of one’s job” (Locke, 1976, p. 1304). In other words, JS reflects the extent to which workers feel positive or negative towards the facets of their jobs (Cek & Eyupoglu, 2020). According to Choi et al. (2013) JS is the result of the interaction between professional commitment and work environment values.

It is essential that employees experience JS, as it enhances individual motivation and work performance (Cek & Eyupoglu, 2020), identification with an organisation, commitment, (Amunkete & Rothmann, 2015), employee engagement and productivity (Tepayakul & Rinthaisong, 2018). Moreover, JS influences the organisation’s efficacy in handling daily activities and ultimately affects not only the individual but also the organisation’s performance (Rowden, 2002) for example, JS has been linked to customer satisfaction and profit (Amunkete & Rothmann, 2015). More importantly for the purposes of this study, JS has also been found to facilitate the relationship between PsyCap and employee performance (Ngwenya & Pelsler, 2020).

5.4. Intentions to leave

High turnover tendencies are associated with high transition cost and the potential loss of valued staff (Zhang et al., 2020). It is of crucial importance for the organisation to retain optimally performing employees to achieve a competitive advantage for business; therefore, the enterprise cannot afford to ignore factors that might erode its knowledgebase.

ITL refers to a situation where an employee is contemplating leaving their job in a particular organisation (Coomber & Barriball, 2007) and is the final stage in the cognitive decision-making process that signals the likelihood of quitting in the nearby future (Tett & Meyer, 1993). ITL is the closest proxy for actual turnover (Hennicks et al., 2022) and is a better indicator of the real management level of an organization than actual turnover behaviour (Zhang et al., 2020).

Although ITL can be influenced by many factors both within and outside the workplace, a recent meta analysis which was conducted in the medical sector, recorded significant correlations between low job

satisfaction and turnover intention (Zhang et al., 2020) and several empirical studies that were conducted on the African continent, have also consistently linked low JS either directly or as a mediating mechanism, to ITL (Amunkete & Rothmann, 2015; Hennicks et al., 2022).

5.5. Relationship between the variables

Positive emotions such as optimism and hope that forms part of PsyCap positively correlate with employee attitudes of WE and JS, and negatively correlate with organisational cynicism and turnover intentions in some specific industries including, the health sector (Avey et al., 2008; 2011; Dudusova et al., 2021). Various studies have found JS be negatively correlated with ITL (Bordia et al., 2011; Holtom et al., 2008; Tummers et al., 2013). Therefore, it appeared from the literature that employees who are satisfied in their jobs tend to be more engaged in their work and possess higher levels of PsyCap. This in turn also make them less likely to quit their jobs as opposed to their counterparts with less PsyCap, less WE and lower levels of JS.

6. Research Methodology

The study adopted a quantitative approach with a cross-sectional survey design. A non-probability, convenient sampling technique with a structured questionnaire was used to collect the data from the permanent and part-time employees of among employees of a ferrochrome producing mining company.

6.1. Participants

The participants for this study were permanent and part-time employees of the organisation. In total, 405 questionnaires were distributed online to the participants of which 339 were completed. The sample, predominantly males (84%) had the largest portion (37%) in the 30-39 age bracket. Most respondents (89%) were permanently employed with the highest portion being employed for 5-9 years (31%). The majority indicated Grade 12 as their highest qualification (50%). Furthermore, the largest portion of the sample identified as black (73%) with Setswana indicated as the dominant (35%) mother-tongue language spoken. Given the nature of the work done at the organisation, the demographics were considered an accurate reflection of the specific population.

6.2. Measuring Instruments

The questionnaire consisted of a short biographical information section and sections with items that appraised psychological capital, job satisfaction, work engagement and intentions to leave. All constructs, except the biographical information, were measured by items reflected on 7-point Likert scales ranging from 1 (*strongly disagree*) to 7 (*strongly agree*). A shortened version of the PsyCap Questionnaire (PCQ) as initially developed by Luthans et al. (2007) was used to measure PsyCap. The original 24-item measure consists of four sub-dimensions namely efficacy, hope, resilience, and optimism. For the current study, a shortened version was used consisting of three items per sub-dimension, as based on subsequent research which identified those items that had the strongest loadings on their respective sub-dimensions, and which were employed to avoid previously recorded problems with the full scale, which also included reversed scored items with known problems associated with their item-reliability (see for instance Simon and Buitendach, 2013 and Bekker and Heyns, 2017).

WE was assessed by the ultra-short measure of work engagement (UWES-3) as developed by Shaufeli et al. (2019). A sample item was “I am immersed in my work”. A South African study reported satisfactory inter-item correlations and a reliability index of $\alpha = 0.67$ for this 3-item scale (Heyns et al., 2021). Job Satisfaction was measured by a 3-item scale developed by Hellgren et al. (1997). An example item was “I am satisfied with my job”. Pienaar et al. (2007) reported a Cronbach’s alpha value of .80 when applied within a South African study context. Employees’ ITL was measured by the Turnover Intention Scale (TIS) (Sjöberg & Sverke, 2000) which consisted of three items that measured the strength of the respondents’ intention to leave a current job. An example of an item was “I am actively looking for other jobs”. Previous applications of this scale within a South African work context recorded a Cronbach’s alpha coefficient of 0.83 for this scale (Hennicks et al., 2022).

6.3. Data Analysis

Descriptive and inferential statistics were used to analyse collected data. Since Cronbach's alpha does not provide a true estimate of scale reliability when latent variable modeling is used (Kline, 2016; Raykov, 2004; Wang & Wang, 2020), scale reliabilities (ρ) were computed in *Mplus* version 8.8 based on a formula based on the ratio of explained variance over total variance (Raykov, 2004). Although a cut-off value of 0.70 as proposed by Raykov and Marcoulides (2011) for interpreting scale reliability was preferred, values above .6 were still considered acceptable (Ahmad et al., 2016; Clark & Watson, 1995) since all sub-scales employed a maximum of three items to measure constructs as economically as possible (Pallant, 2010; Tredoux & Durrheim, 2013).

Confirmatory factor analysis was done within a structural equation modelling framework using *Mplus* 8.8 (Muthén & Muthén, 2022) to test the measurement- and structural models. Item responses were defined as continuous. A mean adjusted maximum likelihood (MLM) estimator was employed as it is robust against non-normality and could be used since the dataset contained no missing values (Kelloway, 2015; Wang & Wang, 2020). The following indices were used to assess model fit: The Chi-square statistic, the Standardised Root Mean Residual (SRMR, acceptable values below 0.8) and the Root-Mean-Square Error of Approximation (RMSEA, acceptable values below 0.8) as indicators of close fit between the model and the data, as well as incremental fit indices such as the Tucker-Lewis Index (TLI) and the Comparative Fit Index (CFI) where values above 0.9 were regarded as acceptable (Wang & Wang, 2020). As the MLM estimation method was implemented, direct comparisons between Chi-square statistic values of competing measurement models were not possible. Instead, two additional fit indices - the Akaike Information Criterion (AIC) and Bayes Information Criterion (BIC) - were also considered. In both instances lower values were preferred as indicative of better fitting models (Kline, 2016; Wang & Wang, 2020). A correlation matrix was also generated for the latent variables, and effect sizes were interpreted as $r = \geq 0.10$ (small effect), $r = \geq 0.30$ (medium effect) to $r \geq 0.50$ (large effect) (Cohen, 1992). Indirect effects were estimated by employing a serial multiple mediation model using PROCESS macro as proposed by Hayes (2022). Bootstrapping (using 5000 samples) was used to construct two-sided bias-corrected 95% confidence intervals (CIs) to generate estimations of potential indirect effects. Mediation was demonstrated if the range of values represented by the upper and lower CI's did not include zero (Hayes, 2022).

6.4. Ethical considerations

This study adhered to the guidelines for ethical research as stipulated by the relevant Faculty Research Committee of a reputable South African university which provided ethical clearance for this research as a low-risk study. In addition, the executive committee of the ferrochrome company provided written permission to conduct the research, including permission to make secondary use of the data in aggregated format.

7. Results and Findings

7.1. Testing the Measurement Model

Confirmatory factor analysis (CFA) with *Mplus* was used to verify if the hypothesized factorial structures of the scales that were used, were valid. Three competing models were tested to reveal the model that offered the best fit to the data. Using the factor structures as proposed by the literature as a point of departure, Model 1 consisted of four latent variables: (a) PsyCap was configured as a second order latent construct consisting of four first order latent factors (self-efficacy, hope, resilience, and optimism) measured by three items each, while (b) WE, (c) JS and (d) turnover intention were respectively measured by three directly observed variables each. Model 2 was specified like Model 1, with the exception that PsyCap was presented as a single first order latent factor measured by 12 items only. To test the possibility of common method bias, all constructs were collapsed in Model 3 to test a single latent order factor consisting of all items employed in the design, thus 21 items in total. Table 1 summarises the fit indices of the initial competing models.

Table 1 shows that the chi-square values for each of the three models were significant, which suggests that a perfect fit to the data was not attainable. However, all the remaining fit indices for Model 1 have achieved the required level of acceptance and consistently pointed towards this model as the one showing a superior fit to the data. In contrast to Model 1, the values recorded for absolute as well as incremental fit in the alternative two models were less ideal as these models not only had higher AIC, BIC and SRMR values, but also recorded CFI and TLI values below the stated minimum threshold as well as RMSEA p-values that were significant. Therefore, Model 1, which is also the model that represents the constructs as theory proposes was selected as the preferred measurement model.

Table 1: Fit statistics of initial possible measurement models

Model		<i>df</i>	AIC	BIC	CFI	TLI	RMSEA	SRMR
Model 1	306.58*	179	25040.27	25319.57	0.947	0.937	0.046 [0.037- 0.054] <i>p</i> =0.778	0.059
Model 2	507.710*	183	25290.19	25554.18	0.864	0.844	0.072 [0.065- 0.080] <i>p</i> <0.001	0.070
Model 3	1063.07*	189	25992.60	26233.63	0.634	0.594	0.117 [0.110- 0.124] <i>p</i> <0.001	0.104

χ^2 = chi-square; *df* = degrees of freedom; AIC = Akaike Information Criteria; BIC = Bayesian Information Criteria; TLI = Tucker-Lewis Index; CFI = Comparative Fit Index; RMSEA = Root Mean Square Error of Approximation; SRMR = Standardized Root Mean Square Residual, * *p* < .01.

Source: Authors

The descriptive statistics, correlation matrix and corresponding reliability coefficients are reported in Table 2.

Table 2: Descriptive Statistics, Composite Reliabilities, and Correlations of the Scales

Variable	Mean	SD	ρ	1	2	3	4	5	6	7	8
1. Self-efficacy	5.70	1.34	.76	1							
2. Hope	5.67	1.31	.81	.59	1						
3. Resilience	5.36	1.30	.61	.31	.33	1					
4. Optimism	5.80	1.15	.80	.61	.65	.35	1				
5. PsyCap	5.63	0.92	.80	.74	.79	.42	.83	1			
6. Work engagement	5.47	1.19	.66	.54	.58	.31	.60	.73	1		
7. Job satisfaction	5.33	1.71	.91	.47	.51	.27	.53	.64	.66	1	
8. Intention to leave	3.72	2.01	.86	-.35	-.38	-.20	-.34	-.48	-.52	-.72	1

Note: all correlations were statistically significant (*p* < .01). Parameters for the correlation coefficients were considered as a small effect when *r* \approx .10, medium effect when *r* \approx .30, and large effect when *r* \approx .50 (Cohen, 1998; Field, 2014).

Source: Authors

Table 2 shows acceptable composite reliability values well above 0.7 for PsyCap, job satisfaction and intention to leave. The work engagement scale and the resilience sub-scale recorded lower values but considering that both these scales employed a maximum of three items per scale, lower values were to

be expected and the recorded values were also still above the stated minimum threshold of .6. It is therefore concluded that all the scales demonstrate acceptable reliability for the purposes of this study.

All the relationships were statistically significant ($p < .01$) and in the directions as expected. Correlations of large effect ($r > 0.5$, $p < 0.01$) were observed among the self-efficacy, hope and optimism subscales of the PsyCap measurement instrument while the mentioned subscales showed statistically significant relationships of medium magnitude with resilience. Regarding the main constructs, correlations of large effect were recorded for all the relationships – i.e., between PsyCap and work engagement, PsyCap and job satisfaction, and between work engagement and job satisfaction. In view of these findings, the associations among constructs are also practically significant (Cohen, 1988).

7.2. Testing the structural model

The ideal measurement model formed the basis of the structural model. The statistical results indicated an identical fit for the re-estimated model to the data: $\chi^2 = 306.58$, $df = 179$, $TLI = 0.937$, $CFI = 0.947$, $RMSEA = 0.046$, $90\% \text{ CI } [0.037, 0.054]$ $p > .05$, $SRMR = 0.059$. All items loaded statistically significantly onto their respective constructs as expected, with values ranging from .41 (lowest, resilience item 2) to .92 (highest, turnover intention, item 2). The results, as shown in Figure 1 below indicate that the estimated path coefficient from PsyCap to work engagement ($\beta = 0.73$, $p < 0.001$), to job satisfaction ($\beta = 0.64$, $p < 0.001$) as well as from PsyCap to intention to leave ($\beta = -0.48$, $p < 0.05$), were all significant. Therefore, hypotheses 1a, 1b and 1c are all accepted.

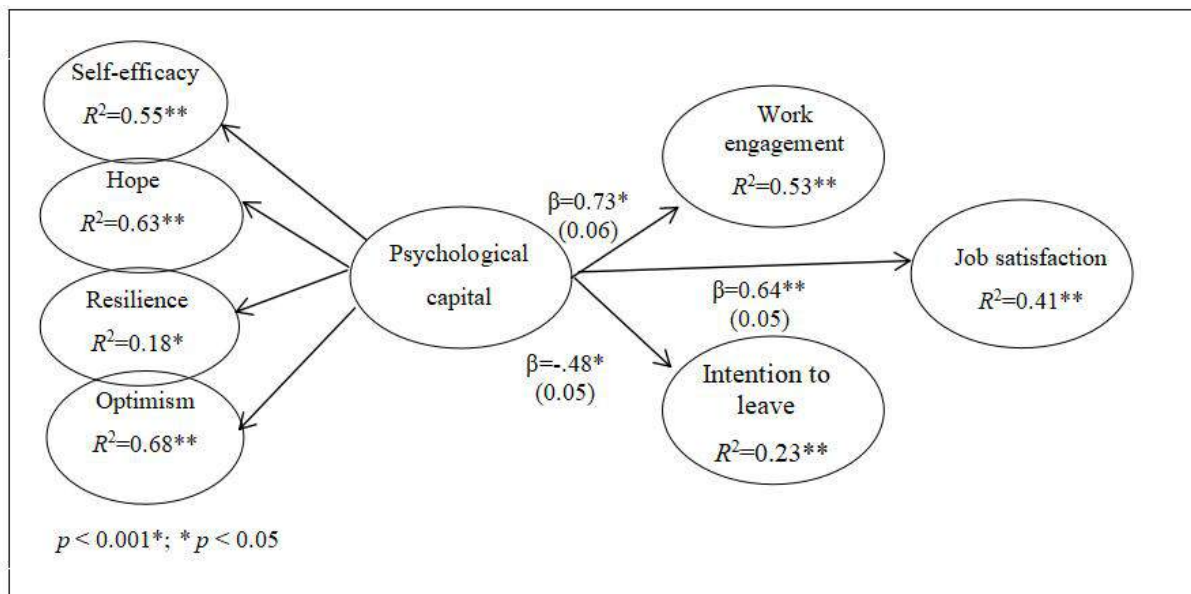

Figure 1: The structural model (standardised solution with standard errors in parentheses)

7.3. Indirect Effects

A serial multiple mediation model was tested through implementing PROCESS macro and specifically Model 6 as proposed by Hayes (2022). The serial mediation model simultaneously tested two alternative single-mediator pathways (psychological capital as predictor of turnover intention via work engagement - mediator 1, and an alternative pathway of psychological capital to intention to leave via job satisfaction - mediator 2), as well as a two-mediator sequential pattern where work engagement affected job satisfaction (mediator 3) which, in turn, influenced intentions to leave. The variables' unstandardized regression coefficients were used (Montoya & Hayes, 2017) to test the indirect effects. Findings (Table 3 and Figure 2) indicate that there is no direct effect of psychological capital in the model: $\beta = .03$, $p > 0.05$, $95\% \text{ CI } [-.19, .25]$.

Contrary to expectations, psychological capital did not have a statistically significant indirect effect on intention to leave via work engagement when the latter was tested as a single, independent

underlying mechanism: $\beta = -.13$, 95% CI [-.28, .01]. This meant that Hypothesis 2a cannot be accepted. In contrast, psychological capital had a significant indirect, diminishing effect on intention to leave via job satisfaction as underlying mechanism, independent of work engagement: $\beta = -.35$, 95% CI [-.54, -.17]. This meant that Hypothesis 2b is accepted. Finally, the data were found to be consistent with the claim that psychological capital affects intention to leave serially through work engagement, which prompts greater job satisfaction which, in turn, leads to reduced intentions to leave: $\beta = -.28$, CI [-.42, -.17]. Hypothesis 3 is accepted. The total indirect effect of psychological capital on intention to leave accounted for 76% of the variance in intention to leave. Table 3 and Figure 2 displays the full model with unstandardized β weights for the path coefficients.

Table 3: Direct and Indirect Effects of Psychological Capital

Variable	Estimate	Standard Error	95% Bias Corrected Confidence Interval
Direct effects of psychological capital :			
Work engagement	.73	.06	[.62 to .85]
Job satisfaction	.59	.10	[-.29 to .69]
Intention to leave	.03	.11	[-.19 to .25]
Indirect effects of psychological capital:			
Intention to leave (via work engagement)	-.13	.07	[-.28 to .01]
Intention to leave (via job satisfaction)	-.35	.09	[-.54 to -.17]
Intention to leave (serially through work engagement affecting job satisfaction)	-.28	.07	[-.42 to -.17]

Figure 2: Two-mediator sequential model depicting the relationship between psychological capital and intention to leave as mediated by work engagement and job satisfaction.

Note. Asterisks indicate significant coefficients (* $p < .05$; ** $p < .01$).

8. Managerial Implications

The present study aimed to empirically assess the relationships between PsyCap, WE, JS and ITL among employees of a ferrochrome producing company. In doing so, it contributed to the existing literature of PsyCap and its relationship with WE, JS and ITL, by extending findings to the smelting industry in South Africa. For example, previous studies had highlighted how the development of PsyCap among employees could nurture optimal behavior change in organisations as well as develop a more an engaged, creative, and energised workforce (Lin et al., 2015). Youseff and Luthans (2013) also indicated that with the declining power of economic capital to create more sustainable competitive advantages, one way in which organisations might differentiate themselves from their competitors is through developing human-based core competencies through PsyCap. Most of these studies had been done in industries other than the smelting industry of South Africa, which made this

study unique. The current study provided further confirmation that positive associations previously found between PsyCap and WE and JS are also applicable to other contexts such as the smelting industry, thereby providing evidence that the observed relations extend across diverse industries. On a practical level, it suggests that organisations should implement development programmes that focus on the enhancement of employees' ability to master tasks (efficacy), encouragement to find and create several alternative pathways towards goal achievement (hope), reinforcing beliefs that one can bounce back from adversity (resilience) and encouraging a positive outlook (optimism) when confronted with challenges.

Furthermore, this study was also unique in that it tested a model which not only considered whether PsyCap, WE and JS could predict ITL, but also investigated the role of WE and JS as potential underlying mechanisms in the relation between PsyCap and ITL. The findings of the present study as reflected in Figure 2 reveal that PsyCap affect ITL serially through WE, which prompted greater JS and, in turn, led to reduced ITL among staff. This highlighted how the development of PsyCap could also develop a competitive advantage for the organisation, despite the challenging prevailing economic climate. Based on these findings, it is recommended that an intervention programme be crafted and implemented amongst employees within the company to cultivate such a competitive advantage by focusing pertinently on PsyCap and WE, and the cultivation of JS in combination with WE.

The findings of the present study also confirm the results reported previously by Du Plessis and Barkhuizen (2011) which highlighted that managers in South Africa who choose to develop PsyCap within their staff can create a caring workplace that takes into consideration the broader economic and social issues affecting employees. Creating such a workplace is critical to prevent detrimental events such as work stoppages that may result in financial losses for both the organisations and the employees. Developing PsyCap amongst employees also reduces their ITL, leading to less turnover and the expensive costs of needing to recruit and train new staff (Zhang et al., 2020). In this way, it is hoped that the present findings will enable managers from this company and other similar organisations to allocate their available support services and resources in a more focused manner to strengthen the PsyCap of their employees. Also, the findings concerning the mediating variables suggest that while doing so, managers should pay close attention to and monitor the JS of their employees given the important role JS plays when it comes to amplifying the effects of PsyCap on WE and ITL. The results imply that employees who might have been considering leaving their jobs at the company would most likely be less inclined to do so if their PsyCap and WE are strengthened, but this effect could be further maximized if managers also ensured that their JS was monitored and promoted at the same time. Without doing so, the chances of employees potentially leaving their jobs might still exist, but if their JS is increased, the chances of them leaving could be significantly reduced. Simple surveys or informal feedback obtained from employees on a regular basis could be a cost effective and simple way managers can use.

Shorter and faster ways to measure relevant constructs simplify the tasks of human resource practitioners because it enables them to gain a comprehensive overview of trends that are being monitored in a more economical and expedited manner. It is nevertheless noted that the shortened PsyCap scale as used in this study still flagged items on the reliability scale as slightly problematic; managers are therefore sensitised to interpret findings of the resilience scale with caution. It is recommended that the newly developed Compound PsyCap Scale (Lorenz et al., 2016) as further improved by Dudusova et al., (2021) - to rectify persisting problems with the reliability scale of the full PsyCap measure - be employed and validated for South African work contexts by future studies.

9. Limitations

This study used a cross-sectional survey-design and made use of a convenience sampling technique. Although this is acceptable for the purposes of an exploratory study (Spector, 2019) to gain a first overall idea of relations between a new or unique combination of variables within a novel setting, the results should be interpreted with caution. This is so because it is acknowledged that convenience sampling might potentially lead to biases since a particular group within the study might be over or

under-represented (Bryman & Bell, 2011) and the lack of longitudinal studies to confirm relations with more certainty limits generalizability beyond the sample group. Furthermore, the scope of the present study only included a limited number of variables that might play a role in the level of work engagement, job satisfaction and intentions to leave among staff. The inclusion of these variables is not meant to be exhaustive as other factors such as economic opportunities, for example, may also influence intentions to leave.

Some of the respondents also indicated that English was not their first language and 50% had indicated Grade 12 as their highest level of education. Although all the assessment measures contained items that would be understandable to individuals with even very basic proficiency in English, it is still possible that language constraints may have led to some uncertainty and inaccurate responses to some items.

10. Conclusion

Despite its limitations, the present study succeeded in its aim of empirically assessing the relationships between PsyCap, WE, JS and ITL among employees within the organisation of interest. This was significant as previous studies had mostly considered the predictive nature and relationship of PsyCap in relation with work engagement in organisations that did not form part of the South African smelter industry. In this way, the present study took an important step towards filling this gap in the literature whilst also providing some valuable practical insights for managers to consider, particularly those operating within this industry. In view of the prevailing global and national economic difficulties, these findings are particularly relevant as managers reflect on how positive behaviour in the workplace could be beneficial to their organisations towards creating a unique competitive advantage. Managers could use this knowledge to motivate for increased investment in interventions to better equip their staff with PsyCap. By doing so, organisations like HFC could also benefit from appointing and retaining staff who are more satisfied and engaged in their work, as well as less inclined to leave. Furthermore, by providing interventions to enhance their PsyCap constructs, a productive environment will be created where employees could thrive despite the challenging economic conditions prevailing in the macroeconomic environment. In doing so, empowering staff can create a competitive advantage. Finally, the resilience subscale of the CPC-12 requires further verification in future research studies. Dudusova et al. (2021) recommended a revised CPC-12 questionnaire in which the items of the resilience scale should be amended. Future studies could replicate the revised measure as proposed by Dudusova (2021) in a South African context for validation purposes.

Factors Influencing Work Engagement in The Automotive Retail Sector of South Africa

Dr Roger Muller^{1*}, Mr Stefan Daniel²

Keywords

Job demands; Job Resources; Work engagement

Abstract

Work engagement is vital in the global economy as it dramatically improves organisational outcomes. Disengagement in the workplace results in lower morale, more staff lateness and higher absenteeism. The negative behaviours lead to reduced productivity, quality of work and a decline in overall job satisfaction. This study aimed to examine the influence of job demands and resources on employees' work engagement in South Africa's automotive retail sector. A quantitative research design yielded a sample size of n = 375. The results reveal that mental demands, social support and autonomy are significant predictors of work engagement.

1. Introduction

Engaged employees can achieve business goals more effectively, perform better on the job, display higher levels of work commitment and lower levels of absenteeism (Bakker & Demerouti, 2017: 274; Osborne & Hammoud, 2017: 53). Job demands (for example mental or emotional demands) have a significant influence on the formation of engagement (Bakker & Albrecht, 2018: 5; D'Emiljo & Du Preez, 2017: 78; Rothmann & Jordaan, 2006: 88). Bakker and Demerouti (2017: 274) describe work engagement based on the dimensions of vigour, dedication and absorption. Engaged employees feel energised, are enthusiastic about their tasks and are immersed in their work (Willmer, Westerberg Jacobson & Lindberg, 2019: 2). High levels of sustained disengagement, however, can lead to burnout and the associated effects of exhaustion, negative thoughts towards work, feelings of uselessness, and a lack of success (Maslach, 2018: 11). Consequently, it is crucial for organisations to fully grasp the impact of work engagement to ensure the well-being of employees and improve organisational performance.

The South African automotive retail industry has developed into a competitive global player in recent years, serving both the domestic and international demand for right-hand drive vehicles (DEDAT, 2017: 71). It is often assumed that car dealerships see volume and customer satisfaction as top objectives and thereby strongly neglect employee satisfaction and cause unwanted deficits (Chen *et al.*, 2020: 31; Block, 2019: 8). The macroeconomic situation of the automotive retail market in South Africa, in particular the decline in long-term GDP, the risk of shortages due to power cuts or current import restrictions and concerns due to COVID-19, may put psychological pressure on employees (Fourie, 2020: 8; DEDAT, 2017: 1). Automotive dealerships mainly provide tangible goods and intangible services. Therefore, a high level of work engagement in customer service is necessary for the success of the business (Hecker, 2019: 85). According to Diez (2015: 32), this human capital is a unique selling point of the automotive retail trade and is vital in constant processes of economic change and digitalisation. For this reason, this study surveyed sales and service people who, through their direct contact with customers, have a decisive influence on customer satisfaction, customer loyalty and business outcomes (Block, 2019: 9; Hecker, 2019: 85).

2. Problem Investigated

Research reveals that disengaged employees do not meaningfully contribute toward the full potential of an organisation's outcomes (Gallup, 2017: 22; Osborne & Hammoud, 2017: 50). Disengagement at work results in lower morale, more staff lateness and higher absenteeism that lead to reduced productivity, quality of work and a decline in overall job satisfaction experienced by the employees (Bellet, De Neve & Ward, 2020: 1). According to Gallup's "State of the Global Workplace" study (2017: 24), 85% of employees worldwide were disengaged and unhappy at work. In Sub-Saharan Africa, this rate is 83%. In South Africa, the rate was at 85% at the time of the study (Gallup, 2017: 24). In addition, previous studies indicate a need for action to improve employee engagement in South Africa (Gauche, De Beer & Brink, 2017: 11; Ruzungunde *et al.*, 2016: 223; Banhwa, Chipunza & Chamisa, 2014: 61; Charles & Chucks, 2012: 1). Ruzungunde *et al.* (2016: 223) have found that job stress has a negative impact on the job performance of employees in South Africa. Charles and Chucks (2012: 5) have also recognised the great potential for improving employee engagement in the South African automotive sector.

Sales and service employees are best at creating customer loyalty (Scherpen, Draghici & Niemann, 2018: 374; Hoffmeister, 2015: 5). However, Hoffmeister (2015: 12) identified a high prevalence of burnout symptoms among sales and service people of car dealerships in the USA and Germany. Disengaged employees focus on potential stressors, resulting in high stress levels and counterproductive behaviours (Chen *et al.*, 2020: 31; Ruzungunde *et al.*, 2016: 223). This study, therefore, set out to determine the influence of job demands and resources experienced by automotive retail employees and the potential impact these factors have on work engagement.

3. Research Objectives

The primary objective of this study is to examine the influence of job demands and resources on employees' work engagement in South Africa's automotive retail sector. The following secondary objectives assisted in achieving the primary objective:

- SO₁: To empirically assess employees' perceptions of job demands and resources and work engagement;
- SO₂: To develop a valid instrument to measure job demands and resources and work engagement;
- SO₃: To formulate managerial guidelines and recommendations to improve work engagement in car dealerships.

4. Hypotheses

Figure 1 presents the hypothetical model of the study. The model illustrates that job demands in this study consist of two underlying variables: mental demands and work pace and workload. Job resources consist of three underlying variables: social support, autonomy, and development resources. Job demands and resources (independent variables) are hypothesised to influence work engagement (dependent variable) as indicated.

Based on Figure 1, the following hypotheses were formulated:

- H₁: There is a significant negative relationship between mental demands and work engagement
- H₂: There is a significant negative relationship between work pace and workload and work engagement.
- H₃: There is a significant positive relationship between social support and work engagement.
- H₄: There is a significant positive relationship between autonomy and work engagement.
- H₅: There is a significant positive relationship between development resources and work engagement.

5. Literature Review

The following sections provide a theoretical overview of job demands, job resources, and work engagement.

5.1. Job demands

Job demands are defined as the organisational, social, psychological or physical elements of work that require sustained cognitive or physical effort and are therefore associated with certain psychological and physiological costs (Radic *et al.*, 2020: 2; Bakker & Demerouti, 2017: 274; Schaufeli & Taris, 2014: 56; Bakker, Demerouti & Euwema, 2005: 170). In previous studies, job demands included mental demands and pace and amount of work (Bakker & Demerouti, 2017: 313; D'Emiljo & Du Preez, 2017: 78; Lequeurre, Gillet, Ragot & Fouquereau, 2013: 100). These variables are proven and relevant to this study for the association with psychological costs and high work pressure according to economic effects and impact on employee health and well-being (Bakker & Demerouti, 2017: 274). The following sections present a discussion of these two demands.

Mental demands

Mental demands are work demands associated with cognitive information processing and contribute to maximising performance outcomes (Babalola *et al.*, 2020: 5; Kirchberg, Roe & Van Eerde, 2015: 112; Lequeurre *et al.*, 2013: 100). Changing attention between different work tasks with varying priorities or multitasking require increased cognitive skills and is associated with work stress, as it is more challenging than to focus on a single activity (Bellet *et al.*, 2020: 24; Zahlquist *et al.*, 2019: 5; Jackson, 2018: 740; Kirchberg *et al.*, 2015: 112; Macdonald, 2003: 5). The frequent use of the ability to concentrate on a task is also mentioned as a mental effort at work (Hussenoeder *et al.*, 2019: 1203; Lequeurre *et al.*, 2013: 103; Macdonald, 2003: 8). Constantly paying full attention to work tasks and applying mental effort to focus on outstanding tasks (for example, to take care of customer relations) is essential at work (Jackson, 2018: 740; Bhattacharjee, Moitra, Kumar & Vardhan, 2017: 29; Lequeurre *et al.*, 2013: 103). A mental or cognitive state is also described as continuous and work-related ruminating and planning (Eib, Bernhard-Oettel, Magnusson Hanson & Leineweber, 2018: 6; Lequeurre *et al.*, 2013: 103; Macdonald, 2003: 5).

Work pace and workload

Work pace and workload are characterised by feelings of having too many tasks to complete in the allocated time (Prasad *et al.*, 2020: 466; Lequeurre *et al.*, 2013: 100; Bakker *et al.*, 2010: 6). Lequeurre *et al.* (2013: 103) and Kristensen, Bjorner, Christensen and Borg (2004: 307) state that extra hard work can be a method of achieving work objectives or completing tasks. Another characteristic of work pace is the rush and hurry to complete tasks (Lequeurre *et al.*, 2013: 103; Kristensen *et al.*, 2004: 307; Van Yperen & Snijders, 2000: 184). Work pace can also be classified from calm and easy to chaotic (Prasad *et al.*, 2020: 465; Lequeurre *et al.*, 2013: 103; Van Yperen & Snijders, 2000: 184). The hours worked in excess of standard hours are referred to as overtime (Parkes, 2017: 384; Kristensen *et al.*, 2004: 310).

5.2. Job resources

Job resources are defined as organisational, social, psychological or physical elements of work that reduce job demands, enhance personal development and learning and are related to psychological costs (Radic *et al.*, 2020: 2; Bakker & Demerouti, 2017: 274; D'Emiljo & Du Preez, 2017: 71). The literature classifies social support, autonomy and development resources as job resources (Bakker & Demerouti, 2017: 274; Wu *et al.*, 2015: 919; Rothmann & Jordaan, 2006: 87). These attributes help to achieve organisational goals and encourage personal development (Bakker & Demerouti, 2017: 274).

Social support

Social support is defined as a way of coping with work-related stress through interpersonal relationships in the workplace, for example emotional or consultative support (Jackson, 2018: 743; Kadian & Ahlawat, 2017: 4293; Schmidt, 2017: 67). Social support also enables self-efficacy through positive experiences of success (Kerksieck, Bauer & Brauchli, 2019: 2). In professional contexts, this is possible above all, through support from colleagues and superiors (Kerksieck *et al.*, 2019: 3; Kadian & Ahlawat, 2017: 4293; Bakker *et al.*, 2010: 4). One way to measure social support is to examine how often employees get help from colleagues when necessary (Jacobs & Roodt, 2019: 7; Rothmann, Mostert & Strydom, 2006: 79). Employees who have good working relationships or feel comfortable with colleagues benefit from support (Jackson, 2018: 740; Martinussen *et al.*, 2017: 490; Rothmann *et al.*, 2006: 79). This also creates trust and feelings of psychological security (Rothmann & Rothmann Jr, 2010: 3).

A harmonious relationship with superiors is also an essential element in supporting employees (Jackson, 2018: 740; Lequeurre *et al.*, 2013: 106; Rothmann *et al.*, 2006: 79). When workers encounter difficulties in daily work, reliable employers who offer support and assistance are indispensable (Jackson, 2018: 740; Lequeurre *et al.*, 2013: 106; Rothmann *et al.*, 2006: 79). Expressing acceptance, praise and respect by the employer gives recognition and appreciation to employees (Jackson, 2018: 740; Schaufeli, 2015: 461; Lequeurre *et al.*, 2013: 106). Employees can therefore reduce job stress and the associated risk of burnout by taking advantage of social support from colleagues and supervisors (Kadian & Ahlawat, 2017: 4293).

Autonomy

Autonomy can be described as taking responsibility and acting independently with conviction (Radic *et al.*, 2020: 5; Motloba, 2018: 418). Employees who experience professional autonomy can make important work decisions without the need for intervention by superiors (Radic *et al.*, 2020: 5). Autonomy is further associated with the freedom to carry out work tasks innovatively (Lee, Shin & Baek, 2017: 834; Tayyasar & Waheed, 2017: 452). In addition, autonomy significantly influences the planning and implementation of individual work activities and engagement (Maslach, 2018: 14; Meyer & Hünefeld, 2018: 4; Lee *et al.*, 2017: 774). With more autonomy, work pace increases and leads to higher states of well-being (Lee *et al.*, 2017: 834; Lequeurre *et al.*, 2013: 103). Independence and autonomy are also represented by the fact that the employees decide independently how the work is carried out (Mache, Servaty & Harth, 2020). In addition, with greater autonomy comes greater freedom of choice over the content of work tasks (Porter & van den Hooff, 2020: 174; Pichault & McKeown, 2019: 60; Lee *et al.*, 2017: 834). In addition, the convictions of autonomously acting

employees are essential, as the employees feel that the work and their opinions expressed are crucial for achieving the organisation's objectives (Motloba, 2018: 418; Brachat, 2016: 116).

Development resources

Development resources are described as challenging opportunities for learning on the job and as benefits for employees' professional and personal development (Jackson, 2018: 736; Brachat, 2016: 120). A distinction is also made between performance feedback, learning and development opportunities and career prospects (Schaufeli, 2017: 123). If performance feedback is supportive for employees, work can be improved by learning from constructive feedback from customers, colleagues and superiors (Radic *et al.*, 2020: 3; Hecker, 2019: 101). Learning opportunities in the workplace can also enable personal growth and development (Schaufeli, 2017: 121; Rothmann *et al.*, 2006: 80). Training courses offer the opportunity for employees to learn about new fields and work changes (Jackson, 2018: 740; Rothmann *et al.*, 2006: 80). Personal work performance provides the opportunity to achieve specific work goals and to experience feelings of success (Poalses & Bezuidenhout, 2018: 175; Martinussen *et al.*, 2017: 489). Furthermore, it has been proven that career prospects such as opportunities for promotion also have a positive effect on employees (Jackson, 2018: 740; Rothmann *et al.*, 2006: 8). Finally, opportunities for professional advancement are a reason, especially for talented and ambitious employees, not to leave jobs, but instead put their strengths into the present organisation (Brachat, 2016: 119).

5.3. Job demands and resources as determinants of work engagement

As indicated in the preceding sections, two types of variables can be distinguished in any job by broadly categorising organisational variables as either job demands or job resources (Schaufeli & Bakker, 2004; Van den Broeck *et al.*, 2008: 278). Job demands are not necessarily harmful, as long as employees' capacity to adapt is not exceeded. When employees are over-extended, the demands become stressors resulting in burnout (Schaufeli & Bakker, 2004). Burnout in this context is a metaphor for the state of mental weariness. Conversely, job resources enhance employees' well-being and are assumed to stimulate engagement and prevent burnout. The overarching impact of job demands and job resources as determinants of engagement is illustrated in Figure 2.

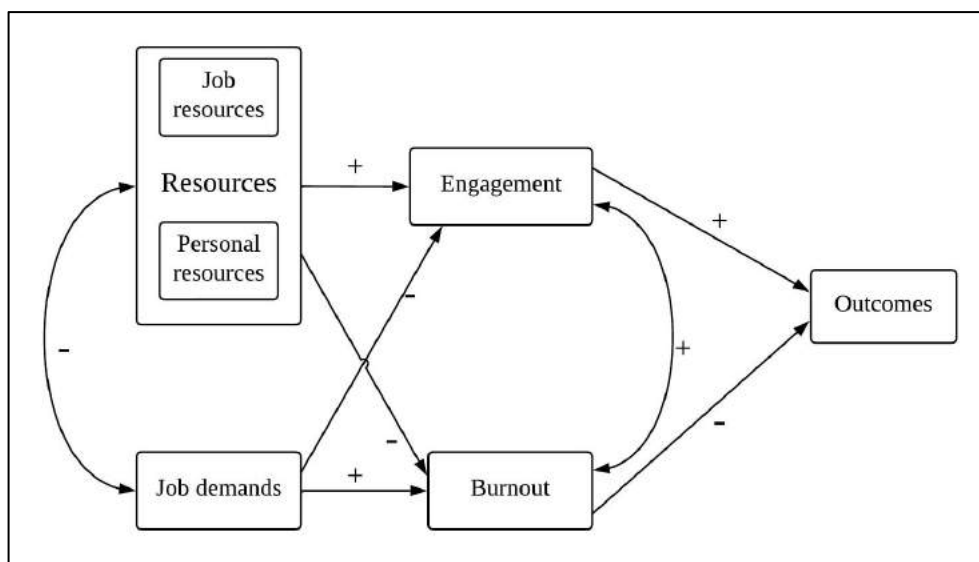

Figure 2: Determinants of work engagement

Source: Adapted from Schaufeli and Bakker (2004); Schaufeli (2013: 37)

Job demands and resources impact burnout and engagement over time (Schaufeli & Taris, 2014: 48). Schaufeli and Bakker (2004) explain that engagement is determined by two processes, depicted in Figure 2, that underlie job resources and job demands. These processes are the energy process and the motivational process. The energy process is associated with burnout dimensions which include: energy depletion (exhaustion), disengagement (cynicism), and diminished performance (reduced

efficacy). Due to the adverse effect of this process on well-being, it is also regarded as a health impairment process since it leads to health problems such as cardiovascular disease, depression and psychosomatic complaints (Schaufeli & Taris, 2014: 47). The motivational process results in well-being and engagement, and is characterised by vigour, dedication and absorption (Schaufeli *et al.*, 2002: 86).

When the underlying motivation and energy processes of job demands and job resources are combined, a buffering effect is exhibited (Bakker & Demerouti, 2007: 317). The resultant relationship between the processes is demonstrated in Figure 3. Figure 3 shows that employees develop strain with increased motivation when job demands and resources are high. Conversely, when both are low - strain and motivation are diminished. Consequently, the high demands-low resources condition results in high strain and low motivation, while the low demands-high resources condition has low strain and high motivation states (Bakker & Demerouti, 2007: 317). The buffer effect has been demonstrated in several studies to prove that where the levels of job resources were high, the effect of job demands on the core dimensions of burnout was significantly reduced (see examples, Bakker, Demerouti & Euwema, 2005; Xanthopoulou, Bakker, Demerouti & Schaufeli, 2007).

The job demands and resources approach is not limited to specific job demands or job resources. It assumes that any demand and resource may affect work engagement, affecting employee health and well-being (Schaufeli & Taris, 2014: 44). The scope of the JD-R model is relatively broad and potentially include all job demands and job resources. This feature makes the JD-R model flexible and appealing to researchers and practitioners, as it can be adapted to various work settings (Schaufeli & Taris, 2014: 44).

Figure 3: The buffering effect between job demands and resources
Source: Bakker and Demerouti (2007: 317)

5.4. Work engagement

The literature uses a variety of definitions of employee work engagement, and no universally accepted definition exists (Kavya & Padmavathy, 2017: 871). The most widely used conceptualisation of engagement is anchored in job demands and resources (JD-R) theory. It defines the concept as a positive, fulfilling, work-related state of mind that results in employee behaviours of vigour, dedication, and absorption (Schaufeli *et al.*, 2002: 74). According to Schaufeli (2013), vigour is

defined as high levels of energy and mental resilience while working, accompanied by the willingness to invest effort in one's work, and persistence even in the face of difficulties. Dedication means being strongly involved in one's work and experiencing a sense of significance, enthusiasm, inspiration, pride, and challenge. Absorption refers to being fully concentrated and happily engrossed in one's work, whereby time appears to pass quickly, and one has difficulties detaching oneself from work. Based on JD-R theory, the fulfilment of different job demands and job resources creates engagement (Bakker & Albrecht, 2018: 5).

Engagement has emerged as an essential construct in organisational research based on the favourable relationship with employee behaviours that promote organisational retention and performance (Chalofsky & Krishna, 2009: 190). Furthermore, there is convincing evidence of the link between engagement and business success from a series of studies conducted by the Gallup organisation. A summarising meta-analysis that included almost 8 000 business units of 36 organisations (Harter, Schmidt & Keyes, 2003: 9) revealed that levels of engagement are positively related to indicators of business performance, such as customer satisfaction and loyalty, profitability, productivity, turnover, and safety (Schaufeli, 2013: 23).

6. Research Methodology

This empirical study followed the positivistic research paradigm with a quantitative research methodology. The exploratory and descriptive research approach was used to evaluate the hypothesised relationships between job demands, resources, and work engagement.

6.1. Data collection

Primary data was collected using the survey method and structured online questionnaires. Non-probability convenience sampling (Quinlan *et al.*, 2019: 178; Ang, 2014: 129) was used to invite sales and service personnel with publicly available e-mail addresses to participate in the survey. E-mails were sent requesting potential respondents to voluntarily opt-in by following the embedded link to the questionnaire hosted on the web-based *QuestionPro* platform. Furthermore, snowball sampling was used to achieve a wider distribution of the questionnaire (Struwig & Stead, 2013: 118).

Large sample sizes are generally regarded as an indicator of the representativeness of the sample (Collis & Hussey, 2014: 198). According to Hahs-Vaughn (2017: 377), the case-to-item ratio of five times the number of questionnaire items can be used to determine the sample size, with a proposed minimum of 100 cases. This study forms part of a more extensive study in which the questionnaire consisted of 45 items. Therefore, the required sample size was 225, which was exceeded in the study by 375 completed questionnaires returned.

6.2. Questionnaire design

The questionnaire of the study consisted of three sections:

- Section A consisted of statements measuring employees' perceived work engagement (ordinal scale). A one-dimensional factor was tested with three items measuring vigour, dedication and absorption, respectively, based on the UWES-3 scale (Schaufeli, 2019: 2).
- Section B involved statements derived from the literature measuring perceived job demands and resources (ordinal scale). Five items were included for each of the three variables: mental demands, work pace, and workload.
- Section C elicited demographic information (nominal scale) using categorical variables, namely, gender, age, qualification, department, length of employment, level of income, and dealer ownership.

The ordinal scales of sections A and B anchored items on a seven-point Likert-type scale ranging from strongly disagree (1) to strongly agree (7). A pilot study was conducted before the full-scale field research, allowing the researchers to pre-assess the questionnaire's validity and reliability.

Feedback from pilot respondents was further used to evaluate the understanding of operational definitions, clarity of statements, and potential misunderstandings.

6.3. Data analysis

Data analysis was conducted using the SPSS (version 25.0) software. The first phase assessed the quality of the research instrument through measures of internal reliability. The Cronbach's alpha coefficient was used to measure the internal consistency of each scale (Quinlan *et al.*, 2019: 114; Hair *et al.*, 2014: 123). The second phase determined the construct validity of the variables. The exploratory factor analysis (EFA) method was used to assess each item's ability to be a valid measure of the construct it intended to measure. In the third phase of the data analysis process, the empirical data's descriptive statistics were calculated through central tendency and dispersion measures. In the fourth phase, Pearson's product-moment correlation was tested to determine if an association between the variables existed. In addition, it was investigated whether there was collinearity between the independent variables. Next, the relationships between the independent variables of job demands and resources and the dependent variable, work engagement, were calculated using simple and multiple regression analyses.

7. Results and Findings

The following sections present the empirical results of the study.

7.1. Demographic data

Table 1 shows the demographic profile of the respondents.

Table 1: Demographic profile of respondents

Gender	Frequency	Percentage %
Female	99	26.4
Male	276	73.6
Total	375	100.0
Age	Frequency	Percentage %
21-30	50	13.3
31-40	110	29.3
41-50	103	27.5
51-60	91	24.3
60 +	21	5.6
Total	375	100.0
Qualification	Frequency	Percentage %
Grade 11 and lower	14	3.7
Grade 12	166	44.3
Diploma	119	31.7
Bachelor's degree	43	11.5
Postgraduate degree/ diploma (e.g. Honours/ Masters etc.)	25	6.7
Other (Please specify)	8	2.1
Total	375	100.0
Department	Frequency	Percentage %
Sales department	260	69.3
Service department	115	30.7
Total	375	100.0
Length of employment	Frequency	Percentage %
0-5 years	170	45.3
6-10 years	74	19.7
11-15 years	39	10.4
16-20 years	41	10.9
21 years +	51	13.6
Total	375	100.0
Level of monthly income	Frequency	Percentage %

< R5001	4	1.1
R5001 – R10 000	67	17.9
R10 001 – R15 000	55	14.7
R15 001 – R20 000	49	13.1
R20 001 +	200	53.3
Total	375	100.0
Dealer ownership	Frequency	Percentage %
Yes	109	29.1
No	238	63.5
Don't know	28	7.5
Total	375	100.0

Source: Own compilation

From Table 1, it is evident that the gender distribution of the respondents is 73.60 percent male versus 26.40 percent female. Most respondents were between 31 - 40 years old (29.30%), followed by those aged 41 – 50 (27.50%). Most respondents indicated that grade 12 (44.30%) and a diploma (31.70%) were the highest educational qualifications. The majority of employees were employed in the sales department (69.30%). In addition, the majority of respondents indicated that the length of employment was no more than five years (45.30%). The vast majority of respondents (53.30%) indicated that their monthly income was more than R20 001. Furthermore, most respondents indicated that the OEM manufacturer/importer did not own the dealership (63.50%) and thus were independent.

7.2. Validity and reliability

Discriminant and convergent validity were assessed through exploratory factor analysis. Internal consistency for reliability was determined by calculating Cronbach's alpha values. The results are presented in Table 2. In terms of validity, the factor loadings represent the correlation between the original variable and its factor and at least three items are required to load per factor. Hair *et al.* (2014: 115) state that factor loadings greater than 0.30 can be considered significant if the sample size exceeds 350. The sample size for this study was 375, and a criterion of 0.40 was used as the cut-off point for valid factor loadings to determine construct validity. Loadings equal to or greater than 0.50 are considered practically significant, and loadings exceeding 0.70 indicate a well-defined structure (Hair *et al.*, 2014: 115). The lower limit of 0.60 for Cronbach's alpha was set as the criteria for reliability, as the research is deemed exploratory in nature with a relatively small number of items per scale (Hair *et al.*, 2014: 162).

Table 2: Results of Exploratory Factor Analysis and Internal Consistency

Variable	No. of retained items	Minimum loadings	Maximum loadings	Cronbach's alpha
Mental demands	3	0.472	0.705	0.689
Work pace and workload	3	0.425	0.693	0.687
Social support	3	0.463	0.855	0.885
Autonomy	5	0.522	0.695	0.785
Development resources	3	0.479	0.756	0.808
Work engagement	3	0.721	0.775	0.819

Source: Own compilation

Table 2 provides sufficient evidence of convergent validity for the variables in the hypothesised model, as all the loadings were greater than 0.40. The factor loadings for autonomy and work engagement also conform to the criterion of being practically significant since it is greater than 0.50 (Hair *et al.*, 2014:115). The reliability results in Table 2 show that values between 0.687 and 0.885 were achieved. The Cronbach's alpha values are all above the cut-off level of 0.6, and therefore sufficient proof of reliability is demonstrated (Quinlan *et al.*, 2019: 114; Hair *et al.*, 2014: 123).

7.3. Descriptive statistics

Descriptive statistics were used to summarise the central tendency of the data by measuring the mean and dispersion of the data around the mean by calculating the standard variation. The results are

presented in Table 3. The questionnaire items were anchored on a seven-point Likert-type scale: 1-strongly disagree; 2-disagree; 3-disagree somewhat; 4-neutral; 5-agree somewhat, 6-agree and 7-strongly agree.

Table 3: Summary of descriptive statistics

Variable	Mean	Standard deviation
Mental demands	6.12	1.04
Work pace and workload	5.05	1.57
Social support	5.62	1.54
Autonomy	5.48	1.43
Development resources	4.96	1.87
Work engagement	6.01	1.23

Source: Own compilation

Table 3 reveals that the independent variable of mental demands had the highest mean value ($\bar{x} = 6.12$). This indicates that respondents “agree” that employees must pay attention to many tasks concurrently, have to memorise various work-related aspects, be attentive to customers at all times and are expected to apply themselves cognitively consistently. The second highest mean value ($\bar{x} = 5.62$) for the independent variables was found for social support. The respondents mainly agree with feeling comfortable with colleagues and supervisors and find their supervisor reliable when difficulties arise. Respondents agree to feel valued by their supervisor. For autonomy, the mean value ($\bar{x} = 5.48$) indicates that respondents agree somewhat to having the freedom to perform work activities, influence the planning of work activities and control the pace of job tasks. Respondents also agree somewhat that they are allowed to make independent decisions and self-select the content of work activities. The lowest mean value ($\bar{x} = 4.96$) was found for development resources. Respondents agreed somewhat that employers offer opportunities for personal growth and development and further training and promotion. The mean ($\bar{x} = 5.05$) for the work pace and workload variable shows that respondents agreed somewhat that there are too many tasks to manage, extra hard work is needed to achieve goals, hurrying is required to complete daily tasks, and a calmer work pace is preferred.

For the dependent variable of work engagement, Table 3 further indicates that respondents are engaged at work ($\bar{x} = 6.01$). Most respondents feel energised and enthusiastic at work and perceive time to pass quickly during the work day.

7.4. Correlation analysis

Table 4 presents the evaluation of Pearson’s product-moment correlation. It is crucial to determine whether no overlap existed in the predictive strength of the variables, as this would indicate collinearity (Collis & Hussey, 2014: 274).

Table 4: Correlation matrix

Factor	Mental demands	Work pace and workload	Social support	Autonomy	Development resources	Work engagement
1 MED	1					
2 PAW	0.350**	1				
3 SUP	0.154**	-0.132*	1			
4 AUT	0.196**	-0.045	0.547**	1		
5 DER	0.232**	-0.065	0.605**	0.522**	1	
6 WE	0.256**	-0.035	0.433**	0.439**	0.389**	1

** . Correlation is significant at the 0.01 level (2-tailed).
 * . Correlation is significant at the 0.05 level (2-tailed).

Source: Own compilation

From Table 4, except for the variable of PAW, all independent variables were significantly ($p < 0.05$) either positively or negatively correlated with the dependent variable of work engagement. The correlation between WE and the independent variables of PAW, SUP, AUT and DER with r-values

ranging from $r = 0.389$ to $r = 0.439$ suggested a weak positive relationship (Zikmund *et al.*, 2013: 564). Little or no association ($r = 0.256$) was found between work engagement and the independent variable of mental demands (Schuster & Liesen, 2017: 189; Zikmund *et al.*, 2013: 564). Since no r -values > 0.7 were found, multiple regression analyses were conducted without removing any variables (Collis & Hussey, 2014: 274).

7.5. Regression analysis

Multiple regression analyses were conducted to investigate the relationships between the independent variables and employees' work engagement.

Table 5: Influence of the independent variables on work engagement

Dependent variable: Work engagement		Adjusted R-Square = 0.269		Collinearity statistics	
Independent variables	Beta	t-value	Sig. (p)	Tolerance	VIF
MED	0.173	3.508	0.001**	0.803	1.246
PAW	-0.051	-1.065	0.287	0.840	1.191
SUP	0.214	3.604	0.000*	0.552	1.811
AUT	0.238	4.294	0.000*	0.638	1.567
DER	0.092	1.561	0.119	0.568	1.759

(* $p < 0.001$; ** $p < 0.05$)

Source: Own compilation

For collinearity, Table 5 indicates that the values of the tolerance of the independent variables were above the cut-off point of 0.25, and the Variance Inflation Factors (VIF) did not exceed the value of five (Schmidt, 2017: 87; Bühner & Ziegler, 2010: 7). Therefore, the critical values at which linear dependencies would exist were not reached (Schmidt, 2017: 87). It was, therefore, possible to proceed with the multiple regression analysis, as no collinearity was evident (Collis & Hussey, 2014: 274).

The R-squared value of 0.269 reveals that the independent variables explain 26.90 percent of the variance in the dependent variable, work engagement. A significant positive relationship ($\beta = 0.173$; $p < 0.05$) was found between mental demands and work engagement. This relationship suggests that work engagement is expected to increase as mental demands increase. A significant positive relationship ($\beta = 0.214$; $p < 0.001$) was also found between social support and work engagement. This relationship indicates that where more social support is available to employees, it is more likely to influence work engagement positively. Autonomy also had a significant positive relationship ($\beta = 0.238$; $p < 0.001$) with work engagement. This finding means that employees with autonomy in performing work tasks experienced positive levels of work engagement. No relationship was found between work pace and workload and work engagement ($\beta = -0.051$; $p > 0.05$). Therefore, employees' work pace and workload did not affect the level of work engagement. No significant relationship was found between development resources and work engagement ($\beta = 0.092$; $p > 0.05$). Therefore, work engagement is unaffected by the provision of development resources in car dealerships.

7.6. Results of hypothesis testing

Table 6 summarises the outcomes of the hypothesis testing based on the results of the multiple regression analyses.

Table 6: Summary of hypotheses

Hypotheses		Decision
H ₁	There is a significant negative relationship between mental demands and work engagement	Rejected
H ₂	There is a significant negative relationship between work pace, workload, and work engagement.	Rejected
H ₃	There is a significant positive relationship between social support and work engagement.	Accepted
H ₄	There is a significant positive relationship between autonomy and work engagement.	Accepted
H ₅	There is a significant positive relationship between development resources and work engagement.	Rejected

Source: Own compilation

From the summary in Table 6 and the regression results presented in section 7.5, it can be seen that H₁ is rejected since there is a significant positive relationship between mental demands and work engagement. No support was found for the hypothesised relationships between work pace and workload, development resources and work engagement. There is, therefore, sufficient evidence to reject hypotheses H₂ and H₅. The regression results further proved that a significant positive relationship exists between the independent variables social support and autonomy and the dependent variable, work engagement. This finding provides clear evidence to support hypotheses H₃ and H₄.

8. Managerial Implications and Recommendations

The following sections elaborate on the managerial implications and recommendations for the job demands and resources that significantly and positively influenced work engagement.

Mental demands

The results of this study show that mental demands have a significant positive relationship with work engagement. This finding implies that the more the dealership employees are exposed to mental demands such as multitasking, memorising various work aspects, paying constant attention to customer service and thinking and planning continuously, the more likely the respondents were to experience work engagement. Under these circumstances, employees feel energised and enthusiastic about work and perceive time to pass quickly. This result is confirmed by the study of Radic *et al.* (2020: 5), in which no negative effect of job demands on work engagement was identified. D'Emiljo and Du Preez (2017: 81) also confirmed this result, as the study found a positive correlation between mental demands and work engagement. With this and the other studies, it was thus established that, contrary to expectations, mental demands do not exhibit negative implications for work engagement (D'Emiljo & Du Preez, 2017: 81).

Schaufeli *et al.* (2019: 587) and Crawford, LePine and Rich (2010: 836) note, however, that this correlation also has limitations when work demands become excessively high and work engagement decreases. Challenging job demands (for example, mental demands) can positively affect work engagement as long as these are low (Schaufeli *et al.*, 2019: 587; Bakker & Demerouti, 2017: 276; Crawford *et al.*, 2010: 836). However, as soon as a tipping point is reached at which the demands become obstructive and unregulated, adverse effects on work engagement and burnout are the consequences (Bakker & Demerouti, 2017: 276; Crawford *et al.*, 2010: 836). According to Crawford *et al.* (2010: 836), hindrance demands can be linked to stress and burnout, as was also investigated in the studies by Ruzungunde *et al.* (2016: 222) and Hoffmeister (2015: 29). The results of the mental demands in this study differ from the studies mentioned above. The mental demand items used in this study represent challenging demands, which are an appropriate level of work stress for optimal performance. A positive correlation can be expected to some degree (Crawford *et al.*, 2010: 836). This effect could be due to, among other things, individual strategies for coping with and recovering from

the mental effort that employees already use (Radic *et al.*, 2020: 5). Radic *et al.* (2020: 5) described a compensation strategy of the employees with, for example, thoughts of the positive financial effects for the family, which produces a certain resilience towards stress (Bosley & Kasten, 2018: 50). However, there may be a risk of alternative adverse effects, so remedial action may still be appropriate (D'Emiljo & Du Preez, 2017: 81). Based on the aforementioned, managers should apply the following recommendations:

- Car dealership employers should provide sufficient latitude and opportunities for relaxation for the staff. Employees should be encouraged to utilise lunch and tea breaks (D'Emiljo & Du Preez, 2017: 83).
- Regarding customer service and task distribution, it should be ensured that there is fairness among colleagues (D'Emiljo & Du Preez, 2017: 83).
- If not already in place, tools, techniques and technologies that can assist with cognitive tasks should be developed and implemented (D'Emiljo & Du Preez, 2017: 83). For example, the Eisenhower principle with the selection and prioritisation of A, B and C tasks according to importance and urgency, the provision of tablets, smartphones or PC access and the use of social media tools for social networking can help (Lee *et al.*, 2017: 834; Siphon, 2016: 602).
- Employees should be made aware of the importance of a healthy diet (balanced meals and drinks in daily life), compensatory time off and sufficient sleep for adequate concentration (Krause & Dayanand, 2020: 323).
- Mindfulness training, for example, mind exercises and meditation, can also be made available to improve employees' cognitive skills (Chen *et al.*, 2020: 38; Bhattacharjee *et al.*, 2017: 34).

Social support

The results of this study show that social support has a significant positive relationship with work engagement. This finding implies that the more the dealership employees felt comfortable with their colleagues and superiors, felt appreciated by their supervisor and could rely on the supervisor when difficulties arose, the more likely employees were to experience work engagement. Similarly, Martinussen *et al.* (2017: 494) found that social support significantly impacted job satisfaction. The findings of this study are further corroborated by Meintjes and Hofmeyr (2018: 8), finding that a significant positive correlation between social support and work engagement exists in a sales environment. Based on these findings, the following recommendations are made on how managers could foster social support:

- Employees should be allowed to interact with supervisors regularly. Thus, employers should have regular one-on-one meetings with employees to create a space to discuss problems, provide support, find solutions and create high-quality relationships and transparency (Arici, 2018: 902; Bosley & Kasten, 2018: 139).
- Respectful treatment of staff should always be upheld (Bosley & Kasten, 2018: 125).
- There should be staff spaces where social interactions can take place. Joint activities such as social events, sporting activities or digital game evenings can also be undertaken to build, maintain and further develop personal bonds with colleagues (Bosley & Kasten, 2018: 139).
- Platforms should be available where employees can access electronic forums such as the company intranet. These platforms will improve the quality of communication at work (Schneider & Schmidtpeter, 2015: 71). Improved accessibility to colleagues and teams should be made possible (Bosley & Kasten, 2018: 139). Open communication should be practised to prevent fear of making mistakes or expressing opinions (Hoffmeister, 2015: 24).
- It should be ensured that employees receive recognition for outstanding performance through, for example, praise, incentives, the transfer of responsibility or the receipt of privileges (Bosley & Kasten, 2018: 125).

Autonomy

Autonomy was found to have a significant positive relationship with work engagement. The implication is that providing employees more latitude to decide how work tasks should be completed,

and allowing employees to give input into the planning of work activities, will lead to greater work engagement. Similarly, opportunities to control the pace and content of work tasks will leave employees feeling invigorated, enthusiastic and immersed in their work. This finding is supported by Shin and Jeung (2019: 9) and Lee *et al.* (2017: 837), who found that work engagement was positively associated with job autonomy. De Spiegelaere *et al.* (2014: 328) also confirmed this relationship and described autonomy and work engagement as the main drivers of employee innovation. Managers are encouraged to foster an autonomous organisational culture by following the recommendations below:

- Managers should encourage employees to operate in self-directed work teams and allow employees to have sufficient latitude for decision-making (Pichault & McKeown, 2019: 67).
- When employees multitask, managers should give employees more freedom in planning and prioritising tasks (Kirchberg *et al.*, 2015: 131).
- Regular meetings with clear communication should clarify the employer's expectations and job requirements, such as timeframes, milestones, and deadlines (Bosley & Kasten, 2018: 60).
- Managers should afford employees a high degree of control and freedom to decide how tasks should be carried out and encourage creative thinking (Lee *et al.*, 2017: 1839; De Spiegelaere *et al.*, 2014: 3).

9. Conclusions

The growth and welfare of organisations form a pivotal part of the economic prosperity of any country. Returns on investment of shareholders must be maximised to ensure continued investment and the welfare of all stakeholders concerned. Work engagement is vital in the global economy as it dramatically improves organisational outcomes. Due to challenges such as complex economic transformation processes from technological changes and the COVID-19 pandemic, work engagement is becoming increasingly crucial for the long-term sustainability of organisations (Wu & Wu, 2019: 3210; Bakker & Albrecht, 2018: 5; Osborne & Hammoud, 2017: 52). Engaged employees drive financial performance, are productive and has high regard for satisfying the needs of customers. These employees are an irreplaceable source of much-needed innovation to sustain competitive advantage.

Exploring Employee Perception of Performance Appraisal Instruments and Job Outcomes within a South African Government Department

Prof LI Graupner^{1,*}, Dr L Rossouw², Ms R Lodewyk³, Mr TS Mthembu⁴

¹⁻⁴ Faculty of Economic Management and Sciences, Northwest University: School of Industrial Psychology and Human Resource Management, Potchefstroom, South Africa.

Keywords

Appraisal instrument, fairness, job satisfaction, motivation, work engagement, commitment, performance.

Abstract

Introduction: Performance appraisal is the key function in the management of performance in the workplace. Many organisations strive to perfect the process of performance appraisals. Both private and public sector organisations are faced with the same challenge of dealing with and making performance appraisal effective. For this to happen organisations need to pay attention to their performance appraisal instrument which is the determining factor of the efficacy of the performance appraisal process.

Problem statement: Past research studies have identified a number of factors that hamper the effectiveness of the performance appraisal instrument. These factors, amongst others, are human resource practices, rater error, application of the instrument and the performance appraisal processes etc. This study aimed at exploring the perceptions of employees in the public sector in South Africa regarding the effectiveness of the implementation of the performance appraisal instrument. The underlying principles against which the current appraisal instruments used by the public sector organisation were measured, were the following: relevance, reliability, discriminability/sensitivity, freedom from contamination, practicability, and acceptability.

The public sector organisation is faced with enormous non-compliance with the performance appraisal evaluations. In terms of its Performance Management and Development System, employees are expected to undergo two formal performance appraisal evaluations. The appraisal reports are expected to be submitted to the human resource unit responsible for performance management at the end of the first semester and the last semester of the performance year. The unit is tasked with the responsibility to establish a moderation committee whose task will be to finalise the process; the timelines for this process are reflected in the performance management procedure guidelines of the organisation. However, it seems challenging to line managers in the organisation to get the process completed.

This study aimed at exploring the extent to which the implementation of the performance instrument affects employee perceptions of the instrument and how it affects the job outcomes (motivation, job satisfaction, commitment and work engagement).

Research methods: To explore the employee perceptions, the study opted to apply the qualitative research methods with an interpretivist approach which allowed the employees to describe the implementation of the performance appraisal instrument in their own individualistic manner. Thus a qualitative descriptive study was found to be plausible for gathering

³ E-mail address: Roslyn.Lodewyk@nwu.ac.za

relevant information for the purpose of this study. A combination of convenience and purposive sampling was decided on to identify the sample of $N=16$ which represented the 4 districts which make up the province. The sample was subjected to semi-structured telephonic interviews and a qualitative survey to explore their perceptions of the implementation of the instrument. Also, the experiences of the participants on how the job outcomes were affected by the implementation of the instrument were explored. Thematic analysis was performed to interpret the information gathered.

Findings: Generally, employees reflected knowledge in respect of the performance management process as a whole. Only a few participants indicated that the current instrument is fair and dependable. The majority found the instrument to be not fair, unable to measure that which it is meant to, takes up too much of their time, lacks inclusivity, lacks consistency (objectivity), not effective due to the application of the instrument simply to comply, and that the ability of the employee to write will earn them good performance ratings. However, some employees indicated portraying high levels of motivation as a result of the implementation of the instrument, but others on the same note were not motivated. Commitment was negatively affected, whereas job commitment was never mentioned by any of the employees. However, the performance management process induced some level of work engagement on the side of the employees.

Recommendations: It was recommended that the public sector organisation develop a training programme to train all relevant role-players in the performance appraisal; to develop and enhance the current appraisal instrument by introducing technology; or to develop an instrument that is electronically available. In the process of developing a better instrument all relevant stakeholders should be consulted so that the new instrument can be legitimate to employees. Recommendations were made for future research studies so as to circumvent the shortcomings faced by this study

1. Introduction

This study focused on exploring employee's perceptions of the performance appraisal instrument and establishing recommended strategies to improve the effectiveness of the tool being applied within a South African government department.

2. Problem Investigated

There is no one simple solution across the spectrum to an understanding of how employees feel about a performance appraisal system. Swanepoel et al. (2013, p. 266) define the performance appraisal system as a "formal and systematic process by means of which the job-relevant strengths and weaknesses of employees are identified, observed, measured, recorded, and developed". The usefulness of the existing performance appraisal instrument in serving this function has been questioned, particularly viewed from a cross-cultural perspective (Brouwers & Van de Vijver, 2015) and more specifically within the South African context where the demand for relevant tools is hardly met (Foxcroft & Roodt, 2009). In this context, the usefulness of performing an appraisal instrument is closely linked to perceptions of fairness and positive work outcomes such as commitment and corporate citizenship (Sallah et al., 2013; Whitman et al., 2012). Rarely though have people's own perceptions of performance appraisal instruments received systematic attention in their own right. In the present study people's perception of a performance appraisal instrument is examined in the South African public sector. The study explores the content of people's perceptions of the performance appraisal instrument to job-related outcomes.

The public service is an institution that does not make profit or aim to maximise it. Instead, its primary objective is to render services to the population of the country as per the mandate of the South African constitution without raising or receiving revenue for the services rendered. A good

performance appraisal tool should assist management or leadership in controlling and guiding employees towards improved performance (Carrell et al., 2000), being able to gauge performance attributes that are worth reinforcing and identifying performance gaps, which will all in all lead to the development of training plans to address the performance shortcomings.

The successful implementation of the instrument lies in the hands of raters (evaluators) who could be supervisors and/or managers in the organisations, and human resources practitioners are expected to train the managers on how to conduct the appraisal interviews and how to provide constructive feedback to employees, which will induce positive performance and motivate them for development (Daft, 2000). The effective use of the appraisal instrument can contribute to the satisfaction and motivation of employees (Carrell et al., 2000). This will ensure that employees view the performance appraisal as a useful and important system that is not meant to affect them negatively.

The study proposed here was set to explore the perceptions employees in the public sector in South Africa have of the effectiveness of the implementation of the performance appraisal instrument. The problem regarding the implementation of the performance appraisal instrument is guided by the six fundamental requirements as stipulated by Swanepoel et al. (2000). For the performance appraisal tool to be regarded as effective it should satisfy the following requirements, which are relevance, reliability, discriminability/sensitivity, freedom from contamination, practicability, and acceptability (Swanepoel et al., 2008).

3. Research Objectives

3.1 The research objectives are divided into two sections, being general objective and specific objectives.

The overarching general objective of the study is to explore employee perceptions of performance appraisal instrument and job outcomes within a South African Government department and is explored through the following specific objectives in the dissertation format:

3.2 Specific Objectives

In this study, the following specific research objectives are identified to articulate and achieve the already stated primary and overall research goal:

The specific objectives of the study thus are to:

- Conceptualise the effective implementation of performance appraisal instrument and job-related outcomes according to literature.
- Explore the perceptions of employees on the current performance appraisal instrument.
- Determine the experiences of the employees regarding the effective implementation of the current performance appraisal instrument.
- Explore how the implementation of the performance appraisal instrument contributes to the job outcomes of the employees.
- Make recommendations for changes to improve the performance appraisal instrument.
- Make recommendations for future research and practice.

4. Literature Review

The public sector as an institution is highly concerned about performance management as is the private sector. The dynamics faced by organisations in dealing with performance management should or are expected to play out in the public sector. Some research has been done in the private sector on how performance management appears to be a factor in the elements of motivation, job satisfaction, work engagement, and commitment. And more other studies are currently produced.

Van der Westhuizen (2016) stated that performance appraisal in the South African public sector is carried out as part of performance management to deal with underperforming government departments and to decrease the number of public protests linked to service delivery. The main challenge is complying with the performance appraisal deadlines.

The public service is an institution that does not make profit or aims to maximise it. Instead, its primary objective is to render services to the population of the country as per the mandate of the South African constitution, without raising or receiving revenue for the services rendered. For effective management of public sector employees, it is important to explore how general performance management and the performance appraisal instrument affect their perceptions and in turn affect the way they will relate to the institution and ensure that service delivery takes place. It will be interesting to establish how closely related factors imperative in both the public and private sector are when it comes to performance management and performance appraisal specifically.

This study aims at exploring the public sector employees' perceptions of the current performance appraisal instrument and how their perceptions of the performance appraisal instrument affect job-related outcomes (commitment, job satisfaction, motivation, and work engagement) for them. Performance appraisal is pivotal in workers' daily lives and their future as employees. Van der Westhuizen (2016, p. 41) defined the performance appraisal system as a "part, phase, activities or aspect of performance management through which the performance of an employee is appraised and a performance score or rating that indicates the level of performance is decided upon". In another way Cascio and Aguinis (2011) defined performance as a tangible thing that people do which are relevant to the goals of the organisation. From the definition it can be deduced that performance is not an abstract or implied but an observable matter that can be linked to the objectives of the organisation. It can be regarded as good performance if it supports or leads to the realisation of the objectives of the organisation.

The success of any organisation depends on the quality and characteristics of its employees; thus making performance appraisal a pivotal tool in reviewing and discussing employees' performance on the assigned duties and responsibilities (Adejoke & Bayat, 2013). Daoanis (2012) stated that performance appraisals in organisations are used to track individual contribution and performance against organisational goals, to identify individual strengths and opportunities for future improvements, and to assess whether organisational goals are achieved. Simply put by Agarwal (2011), 'performance appraisal' generally indicates measuring job performance. Considering the definitions quoted, it can be deduced that similarity exists in the manner in which performance appraisal is viewed by both international and national researchers.

In the recent past emphasis has been placed on the effectiveness, fairness and impact of the performance appraisal instrument on the motivation and job satisfaction of employees. Perceived fairness of the performance appraisal has been found to have a positive impact on a number of work outcomes, including job satisfaction, job performance and organisational citizenship (Whitman & Caleo, 2012). The outcome of this study was further supported by Salleh et al. (2013) who found that perceived fairness of performance appraisal has influenced employee commitment towards the organisation through the mediating factor, satisfaction. In their study, Couhan and Verma (2014) focused on the improvement of a performance appraisal instrument for better management of human resources of the organisation, whereas Adejoke and Bayat (2013) used a balanced scorecard to identify performance enhancement and to assist in promoting professional growth for nurses in the hospital.

The utility of existing performance appraisal tools in serving this function has been questioned, though from a cross-cultural perspective (Brouwers & Van de Vijver, 2015), and particularly in the South African context in which the demand for relevant instruments is hardly met (Foxcroft & Roodt, 2009). In this context, the utility of performance of appraisal instruments is closely linked to perceptions of fairness and positive work outcomes such as commitment and corporate citizenship (Sallah et al., 2013; Whitman et al., 2012). Rarely though have people's own perceptions of performance appraisal instruments received systematic attention in their own right. A good performance appraisal instrument should be used as an instrument meant to assist management or leadership in controlling and guiding employees towards improved performance (Amos et al., 2016), to be able to gauge performance attributes that are worth reinforcing and to identify performance gaps that will lead to the development of training plans to address the performance shortcomings

(Westhuizen et al., 2013). The successful implementation of the tool is in the hands of raters, who could be supervisors and/or managers in the organisations, and human resource practitioners are expected to train the managers on how to conduct the appraisal interviews and how to provide constructive feedback to employees, which will induce positive performance and motivate them for development (Wärnich *et al.*, 2015). The effective use of the appraisal instrument can contribute to the satisfaction and motivation of employees (Carrell et al., 2000). This will ensure that employees view the performance appraisal as a useful and important system that is not meant to affect them negatively.

The fundamental principles that underpin the study are that the performance appraisal instrument has to satisfy the six principles borrowed from Swanepoel et al. (2008), which are relevance, reliability, discriminability/sensitivity, freedom from contamination, practicability, and acceptability. The performance appraisal instrument is expected to be *relevant* to the assessment of performance. The instrument should also be both strategically congruent and context congruent (Aguinis, 2014) by incorporating both the unit and organisational strategies and on the other hand be relevant to both the organisation's culture and the broader culture of the region or country. A performance appraisal instrument should assess employee performance using predetermined job standards (Wärnich et al., 2015). Furthermore, Carrell et al. (2000) stated that the most expected results born out of the process are to achieve both the evaluation and developmental objectives. Lohan (2021) stated that a performance management system provides a continuous process of identifying, measuring, and developing the performance of employees and teams, and aligns it with the strategic goals of the organisation. A large number of efforts of performance appraisal are narrowly focused and over-simplified – so much so that they pay little regard to the favourable perceptions of employees (Demissie, 2015).

Reliability of the performance appraisal instrument can be determined when the instrument is consistent and error free (Aguinis, 2014). Another factor of critical importance is the training of supervisors to be able to conduct accurate appraisals (Wärnich et al., 2015). A study conducted in Kenya by Ndirangu and Ngari (2014) found that validity and reliability of trait-based performance appraisals are highly suspect because the rater's perceptions of the traits being assessed are affected by his/her opinions, biases, and experiences. Lunenburg (2012), as quoted by Zaki et al. (2018), stated that the performance appraisal process is far from accurate and objective, occasionally resulting in rating errors.

The principle of discriminability/sensitivity expects the performance appraisal instrument to be able to distinguish between bad performance and good performance. The performance appraisal instrument should provide information that allows for the identification of effective and ineffective performance (Aguinis, 2014). Chouhan and Verma (2014) stated that performance evaluations should reflect the performance levels of represented employees. Performance appraisal, when conducted in the correct manner, can contribute significantly to employee motivation (Ayomikun, 2017). To reach a certain level of success, organisations must be able to measure how well its employees perform and to use that information to first identify and then reward high performance (Phin, 2015).

Freedom from contamination as a principle of the performance appraisal instrument for it to be effective is critical. Aguinis (2014) referred to this principle as validity, which refers to amongst others, not including factors beyond the control of the employee. Muthee (2020) points out that there should be freedom from contamination by ensuring that the employee is not unfairly appraised due to factors beyond his control. Bogdan (2012) indicated criteria requirements which should be considered, among which was freedom from contamination.

Instruments that are effective are easy-to-use and more beneficial to use, such as increased performance and job satisfaction (Aguinis, 2014). Carrel et al. (2000) defined **practicality** as a performance appraisal instrument that is easy to be understood by both the managers and employees, it takes time, papers it requires, and cost involved in the entire administration. Riantini et al. (2018) in a study titled "Development of science practicum performance assessment in junior high school"

tested practicality of the performance assessment instrument in which they found that the science-based science performance assessment appraisal instrument is easy to use and also found no significant difficulties in its use. Similarly, Yudha et al. (2018) in their work stated that practicality of a test is an indicator of whether or not the quality of a measuring tool is good. They found that the assessment instrument of performance on the developed Mathematics learning instrument met the requirement of practicality.

A good performance appraisal instrument that is perceived by employees to be good complies with the principle of *acceptability* and fairness (Aguinis, 2014). Uniform guidelines are introduced in order to ensure purposeful action for performance appraisal, as well as regulations enshrined in the statutes such as Public Service Act 103 of 1994, the Public Service Regulations of 2001, and the White Paper on Human Resource Management in the Public Service of 1997 (Swanepoel et al., 2013). The following nine steps were recommended to increase employee acceptance level of appraisals and the accuracy thereof (Akhtar & Khattak, 2013):

- Preparation and scheduling of appraisals in advance.
- Creation of a supportive environment.
- Explaining the purpose of the appraisal.
- Employee involvement in discussion and self-evaluation.
- Focusing on work behaviours instead of personalities.
- Supporting results with specific examples.
- Both positive and negative feedback.
- Employee's understanding of explanations of outcomes; and
- An action plan for development

5. Research design

The research design is composed of the research approach, research strategy and research method.

5.1 Research approach

Performance appraisal is a widely researched subject throughout the world, but there is still a vacuum of information that intrigues many human resource practitioners and organisations at large (Longenecker & Gioia, 2001). There is no one simple solution across the spectrum to an understanding of how employees feel about a performance appraisal system. This research will follow a qualitative research approach. According to Hughes & Kamal a paradigm is defined as “a way of seeing the world that frames a research topic” and influences the way that researchers think about the topic. The research study has assumed the interpretivism paradigm approach that will enable the researcher to appreciate the subjective meaning of social action (de Vos et al. 2011). Willis (2007) in the study by Thanh and Thanh (2015, p. 25) stated that interpretivism usually seeks to understand a particular context and the core belief of the interpretive paradigm is that reality is socially construed. Interpretivism as a paradigm assumes that reality is subjective and can differ considering different individuals (Alharahsheh, & Pius, 2020, p. 42). The effectiveness of the performance appraisal tool will be gauged by using the meanings which will be generated from the manner in which employees will narrate their perception. It will be well-suited in exploring hidden reasons behind the complicated problem of the performance appraisal tool (Bhattacharjee, 2012).

5.2 Research strategy

A qualitative descriptive study “strives to describe, analyse and interpret a particular phenomenon” (de Vos et al., 2011). The aim of the current study was to explore the perception of employees regarding the effectiveness and implementation of the appraisal tool. Qualitative descriptive methodology was identified to be an appropriate vehicle for this study to obtain relevant data and to be able to analyse it in relation to the research objectives. Employees provided descriptions of their perceptions of the phenomenon and the researcher analysed and interpreted the perceptions to determine the kind of perceptions employees held concerning the performance appraisal tool.

5.3 Research method

The research method consisted of the literature review, research setting, entrée and establishing researcher roles, sampling, data collection methods, recording of data, data analysis, strategies employed to ensure quality data, reporting style, and ethical considerations.

6. Literature review

Snyder (2019) described literature review as a process by means of which the researcher starts by describing previous research to map and assess the research area to motivate the aim of the study and justify the research question and hypotheses. The researcher consulted books and research articles on a subject related to this study to establish the relevancy of the research questions and to determine how much work has already been done on the subject. This was done by reading textbooks and by visiting online research databases such as EbscoHost and Google Scholar on published journals from 2008 and 2021.

6.1 Research setting

Relevant data was collected by means of interviews and a qualitative survey in a public service department situated in Mpumalanga province. The rationale for collecting data from that public department is based on the premise that environments in the public service departments are similar (Netshakhuma, 2021). Hence data collected from that department could be used to understand other public service departments; thus, not many adjustments will need to be made. Therefore, it was important for the researcher to look at transferability in order to analysis how previous information from public service department is relevant for this study.

Employees of the selected public service department were used to collect data. For the purpose of convenience, participants were allowed to indicate the date and time they would be available and when it would be convenient for them to participate in the interview without disturbing their work programme. Prior to the telephonic interview the researcher distributed the schedule of the interview and the time to all the sampled subjects via email. Participants were requested to give their consent to have the interview recorded and were assured of the safe keeping of the records and that the information gathered would be kept confidential.

A link via email was also sent to all participants to gain access to an online qualitative survey on the Google forms platform. All participants were alerted to the online voluntary consent form which they were expected to first read and secondly complete prior to the completion of the online questions. The online consent forms as well as the answers to the questions were auto saved and submitted through electronic means using the Google forms platform. The completion of the online consent form meant that they were fully conversant of their rights to participate in the online survey and that they had the right to withdraw from the survey when they were no longer interested in participating. Participants were informed that the questionnaires would be auto saved after completion. The data collected in this manner would only be used for research purposes, and confidentiality would be maintained.

6.2 Entrée and establishing researcher roles

The researcher wrote a letter to the Regional Executive Manager of the selected public sector department seeking permission to conduct the study. Once the approval had been granted, employees of the selected public sector department situated in Mpumalanga province were contacted both telephonically and via email (4) by the lead researcher of the study. Each one of the employees selected for interviewing was sent a consent form to complete and sent it back to the researcher; this was a prerequisite for the interview. The content of the consent form clarified the objectives, the importance of the study, and the rights of the participants and confidentiality by which the researcher will abide throughout the research process. Employees who agreed to participate in the study and those that sent back their completed informed consent forms were later contacted for the purpose of arranging the interview via the contact details they had provided to the researcher through emails.

Next, an online qualitative survey was also used. The framework and structure of the survey was taken from Google forms. The questions featured in the survey were self-developed and were put into Google Forms and further developed to incorporate the biographical data as needed by the researcher. The Google Forms platform was opted for because it was easy to customise and did not require any copyright clearance. In addition, the platform was readily accessible and free of charge. Participants were emailed a link that directed them to the Google forms survey. Concerning compliance with the Protection of Personal Information Act (POPIA) the researcher took time to ensure, through the consent form distributed to all participants, that it was clear what information was collected, and how the information was collected (namely, by means of an interview and an online survey). The details of the researcher were communicated as well as what the data would be used for, how it would be stored and processed, how it would be retained and destroyed and that the data was gathered with the necessary consent from participants, and approval from the university. The researcher sent emails to all intended participants who had a link for the online questions. In the email participants were reminded once again of their right and that they needed to complete the online consent form before answering the online questions.

6.3 Research sampling

Data collection was done by using both convenience and purposive sampling. Etikan et al. (2016) defined convenience sampling as a type of non-probability or non-random sampling where members of the target population that meet certain practical criteria, such as easy accessibility, geographical proximity, availability at a given time, or the willingness to participate are included for the purpose of the study. De Vos et al. (2011) explain that for selection in purposive sampling the researcher considers all those characteristics that best represent or are typical to the case in study. The qualification criteria that the sample needed to satisfy for the participants to warrant inclusion in the study were the following: 1) participants must be employed in the selected public service department in Mpumalanga province and must be from either of the four (4) district offices; 2) participants must differ in occupational categories; 3) participants must have a good understanding of English as a language; 4) participants must grant permission for the interview to be voice recorded; and must voluntarily agree to participate in the research by answering interview questions and complete the online questionnaire.

The sample size of the population was 16 ($N=16$) with a breakdown of 7 ($n=7$) managers and 9 ($n=9$) junior employees to cover those in the public sector who have people reporting to them as well as those who do not. However, the number sampled was controlled by data saturation; hence the researcher did not continue to interview the number as anticipated in the research proposal. Therefore data saturation was reached due the researcher obtaining enough information from the sample size that was interviewed.

Table 1 below provides the breakdown of the sample in terms of their demographic presentation to provide a broader analytical picture of the data collected and how spread the sample was to gather qualitative data.

Table 1: Characteristics of the participants (N =16)

<i>Item</i>	<i>Category</i>	<i>Frequency (f)</i>	<i>Percentage (%)</i>
<i>Gender</i>	Male	9	56,25
	Female	7	43,75
<i>Ethnicity</i>	Black	16	100
<i>Language</i>	isiZulu	6	37,5
	siSwati	4	25
	Sepedi	3	18,75
	Xitsonga	2	12,5
	Setswana	1	6,25
<i>Highest qualification</i>	Grade 12	3	18,75
	Degree	4	25
	Post graduate degree	3	18,75
	Diploma	5	31,25
	Other: Certificate	1	6,25
<i>Job level</i>	Clerk	5	31,25
	Senior Clerk	2	12,5
	Practitioner	2	12,5
	Assistant Manager	3	18,75
	Manager	3	18,75
	Senior Manager	1	6,25

6.4 Data collection methods

Trustworthiness and cogency of the study depend on the selection of an appropriate and relevant data collection method that will optimise the quality of data collected. Hence the researcher in this instance opted for conducting interviews as a data collection method. Qualitative interview according to McGrath et al. (2019, p. 1002) “afford researchers the opportunity of exploring, in an in-depth manner, matters that are unique to the experiences of the interviewees, allowing insight into how different phenomena of interest are experienced and perceived”. One-on-one interview was adopted whereby a semi-structured telephone/virtual interview was conducted with each participant. The semi-structured telephone/virtual interviews according to Rubin and Rubin (2005) as quoted by Alshenqeeti (2014, p. 40) “allows depth to be achieved by providing the opportunity on the part of the interviewer to probe and expand the interviewee’s responses”.

7. Findings

In this section the following will be outlined, outline of the findings, limitations, recommendations, practical implications and conclusion.

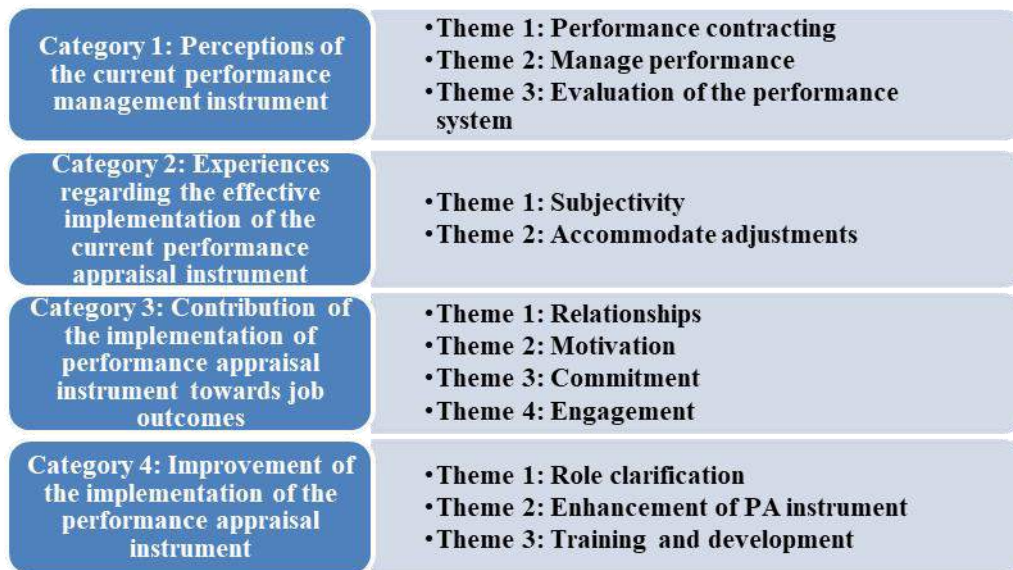

Figure 1: Overview of categories

Category 1: Perceptions of the current performance management system

The first category was structured based on the responses from the sample based on the following questions posed during the interview and the qualitative survey:

- What is your understanding of the performance management and development system (PMDS)?
- Please tell us about your experience of the performance appraisal tool used by your organisation?

Category 2: The experiences of the employees regarding the effective implementation of the current performance appraisal tool

The second category focused on the experiences of the employees regarding the effective implementation of the currently applied performance appraisal instrument. As presented in the themes extracted from the data for this category were analysed using the responses from the following questions as posed during the interview and the qualitative survey:

- What is your experience of the effectivity of the current performance appraisal instrument? Please elaborate.
- What is your perception of the manner in which the performance appraisal tool is implemented?
- Do you think that the instrument is able to assess that which it is purposed to? If not, why?
- Do you find the performance appraisal instrument to be fair? If not, why?

Category 3: Contribution of the implementation of performance appraisal instrument towards job outcomes

However the themes extracted from the data for the third category were analysed using the responses from the following question as posed during the interview and the qualitative survey:

- In your experience, does the implementation of the performance appraisal tool contribute to your job outcomes? If yes, please elaborate.

Category 4: Suggestions for improvement of the performance appraisal instrument and of the implementation thereof

Category 4: were analysed using the responses from the following question as posed during the interview and the qualitative survey:

- What would you suggest being done to improve the implementation of the performance appraisal tool?

- What would you suggest or recommend be done to improve the performance appraisal tool itself?
- What changes, if any, can you recommend being made to the performance appraisal tool so as to improve its effectiveness?

8. Outline of the findings

The general objective of this study was to explore employee perceptions of the performance appraisal instrument and job outcomes within a South African Government department. It will be discussed by outlining the findings of each of the specific objectives.

The first objective of the study was to conceptualise the implementation of performance appraisal instruments and job-related outcomes according to literature. Performance appraisal has been defined by many researchers and scholars, but for the purpose of this discussion a definition by Kondrasuk (2011) was used. In his article he defined performance appraisal as an instrument or form used to assess employee job performance, or as an interview during which employee performance is discussed, or as a process by means of which job expectations and actual achievements are measured and feedback is provided to the employee. Performance appraisal aims to assess, manage and ultimately improve the performance of employees (Gözükara et al., 2017). Grubb (2007) clearly outlined the main reasons for which performance appraisals are done. The reasons cited in the articles were: 1) to promote organisational efficiency and effectiveness; 2) to enhance individual employee performance and satisfaction; 3) to simplify administrative processing; and 4) to ensure management retains control of employee behaviours and attitudes. It can be deduced that although performance management is a tedious process it is imperative for organisations to thrive by improving the application or implementation thereof.

Organisations should in the process take heed of the fact that the success of the performance appraisal is heavily dependent on the perceptions and expectations employees have of the performance appraisal process (Kondrasuk, 2011). When employees see no fairness in the performance appraisal and do not trust it, they will have no faith in the system. Management of performance in organisations makes positive contributions by increasing motivation to perform (Aguinis, 2014). Moreover, in the work environment where performance appraisal induces job confidence, employees display positive attitudes towards it (Njuguna & Maende, 2017) and they would feel motivated to give their best in quest of achieving the goals of the institution (Kyeremeh & Pimpong, 2018).

The second objective was to explore the perceptions of employees on the current performance appraisal instrument. Employees reflected a fairly good knowledge of the performance management and development system. They understood the importance of entering into a performance contract and that the set performance standards in the performance contract need to be aligned with the strategic goals or objectives of the organisation. Newman and Milkovich (2004), as quoted in a study conducted by Kampkötter (2014), indicated that in a formal performance appraisal the alignment of the employee goals and those of the firm is meant to motivate employees to apply the performance appraisal system. From the responses it could be deduced that for organisations to reach greater heights of achievement, agreement on performance standards should be reached during performance contracting. This point is reflected in the study conducted by Grubb (2007) in which it is stated that employees achieve goals and measures set for them at the expense of a number of other activities which are not measured or for which the employee is not specifically held accountable. Further clarified by Daoanis (2012) in an ideal situation the achievement of employees of their own individual performance targets assists the organisation in meeting and indeed in exceeding its strategic targets by linking individual performance targets to the overall strategic target of the organisation.

The results indicated that employees understand and accept that, at a certain interval, performance should be assessed to ascertain the extent to which the agreed performance standards had been met. This will also assist in identifying performance gaps and in deciding on the best possible intervention to address these gaps. Although the standard setting may seem “the most controversial problem” (Cizek et al., 2004), it makes the performance assessment seamless when it is well-orchestrated.

Ayomikun (2017) explains that the critical intention of this process is to identify strengths and weaknesses that can be used in recommending actions for improved employee performance. Some employees indicated the expectation that the performance assessment process would identify and reward satisfactory performance. Employees expected the instrument to be able to distinguish satisfactory performance from 'bad' performance for only the best performers to receive performance rewards. Eiseberger et al. (1999, p. 1028) cited that "employees' expectations of increased pay for high performance should be experienced as more controlling than pay determined by variables independent of performance". The employees who held the view that the final performance rating was dependent only on the individual's writing skills felt that the instrument was failing in identifying good performers. In the study conducted by Idowu (2017) it was indicated that performance appraisals can be used to motivate employees through rewards. Although put differently by Sakti (2021), the hard effort exerted by employees may not necessarily guarantee that expected productivity will be realised, unless it is channelled in the direction desired by the organisation. It is at this stage that certain employees raised a misgiving with the process in as far as the consistency of the assessment is concerned. The involvement of the moderation committee at the end of the process, which will only focus on the written report and not consider any other factors that may have come into play during the performance. The challenge is well put in the study conducted by Cintrón and Flaniken (2011), namely that the most common error with the system is found within the organisational system; not with the employees in the organisation. This holds the potential of influencing the attitude employees may have towards the instrument itself and the manner in which it is implemented, especially when there is a feeling among employees that some supervisors demonstrate lack of knowledge of the instrument they are administering, to evaluate performance. The possibilities of inviting the challenges into the system that can be attributed to personal bias, as stated by Kondrasuk (2011), are high. This makes the process to be selective and to lack objectivity, which has a significant impact on how employees view the entire system.

The third objective of the study was to determine the experiences of the employees regarding the effective implementation of the current performance appraisal instrument. The findings generally indicated that the current performance appraisal instrument lacks objectivity. The results showed that the performance appraisal is not based on actual performance, but that the ability of an employee to write earns them performance ratings. In this instance fairness and accuracy of the system becomes questionable. This finding was further confirmed by findings relating to the effectiveness of the moderation process. Rademan and Vos (2001) found in their study that employees' perceived fairness had a bearing on whether mutual trust exists between the rater and ratee. Obviously, effectiveness of the instrument depends on "how it is correctly done and implemented" (Daoanis, 2012, p. 58). This factor influenced the manner in which they viewed the tool and the application thereof, as some felt that the instrument is not fair or it is not implemented fairly. This factor is covered in the study conducted by Kim and Rubianty (2011) who stated that managing and improving perceived fairness may help increase employees' motivation. Furthermore, Kondrasuk (2011) indicated that when employees do not observe any fairness and do not trust the process of performance appraisals they will quickly deny the importance of the system.

The findings indicated that the performance appraisal process is time-consuming and needs to be more user-friendly. The negative attitude reflected by employees is further exacerbated by the time it takes them to complete the performance appraisal instrument. Agarwal (2011) stated that organisations both in the public and private sector struggle to develop cost-effective, meaningful measures that can drive performance management without yielding undesirable results. The participants indicated that the performance appraisal instrument consumes too much of their time and that it is mentally exhaustive. It implies that employees will have to take from their production time to do performance assessment reports. Idowu (2017) found that the performance appraisal systems that link performance to rewards help in increasing employee motivation, and that the use of the performance appraisal systems to set objectives, to benchmark and to help identify employees' strengths and weaknesses, yield greater satisfaction and consequently higher levels of motivation. Moreover, performance assessment instruments are problematic if they are not representatively

describing the competency (Nuritasari et al., 2020).

The findings showed that it would be necessary to accommodate *ad hoc* tasks, such as activities that they may have performed which were not considered during performance assessment. The results showed that time was spent on additional activities and also that they were delegated to the participants as duties by their respective supervisors. Grubb (2007) stated that employees achieve goals and measures set for them at the expense of a number of other activities which are not measured or for which the employee is not specifically held accountable. This is one of the performance appraisal challenges cited by Cintrón and Flaniken (2011), namely that performance standards and ratings occasionally vary widely and unfairly.

The participants mostly indicated that the instrument is not dependable. To qualify the perception, some felt that the implementation of the instrument is done maliciously, considering the attitude displayed by their supervisors towards the entire process. Of critical importance is how employees perceive the organisation's provision of fair treatment in terms of performance appraisal for them to be eager to protect the image of their organisation (Said et al., 2017). To a certain extent some participants indicated the process as being used as a punishment rather than to assess performance. This perception is not holding the connotation similar to that indicated by Schleicher et al. (2018) who stated that performance appraisal is commonly understood as a discrete, formal, organisationally sanctioned process. Their reflection of the instrument was based on its inability to measure that which it is meant to measure. Pace et al. (2011, p. 7) stated that "reliability is a key property of a critical appraisal instrument, and the efficiency is important from a reviewer's perspective." This negative perception concerning the instrument may affect the employee's acceptance of the performance appraisal outcome and the effectiveness of the system as a whole. However, there were a few participants who felt that the appraisal instrument is dependable, meaning that it is effective in terms of yielding the expected outcomes in relation to performance assessment. This notion is supported in the study conducted by Daoanis (2012) who stated that the success of the performance appraisal system depends on the results of such an instrument. As stated in Salleh et al. (2013), procedural fairness is the perception of employees that they hold of the organisation's performance management system, which should be regarded as being fair. Some participants in this current study construed or regarded the performance appraisal instrument to be objective as it is able to assess that which it purposed to assess. Grubb (2007) states that performance appraisal assumes the burdens of objectivity. Whitman et al. (2012) described distributive fairness as a relationship between employee inputs and outcomes. Perception of accuracy in the study by Rademan and Vos (2001) was stated as having a direct bearing on the reliability of the process.

The findings also reflected some employees' experience of the appraisal instrument as not fair. This feeling among the participants is derived from the fact that the instrument looks at particular aspects of performance targets and excludes other performances that have been executed. Daoanis (2012) stated that the success of the appraisal system depends on the results of such instrument. Grubb (2007) points out that organisations strive to obtain clear, objective outcomes of individual performances. It is crucial for organisations to pay more attention to how employees perceive its practices. Dzansi (2016) indicated that it does not assist in obtaining service quality when employees perceive the HRM practices to be unfair.

The fourth objective of the study was to explore how the implementation of the performance appraisal instrument contributes to the job outcomes (motivation, commitment, job satisfaction (relationships), and work engagement) of the employees. From the results it became clear that relationships play a key role during the performance appraisal process. Some participants reported feeling energised, committed and more dedicated when they knew what was expected of them and when they had met their targets. It was also reflected that a stronger focus should be placed on people development during the performance management process so that staff might even function more efficiently. The findings showed that a good relationship with the supervisor led to the participants experiencing their targets being clearer and they felt more motivated. The supervisor demonstrating understanding towards the employee further led to positive feelings about the process. Literature

shows that work engagement is a key element of well-being and leads to positive feelings among employees (Schaufeli & Taris, 2014). Work engagement can be defined as “a positive, fulfilling, work-related state of mind that is characterized by vigour (that is, high levels of energy and mental resilience while working), dedication (referring to a sense of significance, enthusiasm, and challenge), and absorption (being focused and happily engrossed in one’s work)” (Schaufeli & Taris, 2014; p. 46). A dimension of employee well-being is having close relationships and feeling valued by others (Coffey et al., 2014). Schaufeli and Taris (2014) state that feedback to an employee would promote learning and it is assumed that through the feedback, job competence could be improved. This is viewed as a job-resource, as does social support. Having these resources available to the employee stimulates a “fulfilling, positive work-related state of mind (i.e., work engagement)” (p. 47). It is therefore important especially during the performance management process to focus on valuing employees and building strong mutual relationships; thereby improving work engagement.

The findings showed that the implementation of the instrument induces prominent levels of motivation. The sentiment of those who are motivated by the system is that it is able to determine employees who are performing exceptionally well and to award them with performance bonuses. This acknowledgement has a positive influence on the motivation of the participants. Furthermore, when targets were clear and well-understood employees felt motivated, even to exceed the set targets. The theory on the Job-Demands Resources model (Schaufeli & Taris, 2014) indicates that sufficient availability of job resources, such as supervisor support, play a motivational role in employees. As can be seen in the current study, having sufficient job-resources led to the participants being willing to put in effort towards goal attainment and thereby achieving work goals. This can further be supported by a South African study conducted by Heyns and Kerr (2018) that looked at motivation from the perspective of the self-determination theory on generational cohorts, which found that both generations experience a similar degree of satisfaction of the basic intrinsically motivated physiological needs. However, some participants of the current study indicated that the manner in which the performance appraisal instrument is implemented has a negative impact on their motivation. Nabi et al. (2017) found that motivation and performance have a natural, if not an obvious connection, which improves employee effectiveness and efficiency for achieving organisational goals. Performance of employees is heavily reliant on motivation, as can be seen from the theory relating to the JD-R model (Schaufeli & Taris, 2014). Van der Kolk and Van Veen-Dirks (2019) supported the analysis by indicating that both intrinsic and extrinsic motivation is positively associated with performance.

The study showed that the participants had a sense of accomplishment when they reached their targets and met the satisfaction of their employer. This correlates with the theory on the JD-R model indicating that job resources stimulate work engagement through the achievement of work goals (Schaufeli & Taris, 2014). In a study conducted abroad by Nasurdin et al. (2018) it was found that performance appraisal positively affects organisational commitment. The results from a study conducted by Setiawati and Ariani (2019) similarly found that employee performance is influenced by commitment, since the more committed an employee is to an organisation; the harder they work. Furthermore, a South African study conducted by Mabaso and Dlamini (2018) in the educational sector found that performance management significantly predicted organisational commitment. However, some of the participants, who represented the larger number of the sample, indicated lack of commitment, citing the unfairness they perceived in the process of the performance appraisal. In the event employees perceive bias or favouritism in managerial behaviour during the performance appraisal process that holds the potential of increasing negative perceptions (Njuguna & Maende, 2017).

From the results it can be deduced that unambiguity in the performance standards and targets enhanced the enthusiasm of the participants to work engaged. Findings of a previous study on this construct found that training satisfaction and performance appraisal satisfaction are key drivers of employee engagement at work (Memon et al., 2021). Similarly, Ajibola et al. (2019) established that a relation existed between performance appraisal and employee engagement. A number of South African researchers quoted in the study by Victor and Hoole (2017) found organisational rewards and

workplace trust to have a stronger influence on the increase of work engagement by employees. When subordinates perceive their supervisors as trustworthy, their psychological well-being is positively affected, and in turn it induces their level of work engagement (Maximo et al., 2019). Furthermore, (Coffey et al., 2014) state that positive relationships lead to the employee feeling good and valued and contribute to well-being. The supervisor role is crucial in affecting the perceptions of subordinates regarding the implementation of the performance appraisal process and of the instrument being used for executing the process.

The findings suggested that when the performance management system is used effectively it would result in a positive impact on the organisation. It was reported that the organisation would “*prosper if employees perform well*”, thereby highlighting the importance of employee wellbeing. If an organisation looks after its employees there are many benefits. Schaufeli and Taris (2014) state that stimulating work engagement in an organisation fosters positive organisational outcomes, such as organisational commitment and performance.

Job satisfaction in this current study is an absent factor but with critical influence. This factor was not responded to by almost all of the participants, although there was an indication by one participant that the rigid nature of the performance contract affects job satisfaction. Paillé in (Na-Nan et al., 2020) found job satisfaction to be a mediator in the form of employees’ willingness and as such satisfaction had effects on organisational citizenship behaviour. A study conducted in South Africa in the educational sector confirmed the significance of job satisfaction in the workplace. Mabaso (2017) found among academic staff that compensation, performance management, recognition, talent management and career opportunities have a positive and major influence on job satisfaction.

The fifth objective of the study was to focus on providing recommendations on changes that can be made for the improvement of the performance appraisal instrument. It was recommended by many participants that the moderation process needs to be reviewed. The review should incorporate the clearly defined role of the supervisor during the moderation process and amend the moderation column in the performance appraisal instrument. This was collaborated by Farndale (2017) where supervisor support was found to play a mediating role in the perceived performance appraisal fairness and engagement. Again, Ryu and Hong (2019) stated that constructive performance feedback and trust in supervisors were positively and significantly associated with perceived fairness of performance appraisal. On the other hand, Ayomikun (2017, p. 22) stated “employees who receive support after an appraisal process indicates that such support contributes significantly towards creation and generation of ideas”.

The second recommendation was to consider the enhancement of the performance appraisal system. This includes developing a user-friendly appraisal instrument and changes in its management. This notion is indicated in the article written by Cintrón and Flaniken (2011) who stressed the importance of developing user-friendly and easy-to-understand appraisal procedures and forms. The statement was augmented by Groot et al. (2019) who stated that unambiguous language is an important prerequisite for exchanging electronic information without the risk of misinterpretation. Changing the management of the appraisal instrument incorporated the consideration of the frequency of the administration of the instrument and the reconsideration of the role of the supervisor and/or moderation committee in the entire process. Lawlet et al. (2013) stated that having different systems for every different job provides appraisers with an opportunity to design a system using their direct reports. The relevancy of the appraisal instrument should be worked on to ultimately be improved. The ground-breaking study of Jubaedah et al. (2019) on electronic rubric where the following steps were taken by lecturers before the assessment process took place; the lecturer or instructor provided information on what standards must be achieved, how the performance appraisal process will unfold, and provision of feedback, and provided a platform for organisations to enhance and customise the initiative to suit their conditions. This is a typical example of how effective the performance appraisal can be when expected outcomes are clarified at the very beginning and the subordinates are made aware of how their performance will be assessed, and will be provided with timely feedback as per the standard agreed upon. It is also imperative to ensure that the instrument used is conducive to the

environment and is appropriate in terms of providing the expected appraisal results. Participants indicated the need for the organisation to develop an online performance appraisal instrument. According to Buck et al. (2018) performance management is not a mere single-time discussion, but should be an ongoing data-driven process. Increasingly more companies are using software that uses analytics to improve the relationship between managers and employees. A good example of cutting-edge effective performance management is that of Hum; artificial intelligence is used to leverage people analytics. Buck et al. (2018, p. 262) states that AI is used to “nudge people towards being their best selves, every day, measure what matters most to employees, then nudges leaders, managers, and employees towards positive behavioural change. The result (is) higher productivity, better retention, and greater happiness.”

The principle of legitimacy of the appraisal instrument was covered in the study by Grubb (2007) which indicated a need for continuous improvement of the system and engagement of employees in a collaborative network. In turn, Lawler et al. (2013) indicated that organisations need to establish a performance management system that is integrated with other human resource management systems. To achieve this aim, organisations need to ensure that employee participation is achieved; when it is achieved through decision-making on HRM practices and policies, it enhances employee job satisfaction and performance (Babagana et al., 2019). Salleh et al. (2013) furthermore put forward a suggestion that managers should have control over the employee’s perception of the organisational justice. Employee participation in other studies has been found to be necessary in the development of the performance management process and steps to be taken to ensure that they perceive the performance management process to be fair (Gorman et al., 2017).

The third recommendation covered the training and development of supervisors and employees alike. The results of the study indicated that participants as well as subordinates will increase the effectiveness of the performance appraisal instrument. For a system design to be effective, the supervisor and the employees’ understanding of the appraisal process, and their respective roles in it, should be achieved (Cintrón & Flaniken, 2011). The sentiment is supported by Kondrasuk (2011) by recommending a better training of all involved in performance appraisal, which includes managers and any others involved as well as the human resources specialist. Furthermore, Le (2019) stated that for effective performance appraisal, organisations need to ensure that supervisors possess sufficient skills and knowledge to prepare for it and for good performance management everyone involved needs to possess high skill levels. The training of the role-players will improve the system in its inception in addressing what Daonis (2012) referred to as revisiting the criteria set and providing supervisors with the understanding of scoring so that they apply it accordingly.

The sixth objective of the study concerns the future research and practice recommendations that can be made. This last objective focused on the limitations of the study, recommendations for future studies and practical implications. Below a brief discussion will follow on the three aspects of this objective.

9. Limitations

The researcher envisaged to reach out to 20 participants who were supposed to be spread out to 4 districts that are part of the organisation featuring in the study. The representation of one district was not at an acceptable level due to infrastructural challenge in that specific district. The number reached was less than the envisaged one. A huge challenge was the lack of willingness of the employees in general to participate in the research.

10. Managerial Implications

Key element that featured stronger than others was the training of supervisors/managers on the performance management system and in the appraisal instrument itself. It appeared that more challenges on the system emanated from the inconsistent implementation of the instrument by supervisors/managers, making it difficult for employees to understand the entire process.

