LETTER FROM THE EDITOR

“A total of 144 competitive papers are published in the 15th IBC Conference Proceedings of 2022, signifying a success rate of 82.8%.”

Dear IBC Delegate,

As editor and on behalf of the publisher (North-West University Business School, NWU, Potchefstroom), it is my absolute pleasure to welcome your research into the 2022 conference proceedings of the 15th IBC Conference. The review processes have been stringent and only quality papers are included in this proceedings.

The review policy (which also appears in these proceedings) was stringently followed. In 2022, a total of 174 competitive papers were received, representing 19 local and 5 foreign institutions from 6 countries. Of these, 29 (16.6%) were rejected, including two papers that were transferred to Work-in-progress status. Therefore, a total of 145 competitive papers are published in the 15th IBC Conference Program of 2022, signifying a success rate of 82.8%. Some 54 Work-In-Progress papers have been accepted by developing researchers.

Specific managerial interventions that encouraged delegates to upgrade their research were initiated 13 years ago. At the same time, research guidance was also launched to assist younger (and more experienced) researchers. Resultantly, there was a remarkable improvement in the quality of the competitive papers presented at conferences. These will interventions continue in the years to come.

Finally, I would like to thank all the authors for all their hard work. A hearty well-done on your accepted papers that are deservedly published in this proceedings! I do not doubt that the quality of the papers adheres to the required standards befitting a leading academic conference such as the 15th International Business Conference.

Best regards,
Prof Christo Bisschoff

EXECUTIVES AND MEMBERS OF COMMITTEES

EXECUTIVE COMMITTEE

**GOLDMAN
GEOFF**

DEPARTMENT OF BUSINESS MANAGEMENT
UNIVERSITY OF JOHANNESBURG

 ggoldman@uj.ac.za

CHAIRPERSON

Prof. Geoff Goldman is an Associate Professor in the Department of Business Management at the University of Johannesburg. He is the Postgraduate Coordinator and Coordinator of the MCom (Business Management) program in the department. Geoff lectures on Critical Management Theory and Research Methodology. He is an avid qualitative and conceptual scholar and has authored over 110 articles, conference papers, books and book chapters. Geoff's research interests lie in Critical Management Studies, Business Ethics and Strategy Implementation. He is the managing editor of the SCieLO indexed management journal Acta Commercii, and holds a Visiting Professorship in the Department of International Management, Krakow University of Economics in Poland. Geoff holds an NRF C3 rating for his work in Critical Management Studies.

**VAN DER MERWE
STEPHAN**

NWU BUSINESS SCHOOL

 stephan.vandermerwe@nwu.ac.za

ORGANISING DIRECTOR

Prof. Stephan van der Merwe is a Full Professor of Entrepreneurship at the Potchefstroom Business School, North-West University, South Africa. He teaches Entrepreneurship, Business Management and Project Management at MBA and executive levels. Professor van der Merwe completed his doctorate at the North-West University where he studied the formal planning practices of small and medium-sized family businesses. Professor Van der Merwe also received a MSc degree in Agricultural Management from the Free State University and a MBA (cum laude) from the North-West University.

**ROBERTS-LOMBAARD
MORNAY**

DEPARTMENT OF MARKETING MANAGEMENT
UNIVERSITY OF JOHANNESBURG

 mornayrl@uj.ac.za

MARKETING DIRECTOR

Prof. Mornay Roberts-Lombaard is currently a full professor in the Department of Marketing Management at UJ. He is also the programme manager for Masters and Doctoral studies in the department. He lectures on both undergraduate and post-graduate levels, has published numerous articles in international and South African journals and delivered conference papers locally and abroad. He is also the deputy editor for the European Business Review and the section editor for Acta Commercii. His exposure is also present through various industry panels of which he is part.

EXECUTIVE COMMITTEE

**BISSCHOFF
CHRISTO**

NWU BUSINESS SCHOOL

 christo.bisschoff@nwu.ac.za

QUALITY CONTROL DIRECTOR &
EDITOR

Prof. Christo Bisschoff started his career as an agricultural economist at the North-West Cooperative. After joining the University of Pretoria as a lecturer in Business Management, he moved to the Northwest University's Business School in Potchefstroom where he lectures Marketing Management. Christo focuses his research on brand loyalty, business ethics and still researches his favourite topic, agricultural business management. He collaborates with his international network and also focuses on comparative inter-country research, and obtained an NRF research rating in 2020. He resigned as the chairman of the International Business Conference but still serves as editor to publish the conference proceedings. Christo loves to be out in nature and enjoys fishing, hunting, the great outdoors and off-road adventures. He is married to Antoinette, and they have two sons. Christo (Jnr) is a Sports and Exercise Scientist and Senior lecturer at the North-West University, and Wilhelm is an electrical engineer in Christchurch, New Zealand.

**OOSTHUIZEN
COBUS**

MILPARK BUSINESS SCHOOL

 cobus.oorsthuizen@milpark.ac.za

FINANCE DIRECTOR

Dr. Cobus Oosthuizen is the Dean of Milpark Business School. Cobus' areas of specialisation are Leadership, Entrepreneurship, and Strategy, with keen interests extending into the areas of technology, innovation, complexity, philosophy, artificial intelligence, futures studies, ethics, sustainability, and the Fourth Industrial Revolution. His current research focus is the Fourth Industrial Revolution and its influence on strategy, leadership, management practice and the world of work. He believes that we are not captives to a pre-determined set of choices, but that the future offers many possible outcomes. As a collective, we should aim at creating pathways that enable the enactment of individual and social events to shape a preferred future in which all stakeholders will benefit.

IBC COMPETITIVE PAPER REVIEW POLICY

The quality control and review process of the International Business Conference consists, regarding competitive papers, of a number of steps. These are:

1. On acceptance of the paper it is desk reviewed by either the editor or a member of the academic committee. This is to weed out obvious flawed papers and also to ensure that papers are befitting the conference themes and management.
2. Desk rejected papers are returned to authors with comments. Accepted papers, on the other hand, are dispatched for a double blind review by local and international academia. The requirements of reviewers include publishing experience as well as at least a Master's degree as the minimum academic qualification. In addition, management experts from industry with a similar academic qualification and applied knowledge may also serve as reviewers. Positive reviewers' reports from both reviewers are required for a paper to be accepted.
3. Although the IBC strive to have all papers reviewed by one local and one international reviewer to ensure a quality review process, two fitting local (or two international) reviewers could also review a paper independently.
4. In the case where one reviewer accepts and the other rejects the paper, such a paper is subjected to a third and final review at a senior independent reviewer.
5. Accepted papers are returned to the authors with the anonymous reviews (2).
6. Authors are required to provide proof the corrections made as suggested by the reviewers. This includes an additional document dealing with reviewers' comments and actions taken to address these comments.
7. All final papers are required to be properly language and technically edited. Proof of language editing is required with the submission of the final paper.
8. Once the Academic Committee accepts the corrections made in (6) above, the paper is accepted for publication in the conference proceedings.
9. Only papers that have not been published before/elsewhere are considered for presentation and publication by the IBC. Authors are required to sign a declaration in this regard.
10. If a paper is rejected as a competitive paper, the authors could apply to the Academic Committee for the paper to be presented at the conference as a non-competitive or work-in-progress paper. These papers are not published in the proceedings and clearly indicated on the programme as a non-competitive paper.
11. Only papers presented at the conference are published in the proceedings.

Abstract

The agricultural sector in South Africa is a major contributor to the gross domestic product with livestock farming being a substantial component. Livestock is purchased at auctions and farmers require all available data sets for animal off-taking. In a previous research study, a data centric framework (DCF) for animal trading decision support was developed for cattle farmers, which could be used to predict the price of cattle at auctions. The DCF included a visualisation component for animal family trees.

The implementation of the DCF required that the requirements for the visualisation of cattle family trees be determined for farmers. The Design Science Research Methodology was used to acquire requirements for animal family trees from cattle farmers in South Africa. An online questionnaire was developed showing various information requirements and visualisation options for cattle family trees. The findings show that farmers prefer a cattle family tree visualisation showing three generations, which is different from the one currently being used in auction catalogues. The selected cattle family tree visualisation will be implemented in an online application, combining other catalogue information to assist farmers in their purchase decisions at auctions.

1. Introduction

The world population is estimated to increase to almost 10 billion people by the year 2050, subsequently increasing agricultural demand (FAO, 2017). The demand for milk and meat is also expected to increase due to rapidly growing urban populations and a change in consumer needs. Technological advancements have vastly improved human lives from better medical enhancements to enormous progress in the agricultural sector to create a world free of hunger and malnutrition as stipulated by the 2030 Agenda for Sustainable Development. The second Sustainable Development Goal (SDG 2) aims to end hunger and malnutrition, achieve food security and promote sustainable agriculture by 2030. The 2030 Agenda acknowledges that SDG 2 is particularly important and the success of other SDGs (Sustainable Development Goals) is highly dependent on achieving food security and the promotion of sustainable agriculture. The agricultural sector provides food, employment, foreign currency and raw materials and contributes to the GDP of South Africa (Van Zyl, Nel & Groenewald, 2010).

Agriculture has the capacity to uplift the economy of any country, however for developing countries agriculture plays an important role. According to Statistics SA, South Africa derived three hundred and fifty one billion rand in the agriculture and related services industry in 2019 with animals and animal products contributing almost half (44%) of the sales and cattle contributing the largest percentage (Stats SA, 2019). Livestock farming contributes 48% of the country's agricultural output

with a total of 14 million head of cattle comprising 80% beef and 20% dairy (South Africa Yearbook-Agriculture, 2018). Livestock farming requires large capital investments with a low return on investment, so investing in breeds that possess superior traits is crucial to the success of the farming venture (du Toit, 2022).

Livestock farming in South Africa has a long history with cattle, sheep, pigs, goats and chickens being kept by the people of Southern Africa (Casey, 2021). Cattle are a major part of many lives and cultures in South Africa as they are regarded as a major household asset, because they provide food and nutrition, income, manure for other farming endeavours and hides for shoes and clothes. Cattle also participate in several socio-cultural roles such as appeasement of ancestors and payment of lobola in addition to providing much-needed nutrition to millions of people.

Cattle farmers in SA can be stud farmers or commercial farmers. The stud farmers may also have a commercial herd where they place animals that fail to meet the criteria set for stud keeping (du Toit, 2022). Stud farmers keep pure-bred animals of a certain breed, such as Afrikaner, Angus, Brahman, Jersey or Nguni. Commercial cattle farmers, on the other hand, make use of stud cattle by buying bulls or semen to improve certain traits peculiar to that breed in their own cattle herds. Superior quality genetics are important to improve a given herd hence cattle farmers are always striving to get value for their money.

Livestock farmers in SA who want to sell or buy animals have many options. They can advertise on Sasfox (South African Small Farmers Online Exchange) and conduct a private sale or use the auction route, abattoirs and butcheries. Livestock auctions are an important part of livestock farming as they provide farmers with a platform to buy and sell animals, also called off-taking. Livestock auctions sell a mixture of animals, amongst them beef and dairy cattle. The livestock auctioneering companies supply calendars with information, such as dates and venues. They also furnish auction attendees with catalogues advertising the various animals on sale.

At a stud auction, animals with special breeding traits are for sale (Figure 1). The auctioneer works closely with a breed society to select the best quality animals with superior traits. Reputable auctioneers have websites, for example Bonsmara SA, Hobson & Co, that are easy to access. A Google search for livestock auctions in SA will indicate the number of auctions.

Figure 1. Greendale Brangus production sale
(<https://www.farmersweekly.co.za/auctions-events/>).

In most cases animals must be transported to and from the auction house and certain outbreaks in diseases, such as foot and mouth disease can hinder the normal way of conducting auctions, called

open cry auctions. Recently, due to the global pandemic Covid-19, auctioneers were left with no alternative but to look at other ways of running the physical auction, they used digital technologies and introduced online auctions. Dr. Cobus Oberholster, in an interview with Farmer's Weekly (2022), said there was an increase in the number of farmers preferring digital auctions to open cry ones (Coleman, 2020). He went on to predict a further growth in digital auctions in the next two to three years, largely because of the advantages associated with them such as, a reduction in travelling expenses, easy access from anywhere in the world and a reduction of stress levels of the animals, amongst other advantages.

For cattle farmers and traders to be able to make use of auction catalogues and get value for their money, there is a need for good visualisation of the animal's genetic makeup. The visualisation of the animal's family tree, as well as its physical attributes, are crucial to assist farmers to make a buying decision and get the most suitable animal for their venture. Recently in South Africa, a Bonsmara bull was sold for R2,1 million at an auction (Marais, 2022). Farmers need assurance that when they invest in an animal that it is a genetically superior animal, which will also produce genetically superior offspring.

A data centric framework for animal trading decision support was developed by Nyamutsambira et al. (2021). A major component of the framework (Figure 3) was the visualisation application proposed for use by farmers at auctions. The visualisation component included the visualisation of cattle family trees, including additional catalogue information requirements of farmers. However, the cattle family tree visualisation and information requirements of farmers have not been determined. The aim of this study was to obtain these requirements.

2. Problem Investigated

The predicted rise in online auctions (Coleman, 2020), will require farmers to be comfortable with using online technologies. Farmers need to study animal family trees and understand the breeding values and related data that accompany them. An animal's breeding value is defined as the genetic merit for each trait calculated using Best Linear Unbiased Prediction (BLUP) technology (Breedplan, 2015). Breeding values are estimated and are based on the amount of information recorded for that animal and are then called Estimated Breeding Values (EBVs) (Oldenbroek & Van Der Waaij, 2014). Farmers need to choose the best animals for their breeding objectives and a large amount of information is recorded on livestock performance and pedigree, to assist farmers with purchasing decisions. Prior to an auction, farmers are furnished with auction catalogues that contain a picture of the animal, pedigree and performance data of the animal on auction (Figure 2), however some farmers do not always know how to interpret the information in the catalogues or require additional information (Jordaan, 2016). The auction catalogues generally contain a picture of the animal on auction with some ancestry information. The problem identified in this study is that the data and requirements for the visualisation of animal family trees have not been determined from the farmer's perspective.

3. Research Objectives

Farmers can attend an auction in person, however the animal auctioneering trend presently is to provide an online option as well. Presently, the auctioneering organisation will provide a catalogue (Figure 2) of the animals being auctioned for use by farmers bidding at an auction. The authors could not find any study conducted in SA that surveyed farmers to determine their auction catalogue information requirements.

The main objective of this paper is to elicit requirements for cattle family trees for use at auctions as well as for the data centric framework for an animal trading decision support application (Figure 3) being developed to assist farmers with their purchasing decisions. As the first study done in SA to obtain such requirements, the aim was to survey farmers on their animal information and visualisation requirements to be used at auctions for making purchasing decisions. The information requirements can be recorded for use in auction catalogues and the proposed online application, being developed as

part of this study. The research objective addressed in this study is to determine what information and animal visualisation requirements farmers want when attending auctions.

4. Literature Review

The African continent hosts several indigenous breeds of cattle that come in all shapes and sizes from the Ethiopian Boran to the Ankole in Uganda, the Kamba in Kenya, the Tuli and Mashona in Zimbabwe and the Nguni and Afrikaner in South Africa. However, these indigenous breeds with their superior traits, are disappearing (Dessie & Mwai, 2019). In addition to these indigenous breeds, Africa is also home to many imported breeds like the Aberdeen Angus from Scotland, Limousin from France, Brahman from the USA and many others. Africa contributes a fifth to the world's cattle numbers (Dessie & Mwai, 2019), which is approximately 200 million head of cattle, given that world cattle population is around a billion (Statistica, 2022).

4.1. Importance of cattle

The lead author of this paper grew up in rural Zimbabwe where cattle were considered a symbol of wealth. Owning a herd of cattle was seen as a sign of wealth and the more cattle one had, the richer they were considered. Owning a herd of cattle had many advantages, such as easy access to labour, improving your social status and easily becoming the village head. It also included a general improvement to the owners' lives, as milk would be in abundance and could be easily exchanged for anything they needed. Cattle were slaughtered for most important life events, such as births, deaths, marriages and other celebrations, including Christmas, New Year and Easter holidays. Cattle represented a safety net and savings, milk and sour milk could be exchanged for other goods and services. Cattle could be sold to sponsor events in the family like education for the children or be rented out to help with transportation and buying of other farming requirements.

Well over a half billion people in Africa depend entirely or partially on farm animals with cattle being the main animal of choice because of the numerous products it can give and its size (World Economic Forum, 2019). While demand for milk, meat and eggs is growing modestly in developed countries, it is growing rapidly in Africa due to rising population and is projected to increase by 80% from 2010 to 2030 (World Economic Forum, 2019). This is going to put pressure on farmers to increase the production of livestock products to meet this predicted demand.

There are approximately 14 million head of cattle in South Africa (Stats SA, 2019), which is about 7% of Africa's total. Commercial and communal farming are common practice, where commercial is farming with more head of cattle, better farming equipment and practices and high turnover whereas communal farming involves insufficient resources and the rearing of mostly indigenous breeds of cattle (Malusi, Falowo & Idamokoro, 2021). Communal farming is mostly small-scale and used to meet the needs of the immediate family (Mashoko et al., 2007; Mapiye, et al., 2009).

In view of the information above, this study requires farmers, whether they are commercial or communal, who make use of auctions, to acquire new animals for their businesses. The animal of choice in this study is cattle because cattle in South Africa and Africa as a whole, meet the demands of providing much-needed nourishment as well as meeting economic objectives (Musemwa et al., 2010).

4.2. Livestock trading

The livestock sector is important for growth and value addition and globally contributes around 40% of agricultural GDP with developing countries contributing higher percentages (World Economic Forum, 2019). South Africa produces 21.4% of the total meat produced on the continent of Africa and 1% of global meat production (Cheteni & Mokhele, 2019). The goal of farmers, when they enter a farming enterprise, is to make a profit. Farmers usually find themselves wanting to buy or sell some of their livestock for numerous reasons.

Farmers have several avenues that they can use to buy or sell their animals, including abattoirs, butcheries, speculators, traditional farm gates and auctions (Musemwa et al., 2010; Ndoro, Mudhara

& Chimonyo, 2014). Butcheries and abattoirs are mostly used for selling meat and as such are not suitable for buying stock (Cheteni & Mokhele, 2019). Farmers thus have to make use of speculators, farm gates and auctions. Private sales involving farm gate marketing are out of the scope of this study. Speculators can be involved in a private sale or can be part of an auction and they try to decrease the price of an animal as much as they can (Cheteni & Mokhele, 2019), making them an unpopular market amongst farmers. Auctions are a major part of this study as they offer farmers and traders a platform for selling and buying stock, especially for stud farming.

Stud farmers keep cattle breeds with certain traits of interest. At stud auctions, farmers and traders buy and sell cattle with various traits that reach fair prices, depending on the traits and the needs of the buyer. Auctions provide a good market as they tend to be more regulated, unlike private sales and farmers can sell without any knowledge of the market (Kriel, 2021). Besides these advantages of auctions, there are some disadvantages (Agribook, 2022), which include: high transport costs to and from the auction venue; contraction of diseases in the pens; elevated level of stress for the animals; very time-consuming; auction prices are susceptible to manipulation and lastly farmers may feel pressured to sell at lower prices rather than incur returning transport costs. Some of these disadvantages have been eradicated by the advent of online auctions that are gaining traction according to Russell Luck, CEO of SwiftVee an online auction, in an interview with Farmer's Weekly (Kriel, 2021). Russell attributed the success of online auctions to modern technology, good assistance from Google and a good sales team.

4.3. Auctions and online auctions

Research by Ndoro et al. (2014) showed that South African beef cattle producers lack skills, knowledge and information to explore all markets available to them. With stud farming, the requirements for keeping pure bred animals entail that farmers join breeder's associations, record performance data and be abreast of current trends (Mueller et al., 2015). These requirements ensure that stud farmers get the support they need even when marketing their animals at auctions.

In South Africa, there are numerous livestock auction houses that have been operating for years, including BKB, Sheard Auctioneers, Hobson & Co and KLK Landbou Beperk. Recently there has been a rise in the online sales of livestock with the help of innovative technology, such as machine learning, artificial intelligence, live video streams and data analytics (Njiraini, 2022). A steady increase in online auctions has taken place the past two years due to the global COVID-19 pandemic and lockdowns and research studies showing that face to face auctions can spread animal diseases (Step et al., 2008; Stroebel et al., 2018; Kriel, 2021).

Auction houses have calendars to indicate the dates of the auctions and the venue with directions (Figure 1). There is the marketing officer who sources the livestock, the accountant who handles the finance, the roll clerk who records data about the seller, purchaser, animal and price and finally the labourers who take care of the animals and load them onto vehicles (Agribook, 2022).

Normally animals are branded with the owner's brand according to the Animal Identification Act, 2002, which states that it is compulsory to brand or tattoo one's own animals for identification purposes (South African Smallholder, 2021). Members of the SPCA often attend an auction to make sure all animals on sale are being treated well and to confiscate any animals that look like they are being abused or have been stolen.

There are various types of activities that can take place at an auction and these include special auctions, stud auctions and game auctions (Agribook, 2022). A special auction, which is requested by a seller to sell all their livestock, is known as a dispersal sale. A stud auction is the focus of this study. It is when animals possessing special traits are for sale and is performed by a specialised stud auctioneer. Catalogues containing the animal's family tree and its performance data are usually given out prior to the auction (Figure 2).

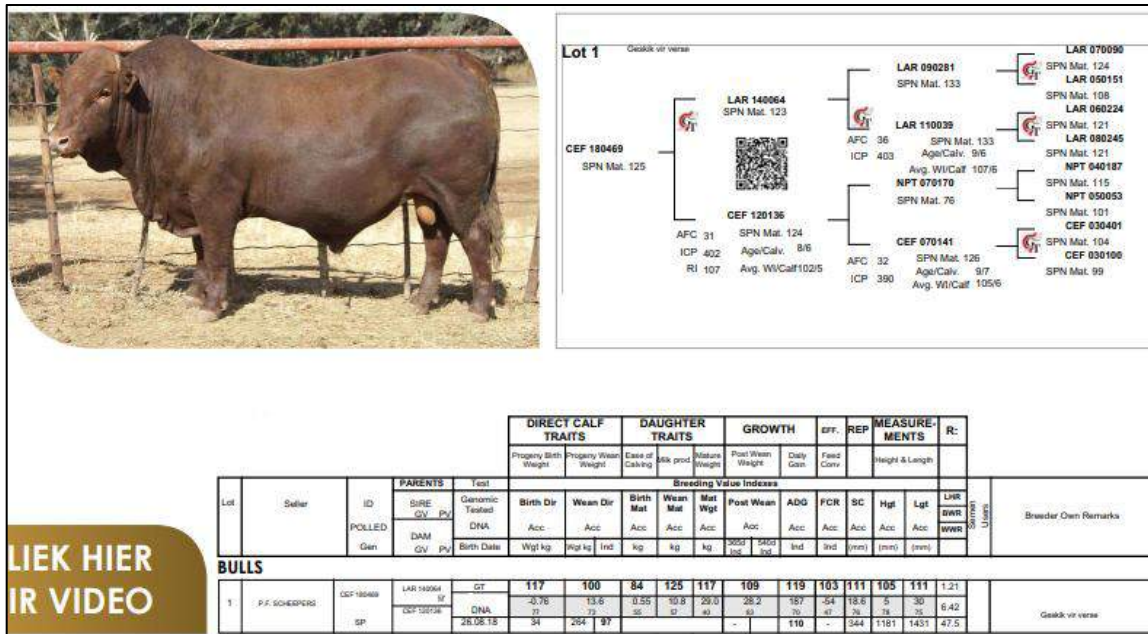

Figure 2. Pedigree and performance data for bull CEF 180469

4.4. Animal family trees and performance data

An auction can be a very intimidating place if you do not know your breeding objectives and the kind of animal that will improve your herd. When presented with an auction catalogue, the farmer must be able to read the pedigree as well as the performance data to make the best purchasing decision. At the auction, farmers are faced with majestic-looking animals that look very appealing to the eye but could be wrong additions to their herd. Farmers need to have the knowledge of the genetic makeup of the animals prior to the auction for them to make informed decisions (Jordaan, 2016).

Figure 2 shows a page in an auction catalogue, the information contained on this page is about bull CEF 180469. Immediately to the right of the bull's picture is its family tree and the table below has performance data that has been recorded for the bull. The numbers represent Estimated Breeding Values (EBVs) of the bull, these numbers are particularly important for a farmer to understand as they give an idea of the genetic merits of the animal.

For most farmers, auction catalogues are not so easy to interpret (Jordaan, 2016). The purpose of this research is to ask farmers the requirements that will help them interpret a catalogue better. The wrong choice of a bull can set a farmer back for years to come and he might not ever recover from the losses (Jordaan, 2016).

4.5. Proposed framework for cattle auction price reduction

This study is a continuation on a study that proposed a cattle trading data driven framework and Decision Support System (DSS) as shown in Figure 3. The focus of this paper is the data visualisation component of the data centric framework for animal trading decision support.

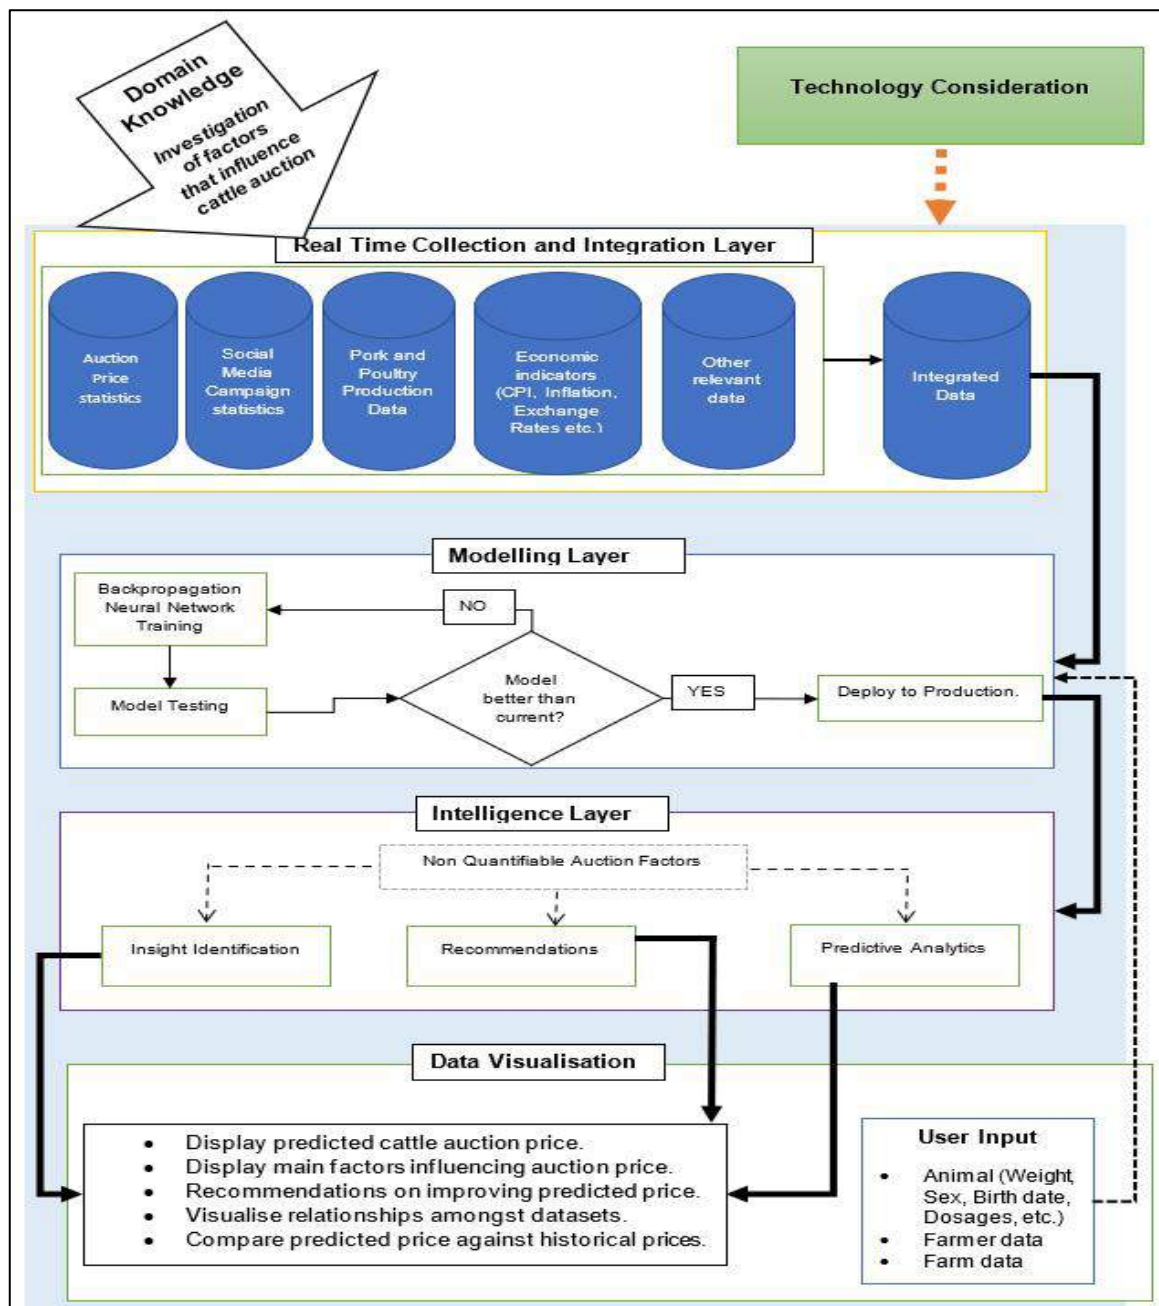

Figure 3: The data centric framework for animal trading decision support (Nyamutsambira et al., 2021)

Stud farmers record performance data for their pure-bred animals as a requirement from their breeder's societies and the SA Studbook (SA StudBook, 2022) as well as for use in breeding programmes for decision making (Kluyts et al., 2003). This data becomes the base of the performance data presented to auction attendees in catalogues as shown in Figure 2.

Technological enhancements have made it possible for farmers to record their animal performance data with ease (Weigel, Van Raden, Norman & Grosus, 2017). Data about the animal and its performance and farmer and farm data must be recorded consistently and ethically as it serves as the major input for the cattle trading DSS. This data can then be visualised to help farmers better understand the animal they want to purchase, establish market prices and do comparisons.

4.6. Information as a Service (IaaS)

Modern agricultural production is not possible without the implementation and use of modern technologies and reliable and up-to-date digital information about farm operations (Calitz et al., 2022).

The new way of thinking and operating for agricultural companies is through digital transformation that transforms the way the companies provide information, interact and communicate with customers (Aguera et al., 2020). Communication with farmers can be in the form of various channels, including Mobile Applications. Mobile Apps typically provide farmers with information services, including herd management (Karim et al., 2020). IaaS is an emerging cloud business model in which a company shares or sells relevant information to another company or individuals to perform their business (Calitz et al., 2022). Agricultural organisations must provide information services to farmers through their website, helpline and the use of other digital technologies to communicate with their customers with accurate information in a user-friendly way (Raza et al., 2020). Visualisation of cattle family trees will enhance the information organisations give to cattle breeders. Communication is the key to success in business because it builds solid relationships based on the effective and efficient exchange of information between two or more parties (Maharan, 2015).

4.7. Data visualisation and family tree visualisations

According to Statista (2022), the total amount of data created and consumed globally is expected to rise sharply from 64.2 to 180 zettabytes from 2020 to 2025. Data have been defined as the new oil in agriculture (Foidl, 2014; Loi & Dehaye, 2017; Sadowski, 2019; Lioutas & Charatsari, 2020). Big data are collected and used by most businesses and industries, including agriculture. In agriculture, large amounts of data must be collected and recorded for the efficient functioning of the farming enterprise (Botha, 2020; Wolfert et al., 2017). The use of modern technologies and Big Data in agriculture, introduces the concept of smart agriculture or smart farming (Kumar et al., 2019; Sadowski, 2019). This has the potential to increase productivity, decision making and enhance farming practices (Van Hertem et al., 2016).

Visualisation is the transformation of data and information into pictures and images. Data visualisation is defined as the graphical representation of data and information for easier comprehension (Steele & Iliinsky, 2010; Sodergard et al., 2021). Data visualisation is multi-faceted and is found in many disciplines and industries, including agriculture (Nguyen et al., 2017; Kumar et al., 2019). The process of data visualisation starts with the acquisition of data, its preparation, analysis and visualisations (Sodergard et al., 2012). Data visualisation assists with the exploration of large data sets and provides graphical representation of the data (Bokhare & Zainon, 2019).

Family data and family histories can be easily interpreted if represented in diagrams, called genealogy graphs or family trees. A family tree is a diagram representing the family relationships for a number of generations in a conventional tree structure. Most human family trees contain names, birth places and dates, pictures and death dates (if applicable). Free commercial software is available to aid family tree visualisations, such as MyHeritage, Ancestry and Findmypast. In addition, Microsoft (2020) provides templates for family tree visualisations (Figure 4). Existing techniques and applications for the visualisation of family trees have been extensively researched (Bokhare & Zainon, 2019).

Organisations such as Studbook (SA StudBook, 2022) records data of various cattle, including the animal's birthdate, birth weight, the parents and the traits of the parents. These data sets allows for the creation and visualisation of family trees of animals. Animal family trees (Figure 4) are different from human family trees as animals have more offspring and cattle genealogical records are more comprehensive than humans (Thompson Hall, 2013). There are a number of factors that contribute to cattle having more genealogical data than humans, such as:

- Gestation period of cattle is 283days, approximately 9 months, so they can have a calf every year;
- They can have calves from as early as two years old and their lifespan is 18-20years which means a single cow can have 16- 18 calves in its lifetime and even more if it has twins.

Figure 5: Visualisation of farmer responses

The fifth question had a list of traits that are often found in auction catalogues and farmers chose which ones were critical in helping with buying decisions (Table 1). The results show that farmers preferred the age, breed and sex of the animal to be necessary items in the catalogue with a total of 19 respondents out of the 20 choosing all three. This was followed by the weights from birth, weaning weight and mature weights specified by 17 respondents. Feed conversion rate with 15 respondents, identity number (n=14), length of animal (n=12), ease of calving (n=12), height (n=11), picture of animal (n=12) and finally milk production by 10 respondents. These responses represent what farmers perceived to be the most important to the least important for their buying decisions.

Table 1: Information to be included in cattle family tree

Cattle family tree visualisation	Count
Identity number	14
Age	20
Breed	20
Weight includes birth, wean and mature	17
Sex	20
Ease of calving	13
Milk production	11
Feed conversion rate	16
Picture of animal	12
Length	12
Height	11

These results present farmers' preferred attributes in order of importance, however since these farmers were not asked whether they were dairy farmers or beef farmers some attributes are more important to beef farmers and vice versa. Beef farmers would not choose milk production as a trait of importance to them, but dairy farmers would find it to be of high importance. Attributes that are equally important for both beef and dairy farmers like age, breed, sex/gender, weights and food conversion rates clearly that they are the most important as shown by the results in Table 1.

Three diagrams were presented to the farmers as shown by Figures 6, 7 and 8. Farmers had to pick their diagram of choice from the three and 80% (n=16) chose diagram 1 (Figure 6), 20% (n=4) chose diagram 2 (Figure 7) and no one chose diagram 3 (Figure 8). Figure 6 relates to human family trees (Figure 4) and Figure 7 includes information relating to the auction catalogues as shown in Figure 2.

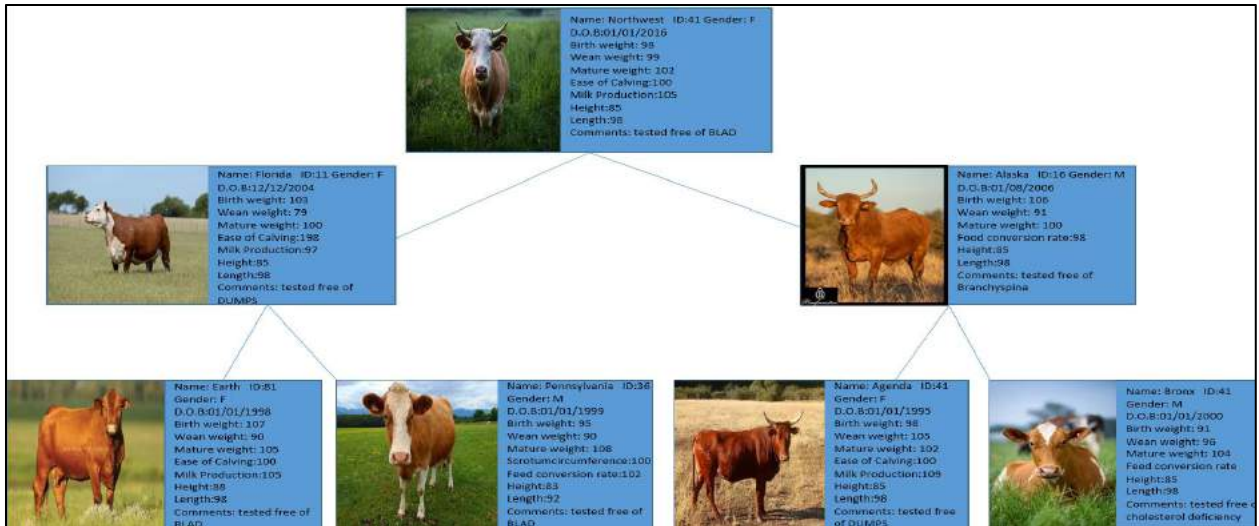

Figure 6: Proposed animal family tree visualisation - Diagram 1

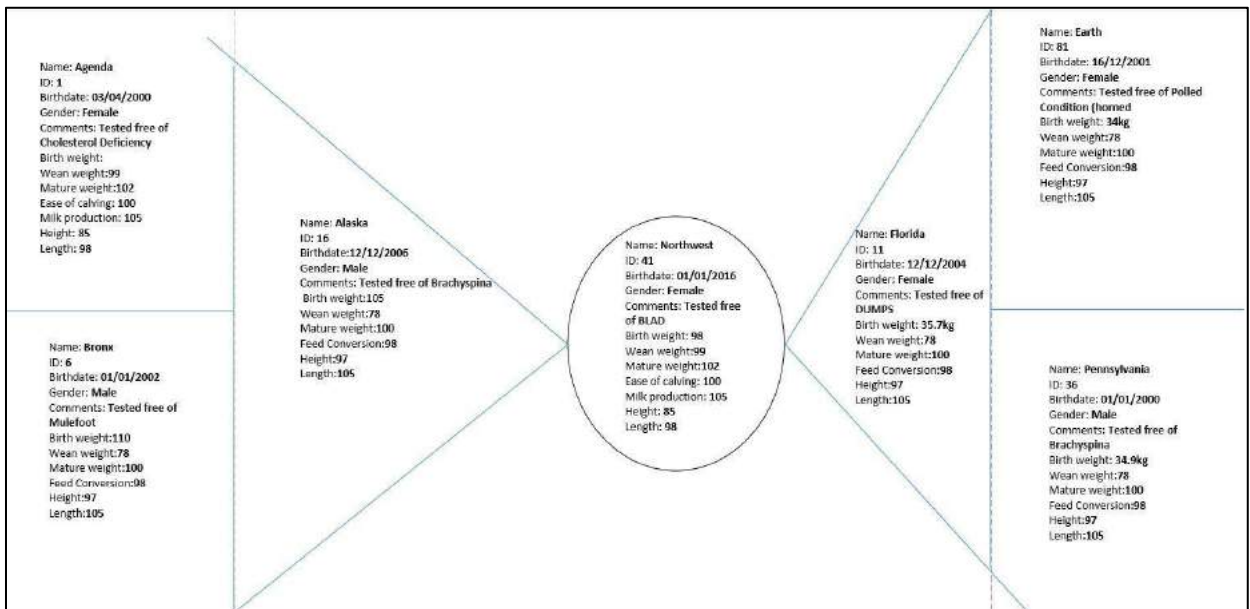

Figure 7: Proposed animal family tree visualisation – Diagram 2

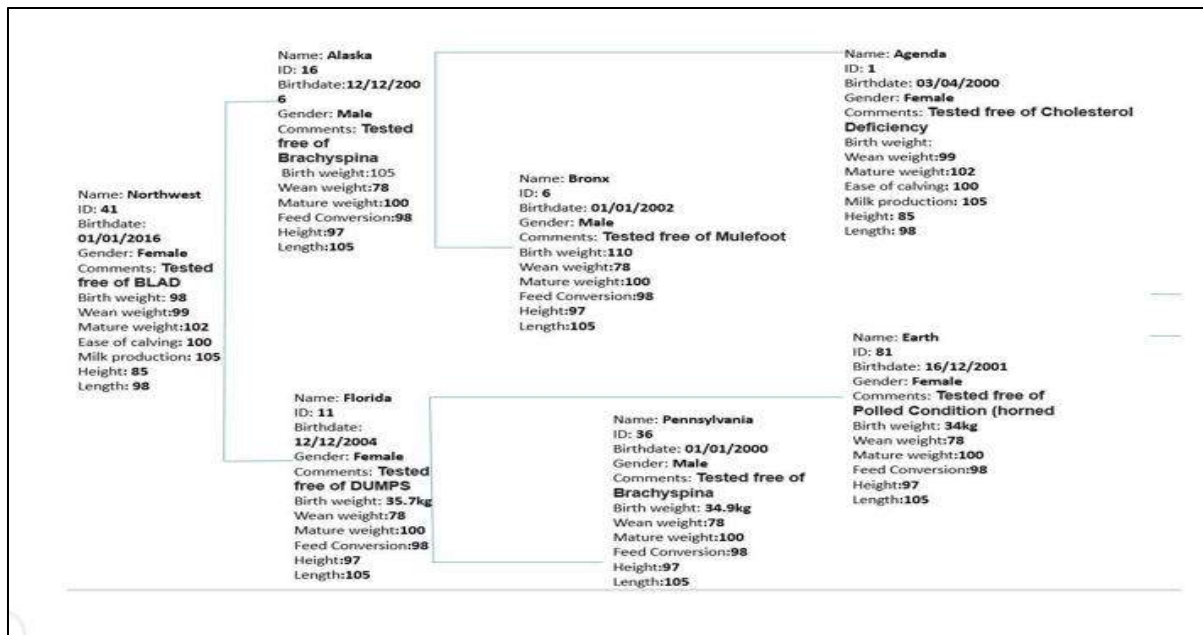

Figure 8: Proposed animal family tree visualisation – Diagram 3

6.1. Thematic analysis

The rest of the responses in the questionnaire on cattle family tree visualisations were qualitative and needed to be thematically analysed. According to Braun and Clarke (2008) thematic analysis offers a flexible way to analyse qualitative data. Braun and Clarke (2008) defined six phases of doing thematic analysis to aid those who are not so familiar with qualitative data and these are:

- Phase 1: Get familiar with the data, which involves reading and re-reading data to search for meanings before coding.
- Phase 2: Coding the data, this is after familiarisation with data, data are placed in codes that explain the main points from the data.
- Phase 3: Generating the themes, which takes place after coding, data with same codes will be clustered into themes.
- Phase 4: Reviewing the themes, which involves refining the themes and storytelling with the given data.
- Phase 5: Defining and naming themes, the final stage of the whole story the data are presenting before the final report.
- Phase 6: Involves telling the story to the intended audience in a report and emphasises the use of data extracts from the actual data involved in the analysis.