11. Conclusion

The study found that employees have positive and negative perceptions of the instrument. Some perceived it to be fair and reliable, whereas others found it unfair, not able to assess that which it is meant to assess, subjective, and lacking inclusiveness. Generally, the instrument was perceived as being time-consuming, cumbersome and not objective. The study further showed that by focusing on improving work engagement through improving job-resources, the well-being of employees can be increased; thus, performance would improve. Based on the finding, recommendations were made to offer training to all stakeholders, develop an online instrument based on sound scientific principles, and consult all relevant stakeholders in the process of developing the new instrument.

Keywords

Employee value proposition; work identity; parastatal organisation; work; benefits

Abstract

An organisation's employee value proposition (EVP) is known to keep employees committed and engaged in their work and establishes how employees experience their work. This study sought to investigate the relationship between the dimensions of EVP and work identity. A cross-sectional quantitative research approach was selected. Data were collected from a parastatal organisation through an online survey. A non-probability sampling technique was selected, and through a convenience sample, 236 responses were elicited. Data were analysed using SPSS. A Pearson correlation analysis and multiple regressions analysis were performed to achieve the research objectives. The study established a relationship between the work sub-dimension of the EVP and work identity. The study contributes to the body of knowledge of work identity and provides linkage to the EVP, which has not been done in previous studies on work identity. It provides guidance to HR practitioners on what is required in terms of the EVP to ensure employees identify with the work.

1. Introduction

Employees play a significant role in improving organisations' operational performance (Whalley, 2021). Organisations have realised that human capital is an essential resource that is pivotal to achieving organisational goals (Koekemoer, 2014). Organisations continuously strive to ensure that employees remain committed through a compelling employee value proposition (EVP) (Lee, 2018; Phungula et al., 2022). It is known that EVP also tends to influence the caliber of potential employees attracted to the organisation (Ferreira, 2016). Whilst studies have established the need for an EVP in terms of talent management (Paadi et al., 2019) and effective talent development (Saurombe & Barkhuizen, 2020), a need exists to understand how EVP influences employees' identification with their work. In other words, how it influences their work identity. Work identity is a "...a multi-identity, multi-faceted and multi-layered construction of the self (in which the self-concept fulfils a core, integrative function), that shapes the roles individuals are involved in, within their employment context" (Lloyd, Roodt, & Odendaal, 2011, p. 31).

Work identity is a growing field of research within the South African context (see de Braine et al., 2015). More so recently, Barkhuizen and de Braine (2021) in their conceptual paper provided a linkage showing that talent management helps to strengthen work identities of employees. There is a relationship between talent management and employee value proposition (Pawar & Charak, 2015). We argue then that through talent management practices, employees experience the EVP of the organization. As such, the current study sets out to empirically measure whether a relationship exists between the EVP offerings of a parastatal organisation and work identity. Furthermore, the study establishes which EVP dimensions best predict work identity. To date there has been no research that investigated the relationship that EVP may have with work identity.

1.1. Literature Review

This section outlines the key variables being researched: employee value proposition and work identity. A concise literature review is presented.

1.2. Employee Value Proposition

The Employee Value Proposition refers to the values and benefits employees can derive from their work experience in an organisation and aims to ensure that employees remain engaged and satisfied with their jobs (Mahajan, 2019; Heger, 2007). Reddy (2017) indicates that a well-packaged EVP offering can make employees feel motivated and satisfied with their employers (Reddy, 2017) and Phungula et al., (2022) noted an increase in normative commitment as a result of EVP. The EVP encompasses employee perceptions of various dimensions within the organisation, including factors such as culture, development, work environment and remuneration (Pattanik & Misra, 2016). Other research has positioned the EVP to include conditions that make work appealing in organisations, based on offerings and experiences provided by the employer and what the employees bring to the organisation (Munsamy & Venter, 2009). Veldsman and Pauw (2018) articulate that the EVP should be a robust approach to driving employee retention. Across studies, it has been established that an EVP is characterised as a reciprocal relationship between the employee and employer which motivates them to stay or join an organisation.

Veldsman and Pauw (2018) hold the view that EVP is a holistic concept based on the premise of an employee value exchange (between the organisation and individual), characterised by giving and receiving. Based on their model of the EVP landscape, they illustrate that components of an EVP set out to include the environment, affiliation, work content, benefits and remuneration. It is known that the EVP contains attributes that employees consider valuable and could include work policies and practices, rewards and benefits and in return, employees provide their service (Aloo & Moronge, 2014). The EVP attributes have a direct impact on the experiences of employees within the organisation. When the organisation takes care of the employees' internal and external needs, the loyalty of employees increases, and they feel valued, resulting in high employee morale and increased productivity (Reddy, 2017). This shows the gap for HR to reposition EVP to align it with EVP expectations of employees. According to Venkataramani (2021), EVPs must focus on employees as people. The EVP package must be people-centred and focus on employees' feelings. This helps employees feel cared for, understood, and valued, contributing to a positive work identity.

1.3. Work Identity

Individual work identity refers to "a work-based self-concept which includes, of a combination of organisational, occupational and other identities that affect the roles people adopt and the corresponding ways they behave when performing their work (Walsh & Gordon, 2007, p. 2). De Braine (2012) asserts that work identity influences how individuals behave in their work, and it is developed due to the interplay between an individual's personal resources and work processes. Walsh and Gordon (2007) assert that individuals are influenced by their social groups at work which helps to form work identity. Walsh and Gordon (2007) state that work identity impacts how employees perform in an organisation, which affects how employees identify with their roles and the organisation. Employees can identify with the organisation and their profession; for example, a doctor can identify with his or her profession due to the impact it has on lives but at the same identify with the hospital that they work. (Cohen & Baruch, 2007).

Understanding the dimensions of work identity and how these dimensions impact EVP important. Value congruence, person-organisation fit and work centrality have been found to dimensions of work identity (Bester, 2012). *Value Congruence* refers to the alignment or similarities of personal and organisational values (Bester, 2012). Therefore organisations need to assess the alignment of values for candidates with the organisational values during the recruitment phase so to ensure that there is a fit and the value congruence is high (McRobert et al., 2018).

Person-organisation fit refers to the compatibility (for example, perception, values, beliefs etc) of the employee with the organisation (Bester, 2012). It is important to note that organisations regard the PO fit as an important element during recruitment (Morley, 2007). Most applicants search for jobs and research the organisation's values and culture to discover if there is a person organisation fit (Morley, 2007). Understanding the need for the PO fit and being proactive in including this factor in the recruitment process positively affects employee experience (Uen, Ahlstrom, Chen & Liu, 2015).

Work centrality directly impacts employee experience (Gavriloaiei, 2016). Work centrality impacts the behaviour of the employee at work and outside work, this has an impact on the brand of the organisation as employees are brand ambassadors of the organisation (Gavriloaiei, 2016). Person-organisation fit and work centrality influence employees' loyalty to the organisation.

1.4. EVP and Work Identity

Work identity is "who am I at work"(Bothma & Roodt, 2012, p.12), and the EVP experience directly impacts how employees identify themselves with work. Adams and Crafford (2012) assert that people are constantly in the process of defining themselves by drawing on and engaging with various environments and contexts, such as family, work, friends, religious groups, and leisure activities.

The EVP experience of employees shapes the way employees relate to the organisation which in turn influences work identity. Organisational support such as supervisor support and participation in decision making (which are part of the EVP) has been shown to be a job resource that predicts work identity (De Braine 2012). In a similar way, opportunities for growth and advancement (which also are part of organisations' EVPs) predict work identity (De Braine, 2012). This may result in deeper connections to an organization. Employees who experience a deeper connection with an organisation usually experience more compatibility with an organisation (Uen et al., 2015). Organisations can include organisational values "who we are" as part of the attraction and selection so that applicants get to understand the values of the organisation before deciding to join the organisation, this could be a considerable cost and time-saving initiative for the organisation as a high-value congruence positively affects employee retention (Bao et al., 2019). The EVP attributes impact work identity; for example, the compensation offered by the organisation can influence how valued the employee feels, which also affects work identity (Daniel, 2017). Affiliation is an attribute of EVP which includes ethics as one of its elements. The ethical behavior of an organisation influences work identity, and employees tend to align to the ethical conduct of an organisation and its leadership. Employees want to be part of an organisation that mirrors their ethical values (Lacy & Hayward, 2011), which helps to strengthen the value congruence dimension of work identity. When employees are satisfied by the EVP attributes of an organisation, they are more likely to have a positive work identity (Heger, 2007). Employees will relate positively or negatively with the organisation depending on the EVP package offered (Paadi et al., 2019).

2. Method

A quantitative research approach was selected to address the research objectives: to establish the relationship between dimensions of the EVP and work identity and which dimensions of the EVP best predict work identity. The study was cross-sectional and involved diverse samples such as different age groups, races, and gender, which yielded various views (Kumar & Roy, 2019).

3. Respondents and sampling

Data was collected from a parastatal organisation, and 236 responses were received. All employees with access to emails were requested to participate in this study. The researcher applied for access to the parastatal organisation. Access was approved, and human resources acted as a gatekeeper. Online questionnaires were distributed via email to a business unit. Reminders were sent to participants as the response rate was low, and follow-ups were made; however, there was limited access to employees as South Africa was under lockdown due to the COVID 19 pandemic, and most employees were working from home. A non-probability sampling technique was used; therefore, all willing respondents had an equal opportunity to participate in the study. Specifically, convenience sampling was used. Convenience sampling was selected because provided ease of access to participants and also sped up the data collection process. The sample comprised of 44.2% men (n = 111), 49.8%

females (n = 125) and 6% other meaning it was unspecified (n = 15). Most participants belonged to the Black race group (n = 133; 64.9%), followed by the Coloured race group (n = 37; 14.7%), Other “unspecified race group” (n = 26; 10.4%), Indian race group (n = 19; 7.6%), Chinese race group (n = 4; 1.6%) and White race group (n = 2; 0.8%). Most participants were employed in the junior category (n= 122; 48.7%) followed by senior managerial category (n = 77; 30.6%) and trainees (n =52; 20.7%). The mean was 9.01, median 7.00 and standard deviation 7.85 for tenure of the participants. The mean was 36.36, median 34.00 and standard deviation 10.39 for the age of the participants.

3.1 Measuring instruments

The online survey consisted of two sections, biographical information was requested in the first section and the second section, and participants were requested to complete the following scales, measuring EVP (The Value Attributes Scale developed by Ferreira, 2016), and Work identity (WI-28 developed by Roodt et al., 2009)

Regarding the use of *Biographical information*, a biographical questionnaire was used in this study to obtain sample-specific demographical related information about the participants such as age, gender, marital status, ethnicity, the highest level of education passed and job category.

The Value Attributes scale was used to measure the employee value proposition and is a twenty-item measure of dimensions of remuneration and benefits, organisational culture, career development, work content, and work-life balance. The items are scored on a 5-point frequency scale ranging from 1 (not at all important) to 5 (very important) and include statements such as. “To what extent are you provided with challenging targets?”; and “Are you satisfied with your employer’s provision of incentive bonuses/variable pay?”. An acceptable Cronbach’s alpha coefficients for the overall scale was reported by Ferreira (2006) as .71.

The *Work Identity scale* (WI-28) is a twenty-eight-item measure of dimensions Occupational identity, Professional identity, Career identity, Job involvement, Person–organisation fit, Work centrality, and Organisational identification. The items are scored on a 7-point frequency scale ranging from 1 to 7 and include statements such as “How much meaning does work add to your life?”; “How much do you give to your job?”; “How rewarding is work itself as an activity?”; “To what extent is your occupation the most important activity in your life?”; and “How embarrassed do you feel when the media criticises the organisation that you work for?” De Braine and Roodt (2011) reported acceptable Cronbach’s alpha coefficients for the overall scale as .95

3.2. Data analysis

Statistical analysis of the data was performed by STATCON (Statistical Consultation Services at University of Johannesburg) utilising SPSS software, version 27, through inferential statistics. Principal component analysis (PCA) was used to reduce the dimensions of datasets, making it easy to interpret the data collected (Pallant, 2011). Principal Axis Factoring (PAF) was used to simplify datasets by creating a valid factor solution (Tabachnick & Fidell, 2007). Reliability analysis was performed, and .70 was considered an acceptable internal consistency value (Pallant, 2011).

The Pearson correlation analysis was performed to establish the relationship between EVP dimensions and work identity. A Pearson’s product–moment correlation measures the strength that exists between two variables, and suggests that (Pallant, 2011). Guidelines by Cohen (1988) were used to establish the effect namely small = $r = .10$ to $.29$, medium = $r = .30$ to $.49$ and large = $r = .50$ to 1.0 .

A Regression analysis was performed on which dimension in the EVP is the best predictor of work identity. The following criteria was noted, a tolerance value of less than .10 indicates the existence of multicollinearity. If it is below 10, beta values can be interpreted with confidence (Pallant, 2011). The variation inflation factor (VIF) above .10 indicates the existence of multicollinearity, and if it is below .10, beta values can be interpreted with confidence (Pallant, 2011). According to Pallant (2011), multicollinearity is possible if the R squared value is less than .10. Pallant (2011) highlights that if the beta value is higher, the variable makes a significant prediction of the dependent variable. The sig

value of fewer than 0.05 means that the variable makes a significant prediction of the dependent variable (Pallant, 2011).

3.3. Ethical considerations

The ethics committee reviewed the study in the Department of Industrial Psychology and People Management at the University of Johannesburg. Ethical clearance was granted [IPPM-2020-407(M)]. The researcher applied for access to the organisation. Human resources acted as a gatekeeper and assisted in the distribution of the online survey. Respondents provided their informed consent. All responses were anonymous and remained confidential. Respondents were made aware of their rights in the study, the nature and purpose of the study and that participation was voluntary.

4. Results

A Principal Axis Factoring with Oblimin with Kaiser Normalisation rotation method was performed as part of the factor analysis for the EVP. The first iteration, items 10 and 15 yielded communalities below .30 and were excluded. Subsequently, in the second iteration, the correlation matrix revealed the presence of communalities above .30, which was considered suitable. The Keyser-Meyer-Olkin (KMO) value of .89 exceeded the recommended value of .60 (Pallant, 2011). Subsequently, Bartlett's Test of Sphericity reached statistical significance. Therefore, supporting the factorability of the correlation mix. There were no clear loadings upon this iteration, so a forced three-factor solution was presented. The following results were achieved: an Eigenvalue of 1.15 for three factors, which explained a cumulative variance of 59.19%. Pallant (2011) states that factor loading above .40 is acceptable. Three factors with all the items loading above .40 were extracted. The Cronbach's alphas for work were .91, and .86 for rewards, and .81 for an opportunity. Therefore, a three-factor solution was accepted: work accounting for 46.92% variance, rewards accounting for 8.08% variance, and opportunity accounting for 4.18% variance. All dimensions in the scale achieved acceptable alphas above .70.

The work identity scale was subjected to Principal Axis Factoring. The correlation matrix revealed the presence of .30 and above communalities for all items. The Keyser-Meyer-Olkin (KMO) was .951 exceeding the recommended value of .60 as suggested by Pallant (2011). Bartlett's Test of Sphericity reached statistical significance, supporting the factorability of the correlation mix. The Eigenvalue of 13.38 was revealed, explaining the variance of 56.35%. The loading for the work identity component was above .40. A one-factor solution was accepted. The work identity measure achieved a Cronbach alpha coefficient of .97.

Pearson Correlation Analysis

A correlation coefficient was used to assess the relationship between employee value proposition and work identity. Table 1 indicates that there is a relationship between EVP, and work identity. In terms of the correlations between the variables in the table 1 below, the following was interpreted: Work is positively correlated to work identity ($r(.483) = 255; p < 0.001$), with medium size effect. Rewards are positively correlated to work identity ($r(.345) = 255; p < 0.001$) with medium size effect. Opportunity is positively correlated to work identity ($r(.431) = 255; p < 0.001$) with medium size effect.

Table 1 Correlation analysis for EVP and Work identity

	EVPF1 Work	EVPF2 Rewards	EVPF3 Opportunity	WIALL Work Identity	alphas
EVPF1 Work	1	.716**	.763**	.483**	.91
EVPF2 Rewards		1	.658**	.345**	.86
EVPF3 Opportunity			1	.431**	.81
WIALL				1	.97

Regression Analysis

A standard multiple regression was used to evaluate the measure in which employee value proposition predicts work identity. A regression equation was found $F(3,244) = 24.09, p < 0.001$. Table 2 indicates the variance of 22.9%. Multicollinearity demonstrated the tolerance value that ranged from 0.342 to 0.400. According to Pallant (2011), common cut-off tolerance values of less than 0.10 may indicate the presence of multicollinearity. The variance inflation factor (VIF) ranged between 2.499 to 2.926. These values were lower than the cut-off value of above 10, as suggested by (Pallant, 2011). Therefore, multicollinearity was not of particular concern. Therefore, the beta (β) values can be interpreted with confidence.

Table 2 indicates that work contributed a large variance to work identity, recording the beta value of .41. Opportunity and rewards did not predict work identity as there were no significant result

Table 2 Regression analysis for EVP and WI

	Unstandardised Coefficients		Standardised Coefficients	T	Sig.	R	R Square	Adjusted R Square	Collinearity Statistics	
	B	Std. Error	Beta						Tolerance	VIF
(Constant)	2.519	0.310		8.133	0.000	.478	0.229	0.219		
EVPF1 Work	0.444	0.104	0.412	4.280	0.000				0.342	2.926
EVPF2 Rewards	-0.085	0.099	-0.071	-0.857	0.392				0.467	2.144
EVPF3 Opportunity	0.183	0.115	0.141	1.590	0.113				0.400	2.499

5. Discussion

The EVP sub-dimension *Work* predicted work identity. This dimension dealt with aspects of challenging and exciting work; manageable workload; quality of performance feedback; teambuilding, and how valued they feel by their employers. All these aspects of work can be regarded as job resources. Job resources are "...those physical, psychological, social or organisational aspects of a job that either/or (1) reduce job demands and the associated physiological and psychological costs; (2) are functional in achieving work goals; and (3) stimulate personal growth, learning and development" (Demerouti, Bakker, Nachreiner and Schaufeli, 2001, p, 501). Job resources predict work identity (Bester, 2012; De Braine & Roodt, 2011; Van Rensburg, 2020). This study's findings that work aspects predicts work identity has been found in previous studies results: Organisational support and team climate were shown to predict work identity (De Braine, 2012; Van Rensburg, 2020). Organisations provide organisational support by providing manageable workload and quality performance feedback. Through team building initiatives, organisations enable healthier team climate environments which serve to bolster better interaction between employees. The work environment impacts the formation of work identity (Mortimer, Lam & Lee, 2015 as cited in Barkhuizen & De Braine, 2021).

The EVP sub-dimensions rewards (includes competitive pay package, recognition and employee wellness programmes) and opportunity (includes career development and opportunities to grow) did not predict work identity. These were unexpected results. Previous studies have shown a direct relationship between rewards and work identity in (Bester, 2012) and that opportunities to be developed, learn and advance positively influences work identity (Adams & Crafford, 2012; Collins, 2009; De Braine, 2012). In this study, this was not found. This should be further investigated in future studies. There has been a call to increase research on the relationship between recognition and identity at work (Tweedie, Wild, Rhodes & Martinov, 2019).

5.1. Limitations and Recommendations for future research

Research is not void of limitations. Data was collected during the height of the pandemic, and employees were working from home. This resulted in low response rates. The study is conducted in a parastatal organisation, so the results must be interpreted cautiously and cannot be generalised to other industries. As such, it is recommended that research on EVP and work identity is conducted in various sectors. More studies can be done exploring the relationship between the employee lifecycle and work identity, exploring the role of EVP in this relationship, as well as gaining a qualitative narrative of the EVP is recommended.

5.2. Implications for management and HR

EVP offerings play an essential role in the motivation of employees within the organisation (Wahba & Elmanadily, 2015). Human resources practitioners should emphasise the importance of EVP in the employee lifecycle to strengthen the work identities of employees, especially in the areas of performance feedback, challenging goals, manageable workload and work-life balance. It is therefore important that managers and HR improve and enhance these areas mentioned within their talent management practices, which may assist towards enhancing the work identity of employees (Barkhuizen & De Braine, 2021). In so doing, employees can have a greater strategic connection with their organisations (De Braine & Dhanpat, 2019), thus leading to greater possibilities of improved work performance.

6. Conclusion

The study aimed at investigating the relationship between the EVP offerings of a parastatal organisation and work identity. Furthermore, the study aimed at establishing which EVP dimensions best predict work identity. It was found that only the work sub-dimension of EVP predicted work identity. This study found that EVP is related to work identity. This relationship has never been investigated in a study before.

Keywords

Role conflict, trust in management, employee work attitudes, core self-evaluation, public sector

Abstract

In today's highly competitive work environment, organisations have a greater need for competitive, agile, and assertive individuals to acclimatise to the fast-paced change in organisations. In particular, the public sector organisations' customer service expectations from the general public require public sector personnel to display desired attitudes towards their jobs. These attitudes are generally influenced by the perception employees conceive about the prevalence of organisational factors within their work environment. The perceived organisational factors, such as the prevalence of role conflict, influence the kind of attitudes employees will develop and exhibit towards their jobs, which has a snowball effect on the quality of services rendered to the stakeholders. Utilising a quantitative approach, a cross-sectional design and a convenience sample (n=290) from Lesotho governmental ministries, this study aimed to determine the mediating role of managerial trust and the moderating role of core self-evaluation in the relationship between role conflict and employee attitudes. The study utilised PROCESS macro (Hayes, 2017) to test for direct and indirect effects with the Jamovi open-access software (Version 2.2.5.0). The findings suggest that all scales used in the study are reliable. The results denote that role conflict demonstrated noticeable relations with trust in leadership, CSE and employee work attitudes. Amazingly, role conflict was not associated, at least statistically, with any of the variables used in this study. Trust in the leader reported a positive association with organisational commitment and job satisfaction with both relationships. Additionally, trust in the leader has an inverse relationship with turnover intention. Affective commitment has a positive relationship with job satisfaction and a negative relationship with intentions to quit. In addition, job satisfaction also has an inverse negative relationship with intentions to quit. Furthermore, the study focused on *the conditions under which these relationships hold true*. It seems like that the level of trust matters for the relationship between role conflict and job satisfaction, performance and intentions to quit. Conspicuous, the results suggest that the effects of role conflict on *job satisfaction, performance and intentions to quit* were only significant for participants with *high levels of trust*. Therefore, low and average levels of trust matter less for the relationship between role conflict and job satisfaction, performance and intentions to quit. The results also imply that the effects of role conflict on *performance* were only significant for participants with high levels of CSE. Therefore, low and average levels of CSE matter less for the relationship between role conflict and performance. The implications and future research are also discussed.

1. Introduction

Employees in the public sector environment work in challenging, demanding and complex situations. They are faced with demands to exhibit professionalism, effectiveness and efficiency in rendering services. On the other hand, they have to satisfy the growing expectations from the general public

they serve and adhere to regulatory systems from management (Steen & Schott, 2019). Most public service workers' duties involve interaction with citizens and require the astute rendering of service quality (Lipsky, 2010). The mass processing of clients and serving various stakeholders has implications on how these employees feel about their jobs and the behaviours they exhibit while executing their duties. The observation of role conflict challenges among the boundary-spanner roles such as public sector employees (public service employees) is not a new phenomenon of investigation among researchers. However, there is a dearth of research investigating the boundary conditions and underlying mechanisms that explain the relationship between employees' perceived role conflict and employee attitudinal outcomes. This study addresses these gaps by utilising the Job Demands-Resource model and Conservation of resource theory as the theoretical frameworks underpinning the envisaged relationships, particularly in the context of a developing country in Africa, Lesotho. Secondly, apart from determining the direct effects, the study also proposes trust in management as a possible mediator and core self-evaluation as a moderator in the relationship between role conflict and employee work attitudes.

2. Literature Review

The next segment considers the overview of both the theoretical and empirical literature from previous studies. The discussion on research methods, analysis and findings section follows, and the study concludes with the considerations of the practical and managerial implications, limitations, and prospects for future research.

2.1. Theoretical overview

Job Demands-Resource Theory and The Conservation of Resource

The job demands-resource model has been used to understand how multifarious aspects of job aspects might relate to individual and organisational outcomes. In this study, the JD-R theory is utilised as a robust theoretical tool to explain the link between the independent variable (role conflict) and the dependent variable (employee work attitudes). *Job resources* relate to organisational aspects of the job that are instrumental to achieving work goals, stimulating personal growth and reducing sustained pressure from the job demands leading to a motivational process. *Job demands* refer to various organisational aspects of the job that require sustained effort associated with physical and psychological costs leading to the health-impairment process (Bakker & Demerouti, 2014). In line with the job demands-resource theory's health-impairment process, role conflict is considered from the objective perspective as a perceived actual and verifiable condition in the environment of the focal person (Pandey & Kumar, 1997). Therefore, role conflict depicts a job demand in this study that can cause strain on employee resources and influence their attitudes toward the job as well as their ability to execute duties.

In addition to establishing and understanding the mechanisms that link the independent variable to the outcome variable, this study further seeks to determine the boundary conditions that influence the relationship between role conflict and employee work attitudes. Boundary conditions identify the situations that specify when relations between variables change due to the values of the other variable (Busse, Kach, & Wagner, 2017). The role of boundary conditions is to signify the presence and strength of such conditions (Gonzalez-Mulé & Aguinis, 2018). Drawing from the conservation of resource theory, this study identifies core self-evaluation as a personal resource instrumental in explaining the presence and strength of the relationship between role conflict and employee work attitudes. The COR theory offers a theoretical underpinning for understanding how employees can use coping resources to prevent resource loss, maintain existing resources, and gain resources necessary for positive work outcomes (Hobfoll & Schumm, 2009). The theory outlines the four basic categories of resources: objects, energies, conditions, and personal characteristics. Accordingly, individuals seek to acquire, preserve and maintain their resources (Hobfoll & Wells, 1998). The COR theory asserts that individuals with greater resources are less vulnerable to resource loss than those who lack resources. Therefore, it is expected that would function as a moderator and employees with higher levels of core self-evaluation will be less vulnerable to the negative effects of role conflict.

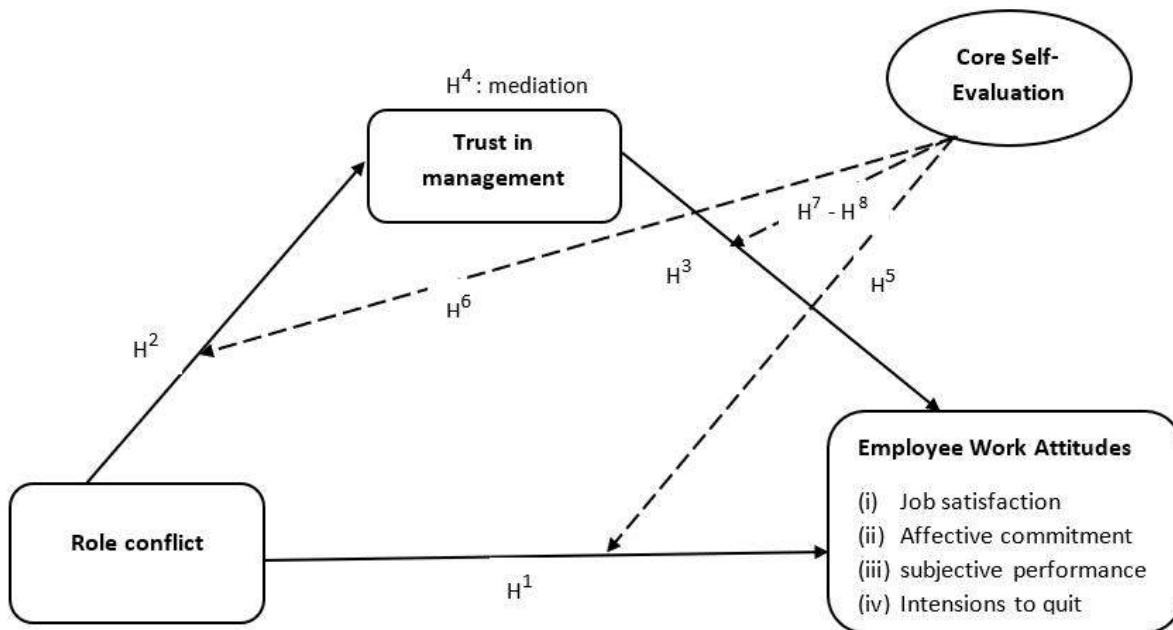

Figure 1. Proposed study model

2.2. Perceived role conflict and employee work attitudes

Role conflict is a salient variable of investigation among public sector employees and boundary-spanning roles in general. Role conflict refers to the perceived discrepancies or incompatible demands relating to work requirements imposed on or experienced by employees and the behaviours expected in executing the role (Rizzo, House, & Lirtzman, 1970; Han, Wang, & Dong, 2014). Work roles' incompatibility and incongruence can arise from different conditions: person-role conflict, inter-role conflict, intra-sender conflict and inter-sender conflict (Pandey & Kumar, 1997). Of the four dimensions of role conflict, this study focuses on inter-role and intra-role conflict. *Intra-role conflict* is associated with the expectation of an individual to execute different roles incongruent with each other. *Inter-role conflict* relates to incompatible expectations anticipated from a single role by different senders or stakeholders (Ebberts, & Wijnberg, 2017). These expectations are common in the public sector, where employees simultaneously serve various stakeholders.

Previous research has explored the effects of role conflict on various organisational outcomes, including employee work attitudes. Attitudes refer to individuals' summary evaluation of objects such as oneself, other people, the environment or issues (Petty, Wegener, & Fabrigar, 1997; Albarracín & Shavitt, 2018). Attitudes can be specific, or they can be generalised across objects, with people having attitudes that are either generally positive or generally negative, whereby some people tend to like things, whereas others tend to dislike things (Hepler, & Albarracín, 2013). In the workplace, attitudes are critical predictors of employees' actual behaviours, which impact organisational outcomes. Hence it is vital to establish how different organisational factors influence attitudinal work outcomes.

The current study considers four critical work attitudes to explore the effects of role conflict on public sector employees, namely job satisfaction, affective commitment, subjective performance, and turnover intentions. *Job satisfaction* denotes the employee's positive emotional response toward achieving job value or equity (Liu, Aunguroch, & Yunibhand, 2016). It is believed that employees with heightened levels of job satisfaction at work will be highly motivated, leading to desired organisational outcomes. Therefore, positive aspects of work-life contribute to job satisfaction, while an uncondusive work environment results in job dissatisfaction (Dhamija, Gupta, & Bag, 2019).

Affective commitment refers to the individual's component of generic organisational commitment manifested by emotional attachment to the organisation (Jaros, 2012; Mercurio, 2015). Affective commitment further relates to the extent to which an individual attachment to the organisation

involves emotional feelings such as loyalty, a sense of belongingness and admiration for the respective organisation (Meyer & Allen 1991). Affective commitment is also advocated as the core essence of organisational commitment and the primary influencer of other components of organisational commitment. This study concentrates on the affective component of the broad multidimensional concept (Mercurio, 2015).

Job performance is perceived as the outcome of the fit between a person's behaviours and the demands of the job or task (Weiss, 2002; Griffin, Neal, & Parker, 2007.) *In-role job performance* refers to employee activities related to formal tasks, duties and responsibilities as depicted by the formal job description. These behaviours can be used as an indicator of employees' performance to evaluate whether the employee is capable of fulfilling required job duties in the organisation (Williams & Anderson, 1991). Employees with higher levels of in-role performance are found to be contributing directly to organisational success because their work activities are aligned with company goals (Van Scotter, Motowidlo, & Cross, 2000).

Organisational turnover relates to the number of employees leaving an organisation within a specified period (Park & Shaw, 2013). *Turnover intention* refers to a multi-staged process of psychological detachment and employees' voluntary inclination to depart from their current position (Takase, 2010). It involves a deliberate, conscious and wilful desire and intention to stop rendering employment services to the current organisation. Various internal and external organisational factors can trigger turnover intentions. In most cases, employees' voluntary intentions to leave their current job reflects their attitude toward the organisation (Ngo-Henha, 2018). Strong feelings of turnover intentions can trigger negative behaviours in the workplace, such as disengagement, low productivity and counter-productive behaviours, including absenteeism (Cho & Lewis, 2012).

The empirical findings on the relationship between role conflict and employee attitudes show that job demands such as role conflict influence different aspects of employees' work outcomes. For instance, relating to association with job satisfaction, Kadir, Kamariah, & Saleh (2017) reported that role conflict negatively influenced job satisfaction using the sample of nurses. In a study investigating role conflict among enterprise employees, an inverse relationship was reported between role conflict and job satisfaction (Ren, Chen, Zhu, & Chen, 2020). These findings signify that increased role conflict can lower individual employees' levels of job satisfaction. Finding from López-Cabarcos, López-Carballeira, & Ferro-Soto (2021) show that role conflict was negatively associated with affective commitment and positively related to turnover intentions. Investigating the link between role conflict and the three dimensions of organisational commitment and turnover intentions, Addae, Parboteeah, & Velinor (2008) found that role conflict was negatively associated with affective and normative commitment while positively associated with turnover intentions. The findings for the role conflict's relationship with in-role or task performance reported an inverse negative relationship (Akgunduz, 2015; Raub, Borzillo, Perretten, & Schmitt, 2021). Even though these findings seem consistent, the strength of the association between the investigated variables varied considerably, the contexts also varied, and limited studies seem to be conducted in the public sector, especially in the African sub-Saharan context, which justifies further investigation.

In this study, the relationship between role conflict and employee work attitudes (job satisfaction, affective commitment, job performance and turnover intentions) can be delineated by drawing on the job demands-resources (JD-R) framework. According to the health impairment or resource depletion process of the model, which suggests that high demands inflict strain on employees, the job demand of role conflict will deplete employee resources which results in lower levels of positive attitudes of job satisfaction, affective commitment, job performance and inversely heightened levels of negative attitudes of turnover intentions. Therefore, in relation to the direct effects, the study proposes that role conflict would be significantly and negatively related to employee work attitudes of job satisfaction, affective commitment and in-role performance while conversely positively associated with turnover intentions.

2.3. Trust in management as a mediator linking role conflict and employee attitudes

The interaction between employees and the organisational context requires meaningful relations that will enable the relationship to serve the goals of all stakeholders involved. One of the critical factors that determine the relationship between employer and employee is trust relations. Trust refers to the discretionary relationship between two parties, enabling people to cope with the uncertainty caused by others' free will (Ruohomaa & Kutvonen, 2005). At the individual level, trust denotes the psychological state signified by the willingness to be vulnerable to the other party's actions with the cognitive expectation that the other party will act on goodwill and yield positive expectations (Rousseau, Sitkin, Burt, & Camerer, 1998). Organisational procedures and policies shape these expectations and psychological state. Trust in management is defined as employees perceived confidence in the immediate supervisor and in top management's ability to secure and manage the organisation's future and to act in the best interest of the employees (Haridas, Ture, & Nayanpally, 2021). The trust state can develop or decline as relationships between parties mature or change as conditions that contribute toward or undermine it change (Audrey Korsgaard, Kautz, Bliese, Samson, & Kostyszyn, 2018).

Previous research confirms the mediating role of trust in management between role stressors and employee attitude. For example, trust in supervisors was reported as a mediator between relationship conflict and employee citizenship behaviour (Kacmar, Bachrach, Harris & Noble, 2012). Further, the mediating role of trust in management was established in the relationship between organisational career management and turnover intentions (Haridas, Ture, & Nayanpally, 2021). Trust in supervisors also mediated the relationship between conflict management styles and employee work attitudes of job satisfaction and turnover intentions (Chan, Huang, & Ng, 2008). In line with the conservation of resource theory, sustained high levels of role conflict are more likely to result in cycles of resource loss. Therefore, it is expected that high levels of role conflict would lead to decreased levels of employee trust in management. In addition, due to the spiral of resource loss, the lower levels of trust might also snowball into lower levels of job satisfaction, affective commitment, in-role performance and, on the other hand, higher levels of turnover intentions. Hence trust in management is proposed as a mediator linking role conflict and employee work attitudes.

2.4. Moderated-mediation model of core self-evaluation in the link between role conflict and employee attitudes

To successfully cope with the pressures and job demands, coping mechanisms are critical for employees. This study proposes core self-evaluation as a salient personal resource that can mitigate the effects of job demands on employees' attitudes and behaviours. The COR theory attests that those individuals who possess strong resource pools would cope better to offset strain and are more likely to benefit from utilising sources than individuals who lack resources (Hobfoll & Shirom, 2000). In this study, core self-evaluation is considered an important coping resource critical for helping employees to offset the severe effects of work demands.

Core self-evaluation depicts the individual's overall appraisal of basic areas in one's life, including how they view reality, themselves and or other people. Within the workplace, these appraisals influence how employees feel, perceive, and behave toward their jobs (McLarty & Whitman, 2016). The construct of core self-evaluation is defined as a broad higher-order latent variable that reflects individuals' self-appraisal, their sense of worthiness, capabilities and competencies, as well as control over situations, outcomes and functioning of the environment (Judge & Cable, 1997; Judge, Erez, Bono & Thoresen, 2003). Core self-evaluation is characterised by four sub-dimensions namely; self-esteem, locus of control, generalised self-efficacy, and emotional stability. *Self-esteem* signifies an individual's positive appraisal of self-worth, respect and self-acceptance. *Locus of control* denotes an individual's convictions in controlling situations and life's outcomes. *Generalised self-efficacy* refers to an individual's appraisals relating to competencies, capabilities, and self-motivation to execute tasks and successfully meet the demands of given situations. Emotional stability relates to an individual's capability to exercise calmness, discernment and good decision-making processes when faced with varying situations (Kacmar, Collins, Harris, & Judge, 2009; Judge & Kammeyer-Mueller,

2011). Therefore, higher levels of core self-evaluation are perceived to equip individuals to appraise themselves consistently positive, capable and in control across various situations.

Past research reported evidence on the moderating role of core self-evaluation associated with the link between job demands and a variety of employee work outcomes. For example, Chhabra (2020) reported that CSE was a buffering mechanism for the effects of job stress on job satisfaction and turnover intentions. CSE further acted as a buffer in the relationship between job demands of challenge stress and safety performance amongst mine employees in China (Yuan, Li, & Lin, 2014). The buffering role of CSE was established in the relationship between social stressors, job satisfaction, turnover intentions and altruism. Higher levels of CSE diminished the negative effects of stressors (Harris, Harvey, & Kacmar, 2009). When applied to COR theory as a personal resource, employees who possess higher levels of core self-evaluation would perceive role conflict not as a threat but as an opportunity to stretch their resources in order to accomplish the desired organisational goals. This study proposes that the line with the COR theory, the personal resource of core self-evaluation will moderate the negative effects of job demand (role conflict) on employee work attitudes through trust in management, in such a way that the negative effects of role conflict on employee work attitudes are weaker for employees with higher levels of core self-evaluation.

2.5. Study objectives

Even though prior research has established the relationships between various organisational situational factors and employee work attitudes, there are limited empirical studies linking perceived role conflict, trust in management, core self-evaluation and employee work attitudes in a single conceptual model. As a result, the main objective of this current study was to examine the moderated mediation model of trust in management and core self-evaluation in the relationship between role conflict and employee work attitudes of job satisfaction, affective commitment, in-role job performance and turnover intentions. The secondary objectives include the following:

- Examine the direct effects between role conflict and employee work attitudes (job satisfaction, affective commitment, in-role job performance and turnover intentions).
- Investigate the mediating role of trust in management in the relationship between role conflict and employee work attitudes.
- Establish the moderating role of core self-evaluation on the indirect relationship between role conflict and employee work attitudes through trust in management.

3. Methodology

The following section outlines the research strategy adopted for the study, data collection procedures and data analysis.

3.1. Research approach and sampling strategy

The study adopted a positivist paradigm. Using the cross-sectional time horizon, the study applied a correlational design. Correlational design refers to a type of research strategy designed to discover relationships between two or more variables (Bougie & Sekaran, 2019). The data was collected from a convenience sample of 290 public service employees from Lesotho governmental ministries. The non-probability strategy of convenience sampling is advantageous considering its reliance on the accessibility of selected organisations and the willingness of respondents to participate in the survey (Stockemer, Stockemer, & Glaeser, 2019). The descriptive statistics show that the sample consisted of 160 (55.2%) female and 130 (44.8%) male respondents. In total, 48.3% of the respondents were aged between 36 and 45 years, while 27.2% were between 25 and 35 years of age. About 20% of the respondents were older than 45 years, while the rest were younger than 25 years. The majority of the respondents (50.1%) had tenures ranging between 6 and 15 years, 30.4% of the respondents had a tenure of 1 to 5 years in public service, and 15.8% had a tenure of more than 16 years of employment with the public service departments. On the educational qualifications, 60.7% of the respondents hold a bachelor's degree certificate, which indicated that generally, public service employees are well qualified with regard to formal education. In relation to the employment rank or position, the majority

of the respondents, 43.5%, occupied middle management or supervisory positions, non-managerial positions were occupied by 39.7% of the respondents, senior management level respondents and consultants occupied 16.9% of the position levels.

3.2. Data collection

Prior to the commencement of data collection, the study obtained ethical clearance for the minimum risk category. After the permission to conduct the study was granted from the respective public service government ministries, the respondents received the survey package through the delegated gatekeeper for each ministry. The survey package included a cover letter explaining the purpose of the study, the questionnaire, and a return envelope. The respondents were informed about the issues of anonymity and confidentiality regarding the data collected, and they were also made aware that participation in the survey is voluntary. The permission to use data for research purposes was requested and obtained from the government ministries and the participants.

3.3. Research measuring instrument

Independent variable - Role conflict. Role conflict was measured by a six-item scale originally developed by (Rizzo *et al.*, 1970) and as used by (Bowling *et al.*, 2017) (e.g. “In my job, I often feel like different people are pulling me in different directions”). The items were rated on a 5-point Likert scale ranging from 1 = *strongly disagree* to 5 = *strongly agree*. Higher scores represented a greater degree of role conflict. The coefficient α score was .70.

Dependent variable - Job Satisfaction. Job satisfaction was evaluated using a five-item scale originally developed by (Andrews & Withey, 1976) and as used by (Rentsch & Steel, 1992) (e.g. “How do you feel about the work you do on your job – the work itself?”). The items were rated on a 5-point Likert scale ranging from 1 = *extremely dissatisfied* to 5 = *extremely satisfied*. The higher scores represented a greater degree of general job satisfaction. The coefficients α score from (Rentsch & Steel, 1992) study was .81.

Dependent variable - Affective Commitment. The affective commitment was assessed using the six-item scale originally developed by Meyer *et al.* (1997) and as used by (Rhoades *et al.*, 2001) (e.g. “I feel a strong sense of belonging to my organisation”). The items were rated on a 5-point Likert scale ranging from 1 = *strongly disagree* to 5 = *strongly agree*. The coefficients α score from (Rhoades *et al.*, 2001) study was .85. The higher scores represented a greater degree of affective commitment.

Dependent variable - Performance. Subjective performance was assessed using the seven-item scale originally developed by Williams and Anderson (1991). An example item reads: “I adequately completed assigned duties.” The items were rated on a 5-point Likert scale ranging from 1 = *strongly disagree* to 5 = *strongly agree*. The higher scores indicated a greater degree of in-role job performance. Cronbach’s α of this scale ranged from 0.85 to 0.90 as reported and used by Tims, Bakker, and Derks (2014).

Dependent variable - Intentions to quit. Intentions to quit were evaluated with the four-item scale originally developed by (Veldhoven & Meijman, 1994) and as reported and used by (Schaufeli & Bakker, 2004) (e.g. “I intend to change jobs in the coming year”). The items were rated on a 5-point Likert scale ranging from 1 = *strongly disagree* to 5 = *strongly agree*. The coefficients α score from (Schaufeli & Bakker, 2004) study was .89. The higher scores indicated a greater degree of intention to quit.

Mediator variable - Trust in Management. Trust in management was measured by a ten-item scale originally developed by (Mayer & Davis, 1999) and as used by (Chao *et al.*, 2004) (e.g. “I am confident that top managers can make right decisions”). The combination of selected items were based on their relevance to general trust and integrity aspect of trust perceived from top management. The items were rated on a 5-point Likert scale ranging from 1 = *strongly disagree* to 5 = *strongly agree*. The greater score represented a higher degree of trust in management. The coefficient of trust

in management was $\alpha .77$ from (Mayer & Davis, 1999) study and $\alpha .92$ for integrity related trust from (Chao *et al.*, 2004).

Moderator variable - Core self-evaluation. Core self-evaluation was measured using a twelve-item direct measure scale developed by (Judge *et al.*, 2003) (e.g. “I am confident I get the success I deserve in life”). The items were rated on a 7-point Likert scale ranging from 1 = *Very strongly disagree* to 7 = *Very strongly agree*. The increased scale was used in line with (Hiller & Hambrick, 2005) recommendation to measure higher core self-evaluations more precisely. The higher scores represented a greater degree of core self-evaluation. The coefficients α score from (Judge *et al.*, 2003) study was .81.

3.4. Data analysis

The collected data were processed with the statistical packages for social science (SPSS) version 27 (IBM, 2022). The statistical analysis for this study included descriptive statistics, reliability and correlation statistics and a simple mediation model analysis. We conducted a Pearson's correlation analysis to determine the type and nature of relationships between role conflict, trust in the manager, and employee attitudes (Affective commitment, job satisfaction, performance and intention to quit). Effect sizes set a confidence level at 95%, $p < 0.05$ was considered significant. Effect sizes with 0.1 denoted a small effect, 0.3 a medium effect, and 0.5 a large effect (Steyn 1999). The minimum criterion for practical significance was a medium effect of 0.30 (Cohen, 1988). For internal consistency, the study conducted a reliability test using Cronbach Alpha. To ascertain the instrument's reliability, the higher the coefficients the better (Sekaran & Bougie, 2016). We utilised PROCESS macro model 59 with the SPSS programme (Hayes, 2017) for simple mediation modelling with the Jamovi open-access software (Version 2.2.5.0). Mediation was established with the indirect effect using a percentile bootstrap estimation approach with 5 000 samples (Shrout & Bolger, 2002). An indirect effect from the bootstrap analysis was considered significant if the lower-level confidence interval (LLCI) and upper-level confidence interval (ULCI) excluded zero (Zhao, Lynch, & Chen, 2010). A complimentary mediation result could only be determined when the mediated and direct effects existed, pointing towards the same direction (Zhao *et al.*, 2010).

4. Results

The results of this study are presented in four sections below, namely, (i) factor analysis, followed by (ii) descriptive statistics and correlational analysis, (iii) testing for conditional process (mediation moderation) models (iv) testing for mediation effects and finally, (iv) testing for moderation effects.

Factor analysis

A simple principal component analysis was conducted on the items of the scale used in this study to assess if the items loaded on the intended scales (factors). An analysis of the eigenvalues and the scree plot were used to determine the number of factors that could be extracted. EFA were conducted using a simple principal component analysis was conducted on the pooled solution (i.e. all the participants were included in the same analysis) of the independent variable (IV) or predictor in the model [*Role conflict* - (RC) - (eigen value = 2.144; variance explained = 35.735%; KMO = .676)], the mediator (M) (*Trust in the leader*) in the proposed model, (eigen value = 4.316; variance explained =61.655%; KMO = .895)] and the moderator (W) (*Core self-evaluation - 0.57CSE*) in the proposed model, (eigen value = 1.784; variance explained =44.601%; KMO = .580)] and the dependent variables (DV), *Organisation Commitment* (OC) (eigen value = 3.891; variance explained = 63.649%; KMO = .860)], *Job Satisfaction* (IJS) (eigen value = 2.174; variance explained = 54.345%; KMO = .665), *Subjective experience of performance* (ISEP) (eigen value = 2.517; variance explained = 62.936%; KMO = .765), and *Intentions to quit* (ITQ) (eigen value = 3.402; variance explained = 85.055%; KMO = .768)] suggested that all of the *scales used in this study were unidimensional*.

Descriptive statistics

The descriptive statistics and the reliabilities of all the scales used in the study are presented in Table 2 below.

Table 2: Descriptive statistics

	Alpha	Mean	SD	Skewness	Kurtosis
1. Role conflict	0.57	2.99	0.57	-0.35	1.18
2. Trust in the leader	0.58	4.00	0.75	0.69	0.46
3. Core Self Evaluation	0.90	3.01	0.88	-0.25	-0.25
4. Organisation Commitment	0.88	3.36	0.90	-0.46	0.00
5. Job satisfaction	0.71	3.31	0.68	-0.34	-0.02
6. Performance	0.80	3.99	0.56	-0.87	2.66
7. Intentions to quit	0.94	3.51	1.17	-0.40	-0.72

Inspection of Table 2 suggested that all scales were reliable and internal consistent because the yielded Cronbach alpha (α) values for the scales used in the study exceeded the required .70 cut-off value (except for role conflict and trust in the leader). Table 2 also suggests that all the variables used in this study were scored above the midpoint of the scale, suggesting agreement with or experiencing the construct. Table 2 also indicates that the data for all scales used were normally distributed given the guidelines of 2.00 for skewness (Finch & West, 1997) and 4.00 for kurtosis (Field, 2009).

Correlational analysis

This study was also interested in determining the relationships between the variables used in this study (role conflict, trust in the leader, core self-evaluation, affective organisational commitment, job satisfaction, subjective performance and intentions to quit). The results of this analysis are presented in Table 3 below.

Table 3: Results

	1	2	3	4	5	6
1. Role conflict	—					
2. Trust in the leaders	-0.08	—				
3. CSE	-0.01	0.09	-			
4. Commitment	0.01	.47**	.12*	-		
5. Job satisfaction	-0.12	.42**	.08	.64**	-	
6. Performance	-0.09	-.10	.24**	-0.05	.14*	-
7. Intentions to quit	0.05	-.31**	-.02	-.59**	-.47**	.10

** Correlation is significant at 0.01 level. / * Correlation is significant at 0.05 level. Results were interpreted as: 01= small effect, 0.3 = medium effect, 0.5 = large effect (Steyn, 1999).

Inspection of Table 3 suggests that role conflict demonstrated noticeable relations with trust in leadership and employee work attitudes. Strikingly, role conflict was not associated, at least statistically, with any of the variables used in this study. Trust in management reported a positive association with organisational commitment ($r = 0.47$) and job satisfaction ($r = 0.42$) with both relationships considered as medium. Additionally, trust in management has an inverse relationship with turnover intention ($r = -0.31$), which is interpreted as a medium practical effect. Affective commitment has a positive relationship with job satisfaction ($r = .64$) and negative relationship with intentions to quit ($r = -.59$) (both with large practical significance). In addition, job satisfaction also has a negative relationship ($r = -.47$) with intentions to quit (medium practical significance).

Testing the moderated mediations (conditional process) models

This study was also aimed at determining the conditional process where core self-evaluation could serve as a moderator in any of the three paths (a, b, and c') in any of the mediation models. In these models, trust in the leader served as a mediator in the relationship between role conflict and employee attitude (affective organisation commitment, job satisfaction, performance and intentions to quit) through a moderator core self-evaluation (using Hayes process macros model 59 with the SPSS programme). We performed a closer examination of the direct and indirect effects as well as confidence intervals to evaluate their relative sizes. We computed the significance of mediation effects by using the bootstrap procedure (95% normal Confidence Interval (CI) using 5000 samples).

The analysis showed that conditional indirect effect was insignificant as suggested by CI including zero for all groups at different level for the CSE (low [effect = -0.0601 and CI = -0.1680: 0.0210], medium [effect = -0.0652 and CI = -0.1591: 0.0164], and high [effect = -0.0540 and CI = -0.2141: 0.0848]). These results confirmed that trust in the leader did not *mediate* the relationship between role conflict and affective commitment when controlling for the moderator in our conditional process (med mod) model. This means that trust was not salient for the relationship between role conflict and the employee attitudes considered in this study.

Next, we focus on possible moderation effects in our hypothetical model (using Hayes process macros model 59 with the SPSS programme). The moderation effects of the conditional process (med mod) model with role conflict as IV and employee attitudes (affective commitment, job satisfaction, subjective experiences of performance and intentions to quit) as DV are presented below.

Table 4: Moderation (interaction) effects

Organisation commitment					Job satisfaction				
		Confidence Interval					Confidence Interval		
Effect	Estimate	Lower	Upper	p	Effect	Estimate	Lower	Upper	p
RC: CSE → Trust	0.0770	-0.1779	0.320	0.544	RC: CSE → Trust	0.0770	-0.179	0.342	0.563
RC: CSE → Commit	0.1617	-0.0755	0.378	0.162	RC: CSE → Job sat	-0.0718	-0.268	0.108	0.455
Trust: CSE → Commit	0.1913	0.0600	0.318	0.004	Trust: CSE → Job sat	-0.0162	-0.161	0.123	0.823
Performance					Intentions to quit				
		Confidence Interval					Confidence Interval		
Effect	Estimate	Lower	Upper	p	Effect	Estimate	Lower	Upper	p
RC: CSE → Trust	0.0628	-0.05043	0.1676	0.259	RC: CSE → Trust	0.0770	-0.178	0.3295	0.552
RC: CSE → Perform	0.0955	-0.00321	0.2407	0.125	RC: CSE → Quit	-0.0256	-0.336	0.2561	0.866
Trust: CSE → Perform	-0.1908	-0.43836	-0.0211	0.0073	Trust: CSE → Quit	-0.1451	-0.350	0.0364	0.141

A closer inspection of Table 4 revealed that there was a *moderation effect* (Trust: CSE → commitment with $p = 0.004$) in one of the models with organisational commitment as DV. The interaction effects of trust in the leader and CSE (trust*CSE) on affective commitment was significant ($p = 0.0017$; R^2 change = 0.0260; $F = 10.0170$) and the CI (0.0723: 0.3103) did not include zero. This means that levels of CSE was salient for the relationship between role conflict and affective commitment (see Figure and Table 5 below).

*Moderation analysis: Trust in the leader * CSE*

Table 5: Conditional effects of trust at different values of the moderator (CSE)

CSE	Effect	se	t	p	LLCI	ULCI
3.2555	0.2874	0.0784	3.6663	0.0003	0.1331	0.4417
4.0009	0.4300	0.0538	7.9871	0.0000	0.3240	0.5360
4.7462	0.5726	0.0609	9.4007	0.0000	0.4527	0.6925

The Figure 2a, 2b and Table 5 above suggest that the effects of trust on affective commitment increase when the levels of CSE increase. Despite confirming the moderating role of CSE in the relationship between trust and affective commitment, the mediating effects of trust in the relationship between role conflict and job satisfaction, subjective experience of performance and intentions to quit could not be confirmed in this study. Next, we focussed on simple mediation (using Process macros model 4) and simple moderation (using Process macros model 1) to probe for the mediation effects of CSE and the moderator effects of trust and CSE in the relationship between role conflict (IV) and affective commitment (DV).

Mediation analysis with CSE in the relationship between role conflict and employee attitudes as IV

Due to the absence of any mediated moderation (conditional process) model to be confirmed we opted for a simple mediation model with only CSE as mediators independently (because the mediating role trust was insignificant in the previous analysis). The hypothesised models are mainly mediation models in which role conflict in an organisation influences the perceptions of CSE (we did not include trust in the leader as mediator because this could not be confirmed in the preceding mediation moderation models), which, in turn, affects employee attitudes at work such as organisational commitment, job satisfaction, subjective experiences of performance and intentions to quit. Although we started with this more parsimonious model, there are no theoretical reasons to exclude partial mediation. We performed a closer examination of the direct and indirect effects as well as confidence intervals to evaluate their relative sizes. We computed the significance of mediation effects by using the bootstrap procedure (95% normal Confidence Interval (CI) using 5000 samples). The results of the independent analysis of the mediation models with CSE as mediator and employee attitudes (affective organisation commitment, subjective experiences of performance, job satisfaction and intentions to quit) as IV *also did not yield any statistically significant indirect effects.*

Moderation analysis with trust in the leader as moderator in the relationship between role conflict and employee attitudes as IV

Next, we opted for independent moderation models with trust in the leader and trust in the leader and CSE as independent and separate moderators in models testing the relationship between role conflict and employee attitudes separately. We performed a closer examination of the interaction effects as well as confidence intervals to evaluate their relative sizes. We computed the significance of mediation effects by using the bootstrap procedure (95% normal Confidence Interval (CI) using 5000 samples). When considering trust in the leader as a moderator we did obtain significant interaction effects (Trust: Role conflict) for the models with job satisfaction ($p = 0.012$), performance (and

intentions to quit ($p = 0.007$). CSE only demonstrate a moderating role in the model predicting performance by yielding significant interaction effects (CSE: Role conflict) in the relationship between role conflict and performance. The statistical models and simple slope plots for the models are presented in the figures below.

*Moderation analysis: Role conflict * Trust in the leader*

The results suggest that the conditional effect of role conflict on job satisfaction (i.e., the simple effect of role conflict when trust in the leader = 0) is insignificant ($\beta = -0.106$, $se = 0.063$; $t = -1.676$; $p = 0.095$; $[CI = -0.231; 0.018]$). However, the conditional effect of trust in the leader on job satisfaction (i.e., the simple effect of trust in the leader when role conflict = 0) is significant ($\beta = -0.323$; $se = 0.041$; $t = 7.879$; $p < 0.000$; $[CI = 0.242; 0.404]$). The interaction was also significant ($\beta = -0.176$; $se = 0.064$; $t = -2.765$; $p = 0.006$; $[CI = -0.301; -0.051]$), meaning that the interaction effects is significant from zero. Therefore, one can conclude that trust in the leader is a significant moderator of role conflict’s association with job satisfaction. In addition to the p values lower than 0.05, the confidence intervals (CIs) also did not include zero for effects of trust and the interaction between role conflict and trust in the leader. Such CIs further supports the conditional effects of especially the interaction effects of role conflict *trust in the leader.

Simple slope analysis was also performed to probe the interaction effect. The results show that role conflict is related to job satisfaction only among participants “high” on trust in the leader ($\theta X \rightarrow Y | W = -0.262$; $se = 0.085$; $t = -3.080$; $p = 0.002$; $[CI = -0.429; -0.094]$). This effect could not be confirmed for “low” or “medium” trust in the leader. Hence, role conflict matter matters less for performance when trust in the leader was “low” and “medium”.

From the results it is evident that the conditional effect of role conflict on performance (i.e., the simple effect of role conflict when trust in the leader = 0) is *insignificant* ($\beta = -0.101$, $se = 0.057$; $t = -1.753$; $p = 0.081$; $[-0.214: 0.012]$). However, the conditional effect of trust in the leader on performance (i.e., the simple effect of trust in the leader when role conflict = 0) is *insignificant* ($\beta = -0.063$; $se = 0.037$; $t = -1.703$; $p < 0.089$; $[-0.137: 0.010]$). The interaction was also significant ($\beta = -0.123$; $se = 0.058$; $t = -2.134$; $p = 0.034$; $[-0.237: -0.010]$), meaning that the interaction effects is *significant* from zero. Therefore, one can conclude that trust in the leader is a significant moderator of role conflict's association with performance. In addition to the p value lower than 0.05, the confidence intervals (CIs) also did not include zero for the interaction between role conflict and trust in the leader. Such CIs further supports the conditional effects of especially the interaction effects of role conflict *trust in the leader.

Simple slope analysis was also performed to probe the interaction effect. The results show that role conflict is related to performance only among participants “*high*” on trust in the leader ($\theta X \rightarrow Y | W = -0.210$; $se = 0.077$; $t = -2.719$; $p = 0.007$; $[CI = -0.361: -0.058]$). This effect could not be confirmed for “*low*” or “*medium*” trust in the leader. Hence, role conflict matter matters less for performance when trust in the leader was “*low*” and “*medium*”.

From the results it is evident that the conditional effect of role conflict on intentions to quit (i.e., the simple effect of role conflict when trust in the leader = 0) is *insignificant* ($\beta = -0.049$, $se = 0.113$; $t = 0.433$; $p = 0.666$; $[-0.173: 0.271]$). However, the conditional effect of trust in the leader on intentions to quit (i.e., the simple effect of trust in the leader when role conflict = 0) is *significant* ($\beta = -0.427$; $se = 0.073$; $t = -5.838$; $p < 0.000$; $[-0.570: -0.283]$). The interaction was also significant ($\beta = 0.369$; $se = 0.114$; $t = 3.254$; $p = 0.001$; $[0.146: 0.593]$), meaning that the interaction effects is *significant* from zero. Therefore, one can conclude that trust in the leader is a significant moderator of role conflict's association with intentions to quit. In addition to the p values lower than 0.05, the confidence intervals (CIs) also *did not include zero* for effects of trust and the interaction between role conflict and trust in the leader. Such CIs further supports the conditional effects of especially the interaction effects of role conflict *trust in the leader.

Moderation analysis with CSE as moderator in the relationship between role conflict and employee attitudes as IV

Simple slope analysis was also performed to probe the interaction effect. The results show that role conflict is related to intentions to quit only among participants “*high*” on trust in the leader ($\theta X \rightarrow Y | W = 0.375$; $se = 0.151$; $t = 2.478$; $p = 0.014$; $[CI = 0.077: 0.674]$). This effect could not be confirmed for “*low*” or “*medium*” trust in the leader. Hence, role conflict matter matters less for intentions to quit when trust in the leader was “*low*” and “*medium*”.

*Role conflict * Core self-evaluation*

From the results it is evident that the conditional effect of role conflict on performance (i.e., the simple effect of role conflict when CSE = 0) is *insignificant* ($\beta = -0.039$, $se = 0.059$; $t = -0.654$; $p = 0.514$; $[-0.154; 0.077]$). However, the conditional effect of CSE on performance (i.e., the simple effect of CSE in the leader when role conflict = 0) is *significant* ($\beta = 0.188$; $se = 0.043$; $t = 4.398$; $p < 0.000$; $[0.104; 0.272]$). The interaction was also significant ($\beta = -0.169$; $se = 0.066$; $t = -2.575$; $p = 0.011$; $[-0.298; -0.040]$), meaning that the interaction effects is *significant* from zero. Therefore, one can conclude that CSE is a significant moderator of role conflict’s association with performance. In addition to the p values lower than 0.05, the confidence intervals (CIs) also *did not include zero* for effects of trust and the interaction between role conflict and CSE. Such CIs further supports the conditional effects of especially the interaction effects of role conflict *CSE.

Simple slope analysis was also performed to probe the interaction effect. The results show that role conflict is related to job satisfaction only among participants “high” on trust in the leader ($\theta X \rightarrow Y | W = -0.165$; $se = 0.063$; $t = -2.608$; $p = 0.009$; $[CI = -0.289; -0.040]$). This effect could not be confirmed for “low” or “medium” trust in the leader. Hence, role conflict matter matters less for performance when trust in the leader was “low” and “medium”.

5. Discussion

Although the relationships between various organisational situational factors and employee work attitudes have been explored and confirmed empirically, there are limited empirical studies linking perceived role conflict, trust in the leader, core self-evaluation and employee work attitudes such as (job satisfaction, affective commitment, in-role job performance and turnover intentions have been considered in a single conceptual model. The current project was aimed at examining a conditional process (moderated mediation) model of trust in leadership and core self-evaluation in the relationship between role conflict and employee work attitudes of job satisfaction, affective commitment, in-role job performance and turnover intentions.

Therefore, *the first objective* was to examine the relationships between role conflict, trust in the leader, CSE and employee work attitudes (job satisfaction, affective commitment, in-role job performance and turnover intentions). The results denote that role conflict demonstrated noticeable relations with trust in leadership, CSE and employee work attitudes. Amazingly, role conflict was not associated, at least statistically, with any of the variables used in this study. Trust in the leader reported a positive association with organisational commitment and job satisfaction with both relationships. Additionally, trust in the leader has an inverse relationship with turnover intention. Affective commitment has a positive relationship with job satisfaction and a negative relationship with intentions to quit. In addition, job satisfaction also has an inverse negative relationship with intentions to quit.

Our findings are in line with empirical studies that have confirmed the positive relationship between trust in the leader and affective commitment. For instance, in a study among public sector nurses a positive correlation was established between trust in a line manager nurse and employees' affective commitment (Akgerman & Sönmez, 2020). Fischer, Hyder, & Walker (2020) have also established trust as a multidimensional construct with dimensions that have different strength to work outcomes such as affective commitment. Trust in supervisor or leader was reported to increase the levels of affective commitment among employees sampled from various companies in China (Xiong, Lin, Li, & Wang, 2016). In the similar vein, past studies confirmed a negative relationship between trust in the leader and turnover intentions, for example higher levels of trust were found to decrease turnover intentions among faculty members in a large US university. Similarly, turnover intentions also decreased among nurses with good trust relations with their managers (Simha & Pandey, 2021).

The *second objective* of the study was to investigate the mediating role of trust in leadership in the relationship between role conflict and employee work attitudes. The results suggest that

conditional direct and indirect effect was insignificant as suggested by CI including zero for all groups at different level for the trust in the leader (low, medium and high). These results insinuate that trust in the leader did not *mediate* the relationship between role conflict and affective commitment when controlling for the moderator in our conditional process (med mod) model. This means that trust was not salient for the relationship between role conflict and the employee attitudes considered in this study. So irrespective of the presence or absence of the level of trust in the leader, the relationship (direction and extent) between role conflict and employee attitudes defined as job satisfaction, affective commitment, in-role job performance (positive) and turnover intentions (negative) will not statistically differ in this sample.

The third objective of the study was to determine the moderating role of core self-evaluation in the relationship between role conflict and employee work attitudes through a mediator, trust in leadership. The results of the conditional process (moderated mediation) analysis also suggest that none of the anticipated moderation (conditional) effects of our hypothetical model could be confirmed except for one. The interaction effects of trust in the leader and CSE (trust*CSE) on affective commitment proofed to be significant. This means that levels of CSE was salient for the relationship between role conflict and affective commitment.

In staying with our proposed hypothetical model that seeks to determine the *mediating and moderation role of trust in the leader and CSE* in the relationship between role conflict and employee attitudes, we considered simple mediation and moderation models to probed for these roles. Due to the absence of any mediated models in our initial conditional process model we opted for only *simple mediation models with only CSE as mediators* independently (because the mediating role trust was insignificant in the previous analysis). The hypothesised models are mainly mediation models in which role conflict in an organisation influences the perceptions of CSE which, in turn, through its indirect effects would affects employee attitudes at work such as organisational commitment, job satisfaction, subjective experiences of performance and intentions to quit. The results of the independent analysis of the mediation models with CSE as mediator and employee attitudes (affective organization commitment, subjective experiences of performance, job satisfaction and intentions to quit) as IV *also did not yield any statistically significant indirect effects*. The mediation indirect effects of both trust in the leader and CSE could best be explained as the results of the poor relationships between role conflict, trust in the leader and CSE as obtained in this study with this sample.

Given the discouraging mediation results obtain when testing our conditional process model, we still had to shed light on the hypothetical *moderating role of trust and CSE* in the relationship between role conflict and employee attitudes. In order to reach this objective, we opted for simple moderation models considering both trust in the leader and CSE as moderators in this hypothesis model. The results of the significant interaction between role conflict and the moderators (trust and CSE) in the various models suggested that moderation roles could be confirmed for trust in the relationship

between role conflict and employee attitudes (job satisfaction, performance and intentions to quit) and CSE in performance respectively.

We then focus on *the conditions under which these relationships hold true*. It seems like that the level of trust matters for the relationship between role conflict and job satisfaction, performance and intentions to quit. Conspicuously, the results suggest that the effects of role conflict on *job satisfaction, performance and intentions to quit* was only significant for participants with *high levels of trust*. Therefore, low and average levels of trust matter less for the relationship between role conflict and job satisfaction, performance and intentions to quit. The results also imply that the effects of role conflict on *performance* was only significant for participants with high levels of CSE. Therefore, low and average levels of CSE matter less for the relationship between role conflict and performance.

6. Implications

Theoretical implications

The first contribution of this project was the construction and testing of a conditional process model focusing on the mediation (trust) and moderation (CSE) role in the relationship between role conflict, affective commitment, job satisfaction, performance and intentions to quit in a single model. The systematic examination of the effects of trust and CSE in employee attitudes in a single model considering various dispositional factors and employee attitudes simultaneously should be encouraged to expand our knowledge on the psychological mechanisms responsible for the direct and indirect effects of role conflict on employee attitudes. With the consideration and inclusion of other worthy dispositional (self-esteem, self-efficacy, locus of control, to mention but a few) and situational factors (involvement in decision-making, rewards, promotion, training, and the right equipment, to mention but a few), our model could become a significant instrument for explaining the *how and when* role conflict have direct and indirect employee attitudes.

It has long been acknowledged that trust in the leader has a significant effect on positive organisational outcomes (e.g., Erkutlu and Chafra, 2016). However, there is not much research on how trust will intervene in the relationship job demands such as role conflict and employee attitudes. This study is unique in explaining the connection of role conflict, trust in the leader and CSE in relation to employee attitudes. Discouraging, as expected, our study did not support the notion of a strong negatively association trust in the leader and CSE with role conflict. Nevertheless, we did introduce in this study important boundary conditions: follower trust in the leader and CSE. By showing that role conflict has a stronger direct effect on job satisfaction, performance and intentions to quit for high trust in the leader and CSE participant's, the findings of the study support the notion that followers can vary in their degree of receptivity to leadership effects and dispositional factors (Wang, et al.; 2018)

Managerial implications

Pertaining to managerial and practical implications, the study findings reveal that organisations should strive to provide a work environment that promotes trust. Public sector organisations, in particular, should avail training support for the leaders that can stimulate their cognitive realisation of the behaviours needed to portray high levels of trust in organisations. Organisations should also include metrics for core self-evaluation when designing performance evaluations to encourage the continuous development of this attribute. Further, the recruitment and selection processes should be utilised to prioritise employees with higher levels of dispositional traits. Therefore, to further advance the atmosphere and culture of trust in organisations, managers should lead by example and engage in behaviours that promote trust relationships.

7. Limitations And Future Research

There are some limitations to note in the study which indicate the path for future studies. First, measurements, based on a questionnaire for all variables, can raise questions regarding the common method variance (CMV). As stated by Podsakoff et al. (2003), CMV can be reduced by gathering research variables from different sources and with time separation, as is the case in our research design. In addition, our research is limited to a cross-sectional design and therefore we cannot make

judgement about cause and effects. In future studies, through a collection of longitudinal data, researchers may attempt to identify the situational and dispositional factors in the workplace leading individuals to role conflict over time. Although the study's recommendations would be more applicable to the contextual setting of the study (Lesotho public sector), the model of the study can be tested in other cultural and contextual settings, especially in other developing African countries.

Keywords

Retention, nurses, turnover intention, retention factors, public hospitals

Abstract

The retention of nurses has become of critical importance to South Africa. This study investigated the relationship between retention factors and intention to leave. A cross-sectional quantitative research approach was used. Data were collected from a sample of nurses from public hospitals in Johannesburg, South Africa, via a self-administered questionnaire. A non-probability sampling technique was used, and through a convenience sample, 203 responses were elicited. Data were analysed using SPSS. A Pearson correlation analysis and multiple regression analysis were performed to achieve the research objectives. The following retention factors predicted intention to leave: work environment was the most significant predictor, followed by training and development, and thirdly job characteristics. This study provides more insight into factors that affect the retention of nurses within public sector hospitals in South Africa.

1. Introduction

Effective retention practices are required to mitigate the effects of turnover intention (Dhanpat, et al., 2018). The effects of high turnover rates are felt by healthcare organisations and have become a global concern due to the nursing shortage experienced (Ayalew et al., 2021; Perreira, 2018; Ferede, et al., 2021). The nursing profession is characterised as demanding and stressful and is often associated with poor well-being (Pisanti et al., 2015; Giorgi et al., 2016). Various demands may hinder nurses' engagement, and access to resources to mitigate their demands remains limited (Patience et al., 2020). Such practices within the healthcare setting expose nurses to job insecurity, resulting in turnover. Strategies are needed to ensure their commitment and retention (Dhanpat et al., 2019).

Studies have shown that hospitals that display positive work environments in terms of practice are less inclined to observe adverse work outcomes associated with nurses, namely, increased job satisfaction, burnout, and intention to leave (Coetzee et al., 2013; Klopper et al., 2012; Liu et al., 2014). However, the healthcare sector for nurses presents a scenario with high stress and anxiety levels (Amin, Oxley, Noah, & Nordin, 2018). The effects of such job-related challenges result in a decline in nurses' job satisfaction (Suni, Nirmala & Sikkandar, 2017).

1.1. The nursing context in South Africa and abroad

Nurses comprise the largest group within healthcare in the country (Rispel et al., 2014). Although work in healthcare can be gratifying, it is also taxing (Kinman & Leggetter, 2016). Public hospitals are also disparate compared to private hospitals (Maseko & Harris, 2018). Nurses experience various work demands (Patience et al., 2020) and the profession is inherently considered a stressful occupation (Gonnelli et al., 2016; Khamisa et al., 2017; Pennanen & Mikkola, 2016; Ruiller & van der Heijden, 2016). Nurses remain dissatisfied mainly with their work based on characteristics of their work resulting in increased workload, absenteeism, staff conflict and exhaustion (Munyewende et al., 2014). Notably, nurses have reported higher stress levels when compared to other health care professionals (Williams & Smith, 2013). The recent COVID-19 pandemic has altered the work environment and exposed nurses to conditions threatening their well-being (Arnetz et al., 2020).

The shortage of nurses has become a global concern (Brooke et al., 2019; De Oliveira et al., 2017; Yamaguchi, Inoue, Harada, & Oike, 2016). Various factors have alluded to this shortage which include the demanding nature of work, little reward and a lack of supervisor support, burnout (Van Bogaert et al., 2013), increased level of stress (Ball et al., 2015), and low job satisfaction (Lacheret et al., 2015). The factors influencing retention need further investigation (Kossivi et al., 2016). Hence, hospitals and human resources need to establish retention strategies to reduce nurses' intention to leave. Therefore, the current study sets out to achieve the following objectives:

- Establish the relationship between retention factors and nurses' intention to leave
- Determine which retention factors best predict intention to leave.

Studies within Africa and sub-Saharan Africa have shown significant healthcare challenges (Ganga-Limando 2018). Moreso, a scarcity of nurses in South Africa is likely to strain its health care system (Crush & Pendleton, 2010). South Africa introduced the Occupational Specific Dispensation (OSD) in 2007 following the Public Health and Social Development Sectoral Bargaining Council (PHSDSBC) to address the retention challenges of nurses such as compensation and career progression. One study of 182 nurses found that the OSD brought very little satisfaction amongst nurses (Khunou & Davhana-Maselesele, 2016). Since the work context of nurses is characterised by work-related stress and burnout, it is noted that it can lead to lower levels of job satisfaction (Khamisa, Peltzer, Ilic & Oldenburg, 2016).

In the context of the study, the turnover intention is considered the intention employees have to leave their present workplace (Dåderman & Basinska, 2016), and relates to nurses' intention to leave the nursing profession, or their current employer. It is known that globally turnover intentions. We define two turnover intentions: (a) the intention to leave the present workplace; and (b) the intention to leave the nursing profession. Turnover intentions are high in nurses worldwide (e.g., Chan et al., 2008; Binkowska-Bury et al., 2010; Sawatzky and Enns, 2012; Homburg et al., 2013). As a result, the current study is of value as the perceived factors affecting the retention of nurses could assist in mitigating nurses' intention to leave. Various studies have been conducted on nursing shortages (Hoseini-Esfidarjani & Negarandeh, 2017; Negarandeh, 2015), nursing development and improvement programmes (Rahimaghvae et al., 2015; Salehi & Emamzadeh, 2014), job satisfaction, exhaustion, and burnout (Ranjbar, et al., 2017) and nurse retention (Chamani, et al., 2012; Rivaz, et al., 2018). More studies need to be conducted on the retention of nurses. According to Boulton and Beer (2021), studies on retention factors of nurses are rare.

Theoretical framework: employee retention and intention to leave

Economists, psychologists, and organisational scholars have primarily researched turnover in organisations. Seminal research has shown that employee retention corresponds with turnover intention, and the work of March and Simon's (1958) attempted to preliminary develop a general theory explaining why people are likely to leave their jobs. The retention of employees can be noted in early research and concerns of employees leaving based on other job opportunities and an individual's self-perception of continuing to work (March & Simon, 1958; Mowday et al., 1979; Price & Mueller, 1981).

Retaining talented employees enables organisations to achieve and maintain success (Das & Baruah, 2013; Paul & Vincent, 2018). Turnover intention remains a concern in the area of retention on research and practices. Turnover intention is considered the final stage before employees explicitly exit the organisation (Dysvik & Kuvaas, 2010).

Globally, organisations struggle to retain talented employees (Hom et al., 2012; Mita et al., 2014). Therefore, research has focused on mitigating reasons for low employee retention with assistance from human resources. Therefore, there is a need to place emphasis on retention factors (Dhanpat et al., 2018). Van Dyk (2016) asserts that an employee's intention to leave is characterised by a decision to leave. In this scenario, nurses think about leaving their current employer (thoughts of leaving, planning to leave, and deciding to leave) and search for alternative job opportunities.

Research on turnover distinguishes between employee's intention to leave, namely, cognitive behavioural intentions (whereby nurses leave their workplace) (Nei et al., 2015). According to Cowden and Cummings (2012), behavioural type intentions are categorised into two concepts – intention to leave and intention to continue. Research has alluded that turnover intentions is considered a multi-step process comprising behaviours and actions to leave, decisions and attitudes (Cowden & Cummings, 2012). Organisations must take proactive measures to address and reduce employee turnover (Dysvik & Kuvaas, 2010). For this reason, there is a need for human resource managers and practitioners and line managers to consider focusing on retention factors and their contribution towards turnover intention.

2. Employee retention

Research on employee retention primarily focuses on establishing organisational practices that assist in employee retention (Coetzee & Stoltz, 2015). In a study by Döckel (2003), several retention factors were established namely identified seven critical retention factors: compensation, job characteristics, training and development opportunities, supervisor support, career advancement and work-life balance. Other studies have operationalised employee retention based on these factors (Dhanpat et al., 2018; 2019). An additional factor was considered in the work environment. These factors are characterised as essential human resource practices influencing turnover intention and employee retention.

Compensation

Compensation is considered one of the very important retention factors across various organisations (Mabaso, 2016). It is defined as “...tangible and intangible rewards that an employee receives in exchange for his or her work.” (Nel et al. 2020, p. 488). Amongst nurses, compensation is also regarded as one of the important factors that contribute towards nurses retention (Duru & Hammoud, 2021; Rana & Skakya, 2021). According to Mumbauer et al., (2021), remuneration influences employment decisions amongst healthcare workers to a large extent. In a study of South African nurses, salary was one of the reasons for higher levels of dissatisfaction (Khunou & Davhana-Maselesele, 2016). A study conducted on German nurses revealed that the nursing profession is attractive based on the “soft” characteristics associated with nursing, such as working with patients and teamwork. However, the researchers also found that increasing compensation or wages also helps to increase the attractiveness of the nursing profession within hospitals (Kroczeck & Späth, 2022).

Job characteristics

According to the Job Characteristics Model by Hackman and Oldham (1980), jobs that create meaningfulness have a combination of the following job dimensions: skill variety, task identity, task significance, autonomy and feedback. Job characteristics are shown to predict job satisfaction and generally do predict stress, and depression (Stein & Vawda, 2014) Job characteristics can also include the workload culture of an organisation, and where the organisation is based (Mumbauer et al., 2021). A study with 320 nurses in Kenya revealed that task identity and autonomy significantly predictors of nurses' performance (Maru, Biwott, & Chenuos, 2013).

Training and development

Employees seek opportunities to develop their work-related skills, learn and develop. Organisations must provide such opportunities to enable their employees to develop their knowledge, skills and attitudes (de Braine & Roodt, 2015). Training and development assist in providing employees with a positive contribution towards their career (Nienaber, Bussin, & Henn, 2011). In terms of the nursing context, there is a need for nursing managers to provide opportunities for their staff through ongoing education and training programs (Rizany, Hariyati & Handayani, 2018). As a result, employees with access to such opportunities are likely to shape their attitudes toward the organisation and decision to leave (Lesabe & Nkosi, 2007, Allen, Shore & Griffeth, 2003). Training and development initiatives provide opportunities for nurses to grow, leading to positive work behaviours (Park et al., 2010; Van Windergerden et al, 2017; Weer & Greenhaus, 2017). Positive work experiences are more likely to influence nurses to remain within their organisations.

Supervisor support

Employees are likely to view support from the organisation as supervisor support. According to De Braine and Roodt (2015), this could include an employees relationship with their supervisor and can be linked to the quality of the supervisor relationship. This can include engaging behaviours of a supervisor (Barkhuizen et al., 2014). Supervisor support positively influences work engagement (Harter & Adkins 2015) and retention (Gu & Day, 2013). Supervisor support positively influences the retention of nurses (Heidari et al., 2017). A systematic review of articles on the predictors and consequences of turnover amongst nurses showed that supervisor support was the most important predictor of retention (Halter, et al., 2017).

Career advancement

Career advancement is considered an essential contributor to employee retention within organisations. Employee career advancement could include promotion opportunities, salary increases, and training opportunities (De Braine & Roodt, 2015). Studies amongst nurses have indicated that when career development opportunities are not present, it leads to dissatisfaction, which may lead to an intention to leave (Washeya & Fürst, 2021). Advancement and promotion were shown to predict job satisfaction amongst Nigerian nurses (Akinwale & George, 2020). In several studies, opportunities to advance in one's career is shown to lead to positive work behaviours (Amiri et al., 2016, & Tharshini et al., 2016).

Work-life balance

Experiencing work-life balance is considered an important contributor to life and work satisfaction (Lee, et al., 2020). Work-life balance is experienced when a person has harmony and satisfaction between their work and personal roles (Cascio, 2000). It is sometimes associated with work-family balance. "Work-family balance is defined as "a global assessment that work and family resources are sufficient to meet work and family demands to such an extent that participation is effective in both domains" (Voydanoff, 2006, p.825). Employees may experience work-family conflict as a result of an unbalanced work-life. Work-family conflict may result in employees disengaging in the workplace (Mauno et al., 2015; & Robinson et al., 2016). In a study amongst nurses in Japan, nurses who displayed lower levels of striving to attain work-life balance experienced higher levels of intention to leave (Matsuo, Suzuki, Takayama, Shibata & Sato, 2021).

The consequence of intention to leave

High costs are associated with turnover intention (Ngqeza & Dhanpat, 2021). Nurses' intention to leave may raise organisational costs, decrease quality care to patients and cause a brain drain in nations (Ayalew, et al., 2021). Overall, once nurses leave, it creates staff shortages within hospitals. Based on the literature review presented the following research questions were developed:

- Does a relationship exists between retention factors and intention to leave?

3. Method

The study adopted a quantitative research approach and followed a cross-sectional design. Cross-sectional studies provide insights into a phenomenon at a particular time point (Saunders, 2011). Data were collected from a sample of nurses from public hospitals in Johannesburg, South Africa.

Respondents and sampling

Data were collected through the use of non-probability sampling, and a convenience sampling technique was selected. The participants of the study were collected from three public hospitals located in Johannesburg. There were 320 questionnaires distributed, which yielded 203 responses (63% response rate). The sample comprised 79.1% of nurses were female (159), and 20.9 % of the sample were men (42). Most nurses (71.6% = 144) identified themselves to the Black race group. Most participants were 25 to 34 years of age (36.6%), whilst the median age group was 35 to 44 years of age. Most nurses employed in the sample were registered nurses (42.6% = 86), whilst only 8,4% were enrolled in nursing auxiliary.

Data Collection and analysis

Data were collected through a paper and pencil questionnaire, supplied to the nursing managers of each hospital, and circulated to the nurses. Permission to conduct the study was obtained from the hospital manager. The questionnaires were completed and collected by the researcher.

Data were analysed through the Statistical Programme for Social Sciences (SPSS, version 27) through the following statistical methods; descriptive statistics and inferential statistics were calculated. Internal consistency and reliability, Cronbach's alpha coefficients were also measured. In order to assess scale validity, factor analysis was computed. Pearson's product-moment correlation was used to establish the direction and strength of the relationships between the retention factors and intention to leave. A multiple regression analysis was used to assess which retention factor could best predict nurses' intention to leave.

Ethical considerations

The researcher followed ethical protocols. An informed consent accompanied the questionnaire detailing the nature and purpose of the study. Participants were informed of their right to withdraw from the study and ensured their confidentiality and anonymity.

Measuring instruments

Retention Factor Management Scale (RFMS)

Participants completed the RFMS developed Döckel et al. (2006). The scale consists of 35 items based participants satisfaction of retention factors on a five-point Likert scale ranging from 1 strongly agree to 5 strongly disagree and intention to leave: compensation ("Consistency of my company's pay policies"); job characteristics ("My job gives me considerable opportunity for independence in how I do the work"); training and development ("I have the opportunity to be part of activities that promote my professional development"); supervisor support ("My supervisor looks for opportunities to praise positive employee performance, both privately and in front of others"); career advancement ("My chances of being promoted are good") and work-life balance ("My work schedule is often in conflict with my personal life"). A previous study by Dhanpat et al., (2018) confirmed reliability and reported the following Cronbach alpha coefficients compensation = .933; training and development = .875; supervisor support = .717; career advancement = .788; and work-life balance .814. Van dyk and Coetzee (2012) reported the Cronbach alpha coefficient of job characteristics as .67. An example of an item of intention to leave include "Do you intend to leave this hospital voluntarily in the near future"? Dhanpat et al., (2018) reported an acceptable Chronbach alpha of .875.

The work environment scale was used as a retention factor and adapted from the survey instrument developed by Chew (2004). The scale used a seven-point Likert scale, with 1 strongly disagree and 7 strongly agree. An example of a work environment item included: "For the work I do, the physical working conditions are very pleasant". Chew (2004) reported an acceptable Cronbach alpha of .70.

4. Results

Reliability and Validity

Table 1 provided insights into the reliability analysis and was assessed by analysing Cronbach's coefficient alpha. The retention factors yielded acceptable alphas compensation = .97; job characteristics = .67; training and development = .92; supervisor support = .82; career advancement = .85; work-life balance = .88 and work environment = .91. Intention to leave achieved an alpha of .75. Nunnally and Bernstein (1994) suggest that when assessing internal consistency .70 is considered acceptable. The inter-item correlation coefficient for job characteristics was also assessed as it achieved a value lower than .70. Upon inspection of the mean inter-item correlation, the value achieved was 0.16, suggesting that this value was within the cut-off point of 0.40 (Pallant, 2010).

Factor analysis was conducted using principal axis factor analysis using a varimax rotation with Kaiser Normalisation for the retention factor management scale and work environment dimension. A principal component analysis was used for the intention to leave scale. In terms of the scales, the Kaiser-Meyer-Olkin measures of sampling adequacy respectively achieved were .908, .880, and .601

exceeding the recommended value of .60 (Pallant, 2010). Upon inspection of Barlett's test of sphericity, statistical significance was achieved ($p < 0.001$) and hence, the factorability of the correlation matrix was supported (Pallant, 2010). The RFMS achieved communalities $> .30$. A six-factor solution was achieved. Eigenvalues > 1 were noted and accounted for 63.35% of the variance. Work environment achieved communalities .30, and a one-factor solution was supported. This accounted for 61.67% of the variance. A one-factor solution was supported, achieving communalities $> .30$ and accounted for 67.01% of the variance. Therefore, the normality and homoscedasticity preconditions for the study were met.

Descriptives, reliability analysis, and Pearson correlation

Table 1 presents the descriptive analysis, reliability analysis and Pearson product-moment correlation. Table 1 shows that nurses were most satisfied with their work environment (mean = 4.12). Nurses were least satisfied with compensation (mean = 2.72). Nurses intention to leave achieved a mean value of 3.15, suggesting their uncertainty to remain or leave their hospital. The relationship between the retention factors and intention to leave were assessed. A correlation index of 1.0 suggests that a perfect relationship exist, regardless of the direction yielded (Pallant, 2010). An R -value closer to one suggests nurses' satisfaction with the retention factors and the more likely to experience a decreased intention to leave. The r -value ranged from $-.149$ to $.601$, $p < 0.01$. representing a low to moderate relationship between the retention factors and intention to leave.

Table 1 : Descriptive analysis, Reliability analysis, and Pearson correlation

	Mean	SD	Comp	JC	TD	SS	CA	WLB	WE	ItoL
Comp	2.72	0.96	.97							
JC	2.96	0.94	.456**	.67

Multiple Regression analysis of retention factors and intention to leave

A multiple regression analysis was conducted to predict intention to leave based on retention factors. Upon inspection, a significant regression equation was identified ($F(7.192) = 16.014$, $p < .000$) with an R^2 value of .369. Table 2 shows that the total variance in the dependent variable (intention to leave) explained in the model is 36.9% (R^2) and presents significant results. For multiple regression to occur, no multicollinearity in the data should be present. Therefore, the tolerance and VIF scores were assessed. Tolerance values are an indicator of variance that is not explained by other independent variables and should be greater than .10. VIF is the inverse of tolerance, and values should be below 10. Higher values on tolerance and VIF suggest the presence of multicollinearity (Pallant 2010). The tolerance values yielded in the study ranged from (0.41 to 0.71) and VIF values of ≤ 2.10 . The values obtained are less than the cut-off points of ≥ 2.5 to ≥ 4.0 suggested for small samples. Therefore, multicollinearity was of concern and Beta (β) values were interpreted with confidence. From Table 2, it is evident that the work environment ($\beta = .33$) is a great predictor of intention to leave, followed by (training and development ($\beta = .21$) and, subsequently job characteristics ($\beta = -.14$).

Table 2 Multiple Regression Analysis for retention factors and intention to leave

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.	95,0% Confidence Interval for B		R	R ²	Adjusted R ²	SE of the estimate	Collinearity Statistics

5. Discussion

Over the years, research on turnover often focused on why employees leave; however, it has become increasingly important to identify why employees remain in the organisation (Harman et al., 2007). Shimp et al. (2017) suggest that organisations need to focus and address factors that may influence retention. A lack of effort on this part can increase turnover intention. Hence, hospitals need to remain cognisant of the current study's findings that work environment, training and development and job characteristics play a significant role in predicting intention to leave amongst nurses. These findings are similar to previous studies regarding training and development (Park et al., 2010; Van Windergerden et al., 2017; Weer & Greenhaus, 2017); and job characteristics (Maru, Biwott, & Chenuos, 2013; Mumbauer et al., 2021). The previous dissatisfaction with the OSD (Khunou & Davhana-Maselesele, 2016), decisions to emigrate, and overall levels of dissatisfaction experienced amongst nurses in South Africa (Mathevula & Dhliwayo, 2022; Oosthuizen & Ehlers, 2007.) requires immediate addressing. According to Boulton and Beer (2018) organisations need to pay more attention and implement policies and practices that will enable greater professional development and career advancement of nurses.

Implications for theory and practice

Healthcare institutions must cultivate an environment which retains nurses within the organisation and the profession. With top management and human resources, effective retention strategies can be deployed, further reducing nurses' intention to leave. In this case, of the three public hospitals surveyed, nurses were largely dissatisfied with their compensation whilst remaining uncertain about their satisfaction with the retention factors. It is duly noted that the South African health care system is under pressure, leading to implications of employee turnover. Subsequently, hospital managers and human resources need to understand their role in ensuring nurses' retention. It is important to note that the dimensions of these retention factors are also encapsulated in the psychological contract (Dhanpat & Parumasur, 2014) as such unmatched expectations of this can lead to turnover. Based on the results of the study in the public sector hospitals, HR managers must focus on the work environment, training and development and job characteristics, as this can lead to the untimely departure of nurses.

Limitations and Recommendations for future research

The study was conducted within public hospitals. It is recommended that future researchers focus on both the private and public sectors, and a comparative analysis would assist in understanding the parity of nurses' intention to leave. More so, the current study focused on one specific geographic location and could be broadened. Findings of the study must be interpreted with caution, and the study cannot be generalised to other healthcare facilities or industries. Data were collected during a non-COVID period. It would be interesting to see how these retention factors play out during the pandemic, considering the strain nurses took at the frontline.

6. Conclusion

Employee and turnover retention remains a challenge across various organisations (Masoga, 2013), particularly amongst nurses. To decrease turnover intention would require improving nurses' current work environments, training and development opportunities and increasing job characteristics that provide meaningful and motivating work. Both public and private hospitals need to develop and implement a large range of sustainable policies and initiatives that can make the nursing profession more attractive for nurses in South Africa.

Abstract

Management needs to properly manage employee relations as employees are an organisational asset. Previous studies on the relationship between demographic characteristics and employee relations are limited within the Military environment. A quantitative research method within a positivistic research paradigm was used to conduct research. The fighting and support staff members of all South African Military (SA Army Fmn units) participated in this study. An existing questionnaire was used to collect data. The data were analysed by using the Pearson chi-square. There was a significant relationship between employee relations and former force, length of service and education. It is important to note that management needs to develop proper institutional policies and programmes, attend to career graphs, create opportunities for employees' participation, develop effective internal communication, give recognition to employees as they are seen as organisational assets, and create a sense of bonding among the employees, maintain cordial relations with the employees, and create a sense of belonging among the employees.

1 Introduction

This article offers a broad overview of the research survey of personnel of all South African Formation (SA Army Fmn) units within the South African (SA) Army and aims to determine if there is a significant relationship between employee relations and demographic characteristics (age, gender, level of education, rank group and former force, and length of service) in the South African Military. Organisational performance and the aligning of employees' aims, objectives, and commitment to the organisational goals have been a priority for many organisations (Anwar, & Abdullah, 2021). Employees feel more motivated to work hard when they understand how their work contributes to the overall achievement of the organisation's goals motivating factors, such as work success, recognition, diversification of responsibilities and career advancement, play an important role in motivating employees at work (Pânjoleanu, 2020).

The alignment between personal and organisational goals and values leads to employee job satisfaction, which is derived from employees enjoying their work because they like it and, thus, experiencing increased identification with their organisation and the sustainability of harmonious employment relations (Mdletye, Coetzee & Ukpere, 2014; Ismail, 2022).

2 Problem Investigated

As shown in sections 5.2-5.3, previous studies on the relationship between demographic characteristics and employee relations are limited within the military environment. It is not clear if there is a significant relationship between employee relations and demographic characteristics within the South African Military. This study aims to close these research gaps.

3 Research Objectives

The research objective of this study is to determine if there is a significant relationship between employee relations and demographic characteristics (age, gender, level of education, rank group and former force, and length of service) in the South African Military.

4 Hypotheses

The following hypotheses were derived from sections 5.2-5.7:

- H₁: There is a significant relationship between employee relations and age in the South African Military.
- H₂: There is a significant relationship between employee relations and former force in the South African Military.
- H₃: There is a significant relationship between employee relations and gender in the South African Military.
- H₄: There is a significant relationship between employee relations and length of service in the South African Military.
- H₅: There is a significant relationship between employee relations and level of education in the South African Military.
- H₆: There is a significant relationship between employee relations and ranks in the South African Military.

5 Literature Review

5.1 Employee Relations

Most organisations have a primary objective: either to produce goods or to provide services for re-sale or consumption by their clientele and could not survive as businesses without it (Aylott, 2022). For an organisation to achieve this aim, it must have all four factors of production, namely capital, personnel, land, and raw material (Odhong & Omolo, 2014). Employees constitute one of the most critical factors of production and are usually referred to as the greatest asset that the organisation can have (Sequeira & Dhriti, 2015). To achieve the set organisational goals, the employers should create and maintain a work environment that satisfies the needs of both employees as individuals and as a collective, therefore management should improve employees' morale and build company culture. An employee can be defined as a person who offers labour to the employer in exchange for remuneration, both in cash and benefits (Budd & Bhave, 2019). This is confirmed by the social exchange theory which advocates for the exchange between behaviour and rewards and proposes that the exchange relationship evolves through time and trust between people occurs to maintain a positive balance in the employment relationship between the reciprocal relationship between management, employees and trade unions (Dodd, Brewster, & Holland, 2021).

An employee relations framework should create and maintain a motivated and productive workforce (Sequeira & Dhriti, 2015). Griffin, Bryant, and Koerber (2015) assert that organisations with a strong employee relations policy framework are more likely to have an advantage over those that do not have it when it comes to competition for skilled employees. Competition for new quality employees in the tight labour market can directly affect the ability of organisations to attract, retain, or motivate those employees (Bratton & Gold, 2017). Finding, keeping and maintaining a productive workforce is according to Wrathall and Steriopoulos (2022) the key to a motivated and productive workforce.

Bratton and Gold (2017) and Hickland (2017) assert that employee relations have an impact on the continued relationship between employers and employees in the workplace. The term 'employee relations' encompasses the mixture of employer-led initiatives aimed at directly or indirectly improving workplace communication, involving employees in decision-making and securing their compliance with management rules through disciplinary actions. Employee relations also contribute to enhancing employee commitment (Bratton & Gold, 2017; Hickland, 2017). The responsibility in terms of employment relations is firstly vested in the compliance with labour legislation and then all

policies and procedures in the organisation by adhering to applicable laws and compliance in practice (Nel, Werner, Botha, Chinyamurindi, Dodd, Du Plessis, Mdingela-Majova, Mey, Poisat, & Van Hoek, 2021).

Employee relations can simply be defined as a study of the rules, regulations, and agreements by which employees are managed both as individuals and as a collective, or the priority given to the individual as opposed to the collective relationship. This may vary from organisation to organisation depending on the management values (Leat, 2014). According to Sisson (2010), employee relations is about the regulation and governance of the employment relationship, regardless of the existence of collective bargaining structures. Employee relations can be defined as a formal or informal interaction between employees themselves and their employers. This interaction encompasses all areas of management that may include labour relations, employee involvement and participation, and employee communication (Odhong & Omolo, 2014). Bendix (2022) describe employment relations as the encompassing study of relationships, the work situation and working man, the labour market problems and certain processes, structures, institutions and regulations unique to the relationship. It is also important to note that all these aspects are places or occur within a specific social, political, economic and historical context, and can or should not be studied in isolation.

Employee relations is a process of collective or individual workforce engagement that is mostly based on verbal or unwritten processes, and a general understanding that arises out of the interaction between both main parties (employers and employees) in the employment relationship in the workplace (Ram, Edwards, Gilman & Arrowsmith, 2001). Vakola and Nikolaou (2005) argue that to sustain organisational productivity, good and effective work relationships between employers and employees are to be prioritised (Bhatnagar, 2007). This is crucial for any organisation to remedy conflicts, build supportive work relationships, and communicate effectively with employees and their representatives. An engaged workforce at all levels of an organisation can trigger sustained positive employee relationships (Bhatnagar, 2007). Employee relations can also refer to the efforts by organisations to manage relationships between employers and employees as well as employees' representatives. Organisations with good employee relations programmes treat employees fairly and consistently so that, in turn, the employees are committed to their jobs while remaining loyal to the organisation (Rea, 2018).

Nel, Kirsten, Erasmus, Gobind, Holtzhausen and Jordaan (2020) define employee relations as a complex and dynamic open system of formal and informal relations with interactions between stakeholders (employers, employees, the state, employers and employee representatives, customers, and competitors) in an employment relationship can be individual and collective of nature. This employment relationship is premised on common ground as well as conflict dynamics (Holtzhausen, 2020). The ideal end state of this relationship is the practice of the notion of fairness in balancing, integrating and reconciling the interests of all parties (Nel, Kirsten, Swanepoel, Erasmus & Jordaan, 2016, Bendix, 2022). Bendix (2022:13-15) confirms this viewpoint and also emphasises that the complexity of the relationship and the uniqueness of it is multi-layered and dynamic in nature.

In the study on the relationship between various demographics and employee relations by Li, Zhang, Chen, Jiang, Wen, and Hu (2018), the results showed that the two most visible dimensions of demographic diversity – gender and race diversity can have direct positive effects on employee relations. Their study showed that employee relations can be influenced by the demographic diversity of the workforce. With an increase in demographic diversity in workforces today, demographic diversity should assist in the improvement of employee relations within the organisation.

Segbenya (2014) found in the study to examine the effect of demographic variables on employees' decision to stay or quit in a Ghanaian Commercial Bank (GCB) that the age of respondents was part of the demographic variable found to have a statistically significant effect on employees' intention to quit results of poor employee relations.

Alsaieri, Puteh, and Ali (2020) indicated that nationality, experience, and age, had a noteworthy effect

on the relationship between HRM practices and employee loyalty. They also stated that most of the literature showed that older employees are more loyal than younger employees. Gender had no impact on the relationship between HRM practices and employee loyalty, and there is no difference between males and females regarding their loyalty to the organisation. It also indicated that the higher the employees move up in the hierarchal levels in organisational structure, and the more years of work experience, the more loyal the employees are.

5.2 The Relationship between Age and Employee Relations

One of the main quantitative variables, namely age, is used by demographers since a link was first identified between mortality and age many years ago. Age is used for the analysis of all demographic phenomena as a variable of choice that indicates that chronological age is the determinant of any demographic behaviour (Séguy, Courgeau, Caussinus & Buchet, 2019). Andoh, Antwi Bosiakoh, and Afranie (2012) state that the concept of age is viewed differently by different people. Some people consider old age as a build-up of experience and knowledge that is accumulated between the time a person is born and any specific time (Khan, Khan, Khan, Nawaz & Yar, 2013). As a person grows older, his or her level of thinking matures and perceives life differently (Baradicco, 1991). As time progresses, the prospects of quitting or resigning lessen and, thus, relate differently to the employer compared to the young employees (Kundi, 2010).

From the above literature, the following hypothesis is derived:

H₁: There is a significant relationship between employee relations and age in the South African Military.

5.3 The Relationship between Former Force and Employee Relations

Former force refers to members of the seven forces amalgamated to form the SANDF in 1994, namely the Azanian People's Liberation Army, Bophuthatswana Defence Force, Ciskei Defence Force, South African Defence Force, Transkei Defence Force, Umkhonto Wesizwe and Venda Defence Force, no literature could be found on the relationship between former force and employee relations. The SANDF is one of the few if not only force which integrated forces from previous homelands and non-statutory forces as a result of apartheid. It is a South African unique situation, hence the lack of studies.

From the above literature, the following hypothesis is derived:

H₂: There is a significant relationship between employee relations and former force in the South African Military.

5.4 The Relationship between Gender and Employee Relations

The biological and physiological features that members of society classify themselves as males or females are referred to as gender or sex. Males and females are distinctly biologically different from each other in many ways and levels such as variations in cells, tissues, organ systems, and anatomy (World Health Organization, 2010). Gender is defined by Khan *et al.* (2013) as the state of an individual being male or female, with a focus on social and cultural differences rather than biological differences. Gender is one of the factors that affect the perceptions that individuals have of their employers or employee relations (Collins & Tisdell, 2002). Men and women perform tasks relatively differently from each other and, thus, alter their perception of the relationship they will have with their employer (Moriarty & Honnery, 2005; Rydstedt, Johansson & Evans, 1998).

From the above literature, the following hypothesis is derived:

H₃: There is a significant relationship between employee relations and gender in the South African Military.

5.5 The relationship between length of service and employee relations

Length of service refers to the number of years of experience an individual has in a specific organisation and has worked for a specific amount of time. Yeatts and Hyten (1998) state the background of an employee can affect the performance of an employee and that the length of service is a direct link between employer and employee relationship. Employees who are employed with a company for a long time are said to be satisfied at work and remain in employment with the company, whereas those who leave are dissatisfied and hope that better jobs can be found. Length of service is the period employees spend on a job (Butler, Brennan-Ing, Wardamasky & Ashley, 2014). According to Ng and Feldman (2013), high levels of employee relations are associated with an increased length of tenure to an employee's worth in the labour market.

From the above literature, the following hypothesis is derived:

H₄: There is a significant relationship between employee relations and length of service in the South African Military.

5.6 The Relationship between Education and Employee Relations

Education necessitates a change in one's lifestyle as well as the improvement of one's ability to choose the best option available in any given circumstance with the information available at that particular time. It refers to personal growth when taking into account the best possible approach to a problem at any given time. The ability to adapt to changing circumstances and environments is critical and education assists with becoming more resilient. Ya'acob, Mohd Awal, Idris, Hassan, Kaur, and Mohd Noor (2011) are of the opinion that education is more than a financial investment; it is a necessary input for human life, progress, and survival. According to Wehmeyer (1996), self-assertiveness is the foundation of life. Strong and steadfast individuals are capable of making choices and decisions on actions and breaking free from unfavourable outside influence or interference from the society we live and work in. Confidence and assertiveness are learned skills while self-esteem is not as strong without education, since people acquire information and experience through education. It is evident that education plays a vital role in communication and promoting values, which in turn affect the attitudes, behaviours, and responses of the people responsible for the success of organisations.

From the above literature, the following hypothesis is derived:

H₅: There is a significant relationship between employee relations and level of education in the South African Military.

5.7 The Relationship between Ranks and Employee Relations

The 1999 Walker Employee Relations Benchmark report found 33 per cent of all employees were uncommitted to their organisation and expected to leave shortly. In the same report, six factors that most influence an employee's commitment to an organisation and influence employee relations were identified as follows: fairness, care and concern for employees, satisfaction with day-to-day activities, trust in employees, the reputation of the organisation and work and job resources.

It was also discovered that the top executives ('the generals') tend to view communication with top managers ('the colonels') and those outside the organisation as more important and more challenging than communication with lower subordinates ('the sergeants'). Senior managers have traditionally been much better at managing macro-communication while leaving micro-communication to the highly variable abilities and ambitions of the supervisor, Therkelsen and Fiebich (2003:121-122). The literature relating to the relationship between military ranks and employee relations is limited and does not directly link with the military ranks.

From the above literature, the following hypothesis is derived:

H₆: There is a significant relationship between employee relations and ranks in the South African

Military.

6 Research Methodology

Bless, Higson-Smith, and Sithole (2014) and Silverman (2013) describe research design as the specification and outlining of the most suitable method to be used to test specific hypotheses under given conditions. The research design relates directly to the answering of the research question (Bless, Higson-Smith & Sithole, 2014), and research methodology guidelines state that research design is the conceptual structure within which research would be conducted (Ader & Mellenbergh, 1999). Bless, Higson-Smith and Sithole (2014) describe a design in quantitative research as a detailed outline for testing the hypotheses, put in clear and definite terms. In this study, a survey design was used, and a quantitative research approach was followed. Quantitative research is focused predominantly on collecting numerical data. It quite often relies on deductive reasoning which forms a view about the likelihood of an event occurring, and then tests whether the view is correct, partially correct or incorrect (Mncwabe, 2013). A cross-sectional survey is the form of data collection or survey that occurs on a once-off basis at a particular point in time to measure the impact of a dependent variable over the independent variable (Ader & Mellenbergh, 1999). A quantitative survey and a cross-sectional design were used amongst all SA Army Fmn units throughout South Africa and the study is correlational, and quantitative in nature. This study was conducted within a positivistic research paradigm.

This study was exploratory in nature as it is a methodological approach that explores research questions that have not previously been studied in depth. It is often used when the issue you're studying is new, or the data collection process is challenging (Bless, Higson-Smith & Sithole, 2014).

6.1 Population, Sampling and Sample

In this study, the population consists of the fighting and support staff of the SA Army Fmn units. There are approximately 13 741 personnel in all SA Army Fmn units situated in all nine provinces. Sampling is the process of selecting the people who could participate in a research project. Stangor (2011) and Bless, Higson-Smith, and Sithole (2014) define sampling as assessing a portion of the entire grouping in social and natural sciences. Brynard and Hanekom (2011) advise that in determining sample size 4.5% of a population between 10000 and 99999 should be extracted. Stratified random sampling is a process of dividing the population into small strata - e.g. age, gender, and level of education - and selecting participants for the sample in such a way that every strata percentage is proportionally represented (Stangor, 2011). A sample is a sub-group of the population from which one wants to draw a conclusion (Ang, 2014; Stangor, 2011). Seminal authors Krejcie and Morgan (1970) developed a table recommending the size of a sample compared to its population which recommends that a population between 10 000 and 15 000 should have a representative sample of 4.5% of the population.

Therefore, in this study, the sample consists of 618 fighting and support staff members of all SA Army Fmn units, which is 4.5% of the total population of 13741.

6.2 Questionnaire

For this study, primary data was utilised. Existing questionnaires were used and they are employee relations (Raghavendra, 2013:477), job satisfaction survey (Spector, 1994:693) and work engagement questionnaire (Schaufeli, Bakker & Salanova, 2006:714).

The questionnaire and Likert scale that were adapted to collect data were divided into four (4) parts. The layout of the data collection tool in this study was as follows:

- **Part A:** Biographical information of the respondents.
- **Part B:** Questions pertaining to employee relations.
- **Part C:** Questions pertaining to job satisfaction.
- **Part D:** Questions pertaining to work engagement.

Part A dealt with biographical information in a choice form question, while Parts B to C consisted of statements using a 5-point Likert scale. A 5-point Likert scale was employed with 1 representing strongly disagree, 2 representing disagree, 3 representing not sure, 4 representing agree and 5 representing strongly agree. The following themes were extrapolated from the questionnaire:

Table 1: Factor analysis of employee relations

Ser No	QN	Question	Factor
1	B1	My employer maintains healthy employee relations	Consultation
2	B3	My employer provides opportunities for employees' participation	Consultation
3	B5	My employer maintains cordial relations with the employees	Consultation
4	B7	My employer maintains the internal communication with the employees	Consultation
5	B9	My employer enhances the career graph of the employees	Consultation
6	B13	My employer maintains the grievances redressing mechanism	Consultation
7	B14	My employer creates good working relations among the employees	Consultation
10	B4	My employer recognises the employees as organisational assets	Recognition
11	B6	My employer creates better working conditions	Recognition
12	B10	My employer creates a sense of belonging among the employees	Team building
13	B11	My employer creates a healthy working atmosphere	Team building
14	B12	My employer encourages the employees to actively participate in organisational activities	Team building
15	B15	My employer brings about a sense of bonding among the employees	Team building

R represents the reversed question during the data analysis

6.3 Validity and Reliability

Factor analysis is a collection of methods that investigate how constructs influence the responses to a group of measured variables (Staines, Johnson & Bonacci, 2008; Decoster, 1998). The researcher validated the questionnaire by conducting a pilot study in the Fmn unit in Pretoria, ensuring that all demographics were represented and that the questions were understood and interpreted in the way they were meant to be. Construct/content validity of the questionnaire was tested using confirmatory factor analysis. Convergent and discriminant validity were also conducted to ascertain the accuracy of the scale instrument used in the study.

The consistency or reliability of a data collection tool is of paramount importance (Staines, Johnson & Bonacci, 2008). Reliability is defined by Bless, Higson-Smith, and Sithole (2014) as the extent to which the observable measures that represent a concept are accurate and stable when used for the concept in several studies, while Stangor (2011) adds that reliability is the degree to which the data collection tool (questionnaire) is free from random errors.

Cronbach's alpha serves to estimate the average correlation among all the items on the data collection scale and is numerically equivalent to the average of all possible split-half reliabilities, as emphasised by Stangor (2011). The acceptable p-value of Cronbach's alpha was set at 0.7, thus, indicating the strong reliability of the construct being measured. All the constructs had a Cronbach's alpha value higher than 0.6, except for recognition which had low internal reliability and consistency but was kept as all the Dillon-Goldstein's rho for all the constructs were higher than 0.7, indicating that all the constructs were reliable.

Cronbach's alpha reliability statistics were calculated to determine the reliability of the questionnaire (Tavakol & Dennick, 2011). An internal consistency method of item analysis was used in a test run to check the reliability of the questionnaire.

Cronbach's alphas for most of the constructs were below 0.7, therefore the average variance extracted (AVE) was used to measure validity of the data collection tool. The quality of a measurement model is evaluated by checking the convergent validity which indicates the degree to which the indicators under the constructs are related. It is assessed by the loading of the indicator variables onto their respective latent constructs; the loading should load higher than 0.5 which suggests that there is a correlation between the latent construct and its indicators. It is also inspected by the average variance extracted (AVE), which is an indicator of how much the construct explains the variance of its observed variables (Ravand & Baghei, 2016:8). Readings of AVE above 0.5 are indicators of convergent validity and it was the case in this study as per Table 2 below:

Table 2: Analysis of convergent validity of employee relations according to AVEs

Variable	Factor	Sub-factor	AVE
Employee relations	Consultation	Relat1	0,652
	Recognition	Relat3	0,616
	Team building	Relat4	0,735

6.4 Data Gathering

Ethical approval was obtained from Tshwane University of Technology and the ethics number is FCRE2018/FR/10/010-MS. For this study, primary data were utilised. The questionnaire was distributed to the sample group in each SA Army Fmn unit by the two research assistants. Questionnaires were hand-delivered in each unit and two research boxes were used for respondents to submit questionnaires; this was to ensure confidentiality and anonymity. One box was for consent forms and the other was for questionnaires.

6.5 Statistical Method and Data Analysis

The descriptive statistics are reported in the form of frequencies and percentages, and the results are presented in tables and graphic format.

Due to the categorical nature of the results the chi-square test was used to test the statistical significance of relationships between employee relations and the demographic characteristics of the respondents. All testing was done at $\alpha=0.05$ level of significance.

7 Results and Findings

7.1 The Demographic Profile of the Sample

The following is the overview of the demographic profile extrapolated from the information derived from the completed and returned questionnaires of the sample population. Fractional percentages are rounded off to the whole number.

Of the 618 questionnaires distributed, 342 respondents returned the forms duly completed forms. This represents a 55% response rate. The demographic profile of the respondents is depicted in Table 2 below:

Table 3: Demographic profile of the respondents

Corps group	Frequency	Percent
Fighting (Combat)	305	89%
Support (Non-combat)	37	11%
Total	N=342	100%
Gender	Frequency	Percent
Male	268	78%
Female	76	22%
Total	N=344	100%
Age	Frequency	Percent
18-30	108	32%
31-40	94	27%
41-50	106	31%
51-60	33	10%
Total	N=341	100%
Union membership	Frequency	Percent
Yes	43	12%
No	302	88%
Total	N=345	100%
Length of service	Frequency	Percent
0-10	127	37%
11-20	153	45%
21-30	60	17%
31-40	3	1%
41-42	0	0%
Total	N=343	100%
Highest Educational Qualification (HEQ)	Frequency	Percent
Grade 12/Matric	253	75%
N6/National Certificate	28	8%
National Diploma/Diploma	23	7%
Bachelor's degree/Advanced Diploma/BTech	22	7%
Honours Degree/Post Graduate Diploma	7	2%
Master's Degree	4	1%
Doctoral Degree	0	0%
Total	N=337	100%
Rank Group	Frequency	Percent
Non-commissioned officer (NCO)	250	75%
Warrant officer (WO)	57	17%
Officer	27	8%
Total	N=334	100%
Former Force	Frequency	Percent
SADF	58	17%
APLA or MK	28	8%
TVBC	32	10%
SANDF	223	65%
Total	N=341	100%

Of the 342 respondents, 89% were from the fighting corps while 11% were from the supporting corps. In the SA Army, the fighting corps consists of Infantry, Armour, Artillery, Air Defence Artillery, Intelligence, Signals, and Engineers. The supporting corps consists of Human Resources, Logistics, Catering, Technical Services, Ammunition, and Military Music. The fighting corps dominates the SA Army as the core business of the armed forces is to conduct military operations supported by the small

component that supplements the fighters. Two hundred and sixty-eight respondents (78%) were males while 76 respondents (22%) were females. Therefore, it can be concluded that the SA Army is dominated by males while females still form a minority of the respondents. The respondents with ages between 18 to 30 and 41 to 50 dominated with 108 (32%) and 106 (31%) respectively from the total pool of 341, while there were 94 (27%) respondents between the ages of 31 to 40. The respondents between the ages of 51 to 60 were a minority at 33 (10%).

Only 43 (12%) respondents were members of trade unions compared to 302 (88%) who were not unionised. This indicates unionisation is not popular amongst the members who responded and, thus, the majority of military members may remain largely un-unionised. Of the 343 valid responses, 153 (45%) respondents had been employed for 11 to 20 years, 127 (37%) had a service of between nil to 10 years, 60 (17%) respondents had been employed for 21 to 30 years and no one had served longer than 41 years. Most soldiers serve an average of 11 to 20 years before exiting the force. Fewer respondents reached the 21 to 30 years milestone and almost none serve beyond 30 years. The majority of respondents, namely 253 (75%), were matriculants, followed by N6/National Certificate holders at 28 (8%), while National and Advanced Diploma graduates share the same percentage (7%) with 22 and 23 respondents respectively. There were 11 (3%) postgraduates, with one possessing a Doctorate or PhD qualification. It can be concluded that the SA Army employs more members with a grade-12 qualification than post-grade-12 graduates if the results of this research are to be applied to the whole organisation.

Non-commissioned officers (NCOs) formed the majority with 250 (75%) responses from a total of 334 participants, followed by warrant officers (WOs) at 57 (17%) responses, while the minority were officers at 27 (8%) responses. The SA Army consists of a larger component of NCOs with the smallest grouping being officers. The SANDF is made up of a larger component of soldiers that joined after 27 April 1994 to date at 223 (66%), followed by the 58 (17%) members who served in the South African Defence Force (SADF) prior to 27 April 1994. Former members of the Transkei, Venda, Bophuthatswana, and Ciskei defence forces (TVBC) constituted 32 (9%), while former members of Umkhonto We Sizwe (MK) and the Azanian People Liberation Army (APLA) were a minority with 28 (8%) respondents combined. This indicates that the SANDF is the only former force growing while others are in the reduction phase because they cannot be rejuvenated - the integration process was terminated in 1998. The SANDF former force or members with no former force is the only grouping that is growing as the MSDS intakes have been taking place annually since January 2003. A Likert scale can be defined as a categorical variable which means the Chi-square test can be used to test for relationships. Frequency tables can be used the assumption that the Likert scale variables are categorical. A Likert scale is usually regarded as ordinal variables which cannot be presented as a mean score (Wegner, 2020).

Next, the chi-square results are discussed.

7.2 Age and Employee Relations

The Pearson chi-square comparison illustrates whether military personnel of age categories 18 to 30, 31 to 40, 41 to 50, and 51 to 60 differed in their views on how they experienced employee relations, job satisfaction, and work engagement within the SA Army Fmn.

Table 4: The comparison between age groups and responses to employee relations

Item	18-30			31-40			41-50			51-60			Pearson chi2(6)	Pr
	Disagree	Agree	Not Sure	Disagree	Agree	Not Sure	Disagree	Agree	Not Sure	Disagree	Agree	Not Sure		
B1	17.59	51.85	30.56	11.70	60.64	27.66	16.98	61.32	21.70	18.18	54.55	27.27	4.1389	0.658

B9	26.85	59.26	13.89	23.40	54.26	22.34	20.75	56.60	22.64	33.33	45.45	21.21	5.5472	0.476
B10	14.95	56.07	28.97	20.21	46.81	32.98	19.81	49.06	31.13	9.09	42.42	48.48	6.9001	0.330
B11	21.30	38.89	39.81	17.02	41.49	41.49	25.47	41.51	33.02	15.15	33.33	51.52	5.2261	0.515
B12	29.63	61.11	9.26	27.17	60.87	11.96	24.76	64.76	10.48	18.18	63.64	18.18	3.4546	0.750
B13	6.48	53.70	39.81	7.45	51.06	41.49	8.49	58.49	33.02	9.09	39.39	51.52	4.6545	0.589
B14	9.26	81.48	9.26	17.02	70.21	12.77	21.70	67.92	10.38	12.12	69.70	18.18	9.3052	0.157
B15	24.07	66.67	9.26	26.60	60.64	12.77	17.92	62.26	19.81	39.39	48.48	12.12	10.9824	0.089

In conclusion, there were no significant relationships between age groups and responses related to employee relations as all the p values are larger than 0.05, which is the maximum significance level.

7.3 Former Force and Employee Relations

The Pearson chi-square comparison as to whether the views of the military personnel of former force SADF, APLA/MK, TVBC and SANDF relate to employee relations within the SA Army Fmn is presented in table 2.

Table 5: The comparison between former force groups and responses to employee relations

Table 6: Chi-square significance - former force groups and employee relations

Q No	Statement	Factor	Chi-Square Pr
B9	My employer enhances the career graph of the employees	Consultation	0.022
B3	My employer provides opportunities for employees' participation	Consultation	0.026
B7	My employer maintains internal communication with the employees	Consultation	0.004
B4	My employer recognises the employees as organisational assets	Recognition	0.011
B15	My employer brings about a sense of bonding among the employees	Team building	0.019

There are generally no significant relationships between the former force groups and responses related to employee relations as all the p values are larger than 0.05, which is the maximum significance level. This; however, excludes questions B3, B4, B7, B9, and B15, where it was discovered that there were relationship differences between employees from different previous forces. Their views on how they experienced employee relations are based on the answers to the questions reflecting the table above, where the p-value was smaller than 0.05.

7.4 Gender and Employee Relations

The Pearson chi-square comparison is presented in table 4 to show the relationship between males and females and employee relations within the SA Army Fmn.

Table7: The comparison between different gender and responses to employee relations

Item	Male			Female			Pearson chi2(6)	Pr
	Disagree	Agree	Not Sure	Disagree	Agree	Not Sure		
B1	16.42	59.33	24.25	14.47	52.63	32.89	2.2888	0.318
B3	17.16	61.94	20.90	23.68	60.53	15.79	2.1530	0.341
B4	17.54	63.81	18.66	18.42	65.79	15.79	0.3324	0.847
B5	25.09	49.44	25.47	28.95	43.42	27.63	0.8906	0.641
B6	20.30	59.77	19.92	28.95	50.00	21.05	3.0064	0.222
B7	15.67	79.48	4.85	23.68	68.42	7.89	4.1123	0.128
B8	19.03	68.66	12.31	11.84	76.32	11.84	2.2583	0.323

B10	16.85	47.94	35.21	18.42	53.95	27.63	1.5301	0.465
B11	20.90	39.18	39.93	19.74	40.79	39.47	0.0804	0.961
B12	25.66	62.26	12.08	27.63	60.53	11.84	0.1194	0.942
B13	8.96	51.12	39.93	3.95	56.58	39.47	2.2322	0.328
B14	15.67	72.01	12.31	13.16	75.00	11.84	0.3309	0.848
B15	23.51	61.94	14.55	27.63	60.53	11.84	0.7433	0.690

There were generally no significant relationships between gender and responses related to employee relations as all the p values are larger than 0.05, which is the maximum significance level.

7.5 Length of Service and Employee Relations

The Pearson chi-square comparison as to how the military personnel between the length of service viewed employee relations within the SA Army Fmn.

Table 8: The comparison between length of service and responses to employee relations

Item	0-10			11-20			21-42			Pearson chi2(6)	Pr

B14	12.60	76.38	11.02	13.07	75.16	11.76	25.40	58.73	15.87	8.2629	0.082
B15	27.56	56.69	15.75	20.92	67.97	11.11	25.40	57.14	17.46	4.7411	0.315

Table 9: Chi-square significance - length of service and employee relations

Q No	Statement	Factor	Chi-Square Pr
B5	My employer maintains cordial relations with the employees	Consultation	0.041

There were generally no significant relationships between length of service and responses related to employee relations as all the p values are larger than 0.05, which is the maximum significance level. This; however, excludes question B5 ('My employer maintains cordial relations with the employees'), where it was discovered that there were significant relationships between employees with the length of service in their views on how they experienced employee relations based on the answer to question B5, as the p-value was 0.041, thus, smaller than 0.05.

7.6 Education and Employee Relations

The Pearson chi-square comparison to show the relationship between education and employee relations within the SA Army Fmn is presented in table 7.

Table 10: The comparison between educational qualifications and responses to employee relations

Table11: Chi-square significance - respondents with educational qualifications and employee relations

Q No	Statement	Factor	Chi-Square Pr
B10	My employer creates a sense of belonging among the employees	Team building	0.005

There were generally no significant relationships between education qualifications and the responses related to employee relations as almost all p values are larger than 0.05, which is the maximum significance level. This; however, excludes question B10 ('My employer creates a sense of belonging among the employees'), where it was discovered that there were significant relationships between employees having different educational qualifications and their views on how they experienced employee relations, as the p-value for this question was 0.005, and this p-value is smaller than 0.05.

7.7 Ranks and employee relations

The Pearson chi-square comparison as to how the military personnel of different rank groups viewed employee relations within the SA Army Fmn is presented in table 9.

Table 12: The comparison between rank groups and responses to employee relations

There are generally no significant relationships between rank groups and the responses related to employee relations as all p values are larger than 0.05, which is the maximum significance level.

Table 13: Outcome of the hypotheses

Hypothesis	Accept/Reject
H ₁ : There is a significant relationship between employee relations and age in the South African Military.	Reject
H ₂ : There is a significant relationship between employee relations and former force in the South African Military.	Partly accepted
H ₃ : There is a significant relationship between employee relations and gender in the South African Military.	Reject
H ₄ : There is a significant relationship between employee relations and length of service in the South African Military.	Partially accepted
H ₅ : There is a significant relationship between employee relations and education in the South African Military.	Partially accepted
H ₆ : There is a significant relationship between employee relations and ranks in the South African Military.	Rejected

There was not a significant relationship between age and employee relations. This finding deviates from the findings of Khan *et al.* (2013), Baradicco (1991) and Kundi and Nawaz (2010). They found that age and employee relations relate to each other.

There were generally no significant relationships between the former force groups and responses related to employee relations as all the p values are larger than 0.05 but there were significant relationships between former force in the South African Military and the statements that relate to institutional policies and programmes, career graph, opportunities for employees' participation, internal communication, recognition of employees as organisational assets and a sense of bonding among the employees. Previous studies could not be found on the relationship between former force and employee relations.

There was no significant relationship between employee relations and gender in the South African Military. This finding deviates from the findings of Collins and Tisdell (2002), Moriarty and Honnery (2005) as well as Rydstedt, Johansson and Evans (1998). These authors all found that gender relates to employee relations.

There was not a significant relationship between employee relations and length of service in the South African Military except for one statement, namely 'My employer maintains cordial relations with the employees'. Butler *et al.* (2014), Schmidt *et al.* (1986) and Ng and Feldman (2013) mainly found that length of service relates to employee relations.

There was not a significant relationship between employee relations and education in the South African Military except for the statement: 'My employer creates a sense of belonging among the employees'. Wehmeyer (1996) found that education relates to employee relations.

There was not a significant relationship between employee relations and ranks in the South African Military. Previous research on this relationship could not be found.

The conclusion is made that the relationship between employee relations and former force, employee relations and length of service as well as employee relations and education are significant.

8 Imitations of the Study

A limitation of this study is that it was cross-sectional in nature and cannot be generalised to all units in the South African Military as well as other the military within other countries.

9 Recommendations

It is recommended that management should be made aware of the former force, length of service and education levels within the South African Military (SA Army Fmn units) so that employee relations are managed optimally and effectively. A plan of action to engage with the former force, staff from different education levels as well as staff from different years of service, may also add value to improving employee relations in this workplace.

10 Recommendations for Future Research

For future research, this same study can be duplicated in other divisions in the South African Military as well as in the Military units in other countries. Comparisons can then be made on the relations between demographic characteristics and employee relations within different units and in different countries. It is recommended that a qualitative study be conducted to obtain rich data from the staff within the South African Military about employee relations.

11 Managerial Implications

To summarise what the results mean in terms of actions, it is essential that management must develop interventions to manage employee relations by addressing the former force, length of service and education levels within the South African Military (SA Army Fmn units). These actions should be

included in their strategic plans. If management does not take action, employee relations can be negatively influenced. It is also important that management needs to develop proper institutional policies and programmes, attend to career graphs, create opportunities for employees' participation, develop effective internal communication, give recognition to employees as they are seen as organisational assets, and create a sense of bonding among the employees, maintain cordial relations with the employees, and create a sense of belonging among the employees.

12 Theoretical Implications

The social exchange theory can also be summarised as a process of negotiated exchanges between parties in which all parties involved in the exchange take responsibility for one another and strongly depend on each other. In addition, the interactions between parties are usually seen as mutually dependent and contingent on the actions made by the other persons (Almaaitah, Harada, Sakdan & Almaaitah, 2017).

This study's theory is underpinned by the fact that the positive or negative adaptation of the level of relationship between employers and employees can lead to the improvement or reduction in employee relations and ultimately demographic groups within the South African military. The social exchange theory is intended to explain "how" and "why" things happen in the way that they do in the social content.

The discussion is premised on the theory that employees are likely to continue the relationship with their employer/supervisor when they perceive that the relationship is worthwhile for them, and terminate the relationship when the costs are more than the rewards that they gain from the relationship. The focus of this theory as applied in this study is on employee relations as influenced by both job satisfaction and work engagement among different demographic groups in the military members.

This study was also underpinned by the theories and models of employee relations, job satisfaction and work engagement. The social exchange theory was integrated with the study's findings.

13 Conclusion

The purpose of this study was to determine if there is a significant relationship between employee relations and demographic characteristics in the South African Military. It was found the hypotheses about the relationship between employee relations, former force, length of service and education were partially accepted. It is, therefore, important that the management of the South African Military needs establish positive employee relationships to ensure that the staff from the former force, different levels of years of service and ranks get the necessary attention in order to ensure healthy employee relations

Retention strategies

Abstract

Talented academic staff is vital for the sustainability and performance excellence of TVET colleges. Yet, institutions of higher learning are struggling to retain crucial and competent staff in a highly competitive work environment. The main objective of this research is to determine the talent retention of academic staff at a TVET college in the Gauteng Province. A talent retention diagnostic tool was administered among a sample of academic staff (N=116). The results showed that more than half of the participants considered quitting their jobs. The participants further showed dissatisfaction with compensation, talent management and diversity management practices. Compensation, management and satisfaction with institutional practices contributed to the voluntary turnover intentions of employees. Satisfaction with institutional practices mediated the relationship between compensation and voluntary turnover. The existence of well-developed talent retention strategies in the college may help achieve a higher employee retention level. Management should thus endeavour to develop strategies that make it attractive for employees to remain in the organisation; this would result in satisfied employees inclined to remain in the organisation for extended periods. Recommendations are made.

1. Introduction

The importance of academic staff for the performance excellence of higher education cannot be overemphasised (Mzini, 2019). Higher education institutions require top academic staff to develop employable citizens by enhancing students' knowledge, abilities and overall performance (Bingwa & Ngibe, 2021). The challenge presented to many South African higher education institutions is to retain capable academics in a competitive workplace era and a war for talent (Ngwane, Khanyase & Gumbi, 2019; Odiro, 2017). Not only do higher education institutions compete with each other for scarce talent, but also with the private sector lure young, talented academics with more lucrative salaries in the private sector (Erasmus, Grobler & van Niekerk, 2015).

This research focuses on the voluntary turnover intentions of lecturers in a South African Technical Vocational Education and Training (TVET) institution. TVET institutions were established to make a meaningful contribution to the social development needs of the country (Rasool & Mahembe, 2014). More specifically, the South African government uses TVET colleges to enhance integrated education and training that will deliver the human resources to promote personal, social, civic and economic development in their country (Unesco, 2015). Consequently, TVET colleges contribute to the country's Vision 2030 by producing well-equipped artisans (Zulu, 2018).

Unfortunately, TVET colleges have been exposed to various challenges since the abolishment of the apartheid era. The further education sector experienced mergers, new governance structures,

³ E-mail address: nbarkhuizen@uj.ac.za

curriculum reforms, and changing stakeholder relationships and funding (Terblance & Bitzer, 2018). Mushemeza (2016) highlights multiple challenges facing higher education institutions on the African continent, such as a lack of financial stability, infrastructural demands, inadequate staff remuneration, high student enrollment with low staff-student ratio, and governance/management deficits. Consequently, the reputation of the TVET sector is tarnished as the education system is fragmented, resulting in various adverse outcomes (Badenhorst & Radile, 2018). Employers, for example, note that the TVET sector does not address the employability skills needs of the industry (Mesuwini & Bomani, 2021). In addition, poor employment brands diminish the chances of higher education to attract prospective talent and retain current employees.

Against this background, the main objective of this research was to determine the factors contributing to the voluntary turnover intentions of academics in selected Gauteng TVET colleges:

- What are the current voluntary turnover levels of TVET lecturers?
- What are TVET lecturers' perceptions of compensation and management support practices?
- What is the TVET lecturer's current level of satisfaction with institutional practices?
- Does institutional satisfaction moderate/ mediate the relationship between compensation, management support and voluntary turnover intentions of TVET lecturers?

The past two decades witnessed an escalation of research on talent retention in public South African higher education institutions (see Barkhuizen, Lesenyeho & Schutte, 2020; Saurombe & Barkhuizen, 2020; Saurombe & Barkhuizen, 2022). However, research on talent management and retention within the TVET sector remains scarce. According to Mmako (2016), academic staff leave TVET colleges for a well-paid positions in the private sector or are head-hunted by other higher education institutions. Kraak, Paterson and Boka (2016) observed that investments in the TVET sector would continue to ensure student enrollment and education opportunities. This will require a need for more TVET staff in future. The Covid-19 pandemic further resulted in anxiety and consternation among TVET academics in their attempts to navigate difficult personal and work conditions while also caring for the well-being of students (Papier, 2021). As such, TVET colleges must prepare staff and students for a future uncertain work environment. Research on factors contributing to the voluntary turnover of academic staff in TVET colleges is, therefore, of strategic importance as the sustainability of these institutions depends on key and competent staff (Oosthuizen, Spencer & Chigano, 2022).

2. Theory and hypotheses

The present study adopts the talent retention diagnostic framework developed by Theron, Barkhuizen and Du Plessis (2014). According to this framework, compensation and management support are the main predictors of voluntary staff turnover in the higher education sector. In addition, employee satisfaction with institutional practices can also contribute to voluntary staff turnover intentions. In what follows next, a brief description of the model's components is presented and its relevance to the TVET sector.

Voluntary turnover

Voluntary turnover occurs when employees leave an organisation of their choice (Mensele & Coetzee, 2014). The voluntary turnover rates among talented academics are alarmingly high, especially in developing countries where there is a need for skilled and competent staff. A study by Lesenyeho, Barkhuizen and Schutte (2018) found that more than half of the early career academics in their sample voluntarily quit their jobs. Similarly, Bwowe (2020) found that higher education academic staff showed high desirability to leave their present jobs due to better opportunities elsewhere. Wei (2015) highlights the importance of retaining skilled and talented employees as they will look for employment elsewhere. Keeping skilled personnel has many advantages, such as savings on new hires, the accumulation of experienced workers, devoted and engaged workers, improved human capital, and workers who are familiar with the organisational culture are a few of these (see Abazeed, 2018). These advantages contribute to institutions' sustained and improved business performance (Al Aina & Atan, 2020).

Factors contributing to academic staff turnover

Compensation, salary and recognition/ rewards: Compensation remains one of the most problematic people management practices in the higher education sector (Aliyu, Bello & Bello, 2018; Delanoy, 2022). Academic staff's poor salaries relative to their private sector counterparts are frequently cited (Lauder & Mayhew, 2020). According to Smit, Stanz, and Bussin (2015), organisations should create and practice compensation and reward plans pertinent to talent management. As such new and contemporary compensation models advocate for a more holistic approach to attracting and rewarding talented employees. Bussin, Mohamed-Padayachee and Serumaga-Zake (2019) found seven reward categories for Generation Y employees: leadership and environment, benefits, performance incentives, individual development, safe, secure working environment, work-life balance and resources and performance recognition. A study by Jeremiah (2018) showed that intrinsic rewards, such as the job itself and extrinsic rewards (i.e. pay and bonuses) play a significant role in the job satisfaction and morale of TVET educators. Henderson and Shaheen (2013) found that salary variations among academic staff members affected their level of satisfaction, which in turn affected their performance. Mabaso and Moloi (2016) found that the poor application of total rewards in TVET colleges resulted in a high academic staff turnover. Odiro (2017) found that dissatisfaction with pay is one of the primary reasons why academic staff would leave TVET colleges.

H 1: Compensation, salary and recognition/ rewards are significant predictors of voluntary staff turnover of academic staff at a TVET college

Management support: The importance of management support for retaining academic staff is well documented (see Hoque & Tshutsha, 2022; Lesenyeho, Barkhuizen & Schutte, 2018). In particular, the management or leadership mindset is essential to recognise the value of talented employees in the workplace (Saurombe, Barkhuizen, Schutte, 2017). Higher education management is responsible for creating a workplace culture that will enable academic staff performance (Boakye, Arpoh-Baah, Odoom, Afram, Addai et al., 2022). Research findings by Robertson and Frick (2018) revealed that the leadership and management demand created conflicting priorities for TVET leaders resulting in poor outcomes for the institution. A study by Mokgojwa (2019) showed that the absence of management vision and strategies poses a significant risk to attracting and retaining academic staff. In turn, poor leadership and management skills contribute to TVET lecturers experiencing a shortage of capabilities and competencies for effective lecturing (Badenhorst & Radile, 2018).

H 2: Management support is a significant predictor of voluntary staff turnover of academic staff at a TVET college

Institutional policy and practices: Academic staff have long been envied by counterparts for their flexibility, autonomy and other perks such as travelling for conferences. Unfortunately, the higher education landscape has not been exempted from rapid changes during the past two decades, threatening the very existence of the academic profession and the subsequent deterioration of the academic profession (Akalu, 2017). Sebola (2022) mentioned that government politicking disrupts university leadership from the required academic freedom to ensure a notable impact on human capital development in required fields. According to Mampane (2020), promotion practices in HEIs are very much characterised by power play and micro-politicking. Consequently, well-intended political reforms are challenged by unfairness, biases and inequality in academic promotions (Sadiq, Barnes, Price, Gumedze & Morrell, 2018). A study by Geldenhuis (2020) revealed that the development of an individual into a mature academic should not be forced or fast-tracked as it can have potential adverse results for both the individuals and institutions involved. Moreover, academic promotions and appointments should be made based on experience, publications and knowledge (see Geldenhuis, 2020). Theron et al. (2014) and Barkhuizen et al. (2020) found that academic staff dissatisfaction with promotion practices will contribute to their voluntary turnover intentions.

Other studies show that HEIs neglect to develop the appropriate policies for a new academic dispensation (Seeletse & Thabane, 2016). A central tenet of effective talent management involves the development of an inclusive culture where all employees are allowed to participate and feel that they

contribute to the institution (Meyers, 2020). Pieters, van Zyl and Nel (2020) found, among others, that lecturers included in decision-making and working in a pleasant work environment will be more committed to and willing to contribute to their institutions and less likely to quit. A study by Bhatti, Alshagawi, Zakariya and Juhari (2019) showed that higher education management should adopt diversity management practices that will enhance the psychological diversity climate and job satisfaction among multicultural employees. Barnes, Du Plessis and Frantz (2021, p. 1) identified an exhaustive list of practices in support of academic career progression, such as *"equity and inclusion, an ethic of care and collaboration, that are integrated with performance management, a career management system, a comprehensive induction and orientation programme, a collaborative structure, remuneration, as well as resources and support."*

The competency and skill development of TVET lecturers is a recurring theme in academic literature. However, there is some evidence to suggest that insufficient training is provided to TVET lecturers despite their low teaching skills (Manyau, 2015). The latter author further found that skills development is hampered by ineffective planning, lack of policies, consultation and the absence of skills auditing. Levitt (2020) observed that TVET colleges should be seen as sites for workplace learning for lecturers. Mabindisa (2021) argues that TVET colleges should invest in organisational development programmes to ensure that employees cope with new technologies. Shandu (2016) also highlighted the importance of mentorship programmes for novice TVET lecturers to prepare them for classroom management and pedagogical skills before starting their duties.

Theron, Barkhuizen, and Du Plessis (2014) discovered that academic staff members' contentment with institutional policies influences their satisfaction and retention at work. In the latter study, three factors matter: Satisfaction with general institution practices, human resource management practices and diversity management practices matter for job satisfaction. Therefore, institutional changes are required should institutions of higher learning wish to retain key academics (Saurombe et al., 2017). These include performance-based rewards, sending academics on courses to learn new skills, providing various benefits for academics, establishing a flexible and independent work environment and instilling a culture of loyalty towards the institution. Lesenyeho et al. (2018) found that a lack of training and development contributed significantly to the voluntary turnover intentions of early career academics.

H 3: Satisfaction with institutional practices is a significant predictor of voluntary staff turnover of academic staff at a TVET college

The intervening role of job satisfaction in the voluntary turnover relationship

Job satisfaction is one of workplace literature's most frequently researched attitudinal variables. According to Pieters et al. (2020), lecturers' job satisfaction needs to be assessed regularly to ensure satisfied and committed staff who will contribute to the institution's success. Research on the intervening role of job satisfaction (i.e. moderation/ mediation) in voluntary turnover intention relationships is inconclusive. Barkhuizen and Gumede found that job satisfaction moderated the relationship between talent management practices and voluntary turnover intentions of staff in a government institution. A study by Turgut, Bekmezci and Ateş (2017) showed that job satisfaction partially moderated the relationship between servant leadership and turnover intention. Han and Jekel (2011) found that job satisfaction mediates the relationship between leader-member exchange and turnover intentions. Froese, Peltokorpi, Varma and Hitotsuyanagi-Hansel (2018) found that merit-based rewards have a direct positive effect on job satisfaction and an indirect effect on voluntary turnover.

H 4: Satisfaction with institutional practices moderate/ mediate the relationship between compensation, management support and voluntary turnover intentions of academic staff at a TVET college

3. Research design

3.1 Research approach

A quantitative research approach was followed using a cross-section design. The latter design was deemed suitable to obtain data from surveys over a shorter time (Field, 2019). In addition, the cross-sectional design is ideally suited to test cause and effect relationships between variables.

3.2 Sampling

The target population for this research as lecturers, senior lecturers and heads of departments employed at a Gauteng TVET College. A total of 152 questionnaires were distributed to a randomly selected group of respondents. The researchers received 116 questionnaires, resulting in a 76,3% response rate. The sample was balanced in terms of gender, with females numbering 58 (50%) of the sample. A large proportion (37.1%), of the sample, was aged between 41 and 50 years. There were 92 permanently employed respondents (79.3%). Most respondents (98, or 84.5%) were African. Over half (57, or 49.1%) of the respondents were married. Regarding qualifications, 46 respondents (39.7%) had an Advanced Diploma/B Tech degree/postgraduate certificate/bachelor's degree, while 40 (34%) had an honours degree. Almost half the sample (55, or 47.4%) had been employed for less than 10 years and 93 (78.4%) of the respondents were lecturers.

3.3 Measuring instruments

The talent retention diagnostic tool of Theron et al. (2014) was used in this study. The questionnaire comprised four sections: Section A: demographic information; Section B: compensation and recognition; Section C: management support; and Section D: employee retention.

- Section A consisted of eight items on compensation and recognition. Respondents were asked to rate their satisfaction with remuneration (i.e. *My basic salary is adequate*) on a six-point Likert scale where 1 = strongly disagree, and 6 = strongly agree. Theron et al. (2014) obtained an $\alpha = 0.882$.
- Section B consisted of eight items. Respondents were asked to rate their relationships with their managers regarding aspects such as trust, communication support, conduct and appraisal (i.e. *My line manager has my best interests at heart*). Theron et al. (2014) obtained an $\alpha = 0.934$.
- Section C measured 17 items relating to institutional factors that can contribute to academic satisfaction (i.e. *Sufficient access to information I need to do my job*) on a six-point Likert scale where 1 = strongly disagree, and 6 = strongly agree. Theron et al. (2014) obtained acceptable internal consistencies ranging from an $\alpha = 0.783$ to an $\alpha = 0.923$.
- Section D consisted of four sub-sections designed to assess respondents' intention to remain with or leave the organisation. First, they were required to indicate whether they had been searching for alternative employment by selecting one of the eight job search-related questions (i.e. *Yes, applied for a promotion in the same institution*). Secondly, of 18 options provided, respondents could choose five that indicated why they might leave in the future. Examples included 'unhappy about career development opportunities', 'would leave for a promotion', 'would leave to study further', 'would leave if my spouse was to be transferred and 'would leave for family responsibilities.
- The final section focused on the respondents' intention to leave the organisation and consisted of three items, with responses measured on a six-point Likert scale ranging from 1 (strongly disagree) to 6 (strongly agree). Cohen's (1993) three-item measure was used to determine the voluntary turnover intentions of the respondents (i.e. *I think a lot about leaving the organisation*). Theron et al. (2014) obtained an acceptable internal consistency of $\alpha = 0.914$.

3.4 Research procedure

The primary researcher approached the management of the TVET college to obtain permission to do the study. The purpose of the study was clearly explained as well as the nature and rights of the study participants. Careful consideration was given to the Department of higher education and training requirements for doing research in the TVET colleges. Ethical clearance was obtained from Southern

Business School prior to the commencement of the study. The questionnaires were distributed to participants by the campus managers. Respondents were informed that their participation was voluntary and that they could withdraw at any time. The primary research data were collected using self-administered questionnaires that were placed in sealed boxes once completed to ensure confidentiality and anonymity.

3.5 Statistical analyses

The data was analysed using the Statistical Software Programme for Social Science (IBM, 2021). Descriptive statistics (i.e. frequencies, means, skewness and kurtosis) were applied. Exploratory factor analyses were used to determine the factor structure of the measuring instrument. The guideline of Hair, Black, Babin and Anderson (2010) for Measure of sampling adequacy (MSA) $\geq 0,60$ were used to determine the adequacy of the sample for factor analyses. The guidelines of Cohen (1988) were used to assess the reliability of the factors, namely $\alpha \geq 0,70$. Pearson correlation analyses were used to determine the relationship between the variables. Cohen's (1988) guidelines were also used to determine the magnitude of the relationships between the variables: $0 \geq r \leq 0,29$ = statistically significant; $0,30 \geq r \leq 0,49$ = practically significant, medium effect; $r \geq 0,50$ = practically significant, medium effect. Multiple regression analyses were applied to determine the moderation/ mediation effect between the variables in the study. The researchers followed the guidelines of Baron and Kenny (1986) to determine the mediating effect between variables. Four steps are involved in the moderation: First, the predictor variable (i.e. compensation, management support) of voluntary turnover is added. Second, the moderator variable (i.e. institutional satisfaction) is added. Third, both the predictor and moderator variables are added. The final step involves adding the interaction variable (i.e. multiplying the predictor value with the moderation variable) together with the predictor and moderator variable. The result of the interaction variable must be significant for moderation to occur. Based on the recommendations of Baron and Kenny (1986), mediation analyses are followed when moderation yields a non-significant result. Three steps are involved in mediation (Baron & Kenny, 1986): (1) Testing the predictive relationship between predictor and dependent variable; (2) Testing the predictive relationship between the moderator and dependent variable; (3) Testing the predictive relationships between the predictor, mediator and dependent variable. For complete mediation to occur, the relationships between the variables for the first three steps must be significant, and the independent variable should not affect the dependent variable after mediation.

4. Results

The results of the measuring instrument are reported in the section below. Firstly, a measure of sample adequacy (MSA) was conducted to determine whether the sample size was adequate for fact analysis. Secondly, exploratory factor analysis was used to determine the factor structure of the measuring instruments, followed by reliability analysis.

4.1 Compensation

The MSA showed an acceptable value of 0,89 for factor analysis (Hair et al., 2010). A subsequent exploratory factor analysis revealed one underlying factor for the Compensation scale with a total variance of 64,16%. This factor, labelled compensation, showed a reliability of $\alpha = 0,92$. The descriptive statistics of the measurement and the item analysis are reflected in Table 1.

Table 1. Descriptive statistics for Compensation

	Mean	Standard Deviation	Strongly Disagree	Disagree	Slightly Disagree	Slightly Agree	Agree	Strongly Agree	KMO	Variance Explained	α
Compensation	3,10	1,23							0,89	64,16	0,92
Basic salary good	3,15	1,539	19	31	12	31	14	9			
Medical aid offered	3,35	1,522	12	31	18	26	17	12			
Pension fund	3,62	1,478	9	23	19	31	20	14			
Praised for my work	2,59	1,527	33	36	18	12	9	8			
I am fairly compensated for the work I do	2,92	1,544	24	31	21	19	12	9			
Bonus structure is fair	3,50	1,574	14	26	14	22	30	10			
Incentives make job worthwhile	2,62	1,443	27	39	23	13	6	8			
Bonus structure reflects my contribution	3,04	1,654	25	31	14	15	22	9			

Source: Authors' own

Table 1 reveals that respondents experienced average levels of satisfaction with compensation. However, it is evident that lecturers are not praised for their work (below the mean at 2,59), were not fairly compensated for the work they were doing (2,92) and they had few incentives to make their jobs worthwhile (2,62).

Management support

The KMO measure showed an acceptable value of 0,884 for factor analysis (Hair et al., 2010). A subsequent exploratory factor analysis revealed one underlying factor for the management support scale with a total variance of 78,478%. The factor, labelled management support, showed strong reliability of $\alpha = 0,943$. The descriptive statistics and the item analysis are reported in Table 2.

Table 2 Descriptive statistics for Management support

	Mean	Standard Deviation	Strongly Disagree	Disagree	Slightly Disagree	Slightly Agree	Agree	Strongly Agree	KMO	Variance Explained	α
Management support	3,64	1,45							0,884	78,478	0,943
Trust line manager	3,81	1,571	13	16	13	28	30	16			
Communicate easily	4,12	1,594	9	18	8	20	37	24			
Line manager (LM) has my best interests at heart	3,87	1,666	13	16	17	22	23	25			
LM supports my development	3,47	1,612	17	20	20	25	19	15			
LM conducts regular appraisals	3,23	1,649	24	20	19	23	18	12			
LM conducts fair appraisals	3,32	1,692	22	23	16	20	21	14			

Source: Authors' own

Lecturing staff seemed to communicate easily with their line managers (3,81 above the mean of 3,64) and had trust in their managers (3,81). Nevertheless, the results indicated that the line managers needed to conduct regular (3,23) and fair appraisals.

Satisfaction with institutional practices

The KMO measure showed an acceptable value of 0,936 for factor analysis (Hair et al., 2010). An exploratory factor analysis indicated one underlying factor for the Satisfaction with institutional practices scale, with a total variance of 76,039%. This factor, labelled institutional satisfaction, showed excellent reliability of $\alpha = 0,976$. The descriptive statistics of the measurement and item analysis are reported in Table 3.

Table 3 Descriptive statistics of Satisfaction with Institutional Practices

	Mean	Standard Deviation	Strongly Disagree	Disagree	Slightly Disagree	Slightly Agree	Agree	KMO	Variance Explained	α
Institutional satisfaction	2,69	1,09						0,936	76,039	0,976
Sufficient access to information	2,96	1,197	18	18	44	23	13			
Support from HR	2,73	1,328	26	29	25	22	14			
Changes and restructuring in institution	2,73	1,197	23	21	48	12	12			
Opportunity to engage in community service projects	2,41	1,202	29	40	27	10	10			
Affirmative action	2,57	1,246	25	38	27	14	12			
Sufficient cultural diversity in the institution	2,92	1,238	21	20	32	33	10			
Sufficient respect for my culture	3,09	1,248	16	22	29	34	15			
Institutional leadership	2,67	1,337	33	19	27	27	10			
Institutional values	2,84	1,292	27	16	32	31	10			
Institutional strategy	2,76	1,276	29	14	39	24	10			
Communication from leadership	2,67	1,221	27	21	40	19	9			
Talent management policies in the institution	2,57	1,273	31	25	34	15	11			
Mentorship for academic staff	2,35	1,218	33	39	23	12	9			
Funding to attend conferences	2,33	1,263	37	35	24	9	11			

Source: Authors' own

The results in Table 3 indicate that satisfaction with institutional practices was low. This is evident from outliers such as staff funding to attend conferences (2,33), mentorship (2,55), talent management policies (2,57), opportunities to engage in community service (2,41) and affirmative action (2,57). All these are below the mean value for satisfaction of 2,69.

Voluntary turnover

The KMO measure reflected an acceptable value of 0,757 for factor analysis (Hair et al., 2010). Exploratory factor analysis revealed one underlying factor for the Voluntary turnover scale with a total variance of 87,166%. This factor, voluntary turnover, had reliability level of $\alpha = 0,926$. The descriptive statistics of the measurement and item analysis results are reported in the table below.

Table 4 Descriptive statistics for Voluntary Turnover Intentions

	Mean	Standard Deviation	Strongly Disagree	Disagree	Slightly Disagree	Slightly Agree	Agree	Strongly Agree	KMO	Variance Explained	α
Voluntary turnover	3,49	1,73							0,757	87,166	0,926
I think a lot about leaving the institution	3,53	1,79	19	23	16	20	12	26			
I am currently seeking employment outside the institution	3,29	1,85	25	27	14	11	17	22			
When possible, I will leave the institution	3,66	1,91	22	20	12	14	17	31			

Source: Authors' own

Respondents who indicated that they would leave the college if there were a possibility (mean of 3,66) outnumbered those who were content to remain. This suggests that voluntary turnover would be higher if lecturers were allowed to go elsewhere. The results of voluntary turnover intentions were further explored by focusing on factors influencing employees to leave the institution. The table below shows the extent to which employees were seeking other employment.

Table 5 Extent to which employees are seeking another job

Items	Frequency	Percentage	Cumulative Percentage
Yes, in the same institution in a different section	15	12,9	13,0
Yes, applied for a promotion in the same institution	21	18,1	31,3
Yes, at another academic institution	28	24,1	55,7
Yes, in another organisation(not in academia)	9	7,8	63,5
Yes, but only placed my CV on the web	4	3,4	67,0
No, but I have been headhunted by another organisation	2	1,7	68,7
No	36	31,0	100,0
Total	115	99,1	

Source: Authors' own

Table 5 indicates that more than half of the respondents (67,0%) actively sought employment elsewhere, while others sought promotion within the institution (31.3%).

The results from the analysis of reasons for employees seeking alternative employment are reported in Table 6 below.

Table 6 Main reasons why employees want to leave the institution

Items	Frequency	Percentage
Unhappy with financial compensation	26	22,2
Unhappy with company policies	18	15,5
Unhappy with career development opportunities	25	21,6
Unhappy with training opportunities	4	3,4
Unhappy with the job itself	3	2,6
Unhappy with the people I have to work with	2	1,7
Would leave for a promotion	19	16,4
Would leave for better pay in another company	3	2,6
Would leave for a job closer to home	2	1,7
Would leave for a career change	2	1,7
Would leave to start my own business	6	5,2
Retirement	6	5,2
Total	116	100,0

Source: Authors' own

This table indicates that lecturers would leave because they were unhappy with their financial compensation (22,2%), with the institution's policies (15.5%) and with career development opportunities (21,6%) and if they could get a promotion elsewhere (16,4%).

Testing the Hypotheses

This section reports on the results of the hypotheses. A combination of Pearson correlation analysis and multiple regression analysis was applied. The results of the Pearson correlation analysis are presented in Table 7.

Table 7 Pearson correlation analysis

	Compensation	Management Support	Institutional Satisfaction
Compensation	1		
Management Support	.653** 0,000	1	
Institutional Satisfaction	.678** 0,000	.706** 0,000	
Voluntary Turnover	-.266** 0,004	-0,126 0,178	-.344** 0,000

Source: Authors' own

These results show that compensation and management were significantly related to institutional satisfaction. In addition, compensation and institutional satisfaction (medium effect) were significantly related to voluntary turnover. No significant relationship existed between management support and voluntary turnover. The above results confirm Hypotheses 1 and 3 that Compensation and Institutional satisfaction is significantly related to voluntary turnover intentions. The results reject Hypothesis 2 that management support is a significant predictor of voluntary turnover intentions.

The results of the mediation analysis are provided in Table 8. Initial multiple regression analyses revealed a non-significant results for the moderation analyses between compensation, management support and voluntary turnover intentions. In line with the guidelines of Baron and Kenny (1986), the researchers opted for mediation analyses.

Table 8 Mediation analysis of compensation, institutional satisfaction and voluntary turnover

	Unstandardised Coefficients		Standardised Coefficients	t	Sig.	R	R ²	ΔR ²
	B	Std. Error	Beta					
Step 1: Compensation and voluntary turnover								
						.266 ^a	0,071	0,063
(Constant)	4,655	0,423		11,010	0,000			
Compensation	-0,375	0,127	-0,266	-2,952	0,004			
Step 2: Institutional Satisfaction and voluntary turnover intentions								
						.344 ^a	0,118	0,111
(Constant)	4,956	0,403		12,298	0,000			
Institutional satisfaction	-0,544	0,139	-0,344	-3,913	0,000			
Step 3: Compensation, institutional satisfaction and voluntary turnover								
						.347 ^a	0,120	0,105
(Constant)	5,047	0,441		11,432	0,000			
Compensation	-0,086	0,169	-0,061	-0,512	0,610			
Institutional Satisfaction	-0,478	0,190	-0,302	-2,521	0,013			

Source: Authors' own

The final step (3) in the mediation analysis showed that compensation and institutional satisfaction together explained 12% of the variance in voluntary turnover. A slight difference was observed between the effect on voluntary turnover in Step 3 and in Step 2. The effect was non-significant for the predictor variable, indicating that institutional satisfaction mediated the relationship between compensation and voluntary turnover.

Mediation: Management support, Institutional Satisfaction and Voluntary turnover

The results of the mediation analysis of compensation, institutional satisfaction and voluntary turnover are reflected in Table 9 below

Table 9: Mediation analysis of management support, institutional satisfaction and voluntary turnover

	Unstandardised Coefficients		Standardised Coefficients	t	Sig.	R	R ²	ΔR ²
	B	Std. Error	Beta					
Step 1: Management support and voluntary turnover								
						.126 ^a	0,016	0,007
(Constant)	4,040	0,433		9,329	0,000			
Management support	-0,150	0,111	-0,126	-1,356	0,178			
Step 2: Institutional satisfaction and voluntary turnover intentions								
						.344 ^a	0,118	0,111
(Constant)	4,956	0,403		12,298	0,000			
Institutional satisfaction	-0,544	0,139	-0,344	-3,913	0,000			
Step 3: Management support, institutional satisfaction and voluntary turnover								
						.382 ^a	0,146	0,131
(Constant)	4,645	0,431		10,784	0,000			
Compensation	0,278	0,146	0,234	1,902	0,060			
Institutional Satisfaction	-0,805	0,194	-0,509	-4,146	0,000			

Source: Authors' own

The final step (3) in the mediation analysis showed that management support and institutional satisfaction together explained 14,6% of the variance in voluntary turnover. A slight difference was observed between the effect on voluntary turnover in Step 3 and Step 2. However, the effect was non-significant for the predictor variable, indicating that institutional satisfaction mediated the relationship between management support and voluntary turnover.

Based on the above results, Hypothesis 4 is partially accepted that institutional satisfaction mediated the relationship between compensation, management support and voluntary turnover intentions.

5. Discussion

The main objective of this research was to determine the factors contributing to the voluntary turnover intentions of academic staff at a TVET college in the Gauteng Province. The results showed that the participants were dissatisfied with their compensation and rewards. The participants felt they are not praised for their work and do not receive incentives that make their job worthwhile. In addition, the participants also felt that they were not fairly compensated for the work that they were doing. The results emphasise the problematic nature of adequately rewarding academic staff and their perceived poor salaries relative to counterparts in the private sector (Aliyu et al., 2022; Delanoy, 2022 & Lauder & Mayhew, 2020). As with previous studies, the results of this study also showed that dissatisfaction with financial compensation enhances academic staff's inclination to quit their jobs voluntarily at TVET colleges (see Mabaso & Moloji, 2016; Odiro, 2017).

In this study, academic staff indicated they could communicate easily with their managers. This is an important finding as management-employee dialogue creates inclusive workplace cultures and pleasant work environments (see Pieters et al., 2020). The participants, however, felt that management neglected to conduct regular and fair performance appraisals. These results are concerning as employees perform best when management recognises their value and recognise them as such (see

Boakye et al., 2022; Saurombe et al., 2017). As with previous research, poor management skills contribute to the risk of retaining key academic staff for TVET colleges (Mokgojwa, 2019).

The participants appeared to be dissatisfied with most of the institutional practices. This is evident from outliers such as staff funding to attend conferences, mentorship, talent management policies, opportunities to engage in community service and affirmative action. Opportunities to attend conferences are essential for the career development of academic staff. Much has been written about poor career development opportunities for TVET staff (Manyau, 2015). The lack of career development and promotion opportunities were some of the main reasons academic staff contemplated leaving their jobs in this study. TVET colleges can benefit from adopting a learning organisation style supported by mentorship programmes where academic staff are given opportunities to enhance their skills and progress in their careers (see Levitt, 2020; Mabindisa, 2021; Shandu, 2016). The study results also highlight the need to create healthy diversity management and inclusivity practices that foster fair, unbiased and equality in academic promotions (see Bhatti et al., 2019; Geldenhuys, 2020; Sadiq et al., 2018). In support to previous studies, dissatisfaction with institutional practices and policies contributed significantly to higher voluntary academic staff turnover intentions (Barkhuizen, 2020; Theron et al., 2014).

Considering the above results, it is not surprising that satisfaction with institutional practices mediated the relationship between compensation, management support and voluntary turnover intentions of academic staff. The results of this study, in general, showed that participants perceived poor compensation and a low level of management support. In addition, the voluntary turnover intention of academic staff in this study was high. About 60% of the staff considered quitting their jobs voluntarily, confirming the results of Lesenyeho et al. (2018), who found high levels of voluntary turnover intentions among academic staff. Therefore, it is plausible that poor compensation and management support resulted in low satisfaction of academic staff with institution practices, which enhanced voluntary staff turnover intentions. The results are in line with Froese et al. (2018) and Han and Jekel (2011), who found job satisfaction as a mediator perceived effectiveness of leader-member exchange, rewards and voluntary turnover intentions.

6. Management implications

The study's results highlight the importance of having sound compensation and rewards practices to retain key employees. Employees need to be recognised for their efforts and performance. Compensation in this study was the main reason employees would consider leaving their jobs at the TVET college. The study results also highlight the need for management to apply more fair and transparent performance management practices. Performance management is an essential enabler for employee promotion. The participants in this study highlighted a lack of promotion opportunities as the second most important reason they would quit the institution. Managers also play an essential role in establishing workplace culture. In this study, the participants were particularly dissatisfied with talent and diversity management practices. Higher education management, therefore, needs to prioritise key individuals' talent management to prevent unnecessary turnover.

7. Limitations and recommendations

As with any research, this study also had some limitations. First, the study was cross-sectional, with data collected at one point. The study is therefore limited in making cause and effect inferences over the longer term. The participants in this study were limited to one TVET college in the Gauteng province. Consequently, the results cannot be generalised to other TVET colleges. The sample size should be expanded for future research, and more TVET colleges should be used to generalise findings. Future research can benefit from including TVET management, human resources and students to obtain a more holistic understanding of talent retention in TVET colleges. Finally, future research can benefit from following a mixed-method approach to explaining the results in more detail.

8. Conclusion

TVET colleges play an essential role in educating South African citizens, contributing to the sustainable goals the country has set itself to achieve. Yet, it appears that talent management of TVET

lecturers is still in the infancy stage, putting these institutions at significant risk of losing scarce skills. Therefore, the management of TVET colleges is encouraged to take note of the findings and take proactive action to prevent unnecessary lecturer turnover, poor compensation and institutional practices.

Abstract

This paper examines the impact of a current global organisational crisis – the Great Resignation – and its implications for the Talent Management (TM) strategies of firms. Recognising the criticality of TM and its contextual idiosyncrasies, we draw on institutional theory to explain the different contextual factors that are at play. Next, through utilising a scoping review, we describe the global Great Resignation phenomenon before exploring how it is manifesting within the UK and South African contexts. We then enter into a discussion that brings TM theory to bear on contextual challenges arising through the Great Resignation and argue that TM practices should be authentically integrated into organisations in South Africa and the UK. In closing, we suggest practical recommendations for management to mitigate or resolve the adverse effects of the Great Resignation, followed by a future research agenda. The contribution of this paper is two-fold in that we (i) describe TM and its practices within two socioeconomic contexts, and (ii) offer practical, contextual recommendations for firms to resolve a current global challenge through inclusive TM practices.

1. Introduction

This paper examines the impact of a current global organisational crisis. Employment crises are not unusual for organisations. The financial crises of the late 2000s, for example, and its subsequent effects caused untold harm to a multitude of organisations with a loss of jobs for many employees. The current global state, however, is an unprecedented one for most people born after the two world wars. The ‘Great Resignation’ – a term coined by US professor Anthony Klotz (Cohen, 2021) – is presenting a supply-side crisis for organisations. Although voluntary turnover is always an organisational reality and it is doubtful that the departure of a few employees will cause severe damage to an organisation, the Great Resignation – also known as the Big Quit (Curtis, 2021) and the Great Attrition (De Smet et al., 2021) – describes the large numbers of employees that have been leaving their organisations voluntarily since early 2021.

Talent Management (TM) typically encompasses the key organisational strategies and practices to attract, retain, develop, and motivate critical or high-potential employees (or those in strategic roles), with a focus on sustaining competitive advantage in a turbulent marketplace (Meyers & van Woerkom, 2014). As a component of human resource management (HRM), TM focuses primarily on the segmentation of the workforce, identifying and developing those who add differential value to the organisation (Huselid & Becker, 2011). Thus, TM practices focus on the development and ‘future-proofing’ of an organisation's human capital pool (Tatoglu et al., 2016). Any failure to do so is levied towards an organisation's focus on shareholder return (Collings, 2014).

Yet, institutional environments and their structures pose problems for the organisations to implement of TM and experience of TM practices. Institutional theory suggests that pressures are exerted on firms, not only by market forces, but also by a range of stakeholders, structures, and contexts that

shape subsequent approaches to human capital development (Larsson, 2018; Thunnissen, 2016; Thunnissen et al., 2013; Bell, 2011). Structural contexts include political, economic, and social environments that shape the choice of organisational agents through the provision of incentives and disincentives, thus constraining or encouraging certain practices and courses of action within organisations (Bell, 2011). These are then interpreted through the lens of the values and culture of the organisation.

The ‘Great Resignation’ is currently presenting a new institutional context for organisations in the form of a supply-side crisis for organisations. Although voluntary turnover is always an organisational reality and it is doubtful that the departure of a few employees will cause severe damage to an organisation, the Great Resignation describes the large numbers of employees that have been leaving their organisations voluntarily since early 2021. Thus, viewed through an institutional lens, a global phenomenon like the Great Resignation, reflects how large, external political and economic forces shape the employment decisions of individuals within firms.

This paper is concerned with the institution of employment, understanding the forces causing so many to leave their organisations, and using TM to mitigate the impact of the Great Resignation on organisations. The objectives of this paper are therefore to analyse the challenges and impacts of the Great Resignation in two different contexts (South Africa and the UK), to examine the Great Resignation through the lens of TM, and to present an argument for integrated and authentic TM practices in response to those challenges.

1.1. Institutional theory and contextual idiosyncrasies

Institutional theory has been a vital tool for analysing the employment relationship for more than 30 years. Morgan and Hauptmeier (2014) examine four key variants of institutionalism, all of which are applicable to the institution of employment: rational choice, historical institutionalism, sociological institutionalism, and constructivist institutionalism.

Rational choice suggests that institutions consist of rational agents that seek to “maximize utility” under the conditions of bounded rationality, complexity, and uncertainty (Morgan & Hauptmeier, 2014, p. 191). Historical institutionalism (HI) places rational choice within an historical context and suggests that agents’ preferences are shaped by institutions (i.e. their choices are path dependent and may prevail even in the face of institutional breakdown). In sociological institutionalism, historical processes of change are not considered; instead, actors seek legitimacy and learn and develop norms and cognitive schema. These schemata subsequently shape discourses that become embedded in organisational routines, rules, and scripts. Constructivist institutionalism eschews the notion of an external institutional reality and instead seeks a more actor-centric approach that emphasises the role of ideas and how they change and become institutionalised. This approach suggests that an institutional ‘reality’ is that perceived by the observer.

Bell (2011) suggests that while more actor-centric constructivist approaches may have increasing appeal, the approach focusses too much on the notion that institutions are what the actor perceives them to be, rendering the institutions themselves as insignificant. But that is not to say that agency does not have a role to play in the historical development of an institution and its legacy. Actors are restrained and empowered by their institutional environments in that they are products of an institution and they have been socialised within these through a process of navigation and negotiation (Larsson, 2018). Institutions are not ahistorical, nor are they based on rational choices; they are prone to both endogenous and exogenous pressures, but any change cannot be solely attributed to actors and their beliefs and perceptions (Morgan & Hauptmeier, 2014; Bell, 2011). Thus, with regard to employment in organisations, institutional context is consequential for the decisions employees and organisations make around TM (Gallardo-Gallardo et al., 2019).

1.2. Employment in South Africa

A consideration of HI is particularly pertinent to the discussion of TM in South Africa. While South Africa now represents one of two countries in Sub-Saharan Africa (the other is Ghana) that has a

comprehensive democratic regime (Maree, 2014), between 1948 and the early 1990s the apartheid regime affected people of different races differently. Prior to the 1970s, Blacks were excluded from any employment relations systems, and it was through the advent of a powerful Black Trade Union movement that workplace rights were eventually extended to all (Maree, 2014). Yet during apartheid, Black access to skilled work was prohibited by law and such jobs were reserved for Whites. During this time, Whites were paid retention focused salaries – increasing wage distortions that continued post-apartheid.

Thus, diverse generational outlooks persist between Black and White South Africans and these impact the workplace. The Apartheid Generation (1938-1960) has no national memory prior to the institutionalisation of apartheid with its legal machinery enforcing racial segregation. While all races in this generation were exposed to protest action and its ramifications, Black South Africans were more aware of the situation (Deal et al., 2010). The material conditions under which the various racial groups existed shaped their outlook on life and consequently racialised relationships in the workplace. The Struggle Generation (1961-1980), a period characterised by countrywide protests included the oppressed, who participated in some form of resistance, and many of the white population who were silent and often complicit in actions against the Black majority. The Transition Generation (1981-1993) entered adolescence in the post-democratic period retaining memory of the apartheid regime and experienced high levels of unemployment and similar levels of economic and physical insecurity as prior generations (Deal et al., 2010). The ‘Born Free’ generation (1994 and 2000) have no memory of restrictive apartheid structures and live and work without any official limitations (Mattes, 2011). While this generation is defined largely as Black, it is believed that this generation has more in common with each other than previous generations and are more culturally integrated (Malila, 2015).

Despite the repeal of prohibitive apartheid-era laws and the introduction of the Employment Equality Act (1998), the implementation of legislation must be supported by positive, progressive employment practices that introduce real change in organisations (Booyesen & Nkomo, 2010). The work of Nkomo et al. (2016) suggests that, despite the wide-ranging legislation research, public debate, and statistics, progress towards employment equity has been incremental and slow.

Gender equality also remains a key concern as women make up 50.5% of the workforce and only constitute 32.4% of top management in South African organisations with most of these roles held in the public sector (StatsSA, 2022). Gender discrimination within certain professions is rife (Bowen et al., 2013). Barkhuizen et al.’s (2012) research in the manufacturing sector showed limited career progression for South African women, including a lack of equity in promotion, training, and pay. As Thusi (2014) argued, despite the active commitment of many South African organisations to encourage the career advancement of women, these strategies lack clear measurement and monitoring frameworks and render their impact unknown.

Although the country has one of the highest rates of education spend at around 6.2% of GDP (World Bank, 2022), South Africa continues to experience an oversupply of unskilled labour and a shortage of specialist skills, with current unemployment reaching 34.5% (StatsSA, 2022). The education system itself is at the root of many problems as it struggles to overcome years of apartheid neglect and dysfunction due to under-funding and poorly trained teachers, particularly in the racially marginalised sections of the community (Mattes, 2011). The ineffectiveness of national training facilities and Sector Education and Training Authorities (SETAs) has exacerbated the national skills shortage (McKechnie & Bridgens, 2008).

Horwitz (2013) suggests that impoverished human resource (HR) practices and limited firm spending on training have led to the misapplication of equity legislation, leading to a series of unintended consequences. This suggests that the range of post-apartheid equality and training measures have a long way to go in redressing the problems caused by apartheid. Thus, HR policies are not enacted in a value-free arena and the historical legacies of apartheid support the ‘stickiness’ that is at the core of historical institutionalism posing fundamental questions for TM, how it is conceptualised, and, more importantly, how it is experienced.

1.3. Employment in the UK

The UK is classified as a liberal market economy (LME) (Fleckenstein & Lee, 2018) – a market-based regime in which organisations are able to act unfettered by state regulation. Employment protections are low, wage inequality is high, job tenure is low, and, as a consequence, employers focus on induction training and seek recruits via an external labour market (Jackson & Kirsch, 2014). Government policy in the UK over the past 40 years has favoured de-regulation, flexibility and privatisation and has bolstered competition in high-tech industries and in low value-added areas of service sector activity (Payne & Keep, 2011). The weak regulation has impacted the nature of HRM practice, including the provision of training and development. Payne and Keep (2011) suggest that the UK skills policy over the last 30 years has been to develop the supply of skills in order to boost productivity, competitive edge, and living standards. Yet, policy has focused on accredited training and done little to improve the promotion prospects of lower-skilled workers (Corradini et al., 2022). Goergen et al. (2009) found that the LME paradigm is indeed consistent with practice: the UK has the lowest training durations, placing a basic emphasis on generic and basic administration skills, weak vocational training provision, and low job tenure.

UK productivity has fallen behind that of other developed economies and it consistently has the lowest rate of total investment by businesses and government of any major economy (Morris et al., 2020; Coutts & Gudgin, 2016). The UK's break from the European Union heralds more fears of a low-skill and low-value economy (Burt, 2017) and, through a growing reliance on a migrant workforce, a pending exodus of skilled labour and a growing mismatch between the skill of the workforce and those required by employers (CIPD, 2017). Further, the Chartered Institute of Personnel and Development (CIPD) (2016) reports that one-third of UK employees believe they are over-qualified for their jobs and only 44% are satisfied with the career progression and training opportunities. Those with university degrees are more likely to be dissatisfied with their career progression. Thus, the emphasis of governments has been to focus on the supply of skills rather than taking a more systemic approach that considers the demand for skill and the creation of 'good' jobs (Corradini et al., 2022; Keep, 2016; Payne & Keep, 2011).

Employer issues are further complicated by the generational differences in the workplace, with older employees having much better skills and skill retention than the younger generation, even though more of the current generation have been educated to graduate level (CIPD, 2017). This increases fear of greater skill deficits once older employees retire – a fear which has been allayed in part by the removal of the Default Retirement Age in October 2011, offering security of employment to older workers for the first time. Prior to this, there was substantial evidence of age discrimination (Wood et al., 2008) and governments followed a voluntarist approach, relying on business leaders to make a business case against age discrimination (Taylor, 2004). The EU Equal Treatment Directive 2000 forced the government to legislate against the use of age discrimination in 2006, but in line with LME characteristics, this was again a light touch (Miuller-Camen et al., 2011). Until October 2011, employers could force their employees to retire at the age of 65, whereas the decision to retire an employee must now be justified on a case-by-case basis. Thus, a key challenge for UK organisations is to create new support mechanisms to support an ageing workforce profile.

As with age discrimination, TM and gender remain a concern in the UK and while there has been much greater representation of women on boards – rising from 12.5% in 2010 to 26% in 2015, the government is aware that using a voluntarist approach might lead to the UK lagging behind other EU countries that have introduced quota systems (Davies Review, 2015). Indeed, only 60% of organisations in the UK have a diversity strategy (CIPD, 2015b). However, chairmen of the FTSE 350 companies understand the pressure to conform to other organisations and create strong employer brands (CIPD, 2015b; Miuller-Camen et al., 2011). This highlights the tendency of companies to respond to institutional pressures by increasing search activities to widen the female talent pool and instituting standard voluntary codes of conduct focused on female talent development (Davies Review, 2015). Elsewhere, however, in 67% of cases, the proportion of women in the workforce tends to decline with seniority (CIPD, 2015a).

2. Problem Investigated

The paper aims to provide insight into how TM practices may address some of the consequences and impact of the Great Resignation in the UK and South Africa while acknowledging contextual realities between a developed and developing country. Such insights are important as skills shortages have become more critical in both contexts. The contribution of this paper is two-fold in that we (i) describe TM and its practices within two socioeconomic contexts, and (ii) offer practical, contextual recommendations for firms to resolve a current global challenge through inclusive TM practices.

3. Research Objectives

Our research objectives are three-fold:

- to analyse the impact of the Great Resignation in two different contexts: South Africa and the UK;
- to examine the impacts of the Great Resignation through a Talent Management lens, and;
- to present our argument for inclusive Talent Management practices.

4. Research Methodology

The study utilised a scoping review, a relatively new approach to synthesise evidence. A scoping review, although similar to, differs from a systematic review in that it provides a ‘snapshot’ of a specific area (Munn et al., 2018) and usually avoids any assessment of the quality of the research (Arksey & O’Malley, 2005). Instead, scoping reviews typically aim to investigate the extent, nature, and range of research on a particular topic or theme – in this instant, the Great Resignation – to provide an overview or map of the evidence (Arksey & O’Malley, 2005). These kinds of reviews do not intend to produce a critically appraised and synthesised result or answer to a particular question.

To answer the question of the impact of the Great Resignation, we conducted an online search using PRIMO and Google Scholar databases in June 2022 to find pertinent literature from 2019 to 2022. This search uncovered 3,108 sources using the search term ‘Great Resignation’. We then excluded literature that did not address the geographic contexts of this article, namely the UK and South Africa. This sifting process yielded 19 total references. Due to the limited number of empirical articles, we then included survey information from professional firms to provide additional data and used 13 sources from the initial literature search to provide the overall context of the phenomenon – see Figure 1 as per recommended guidelines (Page et al., 2021). Relevant documents were also downloaded from the Office for National Statistics in the UK. Unfortunately, no comparable statistical information was available for the South African context.

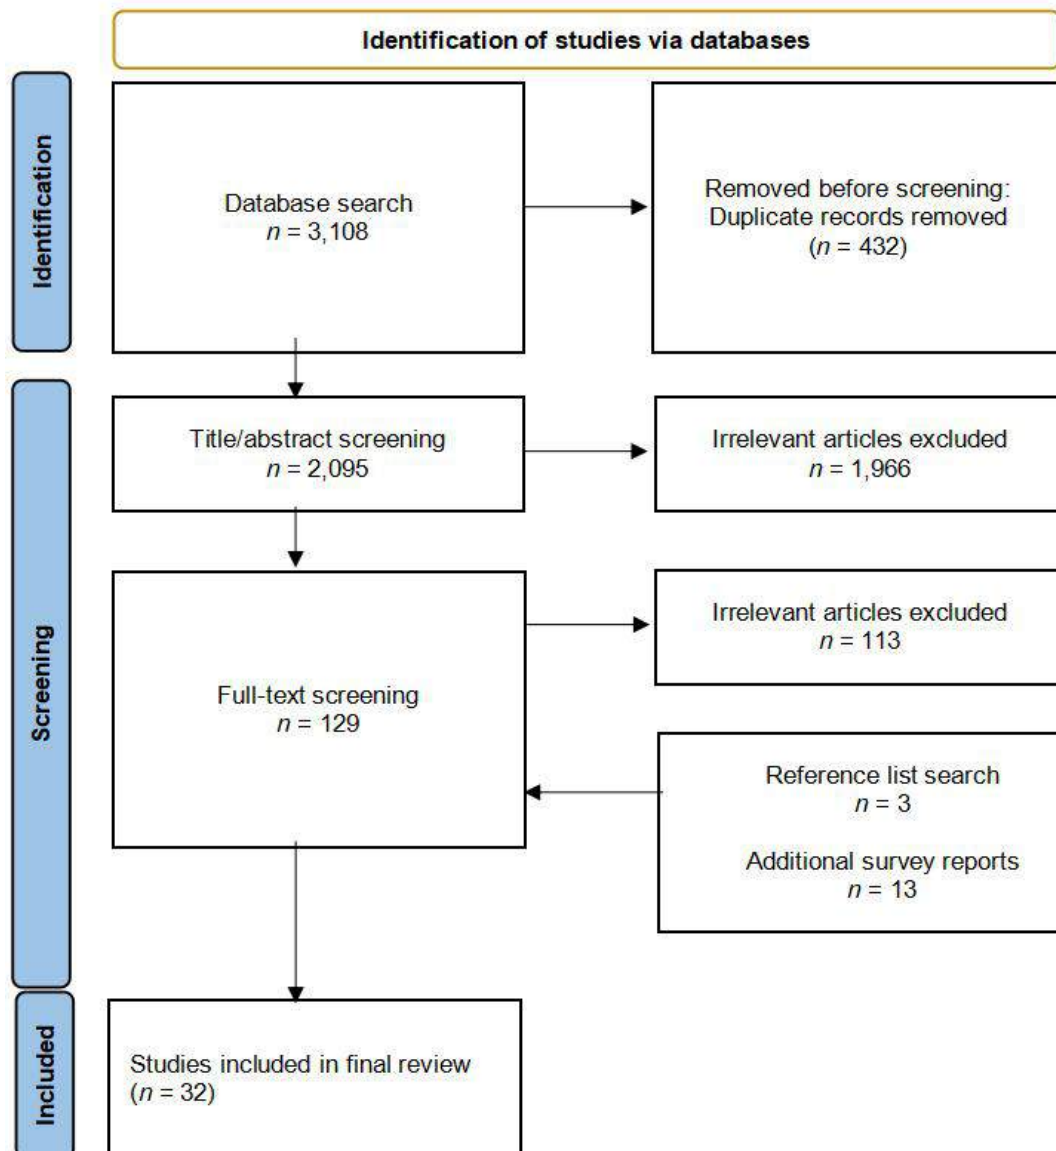

Figure 1. Scoping review process

The paper is organised as follows: First, we describe the phenomenon of the Great Resignation globally before exploring how it is manifesting within the UK and South Africa. We then enter into a discussion that brings TM theory to bear on the contextual challenges arising through the Great Resignation and argue that TM practices should be authentically integrated into organisations in South Africa and the UK. In closing, we suggest practical recommendations for management to mitigate or resolve the adverse effects of the Great Resignation in their organisations.

5. The Great Resignation

In the wake of the COVID-19 pandemic, organisations worldwide are experiencing an organisational exodus with a large number of employees exiting of their own accord. A few authors argue that it is less the Great Resignation as much as the ‘Great Reshuffle’, where individuals are searching for the best available employment (Birinci & Amburgey, 2022). Either way, this trend needs to be understood through employees’ motivations to exit, which may vary by geographic, political, and economic context.

5.1. The global picture

‘Push and pull’ theory proposes that voluntary turnover happens due to either a) a desire to exit, typically as a result of job dissatisfaction (the ‘push’ factor/s), or b) being drawn to other

organisations, characteristically because of potential employment alternatives with attractive benefits and opportunities (the ‘pull’ factor/s) (MacGregor & Wood, 2009). Push factors typically drive employees away from the organisation while the pull factors draw employees towards other organisations.

Much of the research on the Great Resignation has been conducted in the medical field and highlights trends such as stress, burnout, depression, and anxiety as major psychological factors (Ksinan, 2022; Linzer et al., 2022). Across job categories, other reasons for employee exit include ‘pull’ factors such as workplace flexibility (Curtis, 2021), increased remuneration, job security, and options for remote work (Foster, 2021). Across countries, a McKinsey study (De Smet et al., 2021) found that many employees felt a series of ‘push’ factors, including a lack of being valued by their organisations or by their managers and did not experience a sense of belonging at work. Alarming, the same study noted that more than one-third of employees were intending to leave their jobs despite having no alternative employment. Recent research highlights that the Great Resignation is part of a wider phenomenon – which the authors ascribe to the modern alienation of work – resulting in employees leaving their jobs for ethical, cultural, relational, and personal factors (Kuzior et al., 2022).

5.2. The Great Resignation in the UK

A 2021 survey in the UK found that nearly 25% of employees were actively pursuing a change in employer in the next three to six months as part of the Great Resignation, with a staggering 69% feeling confident about a move in the next few months, triggered by both burnout caused by the COVID-19 pandemic and a large availability of vacancies (Randstad UK, 2021). Other sources confirm that the numbers of people moving jobs in 2021 totalled 3.2% of the UK’s working population (CIPD, 2022) and a PwC (2022) survey found that almost one in five UK employees (18%) say they are very or extremely likely to switch to a new employer within the next 12 months, a further 32% say they are moderately or slightly likely to switch, and 16% are planning to leave the workforce temporarily or permanently. With lockdown measures imposing greater remote and flexible working, many employees chose to leave positions that were normally office-based.

What should be kept in mind is that employees did not decide to abandon work and leave the labour force, but that they resigned primarily to start new jobs for other employers. Many are leveraging the current recruitment crisis to transfer into better positions. Others have decided to move into self-employment with an increase to just over 4.2 million self-employed workers in the UK (ONS, 2022). Significantly, the over-50s have been the only age group showing an increase in terms of exiting the labour force, retiring in larger numbers than usual (Carrillo-Tudela et al., 2022). The hybrid work model has also gained favour with 24% saying they desire more flexibility in their permanent working arrangements, including flexible working hours (Weston, 2021). In the UK and Ireland, toxic culture was cited as a significant push factor with 18% of employees stating this was a reason for seeking new opportunities (Personio & Opinium, 2021). These surveys highlight the way the COVID-19 pandemic – combined with the impact of Brexit – have altered how individuals think about work and life, and what they want to get out of both. This moment of reflection has caused ties between employees and their organisations to weaken.

5.3. The Great Resignation in South Africa

Due to the COVID-19 pandemic, the subsequent lockdown conditions, and the resultant recession and economic uncertainty, working South Africans also find themselves considering whether to remain with their companies or seek opportunities elsewhere. With the reality of just over 35% of unemployment, it appeared unlikely that South Africa would experience the Great Resignation, yet the country is confronting some variant of the phenomenon.

The 2022 Salary and Wage Survey from RemChannel found that resignations in South African organisations are at the highest level of all the termination categories seen over the past 10 years (Richter, 2022). Among the main reasons provided by the respondents, 53% cited a better working environment to improve career opportunities or to avoid a toxic environment (citing bullying or harassment); 20% left for a greater work-life balance or to avoid burnout and/or stress; 19% left for

better pay; and 8% were emigrating. The most affected professions were people management personnel, sales and marketing, along with information technology, the academic sector, and financial services. Results from a follow-up survey showed that respondents expressed an explicit wish for work-life balance, including work from home arrangements (Richter, 2022). The majority of respondents were functioning under a hybrid working model (70%) and those who were physically back at their workplaces were unhappy to be there (35%) with 28% actively resisting such a move. Employee prerequisites for remaining with their employer included an enabling organisational culture, trust, better communication, and empowerment.

It appears, therefore, that South African employees – certainly those in the professional and senior management categories – are no longer concerned about the consequences of their organisational exit, especially if their skills are highly sought after. If organisations fail to address the root causes of this level of turnover, institutional knowledge may be lost. Coupled with an impact on succession planning, a reduction in business process efficiency, a depletion of relational capital, difficulty with attraction of suitable staff, and a potential loss of national human capital (Serenko, 2022), these outcomes could damage companies and have further negative impacts on the South African economy. How organisations and their employees address the underlying causes of the Great Resignation and its consequences is therefore critical.

6. Discussion

6.1. Talent Management in context

The characteristics of a country's institutional environment will shape the HR 'models' companies adopt and inform their TM architecture (Gallardo-Gallardo et al., 2019). While in the UK the government seeks to develop high performance workplaces that focus on skill development, the 'bundles' of HR practices used to achieve this are contested and the definition and implementation of each practice varies (Keep, 2016). UK organisations continue to rely on the external labour market rather than deploying a 'grow your own' strategy. This is despite 75% of employers experiencing recruitment difficulties and 50% of private sector firms increasing their spend on TM initiatives in the pre-pandemic phase (CIPD, 2015b). While TM practice varies, it appears to be focused on the development of new hires rather than longer serving employees.

Organisations in the UK public sector question the effects of TM on equality of opportunity and transparent processes (Harris & Foster, 2010). Perceptions of job quality in the UK are higher where HR formality is lower; formality increases in larger organisations and employees become less satisfied (Storey et al., 2010). As a result, TM practices may be perceived as overly controlling and adding a further bureaucratic layer. Thus, a voluntarist/LME regime implies a highly diverse and somewhat fragmented approach to HRM, casting doubt on the ability of TM practices/systems to cope with external pressures.

In the case of South Africa, the development of broader Human Resources (HR) practice remains contentious as there is no established indigenous African HR model. The cultural heterogeneity that is characteristic of South Africa suggests that HRM practices and particular forms of conflict resolution will be mediated by ethnicity, and the extent to which organisations and individuals are tolerant of diversity (Horwitz, 2017; Gomes et al., 2014). Horwitz (2017) suggests that HRM practice in Africa is converging on an East Asian model that is consultative, participative, and focused on internal stakeholders. However, more recent research suggests organisations might be drawn to the practices of ubuntu (Horwitz & Ronnie, 2021). Yet firms investing in South Africa have tended to implement practices characteristic of their home countries, thus undermining the development of an indigenous African HR model (Jackson et al., 2008; Nwankwo, 2012). This perhaps explains the inability of TM practices to address the deeply ingrained issues of skill development, career progression, retention, and equality. TM is therefore a particularly problematic concept within the context of South Africa – especially if used to assess the contextual value and differential contributions of key actors within the organisation (Glaister et al., 2014; Linden & Teece, 2014).

As a practice, exclusive TM may appeal to highly competitive organisations and to those South Africans seeking a more committed, growth emphasis from their employer (Horwitz, 2017), but TM programmes have the capacity to disaffect those excluded from them (Swahilis & Blackburn, 2016). Exclusivity creates a range of problems relating to perceived inequalities (Swales & Blackburn, 2016; Gelens et al., 2014; Thunnissen et al., 2013), organisational justice, ethics, internal competition, and workplace diversity (Kwon & Jang, 2021). While informing talented individuals of their special status as ‘talent’ has a motivational effect (Björkman et al., 2013), exclusive TM widens pay differentials and overemphasises individual performance (Kwon & Jang, 2021) highlighting issues of internal equity and dependable performance management systems (Minbaeva & Collings, 2013). Such dynamics have led to disastrous consequences for organisations in the past, with the investment banks at the heart of the 2008 global financial crisis being one example (Kwon & Jang, 2021).

TM suffers from problems of consistency – the internal consistency of HR practices, and the absence of consistent processes and infrastructures, which force employees to rely on their individual perceptions of HR-type practice (Wright & Nishii, 2013). According to Khoreva et al. (2017), those included in TM programmes not only need to perceive TM practices to be effective, but they also have to buy in to the logic and values behind them, thus historical legacy may create sensitivities to differentiation. A more inclusive TM approach would enable the opening up of TM systems to all employees so that they can be developed. This would ensure their useful and meaningful contribution to the organisation whilst boosting dignified employment and employee wellbeing (Anlesinya & Amponsah-Tawiah, 2020).

6.2. Talent Management and the Great Resignation

The Great Resignation has highlighted two overarching organisational challenges in both South Africa and the UK that impact TM: recruitment and retention. Table 1 shows the various factors that gave rise to these challenges.

Table 1. Overarching challenges in TM due to the Great Resignation

Recruitment	Retention
Specific skillset	Toxic workplace culture
Organisational culture	Pay
Flexible work arrangements	Work-life balance (WLB)

Current recruitment challenges stem from three key employee sources: a dissatisfaction with the culture of the organisation, a desire for flexible work arrangements, and the reality that, due to sought-after and specialised skills, employees with specific skillsets are the most likely to exit. Presently, retention challenges across both countries result from a poor work environment – most notably a toxic workplace culture, inadequate remuneration in terms of sought-after skills, and poor or unsatisfactory work-life balance (WLB).

There is a caveat to the discussion and that is that many of these factors were already present pre-COVID-19. For example, prior to the pandemic, a significant concern in the workplace was WLB. Work demands had placed considerable constraints on employees’ family and social lives Lunau et al., 2014; Bianchi & Milkie, 2010), resulting in harmful effects such as deterioration of physical health, overall life dissatisfaction, and psychological distress (Rahim et al., 2019). With large numbers of workers naming WLB as their main reason to exit, and equal numbers citing it as the top reason they would remain at an organisation (Personio & Opinium, 2021), WLB has proven to be meaningful to employees. Another pre-existing factor was the skills and labour shortage in the UK (Corradini et al., 2022; Davies, 2021), with skills shortage also a challenge facing South Africa.

The consequences of both of the overarching TM challenges cannot be underestimated. The first and most crucial threat is to the long-term sustainability of the organisation. This may manifest in a myriad of ways, one of which is loss of institutional knowledge as people leave the organisation (Serenko, 2022) with a second aspect being the cost of replacement. A recent UK survey calculated

the average cost of potential talent exodus per organisation at £10,076 (Personio & Opinium, 2021), with Richter (2022) estimating recruitment costs at just under R300,000 per South African organisation. Therefore, it is critical that remedial TM measures are put in place to address these adverse and damaging outcomes.

7. Practical Implications and Recommendations

Our findings have implications for organisations in both South Africa and the UK that are dealing with the challenges of the Great Resignation. In particular, we suggest various practical strategies to address gaps in organisational TM strategy. In this way, organisations might consider the shifts that are needed in both the short-term and long-term to ensure their sustainability. These strategies are framed by the Responsible Talent Management (RTM) model, which contends that TM – consisting of attraction, development, and retention practices – be supported through the principles of organisational responsibility, inclusivity, equity, and equal employment opportunity (Anlesinya & Amponsah-Tawiah, 2020).

Tailor the employee value proposition

It has become increasingly clear that the ‘one size fits all’ approach does not work, especially in the case of employees with sought after skills. Idiosyncratic deals, or i-deals, usher in a nuanced understanding of the employer-employee relationship as they are negotiated between individual employees and their management to consider and satisfy the needs of both parties (Liao et al., 2016). Therefore, the outcome of a well negotiated i-deal is that organisations attract and retain valued employees who, in exchange, have their employment and wellbeing needs met (Rousseau et al., 2006).

Improve work-life balance

The period of reflection brought about due to the pandemic has caused individuals to re-evaluate what is important to them in a holistic manner. While organisations have gone some way to address WLB in pre-pandemic times, it has been argued that these approaches have been built on bureaucratic models that inadvertently bolster the very phenomenon they are trying to resolve. As work-life merge is anticipated to carry on as a result of remote working conditions (Fetherston et al., 2020), organisations need to be aware of the potential for adverse impacts on employee wellbeing, with severe implications for employees’ work outputs, colleagues, and their own personal lives.

Address toxic culture in the workplace

Organisational psychopathy, in the form of toxic leadership, is becoming more apparent in organisations today and has been cited as a significant reason for exit in the Great Resignation. Toxic leaders are those who indulge in unethical and irresponsible practices (Thoroughgood et al., 2018). Research has shown its impact on the psychological safety of employees, reducing proactive work behaviour (Khan, 2021), increased psychological distress i.e., loss of self-worth, withdrawal, and agitation (Bhandarker & Rai, 2018), and a reduction in job satisfaction (Labrague et al., 2020). ‘The Toxic Five’ is a term coined by Sull et al. (2022) to describe the elements of toxic culture that have contributed most to employee turnover throughout the Great Resignation: disrespectful, non-inclusive, unethical, cutthroat, and abusive. The authors suggest that these elements require attention by senior management to create a more conducive, enabling workplace culture.

Build flexibility into the workplace model

Remote or flexible working arrangements are now expected by employees. The creation of more flexible working arrangements is also likely to be particularly important to older workers, parents and caregivers, people with disabilities, and those with recurrent or long-term health conditions (Davies, 2021). Recent studies have found that not only are remote workers happier and more engaged (Rahman, 2021), experiencing significantly reduced commuting time and travel costs (Aczel et al., 2021), and appreciative of how the lack of commuting reduces stress and allows them to enjoy more leisure time (ILO, 2020), but the organisational benefits that accrue from flexible work arrangements include increased productivity and more access to scarce talent (Newman & Ford, 2021; Matli, 2020).

Invest in and develop all employees

Organisations retain employees through ensuring a feeling of value and belonging, and that all have a sense of progression within the organisation. Typically, this development is only channelled to those with scarce or highly sought-after skills, with the effect of alienating those excluded from this group (Swales, 2020). As Anlesinya and Amponsah-Tawiah (2020) argue, principles of RTM should be combined into a hybrid set of practices that enable the leveraging of both TM approaches: an inclusive form of TM where all employees are developed and their talent strengthened, and an exclusive form of TM, whereby increased attention is given to employees who differentially added value. In this manner, no one will be excluded, no employee contribution will be wasted, and personal and organisational wellbeing will be enhanced.

Implement workable succession plans

The aim of succession planning is to assist organisations in managing and retaining their talent pipeline (Bolander et al., 2017). Succession planning mitigates the risk of employee turnover because of its proactive nature through the transfer of knowledge to the incoming generation who are likely to assume leadership positions in the future (Appelbaum et al., 2012). Yet, as Serenko (2022) notes, prior to the pandemic, succession planning was not a commonly accepted organisational practice. Typically, succession planning has focused largely on senior executives (Harrell, 2016) or those talented or skilled with excellent career progression potential (Collins et al., 2016). However, employees at all levels of the organisation possess vital organisational knowledge and, as the Great Resignation trends have shown, a substantial knowledge exodus may be completely unanticipated (Serenko, 2022). For organisations and their managers, a starting point would be to examine best practice in the literature (e.g. Groves, 2007).

Address and re-examine remuneration levels and financial wellbeing

Employers are encouraged to combat the mass exodus of their skilled staff by re-considering their salary packages. Importantly, benchmarking is critical in this regard (Remstad, 2022) as well as designing remuneration packages in keeping with employee requirements and including financial and non-financial benefits (Korsakiene et al., 2015; Tymon et al., 2010). This strategy will also assist with attracting suitable staff to the organisation and retaining them (Misra et al., 2013). Given the global economic climate, financial wellbeing has become a key factor to alleviate high turnover.

8. Limitations and future research directions

The focus of this study was to explore the Great Resignation in the UK and South Africa through a TM lens. The research did not focus on a specific sector or extend to other countries. This lends itself to opportunities for future research. Future studies could be conducted on a larger sample across more sectors. As this research is restricted to two countries, the recommendations for TM improvement may lack the nuances and contextual idiosyncrasies to be broadly applicable to other geographical settings. Future research could be valuable to determine if similar challenges are experienced in other comparative contexts and what measures to address the challenges might be found to be effective.

The findings of this study suggest that a more inclusive and responsible approach to TM is required. Empirical research is needed to explore current organisational approaches in terms of exclusive and inclusive TM approaches to establish which adds to organisational sustainability and enhances employee wellbeing.

9. Conclusion

In 2022, the Great Resignation has raised many challenges for organisations especially in terms of their TM practices. These challenges, though not new, are extremely apparent and serve as a wake-up call to employers. They point to the importance of including employees in the decision-making process and encouraging them to help shape the TM plan and solutions. While high turnover and record number of vacancies experienced in recent times are likely to recede, skills shortages are expected to remain over the medium to longer term. Here, organisations in both countries should re-examine their TM practices, in particular the skills pipeline. In the UK, it has been suggested that employers reverse the decline in investment in training and development and that the apprentice levy needs reshaping to provide organisations with more flexibility to accredit other forms of training and

skills development that suit them. South African organisations would do well to fully utilise the skills development fund for existing employees and build closer relationships with the post-school education and training sector to ensure equitable and inclusive TM measures come to fruition and enhance organisational sustainability.

Keywords

Performance Management System; Compliance; Factor analysis; Social Security; South Africa.

Abstract

This paper seeks to assess the South African Social Security Agency's (SASSA) Free State Province compliance with the current Performance Management and Development Systems (PMDS). The aim of the study was to the level of compliance by a provincial department to PMDS. A quantitative research approach was adopted, and surveys questionnaire was used to collect cross-sectional data. Descriptive and Factor Analysis (FA) was performed. Findings from this study suggest that managers, employees, supervisors, union representatives and human resource management staffs are the key stakeholders involved in the implementation of PMDS policies. The study also found that employees are submitting their performance agreements and assessments within the specified timeframe. Although most employees are submitting their agreement and assessment on time, it was established that there is non-compliance to PMDS guidelines within SASSA in Free State province. Understanding the perceptions of key stakeholders may assist SASSA in the Free State to realise their organizational objectives. The study reveals barrier to compliance to PMDS in SASSA Free State does exists. The paper have provided valuable information that could assist SASSA in the development of PMDS regulations and policies by the Department of Social Development to foster employee productivity through effective and efficient PMS processes.

1. Introduction

This paper reviews literature extensively about Performance Management and Development System (PMDS) of South Africa. Islam (2015:141) wrote that the current public service management approach emerged as a replacement to a pre-democratic public service management approach that was in existence before 1994. The pre-democratic public service management approach caters for a minority segment of the population to the neglect of the majority in the country. The study is situated within the discipline of public administration as developments in literature regarding performance management system is gaining renewed attention in public institutions such as municipalities and government departments (Ogolla and Oluoch 2019:20). The reason being the increasing ineffectiveness of the South African public service sector to deliver services to citizens that have led public discontent. As a result, researchers need to carryout studies for the that may lead to the development of a more inclusive assessment and practical approaches towards PMDS, especially in public organisations such SASSA. This South African Social Security Agency (SASSA) is a government agency reporting to the Department of Social Development of South African with the objective improving efficiencies in the provision of social services to the citizens.

Price, Schwartz, Cohen, Scott and Manson (2016:245) have stated that, concerns exist about transformation of the South Africa public sector post-1994 due to weaknesses inherited from the past. The current public service approach in South Africa emphasizes public accountability through the performance management, performance measurement and performance improvement system. As a result, the current public service management approach brought a change at costs to and viewed as a vision and an ideological perspective within the general management principles. Hence, the re-configured public service in South Africa post-1994 introduced a new performance management system as a tool to the optimization of costs and efficiency in the management of performance of employees to improved service delivery (DPSA 2000:51). Sachane et al., (2018:03) posit that, talent management in any organisation is paramount for the prosperity of an individual and the organization. The argument is that the type of talent an organisation attracts determines the effectiveness in the implementation of policies. In the South Africa Social Security Agency (SASSA), performance management function is part of the human resource management unit, and the unit is responsible for the training and the development of staff about compliance with Performance Management and Development System (PMDS).

1.1. Problem Statement

The perception of employees in South Africa public service sector that they are denied an opportunity for career development, recognition and incentives have results in organizational challenges towards the achievement of organizational goals. Masenya et al., (2018:107) also opined that, several government departments in South Africa now focus on performance management as a solution to a low-performance culture and change management in public service. But at the same time, these government departments are tolerating non-compliance to performance management system processes; inadequate feedbacks from employer to an employee for developmental purposes; inadequate Performance Management and Development System (PMDS) training as well as poor communication in the public service is persistent. This study focuses on assessing the compliance of a provincial department to the South African Social Security Agency's (SASSA) Performance Management and Development System (PMDS).

1.2. Methodology Based on the conceptual and theoretical review of literature, it was clear that low-performance culture exists in the implementation of PMDS, and as such, an assessment was sought to fill the gap in the existing body of knowledge on how SASSA is implementing a performance management system in the Free State province of South Africa. This study is guided by ontological philosophy and adopts a positivist research paradigm. Ontology is specifically associated with the question of whether reality can be perceived as objective or as subjective (Polit and Beck, 2014:794). This paradigm helps the researchers to reflect their primary assumptions concerning the world and the foundation of knowledge (Bryman, 2012:27) of PMDS. A positivist research paradigm usually is associated with a quantitative research approach that assumes there is one true reality that can be discovered through rigorous empirical study (Creswell 2013:81). This is consistent with the objective of this study, which is to assess Free State SASSA's compliance with the South Africa Social Security Agency (SASSA) performance management and development system.

1.3. Research designs

Researchers such as Zikmund and Babin (2016:116) and Bloomberg and Volpe (2016:42), categorise research designs in quantitative studies into four categories – correlation, descriptive, causal-comparative and experiments. As a result, across sectional survey design was used to gather information from respondents using a scalar questionnaire to achieve the objectives of the study. Mouton (2001:95) posit that a descriptive approach is most suitable for studies of this nature because it assesses a situation without any modification. This study follows an exploratory and descriptive research designs to assess Free State's SASSA compliance with PMDS (Wiid & Diggines, 2010:196). As Chawla and Sondhi (2014:48) puts it, the research design informs the specification of methods and procedures for acquiring the information needed for a specific study. The descriptive design consists of the collection of data to answer questions about the current status of the subject inquiry (Malhotra,2010:182). Causal-comparative research attempts to determine the cause or reason for

existing differences in behaviour or status of groups of individuals (Zikmund & Babin,2016:116). Quantitative research approach, therefore, involves data collection that is typically numerical and analysed using mathematical models (Creswell 2013:32). A quantitative research method was used to assess the compliance of the Free State province with SASSA PMDS. This approach was descriptive and exploratory in nature.

1.4. Study population and sample

Informed by the objective of this study, the target population include all the employees of the Free State province working for SASSA. The total population of SASSA community is estimated at 450 employees in the Free State Province distributed across five districts with one provincial office. In each district, there are several local offices consisting of (elements) officials responsible for performance management. Therefore, the researcher intends to zoom on all employees of SASSA Free State responsible for the PMDS and employees who have participated in the performance management processes at least once.

1.5. Sampling process

There are two distinct categories of sampling that can be applied in research, namely, probability and non-probability sampling methods (Zikmund and Babin 2009:128). A probability sampling process was followed to ensure every member of the population has an equal chance of being selected. This study applied a stratified random probability sampling process and respondents were divided into homogeneous subgroups (in context such as age values, socioeconomic background, work experience and educational status) before random sampling, and each stratum was defined as a partition of the population (Malhotra 2010:459). The total population of Free State province SASSA employees was 450 personnel according to information from SASSA Free State HR database. The population was stratified into two major categories: managers and supervisors on one and general workers on the other hand. A total of 200 respondents were sample and 120 with a responses rate of 33.33%.

In this study, a questionnaire was deemed suitable since a large, predetermined sample size of n=200 was required to adhere to sound quantitative analysis principles. This sample size was determined using an evidence approach, which focuses on past studies of this nature. Toppo and Prusty (2012) used 194 employees in their study focusing on employee performance management while Owili and Isaac (2018) sampled 218 employees of a public institution and Sachane, Bezuidenhout and Botha (2018) used 209 employees at Statistics South Africa. Before collection of data process, permission to conduct the study in all district offices, local offices and provincial office units was sort from the Regional Executive Manager of SASSA in Free State province. Due to COVID-19, selected respondents were requested to attach a signature on the consent form and returned forms to the researcher agreeing to participate in the study voluntarily. The researcher then administered questionnaires to the selected participants who consented to participate in the study using electronics means.

Before the primary survey was administered to respondents through face-to-face interaction, a pilot study was performed with a small sub-sample of respondents. The aim was to advance, adapt, familiarise, and check the feasibility of methods and to control the reliability of measures, and to approximate the size of the sample. These respondents were purposefully sampled and did not participate in the final study. The techniques and methods applied to answer the research questions were thoroughly assessed, and challenges experienced identified and fix before the final administration of questionnaires. The pilot study was conducted to ensure that the planned data collection method was proper. Questionnaire was divided into six sections with section one focussing on biographical information, and the rest of the sections were aligned to the objective of this articles.

1.6. Data analysis

Data analysis was performed using Statistical Package for the Social Sciences (SPSS version 26.0). Descriptive statistics measurements of central tendencies and ranking such as correlations and exploratory factors analysis was performed. Results from the analysis was presented in the form of graphs and tables using frequencies and percentages. Factor analysis serves the primary objective of

this exploratory study was used to discover the basic factor structure of a set of witnessed variables without commanding a pre-set structure on the outcome (Brown et. al., 2018:3). This form of inferential analysis aims to uncover the unknown about the studied the management of PMDS in the Free State Province of South Africa. The researcher validated the analysed data by identifying new factors using Principal Component Analysis (PCA).

1.7. Reliability and Validity

Reliability is the degree to which a test or measure can produce the same results if it is repeated under identical conditions. In this study, Cronbach alpha's coefficient was used to test the reliability and internal consistency of the items in the questionnaire. The results show that all 29 items are reliable and internally stable. They all have alpha coefficients of 0.734 or higher. A Cronbach's alpha coefficient of above 0.70 is generally considered acceptable (Malhotra 2010:731), but a value of above 0.6 may also be considered acceptable in the case of exploratory research (Field 2013).

The validity of measure points to the level which an exact measure of a tool is important and assists in making inferences from the target population (Hair et al. 2017:142). It is also the degree to which the instrument measures the construct it purports to measure. The content validity of the research tool for this study was done through verification with similar studies from extensive literature review. Some of the statements were modified based on the suitability to the local context and the objective of the study. Table 1 summarises the reliability measurement using Cronbach's Alpha coefficient.

Table 1: Summary of reliability test results

Measures	Construct	Cronbach's Alpha coefficient	Factor loadings	Communalities	Corrected item-to total correlations
Q2.1, Q 2.2, Q 2.3 and Q 2.4	Key stakeholders	0.841	0.585 to 0.957	0.557 to 0.725	0.469 to 0.677
Q3.1, Q3.2, Q3.3, Q3.4, Q3.6, Q3.7, Q3.8, Q3.9 and Q3.10	Views of employees	0.788	0.652 to 0.824	0.60 to 0.817	0.487 to 0.555
Q4.1, Q4.2, Q4.3 and Q4.4	Submission of performance agreements and assessments	0.734	0.847 to 0.891	0.717 to 0.809	0.462 to 0.503
Q5.1, Q5.2, Q5.3, Q5.4 and Q5.5	Barriers to compliance with PMDS	0.804	0.622 to 0.841	0.439 to 0.707	0.501 to 0.578
Recommended threshold suggested by Malhotra (2018)		Above 0.700	Above 0.500	Between 0.200 and 0.500	Above 0.300
Minimum score= 1; Maximum score = 5; N=120					

Source: Researcher's own data

The Cronbach's alpha coefficients for this study ranged between 0.734 and 0.841 and were all above the threshold of 0.70 for acceptable internal-consistency and reliability (Field 2013:668). As an indicator of both construct and convergent validity, the factor analysis has significant loadings (0.585 to 0.957) and strong communalities (0.439 to 0.817), while the item-to-total correlations (0.462 to 0.677) inferred a large variance.

1.8. Ethical consideration

In this study, six ethical research principles were considered, such as informed consent, protection from harm, confidentiality, research integrity, beneficence, and permission to conduct the research

study. As suggested by Hammersley and Traianou (2012:56), these are the main ethical concerns relevant to a quantitative study such as this present research. In the context this research, ethics also refer to moral standards of behaviour that govern or guide the researcher's conduct. These are accepted norms of behavioural conduct that differentiate between acceptable and unacceptable behaviour (Saunders et al. 2016:239). Ethics are fundamental to the research process, and researchers are obliged to observe ethical issues throughout the research process. The acceptable approach to research study is to ensure that the research process is conducted with morality and sensitive findings are treated and reported with a soft approach to avoid breaking the relationship between parties involved (Akaranga & Makau 2016:102).

2. Literature Review

The introduction of Performance Management and Development System (PMDS) in the public service of South Africa in 2002 led to a renewed hope of reforms in the South Africa public service. Sachane et al., (2018:2) have argued that the thinking behind the new performance management system approach in the public service was the expectation that it will bring about a radical paradigm shift to performance management culture in many government departments. Since the introduction of the new Performance Management and Development System (PMDS) as regulated by the Public Service Regulation Part VIIIA of 2001(DPSA 2000:27). The South Africa Social Security Agency (SASSA) of the Free State provinces' employees are submitting their performance agreement and performance reviews post agreed time in contravention of the PMDS regulation part VIIIA of 2001.

The contravention to a system that is expected to drive organizational performance coupled with non-compliance have led to undesirable outcomes whose impact on the performance of employees has not been thoroughly researched. The non-compliance to the performance management system and persistence of post dateline submissions in contravention with the PMDS regulations is concerning (DPSA 2000:30) and Ndou et al., (2013:30) undertook a study to investigate these concerns. These studies found that the current performance management and development system framework supports a standardized and uniform approach to performance management in the public service. The study also found that PMDS set norms and standards for effectiveness in public service to avoid confusion and disparities of implementation of performance management and development in the public service. However, SASSA Free State Provinces' compliance to the performance management system as perceived by its employees is that of noncompliance to PMDS regulations by management, and this study intends to assess the reason of non-compliance by SASSA in this province of South Africa.

SASSA's Performance Management and Development System reports (PMDS Report 2017/18) reveals that submission of performance agreements and performance reviews by Free State SASSA employees happen after the agreed deadlines as per policy. The happens because of management unable to enforces PMDS policies guidelines. Compliance with performance management agreement forms the basis for the promotion of sound governance principles in the organisation. Furthermore, PMDS compliance ensures that employer and employee realised the benefit of an efficient public service (PMDS Report 2017/18). However, transgression (non-compliance) with performance management system occurs when the implementation diverges from established norms and standard as outlined by the PMDS policies and regulations.

Since the introduction of the PMDS regulations and policy in 2002, SASSA employees in the Free State have persistently submitted their performance agreements and performance reviews post datelines due to the noncompliance to policy guidelines. According to SASSA Free state annual report on PMDS, the persistent submission of performance agreements and reviews after datelines makes it challenging to evaluate, identify and separate performing employees from under-performing employees. Furthermore, noncompliance with PMDS regulations and policies makes it difficult to identify skill areas where employees are lacking for future development and training.

A random check across the five SASSA districts and provincial officials in the Free State reveals a significant number of employees do not even submit their performance agreements and reviews in time. The non-compliance has resulted to increases in the number of grievances about the performance of individual employees and the basis for promotion in SASSA Free State. The non-

compliance has also led to many SASSA employees exhibiting unsubstantiated views about performance management system. Hence, the reasons to assess the non-compliance by SASSA Free State employees to the performance management and development system.

2.1. Conceptual framework on PMDS

Chauke (2010:5) have argued that the dynamics and commitment of the South African public service to service delivery lies with managers in government departments to enhance and improve subordinates' performance. Acas (2014:8) opined that, the management of performance in any organization is an endless process and not an occurrence. Therefore, the challenges that exist with regard to PMDS have a direct impact on actualisation of a performance management system of an organisation.

Joubert and Noah (2000:18) refer to performance management as the practice through which management of an institution ensured employees have daily planned activities at work to realise inputs, outputs, and outcomes. Van der Walt (2004:39) defines performance management from strategic management and integrated perspectives and stated that "performance management is about the effectiveness of organizations by improving the performance of employees and this system involves employees to ensure the organizational mission is accomplished". On the other hand, Fernandez (2005:261) defined performance management as a method of engaging all human, financial, and physical resources inside an institution to maximise and achieve the desired results or outcomes for the benefit of the institution. While Rakhoale (2011:52) opined that, there are several different definitions from different perspectives on performance management. However, this article suggests that there exist key elements that are common in all the definitions of performance management indicating the complexity around the concept. In this study, performance management is explained as a process that comprises organisational processes, organisational systems, and organizational culture that strive to achieve the organisational objectives. Therefore, the preferred definition of performance management and development system as used in this article is align to that of Van der Walt (2004:39). This will include managers and subordinates working together in anticipation of desired results/outcomes that are linked to individual organisational goals and objectives. Hence, managers in the public service must understand that planning, leading, coordinating, motivating, and controlling is how performance management relates to other processes and practices in an institution.

Bhattacharjee and Sengupta (2011:497) affirms that, goal setting is the utmost important approaches for starting improved performance amongst employees. Goal setting is continuously established and that effective goal setting allows the following; permits employees to prioritise the tasks, alliance of individual goals with objectives of business, elevates employees' individual performance and support to point the main result areas. A goal setting is a fundamental requirement of a well-organized performance management system. Proper goal setting is intended to be beneficial to performance of an employee and performance of business. Several researchers (Bhattacharjee & Sengupta 2011:496 and Jain & Gautam 2014:18) have researched on the intention of understanding performance management with the intention of objectives being modified and narrowed down to fit organisations of all types and sizes affirming the complexity associated with PMDS. However, Oakland (2020:11) explained that the organisational objectives must be practical, specific, and achievable (output should be clear and eliminate doubts with regard to achievement); measureable (performance activities must be measured in line with time, costs, quantity and quality); achievable (reasonable to be achieved); realistic (objectives must be real and concrete, not abstract) and time bound (objectives must be achievable within a specified time and dates).

Qureshi et al., (2010:856) affirms that, managers are expected to place manageable expectations from their employees as one of the crucial aspects of managing human resource. Toppo and Prusty (2012:8) explained that an effective performance management system must attempts to set clear prospects from both managers and employees' sides, and it is not advisable to anticipate a poor performing employee to start providing good star results or a good performing employee to remain consistently performing forever. Similarly, managers must set expectations in a way that will convey in some results and setting the right goals by outlining the prospects of your employees in clear terms, implementation to

aid employees in achieving objectives of business and to establish a deliverables document with straightforward tasks, roles, and responsibilities to ensure productivity is crucial argues Jain and Gautam (2014:18). Such a clear and unambiguous goal setting will facilitate better business performance and encourages the personal development of the employee.

Qureshi et al., (2010:856) opined that, fluctuating workplace dynamic forces are bringing a cultural change to today's place of work and as such communication should play an important part in the performance management of employees. Jain and Gautam (2014:18) affirms that, an organisation with a good communication culture may result in employees who are engaged and aligned with individual objectives that are also aligned to business objectives. Hence, team members must be acquainted with what their other team members objectives are, succession planning, and notions to fulfil the project (Jain and Gautam 2014:18). Paile (2012:37) support the notion with a view that any team where there are lacks proper communication amongst its team players loose unity bond which is very crucial for high performance team.

The most import objectives of performance management are to set performance standards. An organisation must set performance standards and performance plans for assessing employee performance (City of Polokwane 2017:8). Every occupation has a specific performance standard to be achieved, and failure to achieve performance standards could result in the following, firstly, absence of effort from employees, secondly, setting more impractical standards for work, thirdly, not enough means to complete the task, and lastly, failure of cooperation from team or supervisor. Paile (2012:37) affirms that, an effective performance management system should be able to high point the performance gap and accomplishments. The strengths, weaknesses, opportunities, and threats of your organization may become more evident, hence, more comfortable to advance or correct. Furthermore, a good performance management system must recognized the training and development needs of employees and encourages personal growth as well as expansion in the career of the employees through preferred knowledge and skills development. Employees must be consulted to determine their skills gap to accomplish their tasks perfectly, secondly, the training plan and budget be available to support identified needs, thirdly, an implementation plan is developed for newly acquired skills for key result areas and to align organisational objectives with newly acquired skills.

2.2. Theories underpinning PMDS

Mullins (2011:426) have argued that motivation which is defined as the drive that gives an individual the appetite to persist or persuade something with the positivity of achievement is fundamental in the development of any Performance Management and Development System (PMDS). Therefore, motivation whether extrinsic or intrinsic is the driving effort to take performance to new levels and that, there is no separation between motivation and incentives, needs, tensions and other forces. Hence there exists different forms of motivation theories such the content and process theories which are suitable for this type of study.

This study focusses on content theories of motivation and combines aspects of Fiedler's contingency theory, Path-goal theory, Goal-setting theory, reinforcement theory, expectancy theory and equity theory (Britt and Jex, 2008:316). The justification is that content theories explain the recognition of people's needs, relative strengths and goals which are supposed to be pursued to satisfy needs. Content theories are also about nature and what stimulates the needs of people. In this study, Fiedler's contingency theory argues that the success of a leader depends on the interaction between a situation and a leader. In performance management, employees are expected to meet, discuss their performance with their manager and areas of concern for improvement of tasks are identified with steps taken to ensure achievement. While the Path-goal theory explains "a way in which a leader takes a role to direct a subordinate to a goal". In performance management, a manager is expected to be a task-oriented leader to ensure the focus of an employee is always on the tasks to be achieved.

Furthermore, the Goal-setting theory which focusses on the action plan designed to motivate or guide an individual to achieve a particular goal was very relevant in this study. In performance management, there are specific goals set for performance with a view or intention to achieve certain specific goals

of an organization as well as personal development goals for the benefit of the organization. But the reinforcement theory was used as a basis to motivate an individual to perform in a positive or negative way. In this light, it was argued that performance management process is a positive reinforced approach of rewarding employees for outstanding work. However, this positive reinforcement may result in negative challenges which may be considered as a negative reinforcement. Such an approach is not uncommon in many public institutions in South Africa which has resulted in consequence management of poor performance.