Table 2 shows extracts of the actual data during the thematic analysis of the textual responses. The results show that farmers need reproduction traits of animals in the catalogue as shown by 6 out of the 20 responses (30%). Other reproductive traits such as the ease of calving are already found in the catalogue (Figure 2). The respondents further wanted to know the number of services, days from calving to first service, days from first service to conception, days open, calf size and calf survival rate. Five of the respondents were satisfied with the catalogue as is. Six responses indicated that the animal pictures needed to show all the angles of the animal or include a video showing the animal in real life. Five responses showed an interest in knowing the previous owner and having the previous owner comment on the animal, for example rating its performance against the rest of the herd.

Table 2: Relating themes to literature and responses

Theme	Literature Support	Participant (P)
Catalogue	Bonsmara SA, 2019 BKB, 2021 SA Stud Book, 2022 Wagyu SA, 2019 Drakensberger Cattle Breeder's Society of SA, 2017	P1 “all items in BKB auction catalogue” P3 “none other than what is already there” P16 “Catalogue information”
Reproductive traits	Beef and Lamb New Zealand Genetics, 2017 The Global Standard For Livestock Data, 2018	P13 & 14 “reproductive traits” P9 “reproduction rates” P4 “days open, inter calving period-conception rate”
Previous owner information	FAO, 2018	P2 “previous owner” P6 “number of progeny-general remarks from owner for example progeny out of top 10% of own herd” P12 “traceability/movement report Inter calving period”
Pictures and videos	Lo, Hsieh and Chiu, 2013	P11 “All information on the present auction catalogue. I would like more pictures, previous owners, and a video clip showing the animal” P10 “I would like pictures from various angles” P7 “present auction data with photos (2-3) of animal”

One of the questions required the respondents to provide reasons for them selecting a specific diagram. Figure 6 was selected by 16 out of the 20 respondents (80%) and they indicated that they liked the fact that it was visual, had pictures of the animal and looked the same as a human family tree. All respondents indicated that they liked the diagram they chose because it showed three generations and had traits of the animal on the family tree. The last question asked respondents if they had any additional information they would like the researchers to take into consideration. The following are eight extracts provided by the participants (P):

1. P1 - “Provide family tree information live at auctions”.
2. P3 - “Provide information relevant to sustainable development of growth and reproduction”.
3. P4 - “Animals look better from the side than a photo direct from the front”.
4. P12 - “More pictures of the animal. Previous generations’ pictures. Provide this information online at the auction, especially previous generation data and pictures”.
5. P13 - “Provide the app online and on mobile phones”.
6. P15 - “The ability of the family tree to integrate with digital auction platform catalogue would be very helpful”.
7. P17 - “Comparison of trademarks of animal compared to national averages”.
8. P20 - “Good quality pictures and a side view of the animal is important”.

The current catalogue refers to the traits available in the existing auction catalogues, such as the one in Figure 2. It contains measurements such as height and length, daughter traits such as ease of milking, milk production, mature weight, FCR (food conversion rate), ADG (average daily gain) and many more (BKB, 2021). Figure 9 shows participant preferences as themes with frequency counts.

Figure 9: Participant preferences represented as themes

In Figure 9, inter calving period (ICP), days open, conception rate and reproductive traits were combined to form the theme reproductive traits. Some of these characteristics are found in the current catalogues of some of the auction houses, such as ICP, AFC (age at first calving) and scrotum circumference (Wagyu SA, 2019). The respondents were interested in knowing previous owners' information, movement reports and owner comments. One theme called previous owner comments stemmed from all these responses. The respondents suggested that using pictures or a video would help them to have a clearer idea of the animal on sale, especially in online auctions.

7. Managerial Implications

Buying livestock, especially cattle, at an auction can be very tricky if one is not aware of the traits of the given animal, hence the need for performance data and family trees that clearly show the genetic potential of the animal for sale (Jordaan, 2016). Farmers are provided with catalogues at auctions, showing the animals on show, however as shown in this study, the farmers require additional information and animal family tree visualisations to assist them in making purchasing decisions. One of the biggest shifts in farming over the past few years has been the move towards connectivity and the increase use of modern technologies (Botha, 2020). Existing auction catalogues providers now have to become data providers, data farmers can access in real-time at auctions.

The findings in this paper showed that farmers prefer an animal family tree with additional pictures of the animal on sale and its parents' pictures and information. The information presently included in catalogues at auctions (Figure 2) does not show any animal family tree pictures. The results of the study will now be used to implement the identified cattle family tree visualisations in an online application (App) that can be used by farmers at auctions. Managers, auctioneers, stud breeders, societies and agriculture organisations, such as BKB and Sheard Auctioneers, need to consider the farmers' information requirements and include the visualisations of the animal family tree in catalogues and in a mobile applications for farmers participating in auctions. IaaS will enhance relationships between farmers and agricultural organisations. Recommendations to farmers is that they need to record their livestock's history and use the animal family trees to keep track and market their livestock.

8. Conclusions, Limitations and Future Research

Farmers attend animal auctions regularly, including online auctions (Njiraini, 2022). Farmers are provided with a catalogue of the animals to be auctioned, containing important information and a picture of each animal available for off-taking (Figure 2). The objective of this paper was to investigate the requirements for the animal visualisation component in the data centric framework for animal trading decision support (Figure 3). The visualisation included the data requirements and the preferred cattle family tree visualisation presentation requirements from cattle farmers. The results showed that farmers would prefer additional information and cattle family tree visualisations as part of the auction catalogues when buying livestock. Accurate and relevant information communicated in a format that is appealing for customers is the base for effective communication and the base for developing loyal relationships. Stud auctioneers should embrace this new Mobile app to enhance their relationships with farmers and in doing so build competitive advantage for their businesses.

The findings in this paper showed that farmers prefer an animal family tree with different pictures that show the animal on sale. The catalogue presently used (Figure 2) only provides one picture of the animal and no family tree of the animal for sale. The contribution of this study bridges a gap in literature as no study has been done before to elicit cattle family tree requirements from farmers. The findings can assist farmers and auctioneers to produce animal family trees that farmers can use to assist in their purchasing decisions. The implementation of the cattle trading DSS in Figure 3, will require data from several sources, including data from farmers. The data can be incorporated into auction catalogues to help farmers make their buying decisions This will be up-to-date digital information (IaaS) to farmers (Calitz et al., 2022).

The limitations of the study are that only 20 farmer participated in the study after 3 calls for participation. The findings however have shown the preferred animal family tree visualisation diagram preferred by farmers and the associated animal data requirements. Present research focuses on the implementation evaluation of an animal family tree visualisation mobile application. Future research will focus on implementing and evaluating the data centric framework for animal trading decision support (Figure 2).

Finally, there have been many technological advancements in artificial intelligence, machine learning, data analytics and IaaS in the past decade and farmers are now provided with additional data and information from various sources. Farmers are urged to make use of these technologies to aid with improving farming practices and record keeping of their animals.

Information Systems Project Managers' Perspectives on Critical Success Factors: Do We Practice What We Preach?

Dr. Wikus Erasmus^{1,*}, Mr. Leonard Mkhacani Simango²

^{1,2} Department of Applied Information Systems, University of Johannesburg, Johannesburg, South Africa

Keywords

Information systems project management; Critical success factors; Importance and Implementation

Abstract

Organisations undertake projects of various types and descriptions to fulfil a need experienced by a stakeholder. Projects generally fail and the same is true for most information systems projects. These projects deliver physical infrastructure deliverables and can also provide software or business process-based products. To increase the probability success, specific and applicable critical success factors ought to be implemented to a satisfactory extent. The purpose of this quantitative study is to determine if traditional project success factors apply to information systems projects, how important are these critical success factors perceived to be among information systems project managers and to what extent these are implemented. It is found that traditional project critical success factors do apply to information systems projects and they are all considered to be important by information systems project practitioners. It is also found that these factors are extensively implemented on average but that curious relationships exist between how important a factor is perceived to be and to what extent it is implemented.

1. Introduction

Information systems (IS) permeate all modern organisations (Liu, Zhang, Keil & Chen, 2010). This is manifested either by the infrastructure of an organisation, its capabilities or the associated products or services offered by such an organisation (Gemünden, Lehner & Kock, 2018). Information system projects are very often the vehicle for providing these technology based capabilities products or services.

According to Standish Group (2015), the cancellation rates of information systems projects are unacceptably high at 31.1%. Even worse, 52.7% of projects would exceed their planned budgets by 189%. Success rates are even more dismal in that only 16.2% of projects would meet technical project success criteria of being on time and in budget. For large organisations, the situation is even bleaker in that only 9% of these projects can be deemed a success. In these projects that were deemed successful, the scope or essence of the product developed by the product differs markedly from the initial specification in many cases. Overall, the success rates of IS projects are at that 29%, about 19% are failures and 52% of projects are considered challenged. With the introduction of customer satisfaction as an additional metric, the rate of project success has been increased to 31% overall (Johnson, 2020). Challenged projects as an outcome where the end result is accepted even though it does not meet technical project success requirements such as time, cost or scope and the project requirements may have been amended by agreement to close off a problematic project.

According to Marnewick and Labuschagne (2009), challenged projects occur due to factors such as the communication between teams and customers, user involvement, executive support and clarity of requirement definition is not adequately addressed or managed during the project. The CHAOS report's definition of failed projects in IS projects characteristically comprise projects that have a very poor product, or those that have not been completed or those that have been cancelled (Standish

² E-mail address: leo.xikoci@gmail.com

Group Chaos Report, 2015). Boehm (2000) adds to the debate stating that not all cancelled projects can be considered a failure as there may be very good reasons for abandoning a project. These may be related to changing needs and priorities or the organisation or traumatic market events that either prevent the project from continuing or make the proposed end result unnecessary.

Most organisations experience failed or challenged IS projects at some point. In order to reduce the risk of project failure, identifying and implementing critical success factors (CSFs) is of paramount importance. This research sought to explore the perspectives that project managers have on the accepted success factors in the implementation of IS projects in South African financial institutions. The focus of the data is on the financial services institutions. The rate at which IS projects are failing represents billions of rands in wasteful expenditure and threatens to undermine any remaining credibility the business world may have in the discipline of project management.

2. Problem Investigated

The South African financial services industry provides services in commercial and merchant banking, lending, insurance and investment (Brand South Africa, 2017). The industry is regulated by various regulators, the most influential being the Prudential Authority (South African Reserve Bank, the Financial Sector Conduct Authority (FSCA) and the National Credit Regulator. This sector has consistently added around 600 billion ZAR to South Africa's GDP although that figure has scarcely grown since 2014 (Statista, 2020). Given the weight of the external stakeholders and the expectations of shareholders, organisations in this sector can ill afford unsuccessful projects. Indeed, shareholders would expect any temporary initiative like projects to contribute and grow the organisation and sector at large.

The introduction painted the bleak picture facing organisations attempting IS projects. The approach is to explore the accepted project CSFs to explore the perspectives held by project managers in attempting these projects in financial institutions. Much research has been done on the reasons for project failure, yet projects continue to fail at an alarming rate (Erasmus & Marnewick, 2021; Marnewick, Erasmus & Joseph, 2016). This paper explores the theory regarding IS project CSFs and investigates the perspectives held by IS project managers compared to the level of implementation in the sample's environment.

According to Chmielarz (2015), IS and information technology (IT) have advanced and proliferated at a great speed in all industries during the past decade. A need for IS and IT conversant project management practices and practitioners have arisen. As a result, project managers and processes must be adaptable to be able to manage with future developments. Unfortunately, the troubled state that project management as a discipline finds itself in serves as a barrier to being adaptable to future conditions. It becomes important to determine what the real project success factors are in the IS environment and conversely to determine if they are implemented adequately (Arora, Haleem & Kumar, 2022).

Seminal research by Bannerman (2008), contributed immensely to how projects can be successful on various levels depending on prevailing CSFs adopted by an organisation or even an individual project. It is important for organisations to focus on CSFs they believe would contribute to greater projects success as well implementing it. The extent of implementation should ideally match with the perceived level of importance of these CSFs. It is this observation that prompted the investigation to determine how important accepted CSFs from literature are perceived and to what extent they are being implemented.

3. Research Questions

To address the identified problem, the following main research question is posited:

- What are the perspectives of project managers on critical success factors that contribute to the successful implementation of information and communication technology projects in South African financial institutions?

To be able to answer this main research question, the following sub research questions should be answered:

- What are the CSFs for IS projects?
- How important do IS project managers in the financial services industry consider these CSFs in their environment?
- To what extent are these identified CSFs implemented in the financial services industry?

The purpose overall would be to determine what CSFs are considered and how does this perception compare to how it is implemented. In effect, it is to determine if project managers practise what they preach.

4. Literature Review

This section provides context to the terms “projects” and identifies aspects unique or of more importance to IS projects. This is followed by summaries of the CSFs identified through literature.

4.1. Projects defined

Traditional IT projects (also called the predictive approach) are defined by the following characteristics (Schwalbe, 2015):

- A temporary endeavour with a start and end date;
- To perform a set of activities;
- In iterative steps;
- Are subject to constraints; and.
- To produce a deliverable that fulfils a need.

This implies that a project cannot be an ongoing operational matter and must be closed off at some point regardless of whether the outcome fulfils the need or not. The fact that a temporary endeavour is undertaken to fulfil a need is a defining characteristic of a project, even if it is cancelled and does not ultimately fulfil the stated need. The project requires a plan that defines the set of activities and the order in which they should be completed while considering the various constraints imposed on the project.

These constraints include:

- the allocated budget;
- allocated timeframe;
- scope to be achieved;
- identified and unidentified risks; and.
- required quality to be achieved.

A plan is developed for each constraint and combined into a master project plan. Depending on the project methodology utilised and the type of project attempted, various processes and documentation may be needed to be completed to develop a coherent project plan. As the focus is on IS projects, the next section discusses this in more detail.

4.1.1. Characteristics of Information System Projects

Al-Ghamdi and Saleem (2018) argue that IS and IT are so ubiquitous in the organisation and form the backbone of any modern enterprise. IT itself as a term has been used prominently to refer to the hardware and software resources (Salim, Saleem, Fayoumi, Al-Ghamdi & Ullah, 2013), infrastructure, cloud computing, information management tools (Maresova & Klimova, 2015) and various types of information systems (Ullah, Al-Mudimigh, Al-Ghamdi & Saleem, 2013). For the purposes of this paper, IS projects is the term that will be used to refer to any of these projects as it encompasses the physical technology, software, data and communications network aspects of these projects.

Dekkers and Forselius (2007) argue that IS projects typically involve the delivery of digital systems, but it is important to note that not all IS projects involve physical hardware elements such as infrastructure projects. There may also be projects that are purely focused on business processes but

whatever the case, the aim is to enhance infrastructure and business processes (Al-Ghamdi & Saleem, 2018). This may also include software development projects.

Seng (2010) argues that IS projects are different from projects conducted in other environments in that IS projects present different kinds of challenges to project managers. Hairul Nizam Md Nasir and Sahibuddin (2015) suggested that the success factors of the project were not applicable to all projects and it is conceivable that traditional CSFs do not necessarily apply to IS projects. , Fenech and Raffaele (2013) argue that due to the highly dynamic technical environment, significantly magnified and varied risks non-IS projects are presented. Literature seems to suggest that IS projects often prioritised committed user involvement, effective risk management and the use of formalised project management methodology (Morrison, 2011). This is to the detriment of human resource management practices that are required to manage the aforementioned as they are somewhat neglected. .

The two main approaches for IS software development projects are the waterfall and agile (Säisä, Tiura & Roslöf, 2018). Agile software development has been seen as more appropriate for continuous development of software, thereby circumventing the “defined end” characteristics of projects. This has raised a debate as to whether or not software that is developed through agile methodologies are in fact projects in the proper sense. Nevertheless it is generally recognised that the endeavour is still temporary enough and conforms to most other characteristics of projects that they be included in this discussion. It must be noted that although attempts have been made to apply this approach to infrastructure projects or projects outside of IS and IT, the efficacy of adopting this approach does not seem promising or at least hotly debated (Fotiadis, 2021).

According to Ghani and Bello (2015), agile is a systematic and iterative approach to software production that was successful in producing high-quality applications and also in fulfilling customer expectations. Laanti, Similä and Abrahamsson (2013) add that the main objective of agile project management approaches is to minimise rework by reducing errors and prioritising the development of the minimum viable product. This is achieved by setting periods of review close to one another to make smaller course corrections than could be possible in longer term reviews (Fustik, 2017). This has the effect of reducing risk and rework for major deliverables as this was attended to in the far smaller work packages.

The waterfall method relies on high quality pre-planning as well as thorough arrangement of all plans far ahead of time to facilitate easier execution of the project (Mejtoft & Vesterberg, 2017). It is an iterative approach in essence. Agile approaches evolved from informal approaches to formal, documented methodologies and proved to increase success rates for software development projects (Kaczorowska, Motyka & Słonec, 2016, Fustik, 2017).

The next section focuses on the identified project CSF and summarises them for reference in the analysis discussion.

4.2 Project critical success factors

As defined previously, a project CSF is implemented to increase the chances of a positive project outcome. Over the years, various project CSF's have been developed and proposed for the benefit of project practitioners. Not all CSFs may apply in all environments or all projects The most often suggested have been synthesised in the table below as drawn from literature:

Table 1: The most common traditional project success factors listed

Traditional critical success factors	Summary	Sources
Top management commitment and support	Ensures top level visibility of the project and assures prioritised resource allocation.	Santos, Barriga, Jugend & Cauchick-Miguel (2019) Lavagnon (2008) Ekrot, Rank, Kock & Gemünden, (2018)
User involvement	Participation of intended user groups provides increases probability of the project delivering greater customer satisfaction and success.	Fayaz, Kamal, ul-Amin & Khan (2017) Esteves et al. (2017) Bano and Zowghi (2013)
Stakeholder buy-in	Committed stakeholders ensures continued involvement and greater motivation to guide the project to success.	Mose, Njihia & Magutu (2013) Ola-awo, Alayande and Olarewaju (2021) Dwivedi & Dwivedi (2021)
Customer satisfaction	Perception of the project outcome by the group that commissioned the project that may be independent of traditional project success criteria of schedule and budget.	Rashvand & Majid (2014) Williams, Ashill, Naumann and Jackson (2015) Putra, Subiyakto, Ahlan and Kartiwi (2016)
Solid budget and project plan	Thoroughly planned budgets and schedules provide guidance to project team members as to how to operate within these constraints.	Imtiaz, et al. (2013) Fayaz et al. (2017) De Bakker, Boonstra and Wortmann (2010) Standish Group (2015)
Effective communication	Allowing all stakeholders to be appropriately informed of the established plans, constraints, progress and changes increases the probability of project success.	Gheni, Jusoh, Jabar & Ali (2017) (Santos et al. (2019)Karl & Kralova (2016)
Clearly defined project objectives and goals	A clear vision for a project, clearly and simply stated, assists in guiding behaviour to achieve a desired outcome.	Fortune and White (2006) McLeod & MacDonell (2011) Dan (2010)
Clearly defined project scope	The key deliverables and features of a deliverable must be clearly stated to ensure the customer as well as the project adheres to deliver on what has bene agreed.	Mirza, Pourzolfaghar & Shahnazari (2013) Nasir & Sahibuddin (2013) Catania et al. (2014)
Competent project manager	An experienced project manager, that exhibits key competencies in the context of the expert skills required of the industry or type of project, increases the probability of a positive project outcome.	Montequin, Cousillas, Alvarez & Villanueva (2016) Blaskovics (2016) Alqashami and Mohammad (2015)
Commitment of project manager	Leadership concerns revolving around motivation, commitment, inter-personal relationship and productivity has a significant impact on the performance of projects.	Montequin et al. (2016) Kerzner (2017) De Araujo, Pedron & Quevedo (2018)
User training	For a project to be completed it must be transitioned into the operational space where user must be trained to use the new deliverable if the expected benefits are to be accrued.	Denic, Vujovic, Stevanovic & Spasic (2016) Lin, Chiu & Liu (2019) Dandage, Mantha, Rane and Bhoola (2018)

This very brief summary represents a great body of literature when trying to determine what CSFs are applicable in this context. Of the vary many CSFs that have been identified, the above features prominently in prior research.

5. Research Methodology

This study followed a positivist approach that culminated in deductive conclusions derived from a questionnaire posed electronically to suitable candidates in the population. A summary of the research design is contained in Figure 1:

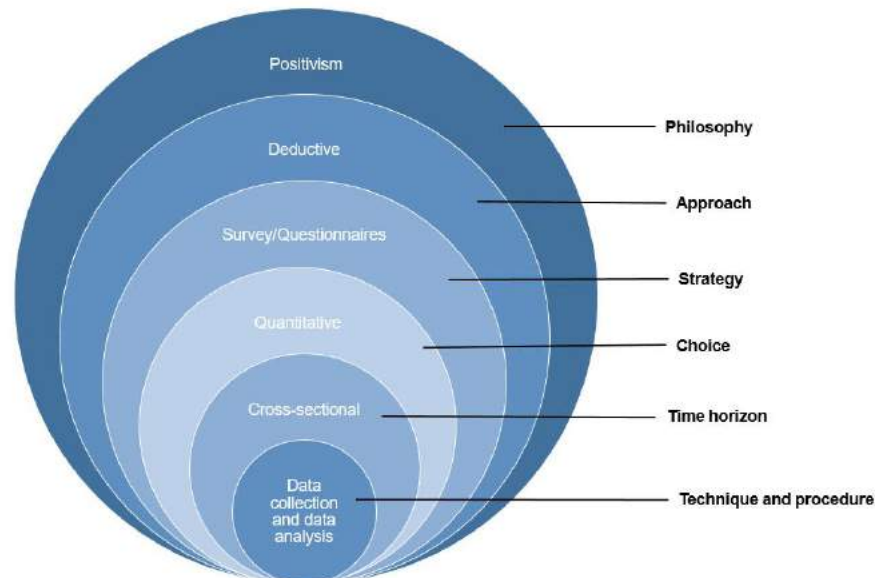

Figure 1: Summary of research method approach (Adapted from Saunders et al., 2012)

The questionnaire is divided in three sections. The first being demographic information to be gathered. Thereafter the respondents were required to reflect on the 11 CSFs in two ways. Firstly, they were requested to raise their opinion on how important they perceived the CSF to be in their environment by way of a 5-point Likert scale. Then they were required to indicate to what extent these CSFs were implemented in their environment on a similar 5-point Likert scale. The cross-sectional data was quantitatively analysed.

The population is identified as project managers in the financial services industry who have had any experience in managing IS projects in that environment. The questionnaire was distributed among potential respondents on a convenience sampling strategy basis as the actual number of project managers who work with IS projects in financial services sector is inscrutable.

A non-random convenience sample was utilised with potential respondents identified through LinkedIn. Due to the data being collected in the time of the pandemic, electronic means were used exclusively through Google Forms. As such, the response rate was quite low. However, due to the nature of an exploratory study, the 33 responses received from several financial institutions at a response rate of 22%.

6. Results and Findings

This section details the pertinent sections of the questionnaire responses. Reliability and validity figures will be followed by some demographic results and then the 11 CSF pairs' results is presented.

6.1 Internal consistency of the research instrument

The main body of the questionnaire consisted of 11 pairs of statements yielding 22 variables. The first section requested reflection on the perceived importance of the presented CSFs and then the extent of implementation of these CSF's. The research instrument was tested for internal consistency by way of a Cronbach's alpha coefficient. The research instrument yielded a score of .93 for 22 variables indicating that there is more than adequate internal consistency (Hair, 2011).

6.2 Project Manager experience and past success

The respondents were requested to indicate their years of experience as well as how often they were successful. Figure 2 indicates the results:

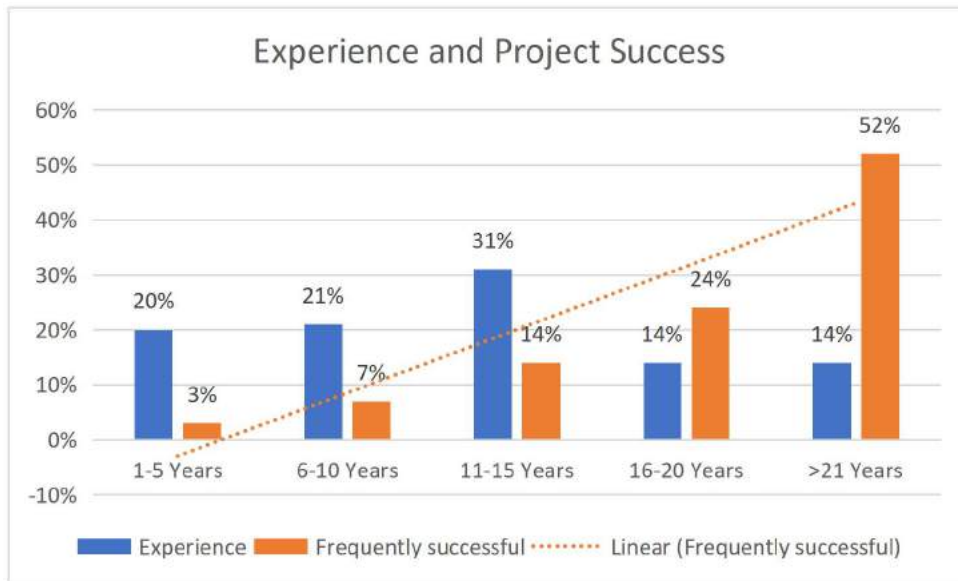

Figure 2: Project Manager experience and success

Most respondents had between 1 and 15 years of experience with 72% of respondents indicating such. The project managers with the most experience was in the minority with 14% in each of 16-20 and >21 years categories. The respondents also indicated how often they delivered successful projects. The trendline clearly indicates that the more experience a project manager has, the more often appear to deliver projects successfully. The most experienced project managers indicated they were most frequently successful while the least experienced project managers indicated the converse. Already there is intimation of the role project manager competence and experience plays in project success.

6.3 Global averages

When viewing the data from the two latter parts of the questionnaire dealing with the identified CSFs, the overall picture is gratifying to see in Table 2:

Table 2: Overall global means of importance and extent of implementation of success factors in ICT projects

	Global mean of success factors importance	Global mean of extent implemented of success factors
Number of variables	11	11
Mean	4.65	4.69

The average values for all are reported to be on the upper end of the 5-point Likert scale. The CSFs are generally considered highly important and almost fully implemented. The averages are also very close to one another. However, this does not mean no variances exist.

6.4 Results, variances, and correlations

Figure 3 indicates the results for how important each CSF is perceived by the respondents:

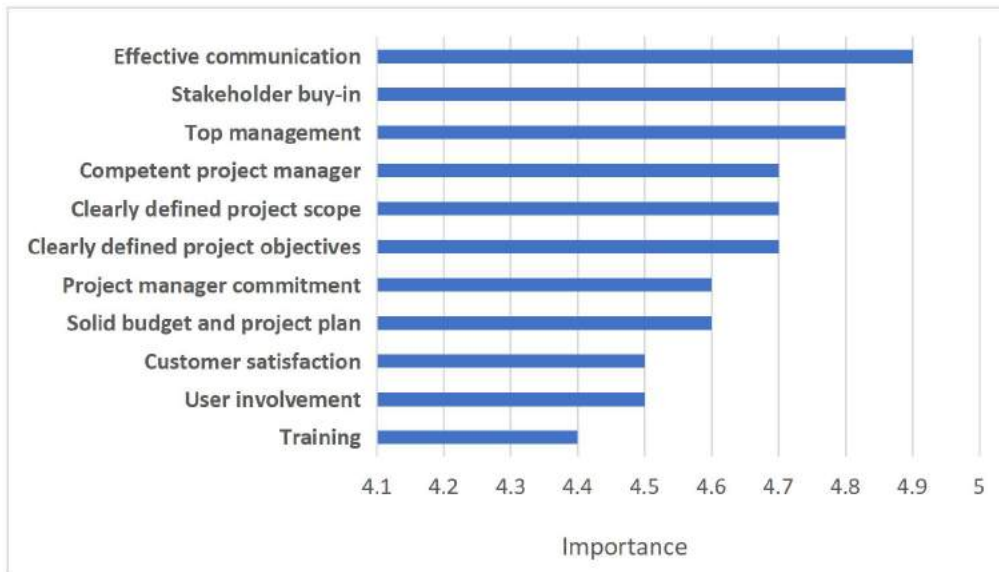

Figure 3: The importance variable averages

The respondents perceive Effective Communication, Stakeholder Buy-In and Top Management Support as the most important CSFs. This supports literature in that these are prominently mentioned as very important for the successful delivery of projects (Mose, Njihia & Magutu, 2013, Gheni, Jusoh, Jabar & Ali, 2017; Santos, Barriga, Jugend & Cauchick-Miguel, 2019). These are also considered for IS projects. The CSFs with the lowest perceived importance are Customer Satisfaction, User Involvement and Training. This is somewhat surprising that Customer Satisfaction rates lower than most other CSFs as these projects are initiated due to a need a customer experiences. While this is still ranked as a very important, it is not as big a priority as other CSFs. Training is the only CSF that is not ranked as Very Important but instead as Important.

Figure 4 indicates to what extent these CSFs are implemented in the respondents' environments:

Figure 4: Extent implemented variable averages

The topmost implemented CSF's closely match those being perceived as important. Effective Communication, Stakeholder Buy-In and Top Management Support are Almost Fully Implemented. The least implemented CSFs are all still highly implemented; however, Training as a CSF being

considered the least important is Almost Fully Implemented as well. User Involvement is the least implemented CSF in this sample.

The differences between how CSFs are perceived as important and to what extent they've been implemented are demonstrated in Figure 5:

Figure 5: Comparison of importance and the extent implemented variables

There is some alignment with the perceived importance of a CSF and the extent to which it has been implemented. The CSFs that are implemented on the same level as what they are perceived, on average, are Effective Communication, Top Management Support, Competent Project Manager, Clearly Defined Project Scope and Solid Budget and Project plan.

CSFs that are implemented to a lesser extent that they are perceived important are Clearly Defined Project Objectives and User involvement. These two CSFs can be classed as CSFs that require more attention to be implemented as project practitioners perceive these to be important and of some value. Clearly Defined Project Objectives provide direction on which all project plans and documentation is based. More User Involvement provides greater clarity on the features of the IS project deliverables who will eventually be required to use it.

CSF's that have been implemented to a greater extent that what is perceived important can be seen as being over implemented. These CSFs are Stakeholder Buy-In, Project Manager Commitment, Training and Customer Satisfaction. It could conceivably be argued that there is an overinvestment on the part of organisations to implement these CSFs. Conversely it could be said that practitioners do not value these CSFs enough and the investment might be appropriate. Further investigation is required to determine which statement is more accurate.

While there appears to be alignment between the extent implemented and the perceived importance of CSFs, these results must be interpreted with caution. Table 3 indicates the relationship between each CSF pair:

Table 3: Correlation coefficient of the importance and extent of implementation of success factors in ICT projects

Importance and extent implemented	Correlation coefficient	Strength of the relationship
Effective communication	-0,07	No relationship
Project manager commitment	0,35	Weak
User involvement	0,43	Moderate
Stakeholder buy-in	0,64	Strong
Top management	0,65	Strong
User training	0,76	Strong
Clearly defined project scope	0,80	Very strong
Clearly defined project objectives	0,82	Very strong
Competent project manager	0,85	Very strong
Solid budget and project plan	0,89	Very strong
Customer satisfaction	0,91	Very strong

Source: Own compilation

Although all the CSFs were considered at least Important and Adequately implemented, there are variances between how the respondents' perceptions and how they answered the questionnaires. The above Pearson Correlation Coefficients (PCC's) indicates relationships among CSF pairs when considering their perceived importance and extent of implementation. These relationships do not indicate a causal relationship however one can logically assume that if a CSF is considered important, it should be implemented to the same extent. For most CSFs, one can predict a similar level of implementation as its perceived level of importance. This is true especially for (i) Clearly Defined Project Scope, (ii) Clearly Defined Project Objectives, (iii), Competent Project Manager, (iv) Solid Budget and Project Plan, and (v) Customer Satisfaction.

What is interesting is the weak and no relationship for Project Manager Commitment and Effective Communication. Firstly, regard Project Manager Commitment which scored in the middle of the pack for both perceived importance and slightly higher for extent implemented. It means that there is little expectation to see that the extent to which this CSF is regarded would be implemented to the same level. Rather it would appear where the same level of importance and implementation is observed, it is mostly by chance.

Secondly, this is true for the CSF that is most important and most extensively implemented, Effective Communication. For this CSF, the average level of perceived importance is the same as the extent of implementation. While on average, these seem to align, the respondents' submission varied greatly internally. This means that many respondents did not see this CSF to be implemented to same extent that it was perceived to be important. Therefore, there is no reason to assume that this CSF would be implemented to the same extent as it is perceived important.

The causal relationship needs to be explored further to determine if there are other variables at play. Especially if one considers that some CSFs are implemented to a greater extent than they are seen to be important. It is therefore premature to state that the perceived level of importance of a CSF determines the extent of implementation thereof.

7. Recommendations and Managerial Implications

From the respondent's submissions, it is clear that they perceive CSFs as part of their project delivery method while their organisations support them in implementing these CSFs. What is generally not clear is how these approaches differ. On average the CSFs are consider Important to Very Important. On average, the CSFs are either Adequately Implemented or Fully Implemented. However, there are some misalignments on a small scale while some CSFs are not internally coherent in how they are implemented relative to their perceived importance.

Firstly, it is recommended that organisations, through the leaders and staff responsible for project delivery, adopt a formal methodology and framework containing the CSFs important for their organisation, the financial services industry, and types of projects they attempt. In adhering to such a framework, it is believed to reduce the risk of project failure or non-delivery. It is however important for organisations to realise that their particular set of success criteria or CSFs may differ upon their context. The participants in this study have clear opinions of what practices they believe to be important in their respective organisations and for the industry. Matos, Romão, Sarmiento, and Abaladas (2019) agree that the selection of appropriate CSFs will impact project outcome as it relates to the context of the commercial activity.

Secondly, the importance and prominence of Effective Communication cannot be overstated. The respondents perceived this to be one of the most important CSFs while it was also seen that the organisation outside of the project discipline, implements this CSF to greater extent than its perceived importance. Project managers should encourage communication among project team members for better project outcomes. It is critical that communication does not break down during the various project phases, especially if the project involves different business units and other stakeholders in the financial industry. With the development of new technology in virtual communications, project managers can benefit from greater effectiveness in communication in a world where project effort is distributed in remote working (Abbas, Choi, Seo, Cha, & Li, 2019)

Thirdly, Stakeholder Buy-In is also a critical success factor, since the project manager should first identify essential stakeholders for the project and guarantee their buy-in before the project is started. Because stakeholders contribute resources and support for the project, it is critical that project managers build productive relationships with them and guarantee that a communication strategy exists for regular contact with stakeholders. This may include external regulatory bodies such as the Financial Sector Conduct Authority (FSCA), the Credit Regulator and the Prudential Authority (South African Reserve Bank) where applicable. Project practitioners should seek to increase the legitimacy of stakeholders to increase their commitment and buyin (Allen & Cain, 2022). This achieved by involving stakeholders and removing barriers that could prevent their participation in a community of practice such as these information systems projects.

Additionally, Top Management Support is a critical success element in IS projects, as support from top management provides vital confidence to project managers. Therefore, organisations should recognise the significance of project leadership in project success. Project manager abilities are just as critical for project success and the research findings indicate that they do indeed contribute to the success of ICT projects. To contribute positively to an organisation in the financial services sector, project managers should invest in their project competencies. If the project manager is found wanting, it will have a negative influence on the project, since project team members frequently look up to project managers for clarification on project duties. This CSF has a profound impact in different types of IT projects, be they iterative or predictive where this had an ancillary effect on team motivation (Tsoy & Staples, 2021; Zaleski & Michalski, 2021). It would seem that executive support provides additional legitimacy to project leadership and team motivation where it is present as a CSF.