Finally, the expectancy theory which focusses on individuals' behaviour and actions was also relevant to this study. The basis was that individuals' behaviour and actions are influenced by expectations of benefits for such behaviour or actions. In performance management, the employees of an organisation (SASSA) are expecting rewards for good performance and therefore work harder in expectation of rewards thereby creating a specific type of culture (SASSA reward policy). But the equity theory was used to explain fairness of social exchange in the work context and argues that, in performance management, the employee of an organisation is expected to give the optimal performance to the organisation in return, for a rewarded for their optimal performance. Although, Maslow's hierarchy of needs model according to Mondy and Premeaux (1995:315) is of the view that, the achievement of one level by an employee in the need's hierarchy necessitates the development of the need for the next level of needs. Hence, the motivation for performance according to Maslow is developed in five levels.

2.3. Linking PMDS to factors driving PMDS in SASSA

Performance Management and Development System is a system which lays down policy, procedures, processes, and systems of managing and developing performance for the public service environment, specific institutions, branches, teams and individuals (DPSA 2000:54) in South Africa. The public service environment in South Africa is a complexity of different sectors with different forms of organizational structures. These different organizational structures make it difficult to harmonise a uniform standard for performance management in the public sector. The Department of Public Service and Administration (DPSA) permitted each department to use the PMDS guidelines to tailor their own performance management and development system policy. Hence, different approaches PMDS policy exists within the South African public service sector and implementation thereof (DPSA 2000:19) is very challenging.

Powell (2019:26) stated that, corporate governance in South Africa was established by the introduction and publication of the King I report in 1994 and subsequent II, III and King IV report. Corporate governance is embodied with processes and systems, and these processes and systems are used to control, direct, and hold the organization into account. Besides, good governance is controlled and maintained by law and therefore, government departments must comply with legislation, policies, processes, and systems of corporate governance to achieve good governance. Compliance is a broad concept which refers to prescribed requirements in relations to section 159 (7) of the South African Companies Act. Hence, compliance can be interpreted in many ways such as compliance with process, compliance with standards, compliance with norms, compliance with systems and compliance with procedures.

Compliance in the public sector of South Africa has become an understandable concept based on obligations and responsibilities related to compliance. The South African government has several legislations, policies and practices which are developed and introduced in striving to put layers of compliance. The most important strive in public sector compliance is risk assessment. The public sector compliance programme can only be effective and efficient when obligations and responsibilities are performed by top management with commitment, proper operational policies and procedures, communication and training, and periodic reviews. In the South African public sector, the overall purpose of PMDS to transform public service and improve performance, safeguard continuous enhancement of the human capacity of public service and to provide mechanisms for assessing, reviewing, and accounting for achievements/results (DPSA 2000:11). PMDS is controlled by public service regulation (2001) part VIIIA, which is consistent with performance management principles such as consultation process, accountability, staff development, departmental planned goals, human

capital development, recognition of outstanding individual performances and maintain transparency as well as administrative justice (DPSA 2000:27).

To achieve this purpose of compliance, there exists daily factors driving PMDS in SASSA as observed by the researcher. These factors include SASSA strategic plan, operational plan, and annual performance plan as well as employee's performance agreement. There exist three main drivers of SASSA's performance management and development system implementation. These include, individual performance agreement (contract), individual performance assessment (review) and individual performance recognition (rewards). In a performance agreement of any employee, there are three sections that forms the performance agreement, namely, the Work plan (part A), Generic Assessment Factors (part B) and personal development plan (part C). In Performance Assessment, there is only Work plan (Part A) and Generic Assessment factors (Part B) (SASSA PMDS Policy 2016:3).

The development of performance agreements is underpinned by principles of performance management and development system (PMDS) policy and PMDS procedure manual. In a performance agreement (contract), there are performance objectives (the Key Responsibility areas (KRA)), performance standards and performance indicators, all these factors such as performance objective, performance standards and performance indicators are developed within "SMART" principle (DPSA 2000:116) and within Pareto principle (DPSA 2000:133). While in the work plan (Part A), key responsibility area, performance standards and performance indicators of each employee is outlined. These indicated elements are the elements which are subjected to be measured during performance review (SASSA PMDS Policy, 2016:10). The Generic Assessment Factor (GAF) outlines the different skills which are used/needed by employees and aimed at assisting each employee in executing the key performance areas (objectives) for achieving the key performance indicators (SASSA PMDS Policy 2016:10). While the Performance development plan (part C) outlines occupational, developmental courses which must be undertaken by the employees and supported by the employer to enhance skills of the employee to improve an employee performance for the benefit of the organization (PMDS Policy 2016:8).

The main purpose of performance assessment is to review the periodic progress report on the performance of all employees contracted to an employer. Every employee performance evaluation in SASSA has performed twice annually, the performance evaluation period and performance review period are the most critical time for employee and employer to communicate effectively about expectations and barriers to the expectations of the employer to the employee (DPSA 2000:105). According to Van der Waldt (2004:62), the performance standard is a certain level of performance measure agreed upon during signing of performance agreement by employer and employee. This is level which is used as a benchmark of performance expected by the employer from the employee. The performance standard is an indicator and measure of performance quality expected and to be delivered by an employee to the employer.

According to Grobler (2002:260), performance measurement has several tools which could be used, such as total quality management (TQM), just-in-time (JIT) and key performance indicators (KPI). In accordance with the implementation of PMDS and procedure manual, the model which is preferred in SASSA is a key performance indicator (KPI) to measure performance. The employee is considered to have performed work efficiently and effectively when the key performance indicator could be confirmed on the report as a portfolio of evidence (DPSA 2000:105). The key performance indicators are taking the central stage and focus because the presence of achieved key performance indicators means performance attained. As a result, the goals and objectives of an organization are achieved. The only challenge remained is improved performance of an employee; the measurement of performance in SASSA does not mean an analysis of performance for feedback. The feedback of the individual employee must be provided from the employer (supervisor) for improved performance purposes (SASSA PMDS Policy 2016:10). The purpose of performance evaluation is to identify employees who contributed immensely to the achievement of organizational objectives for that performance cycle; therefore, identified employees are rewarded accordingly. In SASSA, a performance reward

policy is in place to ensure that employees who performed excellently than others are monetarily rewarded accordingly (SASSA reward policy 2016:8).

2.4. Linking employees training and development with PMDS

The South Africa Social Security System (SASSA) of South Africa is expected to comply with the need to uplift the skills of individual employees and teams for the benefit of organizational performance. Since the Department of Public Service and Administration (DPSA) has developed the policy guidelines for the benefit of performance improvement. The training needs or training solution of SASSA should be in line with challenges identified during the performance review process between an employee and supervisor. There exist many training methods which can be used to enhance employee performance. However, it is the responsibility of the supervisor to confirm and select the method that best suits an employee for the benefit for both employee and supervisor. The SMART principle was developed as an imperative for supervisor and employee to ensure that goals and the purpose of training are realised. The effective management of the training and development factor assists the SASSA in reaching organizational performance peak. All employees are trained and developed to face new challenges with acquired skills and knowledge during the training.

However, barriers to PMDS implementation persists in SASSA and according to Klein 2019:20), these are barriers that are common for an effective performance management system implementation in many organisations. But these barriers response to organisations differ and organisations must ensure that, barriers are removed before consequence management could be implemented as a last resort to deal with ineffective performance management as shown in Figure 1.

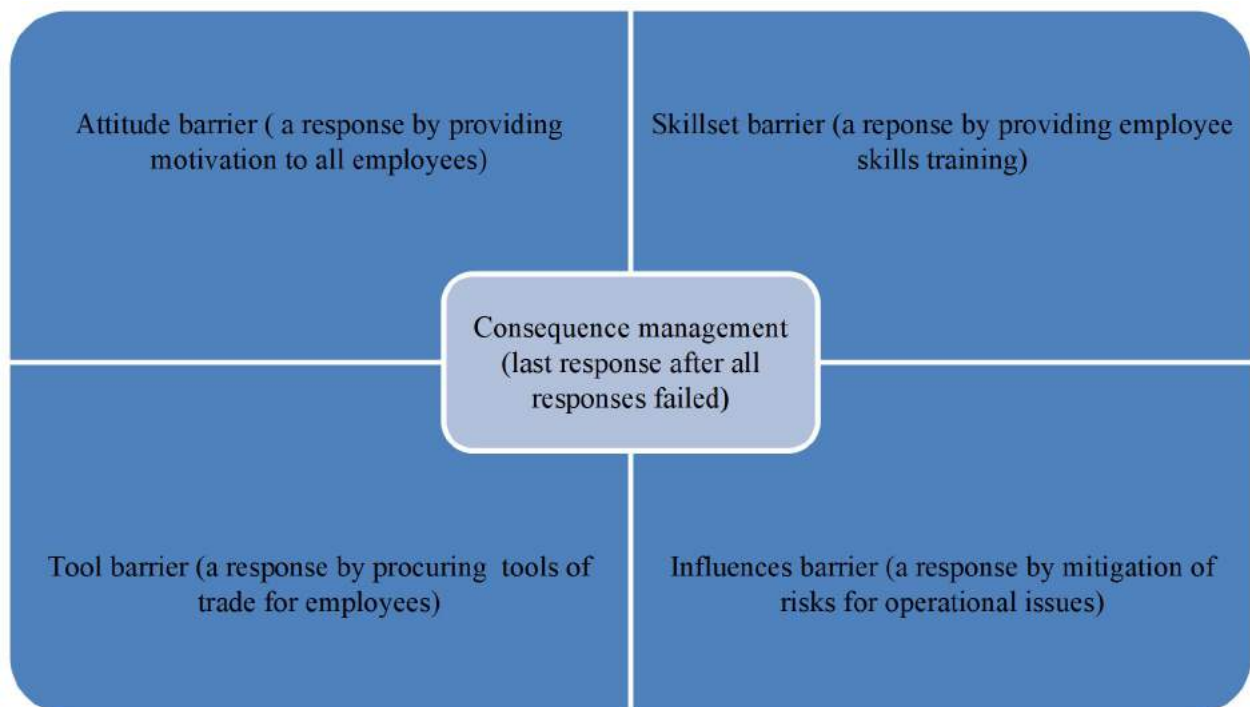

Figure 1: Barriers to effective performance
Source: Adapted from Klein (2019:20)

Klein (2019:20) as illustrates in Figure1 have identify barriers in the implementation of effective performance in an organisation by its employees. these barriers are grouped into attitude barrier which requires human resource personnel to attend to an employee for counselling and referrals for emotional support. Skillset barrier which requires the training for employees by employer to capacitate employees through the personal development plan. Tool barrier on the other hand needs the employer to provide stationery, computers, and the conducive environment from employer to employees to enable employees to perform their activities. Influences barrier which demands for a proper risk assessment plan and risk mitigation plan of the possible risks. There is a need for research

focus on performance management in South Africa but existing research have mostly focussed on poor performance culture and poor change management in public service, non-compliance to performance management system processes, poor feedback from the employer to the employee for developmental purposes and inadequate PMDS training and communication in the public service rather than a harmonisation of PMDS guidelines and policies to avoid confusion and enhance implementation Rakhoale (2011:9).

3. Results and Findings

3.1. Presentation of results

Prior to conducting the exploratory factor analysis, sample size requirements, as well as common methods bias, were checked. In general, it is recommended that a minimum of 300 cases should be maintained to have a good factor analysis. Hair et al. (2017:89) recommend a minimum of five observations for each variable (5:1 cases) under study, which was evident in this study. Initially, a Harman one-factor score test was conducted by running the preliminary EFA on the sample data, whereas the unrotated factor solution was examined to determine the number of factors that are necessary to account for the variance in the variables. The single factor that emerged yielded one general factor accounting for approximately 26.64% of the covariance among the measures leading to the conclusion that, common method variance is not a problem. Principal Component Analysis (PCA) was performed for four scales (section 2, 3, 4 and 5) respectively to reduce the components of the item that address the constructs. Section 6 only had two items, which makes it disqualified for factor analysis and Table 2 presents the findings from EFA.

An EFA was then performed using principal axis factoring by applying an orthogonal method of rotation termed, Varimax, which helped to evaluate the construct validity. A maximum iteration value of two for convergence was used to search for the optimal factor solution. The suitability of data for factorability was ascertained after examining the large Kaiser-Meyer Olkin test statistic (KMO = 0.652) as well as the Bartlett spherical test, which showed a significant result with a large chi-square value ($\chi^2=265.298$; $p<0.000$) for section 2 (Key stakeholders in PMDS implementation). The two-factor solution was identified with two items each. The two-factor solution explained 62.21% of the variance.

Table 2 reveals that the KMO for all the constructs of the questionnaire were above the acknowledge threshold of 0.6, and Bartlett's test of sphericity was statistically significant ($p < .000$) indicating the suitability of the factor analysis method about the constructs. The Cronbach's alpha coefficient value for all constructs was at the acceptable threshold of 0.7 and 0.6 in the event of an exploratory study. Hence the reliability was considered satisfactory and therefore deemed acceptable. However, the item of the questionnaire that does not encounter the lowest standard of having a primary factor of 0.400 or above was eliminated from analysis.

Table 2: Summary of exploratory factor analysis for the four scales

Construct and items	KMO (Sig of Bartlett's test)	% Variance explained	Factor loading	
			1	2
Key stakeholders	.652 (p<0.000)	62.210		
The key stakeholders are employees, supervisors, managers, unions and HR				0.798
The most effective stakeholder are employees			0.750	
The most effective stakeholder are Union reps				0.865
The most effective stakeholder is HR			0.763	
Views of employees	.857 (p<0.000)	59.740		
SASSA PMDS policy regulation			.706	
SASSA PMDS policy promotion			.933	
SASSA PMDS policy consultative			.957	
SASSA performance contracts			.710	
Six months performance assessments			.672	
Poor performance of employees				.814
SASSA moderating committee				.809
SASSA HR attendance of grievances				.585
SASSA performance rewards			.622	
Submission of performance agreements and assessments	.747 (p<0.000)	76.718		
Employees submit their agreements on time			.899	
Senior management ensure submissions are signed and submitted on time			.865	
Employees submit their agreements to HR on time			.891	
Senior management ensure performance assessments are conducted on time			.847	
Barriers to compliance with PMDS	.795 (p<0.000)	56.993		
SASSA allows employees to perform PMDS processes			.662	
Managers & supervisors perform their PMDS processes			.841	
Employees perform their PMDS processes			.727	
HR performs PMDS processes			.766	
SMART performance standards			.767	

Source: Researchers own data

Note: *item 3.5 was eliminated for further analysis as primary factor of .400 or above have a minimum criteria to be met, and that minimum criteria were not met. The items were summarised to fit into the table and complete questionnaire is attached.

The interpretability of variables was enhanced by rotating factors to load into factors as observed by Malhotra (2010:283). In obtaining an orthogonal rotation of factors, the most proved successful method in analytic approach and frequently used and reported option is Varimax method (Zikmund&Babin2013:347). Factor clarification depends on factor rotation, showing the relationship of items to factors by maximising the loadings on one factor and minimising loadings on all the others. The formula which was applied is the principal components method of extraction with Varimax orthogonal factor rotation. The factor loadings of 0.400 and above were regarded significant with

factor loading matrix presenting loadings beyond 0.5 excluding for item 3.5. The criterion of Hair et al. (2017:239) was exceeded, and this criterion indicates that factor loadings that are regarded to achieve lowest standard are greater than ± 0.300 loadings that are regarded significant are of ± 0.400 , and loadings that are regarded more significant are of ± 0.500 and greater.

An exploratory factor analysis was then performed using principal axis factoring by applying an orthogonal method of rotation termed, Varimax, which helped to evaluate the construct validity. A maximum iteration value of eight for convergence was used to search for the optimal factor solution. The suitability of data for factorability was ascertained after examining the large Kaiser-Meyer Olkin test statistic (KMO = 0.652, 0.857, 0.747 and 0.795) as well as the Bartlett spherical test, which showed a significant result at a significant level of $p < 0.000$. All the retained factors were above the recommended 'greater' of 0.500, suggesting that the retained items are the important factors to be considered in the implementation of PMDS, especially at SASSA in Free State. It was one of the objectives to identify the factors contributing to the implementation of PMDS within the demarcated area. Therefore, this study findings provide SASSA Free State with important drivers of PMDS implementation to consider and improve.

3.2. Discussion and interpretation of findings

Findings from the respondents' biographical information reveal that most (48.30%) of the employees at SASSA Free State province are Clerks or Grant administrators. These findings could also reflect the importance of administrative work within public institutions. Furthermore, the findings reveal that the majority (46.22%), which, have been working at SASSA for more than 13 years and that 66% of them are from a grant administration branch or unit. To support the above findings, research managed by Qureshi et al. (2010) revealed most stakeholders inside public organizations are non-managers. The literature also suggests that the majority have working experience of over ten years (Cameron 2015; Masenya et al. 2018).

Research question

What is the level of compliance by a provincial department of the South African Social Security Agency's (SASSA) Performance Management and Development System (PMDS)?

The factor analysis results with 0.652 ($p < 0.000$) significant value of Bartlett's test and 62.10% of variance suggest that employees, supervisors, managers, Union representatives and Human resources as the key stakeholders in the implementation of PMDS at SASSA in the Free State province. These findings are supported by many researchers, including Jain and Gautam (2016). They maintain that in any industry, the role of human resource has expanded from the traditional role to expand its dimensions to assess its employees' performance, and this expanded role is managed by the performance management system. Ogolla and Oluoch's (2019) study in Kenya also found that both lower and middle management level employees are the key contributors of PMS.

4. Conclusion

The study concludes that, barrier to compliance to PMDS in SASSA Free State exists and implies most employees are either overloaded with work or the institution is short-staffed. That senior management ensures that performance assessments are conducted, and all employees signed and submitted performance assessments in each performance cycle. That the non-compliance to the PMDS regulations and policies may be due to work overload and Staffs shortage in SASSA and managers finds it difficult to improve the poor performance of employees in the face of such challenges.

5. Managerial Implications

The study purpose was an assessment of level of compliance of the Free State Province South African Social Security Agency's (SASSA) employees and management to Performance Management and Development System (PMDS). Exploring and understanding the key stakeholders involved in PMDS implementation as well as the perceptions of employees regarding PMS compliance might assist SASSA in Free State to realise their objectives through the most efficient usage of the performance

management systems. From the perspective of the SASSA, this study has provided valuable information to assist in the development of PMDS regulations and policies by the department of social development toward fostering employee's productivity through effective and efficient PMDS processes. There was valuable and positive information for improvements of managing performance in SASSA and negative information which needs serious attention to manage performance and avoid risks related to this negativity on PMDS.

6. What was this paper all about?

The empirical objective as set out was to:

- Assessing the compliance of a provincial department to the South African Social Security Agency's (SASSA) Performance Management and Development System (PMDS)

Using EFA, the key stakeholders in the implementation of PMDS at SASSA in Free State are employees, supervisors, managers, unions members and human resource staffs. This objective was achieved where the KMO test was used to determine the number of factors extracted as well as percentage of variance explained. Furthermore, using frequency analysis to determine the views of employees at SASSA regarding the current PMDS implemented. SASSA employees suggest that PMDS policy regulates and promotes alignment of individual performance with SASSA strategic objectives through performance management. Using the EFA to identify the barriers in the implementation of PMDS at SASSA in Free State, the factor loading was all above 0.400 suggesting that employees agreed of the barriers. These challenges are perceived as barriers to compliance with PMDS submission deadlines and employees are not complying with the PMS regulations and policies.

In the assessment of compliance to Performance Management and Development System (PMDS), this study was by no means without limitations. In fact, one of its limitations was that the study was confined to only SASSA employees in Free State province. Further studies can consider the South African SASSA employees. The study was exploratory, employed a quantitative research approach and utilises cross-sectional data. Future research may consider both a qualitative and quantitative research design using triangulation methodology where a qualitative design could be used in generating rich ideas and explanations. In addition, collecting data from the same population more than once may yield different results since PMDS is a continuous process and requires follow up. Despite these limitations, the study advances knowledge regarding PMDS at a governmental institution, considering that there is a noticeable absence of prior research within the SASSA context.

Acknowledgments

The Authors want to thank the academic staffs of the North -West University Business School who participated in the Scientific Committee (SC) and assisted in reviewing the proposal. Furthermore, members of the Faculty of Economics and Management Science (FEMS) ethics committee for further reviewing the proposal, data collection tool, informed concern form, etc. to ensure ethical compliance, quality assurance and strengthening of the content.

Keywords

training and development, organisational performance, case study automotive

Abstract

For organisations to be successful, they rely not only on the tangible assets of the organisation, such as machinery equipment but also on the knowledge and expertise of the employees. This study aims to understand the impact of training and development on organisational performance, of selected automotive companies in the Eastern Cape. Motivation for the study resulted from automotive companies spending millions on training and development initiatives without receiving maximum return on the investment made. The quantitative research approach used a descriptive method with online questionnaires designed to evaluate the aspects of management support on training and development initiatives as well as the training design approach used. The findings revealed that there is a positive relationship between training and development with organisational performance. Management's support was found to be an area of weakness when it comes to training and development of the employees. This study contributes to improved performance in an automotive industry through the utilisation of human capital skills and knowledge acquired through training and development initiatives.

1. Introduction

Since the advent of democracy in South Africa in 1994, the South African government has initiated different constitutional and legislative frameworks to make it possible for public-sector organisations to enhance their delivery of public goods and services (Mafini & Pooe, 2013). Regardless of these initiatives and solutions government takes, poor performance is still a challenge to deal with in the public-sector as government departments continue to fail to provide effective service (Paarlberg & Zuhlke, 2019). An employee will get a promotion until he/she reaches his/her highest levels of incompetence. However, training can still be a part of any attempts at succession planning, and for such reason's employee attitude is critical.

Training is significant and an imperative tool for the organization to restore the performance of all the personnel for organizational growth and success (Paarlberg & Zuhlke, 2019). It is useful to both employers and employees of an organization. An employee will turn out to be more efficient and productive if he/she is trained well. Firms can create and enhance the quality of the present employees by providing widespread training and development. Training is important not only to expand productivity but also to motivate and inspire workers by allowing them to know how essential their jobs are and providing them all the information, they require in carrying out those jobs (Chhetri, Gekara, Manzoni & Montague, 2018). The general advantages received from employee training are increased job satisfaction and motivation and morale, resulting in financial gain, increased efficiencies in processes, increased capacity to adopt new technologies and methods, increased innovation in strategies and products and reduced employee turnover.

1.1 Research problem

Training is a systematic process to enhance employee's skill, knowledge, and competency, necessary to perform effectively on job. Overall, training affects organizational competitiveness, revenue, and performance. Unfortunately, most of the governmental, private organization and international

*Corresponding Author

¹ E-mail address: naidoosu@unisa.ac.za

organizations are not recognizing the importance of training to increase their employee's productivity, and when the economy slows or when profits decline, many organizations first seek cuts in their training budgets. This will lead to high job turnover then increase the cost to hire new employees, which slows down the organizational profitability. According to (Patgar & Vijayakumar, 2014), most employees are ready to remain with their current organization when they are aware of an opportunity and realise the experiences they have with the current organization will lead them to expand their careers and growth and ultimately performance increases. Furthermore, in the past, employee retention strategies such as compensation, environment, growth, relationship and support have been empirically proven to attract, retain and nourish good people in organization, which also led to increased organisational performance.

The insights of employees on training have a great importance on the success of any organization. If the employees are pleased with the organisation's training policies, this will positively impact the organization's productivity. The insights or attitude of employees is changed into positive or negative behaviour. It is important to ascertain how the employees view employee-training policies of the organization. It is also important to investigate how management view the Training Policy of the organization. Some view training and development as a waste of time and capital that would have been used in the production of goods and services that will increase profit to the organization. Sometimes, the concern that an employee could leave the organization after training affects the employees training and sometimes makes it unforeseen and unsystematic. To fill this gap, the researcher is compelled to conduct a study on the effects of training on employee and organizational performance with focus on processes and procedures of identifying skill gaps, training design and delivery style and employee perception towards training in the automotive industries in Eastern Cape.

This research study will therefore be focused on the following problem statement:

To evaluate the impact of training and development on organisational performance in the selected automotive industries.

The study will also aim to answer the following research questions:

- What are the factors that influence training design on employee performance?
- What impact does training design have on employee performance?
- What recommendations can be offered to organizations to help in training design?

2. Literature Review

2.1 Theories underpinning this study

Motivational theories, including Maslow's Hierarchy of Needs Theory and Vroom's Expectancy Theories were developed to guide the organisation in understanding motivation and how motivation influence employee performance (Kuranchie-Mensah & Amponsah-Tawiah, 2015).

2.1.1 Vroom's expectancy theory model

The Expectancy Theory was developed in 1964 by Victor Vroom and pronounced that an employee will be motivated if he believes that good performance will lead to financial rewards such as bonuses, promotions, or a salary increases that will in return lead to the achievement of own personal goals. Vroom's expectancy theory assumes that if an employee believes that his effort will lead to a specific performance level, and that it would lead to various reward outcomes such as promotion and increases, this perception is reflected as expectancy.

2.1.2 Maslow's Hierarchy of needs

Managers, in determining the motivational factors and rewards that influence an employee's performance (Kuranchie-Mensah & Amponsah-Tawiah, 2015), regard Maslow's theory on motivation and needs as a powerful management tool for the utilisation. The physiological needs in the Maslow theory, is the need that focus on sustaining an individual's life such as food, water, and oxygen as the basic needs that must be satisfied before the next level can be satisfied (Kuranchie-Mensah &

Amponsah-Tawiah, 2015). Secondly, an employee’s safety needs in terms of job security and emotional development. The third level of the hierarchy is the employee’s social needs that deal with the social aspects of the individual, such as their need to be loved, to belong, and to be accepted by others within the organisation (Kuranchie-Mensah & Amponsah-Tawiah, 2015). In the hierarchy, Maslow refers to an individual’s esteem needs as being satisfied when employees are motivated through power, status, and self-confidence resulting from their own achievements. Self-actualisation is on top of the hierarchy that symbolises the employee's drive to become “someone” and this need at the apex of the hierarch is achieved by maximising one’s own full potential and self-fulfilment.

2.2 Conceptual Framework

An organisation’s ability to perform and obtain and retain a competitive advantage in the industry, and achieving the overall strategic objectives depends on the performance of the employees (Amoatema & Kyeremeh, 2016). This then creates the need for managers and leaders to build strong relations with the employees to encourage performance; therefore, it is important for leadership to understand what motivates the employees to maintain high-performance. Organisations strive to understand and meet employees' different needs and what motivates them to perform and exceed. Some employees are motivated by money and other financial rewards; however, Amoatema and Kyeremeh (2016) indicate that employees who are motivated and committed to the organisation are more appreciative of recognition by management. Motivated employees are loyal and produce high quality work and improved teamwork by creating a supportive working relationship (Hussein & Simba, 2017).

According to Noe (2017), training is a planned effort to “facilitate learning of job-related competencies, knowledge, skills, and behaviours by employees”. The goal of training the organisation’s employees is for them to master the knowledge, skills, and behaviours highlighted in training and apply it to the daily activities. Figure 1 will be used as the conceptual framework for the study.

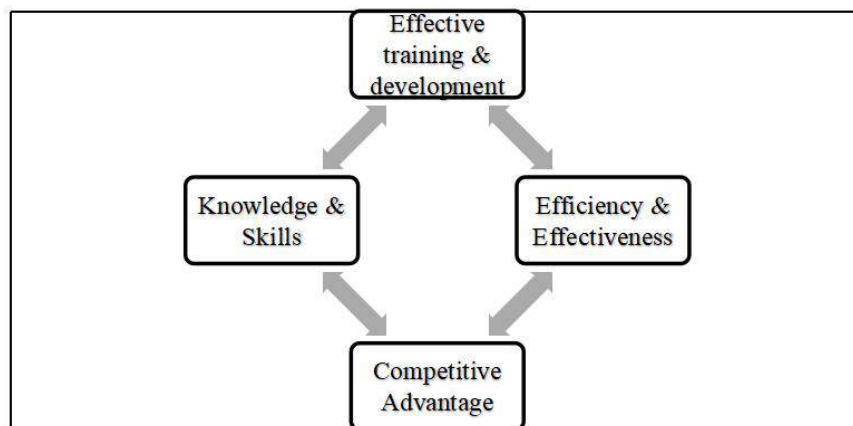

Figure 1: Conceptual framework for the study

2.3 Training and Development

From the human resources perspective, training and development is a process of transferring knowledge, skills and abilities needed to carry out a specific activity or task (Ross, 2019). According to Berkley’s 2019 training and development strategy is defined as the plan by which an organization ensures its employees have the knowledge, skills, and abilities to meet the organizations objectives, in meeting the organizations objectives training strategy must consider the following:

- The internal organizational environment
- The company strategy
- The external environment

The organisation will conduct a needs analysis to identify the gaps after which a specific training or development plan will be developed. The training strategy must be in alignment with the cooperate

strategy integrated within the larger HR infrastructure. Internal organizational dimensions and developed needs assessment are to ensure a plan is a success. (Ullah, 2019) indicates that all organizations have limited resources it is incumbent upon them to always have better decision makers on board. Businesses and organizations spend a good amount of money and time to educate and train employees. Based on the literature above, it is evident that training and development is about transferring skills and knowledge to employees to meet the organizational strategic objectives and sustainability in the market.

2.4 Organisational performance

According to (Maduenyi & Oluremi, 2015) the existence of an organisation is to achieve the business's goals and objectives. Organizational performance is the ability to accomplish its aims using resources in a properly structured manner. According to (Abbas, 2019) performance is an individual output, which is influenced by the requirements of the organization, therefore effective, and efficient leadership becomes critical towards the success and sustainability of the organisation.

2.5 Effect of Training on a Learning Organisation

Research by (Mpofu & Hlatywayo, 2015) revealed that quality training and development programmes are imperative for better employee performance within the organisation. The same study established that the standard of employee training and development programmes within the municipality was high (confirmed by 53.33% of the employees). The findings of the study also disclosed that quality programmes and highly qualified facilitators result in quality employee that enhances employee performance and improves service delivery. Mpofu and Hlatywayo, (2015) tend to agree that training does have a positive impact on the performance of employees, In addition, the preceding researchers have seldom linked their studies to training initiatives costs.

2.6 Globalisation in the automotive industry

Vladimir (2020) indicates that the global economic system is experiencing difficult times nowadays, especially because of negative consequences of COVID-19 pandemic situation. A similar statement can be applied to the economies of European countries. Among the most affected sectors, it can be ranked automotive industry, which is one of the most dominant contributors to European GDP. (Humphrey & Memedovic, 2020) state that the automotive sector has global character and represents a capital-intensive industry characterized by vertical integration. Automotive industry also contributed to innovation development and fundamental industrial production changes The ecosystem of automotive industry creates a workplace for 14,6 million Europeans, what represents 6,7 percent of total European Union employment, (Nieuwenhuis, 2015)

2.7 South African view on automotive industry

According to (Barnes, 2017), the South African on the automotive industry is faced with numerous challenges; these have been widely documented in previous literature reviews. The industry consequently remains a marginal player globally contributing only 0.65 % of global vehicle output. South African industry performance therefore resembles that of a developed economy, as opposed to a developing economy with low levels of vehicle ownership, and a growing population. It is a strategic position that has ensured the national's government's target support for the industry over the last couple of decades. South Africa's automotive industry has steadily established itself as a global engine for manufacturing and exporting vehicles and components. Many major multinational firms to source components and assemble vehicles for the local and international markets use SA. Indications are that although the industry had a slow start in 2016 with lower-than-expected domestic sales and export recorded thus far, a substantial increase in new vehicle exports was expected to materialize from March 2016 onwards. At this stage, industry projections for exports during 2016 showed an improvement of around 12% on the previous year. According to (Van Rensburg, 2020) the South African Vehicle Industry is the largest manufacturing sector in South Africa's economy. According to the National Association of Automobile Manufacturers of South Africa (Naamsa), the motor industry contributes 6, 8% to the country's gross domestic product (GDP).

2.8 Methods of training and development

(Daniels, 2021) For any company, its employees have utmost importance as they play a primary role in the growth of the business. The organization needs to ensure its employees are equipped with the necessary knowledge and skills. Just to increase their productivity and for this purpose, there is no other way safer and better as compared to training. There are many techniques and methods of training and development that helps business in equipping its employees to improve their work quality and speed. Interactive training methods are one of the best ways to keep your employees engaged, which helps them in perceiving a lot more information. Moreover, then when they are not interested in the training material. This includes a friendly environment, humour, and the usage of attractive and eye-catching learning materials.

2.9 Relationship between Employees' Performance and Organizational Performance

According to (Mayhew, 2020) companies that make investments expect something in return – a return on investment for the money they spend on training their employees and supporting professional development for their staff. In its September 2018 article, HR Technologist suggests four unique ways to measure an organization's ROI for investing in employee training. Pre- and post-training assessments measure the effect that training has on their skill sets or capabilities. Data mining is another useful method for measuring the relationship between training and employee performance. Employees who spend more time in training or devote time and energy to employer-provided training are likely to improve performance. Post-training evaluations such as surveys that ask employees how valuable

Finally, assessing the level of engagement in the training program may be effective in determining how receptive employees are to the employer-sponsored training. High engagement levels may suggest the employee is acquiring skills and best practices that he will use in performing his job duties.

3. Methodology

This section presents an overview of the research methodology utilised in this study, which included an extensive explanation of the population of the participants, description of data collection instruments, the procedures utilized to answer each research question, data collection, and the measurements in the study. Figure 2 the research onion was used to explain the research approach.

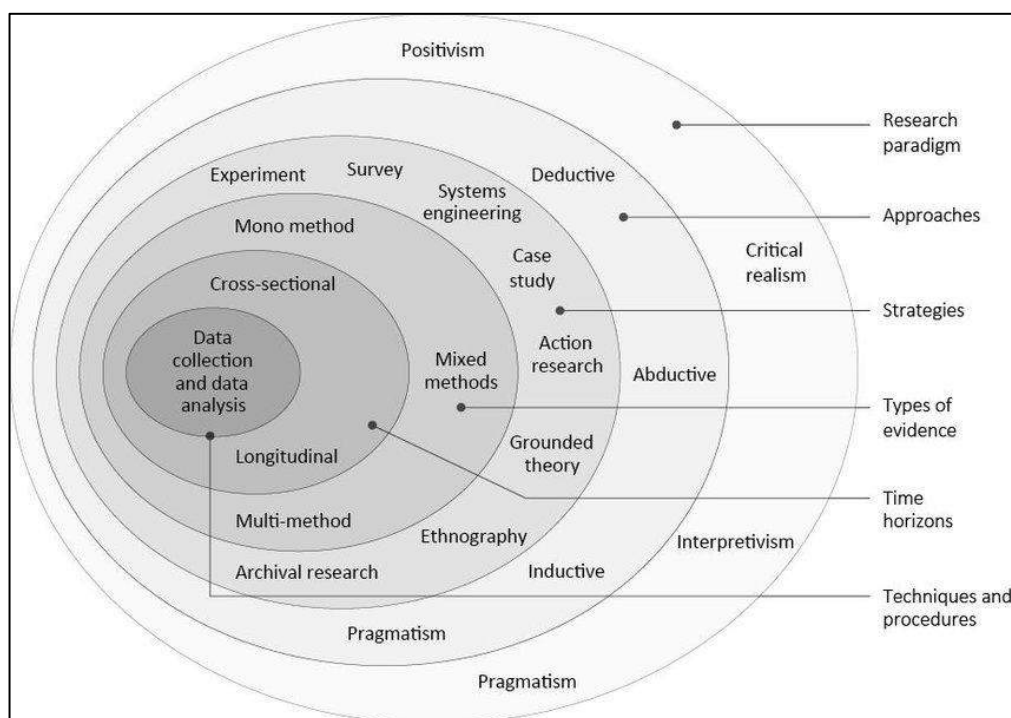

Figure 2: Research onion
Source: Saunders & Lewis and Thornhill (2014)

3.1 Research paradigm

The dominant research paradigm for the study was positivist, which according to (Oates, 2014), facilitates the researchers' ability to comprehend how various variables within a particular system influence one another or influence a particular dependent variable.

3.2 Research approach

A quantitative research methodology approach was adopted for this research study. According to (Bryman & Bell, 2015), quantitative research usually emphasises quantification in the collection and analysis of data and as a research strategy it is deductivist and objectivist, it incorporates a natural science model of the research process, in a particular one influenced by positivism.

3.3 Research strategy

The main strategy employed for this study was an analytical survey, which utilised the self-administered questionnaires to gather data. The study employed an empirical style of research as the study is mainly based on observing the effect of training and development on organizational and employee performance for the Automotive Industries in Eastern Cape.

3.3.1 Survey research strategy

The survey questionnaire was hand distributed or emailed online to respondents with the link to answer the questionnaires.

3.3.2 Population and sample framework

A population is the full group of potential participants to whom the researcher wants to generalize the study's findings and or the portion of the universe that the researcher has access to (Cavus & Kapusuz, 2015). A total of 300 respondents were identified as possible respondents (table 1).

Table 1: Target population and sample size

Occupation	Population	Sample	Percentage of the sample
Skilled Technical -Artisans	100	30	30%
Semi- Skilled Operators	100	30	30%
Senior Management & Professionally qualified Admin staff	100	30	30%
Total	300	90	90%

The target population is the total company workforce that is comprised of 300 employees. The sample of respondents was selected based on a predetermined criterion of active participation in the production of car parts within the organizations. The criteria were that the participants had knowledge of the automotive industry and had an opportunity to attend trainings in their respective places of employment. The sample consisted of at least 100 employees from various occupational levels in the selected companies. From the sample batch 10 respondents were selected for an in depth questioner for the pilot study.. The selection of these respondents formed a suitable sample size to provide adequate data relevant to the research problem. The artisans which are skilled labour used as respondents in this research paper are employees who are inclusive of electrical engineers and the professionally qualified employees comprises of employees on middle and managers who are decision makers.

3.3.3 Central limit theorem (CLT)

The CLT is a statistical theory that states that given a sufficient large sample size from a population with finite level of variance, the mean of all samples from the same population will be approximately equal the mean of the population (Leedy and Omrod, 2014). In this study, the sample size was large enough to satisfy this theorem, thus attaining a normal distribution.

3.4 Pilot study

A pilot study can be defined as a small study, which serves as a preliminary test on a sample population to test the research techniques, the data collection instruments, and the strategies selected to conduct a research study-using questionnaire in preparation for a larger study on a target population. The questionnaire generated was pilot tested by the researcher on five participants who provided feedback on the completeness and data validation of the input fields of the questionnaire. Amendments were made, and the researcher before final distribution finalized the questionnaire.

3.5 Data collection

Data collection, according to Creswell (2015), is a set of interconnected tasks intended to gather rich data that will be utilised to answer the study's research objectives. In this study, primary research data was collected via probability, simple random sampling, by the use of an online self-administered questionnaire.

3.6 Questionnaire design

The format of the questionnaire and structure has an impact on data collection. A questionnaire must be constructed in such a way that the researcher can obtain useful data from respondents (Zikmund, 2017). For this study, the questions were grouped into different sections. The questions were designed using the Likert scale which measures variables from strong agreement to strong disagreements or vice versa.

3.7.2 Questionnaire distribution

A link to the Survey Monkey website was emailed to the sample population, and they were requested to click on the link to access the online questionnaire.

3.8 Pilot study

Once ethical clearance was confirmed with UNISA SBL, the questionnaires were handed to eight employees in the procurement department of the study organisation. The pilot study results were analysed using SPSS 25 results showed a Cronbach Alpha of 0.90. This high Cronbach Alpha indicates that the research instrument was quite dependable. To avoid data contamination, the results of the pilot study were not included in the main study.

3.9 Administration of questionnaire

Before the survey was released, each participant received a letter of consent and participation.

3.9.1 Collection of questionnaires

All responses were collated within the survey monkey platform in the form of spreadsheets, graphs and diagrams. This information was further downloaded and uploaded into SPSS version 25 for further analysis.

3.9.2 Storage of questionnaire data

A copy of the data was downloaded onto the researcher's computer. The data on the computer was kept secure because the computer is password protected and only the researcher has access to it.

3.10 Data analysis

Data was analysed via SPSS a statistical software for quantitative research.

3.11 Validity and Reliability

The Cronbach's alpha test was used to support the outcomes of this study's internal consistency reliability test. With an average of 0.90, the Cronbach's Alpha reliability test revealed very high and hence reliable (Creswell, 2015) .

4. Findings

The findings in this paper are also aimed at meeting the study's research questions. The study is based on the primary data collected from employees working in the automotive firms in the Eastern Cape

with the help of a self-administered questionnaire. The study includes sample selected using purposive sampling.

To provide reliable and compelling results, the main survey results were evaluated using statistical techniques and software (SPSS). A statistician was engaged to assure authoritative and accurate results. The internal reliability of the research instrument's constructs was determined using the Cronbach alpha coefficient. Table 2 shows the reliability statistics for the study.

Table 2: Training and Development Factor

Questionnaire Statements	Factor Loading
Training programs are designed based on the requirements of either the task or the employee deficiency of their ability on task.	0.863
I have regularly participated in training and development programs within the organisation.	0.802
My organisation has a training and development strategy, that is aligned with the organisation business strategy.	0.799
The organisation conducts extensive training programs.	0.740
Employees who have regularly participated in training and development within the organisation perform better.	0.523
My manager and/or Human resources unit, shows full willingness to help me to apply what I have learned in training.	0.508
Cronbach Alpha	0.799
Mean & Std. deviation	4.013 ± 0.606

Extraction Method: Principal Component Analysis. Rotation Method: Oblimin with Kaiser Normalization.

4.2.2 Organisational Performance Factor

The results of organizational performance factor analysis are presented in Table 3. The KMO was 0.877 and the associated Bartlett's Test of Sphericity was statistically significant as $p \leq .001$. The extracted factor accounted for 66.2% of total variance. The mean of the scale for the respondents was 4.002 and Cronbach's alpha for this scale was 0.896. Based on mean of the training and development factor (mean= 4.002, sd = 0.725), the respondents mostly agree with the performance taking place in the workplace after implementing training and development initiatives.

Table 3: Organisational Performance Factor

Questionnaire Statements	Factor Loading
The training I have received has helped me to enhance quality of product service.	0.871
Training and development has an impact on the overall performance of staff in the organisation.	0.863
Training enables me to improve my capability.	0.832
There are many opportunities for career development after completing training.	0.820
Training enables me to improve my knowledge and skills.	0.750
My performance has increased after completing training.	0.734
Cronbach Alpha	0.896
Mean & Std. deviation	4.002 ± 0.725

Extraction Method: Principal Component Analysis. Rotation Method: Oblimin with Kaiser Normalization.

4.3 Correlation of the factors

The correlation between training and development factor and organizational performance factor is presented in Table 4. The Spearman rank correlation coefficient was used to describe the strength of the relationship between the factors. Cohen (1998) suggest the following values as guidelines of

strength of relationship: $r = 0.100$, small; $r = 0.300$, medium; $r = 0.500$, large. Thus, there is medium strength of relationship between training and development factor and organizational performance factor ($r = 0.471$).

Table 4: Correlations

	Training & Development Factor	Organisational Performance Factor
Training & Development Factor	1	0.471**
Organisational Performance Factor	0.471**	1

** . Correlation is significant at the 0.01 level (2-tailed).

4.4 Results of the Regression Analysis

Results of regression analysis, which sought to explore the influence of training and development on performance of employees in the organization, are presented in Table 5. The regression model accounts for about 22% of organizational performance. A significant and positive relationship was found between training, development, and performance of employees in the organization.

TABLE 5: Regression Results

Predictors	Organisational Performance
Constant	1.739
Training and Development	0.564
R	0.471
R ²	0.222

The regression equation is represented as:

$$\text{Organisational Performance} = 1.739 + 0.564 (\text{Training \& Development})$$

The regression equation provides the expected change in the dependent variable (organizational performance) for a one-unit increase in the independent variable. So, a unit change in training and development initiatives, results in 0.564 unit increase in performance by the employees in the organization.

5. Discussion

The aim of this study was to evaluate training and development to organizational performance.

5.1 Research question one

Research question one was to determine where the strengths and weaknesses of the training design. It was concluded that training programs based on distributed surveys reveal both weaknesses and strengths related to this objective. The first weakness was that both departmental managers and HR unit are not willing to support employees in their professional development, in a competitive environment, that is critical for management and employers to allow employees to implement what that they have learned during training. The second weakness was the need for training tailored to employee skill gaps. Training programs must be tailored to the demands of the job or the lack of skills or responsibilities of employees.

5.2 Research question two

Research question two was to determine the influence of training design on employee performance, one must determine whether planned meteorological training sessions and those presented to the workforce actively improve service quality and employee performance. Based on the survey results, an identified strength was that scheduled training improved product service quality and that the training had an impact on the overall performance of the organization's employees. The first weakness of this goal was that the planned training did not improve personal development and the second weakness was that the training did not increase employee performance. These weaknesses indicate that it is critical that training be based on current employee needs.

5.3 Research question three

Research question three was to make recommendations on how organizations can improve their training design, it is important to assess employee training needs as well as training objectives. When training current employees to learn a new skill, employers must first understand what the employee already knows and how they can improve. The need may come from a global organizational and strategic vision, from departments or teams, or from an individual assessment. Assessing the organization's needs can determine training objectives. These objectives become the basic components of the organization's training concept. Finding weaknesses in previous training or in employee knowledge is critical to the success of the organization once training objectives are established, the type of training become critical. All training design should fit within an existing budget or be proposed with a budget. Action plans need action. Adults also learn through action and interactive learning through workshops, hands-on exercises, activities, role-plays, and group discussions are hands-on training that involve staff. It is also important to understand that some learners are visual and others are auditory, so employers must be diverse in their training process. Effective training helps learners engage in lessons that flow logically for better learning, with resources well spent and an outcome consistent with learning and training objectives. Reviewing and adapting plans can lead to new assessments and training goals. Training design is a means of continuous improvement.

5.4 Relationship between employee performance and organizational performance?

This study found that most respondents agreed that there is a positive link between the organisations is training programs and the organization's strategies. The results confirmed more training and development programs are stabilizing the organization. This study also found that, the organization has implemented detailed development programs aimed at improving employee performance. This study found that employee training acquired during training sessions improved employee performance. As a result, T&D has improved the performance of the automotive industry.

6. Research Limitations

The study was limited to a sample of 90 employees from three automotive companies in the Eastern Cape. Due to the limited number of study participants, the investigator could not make broader generalizations as there were also challenging time constraints. One of the major limitations of the study was the use of a single organisation and general implications where made, which is not entirely representative of the pathology industry within South Africa.

7. Recommendations

Based on the results of the study, the following suggestions are recommended: alignment of the organization's training and development strategy with the organization's business strategy, training and development of employees based on the lack of required skills. Guarantee a sufficient budget to execute training initiatives. Inclusion of all relevant stakeholders in training analysis sessions. This study suggests that other studies could use a qualitative method, or both qualitative and quantitative methods, to determine the impact of training and development on business performance. Using a qualitative method, the researcher will be able to collect data through in-depth interviews, which provide more data than questionnaires. A comparative study can examine the impact of training and development on business performance. A study can determine the impact of training and development on executive performance. Management support should improve within the organisations by also allowing employees to make their own decisions.

8. Managerial Implications

HR staff to clearly communicate training and development guidelines to all employees, as well as the training opportunities available within the organization. Identifying training needs and establishing training objectives. Training committees such as skills development forums that oversee training design and implementation of training programs. Mostly according to the three theories of motivation discussed above, motivation of employees is critical. This study found that employee training acquired during training sessions improved employee performance. As a result, T&D has improved the performance of the automotive industry.

9. Conclusion

This study found that employee performance increases after completing a training program. Training enables employees to improve their skills, knowledge, and abilities to better perform their tasks. The study also suggests that investing in employee training would not only lead to employee motivation and excellent customer service but would also make a major contribution to improving organizational performance. The study found that participating in a training program exposes employees to great career development and has a positive impact on the overall performance of the workforce. This confirms that there is a significant correlation between employee performance and organizational performance.

Perceptions;
AI;
Cobots;
SMEs;
New technology.

Abstract

The twenty-first century economic development agenda places emphasis on the critical role that SMEs play in economic growth, job stimulation and poverty alleviation. Digital innovation, which is enabled through modern IT technologies, is an important resource to scale SMEs. Artificial Intelligence (AI) and robotics are new technologies used to improve business practices and productivity. AI is incorporated in technologies, such as Robotic Process Automation (RPA) to automate and improve business processes. Physical human-robot interaction, through the use of collaborative robots (Cobots) is increasingly being used in modern production environments.

The aim of this study was to determine the perceptions of the use of AI and Cobot technologies by SMEs. An on-line questionnaire was developed and distributed to SMEs in South Africa. The results from 295 respondents indicated that only 17% had a positive perception of the use of AI and Cobot related technologies. The results indicate that only 25% the respondents see the potential for SME benefits stimulated by the new technologies. This paper offers new insights on the perceptions and adoption of modern technologies, such as AI and Cobots by SMEs. The value derived from this study is its accent on the significance that modern technologies could have on improving productivity, innovation and global competitiveness, specifically amongst SMEs, if they were adopted.

1. Introduction

Small to medium-sized enterprises (SMEs) are challenged to remain competitive and innovative in various aspects of their business (Bélanger-Barrette, 2015). Small and mid-size enterprises are businesses that maintain assets and revenues or a number of employees below a certain threshold. Every country has a different definition of what constitutes a SME (Liberto, Berry-Johnson & Kvilhaug, 2021). SMEs in South Africa are defined as an enterprise with one or more of the following characteristics, namely less than 200 employees, an annual turnover of less than R64 million, capital assets of less than R10 million and direct managerial involvement by the owners (Du Toit, Erasmus & Strydom, 2009).

Digital innovation is defined as products, processes or business models that are perceived as new and require changes on the part of the adopters and are enabled by IT (Ramdani, Raja & Kayamova, 2021). Globally, organisations are undergoing digital transformation and automating business processes and functions. The use of software, instead of people, to perform particular tasks has become common practice. Artificial Intelligence (AI) and Robotic Process Automation (RPA) are two technologies that are changing and improving business processes and functions (Calitz, Poisat & Cullen, 2017).

Cobot technologies have been introduced as one of these drivers of process innovation (Harbour & Schmidt, 2018) as they characterise consistency, reliability and prove to achieve a sustainable competitive advantage. Cobots are smaller in size than traditional caged robots, which allows workers to work side-by-side with Cobots. Introducing Cobot technologies into production environments,

³ E-mail address: Andre.Calitz@mandela.ac.za

redirects human workers to more stimulating tasks, increasing employee engagement (Harbour & Schmidt, 2018). This creates an engaging environment, which supports learning and development of the workers (Bélanger-Barrette, 2015; Strohkorb & Scassellati, 2016) and dictates the supposition of developing native skills (Harbour & Schmidt, 2018). The adoption of Cobots by SMEs however, has been slow, due to many challenges SME management face (Schnell & Holm, 2022).

South Africa's workforce consists of mainly semi-skilled workers and one of the purposes of new technologies incorporating AI and Cobots is to reduce repetitive tasks and promote skill development (Harbour & Schmidt, 2018; Calitz et al., 2017). Approximately 1 332 000 jobs located in the manufacturing sector would be at risk with the introduction of Cobot technologies (Calitz et al., 2017; Skhosana, 2017; Statistics South Africa, 2017). However, research indicates that automation does not lead to job substitution but re-allocation (Acemoglu & Restrepo, 2018) of tasks by accompanying and enhancing human labour (International Federation of Robotics, 2017). A study amongst 94 participants, Schneiders and Papachristos (2022) found that worker perceptions regarding the benefits of robots were positive and their possibility of creating new jobs. At the backdrop of this supposition are the imperfections of introducing automation due to the slow adjustment of the economy and labour market (Acemoglu & Restrepo, 2018). Arguably, the slow adjustment may weaken the productivity gains.

Industry 4.0 is changing the manufacturing industry and business processes (Rodriguez-Bustelo, Batista-Foguet & Servalos, 2020). South Africa is a prime market for the implementation of automated robotic systems as the manufacturing sector contributes 13% of the GDP (Brand South Africa, 2018). Automated robotic systems can increase the efficiency, productivity and profitability of this sector and other sectors, boosting the country's GDP (Li, 2017). Cobots and automation could yield improvements in sustainability and cost performance for SMEs, including SMEs in emerging economies (Schnell & Holm, 2022).

Despite the advantages of deploying Cobots, the integration of these technologies among small enterprises remains limited (Schnell & Holm, 2022; Schröder, 2016). This paper attempts to determine SMEs management's perceptions of the use of AI and Cobots in South Africa. Research on AI, RPA and Cobots is typically focused on large enterprises within the manufacturing sector. Arguably, the integration of AI and Cobot technologies in SMEs offers socio-economic gains.

This paper begins by discussing SMEs, the latest trends in AI and Cobot technologies. Second, the growth and impact of Cobots is explored. Thirdly, the theoretical value is explained. The remainder of the paper offers the research design, approach and method followed by a discussion of the empirical results. Thereafter, the limitations and future research for the future use of Cobot technologies and AI are provided. The conclusion and implications of AI and Cobot technologies to support economic development are addressed. A discussion of SMEs' willingness to invest in AI and robotic technologies follows Calitz et al., (2017) to reveal the impact of a so-called disinvestment mind-set on global competitiveness and globalisation extremities.

2. Problem Investigated

Digitalisation, Industry 4.0 and sustainability are some of the most dominant megatrends in the latest decades for SMEs (Reka, Tick & Kárpáti-Daróczi, 2022). Digital transformation is the adoption of digital technologies by an organisation. Digitisation and automating business processes, specifically the use of software, instead of people to perform particular tasks, have become common practice.

Artificial Intelligence (AI), Robotic Process Automation (RPA) and the use of Cobots are three rapidly advancing technological domains altering business processes and how the workforce operates. However, the adoption of modern technologies, such as AI and Cobots has been relatively slow amongst SMEs (Schnell & Horm, 2022) and specifically in South Africa (Poisat, Calitz & Cullen, 2021; Calitz, et al., 2017). This results in the research problem investigated in this study, namely that *SMEs' owner and management perceptions of the use of AI and Cobots has not been assessed in South Africa.*

3. Research Objectives

The main research objective of this study was to determine the use of modern technologies, specifically the use of AI and Cobots by South African SME owners and managers. The authors included an additional factor, *Modern Technologies* in a national study that was conducted amongst SMEs to determine the factors influencing the scalability of SMEs in South Africa. The national survey was conducted by means of an online questionnaire and through the use of fieldworkers. The online questionnaire was distributed using various SME databases and organisations, such as The Business Place and The Nelson Mandela Bay Business Chamber.

4. Hypotheses

AI, RPA and the use of Cobots are increasingly being implemented in businesses (Poisat, et al., 2021). The adoption of modern digital technologies, including the use of AI, RPA and specifically Cobots by SMEs has been slow. The challenges SMEs face when adopting technologies, such as Cobots are safety, workforce involvement and training and the lack of long-term strategies (Schnell & Holm, 2022). This study hypothesises that the understanding of the perceptions of the use of AI and Cobots by SMEs' owner and management in South Africa, could help with persuading them to adopt modern technologies, which would improve SME performance and productivity.

5. Literature review

5.1 SMEs

SMEs are defined as independent businesses and categorised by size class, which is based on two thresholds: number of employees and turnover. In South Africa, small enterprises have 11-50 employees and medium enterprises have 51-250 employees. The total annual turnover varies by size and sector (European Commission, 2016).). SMEs in South Africa are defined as an enterprise with an annual turnover of less than R64 million and must have direct managerial involvement by the owners (Du Toit, et al., 2009).

SMEs that scale up create opportunities to access markets or new sectors, which leads to an expansion of the workforce. However, the OECD (2020) states that 70% to 80% of small businesses fail in the first year and approximately half of the balance succeed over the next five years. SMEs that are innovative and competitive contribute to a country's GDP per capita growth and employment (Mason & Brown, 2014; Stam, 2015). Therefore, SMEs need to adopt innovative practices to compete and survive in the long run. This suggests that SMEs should shift focus to the exploitation of resources, such as IT technologies to benefit from economies of scale.

Modern IT technologies can create value for SMEs by improving business productivity, which can lead to the transition in their lifecycles and new business models (Goldfarb & Tucker, 2017). Gaynor (2002) contends that SMEs' scalability relies on their adoption of modern technology as it supports expansion, growth and sustainability. Technology adoption improves forecasting, reduces transaction costs and increases turnover and market access notwithstanding access to knowledge and skills (OECD, 2018; Kumar & Ayedee, 2020). Therefore, SMEs can draw benefits, such as integration into corporate value chains and the international market. In this line, the scalability of SMEs relies on their ability to integrate technology into their business models.

5.2 Artificial Intelligence (AI)

The last two decades have witnessed major advances in AI and robotics (Acemoglu & Restrepo, 2018). AI is increasingly being incorporated into business applications. It is intelligence designed by humans and demonstrated by machines (Cheng-Tek-Tai, 2020). AI is a wide-ranging tool that enables people to rethink how to integrate information, analyse data and use the resulting insights to improve decision making (West & Allen, 2018). AI, a major technology driving the fourth industrial revolution (4IR), is going to change not only the way things are done, how people relate to others, but also our knowledge of self (Cheng-Tek-Tai, 2020). The 4IR and its accompanying technologies can provide solutions to the challenges facing the African continent (Foresight Africa, 2020). One of the

key enabling technologies identified in the Foresight Africa 2020 Report that will drive Africa's digital economy is AI (Travaly & Muvunyi, 2020). AI has the following benefits:

- AI reduces the time taken to perform a task;
- It enables multi-tasking and eases the workload for existing resources;
- AI enables the execution of complex tasks without significant cost outlays;
- AI operates 24x7 without interruption or breaks and has no downtime;
- AI augments the capabilities of differently abled individuals;
- Reduces human error;
- Enhanced customer experience;
- AI has mass market potential; it can be deployed across industries; and
- AI facilitates decision-making by making the process faster and smarter (Saidyutivaishnavi, 2021).

AI could benefit SMEs in developing countries and the above-mentioned benefits would enhance SME performance if understood and adopted.

5.3 Cobot technologies

Collaborative robots (Cobots) follow a design that can be easily programmed and work safely with humans, which complements the flexibility required in complex production environments. Modern manufacturing production processes are increasingly implementing the use of Cobots, thus responding to challenges faced by industrial automation that could not deal with uncertainties in the past (El Zaatari et al., 2019). Their introduction is seen as a process innovation to meet mass customised production, while supporting the operator's well-being in Industry 4.0 (Matheson et al., 2019; Michaelis et al., 2020; Liu & Wang, 2021; Rossato et al., 2021). Well-being in this context refers to improved ergonomics in response to physical and cognitive fatigue experienced by human operators. Human-robot collaboration (HRC) allows humans and Cobots to coexist to carry out tasks and actions providing the balance between automation and flexibility (Calitz et al., 2017; Mautua et al., 2017; Michaelis et al., 2020). The HRC collaboration shows that humans and Cobots interact in close physical proximity, which requires strict safety measures, but reaps benefits in terms of floor space, quality and production efficiency (El Zaatari et al., 2019; Malik et al., 2019). Additionally, research conducted by Oracle revealed that workers showed more trust in robots than managers (Redwood Shores, 2019).

The introduction of Cobots allows organisations to diversify their labour by enhancing native abilities and supports the increasing role of customisation and complexity in the market environment (Harbour & Schmidt, 2018). Diversification of the workforce presents opportunities to acquire competencies, such as programming, which align with Industry 4.0 requirements (Michaelis et al., 2020).

Against this background, Cobots are an industrial development of value-adding and an alternative to traditional robots. This leads to factories, production and cities becoming smart (Varghese & Tandur, 2014), which creates benefits for modern industry, automation and the future of work.

5.4 The growth and impact of Modern Technologies for SMEs

As the market environment becomes more competitive, SMEs are challenged in many aspects of their business and product/process innovation is central as a growth driver. Cobots are integral to the supposition of innovation (Bélanger-Barrette, 2015) and anchored in continuous improvement. SMEs are hesitant to invest in Cobots and automation technologies (Schnell & Holm, 2022). However, the declining costs of Cobots, including the manual labour challenges and trade union pressure, may change the cost of investment in the future (UR, 2022; MCISA, 2017). Notably, a goal of Universal Robots, an international Cobot manufacturer and automation organisation is to make robots accessible to SMEs (UR, 2022).

Process innovation ties into the three aspects of digitisation that are central to Industry 4.0 (Calitz et al., 2017; Geissbauer, 2016). Calitz et al. (2017) and Geissbauer (2016) describe digitisation through a company's operations, its products and services and proximity to clients. Schröder (2016) asserts

that a strong association exists between the company size and the integration and execution of Industry 4.0. The results presented by Schröder (2016) are based on a survey conducted on SMEs in the manufacturing sector and explicitly indicate that large and medium-sized companies are advanced in the integration of automation process innovation compared to small companies.

The benefit of this integration is charged by the assertion that Cobots support human workers by reducing repetitive tasks (Calitz *et al.*, 2017) and interchangeably reducing the presence of defects and entrenching robust safety measures (Tobe, 2015). Equally, companies that leverage Cobots have reported cost savings (Acemoglu & Restrepo, 2018; Hollinger, 2016; Calitz *et al.*, 2017) and this may indicate a sustainable competitive advantage, specifically for SMEs (UR, 2022; Schröder, 2016).

The report by Bélanger-Barrette (2015) discusses an Illinois-based machine shop whose integration of Cobots doubled its production. Similarly, MIT researchers at a BMW factory investigated the effect of Cobots and found that the cooperative process reduced the idle time by 85 percent (Tobe, 2015). This process innovation proves to entrench economies of scale through high-efficiency gains (Schröder, 2016).

Safety and health have surfaced as key challenges in manufacturing environments. Heavy industrial robots are caged to keep humans safe and out of harm (Harbour & Schmidt, 2018). Cobots have changed the traditional work environment as they have integrated sensors, as well as soft and rounded surfaces to minimise the risk of impact, pinching and crushing (UR, 2022). Trust is a vital component in any workplace. Workers must be able to trust their colleagues and their capabilities, top management and the overall organisation to remain productive. In a study conducted by Sadrfaridpour, Saeidi, Wang and Burke (2014), it was concluded that when the robot's performance matches human expectations, the human worker's trust in the robot increases.

Organisations are placing greater focus on their long-term sustainability by developing strategic investments to ensure their endurance and sustainability (Shaw, 2015). Cobots and automation are good examples of an investment that can yield improvements in both sustainability, cost performance and improve competitiveness, however the adoption by SMEs has been slow (Schnell & Holm, 2022). One of the biggest areas that organisations need to address to improve their sustainability performance is product and process innovation. Cobots offer a solution to these organisations due to their high level of flexibility and ability to be programmed to handle many product variations and sizes (International Federation of Robotics, 2017; Harbour & Schmidt, 2018).

Rapid advances in AI will open up new opportunities in various sectors such as healthcare, logistics and services, which need productivity improvements to manage the rapidly growing population (Saidyutivaishnavi, 2021; Skhosana, 2017). Technology will continuously shape the way people work in the future as it has great potential to make improvements in productivity, innovation, global competitiveness and the potential to improve the quality of products and services.

5.5 Theoretical perspective

This paper is guided by the diffusion of innovation theory. The diffusion of innovation theory describes process improvement through innovation and its diffusion within social networks. This theory explains how innovation is accepted by a population. According to Calitz *et al.* (2017) the diffusion of innovation theory is influenced by the innovation-decision process. Diffusion is a social process that occurs among people in response to learning about an innovation with the typical dependent variable being the time to adopt (Dearing & Cox, 2018). This process comprises five stages, namely: knowledge, persuasion, decision, implementation and confirmation (Rogers, 1983). A critique of the diffusion of innovation theory is that it assumes all innovation offers efficiency. However, some innovation may not be a cultural fit and may affect an organisation negatively (Miles, 2012). Diffusion, or the lack thereof, is often well explained by three general sets of variables: the positives and negatives of the innovation, the characteristics of the adopters and social influence (Dearing & Cox, 2018).

6. Research Methodology

6.1 Research design

The aim of this study was to determine the perceptions of the use of AI and Cobots by South African SMEs. The study followed a positivistic research paradigm, which is deductive in nature. The research design was descriptive and the survey research strategy was used to collect the data. A cross-sectional study using a quantitative survey was conducted using a questionnaire. An additional factor, *Modern Technologies* was included in a national study that was conducted amongst SMEs to determine the factors influencing the scalability of SMEs in South Africa. The data were statistically analysed using descriptive and inferential statistics.

6.2 Questionnaire development and sampling data method collection

Primary data for the national survey were collected by respondents completing an online questionnaire and through the use of fieldworkers. The online questionnaire was distributed using various SME databases and organisations, including SME databases of *The Business Place* and *The Nelson Mandela Bay Business Chamber*. The questionnaire included a five-point Likert scale, ranging from 1 - Strongly Disagree to 5 - Strongly Agree. The questionnaire was captured on the survey tool, QuestionPro. The questionnaire was operationalised from literature and included the factor, *Modern Technologies* that was used to determine how SMEs perceive the use of AI and Cobots in South Africa.

6.3 Validity and reliability

Pilot studies are undertaken to determine problems that might compromise the data collection for the study. A pilot study was conducted with three academics and three SME owners. The pilot study was used to test the wording, layout and content of the questionnaire as well as whether the statements in the questionnaire were easy to understand (van Teijlingen & Hundley, 2002). Validity and reliability are essential for academic rigour (Heale & Twycross, 2015). Content validity was ascertained in the pilot study test where academics and a selection of SME owners determined the validity of the statements regarding the content. Cronbach Alpha Coefficient was used to assess the reliability of the factor, *Modern Technologies*, discussed in this paper and was 'excellent' ($\alpha=0.88$).

6.4 Sample

The questionnaires were distributed by an accompanying covering letter that explained the objective of the study and that respondent participation was voluntary. A representative sample of $n = 295$ responses were received. Equally, potential respondents from the organisations mentioned were reminded four times to respond. The sample of 295 comprised of SMEs operating in various sectors predominantly in Nelson Mandela Bay (NMB) and is reflected in Table 1. Purpose and snowball sampling methods were used in this research study. The sampling frame included owners and representatives of SMEs in South Africa. A representative refers to senior managers working in the SME and who can offer insights due to the nature of their role. The respondents ($n=295$) included 72% ($n=211$) SME owners and 28% ($n=84$) managers.

7. Results and Findings

The gender of the participants in the study were 52% male and 48% female (Table 1). The majority of the respondents (79%, $n=233$) were in the age range 26 years to 55 years. The majority of the respondents were Black (47%, $n=134$), followed by White (26%, $n=75$) and only 6% ($n=17$) were Asian. Fifty-five percent ($n=164$) of the respondents had a post-matric qualification and Table 1 further indicates the years the SME was in operation and B-BBEE level. Sixty-nine percent ($n=202$) of the SMEs employed 0 to 10 employees, 38% ($n=86$) were sole proprietors, 40% ($n=90$) Pty (Ltd) and 22% ($n=51$) closed corporations.

Table 1: Biographical data

Gender	Male	Female	Total		
	153 (52%)	142 (48%)	295 (100%)		
Age	18-25 years	26-35 years	36-45 years	46-55 years	56-65+ years
	43 (15%)	72 (24%)	90 (31%)	71 (24%)	19 (6%)
Race	Asian	Black	Coloured	Indian	White
	17 (6%)	134 (47%)	45 (16%)	17 (6%)	75 (26%)
Education	< Matric	Matric	Diploma	Degree	PG Degree
	24 (8%)	107 (36%)	73 (25%)	66 (22%)	25 (8%)
Years in operation	< 1 year	2-3 years	4-5 years	6-15 years	16+ years
	33 (11%)	65 (22%)	70 (24%)	98 (33%)	29 (10%)
Number of employees	< 5	5-10	11-20	21-100	51-200
	117 (40%)	85 (29%)	51 (17%)	74 (25%)	19 (7%)
B-BBEE level	Level 1	Level 2-4	Level 5-8	Non-compliant	
	63 (21%)	76 (25%)	27 (9%)	129 (45%)	
Business registration	Pty (Ltd)	Sole Proprietor		Closed Corporation (CC)	
	90 (40%)	86 (38%)		51 (22%)	

In addition, seventy-two percent (n=123) of the respondents indicated that they own the SME and seventy-three percent (n=214) of the respondents indicated that they have female representation at management level. Sixty-eight percent (n=201) of the SMEs were VAT registered and 87% (n=237) were legal entities. Seventy percent (n=119) said they were profitable and 30% (n=52) indicated they break-even or run at a loss. Sixty-eight percent (n=194) indicated they use social media to promote their business and 81% (n=232) said that social media boosts their business network. Seventy-three percent (n=214) had female representation at management level and 23 SMEs were owned by females.

Table 2 – SMEs per in industry

Industry	Number of respondents (n=295)	(%)
Agriculture, Fishing and Forestry	7	2%
Catering, Accommodation and Other Trade	65	22%
Construction	16	5%
Community, Social and Personal Services	29	10%
Electricity, Gas and Water	5	2%
Finance and Business Services	18	6%
Retail and Motor Trade and Repair Services	89	30%
Transport, Storage and Communications	11	4%
Manufacturing	12	4%
Wholesale Trade	21	7%
Services	22	7%

Table 2 indicates that most respondents were either in the automotive (30%) or hospitality (22%) sector. Nelson Mandela Bay, where the survey was conducted is one of the motor industry hubs of the country. The hospitality sector is important for the South African economy. Nationally the number of people employed in the tourism industry in 2019 was 2,879,330 (Statista, 2022). However, the COVID-19 pandemic had a major impact on the industry.

The respondents were asked where they obtained the startup capital for their businesses. Table 3 indicates that startup capital to fund the SME business was obtained from personal savings (74%), loans from banks (25%) and family and friends (22%). Funding to grow the business were from personal savings (61%) loans from banks (30%), family and friends (16%) and retained income (12%). No access to venture capital funding was recorded. The lack of finance creates growth stagnation. Ogujiuba, et al. (2020) indicate that the South African economy cannot be sustained without developing sustainable SMEs.

Table 3: Business funding (n=295)

Capital obtained	Start-up	Grow business
Personal Savings	74% (n=217)	61% (n=180)
Family and Friends	22% (n=66)	16% (n=47)
Government Financial Agencies	6% (n=18)	9% (n=27)
Government Non-Financial Agencies	1% (n=2)	1% (n=2)
Loans from Banks	25% (n=74)	30% (n=89)
Venture Capitalists	1% (n=4)	2% (n=7)
Micro Financing	2% (n=6)	3% (n=8)
Retained Earnings	n/a	12% (n=35)

Thirty-eight percent (n=114) of the respondents indicated that their businesses were B-BBEE levels 1 to 3 compliant, 18% (n=52) levels 4-8 and 44% (n=129) indicated they were non-compliant (Table 4). Fifty-one percent (n=121) of the SMEs were 100% black owned and 23 respondents indicated that their businesses included female black owners.

Table 4: B-BBEE level and Ownership

B-BBEE level (n=295)		Black Ownership (n=238)		Black Female Ownership (n=67)	
Level 1	21% (n=63)	None	18% (n=42)	None	66% (n=44)
Level 2	7% (n=22)	< 51%	16% (n=39)	<31%	21% (n=9)
Level 3	10% (n=29)	> 50%	15% (n=36)	>30%	13% (n=14)
Levels 4-8	18% (n=52)	100%	51% (n=121)		
Non-compliant	44% (n=129)				

Table 5 provides an overview of the general perception of the sample of 295 SMEs surveyed and shows that of the 295 SMEs only 91 (31%) indicate a positive (Agree or Totally Agree) perception of AI and Cobot technologies. The results in the table link to the assertion made by researchers (Schnell & Holm, 2022; Calitz et al., 2017; Schröder, 2016) regarding the general unwillingness of SMEs to make large investments and integration in modern technologies. The lack of knowledge of the use of modern technologies is very evident from the results in Table 4. AI and Cobots would enhance and improve SMEs performance, however a lot of work must be done for them to realise the benefits (Schnell & Holm, 2022).

Table 5: Frequency distribution – Modern Technologies (n=295)

Items	μ (S.D)	Disagree		Neutral		Agree	
		n	%	n	%	n	%
I am aware of AI and Cobots and their benefits	2,81 (1.22)	111	38%	93	32%	91	31%
I know of businesses that are using AI and Cobots	2,61 (1.18)	145	49%	78	26%	72	24%
In our SME we have discussed the use of AI and Cobots	2,26 (1.04)	176	60%	90	31%	29	10%
AI and Cobots could be effective in our business	2,73 (1.14)	116	39%	109	37%	70	24%
AI and Cobots could solve labour problems	2,82 (1.10)	98	33%	124	42%	73	25%
AI and Cobots could make our business more profitable	2,89 (1.14)	92	31%	126	43%	77	26%

The ANOVA statistical analysis results (Table 6) did not indicate any statistical differences ($p < .0005$) for the biographical variables for the factor Modern Technologies.

Table 6: Univariate ANOVA Results – Modern Technologies

Effect	F-value	D.F.	p-value	Cohen's d
Gender	1,04	1; 270	,309	n/a
Age	0,60	4; 270	,662	n/a
Race	2,76	4; 270	,028	n/a
Education	0,44	4; 270	,778	n/a
VAT registered	0,95	1; 287	,331	n/a
Legal entity	1,13	1; 287	,290	n/a

8. Managerial Implications

This study attempts to examine the perception of the use of AI and Cobots technologies by SMEs in a developing economy. Academic literature indicated that AI and Cobots as innovation drivers towards achieving a sustainable competitive advantage for SMEs (Ogujiuba et al., 2020; Schnell & Holm, 2022). Notably the implications of limiting product, process and business model innovation strain economic growth. On the other hand, automation develops a displacement effect on the labour market as it reduces the demand for labour and wages (Acemoglu & Restrepo, 2018). Acemoglu and Restrepo (2018:1) also highlight that a countervailing force against automation exists. This is characterised by the deepening of labour intensive tasks to increase the labour share, thus, balancing the impact of automation.

Calitz *et al.* (2017) highlight that SMEs are hesitant to invest in AI and Cobot technologies. Equally, small companies are noted to be slow to integrate automation process innovation (Schröder, 2016) in their business models. SMEs need to rethink their strategy and upgrade their workforce by focusing on skills and not just certification. The embracing of digitisation requires lifelong learning. Technology-enabled jobs will require higher skills levels and greater application of expertise and management, which will necessitate a significant investment in human capital (Rajagopaul, Chui & Singh, 2019). The technology gains through improvement in productivity and strategic infrastructure would improve the country's productivity and GDP. The generic objective of maximising reward should drive the behaviour (Silver, Singh, Precup & Sutton, 2021). The 'rewards' of digitisation need to be explained to SME management and the adoption thereof encouraged.

AI and Cobot technologies in SMEs require comparative research and a longitudinal study to afford external validity. Guided by the concept of sustainable development, competitive advantage and the diffusion of innovation theory, this study hypothesised that AI and Cobot implementation have the potential to make improvements in productivity, innovation, global competitiveness and improve quality of products and services.

The study by Calitz *et al.* (2017) states that the reduction in Cobot costs and the current labour challenges will change the adoption of Cobots over the next five years. Calitz *et al.* (2017) and Tobe (2015) advocate that SMEs represent over 6 million businesses worldwide. For this reason, SMEs are predicted to drive the installation of Cobots and the use of AI enabled technologies. This assertion also aligns to the goals of Universal Robots (UR, 2022) of making robot technology accessible and affordable for SMEs.

9. Conclusions, Limitation and Future research

Modern technologies, such as AI, RPA and the use of Cobots are increasingly being used in organisations world wide. SMEs are forced to accept digital transformation and have to automate business processes and functions to remain sustainable and competitive (Ogujiuba et al., 2020). SMEs are however slow to adopt new technologies, such as AI, PRA and Cobots in business processes (Poisat et al., 2021; Schnell & Holm, 2022). The South African workforce consists of mainly semi-skilled workers and one of the drivers of modern technology adoption is to reduce repetitive tasks and increase operational efficiency using AI and Cobots (Harbour & Schmidt, 2018; Calitz et al., 2017).

The results from the study indicate that SMEs may lack knowledge or exposure to AI and Cobot technologies and the economies of scale entrenched in deploying them for productivity gains. The theory used within this paper is underpinned by the diffusion of innovation theory and offers a fundamental critique that relates to the innovation decision process (Dearing & Cox, 2018). In terms of the variables that affect diffusion, it appears that the benefits of digitisation have not been convincing for SMEs in this study and that the characteristics of the adopters do not favour the adoption of new technologies. Education and training regarding new technologies and their benefits need to be initiated so that the SMEs can be competitive and benefit from new technology adoption.

Education, training and re-skilling of workers were identified as important factors for the introduction of Cobots (Poisat et al., 2021). Poisat et al. (2021) further indicated that retrenchment and unemployment did not feature as a major theme in their study. Industrial workers with first-hand robot experience had more positive perceptions regarding the benefits that robots can bring and their possibility of creating new jobs (Schneiders & Papachristos, 2022). Therefore SMEs have to consider these technologies, for if they do not keep up with development, workers may be out of a job soon. The costs of introducing AI and Cobot technologies remains a challenge.

While this paper attempted to determine the perceptions of SMEs regarding the use of AI and Cobot technologies, there are several limitations to consider. The research was conducted in South Africa just before the COVID-19 pandemic period and the majority of the respondents were from the Eastern Cape province. It is important to exercise caution when generalising the results as a more representative sample from other regions in South Africa must be obtained. Future research may attempt to explicate factors like the innovation decision process to induce the implementation of AI and Cobot technologies as a limiting variable. In addition, the best business practices and lessons learned by the automotive manufacturers who have successfully implemented collaborative work environments in Africa need to be explored. Future research should include the adoption or perception of modern technologies by the different sectors.

Exploring The Impact Of Industry 4.0 Technologies On Mining Logistics

Mr Charndre Wynton Erens¹, Dr Peter John Kilbourn^{2,*}, Ms. Hemisha Makan³

¹⁻³ Department of Transport and Supply Chain Management, University of Johannesburg, Johannesburg, South Africa

Keywords

Industry 4.0; Technology adoption; Mining-industry; Mining logistics; Big Data Analytics; Blockchain; Internet of Things; 3D Printing; Artificial intelligence

Abstract

In recent years, the costs of performing logistics activities have increased globally. Industry 4.0 technologies are being implemented within the logistics sector on a global scale to reduce costs and optimise logistics functions. Technologies such as Big Data Analytics, 3D Printing, Artificial Intelligence, Robotics, Cloud Computing, and the Internet of Things have all been identified as crucial Industry 4.0 technologies set to impact logistics systems in various ways.

The South African mining industry is critical from a Gross Domestic Product (GDP) and employment perspective, and it is important for the country that it performs effectively and efficiently. The mining industry is, however, characterised by traditional processes and a lack of technological innovations. To that end, the industry's logistical capabilities are not advanced compared to other sectors. The successful implementation of Industry 4.0 technologies could significantly contribute to the performance of the mining industry's logistics systems. However, limited research has been conducted on the use and impact of Industry 4.0 technologies in the South African mining industry. Therefore, this study aims to explore the potential impact of key Industry 4.0 technologies on logistics within the mining industry, with a specific focus on the critical logistics functions of transportation, inventory, and warehouse management.

1. Background

Over the past decade, organisations within the supply chain have been confronted with myriads of changes and complexities. Globalisation and technological advancements have been the key drivers of these changes. In addition, there have been vital changes to consumer behaviour resulting in an exponential increase in customer demands for goods and services. The growth in the need and demand for various products has resulted in a dire need for changes in processes within the supply chain to rapidly satisfy these demands (Makan & Heyns, 2018). Furthermore, to gain a competitive advantage, organisations within the supply chain are mass producing, which has caused an intensification in demand for natural resources as well as a surge in the cost and need for logistical services such as warehousing, transportation, and inventory management (Makan et al., 2018; Skapinyecz, Illés, & Bányai, 2018).

A study conducted by Langley Jr. and Penske Logistics (2019) illustrates the logistics cost within various industries, including fast-moving consumable goods (FMCG), retail and energy and extraction (mining). Their study explicitly displays the increase in logistics cost at approximately 10% of revenue in 2019. Reducing logistic costs has become a global trend, and leaders within the logistics industry are attempting to attain operational excellence by adopting advanced technologies to streamline processes (Bag, Wood, Xu, Dhamija & Kayikci, 2020). When looking at South Africa, it is notable that the logistics cost ratio to Gross Domestic Product (GDP) is significantly higher due to having smaller economies and the travelling distance between trading partners is much longer

*Corresponding Author

² E-mail address: pkilbourn@uj.ac.za

(Netherlands Enterprise Agency, 2020). The logistics cost within the mining industry is high, amounting to approximately R56 billion in costs associated with transportation, warehousing, and inventory management (Havenga, 2015).

According to Arnoldi (2019), mining is an important industry when considering South Africa's future economic growth. The industry employed approximately 456 438 people in 2018 and has an enormous proportion of foreign direct investment (FDI) (Minerals Council South Africa, 2019). Furthermore, in 2018, the industry provided R91 billion in direct fixed investment to advance the South African economy and its infrastructure (Minerals Council South Africa, 2019). Like other industries, logistical functions relating to transportation, warehousing and inventory management are also used within mining operations. They are a crucial function when observing the success or failure of operations within the mining supply chain and logistics (Zuñiga, Wuest & Thoben, 2015). On average, 11% of the revenue that is gained by the mining industry is used to cover the cost associated with logistical functions (FSE, 2018). This cost illustrates the substantial amounts paid for logistics function within the mining sectors, especially since logistics is seen as merely an ad-hoc function within mining. Reducing these costs can be challenging.

In addition, operations within the mining industry are conducted in a traditional siloed approach with a lack of integration between departments. The resultant effect of this is that there are inefficiencies within operations. These barriers can be overcome by implementing advanced technologies (Gorner, Kudar, Mori, Reiter & Samek, 2020). In a study conducted by Connell (2019), utilising Industry 4.0 technologies provides the mining industry with an opportunity to uncover value-driven opportunities. As such, this study aims to explore Industry 4.0 technologies in the logistical functions relating to transportation, warehousing, and inventory management within the South African mining industry, as well as the possible benefits and challenges experienced.

2. Literature review

The 21st century has brought about numerous changes in how organisations operate. As such, achieving overall objectives requires organisations and industries to embrace technological advancements which have been considered a developmental change factor (Vitez, 2019). Technology has also altered how consumers behave and their need for instant gratification. In a study by Barreto, Amaral and Pereira (2017), it is observed that with technological development, customer demands are increasingly dynamic, forming new service delivery challenges for organisations. These changes in customer behaviour have been considered one of the critical drivers of logistics system changes (Yin, Stecke & Li, 2018). The changes and escalation in demand for goods and resources have also resulted in economic growth globally. A study conducted by Chakamera and Pisa (2021) explicitly reveals that servicing these demands requires an efficient and agile logistics function and network.

Focus has been placed on the South African mining industry and its logistical functions as it is seen as a key global player (Sikhakhane, 2012). On that account, it is imperative to understand the role of the South African mining industries and the impact that Industry 4.0 have on the logistical function within the industry. According to Vegter (2019), South Africa is the world's largest producer of manganese, chromium and platinum; the second largest producer of palladium, the fifth largest exporter of coal and the third largest exporter of iron ore.

In addition to the above, the industry makes a substantial contribution to the South African GDP. On average, the mining industry contributes 8.3% to the GDP and obtains export revenue of more than 40% (Minerals Council South Africa, 2020). In 2016, the GDP had a downward trend and dropped to 6th place due to an increase in operational cost and a decrease in demand (Minerals Council South Africa, 2017). This decline could result from the lack of technological advancement within the industry attributed to challenges such as siloed processes, lack of investment and low commodity prices (Minerals Council South Africa, 2017). The mining industry is faced with numerous other challenges that hinder the industry from meeting its objective, predominately concerning its logistical functions, and reducing its costs.

2.1 Logistics within the mining industry

Logistics plays a pivotal role within many industries, including mining. Logistics aims to improve efficiency and effectiveness within organizations' activities. This means having seamless information flow and appropriate management of materials that ultimately lead to enhanced operational performance and competitive advantage. In addition, through proper management of inventory, transportation and warehousing operations, the logistical cost can be reduced. In South Africa, the importance of logistics is highlighted by the sum spent on logistics cost, which is 11.8% of the country's GDP (Havenga, Simpson King, de Bod & Braun, 2016). As per Bester (2022), logistics costs represent a substantial percentage of total delivered costs, and the disadvantage is that most South African mining industries are far from port, approximately 1000 km away. In addition, mining industries within South Africa are dependent on exports and imports. They rely on logistic functions that deliver, maintain and warehouse parts and components efficiently and effectively (Yaping & Bossman, 2021).

Transportation is a non-value-adding activity, consuming excessive resources and money (Farquharson, Mageto & Mekan, 2021; Shao, Xu & Li, 2019). Further to the above, freight transport is faced with numerous challenges such as safety, quality, flexibility, reliability, punctuality, and efficiency, which has created a need for efficient transport management at a lower cost (Farquharson, et al., 2021). This is supported by Schönsleben (2016), who clearly states that effective and efficient transportation management will have a favourable impact on performance by decreasing costs.

In a report produced by PWC (2019), operating costs within the mining industry in 2019 increased by 8% compared to the previous year and transportation costs represented 8% of the composition of the operating cost amounting to R27 billion. The indicated amount is magnanimous and may be reduced, using technological advancements, thereby creating an efficient logistical operation (PWC, 2019). It is noteworthy that warehousing management and inventory functions are directly impacted by transportation. For this reason, it is vital that value-adding strategies are implemented so that execution of product movement from origin to destination is done effectively and efficiently.

Managing warehousing processes is fundamental due to the impact it has on logistics performance, and for this reason, it must be managed together with transportation costs. Implementing proper warehouse management processes ensures a seamless flow of activities and products, enhances inventory management, and indirectly decreases transportation costs.

Inventory management's role is to ensure that the business maintains the desired stock level (Oluwaseyi, Onifade & Odeyinka, 2017). Inventory management impacts the organization's financial performance since sourcing, transporting, and storing inventory incurs costs (Markou & Corsten, 2021). Optimising and managing inventory as part of the overall logistics function and cost is essential (Öztürk, & Vergili, 2018). Between 2018 and 2019, a significant increase in production within the mining industry resulted in an increase in inventory cost, which negatively affected the logistics cost (PWC, 2019). The inventory cost increased from R67 billion to R78 billion, constituting an 11% increase in costs.

Taking the above into consideration, it is evident that the mining industry is inundated with these problems. Additionally, limited technological advancements to manage logistics have resulted in the industry losing valuable opportunities to improve its financial objective and logistical performance (MacDonald, 2020).

2.2 Logistics challenges within the mining industry

Technological advancement within the mining industry in South Africa is limited, and as a result, managing processes pertaining to warehousing transportation and inventory is challenging (Sánchez & Hartlieb, 2020). These complexities are further intensified due to operational challenges face internally and externally. One such challenge is when products are delivered late, incorrect, or short leading to an increase in excess stock, which may become obsolete and thus cause unwanted

inventory costs (Thuynsma, 2015). Also, manual entries of critical documentation and mismanagement of master data resulting in inaccuracies are challenges faced by the industry (Singh, van Sinderen & Wieringa, 2017).

It is also seen that transportation, warehousing and inventory management are managed by individual mine personnel leading to a lack of visibility and control of processes (Trace, 2017). A study by Isherwood (2013), found that 75% of the executives within the mining industry expressed that visibility caused by siloed approaches was a major challenge. Also, reliance on manual systems such as using spreadsheets to manage logistic processes has been seen as time-consuming due to input errors. Mengistu (2016) stated that errors in spreadsheets are often undetected, leading to flawed and uninformed operational decisions.

Additionally, heavy reliance on spreadsheets can deter the process making it an arduous task to determine the operational performance accuracy (Mengistu, 2016; Gomez, 2021). This ultimately results in penalties pertaining to contractual quality as well as lost opportunities in improving logistical functions. However, implementing Industry 4.0 technology can potentially enhance logistical processes within the mining industry.

2.3 Industry 4.0 and its impact on logistical functions

There has been a revolution in how organisations operate within the supply chain. The change can be attributed to the implementation of Industry 4.0 technologies. Industry 4.0 is regarded as a “mandatory change catalyst”, outlined by digitalisation and automation of organizational processes. Organisations focusing on continuous improvement and research and development acknowledge Industry 4.0, thereby gaining a competitive advantage (Marcos, Suárez, Marcos, Fernández-Miranda, Marcos, Peralta, & Aguayo, 2017). Industry 4.0 technologies such as Big Data Analytics, interconnectivity via machines and human-to-machine interfaces, Internet of Things (IoT), 3D printing, automation, artificial intelligence (AI), and augmented reality bring about innovative disruptions (Marr, 2021; Rabah, 2018). Introducing these technologies within logistics is imperative considering the escalation in global demand for logistics to goods and services efficiently and effectively (Kache & Seuring, 2017; Barata, Rupino Da Cunha & Stal, 2018).

According to Oztemel and Gursev (2020), digitalisation of the logistics network can result in a paradigm shift from a traditional logistical activity to one that is technologically advanced with an interconnected intelligent network that can enhance efficiencies and processes. Amalgamating the physical and digital environment initiates innovation by collecting, transforming, and using data in collaboration with AI and business analytic tools, thereby producing optimized business solutions (Reinartz, Wiegand & Imschloss, 2019). Introducing Industry 4.0 within the logistical processes brings about numerous advantages such as the availability of real-time information, enhanced operational efficiency, improved safety, collaborative planning and execution and advanced logistics network design (Ardito, Petruzzelli, Panniello & Garavelli, 2019; Ghobakhloo & Ching, 2019). Applying Industry 4.0 technologies can also automate logistical functions within the mining industry, thus creating an efficient and effective digital and physical platform. This would create an opportunity for mining houses to reduce waste and become industry leaders (Bechtsis, Tsolakis, Vlachos & Srail, 2018).

As previously stated, transportation, warehousing and inventory are important logistical components within the mining industry with huge cost implications. Improving these functions using Industry 4.0 technologies is paramount. Warehousing plays a pivotal role in logistics because it is the essential hub in the flow and storage of goods. Embracing Industry 4.0 can initiate intelligent warehousing solutions which can transform the way the industry meets future needs (Schrauf & Bertram, 2016). Warehouse management systems (WMS) supplemented with Industry 4.0 technologies, bring about numerous advantages such as (Barreto, et al., 2017):

- Combining WMS with the transport function will bring about information sharing about product arrival times, allowing the warehouse to prepare and optimise just-in-time and just-in-sequence deliveries.
- Visibility of inbound and outbound shipments can be created using Radio Frequency Identification (RFID), utilising track and trace data. In addition, using RFID and an intelligent sensor will enable real-time visibility of inventory levels, averting out-of-stock situations and stock losses and preventing loss of sales and unnecessary costs.
- WMS, in conjunction with Automated Replenishment (AR), can improve slotting, picking, and staging activities, ultimately improving productivity levels.

To reiterate, transportation cost within the mining industry is seen as the most significant operational expense, and as such, implementing innovative technology can assist in reducing cost. According to Santos and Piva (2020), a key asset within transportation is Transport Management System (TMS). Integrating TMS with Order Management Systems and WMS enables end-to-end visibility across the mining value chain (Li & Zhao, 2019). In addition, using TMS with the Internet of Things (IoT) allows operational effectiveness and cost savings by utilising data to provide load configuration and optimise route scheduling (Wanganoo & Patil, 2020).

Inventory as a logistics function includes raw material, work in process (WIP) and finished goods, which are moved through the value chain using warehousing and transportation functions. Inefficiencies in inventory management can be a risk without proper optimisation of inventory, and as such, the need for intelligent technology is fundamental to reducing cost while simultaneously meeting supply and demand (Singh & Verma, 2018; Silver, Pyke & Thomas, 2016).

2.4 Industry 4.0 Technologies

Literature has identified numerous Industry 4.0 technologies, some of which are more prominent and are likely to impact logistics (Tay, Lee, Hamid & Ahmad, 2018; Bai, Dallasega, Orzes, & Sarkis, 2020; Sishi, & Telukdarie, 2020).

2.4.1 Internet of things (IoT)

IoT is an Industry 4.0 technology that enables “object-to-object” communication by connecting physical objects, systems, and services (Zhong, Xu, Klotz, & Newman, 2017). The implementation of IoT technology within logistics has resulted in the progression of intelligent packing processes, storage pallets, packaging methods, material handling equipment (MHE), warehousing storage and containers (Radivojević, Bjelić & Popović, 2017). Implementing IoT technologies and integrating this with suppliers and 3PLs who provide transportation, warehousing, and inventory management services can result in improved efficiency and end-to-end logistics functions within the South African mining industry (de Vass, Shee & Miah, 2021).

2.4.2 Big Data Analytics

Big Data Analytics allows the storing, communication, interpretation, and analysis of data, enabling decision-making and business systems that enhance efficiency throughout the value chain (Wang, Gunasekaran, Ngai & Papadopoulos, 2016). The use of Big Data Analytics facilitates sharing of information such that logistical functions of forecasting, planning and network optimisation are supported efficiently (Ilin, Simić, & Saulić, 2019). From a study by Raman, Patwa, Niranjana, Ranjan, Moorthy and Mehta (2018), it is observable that Big Data Analytics within the mining industry can foresee any disruptions in the supply of components predict demand, assess warehousing and transportation requirements, and monitor and forecast inventory.

2.4.3 Cloud Computing

Cloud computing allows users to access the internet from numerous devices without usage, capability or capacity constraints. Cloud systems measure and monitor the resource usage rate, which can discern inefficiencies, thereby introducing corrective action to improve and optimise problem areas (Mladenović, 2018). The advantage of having Cloud computing within logistics is that it provides

flexible and efficient access to information technology services and presents an opportunity to implement value-added, innovative solutions within the supply chain. As such, the mining industry will save a significant portion of cost due to not having to invest in expensive software and hardware infrastructure to manage transportation, warehousing, and inventory management (Mladenović, 2018).

2.4.4 Artificial Intelligence (AI)

According to Popenici and Kerr (2017), AI refers to "computing systems that can engage in human-like processes such as learning, adapting, synthesising, self-correction and use of data for complex processing tasks". AI is essential to the future of logistics, primarily due to the rising uncertainties in customer demands (Plastino & Purdy, 2018). By implementing AI, organisations can forecast and plan routing and scheduling activities and future warehousing and inventory location planning (Boute & Udenio, 2021).

2.4.5 Blockchain

Blockchain as per Viriyasitavat and Hoonsopon (2019) is defined as, "A technology that enables immutability, and integrity of data in which a record of transactions made in a system is maintained across several distributed nodes that are linked in a peer-to-peer network". The mining industry suffers from inefficiencies, lack of transparency and traceability which leads to a dire need for improvements in processes. Blockchain as an emerging technology is seen as a possible solution to improve inefficiency and provide transparency within the supply chain (Loklindt, 2017:5). Additionally, blockchain emerged as one of the top 10 strategic technology trends for 2017 which "promises a model to add trust to untrusted environments and reduce business friction by providing transparent access to the information in the chain" (Gartner, 2016).

2.4.6 3D Printing

3D printing, as per Shahrubudin, Lee and Ramlan (2019), is defined as "digital fabrication technology or additive manufacturing, which creates physical objects from a geometrical representation by successive addition of materials". The creation of three-dimensional objects is possible with 3D printing technology, and when implemented within the mining industry, the focus is on spares and components (Xu, Rodgers & Guo, 2021). Leonida (2019) expressed that by 3D printing spare parts within the mining industry, sustainable logistics efficiencies are achieved because of lower inventory costs.

2.4.7 Robotics

Rosenthal, Selvaraj and Veloso (2016), define autonomous robotics as "service robots which autonomously generate and execute plans to successfully perform tasks for humans, appropriately handling the uncertainty of their surroundings". Within the logistics sector, robotic brings about numerous benefits which includes increased safety levels, reduced errors, enhanced quality of goods, optimised labour, improvements in operational service levels and reduction in cost (Radivojević & Milosavljević, 2019). By introducing robotics within the mining sector, large warehouse and storages yards can be managed in a safe and efficient manner. Moreover, the movements of goods can be supervised and controlled smartly resulting in stock accuracy and increasing visibility.

2.5 Industry 4.0: Benefits for Logistics

Implementing Industry 4.0 within logistics brings numerous benefits such as customization, agility, accuracy, and efficiency.

2.5.1 Customisation

Having a diverse range of procedures and process packages such as mass customization, micro-segmentation, and advanced scheduling allows companies to provide customers with varied choices that assist in resolving logistical problems. Orders placed by customers can be completed by implementing digitized warehousing solutions and using delivery techniques such as drones (Zawadzki & Żywicki, 2016; Hofmann & Rüscher, 2017; Ghobakhloo, 2018).

2.5.2 Agility

Industry 4.0 technology assists in real-time planning that improves an organization's competitiveness (Oztemel & Gursev, 2020). By utilising technologies such as Big Data Analytics and demand planning, organisations can predict customer demands, simplifying transport routing and scheduling, warehousing functions, and inventory management (Barreto, et al., 2017).

2.5.3 Accuracy

Accuracy within logistics is paramount and can be achieved through Industry 4.0 technologies. Real-time information, accuracy and consistency in data, promoting end-to-end visibility, are obtained by Industry 4.0 technologies (Miragliotta, Sianesi, Convertini & Distanto, 2018). Organisations can access high-level customer services information and critical measurements such as on-time-in-full, including live vehicle and inventory tracking (Ghadge, Kara, Moradlou & Goswami, 2020).

2.5.4 Efficiency

Automating physical tasks and seamlessly sharing information across the value chain can strengthen logistical functions (Pereira & Romero, 2017). The logistical cost can be reduced by sharing data across the supply chain using Industry 4.0 technologies and ensuring visibility and transparency. This ultimately enhances the logistical function, creating an efficient logistic network (Ghadge et al., 2020). Although there are numerous benefits from implementing Industry 4.0 technologies, challenges are also experienced.

2.6 Industry 4.0: Challenges for Logistics

Implementing Industry 4.0 technologies can be complex due to numerous challenges that are encountered. Common challenges include lack of management support, legal issues, resistance to change, a lack of expertise, and financial constraints because huge investments are required (Glas & Kleemann, 2016; Luthra & Mangla, 2018; Ghadge et al., 2020).

2.6.1 Lack of management support

The absence of management support can make implementing Industry 4.0 a problematic task (Gökalp, Sener & Eren, 2017). Collaboration amongst management is essential when implementing Industry 4.0 within logistics. Collaboration provides unified decision-making and breaks down silo practices leading to efficiency.

2.6.2 Legal issues

Cyber security risk is a considerable concern when implementing Industry 4.0 technologies, primarily since critical data and information are being transacted. As such, one should pay attention to security, and privacy needs when introducing Industry 4.0 technologies (Müller, Dotzauer & Voigt 2017; Kamble, Gunasekaran & Sharmac, 2018).

2.6.3 Resistance to change

Embracing Industry 4.0 is a global challenge for organisations due to uncertainty and not having the correct knowledge of what benefits digitisation brings. This result in an unwillingness by organisation to implement Industry 4.0 (Müller, Maier, Veile & Voigt, 2017; Theorin, Bengtsson, Provost, Lieder, Johnson, Lundholm & Lennartson, 2017). Globalised business networks have reformed the way organisations operate, creating increasing complexities. Limited expertise in dealing with global information and advanced technologies increases the hesitancy to adopt Industry 4.0 (Ras, Wild, Stahl & Baudet, 2017).

2.6.4 Lack of expertise

Literature about the exploration of Industry 4.0 within the mining industry is limited, leading to a need for focused research to discover and expand the concept (Almada-Lobo, 2015; Hofmann, et al., 2017). Further literature in this field can assist the industry in building a framework for emerging Industry 4.0 logistics solutions. Traditional business processes cannot handle Industry 4.0 technologies, so industry leaders must consider advanced innovation for future business developments

(Sung, 2018). Within the mining industry, traditional business approaches are used, and due to the lack of adequate expertise, implementing Industry 4.0 technologies in logistics can be a risk.

2.6.5 Financial constraints

Implementing Industry 4.0 technologies require considerable capital investments and are deemed a major challenge. Developing high-tech infrastructure to obtain sustainable results requires significant capital and needs to be considered before implementing Industry 4.0 within logistics functions (Theorin, et al., 2017; Nicoletti, 2018). Due to the limited knowledge relating to the cost-benefit analysis of technology implementations, investing in advanced technology is seen as a major challenge when adopting Industry 4.0 technologies in logistics (Arnold, Kiel & Voigt, 2016).

3. Research gap

Literature related to Industry 4.0 technologies within the mining industry is limited. Databases used to obtain information pertaining to this study were Google scholar, Taylor and Francis, SCOPUS, Elsevier, Emerald, and Science Direct. SCOPUS search provided few results, while Google scholar provided limited research about the mining industry within South Africa with a core focus on green supply chain management. There were no studies on the implementation of Industry 4.0 technology within the logistical function in the South African mining industry.

4. Research problem statement

Changes within the global economy have resulted in a transformation in organisational processes. The advent of Industry 4.0 has created a need for changes within the supply chain and logistics function to provide efficiency throughout its operations (Pfohl, Yahsi & Kurnaz, 2015). To encourage innovation and implementation of advanced technologies within the mining industry, leadership must embrace them to meet their operational and functional goals and objectives (Löow, Abrahamsson, & Johansson, 2019). Due to limited research about this topic, a literature gap currently exists. As such, the problem statement for this research is:

The mining supply chain, specifically its logistical functions, is characterised by traditional processes. Due to the lack of technological innovations, the logistical capabilities are not advanced compared to other industries. Limited research exists regarding the potential impact of Industry 4.0 on logistics functions within the mining industries in South Africa. This demonstrates a gap in research hence a need to undertake this study.

5. Research question and objectives

5.1 Research question

What is the potential impact the implementation of Industry 4.0 technologies has on logistics within the South African mining industry?

5.2 Research Objectives

The primary objective was to investigate the potential impact of Industry 4.0 technologies on logistics functions within the South African mining industry.

The secondary objectives of this study are as follows:

- To explore which Industry 4.0 technologies, have the most significant potential impact on logistics functions within the mining industry.
- To explore the possible impact Industry 4.0 technologies may have on the efficiency and effectiveness of transportation, warehousing, and inventory management.
- To explore which Industry 4.0 technologies are most likely to be adopted in the South African mining industry
- To explore the potential benefits of the South African mining industry in implementing Industry 4.0 technologies in logistics functions.
- To explore the challenges faced within the South African mining industry in implementing Industry 4.0 technologies in logistics functions.

6. Research methodology

6.1 Data sample and collection

To collect rich textual data relevant to the study objectives, this study followed a qualitative method using semi-structured interview guides with open-ended questions. The target population consisted of experienced executives in the South African mining industry with knowledge of logistics management. The researchers used a purposive sampling strategy to select a sample of ten participants, which can be regarded as an adequate sample for establishing a consensus in a qualitative study (Kim, Brenner, Liang & Asay, 2003; Malterud, Siersma & Guassora, 2016). Participants were selected based on a requirement that they possess logistics management experience in the South African mining industry, including experience in transportation, warehousing, and inventory management, which are key focus areas of this study. Table 1 provides a list of study participants.

Table 1: List of study participants

Participant Number/(Code)	Participant position	Work responsibility of the participant
Participant 1 (P1)	Head of Supply Chain	Supply chain strategy development and implementation
Participant 2 (P2)	Data Scientist (Supply Chain)	Managing supply chain data sources and Enterprise Resource Planning (ERP) functionality
Participant 3 (P3)	Inventory Manager	Managing all inventory at a mine and in the mining supply chain. Developing inventory policies and ensuring inventory optimisation. Ensuring that service levels are provided as agreed with customers
Participant 4 (P4)	Regional Logistics Manager	Managing all logistical activities related to transportation, warehousing and inventory management for the region
Participant 5 (P5)	Regional Logistics Manager (Optimisation)	Ensuring the continuous improvement and optimisation of the logistics function of the mine
Participant 6 (P6)	Transportation Manager	Coordinating and planning transportation between mines, distribution centres and other facilities within the supply chain network
Participant 7 (P7)	Head of Logistics	Overseeing the operations of the logistics department across each mine site and between nodes in the supply chain network. Managing the logistics system including procurement and supplier relationships
Participant 8 (P8)	Head of Strategy and Systems	Ensuring that the strategy developed by the Group Head of Supply Chain is implemented by every supply chain function. Ensuring that information systems can provide optimal support to logistics activities
Participant 9 (P9)	Project Manager (Supply Chain)	Overseeing and managing key logistics projects within the Logistics Department
Participant 10 (P10)	Mine Supply Chain Manager	Overseeing all logistics functions within a mining organisation
Total Number of Participants	10	

Source: Own compilation

At the time of the study, South Africans were placed under COVID-19-induced lockdown regulations with limited contact between people. Since face-to-face interaction was not deemed safe, this study used an alternative method of conducting interviews. Audio-recorded interviews via the Microsoft Teams software were used, and the sessions were recorded with participants' permission. The recordings were used to transcribe participants' responses to Microsoft Word documents. Using electronic communications platforms to conduct interviews is a valid qualitative research strategy (Panda, O'Malley, Barry, Vallejo & Smith, 2021). The data were collected during November 2021.

6.2 Research rigour

A trustworthy study is ensured by meeting the criteria of “credibility” and “dependability” (Moon, Brewer, Januchowski-Hartley, Adams & Blackman, 2016). To ensure credibility of this research, participants were well briefed on the questions to ensure they understood the Industry 4.0 construct and related technologies in the context of the study purpose. In addition, research credibility was supported by the fact that a purposive sampling method was carefully implemented as advised by Onwuegbuzie and Leech (2007) to ensure that all the participants had the requisite experience and knowledge to contribute to the study. This ensured relevant and comprehensive responses would be provided.

To ensure dependability, researchers examined the responses from the participants and the findings against relevant literature as prescribed by Ary, Jacobs, Razavieh and Sorensen (2010). Furthermore, notes were kept for comparison purposes concerning any changes made in coding decisions and conclusions (Ary et al., 2010).

6.3 Data analysis

Data were analysed following a thematic analysis approach to identify patterns and themes. Thematic analysis is an effective method to use when attempting to understand a set of experiences and thoughts across a data set (Braun & Clarke, 2012). Themes and categories develop as patterns emerge through the recurring appearance of codes (Theron, 2015). Relevant thematic codes were identified by constantly examining themes and cross-checking these by referencing the individual transcripts against the collective data set. Thereafter, linkages between themes and literature were made. This study followed a six-step approach in the thematic data analysis process. Figure 1 outlines the steps followed in the analysis process.

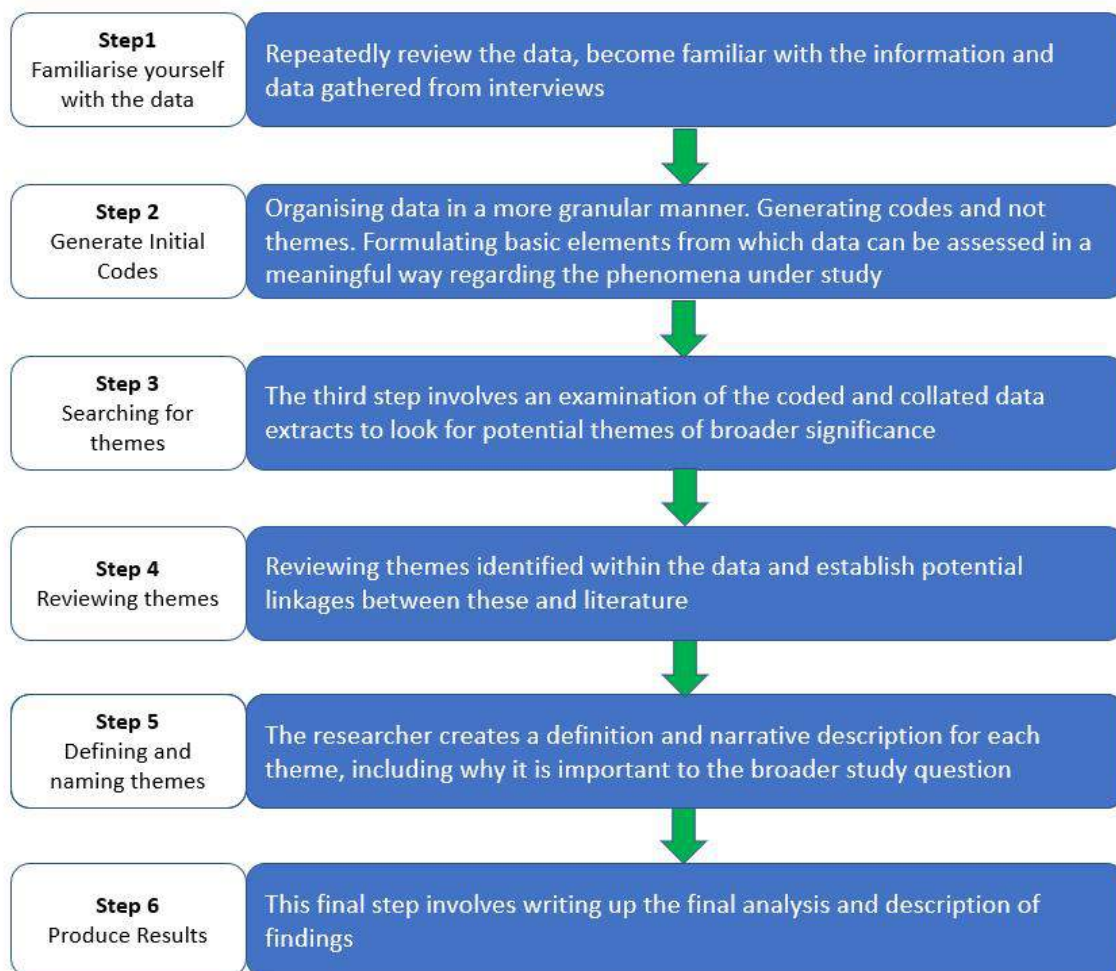

Figure 1: Data Analysis Approach using Thematic Analysis
Source: Adapted from Kiger & Varpio (2020)

6.4 Research ethics

Ethical clearance was obtained through the affiliated university's ethical clearance committee as per the respective university's Code of Academic and Research Ethics policy. All participants were informed of their rights in the research process, and that participation in the study was voluntary. To that end, participants were requested to complete a consent form. Furthermore, all participants were informed of the purpose, scope, and timeline of the study. Participants were also ensured of anonymity in the reporting of results and that confidentiality would be upheld in conducting the study.

The identities of participants were protected in the collection and analysis of data and the reporting of findings by referring to them in digital sequential naming, with a number affixed to the relevant participant when quoting responses. The recruitment of participants concluded once data saturation was obtained.

7. Results

The subsequent section provides an analysis of the results structured in accordance with the research objectives.

7.1 Industry 4.0 technologies with the greatest potential impact on mining logistics functions

The following technologies emerged as having the most significant potential to affect mining logistics; Big Data Analytics, 3D Printing, Blockchain, Robotics, and the Internet of Things (IoT). Big Data Analytics was supported by most participants predominantly due to its ability to enable better utilisation of existing data and ultimately improved decision making. There is an opinion that a lot of data is generated in the mining industry that can be better utilised, more specifically in inventory management through improved planning and monitoring of existing inventory levels. Big Data Analytics was also perceived as an instrument to improve the safety records of mines due to an enhanced ability to generate and monitor safety statistics. A further reason mentioned for the importance of Big Data Analytics is that it is perceived to be an enabler for the full utilisation of other Industry 4.0 technologies since most will require high-quality data to function correctly.

“There is a lot of data which we cannot analyse easily, and these need to happen to plan and predict the future” (P5)

“Decisions in the South African mining industry are not made on accurate data. To improve this Big Data needs to be captured, controlled, and used to improve decision-making as large data sets are generated every minute.” (P9)

“In my view, once you have the data aspect down, the next technologies can be implemented easily and work better since Cloud Computing, AI, and Robotics all depend on data and therefore this will have the biggest impact” (P4)

Blockchain was another Industry 4 technology that stood out in the analysis of the responses received. The need for Blockchain technology was derived from the need for timeous, reliable, and transparent data in the mining supply chain. It was perceived to be an essential instrument to reduce human error. Blockchain was considered useful in a wide spectrum of functions such as tracking and tracing transactions, tracking the inbound and outbound flow of goods, and managing warranties. Blockchain was also perceived as a supplement to the use of Big Data Analytics technology and fulfilling an essential role in ensuring sustainability in the mining industry. Participants reflected on the safety of the workforce being a critical issue in the South African mining environment. This view is supported by Ghobakhloo and Ching (2019), who found that Industry 4.0 technologies could improve operational safety in logistics.

“Blockchain needs to be used with Big Data Analytics as much as we want to analyse data, we would require reliable transparent data and information on what is happening right now. Blockchain will be useful in terms of tracking inbound and outbound flow of goods as well as for e.g., warranty management processes in mining in removing any human error” (P5)

“Blockchain can be used to track and trace transactions and ensure that mining becomes more responsible in terms of sustainability” (P9)

The importance of 3D Printing is linked to it being used to manufacture some critical parts locally rather than importing it. More specifically, the local manufacturing of parts using 3D printing is seen to assist in employment creation and reduce the need for expensive parts inventories and the associated costs. Local manufacturing of parts will also reduce the order cycle time of parts. This

view is supported by Reijonen (2017), who found that 3D Printing promoted delayed manufacturing (postponement) to reduce inventory and improve lead times.

“3D printing will definitely have a profound impact, but so will the Internet of Things, through connectivity and the removal of the human element, through connecting for e.g., sensors and machines, preventative measures can be in place to pre-empt something going wrong, this is almost needed immediately in the production and maintenance environment in mining.” (P7)

“3D printing if you look at expensive parts which are imported, this can be used to manufacture locally and improve planning.” (P9)

The IoT is regarded an essential technology since it allows the creation of useful data. Furthermore, it was seen as an instrument to improve connectivity between machines, sensors, and mobile technology instruments and in so doing, to reduce reliance on the human element to prevent breakdowns and safety breaches. It was also mentioned that an immediate need exists for IoT to improve production and maintenance in the mining environment.

“The Internet of Things, through connectivity and the removal of the human element, through connecting for e.g., sensors and machines, preventative measures can be in place to pre-empt something going wrong, this is almost needed immediately in the production and maintenance environment in mining” (p7)

7.2 Possible impact of Industry 4.0 technologies on the efficiency and effectiveness of the mining logistics functions: transportation, warehousing, and inventory management

Most participants indicated that the most significant impact of the successful implementation of Industry 4.0 technologies in mining logistics would be the achievement of greater efficiencies through improved decision-making based on better quality information and collaboration in the supply chain. This supports findings by Ardito, Petruzzelli, Panniello, and Garavelli (2019) and Ghobakhloo and Ching (2019) about the effects of integrating Industry 4.0 technologies into logistics and supply chain functions.

Six participants agreed that by improving functional planning and further integrating systems throughout the value chain, the mining industry could achieve greater logistical productivity. Four participants highlighted increased labour productivity as a requirement for improved logistics. Five participants also agreed that better safety would promote an increase in productivity as the safety of people is a significant concern in mining and can hold back productivity. This view is supported by Ghobakhloo and Ching (2019), who found that Industry 4.0 technologies could improve operational safety in logistics.

Regarding the impact of Industry 4.0 technologies on logistics functions specifically, transportation management was highlighted as an area that could benefit significantly from implementing these technologies. Participants believed that supply chains could be “shortened” by removing intermediaries. Technologies such as 3D printing would result in fewer transport activities being required to deliver goods to mining operations. This would ultimately drive transportation costs down for the entire mining value chain. Participant P6 remarked that “there is an opportunity to improve visibility of transportation activities” using IoT technologies. This view is supported by Isherwood’s (2013) finding that a lack of visibility is a mining supply chain problem and that such a problem could be addressed by means of IoT adoption (Daithankar & Pandit, 2014.) Transportation was also flagged as a logistics activity being susceptible to the application of AI technologies which together with Big Data Analytics technologies could be used for optimised route planning and scheduling, this could significantly reduce transport costs and carbon emissions.

Most participants believed that using technologies such as AI, Robotics and Big Data Analytics would positively impact warehousing. These technologies would provide an opportunity to improve warehousing activities and processes and, therefore, warehousing productivity. More specifically, the

technologies mentioned would impact warehousing operations, including storage, retrieval and inventory planning and control.

Six participants agreed that improved logistical productivity could be achieved through improved inventory management. Inventory was regarded as one of the most important cost drivers in mining logistics by several participants and the successful utilisation of various Industry 4.0 technologies could result in reduced inventory levels whilst still meeting inventory demands. This could be achieved on the back of improved inventory planning stemming from better inventory visibility in the logistics pipeline and collaborative planning made possible by the sharing of demand information. Furthermore, technologies such as 3D Printing and AI could facilitate Just-in-Time inventory management approaches to reduce inventory investment further. This finding corroborates with that of Yuan (2020), who found that AI and Big Data Analytics are beneficial technologies for those attempting to optimise inventory levels.

“If you think about it, if we have some visibility and transparency, it is more than likely that lots of inventory types could be halved. Also reducing the amount of warehousing space you need, reducing the number of machinery and material handling equipment, racking and all the infrastructure that you need. So, inventory management. The less inventory you hold, the less warehouse space you need and fewer transport movements.” (P9)

“Being able to expand on virtual inventory with 3D Printing and AI in facilitating a Just-In-Time (JIT) approach with inventory. JIT will promote consolidation of transport and cost reduction. Cost reduction mainly in working capital costs in the inventory management space. A postponement inventory strategy enabled by 3D Printing would improve inventory management, transportation, and warehousing functions. Safety can be improved by removing the human element in mining to a great extent.” (P10)

7.3 Industry 4.0 technologies most likely to be adopted by the South African mining industry in the future

All the participants agreed that several Industry 4.0 technologies are, to some extent, already implemented in the mining industry. However, the implementation of Industry 4.0 technologies happens mainly outside the logistics function. Most implementations occurred in the processing and extraction functions which, according to the participants, are due to the latter functions being regarded as core functions. This finding is supported by the Minerals Council South Africa (2019) who found that lower mine productivity in the country could partially be ascribed to a lack of cross-functional technological advances in the industry.

Most participants indicated that 3D printing is the Industry 4.0 technology most likely to be adopted within the mining industry in the future. It was also indicated that 3D technology has already been trailed in the industry for printing parts and components. Inhibiting factors for the wide-scale implementation of this technology were identified as prohibitive costs and the item designs for parts and components which may be difficult to print. This finding is supported by the work of Kückelhaus and Chung (2016), who found this technology could reduce inventory investment and warehousing expenditure. However, the net benefits should be determined based on a trade-off against increased capital investment costs related to the implementation of the technology.

Cloud computing, Big Data Analytics and Blockchain were also very popular choices amongst participants, with some indicating that the first two of these technologies were already implemented to a limited extent in the mining industry. The use of Cloud Computing was found to be the standard practice for storing information and data across several functions, including logistics. Big Data Analytics was used to analyse data specific to mining operations.

Technology such as Blockchain is ideally suited for the mining industry since it can facilitate the tracking and tracing of commodities along the value chain. More specifically, it allows for the tracking and tracing of commodities mined as well as waste disposal activities to ensure compliance

with sustainability requirements and the use of automation in dump trucks. However, participants raised concerns that it will only be implemented at a future stage, owing to the immaturity of the technology and the lack of readiness of the South African mining industry. It emerged that Robotics has not been implemented due to labour issues but that it would be considered in the future.

“It’s a matter of maturity. From my South African mining knowledge, Big Data Analytics will be a part of the first wave of implementation, yes, with cloud computing and AI. Blockchain will be in the second wave and Blockchain and 3D Printing in the third wave. Maturity plays a huge part.” (P2)

7.4 Potential benefits for the South African mining industry to be gained from the implementation of Industry 4.0 technologies in logistics functions.

Cost reductions from improved operational practices in mining logistics were the most cited potential benefits of the successful implementation of Industry 4.0 technologies. Nine participants agreed on these benefits. Reduced inventory levels due to improved planning and control, shorter order cycle times, and inventory substituting technologies such as 3D Printing would drive most of the cost savings. Better demand visibility would simultaneously result in better service levels. These identified potential benefits are supported by findings in the literature on the potential benefits derived from the use of Industry 4.0 technologies in logistics (Ghadge, Kara, Moradlou & Goswami, 2020).

One of the most significant potential benefits to be derived from the use of Industry 4.0 technology, particularly relevant to the mining industry, is improved safety. Six participants mentioned that Industry 4.0 technologies would enhance safety in logistics by reducing the need for human presence in dangerous activities using Robotics and automation. The transportation and warehousing functions have been identified as ideal environments for using robotics and automation to reduce human input. Complementary to the view of study participants, Fersht and Slaby (2012) found that using technologies such as robotics has resulted in safety improvements and increased productivity while reducing human error.

Industry 4.0 technologies would also promote improved collaboration along the value chain and, in so doing, improve demand planning with the use of AI, Cloud Computing and IoT technologies. The findings of Ras, Wild, Stahl and Baudet (2017) support the view that digitalising logistics functions would encourage supply chain collaboration to improve decisions and efficiency.

“If several mining houses implement these technologies, they may all benefit from increased speed in logistics, reduced costs, their logistics solutions will become more flexible as well as improved visibility. Collaboration and strengthened relationships between mining companies and their customers will also prove to become advantageous to mining companies if technologies are implemented correctly” (P6)

Reduced environmental impact and sustainability were highlighted by participants P2, P7, P8 and P9 as benefits to be derived from the implementation of Industry 4.0 technologies. Using autonomous vehicles and hydrogen-powered trucks can assist to optimise transport activities and reducing carbon emissions. According to four participants, Industry 4.0 technologies would also improve host community development by upskilling community members using technologies such as 3D Printing. Participants P1 and P4 thought that an additional benefit would be improved productivity. This could be achieved by reducing downtime and lessening the risk facing mining operations and logistics functions.

Another theme that emerged was a reduction in downtime. Big Data Analytics, together with other technologies, can assist in predictive maintenance, allowing fewer breakdowns and more opportunities for production.

“I think it all comes back to having a responsive supply chain which promotes uptime and reliability in mining. A key factor is being able to plan maintenance and having predictive condition monitoring,

which assists in planning for inventory and parts needed to support these activities when needed.” (P2)

7.5 Challenges for the South African mining industry in the implementation of Industry 4.0 technologies in logistics functions

Three themes emerged in the analysis of participants’ responses regarding challenges in implementing Industry 4.0 technology, namely personnel, costs, and infrastructure. Seven participants identified personnel as the main challenge. Personnel is an essential factor in the South African mining industry when one considers the impact of the mining industry on employment in the country. The challenges associated with people primarily relate to change management, a lack of skills and the need to re-skill employees. Employee resistance to digital transformation is considered a factor, and a lack of digital technology skills and expertise is a significant hurdle when attempting to implement Industry 4.0 technologies. This finding supports the view that the mining industry needs to adopt an innovative management approach and implement skills development programmes (Hermann, Pentek & Otto, 2016; Müller, Maier, Veile & Voigt, 2017; Theorin, Bengtsson, Provost, Lieder, Johnsson, Lundholm & Lennartson, 2017). Concern was also raised regarding the mines being careful to create the impression that machines or robots can replace personnel. The mining labour environment is unionised, and staff retrenchment issues are dealt with cautiously. An additional challenge identified by participants (P1, P3, and P8) relates to the lack of management support for adopting new technologies. A strong business case for adopting new technologies will be vital in ensuring this challenge is mitigated.

“Low literacy levels and skills, the true benefit of implementing these technologies won’t be attained with the incorrect people. People’s resistance in terms of implementing technologies as they pose a job risk, is a further challenge” (P7)

“Change management issues with people and having to use technologies they have not used before” (P1)

“The biggest challenge will be from labour and the unions itself” (P5)

Four participants (P2, P3, P6 and P9) felt that implementation cost was a factor that could hinder the adoption of Industry 4.0 technologies. Capital-intensive technologies such as robotics might be too expensive. It emerged that strong business cases must be developed to ensure that implementation benefits outweigh the implementation costs. This view is supported by research findings that financial constraints are a significant challenge to the implementation of technologies. A comprehensive cost-benefit analysis must be conducted and presented to all key stakeholders to overcome this barrier (Theorin et al., 2017; Nicoletti, 2018).

“Cost is a challenge. Getting the willingness to invest and understand the benefits in the mining industry could be a challenge” (P8)

Three participants highlighted the lack of technological infrastructure and reliable power supply in South Africa as an obstacle for the mining industry in implementing Industry 4.0 technologies. The erratic power supply could significantly impact the ability to fully use and integrate new digital technologies in the mining value chain.

“Infrastructure needed to host these technologies in South Africa for e.g., connectivity issues which is a problem. Power supply in South Africa is a challenge and therefore alternative power sources will be needed to support the successful use of these technologies” (P7)

Other challenges identified were the risk of the new technology failing (P3) and the technological maturity of the mining industry (P2). There are no guarantees that the adoption of new technologies will pay off. An opinion was raised that the mining industry is not yet mature enough to roll out technologies such as Blockchain that require multiple supply chain level buy-ins to function correctly.

Lastly, an additional factor mentioned by P6 was that logistics is challenging in the mining industry due to several multi-echelon supply chain structures. This presents complexities when implementing new technologies due to higher costs, different approaches to technology use, and varying levels of technology adoption amongst stakeholders. To this end, it was proposed by a participant that a holistic supply chain approach be adopted to overcome this problem. Entire value chains may have to be redesigned to ensure new technologies are used to their full effect. A digital roadmap can assist in the rollout of technology across entities in the supply chain.

8. Conclusions

The study's findings suggest that mines could use Industry 4.0 technologies to positively affect logistics functions. The technologies considered in this study appeared to be valuable instruments in improving efficiency and effectiveness throughout logistical functions but especially in the essential logistics functions of inventory management, transportation, and warehousing. The adoption of Industry 4.0 technologies is expected to improve visibility, collaboration, and decision-making in all logistical functions. Certain Industry 4.0 technologies, including Cloud Computing, are already used in the mining industry. Other, such as 3D Printing, is potentially great value to mining logistics systems and is currently being tested. The study's findings suggest technologies such as 3D Printing, Big Data Analytics, Blockchain, IoT and AI could significantly impact the efficiency and effectiveness of mining logistics.

The study identified potential benefits and challenges the mining industry could experience when implementing Industry 4.0 technologies in its logistics functions. The most likely benefit would be improved efficiency in all logistical functions, especially inventory management. Better demand planning and inventory optimisation abilities coupled with a reduced need for the inventory of parts and components due to technologies such as 3D Printing can significantly reduce inventory levels and their associated costs without jeopardising service levels. Improvements in one area of logistics usually have a knock-on effect on other areas due to the interdependence of the logistics system. Optimisation improvements in inventory management would lead indirectly to improved warehousing and transportation functions because the mining industry relies on inventory and working capital to keep operations running. Other additional significant likely benefits that were identified were in the form of reduced operating downtime due to predictive maintenance and improved productivity and personnel safety made possible through automation and Robotics. From an overall logistics systems perspective, it is reasonable to expect improved efficiencies resulting from improved decision-making, greater collaboration, and enhanced operational effectiveness in most, if not all, logistics functions.

The mining industry's most significant obstacle in implementing Industry 4.0 technologies is related to its personnel. Resistance to change and a lack of skills were identified as significant challenges that would have to be overcome by the industry. Other difficulties included a lack of a reliable power infrastructure to support the continued use of technologies and the high costs of acquiring and implementing capital-intensive technologies such as 3D Printing and Robotics. It appears that neither the Blockchain technology nor the mining industry is currently mature enough for implementation over the short term. It is, however, predicted that the implementation of various Industry 4.0 technologies will occur over stages and that, ultimately, the industry will become mature enough to adopt a wide variety of these technologies, including Blockchain.

There is an indication that the mining industry and its logistics functions have not been at the forefront of adopting and implementing Industry 4.0's technological advances in its logistics functions and operations. Furthermore, and perhaps partially an explanation of the low adoption of Industry 4.0 technologies, the logistics function has long been seen as a secondary service rather than a primary or core component of mining, and one that could be used to achieve a competitive advantage in the industry. A different perspective on the role and importance of the logistics function in the mining value chain can help to speed up the adoption of Industry 4.0 technologies in mining logistics.

9. Recommendations

Managers within the mining industry are provided with extensive information pertaining to the various industry 4.0 technologies that could potentially be implemented to reduce logistical costs. Logistics is an essential component of the mining value chain, and the mining industry should invest in developing its logistical functions. The successful implementation of Industry 4.0 technologies is likely to contribute significantly to achieving lasting gains in efficiency and effectiveness. Technologies such as Big Data Analytics, 3D Printing, and AI warrants urgent consideration on the back of comprehensive cost-benefit studies.

The study's results suggest that the most significant challenge the mining industry faces in implementing Industry 4.0 technologies is a lack of skills. The industry would need to take a proactive approach to ensure that personnel understand the necessity for using Industry 4.0 technologies. To that end, the mining industry would need to ensure that the right skills training and development programmes in logistics functions are offered to implement these new technologies. People would be more likely to embrace these technological advances if they had a proper understanding of the potential benefits these new technologies hold for daily activities and improved productivity, safety, sustainability, efficiency, and effectiveness (Philbeck & Davis, 2018). Training and development programmes would promote an industry culture that embraces the change needed to achieve operational excellence throughout its value chain (Bühler, Nübel & Jelinek, 2021).

Higher inventory costs have plagued the mining industry due to the risks faced by the security of supply, siloed operating practices, inefficient planning, and a lack of integration with end-users. As a result, inventory management would be the first logistics function that needs to be improved and optimised with Industry 4.0 technologies. Participants observed that technologies such as 3D Printing, AI, and Big Data Analytics would hold the most significant benefits for the inventory management function in improving planning, demand forecasting, optimisation, and collaboration along the value chain. These technologies should be trailed and implemented where necessary to exploit these potential benefits.

The mining industry should investigate developments in other industries that rely more on logistics to ensure the business's success. These include industries such as FMCG and automotive and 3PL service providers. In so doing, a blueprint could be developed for the mining industry to implement the relevant Industry 4.0 technologies to ensure that logistics functions provide an efficient and sustainable service to mining houses and that those focusing on improving logistics can gain a much-needed competitive advantage in the future.

Furthermore, implementing Industry 4.0 technologies can be capital intensive and comprehensive feasibility studies will have to be developed in support of such investments. However, this study argues that the benefits of adoption are potentially significant and likely to give the industry higher competitiveness. With the implementation of Industry 4.0 technologies, managers can have a holistic view and visibility of their logistical functions within mining operations. The practical application of the highlighted technologies, enable managers to operate the transportation, warehousing and inventory functions efficiently and effectively, thereby reducing cost and as well as improve work conditions for staff. The obligation of top management in executing Industry 4.0 technologies is essential in instituting standards and processes as well as supplying critical support and resources during the implementation phases.

10. Suggestions for future research

The global mining industry is changing, and its reliance on logistics is increasing. Contemporary organisations require flexible, agile, and resilient logistics solutions to survive and prosper. Intelligent logistical solutions are needed to accomplish this, and as this study found, Industry 4.0 technologies could contribute significantly to improvements in the mining industry. Mining houses will have to investigate and develop technological business strategies and roadmaps if this industry is to enjoy the benefits associated with implementing Industry 4.0 technologies. Future research is needed to provide

guidelines on how the mining industry should implement these technologies to ensure that they have resilient and optimised logistics solutions to efficiency and effectiveness problems.

Sustainability has become a critical issue in the mining industry. Further research should be conducted to understand how Industry 4.0 technologies drive sustainability and how the industry could become more environmentally friendly. One such opportunity is a study of the impact that Industry 4.0 technologies could have on reducing carbon emissions generated by mining logistics.

FINANCIAL, INFORMATION AND KNOWLEDGE MANAGEMENT

Cyber Security Disclosure In The Banking Sector: A Case Of South Africa and China

Keywords

Cyber risk; Financial sector; Disclosure

Abstract

This study compares risk reporting, specifically cyber risk reporting, between South African and Chinese banks. Major corporate scandals had significant impacts on the economic environment and has led to an increased interest in risk reporting. The population is all the listed financial service providers (banks) in South Africa and China. By purposeful sampling the four biggest banks in each country were selected based on their asset value. The research method utilised is content analysis. A disclosure index is developed from the literature study and used to analyse the results. It is concluded that the disclosure practices on cyber risks of the banks differ substantively between the two countries. China does not explicitly refer to cyber risk but only discloses it as an operational risk in its annual reports. No ranking is associated with any of their risks or categories. This is in contrast when compared to the South African annual reports as South African banks clearly define cyber risk and rank it amongst their top risks.

1. Introduction

All Stock Exchange-listed companies must publish their annual financial results (Khlif, Ahmed, Souissi & Sargsyan, 2018). The financial part of the disclosures is more regulated than some of the non-financial disclosures. Since the non-financials are not as regulated, organisations struggle to navigate the sometimes-confusing landscape of disclosure where numerous frameworks and standards exist (Elshandidy, Shrivs, Bamber & Abraham, 2018:2; Krzus, 2011). The Securities and Exchange Commission ("SEC") is very concerned about cyber risk. In February 2018, the SEC updated the 2011 guidelines and stated that public businesses must stay focused on cybersecurity issues and take all required efforts to inform investors about substantial cybersecurity risks and events. Under the Securities Act of 1933 and Securities Exchange Act of 1934, corporations must report their cyber controls, risks, and vulnerabilities (SEC, 2018 & SECPCCD, 2018). While banking law and regulation have been inactive in the face of cyber risk, the SEC has made some progress. Skinner (2019) critically examined nearly 900 SEC filings filed by seven prominent U.S. bank holding corporations during a three-year period that are covered by the framework of mandatory disclosures. Their review suggests that SEC laws and recommendations are too broad for these institutions, and not enough to address public and private interests. The study, therefore, urges the SEC to adopt more nuanced cyber disclosure standards for banks. It is evident from the prior evidence (Skinner, 2019) that, the SEC has led among financial regulators in addressing cyber risk, primarily through a focus on disclosure.

From a societal standpoint, cyber risk is especially concerning when it comes to systemically important financial institutions, such as the largest internationally active banks. This is because the overall stability of the financial system and thus the real economy depends on these banks' ability to withstand stressful events such as cyber-attacks. The main aim of this paper is to analyse the degree of

cyber risk disclosure in the banking sector and compare cyber risk disclosure practises in the banking sector in South Africa and China.

Risk is vital to any organisation, and businesses must identify, evaluate, manage, and report all types of risk to enhance decision-making (CIMA, 2008). Risk is one of the leading causes of uncertainty in an organisation and can originate from various internal and external sources (Epstein & Rejc, 2006). Risk management can be associated with two types of events: risks or adverse events and opportunities or positive events (Ata & Schmandt, 2016).

Most investors prefer principal risk reporting that is specific to an organisation. They need improved disclosure that avoids boilerplate text and provides enough detail to understand how the organisation accounts for its transactions, how it identified its principal risks and how the organisation is planning to manage those risks (Financial Reporting Council (FRC), 2017:3). Management can improve investor confidence if they can prove how the reported risks relate to the business model (FRC, 2017). As stated in a recent study by Gao, Calderon & Tang (2020) cybersecurity risks are important and could affect business operations and the integrity of financial reporting, although there is limited empirical research on the cybersecurity risk disclosures. The following section will highlight related aspects to provide more background on cyber risk disclosure in the banking sector.

2. Background to the study

The 2007 global financial crisis was partly due to most of the banks lacking the ability to combine their risk exposures and identify risk concentrations at a bank group level (Thun, 2015). As a result, more banks are starting to identify cyber risk as a priority risk (Härle, Havas, Kremer, Rona & Samandari, 2016:4). Furthermore, as technology and digital banking has developed in the past decade, cyber risk, and the need to disclose information has escalated.

To support the quality disclosure of information, various reporting guidelines and frameworks have been developed. All listed South African companies are required by the Johannesburg Securities Exchange (JSE) to comply with the International Financial Reporting Standards (IFRS) as well as the King reports (IODSA, 2010; JSE, 2017). King III report was the first report that stated that organisations need to produce an integrated report instead of both a traditional annual financial and a sustainability report. King III declares that listed organisations that fail or choose not to produce integrated reports must explain why they are not adhering to this requirement (IODSA, 2010).

Integrated reporting states that organisations should disclose the specific risks they face, what possible opportunities can arise from these risks, and how they affect the organisation's ability to create value (Integrated Reporting Committee of South Africa, 2018). To regulate and improve security, listed companies must adhere to some listing requirements. King IV outlines the requirements for risk governance in principle 11, which states: "The governing body should govern risk in a way that supports the organisation in setting and achieving its strategic objectives" (IODSA, 2016). King IV provides a series of recommended risk practices that the governing body of any listed organisation should perform.

3. Problem Investigated

In the business world, business risks have always existed. In addition, there have been major corporate scandals that had significant impacts on the economic environment. All of which has led to an increased interest in risk reporting (Oliveira, Rodrigues & Craig, 2013). It became clear that some banks manage their risks poorly due to weak risk data compiling capabilities and risk reporting practices. The poor management of risks proved to have severe consequences on the banks themselves and the financial system's stability (Bank for International Settlements (BIS), 2013).

In a study done by Linsley and Shrivs (2000), they argue that organisations have become more exposed to volatility and uncertainties (Khlif & Hussainey, 2016:181). Although there have been many improvements in recent years, investors still know too little about an organisation's risks, and a risk information gap still exists between organisations and their stakeholders (Wilson, 2014). In

addition, it was found that organisations are reluctant to comply with risk disclosure requirements (Al-Hadi, Hasan & Habib, 2016). In general, larger organisations are more complex and have a more comprehensive range of operations. Therefore, the statement above implies that they are subject to higher risk levels, translating into higher information irregularities amongst investors (Al-Hadi et al., 2016).

Media platforms report daily on the rampant increase in cybercrime. This increase has sparked fear in the public eye that cyberattacks would affect national resources and destabilise infrastructure (Berry, 2018). One of the main contributing factors to this naivety is that the Protection of Personal Information Act (POPIA) is not entirely in effect. Sophos, an organisation that is a global leader in network security, conducted a study and found that only 34% of South African organisations comply with the POPI Act (Sophos, 2019). Every day, media organisations report on the unprecedented growth in cybercrime. This increase has raised widespread concern that cyberattacks will harm national resources and impair infrastructure (Berry, 2018).

Between January and August 2018, South African Banking Risk Information Centre (SABRIC) reported that an estimated R250 million were lost due to cyber and digital banking crimes. However, these losses are only the reported statistics. Most cybercrimes go unreported (SABRIC, 2019). Furthermore, as discussed in the problem statement, it seems that risk disclosures in general, but cyber risks specifically, are not reported uniformly between organisations, leading to this study's objective.

4. Research Objectives

The main objective of this paper is to evaluate the level of disclosure on cyber risk in the banking sector and compare the practices of cyber risk disclosure in the banking sector between South Africa and China.

4.1 Secondary Objectives

The secondary objectives include the following:

- To identify the rules and regulations that govern reporting disclosures in South Africa and China.
- To identify the research method and the sources of the data.
- To develop the measuring instrument and to analyse the data.

5. Literature Review

5.1. Risk reporting

Risk reporting tends to be more non-financial than financial information, historical rather than future-orientated, and qualitative rather than quantitative. The current reporting shortcomings have emphasised the need for a more integrated and holistic form of reporting that will integrate both the financial and non-financial information in a meaningful and integrated manner (Carels, 2014:3; Global Reporting Initiative (GRI), 2018)

Elshandidy and Neri (2015) postulate that organisations, in general, do not tend to provide quantitative and forward-looking attributes related to risk disclosure but qualitative and historical information. Variations in risk disclosure are partially aligned with country-related regulations, which plays a vital role in an organisations incentive. The impacts of risk factors vary by country. In the United States and Canada, an organisation's risk disclosure is positively associated with its risk levels. In contrast, German organisations are negatively associated with their risk levels, and United Kingdom organisations are not significantly related (Elshandidy *et al.*, 2018). Cyber risk is identified as the fourth most crucial risk out of ten identified by Corporate Compliance Insights (CCI), Deloach, 2019).

5.2. Regulatory requirements for risks reporting

To regulate and improve security, listed companies must adhere to some listing requirements. Organisations must comply with International Financial Reporting Standards (IFRS) (JSE, 2017). As

per principal 7 of IFRS, organisations are required to list the nature and extent of risks arising from financial instruments to which the entity is exposed during the period and at the end of the reporting period, and how the entity manages those risks. The qualitative disclosures describe management's objectives, policies, and processes for managing those risks, and need to be included (IFRS, 2018). All listed organisations in South Africa must comply with King IV and IFRS as stipulated in the JSE listing requirements.

China's financial reporting had to adhere to all the requirements as stipulated by China Accounting Standards Committee (CASC) until China adopted accounting standards specified by the International Accounting Standards Board (IASB) (CASC, 2018). The Chinese Accounting Standards (CAS) were replaced by the International Financial Reporting Standards (IFRS). This replacement brings China more in line with the rest of the world. The new procedures became law on 1 January 2007. China complies with various IFRS standards, specifically IFRS 7, as stated above. IFRS 7 requires entities to provide disclosure in their financial statements that enable users to evaluate the significance of financial instruments and the risks arising from these financial instruments (IFRS, 2018). This practice is like the South African reporting requirements as stipulated by the JSE.

5.3 Risks reporting in the financial sector

The China Banking Regulatory Commission (CBRC) adopted regulations that came into effect on 1 January 2013. According to these regulations, all China's commercial banks are required to disclose information related to exposure and evaluation of credit risk, operational risk, market risk and any other relevant risks, as well as risk management (Wang, Chen & Zhao, 2018:2).

After the global financial crisis that started in 2007, a key finding was that information technology and data architecture in the banking sector was severely lacking and unable to support the broader management with financial risks (BIS, 2013:8). As a result, most banks could not combine their risk exposures and detect risk concentrations quickly and accurately at a bank group level, across business lines and between legal entities (Thun, 2015). Some banks managed their risks poorly due to weak risk data compiling capabilities and risk reporting practices. The poor management and availability of data proved to have severe consequences to the banks themselves and the financial system's stability (BIS, 2013).

5.4 Cyber risks in the banking sector

Organisations depend more and more on digital technology to conduct their business operations and use digital technology to engage with their customers, business partners, and other constituencies (Securities & Commission, 2018:2). This technological advancement and digital connection in the world have presented some risks. Cybersecurity is an ever-present ongoing risk to all markets and industries (Securities & Commission, 2018). As the banking sector is highly advanced in technology and relies on digital connections, the sector is vulnerable in terms of cyber risk (Bouveret, 2018). After the release of the Securities and Exchange Commission's (SEC's) cybersecurity disclosure guidance in October 2011, cybersecurity risk disclosure has been intensified according to Li, No & Wang (2018). They investigate the usefulness of cybersecurity-related risk factors disclosed in 10-K filings and subsequently reported that SEC's disclosure guidance encourages firms to increase their disclosure of cybersecurity risks (Li, No & Wang, 2018).

Businesses are primarily concerned, as cyber-attacks could lead to substantial costs and various other implications such as exposure of sensitive personal information, business disruptions, and remediating costs. Other expenses such as increased cybersecurity protection cost, litigation and legal risk, reputational damage could also occur. (Li, No & Wang, 2018:40; Securities & Commission, 2018:4). In 2018 cybersecurity played a vital role in the Securities and Exchange Commission's (SEC) regulatory agenda. The commission published an interpretive guideline that urges companies to be: "more transparent in disclosing cybersecurity risks in their public filings and to disclose material data security incidents in a timely fashion. In addition, the SEC urges businesses to implement safeguards such as trading bans to prevent insiders from selling securities after a breach is detected but before it is publicly disclosed" (Newman & Belknap, 2019).

Cyber risk can be defined as "operational risks to information and technology assets that have consequences affecting the confidentiality, availability, or integrity of information or information systems" (Bouveret, 2018). Eling & Wirfs (2016) add to this definition by mentioning that cyber risk shares similar property and liability risk characteristics as catastrophic and operational risk. Cyber-attacks have a severe impact, directly and indirectly, on an organisation, and losses occurred from cyber breaching be significant (Bouveret, 2018). In a study done by Cavusoglu, it was established that a cybersecurity breach could negatively affect an organisation's share price by up to two and a half per cent (Eling & Schnell, 2016:477). However, not all cyber risks are related to cyber-attacks or "hacks" that are malicious, and some occur due to business disruptions such as software updates. These are referred to as cyber incidents (Bouveret, 2018). Business disruptions hinder organisations from operating, resulting in lost revenue, while the effects of data breaches materialise over a more extended period. All these causes reputational damage and possible litigation costs (Bouveret, 2018:4). In addition, the loss of confidence following a cyber-attack could be significant for the financial sector, given the reliance of financial institutions on the trust of their customers (Warren, Kaivanto & Prince, 2018:28).

Based on the literature study, a measuring instrument was developed to measure the disclosures of the different banks. The paper addresses the disclosure practices of the banks on cyber risks in a systematic way by dividing the information into different sections, namely General information, Governance of risks, ranking of cyber risks, Reporting on cyber risk incidents, Causes of cyber risks, The impact of cyber risks incidents and the overall level of disclosure. These sections correspond with the layout of the disclosure index, as displayed in Table 1. In the next paragraphs are brief discussion on each section.

- ***Governance of risk***

Any organisation needs to have policies and procedures in place to manage its risks. For example, government Gazette, No. 35950, sub-regulation 17 states the following: "achieves the objectives relating to sound corporate governance and effective risk management and complies with the relevant minimum requirements specified in regulation 39". This regulation covers managing risk management processes, managing material exposures to risk, and reporting material information technology and cyber incidents (SARB, 2012; SARB, 2019). As per Principle 11 of King IV: "The governing body should govern risk in a way that supports the organisation in setting and achieving its strategic objectives" (IODSA, 2016:61). This principle entails that the governing body assigns implementation and risk management responsibility to a responsible individual. Risks need to be managed as an integral part of the company's day to day activities (IODSA, 2016:61).

The cybersecurity law in China came into force on 1 June 2017. Under the cybersecurity law network, operators are required to appoint a designated person in charge of cybersecurity. To identify responsible people or directors with expertise in the field of cybersecurity, was evident in a study by Klemash, Smith & Seets (2020) which indicates that 58% of the Fortune 100 companies included cybersecurity as an area of expertise sought on the board. In addition, all cybersecurity incidents must be monitored and recorded (Ning & Wu, 2019). In table 1, below, six questions need to be evaluated to analyse the governance of risks.

- ***Ranking of cyber risk***

Organisations such as Forbes and the World Economic Forum lists cyber risk as one of the top 10 risks (Demrovsky, 2019; Fleming, 2019). Business tech ranks cybersecurity as ninth in the listed risks affecting the South African economy (Businesstech, 2019). Laws in China regulating cyber risks were only implemented in 2017. Therefore, there is no clear indicator of whether cyber risk is ranked in the Chinese business environment (KPMG, 2017:4). The literature above is proficient at investigating how the banks rate the importance of cyber risk. The "Ranking of cyber risk" section, as in table 1, addresses the following two questions:

- Does the bank rate cyber risk as one of its top ten risks?

➤ If ranked, how important are cyber risks to the bank?

• ***Reporting of cyber risk incidents***

The South African Reserve Bank has issued a new directive 2/2019 regarding Regulation 39 on the regulations relating to the Banks Act 94 of 1990. The directive sets out the reporting requirements for cyber incidents. The Protection of Personal Information Act (POPIA) was introduced in 2013. After it comes into full effect, section 22 of POPIA requires that any data breach or suspected breach be reported to the information regulator and the affected parties. Under the Cyber Crimes Act, the incident must be reported within 72 hours.

Following the Chinese Cybersecurity Law, organisations must notify the relevant authorities of any cyber incidents within 24 hours. If the publication of such an event will jeopardise China's national security, then such information will be withheld. In addition, as with the POPI Act, Chinese Cybersecurity Law requires organisations to notify affected users in case of disclosure and damage or loss of user information. Currently, relevant laws and regulations in China do not provide specific requirements about the nature and scope of information to be reported. This practice is similar to King IV, where there are no precise reporting requirements and limited guidance for reporting cyber incidents. Therefore, the following question is considered in this section on “Reporting of cyber risk incidents”:

➤ Identify if there was a cyber risk incident, was this cyber risk incident reported?

• ***Causes of cyber risk incidents***

Banks face many cybersecurity threats that fall within these three categories (Tylor, 2018), namely Financial gain, Disruption and Espionage. Virtually every cyber threat can be categorised into one of these three types. With current technology, there is an abundance of methods to initiate an attack. The results of a study performed by Gao, Calderon & Tang (2020) show that the two most disclosed cybersecurity risks are risks of service/operation disruption and risks of data breach. Below is a list of the ten most common types of cyber threats: Malware, Phishing, Spear Phishing, “Man in the Middle” (MitM) attack, Trojans, Ransomware, Denial of Service Attack or Distributed Denial of Service Attack (DDoS), Attacks on Internet of Things (IoT) Devices Data Breaches and Malware on Mobile Apps. (Regan, 2019, Norten, a-f, 2019). In table 1, the banks are analysed accordingly.

• ***The impact of cyber risk incidents***

A successful cyber-attack can cause severe damage to an organisation. It impacts an organisation's bottom line, the organisation's standing and consumer trust. The impact of a cyber-attack can be divided into three categories (Cruickshank, 2019) which are considered in the disclosure index:

- Damage to the reputation
- Financial losses
- Legal actions or implications.

• ***Mitigating procedures***

A risk mitigation strategy is an action plan that organisation create after they have made a thorough evaluation of possible threats that can affect the organisation. The purpose of such a strategy is to minimise or ideally prevent adverse impact before any damage or disaster takes place (Cantoria, 2019). Therefore, the following question is considered:

➤ Is a mitigation procedure in place?

• ***Level of disclosure***

The level of disclosure aims to display how much information each organisation discloses on cyber risk. However, previous studies have raised concerns on the unit of analysis used to determine the amount of disclosure even though it is common practice to use words or sentences (Amran, Bin & Hassan, 2009). For example, Linsley & Shrivs (2006) argued that it is difficult to determine which words can be used to estimate risk disclosure. However, early studies done by Hackston & Milne (1996) and later copied by Linsley & Shrivs (2006) indicate using either sentences, words, graphs, or

columns all similar yield results. Therefore, for this study, a word search for all cyber-related phrases was done to determine the level of disclosure.

6. Research Methodology

The research method utilised is content analysis. A disclosure index is developed from the literature studied. Finally, the disclosure index is used to analyse the results. The population is all the listed financial service providers (banks) in South Africa and China. The sampling method used is purposeful sampling, where a particular setting is explicitly selected for the information, it can provide (Bryman & Bell, 2014). The banks were selected based on their asset value. China was chosen as it is an emerging economy, and along with South Africa, it is part of the BRICS countries (Asongu, Akpan & Isihak:2018:2).

For the South African market, the four biggest banks were selected based on their asset value. These four banks (FirstRand Bank, Standard Bank, Absa Bank, Nedbank) had a combined asset value of 5 940.6 billion rands in 2018 (454.1 billion dollars) (Businesstech, 2018). In 2017 FirstRand had the most significant headline earnings of 22.4 billion rands, and Standard bank has the most extensive footprint of all the South African banks (Businesstech, 2017). These banks represented most of the South African banking sector and will remove the possibility of the much smaller banks skewing the findings (Bryman & Bell, 2014).

For the Chinese financial markets, the following four banks in China were selected based on their asset value – the Industrial and Commercial Bank of China, China Construction Bank, Bank of China, and the Agricultural Bank of China. These are the four biggest banks in China, having a combined asset value of 13 637.2 billion dollars (Businesstech, 2018), and according to the British magazine "The Banker", these banks are also the four biggest banks in the world (Businesstech, 2018; chinaplus.cri.cn, 2018). The four banks from the South African market and the four banks from the Chinese market give a total sample size of eight units. All the banks chosen for this study must submit annual financial reports as stipulated by the JSE and CASC (CASC, 2018; JSE, 2017). These annual reports are available for download online. Following the discussion on the research methodology, details concerning the disclosure index are displayed in the next section.

6.1 Disclosure index

The disclosure index is built around the reporting requirements indicated by the IIRC and CASC and the Chinese Cybersecurity Law requirements. Therefore, this study is systematic and fully replicable. As shown in Table 1, the disclosure index is used to measure the disclosure practices of the banks. The numeric values assigned are derived from the observations of the index. For example, should something be true, or "Yes", a numeric value of 1 would be assigned to that observation? Should something be false, or "No", a numeric value of 0 would be assigned. If no value could be assigned due to the criteria not being met, the field was assigned a not applicable (N/A). Table 1 is the presentation of the measured criteria from each of the banks' annual reports.

Table 1: Cyber risk disclosure index

	FirstRand	Standard Bank	Absa Bank	Nedbank	Industrial & Commercial Bank of China	China Construction Bank	Bank of China	Agricultural Bank of China
General information								
Does the bank produce an integrated report (Yes/No?)	Yes	Yes	Yes	Yes	No	No	No	No
Which rules and regulations does the bank adhere to:								
IFRS	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
KING IV	Yes	Yes	Yes	Yes	No	No	No	No
Is cyber risk reporting mandatory?	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Governance of risk								

Does the bank have a policy on risks reporting in general?	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Does the bank have a cyber risk policy?	Yes	No	Yes	Yes	No	No	No	No
Does the board of the bank take ownership?	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Do they refer to any strategy related to managing cyber risks?	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No
Does the bank define cyber risk clearly?	Yes	No	Yes	Yes	No	No	No	No
Does the bank identify cyber risk as a material item?	No	Yes	Yes	Yes	No	No	No	No
Ranking of cyber risk								
Does the bank rank cyber risk as one of its top ten risks?	No	No	Yes	Yes	No	No	No	No
If ranked, how important are cyber risks for the bank?	N/A	N/A	1	2	N/A	N/A	N/A	N/A
Reporting of cyber risk incidents

Mitigating procedures								
Is a mitigation procedure in place?	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes

7. Results and Findings

7.1 General information analysis

In the first place, the disclosure index starts collecting general information based on the following questions:

- Does the bank produce an integrated report?
- Rules and regulations the banks need to adhere to; and
- Are the rules of reporting cyber risks mandatory or not?

Table 2: General information analysis

General information	Compliance Percentages
Does the bank produce an integrated report?	50%
Which rules and regulations does the bank adhere to:	
IFRS	100%

King IV	50%
Is cyber risk reporting mandatory?	100%

When analysing the results about the general information, it is evident from Table 2 that 50% of the banks in the sample produce integrated reports. In addition, all the banks complied with IFRS reporting standards, and 50% complied with King IV regulations. These results indicated that half the banks within the total sample must comply with different reporting regulations, although all the banks must report cyber risk incidents.

7.2 Governance risk analysis

The initial steps in cyber risk management are to realise the current threats and set risk management goals (Eling & Schnell, 2016:480). Risk management has advanced to such a degree that many standards can assist in managing cyber risk. This section looks at the extent to which the banks govern risks.

Table 3: Governance risk analysis

Governance of risk	Percentages
Does the bank have a policy on risk reporting in general?	100%
Does the bank have a cyber risk policy?	38%
Does the board of the bank take ownership of managing risk?	100%
Do they refer to any strategy related to managing cyber risks?	88%
Does the bank define cyber risk clearly?	38%
Does the bank identify cyber risk as a material item?	38%

All the banks had a risk reporting policy, but only 38% had a cyber risk policy. Only 38% had a clear definition of cyber risk, and 88% of the banks had implemented strategies to manage cyber risk. Additionally, 38% of the banks identified cyber risk as a material item, including Standard Bank. However, Standard Bank does not define cyber risk in its reporting. These results are conflicting and could indicate that cyber risk incidents reported by them could relate to a broader range of concerns than assumed in general. From the six questions only, Absa and Nedbank both scored 100% compliance. When addressing the governance section, the banks yielded a 67% compliance rate for the specific questions asked. Graph 1 summarises the above and illustrates it by country.

Graph 1: Governance of risk

Analysing the countries individually, China had an average compliance rate of 46%, while South Africa had almost double the percentage of 88% compliance in reporting on the governance of risks.

7.3 Ranking of cyber risk

This section looks at the cyber risk ranking within the banks.

Table 4: Ranking of cyber risk analysis

Ranking of cyber risk	Percentages
Does the bank rank cyber risk as one of its top ten risks?	25%

When analysing the risk rankings, only 25% provided a ranking for the risks they faced. However, the two banks, which provided cyber risk rankings, rated cyber risk amongst their top three risks.

7.4 Reporting of cyber risk incidents analysis

One of the SEC guidelines is that organisations disclose all prior cyber risk incidents and their impact (Newman & Belknap, 2019). This section looks at cyber risks' incidents, the causes of these incidents, and if the incidents were reported.

Table 5: Reporting of cyber risk analysis

Reporting of cyber risk incidents	Percentages
If there was a Cyber risk incident, was a cyber risk incident reported?	0%
CAUSES OF CYBER RISKS INCIDENTS	
Identify the cause of the cyber risk incident	
Malware	x
Phishing	x
Spear Phishing	x
Man in the Middle	x
Trojans	x
Ransomware	x
Denial of Service attack	x
Attacks on IoT devices	x
Data Breaches	x
Malware on mobile apps	x
What was the impact of these incidents	
A description of the impact on the bank:	
Damage to the reputation	x
Financial losses	x
Legal actions or implications.	x

For the 2018 financial year, there were no cyber risk incidents confirmed in the annual reports. However, this result might be a limitation of the annual reports, and such incidents might be found in additional reports.

7.5 Mitigating procedures analysis

This section identifies if the banks have mitigation procedures in place for risks in general.

Table. 6: Mitigation procedures analysis

Are mitigating procedures in place	Percentages
Is a mitigation procedure in place?	100%

All the banks have stated that they do have risk mitigation procedures in place. However, very few referred explicitly to cyber risk mitigation procedures. The following section evaluates the levels of disclosure between South Africa and China in terms of cyber risk reporting.

7.6 Level of disclosure analysis

A search based on word count was done to evaluate the overall level of disclosure on cyber risk reporting. A word search was applied to evaluate how many times all related cyber terms appear in the annual reports. This includes "cyber risk", "cyber risk", "cybercrime", "cyber security" and "cybersecurity" to name but a few. This section indicates the level of disclosure per bank.

Table 7: Level of disclosure

Disclosure	FirstRand	Standard Bank	Absa Bank	Nedbank	Industrial & Commercial Bank of China	China Construction Bank	Bank of China	Agricultural Bank of China
Cyber term search	2	28	11	48	2	2	3	0

Results indicated that the South African reports yielded a higher level of disclosure based on a word search than the banks of China. The related words were found 89 times in the South African reports in contrast with only seven times referred to in the China reports.

Concerning the South African banks, Nedbank had a count of 48, ABSA had a count of 11, Standard Bank, 28 and First National Bank had only two. The China banks yielded a much lower count, with the Industrial and Commercial Bank of China showing two, the Bank of China having three, the Agricultural Bank of China having a count of two and the China Construction Bank not referencing any of the terms at all.

8. Conclusions

Both countries chosen for the study must comply with different reporting requirements. South Africa is subject to the JSE listing requirements, including IFRS and King IV (JSE, 2017). To produce an integrated report is one of the requirements as per King IV. King IV also requires organisations to provide reasons for not submitting integrated reports (IODSA, 2016).

China is subject to the CASC listing requirements, including IFRS and CBRC (CASC, 2018). In addition, cyber risk reporting is a legal requirement in specific South Africa and China (Ning & Wu, 2019; SEC, 2012). Both IFRS and King IV are required to disclose all risks (IFRS, 2018; IODSA, 2016).

As it is referred to by some banks in China, cyber risk, or information technology risk, forms part of their operational risk portfolio. Both South Africa and China have legislation and cyber risk reporting policies that fall outside the IFRS and King IV requirements. However, this legislation and policies, the POPIA and the Chinese Cybersecurity Law, are relatively new and thus not fully implemented (Ning & Wu, 2019; Sophos, 2019). This statement paralleled with the insufficient disclosure of China's banks. Furthermore, there is no specific framework for cyber risk reporting used by China's banks. However, their annual reports show that this is incorporated in their primary risk policy documentation.

A total of six governance-related questions, focusing on risk reporting, cyber risk reporting and policies, were utilised in building the disclosure index. It was found that all the banks in the sample have policies in place regarding risk reporting, but only three (all of the South African banks) specifically indicate that they have cyber risk policies in place. These results mean that only 38% of the total sample have a cyber risk policy.

Seven out of the eight banks state that they have strategies to manage cyber risk, which is 88% of the total sample. However, the banks' in China classifies cyber risk under their operational risk portfolio and refers to risk management strategies in general. Only one bank, the Agricultural Bank of China, did not mention such a strategy. These results indicate that 100% of the South African banks have strategies to manage cyber risk, whereas only 75% of the Chinese banks have such strategies. Of the eight banks, only three South African banks identified cyber risk as a material item, 38% out of the total sample.

The banks chosen for this sample complied with 67% of the governance questions asked. However, when looking at the countries individually, China only had a 46% compliance rate, where South Africa had almost double that at 88% compliance. Only Absa and Nedbank had complied with all the questions. Only two banks provided risk rankings. That is 25% of the total sample size, all of which were South African banks. Absa ranked cyber risk as their number one risk, and Nedbank ranked cyber risk as their second most critical risk. The other 62% of the sample did not rank cyber risk.

The World Economic Forum (2015) stated that the financial impact within the first few days is estimated to be around \$ 250 billion in the extreme event that internet connections worldwide go down. Furthermore, in a study done by Hovav & D'Arcy (2003), results show a negative share price effect for organisations, such as banks, that have a business model heavily reliant on the internet when they fall victim to cyber incidents. However, from all the banks sampled, no single cyber risk incident was disclosed for the 2018 financial year. This could be due to no cyber-attacks occurring during the 2018 financial year or that organisations are reluctant to disclose this information out of fear of possible attacks even though regulators require it.

Eling and Schnell (2016) state that to actively manage cyber risk, risk mitigation is a lot more plausible than risk avoidance. Risk mitigation, along with the support of various instruments (e.g., anti-virus and firewalls), has proven to be most effective in reducing the probability of occurrence and minimising the size of losses. Furthermore, 100% of the banks showed that they do have risk mitigation procedures in place.

9. Managerial Implications

When analysing the results from the study, it is concluded that the disclosure practices on cyber risks of the banks differ substantively between the two countries. These differences between countries have implications if potential investors or any stakeholders would like to make any comparisons.

Cybersecurity is a critical factor in banking operations because of digital technology advancements. The annual reports of China's banks classify risks under different categories. Cyber risk and information technology risk is classified as operational risks. As a result, China does not explicitly refer to cyber risk but only discloses it as an operational risk in its annual reports. No ranking is associated with any of their risks or categories. This is in contrast when compared to the South African annual reports as South African banks clearly define cyber risk and rank it amongst their top risks. They also recognise it as a material item.

From a South African reporting perspective, cybersecurity is one of the most significant risks in the banking sector. It is precisely defined and referred to in the annual reports. For stakeholders, it is easier to assess the impact of cybersecurity from a South African company as the information is more specific and available.

For the 2018 financial year, there were no reported cyber risk incidents in either country. For China, however, as per Chinese Cybersecurity Law, if any cyber-attack poses a risk to national security, such an incident will not be published. This could mean banks have been prohibited from reporting it to anyone, except the relevant authorities, if any incident occurred.

Based on this study, it is evident that South Africa's banks provide more defined and relevant cyber risk information. In conclusion, integrated reports published by South African banks are of a higher quality when compared to China's banks' annual reports.

To conclude, companies need reinforce their cybersecurity disclosures. This reinforcement and emphasis are needed to demonstrate accountability and to enhance stakeholder trust around cybersecurity.

Exploring The Relationship Between Customer Engagement Antecedents And Brand Loyalty

Prof Christo Bisschoff^{1,*}, Dorothy Flint²

^{1,2} NWU Business School, North-West University, Potchefstroom, South Africa

Keywords

Customer; Engagement; Brand reputation; Social media; Word-of-mouth; Brand community; Merchandising; Brand loyalty

Abstract

Customer engagement has become more than just a strategy for business or marketing. It empowers the consumer to be engaged throughout their initial interaction and purchase journey. This engagement journey can help a brand to establish and grow due to the continuous support from consumers. The general aim of this study was to determine the nature of the relationship between customer engagement strategies (CES) and brand loyalty. CES identified five antecedents (brand reputation, social media, word-of-mouth, customer experience, and merchandising) for the self-developed questionnaire where 135 social media participants could partake in this study. The value of this investigation lies in determining the most influential antecedents for brand loyalty from a consumer. These findings can contribute to how brands strategize their marketing budgets and which segments of customer engagement consumers find valuable. The study was conducted on the social media platform Instagram, where participants were recruited with the referral from other participants. The data, collected via Google Forms, are reliable ($\alpha \geq 0.70$) and adequate ($KMO \geq 0.70$). Data analysis using exploratory factor analysis suggested that eight antecedents influence consumers' brand loyalty. The study found a positive relationship for most of the antecedents. However, customer experience should be reconsidered because this antecedent did not significantly influence a consumer's loyalty to a brand.

1. Introduction

The modern digital era withholds endless opportunities for companies or brands to connect and engage with current or potential customers. As a result, customer engagement has significantly evolved over the last decade. Various engagements via omni-channels allow brands to interact with their customers, whether person-to-person or person-to-community (Prentice *et al.*, 2019:339).

The term omni-channel refers to a marketing strategy that uses numerous channels to communicate with customers and encourage them to purchase. It has similar characteristics as multichannel marketing, although it is not the same. The goal of omni-channel marketing is to simplify the purchasing process for customers by placing them at the centre of all interactions. Offering multiple options for purchasing as well as removing potential objections to the purchase is what accomplishes this.

The Internet as an engagement platform has promoted countless possibilities to connect and build lasting relationships with customers, thus allowing unrestricted access for a consumer to reach a brand, vice versa. Therefore, business communication with a customer is achieved through various communication channels regarding the brand/product to create an opportunity for sale (Yerpude & Singhal, 2021:92).

A brand should continue to listen and encourage feedback, suggestions, and recommendations from their brand community. An engagement strategy that empowers customers to become the voice of the company or brand. It allows brands to deliver according to the expectation of customers accurately with a competitive advantage.

Customer engagement is characterised in the literature as a psychological process where customer loyalty contributes to a service or brand (Vivek *et al.*, 2012:27; Kumar *et al.*, 2019:141). This enrichment of engagement may also influence customer loyalty; therefore, brands embrace engagement today. Over time, it has been shown to contribute to consumers' behaviour and preference for a specific brand or service.

According to Prentice *et al.* (2019:346), these authors illustrate a positive relationship between customer engagement and customer purchase intentions in their literature research. Hence, a company should consider formulating or developing an appropriate business intelligence strategy to drive customers to engage with its brand. Furthermore, Jaakkola and Aarikka-Stenroos (2019:38) observed that a customer's psychological shopper behaviour might expand and improve current research towards a customer perspective. Customer behaviour can be distinguished by how customers are incentivised during brand activity ventures. Suggesting that customer engagement and customers' judgments in business have a notable positive impact; thus, brands should identify what their businesses centre their attention or attraction is. For a brand to understand and identify the best engagement strategies for its target customers, the business has to use the opportunity to enable the brand to develop new innovative approaches. These approaches will continuously drive brand loyalty through sales by creating a competitive advantage in the market.

Businesses and companies should act rapidly and systematically to ensure that the brand's customer focus is evident to customers. A simple example would be how a brand responds to consumer feedback and how reviews can be an engagement strategy to improve business operations through customer service. Sheng (2019:49-50) suggests that once a company receives many reviews in a certain period, companies should ensure that it can compete with the review update pace and meet customers' expectations by engaging with a customer. As a result, it will be driving an enhanced power in influencing the competence for customer engagement. In addition, the continuous positive outcome of the company's responsiveness creates strategic value for managing or maintaining customers and potentially for financial outcomes (Sheng, 2019:49).

Hollebeek (2011:570) proposed customer brand engagement (CBE) themes like brand attitude, image, identity, personality, and experience, can be adapted to guide customer engagement in a company with strategies and campaigns that communicate with consumers.

Customer engagement has become more than just a strategy for business or marketing. It empowers customers to be engaged throughout their initial interaction and purchase journey. This engagement journey helps to grow customer loyalty and collect valuable customer information (Hollebeek, 2011:570). CBR has been determined to exhibit both positive and significant influences on brand loyalty. More customer interactions can drive users to find a more relevant or valuable brand, providing potential customers with insight. These customer insights can create an opportunity to formulate a strategy where informed marketing decisions can be made on the available information, such as content or retargeting improvements, which can significantly drive sales through social media channels and outreach methods.

Throughout current years, the synergies between customers and brands have progressed due to increased competition and the surge of various social media platforms. As a result, more organisations have shifted their focus on more engagement with current or potential customers to create a more sustainable long-term competitive advantage through the voice of their customers (Sheng, 2019:49). Today customers play an incremental role towards how a brand can improve or change its engagement strategies. Consumers expect brands to be one step ahead of service, playing their part in society and acknowledging a customer's experience with a brand. In the end, creating a strategy that

incorporates competitive advantage is crucial for a brand to be ahead or retain more brand loyalty. Customer engagement has also shown a linkage between the firm or brand performance indicators such as brand image, customer involvement, sales growth, referrals, and brand purchase intentions (Harmeling *et al.*, 2017).

It is, therefore, to be expected that engaged customers are expected to progress enduring relationships with the brands by expressing their trust, commitment, satisfaction, or loyalty. The engagement or experience of buying in a store can also follow through on brand loyalty in the consumer. This study will focus on social media users where customers are influenced through various engagement strategies through sharing their insights towards strategies that drive their brand loyalty.

Although digital engagement has become the first step in communicating to the consumer daily, it also empowers the consumer to make an informed decision with the information given during the engagement, especially if this specific item or brand will solve a particular problem identified by the consumer.

More companies have become aware of the consumer's voice, and therefore companies have created various strategic platforms to listen and encourage feedback or suggestions from their customers. An engagement strategy that empowers customers to share their experience as consumers. Thus, it allows brands to deliver according to the expectation of customers accurately with a competitive advantage.

1.1. Problem Statement

The predicament reviewed in this research is whether brands benefit from customer engagement strategies to increase and manage customer retention through brand loyalty. Each brand has access to connect with a customer according to a strategy suggestion or research available.

Consumers today are more responsive to trustworthy brands, who pay attention to their interests and preference by not taking advantage of their loyalty. Therefore, brand managers should put more effort into developing effective relationships between brands and consumers. Consequently, brand managers should encourage consumers to evaluate their brand towards brand satisfaction; if the outcome exhibits satisfaction, brand loyalty will be positive (Ekinici *et al.*, 2019:104-105).

For many consumers, social media has become a fundamental part of their everyday lives, allowing them to express their ideas, preferences, and likes on a wide range of topics and share their experiences with others.

Brands end up spending a tremendous number of resources on customer engagement or interaction, assuming that specific strategies will retain brand loyalty. However, literature may suggest several theories or methods; identifying the most effective engagement strategies from a customer's outlook can limit brands to choose more than one strategy. Instead, a business can rather scale down to practices that drive brand loyalty and customer engagement.

In the past decade, the literature upon customer engagement has become an increasingly assertive strategy for companies or brands to retain customer loyalty; however, customers can have different views on what sort of engagement will conquer their commitment into support.

Although various engagement strategies have been identified, poor execution can influence a customer's behaviour or brand preference. It inflicts a barrier for the brand to expand its customer database and market share. Nevertheless, specific customer engagement strategies that influence brand loyalty may not always be evident due to different consumer categories. Moreover, companies and brands do not always have the antecedents that influence customers' preference of a particular brand.

Suppose the initial engagement took place outside the retail environment. In that case, other instore activities or engagement should also be evaluated to determine if it also contributes to brand loyalty.

Through social media branding campaigns, consumers aware and informed will be more loyal to the brand they prefer and value. Therefore, the companies should not exclusively focus on detailed and informative advertisements but should also combine engagement. Today companies should accept and embrace social media platforms being considered as the most valuable brand management tool. It provides engagement, interactivity, and open discussion with the target audience (Ahmed *et al.*, 2019:210). Customer's attitude and perspective towards digital marketing or social media platforms, such as Facebook and Twitter, positively affect brand engagement (Faiz *et al.*, 2017:54).

1.2. Objectives

The primary objective is to determine which customer engagement strategies are the most effective for a brand or business to gain and retain customers through loyalty.

Three secondary objectives have been identified for this study:

1. To compile and validate a questionnaire to measure the customer engagement antecedents that contribute to brand loyalty.
2. To determine the relationships between customer engagement strategies and brand loyalty.
3. To identify customer engagement factors of brand loyalty empirically.

1.3. Research methodology

1.3.1. Population and sample

The study population were participants who are mainly active on social media platforms such as Instagram. The researcher has two social media accounts, namely the personal; account (Dorothy Grace Flint) and a second social media account called Patron & Niche. Thus, to separate the research from family and close personal friends, Patron & Niche's social media account started the snowball sampling for this study. Participants were recruited by using electronic word-of-mouth (eWOM). This was through invitations to participate, supported by other successful influencers on the social media domain. Targeting participants on social media was more accessible and responsive platform to engage with different individuals in South Africa. Ideally, it would give a broader perception to understanding a larger volume of participants regarding how they perceive brands and their engagement.

No sample will be drawn. Thus, all the members belonging to the population using Patron & Niche (as the first snowball) will receive the invitation to participate. This population was invited to partake on these platforms and then requested to share the invitation to partake in the research project with their friends, and they will then share the invitation with their friends, and so on. It is therefore not possible to determine the population or sample size. Data were collected until suitable numbers are reached (as determined by the Kaiser, Meyer and Olkin test of sample adequacy).

1.3.2. Research design

The study is a quantitative study and collects data via a self-administered questionnaire. See Appendix 1 (Self-developed questionnaire) with insight and questions aligned with customer engagement strategies. The electronic platform GoogleForms was used to collect the data. The questionnaire's answers were on a Likert scale between 1 to 5, where 1 suggests "strongly disagree" and 5 "strongly agree" to the specific question asked.

1.3.3. Data collection

The social media platform Instagram was used to snowball the invitation to participate in the survey. The following steps clarifies the data collection process:

Step 1: An invitation to take part in the survey was placed on the social media platform i.e., Instagram.

Step 2: This invitation was also requesting the respondents to share the invitation with their friends, and their friends and so on – thus snowballing the reach of the questionnaire

Step 3: On receipt, the respondent will be requested to complete the questionnaire – the first page of the questionnaire contains the Letter of Consent (Appendix 2)

Step 4: After the respondent ticks the box where consent is given, the questionnaire will open. If the consent is not given, the respondent will be reminded that consent is required. If still not given, thanked and not receive the questionnaire

Step 5: On completing the questionnaire, the data will automatically be captured and saved in the dataset. It is impossible to isolate any one respondent or identify a specific respondent's data from the dataset

Step 6: Dataset will be provided electronically to the statistical consultation services at the NWU for analysis.

Step 7: Researcher received the results from statistical services, interprets and writes the report

Please note that the responses are anonymous, and neither the data, identity, or contact details were identified from the electronic database. The researcher, therefore, has no idea who responded to the questionnaire, even though Instagram where participants were invited to partake in the survey. A total of 135 respondents participated in the study.

2.1. A theoretical model of customer engagement and brand loyalty

The study and the results will support the conceptual model designed according to the segments that may influence customer engagement that contributes to overall brand support or loyalty. In the model, the dependent variable CES is serviced by five independent variables, namely (1) Brand reputation (CES¹), (2) Social media (CES²), (3) Word-of-mouth from the Brand Community (CES³), (4) Customer Experience (CES⁴), and (5) Merchandising / Visibility (CES⁵). Furthermore, the theory also shows that these customer engagement strategies lead to brand loyalty. Therefore, more effective customer engagement antecedents serve as a pathway to improve brand loyalty (see Figure 1).

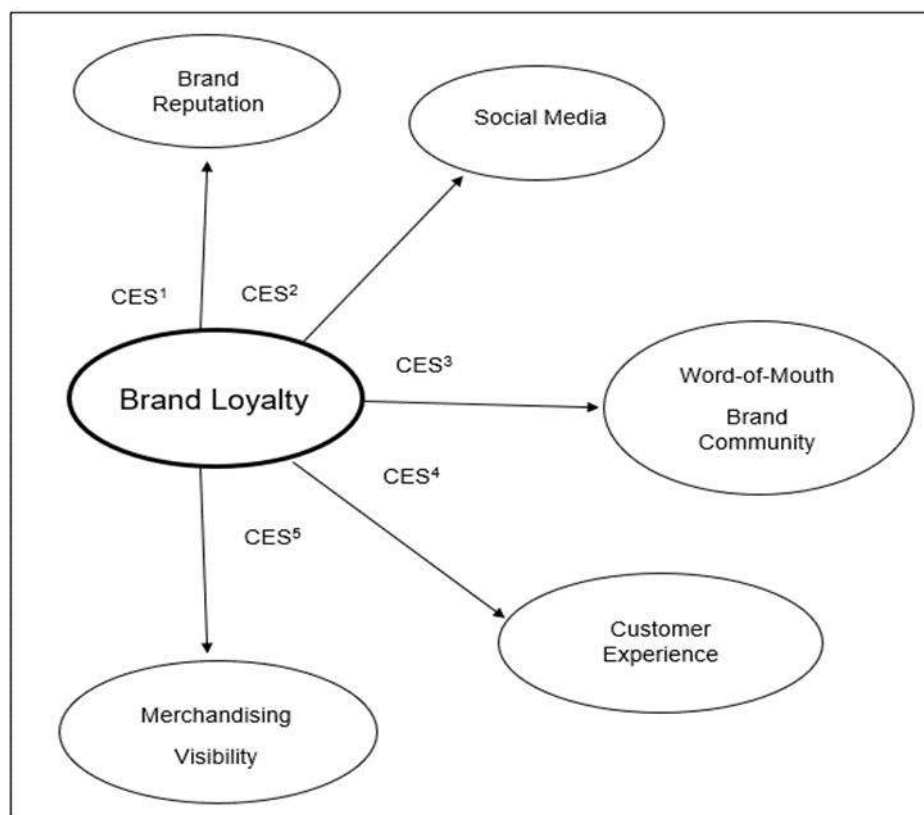

Figure 1: Conceptual model of customer engagement antecedents and brand loyalty

2.1.1. Brand reputation

A brand is generally the name, a term, design/symbol, or any other characteristic that distinguishes differentiates or identifies one seller's goods or services (Saboo *et al.*, 2016:526)

When a brand wants to build relevant and effective frameworks, it may be essential to incorporate ideas from various research findings, such as customer relationship management, customer experience, social media, and customer-oriented enterprises (Venkatesan, 2017:293). Acharya (2021:41) identified that unfamiliar and established brands might have to work harder to maintain and build brand reputation, which go hand in hand with brand recognition. The authors' findings provide managers with strategic means that will benefit customers to connect with their brand. According to Prentice *et al.* (2019:346), their research illustrates a positive relationship between customer engagement and customer's purchase intentions. Therefore, it is recommended that a company generate an appropriate business intelligence system and drive customers to engage with the brand.

Customers should experience a level of value and preference, as the association has been identified to have a positive outcome concerning customer engagement. It provides an increased level of value in terms of interest, sign, and pleasure with the product or service delivered (Parihar *et al.*, 2019). Merging insights from the various research findings, including customer relationship management, customer experience, social media, and customer orientated companies, can collectively be essential to develop actionable and practical frameworks that will represent a strong brand reputation (Venkatesan, 2017:293).

Besides brand loyalty, a brand's reputation and history can influence customers' perspectives and enthusiasm to be part of this brand's culture. Therefore, a corporate business legacy, especially towards brand management, indicates that nine mandatory elements must be considered if corporate heritage or their brands are to evolve. These are the historical identity, longevity; representation; brand leadership or brand stewardship; value proposition; consistency, trust, authenticity, heritage, brand evolution, and legacy of corporate social responsibility (Adegbile & Otubanjo, 2019:8).

2.1.2. Social media

Brands today are surrounded by multiple social media platforms and channels, which enables brand awareness and engagement more significantly. The progression and evolution of social media as an interactive technology has empowered, enabled, and changed millions of lives; it can be personal, organisational, and global. Its impact within the scope of marketing remains unique and is perceived as the primary component of enhancing consumer engagement towards online platforms (Ahmed *et al.*, 2019:202). A theoretical model of Ahmed *et al.* (2019:205) demonstrates the interchanging elements of social media marketing; consumer consciousness, and the impact on brand loyalty. Faster and more consistent responses from businesses and brands are needed to show customers the managerial effort. In addition, a considerable number of reviews received in a short period suggest that organisations should make sure they can keep up with the rate of review updates (Sheng, 2019:49-50). Quick and frequent responses enhance the likelihood of appearing at the top of a review page, allowing a brand or business to be more visible to review readers and potential reviewers. As a result, the capacity to influence customer engagement competency will be strengthened. According to Sheng (2019:49), due to the company's responsiveness, strategic value is generated for managing or sustaining customers and financial repercussions.

However, Saboo *et al.* (2016:538) concluded by suggesting that a brand should not focus on the number of followers alone, but that brand managers should also encourage participation on social media platforms from consumers. Furthermore, these activities positively influence each other. For example, an increase in a brand's popularity or fame can positively influence other social media activities, implying that brands need to consider combining both activities. Social media sites such as Facebook, Twitter, and Instagram can help businesses, brands, and customers build stronger relationships with their target customers. However, there has been no systematic investigation of the factors influencing consumer interaction on social media despite the widespread acknowledgment of

their importance. When conducting their research, Ajiboye *et al.* (2019: 239) used a systematic strategy that included a thorough review of the empirical literature on consumer interaction behaviour on social media platforms. Five of the most important antecedent causes identified in the research literature include social connections, ownership-value, information-seeking, involvement, and functionality. Using social media by a business requires all of these elements.

Customer brand relationships have been found to have a favourable effect on consumer purchase intent via social media. A strong desire to purchase is shown among customers who have developed a strong confidence level in a particular brand, which suggests a high level of contentment and commitment. Customers' purchasing intentions can be induced by various brand-related actions by marketing managers who focus on building trust and happiness in their customers (Sharma *et al.*, 2021:614). Connecting with people is part of social media platforms' functioning. Thus, customers are exposed to it in response to their involvement and interactions with social media platforms (Ajiboye *et al.*, 2019). The above mention promotes the exchange of similar brand interests, values, and ideas, resulting in online brand communities and a sense of social cohesion.

2.1.3. Word-of-mouth / Brand community

Consumers, creators, and contributors connect with brands or businesses in various means, primarily through brand communities (Ajiboye *et al.*, 2019: 248). Two decades ago, brand communities were already identified and defined as "social entities that represent the embeddedness of brands in consumers' daily lives" (Muniz & O'Guinn, 2001:418). The modern brand community, however, differs in the speed and reach of communications. Instead of portraying a customer-incentivised action or venture, Jaakkola and Aarikka-Stenroos (2019:38) observed that consumer recommendation of a brand to other consumers will most likely expand and improve future purchase behaviour. Prentice *et al.* (2019:345) recommend that new members rely more on the brand community than long-term members, and they must have confidence in the brand and its community to engage in its activities. Word-of-mouth is an oral, written, and electronic communication between communities related to the quality/experience of a product or service purchased or used (Kotler & Keller 2009:174; Indrasari *et al.*, 2019:190).

Brand managers experience constant pressure to engage with their target audience. A common strategy is to drive and motivate consumers to "follow, like, or share" the brand's key message with other followers, indirectly influencing consumer purchase decisions (Saboo *et al.*, 2016:526). The value of social word-of-mouth (SWOM) or electronic word-of-mouth (eWOM) on social media suggests that the advantages of SWOM can increase exponentially at higher levels of SWOM. Consequently, the more SWOM takes place on social media, the larger target or non-target audience will be reached. Thus, SWOM continues to increase at an increasing rate. However, the authors also considered it possible that the outcome of SWOM will reduce once it reaches a certain level of exposure (Saboo *et al.*, 2016:538).

Social media can significantly impact customer decision-making, affecting shareholder value. Social media is contributing to an overall positive impact on business performance. This contributes to both the necessary business of offline advertising and WOM and current social media research. Therefore, a brand should keep in mind that the multidimensional nature of customer engagement may vary depending on the depth of engagement and exposure to the consumer. For example, Boujena *et al.* (2020:8) concluded that the lowest level of customer engagement could be obtained via "views" and "likes" which are natural actions because they require little time investment from the consumer.

"Most customers use the brand community primarily as a source of information, reading messages rather than contributing with likes and comments," according to Gummerus *et al.* (2012:87). Halaszovich and Nel (2017:29) propose that two "like" intents can be the engagement through word-of-mouth and connect with a brand to get information are two main intentions driving fan-page like behaviour," back up the antecedent of the source of information. Chiang *et al.* (2017:1457) can add to this finding through behavioural customer learning, which is fundamental to explaining customers' online habits and contributing to customer engagement behaviour. Consumers experience an elevated

belief towards their favourite professionals or sports stars; therefore, they are likely to adhere to their attitudes and behaviours when they believe in these role models. Furthermore, they will subsequently act as word-of-mouth ambassadors for the marketed companies and their brands (Wong et al., 2015:321).

2.1.4. Customer experience

Customer experience is defined as "a multidimensional construct that focuses on a customer's cognitive, emotional, behavioural, sensory, and social responses to a firm's offers throughout the customer's whole buying journey" (Lemon & Verhoef, 2016:3). While a consumer interacts with a brand, they assess their direct and indirect experience with a brand. Therefore, the management of brands should not be managed traditionally, as traditional marketing elements are becoming less influential for a consumer's decision-making process and purchase behaviour. A consumer's customer experience is another contributing factor a company should consider to drive a consumer's brand perception (Klaus, 2020:7). Customer experience is why a brand is perceived as positive or negative, as a consumer evaluates brands according to how their expectations and experience were delivered.

Customer experience during market research can shift the tactical level towards a more strategic approach. Customer experience provides market research with a different opportunity to explore what drives customer behaviour and business performance (Klaus, 2020:7). However, companies with their brands may find customer experience a complex field regarding measuring or managing it. Customer engagement and customers' opinions or feedback have a beneficial influence, which means brands and companies should focus on more innovative business models that can drive consumer engagement towards their brand or company.

Pan (2020:81) identified that further agreement analyses reveal that customer community involvement partially relates to community perceived value and brand endorsement. In addition, it plays a function in the agreement of social value in the community and brand recommendations. This research analyses the impact of customer community relationships on the consumers' two community value demands. Consumer community engagement and cognitive value were strongly related, while brand symbolism did not impact the relationship. That being said, it harms both social value and the level of consumer community engagement.

Customers should feel appreciated and preferred for customer involvement because the connection has been a favourable impact. In terms of interest, sign, and enjoyment add more value to the supplied goods or service (Parihar *et al.*, 2019). Jaakkola and Aarikka-Stenroos (2019:38) observed that customer referring behaviour could expand and improve existing research upon customer viewpoints instead of portraying a customer incentivised activity and venture. This suggests that customer engagement and customer's views in business had a positive impact; therefore, brands and companies should centre their attention towards more innovative approaches. Businesses and companies should respond faster and more systematically to ensure that managerial effort is evident to customers.

Regardless of how consumers purchase items and services, brands will significantly influence consumers' shopping decisions. Therefore, consumers are not choosing one brand over another because of advertising, marketing, persuasion, or branding, which signifies that these elements of brands are not the only influencing factors that cause a consumer to select one brand over another. Since traditional brand-building tools serve the role of customer experience, these elements are intended to create and drive consumer interest, contributing to the journey of customer experience (Klaus, 2020:7).

2.1.5. Merchandising / Visibility

To be successful in a modern connected internet world, merchants must clearly express their identities to customers across different platforms. Consumer-brand relationships are more likely to result in improved customer engagement, increased brand loyalty, and increased readiness to pay if the retailer's brand identity is similar to the consumer's identity. Even though retailers must align their brand identity with their customers' identities, they must also accept that both identities may change

over time. Consumer experiences across touchpoints must be identified, crafted, and integrated in a way that connects with consumers if the retailer is to keep the identities congruent.

The perceived symbolic value of an online shopping website (sign), interest in a website (cognitive), and pleasure a person expects from purchase can influence brand engagement. Sign and pleasure are the following most effective motivators for keeping a consumer engaged: interest and desire. This favourable association may be a result of consumer involvement with the brand provides expected values like interest, sign, or pleasure for customers from that product or service category (Parihar *et al.*, 2019: 74).

Roggeveen *et al.* (2021:81) identified in their research that the relevance of retailer-consumer identity congruence matches the identity of the retail brand with the identity of the customers. Therefore, brand-consumer interactions can be strengthened by using identity congruence to build more robust engagement, brand loyalty, and a greater desire to pay for products.

Innovative merchandising tactics and innovative product offerings help create a distinct retail brand identity and make that identity more easily communicated to customers. According to Venkatesan (2017:293), integrating several insights and research streams such as customer relationship management (CRM), customer experiences, social media, and customer orientated organisations are powerful fundamentals to develop an executable framework for these strategies. Customer brand engagement has become more than just marketing; companies focus on broadcasting visibility activities to improve brand engagement (Faiz *et al.*, 2017:53).

Customers' attitudes towards outdoor marketing like billboards and posters as a customer engagement platform had a positive and significant impact. Once organisations adopt social media platforms to implement marketing and engagement activities, it is relevant to maintain engagement and communication as a consistent practice.

Roggeveen *et al.* (2021) identified five new merchandising concepts to help retailers better interact with customers by creating themes, reflecting the brand story, being playful, signalling exclusivity, and virtual merchandising. In addition, a consumer is more likely to identify with the retail brand if the retailer is using social and technology tools to enhance the retailer's identity.

3.1. Descriptive statistics

GoogleForms provided the analysis for the descriptive statistics. Highlights of these statistics are that:

- 71.9% of participants first read the reviews of a new product that was launched. Thereafter they use word-of-mouth, a brand community to make an informed discussion before purchasing the product.
- 71.9% first read online reviews about products before purchasing the product.
- 60.7% uses Facebook or Instagram to communicate to their brand community (30.4% uses email communications for this purpose).
- Communication methods classified as “Irrelevant” are SMS messages (35.6%) and Telephone calls (35.6%)
- Most memorable advertising media is Social media (62.2%) and TV (59.3%). Brand influences and brand ambassadors are fairly low-key reminders (17.8% and 18.5%, respectively).
- In the omni-channel the respondents indicated that Traditional advertisement (TV, radio, billboards, Screens, advertisements) contributes to 56.68% of memorable brand communication, where Modern advertisement (Social media, brand ambassadors, brand/social media influences) contributes to 43.32%.

3.2. Multivariate statistics

3.2.1. Objective 1: Suitability of the data and validity of the questionnaire

A total of five antecedents were identified from the literature (each measured by five measuring criteria using a 5-point Likert scale). The measuring criteria of the antecedents, sample adequacy, variance explained, and reliability were computed and these results appear in Table 1. Table 1 indicates that the data are adequate ($KMO \geq 0.70$), reliable ($\alpha \geq 0.57$ - minimum; 0.70 - preferred) (Field, 2017; Cortina, 1993) and also that sphericity is significant ($p \leq 0.05$).

Table 1: Customer engagement antecedents' suitability statistics

Antecedents	Sample adequacy (KMO)	Sphericity (Bartlett)	Reliability (α)	Variance explained (σ^2)
Antecedent 1: Brand Reputation	0.77	0.00	0.43	63.56%
Antecedent 2: Social Media	0.87	0.00	0.86	61.59%
Antecedent 3: Word-of-Mouth / Brand Community	0.69	0.00	0.63	58.24%
Antecedent 4: Customer Experience	0.64	0.00	0.61	53.89%
Antecedent 5: Merchandising / Visibility	0.85	0.00	0.87	61.45%
Outcome: Brand loyalty	0.78	0.00	0.75	51.08%
Total data set	0.84	0.00	0.91	63.50%

In serving *Objective 1*, each antecedent's measuring criteria are subjected to exploratory factor analysis to establish if these criteria truly measure the antecedent. All criteria should ideally load onto the antecedent identified in the literature; this indicates validity and that the antecedent is a pure construct with no embedded sub-constructs. This suggests that the relevant criteria only assess one construct (Field 2009:786; Asvat 2018). Table 2 below shows the details on the measuring criteria and their validity towards the antecedents.

Table 2: Antecedents, measuring criteria and factor scores

Antecedent 1: Brand Reputation	Factor 1 loadings	Factor 2 loadings
Q.1.1. A tried and trusted brand is always my first option	.600	***
Q.1.2 If I cannot find my brand in-store, I would instead go to another store to buy the brand I want	.794	***
Q.1.3 As a consumer, I do care about an established brand that delivers a quality product for my use	.918	***
Q.1.4 I find it easy to switch from one brand to another	-.771	***
Q.1.5 A brand's reputation influences my purchasing choices	.647	***
Q.1.6 I only buy brands with a good reputation	.691	***
Antecedent 2: Social Media	Factor loadings	Factor loadings
Q.2.1 I trust a brand that is present on social media for communication	.825	***
Q.2.2 I can remember brands with social media visibility when I enter the shops	.837	***
Q.2.3 Social media is a helpful medium to consult when I want to learn more about a brand	.811	***
Q.2.4 I will follow a brand's social media page after I have bought it	.719	***
Q.2.5 I value a brand that follows me back on social media	.632	***
Q.2.6 A strong brand presence/engagement on social media influences my buying behaviour positively towards the brand	.861	***
Antecedent 3: Word-of-Mouth / Brand Community	Factor 1 loadings	Factor 2 loadings
	<i>Listening</i>	<i>Sharing</i>
Q.3.1 Recommendations by other consumers influence my brand choices	.796	
Q.3.2 I value the customer reviews and feedback on brands	.701	
Q.3.3 I trust a recommendation made by a health care professional (such as a pharmacist) on a specific brand	.522	
Q.3.4 Recommendations by other customers on a specific brand could influence me to try their brand	.784	
Q.3.6 Even if I am not asked to, I volunteer to share my experiences with other consumers about the brands that I purchase		.873

Antecedent 4: Customer Experience	Factor 1 loadings	Factor 2 loadings
	<i>Support</i>	<i>Store</i>
Q.4.1 Knowledgeable aisle managers can influence my brand choice when I am uncertain what brand to buy	.672	
Q.4.2 I feel irritated if my chosen brand is out of stock	.534	
Q.4.3 I prefer readily available instore assistance (and not having to look for or ask someone to help me)	.692	
Q.4.4 I value the insight of a pharmacist (or some other knowledgeable person such as the instore manager) to provide information about a brand	.747	
Q.4.5 An efficient store layout is essential when I decide where I will be shopping		.832
Q.4.6 A delightful overall customer experience influences me to support a store that stocks my brand		.813
Antecedent 5 Merchandising & Visibility	Factor 1 loading	Factor 2 loadings
Q.5.1 A supreme display of a brand (i.e., a clear brand block, shelf strips, or point of sale material) indicates that the brand is worthy of my purchase	.853	***
Q.5.2 The more I see the brand in-store at various points, the more I get encouraged to purchase the brand	.814	***
Q.5.3 Merchandising that communicates the brand characteristics encourages me to choose the product	.671	***
Q.5.4 If my brand does not make use of in-store brand merchandising, the low visibility will make it difficult to locate my brands	.720	***
Q.5.5 Good merchandising and/or visibility of a brand demonstrates that this brand values my shopping experience	.837	***
Q.5.6 A well-executed brand on display may influence me to support the brand	.793	***
Outcome: Brand loyalty	Factor 1 loadings	Factor 2 loadings
Q6.1 The reputation of a brand has a significant impact on my total support or devotion to it	.713	***
Q6.2 The presence and engagement of a brand on social media have a significant impact on my overall support or loyalty to that brand.	.715	***
Q6.3 What other people advocate or say about a brand has a significant impact on my total devotion	.706	***
Q6.4 My overall shopping experience will influence my decision to return to a particular store or brand in the future	.655	***
Q6.5 A well-executed brand display in-store will influence my decision to support the brand	.779	***

Table 2 tested the validity of the 35 questions across five antecedents and the outcome to ensure the validity of the questionnaire statistically. Antecedents 1 (Brand reputation), 2 (Social media) and 5 (Merchandising & visibility) are validated as is. All the questions measuring these antecedents respectively, load as one construct indicating that these questions indeed measure the specific antecedent. Antecedents 3 (Word-of-mouth & Brand community) and 4 (Customer experience), however, measures two constructs each; this means that sub-factors exist within each antecedent.

In the case of Antecedent 3, the questions show that questions Q3.1-Q3.4 and Q3.6 all deal with the advice received from other parties on products and brands, thus entailing receiving information. This sub-factor is thus labelled as “Listening to word-of-mouth advice”. Contrary, Q3.6 deals with sharing one’s experiences with other customers, and as such, the sub-factor is labelled as “Sharing advice via word-of-mouth”. Question 3.5 was discarded because it returned a factor loading lower than the required 0.40.

Antecedent 5 also identified two sub-factors. Three questions (Q4.1, Q4.2 and Q4.4) deals with advice in the shop, while Q4.3 deals with irritation on out-of-stock products. Since most of the questions deal with advice and support concerns, this sub-factor is labelled “Support”. The other two questions (Q4.5 & Q4.6) deal with store-specific issues. Hence, the sub-factor is labelled as “Store selection.”

3.2.2. Objective 2: Regression analysis of antecedents

In serving Objective 2, the five antecedents and their relationships towards the dependent variable Brand loyalty were tested using linear regression to determine if the model signifies a good fit and to what extent each of the antecedents contributes towards brand loyalty. This was done by using the AMOS software of IBM SPSS (Version 27). The regression structural equation model is shown in Figure 1. The standardized regression weights and the significance ($p \leq .05$) appear in Table 3 directly below the model. The model summary portraying the R-statistics are shown in Table 4.

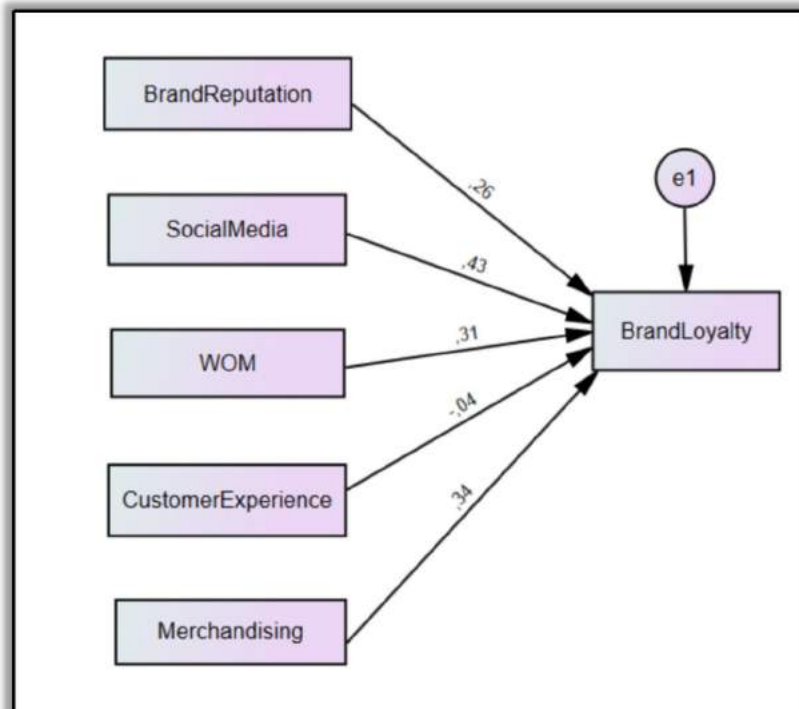

Figure 1: Regression model of brand loyalty antecedents

Table 3: Standardized regression weights, intercept and model summary

Variable description			Estimate	P-Value
BrandLoyalty	<---	BrandReputation	.262	***
BrandLoyalty	<---	SocialMedia	.430	***
BrandLoyalty	<---	WOM	.309	***
BrandLoyalty	<---	CustomerExperience	-.039	.535
BrandLoyalty	<---	Merchandising	.340	***
Intercept			.217	

The analysis shows that all the independent variables except Customer experience are significant at the 95% confidence level) ($p \leq .05$). It is also noteworthy that Customer experience has a negative and low regression weight; this indicates that this independent variable (even if it was significant) would have minimal effect on the brand loyalty of the respondent in this study.

Table 4: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.807 ^a	.651	.638	.39073
a. Predictors: (Constant), Merchandising, BrandReputation, WOM, CustomerExperience, SocialMedia				

The adjusted R^2 is .638, meaning that the data fit the regression model well ($R^2 \geq .60$) (Frost, 2021). This means that the model explains a variance of 63.8%. Also evident from the tables and figure above, the regression model ($y = a + b_1x_1 + b_2x_2 + \dots + b_5x_5$) then shows that the antecedents and their predictive properties towards Brand loyalty are:

Brand loyalty (y) = .217 + .262(Brand reputation) + .430(Social media) + .309(WOM) + .340(Merchandising)

3.2.3. Objective 3: Identify factors of brand loyalty

The data was also subjected to exploratory factor analysis to determine if underlying intelligence or “other factors” were embedded in the data. The results show that eight factors (contrary to the original five antecedents identified from the literature) are present. (This observation is supported by identifying sub-factors in the antecedents’ word-of-mouth/brand community and customer experience (see Table 3).

These factors explain a cumulative variance of 63.5%, and all eight factors have eigenvalues larger than one. As per the Kaiser criterion, these factors should thus all be retained. The Varimax rotated factor matrix appears in the Table 5 below.

Table 5: Varimax rotated factor matrix

Measuring criteria	Component							
	1	2	3	4	5	6	7	8
Q.5.5 Good merchandising and/or visibility of a brand demonstrates that this brand values my shopping experience	.849							
Q.5.1 A supreme display of a brand (i.e., a clear brand block, shelf strips, or point of sale material) indicates that the brand is worthy of my purchase	.821							
Q.5.2 The more I see the brand in-store at various points, the more I get encouraged to purchase the brand	.732							
Q.5.4 If my brand does not make use of in-store brand merchandising, the low visibility will make it difficult to locate my brands	.706							
Q.5.6 A well-executed brand on display may influence me to support the brand	.695							
Q6.5 A well-executed brand display in-store will influence my decision to support the brand	.670							
Q.4.5 An efficient store layout is essential when I decide where I will be shopping	.622							
Q.5.3 Merchandising that communicates the brand characteristics encourages me to choose the product	.520							
Q.2.2 I can remember brands with social media visibility when I enter the shops		.749						
Q.2.6 A strong brand presence/engagement on social media influences my buying behaviour positively towards the brand		.749						
Q.2.1 I trust a brand that is present on social media for communication		.738						
Q.2.3 Social media is a helpful medium to consult when I want to learn more about a brand		.730						
Q.2.4 I will follow a brands social media page after I have bought it		.721						
Q6.2 The presence and engagement of a brand on social media have a significant impact on my overall support or loyalty to that brand.		.688						
Q.2.5 I value a brand that follows me back on social media		.626						
Q.1.2 If I cannot find my brand in-store, I would instead go to another store to buy the brand I want			.764					
Q.1.6 I only buy brands with a good reputation			.721					
Q.1.1. A tried and trusted brand is always my first option			.679					
Q.1.5 A brand's reputation influences my purchasing choices			.661					
Q.1.4 I find it easy to switch from one brand to another			-.631					

Q.4.2 I feel irritated if my chosen brand is out of stock			.492					
Q.3.1 Recommendations by other consumers influence my brand choices				.760				
Q.3.4 Recommendations by other customers on a specific brand could influence me to try their brand				.714				
Q6.3 What other people advocate or say about a brand has a significant impact on my total devotion				.650				
Q.3.2 I value the customer reviews and feedback on brands				.460				
Q6.1 The reputation of a brand has a significant impact on my total support or devotion to it				.408				
Q.4.3 I prefer readily available instore assistance (and not having to look for or ask someone to help me)					.735			
Q.4.4 I value the insight of a pharmacist (or some other knowledgeable person such as the instore manager) to provide information about a brand					.717			
Q.3.3 I trust a recommendation made by a health care professional (such as a pharmacist) on a specific brand					.540			
Q.3.5 If asked, I freely share my experiences with other consumers about the brands that I purchase						.679		
Q.4.6 A delightful overall customer experience influences me to support a store that stocks my brand						.462		
Q.3.6 Even if I am not asked to, I volunteer to share my experiences with other consumers about the brands that I purchase							.703	
Q.1.3 As a consumer, I do care about an established brand that delivers a quality product for my use							.547	
Q.4.1 Knowledgeable aisle managers can influence my brand choice when I am uncertain what brand to buy								-.662
Q6.4 My overall shopping experience will influence my decision to return to a particular store or brand in the future								.606

Extraction Method: Principal Component Analysis.

Rotation Method: Varimax with Kaiser Normalization.^a

a. Rotation converged in 8 iterations.

The data were tested for sample adequacy (using the test developed by Kaiser, Meyer and Olkin (KMO=.871), Bartlett's sphericity test showed significance ($\chi^2 (595) = 2264.119, p < 0.05$), and the data possess excellent reliability according to the Cronbach alpha coefficient ($\alpha = 0.907$) (Field, 2009:658-659; 675). The first two factors dovetail nicely with the antecedents identified from the literature. In this regard:

- **Factor 1** is labelled *Merchandising and Visibility* (Antecedent 5), while
- **Factor 2** is labelled as *Brand reputation* (Antecedent 1).

These factors explain 27.9% and 8.23% of the variance, respectively. However, the other factors identified new underlying constructs. They are discussed next.

Factor 3: Brand trust and reputation (7.02%)

According to Rust *et al.* (2021:22-23), a brand's reputation is the overall total of how its stakeholders perceive, feel, and discuss it. Therefore, a brand's financial performance might be adversely affected by brand incidents. The following are the characteristics of this definition: All stakeholders (current and potential customers, employees, partners, and investors) are considered rather than just the current or potential clients; (2) thinking, feeling, and talking components (rather than just brand knowledge); (3) actual brand events (e.g., controllable marketing activities, uncontrollable public events); and (4) links to the financial performance of the firm are included.

An organisation's reputation is an asset that can help it differentiate itself from its competitors and create obstacles to new competitors entering the market. As a result of long-term behaviour, a company's reputation is based on its capacity to produce value for customers and other stakeholders. Credibility and trustworthiness are closely tied to the implementation of rules and practices that have been explicitly declared. Therefore, the terms "reputation" and "judgment" or "credibility" are often used interchangeably (Pereira *et al.*, 2021:559).

Brand popularity and knowledge have a favourable impact on customer loyalty. Thus, in contrast, familiarity has a detrimental effect on the user. Although customer loyalty increases as a company's popularity and recognition rise, this impact is reversed as people become more acquainted with the brand.

Factor 4: Out-of-store recommendations (5.06%)

Various factors can significantly affect customers' behaviour, including price, brand awareness, and brand image. According to De Toni *et al.* (2021:633), there is a strong correlation between price and brand when customers have limited information about what they are considering purchasing. In addition, customers' perceptions of fairness and value (cognitive factors) and, in some cases, a higher social status are influenced by well-known brands with higher prices and higher quality (affective factors). Thus, the information consumers obtain before in-store purchase may influence their decision making according to what they know about the brand. Items priced at a high rate, yet brand or quality unknown can be perceived as an "expense" item to purchase.

What a brand communicates to their market is critical; the key messages they want to share with consumers can direct consumers towards finding a need or a want for the desired brand.

Factor 5: In-store advice (4.78%)

Personal selling, according to Indrasari *et al.* (2019:191), these sales are found to be more successful as it places a higher emphasis on direct contact with customers face to face are more successful. This is primarily to promote their services or introduce new products. It is expected that face-to-face interactions will significantly impact customers' perceptions of and interest in the product

Personal selling directly impacts the consumers' buying behaviour, which is an essential tool of marketing. Personal selling changes the negative attitudes of the customer to positive ones. According to Azeez and Abeyratna (2020:48), their research explains how personal selling affects customers'

buying behaviour relating to clothes retail shops. Therefore, a salesperson's advice can change customers' attitudes and, ultimately, the customers' buying behaviour.

Factor 6: Shopping experience (4.14%)

According to Hu and Jasper (2018:153), these authors defined a consumer's shopping experience as the "totality of things that a consumer encounters or lives through as he or she makes consumption-oriented movement in a retail setting, with or without the possibility of making purchases". Thus, the definition mentioned above is also in line with how retail professionals perceive the shopping experience.

Retail stores would benefit significantly from knowing which specific aspects of their offerings affect customer satisfaction of unexpected buyers. Consumer insight information could develop ad hoc strategies for reaching these customers and building profitable long-term relationships with them. Satisfied unplanned buyers can return to the store where they purchased their unplanned item(s) and positively discuss it with other customers (Martínez-Ruiz *et al.*, 2017: 277). As many purchases are made in the store, new technologies can help store managers leverage the economic potential of unplanned purchases. For example, mobile applications could inform consumers about special in-store promotions connected with their planned purchases, thus inducing them to purchase unplanned items. Customers are more likely to return, spend, and recommend the product if they have a positive shopping experience (Hu & Jasper, 2018:155).

As a result, understanding which store attributes are most important to customers' satisfaction who tend to make impulsive purchases may help retailer managers better set their offerings, effectively deliver value to these customers, and ultimately increase their profits (Martínez-Ruiz *et al.*, 2017: 278).

Factor 7: Brand ambassador (3.25%)

A "famous person" is a celebrity or a brand ambassador. A well-known person for accomplishments outside of the product category in which they are endorsing is an expert in their profession. Thus, celebrities have a disproportionately high level of public recognition among a particular set of people. They have unique characteristics, such as their attractiveness, extravagant lifestyle, or ability to master a particular talent (Olugbenga & Oluwafemi, 2018:456).

Kim *et al.* (2020: 8) found that endorsements, including their attractiveness and expertise, were linked to brand loyalty through brand passion. Previous studies found connections between consumers' satisfaction with their relatedness needs and their brand passion for sporting goods. Therefore, consumers develop a strong emotional attachment for a brand when exposed to an endorsement, especially by an attractive star athlete with the image of an expert in their field. Individuals may have a basic psychological need for relatedness, and when that need is met, a strong emotional attachment develops with the related entity.

According to Olugbenga and Aluwafemi (2018:456), there has been a dramatic increase in celebrity endorsements as a marketing tactic in recent years; celebrities have been utilized for anything from sports to beverages to all kinds of electronic devices to a wide range of other things. However, despite celebrity endorsers becoming prevalent across many industries, this trend is not restricted to just one. Researchers suggested that the employment of celebrities in TV commercials provokes the interest of customers, particularly when their favourite celebrities are involved. Celebrity endorsements are an excellent method to draw attention to a brand or product and enhance consumers' likelihood of buying it. As a result, advertisers are increasingly using celebrities in their campaigns.

Factor 8: Personal choices (3.13%)

There are several reasons why consumers like to experiment with new personal choices from a marketing and psychological standpoint.

In psychology, individual elements like satiation, the need for stimulation, and ambiguity about future preferences are examined to understand the phenomenon.

Various factors have been shown to encourage consumers to make more diverse purchases over time. However, internal or personal motivation is the first reason customers desire variety in their personal choices (Stasiuk *et al.*, 2021:1121).

4. Conclusions and recommendations

The conclusions are first drawn on the research methodology, and second, on the results. Recommendations follow the conclusions.

4.1 Research methodology

Conclusion 1:

The study performed a rigorous theoretical review of brand loyalty and its antecedents. From this study, a proven model was selected as the foundation for the empirical research. Likewise, theory guides the researcher to relevant questions to compile the online questionnaire. It is thus concluded that doing a sound theoretical study resulted in a relevant and quality research instrument.

Recommendation 1:

It is recommended that future researchers take note of the value of a sound theoretical study; this would guide them towards a solid foundation based on relevant literature. These researchers could duplicate or mold their research on similar theoretical principles.

Conclusion 2:

Regarding data collection, the response rate from participants was quick and effective using both the social media platform as well as an electronic questionnaire on GoogleForms.

Regarding analysis, sound research and consultation with statistical experts (such as the NWU Statistical Consultation Services) are imperative to select proper analytics procedures. In addition, using recent and specialised software to analyse the data are also required. These methodological guidelines assisted the study greatly, and it can thus be concluded that the proper analysis and data mining provided more than just the apparent intelligence in the data. Furthermore, it is concluded that the methodology followed suited this study well. More specifically, it can be concluded that the data were:

- 1) Adequate, meaning that a “sufficient” number of respondents participated (the Kaiser, Meyer and Olkin measurement exceeds 9.70)
- 2) Suitable for multivariate analysis because Bartlett’s test showed significance ($p \leq 0.05$)
- 3) Reliable as per Cronbach alpha’s coefficient ($\alpha \geq 0.70$).

Therefore, it is concluded that the data are fit to use in analysis and the results, therefore, suitable for managerial decision-making. It is also concluded that electronic platforms can be used to quickly and effectively collect data, albeit the target population needs to be selected effectively to get a good response.

Recommendation 2:

It is therefore recommended (based on Conclusion 2) that other researchers:

- 1) Ensure their data is suitable for analysis by performing the tests mentioned above
- 2) Make use of knowledgeable statistician to analyse the data
- 3) Use specialised statistical software to correctly analyse the data.

4.2 Results

Conclusion 3:

The analysis not only measured the respondents’ views on the initial theoretical model (the measuring criteria and the antecedents), but also identified underlying factors (or intelligence) in the data. Furthermore, the analysis confirmed these factors with confirmatory factor analysis, and measured model fit indices. Based on the thorough analysis of the data, it is concluded that the antecedents of

brand loyalty and the identified factors are relevant and valid constructs to manage brand loyalty. More specifically, it is concluded that:

- 1) The results remained valid when tested on the original five antecedents of CES
- 2) The antecedents could be used to manage and influence brand loyalty in consumers
- 3) The underlying intelligence (factors) provides a secondary and good indication of what drives brand loyalty. In this case, eight factors have been identified, and these factors are more specific than the original five antecedents identified from the literature.
- 4) The confirmed model shows a fair fit to the brand loyalty data. This means the model can be used with confidence.

Recommendation 3:

The results of this study can assist and guide managers towards improving their brand loyalty managerial decisions. It is thus recommended that:

- 1) Managers peruse the results and internalise knowledge specifically relevant to their brands and customers.
- 2) The confirmed model be operationalised and used in brand loyalty decision-making because industry and management can benefit from the results in practice.
- 3) Academia and other researchers also take note of the results as it adds to the body of brand-loyalty knowledge while also forming a basis for further research.

5. Areas of further study

In this section, recommendations are made for future researchers. Possible areas for future research are:

- Investigating the age and demographic areas with regards to how the participant could have viewed their opinions. A more centralised focus towards different ages groups or generations such as Gen Z, Millennials, Gen X, Boomers, and Silent Generation can also be investigated to compare or illustrate which engagement strategy is most influential towards their brand loyalty.
- Expand the study to a wider geographical area and also use more social media platforms.

6. Limitations

There are some limitations to this study. The limitation is that his study used only one facet of social media, namely Instagram, to recruit participants. More social media platforms could have yielded a better response. The sample size was 135 participants, and a larger sample size on various social media platforms can reach a larger target population with a more comprehensive view regarding research.

7. Managerial Implications

Based on the conclusions and finding the following managerial implications are evident:

Implication 1: Managers who aim to base decision-making on research-based information should take note and make sure that their data is reliable and the sample adequate before they initiate managerial action steps

Implication 2: This study provides a blueprint for social media data collection. By implication managers can use this as an example on how to collect data easily, quickly and at low cost.

Implication 3: Managers should properly analyse the data before making decisions. Proper analysis and interpretation are key to making good managerial decisions (see for example the newly identified sub-factors in table 1).

Implication 4: Managers should deal with decisions that would provide them with the greatest return on input; this means that they should deal with the factors explaining the most variance first. In practice, Merchandising, visibility and Brand reputation are thus the first managerial inputs to consider addressing.

Implication 5: The brand loyalty antecedents are inter-related. Managers should take note that addressing one antecedent has an effect on the others. This should be factored in when they make managerial decisions.

Keywords

First-year students;
Career choice; Culture;
Career perceptions.

Abstract

Research has indicated that a scholar's career choices are influenced by good career prospects, such as salaries and employment opportunities. In addition, their career decisions are influenced by parents, teachers and cultural backgrounds. Culture is the customs and habits that characterise a certain society or nation. Individuals' decisions to choose a particular career might be influenced by their cultural values. This study aimed to determine whether first-year students' career choices were influenced by their culture and cultural perceptions of their chosen career. A questionnaire was completed by 405 first-year IT and Business students at a large university in South Africa. The results were statistically analysed and included Exploratory Factor Analysis. The results indicated that culture does influence a first-year student's career choice, specifically students with different home languages. The results further indicated that the IT group had better perceptions about their chosen career compared to the Business group. The IT group listed specific IT job titles as their chosen career. A statistically significant correlation was obtained between the factors *Culture* and *Perceptions about their chosen career*. This study forms the basis for future research to create IT career awareness amongst scholars, parents and teachers.

1. Introduction

Information Technology (IT) plays an important role in modern business sustainability and growth. Employing skilled IT professionals is essential for business success and profitability; however, businesses are experiencing an IT skills shortage (Kirlidog & Coetzee, 2018; Malinga, 2022). The Career Junction Index (Career Junction Index, 2022) revealed that Software Development is currently the most sought-after skill in the IT job market. South African software developers are also in high demand internationally and 20% of South African software developers are actively looking to move jobs within the next 12 months in search of offshore fortunes (Malinga, 2022). Computer Science (CS) and Information Systems (IS) graduates are also experiencing increased demand from the IT job market.

Several factors influence first-year students' career choice decisions. The factors that influence first-year students' decisions to choose IT careers included computer experience at school, parents, advisors, their culture and awareness of IT job titles (Twani, Calitz & Cullen, 2020). The career choices made by young adults are influenced by role models, teachers, society and the education system (Gathungu & Mwangi, 2014). Research indicates that parents and teachers were more likely to encourage girls towards traditional

careers, for example teaching, than boys (Adya & Kaiser, 2005). Gathungu and Mwangi (2014) indicated that culture does play a role in the career choices women make worldwide.

Culture is defined as the arts, customs and habits that characterise a particular society or nation. Culture includes how the people in a society dress, the customs they practice in their marriages, the languages they speak, the way the family lives, the family work patterns, religious ceremonies and leisure pursuits (Patton & McMahon, 2014). Culture can influence a person's career decisions (Esterhuyse, Calitz & Cullen, 2019). Cultural factors that influence career choice include but are not limited to religion, personal relations, family responsibilities and attitudes towards networking (Esterhuyse, et al., 2019).

Individuals' career decisions may depend on their cultural values (Ma & Allen, 2009). The differences between cultures of individualism and collectivism are highlighted by Majid, Weserat and Sharif (2014). Individualism allows individuals to decide for themselves what kind of career they want to pursue, with the focus being on personal success. Collectivism views norms as more important than an individual's attitudes and career decisions are based on how the culture, family and friends view that career (Majid, Weserat & Sharif, 2014).

Theories relating to career choice have focused on the characteristics of individuals, their environment and more recently, on the stages and process of career development (Patton & McMahon, 2014). The Social Cognitive Career Theory (SCCT) has developed from Bandura's (1986) general social cognitive theory. Alshahrani, Ross and Wood (2018) indicated that the SCCT can be used as a framework for understanding how personal, cognitive and contextual factors influence career choices. The SCCT is a theory that has become fundamental when studying how young people develop interests and career choices (Balakrishnan & Low, 2016).

This study aimed to determine the influence of culture on first-year student's career choice and their perceptions of their chosen career. This study provides insights into the role of culture in the career decisions made by first-year IT and Business students. In the following sections, the research problem and research objectives are presented. Thereafter a literature review is provided and the research methodology and the results of the study are discussed. The study is concluded in Section 9, where limitations and future research are also presented.

2. Problem Investigated

First-year students' career choices are influenced by parents, teachers, society and the educational system. First-year IT students' career choices are influenced by previous exposure to IT, specifically programming (Twani, et al., 2020). It has been shown that culture does play a role in career choices (Gathungu & Mwangi, 2014). The research problem addressed in this study is that many scholars do not consider a career in IT, possibly because of cultural influences.