The commitment of the project manager guarantees that the project does not lose momentum. Committed project team members frequently identify effective solutions to iron out issues throughout project development and assist in achieving the desired goals. It is critical that a project manager be committed to completing the project successfully. In the case of committed project manager, the application of their emotional intelligence capabilities are more apparent (Zhu, Wang, Wang, & Yu, 2021). Organisations therefore need to ensure that project managers are effectively motivated to take ownership of the project results. This should however happen in way that positive reinforcement can be applied so as not to destroy team motivation.

In order to design an acceptable project scope, project managers must first grasp exactly what is required to meet the project objectives. Although project scope is frequently changed as the project progresses, it is critical that project managers are familiar with the project scope from the start so that

modifications may be made more easily as the project progresses. To help create a clear project scope, project managers should ensure project deliverables are defined, quantifiable and attainable. In doing so, controlling the scope is essential to eliminate the associated problems of scope creep (Jan, Abbas, & Ahmad, 2022).

To begin with, IS projects require financial support. The project budget is dependent on the organisation's top executive for financial backing. In principle, no project will take off without a budget because project managers should guarantee that appropriate finance is available for the ICT projects. The adoption of beyond budgeting principles may even increase the probability of attaining the benefits envisaged by business case in that an adaptable approach be used (Marnewick & Marnewick, 2022).

Project planning is essential for project success, for without a plan, it is impossible to set objectives and goals. It is critical in leading stakeholders, sponsors and team members through project phases and assisting the project managers in completing the projects successfully. Handel (2022) supports this point by adding that all documented arrangements must be available to ensure effective communication and to provide a basis for stakeholder buy-in.

Any organisation attempting a project should ensure that the crucial success factors identified by the research as the most necessary for effective implementation are examined by all stakeholders in the project at the outset, and that they understand the importance and advantages thereof. User involvement, user training and customer satisfaction are the least essential success factors with low average values, indicating the need for more study on these factors. The researcher recommends that the project manager maintain contact with the customer which will provide value to future studies. Even though IS projects continue to be challenged, practitioners should continuously recognise the significance of essential success factors.

Effective Communication is the CSFs with the greatest level of implementation while being perceived as one of the most important CSFs. It is however the CSF that exhibits no relationship between its level of implementation and perceived importance. It is recommended that this be more fully investigated as to its contribution in the context of IS project management.

8. Conclusion

In conclusion, the research project set out to determine what CSFs of traditional projects apply to IS projects, how important they are perceived and to what extent these are implemented. The results provide insight into the external influences on IS projects and that traditional knowledge and wisdom regarding projects in general apply to IS projects.

The financial services sector is very technology driven (Alt, Beck, & Smits, 2018). The core business of organisations participating in the financial services industry is expanding to include more complex IT and information systems capabilities. In order to achieve this, temporary initiatives in the form of projects must be undertaken. To increase the probability of success, CSFs should be found that apply to the context of specific projects in the financial services.

Future research may examine delving deeper into critical success factors for which project managers, stakeholders, senior management, and organisations as a whole assessed the importance and, more importantly, the degree to which they had been applied. The research study had already established the most important success factors from the perspective of project managers, namely top management commitment and support, continuous user involvement, stakeholder buy-in, customer satisfaction, a well-planned budget and project plan, effective communication, user training, project objectives that are clearly stated, a project scope that is well defined, project manager competence and project manager commitment. A predictive model could be designed and tested to determine to what extent each CSF contributes to ultimate project success. This can be tested to deploy a predictive success tool in industry.

Extensive study in both quantitative and qualitative methods is necessary to present varied perspectives from project professionals. The research would be required to obtain project managers' opinions from various institutions and industries in order to contribute to the critical success factors that influence project implementation.

A clear limitation of this exploratory study is the low number of respondents. The researchers desire to replicate this study with greater numbers and in more industries to determine additional CSFs that are applicable to IS projects and to pursue the future research paths.

This exploratory quantitative study expands the current body of knowledge on project success factors while confirming literature. Additional avenues for research are also illuminated. In this case, it does indeed seem that project practitioner practice what they preach. The question then remains, why do projects still fail if we do the right things right? Perhaps the answer lies in the fact that CSFs are not the be all and end all for IS projects and further innovation and research is required to increase project success rates.

Keywords

Emerging farmer; business failure; entrepreneurs; agriculture.

Abstract

The South Africa agricultural sector is important for various reasons including contributing to food security and job creator for low skilled labourers. Despite the government prioritising transformation in the agricultural sector since 1994 and investing billions of rands in the development of emerging farmers, this initiative has been failing. There are various reasons why emerging farmers fail and this includes lack of extension services by government, farming skills, access to markets, access to finance as well as drought and crime. The South African Department of Agriculture have in the past allocated substantial financial resources to assist emerging farmers through the Comprehensive Agricultural Support Programme (CASP). CASP was launched in 2004 to provide capital and support to emerging farmers. However, the return on investment has been very low for the CASP funds spent within the North West province and did not contribute to the success of the emerging farmers. To determine the main causes of these failures, quantitative data was gathered from 202 emerging farmers on the problems they faced and qualitative data were gathered from four external role players within an agricultural sector. The quantitative data revealed that most emerging farmers blamed the department of not assisting in extension services. Other factors mentioned include lack of finance, markets and skills. The qualitative data revealed that there is a comparison between all parties interviewed. They all agree that the failure of emerging farmers is because of 1. Misappropriation of CASP funds 2. CASP programme in its existing form is ineffective 3. Selection of the beneficiaries to this programme is key meaning poor selection of the recipients 4. Inadequate government or department knowledge.

1. Introduction

Productive farmers create employment for unskilled workers, helps with poverty alleviation, economic growth, and food security. For the South African government emerging farmers are of particular importance but despite the attention and funding most emerging farmers are still failing. The aim of this study is to identify the key external factors that contribute to the failure of emerging farmers in the North West province, South Africa.

The South African land reform program has been in place for almost three decades. From 1994 until 2008, the government-initiated land reform programme transferred four million hectares to historically disadvantaged South Africans. However, factors including inadequate planning, general lack of capital and skills shortages amongst the emerging entrepreneurs have resulted in land reform projects having limited impact and most emerging farmers failing (Lahiff, 2008; Bates, 2004). Despite these failures it remained an integral part of the ruling party's policies. The African National Congress

(ANC) election manifesto of 2009 (ANC, 2009) declared that rural development, food security and land reform were priority areas and that:

The ANC government will intensify the land reform programme to ensure that more land is in the hands of rural poor and will provide them with technical skills and financial resources to productively use the land to create sustainable livelihoods and decent work in rural areas, expand the agrarian reform programme, which will focus on the systematic promotion of agricultural cooperatives throughout the value chain, including agro-processing in the agricultural areas. Government will develop support measures to ensure more access to markets and finance by small farmers, including fencing and irrigation systems. Linked to the land reform programme will be an expanded agrarian reform programme. This programme will focus on the systematic promotion of agricultural co-operatives throughout the production cycle. There will also be active promotion of agro-processing in the agricultural sector. Government will develop support measures to ensure more access to markets and finance to small farmers (ANC, 2009).

National Treasury (2019) spent billions of Rands towards this goal and in 2018 alone spent R176m on farming support in the North West Province, compared to the total budget of R1 750m for the South Africa government. This was done through the Department of Rural, Agriculture, Environmental and Development (READ) introducing the Comprehensive Agricultural Support Programme (CASP) in 2004 to assist emerging farmers in the North West province (Hall & Aliber, 2010). The aim of the CASP fund is to provide capital and post-settlement support to the emerging farmers to enable them to become successful small, medium, and micro entrepreneurs (SMMEs) within the agricultural sector. Emerging farmers are defined as previously disadvantaged beneficiaries of the land reform programme who want to become successful entrepreneurs in the agriculture sector with the aim of becoming commercial farmers (Ducastel & Anseeuw, 2017). The Directorate Entrepreneurial Development (DED), a parastatal to READ, was established to provide capital and post-settlement support. Thus, emerging farmers do benefit from government financial assistance to start and run agricultural production, which should contribute to their success if the grants are handled effectively (Francis, 2019). However, at the end of the first financial year 31 March 2009, after the first year of administrating the CASP funds, 91 percent of the agricultural projects (emerging farmers) financed by these development grants failed (DED, 2009). In 2010, the then minister of rural development and land reform Gugile Nkwinti stated that 5.9 million hectares of farming land was unproductive and 90% of the farming projects were not functional (Pretorius, 2019). During this year the DED did receive a qualification in audit opinion as well as National Department of Agriculture due to non-performance (high failure rate within the development of emerging farmers)

A decade later this has not improved and by 2021 emerging black South African farmers produced less than 10% of the country's total agricultural output according to Sihlobo and Kirsten (2021). The reasons for this include:

- A lack of direction from government
- Poor adoption of the latest technology
- Fractious nature of organised agriculture
- Sub-optimal collaboration between government and the private sector
- Inefficiency in extension from provincial department of agriculture.

There was no change to the audit opinions and remain a qualification to the National Department of Agriculture as well as Provincial department of Agriculture.

1.1. Problem Statement

The problem is that the initiatives of growing SMMEs in the emerging farming communities of the North West province are failing, despite much money spent. At the end of the financial year 2008/2009, the first year this programme was lodged in the North West province, READ made use of

the North West Directorate Entrepreneurial Development (DED), a parastatal to the READ, as a vehicle to fulfil the function of providing capital and post-settlement support. The annual report of DED (2009:66) states (the first year CASP was operating) that the success rate on the creation of successful entrepreneurs was extremely poor during the 2008/2009 financial year, as 91 percent of the agricultural projects (emerging farmers) financed by these development grants were not viable and failed. Out of the R68m spent for the 2008/2009 year, R62m was declared fruitless and wasteful expenditure in the annual report for the financial year 2008/2009 presented in the financial statements of DED. After the financial year 2008/2009, this function was taken over by READ. However, this did not result in a positive change in the development of successful farmers. During the 2016/2017 financial year, R157m of these CASP funds was declared irregular expenditure and R14m was declared fruitless and wasteful expenditure. This is public money and reflects very negatively on government regarding how taxpayers' monies are spent. According to READ's annual report for the 2020/2021 fiscal year, the CASP program had a budgeted value of R141m, but only R43m was actually spent on it, an under expenditure 64% (READ, 2021). This means that there were no contributions made towards food security and the realisation of the government initiative.

During all these years the both the National Department of Agriculture and the Provincial Department of Agriculture received a qualification in audit opinion due to non-performance because of the high failure rate within the development of emerging farmers.

1.2. Methodology

This study is based on a pragmatic paradigm where a mixed method approach is being utilised to gain data.

Self-administered questionnaires (quantitative method) were used to gather data from the emerging farmers. The emerging farmers who participated in this study all received financial assistance from the CASP programme. A list of these emerging farmers (projects) was obtained from DED. All these emerging farmers were registered with the Provincial Treasury as beneficiaries to the CASP programme.

The second type of mixed method design used in this study was the explanatory design, where the quantitative data are collected first and depending on the results, qualitative data were gathered to explain the quantitative findings.

Semi-structured interviews (qualitative method) were held with four purposively selected individuals, one from the Department of Agriculture (being the Member of the Executive Council at the time), one from an agricultural corporation responsible for agricultural development and two black commercial farmers within the North West province.

Table 1: The research process model

Research philosophy	Research design	Research method	Target population	Sampling strategies
Pragmatism	Mixed method approach Explanatory design	Case study	1 st target group – 410 emerging farmers: quantitative method 2 nd target group – 4 selected individuals: qualitative method	1 st target group – purposive sampling technique 2 nd target group - 4 selected individuals: judgement sampling and critical case sampling

- **Sampling strategies**

A questionnaire was distributed to all 410 emerging farmers. This survey is “...the collection of a large quantity of evidence usually numeric, or evidence that will be converted to numbers, normally by means of a questionnaire” (Remenyi *et al.*, 2002:290). The total population sampling method was used for this target group. Total population sampling is a type of **purposive sampling technique** that involves examining the **entire population**. From the 410 questionnaires distributed only 202 was collected, a response rate of 49%. The target population comprised of emerging farmers in the North West province and who received CASP funds. The North West province is divided into four regions, namely Ngaka Modiri Molema District, Bojanala District, Dr Ruth Segomati Mompoti District and Dr Kenneth Kaunda District. Within READ, a regional manager is appointed for each of the four regions. Extension officers are also appointed for each of these four regions responsible for the managing and development of the emerging farmers. The extension officers know where each project or emerging farmer is situated in the North West province. The questionnaires were distributed to the emerging farmers with the help of these extension officers within READ.

Interviews were held with four representatives of the institutions earlier. Each interview was recorded and transcribed. The analysis of these data was done by an independent analyst using the instrument NVivo 12 Pro. The non-probability sampling method was employed to draw a sample from these institutions and the specific technique regarded as appropriate is purposive sampling. Judgement sampling was employed in this study by the researcher for selecting sample members to confirm to the criterion. Participants were chosen on an arbitrary basis because of their unique knowledge (critical case sampling).

1.3. Research objectives

The research primary objective of this study is to determine what are the factors contributing to the success rate among emerging farmers.

2. Literature Review

Anafo (2018) mentioned that emerging farmers are referred to as farmers entitled to government benefits through CASP and Land Redistribution for Agricultural Development (LRAD). Emerging farmers refer to as farmers that are dependent on semi-state and state organisations for financial support (Pilcher, 2017).

Farming is being considered as a source of revenue in both rural and urban areas until the rise of an increasing trend of the population worldwide that changed the farming perception into a business (Ducastel & Anseeuw, 2017). Hence, emerging farmers should possess entrepreneurial skills to carry

on farming as a business. Since all emerging farmers cannot have skills of entrepreneurship, the government and private organisations should assist emerging farmers to come up with feasible business plans and be guided on implementation and management of the farm plans to realise a profit. Due to population increase, there is an increase in demand for food from a large number of consumers. Emerging farmers are supported by government to promote agricultural production for supplying food and to be income generating. Marketing channels, food security, finances, and support (extension) services are the characteristics to be discussed.

The selling of fresh produce, either on small or large scale, shows the ability of market participants to enhance market accessibility that provides cash to the farmers after selling of agricultural products. However, there is a limitation to the access of the market for smallholding farmers or emerging farmers, which makes it difficult for-profit realisation in agriculture. Emerging farmers have less connection to formal markets, which leads to exploitation from the brokers of agricultural products resulting in low-profit margins. Tibesigwa & Visser (2016) mentioned that 88.3% of emerging farmers are self-selling. Sachs (2019) stated that sometimes government support smallholder farming with land and other agricultural inputs without clear marketing channels for their agricultural products. Farmers do individual marketing as a cheaper method of marketing their agricultural products (Senyolo et al., 2018). Francis (2019) commented that some emerging farmers producing surplus food languish in poverty due to poor access to a market that is profitable but sells as dictated by the buyer that led to losses.

People living in rural areas in every part of African countries not only in South Africa depend on agriculture as a source of food for their household.

Emerging farmers play a critical role in lowering the vulnerability of urban and rural food-insecurity household as a way to improve livelihoods, in addition to mitigating price inflation of food that is high. Engaging in farming in rural areas is also a way people can afford food. Buying from urban areas is very expensive. Thus, emerging farmers have and are being supported via protection of the domestic market and provision of support services, where possible, to increase food supply in rural areas. Food security according to Disable World (2019) is defined as the availability of food and one's access to it. Due to population increase, there is an increase in demand for food from a large number of consumers. Food security - it is very important to generate successful emerging farmers for food security for the future (Van Doorn et al., 2017).

It was difficult for the emerging farmers to obtain loans from any financial institution due to poor collateral agreements. The government decided to intervene to assist the emerging farmers with funds and established two funds wherefrom the emerging farmer was benefiting, namely CASP to provide capital and post-settlement support and Micro Agricultural Financial Institutions of South Africa (MAFISA) for assisting with loans to the emerging farmers at low interest rate. Financing is a critical aspect for emerging farmers to facilitate their agricultural productivity. This attracts the need for government to make an effort to improve the accessibility of credit as a way of improving agricultural productivity. In this regard the need financial institutions to provide credit to farmers, the South African government has established parastatal institutions mandated for channelling credit at affordable rates to promote agricultural development for example MAFISA funds (Alberts et al., 2019). Poor collateral requirements and long procedures for loan application deem financial to be inaccessible physically. Long application procedures of loans discourage loan application by emerging farmers due to delay and insecurity of loan due to poor collateral agreements. The development fund, CASP, was launched in 2004 also by government for disbursements to farming households. Hall and Aliber (2010) mentioned that the aim of this programme or fund is to be targeted previously disadvantaged group (emerging farmers).

The achievement of agricultural growth for emerging farmers can be successful through assessing extension services. Increase of agricultural growth is subject to support services. That are paramount to provide relevant services to farmers to adopt relevant methods of crop and livestock production. Hence for the growth of the smallholder agricultural sector, it is a requirement to offer comprehensive

support services (Soas.ac.uk, 2019). McAllister (2018) stated that approximately 50% of emerging farmers completely lack awareness of the support services and projects in South Africa. En.wikipedia.org, (2019) also stipulates that the following extension-related points are crucial namely, extension helps in adoptions of innovations, studying and solving the rural problems and crease farm yields and improve the standard of living of farmers. Extension services are classified into three types, namely technology transfer as the traditional model of the transfer of advice knowledge and information. The second type of extension service is advisory meaning the use by farmers of a cadre to experts as a source of advice in relation to the specific problem faced and the third type of extension service is facilitation, with the aim of this is to assist farmers to define their own problems and develop their own solutions (Ag4impact.org, 2019)

During the start of the agricultural revolution, only a limited number of farmers were undertaking agriculture as business, as opposed to subsistence farming that was aimed for household consumption. This is evident in 2016, where approximately 65 percent of adults were considered as poor workers and relied on agriculture as a source of livelihood worldwide (Ducastel & Anseeuw, 2017). Currently, there is increasing calls to do farming as agribusiness, to meet the increasing global demand of consumers. This is evident in that 10 percent of customers globally spend \$5 trillion on agricultural products consumption (Davis *et al.*, 2016). Small and medium agricultural investment takes the largest role in job creation globally.

There is a need to come up with strong policies and regulations to connect entrepreneurs and producers to global, regional and domestic markets to increase their profit margins and to be sustainable to cater for the increase in demand for food. Creation of connection to entrepreneurs in agriculture plays a critical role in providing sources of economic and social growth through agricultural enterprises. The World Bank Group (WBG) are critical role players in different countries supporting the improvement of infrastructure for access of markets in agriculture, increasing food supply and income generation as a business (Arinloye, Pascucci, Linnemann, Coulibaly, Hagelaar & Omta, 2015).

In most African countries, at least 80% of people are engaged in subsistence farming. Such percentage creates a gap between food supply and demand from consumers since food supply cannot meet the demand (Sachs, 2018); hence, this means African countries are importing food to meet the food gap in the market. In South Africa, the search for sustainable and productive emerging farmers is important for food security, as mentioned by Mmbengwa (2010). It also brings the previously disadvantaged farming entrepreneurs into the mainstream of the agricultural economy.

In South Africa, the agricultural sector is diversified within the private and corporate sector. Primarily, the Mediterranean and subtropical climate changes in South Africa support different agricultural opportunities. (Francis, 2019).

Despite the challenges in agriculture, farmers are taking up the use of technology to increase agricultural output while using less agricultural input. Specifically, South Africa supports agricultural policies as a method of increasing income generation among poor farmers in society via medium- or small-scale farmers. Efficiency within the production processes of the agricultural sector, production support to increase small- and medium-scale farmers, as well as conservation of natural resources are all strategically targeted by National Department of Agriculture in South Africa (Sachs, 2018).

Thus, this paper will discuss the contributing factors that lead to the success rate among emerging farmers.

3. Results and Findings

- Quantitative results

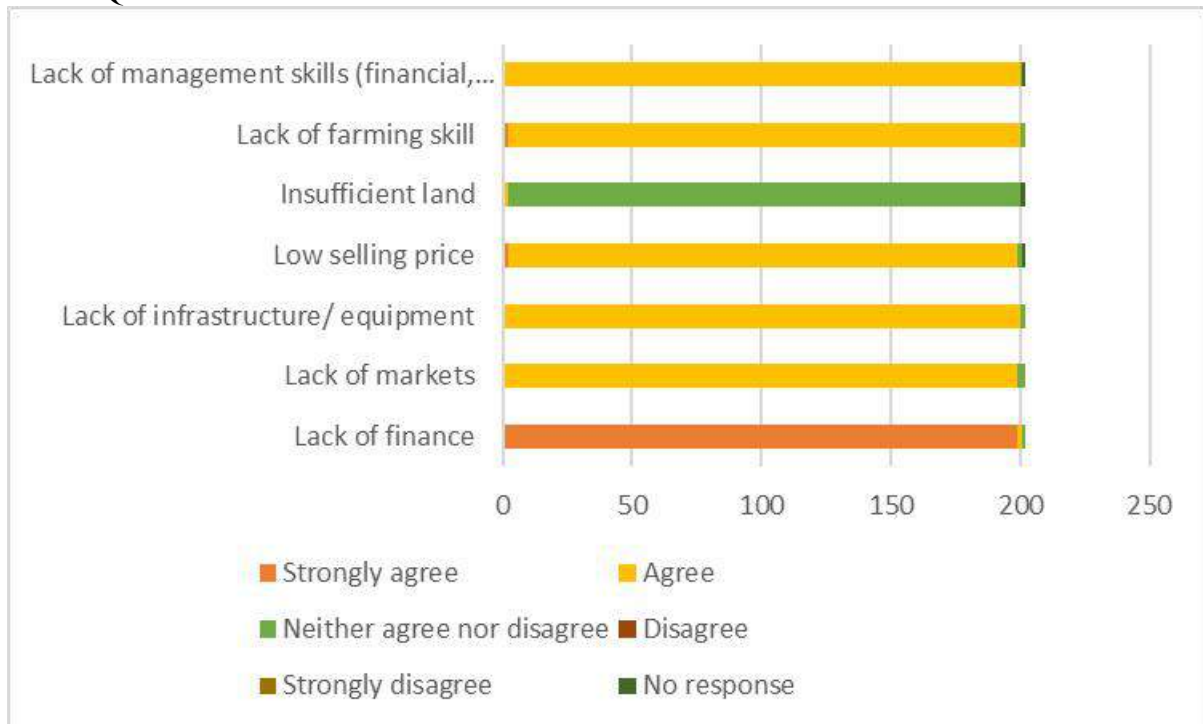

Figure 1: Factors contributing to emerging farmers' failure

The emerging were asked to rate how much each of seven possible factors contributed to their failure. Almost all participants who answered the questionnaire, strongly agree or agree to all the factors that are contributing to the failure on the failure of emerging farmers. Managerial components standing out in this feedback are the lack of management skills, farming skills, infrastructure, and lack of markets. From this feedback, it illustrates that government fails in the extension programme. The government is also aware of this problem and have tried to address it on several occasions (Harper, 2018).

It was mentioned in the literature study that the emerging farmer was selling to friends, family, and the informal market as the cheapest way of selling. Emerging farmers according to the literature study did not have any links with market agencies and were very expensive.

Even though emerging farmers are assisted by the extension officers from the Department of Agriculture, as per the literature review, the emerging farmers continue to fail in the farming industry and does not contribute towards food security. The emerging farmer needs more training concerning agricultural activities, marketing, and overall business management.

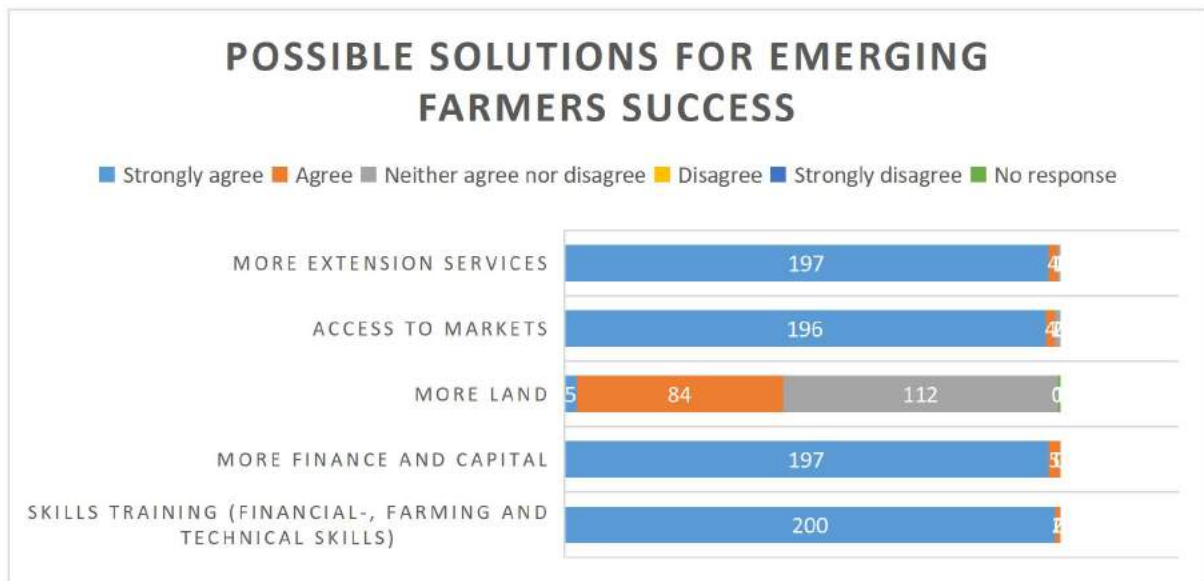

Figure 2: Possible solutions for emerging farmers success

Almost all participants, strongly agree or agree to the possible factors that can contribute to the success emerging farmers in agriculture. Managerial components standing out in this feedback are the need of management skills, more finance and capital, access to markets and the need to have more extension services. Marketing and skill training were also emphasised in the literature review. This also illustrate that the government is failing in the development of successful agricultural entrepreneurs

- Qualitative results

As mentioned above under the methodology section, semi-structured interviews were held with four purposively selected individuals, one from the Department of Agriculture (being the Member of the Executive Council at the time), one from an agricultural corporation responsible for agricultural development and two black commercial farmers within the North West province.

The following are the comparison arguments to the failure of emerging farmers followed between the four interviews:

- Misappropriation of CASP funds
- CASP programme in its existing form is ineffective
- Selection of the beneficiaries to this programme is key meaning poor selection of the recipients
- Inadequate government or department knowledge

The misappropriation of CASP funds and CASP programme in its existing that is ineffective was also emphasised in the introduction to this study because of the irregular, fruitless and wasteful expenditure year after year stipulated in the annual report of READ. Also, referring to the problem statement of this study, it was mentioned in the annual report of READ that for the 2020/2021 fiscal year, the CASP program had a budgeted value of R141m, but only R43m was actually spent on it, an under expenditure 64%. This emphasise that the management of the CASP programme in its existing form id ineffective.

The following are the comparison arguments to the recommendations to the creation of successful emerging farmers followed between the four interviews:

- Emerging farmers need technical support
- It is important to equip emerging farmers with what is needed in farming

- Training and empowerment are important.
- Communicate, report and engage with all stakeholders in agriculture i.e. commercial farmers, agricultural corporations, private organisations as well as other educational institutions that might possess knowledge and skills to the emerging farmer.
- On the job training is very much important to the emerging farmer.

From the above comparisons, it is clear that all the interviewees agreed what went wrong in the past as also on what is needed to be implemented for successful agricultural entrepreneurs.

This study also mentioned comparisons between the quantitative and qualitative results in connection that emerging farmers need clear guidance (extension services) from the department of agriculture that it fails to deliver. This emphasises the contribution made to answer all the research objective and to get solutions.

The key finding and the core of the result to this study is to empower and giving skill to those emerging farmers who must become self-sustainable and independent commercial farmers. Emerging farmers must obtain technical skill concerning farming, marketing skills, financial skills through effective training and extension support supplied to them. Emerging farmers do not possess the skill nor the knowledge to handle things when they go wrong - so they end up selling off all that, which was simply given to them. For example, selling cattle when they had calves, selling off the tractors intended for farming and selling the seeds to white farmers that should have been planted.

In addition, a major part of this is the failure on the part of government who also lack the knowledge and the skills to adequately identify and advise, therefore, they end up poorly selecting people (that contribute to the high failure rate of becoming successful entrepreneurs in agriculture) and thereafter failing to provide the necessary training, support, or any other appropriate intervention to see the project to success.

4. Conclusion

Agricultural development has been targeted by government as one of the main areas in which to improve the lives of previously disadvantaged people. The same is true of the North West province, with large amounts of taxpayer's money being invested in agricultural development initiatives, most of which are unsuccessful. This study, therefore, aimed to develop a framework that will serve as a mechanism to improve the success of emerging farmers in the North West province. The aim of the study was to create a comprehensive, sustainable, and appropriate capacity-building framework for emerging farmer SMMEs in order to contribute to food security, eradication of poverty, reduction of unemployment in rural areas and commonages through creation of sustainable and market-driven farming SMMEs.

As mentioned above, as part of the objectives of this study, the results of this study indicated that emerging farmer SMMEs need farming skills, financial, extension services and infrastructure to ensure the success of their farming enterprises. Besides the abovementioned factors, training and extension support were reiterated as the main determinants of success and failure for emerging farmer SMMEs.

4.1. Strategies to improve emerging farmers' success rate.

Is it evident, given the data gained from the quantitative and qualitative studies conducted, that private organisations ought to and would like to collaborate with the government on the development of emerging farmers.

In light of this, the government and other external role players in agriculture should adhere to the points that need to be emphasised in order to construct a framework for the training of emerging farmers:

- The importance of partnerships between the government and private Agribusiness (e.g. Senwes Cooperation, North West Cooperation, Development Financial Institutions, Processing Companies, Marketing Institutions, Commercial farmers, etc.)
- Marketing channels need to be explored to ensure that the produce of emerging farmers is marketed properly.
- Research and collaboration with universities play a crucial role in teaching and comprehending technical concepts for emerging farmers.
- Partnerships with commercial farmers need to be developed in a structured manner, and a mentoring program needs to be implemented.

The researcher wants to establish a framework so that both public and commercial agribusinesses can contribute to the success of new farmers. It would be suggested that Schedule 3 Part C, a provincial public entity, be established by the government, in particular the Department of Agriculture in the North West province. This should be a public entity where the private organisations should feel free to have an input to management, and daily operations to ensure better development of emerging farmers in the North West province. This should be a provincial public entity which is:

- Established in terms of legislation and provincial constitution
- Fully or substantially funded either from provincial funds or by tax, levy or other money imposed in terms of legislation
- Accountable to a provincial legislature.
- According to the PFMA, the public entities have been further divided into three schedules, namely:
 - Schedule 3: Other Public Entities
 - Part C: Provincial Public Entities

The objective of this public entity is to establish and manage the policies to be implemented on the selection, training, and monitoring process of the emerging farmers. The private sector (which will also contribute expertise, resources, training, etc.) should be represented on the board of this institution. It is proposed that this three-year on-the-job training program begin, and that this institution receive South African Qualification Authority (SAQA) accreditation. This is not to replace agricultural colleges, but on the job, training is very important. As a result, an emerging farmer will graduate after three years. These new farmers will be observed by extension officers and other outside officials, and they will submit quarterly performance reports in accordance with SAQA guidelines. An emerging farmer who does not perform will be kicked out of the three-year training programme.

The emerging farmer will graduate once the three years have been successfully completed. During this period, the emerging farmer would have accumulated enough equity and should be introduced to the land redistributing programme.

Urban farmers, social media, food systems, internet ;

Abstract

Social media hold potential to develop the enterprises of urban food producers and traders. Recent studies have affirmed the potential of urban areas to become self-sufficient in vegetable and fruit production which implies the creation of local food systems that integrate diverse producers, scattered across the urban landscape. Social media can facilitate and help create such local food system. With this in mind, we re-interpret a survey completed by student researchers, that probed social media use by urban food traders and producers. We found the use of social media limited by costs and data access, and show how urban food producers and traders have adapted by developing hybrid systems that blend social media with word-of mouth marketing. We compare these findings with available literature and conclude on the key themes that will be important in the further study of social media in an urban agricultural context.

1. Introduction

Urban farmers and informal food traders have the opportunity to use social media to build enterprises, inclusive of clientele, a brand, their enterprise and a larger local food economy. Urban agriculture is an important opportunity for local municipalities as these areas have the potential to feed themselves (Walsh *et al.*,2022; Martellozzo *et al.*,2014; Thebo *et al.*,2014), provided sufficient land – 30% of the municipal area – is made available for the production of fruits and vegetables. These recent studies suggest that the structural constraints limiting urban food production could be overcome. Local food self-sufficiency in fruits and vegetables in a city is thus possible but would necessarily have to integrate many small, dispersed producers, and develop locally-based distribution and logistics systems. To mainstream urban agriculture and local food trade, we need to create a short path from production to retail, build local organising methods for sales and waste harvesting (to ensure fertility for production) and develop local institutions and opportunities to deliberate about food and its place in our society and economy. Social media would make all this possible, although it may not be sufficient. This article analyses research conducted amongst informal food traders and urban farmers with this in mind. The findings show how urban food traders and producers use social media in their enterprises. In a popular blog (<https://www.izindabazokudla.com/post/urban-peri-urban-and-small-scale-rural-agriculture-and-township-economies-a-manifesto>), we developed a manifesto for the creation of local food markets. This creates an imaginary useful to create new pathways for the development of urban food traders and producers in the informal sector in South Africa.

Basic information on the use of social media is necessary to ascertain if these systems have any potential to benefit urban agriculture and food systems, and, how these are used by

emergent and informal producers and traders. This paper presents and analyses a survey of informal food producers and traders that investigated both agricultural production and use of social media to market the produce. This student research project and dataset is here re-interpreted in the light of more recent concerns about urban agriculture. The original survey delivered findings that are pertinent to new insights on urban agriculture and digital connectivity in South Africa and enables us to establish the extent to which UA is a viable activity in South Africa, enable us to show where and how social media is used for the marketing of food amongst producers and traders, the costs and benefits associated with it, and thus the current utility that may be derived from these systems. Although we found the use of social media to be pervasive, we also identify limits to its use, and these may be associated with the costs of data. Hence, we make a set of recommendations on how social media could be used to further the creation of local food systems for urban farmers and food traders.

This survey has clear limitations, and these are also of a conceptual nature, hence the need to reinterpret these findings with recent literature in mind. We nevertheless can make clear recommendations not only where the limits of social media use lie in South Africa (the costs of these services are still out of reach of nascent and emergent producers and traders) but also what a survey of such new urban agricultural producers and traders should focus on. We thus reinterpret the original findings from our student researchers, and present a set of issues that maybe relevant to future study of social media and urban agriculture.

2. Social Media And Its Potential: Costs As Driver Of Usage

Social networking sites are simple and cost effective (Morris and James 2017). They reach a large audience, and when combined with a consistent and efficient business plan leave opportunities for growth, can build strong brand loyalty among consumers, and increase sales (Duane & O'Reilly 2017). Stelzner (2015) emphasises the brand exposure this brings to enterprises, which would be impossible without this service. After the turn of the millennium, Castells emphasised the virtues of a network society (Castells 2010) and others the benefit of a peer-to-peer social mobilisation strategy (Engeström 2007). Social media platforms could thus bypass the existing food system, create a new market pattern, and this may be easiest in the informal sector, without constraints of governance and regulation. Malan (2015: 57) mentions short supply chains, and integration with and innovation in retail, embedded in local waste systems and social media could provide the means and communication channels to maintain such a system. This might alter how a business is perceived by consumers and is a new frontier in marketing and product design.

Freedom House's "Freedom on the net" (<https://freedomhouse.org/country/south-africa/freedom-net/2021>) indicates access to and use of the internet is broadly "free" in South Africa, with a score of 73/100. Regulation is independent and there is an absence of censorship and restrictions on online content. Manipulation and harassment, as is evident elsewhere, is nevertheless prevalent here. Connections to the global web are also stable and the internet is clearly open and useful to most of the South African population.

Freedom House reports that 63.3% of all households in South Africa have at least one member with access to the internet. In full, 59.5% of urban dwellers have access and in Metropolitan areas – the larger cities – 67.8% of households enjoy access to the internet, as would be the case in Soweto where our survey was done. 12% more men than women have access and 71% of the youth own a smartphone. As we write, the costs of smartphones continue to decline, reinforcing the idea that internet access could hold benefits for the transformation of the South African economy. There are significant efforts underway to make access affordable, but data costs on the mobile carriers is a point of contention as our study indicates. Freedom House mention that 42% of households have no access due to this. These are the households who would benefit from the local production and trade of food but have no means to access it through the internet.

South Africa is experiencing significant unemployment, which currently stands at 34.9% (<https://www.statssa.gov.za/?p=15407>) as compared to 29.1% in 2019 right before COVID when the survey was done (Statistics South Africa, 2019:2). Statista reports a monthly income figure of R23 982.00 per month per person for November 2021 (<https://www.statista.com/statistics/1227081/-average-monthly-earnings-in-south-africa/>). We compare this with urban agricultural incomes below. Unemployment would condition and limit many activities of people, including data purchases. In such a context, a social media-based market would be inappropriate and possibly regressive. Urban farmers do not only face financial challenges but also lack skills and knowledge to create networks facilitated by technology (Mpandeli and Maponya, 2014:135), which very few apps enable them to do. We also note the absence of an application that is focussed on the creation of local food networks. Due to a lack of smartphones, money, and knowledge, it is difficult for disadvantaged urban farmers to expand and improve their farming operations using social media. We discuss how these factors interrelate below, emphasising how farmers and traders used lowest cost options for trade including face-to-face trade, in effect innovating above the affordances a communication channel makes possible. In our analysis, we emphasise the limits to social media-based food trade, highlighting the key face-to-face benefits that may be created by urban farmers and food traders as they develop their enterprises. This leads to interesting recommendations, which we deliberate on in the conclusion.

Research on the utilisation of technology by urban farmers in Soweto is in an early stage. We do not know how urban producers and traders use applications and social media as a communication and marketing strategy, and if this has any promise of further development of their enterprises and the economy. The survey also aimed to identify the devices used by urban farmers, their access to the internet, and their communication methods with customers. We also identified the production systems of urban farmers, and the incomes, labour, and methods of sale used. We also asked questions on the costs and benefits, and preferred communication methods in the use of social media by urban farmers and traders. We also identify limits to this survey, and base our recommendations on ways these limits can be overcome and what additional issues the local self-sufficient production of food in cities invokes.

3. Urban Agriculture And The Informal Sector: a Proto-Food Systems

Urban agriculture is defined by Salau and Attah (2012) as producing food and fibre within the urban environment and its borders for household consumption and the market, including small scale processing and marketing activities. Urban farming can take place in a variety of ways, including community and backyard gardens, as well as rooftop and balcony gardens. Very many different forms and sizes of farms may be identified. Additionally, some urban farmers create a fruit and vegetable store in front of their homes or sell on the street as street vendors to increase their income (Gwamba, 2018:13), linking production and retail. We thus see the beginnings of a new food system that may draw on local resources for sustainable production. Battersby (2011: 546) cautions us to understand the “connections” between formal and informal food sectors, and the opportunity for social media to rationalise these connections is important. They can be used for higher order organising amongst stakeholders. This could extend to participation in broad public fora (RUAF 2010; UN Habitat 2008) or how “partnership brokers” (Serafin 2015) could organise producers and consumers into short food supply chains. We thus speculate on the information processing abilities that social media make possible in the conclusion.

Current examples of urban farming and informal food trade emphasise the informal nature of urban land access (Suchá *et al.*, 2020; Suchá & Duškova 2022), particularly in Soweto, where our survey was done. They advocate for the implementation of the principle of a “mutual beneficial relationship” (2020: 4) between urban farmers and landowners to secure tenure, and this could be highly conducive to interaction on social media. Social media, which has an “informal” character, could thus be used to maintain not only sales and marketing, but also access to land, and by implication, further relationships around investment, production and marketing. The governance of urban agriculture could also benefit from extra-institutional governance outside formal arena’s (Malan 2021) and social media can certainly play a role here. Urban agriculture struggles to produce food in significant

quantities (Zezza & Tasciotti 2010; Crush *et al.*,2010: 8), but this is done in a structurally constrained context. This highlights land tenure and its connection to income and livelihoods, and the informal ways these operate. Would social media create space for innovation and growth in urban agriculture, particularly if it can adjust how we manage land, resources and opportunities? To answer this question is outside the scope of this paper, but is relevant to the pronouncements of Walsh *et al* (2021) Martellozo *et al* (2014) and Thebo *et al* (2014) that 30% of land needs to be set aside for food production for municipal areas to be self-sufficient in vegetables and fruit. This structural shift will make land available for urban agriculture and could change its impacts. Should this be done, social media will certainly be used and this survey explores the potential of this avenue for growth.

4. Social Media And Marketing: A Hybrid System

Social media refers to web-based digital technologies that enable individuals to exchange and debate information (Edeoghon and Esene 2018). In South Africa the use of dedicated agricultural applications are emerging, like the Khula! App (<https://www.khula.co.za/>). Digital platforms such as Facebook, Twitter, YouTube, and WhatsApp are relevant, with Facebook appearing to be the most often utilized social networking site by agricultural businesses, owing to its vast appeal among the intended audience.

Tweeten (2014) emphasises access to technology and connectivity, as well as experience, as barriers to technology use. These barriers can have a negative impact on customer service – the totality of what an organisation does to add value to its products and services to meet customers’ requirements (Machado, 2015:6). As social media becomes pervasive, urban producers and traders have to adapt. By maintaining this customer experience the urban farmer and trader is in effect maintaining the network of trade and production. In this way they create customer value as the net benefits accrued over and above the total cost incurred (Pienaar and Vogt, 2016:16). Social media nevertheless enables a trader to go beyond the “5 Rs of order processing” that relate to the right quantity and quality (Chuah *et al* 2017: 126) charged at the right price and delivered (Sain 2017: 2) at the right location (Nieman, 2017:22). Hence, we look at how these services are used, to build and maintain relationships and speculate on the degree to which it could create a new pattern of trade in the food system.:

5. Producing Urban Agriculture Through Social Media

Farmers and traders would be able to expand their potential market by encouraging interaction amongst people who use the internet to accomplish a specific purpose such as marketing (Cleary, 2015:1), but also suggests how future development may play out in a hybrid context. The ability of social media to bind communities and create and maintain social capital is noteworthy. This could reorganise local production and consumption to create “symbiotic communities” (Signer *et al.*,2020: 587) or “autocatalytic networks (Lenton & Latour 2019) that can reorganise production, consumption, waste management and recycling, and thus “produce” a sustainable food system as it organises stakeholders into new relationships. These communication channels can extend to municipal planning, and although we did not touch on these larger issues in the survey, we make recommendations on how this can be taken further, which concerns the development of a public forum (Dubbeling 2010; UN Habitat 2008) or “public innovation lab” (Williamson 2018) that can steer food systems transformation.

6. Research Methodology

Our survey focussed on urban farmers and food traders in the Metropolitan area of Johannesburg, and specifically Soweto, where we may expect greater than normal internet access. The descriptive research design (Saunders *et al.*,2019:187-188) tracked respondents who frequent the iZindaba Zokudla Farmers’ Lab, and this Lab is located in Johannesburg, the biggest Metropolitan Municipality on South Africa. These traders are also informal, nascent or emergent (although this was not asked directly, the sampling drew from a population who frequent the Lab in order to develop their businesses, and the Lab is aimed at empowering new and emergent traders and producers).

A descriptive quantitative survey (Saunders *et al* 2019) was conducted using a structured questionnaire to collect data from urban farmers in Soweto. According to Thebo *et al* (2014: 2)

between 10 and 70% of urban dwellers may be engaged in urban agriculture. They suggest a median of 266 million urban households practicing urban agriculture, and it is clear this is a pervasive activity throughout the world, and we may see at least 100 000 urban farmers in Soweto according to these estimates. The poor are disproportionately represented in urban agriculture, as they are the first to take this up. This is pertinent for social media use and magnifies the cost driver of social media as particularly important, the informal character of food production and trade in the city, and the limits of managing all this on social media. The sampling clearly crowded-in resource poor farmers and traders, and this is reflected in the findings.

The survey initially aimed to hand out the questionnaires to the 400+ farmers that attend the monthly iZindaba Zokudla Farmers' Lab in Soweto. This was not possible owing to COVID-19 lockdown regulations in 2020 that abruptly terminated hosting this event. iZindaba Zokudla however has a significant presence on the internet, and several WhatsApp groups and groups on Facebook have formed. Hence, we were able to distribute the questionnaires via WhatsApp and Facebook group chats which were part of the communication network that emerged around iZindaba Zokudla. The response rate was very low, and researchers were forced to resort to telephonic interviews to reach farmers who did not have access to the internet or adequate data to respond. Eventually, after repeated phone calls, data from 40 farmers were collected. The structured questionnaire followed a purposive sample, where we looked for respondents who are trading or farming (or both).

All respondents had the opportunity to be informed of the aims of the survey, and all accepted ethical procedures were followed, including institutional review and approval. This survey created a database that includes farmers and food traders who are active online and who have used social media to a significant extent in their enterprises. The survey was piloted, and this increased its reliability. Because the survey was descriptive, we used words and phrases that would be familiar to urban traders and producers, and the themes were all common themes in agriculture. Social media use, with its own specific jargon, also presented challenges. However, the concepts used in the survey were simple and derived from the platforms themselves. Anyone using these would understand them. We believe the farmers and traders are familiar with the language and concepts used in the survey. The results obtained showed significant consistency with previous studies of urban agriculture. As this was a limited survey, we are able to express some confidence in the quality of the findings.

There were nevertheless some conceptual challenges in the survey. The question on the farm profile – that includes reference to “farm owner” or “manager” is ambiguous, as ownership of land is in question, and may be attained through informal means (Suchá *et al* 2020; Suchá & Duškova 2022). Both may refer to a de facto “ownership” or “access” to land. From experience, “ownership” could mean the farmer has secured the land either through a contract or through an “informal” arrangement. Clearly, the word “ownership” needs to be carefully interpreted in the light of this new research. Answers to our question “where do you farm” was also misunderstood, as some indicated they source food from the Johannesburg Fresh produce market. This is clearly a source of food for traders, but farmers would also have answered this in the affirmative, indicating complex supply chains for urban food trade in Soweto. These questions need to be rethought. We discuss this in the conclusion and suggest ways this can be better enumerated.

There is no database of urban farmers in Johannesburg and surrounding areas, and we have no information to clearly set out how far the findings from this survey can be generalised, although we note that urban agriculture is pervasive globally. The sampling strategy does make some generalisation possible, but it is also limited as we used a purposive sample that could have crowded in respondents. However, they offer valuable information from farmers and food traders who are using social media. They represent a group that is active on these platforms, and the findings thus speak to how these platforms may be used by urban farmers and food traders. This sample allows us to generalise to a limited extent how these systems can be used by urban farmers and food traders. We interpret the findings in the context of well-developed theoretical positions on urban agriculture and local food systems, and social media use. This allows us to generalise with reference to these sources

of knowledge and position our findings in the context of the greater movement towards local, circular and sustainable food systems.

7. Results and Findings

7.1 Biographical data

According to the research, all 40 farmers were African and resided in Soweto. Females comprise the majority of respondents (55% female, 45% male), as may be expected. Respondents ranged in age from 22 to 71 years, with the majority (43%) falling between the ages of 32 and 41 and 22% between 21 and 31 years. It is evident that an increasing number of young adults and middle-aged people are taking an interest in farming. One explanation for this could be a shortage of employment possibilities, and farming is an accessible choice for maintaining food security and supplementing income. The educational status of respondents revealed that the majority (57.5%) completed Grade 11 or lower, followed by those who completed Matric (22.5%), while 20% completed tertiary education. The fact that most respondents (80%) lack a higher education may have affected their decision to start a farming business to produce revenue and emphasises that the poor dominate this activity. Social media may be accessible to a very wide pool of users, and educational attainment is of lesser importance in its use. It also emphasises the “local” character of urban food trade and production, as these producers and traders have a low opportunity for social mobility. This in turn reinforces our aim to transform these systems to build local solidarities and hence they in a sense constitute a proto-food system amongst practitioners.

7.2 Farm profile

The majority of respondents (75%) own and operate their own farm (Figure 1), although we are aware that access and ownership may not be clear or permanent, as Suchá *et al* (2020; 2022) emphasised. Of the respondents, 18% are farm managers, and several respondents claimed that because it is a family business, family members typically oversee the operation. Only 8% are general workers, with most of these workers employed by larger producers. This is consistent with the findings of Suchá (2020) that underscores the informal nature of land access in the townships of South Africa. This augurs well for the interpretation that will follow, as this forms a base for social media to draw upon and build larger systems of exchange. The existence of farm workers suggests the occupational category of “urban agricultural worker” is emerging, further suggesting the sector is open to further development.

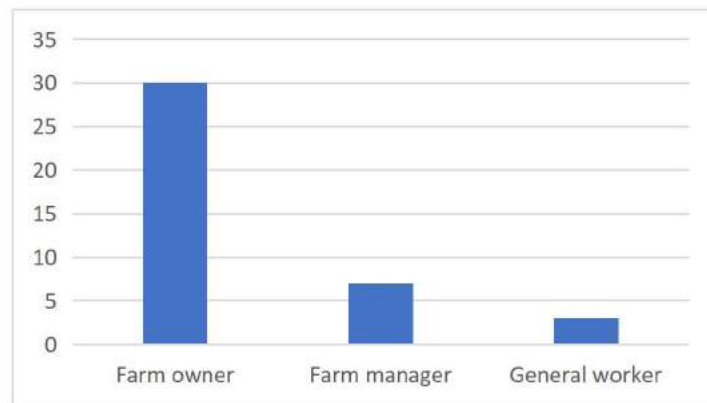

Figure 1 Occupation/Function on the farm

7.3 Years of practice

A third of the respondents (33%) had 4-6 years of agricultural experience (Figure 2), followed by 18% who started their farms more than 15 years ago. These long periods of engagement with urban agriculture points to a maturing sector. Please see below.

Figure 2 Years of farming practice

7.4 Agricultural production systems

Crawford (2021) recognizes different production systems of urban agriculture, including community gardens, rooftop gardens, aquaponics, vertical farms, greenhouses, and peri-urban farms. The research identified the following sources of food: rooftop gardens (2.5%), container gardens (2.5%), sourcing from the Johannesburg Fresh Produce Market (2.5%), backyard gardens (15%), open land gardens (35%), and community gardens (42.5 %). Community gardens and “open land” gardens are likely to be managed in “informal” ways, and could indicate pervasive systems in place that enable access to land and productive resources. The diversity of production sites and implied techniques augurs well for a robust and multi-faceted urban agricultural sector. Their small sizes, implies we have to organise many smaller pieces of land for food production and is suggestive of additional communicative methods. The mentioning of the Johannesburg Fresh Produce market in this answer, under “other” also indicates the deep linkages between urban agriculture and the larger food system. Urban farmers are thus integrated with own, local and distant and rural markets for food. This diversity of sources will enable the enterprises to deliver over and above the seasonality they will encounter in the urban area.

Diekmann et al., (2018) emphasise the nutritional advantage home gardens give, albeit in the “Global North”. Csortan, Ward and Roetman (2020) emphasise that years of experience and knowledge has a positive relationship with garden efficiency, and this is also borne out by urban farmers in Soweto. This in turn suggests lucrative opportunities for training and research on production techniques. They also emphasise the value of labour, which is also evident in our survey. Gardens, according to them (2020: 27) offer “access to a cheaper alternative” and they identify “raised-mixed” methods as most productive. These may be evident in open land, backyard and community gardens.

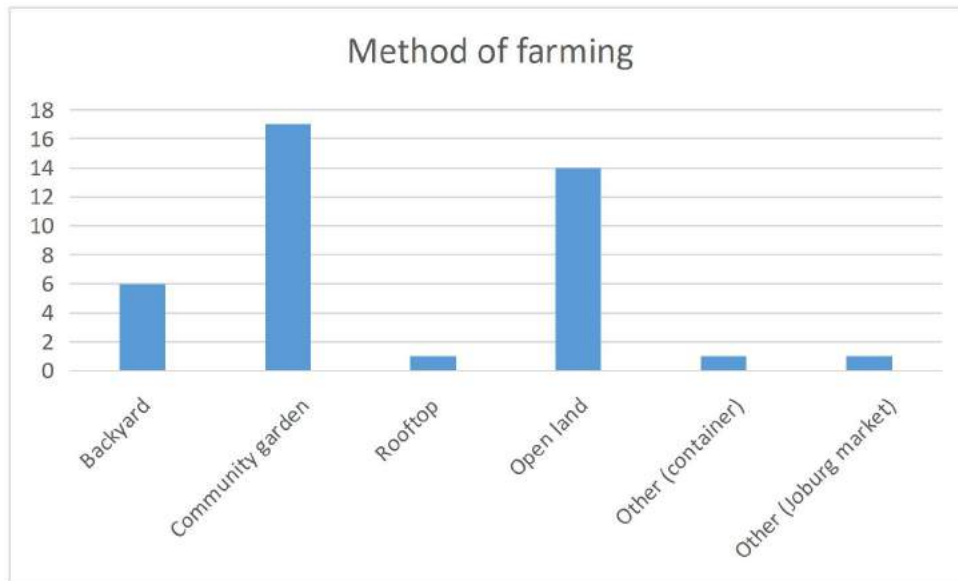

Figure 3 Techniques of urban agriculture

Rooftop production would normally use hydroponic or aquaculture production systems. These are prevalent in Soweto, although rooftop space is limited, as single story units dominate. Nevertheless, the existence of such production systems, in a confined space, point to the diversity of practitioners, and production systems. This suggests that the sector is able to mature and consolidate and be susceptible to engagement on policy issues. The findings on the fresh produce market may be explained by the fact that both traders and producers were targeted in the research.

7.5 Number of employees

According to the research, 40% of respondents do not have any employees on their urban farms. The respondents operate the urban farm alone and rely on assistance from family. This is typical of the informal sector, where enterprises are often “individualised” (Petersen 2020). About a third (32.5%) have at least one person assisting them or have a business partner. Typically, one partner will operate the business while the other does various business-related activities. Only 12.5% of the farms employ more than five people. These farms do provide work for a small number of individuals, they do so on a small scale but the existence of larger numbers of workers on the larger farms, indicates that this employment category has some merit. This would support the development of an urban agricultural training programme, as skilled workers could enhance productivity. Labour costs are a significant expenditure for urban farmers (Signer *et al* 2020; Csortan, *et al.* 2020) but the ability of Soweto farmers to employ people seems to be significant. This indicates the maturing character of the sector, and the need for labour indicates a significant redistributive potential.

7.6 Income

Our findings point to significant opportunities for urban farmers to earn income, although these do not beat the average wage in South Africa. Half of the farmers (50 %) make a net weekly income of between R0 - R499 after reinvesting a portion of their revenues (Replenishment of the farm or acquisition of additional supplies required for farming operations) This is slightly lower but comparable to incomes in the informal food catering sector (Petersen 2020) (Figure 4). About a quarter (18%) of the respondents earn an average of between R1000 and R1499 per week, which occurs most commonly during peak periods, which are typically at the end of the month or the start of the following month, according to the respondents. Farmers earning between R500 and R999 per week, as well as those that service larger markets and earn more than R2000 per week, make up 13% of respondents. The highest recorded sales normally take place at the end of the month (Figure 5). Generating an income of more than R 2000 per week indicates that urban agriculture and food trade could enable decent incomes. These could be exceptional farmers, whose practices need to be further

studied, as they may indicate not only how such incomes can be achieved, but also how we could move the whole sector to higher incomes.

Kapoor & Kumar (2015:215) affirm this buying trend driven by customers receiving their salaries at the end of the month. This overlaps with the social grant payment days and wage payment dates. This indicates a responsive selling strategy, optimised to the earning patterns of the consumer. Urban farmers and traders are responsive entrepreneurs who are able to adjust and manage their enterprises as new opportunities emerge.

Many studies have emphasised food insecurity amongst urban farmers in South Africa (Crush et al 2010) and the figures above seem to suggest that urban production is insufficient to ensure food security. The cost of an acceptable food basket in Johannesburg, according to the organisation Pietermaritzburg Economic Justice and Dignity, is R 4748,87 per month in July 2022 (https://pmbejd.org.za/wp-content/uploads/2022/07/July-2022-Household-Affordability-Index-PMBEJD_29072022.pdf). Only the most proficient urban farmers would be able to match this. Urban agriculture is in many respects a survivalist activity, but the most proficient farmers' incomes support the idea that this could be a path to economic development.

We need to know the contexts of such proficient farmers, and how they can garner such incomes from their farms. The existence of such proficient farms is evident in the literature and in anecdotal accounts and indicate that local self-sufficiency may be achieved. However, the stark differences between them and others who earn much lower incomes, suggests that the path to self-sufficiency would only be possible if the sector can transform significantly, as would happen if a comprehensive local plan was adopted to promote urban agriculture.

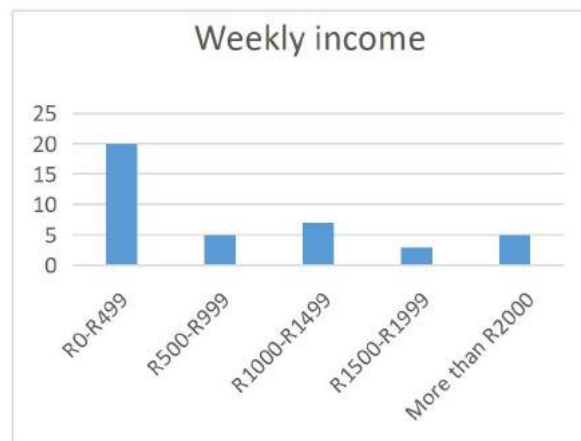

Figure 4 Weekly income

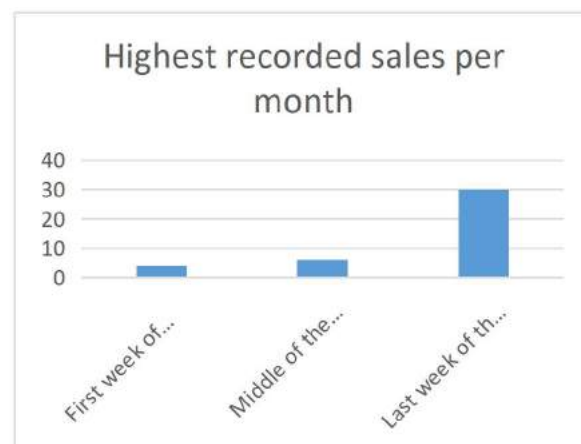

Figure 5 Highest recorded sales per month

7.7 Selling methods

Farmers lack internet access, and this is often unaffordable (Lyle *et al.*,2013: 10). Many lack smartphones and others lack access to the internet. As a result, many farmers in Soweto are unable to advertise or sell their products online. We also see this in the absence of applications used, and the absence of the use of the Khula! App (locally developed) indicates significant work is needed in popularising and promoting these applications.

Farmer's markets are small tables set up in open spaces where they sell their fruits and vegetables to passers-by. The majority of respondents (75%) were street vendors, while only 3% of the respondents uses WhatsApp for commerce. However, regular customers are most likely to place an order through the cell phone messaging application, indicating the ways social media create and maintain networks. This limited use of WhatsApp needs to be interpreted with reference to the pervasiveness of face-to-face trade and relationships. We thus ask, in the conclusion, if this is the result of the high costs of data and connectivity in South Africa and deliberate further on how these networks can be maintained and developed further by urban farmers and traders.

Only about a quarter (18%) of the respondents earn R 1000 per week or more. They would be able to produce enough to meet the needs of a wider market. These producers and traders are commercially focussed, suggesting that a class of producers and traders may emerge in urban areas if conditions are right. According to the data, the majority of farmers in Soweto work as street vendors, with only a small number of farmers selling their produce through social media platforms such as WhatsApp. The interaction between production (farmers) and trade (vendors) is a key point of interest. This may indicate that a more complex pattern is emerging, with farmers and hawkers and traders dividing the labour of urban food production and sales. This suggests that a relationships dependent food pattern is emerging, which would be open to maintenance through social media.

The pervasiveness of face-to-face relationships is also important to note. This could be accounted for by the costs of data and connectivity, but also that organising and mobilising customers would be most effective at the local and immediate level, and that the real relationships count in doing so. Hence, we can infer that only the most basic requirement of a sustainable local food system is evident in current patterns of trade, but that significant changes, in data costs, relationships building, and locally embedded production techniques are needed to reach its full potential.

7.8 Devices

Respondents primarily use smartphones (70% as per Figure 6) for communication. However, the primary method of communication between farmers, without connectivity, and their customers is word of mouth (58 %) (Figure 7). The pervasiveness of smartphones indicates that connectivity is available, but then the pervasiveness of word-of-mouth communication suggests data costs are a barrier. However, a future sustainable and local food system would necessarily have to be a hybrid system that uses social media and other digital tools in addition to face-to-face organising and marketing. This would be conducive to the development of ancillary activities around urban farms, like the local harvesting of wastes, and their further processing in local sites. Face-to-face relationships would be necessary to educate consumers about the value of local wastes, both food and recyclable wastes, and this may have to take precedence over a media and content heavy social media strategy.

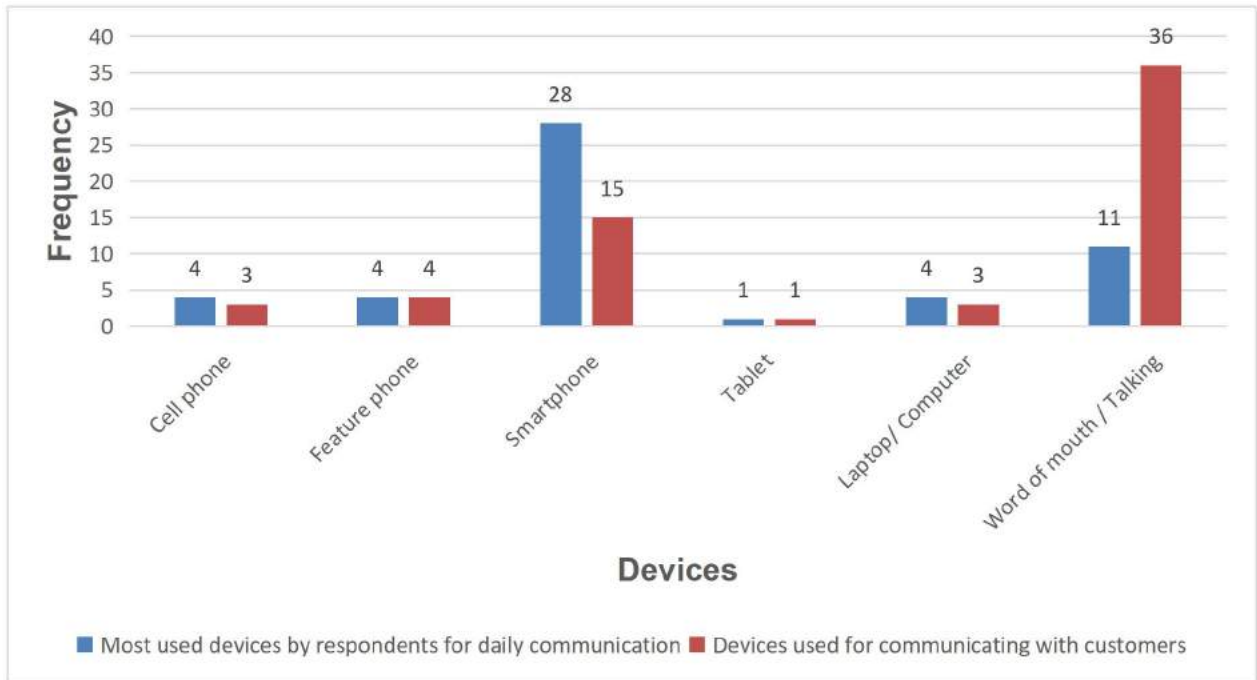

Figure 6 Devices

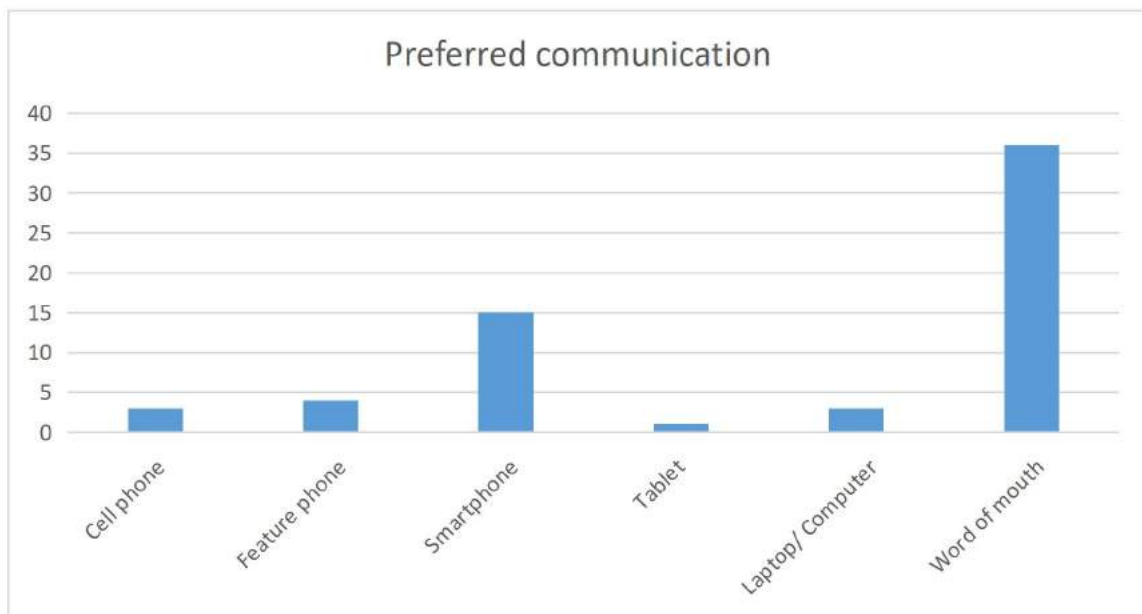

Figure 7 Preferred communication method

7.9 Internet access

Lyle *et al.* (2013:10) found that urban farmers in Soweto do not have accessibility to internet connection or smartphones due to affordability. Many farmers therefore lack the ability and resources to advertise or sell their produce online. According to our survey, two-thirds of the farmers (67%) do not have access to the internet. This underscores the need, in any attempt to develop this sector, to blend social media with face-to-face interaction, and suggests that farmers and food traders need to build a hybrid system to communicate to customers.

The respondents with internet connection prefer and mostly use WhatsApp for communication (Figure 8). WhatsApp seems to be able to fill this gap, suggesting that a general communication platform may be sufficient for local food trade, but this may preclude the use of more complex network management strategies. We however are mindful of the universe of multiple platforms that

may be relevant here. Social media is pervasive as a multiplicity of platforms, and the benefits of social media emerge on multiple platforms. Data costs may prohibit such use, but this may also point to the lack of a comprehensive application that is tailored to urban farmers. Even though many respondents own smartphones, they lack internet access (16,85%) to communicate with their clients and therefore depend on word-of-mouth communication as indicated in Figure 9.

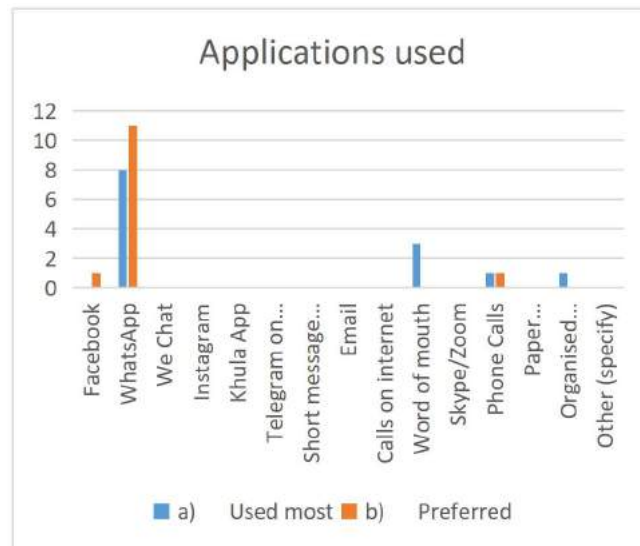

Figure 8 Applications

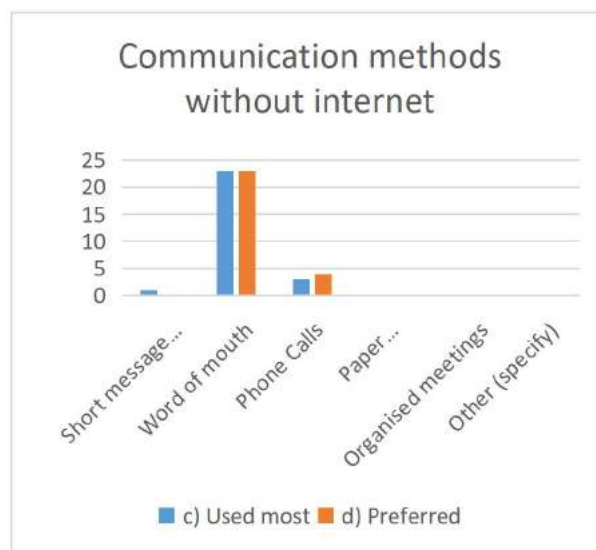

Figure 9 Communication methods without internet

One of the barriers to respondents obtaining internet connection is the prohibitively high cost of data and airtime. Three-quarters of the respondents (75%) spend between R0 and R99 on data and airtime and this is mostly used to contact family members and not for business purposes (Figure 10). Trade is blended with social reproduction, as respondents use WhatsApp for multiple purposes. It is clear the investment in data will not lead to the required returns as customers are also limited in using social media. There are many food traders in Soweto who source their food from the Johannesburg Fresh Produce markets through various channels, and they compete with local producers. Data costs may prohibit innovations in local production, but it is necessary to contemplate the possibility of developing a dedicated application to stimulate local food systems. Hence, we can suggest that future development of applications could blend social and business functionality, particularly at retail sales level, but data costs would have to be incorporated into the business model.

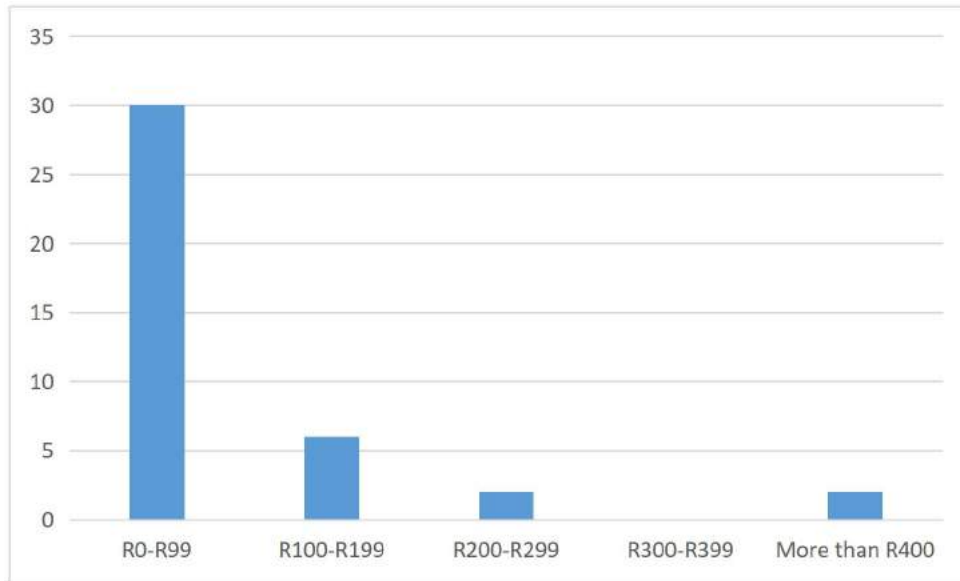

Figure 10 Connectivity costs

7.10 Applications

According to Varrella (2021), WhatsApp is the most popular social media program in South Africa (93% of internet users) and accounts for 23 million users in the country, followed by YouTube (92%) and Facebook (87%). YouTube (92%) has surpassed Facebook (87%) in South Africa in terms of usage, owing to lower data costs and increased broadband accessibility (HelloYes Marketing, 2020:1). However, in 2015 Facebook Lite was launched to developing markets and designed to work in areas with slower or limited internet connections (Facebook Lite 2018). By 2026, the expected number of WhatsApp users in South Africa would reach 28.6 million. The use of WhatsApp is thus highly appropriate, and underscores the functionality of this platform also as a business platform. Its ability to blend social communication and business communication needs to be noted for the development of future applications. It also raises question on the suitability of platforms like Facebook for the stimulation of local food economies. Data costs may be the root cause of this, but we nevertheless have to mention that the simplicity of a pure communication tool, may overshadow complex platforms and the interaction on them.

Figure 11 Applications utilised

As mentioned before 54% of respondents used smartphones for communication, but only 24% used them to communicate with clients (Figure 11), primarily using WhatsApp and Facebook. This deficit in digital communication should alert policy-makers on the ways in which urban agriculture and food self-sufficiency can be managed. It directly points to the need to mobilise in ways other than social media, and emphasises the need for face-to-face communication and organising.

7.11 Advertising

The respondents view word of mouth as a critical (88%) mode of advertising. Additionally, as seen from Figure 6, the farmers claimed that cell phones (65%), feature phones (70%), tablets (78%), smartphones (58%), and laptops/computers (78%) do not play a role in their farming business. The use of technology therefore has little impact on the way the farmers advertise their produce as they heavily rely on word-of-mouth advertising. This suggests local food systems are already evident in Soweto, with strong relationships being built, but this is being done with only the slightest use of social media. This is a sufficient basis for the development of further processes, like waste harvesting, and consumer education, but does not preclude the use of other, still unknown ways of organising. Should data costs be the key barrier to the adoption of more social media for these processes, we may see local sales, waste harvesting and local advertising emerge as key drivers of a local food system. However, Pienaar and Vogt (2016:16) argue that a successful supply chain requires information accuracy, visibility, and access to real-time data, and unfortunately, some respondents lack access to technology, preventing them from engaging with their customers efficiently (Lyle *et al.*,2013:10). The ability to draw on the analytics of platforms would be lost in a pure face-to-face approach to local food system development, and hence we are able to conclude that significant change may be expected if data costs can be lowered.

The majority of respondents utilize word of mouth to advertise their produce, and the freshness and quality of the produce is what attract clients. Most farmers responded that they prefer street vending since it allows them to gain new clients daily as people pass by and opt to purchase in addition to their regular customers. Farmers occasionally utilize airtime and data to communicate with suppliers and consumers, but most of their communication with customers and with one another occurs through word of mouth (Figure 7). They rely on passers-by to spread the word about their produce's quality. Only a small group of respondents use WhatsApp and Facebook as social media platforms to communicate with customers. According to the respondents, customers choose these modes of communication since they are economical and convenient to use. These are the three most viable modes of contact between respondents and their consumers. Additionally, the farmer-customer relationship is critical for effective communication because it is built on trust and an understanding of the customer's purchasing patterns.

7.12 Financial implications

Overarching our findings is the costs of data, and there is a dissonance between the state and society's wishes to expand internet access, and the costs of data. Urban agriculture is as old as cities, but in our social imaginaries it is a new phenomenon. It would most likely only be able to reach its full potential in a context where hybrid systems are used that straddle digital and face-to-face relationship building. Such hybrid systems would be necessary to develop a sustainable food system that responds to local priorities and resources. The beginnings of such a system is evident, but data costs and application development undermines the achievement of a sustainable local food system.

8. Conclusions

Farmers in Soweto rely heavily on street vending to sell their produce to clients. Impulse and convenience purchasing are evident in the usage of word-of-mouth communication. Furthermore, word of mouth is primarily employed by persons who do not have access to the internet. As a result, this group of farmers have not exploited the value added by technology to their operations, and we found, in general, the cost of social media use are too high for urban farmers and food traders. However, respondents with internet connection rely on the WhatsApp platform due to its simplicity of use, accessibility, affordability, and client preference..

9. Recommendations

While social media can aid urban farmers in promoting their produce, there are limitations which include a lack of connectivity due to the high cost thereof, and a lack of information regarding the use of social media as a marketing tool underscores the critical nature of training in this strategy. We also want to point to the lack of a comprehensive application that can connect production with households at the retail level.

The following recommendations are made considering the findings:

- Training for urban farmers in the use of social media as an advertising tool.
- The development of an appropriate application for urban farmers that can manage all the processes necessary to build a sustainable and local food system;
- The lowering of data costs to stimulate wider adoption and use of social media by nascent and emergent urban traders and food producers.

The formation of dense relationships between traders, producers and customers through social media is possible, but is yet unrealised. Many have indicated that the development of urban agriculture can be accomplished by integrating stakeholders and actors in multi-stakeholder forums (RUAF 2010; Malan 2020) or public innovation laboratories (Williamson 2018). These would have to be hybrid, between the digital and real life, and would build on the relationships already evident amongst urban producers and food traders.

We further recommend that future research emphasise the following issues:

- To what extent is land and access to it mediated by informal systems? What role can social media play in enhancing this access?
- Access and “ownership” of land for agriculture may be found in a variety of formal and informal ways. These need to be distinguished from each other and presented as such. This may need a research intervention on its own, and it may be necessary to probe for this in an open-ended way, to capture the diversity of ways farmers gain access to land for productive purposes.
- Labour and returns: Labour is extensively used in urban food production and trade, but if we know the returns on labour, we can ascertain to what extent a farmer can feed more people than himself, and this would be the basis of food security through local production. Understanding labour and productivity would enable us to cross reference with production techniques and other measures to gain an understanding of what production methods are best in an urban context.
- Productivity and returns on social media: it would be necessary to ascertain the extent to which investments in social media, from devices and data, stimulates the urban food enterprise.
- What do farmers do amongst themselves? Are they perpetuating an “individualism” or are they exploiting the powers of networks for economic advantage? We would have to analyse social media interaction to understand the extent to which farmers are able to form and maintain a durable Community of practice amongst themselves. This would be the basis of innovation in local areas, and this may be very important.

Price Tariff Payment Models Used In Private Hospitals In South Africa To Provide Insights Into The National Health Insurance

Abstract

Price tariff payment models are critical as private healthcare is unaffordable to most South Africans, and the introduction of the National Health Insurance (NHI) will require greater sharing of resources between private and public hospitals. This paper explores the various price tariff payment models used in private hospitals in South Africa to provide greater insights into the NHI proposals. Price tariff payment models charge price tariffs for patient treatment and reward providers for delivering value to patients. Most price tariff payment models reward the quantity of health care provided and are not linked to value based on patient outcomes. This paper reports the results of a qualitative investigation into the price tariff payment models used by two private hospitals for one procedure. A hypothetical case is used to illustrate the price tariff payment model highlighted by the Competition Commission as being key to driving innovation and competition in the South African private health care system. These price tariff payment models were compared to the preferred price tariff payment models put forward for purchasing in-hospital services for the NHI Fund, which all private hospitals will have to adopt if they want the NHI Fund to purchase in-hospital services from them. The results show that the DRG price tariff payment method preferred by the NHI is not a value-based price tariff payment model because it typically reimburses only for inpatient episodes or procedures and does not incorporate the full range of physician, outpatient, rehabilitation, education, and other services needed to achieve good outcomes over a complete care cycle.