3. Research Objectives

Several factors influence a scholar's perceptions about a career and finally their career choice. These factors include exposure to career guidance at school, parents, teachers and the cultural environment they grow up in. The cultural factors that influence a student's perceptions of career choices include religion, personal and social relationships, family, friends and role models (Esterhuyse, et al., 2019). The main research objective of this study was to determine whether a scholar's culture influences their first-year student's perceptions about a chosen career and their career choice.

4. Hypotheses

The following hypothesis was formulated for the study:

- H₁ - The factor *Culture* is positively related to *Perceptions about a Chosen Career*.

5. Literature Review

In the following sub-sections theories relating to career choice are discussed, including literature relating to culture, career perceptions and sources of information.

5.1 Theory of Reasoned Action

A person's decision to choose and pursue a specific career is generally made during high-school years and is influenced by several factors. These factors may be internal to the individual, such as interests or skills, or external, such as influences by families, teachers, culture and the education system (Dick & Rallis, 1991). An important theory related to career choices is the Theory of Reasoned Action (TRA) by Azjen and Fishbein (1980), which states that an individual's behavioural intention is influenced by his/her attitude and the social subjective norms prevalent in their environment. This theory is derived from the Expectancy Theory, which indicates that motivation for a career decision is the result of the individual's belief in future possible outcomes. The TRA stresses that an individual's behaviour can be examined and predicted through the examination of their underlying basic motivation. A scholar's career choices can be predicted based on their respective attitude and the influence of those in their social circle and in this case, their culture (Dick & Rallis, 1991).

5.2 Social Cognitive Career Theory

The Social Cognitive Career Theory (SCCT) was developed from Bandura's general Social Cognitive Theory (Bandura, 1986). The theory aims to understand the processes and outcomes whereby individuals develop an interest in and make decisions about their educational pursuits and careers (Lent & Brown, 2006). Alshahrani, et al. (2018) state that the SCCT is a framework for understanding how personal, cognitive and contextual factors influence a person's career choices. According to the theory, social and structural factors impact career choice indirectly through individual factors. The SCCT is a theory on how people make decisions about their future by examining the factors that will influence their decisions (Armstrong, Riemenschneider & Giddens, 2018).

The SCCT theory was originally based on three models, namely the development of study and career interest; the leading of those interests into study and career choices and the performance and persistence people achieve to realise their choices. A fourth model that aimed to explain satisfaction at study and work was added later (Lent & Brown, 2006). SCCT is thus a motivational theory driven by self-efficacy, outcome expectations and goal-directed activity.

5.3 Sources of information

The factors affecting IT career choices have been extensively researched internationally and in South Africa. Previous research indicates that IT graduates entering the IT industry were not familiar with IT careers, career descriptions and career opportunities (Calitz, Greyling & Cullen, 2011; Cohen & Parsotam, 2010). There are many initiatives to promote careers in IT in several countries. For example, scholars and tertiary level IT students in England and the USA are educated about IT careers and IT career opportunities. Students receive advice from family, teachers and in the United Kingdom, for example, professional IT organisations, such as the British Computer Society, actively promote IT career awareness. This is referred to as social support, which students need when making career choices (Alshahrani, Ross & Wood, 2018). Additionally, interest, awareness and views from family and professionals have also been regarded as influencers of students' choice of pursuing a career in IT (Babin, Grant & Sawal, 2010; Cohen & Parsotam, 2010). Several studies have identified the support from family, friends, teachers and career advisors as key influencers for scholars' decisions when choosing a career (Säde et al., 2019).

A study by Govender and Khumalo (2014) indicated that influencers, which include family and friends and their lack of knowledge, led to students not choosing to pursue IS studies. Students' decisions to enrol or not to enrol for IS-related courses were influenced by the lack of information from their teachers (Seymour & Serumola, 2016).

5.4 Culture

Taylor (1871) provides one of the earliest definitions of culture, namely the complex whole, which includes knowledge, belief, art, morals, custom and any other capabilities and habits acquired by humans as members of society. Subsequent contributions share the all-inclusive nature of culture as affecting aspects of human life in a society. Culture is defined as the customs and habits that characterise a certain society, nation or group. Additionally, culture includes the way people in society

dress, the language they speak, family lives, religion, work patterns and leisure pursuits (Itulua-Abumere, 2013). Zimmermann (2017) summarises culture as the beliefs, values and material objects that constitute people's way of life. Culture influences the career choice of a person and refers to the way people work, the way they make decisions about work, how their career paths are shaped, the way groups communicate, the way they take care of and educate their children, how they provide food and shelter and how they earn a living (Zimmermann, 2017). Individuals' perceptions towards careers may depend on their cultural values (Majid, et al., 2014). Individuals' career decisions are sometimes based on their perceptions of status at work and the need to achieve and maintain their status, however individuals with a certain cultural value may use their own standards for judging work status (Torelli, Leslie, Stoner & Puente, 2014).

Gathungu and Mwangi (2014) further indicated that culture influences a person's career choices. Globally, females are often noted to have strong societal ties to family units, religion and cultural activities. A female's participation in a career often hinges on the support from these communities and the ability to continue with the associated activities with these groups (Potter, von Hellens & Nielsen, 2009; Seymour & Serumola, 2016). In South Africa, women view themselves according to traditional society's expectations, which emphasise women as homemakers before being viewed as career women. Adya and Kaiser (2005) indicated that females who opt for a career in IT generally have parents who are highly skilled and professionally educated. The influence of parents with degrees allows the family structure to choose non-traditional careers where success is highly valued.

5.5 Career perceptions

Scholars make career choices during their early secondary school years (Njoki, Wabwoba & Micheni, 2016). The high school era is a critical time where scholars are guided by their family, teachers, career counsellors and those role models most influential to them to choose school subjects that later direct them to future fields of study and careers. Seymour and Serumola (2016) state that scholars have misconceptions of the IT field, due to limited exposure at high school. The perceptions were dominated by the misperception of the value of IT and a lack of IT information. In support, Govender and Khumalo (2014) concur that some scholars make their decision not to enrol for IT studies, due to a lack of access to information regarding IT courses.

Cohen and Parsotam (2010) state that the primary determinants of a student's career and study choice is the student's perceptions of IT at school. Additionally, they include stereotypes students have about the IT field/professionals and job availability. Hodges and Corley (2016) further add that job availability does influence students' career choice. Students' IT career choice is further influenced by the reputation of IT-related fields in society (Sade et al., 2019). Other factors that influence students' perceptions are opportunities for employment and salaries, access to technology at school and home and students' perceptions of IT at school level (Potter, von Hellens & Nielsen, 2009). Stone (2019) indicated that at school level, students can form misperceptions regarding careers in IT. Factors such as gender, socioeconomic status, societal norms and access to information technologies all contribute to the misperceptions.

6. Research Methodology

This study followed a positivist paradigm and gathered quantitative and qualitative data from first-year students. The results for the independent factor *Culture* and dependent factor *Perceptions about Chosen Career* are reported. A five-point Likert rating scale (1= Strongly disagree to 5= Strongly agree) was used to gather information from first-year students, regarding the factors that led them to choose a career, specifically in IT and Business. The questionnaire was captured using an on-line survey tool, QuestionPro. The data were collected from first-year students enrolled for CS, IS and IT programmes and Business programmes at a Comprehensive University in South Africa. The data were statistically analysed by the university statistical consultant, using Statistica and included Exploratory Factor Analysis (EFA). Ethics approval was obtained from the University Ethics Committee, #H2010BUSBS15.

First-year CS, IS and IT students have decided to enter the IT industry and an understanding of the factors influencing their career decisions is important. A questionnaire for first-year students was compiled using a similar questionnaire that was validated and used in previous studies (Calitz, Cullen & Fani, 2020; Twani, et al., 2020). The items for the factor *Culture* were operationalised from the literature (Gathungu & Mwangi, 2014; Pretorius & De Villiers, 2010). In order to determine personal perceptions and honest information, it was decided to keep the survey anonymous. The questionnaire consisted of the following sections:

- Biographical details (Age, Gender, Home Language, Race, Qualification);
- Career choice influencers;
- Culture;
- Learning experiences;
- Perceptions about Chosen Career; and
- Career awareness.

7. Results and Research Findings

The quantitative data were analysed and the research findings are discussed in the following subsections, namely:

- Biographical details;
- Role of culture; and
- Career perceptions.

Biographical Details.

The first-year survey was completed by 405 first-year students at the Nelson Mandela University. Table 1 shows that the sample consisted of 184 males and 221 females. The sample included 82% Black, 11% White, 5% Coloured and 1% Asian students. The citizenship of the total group was mainly South African (86%, n=348). A small number of students were from Botswana, Malawi, Namibia, Zambia and Zimbabwe.

Table 1: Demographical variables

Gender	Male	Female	Total	n (%)
	184 (45%)	221 (55%)	405 (100%)	
Age	18 years	19 years	20 years	21+ years
	101 (25%)	111 (27%)	66 (16%)	127 (31%)
Race	Black	Coloured	Asian	White
	332 (82%)	21 (5%)	6 (1%)	46 (11%)
Qualification	CS/IS/IT Degree	IT Diploma	Business	
	92 (22%)	181 (45%)	132 (33%)	
Career choice				
CA, Accountant, Attorney, Auditor, Lawyer, Forensic auditor, Economist, Doctor, Investment Specialist, Manager, Pilot, QS, Scientist				114 (28%)
Entrepreneur, Lecturer, Teacher, COO, Assessor, HR, Politics, Tour guide, Bookkeeper, Intern,				51 (13%)
Software developer, Programmer, Game designer, Graphic designer, UX/UI designer, BI, BA, Software Engineer, IT Manager, IT Specialist, System Analyst, AI and Machine learning				194 (48%)
TV personality, TV Production, Arts Director, Aerospace Engineer, Unknown/unsure, anything available				46 (11%)

This study focused on first-year students who have chosen CS, IS and IT programmes (n=92, 22%), including IT diploma programmes (n=181, 45%). A total of 273 (67%) first-year students thus enrolled for IT-related programmes. The Business group (n=132, 33%) consisted of students

completing programmes, such as BCom Accounting Sciences, BCom General, BCom Business Management, BCom Economics and BA General.

The first-year students were asked to specify their career choice or job title (Table 1). Of the 273 (67%) first-year IT students, 194 (48%) listed an IT-related job title. Thus, not all first-year IT students indicated an IT career or job title. A total of 114 (28%) first-year students specified other professions, such as Chartered Accountant, Auditor, Investment Specialist/Consultant and Manager which are business orientated.

Role of Culture

Culture focuses on understanding the influence of culture on a chosen career. Table 2 indicates the frequency distributions for each of the questionnaire statements on culture. Seventy-eight percent (n = 314) of the respondents indicated that in their culture, people are encouraged to study towards professional careers, such as doctors or chartered accountants. Seventy-two percent (n = 290) of the respondents indicated that in their culture, it is important to obtain a qualification. Sixty-two percent (n = 250) of the respondents indicated that IT is a career for both men and women. Only 34% (n = 138) agreed that many people in their culture clearly understand IT careers. Most of the respondents agreed with the statements for the rest of the items.

Table 2: Frequency distribution – Culture (n=405)

Items	Disagree		Neutral		Agree	
	n	%	n	%	n	%
In my culture, people have a clear understanding of professional careers, such as a chartered accountant	67	17%	134	33%	204	50%
In my culture, people have a clear understanding of IT careers	122	30%	145	36%	138	34%
In my culture, a woman is expected to have a family and children	116	29%	107	26%	182	45%
In my culture, having a large family is important	163	40%	147	36%	95	24%
In my culture, IT is seen as a career for men and women	52	13%	103	25%	250	62%
In my culture, it is important to have a qualification	37	9%	78	19%	290	72%
In my culture, it is important that women have a formal qualification	52	13%	142	35%	211	52%
In my culture, people encourage children to study towards professional careers, such as a doctor or a chartered accountant	32	8%	59	15%	314	77%
In my culture, women are expected to have a full-time job	67	17%	184	45%	154	38%
People in my culture are religious	20	5%	117	29%	268	66%

The Cronbach alpha coefficient for the factor *Culture* (n = 405) was 0.70 indicating *Good* reliability. Exploratory Factor Analysis (EFA) is a multivariate statistical technique that verifies the constructs influencing a set of responses. Exploratory factor analysis is used to categorise items that fit together, thus measuring the same factor. The Eigenvalue is used to determine which items to retain for each factor. The factor loading greater or equal to 0.300 was deemed significant at the $\alpha=0.05$ level for the sample size n = 405.

The initial factor loadings for the factor *Culture* resulted in a three-factor loading model, explaining 57.8% of the total variance. The items *In my culture, having a large family is important* and *In my culture, a woman is expected to have a family and children* did not meet the minimum factor loading of .300 and were removed. The analysis was repeated and a two-factor model resulted in an optimal solution with 53.2% of the total variance explained. The original culture factor portrayed two sub-factors (Table 3). These factors were renamed and Factor 1 was named *Culture Expectations* with five items while Factor 2 was named *Culture Career Understanding* consisting of three items. These two factors should be further explored in future studies.

Table 3: EFA Final Loadings (2 Factor Model) – Culture (n = 405; Minimum significant loading .300)

Item	Factor 1	Factor 2
In my culture, it is important to have a qualification	.751	.066
In my culture, it is important that women have a formal qualification	.737	.244
In my culture, women are expected to have a full-time job	.731	.083
People in my culture are religious	.638	-.091
In my culture, people encourage children to study towards professional careers, such as a doctor or a chartered accountant	.577	-.045
In my culture, people have a clear understanding of IT careers	-.007	.850
In my culture, people have a clear understanding of professional careers, such as a chartered accountant	.081	.798
In my culture, IT is seen as a career for men and women	.248	.602
Explained variance	2.45	1.80
% of Total variance	30.6%	22.5%
Total % of Variance Explained = 53.2%		

The results of the ANOVA analysis (Table 4) show that Home language is statistically ($p = .004$) and practically significant (Cohen's $d = 0.36$). Therefore, this depicts a difference in mean values for Home language.

Table 4: Univariate ANOVA Results - Culture

Effect	F-value	D.F.	p-value	Cohen's d	Practical Sig
<i>Gender</i>	3,56	1; 401	,060	n/a	n/a
Age Category	0,20	1; 401	,658	n/a	n/a
<i>Race</i>	1,38	2; 227	,254	n/a	n/a
Home Language	8,62	1; 401	,004	0,36	Small

The post-hoc results in Table 5 affirm the differences between respondents Home languages. For respondents with the Home language of Afrikaans/English, their culture was more influential ($\mu_2 = 3.77$) than respondents with an African Home language ($\mu_1 = 3.57$). The results indicate that Culture has a greater influence on respondents with an Afrikaans/English Home language than the African Home language. However, these results must be treated with caution, as Coloured students could speak Afrikaans or English at home and Black students could speak English at home.

Table 5: Post-hoc Results - Culture

Effect	Level 1	Level 2	μ_1	μ_2	p-value	Cohen's d	Practical Sig
Home Language	Afrikaans /English	Black Languages	3,77	3,57	,004	0,36	Small

Perceptions of chosen career

Table 6 shows the frequency distribution for each item relating to the perceptions about their chosen career. Overall, the respondents agreed with the statements regarding the perceptions of their chosen careers. Ninety-seven percent ($n = 391$) of the respondents agreed that they would learn new skills in their chosen career, while 91% ($n = 361$) acknowledged they will have to keep ahead of the change and technologies in their chosen field. Seventy-four percent ($n = 299$) of respondents agreed that they have good prospects for a better than average salary in their chosen career.

Table 6: Frequency Distribution: Perceptions about Chosen Career (n = 405)

Statement	Disagree		Neutral		Agree	
	n	%	n	%	n	%
I am happy with my career choice	17	4%	68	17%	320	79%
My family respects my career choice	28	7%	53	13%	324	80%
My chosen career will be rewarding	4	1%	54	13%	347	86%
I would recommend my career choice to others	10	2%	66	16%	329	82%
I must keep ahead of change and new technologies in my chosen career	5	1%	31	8%	369	91%
I will learn new skills in my chosen career	0	0%	14	3%	391	97%
There are many jobs available in the career I have chosen	14	3%	84	21%	307	76%
There are good prospects for a better than average starting salary in the career I have chosen	5	1%	101	25%	299	74%
I will have opportunities to work in different kinds of business functions in my chosen career	12	3%	68	17%	325	80%
I can become an entrepreneur with my career choice	14	3%	73	18%	318	79%

The Cronbach alpha coefficient for the factor Perceptions about a chosen career (n = 405) was $\alpha = .87$, indicating excellent reliability. The initial factor loadings of the Eigenvalues for the 10 items for the factor, *Perceptions about chosen career*, resulted in a two-factor model, explaining 47.3% of the total variance. The items *My family respects my career choice* and *I can become an entrepreneur with my career choice* did not meet the minimum significance of .300 and were removed. A one-factor model was considered an optimal solution with 52.4% of the total variance explained (Table 7).

Table 7: EFA Final Loadings (1 Factor Model) – Perceptions about chosen career (n = 405; Minimum significant loading .300)

Item	Factor 1
My chosen career will be rewarding	,789
There are many jobs available in the career I have chosen	,747
I will learn new skills in my chosen career	,743
I will have opportunities to work in different kinds of business functions in my chosen career	,727
I would recommend my career choice to others	,719
I am happy with my career choice	,713
There are good prospects for a better than average starting salary in the career I have chosen	,680
I must keep ahead of change and new technologies in my chosen career	,663
% of Total variance explained = 52.4%	30.6%

Gender differences were identified for the factor *Perceptions about chosen careers* (Table 8).

Table 8: Univariate ANOVA Results - Perceptions about Chosen Career

Effect	F-value	D.F.	p-value	Cohen's d	Practical Sig
Gender	5,53	1; 401	,019	0,27	Small
Age Category	3,52	1; 401	,061	n/a	n/a
Race	3,98	1; 401	,020	n/a	n/a
Home Language	0,89	1; 401	,345	n/a	n/a

The Post-hoc results confirm that *Gender* is statistically ($p = 0.19$) significant with a small practical significance (Cohen's $d = 0,27$). Female ($\mu = 4.26$) respondents had higher perceptions about their chosen career compared to males ($\mu = 4.11$), as indicated in Table 9.

Table 9: Post-hoc Results - Perceptions about Chosen Career

Effect	Level 1	Level 2	μ_1	μ_2	p-value	Cohen's d	Practical Sig
<i>Gender</i>	<i>Male</i>	<i>Female</i>	4,11	4,26	,019	0,27	Small

Pearson Product Moment Correlations and t-Tests

A correlation coefficient r is statistically significant at the 95% confidence level ($p= 0.05$). A statistically significant correlation ($r=0.120$) exists between the factor *Culture* and *Perceptions about chosen career*. However, the correlation was not practically significant. In Table 10, the one-sample t-test ($n=405$; d.f. = 404) indicated both statistical and large practical significance for *Culture* ($t=35.29$; $p<0.0005$; Cohen's $d=1.27$) and *Perceptions about chosen career* ($t=28.72$; $p<0.0005$; Cohen's $d=1.43$).

Table 10: One-sample t-Tests.

Variable	Mean	S.D.	95% Lo	95% Hi	$H_1:\mu$	t	p (d.f.=404)	Cohen's d
Culture	3.62	0.58	3.56	3.68	$\neq 2.60$	35.29	<.0005	1.75 Large
Perceptions about Chosen Career	4.19	0.55	4.14	4.25	$\neq 3.40$	28.72	<.0005	1.43 Large

One-Sample t-tests were conducted between the IT and Business groups (Table 11). No statistically significant difference exists between the factor *Culture* and the IT and Business groups. The factor, *Perceptions about the Chosen Career* had statistical significance ($p = 0.040$) and a small practical significance (Cohen's $d = 0.22$). The results showed that the IT group had better *Perceptions about their Chosen Careers* ($\mu = 4.23$) than the Business group ($\mu = 4.11$). A possible explanation could be that the IT group ($n=194$; 48%), as indicated in Table 1, could list an IT career or job title.

Table 11: One-sample t-Tests.

Factor	Group	Mean	S.D.	Diff	t	p(d.f.=403)	Cohen's d
Culture	IT	3.65	0.58	0.09	1.46	.144	n/a
	Business	3.56	0.58				
Perceptions about Chosen Career	IT	4.23	0.54	0.12	2.06	.040	0.22
	Business	4.11	0.58				Small

8. Managerial Implications

This study has implications for IT departments in Universities, businesses that have IT employees and schools who are instrumental in giving career advice to scholars. Universities must embark on education drives to inform both scholars and parents about career choices and the required degrees to pursue those careers. IT plays an important role in modern business sustainability and growth. Employing skilled IT professionals is essential for business success and profitability; however, businesses are experiencing an IT skills shortage (Kirlidog & Coetzee, 2018).

Businesses should collaborate with universities to educate scholars, parents and teachers so that the shortage of IT people is resolved. It is in their interest to educate scholars so that they have a secure pipeline of graduates, which will enhance the sustainability of their businesses. The IT awareness campaigns need to address the issue of culture and its influence on career choice as indicated in this paper. Suggestions include identifying role models from different cultures who have built successful careers in IT who could become 'evangelists' to inform and persuade scholars of the benefits of choosing this career path.

9. Conclusions, Limitations and Future Research

IT remains a scarce skill industry, which is compounded by limited IT career awareness amongst scholars, teachers and parents. Various factors influence first-year students' career decisions. Research has indicated that culture influences scholars' decisions when choosing a career (Sade et al., 2019). A scholar's career preferences may be influenced by the perceptions of those in their family and in their culture. The study aimed to determine if a first-year student's culture influences their career choice and perceptions about their chosen career.

The results indicate that people did not have a clear understanding of IT careers as only 34% (n=138) agreed with the statement. On the other hand, 77% (n=314) agreed that people encourage children to study towards professional careers, such as a doctor or a chartered accountant. The first-year students indicated that they were happy with their career choice (79%, n=320) and the majority of first-year students indicated that their family respects their career choice and that they would recommend their career choice to others (Table 6). The majority of the respondents indicated that they must keep ahead of change and new technologies in their chosen career and that they will learn new skills in their chosen career. There were statistically and practically significant ($p = .019$; Cohen's $d = 0.36$) differences between the IT group ($\mu = 4.23$) and the Business group ($\mu = 4.11$) regarding career perceptions. The IT group had better perceptions of their chosen career than the Business group. The hypothesis H_1 - The factor *Culture* is positively related to *Perceptions about a chosen career* ($p < .0005$, $r = 0.120$) was accepted.

Home languages are rough indicators of cultural identity (Eaton & Louw, 2000). In their study, investigating the influence of culture on career decisions, Calitz et al. (2020) indicated that South African ethnic groups had differences in the role that culture plays in the influence of a career choice. Therefore, the results of this study are similar, as Culture amongst the Afrikaans/English speakers compared to African languages speakers differs statistically ($p < .004$; Cohen's $d = 0.36$). One possible conclusion could be that parents and the family of students speaking African languages at home are less familiar with IT careers. Theories of cross-cultural differences in the conception of the self, derived from individualism-collectivism research are also useful and applicable in the African context (Eaton & Louw, 2000) and could have an influence on students making choices for themselves or to fit in with their cultural expectations (Majid, Weserat & Sharif, 2014).

Scholars make subject choices in secondary school. Different stakeholders, including parents, teachers and universities should make an effort to try and change the culture regarding IT career choices, specifically for female scholars. Educating these stakeholders regarding IT careers could influence the scholars' future career choices, increase the number of IT graduates entering the profession and help alleviate the IT skill shortage.

This study confirms the TRA theory, as the subjective norms that are included in the TRA model, include the influence of parents, teachers and culture on an individual's career decisions (Balakrishnan & Low, 2016). The research has given insight into the role of culture on first-year students' career choices. The limitations of this study were that the study focused on one comprehensive university in South Africa and that the factor *Culture* actually consisted of two sub-factors, namely *Culture Expectations* with 5 items and *Culture Career Understanding* with three items (Table 3). These two factors should be further explored. Future research will further focus on a more qualitative approach and include interviews with selected first-year students. Interviews and focus groups with first-year students could explain the "why" of the decision-making in more detail to support the quantitative findings.

Assessing The Maintenance Practices Of Operational Processes To Improve Performance at a South African Rail Organisation

Prof Barnes Sookdeo^{1,*}, Mr Sipho Antonia Sundlana²

^{1,2} Operations Management, University of South Africa, Pretoria, South Africa

Keywords

Maintenance practices, machinery and equipment, operational processes, performance improvement.

Abstract

This paper reports on a study to assess the impact of maintenance practices to aid organisational performance at a sub-division of a rail organisation. Central to this effort was to identify factors affecting the effectiveness of machinery and equipment and the subsequent operational performance. The study pursued three objectives; to review current maintenance practices, to assess the impact of maintenance practices on the operational processes and to make recommendations to improve performance. The study utilised a quantitative research approach using a questionnaire. Stratified sampling was used with a sample of 94 employees. Descriptive, regression, and correlation analyses were conducted. The findings revealed a strong relationship between the variables that were measured. This paper succeeds in assessing the impact of maintenance practices in production processes towards achieving improved performance. The recommendations address the upskilling of employees and reducing operational costs to improve productivity. As further research, a qualitative study is envisaged.

1. Introduction

In today's world, an economy and its society depend more than ever before on an uninterrupted delivery of wealth and services provided by mechanical, electrical, and automated systems. Furthermore, the dependency on such systems is such that a large-scale failure in any single system could change the world as we know it, and with the increase of just-in-time systems, even small-scale failures sometimes have large scale consequences. Alsyouf, (2004) in Calais, Azevedo, De Matias and Da Silva Catalão, (2017) state that without proper maintenance of machinery and equipment, any plant could lose its competitiveness in today's volatile markets, which require low-cost and high-quality products with short lead times. Consequently, maintenance is important since it impacts on the availability, reliability, safety, life cycle cost and the quality of equipment, of an organisation, (Calais *et al.*, (2017). Maintenance is normally ignored where policies do not exist and result in machinery and equipment not performing to their maximum capacity. Aged and obsolete machinery and equipment are at times too expensive to refurbish due to improvements in manufacturing methods and the latest technological advancements.

Technological advancements by organisations have resulted in less robust and often more complex designs where modern technology replaces older designs making the older designs more expensive to produce or maintain (Tshabuse, 2015). The maintenance cost of aged machinery and equipment does not compare to purchasing modern machinery and equipment, and negatively affects the competitiveness of an organisation against their peers that utilise modern methods, (Tshabuse, 2015). However, the concern for organisations is the high failure rate of their machinery and equipment, which subsequently affects the competitiveness of an organisation. Calais *et al.*, (2017) states that the problem can be solved by re-designing and upgrading equipment, changing maintenance strategies, and introducing the latest technology advancements. Further to this, changing maintenance strategies can be considered most cost effective.

Over the past decade, it was found that the railway industry in South Africa did not perform well in terms of production and profitability. Findings indicated a high failure rate of machinery and equipment due to poor maintenance practices. According to Patidar, Soni and Soni, (2017), maintenance functions have become challenging in the current competitive environment. As such, the adoption of suitable maintenance practices for machinery and equipment which are plant assets, is important. In the maintenance environment, there are four basic maintenance practices, which when followed properly, will ensure that the machinery and equipment will perform to maximum efficiency. These are: run to failure, preventive maintenance, predictive maintenance, and corrective maintenance Calais *et al.*, (2017).

This study was conducted at the engineering division of a South African rail organisation, termed Company A, which is responsible for manufacturing, upgrading, and maintenance of railway rolling stock. The rolling stock machinery and equipment refer to the locomotives and wagons. The organisation consists of maintenance depots across the country to ensure that machinery and equipment are maintained in close proximity to operations. Company A is largely responsible for manufacturing, refurbishing, and maintenance of rolling stock machinery and equipment of the Passenger Rail Agency of South Africa (PRASA), Botswana Railways, and other partner railway organisations in the Southern African region.

The essential contribution of this paper is to assess the maintenance practices at Company A, highlight tools, and acceptable methods used to analyse the impact of maintenance implementation in the production systems of the organisation towards achieving higher performance. As such, this paper will aid Company A to understand and improve its maintenance practices.

2. Problem Investigated

Company A is currently facing challenges of continuous failures of machinery and equipment that has led to poor operational performance of the business unit and the various organisations which it supports. As an example, Company A has regularly failed to honour its plant availability and reliability service-level agreements with its holding company, due to the high failure rate of machinery and equipment. This has negatively impacted, not only Company A, but the whole supply chain. The aim of the study was to review the maintenance practices at Company A and to assess the impact of maintenance practices on operational processes to aid organisational performance of Company A.

3. Research Objectives

The primary objective of this paper is to review the maintenance practices at Company A and to assess the impact of maintenance practice on operational processes to aid organisational performance.

4. Literature Review

The theoretical framework for this paper consists of an overview of maintenance practices and production and operations processes. It also contains a review of the measures for maintenance performance. The review concludes with a look at plant maintenance technology and trends.

4.1. Maintenance practices

The existence of poor maintenance practice is not a natural problem and certainly, it has been driven by several factors. The definition of maintenance practices (predictive, preventive, and corrective maintenance strategies) was reflected on and showed the importance of maintenance practices on the Company A. Davis (2021) states that there is currently no single all-time best maintenance program. As every industry is different, and each facility faces its own challenges.

In the standard EN 13306: 2001 terminology, maintenance is defined as the combination of all technical, administrative, and managerial actions during the life cycle of an item intended to retain it in, or restore it to, a state in which it can perform the required function, (Ingwald, 2014). The maintenance function serves as a crucial part in any machinery and equipment's life cycle and supports the business objectives of the organisation, (Ingwald, 2014). It follows therefore that

management in the maintenance environment need to understand the importance which maintenance practices play to improve organisational performance.

The neglect of maintenance has an impact and speedily increases the deterioration of equipment components and leads to machinery and equipment failure, (Yinghua, Sylvester, Osei-Assibey Bonsu & Minkah, 2018). Also, there is a need to ensure that the maintenance personnel understand that they are part of the organisational strategies, and that their understanding and best maintenance practices will ensure an improvement in performance, (Yinghua *et al.*, 2018). When considering the financial impact of maintenance, both direct costs (labour, material, spares, tools, information, and contractors) and indirect costs (lost revenue due to downtime, lost reputation, customer compensation, and penalties) should be included, (Mungani & Visser, 2013).

However, maintenance is classified into two major areas, namely: preventive maintenance and corrective maintenance, Enofe & Aimienrovbiye, (2010). Preventive maintenance includes all the planned actions, which include periodic inspection and condition monitoring. Corrective maintenance includes all the unplanned maintenance actions to restore failures. Figure 1 depicts the classification of maintenance practices used in the equipment and machinery environment. It should be noted that Company A uses these maintenance practices to ensure that machinery and equipment are maintained according to required international maintenance standards.

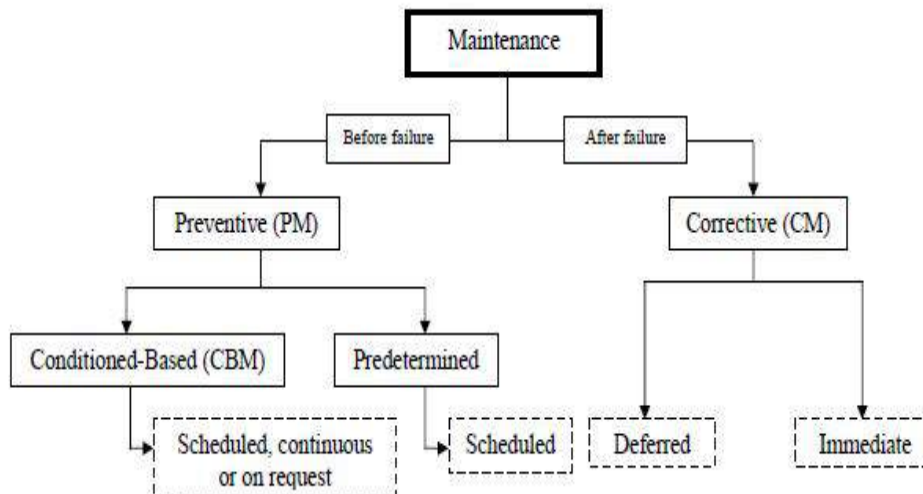

Figure 1: Classification of maintenance practice
Source: Enofe & Aimienrovbiye, (2010)

4.2. Production and operations processes

Previously, organisations were confronted with many changes at the level of concepts and management approaches, products, process technologies, customer expectations, and attitudes of suppliers, Calais *et al.*, (2017). Company A needs to regularly visit its production and operations processes and review their ways of work to keep up with the competitive environment. Linked to this is production planning and control which are activities of loading, scheduling, sequencing, monitoring, and controlling the use of resources and materials during production (Oluyisola, Bhalla, Sgarbossa & Strandhagen, 2022). To ensure that Company A has a competitive advantage over the environment, the following factors will be discussed: the definition of operational processes, the impact of maintenance on production, the impact of maintenance on quality, and the impact of maintenance on profitability.

4.2.1. The impact of maintenance on productivity

Mohanty, Rath, and Jena (2022) state in their study that maintenance is not an extra cost for an organisations but a rather way to increase productivity. Maintenance productivity is the backbone of the supply chain and the rule of the economics of production activity. Alsyouf, (2004) defines profitability as the product of production and price recovery. However, maintenance can be an

organisational purpose that functions in accordance with production. Well-maintained machinery and equipment can be reliable and have a positive impact on the productivity of Company A. When busy repeating the production makes products, most researchers state that maintenance produces the capacity for production, (Mushavhanamadi & Selowa, 2018). In this way, it can be concluded that maintenance affects production by increasing the capacity of production and at the same time also controlling the quality of the output and quality.

4.2.2. The impact of maintenance on quality and profitability

In most organisations, maintenance is not considered in the context of quality, (Tshabuse, 2015). Company A considers quality as the main edge for competitiveness and long-term profitability in a modern-day global economy. Profitability and the survival of the organisation might not be maintained without sustaining the quality of the product, (Mushavhanamadi & Selowa, 2018). Poorly maintained machinery and equipment reduce the quality of products or services which the organisation must produce. Choi, Lee and Olson (2015) determined that in the long term a focus on service quality may help increase customer satisfaction, thus improving service productivity and overall organisational performance.

Profitability is the result of price recovery and productivity. Recently, more emphasis has been placed on maintenance as a profit-generating function. Poorly managed maintenance practices drive maintenance costs higher and have a serious impact on the profitability of an organisation. Maintenance improvement in general aims at reducing the cost of operations and improving product quality, thus, the cost-effectiveness of each improvement may well be scrutinised through evaluating the relevant cost constraints before and after improvements, (Enofe & Aimienrovbiye, 2010). If Company A management can ensure the proper implementation and management of maintenance principles, the organisation will reach its production goals and the subsequent improved organisational performance. Figure 2 depicts the relationship between maintenance goals, production goals, and the objectives of the Company A.

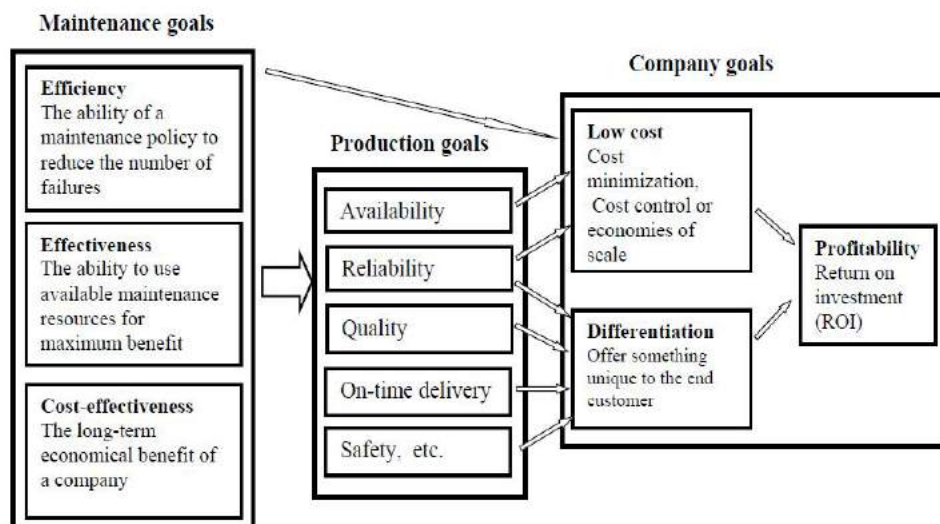

Figure 2: Connection between maintenance and profitability

4.3. Measures for maintenance performance

Maintenance performance measurement is defined as the multidisciplinary process of measuring and justifying the value created by maintenance investment and taking care of the organisation's stakeholders' requirements viewed strategically from the overall organisational perspective, (Kumar, Parida & Duffuaa, 2013). All activities in an organisation should be conducted to fulfil the organisation's overall strategic objectives, including maintenance activities, (Ingwald, 2014). Consequently, maintenance performance measuring is an essential part of the maintenance management information system. There are many models, techniques, systems, and approaches available to facilitate and support maintenance management of activities, resources, and decisions. For

the purposes of this study, the main emphasis will be on reliability-centered management, total quality management, total production management, and computerised maintenance management system.

4.4. Plant maintenance technology and trends

Zheng, Ardolino, Bacchetti and Perona (2021) state that the demand for faster delivery times, more efficient and automated processes, and higher quality products have driven organisations towards the fourth industrial revolution. Traditionally, maintenance is viewed as the necessary challenge that needs to be controlled and minimised to an affordable size. The rapid increase in technology over the past decades helped organisations to manage huge volumes of data which the organisations produce, (Fusko, Sulírová, & Rakyta, 2016). Zhou et al. (2021) states that the application of new technologies leads to improvements of intelligent manufacturing systems and this will change how work is done and managed.

4.4.1. Relevance of technology and trends in the maintenance organisation

Ghazali and Shamim (2015) state that technology may be summarised as the information, equipment, techniques, and processes necessary for an organisation to alter its inputs into outputs. With the ever-changing technological environment, there must be ways of collecting information and to improve the ways of working. According to Fusko *et al.*, (2016), the continuous change in technology, IT will contribute significantly especially the internet and its latest development, the Internet of Things (IoT). Although maintenance management can be highly technical in nature, maintenance teams are often the last in an organisation to get new IT systems.

Company A has been more focused on the bottom line and any breakage of the machinery and equipment risked the profitability of the organisations. Effective software and hardware system become critically important in predicting, forecasting, and enable the sharing of information and to mitigate any unforeseen circumstances that the organisation can face, Fusko et al., (2016). Technology and trends will benefit maintenance organisations with the traceability of events, cost-saving, product development, continuous improvement, and integrated business functions.

5. Research Methodology

5.1. The research design and instrument

The research design consisted of a quantitative approach which was used to gather data, which enabled the researcher to come to conclusions and to make recommendations regarding the impact of maintenance practices to aid organisational performance. The data collection technique consisted of a questionnaire survey.

The questionnaire was designed using Google Forms, a web-based survey administration software. The participants were contacted using the social media platforms of WhatsApp and Facebook messenger to participate in the research. The participants were given one week to complete the questionnaire on the link that was provided. The link allowed the participant to complete the questionnaire online and an option was provided to submit the questionnaire. The researcher received feedback immediately on the researcher's link once the participant had made the submission.

5.2. The population and sampling in the study

The population of the study reported in this paper was composed of selected employees (n = 2000) of the engineering department at Company A. The target population were employees who were responsible for maintaining machinery and equipment and practicing maintenance strategies.

Stratified sampling was utilised to select one hundred and fifty (150) participants. One hundred and three (103) respondents submitted their questionnaires online to the database, of which nine (9) were found to be incomplete submissions, realising a total of ninety-four (94) questionnaires. The response rate was 62.67% and found to be acceptable for the purposes of this study.

5.3. Data collection and analysis

Data was collected by means of a structured questionnaire administered via a web-based survey which was sent to the participants. The questionnaire was utilised to elicit responses as to the impact of maintenance practices to aid organisational performance. The questionnaire was pilot tested in the engineering division at Company A. Descriptive statistical analysis was used to identify and show patterns in the data. Descriptive analyses of all questions were performed to look at the distribution of the respondents. Regression analysis and the Pearson Correlation coefficient aided this study to determine/achieve the significant strength between the variables, maintenance practices, operational processes and organisational performance and the latest technology in Company A.

6. Results and Findings

6.1 Presentation of analysis and findings

The findings and results are aligned to the objectives and the three main constructs of this study.

Objective 1: To review the maintenance practices currently used at Company A:

Maintenance practices - The respondents were asked to indicate the maintenance practices which currently existed at Company A.

Table 1: Maintenance practices currently used at Company A

<i>Objective 1: Maintenance practices currently used at Company A</i>							
Question No.	Description	1 <i>Strongly disagree</i>	2 <i>Disagree</i>	3 <i>Undecided</i>	4 <i>Agree</i>	5 <i>Strongly agree</i>	Mean score
1.	Review for accuracy and updates	7	22	7	45	13	3.37
2.	Cost of maintenance practices	3	19	15	44	13	3.52
3.	Plans to prevent breakdowns and failures	2	20	18	37	33	4.35
4.	Meeting production targets	2	20	18	37	16	3.38
Total:		14	81	58	163	75	3.63

Figure 3: Status of maintenance practices

The information contained in Table 1 is based on the analysis of maintenance practices and how maintenance practices could improve performance. The average mean score of 3.63 was noted from

the analysis and indicated that there is an agreement that maintenance practices can improve performance. The respondents (61.70) agreed on the review for accuracy and updates with a mean score of 3.49, and maximising quality and profitability (60.64%), with a mean score of 3.52. The plans to prevent breakdowns and failures (74.46%), with a mean score of 4.35.

Objective 2: *To assess the impact of maintenance practices on the operational processes and the organisational performance at Company A.*

Production/operational processes - The respondents were asked to indicate the current production/operational processes used to achieve improved performance.

Table 2: Production/operational processes

Objective 2: Production/operational processes							
Question No.	Description	1 Strongly disagree	2 Disagree	3 Undecided	4 Agree	5 Strongly agree	Mean score
1.	Standard operational procedures	6	18	9	42	18	3.48
2.	Review and analysis of the production/operational processes.	8	13	19	40	12	3.71
3.	Incorporation of technology	3	8	10	36	37	4.02
Total:		17	39	38	118	67	3.74

Figure 4: Production/operational processes

The results presented in Table 2 were based on the analysis of the importance of production/operational processes in Company A. The respondents showed the level of agreement with the questions asked, the average mean score of 3.74 was recorded from the analysis depicted on the table. The respondents (63.83%) agreed that the standard operational procedures are consistent in improving the productivity and with a mean score of 3.48, Review and analysis of the production/operational processes (55.32%), with a mean score of 3.71 and the incorporation of technology (77.66%) with a mean score of 4.02.

Measures for maintenance performance - The respondents were asked to indicate how the measures for maintenance performance could impact performance of Company A.

Table 3: Measures for maintenance performance

<i>Objective 2: Measures for maintenance performance</i>							
Question No.	Description	1 <i>Strongly disagree</i>	2 <i>Disagree</i>	3 <i>Undecided</i>	4 <i>Agree</i>	5 <i>Strongly agree</i>	Mean score
1.	Maintenance measures increase machinery and equipment performance	5	12	17	46	13	3.50
2.	Maintenance compliance	6	14	22	41	9	3.71
3.	The use of CMMS	10	10	15	43	16	3.48
4.	Effectiveness of maintenance measurements	5	11	6	47	25	3.81
Total		26	47	60	177	63	3.63

Figure 5: Measures for maintenance performance

Organisations must comply with international maintenance standards to ensure that products produced are of an acceptable standard. This objective aimed at determining how the measurement of maintenance performance can improve the performance of Company A. The respondents showed the level of agreement with the questions asked and the average mean score of 3.63 was recorded from the analysis.

The percentage of respondents which agreed were as follows: 62.76% agreed that maintenance measures increase machinery and equipment performance, 53.19% agreed to maintenance compliance, the use of CMMS, 59.57% and the effectiveness of maintenance measurements, 76.60%. The corresponding mean score analysed from the measures of maintenance is denoted as, 3.50, 3.71, 3.48 and 3.81 respectively.

Objective 3: *To make recommendations regarding the use of the latest technologies to improve organisational performance and effectiveness of machinery and equipment.*

Technology and trends - The respondents were asked to indicate how the use of technology and trends will assist in increasing the operational efficiency of Company A. Table 4 presents the statistical data analysis of the technology and trends that were used in the study to aid the maintenance in improving the performance.

Table 4: Technology and trends

<i>Objective 3: Technology and trends</i>							
Question No.	Description	1 <i>Strongly disagree</i>	2 <i>Disagree</i>	3 <i>Undecided</i>	4 <i>Agree</i>	5 <i>Strongly agree</i>	Mean score
1.	Monitoring maintenance cost and the life cycle	2	9	6	41	36	4.06
2.	Implementation of simulation	2	7	12	45	28	4.21
3.	Integration of functions	2	5	5	45	33	4.13
Total:		6	21	23	131	97	4.28

Figure 6: Technology and trends

Table 4 indicates that technology and trends are responsible for improving operational efficiencies. The respondents showed the level of agreement with the questions asked, and the average mean score of 4.28 was recorded from the analysis depicted on the table.

The respondents agree that technology and trends have a positive effect on improving the performance. The percentages of the following are monitoring maintenance cost and the life cycle (81.91%), implementation of simulation (55.32%) and the integration of functions (82.98%). The average mean score was 4.28. Further to the above statistical analysis and interpretation, regression and correlation analysis were also conducted as shown below:

6.2. Regression analysis

Regression analysis aided this study to determine the significant strengths between the variables, namely: maintenance practices, operational processes and organisational performance and the latest technology at Company A. The p-value is used to determine the significance of age that impact maintenance practices on the machinery and equipment. The variables are considered significant when $\alpha < 0.05$.

Table 5: Regression analysis

<i>Regression Statistics</i>						
Multiple R	0,188					
R Square	0,035					
Adjusted R Square	0,003					
Standard Error	0,488					
Observations	94					
ANOVA	df	SS	MS	F	Significance F	
Regression	3	0,78	0,26	1,10	0,3546	
Residual	90	21,43	0,24			
Total	93	22,21				
	Coefficients	Standard Error	t Stat	P-value	Lower 95%	Upper 95%
Intercept	1,60	0,17	9,29	0,0000	1,25	1,94
Maintenance Practices Question 1.	-0,07	0,05	-1,46	0,1469	-0,16	0,02
Maintenance Practices Question 2.	0,03	0,05	0,57	0,5715	-0,07	0,13
Maintenance Practices Question 3.	-0,04	0,05	-0,96	0,3414	-0,14	0,05

Table 5 represents the regression analysis to determine if age influences understanding the impact of maintenance practices in the organisation. The hypothesis test is rejected, and because all the p-values that are greater than $\alpha=0.05$, there is no linear relationship between age and the maintenance practices. The results are interpreted by the regression equation $y = 1.60 - 0.07Q1 + 0.03Q2 - 0.04Q3$. It is evident that regardless of the age differences, employees must understand the impact which maintenance practices have on improving the performance of Company A.

6.3. Correlation analysis

Correlation in the broadest sense is a measure of an association between variables. In correlated data, the change in the magnitude of 1 variable is associated with a change in the magnitude of another variable, (Schober, Boer & Schwarte, 2018). They further state that most often, the term correlation is used in the context of a linear relationship between 2 continuous variables and expressed as Pearson product-moment correlation. The Pearson correlation coefficient is designed to range between -1 to +1. Pearson correlation was used in this study to determine the relationship between maintenance practices, operational processes and organisational performance and the latest technology within Company A.

Table 6: Correlation analysis

		Maintenance practices	Company A	Production/operational processes	Measures of maintenance performance	Technology and trends
Maintenance practices	Pearson correlation	1	.673 ^{**}	.571 ^{**}	.574 ^{**}	.587 ^{**}
	Sig.(2-tailed)		.000	.000	.000	.000
	N	94	94	94	94	94
Production/operational processes	Pearson correlation	.571 ^{**}	.764 ^{**}	1	.673 ^{**}	.657 ^{**}
	Sig.(2-tailed)	.000	.000		.000	.000
	N	94	94	94	94	94
Measures of maintenance performance	Pearson correlation	.574 ^{**}	.601 ^{**}	.673 ^{**}	1	.598 ^{**}
	Sig.(2-tailed)	.000	.000	.000		.000
	N	94	94	94	94	94
Technology and Trends	Pearson correlation	.587 ^{**}	.485 ^{**}	.657 ^{**}	.598 ^{**}	1
	Sig.(2-tailed)	.000	.000	.000	.000	
	N	94	94	94	94	94

Table 6 depicts the correlation analysis of the impact of maintenance practices on the production processes in Company A. The analysis indicates a positive correlation between the variables. Company A and Production processes shows a stronger positive correlation ($r > 0.7$, $p < 0.01$) while the other variable shown a medium positive correlation ($0.4 < r < 0.6$; $p < 0.01$).

Table 7: Correlation analysis

Correlations	Objective 1 (Maintenance Practices)	Objective 2 (Operational processes and organisational performance)	Objective 3 (Technologies and trends)
Objective 1: Maintenance practices	1		
Objective 2: Operational processes and organisational performance	0,64	1	
Objective 3: Technologies and trends	0,52	0,35	1

Table 7 depicts the correlation results, where the results show a level of correlation between the variables. There is a high level of correlation between objective 1 and objective 2 of 0.64, the maintenance practices are highly correlated with the operational process to improve the performance of Company A. The value obtained between objective 1 and objective 3 is 0.52. There is a positive correlation which means the introduction of technology in maintenance will improve the performance of the organisation. A weaker correlation of 0.35 was noticed on objective 2 and objective 3, the weak correlation is on the operation processes to improve performance and the introduction of technology to advance maintenance practices.

7. Limitations of the research

As with all research, this study was not without limitations, (Van der Merwe & Nienaber, 2015). The typical limitations of quantitative research apply. A limitation of this paper is that this study was

limited to the maintenance section of the organisation. The Covid-19 pandemic had a negative effect on the collection of data, since it was difficult to reach the participants. The researcher had to use WhatsApp and Facebook messenger as social media platforms to reach the participants. As further research, a similar study could be conducted using a qualitative research approach.

8. Managerial Implications

The outcomes from the objectives of the study will encourage Company A's management to facilitate the skilling of employees and the subsequent implementation of proper maintenance practices to achieve enhanced organisational performance and hence, to ensure that the organisation gains a competitive advantage. There is a need for management to intervene to ensure that regular maintenance is conducted to prevent failures and increase performance. The recommendations on maintenance practices, measures of maintenance performance, production/operational processes and technology and trends will benefit their management by upskilling workers, reducing operational cost, improved decision making and influence and the effectiveness of machinery and equipment. Management at Company A needs to revise its strategy regarding the use of the latest technological advancements towards performance improvement and reduction of operational costs.

9. Conclusion and recommendations

The conclusions of this study are based on the research findings in line with the objectives of the study. The following note-worthy conclusions were drawn from the findings:

Lack of resources and poor management skills led to poor performance at Company A. The literature review revealed that there is a need to conduct regular maintenance to prevent failures and increase performance. There was a high number of machinery and equipment failures and hence the study revealed that there was an urgent need to conduct regular maintenance. The purpose of regular maintenance is to ensure that all machinery and equipment required for production are operating efficiently. The organisation also had inadequate resources (finances, human resources, infrastructure, and tools). The statistical analysis concluded that 57.09% of respondents agreed that a lack of financial capacity, unskilled workers and poorly implemented production/operational processes affected the performance of Company A.

9.1 Research objective 1: To review the maintenance practices used at Company A.

Maintenance practices:

The research established that the maintenance practices are not properly followed by the workers and they do not understand the importance of performing certain maintenance procedures. This was shown to affect the effectiveness of the machinery and equipment and resulted in an increase in failure frequencies. This study showed the need to perform maintenance on machinery and equipment. The statistical analysis indicated that an average of 63.00 % of respondents agreed that it is important to conduct maintenance to improve the effectiveness of machinery and equipment.

It is recommended that Company A ensures that management and workers in operations are provided with the necessary training to ensure that set maintenance practices are followed.

9.2 Research objective 2: To assess the impact of maintenance practices on the operational processes and the organisational performance at Company A.

Production/operational processes:

The research established that a lack of production/operational processes affects the maintenance conducted on machinery and equipment. Maintenance organisations need to regularly visit their production and operational processes and review their processes to keep up with the competitive environment, (Calais *et al.*, 2017). The literature review revealed that there is a high number of machinery and equipment failures which led to poor performance of Company A. The poor performance was the result of improper production/operational processes and poor-quality work produced by employees. The statistical analysis showed that 65.60% of respondents agreed that to

improve the performance, production/operational processes and quality must be prioritised to improve the methods of conducting maintenance of machinery and equipment.

It is recommended that Company A provide training to quality assurers/controllers and engineering technicians to upskill them with the required maintenance knowledge to manage maintenance processes and to ensure that the maintenance team complies with set standards. This is critical as more than 50% of respondents mentioned the absence of proper production/operational processes.

9.3. Research objective 3: To make recommendations regarding the use of the latest technologies to improve the performance and effectiveness of machinery and equipment.

Technology and trends:

Failure to acquire the latest technologies negatively impact Company A on its operational/production processes. The study revealed that Company A has focused on generating revenue and neglected the importance of investment in technology in its production/operational processes. The statistical analysis revealed that 73.74% of respondents agreed that outdated technological systems impacted the monitoring of maintenance cost and the life cycle of machinery and equipment. Furthermore, the implementation of simulation and integration of operational functions could increase the performance of Company A.

It is recommended that Company A revise its strategy to prioritise technology implementation as it ensures improved performance and assists in reducing operational costs. Company A must acquire the latest technological systems that will enable optimum performance.

A Role Identity Framework for Academic Staff in a VUCA World

Mrs Bernadette Kruger^{1,*}, Prof Nicolene Barkhuizen²

¹ School of Management and Administration, STADIO, Krugersdorp, South Africa

² Centre for Work Performance, Department of Industrial Psychology and People Management, University of Johannesburg, Johannesburg, South Africa

Keywords

Academic staff; Covid-19 pandemic, Fourth Industrial Revolution, Role identity; VUCA

Abstract

Private Higher Education (PHE) academics must adapt to an avalanche of change caused by VUCA. VUCA portrays an environment of volatility, uncertainty, complexity, and ambiguity. Academics face the complex problem of functioning at their best capacity, planning, and scheduling within an "unness"; an uncertain, unplanned, unpredictable, and unstable environment. Furthermore, it appears that private higher education institutions (PHEIs) in South Africa constantly strike a balance between the need to make a profit, their commitment to academic excellence, and the services they offer. As a result, academics' traditional roles could be threatened, jeopardising their basic existence and sense of scholarship. The main objective of this study was to develop a preliminary framework for academic role identity based on the literature already available in the modern workplace. From the first results, it is clear that external influences, including 4IR, the Covid-19 pandemic, political involvement, and corporate imperatives, could impact how academics define their roles. Due to a shortage of resources and a sharp increase in student enrolment, academics in their positions are heavily confined, which could lead to work overload. Negative effects for both employees and institutions could result from a lack of a sense of identity in one's academic function and a restrictive work environment. Recommendations are made for private higher education management.

1. Introduction

Recent economic, demographic, and political changes have thrown educational institutions into an ambiguous arena resembling a competitive marketplace (Gioia & Thomas, 2016). In such a dynamic environment, institutions must adapt to meet these new conditions – behaviour that is almost second nature in business but is still relatively unknown in academia. In institutions that have traditionally been content with slower, self-paced, incremental change, there is growing insistence that change occurs and that it occurs quickly. Coetzee et al. (2021) highlight disruptive factors facing South African education, such as the Fourth Industrial Revolution (4IR), Massive Online Open Courses (MOOCs), and the Covid-19 pandemic. These disruptive factors have consequences for academics' roles and work identities, which in turn leads to reduced service delivery and performance, burnout, and time constraints, to name a few.

As a result, substantive change necessitates rethinking one's current identity and image (Gioia & Thomas, 2016). Along with academic concerns, talent management (TM) has been a critical issue over the last two decades. It entails activities such as identifying talented employees, which is essential to the successful operation of organisations (Daruka & Pádár, 2019). According to Musakuro and de Klerk (2021), the most important role in the South African higher education sector is talent management, which includes attracting and retaining academic staff. These employees help ensure that the institution's vision and mission are realised. Furthermore, the role of academic staff is critical because they contribute to economic growth, poverty reduction, and the supply of scarce skills. Musakuro and de Klerk (2021:9) presented evidence on the talent development of academic staff, the

*Corresponding Author – Mrs B Kruger

² E-mail address: NBarkhuizen@uj.ac.za

lack of enough time for a proper induction process, and the lack of standardised processes and systems. As a result, it is proposed that academics undergo more induction processes in a VUCA world of education to adapt to an agile world of work.

Therefore, the increasing demand for quality higher education and the supply and retention of researchers and academics in the near future have become a growing concern globally, sparking a significant discussion among South African higher education institutions (Weaver & Osterman, 2017). Adding to the country's growing concern is the Covid-19 pandemic, and this novel Coronavirus SARS-CoV-2 has impacted every economic and social sector worldwide, including higher education in South Africa (Hedding et al., 2020). Furthermore, Kenny and Fluck (2021) have argued that higher education is a different sector now than it was a generation ago because there are more pressures and demands on the academic staff member who needs to deliver on several tasks. These tasks include research excellence and publishing, teaching quality, community engagement and generating funds for the institution.

Higher education in South Africa has 93 registered PHEIs and 26 public universities, according to the most recent register in August 2021. However, they have a limited capacity in terms of the number of students they can accept (Register of Private Higher Education Institutions, 2021). These tumultuous changes have a direct impact on the academic role of PHEIs. As a result, it is necessary to investigate how they have experienced the differences in recent years and how this has changed their academic role identity.

Martin et al. (2020:258) researched academic identity and concluded that academic identity constructs, deconstructs and reconstructs on an iterative process by means of interpreting and reinterpreting experiences, like, change, in a VUCA environment. This identity formation process necessitates academics to exert emotional and cognitive efforts to understand who they are and, finally, shaping and reshape self-hood in response to socio-environmental/VUCA change. Therefore, conducting this research on the changing role identities of academic staff is critical. "Recent PHEI research has revealed that challenges exist and are problematic in teaching and learning strategies, including subject-specific and pedagogical content knowledge." Furthermore, "PHEIs in South Africa appear to be constantly balancing the business imperative, the academic nature of their business, and the services they provide" (Nukunah et al., 2019).

The main objective of this conceptual paper is to preliminary explore the components of a role identity framework for academic staff in the VUCA world. Academics working in a VUCA world should act as leaders and experts in their respective fields, reacting quickly and confidently to unanticipated change. This research is motivated by the reality of a VUCA (volatility, uncertainty, complexity, and ambiguity) World of Work in education, in which the role of academic staff is constantly changing. Moreover, contemporary academics need to process more information than a couple of decades ago to stay competent and professional in their spheres. However, there is currently no role identity framework to help academics navigate the space. Typically, change that is expected in a stable environment is managed and planned and perceived as a challenge (Biron et al., 2020). It is then proposed that unanticipated volatile changes affect academic role identity and their formidable task of operating with optimal capacity (Bonds, 2020).

With little time to plan, organise, or reflect, the academic must deal with disruptors while completing the academic task (Billot, 2010:710). As a result, time constraints, a lack of a clear purpose, burnout, and reduced service delivery and performance occur. The academic role contributes to the mission of a higher education institution to be responsive to societal needs by doing what educational institutions are uniquely structured to do: generating knowledge and providing an educational experience that prepares students to meet societal needs (Sinclair & Webb, 2020:124). To cope with a new, ever-changing situation, the concept of VUCA drives the need for broader knowledge and application of new concepts, tools, and frameworks, which are lagging in the current changing work environment (Mack et al., 2016).

2. Literature review

The literature review will focus on previous similar studies and scholarly work conducted on the role identity of academic staff in a VUCA world. The literature review will start by identifying the existing gaps relating to the role identity of academics in a VUCA world. Thereafter the literature review will be presented according to the research paper's objectives; the concept of VUCA world will be defined, the transformation of the academic role, the main drivers for the changing academic role in a VUCA world, the academic perception of the new World of Work, enabling and constraining factors of academics to adapt to an agile work environment and the individual and institutional outcomes as a result of the changing role identity of the academic.

2.1 The current gap in the research literature

A great deal of research has been devoted to academics in South African public higher education institutions, covering a wide array of topics. Table 1 below indicates studies relating to the roles of academic staff in *public* universities, indicating the changing nature of academic work in the new World of Work and its effects on their identity. However, little research has been done in South Africa in the PHE context regarding the changing role identity of the academic.

Table 1: Research conducted in the South African context with academic staff

	Authors	Title of study	Description/Findings
1	Sabelis (2020)	The construction of a post-academic university: Opportunity or status quo? <i>Indicate to some extent the difference between public universities and PHEIs</i>	"Awareness and debates created about the present and future of HE".
2	Joubert, Town, Africa and Seymour, (2019)	A work systems view of unplanned business process change: The case of #Feesmustfall at a South African University <i>Research related to change within the university context, not PHEI</i>	"During unplanned business process change, change management, staff training, customisable technology and strategic fluidity, and focus were found to be important. Unplanned business process changes result in all elements of the work systems and its environment changing, even resulting in changed products and customer behaviour".
3	Du Plessis, (2020)	Model of coping with occupational stress of academics in a South African higher education institution <i>Research related to stress of academics but not in PHEI</i>	"HEI should implement interventions to mitigate occupational stressors, and academic staff should be encouraged to adopt adaptive coping strategies".
4	Lesenyeho, Barkhuizen and Schutte, (2018)	Exploring the causal relationship between the antecedents and consequences of talent management for early career academics in South African higher education institutions <i>Focus on the early career academic and TM, but</i>	"The results highlight the importance of management support in improving the effective application of talent management practices among early career academics. Higher education managers are encouraged to implement talent development opportunities and adequate compensation and recognition practices to retain early career academics".

		<i>not in PHEI context</i>	
5	Portnoi, (2015)	Pushing a stone up a hill: A case study of the working environment of South African academics <i>Transformation but not in PHEI</i>	"When combined with prior research, the findings suggest an imperative for South African higher education institutions to focus on improving the environment in which academic staff conduct their work, particularly given the post-apartheid impetus to transform institutions for both equity and global competition purposes".
6	Musakuro and De Klerk, (2021)	Academic talent: Perceived challenges to talent management in the South African Higher Education sector	"The study aimed to establish talent management challenges in one selected <i>public higher education institution in SA</i> (HEI) that offers contact tuition in the Western Cape. Several recommendations were made to solve the challenges of talent management".
7	Kruss, Haupt and Visser, (2016)	'Luring the academic soul': promoting academic engagement in <i>South African universities</i>	"The analysis sought to identify how disciplinary, institutional, and positional attributes are correlated with academic activities engaged and to find an understanding of the influences on academic propensity to engage in incentives and policies".
8	Roberts (2018)	Future and changing roles of staff in distance education: a study to identify training and professional development needs	"Adjacent factors should also be taken into account, these being participation in community engagement, and enabling organisational structure, change management, resilience and the effect of generational cohort differences for both staff and students".
9	Mmako and Schultz (2016)	An Employee Engagement Framework for Technical Vocational Education and Training Colleges in South Africa	"The South African Technical Vocational Education and Training (TVET) sector faces major challenges to produce, recruit and retain all categories of academic and teaching professionals".
10	Sadiq, Barnes, Price, Gumedze and Morrell, (2018)	Academic promotions at a South African university: questions of bias, politics, and transformation	"Although our findings provide some quantitative evidence of UCT's success at creating a fair system of academic advancement, broader demographic transformation remains a priority".
11	Vandeyar, (2010)	Shifting selves: Constructing and negotiating academic identities	"Provides a lens through which academics can be understood as shifting constructions of identity but allows them to rethink who they are and have become and what influence power relations have had in promoting or negating their sense of academic self".
12	Oliver, (2018)	Change agency and higher education in South Africa	"The focus is on the characteristics of a change agent, which could be an individual or a group. Seemingly, change will not be initiated in a 'top-down' approach; therefore, this article suggests a 'bottom-up' approach".

In comparison, research on the changing role of academics in private higher education institutions (PHEIs) has received relatively little attention. This study will attempt to fill this knowledge gap.

2.2 Defining the VUCA world

The workforce in the new World of Work faces challenges that are riddled with contradictions. (Sankaran, 2014:6). This statement enhances the reality of VUCA change. Therefore, managerial decision-making often calls the very foundations of value systems into question, and value systems relate to the identity of the academic. Currently, decision-making requires the courage to face the consequences and the willingness to make mistakes, due to the uncertainty and volatility of the workplace environment. Academics face challenges such as outdated information, slower response rates, and a tendency to avoid risks. Because of the uncertainty in the environment, the workforce tends to obtain incomplete information, which could lead to a relapse into old ways of working. This should be avoided for academic staff members, as this is where the development of a role identity framework will add value (Mack et al., 2016; Waller et al., 2019).

Sinha and Sinha (2020:17-19) explain the elements of VUCA and risks that could be associated with them, as follows:

Table 2: Risks due to VUCA from higher education institution perspective

VUCA element	Description	Example	Risks
Volatility	Rapid and unexpected change and there is a struggle to comprehend the duration and to keep up with the frequency of change	New learning platform – Blended learning Writing online exams – integrity of learning Dependency on technology	<ul style="list-style-type: none"> • Outdated information and technology • Lack of timeous knowledge • Risk-aversion
Uncertainty	Not knowing the future and what it holds. It can cause anxiety. It involves unexpected interactions	Pending launch of sit-down exams or online exams or incorporating both at the same time	<ul style="list-style-type: none"> • Incomplete information • Resort to what worked in the past
Complexity	"Too many moving and connected parts with unclear causes, effects and interactions with an overwhelming amount of information"	Complexity of academic and administrative tasks. Regulatory environments, changing policy and the diverse needs of the student cohort. New World of Work	<ul style="list-style-type: none"> • Analysis Paralysis • Resort to short-term fixes and quick wins
Ambiguity	Multiple perspectives and viewpoints can cause confusion. Inability to correctly interpret or predict events and situations. Unknowns	Immature or emerging decision-making, new processes outside of your core competencies	<ul style="list-style-type: none"> • Failure to understand the significance of events • Taking inappropriate action • Misinterpretation

Source: (Sinha & Sinha, 2020)

Winkler-Titus and Crafford (2020) define six key steps to follow whenever a work process changes for effective reform. First, the type of change should be defined and aligned with business goals. This

could cause conflict when time is limited, and the change is poorly defined and forced in a standardised manner upon all stakeholders. The next step is to determine the impacts of the change and those affected, but in a VUCA environment, that is sometimes very uncertain. Step three should be developing a communication strategy that should involve the participation of all stakeholders on a platform where communication is disseminated so that all staff are kept informed. The next step is to provide effective training, but staff could experience time pressures that do not allow them to obtain the training. That, however, could relate to the ambiguity within the VUCA world of change, where ambiguity can be viewed as something open to more than one interpretation of how academics interpret unexpected and swift change and how they cope in such an environment. The last two steps relate to the availability of a support structure and that the process should be managed throughout.

2.3 The academic role transformation as a result of the VUCA world

Higher education research in the Covid-19 era has repeatedly demonstrated that the only constant is change, and institutions must endure and respond effectively to the VUCA world. As a result, the focus of this study will be on PHEIs in South Africa. Although many scholars have considered these changes and their impact on institutional outcomes, it is important to consider academic staff members within the institution and how rapidly changing external and internal competitive conditions affect them (Mousa & Ayoubi, 2019). Academic staff members' work processes are shaped by strategy and practices and by disruptive, forced changes related to VUCA, such as the Covid-19 pandemic. The academic role evolves as a result of its rapid adaptation to such changes, such as travel bans, large-scale workforce restructuring and layoffs, the overall shift to a work-from-home mode of operation, and innovative behaviours implemented by academics (Biron et al., 2020). Furthermore, this research on the changing role identities of academic staff is critical. According to Sinha and Sinha (2020:20), to survive and thrive in the academic role in this era of chaos and complexity, academics, as educational leaders, must commit to a 'tolerance' for chaos while also constantly adapting themselves, which is becoming increasingly inevitable in the work ethos of the World of Work.

According to Tiwari (2017), teaching has been a profession in society since the beginning of time. However, the roles of educators have changed dramatically as the times have changed. Teachers' roles and responsibilities include delivering quality lectures and imparting the best skills to students, and sustaining a job characterised by demands, role ambiguity, and a plethora of administrative obligations. Skea (2021) has sought to bring together the academic roles of teacher and researcher in the neoliberal university. She labelled this complex identity as *Homo Economicus* and tried to reclaim 'the academic' as *Homo Academicus*, building this possibility on the grounds of collegiality and productivity versus performing. The virtue of practicing mindful academic work is evident in the role of the academic. This is in line with the aim of this study to re-establish the role of academic identity amid global and institutional volatile changes and how academics on different career levels handle unplanned and continuous changes.

2.4 The changes in the tasks of the academic

Waller et al. (2019) demonstrated that globalisation, legislation, the use of modern technologies, policy, and curriculum changes, and the 'new normal' World of Work all pose challenges to higher education in the twenty-first century. In addition, the considerable increases in the rate of change in the VUCA world place new demands on people, processes, technologies, structures, and systems. In a recent study, Kenny and Fluck (2021) acknowledged global changes in higher education such as massification, under-resourcing, competition, institutions that operate like commercial businesses, Covid-19, and 4IR.

Roberts (2018:38) suggests in her study that academics teaching online, and distance have to be knowledge experts, effective listeners and communicators, coaches, facilitators, mentors, problem solvers, designers, supporters, and resource coordinators. Cornelius and Higginson (in Roberts, 2018) identified 11 clearly defined roles for academics: technologist, manager, co-learner, designer, knowledge expert, researcher, facilitator, assessor, adviser-counsellor, e-tutor, and mentor.

Previous studies have focused primarily on the institution and the changes that it has had to endure. However, the focus of this study will be on the academic members of staff who are part of the institution and how they experience and cope in the VUCA world of PHE (Sinha & Sinha, 2020).

2.5 Main drivers for changing academic roles in the VUCA world

Global change, institutional change, and changes to the already complex academic task are the primary drivers of evolving academic roles. According to Kruss et al. (2016), there is widespread global pressure on universities and academics to become more responsive and accountable to multiple demands in their local, national, and global contexts (2016). This implies that the institution and academics must respond to and adapt to the change. Where legislation and policy must be reinterpreted, an institution should interpret it under the needs and requirements of their community. Every stakeholder must be involved.

As a result, this study will look at how academics in PHEI respond to new added tasks and trajectories related to entrepreneurial aspects, where academics must respond to industry links and innovation and should be preparing for a changing, dynamic future with local and global competition. Consequently, economic considerations related to international competitiveness have become a significant driving force behind higher education internationalisation." (Flecknoe et al., 2017).

2.5.1 The complexity of the academic tasks

Academics find their identity challenged by the multiple roles they must fulfil in their execution of the academic task. These academic tasks relate to the interaction and action between processes, science and relationships and planning in the academic context. Barnard (2019) refers to academic tasks as teaching, research, leadership, knowledge exchange through academic citizenship, and community engagement. Academic identity can become contradictory where research on the one hand and teaching on the other form part of the academic role; tensions grow when the academic favours the one or the other. Kruss et al. (2016) restate the academic's primary responsibilities, referring to the threefold mission of teaching, research, and service or community engagement. Their focus is on community engagement activities, describing the academics who participate, their main academic influences, and what they do in this context. They conclude that when academics become involved and engaged in the community, institutional and disciplinary factors intersect in complex ways, related to the multiple roles that academics are expected to play.

Global higher education leaders must manage enormous complexity, mainly when dealing with disruption and innovation, as seen through the lens of complexity (Lemoine, Garretson & Richardson, 2018). Furthermore, specific dimensions contribute to the complexity of the academic role in higher education; the structure remains rigid and less autonomous, bound by institutional policies, procedures, and legislation. Second, institutions are becoming increasingly complex, less agile, adaptable, and increasingly reliant on technology. Third, the ever-increasing speed of change necessitates more adaptable, adaptive, and agile higher education institutions to compete globally.

Since the beginning of the twenty-first century, there has been a worldwide decrease in government funding for higher education across various Western societies. In many of these countries, universities' increased reliance on competitive research grants has resulted in a bias toward recruiting academics based on their research reputation, potentially at the expense of teaching quality (Flecknoe et al., 2017). Higher education is a complex system, and the tasks performed by academic staff at an HEI are complicated. Complexity can be viewed as a theory of change and adaptation that details how change occurs in systems and the principles and role identities needed by academic staff to flourish in turbulent environments (Siemens et al., 2018 & Barnes et al., 2021).

2.5.2 4IR and the academic role

The Fourth Industrial Revolution (4IR) or Digital Revolution is entrenched in the integration of networked technologies to facilitate automation. It is directly related to the onset of artificial intelligence (AI) and the pervasive use of the Internet in most people's everyday lives. The application of automation is also found in education. A variety of technologies fuel the 4IR concept,

as expounded by Mhlanga and Moloji (2020): " Artificial intelligence and robotics, ubiquitous linked sensors, virtual and augmented reality, additive manufacturing, blockchain and distributed ledger technology, advanced materials and nanomaterials, energy capture, storage, and transmission, and new computing technologies, biotechnologies, geoengineering technologies, neurotechnology, and space technologies are among these technologies" (Mhlanga & Moloji, 2020).

Before the advent of Covid-19, the World of Work was already changing, and the workforce strove to create resilient tools that assisted with coping with change and contributed to a certain measure to predict future change. Examples of innovations that cause change are how 4IR changes the work-related demands, the new young workforce entering the market, the older workforce with all their accumulated knowledge and experience that exit the workforce, and then, of course, the boomers that are still climbing the corporate ladder and the globalisation of the workplace and enterprises. Then the pandemic hits the World of Work in change (Veldsman & Veldsman, 2020).

From an education perspective on 4IR and how academics are affected, educational institutions have contributed greatly to reshaping future technologies by being the test laboratories for innovation. Therefore, special attention is placed on going beyond the traditional teaching approach and employing trending technologies to prepare students with the right knowledge and skill sets. Therefore, it is imperative to consider how educational institutions will be restructured by the 4IR (Yusuf et al., 2020).

2.5.3 New World of Work

Increasingly, organisations must be more flexible and innovative in responding to unexpected changes that affect staff members. The Covid-19 pandemic is an unexpected event that forced a massive transition to remote work changes in the industry's landscape. These changes significantly alter learning and development (Biron et al., 2021). This influenced the academic role, and the Covid-19 pandemic had both short- and long-term effects that educational institutions will feel and recognise for a long time. For example, academic staff had to upload and deliver study material online during the lockdown period. However, academic staff have had little, if any, experience or training in the pedagogy or delivery of online learning. As a result, academics with teaching responsibilities will have had to quickly upskill and become acquainted with online learning platforms and all they entail, including increased administration. (Hedding et al., 2020).

Evidence indicates that this is a global phenomenon, with academics worldwide reporting increasing pressure to perform, high levels of workplace stress amid unexpected changes to their work processes and procedures and loss of power and academic identity within their institutions (Kenny & Fluck, 2017). Therefore, it is necessary to consider the workload allocation models used in many studies as measures to mitigate the complexity and the overload of academic tasks that have always existed in some form in educational institutions. However, they were largely collaborative or designed to allocate teaching loads in the past. Additionally, they were often based on allocating teaching responsibilities for units or student load instead of the actual time involved in these tasks (Kenny, 2017). However, recent trends in academic performance management in universities specify performance outcomes to be achieved in teaching, research, and service. It requires academic work to be considered more holistically by including all aspects of the work (Kenny, 2016).

Hedding et al. (2020) further implied a different point of view, namely that the shift to online teaching forces academics to seriously question and re-evaluate their curricula. Because traditional assessment techniques are no longer viable, it encourages a shift from rote learning toward problem-solving, critical thinking, and applied understanding through a holistic and integrated approach. However, the forced change again causes more time pressures for the academic to implement this change effectively.

2.5.4 Institutional change (Internal)

Change affects private, and public education institutions in the same way, and poor change leadership in either sector may impact staff. There are, however, some significant differences. Publicly funded universities, for example, may follow a different logic than for-profit corporations (PHEIs).

Furthermore, while administrative offices are in charge of managing change, academic staff actively participate in these processes as well. Higher education institutions frequently hire consultants and coaches to assist with the transition (Vlachopoulos, 2021).

Academics at various career levels perform the same tasks but follow different processes, resulting in non-standardised outcomes. However, we can gain relevant knowledge by investigating the various approaches of academics at various career levels to academic tasks in a VUCA environment. All academics are involved in the same tasks, which include research and scholarship, teaching and learning, community engagement, and fundraising efforts. These tasks would benefit academics if they were prioritised. They must determine which tasks should be prioritised. It will imply that academics at various career levels will have different priorities and outcomes (Nkomo & Marnewick, 2021).

When academics have to deal with unplanned process changes, they will adopt specific roles to implement the change efficiently, but academics will perform these roles differently, depending on their career level. Such changes could lead to changing the role identity of the academic (Kruss et al., 2016). The focus in 21st-century society is knowledge-based, meaning that higher education institutions will need to show their ability to operate in a complex system by exhibiting adaptability and agility to complexity (Lemoine et al., 2019).

2.6 Transforming academic role identities in the new World of Work

Multiple imperatives that transformative change has already presented for the future of work were already part of the changing role of the academic before the outbreak of Covid and have had consequences on how the policy has been interpreted and perceived (Annala et al., 2020). While academics are expected to balance these different roles, they also have to deal with various disruptive factors forced by volatile changes in different environments, including higher education. These disruptive factors include the impact of Covid-19 that necessitated different teaching and assessment methods, developments in the Fourth Industrial Revolution (4IR), additional demands for student support transformation and decolonisation of curricula (Waller et al., 2019).

2.6.1 Academic identity

Identity usually relates to the characteristics determining who or what a person is; or a group forms part of one's identity or character, ethnically, culturally, or nationally, and this character, role or appearance can be affected by someone or something (Jooste & Frantz, 2017). The academic profession constitutes a *productive workforce* within educational institutions. Academics are highly respected because they form the '*key profession*' among the disciplines; they are a highly select group of specialists and have succeeded in most countries over long periods of history in claiming that academic freedom and the governance of their institutions as a republic of scholars were both necessary to ensure the highest quality and significance of higher education (Billot, 2010).

To better understand the transformation of the academic role, Martin et al. (2020) examined the academic identity in the context of changes in UK higher education. The results showed ambiguities and uncertainties embedded in support of academic identity, with stress caused by managerial approaches and difficulties in maintaining the identity of a 'proper' academic with implications for management, reiterating that the academic identity is affected by rapid changes and suggesting that academic identity is fluid rather than fixed.

Van Winkel et al. (2018) revealed six identities related to identity, role-making, and research-active academics. These are the Continuous Learner, Disciplinary Expert, Skilled Researcher, Evidence-based teacher, Guardian of the research work process, and Liaison Officer. It should be noted that different identities relate better to different tasks. Further challenges academic staff could experience in a VUCA environment related to their identity are the absence of cultural and technical dimensions like adaptability, consistency, and knowledge sharing, which may present hurdles to the academic staff member (Ilieva & Vitanova, 2019).

Research has shown that different identities of academics approach academic tasks differently. For example, an academic with an agency-based identity may be suitable for determining the performance of an institution, while an identity with a stewardship-based approach is appropriate for determining the research performance of individual academics. "To encourage research productivity performance by individual academics, the process must be re-designed to suit the nature of academic work: it must recognise the intrinsic motivational aspects of the work and the wide range of demands on academic time" (Kenny & Fluck, 2018).

2.6.2 New purpose

Geertsema and Van Der Rijst (2021) agree that the academic experience challenges and affordances of transition during change. However, their study is oriented specifically to the experience of moving from expertise in a particular discipline to becoming 'interdisciplinary educators'. However, this is also in line with the new role that academics should adapt to include the world integrating learning into the curricula. Their study also focused on the personal development that is needed. Academics are transitioning to a new, unfamiliar role and experience 'adrift and undisciplined' feelings.

Furthermore, Maroun and El Hage (2020) argue that educational institutions need to transition from the common 'traditional' settings towards an education that contributes to sustainable social change by preparing students to be change agents who care for others and the wellbeing of society. They also identified five drivers for change, of which empathy and reflexivity were not previously listed as a driver of change in change management, along with communication, participation and sharing. It is important to note that change is a complicated process in a stable environment and, therefore, even more complex when unexpected or unpredicted.

2.6.3 New entrepreneurial task (generation of funds)

Funds are no longer received from the state, and the academic needs to fulfil the role of an entrepreneur and generate funds for the institution and department of a specialised field; this begs the question of what skills the academic should obtain or show to be successful in this role. Much has been written in the wake of universities changing from knowledge institutes to education-producing entities. Furthermore, Sabelis (2020) claims that the belief is that all organisations and institutions ultimately could thrive on market-economy principles. However, the consecutive privatisation of industries, including education, has unintended effects. Academics as higher education leaders are experts in various disciplines with different levels of educational experience. Although they may have succeeded in research, innovation, teaching, or knowledge transfer, a comprehensive and unified approach to facing the VUCA world is not yet evident (Vlachopoulos, 2021).

2.6.4 Priority of academic tasks for different academic career levels

Herein lies the great paradox of academia that all academics must confront, especially early in their career: promotion and progression largely depend on one's research activity. This leads to whether the same workload should be allocated for different academic career levels and how this allocation is measured and implemented (Papadopoulos, 2017). Models regulating academic workload quantify various dimensions of academic labour and allocate nominal amounts of time for each included activity. Most models start from a statement of annual hours ranging from 1595 hours to 1800 hours, then through a combination of metrics derived from other policies (e.g., acknowledgement of research output or maximum teaching contact hours) (Kenny & Fluck, 2017).

Early career academics experience more conflict between time to do research and being overloaded with teaching commitments. Additional to the time needed to do their research, and according to the Teaching Excellence Framework (TEF) in the UK, it is still difficult to make a case for promotion based on one's teaching abilities rather than research output (Skea, 2021). A study that stemmed from a lack of productivity in research from academic staff explored whether organisational factors such as technological progress, computer skills, research funding, and human resources were significant antecedents of academic staff research productivity. Research productivity of the academic staff requires attention and methods to address (Oonyu & Onen, 2020).

2.7 Constraining factors for academics to adapt to an agile work environment

2.7.1 Responses of academic staff to volatile change

Fisher's theory of change is about the model of personal change. The personal transition curve is an analysis of how individuals deal with change. It refers to individuals dealing with personal change and managers and organisations helping their staff manage change (Sankaran, 2014). The researcher wants to establish how academics effectively manage time and personal organisation in a VUCA world and how it affects their role identity. Staff at different academic career levels could experience this inversely, where more senior academic staff have more experience coping with the change and might have more experience in time management and planning strategies (Gioia & Thomas, 2016). Turbulent changes in PHEI in South Africa can account for the tension between the business focus of private providers and the requirement of meeting the conditions of the regulatory framework (Ellis & Steyn, 2014).

2.7.2 Lack of time and change management skills

Time management can be considered as the process of an individual effectively accomplishing tasks and goals, a process by which an individual obtains control over the timing and the context of what he does and what can be achieved with time (Sajeevanie, 2018). Given the increasing demands on academic time and the complications of creating and sustaining an equitable workload model.

Miller notes that "managers and individual academic staff should play an active role in managing workloads through advocacy for needed changes to institutional practice, programme delivery patterns, and reconsideration of activities that detract from the fundamental purposes of higher education" (Miller, 2019:636).

2.7.3 Linear/rigid work environment

This study anticipates identifying how academics manage new processes and adapt their working processes due to unpredictable changes. Hrabala et al. (2017) claim that process management is a management approach that views an organisation and its activities as a set of processes. Process management aims to identify and improve these processes to create the best possible quality and performance through a continuous design, evaluation, and improvement process. It could be argued that a type of improvement process can be established by investigating these work processes of academic staff as a response to a VUCA environment.

2.8 Enabling factors for academic staff in Private Higher Education

Pillay (2019) demonstrated the importance of professional staff development in academics, but where do they find time with their pressured time schedules and other changes they must deal with already? Pillay further writes that previously, the focus areas for academics were teaching and research, but community engagement was also added. So now, the question is: how do academics manage their time more stringently to accommodate community engagement work?

Training and academic development are viewed as enabling aspects for the academic to achieve agility in the work environment. In the eyes of academics, the credibility of time-based approaches rests on their ability to reflect the work done. This is associated with the degree of consultation in development, the level of transparency in their application and their capacity to cater for a wide range of disciplinary variations in academic roles (Kenny & Fluck, 2018). More enablers relate to reward and institutional grant income, but that is different for private and public institutions in South Africa; individual academics have little control over the outcome. Therefore, this study will explore instances where different academics identify and focus on different academic tasks (Sabelis, 2020). Roberts (2018) highlights the importance of capacity and continuous professional development processes necessary to train academic staff to prepare for these changing roles.

2.9 Outcomes of changing role identities

Including this as part of the study is needed to determine the outcomes, for example, whether academics are demoralised, stressed, or want to leave the profession due to a lack of a role identity framework.

Similarly, Tiwari (2017) made the following recommendations for the individual outcome of the academic role identity; academics should be given more freedom to explore innovative ideas, allow more time for academics to do quality research that can benefit the institution, and there should be an effective consultation process about workload.

Jooste and Frantz (2017) demonstrated five themes that emerged around academic leadership and self-traits: its development over time; that it can be earned through different means; that it is influenced through personal experience; the role of role models; and environmental encouragement, however, this is a challenge in the VUCA world. Therefore, academics will experience increased occupational stress unless strategies and mechanisms for dealing with the environmental demands of their profession are implemented. Higher education institutions that want to promote the health and wellbeing of academics must first understand the complexities of the coping process (Du Plessis, 2020). Jakovijevic (2018:127) claimed that contrary to extensive research and awareness about the role of innovation in education, insight is missing regarding an individual frame of innovation of how to empower an individual. Therefore, this study proposes that the information gathered from academics' responses in a VUCA world can add value to an innovative academic role identity framework.

2.9.1 Legitimacy as an academic

Figure 1 represents the work of scholars Martin et al. (2020) on the identity work of the academic. The figure demonstrates how the academic identity continuously evolves despite unsaid issues within recognised pressures.

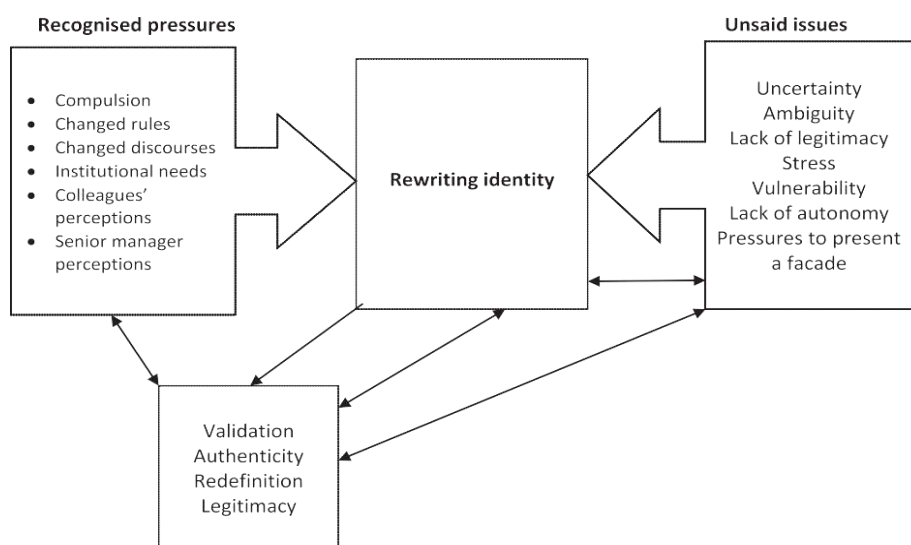

Figure 1: Identity work to achieve legitimacy as an academic (Martin et al., 2020:10)

2.9.2 Transformation

Organisational change or transformation, both in business and social contexts, is a difficult problem because of the complexity and diversity of the participating stakeholders (Sankaran, 2014). The explanation of metamorphosis is a classic example of transformation. "Transformation is profound, fundamental change, altering the very nature of something. Transformational change is both radical and sustainable. Something transformed can never go back to exactly what it was before" (Gass, 2014). Oliver (2018) suggested that educators become change agents in the learning environment and highlighted that higher education institutions require significant change, implying a paradigm shift in their educational process. However, because most educators in South Africa are not adequately equipped for this task or share the passion of being a change agent, higher education institutions should motivate and train educators to become part of the process of change agency. Oliver concluded that " the educator becomes a facilitator in the student's learning process and problem-solving environment, and to accomplish this, educators must become change agents who ground their actions

in sound moral decisions and embrace the tools that technology provides education. They must be self-directed, lifelong learners who initiate innovative and life-changing projects that bring positive change to South African communities".

2.9.3 Autonomy

The high differentials between individuals of status and autonomy have had a profound effect on the participation of academics and their sense of professional identity. The underlying structures and ideologies in communities of practice can work to the disadvantage of academics (Vandeyar, 2010). Further, Vandeyar (2010:918) distinguishes between tangible and intangible benefits of the academic position. The tangible benefits include 'wages, facilities, work rules, and fringe benefits,' The intangible benefits include 'personal and institutional reputation, autonomy, influence, and sense of belonging. It has been alleged that the academic world is generally reluctant to change, especially when it comes to an external influence on individual autonomy, but this depends on the characteristics of the academic and governing bodies (Barbato et al., 2019). They further assert that this reluctance and the limited ability to change result from the innovations, like new teaching methods or different focus on new student cohorts, require collaboration among professionals and the capacity to adapt teaching patterns to new operational modes.

3. Towards a preliminary conceptual framework, academic role identity

The framework is predicated on the idea that there are numerous internal and external contextual elements that have an impact on the academic function in the modern workplace. One example of an external element is 4IR, which introduces a variety of new online learning methods that academics must become used to. Additionally, the Covid-19 epidemic ushered in a new employment era marked by hybrid work arrangements combining office, online, and work-from-home activities. Covid-19 increased its usage of 4IR technologies to provide virtual classroom instruction. From a political standpoint, the continued massification of student enrolments puts a lot of strain on the infrastructure and resources already in place in the higher education community to accommodate students who are pursuing educational credentials but are sometimes not quite ready to start the journey. Academics are therefore burdened with a significant amount of labour, which has negative effects on their wellbeing. Last but not least, profit-driven competition is what drives the operation of private higher education institutions.

The internal change factors are largely determined by the enabling (i.e., institutional support, training, and development) and constraining factors (i.e., lack of time, rigid work environment). All of these adjustments aid in the development of new academic identities and a variety of positions, including Liaison Officer, Skilled Researcher, Evidence-Based Teacher, and Continuous Learner (see Van Winkel et al., 2018.) Therefore, academics must reframe their mission and modify their priorities in a demanding work environment marked by rigid/linear work environments, a lack of time and change management skills, and inadequate coping mechanisms. The challenges can be overcome by creating a more compassionate and fulfilling workplace where academics feel like they belong and have a purpose. In order to reduce and eliminate hazards, academics can also be trained and proactive about preparing for extraordinary changes. These procedures can help academics maintain their status as legitimate scholars and stop plans for voluntary turnover.

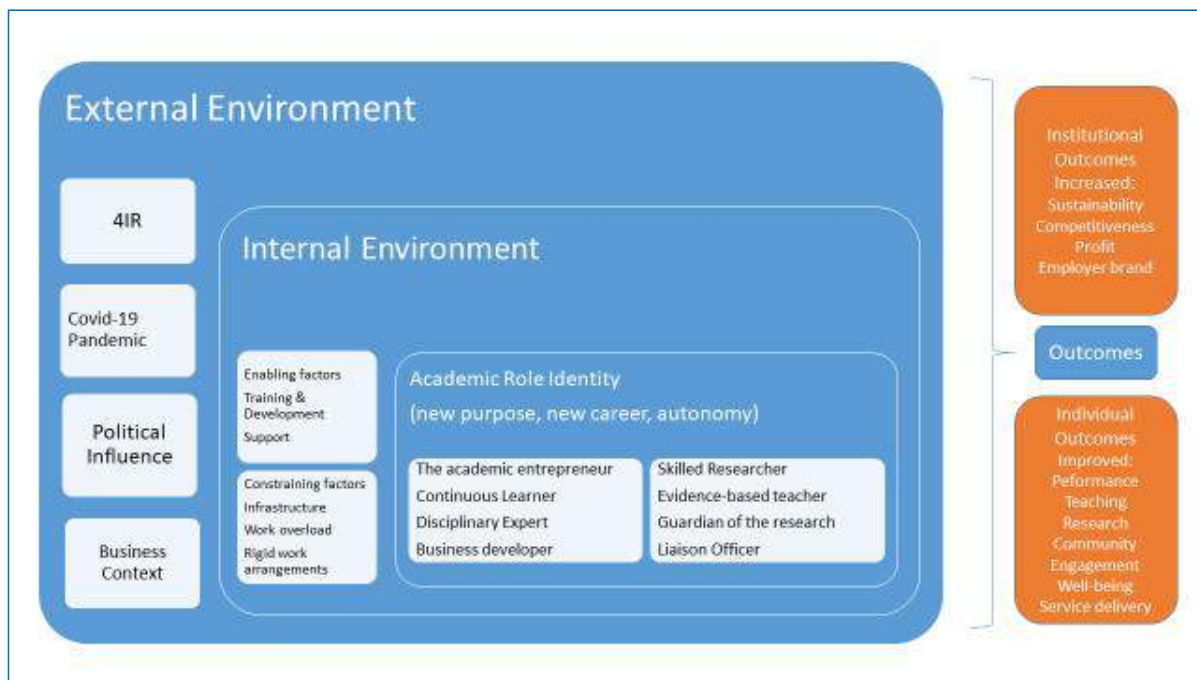

Figure 2: An academic role identity framework for the VUCA world (Authors' own)

4. Management implications

Higher educational management is functioning in a VUCA world where a great scarcity of academic staff prevails. As such, management should take cognisance of the external, internal, and personal factors impacting the higher educational work environment and redefine the academic role identity to ensure future-fit and workplace ready scholars that can make a contribution to the broader society. This requires an education intervention whereby HEI management on all levels (i.e., executive, middle and line level) be equipped with the leadership intelligence and practical acumen to navigate staff through times of unprecedented change and crises. No academic institution can survive without competent and key skills. Therefore, an investment into academic role identities and future-ready skills is imperative for sustainable and competitive higher education institutions.

5. Limitations and recommendations

This research involved a preliminary literature review aimed at detecting those elements that could contribute to the academic role identity in a VUCA and new World of Work. It is clear from the literature review that there are still some sizeable gaps in the definition of work identities in PHEIs. Due to this, the literature evaluation was restricted to those research studies that highlighted the problems and supportive factors faced by PHEIs as well as the elements influencing the role identities of academic staff. The research will next move into a qualitative phase where personnel from PHEIs will be interviewed in order to add empirically to what is already known about the role identities of academics in these schools.

6. Conclusions

This conceptual paper's main objective was to provide an overview of the various aspects that affect academic role identity in a higher education setting undergoing significant disruption. This study significantly advances our understanding of the elements that affect academic staff members' perceptions of their roles and the proactive steps that may be taken to prepare them for the workplace better. The introduction of new technologies, such as the rise of 5G, will continue to disrupt the workplace. In order to maximise the performance of skilled employees, HEI management must design meaningful workspaces in the middle of a chaotic world.

Small businesses; start-up lifecycle; entrepreneurship education; business training

Abstract

Background: Banks are changing the way they deliver their service to customers through digital channels. This presents challenges to the informal microenterprise owners who lack adequate education and income to explore these solutions easily.

Aim: The purpose of this research was to explore the factors that determine the adoption of digital banking by informal microenterprises in Gauteng, South Africa.

Setting: The research was carried out in the township communities of Alexandra, Soweto, Tembisa, and Vosloorus, in the Johannesburg area. Moreover, the study focused on informal microenterprise owners.

Methods: A qualitative approach consisting of eight semi-structured interviews were conducted amongst informal microenterprise owners. All respondents were based in townships situated in the Gauteng province.

Results: The findings suggest informal microenterprises within a township environment are plagued with many obstacles when it comes to financial inclusion in banking. Lower levels of education and income are contributing factors that hinder the adoption of digital banking by microenterprises in the informal sector.

Conclusion: Informal microenterprise owners do not maintain a positive attitude toward digital banking since financial exclusion is exasperated by digital banking alternatives. Lower-income levels and lower education levels contribute to the financial exclusion of informal microenterprises.

1. Introduction

1.1. Problem Statement

The informal sector is integral in addressing the socio-economic issues across the globe. Informal sector entrepreneurship activities contribute 10–20% of the GDP in developed economies and up to 60% in developing economies. In South Africa, the informal sector accounts for 15–17% of total employment and about 5.2% of the country's GDP (Musara & Nieuwenhuizen, 2020)

Urban townships in South Africa are dominated by informal microenterprises (Petersen & Charman, 2018). Microenterprises as defined by the Department of small business development are businesses that employ between 1-10 people and generate an annual turnover of up to R20 million, depending on the sector; these microenterprises are regarded as informal when the owners are not registered for

income tax or value-added tax (Government Gazette, 2019). Township entrepreneurs have the tenacity to succeed and have the potential to further grow the South African economy (Mulligan, 2015). Yet, township economies are severely hindered, with poor infrastructures such as lack of internet connectivity, a lack of technical skills training, and higher education institutes (Mulligan, 2015). Microenterprises in the informal township economy exist under greater situations of economic and social stress (Petersen & Charman, 2018). In South Africa, the township economy services more than 50% of all South Africans who are generally black and economically disadvantaged (Petersen & Charman, 2018). Microenterprises in this setting have nonetheless emerged naturally and created many opportunities for the livelihoods of individuals thereby reducing poverty within the informal economy (Greenberg, 2015).

Ceyla et al. (2020)) provides a global perspective that access to affordable financial services is critical for poverty reduction and economic growth, emphasising that there is very little contact between the informal sector and formal financial institutions. More recently, financial institutions have started providing more financial services through a digital infrastructure which includes mobile phones, computers, or cards that are used over point-of-sale devices (OECD, 2020). South African banks have upgraded automated teller machines (ATM's) with multiple features, which include stamped statement dispensation, wider provision for cash deposits as well as many other self-service features. To reduce the risk of card skimming and secure ATM transactions, South African banks have implemented new technologies that include tap-and-PIN authentication in addition to biometric security (McKane, 2018).

Although considerable progress has been made in the digitisation of the banking sector, informal microenterprises remain a large part of the financially excluded and under-banked (Ceyla et al. 2020). While Van Hove and Dubus, (2019) found that the use of a mobile money transfer system, M-Pesa, in Kenya has had a positive impact on the informal microenterprises, Phillipus (2013) found that mobile money systems in the South African informal taxi sector were unsuccessful due to the preference of cash. In this era of digitisation, a challenge is presented for the informal sector in adapting to digital innovation in banking particularly since there is significantly low educational attainment amongst the poorer communities and individuals who are economically, socially, and technologically disadvantaged have a reduced chance of access to digital technology (Mohalajeng & Kroon, 2016). This financial exclusion of informal microenterprises is further exasperated as financial institutions see no substantial returns when transacting with the informal sector. What's more, South Africa was under a national lock-down due to the global COVID-19 pandemic. Elderly banking customers and those with comorbidities had to remain extra vigilant against contracting the disease. As a result, these microenterprise owners were deemed high risk and needed to remain indoors as a means of safety. This research revealed an interesting insight concerning their digital migration journey during the COVID-19 pandemic.

In light of this, financial institutions should not neglect informal microenterprises when migrating to digital technologies for banking. Microenterprises in the informal sector play an important role driving economic growth. It is therefore necessary to ensure that informal microenterprises are financially included by the banking sector as access to financial services contributes to increasing the credibility of the informal business owners and microenterprises and helping them overcome the entry cost into the formal economy (G20 Global Partnership for Financial Inclusion, 2018). Consequently, the successful adoption of digital technologies by informal microenterprises may serve as a source of competitive advantage in the modern township economy, yet it remains unclear why these informal microenterprises do not make use of existing digital financial technology and tools. Uncovering exactly what determines the acceptance and use of digital banking tools by informal microenterprises can lead to an in-depth understanding of what is needed to bridge the gap from financial exclusion to financial inclusivity – that is access to useful and affordable financial products or services that meet the financial needs of microenterprises in a responsible and sustainable way.

2. Methodology

A cross-sectional research method that followed the interpretivist paradigm was used and was inductive in its approach. The research involved a qualitative approach allowing for data to be collected in the form of one-on-one semi-structured interviews. The aim was to gain deep insights into the factors that were inherently present by the participants when electing to use digital banking alternatives and new ones that may not necessarily have been identified in the literature review.

Ten participants were identified and approached for interviews, of which eight participants provided consent to be interviewed. Anonymity and confidentiality was ensured through the data collection and analysis process as pseudonyms were used for the interviews and coding. . Non-probability, purposive sampling was employed to sample the participants. Participants were approached and contacted by fieldworkers located near participants' microenterprises. The fieldworkers were colleagues of the researcher who reside in the townships where the informal business owners operate and could conduct the interviews in a language the participants were most comfortable with. Interviews were conducted telephonically to protect participants during the COVID-19 restrictions. All eight semi-structured interviews were recorded and transcribed for the data analysis to commence. Transcripts were analysed concurrently during the interview process. Data saturation was reached when no new themes emerged from the eight interviews during the analysis.

An inductive thematic content analysis method was utilised. Content analysis entails systematically categorising responses with the aim to identify overall patterns and themes (Vaismoradi, Turunen & Bondas, 2013:400). The aim of content analysis is to obtain a condensed and broad description of the phenomenon, and the outcome of the analysis is concepts or categories that describe the phenomenon (Elo & Kyngäs, 2008:108). The content analysis served to determine the characteristics of the transcribed interviews' content by examining who says what, to whom and with what effect (Bloor & Wood, 2006:58). Categories that emerged from the free coding process were grouped into the three major themes were identified: Education level, Income level and financial exclusion.

2.1 Trustworthiness and confirmability

Two issues contributed to the reliability of the qualitative data, namely its trustworthiness and its confirmability (Miles, Huberman & Saldana, 2014:312). Bias and deceit were avoided because the transcription of the interviews was done by an expert in the field and also evaluated by the researcher to ensure accuracy. To confirm the originality of the qualitative results, direct quotations were used from the discussions so that recurring themes from different interviews can be seen. The researcher also acknowledged any limitations of the investigation and the potential effects thereof (Shenton, 2004:73). Transferability measures how the results or findings are relevant to a wider population or a different case (Mathew & Ross, 2010:12). The data obtained from the interviews provided detailed information regarding informal microenterprises in the Gauteng area. Therefore, the information provided cannot be applied to a wide variety of cases but could serve as a guideline for such cases.

The limitation of this research: The research was restricted to microenterprises in the informal sector in Gauteng. This specifically included township businesses surrounding Johannesburg. These townships were Alexandra, Soweto, Tembisa and Vosloorus. The research did not focus on the digital adoption of any technology that is not used by customers or potential customers for banking.

3. Purpose of the research

By employing the technology acceptance model by seminal authors Davis Bagozzi and Warshaw (1989), the purpose of this research was to explore how 3 factors, namely education, income and exclusion, determine the adoption of digital banking by informal microenterprises in Johannesburg townships in the Gauteng province of South Africa.

To achieve the purpose of this paper, the following research questions were formulated:

- How does the level of education amongst informal microenterprise owners contribute to the perceived ease of use of digital banking tools?
- How do lower-income levels by informal microenterprise owners impede the perceived usefulness of digital banking?

- How does the implementation of digital banking technologies financially exclude informal microenterprise owners with a negative attitude toward digital banking?

This research contributes to the debate in the local context that digital adoption by the banking sector could exasperate financial exclusion in microenterprises since this segment does not understand how to use banking technology effectively. This research contributes to the knowledge gap that exists in understanding the drivers behind informal microenterprises adopting digital tools in everyday banking. It does also help to realise how the banking sector can become more inclusive to these stakeholders in the SA economy.

4. Literature Review

4.1 The technology acceptance model (TAM)

Seminal authors Davis et al., (1989) introduced the technology acceptance model (TAM), which is specifically meant to describe computer usage behaviour and may be appropriate for demonstrating computer acceptance. TAM is a revision of the theory of reasoned action (TRA) specifically custom-made for modelling user acceptance of information systems. TAM explains user behaviour across a broad range of computing technologies (Davis & Venkatesh, 1996). Davis et al., (1989) demonstrate the need to have a model that can assist not only in prediction but also for an explanation as to why a system may be unacceptable and pursue appropriate corrective steps. TAM, therefore, provides a basis for outlining the impact of external factors on attitudes, internal beliefs and intentions.

According to TAM, behavioural intention is led by perceived usefulness (Davis et al., 1989). Davis (1989: 320) has defined perceived usefulness as the level to which “a person believes that using the system will enhance his or her performance.” Research suggests that individuals either use or not use a system or application if they believe it will help them perform their job better (Davis, 1989). There have been numerous studies that depict perceived usefulness as an influencer to behavioural intention to use an online system (Lin & Chang, 2011). Davis (1989:320) further defined perceived ease of use as “the degree to which a person believes that using a particular system would be free of effort.” Davis (1989) asserts that if all else remaining equal, an application that has been perceived to be easier to use than another will more likely be accepted by a user

In TAM the two primary predictors involved include perceived usefulness and ease of use, which jointly influence the attitude and behavioural intentions of users’ (Davis et al., 1989; King & He, 2006). Lin and Chang (2011) found that customer technology readiness enhanced the perceived ease of use, perceived usefulness, attitude toward use, and intention to use. The results also depicted that technology readiness diluted the positive correlation between perceived ease of use and attitude toward using self-service technologies. Types of self-service technologies include the internet, kiosks, mobile devices and interactive voice responses. In banking, these include digital channels like automated teller machines (ATMs), banking by telephone, services through websites and internet, mobile channels and interactive phone systems (Casto, 2010, Lin & Chang, 2011).

Early studies have revealed that the attitudes of users’ in accepting new information systems have a significant impact on the adoption of information systems (Davis, 1989; Davis & Venkatesh, 1996). In later research by Aboelmaged and Gebba (2013), attitude was confirmed as a determinant of behavioural intention, which was the same as Davis et.al.’s (1989) research. Aboelmaged and Gebba (2013) showed that attitude did have a positive influence on mobile banking adoption. Similarly, Saji and Paul (2018) confirmed the usefulness of TAM in predicting mobile banking adoption behaviour among customers in Kerala using structural equation modeling.. It was shown by both Davis (1993) and Davis and Venkatesh (1996) that a willingness to accept an information system by users was necessary, or else the full benefits of the system will not be achieved.

Notably, studies into TAM apply predominantly quantitative methods with no common building process of acceptance (Saji & Paul, 2018; Scherer et al., 2019; Al Arif et al., 2022). . Additionally, the theory building process of acceptance theories is often done by combining already existing theories making it hard for unknown constructs to find entry into the models (Vogelsang et al., 2013).

Nevertheless, such constructs might turn out to be of high relevance to explain software acceptance. As such, the prevalent theory building process can be characterised as incomplete. This paper will build on the theory by making use of a qualitative approach for TAM using interviews with informal microenterprise owners to explore factors which impact the acceptance of digital banking.

4.2 Level of Education

Goldin and Katz (2008) debate that people who are highly educated are in a position to stay ahead with technological advancements as opposed to people who are not. According to seminal work by Chen et al.(2002), online consumers were usually well educated and had higher incomes. However, to increase the online patronage, appropriate education of the user, lower accessibility cost and proper technological infrastructure were required.

The level of educational attainment is an important consideration when measuring internet skills (Deursen et al., 2011). High levels of computer ownership; broadband connectivity; availability of internet access at home and time spent online are indicative of a higher educated segment of the population (Buente & Robbin, 2008). Jain (2015) further proclaims that financial exclusion is exacerbated by a lack of education of individuals in developing countries.

South African informal businesses are mostly run by black Africans with lower levels of education (Statistics South Africa, 2018b). Poorer individuals may willingly refuse to participate digitally in the formal financial system due to lack of awareness of the benefits of digital banking, lack of education about how to use digital finance platforms or their lack of education about the risks of digital finance services (Peterson, 2018). Peterson (2018) further argues that individuals will not use a product, service or system that is not understood. Palani and Yasodha (2012) reveal that education, in addition to income play a significant role in shaping customer's perceptions about mobile banking services.

4.3 Lower Income levels

A substantial proportion of household heads who live in chronic poverty in South Africa are self-employed in the informal sector (The World Bank, 2020). Buente and Robbin (2008) debate that individuals who are better off financially will use the internet to pursue financial transactions. Younger age groups are also more inclined to purchase financial products online (Fischbach,2020). Research shows that poorer communities within the same country have variances in the data infrastructure quality and are usually less connected to the internet (Salemink, Strijker & Bosworth, 2017). Internet access and proper internet connectivity are necessary for the adoption of online banking (Al-Somali et al., 2009).

Guesalaga and Marshall (2008) discussed that the consumption pattern of lower- income individuals in developing countries was mostly concentrated on basic items such as food, shelter and household goods, with less spending on information and communication technology.

Education and income influence the “digital divide” that exists between the rich and poor (Whitacre, Strover & Gallardo, 2015). Low-income individuals residing in inner cities are particularly digitally excluded (Servon & Nelson, 2001). The informal sector is part of a survivalist approach that permits individuals without considerable formal education to work and earn a living (Yu & Nackerdien, 2019).

5. Results and Findings

Demographic profile of respondents

Participants were informal microenterprise owners found in township communities of Alexandra, Soweto, Tembisa, and Vosloorus. The informal microenterprise owners conducted their businesses either from home, the roadside or taxi-ranks. Participants who operated microenterprises in the Vosloorus township did not possess a senior level basic education and were both in the business of selling food. In the Alexandra area, grade 10 was the highest level of basic education of participants. These participants were also involved in the business of selling food. Only one participant operated a carwash in Soweto obtained a diploma which was the highest level of education amongst all participants. A participant from Tembisa, had completed their senior level of education. The lowest level of education amongst all participants interviewed was grade five.