1. Introduction

Worldwide, policymakers are attempting to lower the cost of providing quality health care. However, the opposite is taking place with the cost of health care increasing across the globe owing to numerous factors, including aging populations and medical technology advancements (Porter, Kaplan & Frigo 2017:25). There is a lack of understanding of how much it costs to deliver patient care. Cokins and Scanlon (2017:1) explain that it is not enough only to measure the cost to deliver health care, it must be coupled with the price tariffs charged to deliver health care. The setting of price tariffs that are based on appropriate costing structures of healthcare service providers is thus a critical component in managing a healthcare business. One of the most critical factors that influence the attributes of price tariffs is the price tariff payment model that is used to charge the price tariff to the patient. The price tariff payment model influences the unit of services that is acquired, the period for which the services are purchased, whether the price tariff payments are prospective or retrospective, and whether payments are fixed or variable depending on specific outcomes being achieved (Casto & Forrestal 2015:8). Price tariff payment models are also commonly referred to as provider payment models or reimbursement models, but the term price tariff payment model will be used in this article.

Porter and Kaplan (2016:90) suggest that the price tariff payment models used to charge price tariffs for patient treatment need to reward providers for delivering value to patients, that is, for achieving health outcomes at a lower cost. Health care outcome measures indicate the impact of the health care services or interventions on the health status of patient or patient groups. Using health outcomes of care reveals the effect of care or intervention on the patient's life by using specific measures before and after treatment (Sedley, 2013:1-2). These could be assessed self-reported, observed, or clinically (physical examination, laboratory testing, imaging). Certain health outcomes involve complex assessments to determine if they are present or absent (Oleske & Islam, 2019:69-70). Most of the price tariff payment models reward the quantity of health care provided and not the reward value provided measured based on patient outcomes.

Price tariffs and the price tariff payment models that are used to charge them to patients have been subjected to much debate in South Africa. The Competition Commission inquiry included a reference to the impact of the price tariff payment model on price tariffs in the private health care system in South Africa (Competition Commission 2019:94). The South African government identified price tariffs models that will be used by the proposed National Health Insurance (NHI) Fund, the sole purchaser of health care services under the NHI, to procure health care services for the South African population from both private and public sectors providers to be central to ensure effective cost containment and the future sustainability of the proposed National Health Insurance (NHI) (Department of Health, 2015:63, 68, 71–72).

The primary objective of this article is to explore various price tariff payment models used in private hospitals in South Africa and the compatibility with the NHI proposal in the context of one specific procedure. This is achieved by comparing the price tariff payment models and price tariff data of two different hospitals for a laparoscopic appendectomy (a minimally invasive surgery to remove the appendix through several small incisions).

2. Problem statement

Private hospitals and/or hospital groups use various price tariff payment models to charge price tariffs to patients for medical procedures performed. The use of a particular price tariff payment for a given procedure is based on the agreement reached between the private hospital and/or hospital group and the different medical aid schemes (Noble 2018). This might cause one procedure to have various price tariff payment models being used to charge the price tariff. However, the NHI Fund has identified only one price tariff payment model which is the diagnosis-related groups price tariff payment model (DRG price tariff payment model) as the preferred model to purchase hospital inpatient services (Department of Health, 2015:63, 68, 71–72). Private hospitals and/or groups face a problem: they will be required to adopt the DRG price tariff payment model if they wish to contract with the proposed NHI to provide hospital inpatient care (Department of Health, 2015:63, 68, 71–72).

3. Research objectives

The primary objective of this research is to explore various price tariff payment models used in private hospitals in South Africa and the compatibility with the NHI proposal in the context of one specific procedure. These price tariff payment models will be evaluated to determine their usability when compared to the preferred price tariff payment model put forward for purchasing in-hospital services by the NHI Fund.

To assist in achieving the primary objective, the secondary objectives of this study were:

- i. To perform a literature review of price tariffs payment models being used in South Africa.
- ii. To investigate the characteristics of the price tariffs of the various price tariff models and apply them to a laparoscopic appendectomy procedure at two different private hospitals.
- iii. Compare the price tariff payment models used by private hospitals to provide insights into the preferred price model put forward for purchasing in-hospital services for the NHI Fund.

4. Literature review

Costing in health care organisations is focused on determining the unit cost of a particular service or episode of care (Hilsenrath, Eakin & Fischer 2015:2). Kaplan and Haas (2014:122) argue that the unit cost should be calculated over the cycle of treatment of a patient's primary medical condition and not only for the health care services provided or the episode of care. To better understand what it costs to treat a patient, the patient's condition should be the cost object and not department units, procedures, or services because the patient's condition is then the driver of the treatment provided and the direct and indirect costs incurred to treat the patient. For this article, costing is defined as determining the unit cost per patient's primary condition throughout the cycle of treatment by assigning both the direct and indirect costs that have been incurred in the treatment of the patient's primary medical condition.

According to Simon (2015: Loc 686), the definition of price tariffs has many aliases, for example, sales price, pricing, premiums, tuition fees, and tariffs. The definition of price tariffs is mostly dependent on the particular industry. Sharp, Bergh and Li (2013:45) define an industry as a group of organisations that offers similar products or services. The medical industries of South Africa and the United Kingdom refer to tariffs (South African Medical Association 2014:6) probably because the treatment provided to a patient is made up of various services with each service having its own tariff. Consequently, it was decided to use the concept of price tariffs in this article to refer to the amount that private hospitals charge patients for the treatment they receive for their primary medical condition.

The term alternative price tariff payment models refer to all price tariff payment models other than the fee-for-service price tariff payment model (Kaplan 2016:18). Noble (2018) explains the alternative price tariff payment models that are used in private hospitals and their impact on the cost of health care as:

- a) The per diem price tariff payment model charges tariffs using CPT 4 codes (CPT stands for Common Procedure Terminology) and specifies the procedure that was performed. It incentivises the hospital groups to manage the level of care, medicine provided, and consumables used in one day but provides no incentives for managing the length of stay.
- b) The fixed fee price tariff payment model also uses CPT 4 codes and incentivises hospitals to manage the length of stay, level of care, medicine provided, and consumables used.
- c) The global fee price tariff payment model is based on the CPT 4 codes. This model discourages unnecessary care and encourages care coordination between health care providers across the continuum of care. It incentivises the hospital, surgeons, and other health care providers to provide efficient treatment for the patient by managing the level of care, length of stay, medicine provided, consumables, and surgical items used, and includes pathology and radiology to ensure limited wastage of health care resources.
- d) The DRG price tariff payment method analyses resource usage for the particular primary medical condition.

The different alternative price tariff payment models have different characteristics, which will also affect the price tariff amounts for each of the various models. The price tariff payment models will be discussed in more in detail in the section below.

4.1 Price tariff payment models

The World Bank (2009:3) contends that price tariff payment models can act as an accountability mechanism between health care providers and purchasers. The models can enable health care service providers to achieve health policy objectives such as improving patient access to health services, promoting effective and efficient use of resources, and controlling costs. The importance of price tariff payment models was also highlighted by Berenson, Upadhyay, Delbanco and Murray (2016a:1) who argue that health care reforms in terms of patient treatment cannot happen in isolation and need to be integrated with the price tariff payment models used in the health care system. Berenson *et al.* (2016a) further state that each price tariff payment model has both strengths and weaknesses and, depending on its operational design features, affects the behaviour of health care providers differently.

The terms health care providers and health care purchasers need to be clarified to provide context to this section. Health care providers are the service providers that treat patients for their primary medical condition and health care purchasers are organisations, public or private, that acquire health services on behalf of a defined population. Health care purchasers are often health insurance organisations but they may also be employers, cooperatives, and other institutions that pool funds and purchase health care on behalf of their beneficiaries (Competition Commission 2019:17,244).

Berenson *et al.* (2016a:7) identified several price tariff payment models of which the following are the most widely used in health care systems (Casto & Forrestal 2015:9–14): (i) diagnosis-related group system, (ii) fee-for-service, (iii) per diem and (iv) bundled purchases. These four models can be categorised according to different criteria, which are discussed in the next section.

4.1.1 Diagnosis-related groups (DRG) price tariff payment model

Diagnosis-related groups' price tariff payment models (DRGs) classify patients' diagnoses according to variables, namely, principal and secondary diagnoses, patient age and sex, the presence of comorbidities and complications, and the treatment given (Mathauer & Wittenbecher 2013:746). Patients who are classified in the same group have similar diagnoses, treatments, consumption of resources and length of stay. These groups are assigned a weight that reflects the cost of treating patients in that category relative to other categories (Berenson *et al.* 2016b:18). This payment model tends to be a prospective payment method because payment is based on the diagnosis and not the treatment provided (Casto & Forrestal 2015:13). The health care provider receives a fixed amount for the specific diagnosis-related group. This makes it essential for the health care provider to use a costing model that can determine the unit cost for the specific diagnosis-related group, as the cost of the resource used is the starting point for the health care provider to negotiate diagnosis-related group rates with purchasers (Quentin, Geissler, Scheller-Kreinsen & Busse 2011:27).

The standardisation of classification, resource utilisation and clinical characteristics brought about by diagnosis-related groups supports transparency and describes hospital activity in standardised units that enable analyses that would otherwise not be possible (Geissler, Quentin, Scheller-Kreinsen & Busse 2011:11–12). However, to increase revenue per patient, coding practices of diagnoses and procedures or services could be changed, or additional treatment could be provided, leading to the reclassification of patients into higher-paying diagnosis-related groups, which is a limitation of this model (Melberg, Beck Olsen & Pedersen 2016:992).

4.1.2 Fee-for-service price tariff payment model

As suggested by the name, fee-for-service price tariff payment model, health care service providers are paid for each service provided. Payments under this model are traditionally retrospective and variable because health care service providers are paid per service provided (Casto & Forrestal 2015:9–10). This model allows either the providers or the purchasers to set price tariffs for services (Ellis, Martins & Miller 2017:113).

The fee-for-service price tariff payment model rewards the number of services provided and not the quality or efficiency of treatment (Porter & Kaplan 2016:88–89). This model also contributes to the fragmentation of health care delivery by paying health care providers based on service volumes rather than an episode of patient care, which creates little incentive to coordinate with other health care providers to deliver efficient health care to the patient (Bestmed 2014:68). The model's strength is its ability to accommodate elements of other price tariff payment models (Ginsburg 2012:1977–1978) and the model also incentivises the fullest possible care for patients (Barr 2017:6).

The price tariffs that are charged using this model are based on effort, which is denoted as relative value scales that measure both inputs by time and intensity of effort. The intensity of effort includes the cost of providing the service efficiently. The use of relative value scales is problematic because they need to be updated with new technologies. This is because they are affected by new standard treatment protocols, and the data quality needs to be good to enable an accurate update to the relative value scales (Ginsburg 2012:1979–1980).

4.1.3 Per diem price tariff payment model

With a per diem price tariff payment model, a fixed daily price tariff is charged for specific services or outcomes, regardless of the actual costs incurred for caring for a particular patient. The price tariff is usually a flat all-inclusive rate that may vary by the level of care (Noble 2018). Often hospitals will exclude days in an intensive care unit or another specialised unit where it is difficult to determine the cost of treating the patient unless there is a sufficient volume of regular medical-surgical cases to make the reimbursable costs predictable. Similarly, multiple per diems are often negotiated based on service type (medical-surgical, obstetrics, intensive care, heart surgery) (Berenson *et al.* 2016a:19).

This model's strength is that it transfers the risk relating to the treatment costs to the health care provider, as the per diem rate is a fixed rate for a particular level of care that is expressed in hospital days (Life Healthcare Group 2014:30). However, the per diem model also encourages health care providers to increase the number of inpatient hospital admissions or to extend the length of stay, or both to increase revenue for the health care provider, which is a weakness in this model (Casto & Forrestal 2015:13).

4.1.4 Bundled purchases price tariff payment model

With a bundled purchases price tariff payment model, a patient pays a single price tariff for all the care required for their primary medical condition across the entire care cycle or overtime for chronic conditions or primary care. The scope of care is defined from the patient's perspective and also extends to the management of common comorbidities and related complications (Porter & Kaplan 2016:90–92).

The bundled purchases price tariff payment model should include care for common complications and comorbidities but exclude treatments unrelated to the medical condition. The payment amount should be contingent upon achieving certain patient outcomes and provide a positive margin above the actual costs incurred by efficient and effective providers. The price tariff should also be adjusted for risk, for example, the patients' age and health status that may affect the complexity, outcomes, and cost of treating a condition and their social and living circumstances. These risk factors should be reflected in the bundled payment and in expectations for outcomes to reward providers for taking on hard cases. The bundle should be targeted at a homogenous patient population and risk-stratified across a broader covered patient population. The bundled purchases price tariff payment model includes stop-loss provisions funded by the payer to protect against catastrophic cases. The price tariffs should also be stable over a specified period to allow providers to capture benefits from the outcome and process improvements (Porter & Kaplan 2016:92). Well-designed bundled payments encourage teamwork and high-value care. The price tariff is tied to overall care for a patient with a medical condition, aligning payment with what the team can control (Porter & Lee 2013:60).

In South Africa, there are two forms of the bundled purchases price tariff payment model, namely, the global fee price tariff payment model and the fixed fee price tariff payment model. The global fee price tariff payment model is similar to the bundled price tariff payment. Both the fixed fee and global fee price tariff models are included in the bundled price tariff payment model category as their price tariffs encompass a bundle of health care services that relate to an episode of care (Scott 2018). Although the price tariffs of the per diem price tariff payment model also encompass a bundle of health care services, they do not relate to an episode of care but rather to a hospital day.

The operational workings of the global fee price tariff payment model and the fixed fee price tariff payment model used in South Africa are described below:

- a) The global fee price tariff payment model charges a single price tariff for a health care episode, that is, a procedure that includes the costs of all the service providers (surgeon, anaesthetist, pathologist, physiotherapist and hospital). This tariff is then paid to one of the primary providers (for example, the hospital or the treating medical practitioner), who, in turn, pays the other service providers (Profmed 2014:26). The price tariff structure of this model discourages the provision of unnecessary care while encouraging the coordination of care

among health care providers across the continuum of care. This has the potential to improve the quality and decrease the cost of care provided by reducing inefficiency and the redundancy of care provided in silos (DLA Cliffe Dekker Hofmeyr 2014:153). It is challenging to adopt this model in South Africa because the Health Professions Council of South Africa (HPCSA) prohibits hospitals from employing specialists and, therefore, specialists have to perform their own billing (DLA Cliffe Dekker Hofmeyr 2014:20). This means that their price tariffs cannot form part of the global fee price tariff payment model's single tariff.

- b) The fixed fee price tariff payment model uses a single price tariff for all the hospital costs for a specific procedure but the amount excludes the specialist's costs for the given procedure (Scott 2018). This payment model transfers the risk associated with all hospital-related costs to the health care service provider for a specific procedure (Competition Commission 2018:50). The fixed fee price tariff, irrespective of the actual resource costs of treating the patient, brings about savings to the medical aid scheme. However, personal characteristics affect a patient's medical condition and resource usage (Balakrishnan, Pugely & Shah 2017:2). The model transfers the risk associated with hospital costs but excludes specialist costs, which is problematic as the specialists determine the type and intensity of treatment that the patient receives. This creates fragmentation, and the specialists have no incentive to work with the hospital to reduce costs and improve efficiencies in patient care.

4.2 Price tariff payment models used internationally

To provide further context to the use of price tariff payment models, the price tariff payment models used in America, India, Nigeria and Zimbabwe are illustrated in Table 1. To adequately explain the use of price tariff payment models in these countries, one must differentiate between private medical aid schemes and National Health Insurance (NHI) in universal health care. As the NHI also uses a price tariff payment model to purchase health care services from either private or public health care service providers, it often plays a leading role in deciding which price tariff payment model to use.

These four countries are selected to describe the use of price tariff payment models in different contexts. America illustrates the price tariff payment models used in a developed country. India illustrates the price tariff payment models used in a country that has an NHI that covers a significant number of people, while also having one of the most innovative private health care providers in the world (KPMG 2017:10). Nigeria and Zimbabwe allow for a comparison between the price tariff payment models used in these African countries and in South Africa. Table 1 summarises the various price tariff payment models used in four countries.

Table 1: The various price tariff payment models internationally

Country	Price Tariff Payment Model
United States	The United States does not have universal NHI. Medicare and Medicaid are the two largest public health insurance programmes that serve the elderly, disabled and the lower income population. The <u>diagnosis-related group (DRG) price tariff payment model</u> is the most widely-used for purchasing health care services from hospitals (Benson <i>et al.</i> 2016a:19).
India	The private health care industry uses the <u>fee-for-service price tariff payment model</u> . However, the government is considering more innovative price tariff payment models (Bali & Ramesh 2015:312–313, 315). About 407 million people are covered by NHI schemes and around 53–58 million by private medical aid schemes. Most of India's population (± 63%) has little or no coverage. The Indian government has focused primarily on getting health coverage for the very poor instead of the entire population (KPMG, 2017:10).

Country	Price Tariff Payment Model
Nigeria	In the public health care system, the staff receives a performance bonus that is derived from the <u>fee-for-service price tariff payment model</u> (Beith, Wright & Ergo 2017:17–18). Most of the population does not have access to private health care and relies on the public health care system. Nigeria does have a NHI that has been in existence for more than 10 years, but it only covers 6 million members, comprising mainly of the private sector and federal government workers (KPMG, 2017:12). The NHI scheme purchases health care services mostly using the <u>capitation price tariff payment model</u> , whereas a <u>fee-for-service price tariff payment model</u> is used for patient referrals to secondary or tertiary levels of hospital care (Mohammed, Souares, Bermejo, Sauerborn & Dong 2014:10).
Zimbabwe	Zimbabwe does not have an NHI. Only 10% of Zimbabwe’s population of 13 million has private medical aid, which limits access to private health care for the urban and rural poor unless they pay via out-of-pocket expenses (Mugwagwa, Chinyadza & Banda, 2017:7). The remaining 90% of the population has to rely on government-provided health care facilities. Zimbabwe’s health care system is divided into public and private systems. The <u>fee-for-service price tariff payment model</u> is mostly used in the private health care industry (Dube 2014:45–46).

Source: Own compilation

Table 1 shows India and Nigeria have a NHI scheme. The NHI purchases services using the fee-for-service price tariff payment model in India and the capitation price tariff payment model in Nigeria.

4.3 Price tariff payment models used in South Africa and the proposed NHI

In South Africa, there are two health care systems: public health care and private health care systems. The public health care system is staffed by approximately 30% of the country’s physicians who provide health care to approximately 59% of the national population, of which 84% are uninsured. The remaining 70% of physicians services approximately 41% of the national population. The 41% of the population is broken down into 16% of the population that is insured and 25% that is uninsured and pay out of pocket (Younger, 2016:1131). This shows the need for more equitable financing, health care provision, and distribution of physicians between the public and private health care systems.

Analysts regard South Africa as having one of the world’s most inequitable health systems, where of a high quality, but expensive health care is slanted towards the private system. Historically, more than 80% of South Africans could not afford private medical insurance and relied on poor quality public hospitals and facilities (Baleta, 2012:1188). According to the World Economic Forum (2014:32), the delay in implementing the proposed National Health Insurance (NHI) to address the inequality in South Africa’s health care expenditure could lead to social unrest in the not too distant future.

In order to bridge the gap between the private and public health care systems, the South African Government investigated the possibility of introducing a National Health Insurance (NHI). The proposed implementation of the NHI was released in the form of a Green Paper on 11 August 2011. It aims to improve access to quality health services, pool the risks into a single health fund, procure services on behalf of the entire population to efficiently mobilise and control financial resources, and strengthen the public health system (Matsoso & Fryatt, 2013:156).

The proposed NHI financing model under review predicts that resource requirements will increase from R125 billion in 2012 to R214 billion in 2020 to R255 billion in 2025 if the proposed NHI is implemented gradually over a 14-year period (Department of Health, 2011:37). The proposed NHI will pool funds from three sources: a surcharge on taxable income, payroll taxes for employees and

employers and an increase in value-added tax. Taxes will be mandatory but the option to belong to a private medical aid remains (Baleta, 2012:1188).

In order to ensure effective cost containment and the future sustainability of the proposed NHI, the government has identified the price tariff payment models as the key to achieving these two objectives. To procure hospital health care services, the government will purchase from both private and public hospitals and has identified the Diagnosis-Related Group (DRG) price tariff payment model as the preferred model to purchase hospital inpatient services. Both private and public hospitals will also need to adopt the DRG price tariff payment model if they wish to contract with the proposed NHI for the provision of inpatient care (Department of Health, 2015:63, 68, 71–72).

In South Africa the fee-for-service (FFS) price tariff payment model, is currently, the predominant payment mechanism in the private health care system (Department of Health 2015:63, 68, 71–72), however, the Competition Commission Inquiry recommended a transition from a fee-for-service price tariff model to alternative price tariff payment models. They further hope to encourage the adoption of alternative price tariff payment models that promote real risk sharing, provide better value for money and also reward physicians and facilities for value and quality (Competition Commission, 2018:474).

The global fee price tariff model is the model that the Competition Commission (2019:172) identified as being central to drive innovation and stimulate competition in order to expand access to healthcare services in the private healthcare industry. The NHI Fund has identified only one price tariff payment model which is the diagnosis-related groups price tariff payment model (DRG price tariff payment model) as the preferred model to purchase hospital inpatient services (Department of Health, 2015:63, 68, 71–72). The problem that private hospitals and/or groups face is that they will be required to adopt the DRG price tariff payment model if they wish to contract with the proposed NHI for the provision of hospital inpatient care (Department of Health, 2015:63, 68, 71–72).

5. Research methodology and design

To explore the price tariff payment models used in private hospitals in South Africa, the price tariff payment model and the price tariff data for laparoscopic appendectomy from **Hospital A** and **Hospital B** were calculated to illustrate the impact that different price tariff payment models have on the characteristics of price tariff, using primary research. In addition, a hypothetical calculation for this procedure was also performed using the global fee price tariff model which is the model that the Competition Commission (2019:172) identified as being central to drive innovation and stimulate competition in order to expand access to healthcare services in the private healthcare industry. The various price tariff payment model used in the laparoscopic appendectomy illustration were evaluated to determine their usability when compared to the preferred price tariff payment model put forward for purchasing in-hospital services by the NHI Fund.

The price tariff payment model and price tariffs were requested from **Hospital A**, while the information for **Hospital B** was requested from a medical aid scheme that had an agreement with the hospital.

5.1 Data for hypothetical case illustrating the global fee price tariff payment model

For the hypothetical case, the basis of the calculation was a detailed process description of an actual laparoscopic appendectomy that was performed and included resource usage in terms of time, nursing levels, theatre time used, ward usage, medicine, and gas usage. After that, approximate costs for the various resources were sourced and resource rates were calculated for each resource based on practical capacity and. Finally, the cost of the resources was determined by multiplying the resource rate by the resource usage. Once the unit cost was calculated, the global fee was based on a combined single price tariff that included a 30% profit mark-up on the hospital unit cost. The following formulae were used to calculate the global fee price tariff of the hypothetical case:

- Resource Rate X Unit of Measure = Total Rand Value
- Total Rand Value + 30% Mark-up = Global Fee Price Tariff

6. Results

Table 2 shows the results and the elements of the different price tariff payment models for laparoscopic appendectomy. Table 2 further shows the price tariff payment model and the associated price tariffs for the two private hospitals, **Hospitals A** and **B**, and the hypothetical case. This illustrates the impact that the different price tariff payment models had on the characteristics of the price tariffs for the given procedure.

Table 2: Results of different price tariff payment models for a laparoscopic appendectomy

Category Breakdown	HOSPITAL A			HOSPITAL B	Hypothetical Case
	Diagnosis-related group (DRG) fixed fee price tariff payment model	Fee-for-service price tariff payment model	Per diem price tariff payment model	Fee-for-service price tariff payment model	Global fee price tariff payment model
Theatre time price tariff	R 30 427 per diagnostic group	R10 132 - basis theatre time that is based on per minute rate	R9965 basis per diem -15-minute blocks	R6203 basis theatre time that is based on per minute rate	R 40 436 Inclusive of Surgeon and Anaesthetist
Ward price tariff		R 2 170 - basis per day or half day thereof	R2 817 basis per diem – per day	R6412 basis per day or half day thereof	
Pharmacy price tariff		R 7 081-basis per item	R 0 – basis included in the per diem tariff	R6254 basis per item	
Equipment price tariff		R 3 249 per use	R0 - basis included in the per diem tariff	R3 165 per use	
Laparoscopic rate price tariff			R14 861 - basis per day Lap modifier		
Other price tariff			R2608 - basis other modifier	R43 per item	
TOTAL PRICE TARIFF for laparoscopic appendectomy		R 30 427	R22 632	R30 251	

Source: Researchers calculations

Table 2 shows that **Hospital A** and **Hospital B** used different price tariff payment models and charged different price tariffs for the same procedure because the different medical aid schemes negotiated both the price tariff payment model and the price tariffs with the individual hospital groups on an annual basis. Furthermore, Table 2 also shows that the different price tariff payment models impact the characteristics and the amount of the associated price tariffs. The highest price tariff for the procedure is the Global fee price tariff model and the lowest tariff is the Fee-for-service price tariff.

6.1 Discussion of results

Table 2 confirms that private hospitals can have more than one price tariff for the same procedure as is the case with **Hospital A** having a DRG fixed price tariff, fee-for-service, and a per diem price tariff model for this procedure compared to **Hospital B** that only used a fee-for-service price tariff payment model. **Hospital A's** combination of models included two alternative price tariff payment models (DRG and per diem) in addition to the fee-for-service price tariff payment model, compared to **Hospital B's** which used only a fee-for-service price tariff payment model.

Table 2 further shows that the use of the global fee price tariff model was R10 000 higher than the other price tariffs because it included the surgeon's and anaesthetist's price tariffs. This model further discouraged unnecessary care and encouraged coordination of care between health care providers across the continuum of care (DLA Cliffe Dekker Hofmeyr, 2014:153).

The dilemma with price tariff payment models is that they influence the characteristics of price tariffs and, consequently, the risk transfer between private hospitals and private medical aid schemes. Furthermore, the models affect the behaviours of health care providers and funders, which makes it essential to consider both the operational details and the strengths and weaknesses of price tariff payment models when comparing the different models (Competition Commission 2019:79).

Another key element of the price tariff payment models is the risk transfer between the funder and the service provider. Risk transfer assists to align the incentives of the two negotiating parties, facilitating positive outcomes for both parties. Under the fee-for-service price tariff payment shown in Table 2, the risk relating to the risk of cost increases remains with the funder as each additional treatment is billed to the funder. Whilst the per diem price tariff payment model combines a number of items and services of in-patient care into a fixed daily rate, with any costs or savings from claims being above or below the agreed rate accruing to the provider. Thus the risk of escalating costs is partially transferred away from the funder, but the funders are still at risk for any additional costs such as length of stay, the volume of admission, and procedure mix. DRG price tariff payment model covers the entirety of a patients' care cycle for a particular event and the funder is still liable for the costs associated with an increased volume of patients needing care (Competition Commission, 2018:50-51). The global price tariff payment model transfers the actual care risk to the providers they deliver and can influence directly (Porter & Kaplan, 2016:91).

Health care purchasing is moving from using a fee-for-service price tariff payment model to value-based price tariff payment models (Cokins & Scanlon, 2017:1). A value-based price tariff model bases price tariffs on health care providers achieving certain outcomes. However, the DRG price tariff payment model which is the preferred price tariff payment model that the South African government identified to purchase hospital services for the NHI Fund falls far short of being a value-based price tariff payment model because it typically reimburses only for inpatient episodes or procedures and does not incorporate the full range of physician, outpatient, rehabilitation, education and other services needed to achieve good outcomes over a complete care cycle. Nor does it foresee for more than one management protocol per admission. It favours treatment via a particular procedure or a specified type of care, rather than encouraging innovative treatment for multiple medical conditions (Porter & Kaplan, 2014:7). It is worrying that the proposed NHI has identified the DRG price tariff payment model as its preferred model to purchase inpatient health care services when there is a move towards value-based price tariff payment models. The proposed DRG price tariff payment model does not have the attributes to become a value-based price tariff payment model for the above reasons.

Of all of the price tariff payment models shown in Table 2 only the global fee price tariff payment model is a value-based price tariff payment models because this model promotes risk sharing as it involves a single payment for the entire episode of care and any unnecessary care and waste will be at the health care providers' risk. This model supports multidisciplinary practices as it provides a single price tariff that is charged for a health care episode, that is, a procedure that includes the costs of all the service providers (surgeon, anaesthetist, pathologist, physiotherapist and hospital) (Profmed,

2014:26), which discourages unnecessary care and encourages coordination of care between health care providers across the continuum of care. (DLA Cliffe Dekker Hofmeyr, 2014:153). Hospitals that are integrated in this fashion would be able to negotiate better prices when they purchase supplies in bulk. It also provides greater transparency in outcomes and price due to the published information. This model will support the measurement and reporting of outcomes versus costs (DLA Cliffe Dekker Hofmeyr, 2014:153) and in so doing enable patients to compare and choose between different health care providers for their given healthcare condition in terms of outcomes and price. This will increase competition based on value and providers that are effective and efficient will grow, earn attractive margins and expand regionally and even nationally. In contrast, the rest will see their margins decline. Those with poor outcomes will lose patients and bear the extra costs of dealing with avoidable complications, infections, readmissions, and repeat treatments (Porter & Kaplan, 2016:93–94, 98). Private hospitals should note that the use of the DRG price tariff is proposed by the NHI and should understand how this method could possibly influence their current practices.

7. Implications of the research

The research illustrates that each price tariff payment model has both strengths and weaknesses, and each model affects the behaviour of health care providers differently, depending on their operational design features. This is extremely important to note for both health care providers and funders when managing their risk as the operational design of features of the price tariff payment model impacts the associated price tariffs risk-sharing arrangement between the two parties which has a financial implication for both parties.

The price tariff payment model also has business implications, with the most important being that the associated price tariff must be based on an accurate unit cost that is reflective of the cost of resources used to provide both efficient and effective care and not based on set price tariffs. The price tariffs should provide a margin over a provider's full costs when using effective and efficient clinical and administrative processes throughout the care cycle to ensure the health care provider makes enough profit to cover their costs. Furthermore, implications includes whether the price tariff payment model either encourages or discourages waste reduction (James & Poulsen, 2016:104), the impact of price tariff payment models on patients and their physicians in making decisions that are in the patients' best interest (James & Poulsen, 2016:104–105), whether health care providers bear only the risks related to the actual care that they deliver and can influence directly (Porter & Kaplan, 2016:91) and lastly how does the price tariff model affect innovation (Porter & Kaplan, 2016:93).

8. Conclusion, limitations and future research

Price tariff payment models play a central role in health care reforms. Price tariff payment models can enable health care service providers to achieve their health policy objectives by improving access to health services for patients, promoting the effective and efficient use of resources, and improving cost control. Price tariff payment models also have an impact on the setting of price tariffs for health care services by influencing the units of health care services purchased (Waters & Hussey 2004:176), whether payments are prospective or retrospective and whether payments are fixed or variable (Casto & Forrestal 2015:8). Furthermore, it was found that the features of the different price tariff payment models are often combined in order to mix incentives for both health care providers and patients (Waters & Hussey 2004:176). Noble (2018) explained that no alternative price tariff payment model is optimal across all medical and surgical treatments of a patient's medical condition. Each condition requires different treatments, levels of care, and length of stay. For example, a fixed fee price tariff payment model needs to have predictable outcomes, standard treatments, and high volumes.

The introduction of value-based price tariff payment models is on the horizon in South Africa. In South Africa, both the fixed fee and global fee price tariff payment models are forms of the bundled purchases price tariff payment model. In the fixed fee price tariff payment model, all the hospital costs for certain procedures are included in one price tariff amount, but the specialist's costs for the given procedure are excluded because, under HPCSA rules, hospitals are not allowed to employ specialists. Consequently, specialists are required to perform their own billing (DLA Cliffe Dekker Hofmeyr 2014:20). In the case of a global fee price tariff payment model, one tariff is charged for the

procedure, which includes both the hospital costs and the specialist's costs. By definition, a global fee price tariff payment model should include all costs, but it does not in all cases (Noble 2018). The medical aid schemes are in favour of implementing this model, but the HPCSA has advised its members that they are not allowed to enter into these contracts.

Certain private hospitals have implemented a DRG price tariff payment model that is technically not a true DRG model. A true DRG price tariff payment model makes payment based on the patient's diagnosis and not the procedure that was performed (Scott 2018). It is estimated that up to 30% of the diagnosis coding is lost by how the South African ICD 10 coding is submitted to the medical aid schemes. The lost diagnosis coding often relates to comorbidities that the patient may have that would influence the price tariff rate in a proper DRG system.

Access to private health care is unaffordable to most South Africans, which led to an inquiry by the Competition Commission. The release of the completed Competition Commission's Inquiry Report into private health care and the proposed implementation of the National Health Insurance (NHI) highlights the importance of price tariff payment models. This research shows the need for further investigation into price tariff payment models by providing an overview of the most widely-used price tariff payment models and summarising the alternative price tariff payment models used by private hospitals. Although the amount for the fee-for-service price tariff payment model seems to be the lowest, it does not consider the treatment's appropriateness or quality as payment is based on activities and not health care outcomes. Furthermore, this model does not transfer the risks relating to the intensity, cost, and severity of care to the health care provider, and the medical aid scheme carries these risks.

The global fee price tariff payment model on the other hand has higher price tariffs as it includes surgeon's and anaesthetist's price tariffs. This model discourages the provision of unnecessary care while encouraging the coordination of care among health care providers across the continuum of care. This model also has the potential to improve the quality and decrease the cost of care provided by reducing inefficiency and the redundancy of care provided in silos owing to the risks associated with the cost, intensity, and severity of care being transferred to the various health care providers.

This research also evaluated the appropriateness of the NHI identifying the DRG price tariff payment model as its preferred model to purchase inpatient health care services. It was found that this model does not have the attributes to be considered a value-based price tariff payment model and thus not aligned with the worldwide and Competition Commission's recommendation that private hospitals adopt value-based price tariff, payment models. The Covid-19 pandemic has brought about opportunities for private hospitals as the government entered into contracts with private hospitals to admit public patients based on prescribed rates that were calculated on a cost-recovery basis (Kahn 2020). These arrangements pave the way for the greater sharing of resources between public and private health care systems towards the introduction of the NHI. The central role that price tariffs play in government contracting services from private hospitals and also in the functioning of the NHI emphasises the importance of research into price tariffs.

Although the calculations in this study include a single procedure, they can be extrapolated to all clinical situations and procedures. Future research should consider the unit costing models that could be used to determine the unit cost for providing treatment for a patient's primary medical condition in South Africa. Furthermore, the influence of unit costing models on price tariffs should be investigated. This will reassure health care providers and purchasers that the price tariff is based on the actual cost of resources used to treat the patient, which will provide more transparency to price tariffs. This will also assure health care providers that the price tariff is sufficient to cover their unit cost of treating patients for their medical conditions.

To KBE or not to KBE?: Insights From a Macroeconomic Agent-Based Model

^{1,2} Rhodes Business School, Rhodes University, Makhanda, South Africa

Keywords

Agent-based modelling; Strategic decision making; Knowledge-based economy.

Abstract

This paper aims to investigate how strategic decision-making of firms affects an economy. Research in this area is necessary as without a coordinated strategy between industry, academia, and government in attempts to achieve a knowledge-based economy (KBE), economic growth may be constrained, while the levels of unemployment, inequality and poverty may deteriorate. An agent-based model is developed that simulates micro-level economic interactions between individuals and firms in different markets, resulting in emergent macro-level features. The simulations show that a shift towards a KBE has an insignificant impact on GDP over the long-term. However, the shift does produce a significant increase in unemployment. The higher unemployment is shown to be particularly high for the unskilled sectors of the population. It is therefore paramount that companies embark on skills development, training and educational initiatives when following a path of technological and knowledge innovation. There should be a transformation of the education system. The education system should be inclusive, focused on quality, adaptive, encourages creativity, aligned with the needs of industry, and stimulates research and development.

1. Introduction

Firms are an integral part of an economy, so that a collective strategic shift by firms in an economy could result in significant macroeconomic consequences. Such strategic shifts are often driven by external factors such as prevailing economic conditions, changes in government policy, increased competition, or technological change. Recent political uncertainty, struggling state-owned enterprises, and low business confidence has led to many South African companies reducing their investment in fixed capital, with a resulting downturn in economic growth and persistently low unemployment (Hungwe & Odhiambo, 2019; Lings, 2017). South Africa is also wanting to move towards a knowledge-based economy (KBE), which will result in considerable change for many existing companies and will require new innovative companies to be created (National Planning Commission, 2011; Vadra, 2017). It is important to consider the economic consequences of such a paradigm shift.

An economy is a highly complex system, comprised of many agents that are constantly changing and interacting with each other in a myriad of ways. Constructing and analysing models are an attempt to understand complex real-world phenomena. This complexity often requires simplifying assumptions or considering only certain aspects of the system (Giordano, et al., 2014). Microeconomics considers the properties and behaviour of each of the individual economic agents (Besanko & Braeutigam, 2013), while macroeconomics attempts to understand the aggregated behaviour of an economy as a whole. Various economic modelling techniques can be used to understand, describe, or predict the behaviour of each of these aspects. One modelling technique that has gained some traction in recent years is agent-based modelling (ABM) (Siegfried, 2014; Gatti, et al., 2011). The appeal of ABM in economic modelling is that by implementing the micro-level properties and behaviour for many agents, macro-level phenomena should emerge (Dawid & Gatti, 2018). In principle, it provides a tool that can tangibly connect the realms of microeconomic and macroeconomic theory.

2. Problem Investigated

An agent-based macroeconomic simulation model was developed that can be used to explore the macroeconomic consequences of a collective strategic shift by firms. As more firms in the economy make strategic choices to embrace technological sophistication, nurture innovation and invest in knowledge, the simulation should provide a means to predict any significant long-term changes in macroeconomic measures.

3. Research Objectives

The primary objective of the project is to implement an agent-based simulation that can be used to determine the macro-economic impact of firms strategically adopting higher levels of technological sophistication. It should demonstrate the consequences of micro-level strategic decisions on macroeconomic indicators. This would facilitate a quantitative analysis of the short-, medium-, and long-term impact of macroeconomic policy decisions. The implementation incorporates both quantitative and qualitative techniques to model the behaviour of individuals and firms in an economy, placing it within a positivist research paradigm (Guo & Sheffield, 2006; De Vos, et al., 2011).

Two simulation scenarios are considered: one scenario (referred to as the *baseline scenario*) that is used as a reference or benchmark, and a second scenario (referred to as the *explored scenario*) in which firms in the economy have made a shift towards higher investment in knowledge and higher levels of technological capabilities. Several Monte Carlo simulations (Rubinstein & Kroese, 2016) will be conducted with a set of base parameters for each of the scenarios, establishing baseline trends in several macroeconomic and other variables. Stochastic fluctuations from each Monte Carlo run are then averaged out, giving the underlying output variables from the model.

4. Literature Review

This section provides an overview of strategic planning and the role of technology within firms. Section 4.1 provides an overview of strategic planning within organisations. An important contemporary perspective of strategic planning is encompassed by the resource-based view (RBV), discussed in Section 4.2. The agent-based model developed in later chapters will require a mathematical model of a firm's production that is outlined in Section 5.3. Section 5.4 discusses the importance of technology and knowledge, and in particular the 4th industrial revolution and the knowledge-based economy (KBE). Section 5.5 provides some brief comments about the relevance to South Africa. Finally, Section 5.6 provides a detailed discussion of the agent-based modelling.

4.1. A Perspective on Strategic Planning

Organisations need to constantly evaluate where they are, where they want to be and how to get there. The essence of strategic planning is to provide a path between the current status and a desired future status (Butuner, 2015). There are three main questions that organisations need to consider, leading to various strategic planning phases (Louw & Venter, 2013). The "*where are we?*" question is addressed in the strategic analysis phase. The "*where do we want to be?*" question addressed is in the strategic development phase. The "*how do we get there?*" question is answered in the strategy implementation phase.

- (a) **Strategic analysis:** A careful and critical analysis of the business and its operating environment needs to be undertaken. Typically, an organisation would need to address many questions such as: *What are the current problems? What are we doing well? What are we doing badly? What is our market? What is happening in our market? What can be done about it? What are our strengths and weaknesses? What opportunities do we have? What threats or risks do we face?* Many strategic analysis tools can be used in this process (Fleisher & Bensoussan, 2007), including: SWOT analysis, the PESTEL framework, etc.
- (b) **Strategy development:** With an understanding of the current situation, an organisation can then begin to develop its strategic intent, which essentially aims to answer the question: *Where do we want to be?* As opposed to operational or functional plans that are short-term, strategic plans are usually long-term in nature, and so the strategic intent should describe aspirations for a desired, distant future (Butuner, 2015). The importance of strategic intent is

illustrated by the quote by Lewis Carroll, “*if you don’t know where you are going, any road will get you there.*”

Strategic intent is usually encapsulated in an organisation’s vision, mission, and goals (Rothaermel, 2016). A ‘vision’ articulates an organization’s future aspirations, providing an answer to the question: *What do we want to become?* (David, 2014). Collins & Porras (2011) suggested that a vision should consist of a vivid description of the future and be a “*big hairy audacious goal*” (BHAG). A BHAG is a clear and compelling future objective that an organization can strive for. The ‘mission’ encapsulates what an organisation actually does, defining the way in which the vision can be achieved, answering the question: *What is our business?* (David, 2014) . It establishes the goods and services the organisation plans to provide, and the markets in which it plans to operate. The goals are broad targets or milestones that need to be achieved in order to accomplish the mission and vision. Underpinning the future intent would be the aspired culture within the organisation and the values establishing how it would operate.

- (c) **Strategy implementation:** With a clear understanding of where they are and where they want to go, it becomes necessary to formulate a plan to achieve the strategic intent. This would entail developing short-term operational plans, possibly restructuring the organisation, identifying the leadership requirements, developing processes and systems, effective communication, formulating a change management plan, analysing possible future scenarios, and implementing techniques for monitoring and control (Louw & Venter, 2013). There are several tools that can assist in this process. Organisational analysis and design can be performed using the McKinsey 7S framework (Ravanfar, 2015). Business processes can be formulated using business process re-engineering (Hammer & Stanton, 1995). Tools such as the balanced scorecard can be used to develop approaches to measurement and control (Atkinson, 2006).

In practice formulating a strategic plan should be an iterative process and organisations typically iterate between each of the phases outlined above (Steiner, 2010). Within the model developed here, the strategic intent of firms would shift towards adopting greater levels of technologically sophistication and making more effective use of knowledge within the organization. The implementation of such a shift would require an appropriate allocation of resources.

4.2. Resource Based Theory

The ability of an organisation to effectively identify, understand, and exploit any potential sources of competitive advantage are important goals of strategic management (Barney & Clark, 2007) . A competitive advantage can be expressed in terms of a firm’s ability to implement a value-creating strategy than cannot be easily adopted by competitors (both current and future). A *sustained competitive advantage* is a competitive advantage whose benefits cannot be easily duplicated by competitors in the long-term. Strategy can be viewed in the context of resource-based theory (RBT) as “*the match an organization makes between its internal resources and skills and the opportunities and risks created by its external environment*” (Grant, 1991) . The relationship between resources, capabilities, competitive advantage and strategy in the context of strategic analysis in the resource-based view is illustrated in Figure 1. The diagram illustrates the closed-loop link between strategy and resource allocation. This idea will be instrumental in the implementation of strategic decision-making used in the current model.

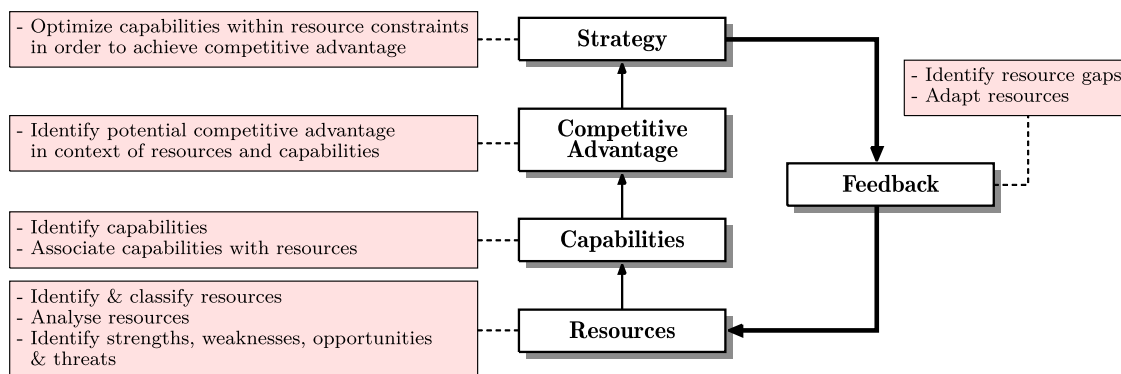

Figure 1: A resource-based framework for strategic analysis. (Adapted from Grant (1991))

Barney (1991) proposed a resource-based model incorporating four factors that are required to achieve a sustained competitive advantage: the resources must be valuable (*V*), rare (*R*), imperfectly imitable (*I*), and non-substitutable (*N*). These characteristics are often referred to as the ‘*VRIN*’ framework (Foss, 2011). Valuable resources can lead to a sustained competitive advantage since they enable a firm to implement strategies that improve efficiencies and effectiveness. If the resources are homogeneously available to many organisations, then each organisation can utilise the resources in a similar manner, thereby ensuring that no one organisation has a competitive advantage (even though the resource may be valuable). When the valuable resources available to an organisation are rare, then those resources have the potential to establish a sustained competitive advantage. Barney (1991) goes on to argue that valuable, rare resources can only be a source of sustained competitive advantage if they cannot be easily obtained by other firms, i.e. are imperfectly imitable (Barney & Clark, 2007). The final requirement for a resource to be able to lead to a sustained competitive advantage is that it is not strategically equivalent to another resource. If a resource can easily be substituted by another resource, which may not be valuable or rare, to implement a particular strategic plan, then that resource is not a source of competitive advantage.

It is more widely recognised in the economics literature that performance is strongly influenced by the path taken by a firm, i.e., ‘*history matters*’ (Liebowitz & Margolis, 1999; David, 2005; Martin & Sunley, 2012; Lockett & Thompson, 2001). Within the RBV, the resources to a firm (its ‘*opportunity set*’) are unique to the particular firm and are acquired or developed over time (Lockett & Thompson, 2001; Lockett, et al., 2009). Several path-dependent aspects of firm behaviour are strategically relevant for the firm (Lockett & Thompson, 2001): (a) various patterns of diversification and market entry; (b) corporate refocusing and market exit; (c) the ability of firms to innovate and exploit their dynamic capability; (d) the relationship between diversification and performance; and (e) the evolution of an industry with rapid technological change. Of relevance to this project is the evolutionary role of knowledge, innovation and dynamic capabilities.

Motivated by the RBV of the firm, Zott (2003) proposes a model in which a firm is characterised by its resource configuration at any point in time that is comprised of three variables: product quantity, product innovation rate that encapsulates the resources allocated to product differentiation, and process innovation rate that incorporates the resources that a firm allocates to achieve innovation. The resource configuration is reconfigured in four stages: variation (through imitation/experimentation), selection, retention and competition. Dynamic capability refers to a “*firm’s ability to integrate, build and reconfigure internal and external competencies to address rapidly changing environments*” (Zott, 2003). The dynamic capability attributes that characterise the evolutionary process are the timing of the change, the cost of the change and how the firm learns from changes. The essence of the current project is to determine the macroeconomic impact of widespread changes in the resource configuration of firms in an economy.

4.3. Modelling Firms

Firms play a vital role in an economy by transforming available productive resources into final goods and services. The manner in which they accomplish this is often highly complex (Walker, 2016). The productive resources (land, labour, capital equipment, natural resources, raw materials, water, electricity, etc.) can be characterised as inputs or *factors of production* that firms use in the production or transformation process, while the outputs are the various goods and services that the firm produces (Besanko & Braeutigam, 2013).

The mathematical relationship between the inputs and outputs of a firm are encoded in a *production function* (Heathfield & Wibe, 2016). It allows one to simplify the operational details within a firm and focus purely on the most significant factors of production. At an abstract level, the production function encapsulates a firm's production process, and is often expressed in terms of a mathematical model that describes the transformation process of a firm. The production function can then be used to model the output behaviour for the firm, without going into details on how the production is physically accomplished. One needs to clearly define the inputs and outputs of the system. It is assumed that each factor of production may be aggregated and quantified in some way (Heathfield & Wibe 2016). For example, a firm may have a wide variety of equipment used in its manufacturing process but are all 'lumped together' as a quantifiable measure of equipment. This is an enormous simplification but is often a necessary step in mathematical modelling (Giordano, et al., 2014). A widely used production function is the Cobb-Douglas production function,

$$Q = K^\alpha(AL)^{1-\alpha}$$

where K is the capital factor of production, L is labour, A is a labour productivity parameter and α is the output elasticity of capital, while $1 - \alpha$ represents the output elasticity of labour (Sørensen & Whitta-Jacobsen, 2010; Romer, 2011).

4.4. The Role of Technology and Knowledge

Technology plays an important role in many contemporary economic growth models (Romer, 1990; Sharipov, 2015). Schumpeterian growth theory recognizes the importance of innovation in replacing old technologies through creative destruction (Aghion, et al., 2014; Aghion, et al., 2015). In the Schumpeterian framework, improvement in production quality and efficiency as a result of process innovations is the 'engine of economic growth' (Acemoglu, 2009). The Romer (1990) model for economic growth, incorporates knowledge accumulation as a dynamic endogenous variable. It can be argued that technological change and innovation is driven by both *technological capabilities* and 'know-how' or *knowledge* (Cantner & Pyka, 1998). These two interrelated aspects of technological evolution have been incorporated in the agent-based model developed here as two separate variables: *technological sophistication*, τ , and knowledge, W (refer to 5.2.1 for details). These two variables allow for the implementation of level and composition effects in determining productivity growth, loosely aligned with the approach of (Vandenbussche, et al., 2006).

Digital connectivity coupled with innovations in software technology are fundamentally changing society and business. Some of these innovations include implantable technologies, big data for decision making, cloud computing, artificial intelligence (AI), 3D printing, blockchain, smart homes, the internet of things, etc. (Schwab, 2016). It has been observed that innovation can benefit organisations and consumers in several ways (Powell & Snellman, 2004). Reducing costs through improved productivity and higher levels of efficiencies are important benefits for a business. Innovation has led to a dramatic proliferation of new goods and services, which is attractive to consumers. Using data-mining, AI, machine learning, and big data analytics technologies, many companies are now able to exploit their vast amounts of data towards gaining a competitive advantage (Provost & Fawcett, 2013). Data and the ability to extract knowledge is becoming an important strategic resource (Smith, 2020). This observation has become one of the fundamental principles of data science (Provost & Fawcett, 2013).

4.5. Knowledge-Based Economies

The ability to solve complex problems by extracting useful knowledge from data is an important part of a modern business (Provost & Fawcett, 2013; Larose & Larose, 2014). Knowledge has become an important driver for economic growth in many countries (Godin, 2006). This has led to the concept of a knowledge-based economy (KBE). “*The knowledge-based economy is an expression coined to describe trends in advanced economies towards greater dependence on knowledge, information and high skill levels, and the increasing need for ready access to all of these by the business and public sectors*” (OECD, 2005). Vavra (2017) proposed four pillars that underpin the successful cultivation of a KBE:

- (a) a highly educated and skilled workforce,
- (b) an environment that nurtures research and development,
- (c) a dynamic and effective information and communications technology infrastructure, and
- (d) a culture that promotes knowledge development.

These pillars are closely aligned with the four pillars comprising the World Bank Knowledge Economy Index (Chen & Dahlman, 2005). The World Economic Forum has identified several technological drivers of change for the foreseeable future: high-speed internet connectivity, AI, big data analytics and cloud-based technology (WEF, 2018).

Knowledge, innovation and the ability to successfully leverage technology has become important strategic resources for organisations. Andrade et al. (2018) showed that a higher return on investment from research and development (R&D) is achieved as firms approach the technological frontier. The RBV and a firm’s dynamic capability may explain why certain firms are better positioned to develop new innovative processes or products. An innovative firm tends to create an environment that fosters further innovative behaviour, resulting in ‘innovability’ being an important intangible and dynamic resource for the firm (Saunila & Ukko, 2014). There is an increasing need for firms to focus on the role of learning and continuous innovation (Powell & Snellman, 2004). Such a firm will tend to be more flexible, perceptive, adaptable and profitable. A firm’s dynamic capability, including its ability to innovate and utilise its accumulated knowledge, is therefore closely associated with the firm’s ability to learn and embrace change. Once a firm embarks on a path of innovation to enhance its capabilities, the positive feedback loop (as shown in Figure 1), may lead to superior performance and a sustained competitive advantage.

4.6. The South African Situation

South Africa is experiencing persistently poor economic growth, high levels of inequality and poverty (Akanbi, 2016). Based on long-run historical data, Akanbi (2016) demonstrated that there are several causal links between growth, poverty and inequality. It has been observed that South Africa is “*one of the most unequal societies in the world*” (Tregenna & Tsela, 2012). Income inequality, measured using the Gini index, in South Africa has followed an upward trend since 1993, as can be seen in Figure 2(c) and as observed by Tregenna & Tsela (2012). A recent report by Stats SA highlighted that South Africa currently has a Gini coefficient between 0.65 and 0.67 (Statistics South Africa, 2019), ranking it the worst in the world (World Population Review, 2022).

Some of the reasons for the poor economic performance include, decreasing levels of foreign direct investment (shown in Figure 2(a)), high levels of uncertainty (Redl, 2018), a struggling education system (Reddy, et al., 2015), poor performance by state-owned enterprises, an underperforming manufacturing sector (Ly, 2019), and a low savings rate (Hungwe & Odhiambo, 2019).

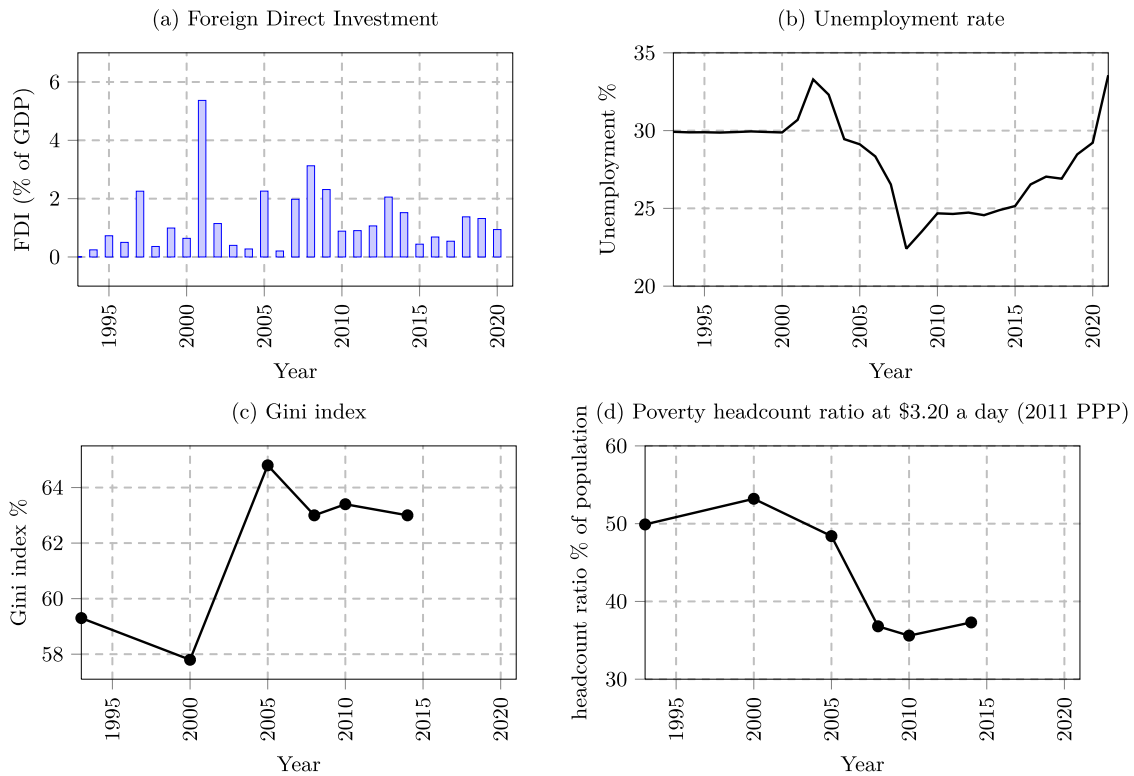

Figure 2: Various macroeconomic indicators for South Africa. Raw data source: World Bank (2021)

Recent media articles have noted the potential negative implications of the 4IR on South African unemployment (Biepkke, 2018; Falkenberg, 2018). South Africa has a high unemployment rate fluctuating around 30% (shown in Figure 2(b)), and a relatively large number of low-skilled workers (Davies & van Seventer, 2020). Without significant improvements in education and skills development, the fourth industrial revolution may result in even higher levels of unemployment. The agent-based model developed in this project aims to test this hypothesis.

4.7. Agent-Based Modelling

Agent-based modelling (ABM) is a computational approach for simulating the behaviour of a large number of autonomous *agents* within an artificial *environment*, where the agents may interact with each other and their environment (Siegfried, 2014). It has become an increasingly useful tool in the study of complex adaptive systems, particularly in social systems including areas such as economics, sociology, geography, ecology and environmental sciences (Billari, et al., 2006; Epstein, 2006). Complex adaptive systems are characterised by many coupled elements whose properties are interdependent (Siegfried, 2014; Gatti, et al., 2018).

There are three basic ingredients in an agent-based model: *agents* as the active elements in the model, an *environment* in which the agents operate and a *scheduler* that determines the sequence and timing of events in the simulation. An agent can be defined as a discrete, heterogeneous, software object, with a set of unique defining attributes or characteristics, that exists within some artificial environment, is capable of autonomous action governed by a set of behavioural rules and interacts with other agents in order to meet its objectives (Siegfried, 2014). Each type of agent is assigned attributes and possesses behavioural functionality that encodes their interactions with other agents as well as the environment. The environment could also be attributed with characteristics that may either be externally determined or altered based on the interactions with the agents. A key feature is that “*the only equations present are those used by individual agents for decision making. Different agents may have different decision rules and different information; usually, no agents have global information, and the behavioral rules involve bounded computational capacities.*” (Axtell & Epstein, 2006).

Another distinguishing feature of an ABM is that it is a ‘bottom-up’ approach to modelling in which one models the micro-level behaviour, decision-making and interactions of the various agents in the system (Grow & Van Bavel, 2017). An important consequence of the ABM approach is the concept of *emergent phenomena*. The term emergence is used to characterise aggregated structures that may arise from simple rules (Gatti, et al., 2011). An advantage of ABM is that it provides a way to study the interplay between different scales within a system since it is possible to interrogate the relationship between micro-level behaviour and macro-level phenomena (Gatti, et al., 2018). In an economic ABM model, macro-economic phenomena emerges from micro-level behaviour. It provides a computational link between microeconomics and macroeconomics (Gualdi, et al., 2015; Gatti, et al., 2005; Lengnick, 2013; Gatti, et al., 2018). For example, macroeconomic consumption within a country is a consequence of the aggregated consumption decisions of all the households in the country. The emergence of macroscopic behaviour from microscopic interactions is an important principle in physics, where for example, the empirical laws of thermodynamics emerge from the quantum interactions of a large ensemble of particles using the theoretical framework of statistical mechanics (Pathria 1996).

Agent-based approaches have become a popular tool to economic modelling in a wide variety of economic applications (Boero, et al., 2015). The appeal is due to the fact that simple behavioural rules determine how agents interact within a complex environment (Ashraf, et al., 2017). The usefulness of agent-based economic modelling is that it provides a way to integrate theoretical models with empirical data, allows for the exploration of causal effects, provides a way to incorporate different levels of heterogeneity of the economic agents, is usually scalable, and can integrate social dynamics (Boero, 2015). Some applications of *macroeconomic* agent-based modelling (MABM) include: emergent macroeconomic phenomena (Gualdi, et al., 2015; Gatti, et al., 2005; Lengnick, 2013; Gatti, et al., 2018), financial markets (Grilli & Tedeschi, 2016), the impact of technology on economic growth (Napoletano, et al., 2005), the effect of inflation on macroeconomic performance (Ashraf, et al., 2014), the role of banks in an economy (Ashraf, et al., 2017), the impact of economic policy decisions (Dawid, et al., 2014; Riccetti, et al., 2017; Bonaventura, 2011), the impact of consumer behaviour (North, et al., 2010; Tsekeris & Vogiatzoglou, 2011), and the dynamic impact of various types of firms (Assenza, et al., 2015; Ikeda, et al., 2007; Ciutacu & Micu, 2015).

A recent review article by (Dawid & Gatti, 2018) summarised and compared several *macroeconomic agent-based models*. Lengnick (2013) argues that there are two categories of agent-based computational economics models: models that try to accurately mimic real-world economies, and models that are more stylized or abstract that try to develop a deeper understanding of macroeconomic theory. The simplest MABM models, such as the model by Lengnick (2013), incorporate only two types of agents: households and firms. They only interact via two markets: the consumer goods product market and the labour market. More complex MABMs incorporate more types of agents (such as government, banks, different types of firms, etc.) that would interact via additional markets. Markets therefore serve as an important mechanism for interaction amongst economic agents.

5. Research Methodology

The agent-based model that has been developed is based on a simplified economy consisting of various types of agents and markets as shown in Figure 3. The model consists of 5 types of agents: *individuals*, *consumer firms* (C-firms), a *capital firm* (K-firm), other *countries*, and *government*. The agents interact via three markets: a *product market*, a *foreign market* and a *labour market*.

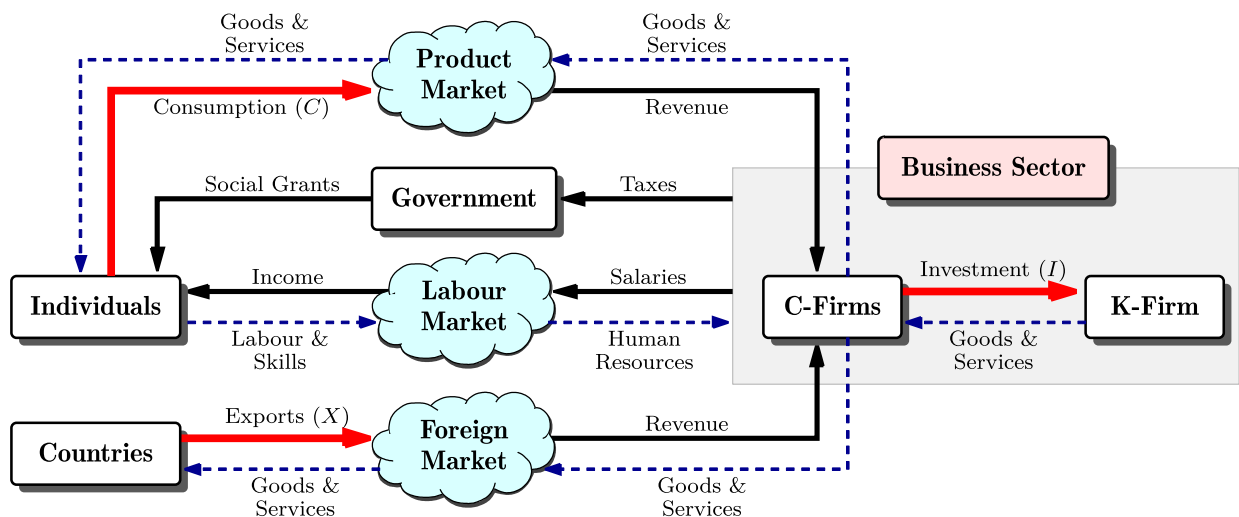

Figure 3: The economic framework used as the basis for the simulation model.

The sections that follow provide highlights of some features of the model. Full details are available in the thesis (Giovannoni, 2021).

5.1. Individuals

The primary consumers in the economy are individual agents, that also serve as the workforce for firms. The collection of all individual agents forms the population. Each individual agent is characterised by an age, a level of education, an economic status, a demand for various goods and services, available cash and accumulated wealth.

The agent-based model presented here differs from many of the other macroeconomic ABM (MABM) models outlined in Section 4.7, with the main difference being in the nature of an individual agents' ability to evolve over time. The number of individual agents within the population will grow at a predefined growth rate, so that the number of individuals in the economy is not constant as is the case with many other MABM models (Assenza, et al., 2015; Gualdi, et al., 2015; Lengnick, 2013). In addition, each individual will undergo a life-cycle, by being born, ageing and eventually dying. It is for this reason that the consumers are referred to as 'individuals' and not 'households'.

Individual agents will have an amount of *cash* representing their disposable income. Income received either from salaries or social grants will increase the cash available. A fixed percentage of cash, dependent on the level of education, will be allocated to savings. After a person has retired, they will live off their accumulated *savings*.

5.1.1. Age of Individuals

Each individual agent in the population is created with an *age* attribute that increases yearly. The age distribution of individuals in the population is initialised in such a way as to follow the general shape of the South African age distribution curve. The population distribution is approximated by a half-normal distribution function, and so the population of individual agents is initialised with randomly drawn ages that approximately follow a half-normal distribution.

The initial and final distribution of ages in a typical simulation run is shown in Figure 4, together with fitted half-normal distribution curves and the appropriately scaled actual distribution of ages in South Africa (Statistics South Africa, 2019). The simulation has approximately maintained the half-normal population distribution throughout the simulation runs.

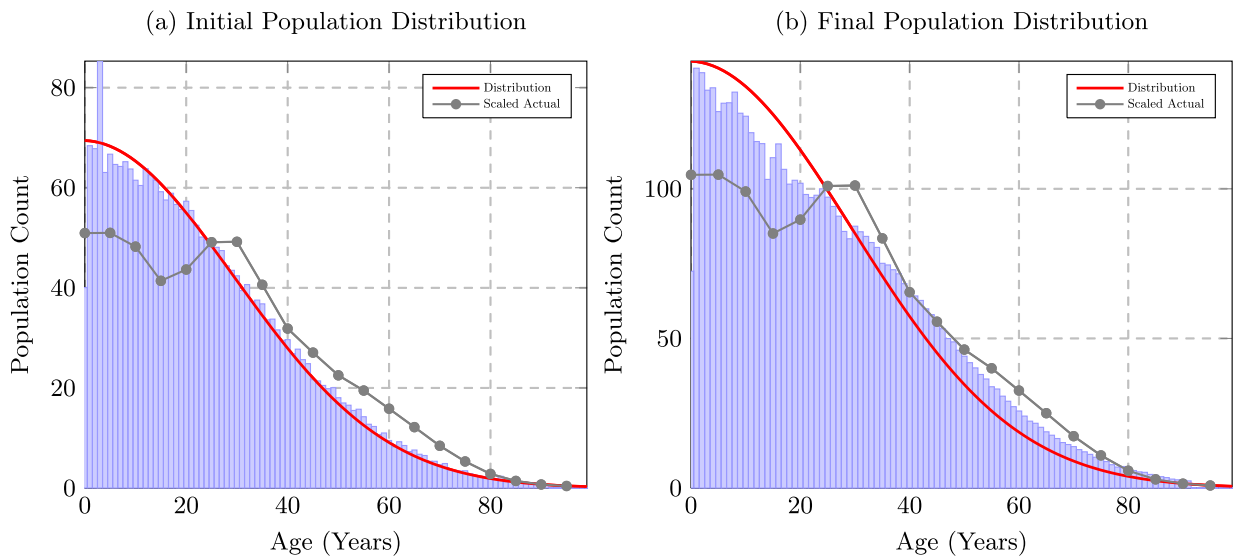

Figure 4: Initial and final age distribution of the population from the baseline simulation. The scaled actual data points are based on South African population data (Statistics South Africa 2019b, Table 11).

5.1.2. Status of Individuals

There are two properties that characterise the role of an individual within the economy: an *education* attribute, and a *status* attribute. The *education* attribute defines the individuals' level of education in a similar way as by (Kinsella, et al., 2011). The *education* attribute may be assigned the values: *unskilled* (no qualification), *matric* (semi-skilled), *bachelors* (skilled), or *postgraduate* (highly skilled). In later sections, each of these levels of education is identified by the index, *e*.

As individuals age their role in the economy is determined by the *status* attribute. When 'born', they are classified as a *child*, and after entering the schooling system identified as *school*. They progress through the education system, possibly progressing to tertiary education (*studying*) gaining higher levels of qualification (assigned to the *education* attribute). Upon exiting the education system with a particular level of education, the individual is classified as *unemployed* and enters the labour market. If a firm decides to employ an individual, the *status* attribute is set to *employed*. The individual will then work until retirement. The possible values for the *status* attribute are therefore: *child*, *school*, *studying*, *unemployed*, *employed*, or *retired*. The various status possibilities are shown in Figure 5, together with a status categorisation scheme used to identify if an individual is a *consumer*, or a *passive* member of the population.

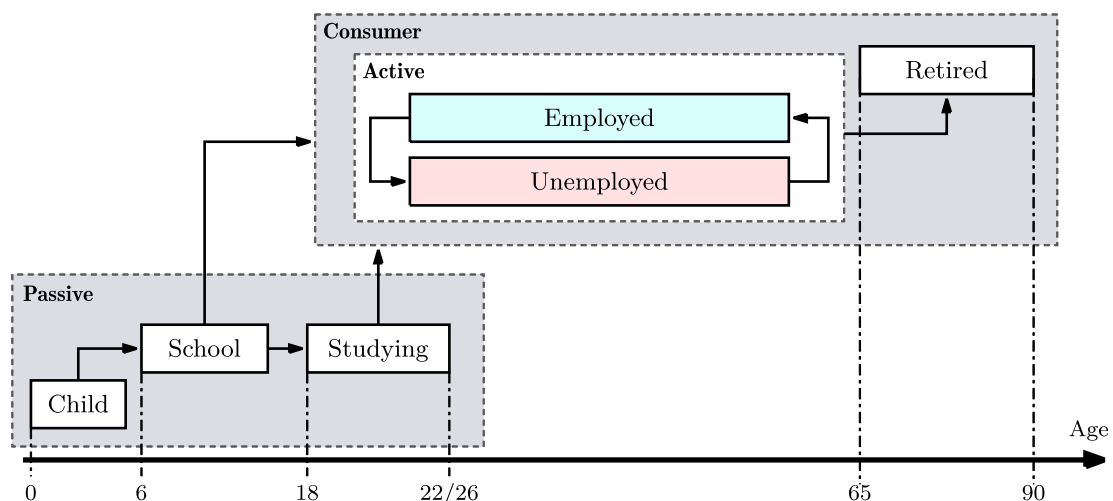

Figure 5: A diagrammatic representation of the evolution of the status attribute for individuals.

5.1.3. Behavioural Rules

The change in *status* of an individual is a function of the age of the individual, random choices or decisions that the individual makes, and whether they are employed. The choices or decisions are based on a set of progression probability parameters used for the simulation. At various times when a progression choice needs to be made, a uniformly distributed random number is generated. Progression through the education system is based on the random number relative to the progression probability. For example, if an individual has finished school and obtained a matric qualification (with *education*, e , assigned the value of *semi-skilled*), there is a progression probability of 0.4, that the individual will enter higher education, upon which the *status* attribute is assigned the value *studying*. The remaining 60% of those individuals with matric would enter the labour force as active members of the population, with a *status* as *unemployed*. The individuals that are categorised as consumers (Figure 5) receive various sources of income: the *employed* receive salaries, the *unemployed* receive social grants and the *retired* use their accumulated savings. Each month, the income received is added to the individual's *cash* variable. After receiving a salary, employed individuals will save a percentage of their income adding to their accumulated savings. The propensity to save increases with *education*. Any remaining cash is then available to purchase goods from the product market.

During the month, the consumer individuals will decide on the *basket* of goods required, analogous to the '*consumption bundle*' of Ashraf et al. (2017). The various categories of consumers will each demand a different mix of products. Unemployed and retired agents will have a goods basket dominated by *essential* goods, while employed individuals will have a mix of goods that progressively includes more *luxury* goods at higher levels of education.

5.2. Firms

The second major class of agents in the economic model are firms that produce consumer goods, referred to as *C-firms*. A fixed number of C-firms are created (based on population size) and are infinitely lived. For the sake of simplicity, it is assumed that each C-firm in the economy produces a single product. A single capital producing firm, or *K-firm*, provides the necessary capital equipment or knowledge infrastructure to the consumer firms. Both types of firms will employ individuals, earn revenue, accumulate profits, and pay taxes. Thus, the only costs incurred by firms are labour costs and taxation. There are no material costs in the model. It is assumed that salaries paid to an individual do not change with time.

Each C-firm is defined by several parameters including: the type of *product*; the base sales *price* for the product; the labour skills *composition*; its investment in *capital* and *knowledge*; and the level of *technological sophistication*. A firm can produce one of two possible types of products (or services): *essential* goods or *luxury* goods. These types of products established two sectors in the product market. Each product sector is assumed to have a similar market structure in terms of product homogeneity, pricing, technological sophistication, labour requirements, productivities, etc.

5.2.1. Knowledge and Technological Sophistication

Two variables are used to define different yet complementary aspects of the technological capabilities of a firm: *knowledge* and *technological sophistication*.

- **Knowledge, W :** The accumulated knowledge of a firm, incorporating 'know-how', systems, procedures, associated infrastructure, etc., is captured by the knowledge variable, W . Knowledge is treated as an asset, which means that the knowledge variable is measured in currency units. Firms can therefore invest in knowledge in a similar way as investing in capital. A primary difference between *capital* and *knowledge* in the model is that knowledge does not depreciate over time.
- **Technological sophistication, τ :** The technological capabilities of a firm are represented by the technological sophistication variable. It encapsulates aspects such as production technologies employed, the level of automation, resource planning systems, etc. Each firm is created with an initial level of technological sophistication, taking on a value between 0 and 1, that grows slowly over time. The lower limit, $\tau \approx 0$, represents a firm with low

technological capabilities; while $\tau = 1$, represents the technological frontier for the industry (Andrade, et al., 2018). Technological sophistication is used to establish the skills *composition* of employees within the firm, discussed in the following section.

Technological progress as an important determinant of economic growth has been decomposed into these two complementary factors. The role that these variables play within a firm will be described in the sections that follow.

5.2.2. Labour

A firm will employ individuals with an appropriate mix of skills. There are two aspects of labour that a firm needs to consider: the total number of employees, and the capabilities of the employees (Bechet, 2008). In the model, it is assumed that the total number of employees is determined by production requirements, while the required capabilities is determined by the technological sophistication, τ , of the firm. A more technologically sophisticated firm will require a workforce with a higher percentage of skilled employees. The skills requirements of a firm are described by a qualifications mix of employees, as a function of τ . The *labour composition* of employees, L_{fe} , is an array of the number of employees for a firm, f , with a particular level of education, e (see Section 5.1.2).

5.2.3. Production

The production capacity for each firm, f , is assumed to depend on the *labour composition*, L_{fe} , the available capital, K_f , and accumulated knowledge, W_f . The firm capital, measured in currency units, represents the total investment in plant and equipment. Capital depreciates over time at a fixed depreciation rate for each firm. Each C-firm is assumed to follow a Cobb-Douglas type production function used to calculate the production capacity of a firm, given by

$$q_f^{MAX} = C_f (A_f^K(W_f) K_f)^{\alpha_f} \left(\sum_e A_{fe}^L(W_f) L_{fe}(\tau_f) \right)^{1-\alpha_f},$$

where, C_f is an overall production scaling parameter; $A_f^K(W_f)$ is the capital productivity as a function of knowledge; $A_{fe}^L(W_f)$ are the labour productivities for each education level, e , and α_f is the output elasticity for capital. The modelled components of technological progress: knowledge and technological sophistication, affect the firm production function in different ways. The key idea is that knowledge influences the capital and labour productivities, while technological sophistication influences labour composition.

5.3. Markets

In the model, markets are the mediating mechanism by which the various economic agents interact with each other. There are three types of markets used in the model shown in Figure 3: a *product market*, a *labour market* and a *foreign market*. A **market** software object was created to provide generic properties of a market, consisting of a collection of **buyer** agents who will attempt to purchase an assortment of products in each market sectors; and a collection of **seller** agents that are each able to supply a product in a particular market sector. In the *product market*, the **buyers** are individuals, the **sellors** are C-firms and there are two product sectors for *essential* and *luxury* goods. Each individual will establish its required *basket* of products that it needs to purchase from the market, based on income, *education* and *status*. In the *labour market*, the **buyers** are firms, the **sellors** are individuals and there are four ‘product sectors’ for each level of education. The *basket* of skills required by a firm is determined based on its production needs, current levels of employment and *labour composition* needs based on its level of technological sophistication (see 5.2.2). A **buyer** will make several trips to the market in an attempt to fill its *basket* and will only purchase a product if it has enough cash available.

5.4. Firm Choices and Strategic Decisions

Based on prevailing market conditions a C-firm may adjust its production capacity and the sales price of its product. There are various approaches to production and pricing decision-making used in existing MABM models (Dawid & Gatti, 2018). The approach to changing a firm's production capacity, motivated by the approach of (Lengnick, 2013), is to adapt the factors of production, using stock, Δ_f , as a firm's measure of demand. Low stock provides a signal for high market demand; while high stock levels indicates low demand (at the firms current prices.) These adaptations can occur at different frequencies for each firm. Pricing adjustments can be made with relative ease and so can occur relatively frequently. The ability to change production capacity would take more time, hence less frequently. Long-term decisions are made every few years and result in significant changes to the factors of production: labour, capital or knowledge. These decisions are more strategic in nature and typically would require knowledge of the prevailing market conditions and require long-term history of market performance.

5.4.1. Relative Stock as a Signal of Demand

Each firm will have a unique production capacity and operate in a particular market sector. Using current stock levels for a firm, Δ_f , is problematic as an absolute measure of demand since each firm would have different production capacities. A relative measure of stock, $\delta_f = \frac{\Delta_f}{q_f^{MAX}}$, provides a more convenient measure since it is a normalised variable, with $\delta_f = 0$ representing a stock-out scenario, signalling high demand; while $\delta_f = 1$ represents an extreme condition of zero sales, signalling low demand. Furthermore, a moving average of the relative stock is used to ensure that decisions are made based on persistent market conditions, so that firm decisions are not based on possibly anomalous conditions for a particular month.

5.4.2. Pricing Heuristic

Firms will change their prices based on their supply capabilities, demand characteristics and their prices relative to prevailing market prices. If the demand is low, signalled by a high value of average relative stock, the firm should reduce its price; while a high demand means that a firm can increase its price. A firm would also need to compare its product price, to the average market price in the sector. If the firm's price is higher than the average market price, then the firm should decrease its price; while if the price is lower than the average market price, then the firm should increase its price.

There are two scenarios where the rules conflict: high demand with a higher-than-average market price and low demand with a low product price. A high demand with a high-price scenario is favourable for the firm, meaning that despite having higher than average market prices, the firm is still able to sell its product. In this case, the firm should leave the price unchanged, or reduce the price by a very small amount in order to remain competitive. The low demand with low relative market price case is an ambiguous scenario for the firm. Despite having a low price, the firm is still incapable of selling all its products. In this case, the firm would only slightly decrease its price in an attempt to sell more products in the market.