Table 1: Demographic profile of participants

PSEUDONYM	AREA	DESCRIPTION OF BUSINESS	LEVEL OF EDUCATION
Participant 1	Soweto	Carwash operated next to a petrol station.	Diploma
Participant 2	Vosloorus	Roadside business selling vegetables and biscuits.	Grade 5
Participant 3	Alexandra	Self-made vetkoeks, mixed fruit packs and chips. Sold at the taxi rank.	Grade 7
Participant 4	Tembisa	Ornaments and vases made with wire and sticks. Sold at the taxi rank.	Grade 12
Participant 5	Alexandra	Home-based spaza shop selling vegetables, bread, milk, eggs, cooldrinks, canned food and meat.	Grade 10
Participant 6	Tembisa	Door stoppers, hangers, firewood and charcoal sold at the road intersection.	Grade 5
Participant 7	Soweto	Home-based hair cut parlour.	Grade 10
Participant 8	Vosloorus	Home based chisenyama shop selling braai vleis, pap and chakalaka.	Grade 9

5.2 Thematic content analysis results

The eight interviewees, who are informal microenterprise owners found in township communities, were asked questions that provided them the opportunity to share their thoughts regarding their perceived ease of use of digital banking tools (research question 1), to share their perspectives on their perceived usefulness of digital banking tools (research question 2) and shed light on their attitudes toward the implementation of digital technology (research question 3). Using an inductive approach for content analysis, three major themes were identified: Education level, income level and financial exclusion.

5.2.1 Education level

Palani and Yasodha (2012) revealed that education was a contributing factor in influencing customer's perceptions about mobile banking services. Similarly, this research found that lower education levels had an impact on the perceived ease of use of digital banking adoption. The majority of the microenterprise owners in the informal sector lacked business skills which were attributable to most of the participants not having completed a grade 12 or equivalent certificate. This lack of business skills was mirrored in the low levels of digital banking adoption in most participants. The participants did not easily understand digital banking, and this impacted the adoption rate. Due to the lower levels of education and the lack of business skills, microenterprise owners are unable to keep abreast with technological changes in the banking sector. These participants depended on relatives and banking staff to assist them in using digital banking channels. While participants did not have adequate business skills to run their microenterprises, they were determined to succeed in making their businesses a success amidst obstacles.

Additionally, a lack of digital skills existed amongst participants. Peterson (2018) argued that poor individuals voluntarily refuse to participate in the formal financial system digitally because of their lack of awareness of digital banking benefits, a lack of understanding on how to use digital platforms specifically for financial activities and not wanting to work with internet service providers. However, this research found that individuals do not adopt digital banking alternatives due to their lack of digital skills. Some participants had never used a computer or smartphone, whilst some were dependent on relatives to assist them in using such devices. Thus, their adoption of digital banking is influenced by their perceived ease of use of digital tools.

The research by Chitungo and Munongo (2013) revealed that service providers such as banks must participate in large community-based education initiatives. This will improve the perceived ease of use of mobile banking and increase usage. Similarly, in this research, the participants mentioned their need for more initiatives by the banking sector in simplifying digital banking.

Microenterprise owners emphasised that they have, to a certain extent, been “forced” to adapt to digital banking as a means of avoiding bank visits and long queues as a result of the COVID 19 pandemic.

Table 2: Direct quotations of responses in relation of educational backgrounds

THEME 1	SUB-THEMES	DESCRIPTION (<i>VERBATIM QUOTES</i>)	PSEUDONYM
Education	Basic Education	“I have a grade 12 and a diploma... I didn’t require any... additional knowledge.”	Participant 1
		“Only went to school for 5 years... I don’t understand how to use them. (Digital platforms) I go to the nearest branch to do my banking”	Participant 2 Participant 3
		“...I stopped going after standard 5... I do not use internet banking...and also, I don’t know how.”	Participant 4
		“I completed my grade 12...I don’t use technology when it comes to banking because I don’t know how.”	Participant 6
		““I completed only standard 3... I take statements and make payments to my club accounts inside the bank. I don’t know how to use the machine to do those things”	
	Lack of business skills	“I didn’t require any experience or additional knowledge to start my business. I just ran with the things as it went along.”	Participant 1
		“There are somethings I don’t understand in business, but I am learning as I am going along.”	Participant 3 Participant 4
		“I ask friends for help, but they don’t always show you the right way to make your businesses successful.”	Participant 5 Participant 8
		“With my little knowledge I am able to run my business well.”	
		“But I can read and write and that’s enough for me to have this shop.”	
	Lack of digital skills	“I can learn more things like using computers and other things. I don’t know how that (computer) works. ... I don’t even know how to use the internet or do my banking on it...what is a smartphone? My phone is only to make phone calls. Nothing else.”	Participant 2
		“...don’t know how to use a computer. I have never used a computer.”	Participant 3 Participant 5
		“My kids bought me a smartphone for my birthday last year. I use it make calls and they are teaching me how to use WhatsApp...I don’t do any banking with my phone. The lady at the bank said she will show me the next time I go there. So, I can learn to do banking on my phone.”	Participant 6 Participant 7
		“I have never used a computer”	
		“... I sometimes go to the internet café to use their computers and learn how to. Yeah, you can say am still learning.”	Participant 8
		“...My son promised to teach me when he will buy one.” (a computer)	
	Lack of knowledge in understanding digital banking platforms	“I think it’s nice for those who understand but for me, it’s hard...”	Participant 2 Participant 3
		“My daughter helps me to make my deposits at the ATMs and draw money.” “It is nice to learn them because as you can see right now it is not safe to go to the banks because of the COVID infections. So, it is important for people like me to learn to use the internet banking to avoid going to the bank. My daughter can teach me but we don’t have internet at home so I can’t learn how to use internet banking.”	Participant 4
		“I don’t know how to use those platforms and prefer to go inside the bank to do my transaction. I know it costs more but if you don’t understand something then you can’t use it.”	Participant 5
		“If there is no one to help me to make payments on the machine I go inside. I don’t deposit on the ATM. I only withdraw at the ATM when my kids are with me. “...I went to the bank the other day and it was so busy. The staff member took me outside and helped me to make a payment on the ATM. It was so quick, and she showed me how easy it is for next time. I liked it very much and I left the bank in 10 minutes. I am 56 years, and I can’t be waiting at the bank and putting myself at risk. The same bank had to close yesterday because some staff members tested positive. So, I think it is very good especially now with social distancing for COVID 19. It is so much safer not to go into the bank.”	Participant 6 Participant 8
		“I don’t know how to use internet banking.”	
		“I don’t do internet banking alone.”

5.2.2 Income levels

As shown by Woodward et al., (2014) and Chu et al., (2007), informal trading contributes considerably to the income of many homes that are exposed to poverty. Similarly, studies by Yu and Nackerdien (2019) and Potts (2008) demonstrate that informal microenterprises were established in the pursuit of poverty eradication. In this research, the participants interviewed had started their businesses as a mechanism of survival. Most of the participants were just surviving on a daily basis and started their microenterprises as a means to escape poverty.

In this research, the majority of the participants did not have surplus income to acquire digital tools like computers and smartphones. Internet connectivity and accessibility were limited for some participants due to the rural areas that they lived in.

Salemink, Strijker and Bosworth (2017) found that poorer communities had varying data infrastructure quality and lesser internet connectivity. Adequate internet accessibility and connectivity are deemed necessary for online banking to be adopted (Al-Somali et al., 2009). Moreover, it's established that lower-income households spend most of their earnings on essential items such as food, shelter and household goods (Guesalanga & Marshall, 2008). Far less is spent on information and communication technology. Hernandez, Jimenez and Martin (2011) debated that income did not have a central effect on attitudes, perceptions and behaviour of individuals who were familiar with information technology. Contrary to this, this research showed that the participants did not have adequate income to purchase devices like computers and smartphones. Hence, the participants could not become familiar with digital solutions like internet banking and therefore this lowered the perceived usefulness of digital banking.

Participants did not have sufficient money to commute to the closest bank branches. Most banks had closed a vast number of branches in recent years, in the pursuit of driving digital adoption by their customers (Tarrant, 2019). This research showed a similar view since the closest bank branches involved an expensive commute for the microenterprise owner. This has an unfavourable effect since the affected participants instead opted for using their cash revenues in the business instead of banking their proceeds regularly. Louis and Chartier (2017) reflect that geographical exclusion resulting from bank branch closures contributes to financial exclusion. Similarly, this research revealed that informal microenterprises in the townships did not have easy access to bank branches and were not in a position to fully migrate to digital tools. The research by Shevlin (2019) demonstrated a different view that showed customers preferring to use internet banking instead of waiting in long queues at banks. In that research though, bank customers were found to possess suitable knowledge on how to use digital devices and had internet access. This is not the case for informal microenterprises in this research. Table 2 reflects the direct quotations of participants.

Table 3: Direct quotations of responses in relation to income levels

THEME	SUB-THEMES	DESCRIPTION (<i>VERBATIM QUOTES</i>)	PSEUDONYM
2			
Income levels	Survivalist nature of microenterprises in the informal sector	<p>"I needed to put food in my house so the children could eat."</p> <p>"I was working as a domestic but then I lost my job and could not get any other jobs. My children and I needed to eat so that's when I started to make vetkoeks in my kitchen and go to the taxi rank and sell every morning."</p> <p>"I started the business fifteen years ago when I couldn't find any job. I was the only one in my family who could work."</p> <p>"When my husband died, he left us with no money and I had 5 children to raise. So, I started to sell groceries from my home."</p> <p>"I started my business when I lost my job as a gardener. I made the door stoppers and sold them to all my friends and family and then started to sell them at the intersection in Tembisa." "...then I gave up when I couldn't find any job. ... so I decided to just run my business full time. I cut hair from home."</p> <p>"I needed to make money to care for my family so I decided to start this small business in my house some few years ago."</p>	<p>Participant 1</p> <p>Participant 3</p> <p>Participant 5</p> <p>Participant 6</p> <p>Participant 7</p> <p>Participant 8</p>

Lack of access to digital tools	<p>“Sometime there is not sufficient internet coverage in my area...”</p> <p>”My phone is only to make phone calls. Nothing else. I am not sure if I can get connection (internet) at my place. I live in a small shack and I don’t know.”</p> <p>“I don’t have a smartphone. I have an old phone from MTN. “I have never used a computer. I can’t afford to buy one to learn how to use it. It is expensive to get one...” “It is expensive to have internet access and right now I am just trying to live with the little money I make.”</p> <p>“I don’t have access to the internet since data is expensive and I don’t know how to use it.” “I have used my friend’s computer a few times but it is too expensive for me to buy one.”</p> <p>“It is very expensive to buy one”-A computer.</p> <p>“I sometimes don’t have internet signal here...”</p>	<p>Participant 1 Participant 2</p> <p>Participant 3 Participant 4</p> <p>Participant 6 Participant 7</p>
Lack of access to a bank branch	<p>“...I only use the bank branch when I can go to town...Eish it’s far you know. I have to take two taxis to go into the town...The bank closed its branch that was nearer to my house. Now it’s more expensive for me to go into the bank.... I only go every second month. My business doesn’t make so much money for me to spend on taxi fare.”</p> <p>“...sometimes if I don’t have enough money for transport to get to the bank then I just keep the cash with me and use it in the business.”</p>	<p>Participant 2</p> <p>Participant 4</p>

5.2.3 Financial exclusion

This study demonstrated that informal microenterprise owners preferred to use a physical bank branch instead of digital channels. This was attributable to the business owners lacking sufficient knowledge, digital skills as well as accessibility to technological tools. Some of the participants did not want to use digital channels when transacting with larger amounts of money and preferred to visit a bank branch. Even though the participants were aware of the increased costs of using a physical branch channel, they were “forced” into using the branch since they did not understand the digital banking platforms. Lower levels of education and income were key themes that heightened the financial exclusion that digital banking brought to the microenterprise owners. Jain (2015) maintained a similar view in finding that a lack of education exasperated financial exclusion.

Cash was the preferred method of payment for the microenterprise owners that were interviewed. The primary reason for the participants favouring cash was not understanding as well as trusting the safety and security of card machines. In the absence of knowledge on technology and banking, the participants did not have a positive attitude toward banking digitally. As mentioned by Mckane (2018), cash was very popular for payments of smaller value.

Table 4: Direct quotations of responses in relation to financial exclusion

THEME 3	SUB-THEMES	DESCRIPTION (VERBATIM QUOTES)	PSEUDONYM
Financial exclusion	Implicit need to use a bank branch	“I do go to the branch when I need to pay larger amounts since I am not comfortable in paying larger amounts online in case I make a mistake. I also go when I need to pay larger amounts since I am not comfortable in paying larger amounts online in case I make a mistake. I also go to the branch since alot of the times there is no network coverage in my area.”	Participant 1
		“I go to the nearest branch to do my banking...Only deposit my money in the 32 day account and give notice. I take my money out there too.”	Participant 2
		“...prefer to go inside the bank to do my transactions. I know it costs more but if you don’t understand something then you can’t use it...I draw cash at the machine, but I deposit my money inside the bank and I take my statements inside the branch.”	Participant 4
		“Generally, I do everything inside the branch. Payments, deposits, transfers, taking out the money.”	Participant 5
		“I take statements and make payments to my club accounts inside the bank. I don’t know how to use the machine to do	Participant 6
			Participant 7

	those things.” “I only withdraw large amounts inside.”	
Preference to use cash	<p>“The people that come to the carwash generally pay with cash in any case. Also the bank will not give me a card machine facility since I do not run a business account with them. I use my personal bank account.”</p> <p>“Only cash is accepted”</p> <p>“I only accept cash from the people who buy my stuff.”</p> <p>“I only take cash from my customers. I don’t use cards because I don’t know if they are safe and I am not familiar in paying with them...I don’t use technology when it comes to banking cause I don’t know how. I rather keep my cash in my business if I am not sure.”</p> <p>“I don’t accept card payments at my shop. Some customers want to pay with their cards but I don’t like cards. For me I must see my customer’s cash and take it in my hand before I give them their stuff.”</p> <p>“I only take cash. No cards for my business.</p> <p>“I don’t pay with my card when buying things for the shop. I use the cash I get from the customers. My customers pay with cash only here too.”</p>	<p>Participant 1</p> <p>Participant 2</p> <p>Participant 3</p> <p>Participant 4</p> <p>Participant 5</p> <p>Participant 7</p> <p>Participant 8</p>

6. Discussion and conclusion

The purpose of this research was to explore the factors that determine the adoption of digital banking by informal microenterprises in Johannesburg townships, South Africa. In addition, the study used TAM as a theoretical foundation. The results of the study include demographic constructs which would not have been revealed in traditional acceptance studies. The qualitative findings contribute to TAM theory by identifying constructs which play a crucial role the digital banking context. The qualitative approach can be used to build theory for testing quantitatively. Figure 1 below depicts the outcomes of the qualitative research in relation to the theoretical foundation - TAM.

Informal microenterprise owners do not maintain a positive attitude toward digital banking since financial exclusion is exasperated by digital banking alternatives. Lower-income levels and lower education levels contribute to the financial exclusion of informal microenterprises. Informal microenterprises owners generally have a negative perception regarding the ease of use of digital banking and its usefulness for the success of their businesses. This is attributable to their levels of education and income. Lower- education levels and lower-income levels further contribute to the financial exclusion of informal microenterprise owners, as a result, microenterprise have a negative attitude towards digital banking is experienced.

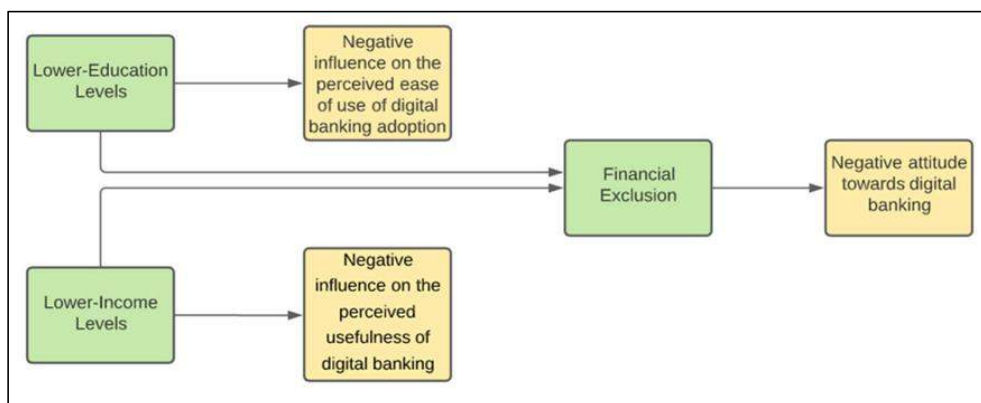

Figure 1: Technology Acceptance model applied to the findings of this research

Recommendations regarding the research can be made as follows: Banking professionals can leverage the insights found in this research. Bank customers who conduct informal microenterprises particularly in the townships require digital banking workshops and interactive learning due to their lower- levels of education. To ensure digital banking is fully entrenched within this segment of the customer base, the banking sector has to adopt a more informative and collaborative approach. Community-based education initiatives around digital banking by banking staff can assist in improving the perceived ease of use of digital banking and ultimately increase usage.

Digital product developers within the financial services industry should consider designing simplified internet banking applications using local township languages such as Xhosa and Zulu with graphic images that can guide customers. Voice-activated tactile screens and instructional videos on internet banking and mobile banking sites can be beneficial to microenterprise owners with low digital skills. Interactive solutions such as voice-enabled robotics could also guide the informal microenterprise bank customers on how to operate digital channels like ATMs. This can assist in increasing the perceived usefulness and ease of use of digital banking as well as positively change the attitude of digital banking by informal microenterprise owners. This will certainly assist in simplifying digital banking and migrating more customers to digital banking alternatives.

This paper makes a significant contribution to an in-depth understanding of what is to bridge the gap from financial exclusion to financial inclusivity – that is access to useful and affordable financial products or services that meet the financial needs of informal microenterprises in a responsible and sustainable way. This research contributes to the knowledge gap that exists in understanding what drives informal microenterprises in adopting digital banking technology.

Learner; Employer;
MICT; Learnerships;
Skills development

Abstract

Youth unemployment continues to be a sticky and persistent challenge in South Africa, and while skills development initiatives are in place, the light at the end of the tunnel is still dim. Post-apartheid in 2001, the ANC led government implemented Learnerships as one of the key policy instruments to address skills shortages and rising unemployment. This study draws on the perceptions of learners, employers and experts to understand Learnership implementation in a Media, Information, Communication and Technology (MICT). The research was designed as a case study and used qualitative research methods. Further to this, document review and analysis was undertaken to further understand learnerships as well as draw insights from other studies and research on Learnerships. A key finding of this study is that learnerships have not been highly effective in reducing unemployment among the youth nor have they catapulted the skills required to advance careers and drive industry growth. This is due to factors such as low demand for certain skill types, a limited number of jobs available and perceptions of learnerships to be inferior to university degrees. The central argument is that the high learner completion results have not been met with an equally robust job creation framework. Over and above this, the expectation placed on learnerships to address unemployment is cumbersome and to a large degree not realistic given that employability is not a function of skill only but of availability and creation of jobs. Learnerships have been effective as a skills development initiative by equipping young people with skills and experience to assist them in finding employment.

1. Introduction

Shortage of skills has been a recurring challenge in South Africa pre-1948, then between 1948 and 1993 under grand apartheid and post-apartheid 1994 to date. The aftermath of the first world war post 1918, was characterised by a flood of semi- skilled labour to 'support' the booming mining and agricultural activities on the African continent, South Africa included (McGrath et al., 2004). This was followed by a chronic skills deficit post the second world war in 1945, as Britain drew on the colonial resources in Africa to supplement men and resources for war purposes (Killingray, 1986). This was due to rapid conscription of military and civilian resources in Africa and Europe to bolster war machinery efforts. The South African mining and manufacturing industry, catapulted into developing semi-skilled labour to sustain its growth, drawing on the existing pool of locals (McGrath et al., 2004). However, from 1948-1993 under apartheid policy, there was contention between state and industry on the purpose and implementation of skills development policy (Akoojee et al., 2008). For the state it's skills development policy, was an instrument for social control in the segregation of Whites and Africans, while for industry they expected the skills development policy to feed their growing skills needs (McGrath, 1998; McGrath et al., 2004). This contention between state and industry resulted in the skills landscape inherited by the ANC government in 1994, which was riddled with skills shortages at all levels i.e. low, intermediate and high skills (Kraak, 2008; Kraak et al., 2006).

A learnership is outcomes based integrating theory and work-based skills training, which culminates in a qualification recognised in the National Qualifications Framework. Learnerships are a tripartite agreement between a learner, an employer and skills provider accredited by the Qualifications Council for Trade and Occupations (QCTO). A learnership is defined as “a work based learning programme that leads to an NQF registered qualification. Learnerships are directly related to an occupation or field of work, for example, electrical engineering or project management” (Skills Development Act 97 of 1998 amended in 2008). The National Qualifications Framework (NQF) is a comprehensive system for the classification and registration of quality assured national qualifications. Its main purpose is to provide an integrated national framework to facilitate and enhance the quality of education and training in South Africa

Outcomes of these evaluations and ATRs on learnerships show progress has been made in driving skills development targets, as the majority of learners enrolled completed a learnership, with some gaining employment. However the skills crisis remains persistent and high unemployment is prevalent especially among the youth, revealing that learnerships are not producing the right skills, at the right standard and volume to support sustained inclusive economic growth (Bloem, 2015; Goga & van der Westhuizen, 2012; HSRC, 2012). Research conducted to understand the perspectives of employers, learners and SETAs on challenges of implementing learnerships have in the main highlighted capacity challenges of SETAs to effectively manage learnership programmes, mismatch between learnership curriculum and needs of employers, as well as low participation by some employers (Babb & Terry, 2005; Davies & Farquharson, 2004; Grawitzky, 2011; HSRC, 2012; Mummmenthey & Du Preez, 2010; Rowe, 2017; Visser & Kruss, 2009).

The learnership system has churned out a large number of mostly low-level skills that are not aligned with the nation’s industrial strategy. Learners find themselves with a recognised qualification but with limited employability prospects, while employers are left bereft as they find themselves saddled with learners they cannot employ, leaving SETAs at crossroads (Fuller & Unwin, 2003). In its 2019 annual report, the MICT SETA acknowledged that training initiatives needed to follow the high skills digital path, however this needs to be balanced by provision of low end skills to achieve inclusive digital transformation for all. It is against this backdrop that a compelling need emerges to conduct a study aimed at understanding employer and learner perspectives on effective implementation of learnerships.

The evaluation of learnerships against Sector Skills Plan remain relevant in measuring output objectives of the NSDS, however there is an opportunity to contribute to the skills development debate through exploring learner and employer experiences to understand implementation challenges of learnerships (Marock et al., 2008; Rowe, 2017). Assessing learnership programmes at sector and national level is riddled with limitations posed by sectoral differences, persistent patterns of exclusion and complexities in implementation (DHET, 2013; DoL, 2008; Du Toit, 2012; Kruss et al., 2011; NFVF, 2009). This presents an opportunity for further research at a more granular level.

Skills required are different across sectors and past studies have mostly focused on understanding implementation and success at a sector level. There is merit in understanding implementation of learnerships from the experiences and perceptions of learners within a single company. This research seeks to understand the effectiveness of learnerships implemented by a South African MICT firm. Learner tracer studies in the MICT sector between 2011 and 2016 show large numbers of learner throughput. However of concern is the low conversion rate, with 54% of learners absorbed into employment (NSA, 2019). Employers in the MICT sector mostly attribute the low conversion rates to learners graduating in occupations that are not in high demand (NSA, 2019). Current analysis on the low effectiveness of learnerships points to an implementation culture that is preoccupied with numerical targets at the expense of looking at the quality, sustainability and relevance of the learnerships (Marock, 2006; Marock et al., 2008; Wildschut & Kruss, 2018). This effectively limits our knowledge on “whether the current workplace based learning system is functioning as expected” (Wildschut & Kruss, 2018, p.198).

There is evidently a gap in understanding the varied experiences and perceptions of learners and employers who go through the work place based programmes. There is a need to unearth the causal relationships that exist between programmes implemented and skills required by industry (Kraak & Young, 2009; Marock et al., 2008; Rowe, 2017; Wildschut & Kruss, 2018). In addition most studies on learnerships were post-implementation presenting an opportunity to understand issues during implementation.

2. Research purpose and objectives

The purpose of this research is to provide insights into learnership implementation at a South African MICT company. The study seeks the perceptions and experiences of learners and the employer to understand what impedes and facilitates learnership success. This will increase existing knowledge on learnerships as a mechanism for skills development. The study was conducted to provide insights into organisation and sector-related idiosyncrasies and needs, contributing to understanding learnership implementation in the sector. More broadly the study will provides further insights through literature review and information from participants in the study on implementation of learnerships within the work based learning framework. The main objective of the study was to explore the perceptions and experiences of learners and the employer on learnership implementation. Specific objectives are to

- Explore the role of the employer in implementing learnerships and perceived success measures of learnerships within the organisation,
- Gain insights from learners on their experiences and perceptions of how learnerships have contributed to their career growth, development and employment prospects
- Provide further insights through a review of literature, interviewing experts at the MICT sector and training providers

3. Literature review

Skills development has become a term used in a wide range of contexts and it's important for this research to quickly bed down a definition that we will adopt in all discussions in this study. Skills is defined as the ability to satisfactorily undertake a task in something one has been trained in (Heery & Noon, 2008; Ivanovic & Collin, 2006). Skills are also defined by Vorwerk, (2009) as “the embodiment of acquired knowledge, experience and the practised ability to read and respond to changes in the environment”. For purposes of this study, skills development will refer to acquisition and increase in skills levels to satisfactorily accomplish tasks. This implies that there is an expected outcome to skills development.

The context of skills development is informed by this “expected outcome”, which brings us to the importance of skills development. The 2004 World Bank Report on Skills Development in Sub-Saharan Africa considers skills development as a tool for growth and prosperity of the individuals, their community, their place of work, hence their economy. This is supported by the latest report (World Bank, 2021) that asserts that low skills can prolong inequality and poverty if such development initiatives are not implemented right. The right implementation can lower underemployment and lead to higher productivity in the economy. Skills development is linked to the competitiveness of nations on the global stage as it equips economies to harness the opportunities both internal and external to their environment (Johanson & Adams, 2004). This view is augmented by Tabbron & Yang (1997), who postulate that the rapid transformation that developed economies underwent in the 80s and 90s created an intense demand not just for skills but for multi-skilled labour.

A key feature of WBL, is a three way partnership between industry, education institutions and government to develop and implement learning curriculum that supports objectives of industry (Burns & Marshall, 2004). This partnership approach to skills development has been implemented in countries across the globe and is commonly referred to as workplace skills training or work integrated learning (Nottingham, 2017). In South Africa work-based learning is referred to as Learnerships which are supported by a robust legislative framework. A key critique of the integration of education and training approach is that it was not accompanied by a common understanding of terminology. The tension lies

in what Lugg (2009), referred to as a superficial consensus as there did not exist a common understanding of what integrated education and training meant. For others it was an integrated approach that involved key stakeholders and ensured there was reduced exclusion of groups marginalised under apartheid, while for others they viewed it as a practical integration of concomitant bodies and systems in implementation that would ideally bring institutional and resource alignment, building a 'single system' across the value chain of education and work (Lugg, 2009; Mcgrath, 1996; Unterhalter & Young, 1994).

In his analysis of skills shortages in South Africa, Erasmus (2009), shows concern of the role of SETAs and lacklustre performance by SETAs. The SETAs are tasked with identifying the skills needed through current and future needs analysis of skills required by the economic sectors (Erasmus, 2009). However SETAs are preoccupied with reporting on number of people trained through Sector Skills Plans, as they do not have the capacity to conduct robust analysis of the labour market to plan for the market of the future (Erasmus, 2009). Breier (2009) points out the cracks in this intricately woven skills development framework, the jarring reality that skills shortages sit uncomfortably next to a growing pool of unemployed youth. This contradiction points to the shortcomings and disconnects within the skills development strategy. Some of the unemployed youth have completed studies at FETs but are unable to qualify in their technical fields as they struggle to find work place experience which is a core requirement to obtain a qualification (Breier, 2009). In a parallel vein, those that have managed to complete the learnership, remain unemployed as employers perceive the acquired skills to be mismatched to what they require in the workplace (Breier, 2009; Erasmus, 2009). As a result there is growing rift between higher education and the skills required in workplace, which contributes to the crisis of skills shortages and high unemployment.

Empirical evidence shows there has been increased access to skills development opportunities. In its 2019 review of the NSDS III for the period 2011 – 2016, the National Skills Authority (NSA) reported that 23,000 companies out of 300 000 companies registered with SETAs claimed skills development grants, resulting in an enrolment of 1.1million learners through the SETAs, of these learners just over 342,000 were learnerships. In terms of financial contribution to skills development R63billion was collected through skills development levies. In spite of the increased participation and access to skills development shown by the figures above, South Africa is still plagued with high youth unemployment and shortage of skills.

Hattingh (2006), brings in another angle to the lacklustre performance of learnerships, suggesting that learnerships fail as a result of half-hearted attempts by employers in implementing the workplace learning component which constitutes at least 60% of a learnership. This places great focus and emphasis on the role of the employer in achieving successful outcomes from learnerships. However Mumenthey & Du Preez, (2010), are of the view that employers value the concept of learnerships but feel unprepared and unsupported by the SETAs and training providers to capably implement the learnerships.

In a case study that sought the perceptions of employers on learnership implementation, employers expressed high levels of dissatisfaction with the level of information shared by SETAs, with 24% of employers in the construction industry being unaware of the learnership (Mumenthey & Du Preez, 2010). A complimentary angle is provided by Marock (2006) and Fuller & Unwin (2003) who attribute employer dissatisfaction to be in part due to the supply forces (training providers) that are motivated by the financial reward of churning out large numbers of learners. This approach does not consider the demands and needs of the labour market resulting in an oversupply of the "wrong" skills, leaving gaping hole of critical skills needed (Marock, 2006). It's important to note that despite the hard selling of high learner numbers by training providers employers are not necessarily ignorant or innocent in this. There is concrete evidence that in some occupations such as nursing, engineering and finance, learnerships equip students with relevant skills at the appropriate level (Fuller & Unwin, 2003; NSA, 2019; Rickard, 2002). In South Africa as in elsewhere in the world, learnerships or work based learning programmes, were conceptualised or revamped as an extended form of apprenticeship applicable to all sectors (Fuller & Unwin, 2003; OECD/ILO, 2017; Smith et al., 2005). In the UK these were termed

modern apprenticeships extending into sectors such retail, social care and finance (Fuller & Unwin, 2003).

Work based learning in non-traditional sectors such as social care and retail has been described as relying on simply providing exposure to learners and not intentionally providing opportunities to learn (Vorwerk, 2009). However Aderibigbe & Mosia,(2019) dispute this view based on their study on the perceptions of students of business studies at TVET. Interestingly the study revealed that workplace learning seems to provide students of business studies with “better opportunities to learn and prepare them for the workplace” more than classroom based learning (Aderibigbe & Mosia, 2019, p81). The students described their work experience as authentic and meaningful and perceived their work experience as to have contributed to the achievement of the organisations’ goals (Aderibigbe & Mosia, 2019). This is further augmented by the fact that students engaged in a wide range of tasks felt a deep learning experience and were able to see the link between theory learnt in class and the practical tasks carried out in the work place (Aderibigbe & Mosia, 2019; Vorwerk, 2009).

The value of work based learning across sectors is further highlighted by Jackson (2015) who refers to observing an improvement in soft skills such as problem solving, team work and communication through work based learning programmes in Australia. These soft skills are sector agnostic, and this evidence begins to cast a shadow on Fuller and Unwin’s assertion. In an online survey to obtain perceptions of students on work placement, Jackson (2015) found that students from multiple disciplines were of the view that the experience enhanced their ability to solve problems, improved their understanding of corporate responsibility and how technology can be applied to their discipline. It is evident that this was learning they did not assimilate through theory and these learnings are the makings of a professional in the workplace.

However, Vorwerk (2014) offers an alternative perspective citing communities of practice are not restricted to trades but to all occupations. He further elaborates that the education system does not create professionals but instead prepares students to become professionals in their next phase of learning e.g. as articulated clerks, cadets or graduate trainees (Vorwerk, 2014). In contrast to Fuller & Unwin’s view, the discouraging performance of learnerships in particular, is mostly due to a “loss of the apprenticeship culture” (Vorwerk, 2014, p.56).

A key component of the learnership model is for learners to have access to a mentor or coach. Hattingh (2006) avers that an active role by coaches and mentors in the design and implementation of learnerships will greatly assist in solving most the problems that impede learnerships from achieving their intended benefits. The mentor is instrumental in initiating the learner into the work community, using their wisdom and experience to play the role of a trusted advisor (Mummenthey & Du Preez, 2010; Stanz & Mosoeunyane, 2007). When a mentor delivers well on their role, this enhances the learners perception that they are learning and having a deep meaningful experience (Aderibigbe & Mosia, 2019).

The review of past studies on work based programmes has unearthed a plethora of perceptions and evidence on the learnerships implementation. The review of empirical literature has provided a framework in which to couch this case study as there are areas that the research can borrow from as well as close some gaps. It is clear that the increased emphasis on integrating work and learning to achieve learning outcomes of vocational education demands constantly evaluating the effectiveness of this pedagogical strategy (Aderibigbe & Mosia, 2019).

As the review of literature has shown the assessment and evaluation of learnership programmes continue to be predominantly outcomes focused with scant attention paid the process of what, why, how and from whom learners and employers will achieve the skills required to increase employability and availability of critical skills (Aderibigbe & Mosia, 2019; Davies & Farquharson, 2004; Marock et al., 2008). Findings from past studies reviewed, are of significant interest to the this study as they have themes that this research is pursuing. Some employers are unprepared for learnerships, feel inadequately supported by training providers and view some of the skills as redundant to their needs as an organisation (Marock, 2006). Training providers have been found to rely on the ability of employers

to respond to technological advances, training initiatives do not result in reduction of skills shortages and learners were offered limited practical experience (Fuller & Unwin, 2003; HSRC, 2012; Marock, 2006; Mummmenthey & Du Preez, 2010). In addition to this, unique sector specific models are required to meet labour market needs of the different sectors, and in some sectors there are no clearly defined career pathways making growth and transition difficult (HSRC, 2012). Perceptions of learners revealed that they need mentorship and coaching to assimilate into the workplace, as well as some level of preparedness to choose the right courses (Hattingh, 2006; Marock, 2006; Rickard, 2002; Zwane, 2012). Related to this the role, capability and competence of a mentor was underscored as being one of the critical success factors for learnership implementation.

Opposing views have also emerged on the effectiveness of learnerships. The HSRC case studies of 2012, put forward that it was evident that inappropriateness of learnerships to labour needs is not the issue, but that the biggest challenge is effective implementation. However there is a compelling view that research studies undertaken do not satisfactorily explain differences in success from one sector to another and that employer participation needs to be more prominent (Davies & Farquharson, 2004; Mummmenthey & Du Preez, 2010).

Recommendations from these studies centred on improved policy coordination frameworks of the various skills development frameworks, enhancing capacity of SETAs and streamlining their efforts (Davies & Farquharson, 2004; NSA, 2019; Rickard, 2002). In addition Feldman (2016) highlights the need for nuanced sector studies to understand the challenges and opportunities in each sector. These views and findings present opportunities that this research explores, by focusing on perceptions of learnership implementation within a single company in the MICT sector, during implementation as opposed to post implementation. This approach will provide deeper nuanced insights as every organisation is different and the setting allows the study to include current learners, past learners and the employer in one single study. This enables the study to identify relationships in the immediate context that may impact perceptions and experiences of participants in a single case study.

4. Research methodology

The purpose of this study was to provide insights on the implementation of learnership programmes, through the perceptions and experiences of learners and the employer. An MICT company was adopted as a case study for the research as it implements and support learnership programmes as part of its skills development initiatives. In an attempt to understand the learnership implementation at this company pursued three research questions that include: (1) what the employer perspectives and experiences are on how learnership programmes contributed to the skills development needs of the firm? (2) what are the perceptions of employees on how learnerships support career development of existing employees? (3) what are the perceptions of learners on how learnerships facilitated them to obtain permanent and retain employment?

The qualitative method allows the research objectives of the study to be achieved by delving into multiple insights and experiences of participants complimented by review of existing reports. Mason (2002) points out that qualitative research is particularly good at supporting arguments that focus on how processes operate and are structured, which was a core focus of the study. Adopting quantitative methods would have been antagonistic to the purpose of the study, as quantitative research seeks to generalise findings as well as predict outcomes in some instances (Ellis, 2020; Merriam & Tisdell, 2016).

The research design is informed by the purpose, process and context of the study (Wagner et al., 2012). On this premise, given that this study aimed at understanding experiences through engaging with personal experiences of participants within a specific context the research was designed as a qualitative case study. The research was designed as a case study with clear boundaries, focusing on MICT firm, which is the unit of analysis and participants were limited to past and current learners at the company, and experts from the MICT SETA and training providers.

As a case study research design was used to gain insights of learners and the employer on learnership implementation at an MICT company, the case of study-the organisation- will be adopted as the population. This is supported by the views of (Schwandt, 2001) that a case is specific and bounded in time and place, where a phenomena can be studied. This firm is considered a leading entertainment company established almost four decades ago and has grown to be an industry leader with an African footprint, however the case study will only focus on a South African MICT company. Given the nature of its core business of delivering entertainment through various digital platforms, there is a growing and constant need for nurturing and acquiring skills in the key fields of technology, digital transformation and innovation. The intention of drawing a sample in a qualitative research is to find participants who have experience and knowledge of the matter under study (Ellis, 2020). This implies people are selected to take part in research on the basis of their ability to contribute towards the purpose of the research. Therefore the sample method purposively decides who participates to meet the objectives of the research (Ellis, 2020; Merriam & Tisdell, 2016).

Qualitative research design mainly relies on three data gathering techniques namely, interviews, observations and document review (Wagner et al., 2012). These techniques were combined for the study to enrich data and enhance its trustworthiness through triangulation (Bryman, 2012). An interview schedule with semi-structured questions, was the primary data collection instrument designed and adopted for this study. Three questionnaires were developed, one focusing on views of employees representing the employer, one on experts and the other on learners. There were some similar questions on the employee and learner schedules to allow for comparison and cross checking of data collected as well as questions unique to employees and learners.

The online platforms (Zoom and MS Teams) were utilised during data collection. This method of data collection was adopted due to Covid-19 restrictions imposed in the country and the remote working conditions that were enforced as a result of the pandemic. Interviews were selected as they offered the advantage of providing thick vivid descriptions of how learners experience learnership implementation. Bloomberg & Volpe (2016), do allude to some pitfalls of interviews as participants can be uncooperative, share limited views and have varying degrees of articulation. To counter some of these disadvantages, the study made use of document review to increase knowledge on the implementation of learnerships. Primary documents reviewed included company policy on learnership implementation, site visit reports by training providers, assessments of learners by training providers and management reports to the company provided by the training providers.

5. Research findings

Here we present findings from the data collection processes undertaken. The purpose of the case study was to understand the implementation of learnership programmes, through the perceptions and experiences of a sample of learners and employees at a MICT company in South Africa. In addition views of experts and training providers involved in implementation were sought. The emerging and confirmed issues emanating from the study, enhance and deepen the existing knowledge on learnerships as a tool for skills development. In addition findings from the research can be applied in the implementation choices of learnership programmes by similar companies. This section presents findings from 16 interviews conducted with stakeholders involved in the implementation of learnerships at MICT.

The response rate of the various stakeholders for this study was encouraging as a fair number of participants agreed to participate. Participants from past and current learners was less than planned. Participants from employees involved in implementation was achieved as all targeted participants agreed to participate. In addition there was satisfactory participation from training providers and experts. Table 1 below depicts a summary of the participants' response rate. The table shows the actual respondents compared to the proposed sample across the 3 respondent categories. In total 16 interviews were conducted against the 26 planned interviews

Table 1: Participant response rate

Group	Designation	Proposed Sample	Actual Responses
Learners	Current Learners	10	5
	Past Learners	10	6
Experts	MICT SETA	2	1
	Employees Implementors	2	2
Training Providers	Training Providers	2	2
Total		26	16

There was reluctance by some learners to participate as a handful that had initially agreed to the interviews, declined to participate closer to the interview.

5.1 Participant biographical data - Learners

In the introductory questions of the interview, some key information with regards to the age, gender and education level of the Learners participating in the study was sought. The table below depicts this data.

Table 2: Learner biographical data

Age		Gender		Highest Educational Qualification	
<i>18 -24 Years</i>	<i>25- 34 Years</i>	<i>Male</i>	<i>Female</i>	<i>Matric</i>	<i>Occupational certificate</i>
7	4	6	5	5	6

Learner respondents had completed or were undertaking various fields of study in the learnerships. The duration of the learnership was indicated as 12 months by all learners interviewed. This was also confirmed by the training providers and the employer. All past learners had less than 2 years working experience and none of the learners interviewed indicated having work experience before commencing the learnership programme. Biographical data of experts, training providers and employees involved in implementation were not recorded as part of the data collection process. The information obtained from the data was supported by quotes taken from the transcripts. To maintain anonymity of the participants the following naming conventions have been applied to identify the different participant groups, past learners (PL), current learners (CL), employees representing employer (EM) training providers (TP) and experts from MICT SETA (EX). Four themes were established from the analysis and these include embarking on learnership, learnerships perceived to be facilitator into employment; the role of the mentor and finally the applicability of theory to practical work component.

5.2 Embarking on a Learnership

For the most part, the process of applying and starting a learnership appears to be well structured as expressed by learners, training providers and employees involved in implementing learnerships. Almost all participants were able to similarly articulate the process and appeared to show understanding, finding it quite easy to follow. Some direct views are presented below

“I went to the assessment in Roodepoort, I filled out forms, they said they would contact me, I came back for a test and I got the call I could come and start.” (PL)”

“It’s been a simple process, if you meet people who can assist you in applying it’s not a problem at all, you need to know [a] company that helps-they do it for free.”(CL)

“Most of these young people are quite eager to start doing something meaningful and complete the required documentation, however of course others need help to provide all required information and that’s why we are here...to help them as much as possible.” (TP)

“The process requires quite a lot of documentation as a complete file is required to support, the contracting process, but the training providers are very astute in managing the administration requirements, it’s not a pain at all for us” (EM)

“I can even help my friends apply, in fact, I do; it’s so easy just follow and gather all the documents, show up for the tests and you’re in.” (CL)

Concurring with what the other respondents had mentioned, PL further explained “It’s not that difficult, they ask you for your personal information, they give you a portfolio of information, you complete and submit it to the training provider, then you go for an interview”. Conversely, it should be noted that a few learners were not very clear on what was expected of them during the application process and did not fully understand the process even though they managed to get onto the programme. PL commented, “I just wanted to learn and get a qualification, I didn’t know there was a placement, it was a good surprise”. The same sentiment was shared by CL

“I remember the training provider telling me that there was an interview, I didn’t know what for, I just went and was interviewed, then I was doing the learnership...I made it”

However, there were some sentiments from training providers that the vetting process of getting learners on to the learnership was not always thorough and not always in their control. Training providers indicated that they source and recruit learners and sometimes they are given existing learners by a corporate and asked to place them at another host organisation.

In terms of entry criteria, training providers explained that learners are required to have a matric at a minimum to be able to embark on a learnership, and in addition competency in English and Maths Literacy is essential to successfully complete a learnership qualification. However in some instances learners who do not have full requirements get onto the programme and struggle to complete the qualifications. There was a suggestion that some training providers are not as thorough, and the recruitment is subjective to some extent. Concurring with this view was a comment by TP that “matric can be verified it’s a yes or no, but the English and Maths literacy is determined through assessments conducted by the training provider, “therefore, competency becomes subjective and its sad but some who don’t have the ability end up on the programme and they fail” (TP). The importance of vetting for competency and ability is further elaborated in the comments below

“So you know one can’t take for granted because people have matric that they’re going to pass the qualification, so we do a very stringent vetting process. We have telephonic interviews with all the learners, we engage with them by asking them questions about their experience, about you know their general communication because that’s very important because they have to be able to have a basic understanding of English and Maths Literacy to attempt the qualifications and then answer the workplace evidence in the Portfolio of Evidence.” (TP)

“One gentleman was allowed to enrol on project management level 4, but he really should not have been enrolled at all because he did not have the competency level on a Maths and English Literacy level to attempt a level 4 qualification, so you see there are loopholes in the system... eventually he had to be dismissed because he was non-compliant in all his interactions with us...he couldn’t come to the party and it a waste of money for MICT and a wasted opportunity for a competent learner.” (TP)

“it’s very important that such kind of decision-making is made upfront before one embarks on a learning program to give them fair advantage to be able to achieve the competence.” (TP)

“When I say ‘able’ I am not talking about disabled people you know physically, I’m saying able to a pass a qualification and then add value to the host company see that’s also so important, so our role is to find able learners there is yeah there is a lot involved you know.” (TP)

“I personally get involved in this upfront process because I deal with the host companies myself, because it's my credibility also at the end of the day when I'm presenting CVs of learners, I've gotta make sure that they are going to not let that host company down, they're going to be reliable people they are going to arrive at work on time they are going to be compliant.” (TP)

“I really do believe that otherwise it's a disservice to the learner you know to, I mean shame wasting a year of their life for something that you know they can't even obtain because they don't have the necessary skills and knowledge it's very sad and a waste of money for MICT yeah it is a lost opportunity that should have been given to someone else.” (EX)

“you know people need to be competent or have a certain skill level before they go into a new learnership that's an instance of ...you just didn't have the required requisite knowledge to cope shame actually it was a bit sad yeah 'cause you can imagine they'd struggle with the next level.” (TP)

Cementing the above views, there was particular challenges that learners also faced over the lockdown period as a result of COVID-19, when they had to work and study remotely. These challenges were not anticipated during recruitment and some learners struggled with making use of IT services such as Zoom, MS Teams and working remotely. One training provider expressed how they really felt for the learners and organised calls with the learners to assist them. They commented “I just wanted to ... help him, like fly to PE ... but you know I couldn't ... just goes back to vetting learners before they come on learnerships and I think that that is something that needs to be improved”. In addition, there was also mention of fraudulent practices by some learners that present dishonest information on their CV's, “making claims on qualifications they do not have” (TP). Some recruiters are not thorough in their vetting and send inappropriate people to training providers. One such incident was aptly described below

“That's what happened with (name withheld) in Project Management for Durban, she ended up lying on her CV. The recruitment agency did not pick it up and she had swindled two other training providers out of stipends, oh the stories I could tell you...there is a desperation among our youth, there really is a desperation they are wanting opportunities so badly.” (TP)

Further to a near-seamless application process, learners indicated a high degree of satisfaction with the process of onboarding onto the programme and into the workplace, CL expressed that “they [MICT] were ready for us when we arrived, we were given laptops even stationery and I even had a company tag with my face on it, just like their own employees”. This is also in line with what PL commented on “ You know when you arrive, you are nervous, but these people are professionals, they know what must happen, everything is organised for us, we even had lunch and I began to feel better, they were expecting us, it felt good”. CL indicated further that “I realised I am now in corporate, they communicate very well what our programme was and what would happen, I wasn't guessing, and I know who to dial if I needed something, they were prepared for us and it helped me”.

In addition training providers also expressed that “there is a need to understand where some of these kids come from, they are unsure of themselves and some don't pay attention to detail as required. I do find that once you clearly explain even if it's again and again, very few don't complete the documentation, most of them do”. In addition, training providers made recurring observations that even though there is induction some learners just don't follow the rules or behave according to the workplace requirements. The training providers emphasized, “we talk about codes of ethics we talk about professionalism in the workplace that is part of our induction process, but people are just unreliable sometimes, it's the human condition”.

All learners also expressed that they had the resources and support they needed for the learnership, from both the training provider and employer. CL indicated “ they [training provider] give us a tablet with all our study materials so we don't carry books around, they also explain what we need to be doing and I find it easy to follow”. PL explained “Even when we start the work, my supervisor told me what I needed to do, it was already written down, so the following day I knew what to do”

5.3 Learnerships as a springboard into employment

All Learners indicated that before starting their learnership, they had completed matric, were not employed and were seeking an opportunity to either gain employment or achieve a recognised qualification to propel them into employment. Based on participants' descriptions of their expectations prior to applying for their learnership, learners believed learnerships would give them leverage in getting employment. The learners expressed this as follows

“After completing Matric, I couldn’t get into university as the programme I was accepted for-Governance studies, did not qualify for NSFAS funding. I couldn’t afford university and I didn’t want to stay at home and my sister’s friend told me that doing a learnership would help me to get a qualification, so I applied” (PL)

“Eish you know it’s difficult to get a job on your own. When I completed Matric, I heard about learnerships from the Department of Labour and they said it can help you get skills and get employed. I submitted my CV and they contacted me so I could start a learnership, it would help me get a job.” (CL)

“I was very happy to get a job...I mean the learnership, as they pay me a stipend that improves things at home, and I can do things for myself and my family.” (CL)

“As soon as I started the learnership with MICT, I knew my foot was in the door and I started looking for vacancies so I can get employed. Yoh, I applied for many positions on the job portal...and maybe that’s how I was now offered a 6-month contract...they saw I really I wanted a job.” (PL)

“The good thing...you know about a learnership is the work placement, this company neh MICT...they can offer many training opportunities and I went, and I got many skills and even certificates that if I don’t get a permanent job here, I now have more qualification to apply for a job somewhere...they will look at me as qualified.” (CL)

In describing their expectations of getting employment through a learnership, Learners that had completed a learnership and were now employed expressed how the learnership gave them an opportunity as cited by PL, who said “...where would they have known me about me if I had not been their Learner-nowhere”, and also PL who commented, “I now tell all my friends, apply for learnerships; it doesn’t matter what you want to do; do the Learner [ship] and you can get a job sometimes”.

Some of the current Learners expressed that although they were hopeful, they also knew employment was not guaranteed and therefore indicated they were anxious of what would happen. CL stated, “I just hope I am offered a job after I finish, I saw other leaving who had finished...they couldn’t get a job here”. Similar sentiments were offered by CL as one expressed “*I can’t imagine not getting a job here when I finish..yhuuuu, but it happens mos, I am doing my best so I can get a job, I also want to work here and get a permanent job*”.

There were however a few learners that expressed their confidence in the learnership qualification as opening opportunities for them beyond MICT. This indicates Learners had found the experience valuable and felt they had achieved something by being part of the learnership. CL emphasized, “...but you know even after my contract ends, I now have experience and a qualification and with my skills I am now better than someone with Matric, I have a better chance out there”. Echoing similar sentiments, CL stated “I am now similar to a graduate, they will also see I can do the work somewhere else and maybe even the SABC can offer me a job; I now know something about the industry”.

You know having spent almost a year here I have made serious connections, I can call them to ask for advice and I can ask them to refer me when I get a job, that is important. Where I am from, I don’t know someone that can refer me or check [that] my CV is ok, but with the people I know even if they hear of an opportunity, they will buzz me...errr...I mean call me to say man, check this out. (CL)

Existing employees that had completed a learnership, expressed mixed feelings on the opportunities for career development the learnerships awarded them. The different views are as below:

Now I have a learnership or a qualification, but I am still doing the same job, I haven't changed, I mean yes I know more, and they know I can do the job, but it hasn't changed. When I apply for other posts, I don't get them. (PL). It's not easy to get another job, sometimes I ask my manager can I do something else in the team and I am given a report to do, and I am happy, but I have the same post. One of my colleagues said I should apply for a secondment...you know to work in another team ...I applied I am still waiting. (PL). Maybe I will do another learnership, who knows maybe could be something in tech, I see there are jobs there; the one I did- project management I don't see more jobs, just senior ones and I am not there yet. (PL)

The view by past learners also suggests that learners perceive learnerships in specific fields to award more opportunities for career development compared to others. This is echoed by another learner saying, “ you know these things of jobs...depend on the type of learnerships, business administration is hard to get a job, but data analyst or technical support you get a better chance”. An interesting perspective was introduced where other learners did not feel confident enough to start looking for growth prospects as they indicated a need to excel in their current role.

My fear neh, is that I need to be able to prove I can do the job I have first, I need to show I am good, now if I start applying for other jobs what if I can't do them, I want to do what I am doing now so well, then when they move me, or I get another job it will be easy. My uncle said do not lift your head looking for other jobs already, lift your head to learn and keep your head looking down to do your job well. (PL)

Perspectives of training providers and experts echoed similar sentiments as above, highlighting that learnerships were an important tool in skills development for the nation as a whole but the biggest shortcoming is the limited absorption into employment upon completion of a learnership.

MICT SETA is the tool. It provides the right kinds of learnerships, but at the end of the day it's about the absorption of learners. So you know we are addressing skills development, but are those people being employed? That's, that's the big gap with learnerships right now. That is a huge anomaly that is happening in all corporates. It's not just MICT, it's happening everywhere. (EX)

I tell the learners if MICT absorbs you be grateful, be humbly grateful and don't stuff it up. Be at work on time, Show the employer that you are really serious about this opportunity, Yeah, it's like a diamond in the dust. (TP)

As a result of the limited absorption there appears to have emerged serial learners , as learners then move from one learnership to another as they cannot find employment. As a consequence they prefer to stay on the learnership and get the stipend and an education while at it. One learner who was on their second learnership expressed that “ it's better than me staying at home, at least I still get money to support at home”. Another learner stressed that ‘if I don't get a job offer, I will try to get onto another learnership, unemployment is not nice guys, I might as well learn, and they give me money”. In support of the views and experiences of the learners, one training provider provided the following comment

It can be disheartening. I mean a big joke amongst training providers is that you have a group ... called professional learners. People, people who enrol from one learnership to another, just as a source of income. You know, and you can't blame these poor kids. (TP)

5.4 Role of the mentor

An emerging theme from participant responses was the role of the mentor in the learnership programme. It should be noted that the supervisor or line manager also plays the role of the mentor. There were interesting perspectives on this from learners, employees and training providers. Overall there is no doubt on the importance of mentors, but it would appear that sometimes the mentor – mentee relationship is fraught with challenges. The views of the employer and training providers on one hand

begin to allude to the challenges associated with mentorship of learners. Their perceptions suggest the need for structure and training of mentors for the mentor-mentee relationship to be successful. Perceptions and views of learner respondents support the views of employers and training providers, and provide more nuanced detail.

The views of learners, actually bring to the fore the suggestion by the employer that supervisors are not well prepared for the learner and their role in developing a learner. However some learners expressed having had a positive relationships with their mentors as it helped them navigate the workplace. The nature of relationship between mentor and mentee came across as varied as shown by the applicant respondents. Some respondents showed a hesitation to freely express their views and referred to their mentors as “hard”, “tough” or even “strict”. In addition there was a view that as a mentor “ they cannot be friendly, as they are the boss” which suggests that some learners experienced their mentors as more focused and interested in the work-related aspects as opposed to the personal and social well-being of the learner. The views of training providers on the expected role of the mentor, mirror the expectations of the learners. The training providers sometimes have to step in and provide social support to learners as some mentors are not always able to assist.

Based on the above the role of the training provider goes beyond just recruiting and training learners but they take a holistic approach and there were some comments by training providers that for them it's about the “moral obligation” to support learners holistically, as it was “not just about earning revenue, but about the future and growth of the learner, the individual”. In addition training providers expressed that some employees involved in implementing learnerships at MICT, also provided social support to learners as required. One employee at MICT was described as having “incredible emotional intelligence when it comes to connecting with learners and developing reports for the learners”. (TP)

Another perspective provided by training providers alludes to the fact that given that mentors already have full time jobs , expecting them to support or coach young learners is a stretch for them. It is common for a mentor to have three to four learners assigned to them at once. The views above begin to suggest enhancements that can be done in the manner in which learners are mentored or supervised to increase the benefit for both employers and learners.

5.5 Applicability of the theory to practical work component

Most participants expressed that the work placement complemented the theory, with a few instances cited where this was not the case. CL commented that “ when I started the work, hands on part of it, it now made sense in relation to what they were teaching us first”. Similarly a number of learners expressed “feeling ready” and “able to see the link” when asked how they felt about the theory and its applicability in the workplace. In some instances learners felt that the practical actually required “more thinking” as in the workplace “things can change so fast”. Some learners gave specific examples of how the theory and practical augmented each other, CL stated that “ It was good that, they taught us how to write emails and conduct meetings...in the meeting I know what to do and I know how to communicate on email”.

Employers involved in learnership implementation expressed confidence in the suitability of the theory aspect and they believed “It prepares them [learners] for when they land, they have the concepts, now it's just applying and expanding”, (EM). In addition there was mention of a healthy disconnect as technology and the way things are done in the workplace are constantly shifting and therefore learners have to keep pace through the practical work.

There was however, several respondents who mentioned that some learners were found wanting on skills or capabilities on the “softer side” when learners started their work placement. The missing skills were described as “ timeliness, showing up, communicating, and how to carry oneself in the workplace”. There was a comment from the training provider to further explain this, “ you know we should understand it's like joining a family, you don't quite fit in unless you do things the way they do, talk, act and mimic”. Some learners attested to this when they said phrases like “I didn't know 2 minutes late is like already late”, “in this place you have to know how to say things and who to tell

when something happens and you can't be there". It is apparent that some learners realised the areas they were not doing right and in some instances took the time to change. PL expressed that, "sometimes you don't know these things and at least they show you and tell you and you improve". However, according to the training providers, it would appear learners should know these things as they expressed that the "we do an induction at the beginning of the learnership where we talk about codes of ethics we talk about professionalism in the workplace that is part of our induction process for MICT learners and indeed any learners we trained on behalf of other corporate clients".

However training providers and experts from MICT SETA did emphasize that in some instances the practical work did not provide an opportunity to apply the theory learnt on the learnership. This was particularly true, where the hosting was done by a secondary organisation and not the organisation sponsoring the learnership. This was particularly in the case where the "opportunity to practice was limited or not available". For certain courses such as IT support, some learners were not able to be placed in an area that allowed to practice this, instead ending up in a general role. The reasons cited for this by training providers, allude to the fact that employers are sometimes not too trusting of the ability of learners and to minimise risk they place them in general departments sometimes not related to their area of study.

The role of the mentor also came to the fore to support and close the gap, where practical opportunity linked to theory is limited or unavailable. In this case learners need to build their portfolio of evidence by doing a lot of research in the host organisation. Mentors are then required to support learners to build their portfolio of evidence so that they understand how the theory can be applied in the workplace. This is an alternative that the training providers rely upon to close the gap between theory and practical skills learnt

5.6 Results and Findings

The purpose of the case study was to understand the implementation of learnership programmes, through the perceptions and experiences of a sample of learners and employees involved in learnership implementation at MICT. In addition, the views of experts and training providers involved in implementation were sought to provide greater understanding to the case. The intention was to bring together the views, opinions and insights of these multiple stakeholders as one way of further enhancing existing knowledge on learnerships as a tool for skills development in South Africa.

This study is situated in the constructivist paradigm as it sought to understand the experiences and perceptions of employers, learners, and experts on learnership implementation. In line with the constructivist paradigm as noted by Creswell (2009) and Wagner et al., (2012), information gathered during this study was influenced by the context, with multiple realities informing the data collected and discussion of the findings. Data was collected through individual online interviews with 16 participants. Research participants consisted of past and current learners, employees involved in implementation who brought in the voice of the employer and experts from MICT SETA and training providers. The data collected was coded and analyzed and first grouped by perceptions of stakeholders on the questions asked and then categorized into themes in line with the conceptual framework as illustrated in Section 2. The study sought to answer the following 3 research questions (a) What are employer perspectives and experiences on how learnership programmes contributed to the skills development needs of the organisation? (b) What are the perceptions of employees on how learnerships support career development of existing employees? (c) What are the perceptions of learners on how learnerships facilitated them to obtain and retain employment?

5.6.1 Interpretation of findings

While there were some different views from the stakeholders, there was overall consensus in the perception that learnerships were a valuable mechanism to drive skills development and increase the employability of unemployed youth. However, there were almost unanimous views and opinions that, when it comes to enabling the unemployed to gain employment, learnerships had not met expectations for the most part. This then puts into question the sustainability of this skills development intervention. In each of the four themes emanating from the study, the perceptions of learnerships by the different

stakeholders is discussed, providing a comprehensive narrative of their views on learnership implementation at an MICT company.

5.6.2 Embarking on the Learnership

The opening questions of the interviews sought to gain participants' perceptions on the process of choosing and applying for a learnership. This was important in understanding the context and circumstances of the learners, as the context of the study is important in understanding qualitative research. Learners expressed that they first heard about learnerships from family and friends who had been on a learnership or that they knew someone who had attended, and this encouraged them to apply. Related to this, learners expressed that they were not always sure of the process but went along with the requests of the recruiters. This view is confirmed by training providers that proffered that “learners were not always prepared for interviews and seemed to struggle in fully understanding that all documentation is required prior to starting a learnership”. In addition training providers mentioned that there were a number of recruitment agencies that advertised and raised awareness on learnerships. However, only one learner indicated they had responded to these particular adverts by recruiters. Challenges at the onset of a learnership are substantiated by Petersen et al., (2016) who found that limited awareness of key processes such as application and registration cause confusion in learnership implementation.

However from the employers' perspective, it would appear that they found the process of getting learners onboarded quite “stress-free” as they found the SETA and Training Providers to be efficient in enrolling learners. Interestingly, this finding contradicts the views of Pauw et al., (2009) that SETAs frustrate the process with their incompetence and mismanagement. Circling back to the manner in which learners heard about learnerships and their approach to applying, it would appear the learners seem to view learnerships as an almost informal process, open to anyone. This evidenced by learners that indicated they really did not understand the process but went through with it all the same. This is also substantiated by the comments of training providers that the vetting process is not always very thorough, further cementing the perception that it is easy and simple to get onto a learnership. This is consistent with the finding of De Louw, (2009) that some learners do not adequately complete the application forms and do not fully meet the entry criteria but end up being enrolled anyway on the learnership.

However, it should be noted that some training providers, make a meticulous effort to vet the learners they recruit as they are aware that their reputation is at stake when implementing learnerships. As one training provider stated, “it’s my name and the company’s reputation on the line, so we are very careful in our selection process to get candidates with the required competencies and abilities”. This approach is supported by Vorwerk (2014) as he asserts that the successful outcomes of learnerships are also dependant on the caliber of the learners and their ability to execute the tasks. However, Vally & Motala, (2014) strongly assert that the very notion of applying screening criteria and credentials in deciding who participates and does not participate is subjective as it is not a complete predictor of trainability. This suggests that although there is perceived importance in the vetting process, it’s an ability and willingness to learn that should also be considered. In the same vein, it should be stressed that there is a need for a selection mechanism to determine who is in and who is out given that resources are finite and not everyone can participate in a learnership. A case in point is given by one training provider through an example of a gentleman who ended up dropping out of the programme as he did not have the required competencies and ability to carry on with the programme.

It can therefore be surmised that learners’ perceptions of a simple and easy application process, are in part informed by their approach to the application process and exacerbated by recruiting agencies that do not adequately vet learners. Interesting to note is that the employer views the application process as well structured, as the training provider ensures that all the necessary documentation is in place to support the contracting process. One employee did concede that “one of the challenges is when a learner does not submit even one document, this can hold up the process as our legal needs a complete file before we can contract”. Evidently, there are several processes and requirements, that are not the purview of the learner, which the training providers have to complete to ensure contracting is done to

commence the learnership. As Mummmenthey & Du Preez (2010) observed, there is a high administrative burden associated with learnerships, and the training provider is saddled with this.

Following on from this we can deduce that, the reasons learners choose a learnership inform their perceptions of the value of learnerships. Almost all learners indicated that they had found themselves with nothing to do after completing matric, having failed to get into college or obtain gainful employment. One learner commented, “I did not get the place to study at university, and my friend told me about the learnership, so I applied”. This suggests two notions with regards to the reasons why participants ended up on a learnership. The first is that they were encouraged by their friends and family and the second notion is that it is perceived to provide a route out of unemployment. This suggests that learnerships are not perceived to be an ultimate goal but a means to something else. The learners appear to pursue learnerships as an alternative or something they can do until they find what they want to do. This view is consistent with the argument by Vally & Motala, (2014) that vocational training programmes such as learnerships, are not the preferred choice by South African youth, as university-based education is viewed as superior, which infers that vocational education is not seen in a redeeming light.

Over and above this, the learners do not always necessarily choose a specific learnership but rather they are enrolled in a learnership that is available. Such a decision-making process or rather lack of decision making does seem to manifest in the limited commitment of the learner during the learnership. This makes us pause and consider the actual value that learners attach to a learnership. Value of the learnership becomes subjective to the needs and circumstances of the learner at the time, which does not necessarily align with the intended value of learnerships within the skills development framework. These findings are consistent with the results of a learnership tracer study conducted by IQ Business in 2014, in which learners expressed that the learnership had no real value unless it resulted in employment (IQ Business, 2014). This view is countered by Pauw et al., (2009), as they suggest that linking the value of learnerships to the potential for employability is a misguided notion, as there are a host of factors that influence employability beyond attaining a qualification.

The views expressed by the learners on how they felt “welcomed and expected” by the host employer indicate that there is value derived from this aspect. Learners seem to imply that they felt they belonged and were part of a team, which instils confidence and self-esteem which are crucial to learning and productivity in the workplace. These sentiments are echoed by the training provider alluding that, entering a formal workplace environment is an achievement for some of the learners and opens up their minds and lives to a world that is not within reach in the communities they come from.

Through discussing perceptions on the process of applying and enrolling in the workplace, it can be stated that learners and employers perceive the process to be quite easy. This is a testament to the robust framework and coordination role that is fulfilled by the SETA and Training providers. Contrasting views from the literature on this, imply there has been marked improvement in the efficiency of the SETAs and the coordination role played by training providers.

Linked to the finding above is the inconsistent vetting process of potential learners which has resulted in some “unqualified” earners slipping through the cracks and enrolling on a learnership programme they actually do not qualify for. Sentiments by Vally & Motala, (2014) suggest that the vetting process is perceived to be a good selector of talent but that this might not be the case. This view however is supported by examples given by the training provider, of learners who did not have the requisite competencies who end up failing or dropping out of the programme.

Another key outcome from the findings is that learnerships are not perceived by learners, as the preferred pathway post-matric, but rather a backup plan or alternative when students fail to get into university education or find themselves unemployed. In this choice, the value of learnerships is perceived through the employability opportunity and the stipend attached to the learnership. As a result, the work-based learning component and the stipend are perceived to be important and worth the effort

and time of enrolling in a learnership. This leads us into the discussion of the second theme on the perceptions of the applicability of theory to the practical workplace experience.

5.6.3 Applying theory to practice

Views on the applicability of the theory in the workplace, give us insights into how learnerships are perceived to support career growth and meet the skills development needs of the organisation. Some of the learners interviewed had completed a learnership and were now employed, while for others they had continued to be in the same role, therefore it was important to get their perceptions and opinions of what they had gained by pursuing a learnership. In addition, the views of the employer in this aspect allow us to get their perceptions on how learnerships support their skills development needs as an organisation.

There was almost a universal response from participants that the theory taught was applicable in the workplace. Participants suggested that doing hands-on work, brought more understanding and there was a sense of “things coming together and now making sense” as expressed by learners. Similar views were expressed by employers, as they felt that the students were adequately prepared with theoretical concepts to tackle the practical work. Employers did acknowledge that some level of disconnect between theory and practice is expected given the rapid change of technology and ways of working, and this was perceived as healthy.

The findings and perceptions above are consistent with the views of Maclaren & Marshall, (1998), that the gap between theory and practicals in the workplace is closed through knowledge creation which happens during work placement. The merging of theory and work projects is a continuous process, which in itself enhances skill and competency. Klees (2014) supports this view by exposing the short-sightedness of expecting education to supply the skills required, as he posits the development of skill is context dependant, therefore the workplace is supposed to cultivate skill and not just receive skilled people. This view is supported by the assertion of Vally & Motala, (2014) that acquiring skills and knowledge is a social activity and therefore learners should be given space and time to learn.

Employers went further to explain that they believed their involvement and input in the curriculum development process was one of the reasons theory and practice were probably not too disconnected. Though there is merit in the role played by the employer in curriculum development, it's important to be cognisant of not only the rapid change in the workplace but also the delays and long lead times of getting curriculum updated and accredited. Wedekind (2014) further suggests that employers need to realise that they do not have direct control over the curriculum and their interests are mainly on immediate issues that drive productivity, whereas the education system takes a longer-term view of developing wider competence.

Employers and training providers provided some interesting observations on how some learners seemed to struggle with soft skills of timekeeping, communication, etiquette in teamwork, and dealing with pressure. The perception here was that though these concepts were taught in theory, learners are generally found wanting in these competency areas. Kruss et al., (2011) finds these perceptions to be opposed to the nature in which soft skills are acquired. Soft skills are gained and assimilated through interaction with others, therefore it's hardly surprising that these would be missing or lacking at the start of the learnership. This view is supported by Vally & Motala (2014) commenting that generic skills such as a positive can-do attitude are acquired through work-based programmes, in interaction with others and are important as they cut across industries and job types. Augmenting this view, Kruss et al., (2011) found that upon completion, learners were more confident that they had acquired soft skills and rather less sure they had the technical hard skills. This is in line with the view of Hlatshwayo (2014) that technological changes actually deskill most workers while reskilling a small proportion of the workforce. This implies it is actually possible for learners to feel less skilled or unskilled in the technical aspects of their learnership if for example the work they are expected to do has now been automated or mechanised.

The assertion above by Hlatshwayo (2014) concurs with the comments by some learners that they felt there had been no change in their career prospects as a result of completing a learnership. Learners would have enrolled on a learnership expecting a promotion or a change in the role they were doing but evidently, there has not been much success in this aspect for the learners interviewed. It's interesting to note that one learner did indicate having moved to another role. However, the move was facilitated by the previous supervisor and not by the skills they had seemingly acquired on the learnership. The career growth in this instance is supported by the social interactions at work that build networks and communities of trust.

Turning to the perceptions of the employer, even though the organisation would prefer that learnerships support their skills development plans, the reality is that this is not always the case. Contextual realities such as the need to achieve high learner numbers to support BBBEE requirements and implementing learnerships to fulfill social obligations can be in tension with the skills development needs of the organisation. In this study, both employers and training providers alluded to this as the “harsh reality” and “double-edged sword” the company and industry are faced with. This is supported by the findings of Pauw *et al.* (2009) where companies in a similar study on learnership implementation owned up to participating in learnerships to improve their BBBEE levels and benefit from the tax incentive schemes associated with learnership programmes. In the view of the researcher, it's a forgone conclusion that there is a social consideration that informs the support of learnerships. In the communities where corporates like MICT firms operate, there is rampant unemployment and as a corporate citizen, MICT firms have a moral obligation to do what they can to ease the burden of unemployment in communities. However, where feasible there should be an intentional strategy to align learnerships with the broader skills planning of the company.

5.6.4 The role of the mentor

At the core of workplace experience is the ‘learning’ by the student, which happens in the work environment. In this study, all participants comprising learners, experts, and employers alluded to the critical role that the supervisor or line manager plays as the mentor to the student. A number of learners expressed and described their experience at a MICT through the relationship they had with their mentors. It would seem that there is a connection between their view of a MICT firm and their perception of the learnership based on how they experienced the mentor. This perception is in line with the description of Maclaren & Marshall (1998), that work-based learning is a very personal experience and the interaction with the mentor is core to how this experience happens.

Upon entering the workplace for the first time, students expressed being excited and exuding enthusiasm to get started on projects and add value. This energy and eagerness needs to be channelled and managed appropriately. As Maclaren & Marshall (1998) point out the passion and prospect of their relevance can result in students becoming overly ambitious and unrealistic of what can be delivered in the workplace. They, therefore, do need solid support to reasonably plan and execute projects and not self-sabotage. When channelled correctly their learning enthusiasm translates into hard work and creativity that benefits the learner and the organisation. In turn, learners will come to perceive the organisation and the learnership as relevant to their growth and enhance their self-confidence. Equally rewarding, the host organisations will be able to trust learners with bigger projects and responsibilities which further enhances the self-efficacy and ability of learners in the workplace.

In contrast, where the learners did not have a good relationship with the mentor, they felt that the learnership had not added that much value to them and as one training provider expressed “when the relationship with the line manager is not so good, it is common for the learner to drop out or not complete”. This implies that the mentors become a sought of anchor and guide when things get difficult for a new entrant into the workplace. It's safe to assume that the relationship of the mentor is akin to how the learner views and experiences the workplace and the organisation. If a learner feels welcomed by the mentor, it is likely they will perceive the organisation as welcoming as well. This view is supported by sentiments of one learner who expressed that they did not feel they could perform as required in the learnership and had entertained thoughts of dropping out, until they were transferred to another department.

It's understood and substantiated by other studies that supervisors that are unprepared and unwelcoming of learners lead to adverse outcomes for the learners (Hattingh, 2006; HSRC, 2012; Vorwerk, 2014). Students begin to shy away from learning and feel frustrated when supervisors appear busy and impatient with them (Rickard, 2002). One learner in this study expressed how they felt nervous to ask questions and felt that the supervisor did not trust them to get the job done. It can be assumed that out of this experience the learner can question the value of the learnership to help them get experience and skill if they are not given an enabling environment to try and learn. Unintentionally mentors who do not support learners shoot themselves and the organisation in the foot as they not only miss an opportunity to cultivate talent, but they lose an opportunity to learn as well. This view is supported by Feldmann (2016) as he posits that learning is achieved through participating and engaging socially, and it is a two-way process. Maclaren & Marshall (1998) further expound on this by alluding to the mutual benefits of the mentorship relationship as the two parties are immersed in the learning process with each having a stake in a successful outcome. This gives a sense of purpose, accomplishment, and motivation for both the supervisor and the learner.

Hattingh (2006) further adds that the mentor should be a guiding light, and he further suggests that mentors should be actively involved in the design and implementation of learnership programmes. This view is consistent with the comments of training providers, that the supervisor needs to be adequately prepared for the role of mentor and that ideally, it should not just be the mentor supporting the colleague but other colleagues that interact with the learner. This does imply that it can be overwhelming to expect one supervisor to mentor all the learners assigned to them and it also brings to the fore a solution, in cases where a supervisor might be strong in one area and challenged in other.

Discussing this theme has revealed that students' perceptions of career growth and obtaining employment are in part influenced by their relationship with their supervisor or mentor. Learning is personal and happens in the immediate context of the learner therefore their motivation, attitude and self-belief are influenced by the experience they create with the mentor. It has been established that success in the workplace is not just about skills but more and more it's the can-do attitude and self-belief of the learner that enhances their employability in the eyes of the employer.

5.6.5 Absorption of learners' post completion of the learnership

Learnerships were instituted to improve the level of skills in the south African economy as well as enhance the employability of the unemployed to tackle high unemployment. Following from this premise it is not surprising that all participants in the study, candidly framed their main expectations from learnerships as to support employment however there was an acknowledgement of the factors on the ground that result in this expectation not being met in its entirety.

From an employer perspective, it is viewed as "an impossible task to expect a 100% absorption rate or even 50% for that matter". This view was elaborated in the context of an operating environment where the company has to manage costs and do what it can to protect the job security of existing employees without shedding jobs, therefore adding onto existing headcount is not always possible. Married to this is the practicality of the organisation "not needing the skills in such high numbers as learners trained" as stated by one employee. This alludes to the point made earlier with regards to the high number of learners being trained out of a social and moral obligation to play a role in skills development, and not necessarily to absorb the skill. In general, less than 10% of learners supported are absorbed by MICT or the hosting company. This is not unique to MICT but a well-documented phenomenon across all industries.

Learners expressed that they participated in a learnership with the hope of getting a job first and foremost. In some instances, the learners view the learnership as a job due to the stipend they receive for the duration of the learnership. It would appear that skills development is a secondary objective for them, as in some instances learners do not bother completing the qualification upon the realisation that they will not get an offer of employment. This is what Breier (2009) referred to as the uncomfortable reality of learners completing their qualifications but struggling to obtain gainful employment, even in the company they were enrolled for work placement. This reality links back to the question of value and

as McGrath et al., (2004) observed, for a learnership to unlock value it needs to lead to absorption, otherwise as one learner stated, “what’s the point?”.

In addition, there is a perception among learners that obtaining employment is dependent on the area of study of the learnership. Learnership studies in Data analysis and IT support were perceived to award more opportunities for employment compared to Business Administration or Project Management. Now at this point, it’s important to note that this is not particularly the case when considering that some of the learners absorbed at MICT were studying Business Administration and the employer confirmed that they generally supported learners in fields relevant to the organisation. The findings by Pauw et al., (2009) that organisations do not perceive the academic qualification of learnerships to be appropriate for all job types, seems to give credence to the views of the learners however Vally & Motala (2014) counters this thought by asserting that employability is in actual fact driven by generic skills and not technical skills. Taking into account the views and findings above, it would appear the issue of absorption is not a simple discussion as there is more at play concerning supply and demand of skills and how this translates into employment.

At this juncture, our research has come full circle to the state of the labour market today. The effects of apartheid policies on the labour market and the economy cannot be fully addressed by education policies such as learnerships. There is a high degree of believing the impossible and it’s important for research to continue unearthing the stark realities that surround us regarding unemployment. As surmised by Feldman (2016) we do not as yet have a universal way of ascertaining that workplace learning enhances employability. Training needs to happen in conjunction with job creation across all levels of the economy as a starting point to address unemployment.

6. Managerial Implications

In this study, it is revealed that learnerships are not a wasted effort as there is skills development, however the point of departure is the role of learnerships in addressing unemployment and to some extent career growth. The aim of analysing the perceptions of the various stakeholders was to enhance understanding of learnerships as a tool for skills development and tackling unemployment, especially among the youth. Unemployment and skills development are such emotive subjects that participants shared a great deal of information. It was important to keep circling back to the focus and purpose of the study and resist getting lost in the passion of the subject.

Linked to the challenge above was distilling the patterns emerging from data and identifying themes that told a cohesive story on the perceptions of learnership implementation at MICT. This was particularly important as training providers work with multiple organisations and it was key to avoid general remarks and to also make note when a comment was made about the industry in general. The researchers performed cross-analysis of the responses from the different stakeholders and there were no significant incidences of dissent in perceptions based on demographic factors such as age, gender and educational background of the learners. This meant the demographic data collected had no bearing on the analysis and interpretation of findings.

7. Conclusion

The purpose of the case study was to understand learner and employer perspectives of learnership implementation at MICT. In addition, the views of experts and training providers involved in implementation were sought to provide a greater understanding to the case. This study emerged as a result of the continued low conversion rate experienced by learnership programmes and the varied perceptions from stakeholders on how learnerships are implemented. Learnerships were instituted as a policy instrument to address national challenges of a low skills base and high unemployment, especially among the youth. This study was designed as a case study and used qualitative methods of data collection through interviews to enhance our understanding of how learnerships are implemented. The conclusions of the study are based on the themes that emerged from the research questions posed on perceptions of employers and learners on learnership implementation.

Hedging Climate Change Risks Using Catastrophic Bonds in Southern Africa's Agriculture Sector

Catastrophic Bonds;
Climate-change;
Disaster-hedging

Abstract

The agriculture sector is one of the key sectors in Southern Africa. However, agricultural production has been highly affected by climate change, threatening food security and business sustainability. Due to underwriting capacity problems, insurers and reinsurers have failed to provide cover for climate change risks. Also, derivatives have failed to provide a reliable option for hedging such risks. Therefore, this paper explores the concept of catastrophic bonds (CAT Bonds) in providing climate change risk finance. By combining money market returns and premiums held in escrow in collateral accounts, CAT Bonds ease disaster-preparedness, disaster risk-reduction, post-recovery initiatives, and sustainable socio-economic agricultural development. Adopting CAT Bonds may assist in coordinating disaster responses, civil and social protection, as well as humanitarian assistance. With respect to agriculture land policies, development, food security, and employment may be enhanced – as well as management policies and disaster risk management frameworks. Well-structured CAT Bonds help ensure sufficient hedge against climate change-triggered risks. Hence, farmers' and agriculture stakeholders' confidence in the viability of the sector can be improved as CAT Bonds provide cover for such risks currently threatening the region. Finally, the paper also discusses how to develop and institutionalise a CAT Bond market, giving agriculture investors another investment option.

1. Introduction

Southern Africa has been known for years as the breadbasket of the African continent. The total agricultural production of South Africa, Zimbabwe, Mozambique, Botswana, and Zambia had been highly significant to the total continental production in past years until the new millennium when climate change moved in (Westermann, 2019). Since 2000, there has been a spat of climate risks in the form of tropical cyclones, droughts, and floods which caused huge agricultural losses beyond the sums insured and insurers' underwriting capacity. Catastrophic (CAT) events have posed significant covariate risks to small and least developed countries (LDCs) (Zimmerman and Carter, 2003:1). The Insurance Information Institute (III) 2019 Report highlighted that the overall losses from worldwide natural catastrophes in 2019 totalled US\$150 billion of which only US\$52 billion losses were insured. The Allianz Risk Barometer 2022 First Quarter (Q1) Report further indicated that according to Swiss Re, the annual insured natural catastrophe losses reached US\$105 billion out of US\$252.1 billion economic losses in 2021, the fourth highest record since 1970.

In the same way, also Southern Africa experienced several catastrophic risks in recent years, leaving devastating effects across the region: The rate of increase in annual natural climate change catastrophe losses is significantly rising and worrisome. Zimbabwe, Mozambique, and Malawi were hit by cyclone Idai in 2019. It claimed at least 1 303 lives, affected more than 3 million others in Zimbabwe and destroyed agricultural production of more than 500 000 ha of crops in Mozambique alone, estimated to be US \$513 million loss (FAO, 2019). In April and May 2022, South Africa's KwaZulu Natal and Eastern Cape provinces were ravaged by floods, claiming 443 lives, leaving approximately

² E-mail address: KlingelhoefHE@tut.ac.za

48 unaccounted for and affecting an estimated 1 386 941 hectares of agricultural cropland (Government of South Africa (GoSA), 2022). Besides this, 4000 houses were destroyed, 8 300 others partially damaged and over 40 000 people displaced by the floods in April alone (European Commission Humanitarian Organisation (ECHO), 2022).

Regular geospatial information for vulnerability and impact assessment in support of climate risk preparedness and response programs take time to be updated. Therefore, all this necessitates the need to find a solution at least to the financial consequences of the climate change risks that are seemingly becoming ubiquitous in Southern Africa. The traditional insurance and risk finance mechanisms are falling short at covering these risks with most insurers undercapitalized to underwrite climate risks, while regional reinsurers have never teamed up to provide cover either. Considering environmental factors such as climate change mitigation and adaptation, preservation of biodiversity, and prevention of pollution, as well as the circular economy, guaranteed future returns are important for many investment decisions, in particular in agriculture. Hence, this paper suggests the use of catastrophic bonds as a concept to hedge against climate risks in Southern Africa.

Financial instruments like derivative contracts in the form of futures and forward contracts, swaps as well as options and option financing have been in use for hedging against risks for a long time (McGuigan, Moyer, Rao & Kretlow, 2012). However, the uncertainty of the time a climate change triggered risk may occur, coupled with its frequency, makes put options, swaps, or futures contract difficult to use. If one party to the contract fails during the period of catastrophic risks, it becomes difficult to finance the risk. This leaves a lot of catastrophic risks difficult to be hedged using derivatives, leaving the government exposed to providing support during and post-disaster periods. Derivatives are not commonly used in Southern Africa which leaves insurance as the most popular risk financing mechanism in the agriculture sector. The challenge of insurance is that it covers general risks, but most policies exclude climate change risks such as tropical cyclones, floods, strong winds, hurricanes, tsunamis, tornados, and so on (Weber, Fecke, Möller & Musshoff, 2015). This is because most of the insurers lack underwriting capacity for high severity risks such as climate change triggered agricultural risks. However, the shortcomings of the use of derivatives and insurance need to be addressed urgently in Southern Africa considering the rate at which the region is experiencing climate change risks for the past three to five years.

2. Problem Investigated

Hedging against agricultural risks and hard times, regardless of the magnitude and severity, in Southern Africa, has commonly relied on a mix of instruments which may include insurance, derivatives, investments into mitigation, and government bailouts. Risk transfer mechanisms to an insurance company in expectation of indemnity is falling short as climate change is triggering high severity risks such as tropical cyclones, floods, and strong winds which are leaving trails of destruction beyond the underwriting capacity of insurers, co-insurers, and reinsurers. The resulting agriculture risks threaten crops, livestock, property, and equipment as well as human life. Should a climate change catastrophic risk strike, insurers' premium pools will be eroded, leaving the insurers with no other option than to close their doors. Hence, while, on the one hand, there are some overambitious insurers and reinsurers who try to develop insurance cover for these risks, on the other hand, their balance sheets scare them from accepting catastrophic risk business, especially in the agriculture sector. Therefore, many of these financial players end up rejecting to insure climatic change-triggered risks.

Alternatively, derivatives such as options and option financing, futures, and forward contracts as well as swaps have been in use to hedge against non-catastrophic agriculture risks. However, employing derivatives to hedge climate change risks is highly risky because of the hazards of trading these financial instruments over the counter with individual financial institutions and the lack of standard regulation in trading and clearing contracts, which makes it difficult to get the contracts fulfilled when a party to the contract fails (McGuigan et. al, 2012). Therefore, "normal" derivatives are far from being ideal when it comes to insuring agriculture against catastrophic risks triggered by climate change.

Due to this increased exposure, the interdependence between the Southern African Development Community in boosting agricultural reserves is under severe threat from climate change risks. While the current method(s) used to manage climate risks in the agricultural sector as insurance and property or commodity hedging may have proved to work in the past, due to low underwriting capacities, they are falling short to match the magnitude of loss or damage caused by catastrophic risks. Therefore, urgent adaptation to climate change and the risks it triggers has become a necessity rather than a want. For this purpose, this paper intends to propose the concept of using catastrophic bonds to hedge against climate change risks in Southern Africa's agriculture sector.

3. Research Objectives

The paper seeks to achieve the following objectives:

- propose the adoption of catastrophic bonds (CAT Bonds) as a new way of financing climate change risks in Southern Africa's agriculture sector
- demonstrate the establishment and institutionalization of a CAT Bond market for agricultural risks in Southern Africa
- show the managerial implications of using CAT Bonds over other agricultural risk hedging techniques in Southern Africa

4. Research Methodology,

The research is carried out as a desktop study. By reviewing the literature on catastrophic bonds, it tries to examine whether adopting them may be a way to finance and hedge climate change risks for the agricultural sector in Southern Africa.

5. Literature Review

Literature on the use of catastrophic bonds (CAT Bonds) in various Southern Africa economic sectors including agriculture, is still in its infancy. The recent increased climate change risks affecting the agriculture sector requires new risk hedging strategies as traditional insurance is failing to cope with the huge financial risks resulting from climate change. Hence, by reviewing the literature on catastrophic bonds, it shall be examined whether adopting CAT Bonds may assist in financing these risks for the agricultural sector in Southern Africa.

5.1 Adopting Catastrophic Bonds (CAT Bonds) in Financing Climate Change Risks for the Agricultural Sector in Southern Africa

In this paper, we investigate the concept of hedging climate change risks using catastrophic bonds (CAT Bonds) in Southern Africa's agricultural sector. Well-structured CAT Bonds can mitigate climate change induced agriculture risks which insurance and hedge instruments like derivatives cannot finance (Miranda and Farrin, 2012; Weber, Fecke, Möller & Musshoff, 2015). Kirk & Pieterse (2019), in their closely related exploratory study on the viability of pandemic CAT Bonds in South Africa, recommended the use of CAT Bonds to reduce insurers' and governments' exposure during catastrophic events like the pandemics. Drifting from the use of insurance and derivatives in hedging catastrophic events like climate change risks in the agriculture sector to the adoption of catastrophic bonds can be done using the disaster risk management cycle. CAT Bonds are high-yield debt instruments designed to raise funds for governments or companies in the insurance industry in times of natural disasters by allowing issuers to receive funding from the bond only if specific conditions such as floods, cyclones, tornados, or earthquakes occur (Cummins & Weiss, 2009).

Different from normal bonds and derivatives, CAT Bonds are insurance linked securities (ILS). They are used as a method of transferring insurance risk to capital markets where their proceeds are invested in nearly risk-free to risk-free assets. In this way, they often generate money market returns and complement the insurer's premium, thereby solving underwriting capacity issues. This allows the CAT Bond to pay a quarterly coupon to the investor with usually a substantial spread above market returns for bonds with equivalent ratings as investors "appear to earn both a liquidity and a 'novelty' premium for taking insurance risk" (Risk Management Solutions, 2012:6-7). In order to do so, this

requires a sponsoring/ceding insurer to establish a special purpose vehicle (SPV) as explained by employing figure 1 below:

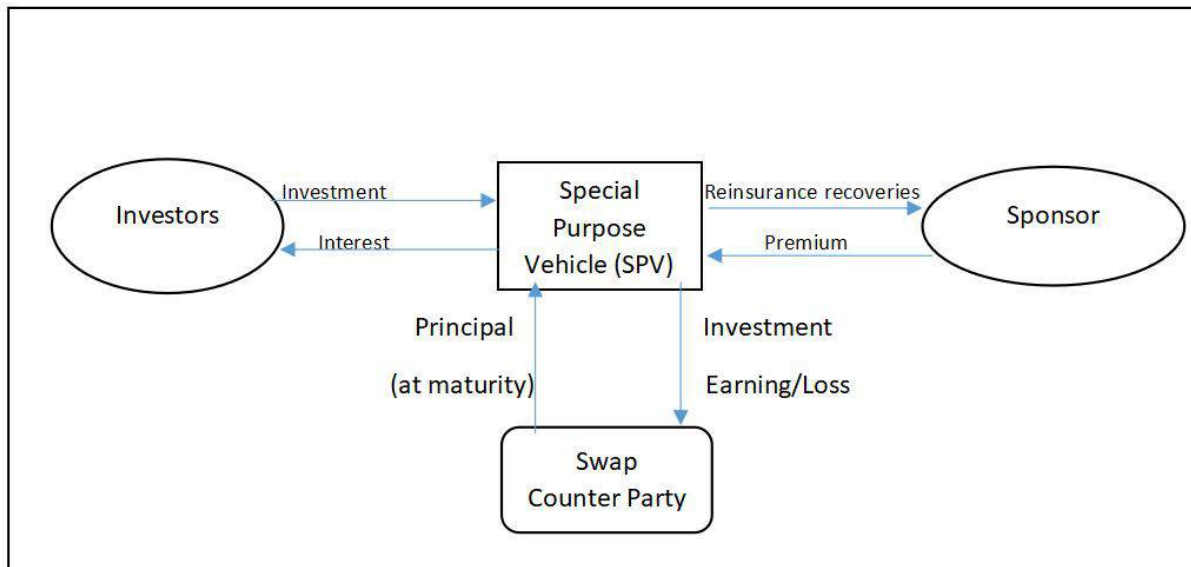

Figure 1: Flow of CAT Bond finances/Structure of a CAT Bond transaction (White and Gambrill, 2020)

This SPV would create a reinsurance agreement with the sponsoring/ceding insurer in a tax efficient jurisdiction. It will also issue a note to investors with default provisions that mirror the terms of the reinsurance agreement, containing trigger events. The funds generated from the sale of the note are managed in a separate collateral account where they generate money market returns which consolidate the insurer’s premiums to cover the agriculture risk/triggered event. Part of the investment funds kept in the collateral account by the SPV can be invested in short-term financial instruments like Treasury Bills (TBs) and Bankers Acceptances (BAs) held by a SWAP counterparty which generates quicker money market returns. These money market returns can help the SPV in paying the agriculture CAT Bond speculative investors’ coupon as well as contributing to reinsurance recoveries requested by the sponsor. The trigger mechanisms need to be balanced to accommodate preferences of the sponsor and the investor. The use of CAT Bonds in hedging against climate change risks in agriculture sector can be done following the Disaster Risk Management (DRM) cycle to determine the stage requiring financing and trigger points.

Reinforcing the Disaster Risk Management (DRM) cycle which shows possible responses to agriculture risks which can be implemented at any stage during post-climate disaster recovery and development can be more effective by use of CAT Bonds. CAT Bonds provide a proactive risk preparedness, response, and post-recovery concept necessary for effective agricultural production projects and programs as shown on Figure 2 below.

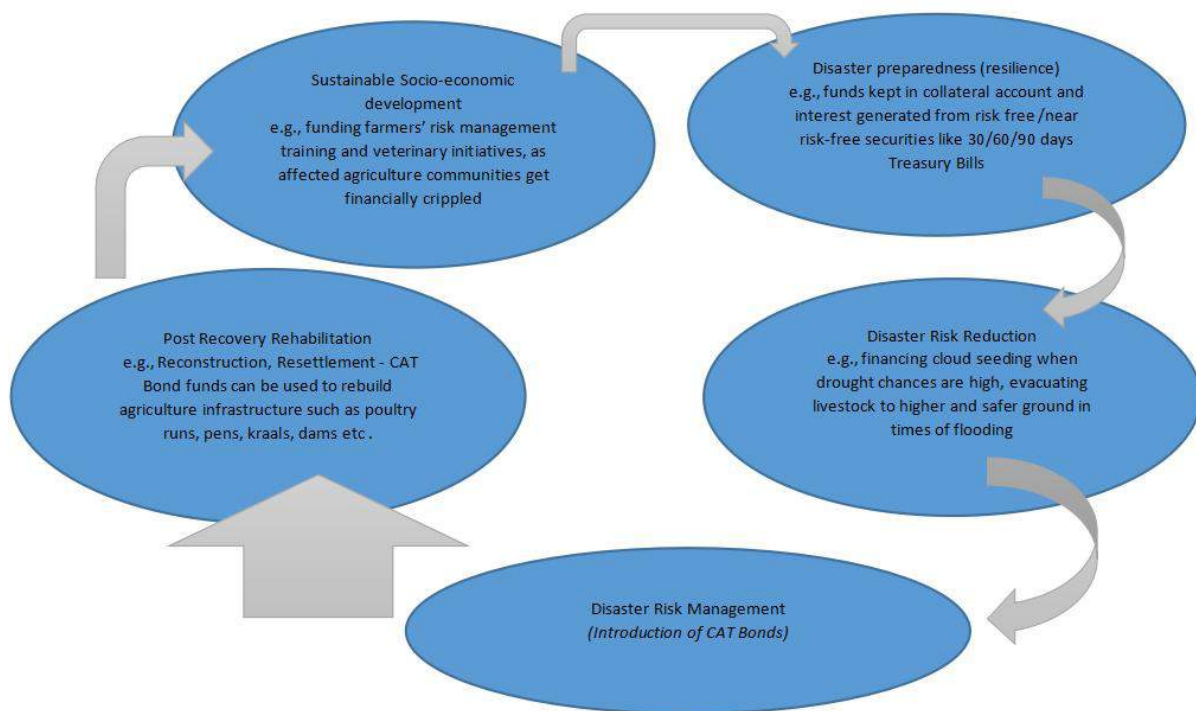

Figure 2: Disaster Risk Management (DRM) Concepts/Cycle – Adapted from Westermann (2019).

Given the above concept for disaster risk management, the adoption of catastrophic bonds (CAT Bonds) can stimulate every stage of the DRM concept, so that climate change risks in Southern Africa’s agricultural sector can be proactively managed: Funds generated from CAT Bond subscriptions’ investment allow for reinforced disaster preparedness as well as the implementation of risk reduction techniques – and by that incentivize production. The post-disaster recovery, rehabilitation, and reconstruction will become much easier since funds generated from investors’ principal amounts may be channeled to the affected farmers and communities, putting them into the same pecuniary positions as before the agricultural loss. Therefore, instead of relying on their own underwriting capacity, the insurers/reinsurers will collect these funds from the special purpose vehicle’s (SPV’s) collateral account as per the underwritten terms of the agriculture CAT Bond (Van Wyk, 2021).

In order to make the CAT Bond attractive to become a tool to cover agricultural risks, the trigger mechanisms for the payout of the bond need to be balanced to accommodate preferences of the sponsor and the investor. Continuing the thought mentioned in the previous paragraph, a trigger may specify for example that the payout from an Agriculture flood CAT Bond is based on actual losses to the sponsor (who will then use the money to pay e.g., the farmers). This will make the Agricultural CAT Bond attractive to the insurer, who do not need to have the underwriting capacity, as well as to the farmers, who are threatened by existential risks from climate change and will value the elimination of basis risk, allowing them to continue with his beneficial agricultural activities without worrying too much about circumstances he cannot influence. “Basis risk” in this context means the difference between the insurers’ (as the sponsor) / farmers’ losses on the one side and the CAT Bond’s payout on the other side when an insured agriculture risk triggers (White & Gambrell, 2020). In determining the trigger types and protection levels through an iterative process with the sponsors (to cover the farmers), a structuring agent may assist. Employing an iterative process makes this concept being adaptable to requirement changes throughout the development of the agriculture CAT Bond’s protection level and trigger types. On this basis and depending on the kind of trigger, an Agric CAT Bond can then be designed in four different ways:

- Indemnity triggers make agriculture loss recoveries based on the sponsors’/farmers’ actual loss exposure.

- Normal loss triggers involve recreating actual climate change event parameters such as floods, tropical cyclones, hail, drought, etc. into the catastrophe model. These shall help to estimate the financial impact on the portfolio of exposure that was originally used in the estimation of the CAT Bond's risk (regardless of whether the portfolio is similar or not to the sponsor's actual exposure).
- Industry loss index triggers are based on actual agricultural losses to the entire insurance industry.
- Parametric triggers are based on objective physical characteristics of the agriculture risk.
- Hybrid triggers are a combination of several of the aforementioned triggers and are used in the issuance of hybrid agriculture CAT Bonds. Hence, they are most suitable for a wide coverage of various climate change risks affecting the agriculture sector – a characteristic that helps in providing cover for most of the risks excluded from insurance policies and other hedging options.³

On this basis, an Agriculture CAT Bond can be customized to have different event parameters such as flood, cyclone, wind, hail, and drought being covered. Applying the different triggers introduced above, this may lead to the following modelling as in Table 1 below:

Table 1: Authors' Model of Agric CAT Bond trigger level structuring for Climate Change Risks

Type of Agric CAT Bond	Triggers & Event Parameters	Level (examples)
(i) Flood CAT Bond	Indemnity trigger (e.g. CAT event parameter - Flood)	*Min Destruction of 300 ha of crops or min destruction cost of R50 million whichever happens first and damage in KwaZulu Natal (KZN) capital, South Africa, from 11 April – 01 May 2022; *Death or bodily injuries to livestock of at least R15 million within 1 week of flooding in KZN; *Agric Equipment & Property Damage of at least R20 million within a week of flooding in KZN.
(ii) Cyclone CAT Bond	Parametric trigger (e.g. CAT event parameter - Cyclone)	*Min of 200mm rainfall, min destruction of R15 million within radius from 50km radius of Chimanimani, Zimbabwe; or *Livestock deaths of minimum R6 million in farms surrounding Eastern Cape's Cradock town
(iii) Wind/Hurricane CAT Bond	Industry Loss trigger (e.g. CAT event parameter - Wind/Hurricane)	Minimum windspeed of 90 knots causing an aggregate loss of at least R200 million
(iv) Hail CAT Bond	Indemnity trigger (e.g. CAT event parameter – Hail)	Leaf crop or fruit/tuber damage of at least R7.5 million in Gauteng between 01-15 June 2022.
(v) Drought CAT Bond	Normal Loss Trigger (e.g. normal loss parameter – Drought in low rainfall regions/provinces)	Annual drought induced agriculture loss in predetermined low rainfall areas of a minimum of R10 million
(vi) All-Risks CAT Bond (Hybrid Agriculture CAT Bond)	Can be a hybrid trigger (combination of parametric, indemnity and industry loss triggers depending on stated CAT risks) Any climate risk affecting Agriculture Hurricane, Drought, Cyclone, Flood, Hail etc	Minimum destruction on crops, livestock, farm equipment & property of +R450 million

To establish trigger levels for event parameters as mentioned in Table 1 above, a calculation that combines all parameter readings/recordings is done. This requires that the recordings relate to the CAT event covered by the bond. Then, an index formula may help to solve the confusion arising in determining whether a CAT Bond has been triggered by a CAT event or not. Therefore, at the issuance of the agriculture risk CAT Bond, the structuring agent will define weights w_i for each of the CAT event parameter levels ρ_i :

w_i : Predefined weights in relation to the distribution of the sponsor's exposure

³ It should be mentioned that the characterization as "hybrid" is ambiguous since literature also uses this attribute to describe a CAT Bond that is combined with a financial derivative to protect the bond against volatility in the collateral. For example, Barriou & Louberge (2009:547) propose to combine "the transfer of cat risk with protection against a stock market crash", employing simultaneously zero-premium digital calls and puts from the index options markets.

ρ_i : Agriculture CAT event parameter (Flood, cyclone, hail or wind, etc.) measurement at each of x recording stations

Using the Index Formula: $I = f(w, \rho)$,

the index value calculated can then be compared to the pre-defined trigger level I_{Tresh} . If the index is above the predefined trigger level I_{Tresh} (seen as a threshold), then the agriculture CAT Bond is triggered. If it is even beyond the exhaustion threshold I_{Exh} , the CAT Bond is exhausted, and the investors lose the invested principal completely.

5.2. Establishment and institutionalization of a CAT Bond Market for agricultural risks in Southern Africa

5.2.1. The idea of setting up a CAT Bond Market for agricultural risks in Southern Africa

The stakeholders for the CAT Bond market are sponsors, speculative investors, and regulating authorities, i.e., in this case the Financial Sector Conduct Authority (FSCA) and JSE Debt Market in South Africa. In principle, an Agriculture CAT Bond can be structured in the same way as a reinsurance contract. An Agriculture CAT Bond contract is needed; it will also insulate the bond from coupon and currency (rand) fluctuations. Cumulative principal amounts invested into the agriculture CAT Bond and premiums from the sponsor(s) are kept in a collateral account by the SPV, which may invest a part of the funds on the money market to generate short-term returns. Effectively, the SPV becomes a fully collateralized reinsurer with the sponsor(s) as its only client(s), and it is financed by proceeds from the Agriculture CAT Bond subscribers (investors) (White & Gambrell, 2020). Already this similarity may give an indication, that existing agriculture normal loss insurers and reinsurers have a huge role to play in the setting up of the agriculture CAT Bond market:

Obviously, the reinsuring SPV will not be bankrupted by any other catastrophic event than the contractually specified agriculture climate change triggered risks. This gives existing insurers and reinsurers the ability to enhance their underwriting capacity by issuing the CAT Bonds – hereby creating an agriculture CAT Bond market. Alternatively, insurers and reinsurers may issue CAT Bonds on behalf of government or local municipalities to cover national or provincial climate change risks for their agriculture sector. This phase will be the piloting stage.

After the assessment of the CAT Bond's success, the government, through the respective agriculture ministry and agents, can design an appropriate statutory instrument to launch a Catastrophic Risk Exchange (CARTEX) for climate change risks. This will allow the trading of Agriculture CAT Bonds not only by the use of SPVs, but also on an active secondary market. There, the CAT Bonds may be offered publicly, and speculative investors can bid for them, thereby raising capital to finance climate change risks in the agriculture sector. The concept of such a CARTEX may follow the one used to establish a “normal” stock exchange such as the Johannesburg Stock Exchange (JSE); private players may be incorporated by means of a public private partnership (PPP).

The advantage of using the CARTEX include, inter alia, the ease of generating several intermediaries support who will bring buyers and sellers together while concurrently availing indicative bid and offer spreads on all traded CAT Bonds (Risk Management Solutions, 2012). Instead of struggling to seek reinsurance, which – in the wake of climate change triggered agriculture risks – may need extra protection from retrocessionaires, a proper institutionalized market for CAT Bonds provides an easier and safer option. In addition, the development of a climate linked index (CIX), that may be used to structure agriculture CAT Bonds, would provide a further mechanism to secure capital market financing at the CARTEX.

Once, such a market is set up is made, the agriculture CAT Bonds can be extended to the Southern African region at various levels. In the end, the concept of a CARTEX market would allow for the exchange climate change risks with other countries within or outside Southern Africa.

The adoption of CAT Bonds in Southern Africa's agriculture sector can be done using various alternatives, possibly starting on small jurisdictions to observe their feasibility ahead of regional roll-out.

5.2.2 Alternative Ways for setting up a CAT Bond Market for agricultural risks in Southern Africa

Catastrophic bonds have never been used in Southern Africa, but the concept has been in use in Europe and America (Steve, 2019; Van Wyk, 2021). Transferring it to Southern Africa, in principle, the hedging of climate change risks using CAT Bonds can be done at provincial, country/national, and regional level with an option of introducing hybrid (all-risks) trigger binds in future.

(i) Provincial Level Agricultural CAT Bonds

CAT Bonds can be designed to cover provincial climate change related agriculture risks. In this case, the sponsoring insurers can work with municipalities to ensure that climate risks that threaten their jurisdiction are hedged against. Parametric CAT Bonds are more suitable for this category. For example, Limpopo province can design its own parametric bond against event parameters such as floods that may come through the overflow of the Limpopo River. Another example can be of Mozambique's Cabo Delgado province designing a cyclone parametric to cover farming activities in the province as the area has experienced consecutive climate change risks in the past 3 years such as Cyclone Idai 2019, Tropical Storm Chalane 2020-2021, and Tropical Storm Ana 2022 (Government of Mozambique (GoM), 2022).

(ii) Country-level Agricultural CAT Bonds

Since most of Southern African countries rely on agriculture industry for food security (FAO, 2019), country-specific agriculture CAT Bonds may provide sufficient protection to guarantee highest agricultural production. In this case industry loss agriculture CAT Bonds may work best as they guarantee increased cover because the entire insurance industry is aligned to the sponsoring company's portfolio (RMS, 2012). In some cases, indemnity CAT Bonds can also work. The country can establish a secondary market where indicative bid and offer spreads on all traded CAT Bonds can be provided and deals can be on a matched trade basis.

(iii) Regional Level Agricultural CAT Bonds

Agriculture risks can also be regional, for example, the Southern Africa Development Community (SADC), may be affected by a climate change CAT risk/event at the same time. The effects of climate change may affect more than one country's agricultural output. This, therefore, affects trade significantly among the countries and also stifles bilateral relations. The adoption of CAT Bonds as a new concept leverages the stability and growth of the agriculture sector regionally as all the effects of climate change are hedged against as long as the agriculture risk CAT Bond receives sufficient subscribing investors. Indemnity CAT Bonds and Industry Loss CAT Bonds are much more suitable for hedging regional climate change risk as Parametric CAT Bonds may be affected by geographical location and territorial trigger limits.

(iv) All Risks Agricultural CAT Bonds

Another option would be to issue an All-risks or Hybrid Agriculture CAT Bond. This will allow all climatic and non-climatic agricultural risks to be covered if they are triggered. This type of CAT Bond however has disadvantages in attracting speculative investors because, increasing with the number of triggers, the risk of losing a part or even all of the investment principal are very high. However, it still depends on the CAT Bond's indenture: if professional underwriting skills are used in designing the terms and conditions, even an all-risks CAT Bond may work in achieving sustainability in financing agriculture in Southern Africa.

Finally, as a variant, CAT Bonds may also be modified in a way that the SPV is given the opportunity not only to invest into more or less risk-free investments, but also into the stock market. This would bring in the advantages of diversification as stock market returns can be generated to consolidate the value of the funds held by the SPV in the collateral account. By doing so, CAT Bonds can offer

higher coverage and higher coupons to investors. To protect not only against the climate change risks, but also against the additional risks coming from such investments in non-risk-free assets (but also against movements in the interest rates in case of the short-term financial investments), one may further think about the combination with financial derivatives.

5.3. Practical Usage of CAT Bonds in the South African Agriculture Market

Considering the importance of the agriculture sector to the economy in Southern Africa as well as the high severity of climate change risks, CAT Bonds can contribute to restoring confidence, and ensure capabilities in the agricultural sector, hence, increase production. The government may work together with insurers and reinsurers to establish SPVs, thereby assisting to achieve sustainable civil protection for all farmers and reducing pressure on the different role players (including government itself) during climate change disasters. By involving the different role players, CAT Bonds may assist in

- managing agriculture risks (as the earlier described flood and drought risks) through enhanced disaster preparedness and reduction techniques such as holding pooled funds in escrow, financing cloud seeding initiatives and urgent evacuation of livestock to higher/safer places during flooding and help as well as
- recovery and rehabilitation after a catastrophic event.

Furthermore, while agriculture insurers and reinsurers in South Africa may use CAT Bonds as an extension of reinsurance protection (increasing their underwriting capacity), on the other hand, CAT Bonds provide for interest/coupon payments to investors from investment earnings in the SWAP counter party.

5.4. Example: Structuring an Agriculture CAT Bond Transaction to Hedge against a Tropical Cyclone and Flooding Risk

Having discussed the different types of (structuring) CAT Bonds and how they might be used in Southern Africa, the following shall exemplify the usage of a catastrophic bond in hedging against a tropical cyclone and flooding risk at South Africa's Indian Ocean coast:

The South African Civil Protection Department may need to hedge against the flood risk in KwaZulu Natal. The Coast Municipality, as the issuer, may issue a Flood Catastrophic (CAT) Bond to the tune of R200 million, with a coupon rate of 14% for the 3 years from 01 December 2022 to 30 November 2025. This coupon rate may constitute the money market interest rate ($x\%$), insurance premium ($y\%$), and (small) risk adjustment ($z\%$). The risk adjustment will be small because the insurance premium ($y\%$) is already factored in separately, which may make the risk adjustment small or even nil. The whole coupon rate may be found as follows:

$$\begin{aligned} \text{Coupon rate} &= \text{Money market rate} + \text{Insurance premium} + \text{small risk adjustment} \\ \text{Suppose, money market rate} &= 9\%; \text{insurance premium} = 3\%; \text{small risk adj} = 2\% \\ \text{Then, Coupon rate}_{14\%} &= x\% + y\% + z\% = 9\% + 3\% + 2\% = 14\% \end{aligned}$$

Investors or sponsors will then subscribe to the bond by paying funds to the Coast Municipality before the commencement of the CAT Bond duration on 01 December 2022. These funds will be held in escrow in a secure collateral account either until the risk is triggered or until the maturity of the CAT Bond on 30 November 2025.