5.4.3. Labour Adaptation

Periodically, firms would adapt their production capacity based on relative stock levels serving as signals of market demand. Various stock-level trigger parameters are used to determine the required change in labour, ΔL . Low values of δ_f will result in an increase in the labour count ($\Delta L > 0$), while high values of δ_f will result in a decrease in the labour count ($\Delta L < 0$).

5.4.4. Capital and Knowledge Adaptation

With similar reasoning as with labour adaptation, firms may adapt their investment in capital, K , and knowledge, W , based on relative stock. The changes in capital and knowledge investment (ΔK , ΔW) are calculated based on the relative stock using continuous sigmoid functions. A relative increase in knowledge will increase the level of technological sophistication.

5.4.5. Implementing Strategic Shifts

Each firm is initialised with an investment period of between 1 to 3 years in which the firm would make a strategic decision on how to invest its savings. Firms can make significant changes to their labour force, make large-scale investments in new capital or embark on knowledge development programmes. In the model, the strategic choice is made by selecting one of the three factors of production to change over the next few years. This choice is regulated by a single parameter, the *capital-labour investment probability*, ζ . In the *baseline* simulation, $\zeta = 0.4$, which means that 40% of the time the firm will choose to expand its labour force; 40% of the time the firm will invest in capital equipment; and 20% of the time the investment will be in knowledge development programmes. For the *explored* simulations, chosen with $\zeta=0.35$, 35% of the time the firm will choose to change its labour, 35% of the time the firm will invest in capital, and 30% of the time the firm will invest in knowledge. All changes to the factors of production are measured in currency units, so the firm will only make the long-term investment if it has sufficient savings. Since there is no banking sector in the model, all financing of the investment is assumed to be from the firm. Adjusting this single simulation parameter results in a shift in the overall trend of how (on average) firms choose to invest for the future. By changing the simulation parameter from $\zeta = 0.4$ to 0.35 is the way in which the firms in the model are made to shift towards a knowledge-based paradigm.

6. Results and Findings

Simulations were run over 600 months, with 20 Monte-Carlo runs for each scenario. The underlying output variables from the model are obtained by averaging over all the Monte-Carlo runs thereby averaging-out stochastic fluctuations arising from each simulation. A burn-in of 3 years was used before data was recorded to ignore any initial transients in the simulation. The simulations were initialised with a seed population of 2,500 individuals, an initial unemployment rate of 25%, and a population growth rate of 1.5% per annum. Only one K-firm was used, 15 C-firms were created in the *essential* goods sector, and 10 firms in the *luxury* goods sector.

As noted previously, two simulation scenarios were considered: a *baseline* or benchmark simulation (with the capital-labour investment probability parameter $\zeta = 0.4$) and an *explored* simulation (with $\zeta = 0.35$) providing a higher average investment in knowledge and technology. Here, results for GDP and unemployment are presented for the two scenarios. Model validation checks are performed by fitting the simulation results to the Solow-Swan growth model and through confirmation of Okun's law.

6.1. GDP

Comparing the change in GDP, shown in Figure 6, we note a slight decrease in the long-term GDP from the baseline simulation to the explored simulation. The decrease is the result of slightly lower consumption, with exports and investment showing little change. The lower consumption is a consequence of changes in unemployment, shown in the following section. In the model, GDP is influenced by the population growth rate, which was unchanged between the two scenarios.

Figure 6: Comparison of GDP for the two simulation scenarios.

6.2. Unemployment

Figure 7 shows the unemployment rate for the two scenarios. In the long-term, there is significantly higher unemployment in the explored scenario. The higher level of unemployment impacts the spending patterns of the population. A larger number of consumers with low disposable income, would result in lower aggregate consumption and hence a lower GDP.

Figure 7: Comparison of the total unemployment for the difference simulation scenarios.

Comparing the change in unemployment for the different skill levels, shown in Figure 8, there are significant increases in unemployment for the unskilled and semi-skilled education levels of the population. For the more highly skilled sectors of the population, unemployment steadily declines, with lower levels of unemployment long-term for the explored scenario. This shows the need for a more highly skilled workforce in the long-term when there is a shift towards higher levels of technological sophistication in the economy.

Figure 8: Unemployment for the simulation scenarios and different education levels.

6.3. Firm labour composition

Results for the labour composition (as a percentage of the total labour force) of all firms between the two scenarios are shown in Figure 9. In both scenarios, the labour composition of unskilled workers steadily declines over time, semi-skilled workers remains fairly constant in the long-term; while the composition of the more highly skilled workers increases over time. As could be expected, the unskilled labour composition is lower in the explored scenario since fewer unskilled workers would be required in a more technologically sophisticated economy. The significant deviation between the two scenarios appears in the composition of the more highly skilled workers (skilled and highly-skilled). The explored scenario shows a significant increase in the labour composition of the more highly skilled workers. These results demonstrate that as firms strategically shift towards higher levels of technological sophistication over time, their workforce would need to be more highly skilled.

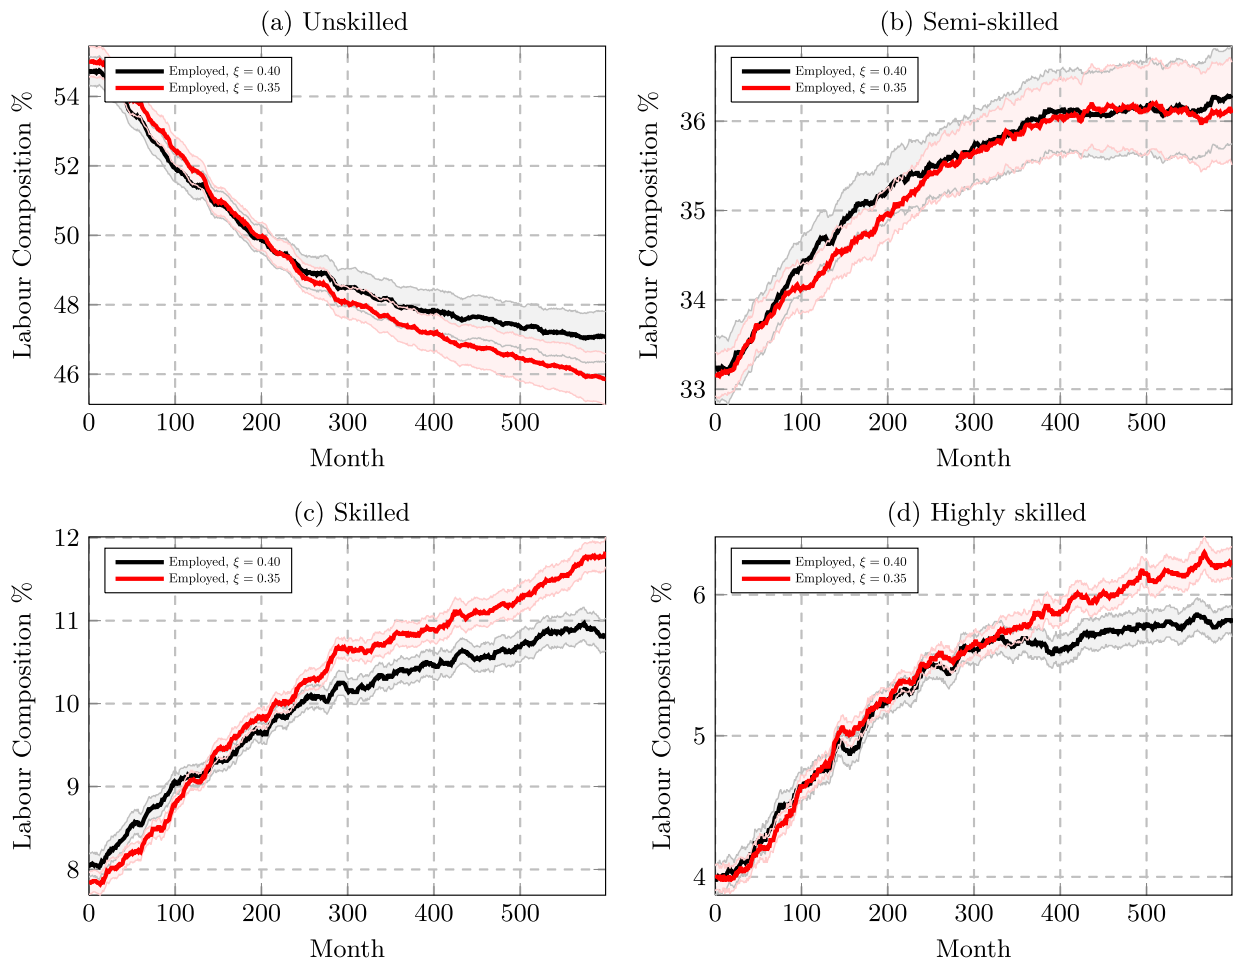

Figure 9: Total labour composition by education for the simulation scenarios.

6.4. Validation of results

The results obtained can be validated according to established macroeconomic models.

6.4.1. Solow-Swan growth model

The Solow-Swan model serves as a simple macroeconomic model for understanding economic growth (Sørensen & Whitta-Jacobsen, 2010; Romer, 2011). The solution to the Solow-Swan model is parameterised in terms of the initial GDP, Y_0 , the initial capital per unit of effective labour, k_0 , the aggregate output elasticity for capital used in a 2-input Cobb-Douglas production function, α , the capital depreciation rate, δ , the savings rate, s , the labour productivity growth rate, g , and the labour growth rate, n . In validating the simulations to the model, the Solow-Swan solution was fitted to the GDP data for the two simulation scenarios shown in Figure 10.

Figure 10: Comparison of GDP to fitted Solow-Swan solutions.

The initial GDP was obtained as the value of GDP in the first month. The labour growth rate was obtained by performing an exponential fit to the total labour force. The savings rate in the Solow-Swan model relates the capital investment to GDP, $I(t) = sY(t)$. Using the capital investment results together with the GDP data, it was possible to calculate the average savings rate, over the duration of the simulation run, which was used as the seed value for the fit. The average savings rate obtained for the baseline simulation was found to be $s_b = 1.77\%$; while for the explored simulation it was found to be $s_e = 1.48\%$. These values indicate a lower overall investment in capital in the explored scenario since there was a greater investment in knowledge in that case. A fit to the baseline simulation results produced the following model parameters:

$$Y_0 = 34.7, k_0 = 0.07, \alpha = 0.499, \delta = 0.0\%, s = 1.78\%, g = 0.132\% \text{p.m.}, n = 0.12\% \text{p.m.}$$

Fitting the explored simulation results produced the model parameters:

$$Y_0 = 35.3, k_0 = 0.06, \alpha = 0.503, \delta = 0.0013\%, s = 1.49\%, g = 0.137\% \text{p.m.}, n = 0.11\% \text{p.m.}$$

The following observations can be made from these parameters:

- (a) The savings rate is reduced from 1.78% in the baseline simulation to 1.49% in the explored simulation. This highlights a decrease in capital investment in the explored simulation scenario, which was the result of the reallocation of investment towards knowledge development within the firms.
- (b) A relevant difference between the fit parameters is the increase in the aggregate labour productivity growth rate, g , from 0.132% p.m. in the baseline simulation to 0.137% p.m. in the explored simulation. Knowledge level effects in the production function of an individual firm were such that an increase in the firm's investment in knowledge would result in an increase in the labour and capital productivities (as shown in 5.2.3). The average relative increase in knowledge investment in the economy in the explored scenario, resulted in an overall increase in the aggregated productivities for the firms in the economy.

The change in parameters of the Solow-Swan growth model therefore confirms the change in behaviour of the agent-based model between the two simulation scenarios.

6.4.2. Okun's law

Okun's law predicts a relationship between changes in GDP and unemployment (Sørensen & Whitta-Jacobsen, 2010; Romer, 2011; Burda & Wyplosz, 2017). The premise is that higher unemployment suppresses GDP growth. A linear growth form of Okun's law may be written as (Abel, et al., 2016)

$$\frac{\Delta Y}{Y} = k + c\Delta u,$$

where $\frac{\Delta Y}{Y}$ is the percentage change in growth of GDP, Δu is the change in unemployment, k is the intercept at $\Delta u = 0$, and c is the slope relating changes in unemployment to changes in GDP. Historical data indicates that there is a tendency for increases in GDP to be accompanied by decreases in unemployment (Sørensen & Whitta-Jacobsen, 2010). This means that Okun's law postulates that the slope parameter, c , should be negative.

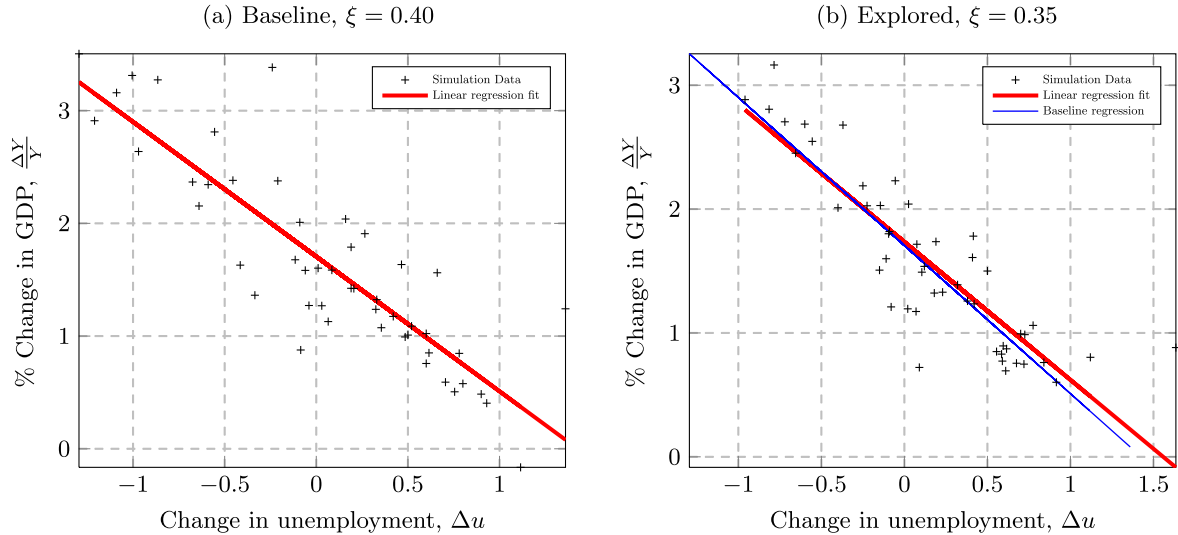

Figure 11: Comparison of annual % change in GDP to change in unemployment for the two simulation scenarios, showing Okun's law.

Figure 11 shows the monthly percentage change in GDP versus the change in unemployment for the two simulation scenarios. The data points show the annual changes in the Monte Carlo averages from the simulations. A linear regression was performed on the data from each of the two scenarios, with the regression lines shown in the figure. In both cases a negative slope was obtained, with $c = -1.195$ in the baseline scenario, and $c = -1.112$ in the explored scenario, confirming the essential postulate of Okun's law. In the model, a 1% increase in unemployment results in a 1.195% decrease in GDP for the baseline scenario, and a slightly smaller 1.112% decrease in GDP for the explored scenario. These values are of the same order of magnitude as those obtained from a recent study on South African data (Mazorodze & Siddiq, 2018).

7. Implications

The results from the model highlight several implications for business and macroeconomic policy decisions, especially in the South African context.

7.1. A holistic approach

The simulations only considered the consequences resulting from a change in a single parameter: investment in knowledge. The composition of skills within the population was unchanged as firms invested more heavily in knowledge. This resulted in stagnant economic growth and higher levels of unemployment. Attempting to leverage the advantages of the 4th industrial revolution (4IR) and the knowledge-based economy without increasing the skills composition of the population will ultimately constrain long-term future growth opportunities.

An aggregate measure of the level of development of a KBE is provided by the World Bank Knowledge Economy Index (KEI), (Chen & Dahlman, 2005). The KEI incorporates the four pillars, and the important consequence of the four pillars framework is that *no single economic stakeholder can be the driver for knowledge-based development*. A coordinated strategy between academia,

industry and government is imperative (Etzkowitz & Leydesdorff, 1995; Leydesdorff, 2012) . Academic curricula need to be aligned with the needs of industry. Government policies need to facilitate human capital development; be aligned with the needs of industry and educational institutions; allow for the efficient allocation of resources; stimulate creativity; encourage collaboration and integration; promote research and development; and incentivise innovation and knowledge development (Chen & Dahlman, 2005; Asongu, 2017). Companies need to engage more closely with academic institutions and implement skill development programmes.

The simulations show that unemployment is highest for the unskilled sector of the population, despite being the largest labour composition within firms. Furthermore, a shift towards a knowledge-based economy resulted in even higher levels of unemployment, particularly within the unskilled and semi-skilled labour force. An important consideration is that the education throughput rates were the same for all simulations, so the population composition of skills was unchanged. Furthermore, it was found that in the long-term, inequality will remain relatively unchanged when moving towards a KBE. The results reinforce the observation that education inequality will lead to higher levels of poverty and income or wealth inequality (Akanbi, 2016).

***Implication:** Failure to adopt a coordinated strategy between industry, academia, and government in attempts to achieve a KBE may result in constrained long-term economic growth and deteriorating levels of unemployment, inequality and poverty.*

7.2. Education and skills development

A largely unskilled population arising from poor education throughput in the model resulted in higher levels of unemployment when moving towards a KBE. In South Africa, despite modest improvements in the education system, there are significant challenges that remain. A recent report by the Centre for Risk Analysis highlighted several of these challenges, including poor throughput rates in the basic education system, high failure rates, large disparities in the attainment of educational qualifications between different racial groups, poor infrastructure in schools, etc. (CRA, 2018).

Investment in human capital, as well as the necessary infrastructure to support high-technology industries, is essential in order to develop a KBE (Blankley & Booyens, 2010) . Perhaps the most critical component required to develop the capacity for a KBE is a highly skilled population (Blankley & Booyens, 2010; Vadra, 2017) . Some important aspects of developing a highly skilled population include: increasing the quality of the education system, balancing the needs of a general education with a technical education, increasing R&D, and promoting a culture of life-long learning (Asongu & Odhiambo, 2020) . In part, this would require a more flexible education system that can adapt to developing the necessary skills required by a more technologically sophisticated economy (Lee, et al., 2018) . Companies wanting to shift towards higher levels of technological sophistication and knowledge utilisation should invest in human capital development and engage more closely with educational institutions to align curricula with their needs.

***Implication:** A necessary condition for a KBE is the transformation of the education system to one that is inclusive, focused on quality, adaptive, encourages creativity, aligned with the needs of industry, and stimulates R&D.*

7.3. The efficiency incentive

An economic incentive for firms to invest in knowledge development is to improve efficiencies. Higher levels of productivity and efficiency can be achieved from technological progress through knowledge development (Perelman, 1995; Powell & Snellman, 2004) . The agent-based model resulted in higher aggregate capital and labour productivities in the economy. When comparing the simulation results to the Solow-Swan growth model, it was found that an increase in investment in knowledge and technology results in an increase in the aggregate Solow-Swan labour productivity parameter. Firms would undoubtedly embrace productivity-improving initiatives in order to increase profitability and operating efficiencies.

Implication: Improved efficiencies provide an economic incentive for companies to invest in knowledge development.

8. Conclusion

An agent-based model was developed in order to simulate and investigate the macroeconomic consequences emerging from the strategic decisions of firms to invest in knowledge development. Technological progress through innovation and knowledge development are important drivers of economic growth (Diaconu, 2011; Asongu & Andrés, 2020). Complementary aspects of technological progress were used in the model: *technological sophistication* and investment in *knowledge*. Two simulation scenarios were constructed, one used as a baseline or reference scenario, and an explored scenario in which there was a higher tendency by firms to invest in knowledge development. The simulation results showed no significant change in GDP as firms in the model economy invested more heavily in knowledge. However, the greater investment in knowledge development resulted in significantly higher levels of unemployment, particularly for unskilled workers. The unemployment rates for the more highly skilled sectors of the population decreased over time as firms became more technologically sophisticated. The results were validated by fitting the simulation data to the Solow-Swan growth model and through the confirmation of Okun's law relating GDP growth and unemployment.

8.1. To KBE, or not to KBE, that is the question!

“A knowledge-based economy will not necessarily ensure national economic prosperity, improved health and well-being, ecological sustainability and reduced inequalities” (Blankley & Booyens, 2010). In other words, a knowledge-based economy is not a silver bullet that can be used to solve broad socio-economic problems of poor economic growth, unemployment, inequality and poverty. The simulation results do not however simply show that a country like South Africa should not embrace the KBE paradigm. What the simulation does show is that embracing a knowledge economy without changing anything else would be problematic in the long-run. A holistic, multi-faceted approach would be required.

There is also another dimension that must be considered: global competitiveness. New opportunities for growth and development in developing countries have been created by the globalisation of technology (Vadra, 2017). The model assumed that global demand would steadily increase regardless of anything else. Not adopting global trends in technological development could leave a country behind due to lower levels of productivity. For South Africa it would be a case of: *damned if we do, damned if we don't*.

Water; water disclosure index; food, beverage and tobacco industry; integrated reporting; sustainability reporting; inductive-, abductive- & deductive reasoning

Abstract

Companies worldwide are accused of lagging responsibility for their environmental footprints. Against the backdrop that the World Economic Forum identified water as one of the top five risks in terms of impact, the main objective of this paper was to develop a generic water disclosure index for the food, beverage and tobacco industry. Within the context of theories that focus on companies' communication on their corporate sustainability reporting (CSR) to stakeholders, three approaches of reasoning contributed to the development of the index. This paper illustrates how a preliminary water disclosure index was:

1. Inductively developed from guiding principles and content elements of integrated reporting (IR), existing water disclosure frameworks, and other literature.
2. Deductively empirical tested in a sample of 49 companies from Australia, South Africa, and global companies.
3. Abductively return to the literature to find some best practices to be incorporated into an improved index.

The novelty of the study is that the guiding principles and content elements of IR are pertinently incorporated into the new index. All the deductive tests have indicated that this index is efficacious. Therefore, this paper recommends that companies in this industry adopt this improved index, consisting of 29 elements grouped into seven constructs, to enhance their reporting on sustainability development to stakeholders.

1. Introduction

Companies worldwide are accused of lagging responsibility for their environmental footprints, such as depletion of natural resources and climate change (Braam *et al.*, 2016:724). Water, species, land, air, and ecosystems are examples of natural capital. Their sustainable development is key to human society (Dong *et al.*, 2021:2). There are many definitions of sustainability or sustainable development. However, the Brundtland's report "*Our Common Future*", published by the WCED (1987:37), remains contemporary, which state that: "*Sustainable development is the development that meets the needs of the present without compromising the ability of future generations to meet their own needs*".

To assist companies in reporting on their sustainable development, Elkington coined the "*triple bottom line (TBL)*" phrase in 1994. That was not only an accounting tool but also a clarion call for deeper thinking of capitalism and the future thereof (Elkington, 2018:4). Khan *et al.* (2021:3) explain the concept of TBL as three compartments, economic sustainability to ensure profits, social sustainability to develop human capital, and environmental sustainability that refers to the

consumption of natural resources. Sustainability accounting, which includes collecting, analysing, and reporting sustainability information to stakeholders, may enable companies to deal with the three compartments (Burritt & Schaltegger, 2010:832). However, the reported information is only helpful in making decisions if it adheres to the qualitative characteristics, relevance, representational faithfulness, verifiability, timeliness, understandability, and comparability (CFI, 2022). Furthermore, ACCA (2013:3) mentions that disclosed information should also be measurable using quantifiable data or key performance indicators (KPIs).

The increase in the global population negatively affects the water, food, and energy nexus (Molajou *et al.*, 2021). Consequently, fundamental hereto is the understanding and accounting of the interrelation between food, energy, and waters' interaction with the environment and human wellbeing. Water is part of natural capital, so its impact and dependency must be measured and communicated to businesses and society.

There are various initiatives aiming to support companies' sustainability reporting, including water reporting, through their frameworks and guidelines, for example, the Water Footprint Network, Global Reporting Initiative (GRI), Climate Disclosure Standards Board (CDSB), Carbon Disclosure Project, The Association of Chartered Certified Accountants (ACCA) and King IV. Since companies acknowledge the TBL concept, they tend to separate their sustainability reporting into stand-alone financial (economic) reports, and non-financial corporate social responsibility (CSR) reports that cover social and environmental issues.

As stakeholders demand different information, they question the usefulness of long and complex stand-alone reports (De Villiers *et al.*, 2014). Furthermore, Bernardi and Stark (2018) note that environmental and social activities are presented in silos that are not integrated into the company's primary operations. These limitations have led to the establishment in 2010 of the International Integrated Reporting Council (IIRC) (Eccles & Serefeim, 2011), which task was to investigate the possibility of the replacement of stand-alone reporting with integrated reporting (IR). IR became an alternative to stand-alone reporting, which aims to support integrated thinking and decision-making (Moolman *et al.*, 2016).

With the nexus mentioned above in mind, this paper's focus is on water reporting (disclosure) in the food, beverage, and tobacco industry. McKinsey and Company (2009) indicate that this industry, among others such as mining and pulp and paper industries, is highly exposed to water scarcity due to their heavy dependency on water. The food, beverage and tobacco industry is highly exposed to the CSR issue of water reporting since they have the potential to affect the environment negatively and, in turn, society (Kemp *et al.*, 2010).

Within the context of theories that focus on companies' communication on their CSR disclosures to all stakeholders, the literature and existing water disclosure frameworks were used to develop a new water disclosure index for the food, beverage and tobacco industry. The paper's novelty is that the guiding principles and content elements of IR are pertinently incorporated. This paper also illustrates how inductive, deductive, and abductive reasoning was applied in a single study.

2. Problem Investigated

Although sustainability reporting is rapidly becoming more prevalent and may hold substantial benefits to reporting companies, it is not without limitations. There is, however, an increasing debate over the lack of completeness and credibility of CSR information and its potential benefits to investors and financial stakeholders (Michelon *et al.*, 2015:60).

Some shortcomings arising from the literature pertaining to sustainability reporting, with special reference to water related reporting, are: Considerable diversity in the types of formats increased over the years, and verification also carries considerable costs (Kolk, 2010:373); The various available water accounting frameworks may become internationally incomparable and inconsistent as the accounting standards are not regulated (Chalmers *et al.*, 2012); The CDP's Water Disclosure Program,

which provides guidelines to companies to disclose water information, emphasise the need to accelerate the progress of water performance benchmarks and standardised measures (CDP, 2015); Environmental accounting can be helpful that companies simultaneously create value in core business activities while operating in a cleaner and greener environment (Menike, 2020); Stand-alone reports provide more information, however some information is irrelevant, camouflaging other vital items of disclosure (Michelon *et al.*, 2015:73); The debate on the appropriateness of IR, which was developed to overcome some shortages of traditional stand-alone reporting, is still not solved (Perego *et al.*, 2016); There are imputations that GRI-based reporting may mislead the users thereof since it seems that some unsustainable practices are not reported on (Fonseca *et al.*, 2012); and There is a need for a better-standardised water reporting framework to assist companies to benchmark their operations with competitors' activities (Semmens *et al.*, 2013).

With the above arguments as a base, the question arises of how companies in the food, beverage and tobacco industry can improve their water disclosure. In short, the question is what a contemporary water disclosure index for this industry should look like.

3. Research Objectives

The main objective of this paper is to develop a generic water disclosure index for the food, beverage and tobacco industry. The development occurred in four phases, which are also represented by the following secondary objectives:

1. To conduct a literature review to determine possible constructs and elements (sub-constructs) that should be included in such an index.
2. To inductively develop a preliminary index by refining the above constructs and elements and incorporating additional IR guiding principles and content elements.
3. To deductively test the preliminary index in a sample of companies in the mentioned industry.
4. To abductively investigate best practice water disclosure of the selected companies that may be included in the index.

4. Literature Review

4.1. Theoretical framework

Sustainability reporting has become an increasingly needed and common practice by companies to meet the expectations of various stakeholders. A broad array of stakeholders continually demand that companies provide transparent disclosure on multiple dimensions of their TBL (Maubane *et al.*, 2014:153). To fulfil these expectations and respond to stakeholders' pressures and criticisms, companies have to communicate their business activities and the impact thereof on the environment and society (Akhter & Dey, 2017:62).

The institutional-, legitimacy-, and stakeholder theories are most often used as essential frameworks for social and environmental accounting research (Bhattacharyya, 2014:27). They are generally alike because they share a similar ontological view and are system-orientated theories (Gray *et al.*, 1995:50).

The institutional theory advocates that a variety of external pressures (whether from government, customers, or communities) activate institutions (companies) to respond and disclose required information (Amran & Haniffa, 2011:143). In practice, this implies that society may affect the company over time; however, on the other hand, the company can impact society. For example, a company that uses a shared water source may affect a community, i.e., water that could be utilised by the community. This community may claim benefits from the company, for example, employment in the company.

According to the legitimacy theory, companies justify their core business activities by linking them to their social and sustainability goals (Silva, 2021:1). Therefore, sustainability accounting and reporting are utilised by companies to legitimise their actions (Deegan *et al.*, 2002:319). The legitimacy theory complements the stakeholder theory, which embraces the relationship between a company and its stakeholders. As stakeholders demand social and environmental information, companies are forced to

document and report their sustainable performance (Sisaye, 2021:9). Both theories regard a company as part of its society; the legitimacy theory emphasises the expectations of the community; the stakeholder theory focuses on different groups (Deegan, 2014). To illustrate, the latter is concerned that there are various stakeholders (government, local community, and shareholders), while the former focuses on their expectations. For example, the government will be concerned about compliance with rules and regulations, the local community will be concerned about clean household water, and shareholders about economic profit.

The theories share some related themes, such as the company's interlinked relationship with its stakeholders. The theories addressed above may be broadly similar because all focus on the internal or external pressures on a company to communicate socially responsible disclosures to all stakeholders (Tamimi & Sebastianelli, 2017:1662). This confirms the statement by Gray *et al.* (1995:52) to view all these theories as complementary rather than to recognise them as competing. These theories serve as a conceptual framework for the study that aims to develop a water disclosure index to communicate (report) water issues to stakeholders.

4.2. Integrated reporting

As already mentioned, IR was established to provide an alternative for stand-alone reporting. IR is a tool to create value for its stakeholders, including shareholders, society, and the environment (IIRC, 2013a:1). IR aims to provide insight into the resources used and affected by a company and are referred to as "*capitals*" in the IR framework. A company must explain how it interacts with the external environment and various capitals (IIRC, 2013b:4). Flower (2015:5) criticises IR on the extent to which it addresses sustainability and anticipates that IR will have little effect on corporate practices. However, Adams (2015:25) states that sustainability is not the primary purpose of IR and that many businesses are adopting IR.

IR fundamentally changed how companies report to their stakeholders by supporting integrated thinking and decision-making. The IIRC (2013b) is a source document that provides a list of guiding principles and a list of content elements. Table 1 displays on the left the seven guiding principles of IR, while on the right, an explanation by the authors in a water reporting context is provided. These principles are essential to this study as they may be incorporated into the new water disclosure index.

Table 1: Guiding principles of IR within a water reporting context

Guiding principles of IR	Explanation within water reporting context
Strategic focus and future orientation	The IR should provide information about the company's water strategy, which impacts future operations and water risks.
Connectivity of information	Indicate an overview of the combination, relation, and dependencies between water issues that affect a company's ability to create value.
Stakeholder relationships	Insight into the nature and quality of the company's relationships with its key stakeholders that effect water.
Materiality	Disclose information about water issues that affect a company's ability to create value over the short, medium, and long-term.
Conciseness	Sufficient context to understand the company's water strategy, water governance, and prospects without being burdened by less relevant information.
Reliability and completeness	Including all material water-related matters, both positive and negative, in a balanced way without material error.
Consistency and comparability	Ensure consistency over time and enable comparisons with other companies about to water disclosure.

Source: Adapted from IIRC (2013b:5).

The content elements of IR as suggested by the IIRC (2013b:5) were also reviewed and put in context by the authors with water reporting in Table 2. These content elements were also considered to be incorporated into the new water disclosure index.

Table 2: Content elements of IR within a water reporting context

Content element	Explanation of content element within water context
Overview/ external environment	Indicate the effect of water on the circumstances under which the company operates.
Governance	The company's governance structure on water should support its ability to create value in the short, medium, and long term.
Business model	Provide the company's business model and how it influences water and the water nexus.
Risks and opportunities	Identify the risks and opportunities in water that could affect the company's ability to create value over the short, medium, and long term. Determine the strategy and resource allocation in terms of water risks.
Performance	Indicate whether the company achieved its strategic objectives regarding water for the period.
Outlook	Indicate challenges and uncertainties the company could encounter in pursuing its water strategy, with potential implications for its business model and future performance.

Source: Adapted from IIRC (2013b:5).

4.3 Literature and existing water disclosure frameworks

With the IR guiding principles and content elements in the above section in mind, existing water disclosure frameworks were also investigated, namely (i) GRI 303: water and effluents (GRI, 2017, 2018a, 2018b), (ii) GRI G3 and G4 guidelines (GRI, 2013), (iii) CDP water disclosure framework (CDP, 2015), and (iv) GRI sector guidance for food and beverage processing (GRI 2013). Other relevant literature was also investigated. From the sources, prominent themes were selected to be considered as constructs in the preliminary and improved water disclosure indices. [To avoid confusion, the three main sources to develop the index are named as follows: IR guiding principles and IR content elements; existing water disclosure frameworks that represent the GRI and CDP sources; and other relevant literature.] The selected themes are:

- Governance and management: The board of directors is responsible for establishing appropriate mechanisms to monitor and control the activities of a company and to be accountable and transparent through the disclosure of information (Dias *et al.*, 2017:4).
- Risk assessment: Since 2015, the water crisis has remained one of the top five risks in terms of impact from 2016 to 2018 (World Economic Forum, 2018:1).
- Supply chain: Companies are accountable not only for their operations and processes but also for their suppliers. But on the contrary, Bateman *et al.* (2017:119) state that most companies only report on their own operations and not the entire supply chain.
- Targets and measures: The phrase "*what gets measured, gets managed*" could be applied to address the water issue. This section deals with the quantitative part of water disclosure, as corroborated by ACCA and the GRI, where they distinguish between narrative reporting and KPIs (ACCA, 2013:3; GRI, 2018a:6).
- Site information: By providing consistent information across all sites, companies can show that they are not manipulating their reports by cherry-picking the best stories and report across their operations (Leong *et al.*, 2014:98).
- Materiality: It should be recognised as a guiding principle in financial and non-financial information, and currently, we are in a transitional phase where sustainability reporting is shifting from a voluntary regulation system to a more concrete or rigorous one (Ortar, 2018:20).
- Future-orientated information: Some critics of the GRI stated that it adopts a predominately retrospective approach and that more future-orientated information is needed (Fonseca *et al.*, 2012:74).

The space restriction to this paper only allows a brief description of the selected themes that may be considered to form constructs of the new index. However, Appendix A exhibits a concise summary of the relevant literature, mainly how the existing water disclosure indices were applied to develop a unique index. Note that only the first five of the above themes from the existing frameworks and other

literature appears in Appendix A as constructs. The reason is that existing frameworks were used as the starting point in developing the new index, and the five constructs fit the existing frameworks better. Therefore, the following five constructs appear in Appendix A, 1) government and management approach, 2) risk assessment, 3) interaction with water as a shared resource (supply chain), 4) targets and measures and 5) site information.

The above starting point is consistent with the study of Weber and Hogberg-Saunders (2018). They utilised the GRI as a basis to develop the water risk benchmarking framework applied in their research. Weber and Hogberg-Saunders (2018:967) stated that the GRI is one of the critical sustainability reporting standards, decreasing subjectivity. While adding the previous GRI guidelines, the latest GRI 103 (GRI 2016) and GRI 303 (GRI 2017, 2018a, 2018b), the CDP (CDP, 2015), the GRI sector guidance for food and beverage processing (GRI, 2013), and grounded literature on water reporting were also incorporated. Appendix A also exhibits how the above sources from the guiding principles (Table 1) and content elements (Table 2) of IR were preliminary organised together with the GRI guidelines and CDP water disclosure framework in the process of developing a new water disclosure index. For example, "*materiality*" as a guiding principle of IR was included in the "*governance and management*" construct.

This literature review concludes the first secondary objective, to determine possible constructs and elements that should be included in such an index.

5. Research Methodology

The research process includes three types of reasoning, firstly, induction, followed by deduction, and finally, abduction.

5.1. Inductive reasoning

The second phase was to develop a preliminary index. That was to refine the constructs and elements in Appendix A, by incorporating more IR guiding principles (Table 1) and content elements (Table 2), describing constructs and elements, adding/moving items, and adding detailed quality descriptions to each element.

Inductive reasoning was applied up to this point of the process, as the constructs were allowed to emerge from existing frameworks, related literature, and IR's guiding principles and content elements (Maree, 2021:42). In other words, this study commenced from the "*concrete*", i.e., the existing indices and literature, and moved to the "*general*", i.e., identified constructs and the elements included in those constructs (Joubert, 2017). Note that the "*general*" implies that the identified constructs and elements are only one of many possible outcomes, meaning that different researchers could select other constructs and elements if they were developed a similar index.

5.2. Deductive reasoning

Deductive reasoning is when researchers look for evidence of a priori constructs in data (Maree, 2021:42), meaning reason "*from the general to the particular*." This type of reasoning is usually associated with positivism, implying that an investigation can only lead to a single outcome. Relevant to this study is that there is only a single possible outcome, meaning that different researchers will obtain the same result each time.

Deductive reasoning was applied in the third phase of developing the index, namely to empirically test the preliminary index. The aim was to calculate a water disclosure score for selected companies in the food, beverage and tobacco industry. A three-point assessment scale was adopted, ranging from 0 to 2, to quantify the elements within the constructs. The minimum score of "0" is assigned in case of no disclosure, whereas the maximum, "2" is set when all possible information is disclosed. This scaling process allowed that qualitative and quantitative data could be converted to calculate a comparable water disclosure score for each company.

Data were extracted from 49 companies' annual reports for 2017/2018 which was the latest data available at the time of analysis. There are 13 companies that adhere to the Dow Jones Sustainability Index (DJSI) listing requirements. They were selected to represent the global economies. Australian

and South African companies were also selected as both countries are arid and experiencing extreme water scarcity (Wright, 2018). The 20 largest of the 26 companies from the Australian Security Exchange (ASX), and the 16 available Johannesburg Security Exchange (JSE) companies, were selected. The largest companies based on market capitalisation were selected, similar to a study conducted by Remali *et al.* (2016) that analysed 10 of the largest Malaysian public listed companies by market capitalisation.

Content analysis was conducted to collect data from the 49 companies' IR and stand-alone reports. Content analysis is employed by researchers to make replicable and valid inferences within the conceptual framework of their study (Krippendorff, 2013). This data collection technique was applied by codifying quantitative and qualitative data into the predetermined constructs (Guthrie *et al.*, 2004). A manual coding process was preferred above a computer-aided method as some companies' reports provide extensive information in interactive web pages, which could be challenging to enter into a computer-aided program. Furthermore, as quantitative, and qualitative information was extracted and best practices were identified, careful and in-depth reading was required. To enhance the coding process, a pilot coding of 10% of the sample companies was done together with an experienced colloquium, before the final coding process commenced by the principal author. An independent senior academic with ample experience in environmental accounting repeated the coding process to ensure that critical data was not overseen.