The structuring of the CAT Bond may specify:

- a. The investors buy the bond for R200 million on 01 December 2022. For reason of simplicity, it shall be assumed that:
 - the index $I = f(w, \rho)$ be expressed just in the monetary damage in Rand, and
 - the predefined trigger level is set at $I_{\text{Tresh}} = \text{R}10$ million.

- b. In case a flood occurs, the damage according to the index value I will be compared to the predefined trigger level I_{Tresh} :
- 1 If damage $I < I_{Tresh} = R10$ million, the Coast Municipality will pay for the damage alone, and the investors will not lose anything.
 - 2 If damage $I_{Exh} = R210$ million $\geq I \geq I_{Tresh} = R10$ million, the CAT Bond is triggered, and the investors will lose from their invested principal of R200 million the portion that is needed to finance the R10 million exceeding part for the Coast Municipality.

Obviously, as long as the invested principal of R200 million is not completely exhausted, the CAT Bond can be triggered more than once, but the maximum total loss to the investors is capped by their invested principal of R200 million.

- 3 If damage $I \geq I_{Exh} = R210$ million, CAT Bond is exhausted and the investors will lose their invested principal of R200 million completely. The Coast Municipality will receive these R200 million quasi as an insured amount.
- c. As long as the flood risk is not triggered, the Coast Municipality will pay to the investors R28 million on 30 November of each year until 30 November 2025. The R28 million will comprise of money market return 9% = R18 million, insurance premium 3% = R6 million and small risk adjustment 2% = R4 million. At maturity, i.e. on 30 November 2025, the investors will also receive their invested principal of R200 million back.
- d. In case b2 (CAT Bond is triggered, but not exhausted), the investors still get the interests and the payback according to c, but relative to the remaining capital after having paid out to the Coast Municipality.

Hence, as long as it is not triggered, the CAT Bond is very similar to any other bonds as the investors render a credit to the Coast Municipality (in this case of R200 million) and receive interest and paybacks at pre-defined dates. However, once it is triggered, the CAT Bond serves as an insurance for the Municipality, that allows it to cover the R10 million exceeding amount up to R210 million. With this money it can finance the exceeding damages caused by the flood risk such as evacuation costs, temporary shelter provision, food, renovation or reconstruction/replacement costs, etc., with any remaining funds being returned to the investor(s) at maturity.

6. Managerial Implications

Adopting CAT Bonds has several managerial implications for all the possible players for such a contract:

1. Insurers may increase their underwriting capacities.
2. (Speculative) investors may receive higher returns than from other bonds.
3. Farmers and agricultural managers can plan proactively for climate change induced risks. Management policies can be informed by this concept and disaster risk management frameworks stand to be guided by this policy especially on areas farmers struggle to get protection due to insurers' incapacitation. Therefore, the concept can be useful in achieving sustainable agriculture production despite the effects of climate change.
4. The gained safety for production contributes to increased contribution of the agriculture sector to the Gross Domestic Production (GDP), food security and employing security in Southern African countries.
5. The government may profit from easier coordinating disaster preparedness and reduction programs.

In particular, CAT Bonds can be structured for specific climate change risks affecting the agricultural sector. This makes it easier for managers to identify triggers and event parameters as well as setting trigger levels that enable effective hedging against climate change risks in agriculture. Thus, CAT Bonds can be designed, pretested, and adjusted to suit specific climate change risks in specific

physical farming areas and agriculture branches such as crop husbandry, animal husbandry, horticulture, aquaculture etc.

7. Conclusion

Given that agricultural production in Southern Africa has experienced significant shocks from climate change risks, the adoption of catastrophic bonds (CAT Bonds) provides a guarantee that climate risks beyond insurers/reinsurers' underwriting capacity will be financed as the capital market returns consolidate insurers' premiums to fund the agriculture CAT risks. Thus, the underwriting capacities of insurers will no longer be threatened by the magnitude and severity of climate risks as CAT Bonds transfer risks to investors. The capital raised by issuing agriculture CAT Bonds lower insurers', governments', municipalities', or other issuers' out-of-pocket costs for natural disaster coverage. This means that CAT Bonds make it easier to raise capital for climate risks. They may even attract speculative investors as they provide higher coupon rates than other fixed-income securities depending on how they have been structured.

Climate change disaster risk management in the agriculture sector can be significantly enhanced by the use of such bonds as they help to be prepared for a possible disaster and allow for both proactive and reactive risk reduction as well as spearheading sustainable socio-economic development. In doing so, farmers' climate change risk management initiatives may be funded to help boost productivity and ensure a sustainable contribution to the Gross Domestic Product in Southern African countries. Therefore, adopting CAT Bonds in the Southern Africa's agriculture sector may assist in addressing capacity and policy gaps around coordinating disaster responses, civil and social protection, humanitarian assistance, agriculture development, management, and sustainability, as well as land policies.

The setting up of a CAT Bond Market for agricultural risks in Southern Africa can bring together all the stakeholders such as sponsors, speculative investors and regulating authorities together for the smooth flow of CAT Bond finances. Considering the rate of climate change and its shocks witnessed in Southern Africa's agriculture sector, the adoption of CAT Bond financing may help ensure productivity, food security and employment.

development;
Taxonomic distance;
African countries

Abstract

Socio-economic development is a complex process that cannot be described by a single characteristic and must be considered in multidimensional terms. Therefore, for the purpose of comparative studies, various indicators are applied that take this complexity into account. Good examples of such measures are the Human Development or Poverty Indexes evaluated by the UN. They are global in nature, which implies their low sensitivity (and therefore their usefulness) when comparing objects of the same class or objects characterized by similar levels of diagnostic characteristics, which is typical for regional comparisons. Thus, our objective is to construct measures of socioeconomic development for African countries and examine its applicability. Various aspects of quality of life and level of development were considered: (1) human security, (2) population trends, (3) health outcomes, (4) educational achievements, (5) national income and resource structure, (6) labor and employment, (7) mobility of people and capital. The proposed measures were constructed using taxonomic distance between an object and a benchmark (real or hypothetical). Based on the evaluated measures, African countries were clustered into homogeneous classes. The applicability of the proposed approach for comparing the socio-economic development of African countries has been confirmed.

1. Introduction

Socio-economic development and its examination are crucial issues for economies at any scale - of the globe, continents, regions or states, their administrative units and unions. And even though economic aspects come to the fore in the research on transformation in the economy, they cannot be isolated from social aspects and the mutually causal role of these factors. Socio-economic progress is made up of processes caused by both internal and external factors which determine the course and direction of the development. These processes do not work in isolation from other actions, and they are usually preceded by, or are consequences of, other processes. The course and direction of the socio-economic development depends on the set of conditions also caused by a concrete historical and geographical situation in which socio-economic changes take place (Chojnicki, 2010).

Therefore, socio-economic development cannot be described by one characteristic since it is a complex process which requires to be considered as a multidimensional issue. Different organizations, e.g., the World Bank, the United Nations, the Mo Ibrahim Foundation, etc., construct special indicators that take into account these complexities and enable comparisons between countries and regions. A good example of such a measure is the Human Development Index (HDI) which is evaluated by the UN and widely used to rate and compare the level of development of countries

around the world⁴. It based on a multidimensional analysis of three fundamental components of human development: (1) healthy life expectancy, (2) education, and (3) a decent standard of living (Roser, 2014). However, global indicators tend to have limited applicability due to the wide range of countries that are considered in the process of estimating these measures. This is because if a group of countries from a particular region or similar (to some extent) countries are compared, these indicators are not sensitive enough to indicate the differences between the analysed objects.

Africa is the second largest (30 million km²) and most populous (1.3 billion people) continent, consisting of 54 sovereign states. African population is the youngest amongst all the continents – the minimum median age among all African states is 15.2 and maximal 37.5 years. In terms of socioeconomic development as measured by the HDI index in global scale, only one African state (Mauritius) is recognized as a state with very high human development, eight countries are classified to the class of high human development, fourteen to the medium human development class, and the rest (i.e., 31 states) is recognized as low human development countries. The question arises as to whether such a classification reflects well the relationship between African countries in terms of socio-economic development.

Thus, the purpose of presented research is (1) to construct synthetic measures of human development addressed to African countries and (2) to verify their applicability by

- (2a) comparing rankings of countries based on the constructed taxonomic measures, and
- (2b) examining the sensitivity of these taxonomic measures to changes in the weights describing the variability in the strength of selected aspects of socio-economic development.

Research is provided using so-called taxonomic distance measures. Selection of countries and considered phenomena are associated with data availability for the year 2019 which is the last year before pandemic.

2. Popular indicators for comparing the level of development of African countries

The standard of living in different countries cannot be measured and compared directly. Thus, interchangeably, available development indicators are used. The basic measures used in comparative studies are Gross Domestic Product per capita and/or Gross National Income per capita, which provide general information about the value of all goods and services produced in a region (usually per year), averaged per person. These *par excellence* economic indicators do not include characteristics from the field of social and economic well-being, such as human health and its protection, the environment and sustainable development, education, human rights, security, equality, the position of women in society, etc. That is why other, more advanced metrics like the Human Developed Index, which additionally includes some aspects of life and education, are being reached.

To compare the assessment of African countries made using GNI (or GDP) per capita and HDI, all countries are grouped into homogeneous classes based on both measures. Assuming that the overall measure of development of the i -th country in the t -th year is denoted by SMR_{it} , which either is GNI per capita or HDI (of the i -th country in the t -th year), the homogenous classes of development are constructed as following (Kompa & Witkowska, 2009; 2010):

- I – very high level of development for $SMR_{it} \geq SMR_t + S_{SMR_t}$;
 - II – high level of development for $SMR_t + S_{SMR_t} > SMR_{it} \geq SMR_t$;
 - III – average level of development for $SMR_t > SMR_{it} \geq SMR_t - S_{SMR_t}$;
 - IV – low level of development for $SMR_{it} < SMR_t - S_{SMR_t}$,
- (1)

⁴ The UN Development Programme also provides other multidimensional composite indices, such as Multidimensional Poverty Index (MPI), Inequality-adjusted Human Development Index (IHDI), Gender Inequality Index (GII) or Gender Development Index (GDI) among others (Composite Indices, 2022)

where $i=1, 2, \dots, N$, N denotes count of compared countries, while SMR_t and S_{SMR_t} – average value and standard deviation of measures of development calculated for all countries, respectively, i.e.:

$$SMR_t = \frac{1}{N} \sum_{i=1}^N SMR_{it} \quad (2)$$

$$S_{SMR_t} = \sqrt{\frac{1}{N} \sum_{i=1}^N (SMR_{it} - SMR_t)^2} \quad (3)$$

Applying the above methodologies to comparisons of the level of development of African countries leads to the conclusion that the evaluation of the standard of living in African countries strongly depends on the measure used, the dispersion of the classification is large and fundamentally different for both classifications. These conclusions arise from the summaries presented in Table A1 and Table A2 in Appendix 1.

Table A1 contains ratings of African countries according to GNI per capita and HDI in 2019. The first place in ranking means the best position. There are only three distinguished classes in classification provided due to GNI. It is visible that the dispersion is bigger for GNI per capita clustering (102%) than for HDI (19% with a flat volatility coefficient in each class). There are 10 states in the first class, and nine of them are recognized as very high developed countries by both measures. Only Morocco and Equatorial Guinea are classified to this class only by one measure. The second class contains 12 countries according to HDI and only 6 of them due to GNI per capita. Among states being classified to the second class, Cabo Verde, Namibia, Eswatini and Angola are recognized as the members of this class by both measures. One may also notice that among African states, Mauritius and Seychelles are outliers if GNI per capita is considered. It is also visible that there are four countries i.e., South Africa, Egypt, Gambia, and Central African Republic, which keep the same position in both rankings.

The biggest differences in positions are observed (Table A2) for Djibouti for which the difference in both rankings equals 17 positions, for Eritrea, Mali, and Sudan for which these differences are 13 places (better position due to GNI than to HDI) together with Madagascar and Uganda which are higher ranked according to HDI than to GNI per capita by 14 places. Further analysis of Table A2 also leads to the application-useful conclusion that countries with a positive classification gap are growing faster in economic terms than in socio-economic terms, and vice versa.

3. Concurrent methodology applied for African countries comparisons

Socio-economic indicators should cover many areas of life. Among them, researchers usually name: social inequality, employment, income and consumption, environment, public safety and crime, health, education, social and political participation, etc. The process of selecting a set of indicators for each of these life domains involves several steps, consisting in the choice of objects and diagnostic variables (i.e., measurement dimensions) and in data collecting, see the following research (Avdiushchenko & Zajac, 2019; Kompa & Witkowska, 2009, 2010, 2021; Khan, 1991; Nermend, 2010; Noll, 2002, 2014a, 2014b; Mo Ibrahim Foundation, 2018, 2019; Singh, 2015; Udjo, Orkin, et al, 2000; and Udjo, Simelane, et al, 2000) among others. In our research we consider following aspects of quality of life and level of development (see Table 1):

- quality of life (10 variables),
- health and environment (6 variables),
- education (4 variables),
- economic development (8 variables).

Features representing all mentioned above aspects will be included in the synthetic measures as diagnostic variables. It is worth mentioning that among diagnostic variables we distinguish stimulants and destimulants. The former are variables whose rise in quantity indicates an increase of the socio-economic development level. The latter are variables whose decrease in quantity indicates an increase of development level.

Table 1. Diagnostic variables

Life domains	Variables		Description of variables
	groups	type	
Health and environment	Health	S	Healthy life expectancy at birth 2019 (years)
		S	Current health expenditure 2017 (% of GDP)
		S	Physicians 2010-2018 (per 10,000 people)
	Environment	D	Carbon dioxide emissions Production emissions per capita 2018 (tonnes)
		D	Mortality rate attributed to household and ambient air pollution 2016 (per 100 000 population, age-standardized)
		D	Mortality rate attributed to unsafe water, sanitation and hygiene services 2016 (per 100 000 population)
Education		S	Mean years of schooling 2019 (years)
		S	Literacy rate adult (% ages 15 and older) 2008-2018
		D	Primary school dropout rate 2008-2018 (% of primary school cohort)
		D	Pupil–teacher ratio, primary school 2010-2019 (pupils per teacher)
Economic development		S	Foreign direct investment, net inflows 2019 (% of GDP)
		D	Total unemployment rate 2019 (female to male ratio)
		S	Exports and imports 2019 (% of GDP)
		S	Employment to population ratio 2019 (% ages 15 and older)
		D	Employment in agriculture 2019 (% of total employment)
		S	Employment in services 2019 (% of total employment)
		D	Unemployment total 2019 (% of labour force)
		D	Unemployment youth 2019 (% ages 15-24)
Quality of life	IT	S	Internet users total 2018 (% of population)
		S	Mobile phone subscriptions 2018 (per 100 people)
	Women situation	S	Share of seats held by women in parliament 2019 (%)
		Safety	D
	S		Stock of immigrants 2019 (% of population)
	Level of life	S	Gross domestic product (GDP) per capita 2019 (2017 PPP \$)
		S	Ratio of education and health expenditure to military expenditure (2010-2017)
		D	Working poor at PPP\$3.20 a day 2019 (% of total employment)
		D	Youth not in school or employment 2019 (% ages 15-24)
		S	General government final consumption expenditure 2014-2019 total (% of GDP)

In our investigation we construct the synthetic measure of development proposed by Hellwig (1968). This measure uses the concept of taxonomic distance from the defined pattern. In other words, all objects (countries) are compared with the distinguished pattern. Therefore, it is necessary to determine such a pattern (benchmark) which might be either the really existing object (country) or the hypothetical one.

The value of the taxonomic measure SMR_i for the i -th ($i=1, 2, \dots, n$) country, is defined as by Kompa and Witkowska (2009):

$$SMR_i = 1 - \frac{q_i}{\max\{q_i\}} \tag{4}$$

where q_i is the distance of the i -th object from the benchmark:

$$q_i = \sqrt{\sum_{j=1}^k \nu_j (z_j^i - z_j^0)^2} \tag{5}$$

evaluated for the weights ν_j and standardized variables z_{jt}^0, z_{jt}^i that describe the benchmark and the i -th investigated state, respectively. The pattern is defined as:

$$z_{jt}^0 = \begin{cases} \min_{i=1,2,\dots,n} \{z_{jt}^i\} & \text{for } x_{jt}^i \in D \\ \max_{i=1,2,\dots,n} \{z_{jt}^i\} & \text{for } x_{jt}^i \in S \end{cases} \quad (6)$$

$$z_{jt}^i = \frac{x_{jt}^i - \bar{x}_{jt}}{S_{jt}^x} \quad (7)$$

where, for each period t , z_{ij} denotes standardized variables of the j -th feature in the i -th country, x_{jt}^i - observations of the j -th raw feature in the i -th country, \bar{x}_{jt} , S_{jt}^x - average and standard deviation of of the j -th raw feature, respectively, D, S - sets of de-stimulants and stimulants, respectively, k - count of variables employed for the measure construction, \bar{q}_t , S_{qt} - the average and the standard deviation of distances q_{it} , respectively:

$$\bar{q}_t = \frac{1}{n} \sum_{i=1}^n q_{it} \quad (8)$$

$$S_{qt} = \sqrt{\frac{1}{n} \sum_{i=1}^n (q_{it} - \bar{q}_t)^2} \quad (9)$$

Value of the weight v_j determines the importance of the j -th variable in the aggregated measure. Evaluation of weights is one of the most important and the most difficult problems that must be solved by the measure constructor. If $v_j > v_h$ then the j -th variable has bigger share in the SMR evaluation than the h -th variable. Another words, introducing bigger values of v_j for the particular variable causes strengthening the influence of that variable. It is worth mentioning that to define the hierarchy of diagnostic features, from the most to the less important, is relatively easy but it is extremely difficult to evaluate the mutual relations among weights determined for variables. Therefore, values of weights are often the same for all considered variables, for instance:

$$v_j = \frac{1}{k} \quad \text{for } j = 1, 2, \dots, k \quad (10)$$

This approach ensures that each variable equally influences the synthetic measure. However, to construct an aggregated indicator, a large number of aspects, represented by groups of different variables, are taken into account. If the count of variables describing each group is not equal than the aspect, that is represented by the bigger number of features, influences the aggregated indicator SMR more than others. Therefore assuming that each group of variables G_l (where $l = 1, 2, \dots, g$) is to influence the synthetic measure to the same degree, the distance of the i -th object from the benchmark should be evaluated as:

$$q_{it} = \sqrt{\frac{1}{g} \sum_{l=1}^g \frac{1}{k_l} \sum_{j=1}^{k_l} (z_{jt}^i - z_{jt}^0)^2} \quad (11)$$

where, g - count of groups of variables considered in the aggregated measure construction, k_l - count of variables describing the l -th aspect of investigated object ($l = 1, 2, \dots, g$), $k = \sum_{l=1}^g k_l$.

Approach introduced by (11) ensures that each considered domain is equally represented in the synthetic measure, regardless the number of variables that are used for the aspect description. In our research, to evaluate socio-economic development of African countries, we apply both approaches and the aggregated indicator SMR is evaluated for equal weights determined:

- for each variable x_j , then the synthetic measures are denoted by $SMRI_{it}$ and are calculated due to formulas (4) – (10), and

- for all groups of variables, then the synthetic measures are denoted by SMR_{2it} and are calculated due to formulas: (4), (11), (6) – (9).

In our study, we also separately analyze each of the distinguished aspects of socio-economic development that are used in the aggregate SMR measure. Therefore, using formulas (4) - (10), we construct "sub" measures for each group of variables.

It is worth mentioning that values of synthetic measure of development (4) belong to the interval [0;1]. They have no economic interpretation, and they are used only to order objects. The bigger value of SMR_i (4), evaluated for i -th object (country), means better position of this object. In other words, taxonomic measure shows the position of the i -the object (country) among other considered objects for the certain set of characteristics which are used for its construction.

In the taxonomic measure construction, the crucial issue is data availability because in multidimensional analysis missing data, which appear in the database, may eliminate either objects or variables (used for the indicator construction). Therefore, the initial step of our research is to preprocess the data to check the completeness of the database and eliminate variables that are

- (1) almost stable i.e., their variability coefficients are smaller than 10%, and
- (2) strongly correlated i.e., the absolute value of Pearson coefficient evaluated for two diagnostic variables is bigger than 0.9.

In the former case, we remove variables that do not differentiate objects strongly enough. However, in practice, measure developers often retain such variables, especially when data availability is poor. The latter case allows us to eliminate variables that duplicate the same information. Preserving highly correlated variables strengthens the impact of the information provided by these variables and may be a deliberate action.

Among 53 African states which are classified by HDI, we excluded from further analysis eight states with the highest number of lacking observations i.e., Comoros, Congo, Djibouti, Eritrea, Libya, Sao Tome and Principe, Seychelles, and South Sudan, together with Mauritius which is the only African state classified as very high human development country. In other words, in further analysis we consider 44 African states representing 97.67% of African population.

In our investigation we started from 77 potential diagnostic variables which might be used for the taxonomic measure construction and 53 African countries. However, for some features, number of missing observations concerns even more than half of countries e.g., freshwater withdrawals 2007–2017 as percentage of total renewable water resources, homicide rate 2013-2018 per 100,000 people, fossil fuel energy consumption 2013–2015 as percentage of total energy consumption. Such variables were deleted from the set of characteristics since it was impossible to complete the missing data in a reliable way. The final set of diagnostic variables contains 28 uncorrelated features among which only healthy life expectancy at birth might be classified as quasi-stable variable (variability coefficient 8%) but it is usually used in the indicators' construction.

All selected diagnostic variables are described in Table 1 together with information on whether they are stimulant (S) or de-stimulant (D). It is visible that apart from the distinguished life domains: "health and environment", and "quality of life", there are several groups of variables (separately "health" and "environment" as well as "IT", "situation of women", "safety" and "level of life"), which might be treated as separate aspects of socio-economic development.

4. Empirical results

Applying described methodology, we rank 44 analyzed countries according to synthetic measures of development and cluster them into four classes (Table 2) using the same method of classification which was described previously (and applied in Table A1). It is worth noting, that the ranking of countries made according to HDI, which is presented in the last column of Table 2, differ from the

one presented in Table A1 by the list (and number) of analyzed African countries. As one may notice, excluding states being outliers let us cluster analyzed states into four classes.

Table 2. Clustering by values of synthetic measure of development SMR and HDI

No.	Class	SMR1 evaluated for equal weights for all variables		SMR2 evaluated for equal weights for 4 life domains		HDI
1	I	Cabo Verde	0.428	Cabo Verde	0.584	Algeria
2		Equatorial Guinea	0.372	Tunisia	0.558	Tunisia
3		Tunisia	0.372	Algeria	0.540	Botswana

44		Central African Rep.	0.000	Chad	0.000	Niger

Source: Own calculation

Among the highest developed countries, Cabo Verde, Tunisia, Botswana, Algeria, and Morocco are recognized by all three indicators (i.e., SMR1, SMR2 and HDI). Whereas among the least developed states, Chad and Central African Republic are recognized by all three measures. It is worth mentioning.

Table 3. Clustering by values of synthetic measure of development SMR3, and “global” IAG

No.	Class	SMR3 evaluated for equal weights for 8 variable groups		“Global” IAG for equal weights for 5 life domains

Source: Own calculation

that both SMRs are calculated using the same 28 variables however they differ by system of weights. SMR1 was calculating using formulas (4)-(5) and (10) whereas SMR2 using (4) and (11) for $g=4$. The former approach let all variables have the same influence while the latter causes the same influence of the groups of variables describing different life domains.

As, it was already mentioned, using 28 variables described in Table 1, it is possible to distinguish eight instead than four selected life domains, i.e., health (4 variables), environment (3 variables), level of life (5 variables), application of IT (2 variables), safety (8) and situation of women (one variable).

Therefore, we also evaluated synthetic measure of development SMR3 for the equal weights for 8 groups of diagnostic variables, i.e., SMR3 is calculated using formulas (4) and (11) for $g=8$. We also evaluated the “global” Ibrahim Index of African Governance (IIAG), assuming the equal meaning of five distinguished life domains, i.e., human development, foundation for economic opportunity, security & rule of law, overall governance and participation, rights & inclusion, assuming the same weight for all these aspects of socio-economic development distinguished in IIAG⁵ (see Mo Ibrahim Foundation 2020). Country rankings due to the SMR3 and “global” IIAG are presented in Table 3.

Analyzing country classification presented in Table 3 one may notice that using SMR3 and “global” IIAG, six countries are classified to the first class (Tunisia, Cabo Verde, Namibia, Botswana, Morocco, and South Africa), and three (- Angola, Chad and Democratic Republic of Congo) are recognized in the fourth class. It means that both measures recognize socio-economic level of development in similar way although both measures use different variables and not the same data sources. Comparing SMR1 and SMR2 to “global” IIAG, it is visible that only four or five states are classified identically to the first class and two or three to the last class.

Table 4. Majority Voting Clustering (MVC) according to SMR1, SMR2, SMR3 and HDI classification

MVC	Country	Frequency in cluster				MVC	Country	Frequency in cluster			
		I	II	III	IV			I	II	III	IV
I	Algeria	4				II	Lesotho		3	1*

Source: own calculation

Note * denotes classification also by HDI

As it is visible in Tables 2 and 3, changes of weights influence values of SMR, and the belongingness to the certain class of development. Therefore, to decide about the position of the country in the distinguished group we apply majorization rules which let us classify the certain object to the class which is recognized the most often for the particular country (Kompa, Witkowska 2021). Therefore, Table 4 contains information about country’s classification to the one of four distinguished classes by three synthetic measures of development evaluated for 28 variables but for different weight systems (i.e., SMR1-SMR3) and by Human Development Index (which is denoted in Table 4 by *). We assumed that HDI is the weakest measure since it uses only 4 variables (which are also employed in SMR construction), thus for the same number of recognitions in the same class we decided to classify the country into the one where HDI classification is absent.

⁵ Global” IIAG was calculated as unweighted arithmetic average of IIAG of five life domains.

We also calculate synthetic measures of development for four distinguished life domains, assuming the same weights for each variable in the group (Tables 5 and 6). As one may notice only Cabo Verde belongs to the first class in all four life domains. There are no such countries which belong to the same class more often than three times in four partial SMRs classifications. Countries belonging three times to the same class are as following:

- to the first class - Gabon and Tunisia,
- to the second class - Morocco, Lesotho and Zambia,
- to the third class – Benin, Burkina Faso, Burundi, Côte d'Ivoire, Ethiopia, Gambia, Guinea-Bissau, Liberia, Malawi, Mali, Mauritania, Senegal, Togo, and Uganda
- to the fourth class - Central African Republic, Chad, and Niger.

In other words, 23 countries are classified to the same class at least for three life domains. Gabon and Tunisia are recognized as the best developed states in three life domains, although the former is evaluated as the second-class country in general classification (see Table 4). One may also notice that both counties (i.e., Gabon and Tunisia) belong to the third class in economic development.

Let us pay more attention to the countries classified to the first class by the majorization rule which are not recognized as very high developed in the majority of distinguished life domains i.e., Algeria, Botswana, Egypt, Morocco, Namibia, Zimbabwe, and South Africa, which (similarly as Gabon) is not classified to the first class in Table 4 since having two “votes” for the first class, the one of them belongs to HDI which we treat as a weaker measure than SMRs.

Algeria is recognized in the first-class by the general measures and by SMR evaluated for two domains - education and health and environment, whereas it belongs to the second class for quality of life and to the last class in economic development. Botswana is the first-class country in general evaluation together with partial measures of education and health and environment, the second-class in quality of life and the third-class in economic development. Morocco is the first-class country in general classification and due to health and environment and it belongs to the second class in the rest of life domains. Egypt is classified to the first class in general, and also in - education together with health and environment. However, it belongs to the third class in quality of life and to the last class in economic development. Namibia, South Africa, and Zimbabwe belong to the first class if education and quality of life are considered. But Namibia and Zimbabwe belong to the third class in economic development, and to the second class in health and environment. Whereas South Africa are recognized as the third- and fourth-class country in health and environment, and economic development, respectively.

Central African Republic, Chad and Niger are recognized as countries with the lowest level of development in health and environment, education, and quality of life. Whereas employing majorization rule (see Table 4), the first two countries are classified in the same way by general measures, and Niger as the third-class state.

In the last stage of our investigation, we compare all measures in terms of their variability, because only well-diversified indicators are able to recognize countries representing the certain level of development. Such comparison is presented in Table 7, where arithmetic mean, standard deviation and variability coefficient of global indicators (SMR1-SMR3, “global” IAG and HDI) together with partial components of SMR and IAG are shown.

Table 5. Clustering on values of SMR measure calculated for “education” and “economic development”

No.	Class	Education		Economic development

Table 7. Comparison of indicators

Measure	Arithmetic mean	Standard deviation	Variability coefficient (%)
SMR1	0.2469	0.0814	32.95
SMR2	0.3279	0.1525	46.50
SMR3	0.3207	0.1562	48.71
education SMR	0.4578	0.2264	49.46
“economic development SMR	0.1932	0.1005	52.04
health & environment SMR	0.2480	0.1262	50.89
quality of life SMR	0.3036	0.0953	31.37
global IIAG	50.1177	10.6376	21.23
human development IIAG	52.5932	9.9446	18.91
economic opportunity IIAG	49.3705	11.6714	23.64
security & rule of law IIAG	51.3295	12.7288	24.80
overall governance IIAG	50.1205	10.6490	21.25
participation, rights & inclusion IIAG	47.1750	13.5653	28.76
HDI	0.5506	0.0956	17.36

Source: Own calculations

The most diversified indicator is SMR “economic development” (52%). Partial measures representing “health & environment” and “education” are also diversified (50.9% and 49.5%, respectively). Among three “global” SMRs, the SMR3 differentiates analyzed countries the most. IIAG indicators are less diversified (from 18.9% to 28.8%), although they seem to better differentiate states than HDI (17.4%). The reason of such results depends on the set of countries and the set of variables which were considered in the measures construction. HDI is worldwide indicator, IIAG includes 54 African, also outliers (Mauritius and Seychelles). It is worth mentioning that it is impossible to make direct comparisons between IIAG measures and SMR because life domains are defined in both indicators in different way. One may also notice that the IIAG indicators are built using 237 variables⁶, whereas for SMR construction we use only 28 quantitative features.

5. Managerial Implications

Comparisons of economies are crucial for management in the sphere of international finance and economic policies. For a long time, the dominant opinion was that single-factor comparisons are enough for the mentioned issues. This view now is being displaced by the multi-factor approach. However, many aggregate indicators fail to examine how economic development supports the social development of countries and regions. There is how it supports development understood not only in economic terms, but also in terms of the well-being of the society. And, how much economic growth drives itself, and how much social development, which is in synergy with the economy. As a result, composite indicators have emerged in the practice of the World Bank, the UN, many international rating agencies or non-governmental organizations (such as the Mo Ibrahim Foundation), taking into account factors that indicate the level of human development in addition to economic aspects.

Our research is a part of this trend by proposing synthetic measures of development for comparative research. Our synthetic measures of socio-economic development are distinguished by their wide range of applications, easy construction, intuitive use, and simplicity of interpretation.

The measures we propose are also strongly related to the "social development management" stream of research, which appears in literature in recent years (Mokate, Saavedra, 2011; Kapur, 2018; Bobrovska et al., 2021) and is a field of practice and knowledge focused strategically on the promotion of social development. The area of management of social development seems to be a response to the prevalence of the main problems of poverty, inequality, illiteracy, unemployment and over-population. It targets to make sure that the community policies will support the properly selected goals and the properly selected facilities. This is also the application area of our methodology.

⁶ IIAG concerns 372 different measures of governance for any given country or group in any given year across ten years (Mo Ibrahim Foundation, 2020).

6. Conclusion

Assessment of socio-economic development is a very complex issue which requires profound investigations and proper selection of methodology. In our research we constructed several synthetic measures based on taxonomic distance to describe selected countries. We also state the rules for selecting explanatory variables and verify our models using publicly available data delivered from the collections of the World Bank, United Nations Development Programme and Mo Ibrahim Foundation. However, we had to eliminate several countries and features from our analyses because of lacking observations which is the weakest point of our investigation. We also realize that the level of national statistics and data collection may differ among African countries thus some of used data might not be reliable.

Nevertheless, we attempted to construct aggregated measures and evaluate level of socio-economic development of selected aspects of human activity. Investigated African countries are clustered into homogenous classes which let us point out the most and the least developed countries. It seems that economic development and health & environment are two life domains which differentiate African countries the most. Whereas quality of life seems to be less diversified among considered countries.

Antecedents of Supply Chain 4.0 Success for Manufacturing SMEs in South Africa

Prof David Pooe¹, Dr Watson Munyanyi^{2,*}

^{1,2} Department of Business Management, University of Johannesburg, Johannesburg, South Africa

Keywords

Supply Chain; Industry 4.0; manufacturing; small and medium enterprises; technology

Abstract

Purpose: A significant component of small and medium enterprises also struggle with gaining awareness regarding how to take advantage of technological development and, as such, are primarily overwhelmed when making technological decisions. With the advent of the fourth industrial revolution, there has been significant scholarly evidence supporting the notion that for manufacturing enterprises to prosper in the future, they should adopt emerging technologies. In this regard, this study sought to investigate the critical antecedents of Supply Chain 4.0 among small and medium enterprises in South Africa.

Design/methodology/approach: The current study employed a combination of a systematic, content-centric literature review and Interpretive Structural Modeling to extract the Supply Chain 4.0 success antecedents. Out of a pool of fifteen experts who participated in the selection interviews, four were excluded due to their lack of conversational competence, familiarity with the Industry 4.0 concept and the industrial implications supply chain, or withdrew before the expert opinion extraction.

Findings: There are thirteen critical antecedents of supply chain 4.0 success, and these should form the centre of focus for small and medium enterprises. There is a need for these institutions to receive adequate support for developing these factors to incorporate supply chain technologies better.

Research limitations/implications: The results obtained were based on the opinion of a few experts and the conduct of a literature review. In addition, the methodology employed is more subjective than a quantitative methodology. As such, further studies need to employ objective methodologies to verify the validity of these factors.

Practical implications: Supply chain management and supply chain 4.0 are interesting phenomena critical for developing small and medium enterprises. Under the umbrella of the fourth industrial revolution, a business must strive to provide for the acquisition and use of technology in their supply chains. Small and medium enterprises need to enhance their technological capabilities to attain an acceptable level of information, digital, operations, and cyber readiness.

Originality/value: This study's contribution to the existing literature is two-fold: firstly, the research findings provide a helpful reference on factors to consider when seeking to improve Supply Chain 4.0 adoption decisions among manufacturing firms. In addition, while these factors have been studied before, the current study empirically examines these factors in a different context, using the theoretical lens of the Technology-Organisation-Environment framework.

1. Introduction

Worldwide, small and medium enterprises (SMEs) are regarded as engines for economic growth and employment, which has been the case in South Africa. According to Maduku, Mpinganjira and Duh (2016), in South Africa, the definition of an SME is derived from a combination of the number of employees, turnover, and gross assets, excluding fixed property. Notwithstanding the contribution that SMEs make to many economies, they still face limited sustainability owing to a lack of financial and human resources, technology infrastructure insufficiency, and stiff competition (da Silva et al. 2020). Most importantly, in the current era, business success is highly correlated with adopting information technologies (Haseeb et al., 2019). As stated by Haseeb, Hussain, Ślusarczyk and Jermisittiparsert (2019), the Fourth Industrial Revolution technologies include big data (BD), internet of things (IoT), and intelligent manufacturing. These can resolve technological challenges currently being faced by SMEs, ultimately increasing their sustainable business performance. In recent years, the business environment has transformed significantly as both the pace and magnitude of adoption of the Fourth Industrial Revolution (Industry 4.0) continue to grow considerably (deSousaJabbour et al., 2018; Luthra & Mangla, 2018). This has led to advances in manufacturing systems (Li, 2018; Sung, 2018) and an increase in debate and discussion over the technological changes affecting the business environment. The central arguments have been that there is inevitably a surgency in novel technologies whose adoption will be central to attaining competitive advantage, especially among manufacturing companies (Doh & Kim, 2014; Kusiak, 2018). Part of the discussions has been centred around how SMEs have participated in this revolution that has hit the global business environment.

Unlike multinational corporations (MNCs), SMEs face resource constraints resulting in the mismatches between the current Industry 4.0 theory and SMEs' capabilities (Moeuf, Pellerin, Lamouri, Tamayo-Giraldo, & Barbaray, 2018; Kaartinen, Pieskä & Vähäsöyrinki, 2016; Vrchota, Volek & Novotná, 2019). Industry 4.0, from which Supply Chain 4.0 is traced, has its origins in Germany in 2011 as a tool to promote manufacturing development (Yin et al., 2018). The term "Supply Chain 4.0" defines the relationship between Industry 4.0 and the supply chain by reiterating how the former facilitates the latter's exploration and clarification of crucial supply elements (Frederico, Garza-Reyes, Anosike, & Kumar, 2019). In this regard, Industry 4.0 technologies significantly transform supply chain processes upstream, downstream, and midstream, thereby uplifting supply chain resilience and visibility (Xie et al., 2020). Industry 4.0 has been characterised by various technologies, including augmented and virtual reality, robotics, and advanced simulations (Egger & Masood, 2020; Malik et al., 2020). There is tangible evidence showing that the advent of Industry 4.0 is creating intelligent factories powered by cyber-physical systems (CPS), IoT, and cloud computing (Zhong et al., 2017). SMEs, accounting for a significant portion of the business world globally (World Bank, 2020), have occupied a central position in the formulation of strategies to achieve inclusive growth (Lukonga, 2020). These organisations can benefit significantly from incorporating these advanced digital technologies into their supply chains (Büyükoçkan & Goçer, 2018; Choi, Wen, Sun, & Chung, 2019). Although most of SMEs' owners and managers are beginning to recognise Industry 4.0 and the subsequent Supply Chain 4.0 as the lynchpin to corporate success, a thin majority of the SMEs have adopted it (Fatorachian & Kazemi, 2018; Luthra, Kumar, Zavadskas, Mangla & Garza-Reyes, 2020).

2. Problem Investigated

Since the beginning of the fourth industrial revolution, there has been significant scholarly evidence supporting the notion that for manufacturing SMEs to prosper in the future, they should adopt emerging technologies. Given the strong supply chain and manufacturing relationship, adopting these technologies will improve approaches, such as Supply Chain 4.0. As the business environment continues to undergo significant transformation and revolutionize production and operational processes, there is a growing need to understand what SMEs ought to achieve Supply Chain 4.0 (deSousaJabbour et al., 2018; Luthra and Mangla, 2018). Undoubtedly, Supply Chain 4.0 technologies facilitate real-time supply chain optimisation and the development of products and services along the supply chain (Bag, Telukdarie, Pretorius & Gupta, 2018; Banyai, 2018). However, owing to limited resources, SMEs cannot match larger firms' performance in supply chain management practices (Moeuf, Pellerin, Lamouri, Tamayo-Giraldo, & Barbaray, 2018). Emerging technologies will contribute considerably to SMEs' ability to overcome supply chain challenges effectively, assist them

in collaborating and interacting effectively, and improve overall performance (Xu, Xu & Li, 2018; Ghobakhloo & Ching, 2019). This study, therefore, predominantly sought to investigate the antecedents of Supply Chain 4.0 successful adoption and development among manufacturing SMEs in South Africa. Supply Chain 4.0 is primarily related to the exploitation of new digital technological developments to increase interaction and efficiency among supply chain actors (Büyüközkan & Göçer, 2018; Makris, Hansen & Khan, 2019). In supply chain operations, manufacturing as a midstream activity is a critical activity that directly impacts performance, and as such, this study focused on manufacturing SMEs. According to Ali (2019), although there is considerable evidence of the benefits of the Industry 4.0 applications, SMEs in emerging economies have reluctantly embraced Supply Chain 4.0. The current research sought to remedy this position by methodically outlining the antecedents for Supply Chain 4.0 success. Successfully applying Supply Chain 4.0 technologies requires financial commitments, which most SMEs in emerging economies can essentially not meet. This study was carried out to assist Supply Chain 4.0 implementation amid a scarcity of empirical studies. This study's contribution to literature in two ways: firstly, the research findings provide a helpful reference on factors to consider when seeking to improve Supply Chain 4.0 adoption decisions among manufacturing SMEs. Secondly, while such antecedents have been examined in existing literature, this study empirically chose a different context and also a different theoretical lens of the Technology-Organisation-Environment (T-O-E) framework. Many studies have remained confined to the technology adoption model (TAM), the unified theory of acceptance and use of technology (UTAUT), or the Theory of Diffusion of Innovation.

3. Research Objectives

. It sought to achieve the following research objectives:

- a) To conduct a systematic, content-centric literature review to identify the critical antecedents for successful Supply Chain 4.0.
- b) To perform interpretive structural modeling to establish the interrelationships among success antecedents identified.
- c) To develop a model guiding manufacturing SMEs to develop Supply Chain 4.0 successfully.
- d) To discuss the managerial implication of this research.

4. Research Questions

the following research questions were formulated:

- RQ1. What are the critical determinants of the maturity of Supply Chain 4.0?
RQ2. What is the relationship between identified critical success antecedents of Supply Chain 4.0?
RQ3. What are the managerial implications emanating from this research?

5. Literature Review

While supply chains have integrated emerging technologies in most developing economies, developing economies are still lagging, with simple linear interactions from suppliers through producers and distributors to customers and back. Scholars have raised several antecedents of supply chain development, including the level of trust, top management support, government support, and external environmental factors (Flynn, Chan, Zhu & Yu, 2017; Raut, Narkhede & Gardas, 2017; Vargas, Mantilla & de Sousa Jabbour, 2018). However, most of these studies were carried out in developed economies.

5.1. Theoretical Framework

The current study is grounded on the technology, organisation, and environment (TOE) theoretical framework propounded by Tornatzky, Fleischer and Chakrabarti (1990). The technology-organisation-environment (TOE) framework is described in Tornatzky and Fleischer's *The Processes of Technological Innovation* (1990). The TOE framework explains technology adoption among firms by clearly describing the technological, organisational, and environmental context influencing the adoption and implementation of technology. The TOE framework represents the segment of the technology adoption process involving the contextual influences of the adoption and implementation

of innovations. In this theory, both the human and non-human perspectives are integrated into the adoption and implementation process, making the theory more relevant.

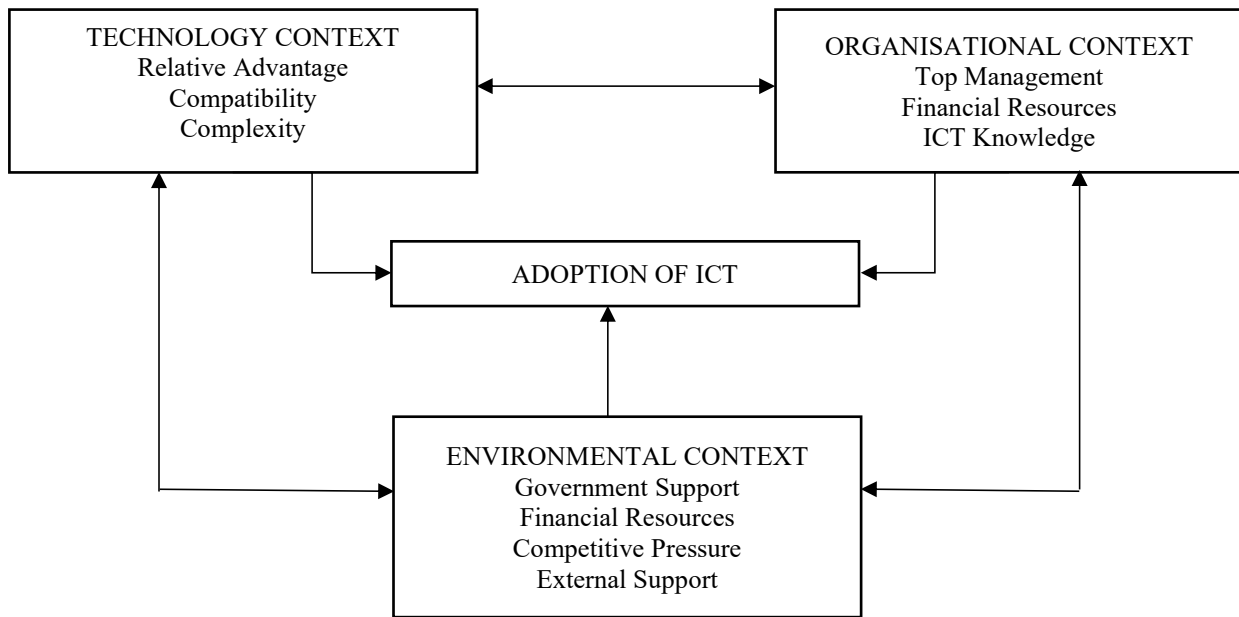

Figure 1. The Technology, Organisation and Environment Framework
Source: Tornatzky et al. (1990)

According to Awa Ukoha and Emecheta (2016), the theory handles the illusion of accumulated traditions and techno-centric predictions in other technology adoption theories. Such theories that the T-O-E framework tends to subordinate in this regard include the technology acceptance model (TAM) (Davis, 1989), the theory of reasoned action (TRA) (Ajzen & Fishbein, 1980), the theory of planned behavior (TPB) (Ajzen, 1991) and the innovation diffusion theory (IDT) (Rogers, 2003). Figure 1 above represents The TOE framework, widely recognised and used in the study of the adoption of business analytics (Kumar & Krishnamoorthy, 2020), cloud computing (Gui, Fernando Shaharudin, Mokhtar & Karmawan, 2020), and big data (Park & Kim, 2021). This makes the valuable framework for studying the antecedents of Supply Chain 4.0 success.

5.2. Industry 4.0 and Smart Manufacturing

The fourth industrial revolution, also referred to as Industry 4.0, relates to the collection of technologies such as artificial intelligence, robotics, cloud computing, the internet of things, and 3D printing. These technologies have made it easier for Industry 4.0 makes it easier for businesses to build a flexible, smart, cost-effective, environment-friendly and socially responsible business ecosystem, especially in manufacturing (Wang et al., al.,2016a; Metallo et al., al., 2018). The dawn of this digital and technological transformation era is changing the way products are developed, services provided, and business operations. According to Onu and Mbohwa (2021), the 4IR era has unveiled remarkable technological capabilities enabling industries to be more organised, efficient, sustainable, and autonomous. In this regard, the emergence of 4IR technologies such as cyber-physical systems (CSP), the Internet of Things (IoT), and big data have seen a remarkable move towards sustainable manufacturing. The result has been the emergence of smart manufacturing, which implies real-time orchestration and synchronization of manufacturing resources, information, and processes inside factories and the entire supply chain (Bogle, 2017; Lohmer & Lasch, 2021). Large and small companies that have successfully incorporated smart technologies have also managed to attain operational flexibility, craftsmanship, and better service delivery, leading to a competitive advantage (Bar, HerbertHansen, & Khalid, 2018).

The advent of 4IR has seen the fusion and blurring of lines between the physical, cyber, and biological systems, resulting in massive cost reduction, operational performance improvement, human safety, and faster production processes. The development highly signifies the integration of

computing with the physical processes, forming the cornerstone for industry 4.0 implementations (Fuchs, 2018). The term IoT relates to the technological advancement that has enabled the independent system to communicate autonomously to each other creating volumes of big data. This has become a critical piece of technology enabling the digital transformation of the manufacturing supply chain processes. By definition, IoT relates to the progression in technology allowing for the linkages among objects and devices over the internet (Dalenogare, Benitez, Ayala & Frank, 2018). IoT has also been defined as the connection of sensors and actuators to computing systems through networks allowing the collection and analysis of data in real-time (Zhang & Yue, 2019). Eloranta and Turunen (2018:745) point out that “IoT increases the availability of data and opens up opportunities for process optimization, collaborative value creation, business model innovation and consequently the restructuring of existing industries”. The IoT technology has predominantly formed a more comprehensive methodology for collecting, aggregating, and analyzing big data about potential consumers from different paces, using real-time analytics. This has allowed for a quicker and better understanding of consumer purchasing behaviors and the flighting of relevant promotions to the consumer (Manyika et al., 2015).

5.3. The Emergence of Supply Chain 4.0

Companies are beginning to acknowledge and implement roadmaps to integrate 4IR concepts into their operations, opening up opportunities for an opportunity to Supply Chain 4.0. With the worldwide supply chain networks growing increasingly solid, robust information and communication technologies and infrastructure would significantly enhance supply chain management (Sawik, 2020; Mazzei et al., 2020). Ultimately, Industry 4.0 has great potential to influence supply chain management, leading to improved business models and processes (Duarte and Cruz-Machado, 2017). According to Makris, Hansen, and Khan (2019), Supply Chain 4.0 relates to a supply chain involving the close collaboration of stakeholders powered by digital technologies such as internet technologies, cloud computing, and the Internet of Things. Manufacturing SMEs are immersed deeply in this revolution, altering their entire supply chain (Ghobakhloo, 2020; Strozzi et al., 2017). The application of digitalisation and automation systems to the supply chains has enabled players to communicate in real-time and autonomously (Ghadimi et al., 2019). The mere fact that Industry 4.0 technologies allow for horizontal, vertical, and end-to-end digital integration (Bag et al., 2021), provides a basis upon which Supply Chain 4.0 can be successfully developed (Luthra et al., 2020). This will help develop and enhance the business's social, economic, and environmental outlook, leading to sustainable supply chains (Luthra and Mangla, 2018). In South Africa, supply chain integration and coordination have rarely been automated, and the incorporation of 4IR technologies has remained limited. However, as supply chains continue to increase in complexity and size, emerging technologies to increase the volume and speed of supply chain processes management become necessary (Bibri, 2018).

5.4 Relevance of Supply Chain 4.0 to SMEs

It is empirically accepted that SMEs can benefit significantly Supply Chain 4.0, which will enable effectively procurement, sale, and delivery of goods, while minimizing supply chain disruptions. Successful implementation of SC4.0 implies that the use of Industry 4 technologies to improve supply chain performance standards and achieve strategic goals (Frederico, 2021). According to Ferrantino and Koten (2019:104), the Supply Chain 4.0 notion relates to “the re-organization of supply chains – design and planning, production, distribution, consumption, and reverse logistics – using technologies that are known as Industry 4.0”. It is therefore, predominantly about managing supply chains based on advanced technologies such as Internet of things and big data analytics to achieve different objectives. However, despite the widespread acceptance of the significance of Industry 4.0 on supply chains, studies in the SMEs context are still limited (Li & Li, 2017; Frederico et al., 2019). As such, this study seeks to contribute to existing literature by empirically investigate the antecedents of SC4.0 success.

6. Research Methodology

It has been observed that there seems to be a disconnect between Supply Chain 4.0 and SMEs' capabilities, and most of the studies conducted on the prerequisites of Supply Chain 4.0 characteristics have been developed for large MNEs. With their limited resources and focus on costs and short-term

benefits, SMEs find adopting Supply Chain 4.0 difficult. Most SMEs also struggle with gaining awareness of the benefits of technological development and are primarily overwhelmed when it comes to making technological decisions. To fill in these gaps in existing literature, this study employed a combination of a systematic, content-centric literature review and the Interpretive Structural Modeling (1982).

6.1. Systematic, content-centric literature review

This study employed a systematic literature review to establish the factors influencing successful supply chain 4.0 adoption and implementation. To ensure objectivity in the research findings, the literature search included an initial determination of relevant and applicable publications to Industry 4.0 and Supply Chain 4.0.

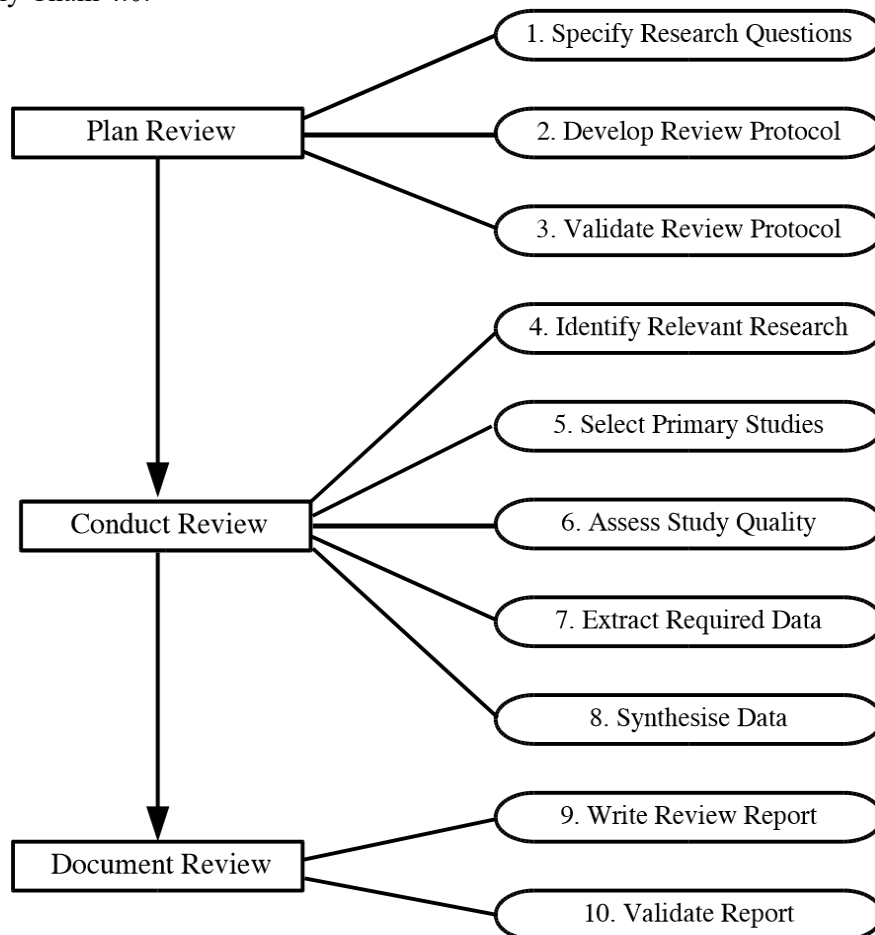

Figure 2. Systematic Literature Review Process
 Source: Adapted from Xiao and Watson (2019).

Several scientific databases such as EBSCO, ScienceDirect, Scopus, and Google Scholar were shortlisted for search, and eventually, Scopus and ScienceDirect provided adequate journal articles for analysis. Martín-Martín et al. (2018) and Tober (2011) recommend Scopus and ScienceDirect as competitive and trusted databases for literature review. Literature screening was conducted by reading the abstracts and findings of the study and removing the articles where supply chain and Industry 4.0 were not thematic areas.

6.2. Interpretive structural modelling (ISM)

The ISM, first proposed by J. Warfield in 1973 to analyze complex socioeconomic systems, is a standard method used to establish relationships among variables relating to a specific problem. It is a graph-theoretic data analysis tool that examines inter-relationships between research constructs, eventually transforming the identified relationships into a graphical presentation (Warfield, 1982). According to Sushil (2012) this method is interpretive in that the selected individuals' judgment

decides on the existence of relationships between variables. The author adds that is technique is “structural in that an overall structure is extracted from the complex set of elements based on relationships, and modeling in that the specific relationships and overall structure are portrayed in a digraph (directed graph) model”. The ISM technique has been used in determining the factors that determine project success factors (Hughes, Rana & Dwivedi, 2020;), the determinants for supply chain resilience (Attri, 2017), and the implementation of supply chain transparency in food logistics systems (Shankar et al., 2018). The ISM technique as applied in this study is represented in Figure 3 below and was developed following the standard procedures widely accepted within the ISM literature (Hughes et al., 2020; Kaswan and Rathi, 2019; Warfield, 1982).

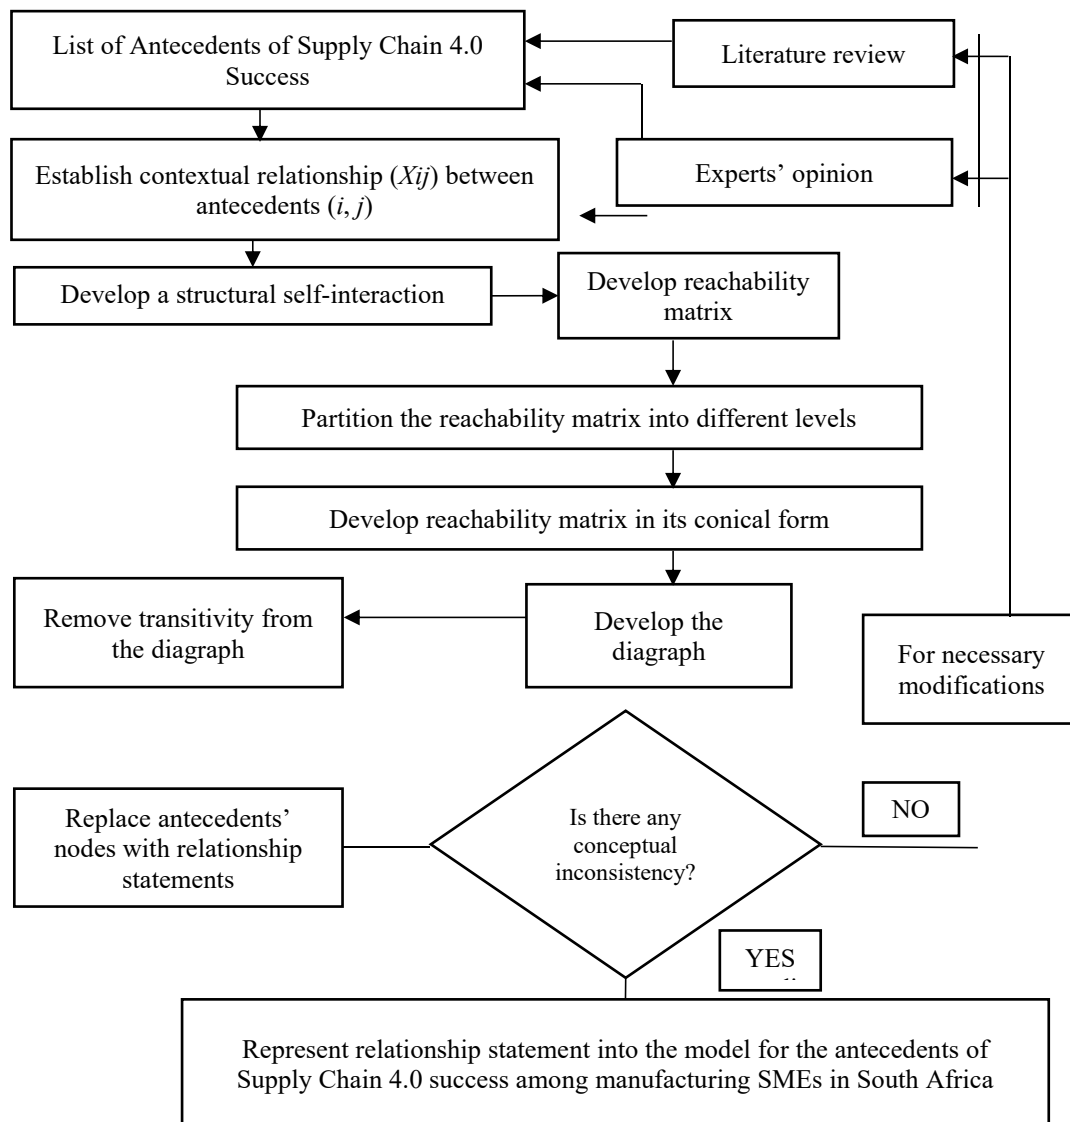

Figure 2. The ISM Implementation Procedure
 Source: Adapted from (Hughes et al., 2020; Kaswan and Rathi, 2019; Warfield, 1982).

The ISM implementation procedure highlighted above represents the road map that the researcher followed in the conduct of data analysis in this study, leading to the answers to the research questions. The procedure has been generally accepted as a standard procedure in extracting relationships using the ISM technique.

7. Results and Findings

The results presented below are based on the systematic review of the literature, and the above is based on the steps followed in implementing the ISM technique.

7.1. Results from Systematic content-centric Literature Review

A systematic literature review was conducted from Scopus and ScienceDirect, and the initial search yielded 66924 journal articles on Supply Chain 4.0 among SMEs, published from 2000 to 2022. However, upon examination, a total of 18991 papers were eliminated owing to duplications in the databases, leaving 47933 journal articles eligible for primary screening. The primary screening of titles and abstracts resulted in 315 articles being considered for full-text reviewing. Finally, the inclusion/exclusion criteria were applied to the articles selected, and 129 articles were selected and considered for review. The results from the systematic literature review are presented in Table 1 below.

Table 1. The thematic antecedents from Systematic content-centric Literature Review

No.	Critical Antecedent	References
1	Technology acquisition partnership	Benitez et al. (2021); Mentzer et al. (2000).
2	Cybersecurity competency	Wong et al. (2022); Kiss & Muha (2018); Sobb et al. (2020).
3	Change management capabilities	Park & Koh (2015); Tavčar et al. (2018).
4	Supply chain 4.0 readiness	Sony & Aithal (2020); Makris et al. (2019);
5	Supply chain 4.0 external support	Sony & Aithal (2020); Ivanov & Dolgui (2021).
6	4IR technology expertise	Manzini (2021); Jacome (2021).
7	Long-term orientation and growth	Geissdoerfer et al. (2018); Kim, Chiou & Calantone (2018).
8	Mutual trust	Park & Kim (2021); Jermsittiparsert & Pithuk (2019).
9	Total quality management	Sriyakul, Umam & Jermsittiparsert (2019).
10	Organisational Culture	Prasanna & Haavisto (2018); Bae & Grant (2018).
11	Technology readiness	Frederico et al. (2019); Haseeb, et al. (2019).
12	Managerial competency	Harvey & Richey (2001); Derwik & Hellström (2017).
13	Resource availability	Gulley, McCullough & Shedd (2019); Tom et al. (2021).

From the literature review, a total of thirteen critical antecedents were derived, presented in Table 1 above. The literature review aided in identifying the critical antecedents for Supply Chain 4.0, while the ISM process was used to transform, refine, validate and create relationships

7.2. Results from Interpretive structural modelling

The ISM process was conducted following the nominal group technique (NGT), a widely used technique due to its robustness and collaborative decision-making technique (Harvey & Holmes, 2012). In total, the participants held three sessions via Zoom Meetings, and to ensure validity and reliability, execution steps propounded by Ghobakhloo (2020) were followed.

7.2.1. Collecting expert opinion

To start data collection and analysis, expert opinion was sought to identify the relationships among these antecedents, forming an integral component of the ISM procedures. The procedure prescribed by Hertzum (2014) in the selection of experts was applied. This is essentially a two-step approach starting with identifying a pool of experts in supply chain management and then applying the expert retrieval model. This model employs generic tools like semi-structured interviews to evaluate the experts' availability, commitment, and knowledgeable-ness. The procedure is applied predominantly to ensure the validity and reliability of the ISM outputs. Table 2 lists the demographic properties of participating experts who refined and validated the success antecedents of Supply Chain 4.0.

Table 2. Demographic properties of participating experts

No.	Country	Job Title	Academic Qualification
1	South Africa	Procurement Manager	Diploma in Supply Chain Management
2	South Africa	Associate Professor	Ph.D. in Business Management
3	South Africa	Lecturer	Masters in Computer Science
4	Poland	Data Scientist	Master in Data Science
5	Zimbabwe	Human Resources Manager	BSc in Human Resources Management
6	South Africa	Change Management Specialist	BCom in Business Administration
7	Zimbabwe	Director of Logistics	BCom in Logistics and Transport
8	South Africa	Strategic Procurement Manager	MPhil in Supply Chain Management
9	South Africa	Demand Planning Manager	Diploma in Operations Management
10	Namibia	Logistics Analyst	Diploma in Supply Chain Management
11	South Africa	Operations Manager	Masters in Business Administration

Source: Authors' Compilation

Four were excluded from a pool of fifteen experts initially selected in the first selection interviews. This was so because either they lacked conversational competence, understanding of the Supply Chain 4.0 concept and its industrial implications, or withdrew before the expert opinion extraction. In line with the COVID-19 restrictions on movement and physical contact, the expert opinion extraction sessions were conducted via Zoom Meetings. Semi-structured interviews were developed to ensure conversational competence and that the participants remain within the realms of Industry 4.0 and Supply Chain 4.0. this was also done to avoid "Yes" or "No" replies in favour of detailed answers. The refinement and validation of success antecedents was done within the first meeting.

7.2.2. Identifying the contextual relationships

Following the leads of the T-O-E framework and a systematic review of literature, a total of thirteen determinants were established, and the coding system highlighted below was applied to develop the Structural Self-Interaction Matrix (SSIM) on a pairwise comparison of variables. . Table 2 presents the SSIM for the study, which is a result of the selected experts' opinions. The results obtained from the analysis are presented in Table 3 below.

Table 3. The structural self-interaction matrix (SSIM) of barriers

No.	Critical Antecedent	13	12	11	10	9	8	7	6	5	4	3	2	1
1	Technology acquisition partnership	V	V	V	V	V	V	V	V	V	V	V	V	
2	Cybersecurity competency	V	V	V	V	V	V	V	V	V	V	V		
3	Change management capabilities	V	V	V	V	V	V	V	V	O	V			
4	Mutual trust	V	V	V	V	V	V	O	V	O				
5	Supply chain 4.0 external support	V	V	V	V	O	V	O	O					
6	4IR technology expertise	V	V	V	V	V	V	X						
7	Long-term orientation and growth	V	V	V	V	V	V							
8	Supply chain 4.0 readiness	V	V	V	V	A								
9	Total quality management	V	V	V	O									
10	Organisational Culture	V	V	V										
11	Technology readiness	V	O											
12	Managerial competency	V												
13	Resource availability													

Source: Authors' Compilation

There relationship between variables was expressed using the following four symbols denoting the direction of the relationship between the parameters *i* and *j*.

- “V – Parameter *i* will lead to parameter *j*”
- “A – Parameter *j* will lead to parameter *i*”
- “X – Parameters *i* and *j* will lead to each other”
- “O – Parameters *i* and *j* are unrelated”

From the results presented, it can be concluded that the factors obtained during the literature review significantly influence the adoption and implementation of Chain 4.0. The extent of significance in determining Supply Chain 4.0 was presented to magnify the strategic priority of the factors under consideration.

7.2.3. Reachability matrix

In line with the steps in ISM, the SSIM was converted into the initial reachability matrix, a binary matrix created by substituting *V*, *A*, *X* and *O* with 1 and 0 as the case may warrant. This process of the substitution of 1s and 0s is done in line with the following rules:

- “If the (i, j) entry in the SSIM is *V*, the (i, j) entry in the reachability matrix becomes 1 and the (j, i) entry becomes 0”.
- “If the (i, j) entry in the SSIM is *A*, the (i, j) entry in the reachability matrix becomes 0, and the (j, i) entry becomes 1”.
- “If the (i, j) entry in the SSIM is *X*, the (i, j) entry in the reachability matrix becomes 1, and the (j, i) entry also becomes 1”.
- “If the (i, j) entry in the SSIM is *O*, the (i, j) entry in the reachability matrix becomes 0, and the (j, i) entry also becomes 0”.

Table 4 below shows the initial reachability matrix emerging from implementing the above rules. Table 4 was further developed into the final reachability matrix shown in Table 5 by incorporating the transitivities described in Step 4 of the ISM procedure.

Table 4 Initial reachability matrix

According to Cherdantseva et al. (2016), “the reachability matrix of a graph and its partitioning may be used to separate the components that are more likely to be impacted from those that are less likely to be impacted.” The final reachability matrix exhibits two significant components; each variable's driving power and dependence. In ISM methodology, the driving power relates to the total number of variables, including itself, which it may help to achieve. On the other hand, dependence refers to the total number of variables, including itself, which may help in achieving it.

Table 5. Final reachability matrix

7.2.4. Formation of ISM

From the final reachability matrix resented in Table 5, this study's structural model was generated by employing nodes and lines of edges. In this instance, where there is a relationship between antecedents *i* and *j*, this is represented by an arrow pointing from *i* to *j*. This results in creating a directed graph or digraph, which is later converted into a ISM model by removing transitivities in following the ISM methodology steps. The resulting ISM graph is as shown in Figure 3 below.

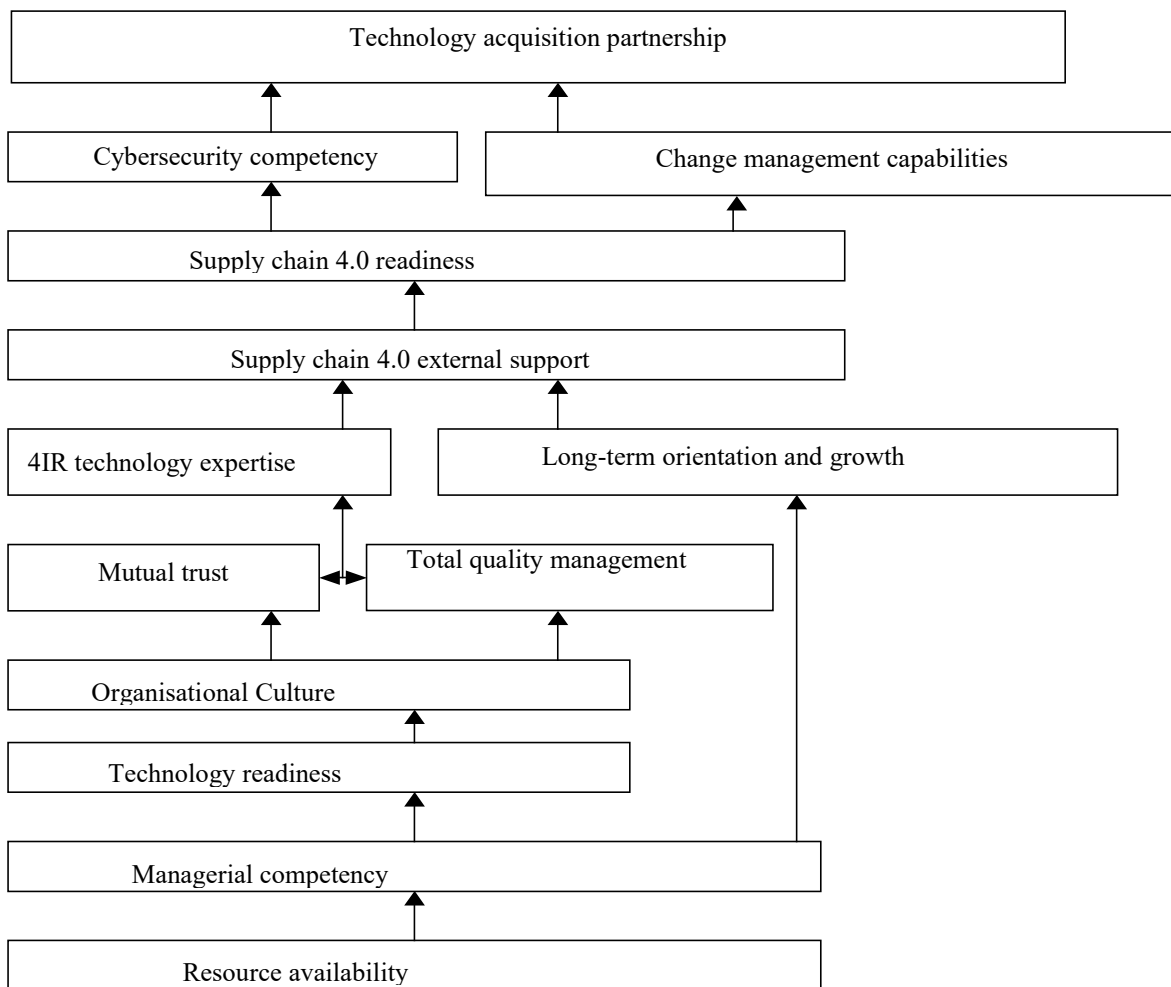

Figure 3 The Structural Model for Antecedents of Supply Chain 4.0 Success

The factors that influence success in Supply Chain 4.0 are presented in the figure above and this diagram illustrates the interrelationships between the factors. These factors are discussed in relation to Supply Chain 4.0 in the paragraph following.

8. Discussion of Findings

From the analysis conducted in this study, it can be noted that for SMEs in the manufacturing sector to implement Supply Chain 4.0 competitively, there is a need to work on organisational characteristics such as resource availability, managerial competencies and organisational culture. This will form the foundational characteristics that enhance the successful adoption of technologies needed to empower Supply Chain 4.0. It is interesting to note that the factors that SMEs need to take cognisance of manifest themselves at both strategic and operational levels. Further factors such as supply chain 4.0 readiness, external support, and 4IR technology expertise have also been uncovered as structurally significant prerequisites to the success of Supply Chain 4.0. Consequently, this provided the much needed answer to RQ1, which questioned, “What are the critical determinants of the maturity of Supply Chain 4.0?” In the ISM model, the factors are presented in the hierarchy of actions SMEs need to take to enhance success in adopting Supply Chain 4.0. through systematic literature review and the ISM model, RQ2, which dealt with “What is the relationship between identified critical success antecedents of Supply Chain 4.0?” was answered. These results are supported by Wong et al. (2022), who argued that factors such as cybersecurity capabilities and technological competencies are essential in enhancing the development of supply chains. Generally, unwarranted cyberattacks have been seen as a cause for the inability of organisations to generate revenue consistently. In line with the results from this study, other scholars such as Manavalan and Jayakrishna (2019), have maintained that 4IR readiness, among other technology capabilities, should be made available only during the adoption and implementation of Supply Chain 4.0 but also during the ongoing management and evolution of the supply chains. RQ3 on “What are the managerial implications emanating from this research?” was answered in the subheading following.

9. Managerial Implications

This study presents an overview of the factors that drive Supply Chain 4.0 success among manufacturing SMEs in South Africa. Managers tasked with running SMEs in South Africa's manufacturing sector must commit to integrating the technical and non-technical factors into their strategies to influence the adoption and success of Supply Chain 4.0. Since the current study focused on manufacturing SMEs, due care should be observed when generalising the current study's results to a broader population. To enhance the success of Supply Chain 4.0, SMEs need to gunner for technological partnership and external support for the emerging phenomenon. Concerning technologies, firms need to work on strategies to enhance 4IR technology adoption. As stated by Tripathi and Gupta (2021) “technologies such as IoT will facilitate global SC with sensors to automate, coordinate and synchronize the flow of information and goods, and enhance SC efficiency”. Managers and owners of SMEs also need to pay attention to organisational factors such as change management capabilities and mutual trust, as these have been found to augment successful transformation to Supply Chain 4.0. Small and medium enterprises need to enhance their technological capabilities to attain an acceptable level of information, digital, operations, and cyber readiness.

10. Conclusion

In South Africa, manufacturing SMEs are lagging in adopting Industry 4.0, let alone supply chain 4.0. The current study examined the factors influencing the success of Supply Chian 4.0 adoption and implementation among manufacturing SMEs under the Industry 4.0 agenda. This provides an opportunity for SMEs to leapfrog their current challenges and adopt technologies and systems that will drive Supply Chain 4.0. The thirteen Supply Chain 4.0 success antecedents determined through a systematic review of literature and ISM are essential for the success of SMEs. Owners and managers of SMEs much take cognisance of these factors to succeed in this era of technological advancement. This ISM model developed in this study lays the foundation for future quantitative studies on the development of Supply Chain 4.0 in South Africa. This study's contribution to the existing literature is two-fold: firstly, the research findings provide a helpful reference on factors to consider when seeking to improve Supply Chain 4.0 adoption decisions among manufacturing firms. In addition, while similar antecedents have been examined before, this study chose a different context to examine these factors and used different lenses of the T-O-E framework rarely used in such studies.

Keywords

EPMS; Motivation;
Career advancement;
Development

Abstract

Contemporary businesses face unprecedented challenges. Shareholders want higher returns on their investments, while companies want increased efficiency and lower costs. On the other hand, employees expect both financial and non-financial rewards to motivate them to perform. Organisations are integrating staff health programmes, support programmes, learning and development, and integrated reward systems in order to stay up with the demands of their environment. The study sought to find out if there is relationship between Employee Performance Management System (EPMS), motivation and career advancement and development levels on employee performance. An alcoholic beverage producer in South Africa was used as a case study. Data were obtained by the use of an online survey instrument or CSAQ (Computer-Assisted Self-administered Questionnaire) from people who were knowledgeable about the topic. SPSS Version 26 was used to analyse the data from 153 participants. EPMS, motivation, career advancement, and development showed a statistically significant (p -value <0.05) positive correlation. As a result, the hypothesis was rejected. The findings cannot be applied to other businesses because the study was conducted in a single company.

1. Introduction

Organisations come in all shapes and sizes and often possess more differences than similarities. However, one common factor amongst them is that their success or failure depends on the skills, knowledge, and experience of their employees (Mohammedi, 2013). Human capital is one of the most important resources an organization can have in its possession; this is because human capital is a significant competitive factor due to its potential for uniqueness (Al-Sada, Al-Esmael & Faisal, 2017). Employees are valuable assets to the organization because they are the one factor that cannot be imitated by competitors (Anitha, 2014).

Scarcity of resources (human and financial) and aggressive competitors are among the factors that compel organizations to consider strategic approaches of satisfying employees and keeping them motivated (Al-Sada et al., 2017). The performance of employees is a key driver in the attainment of organizational goals. Modern-day organizations depend on measurements and analysis of performance to succeed (Boateng & Agyen-Gyasi, 2014). Most organizations utilize an Employee Performance Management System (EPMS) to measure and analyse employee performance. The primary goal of EPMS includes performance measurement and providing feedback on employee performance, linking the activities and outputs of employees to the strategic objectives of the organization (Kanfer, Chen & Pritchard, 2008). Elorza, Harris, Aritzeta, and Balluerka's (2016) research on strategic human resource management found that there is a positive correlation between organizational performance and its systems.

EPMS is described by Boateng (2015) as a formal process utilized by organizations to assess employee's performance against a pre-set criteria and organizational objectives. Armstrong (2009) defines EPMS as a systematic process for improving organizational performance by developing the performance of individuals and teams, and getting better results by understanding and managing performance within an agreed upon framework of planned goals, standards and competency requirements. Motivation, career advancement, EPMS and development are critical management tools that correlate employee performance and performance of the company to strategy (Vieira, O'Dwayer, & Schneider, 2016). Viera et al. (2016)

¹ E-mail address: tebohoj@ymail.com

² E-mail address:sdhliwayo@uj.ac.za

³ E-mail address:tmlilo@uj.ac.za

further state that the EPMS assists companies to focus on critical key performance areas and key performance indicators. Research has demonstrated that EPMS is a great tool that enhances performance owing to its feedback element (Sono, 2014; Hendricks, 2015).

Some scholars (Hendricks, 2015; Sono, 2014 and Bulawa, 2012) researched extensively the challenges faced by organizations in implementing the EPMS system in various sectors. The study by Sono (2014) found that feedback from EPMS played a major role in motivating operational-level employees. He further pointed out that EPMS helped to enhance operational-level employees' performance. However, the study was limited to the steel production company and cannot be generalized to other organizations in South Africa.

At the organization under study, the EPMS was implemented in 2016. The reasons for implementation was to derive the following benefits; it is a major contributor in the alignment between the organizational, team, and individual goals, it can track and communicate corporate, team and individual performance and it helps in meaningful rewarding/compensating of teams and/or individuals. The EPMS system is also used to determine training and development needs; it plays a crucial role in talent management and staff retention. Lastly, the EPMS assists in the corrective action process and in the termination of an employee's service.

2. Problem Investigated

At the organization under study, there are numerous personnel concerns with regards to EPMS. These include relatively high staff turnover and low climate survey scores. In the year under study, the climate survey was 69% satisfaction. Climate survey is defined as a measure or predictor of job satisfaction. It is often linked to employee engagement, which measures the employee perceptions on the impact of their work environment on their wellbeing (Huang, Zhou, Lv, & Chen, (2020).

At the organization reviews are fused with career planning, training and development needs. The fusing of these processes might result in the process being ineffective because during performance appraisals, employees are less receptive to development and are more geared toward a good review score. As a result, this might have a negative implication on the motivation of operational level employees. There is no clear evidence on how the EPMS and career advancement and development process influence the motivation of operational employees. This study will attempt to understand the influence of EPMS and career advancement and development on the motivation of operational level employees.

3. Research Objectives

- To determine if there is a positive and significant correlation between EPMS and motivation.
- To determine if there is a positive and significant correlation between EPMS and career advancement and development.
- To determine if there is a positive and significant correlation between career advancement and development and motivation.

4. Hypotheses

The following hypotheses were formulated for the study:

- H₁: There is no significant positive correlation between EPMS and motivation.
- H₂: There is no significant positive correlation between EPMS and career advancement and development.
- H₃: There is no significant positive correlation between career advancement and development and motivation.

5. Literature Review

The literature review covers the 3 main constructs of the study, namely EPMS, career advancement and development and motivation. This is presented next.

5.1. Employee Performance Management System (EPMS)

Zhang (2012) define EPMS as a process of ensuring that employees concentrate on their duties in ways that contribute to the attainment of the organizations' strategic mission. EPMS is a progressive process predominantly concerned with employee and system development to deliver sustained high performance (Armstrong, 2009). Armstrong and Baron (2014) defined EPMS as a "strategic and integrated approach to

increase the effectiveness of the organization by enhancing the performance of the employee who works in them and by developing the capabilities of teams and individual contributors.” The integrative nature of the EPMS is deemed necessary because it facilitates the achievement of organizational strategic objectives with simplicity (Anitha, 2014). The integrated approach provides employees with a realistic view of their performance and, on the other hand, it serves as a useful framework for devising and implementing an effective EPMS. Armstrong and Baron (2014) state that a performance management system is often utilized by the managers to align the goals of the organization to those of their employees, thereby ensuring productivity. EPMS is a progressive process predominantly concerned with employee and system development to deliver sustained high performance. They further defined performance management by depicting the characteristic of a performance management system, see table 1, below.

Table 1. The characteristics of a performance management system

<p>Characteristics of a performance management system:</p> <ul style="list-style-type: none"> • It communicates a vision of its objectives to all its employees. • It sets departmental, unit, team and individual targets that are related to wider objectives. • It conducts a formal review of the process towards these targets. • It uses the review process to identify training, development and rewards outcomes. • It evaluates the whole process in order to improve effectiveness. • It defines a managerial structure to look after all the characteristics above, so that the individual staff and managers are assigned specific responsibilities to manage the performance management system. <p>In addition, the performance management organisations</p> <ul style="list-style-type: none"> • express performance targets in terms of measurable outputs, accountabilities and training/learning targets; • use formal appraisal procedures as ways of communicating performance requirements that are set on a regular basis; and • link performance requirements to pay, especially for senior managers.
--

Source: Armstrong and Baron (2014:45)

Choong (2014) filched different definitions by different scholars and describe EPMS as an accounting system that help analyse and interpret information, undertakes strategic and management accounting activities, measures business performance and reports on business activities, measures key performance indicators; check the validity of the cause-and-effect relationships among the measures; detects variance, operating mechanism that enables a business to plan, measure and control its business and people performance to ensure that there is alignment with business strategy to create shareholder value. EPMS measures and provides feedback and control mechanisms to the business.

EPMS is a set of activities adopted by organizations to enhance employee performance by providing employees with ongoing feedback formally and informally (Sowa & Selden, 2011). Sowa and Selden (2011) further state that feedback from the EPMS process and recognition play a vital role in motivating employees. The definition adopted for this study is by Sowa and Selden (2011); this definition covers most of the elements that are going to be researched by this study. It emphasizes the point of EPMS being a leading stimulus that enhances the performance of employees, moreover; the definition confirms the importance of ongoing formal and informal feedback from the EPMS process. The approach comprises inclusive conversation with the employee, employee development to be future-fit, and taking corrective action where necessary. Lastly, the definition by Sowa and Selden (2011) recognizes and highlights that there is a link between EPMS processes and employee motivation. The above definition confirms Chubb, Reilly, and Brown's (2011) argument that EPMS is both forward and backward-looking. Backward-looking approach entails structured reviewing employee past performance and identifying performance gaps. Forward-looking approach involves taking cognisance of changing business scenarios, shortened cycle times, and the changes in employee demographics due to globalization.

5.1.1. Benefits of implementing an EPMS

Organizations are made of different stakeholders; such as shareholders, customers, management and employees of the organization and communities that they serve. The focal point for this study is only management and employees. Management structures are made of different levels, namely: strategic, which comprises of executive, tactical level consisting of middle management and operational level, which is made up of lower-level management level. The vision, mission, and strategic objectives are devised at the strategic level and then cascaded into the tactical level and ultimately filtered down to the operation level for implementation.

To enable seamless implementation of strategic objectives, the short-and long-term goals of the organization should be translated into business units' goals and also be further converted into each employee's goals and objectives (Serakwane, 2005). The day-to-day activities of the organization should support the strategic objectives for the organization to be successful and outperform its competitors (Serakwane, 2005). Communication is the golden thread that keeps these stakeholders together.

Although there is a divergence in scholars' views regarding the EPMS effectiveness, there is substantial evidence supporting the strategic role of the EPMS in organizations and its benefits of enhancing employee performance, which results in sustainable competitive advantage. There is a symphony of compliments for the EPMS system, from improved communication between management and employees (McGilloway, 2005). The improved communication has several benefits:

- Core pillar in the alignment of organizational strategic objectives and team, individual goals.
- EPMS saves time by empowering employees to make their decisions
- It eliminates misunderstandings between employees as to who handles which task.
- It assists in decimating the error rate and employee mistakes by identifying causes of error.
- It helps in driving out inefficiencies caused by repetition due to a lack of clarity on the path of employees.
- An exponential increase in performance is realized.

To add to the symphony of benefits by (McGilloway, 2005), different scholars also highlighted additional benefits of EPMS. Paile (2012) says EPMS promotes trust through joint planning, constant communication, and ongoing feedback. The value of joint planning ensures that the organization experiences less wastage because deviations are identified and corrected faster. Open and constant communication ensures that efforts are not duplicated, which results in wastage. The feedback from EPMS reinforces and enhances employee performance and it is also known to be informative and lift employee morale. It is through the EPMS process that clarity is shared on performance expectations and performance standards (Hendricks, 2015). Goals that are derived from organizational objectives are set and monitored through the EPMS processes to ensure that activities carried out by employees conform to the expected organizational standards (Ramataboe, 2015). EPMS processes are geared to ensure that the employees acquire the right skills, knowledge, and competency to carry out their activities/tasks, which eliminates mistakes proactively (Hendricks, 2015). EPMS identifies the areas of improvement timeously and imparts the required skill, which will build employee confidence or self-esteem. Hendricks (2015) states that if an employee is confident, the performance is enhanced automatically.

5.1.2. Challenges in implementing the EPMS

Although EPMS is praised for managing employee performance, on the contrary, some scholars argue that there is evidence suggesting that the 360-degree tool used to build a picture of an employee's performance is distorted and ill-used. Davis (2012) argues that anonymity in the EPMS system allows for subjectivity in the EPMS process. The system's reliability and validity are still being questioned by its opponents (Gupta & Kumar, 2013). Davis (2012) pointed out seven factors that impede a smooth implementation process. These are:

i. Direct biasness

Serakwane (2005) supports the views of Davis (2012) and maintains that EPMS have an element of subjectivity; the subjectivity might stem from factors such as favouritism, inadequate evidence, or manager lack of system knowledge.

ii. Indirect biasness

Dangol (2021) supports the views of Davis (2012) and postulates that poorly designed EPMS system lead to indirect bias. He states that there is a tendency to focus more on the weakness of an employee instead of strengths, which create friction between the employee and manager.

iii. Competency

To add to Davis (2012) view, Serakwane (2005) pointed out that most managers are not formally trained to use the system (EPMS) or don't know how to conduct performance appraisals. Therefore, when it's time to conduct performance reviews and to have development discussion, line managers go through the process to just tick the boxes and complete it without going into a deeper conversation with employees. This type of behaviour erodes the credibility of the system and also lessens the trust employees have in the system.

He further highlights another dilemma, which is that of line managers having to contend with being a specialist in their respective fields/disciplines. He further elaborated that line managers are result and deadline-driven and that may weigh down the attention given to the EPMS by these managers.

In a recent study, Kim and Holzer (2017) found that employees were not completely satisfied with the rating from their supervisor, whereas, on the other hand, the supervisor perceived EPMS as a distasteful chore, because it conflict with other chores. The study also found that the employees were left with a sense of dissatisfaction because they believed they were unfairly rated. The negative perception towards EPMS causes resistance by employees due to supervisor/manager competency; in some cases, it leads to underperformance because of motivational level.

iv. Devolution

According to Davis (2012), EPMS is designed by the HR department however, the implementation is done by line managers. The consequence of this action is that there is little or no buy-in at all from the line managers and that gets rolled down to employees without robust engagements with them. According to Serakwane (2005), one major challenge of EPMS is flexibility. It is conducted at a prescribed time and has a preconceived procedure and format. The obstinate format channel the discussion and does not allow for in-depth and rigour deliberations which might be more relevant for the discussion.

v. Authoritarianism

Authoritarian leaders emasculate employee confidence and that may lead to employees resorting to leaving the organization because of poor treatment (Pulakos, 2009). The lack of training has been identified as the biggest challenge faced by organizations and it leads to improperly implemented EPMS and thus the reluctance from employees to trust the system. Coupled with the lack of training for managers, it's the lack of training for employees to participate in the EPMS session (Davis, 2012).

vi. Informal and incidental appraising

Gomez-Mejia, Cruz, Berrone, and De Castro, (2011) concurs with Davis (2012) and state that employee development and performance enhancement discussion fused together with salary increase discussion are ineffective because at that moment employees are less receptive to development and more geared towards a better salary increase. Unsubstantiated and negative feedback provided in an improperly conducted EPMS review session damages the sense of fairness towards the EPMS by employees (Gomez-Mejia, et al., 2011). The other challenge with EPMS is what is referred to as "short-termism". The phenomenon results in dysfunctional consequences and damaging impact on employees. The absence of robust discussion, lack of competency on the path of managers, lack of career path leads to EPMS being considered another one of those tools that are invaluable to an organization.

vii. Information collection

Due to EPMS not being a priority to line management, they are often on the bottom of the radar or the "To-do list" they are considered an unpleasant process and time-consuming (Serakwane, 2005). Therefore, they are considered time-consuming, the EPMS process is done hastily with little or no preparation at all. They are completed to meet the deadline set by the organization's HR department, just a tick box exercise. In this case, from the above review, how does EPMS relate to motivation? The above arguments should all be about the relationships.

5.2. Personal development plan

Personal development is defined as a strategy that empowers staff with learning proficiency both internally and externally in the workplace, which enables the organization to achieve its envisaged strategic objectives (Arogundade et al., 2015).

The personal development plan is implemented to stimulate employees to undertake learning and development activities (Arogundade et al., 2015). The need for training is identified by both the manager and employee during the performance review discussion. The training intervention needed is documented in a personal development plan report; this report is then submitted to the HR department for capturing and procuring of services. Training is undertaken to reinforce and improve existing skills and knowledge of employees whilst employee development is future-focused.

5.2.1. Personal development and motivation

According to Baldwin et al. (2014), personal development is a crucial motivational factor. He defines personal development as a strategy that empowers staff with learning proficiency both internally and externally in the workplace, which enables the organization to achieve its envisaged strategic objectives. According to Baldwin et al. (2014) the training and development of employees is not only considered being a key driver of sustainable competitive advantage but also a motivational strategy that harnesses innovation and blue-sky thinking. A personal development plan is a skills development plan/document which outlines the development plan for an employee, agreed to by both the employee and his/her manager. The involvement of employee in the discussion of their development and career planning provide employees with a sense of ownership which motivates employees (Kuhil & Michael, 2019). This useful document is then used to track training and development progress.

The personal development plan is furthermore used as a stimulus for the employee to undertake learning and development activities, which in turn is presumed to improve professional expertise and growth (Eisele et al., 2013). Research has shown that training and development is a crucial factor in improving employee engagement because training improves service accuracy and it enhances performance (Anitha, 2014). According to Baird, Schoch, and Chen (2012) training is a planned program designed to enhance employee knowledge, attitude, skills, and most importantly, changes in behaviour. Baird, Schoch, and Chen (2012) further states that training is essential in overcoming employee resistance to change. Moreover, Baird, Schoch, and Chen (2012) said training played an instrumental role in the success of new projects. According to Wood and West (2015), there are many ways in which training and development can be conducted. All these methods, such as Demonstrations, Simulations, On-the-job training, Coaching, E-learning, Job rotation, all help to skill, empower and motivate the employee. For example, job rotation is an effective and proactive way of imparting skills to new employees by actually doing them (Wood & West, 2015).

A personal development, firstly acts as a training need analysis, plan focuses on the shortcoming of an employee which might hinder his/her career progression and secondly it is future focused (Kuhil & Micheal, 2019). Future focus entails employee discussion with the manager and formalizing the discussion through a process known as career planning. Career planning discussion leads to employee motivation and possible retention.

5.2.2. The value of career development and advancement

Human resource policies and systems that support modern-day businesses are of great importance to an organization's human resources retention strategy (Callakoppen, 2016); because employees are considered a key strategic asset to the organization (Boateng & Agyen-Gyasi, 2014). The lack of career development and advancement is a major contributor to employee dissatisfaction and staff turnover (Davis, 2015). Staff turnover of key personnel in an organization can have a disproportionate impact (Armstrong & Baron, 2014). In a recent survey conducted in Australia, it was found that out of 205 employees that were surveyed, 69% postulate that lack of career opportunities is one of the major reasons why employees leave the organization (Davis, 2015). Employee dissatisfaction is often linked to low commitment levels and high staff turnover, which subsequently affects employee performance and motivation negatively (Sharma & Sharma, 2017). The inability of an organization to retain high-potential

and talented employees poses a huge threat to strategy implementation (Letchmiah & Thomas, 2017). When employees leave the organization, they take with them valuable knowledge and skills.

Career planning is a structured exercise undertaken to identify an employee's career aspirations in line with organizational objectives. It is the vital part of career management which deals with shaping employee progression or job upward mobility within the organization (Armstrong & Baron, 2014). Armstrong and Baron (2014) further pronounce that career planning involves the charting of employee career paths within an organization. Career planning and management is not a retrospective process, but a future-focused process. It is concerned with ensuring that the organization's talent bench is occupied by employees with appropriate skills, knowledge, and abilities, in short talented employees. Moreover, career planning and management focus on succession planning. It is an ongoing process through which employees set out their professional career objectives and identify and devise the means to achieve them. The career plan helps both employees and managers to take stock of where the employee is, where they are going in terms of their career, qualifications, competency, and readiness for promotion. This motivates employees to develop a skill that they don't have and work harder because they have a goal in mind to achieve. Consequently, this enables a company to retain talent because their morale has been boosted by this process. The one common way of successfully planning an employee's career is through employee and manager career planning discussion. Davis (2015) recommends that career planning should be isolated from performance review discussion to elevate its status and avoid confusion. The absence of skills audit, career planning, and succession planning exacerbate the misalignment between talent management and EPMS driven by human resources planning (Davis (2015)).

5.3. Motivation

Motivation is defined as the "degree to which an employee wants and engages in certain stipulated behaviour" (Al-Sada et al., 2017). In performing duties; what propels employees is motivation. Motivation helps stimulate employees to want to achieve more, be productive, and have harmonious relationships with fellow colleagues.

Motivation helps stimulate employees to want to achieve more, be productive, and have harmonious relationships with fellow colleagues. Research has shown that employees perform at their best when they perceive their job to be meaningful, perform work that leverages their personal strength and aspirations (Ong, & Jambulingam, 2016). Alghazo and Al-Nani (2016) postulate that it has been proven that there is a strong correlation between achievement and employee motivation. They maintain that motivated employees are highly likely to be top achievers. This is because motivation is intricately entwined with human emotions (Crumpton, 2013).

Crumpton (2013) recommends active coaching to motivate employees. He endorses 6 active coaching techniques:

Reward excellent performance at all times

Crumpton (2013) supported the view that says given the pivotal role rewards play, while Taylor proposed "a fair day's pay for a fair day's work" to induce motivation because he believed that money motivates employees (Armstrong & Baron, 2014). Good wages may lead to greater intrinsic motivation because an employee may consider themselves competent.

Giving positive feedback and recognize efforts publicly

To raise employee self-esteem Crumpton (2013) vouch for positive feedback and recognition. Gomez-Meija et al. (2011) states that positive feedback is a stimulus for employee motivation and it also drives performance however, negative feedback has an adverse result on employees' performance. He further states that positive feedback activates good behaviour, which is highly likely to be repeated by employee whilst negative feedback yield no result and leads to a drop in performance.

Use non-monetary rewards to incentivise good performance

Different scholars support Crumpton (2013) in using non-monetary rewards as incentives for good performance. Harunavamwe and Kanengoni, (2013) argue that the significance of money as the main motivator has always been downplayed by behavioural scientists such as Herzberg who pointed out that the value of constructive feedback (EPMS), challenging job, teamwork, and non-monetary factors act as

stimulants to motivation. Bowden et.al., (2016) advocate for promotion, career support, and recognition to motivate employees. Another scholar, Gordon, (2017) commends autonomy as the incentive to motivate employees. He states that giving an employee the right to make decisions motivates them. From the above statement it is clear that employees are not only motivated by money. There are, therefore, other elements that managers have at their exposure.

Listen carefully and understand to respond appropriately

Davis (2012) recommends the following training for managers and employees to successfully participate in EPMS session; listening skills, communication skills which enhance engagement and negotiation skills which assist each party to reach consensus in appraisals.

Show empathy and interest by asking questions to clarify details

The most striking trait of empathy is care, attention, and understanding (Molokomme, 2013). Molokomme (2013) further states that empathy is the consequence of a manager's willingness to understand employees and pay undivided attention. The concept of empathy encapsulates a customized solution for each employee.

Lead by example and demonstrate collaboration

The most important characteristic of a leader is to lead by example, this is because leadership is defined as competencies and processes essential to empower and enable an ordinary employee to do extraordinary things (Arnold, 2007). In addition, leadership is about persuading employees not controlling them.

5.4. EMPS, Career advancement and development and motivation

Motivation is such a complex concept because if an employee lacks the ability, training intervention can be employed to skill the employee. If the work environment is problematic, culture alteration can enhance performance. However, if employees lack motivation, the solutions are not clearly prescribed (Clark & Saxberg, 2019). Employee well-being might be negatively affected by the lack of optimism about the future (Guest, 2017). Hendricks (2015) claims that, if employees have positive emotions, they will do more than they are requested. Research in this area has shown that when employees are fairly rewarded for their efforts, treated with dignity and respect, they perform at peak and they will go the extra mile. Although the correlation between rewards (money) and satisfaction is significantly weak (0.25), it is scientifically considered meaningful because employees rely on money for life satisfaction (Wood & West, 2015). This is supported by Herzberg's theory, who postulates that if employees are dissatisfied with hygiene factors (pay and rewards) they will be demotivated.

It is evident from the literature that career advancement and development has a significant relationship with motivation, which ultimately affects performance. Well-trained employees tend to be highly motivated, confident and productive (Makhubedu, 2017). Therefore, investment in employee development and advancement has proved to be fruitful because not only does the employee benefit but the organization reap benefits, from competent and productive employees and reduced/low staff turnover. Organizations that invest in employee development tend to have competent employees who possess the right set of skills and capacity to make discretionary decisions. Wood and West (2015:225), states that: "With respect to organizational performance, training and development was found to predict key outcomes, specifically productivity, quality (including high levels of customer satisfaction), objective organizational performance and managerial perceptions of performance". Career advancement contributes to increased employees satisfaction, low absenteeism, lower staff turnover and positive employee attitude (Wood & West, 2015)

6. Research Methodology

The research paradigm, research approach, and research methodology adopted for this study are discussed in detail. Firstly, the research approach is discussed in detail below.

6.1. Research approach

The study adopted a quantitative research approach. Quantitative research aims to measure or establish a relationship between measured variables (Ledwaba, 2015). Ledwaba (2015) further states that the strength of quantitative research is that the researcher is an objective observer, and he does not participate

in the study, which might influence the results of the study. Quantitative research was chosen for this study because of the following reasons:

- Result can be analyzed objectively.
- It allows for hypotheses to be tested.
- It offers a very concise and narrow focus
- Data is in the form of numbers.

6.2. Research design

The widely used research designs in quantitative research include experimental methods, observation techniques, and survey research (Fox & Bayat, 2008). The study followed a survey approach. Survey research is the most preferred and most frequently used research design in social science (Babbie & Mouton, 2021). The reason for the extensive use of surveys is as a result of advances in computer technology; which has made it much easier to analyze large data set in a few seconds. The survey method is also convenient because they can be completed anywhere, anytime without the hassle of having to have a face-to-face discussion.

6.3. Sampling method

There are two sampling methods, namely probability and non-probability sampling. A non-probability sampling method has been preferred for this research. According to Ritchie et al. (2013), non-probability sampling has certain benefits: it enables one to have confidence that the sample is not biased, which may lead to data contamination and it is also accurate in terms of data robustness. This sampling method is convenient and cost-effective (Fox & Bayat, 2008).

A judgemental or purposive sampling method was chosen for the study. The significance of the purposive or judgemental sampling method is that it assists in only selecting the population with knowledge about the study at hand (Fox & Bayat, 2008). For this study the following criteria was applied:

- Must be an employee at the organization
- Should be 18 years and older
- Should have an email address
- Should be an operational employee and not senior management

6.4. Data collection method

The data collection instrument adopted for this study is a self-administered questionnaire. Close-ended questions were chosen because they provide uniformity of response from participants and they are very easy to process (Babbie & Mouton, 2021). The researcher has attempted to avoid double-barrelled questions; this is an effort to ensure that the respondents are not confused and only the best answer is selected.

The study opted for a computerized self-administered questionnaire (CSAQ). In this method, the respondents independently complete a questionnaire on their cell phone or computer. The respondents receive the computerized self-administered questionnaire via email; the email contains the link in which the questionnaire can be accessed. Also included in the electronic mail is the newest innovation in accessing the questionnaire, a QR code that can be scanned using smartphones and it leads the respondents straight to the questionnaire. Google forms were the chosen software for the questionnaire for this study.

The respondents had an option to click on the link or open a QR code and completed the questionnaire; the software populated and submitted their response online. The software accepted the responses and returned the data file. The method was also preferred because the respondents are all computer literate and have access to a cellphone or computer. And the organization under study can receive the summary of findings in an electronic format, immediately after the study is concluded; cutting out the costly printing of results. The non-printing of findings contributes to maintaining a green environment.

6.5. Research instrument

The questionnaire was broken down into 2 sections, section A and section B. Section A of the questionnaire collected biographical information. Section B covered questions on the three main study constructs namely, EPMS, motivation, and lastly, the career advancement and development. First biographical information will be discussed in details below:

6.5.1. Section A

The biographical information was self-developed by the researcher and it incorporated the following personal information about the participants:

- The respondents' gender.
- The age group of the respondents.
- The duration of employment.
- The status of employment.
- The level of education.
- The salary job grade.
- Confirmation of whether the participants have an annual review with the manager or supervisor.
- Lastly, to confirm if the employee has ever considered leaving the organization in the last 12 rolling months.

6.5.2. Section B

Section B covered the constructs of the study EPMS, career advancement and development, and motivation. Each construct consisted of 8 questions. A 4-point Likert scale was used for this study. Firstly, the EPMS questions are discussed in detail below followed by the motivational questions and then lastly career advancement and development questionnaire is discussed in details.

For EPMS, the participants were requested to indicate the importance of certain elements to them on Likert rating. 1= not important at all, 2 = representing low importance and 3 = representing important and lastly column 4 = representing very important. EPMS was made up of the following elements, employee key performance areas, importance of promotion, coaching of employees and regular feedback. The questionnaire is grounded in Herzberg's two factor theory. The participants were instructed to choose only one answer per question and also the design of the question made it impossible to choose 2 answers.

For the second construct, a similar approach was taken. A 4-point Likert scale was used to capture the extent to which some elements contributed to the participants' motivation. Motivation questions included a mixture of hygiene and motivational factors, derived from a study by Ozsoy (2019). Motivation covered the following elements, challenging work, recognition of employees, respect, and rewards. The scale was coded from 1 to 4, 1 = being little extent, 2 =, 3 = and 4 representing great extent.

Lastly, for career advancement and development, the participants were requested to indicate the level of importance of each element to them. The elements includes training, career development plan, job rotation to enhance employee skills and a personal development plan. The questions were rooted in Herzberg two factor motivational theory. The questions were coded from 1= not important at all, 2 = representing low importance and 3 = representing important and column 4 = representing very important.

6.6. Population

The research was conducted at a large global liquor brewing company that employs over 10 000 employees worldwide. In South Africa, the company employs over 753 employees. The survey was sent to 730 employees, of which 153 responses were received back, a fair representation of the population (21%) under study and also adequate for the study. The study was spread by a well-diverse ethnicity, a good representation between male and female, and a cover of all departments in the organization.

6.7. Data analysis

Due to the nature of the research approach being quantitative, data in this study was analyzed utilizing computerized quantitative techniques. The latest version of Statistical Package for Social Science (SPSS version 26) was utilized to analyse data. The method is effective when data is collected primarily through

surveys (Fox & Bayat, 2008). For data presentation, tables and figures were used. To make data interpretation and analysis easy, a descriptive and inferential statistics techniques were employed.

7. Results and Findings

7.1. Inferential statistics

According to Moodley (2011), inferential statistics are statistical techniques that assist in decision-making or predictions about the population based on data obtained from a sample of that population. Inferential statistics for this study included correlation analysis test. First, the factor analysis discussed in details.

7.2. Exploratory factor analysis

According to Pallant (2010), factor analysis is a data reduction strategy; it takes large data sets of variables and converts it into smaller sets of factors. To explore data in the study and gain a good understanding of which factors represent the data, exploratory factor analysis was utilized as suggested by Roux (2010). There are two types of factor analysis, namely confirmatory factor and exploratory factor analysis. Exploratory factor analysis is usually utilized in the initial stages of the research to explore the interrelationship amongst the variables. Exploratory factors analysis was performed in this study as construct validity. Before the factor analysis was performed, the Kaizer-Meyer-Olkin measure of sampling adequacy and Bartlett's Test of Sphericity were conducted first.

Table 2: KMO and Bartlett's test

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy		0.754
Bartlett's Test of Sphericity	Approx. Chi-Square	824.653
	df	91
	Sig.	0.000

Source: Own compilation

The Kaizer- Meyer-Olkin measure of sampling adequacy assesses whether the sample size suffices for factor analysis or not. It is recommended that a study should attain a 0.6 and above rating to be considered sufficient to do a factor analysis (Pallant, 2010). If the study attains less than a 0.6 rating, it is deemed to be insufficient or the sample size is too small. A p-value = 0.754 rating has been achieved, which means the sample size is sufficient and factor analysis can be conducted.

The Bartlett's test of sphericity assesses if there is enough correlations between the variables for factor analysis. It is recommended that a study should attain $p < .001$ (Pallant, 2010). The study has a significant value of $p < .001$ which means there are enough correlations between the variables for factor analysis. According to the Extraction Pattern Matrix, 3 factors were extracted. These align very well with the constructs that were developed in the questionnaire. Roux (2010) postulates that only factors with an Eigenvalue greater than 1 can be retained for a study. The factor loadings are discussed in more detail under the reliability and validity heading below.

Reliability and validity

The researcher took the precautionary measure to ensure that the study is not biased and the views of the respondents are not diluted or influenced. Several measures were also taken to ensure that the study is both valid and reliable. The study adopted a construct validity model. Construct validity is defined by Notelaers and Van Der Heijden (2020), as "the degree to which a test measures what it claims or purports to be measuring". It is utilized to check the quality and the accuracy of the research tool. The study shows adequate construct validity. The results are shown in Table 3.

It is clear on the Eigen values that there are some components from 3 factors which can be extracted from the study for the data interpretation purpose. According to Roux (2010) only factors with an Eigenvalue greater than 1 can be retained for the study. On component 1, which EPMS there are 5 factors which are loading high and on component 2, Motivation, there are 4 factors loading high and lastly on component 3, training and development, there are 5 factors loading high.

Table 3: Summary of Exploratory Factor Analysis and Reliability Results.

Factors	Factor loadings	Eigenvalues	Variance explained (%)	Cronbach's Alpha Coefficient
Factor 1 :EPMS				
EPMS1. How important is it to you to have clear and agreed performance objectives?	0.854	4.664	33.317	0.808
EPMS2. How important is it to you to sit with your direct manager/supervisor to discuss and set annual key performance areas?	0.752			
EPMS3. How important is it for you that you get promoted to the next job grade based on your performance?	0.698			
EPMS4. How important is it for you to have an EPMS?	0.671			
EPMS5. How important is it to you that your performance determines your salary increase?	0.639			
Factor 2: Motivation				
Motivation 1. To what extent being challenged at work, i.e. given more responsibility motivates you?	0.818	1.856	13.258	0.765
Motivation 2. To what extent does being listened to (ideas) by a supervisor motivate you?	0.808			
Motivation 3. To what extent does getting recognition for what you do motivate you?	0.757			
Motivation 4. To what extent does EPMS motivate you?	0.687			
Factor 3: Career advancement and development				
CAD2: How important is on-the-job training for you?	0.793	1.664	11.74	0.799
CAD4: How important is it for you to have the resources needed to complete your task and succeed?	0.701			
CAD5: How important is it for you to have critical success factors clearly listed and understood?	0.691			
CAD6: How important is your involvement in drafting your career development plan?	0.633			
CAD8: How important is it to you that everyone has an equal chance to be promoted?	0.597			
TOTAL		8.184	58.315	2.372

Reliability refers to replicability of the findings result from the study (Radebe, 2013). From table 2 above, it is clear that the Cronbach Alpha Co-efficient score for all 3 constructs is greater than the recommended 0.70 (Pallant, 2010) needed to ensure reliability. The 3 constructs are reliable.

7.3. Testing the study objectives (hypothesis test)

7.3.1. Correlation analysis