Descriptive statistics (minimum-, maximum-, standard deviation-, and mean value) were used to give meaning to the elements. Furthermore, to determine whether the elements in the preliminary index are sensible, meaning that they belong there, a principal component regression analysis was conducted. This is a data reduction technique to justify the inclusion of each element in the index (Pietersen & Maree, 2021:266). Principal component regression analysis is a variation of factor analysis that attempts to identify the principal component(s) that best explains the constructs, including the elements. Principal component regression analysis analyses a data table represented by several dependent variables that are generally inter-correlated (Abdi & Williams, 2010:433).

As part of the principal component analysis, the Kaiser-Meyer-Olkin (KMO) Measure of Sample Adequacy was conducted. That provides an index ranging from 0 to 1, with 0.50 considered suitable for factor analysis and indicates the proportion of variance in variables that might be caused by underlying factors (Williams *et al.*, 2010:5). Secondly, we did Bartlett's test of sphericity to test if the data is appropriate for factor analysis (Kaiser, 1974:35). Bartlett's test should be significant with a p-value of less than 0.05. Then we did a scree plot to indicate the number of factors, where the line (plot of the eigenvalues) typically forms an apparent bend (elbow). The eigenvalues at the upper end of the "elbow" equal the number of factors (Pietersen & Maree, 2021:265). Finally, the factor loadings for each element were calculated, which should be more than 0.40 to justify its inclusion (Pietersen & Maree, 2021:266).

To measure the internal consistency of a test or scale, Cronbach's alpha coefficient, which is expressed as a number between 0 and 1, could be utilised. It is recommended that Cronbach's alpha coefficient values be above 0.7 to be acceptable (Babin & Zikmond, 2016:281). The Cronbach's alpha scores were calculated for the entire index and for each construct.

5.3. Abductive reasoning

Eriksson and Lindström (1997) explain that abductive reasoning is a fundamental idea to recognise and create a context of meaning and interpret underlying trends and patterns. Mantere and Ketokivi (2013) add that this is used to draw theoretical conclusions from empirical data. To further enhance the preliminary developed index, abductive reasoning was applied by adding additional information found in the literature. The literature, including IR guiding principles and content elements, existing water disclosure indices, and other sources, were used to develop the preliminary index inductively. At this point, the fourth phase of developing the index commenced, i.e., the researchers went back to the literature, namely the IR and stand-alone reports of the 49 selected companies, to extract further data that can be added to enhance the preliminary index into an improved index. This data extraction

coincided when the above-mentioned qualitative and quantitative data was collected from the company reports to test the index empirically. During the data collection, some practices by the companies were spotted that stood out what can be labelled as "*best practices*" in this industry's water disclosure.

6. Results and Findings

6.1. Developing a preliminary index

The second secondary objective was reached with Appendix A as the basis. That was to develop a preliminary index, where additional IR guiding principles and content elements were added, constructs were added and regrouped, elements were moved around, and detailed quality descriptions were added to each element. A preliminary index, similar to Appendix B was developed. The difference between the preliminary index and Appendix B is that the latter includes some best practices found in the fourth phase of the development. Table 3 exhibits a summary of the preliminary index. To enhance the readability, the elements were rewritten in Table 3 into concise quality descriptions.

The index in Table 3 includes the five constructs selected in Appendix A, governance and management approach, water-related impacts in its supply chain, targets and measures, site-specific information, and risk assessments. Two constructs were added in Table 3, materiality, and future-orientated information. Twenty-seven elements were included under those seven constructs.

The construct, and elements included in it, "*targets and measures*" consist primarily of information in existing water disclosure indices. The "*supply chain*" as a construct is primarily developed from existing indices and other literature, while "*site information*" is mainly developed from other literature. The constructs and their elements, "*governance*", "*risk assessment*" and "*materiality*", are developed from existing indices, other sources, and IR's guiding principles and content elements (Tables 1 and 2). Also note for example, G3 that require from companies to include water related aspects in their *business plan*, is a direct derive from one of the IR content elements in Table 2. The new construct "*future orientated information*" is directly derived from the IR guiding principles in Table 1.

6.2. Testing the preliminary index

The third secondary objective was to test this index on the sample of companies. Data were collected from all 49 companies to attach a value between "0" and "2" to all 27 elements. The assessment scale (ordinal scale) enabled the index to provide the disclosure quality. It is worthy to note that a quality assessment scale applicable to each element in the water disclosure index was developed to enhance the accuracy of coding every item. In all cases, the minimum score was zero and the maximum score two, implying that each element's mean score lies between "0" and "2". The scores were converted into percentages. Table 3 shows the descriptive statistics for the 27 elements, i.e., the standard deviation and mean percentage. The element with the highest mean score is RA1, the first element in the "*risk assessment*" construct, "*disclosure of physical water risk*", with a score of 69.39%. The lowest mean score is SI1, the first element in the "*site information*" construct, "*water-related information for each facility*", with 17.35%.

In developing the index, the question arises of what weight should be attached to each construct, and elements within such a construct. Therefore, a principal component regression analysis was conducted. The KMO Measure of Sample Adequacy estimate was 0.806, well above the cut-off point of 0.5. The Bartlett's Test of Sphericity yielded an Approximate Chi-Square estimate of 1173, which was significant at $p = 0.000$, well below 0.05. A scree plot indicated that only one factor is necessary to summarise the index. This factor is appropriate as it explains more than half of the total variance, i.e., 52.72%. The factor loading for each element is indicated in Table 3. The factor loadings are all above 0.4 and range between 0.513 and 0.846. The element with the highest factor loading is G5, "*the company has water-related policies*" (0.846), followed by RA5, "*stakeholders identified in water assessment risk*" (0.843), and G1, "*environmental management system (EMS) in place and developed water strategy*" (0.841). Finally, the Cronbach's alpha coefficient for the entire water disclosure index consisting of all 27 elements was 0.964, indicating good internal consistency reliability as this is well above 0.7. A Cronbach's alpha coefficient was also calculated for each of the seven constructs to

ensure that the elements included in it belong together. Values were all above 0.7 and ranged between 0.754 and 0.930.

Table 3: Preliminary water disclosure index

Construct: Sub-theme or element		Factor loading	SD	Mean %
Materiality	M1: Identify water as a material aspect.	0.759	44.49	50.00
	M2: Describe the process and identify stakeholders.	0.694	44.49	42.86
Governance and management approach	G1: Environmental management system (EMS) in place.	0.841	42.91	59.18
	G2: Understands the context in which it operates.	0.750	35.92	66.33
	G3: Includes water-related aspects in the business model.	0.712	39.80	34.69
	G4: Indicates board-level oversight for water.	0.759	40.41	40.82
	G5: The company has water-related policies etc.	0.846	39.50	60.21
Supply chain information	SC1: Identify suppliers causing water-related impacts.	0.611	28.98	27.55
	SC2: Policy to manage water-related aspects in SC.	0.756	39.10	40.82
	SC3: Identifies water risk factors in SC.	0.754	41.44	48.98
	SC4: Understands role players in SC (nexus).	0.743	37.68	43.88
Targets and measures	TM1: Total water withdrawal per source.	0.787	41.62	43.88
	TM2: Total water discharged.	0.716	42.76	32.65
	TM3: Disclosure of water quality.	0.676	40.82	42.86
	TM4: Total water consumption.	0.544	44.46	39.80
	TM5: Volume of water recycled and reused.	0.513	43.96	32.65
Site information	SI1: Water-related information for each facility.	0.572	26.12	17.35
	SI2: Water risk assessments at a geographical scale.	0.663	34.04	25.51
Risk assessment	RA1: Disclosure of physical water risk.	0.745	36.54	69.39
	RA2: Disclosure of regulatory water risk.	0.612	37.37	53.06
	RA3: Disclosure of reputational water risk.	0.731	38.19	35.71
	RA4: Procedures & methods of water risk assessment.	0.822	39.47	47.96
	RA5: Stakeholders identified in water risk assessment.	0.843	40.35	43.88
Future-orientated information	FO1: Reports on future-orientated water information.	0.820	38.66	58.16
	FO2: Identified a long-term water strategy.	0.812	37.34	33.67
	FO3: Information on which could affect value creation.	0.696	30.83	24.49
	FO4: How does water risk assessment affect future growth.	0.693	36.94	26.53

6.3. Investigating best practices from selected companies

The fourth phase in developing the index was to detect some best practices from the analysis that can be incorporated to improve the preliminary water disclosure index. As a result of space restriction, only two items identified in the company reports – baseline year and efficiency ratios – will be discussed.

Providing a baseline year in a water disclosure index gives more interpretation perspectives to the reader. Many reporting organisations utilised their quantified water information under the targets and measures construct (TM1 – TM5) as a basis to provide future-orientated disclosures in terms of water. For instance, Nestlé (2017:80) aspires to reduce direct water withdrawals per ton of product in every category to achieve an overall reduction of 35% by 2020 – against an achieved reduction in water withdrawals of 28.7% per ton of product since the baseline year of 2010. Correspondingly, the Oceana Group (2018:44) set a September 2020 target of 44% absolute reduction in potable water consumption, and British American Tobacco (2017:27) aims to reduce water use to 3.17 m³ of water per million cigarettes equivalent produced by 2025 – 35% lower against their 2007 baseline. The baseline year was added to the index in the "*targets and measures*" construct as TM6, which would provide stakeholders with comparable information to a baseline year.

The above reference to British American Tobacco (2017:35) illustrates where the 3.17 m³ of water is relative to one million cigarettes. Distell (2018:48) reported usage of 3.33 litres compared to 4.94 litres used by Diageo (2018:8). Considering that both companies operate in the alcoholic beverage industry, the expression of water efficiency ratios could provide valuable and comparable information to stakeholders. The companies disclosing water efficiency ratios are utilising their measurements from total water withdrawal (TM1), to calculate an efficiency ratio in terms of water used per kilogram of the finished product or litre of the packaged product. For example, ThaiBev (2018:94) listed on the DJSI divided their water intensity ratios per product line – to advance comparability. The water efficiency ratio was added as an element in the "*targets and measures*" construct as TM7.

7. Developing an improved water disclosure index

The study's main objective was to develop a water disclosure index for the food, beverage and tobacco industry. Appendix B exhibits the improved index, reaching the four mentioned secondary objectives (phases). The index includes the same seven constructs as in Table 3, materiality, governance, water-related impact on its supply chain, targets and measures, site information, risk assessment, and future-orientated information. After the inclusion of TM6 and TM7, the seven constructs consist of 29 elements. Appendix B provides on the left-hand side a quality description of each element and on the right-hand side some guidance that a company may follow to achieve the element's disclosure.

The factor loadings in the preliminary index with seven constructs and 27 elements ranging between 0.513 – 0.846 was an important indication that all elements load sufficiently onto one factor, implying that the index can be constructed. The improved water disclosure index included two new elements (TM6 and TM7) observed from best practices in the empirical analysis, which would provide stakeholders with additional information to compare companies in the same industry. The improved water disclosure index could be used in another empirical analysis to test whether the elements TM6 and TM7 sufficiently load onto one factor. Including companies from the DJSI in the empirical analysis compared best practices in sustainability reporting to be included in the improved water disclosure index.

8. Managerial implications

The preliminary water disclosure index inductively developed from the literature, the deductively empirical testing thereof, and the abductively return to the literature to find some best practices all contributed to the development of an improved water disclosure index for the food, beverage and tobacco industry.

The practical managerial implications of this index are that it accounted for the integrated nature of water disclosures in the food, beverage and tobacco industry. Consequently, the improved water disclosure index could be applied by companies in the food, beverage and tobacco industry – regardless of whether or not a company is implementing IR. Currently, various water accounting frameworks are available, leaving companies to decide what to measure and report, which could result in non-monitoring of fundamental water activities and incomparability of reports. Implementing the developed water disclosure index would allow the reporting company to combine essential water-related aspects into a holistic, concise, and comparable report. This would provide key stakeholders with forward-looking and strategic water-related information incorporated into the business model to deal with the challenges from the external environment.

9. Conclusion

In the context of theories that focus on companies' communication on their CSR disclosures to all stakeholders, the research question of what a contemporary water disclosure index for the food, beverage and tobacco industry should look like was answered by reaching four secondary objectives built-up to achieving the main objective. The main objective has been reached by developing the improved water disclosure index as presented in Appendix B.

An inductive approach was followed where the literature and existing water disclosure frameworks were used to develop a new index. However, the novelty of this study is that the guiding principles and content elements of IR were incorporated into the new index. A deductive approach was followed to test the index empirically, and all the statistical measures indicated this index's efficacy, namely the KMO Measure of Sample Adequacy and Bartlett's Test of Sphericity. Furthermore, the loadings of the principal component regression analysis and Cronbach's alpha coefficients all confirmed the suitability of the elements included in the index. An abductive approach was followed to further improve the index by incorporating some best practices found in the reports of the selected sample companies.

The practical value (linked to the managerial implications) is summarised that through the methodological process of applying the three reasoning approaches and the integrative approach followed, an improved water disclosure index is made available to companies in the food, beverage and tobacco industry. The purpose of the paper was not to consult stakeholders but to provide key stakeholders with a water disclosure index that all companies could use to report on water. Noticeable concepts such as materiality, governance, risk assessments and future-orientated information included in the index would provide stakeholders with concise, comparable and forward-looking information on a company's water-related practices. The study also contributed to the theory, i.e., the institutional-, legitimacy-, and stakeholder theories were relevant as this study provides an enhanced manner of how companies can communicate their CSR responsibility of water disclosure to all stakeholders.

As with all studies, this research is not without limitations. Consequently, the results, conclusions, recommendations, and contributions of the study, need to be considered in light of the following limitations. Firstly, it is recognised that the constructs and elements included in the water disclosure index were compiled from multiple literature sources, applicable to different industries and that some could be omitted. Secondly, applying content analysis as a research design will always involve individual judgments by coders. Thirdly, the associations and relationships from the sample cannot be generalised – which was not the study's intention. Areas for future research include extending the study to other industries and to other countries allowing for cross industry- and country comparisons.

Appendix A: Existing indices and literature review

The previous GRI (EN 8, EN 9 & EN 10)	The latest GRI (GRI 303) water and effluents, 2018	CDP, GRI sector guidance, and literature studies
Governance and management approach		
<p>Materiality Does the company identify water as a material aspect?</p> <p>Environmental management system (EMS) Establish whether the company has EMS for water-related issues by identifying the following:</p> <ul style="list-style-type: none"> Does the company have indications of improving operational water systems by applying internal measures? Does the company indicate that it understands the context in which it operates in terms of water stress, flooding, water quality, and regulatory uncertainty? Has the company developed its own water strategy? <p>Governance Establish the awareness of governance aspects for water by identifying the following: Does the company have a director or senior staff member responsible for water disclosure programs? Does the company have a water-related policy / policies?</p>	<p>Disclosure 103-1: Explanation of the material topic and its boundary An explanation of why the issue is material. The explanation of why the issue is material can include:</p> <ul style="list-style-type: none"> A description of the significant impacts identified and stakeholders' reasonable expectations and interests regarding the topic. A description of the process, and impacts related, such as due diligence, that the organisation used to identify the topic. <p>The boundary for the material topic, which includes a description of:</p> <ul style="list-style-type: none"> Where the impacts occur; The organisation's involvement with the effects. <p>Any specific limitations regarding the topic boundary.</p> <p>Disclosure 103-2: Management approach and its components An explanation of how the organisation manages the topic. A statement of the purpose of the management approach. A description of the management approach includes policies, commitments, goals and targets, responsibilities, resources, grievance mechanisms, or specific actions (i.e., processes, projects, programs, and initiatives).</p>	<p>Detrimental impact Has your organisation experienced any detrimental water-related impacts? Describe the water-related detrimental impacts experienced by your organisation, your response, and the total financial impact.</p> <p>Risks and opportunities: Risk exposure How does your organisation define substantive financial or strategic impact on your business? Water-related risks and response. Provide details of identified risks in your direct operations with the potential to have a substantive financial or strategic impact on your business, and your response to those risks.</p> <p>Business strategy: Value creation The inclusion of water issues as part of the company's business model was evident in the study by Sánchez-Hernández <i>et al.</i> (2017:845), and such inclusion could be considered one of the best practices. Robust governance management systems are required to manage water; consequently, water governance in the boardroom is essential. Companies with board-level oversight of water issues are reaping the rewards, including market differentiation, shareholder</p>

		<p>confidence, and business. Across all your operations, what proportion of the following water aspects are regularly measured and monitored?</p>
Risk assessment		
<p>Risk assessment Establish whether the company has risk assessment actions for water-related issues by identifying the following:</p> <ul style="list-style-type: none"> • Has the company identified physical risks such as flooding, water stress, and pollution? • Has the company identified regulatory risks such as water permits, water controlling rates, water withdrawal, discharge quantities and other restrictions? • Has the company identified reputational risks such as tensions between businesses and local communities or businesses and other supply chain members? 	<p>Disclosure 103-3 Evaluation of the management approach: An explanation of how the organisation evaluates the management approach, including:</p> <ul style="list-style-type: none"> • The mechanisms for assessing the effectiveness of the management approach; • The results of the evaluation of the management approach; • Any related adjustments to the management approach. 	<p>Business impacts Recent impacts on your business. Describe the water-related detrimental impacts experienced by your organisation, your response, and the total financial impact.</p> <p>Procedures Risk identification and assessment procedures.</p> <ul style="list-style-type: none"> • Does your organisation undertake a water-related risk assessment? • Select the options that best describe your procedures for identifying and assessing water-related risks. • Which contextual issues are considered in your organisation’s water-related risk assessments? • Which stakeholders are considered in your organisation’s water-related risk assessments?
Interaction with water as a shared resource (supply chain)		
<p>Water sources significantly affected by the withdrawal of water (EN 9) Does the company report on the total number of water sources significantly affected by the withdrawal of water, taking the following into account?</p> <ul style="list-style-type: none"> • Size of water source in cubic metres (m³); • Whether the source is designated as a protected area (national/international); • Biodiversity value (i.e., species diversity and endemism, number of protected species); and <p>Value or importance of water source to local communities and indigenous people.</p>	<p>Disclosure 303-1: Interaction with water as a shared resource A description of how the organisation interacts with water, including how and where water is withdrawn, consumed, and discharged, and the water-related impacts caused or contributed to, or directly linked to the organisation’s activities, products, or services by a business relationship (e.g., effects caused by runoff). Extract: The description of how the organisation interacts with water can include [...] information on what the water is used for in direct operations and elsewhere in the value chain (e.g., for cooling, storage, incorporating in products, growing crops). A description of the approach used to identify water-related impacts, including the scope of assessments, timeframe, and tools or methods. Extract: When assessing impacts, the organisation must consider its future impacts on water quality and availability, as these factors can change over time. A description of how water-related</p>	<p>Supply chain and risk Refer to the “procedures” above that address water related risks assessment. The concern here is findings by the Ceres investor coalition, the financial services firm UBS, and financial data provider Bloomberg, which issued a report that found that many of the 100 publicly traded companies do not include data on water risks, and none of them provided data on water usage or risk for their supply chains (Wilburn & Wilburn, 2013:64). Inequalities such as nutrition, health, sanitation, and security are at the heart of the nexus, and companies play a vital role in ensuring that supply chains are dynamic and able to provide food, energy, and water (Whiteman <i>et al.</i>, 2013:317). By managing their activities, they can ensure that environmental targets and policies are integrated upstream (suppliers) and downstream to the consumer.</p>

	<p>impacts are addressed, including how the organisation works with stakeholders to steward water as a shared resource, and how it engages with suppliers or customers with significant water-related impacts.</p> <p>An explanation of the process for setting any water-related goals and targets that are part of the organisation's management approach, and how they relate to public policy and the local context of each area with water stress.</p> <p>Extract: Meaningful targets for managing water-related impacts:</p> <ul style="list-style-type: none"> • Account for the local context where water is withdrawn and discharged; • Are scientifically informed by sustainable thresholds and the social context of a catchment; • Align with public sector efforts (i.e., the water-related targets of the UN Sustainable Development Goals, in particular, Goal 6); • Are informed by the advocacy of stakeholders (i.e. civil society organisations, trade associations, and action groups). <p>An overview of water use across the organisation's value chain.</p> <p>A list of catchments where the organisation causes significant water-related impacts.</p>	<p>Value chain engagement</p> <p>Do you engage with your value chain on water-related issues?</p> <p>What proportion of suppliers do you request to report on their water use, risks, and/or management information, and what proportion of your procurement spend does this represent?</p> <p>Provide details of any other water-related supplier engagement activity.</p> <p>Bateman <i>et al.</i> (2017:119) state that most companies only report on their operations, not the entire supply chain.</p>
Targets and measures		
<p>Percentage and total volume of water recycled and reused (EN 10)</p> <p>Does the company report on the total volume of water recycled and reused by the organisation in cubic metres per year (m³/year)?</p> <p>Does the company report the total volume of water recycled and reused by the organisation in cubic metres per year (m³/year) as a percentage of the total water withdrawal reported under Indicator G4 – EN 8.</p>	<p>Disclosure 303-4: Water discharge</p> <p>Total water discharge to all areas in mega litres (ML), and a breakdown of this total by the following types of destination, if applicable: (a) surface water; (b) groundwater; (c) seawater; (d) third-party water, and the volume of this total sent for use to other organisations, if applicable.</p> <p>Extract: Third-party water discharge is when an organisation sends water and effluents to other organisations for use. The volume of this water discharge must be reported separately.</p> <p>Priority substances of concern for which discharges are treated: Number of incidents of non-compliance with discharge limits.</p> <p>Any contextual information necessary to understand how the data have been compiled, such as any standards, methodologies, and assumptions used.</p> <p>The number of occasions on which discharge limits were exceeded.</p> <p>Disclosure 303-5: Water consumption</p>	<p>Company-wide water accounting</p> <p>What are the total volumes of water withdrawn, discharged, and consumed across all your operations, and how do these volumes compare to the previous reporting year?</p> <p>Provide total water discharge data by destination:</p> <ul style="list-style-type: none"> • Fresh surface water • Brackish surface water/seawater • Groundwater • Third-party destinations <p>Business impacts/compliance impacts</p> <p>Was your organisation subject to any fines, enforcement orders, and/or other penalties for water-related regulatory violations in the reporting year?</p> <p>Provide the total number and financial value of all water-related fines.</p> <p>Provide details for all significant fines, enforcement orders, and/or other penalties for water-related</p>

	<p>Total water consumption from all areas in ML.</p> <p>Extract: If the reporting organisation cannot directly measure water consumption, it can be calculated with: Water consumption = Total water withdrawal – Total water discharge.</p> <p>Any contextual information necessary to understand how the data have been compiled.</p> <p>Total water consumption in ML at each facility.</p>	<p>regulatory violations in the reporting year and your plans for resolving them.</p>
Site information		
		<p>Facility-level water accounting</p> <p>For each facility referenced, provide coordinates, total water accounting data, and comparisons with the previous reporting year.</p> <p>By providing consistent information across all sites, Leong <i>et al.</i> (2014:98) argued that companies can show that they are not manipulating their reports.</p> <p>Fonseca <i>et al.</i> (2012:70) contested the effectiveness of the GRI framework by arguing that GRI-based reports could mislead decision-makers because unsustain-able practices, particularly at a site level, are not reported on.</p> <p>Given the differences in firm's types and activities, fluidity and flexibility should be built into the guidelines and standards of IR. This refers to the fact that industry-based or site-level-based metrics should be considered (Dumay <i>et al.</i>, 2016:179).</p>

Appendix B: Improved water disclosure index for the food, beverage and tobacco industry

Elements	Guidance
Materiality (M)	
M1: Identify water as a material aspect, and describe significant impacts associated with water – specific to the company.	The company identifies water as a material aspect describes the impacts associated.
M2: Describe the process of identifying water as material, and identify the stakeholders affected and included in the process.	The company describes the process and identifies all the relevant stakeholders affected.
Governance (G)	
G1: Indicate the environmental management system (EMS) and develop an own water strategy.	The company should have EMS incorporated into its water strategy.
G2: Disclose the context within which the firm operates regarding water stress, flooding, water quality, and regulatory uncertainty.	Provide an understanding of the context and details, such as flooding, water quality, and regulatory uncertainty.
G3: Include water-related aspects as part of the firm’s business model.	Water should form part of the firm’s business model, which would assist in formulating the water strategy.
G4: A senior director or senior staff member should be responsible for water governance (board oversight).	Board oversight of water governance should be very clearly embedded in the organisational structure. Established awareness of governance structure of water-related issues.
G5: Water-related policies, commitments, goals and targets, responsibilities, resources, grievance mechanisms, and specific actions, such as processes, projects, programs, and initiatives, should be disclosed.	Detailed information about policies, commitments, resources, projects, programs, and initiatives within the context of water governance should be disclosed.
Water-related impact on its supply chain (SC)	
SC1: Identify suppliers causing significant water-related impacts.	Water withdrawal and discharge figures should identify and quantify significant water-related impacts caused by suppliers.
SC2: Develop a policy and strategy to manage water-related aspects in the supply chain.	The company should have policies and strategies to manage water-related aspects in its supply chain.
SC3: Identify water risk factors in the supply chain.	The company should identify water risk factors in their supply chain by conducting water risk assessments at suppliers or seeking information from suppliers.
SC4: Display an understanding of the WEF nexus by considering the water impact of the upstream and downstream role players in the supply chain.	The company indicates that they understand the WEF nexus by identifying role players and their effect on water in the supply chain.
Targets and measures (TM)	
<p>Total water withdrawal by source</p> <p>TM1: Disclose total water withdrawal from all areas in mega litres (ML) and provide a breakdown of this total by the following sources, if applicable: (a) surface water (includes collected or harvested rainwater); (b) groundwater; (c) seawater; (d) produced water; (e) third-party water.</p> <p>Total water withdrawal from all areas with water stress in ML, and a breakdown of this total by the following sources, if applicable: (a) surface water; (b) groundwater; (c) seawater; (d) produced water; (e) third-party water, and a breakdown of this total by the withdrawal sources listed in a-d. (When compiling the information specified above, the reporting organisation shall use publicly available and credible tools and methodologies for assessing water stress</p>	The company should disclose total water withdrawal, quantifying each source.

<p>in an area).</p> <p>A breakdown of total water withdrawal from each of the sources listed in Disclosures 303-3-a and 303- 3-b in ML by the following categories: (a) freshwater ($\leq 1,000$ mg/L Total Dissolved Solids); (b) other water ($> 1,000$ mg/L Total Dissolved Solids). (Other water constitutes that has a concentration of total dissolved solids higher than 1,000 mg/L. Therefore, other water is all that does not fall into the freshwater category.)</p> <p>Any contextual information necessary to understand how the data have been compiled, such as any standards, methodologies, and assumptions used.</p>	
<p>Water discharge</p> <p>TM2: Disclose total water discharge to all areas in ML and provide a breakdown of this total by the following types of destination, if applicable: (a) surface water; (b) groundwater; (c) seawater; (d) third-party water, and the volume of this total sent for use to other organisations, if applicable. (An example of third-party water discharge is when an organisation sends water and effluents to other organisations for use. In these instances, the organisation is required to report the volume of this water discharge separately.)</p> <p>Priority substances of concern for which discharges are treated, including the number of incidents of non-compliance with discharge limits.</p> <p>Any contextual information necessary to understand how the data have been compiled, such as any standards, methodologies, and assumptions used.</p> <p>The number of occasions on which discharge limits were exceeded. Any fines received or to be paid.</p>	<p>The company should disclose total water discharge, quantifying each source.</p>
<p>TM3: Disclose information on water quality.</p>	<p>Provide detail on water quality which could affect food and beverage products.</p>
<p>Water consumption</p> <p>TM4: Disclose total water consumption from all areas in ML. (If the reporting organisation cannot directly measure water consumption, it may calculate this using the following formula: Water consumption = Total water withdrawal – Total water discharge).</p> <p>Any contextual information necessary to understand how data have been compiled, such as any standards, methodologies, and assumptions used, including whether the information is calculated, estimated, modelled, or sourced from direct measurements, and the approach taken for this, such as the use of any sector-specific factors.</p>	<p>The company should disclose total water consumption (quantity) with contextual information.</p>
<p>Percentage and total volume of water recycled and reused</p> <p>TM5: Disclose the total volume of water recycled and reused in m³/year as a percentage of the total water withdrawal reported.</p>	<p>The company should disclose the total water recycled and reused (quantify and percentage of total withdrawal).</p>
<p>TM6: Baseline year</p> <p>Set and disclose a baseline year of total water withdrawal, water discharge, water reused, and water efficiency ratios against which comparisons should be disclosed from one year to the next.</p>	<p>Disclosure of different timeframes and comparisons with a baseline year would assist in progressing towards more water-efficient operations.</p>
<p>TM7: Water efficiency ratio</p> <p>Calculate water efficiency ratios in terms of input (water consumption in ML) divided by output (kilograms of finished product or litres of packaged product).</p>	<p>Firms should calculate and express their water consumption in an efficiency ratio, and compare this to a set baseline year (as discussed above) to determine whether progress is made toward more water-efficient operations. These ratios could be</p>

	utilised to compare with other firms.
Site information (SI)	
SI1: For each facility, provide coordinates, total water accounting data, and comparisons with the previous reporting year (or baseline year).	Detail should be presented at each site, such as coordinates and comparisons with the previous year.
SI2: Disclose water risk assessments at a geographical scale (each site).	The company should disclose detailed water risk assessments at each site with quantified information.
Risk assessment (RA)	
Establish whether the company has risk assessment actions for water-related issues by identifying the following: RA1: Identify physical water risks such as flooding, water stress, and pollution.	Provide detail on physical water risks.
RA2: Identify regulatory risks such as water permits, rates controlling water withdrawal, discharge quantities, and other restrictions.	Provide detail on regulatory water risks.
RA3: Identify reputational risks such as tensions between businesses and local communities.	Provide detail on reputational water risks.
RA4: Indicate the procedures and methods for water risk assessments .	The company should disclose procedures and methods used for their water risk assessments and the frequency thereof.
RA5: Identify stakeholders which are considered in their organisation's water-related risk assessments .	The company should disclose stakeholders considered in their water risk assessments and indicate contextual issues (positive and negative information) which could affect the stakeholders.
Future orientated information (FO)	
FO1: Report on future-orientated information on water issues.	The company should disclose quantitative, future-orientated information.
FO2: Identify the need for a long-term water strategy and disclose the long-term strategy.	The company should disclose a long-term water strategy.
FO3: Provide information on water that could affect value creation over the short, medium, and long term.	The company should disclose future information on water which could affect value creation in the short, medium, and long term.
FO4: Evaluate how water risk assessments could affect future success and growth strategy.	The company should disclose evaluations on how water risk assessments could affect future success and growth strategy.

Using SPACs To Stimulate The South African Second Economy: A PE Value Creation Principles Perspective

Mr. Thabiso Madiba^{1,*}, Ms. Boniswa Madikizela²

^{1,2} Department of Accountancy, University of Johannesburg, Johannesburg, South Africa

Keywords

Private equity, SPAC, venture capital, growth equity, second economy, South Africa

Abstract

Purpose – The purpose of this study is to propose a special purpose acquisition company (SPAC) as a possible vehicle for promoting re-industrialisation through small and medium-sized enterprises (SMEs) based on the private equity (PE) value creation principles from Southern African Venture Capital and Private Equity Association (SAVCA) and the processes of funding from the Industrial Development Corporation (IDC). In this regard, the specific objective of this work is to propose the SPAC based on the principles observed from SAVCA and the IDC processes.

Design/methodology/approach – This is an exploratory qualitative study which reviewed the existing IDC processes and SAVCA PE value creation principles in order to inform the mechanics of the functioning of the SPAC.

Findings – It was observed that it is possible to use the SPAC as a vehicle for promoting re-industrialisation through SMEs. Further, it was determined that it is also possible for the SPAC to take on the characteristics of the principles of PE value creation and to adopt some of the IDC processes.

Originality/value – The originality of this work emanates from the observation that in the South African context, SPACs, as envisaged will not be used solely for the purpose of financing SMEs through debt, it will also include an element of management skills transfer, as well as an element of taking on an equity ownership stake. The authors are of the view that the SPAC would be a mechanism to operationalize the social compact that is a fundamental approach of a developmental state.

1. Background and introduction

In South Africa, small and medium-sized enterprises (SMEs) are critical to the economy and job creation. It is estimated that SMEs make up around 91% of formalized businesses, provide employment to about 60% of the labour force, and account for about 34% of gross domestic product (GDP) (Marx, Haji, Botha, Madikizela and Madiba, 2021) . The South African government has identified the SME sector as one of the potential enablers to achieve its objectives of improving job creation opportunities, reducing poverty, and creating a more equitable distribution of wealth (Peters & Naicker, 2013) . Further, and according to the Banking Association of South Africa (2019), the development of the SME sector in South Africa has the potential to not only erode unemployment but also contribute to economic growth.

The development and growth of SMEs can contribute to turning around an economic situation(Lekhanya, 2015). However, the majority of small and medium businesses struggle to secure capital for growth and expansion due to stringent requirements. SMEs are the most vulnerable group of entities due to a lack of resources to survive a crisis, they struggle to secure adequate funding to grow and become sustainable (Gourinchas, Kalemlı-Ozcan, Penciakova & Sander, 2021; Sesep, 2016). Fatoki (2011) states the importance of funding for the growth of SMEs and how lack of finance contributes to the failure of SMEs.

Currently, the South African economy is at one of its lowest points in several decades, with low economic growth, coronavirus challenges, and unemployment being at an all-time high (Marx *et al.*, 2021). According to Govinden, Pillay & Ngobeni (2020), 38.2% of businesses that applied for financial assistance during COVID reported having used government relief schemes, and a further, 28.3% indicated that their workforce had decreased and 19.6% had laid off their staff. The Covid 19 pandemic crisis has negatively impacted the sustainability of SMEs by inhibiting their expansion, worsening their financial situation, and ultimately contributing to their insolvency and bankruptcy (Gourinchas *et al.*, 2021).

It appears that with the many challenges the economy faces currently, public sector programmes to stimulate sustainable growth of the SME sector are struggling. The national strategy for the development and promotion of small businesses in South Africa has as its primary objective the creation of an enabling environment for small enterprises (Department of Trade and Industry, 1995). In creating the enabling environment, the national framework is required to be complemented with programmes developed and implemented at a regional and local level. As small enterprises do not in themselves constitute an economic sector all on its own, policies need to be in tune with national and regional, and sectoral developments.

According to Peters & Naicker (2013), considerable emphasis was placed on developmental local government, increasing the role of government, particularly local agencies, in promoting growth and development. The Industrial Development Corporation (IDC) is a development finance institution that is a state-owned agency tasked with promoting growth and development in line with the national strategy for the development and promotion of small business. However, the IDC may have not achieved its mandate, which is “to maximise our development impact through job-rich industrialisation” (IDC, 2021) to a significant extent since “despite the economic recovery in 2021, the South African economy remains with extremely high unemployment levels and with many companies remaining in a difficult financial position” (Department of Research and Information, 2022).

The DTI (1995) stipulates that the SA government’s role is one of facilitator as opposed to an implementer. The engagement with the government through public-private partnerships, together with effective risk management strategies, is crucial in stabilizing policies that would ensure adequate funding to support the SME sector (Ramcharran, 2017). With this in mind and the fact that public sector programmes to stimulate sustainable growth of the SME sector are struggling, the authors are of the view that the proposition to use SPAC as a vehicle for promoting re-industrialisation through SMEs would be a mechanism to stimulate sustainable growth of the SME sector.

As discussed above, SMEs are the most vulnerable group of entities due to a lack of resources to survive a crisis. This lack, according to The Banking Association of South Africa (2019), includes but is not limited to the lack of management skills and finance, obtaining credit and access to markets, administrative burdens, and regulatory compliance. A SPAC might be a solution to address these constraints faced by SMEs with a specific sectoral focus (Marx *et al.*, 2021). Further, in addressing the lack of management skills and finance of SMEs, the SPAC uses private equity value creation principles in financing and investing in the SME sector.

Accordingly, this study has reviewed relevant literature and benchmarked with IDC and SAVCA to determine the possibility of the stimulation of the South African second economy (SME growth and sustainability) through the adoption of the SPACs re-industrialisation proposal.

2. Literature review

Promoting the SME sector to create an enabling environment by reducing unemployment and creating a more equitable distribution of wealth is the overall ambition of government support initiatives in South Africa (Peters & Naicker, 2013). The most common problems facing SMEs include an unfavourable legal environment, lack of access to markets and procurement, lack of access to finance

and credit, low skills levels, lack of access to information, and lastly, a shortage of effective supportive institutions (Republic of South Africa, 1996). Government support initiatives are envisaged by the authors to have to ultimately lead to sustainable job creation and increased turnover leading to growth and sustainability for the SME sector.

Since the purpose of this study is to propose a SPAC as a possible vehicle for promoting re-industrialisation through SMEs based on the PE value creation principles, the selection below presents the literature review.

2.1 Special Purpose Acquisition Company

Defining a SPAC

According to Riemer (2007), SPACs are in essence public-traded buyout firms that are incorporated with the sole objective of raising funds for acquisition through a public offering of their securities. Kolb & Tykvova (2016) describe SPACs as cash shells that try to buy private operating firms to which they confer public-listing status. According to Murray (2017), SPACs are shell companies that originally have no operations and which are created to undertake a business combination with an operating business. SPACs do not have operations or a business plan other than the intent to acquire an unidentified business (Thompson, 2010).

A SPAC is an innovative financial structure that raises funds in capital markets through the IPO process with the objective of acquiring an unknown existing company within a limited time period (Yochanan & Milos, 2018). Therefore, a SPAC is an alternative to the initial public offering. The difference between an IPO and a SPAC is that a SPAC can raise funds without any operational assets and funds are kept in escrow during the period before an acquisition or listing and are refunded when there is an exit (Jooste, 2019). SPACs are an opportunity for private venture capitalists to make private equity investments (Yochanan & Milos, 2018). The major stakeholders in SPAC are management, underwriters, and investors.

2.2 SME sector challenges

It is common knowledge that SMEs struggle in obtaining loans from banks. The struggle related to the credit application requirements may be linked to the financial health or the balance sheet of the business. Yoshino, Taghizadeh-Hesary, Charoensivakorn, & Niraula (2015) state that SMEs usually have severe difficulties with raising money. Lekhanya (2015) states that the most significant difficulties faced by SMEs include access to finance.

Traditionally SMEs engage with a bank for most of its financial requirements necessary for business operations. As a result, a bank would provide financial and advisory services to small, medium, and large businesses. The financial services which are typically tailored to the specific needs of the business generally include credit cards, transactional banking, savings, asset financing, and loans. Bank loans are the main sources of financing for the SME sector of an economy (Ramcharran, 2017). A risk of the economy stagnating and not prospering is introduced (Cant & Wiid, 2013) when there is a lack of funding to create new SMEs and sustain the existing ones. It is from this background that the researchers are exploring strategies such as SPACs to diversify the SME financing environment.

SPAC as a possible vehicle for promoting re-industrialisation through SMEs

SPACs offer enormous potential as a source of funding of seed capital to SME entrepreneurs who are finding access to capital to fund their businesses onerous and almost impossible at times (Marx *et al.*, 2021). The effective use of SPACs as an empowerment vehicle can give stimulus to the active investment of previously inaccessible capital in the economy (Marx *et al.*, 2021). SPACs can also effectively give rise to the empowerment of a broader pool of talented management that may not be able to progress in the current corporate context, becoming effectively a delivery mechanism for sustained and broad-based economic empowerment in the economy (Marx *et al.*, 2021). In operationalizing the SPAC, the authors are of the view that consideration should be given to the possibility of incentivizing companies to invest in SPACs. One way of doing this is to possibly incentivize investors by allocating BBEEE points for investments that meet the required

empowerment criteria (Marx *et al.*, 2021). Such BBEED criteria that investment SPACs should meet, could include aspects such as Enterprise and Social Development, Preferential Procurement; Management Control, and Ownership (Marx *et al.*, 2021). This is a concept that could be explored to kick start investments in SPACs for sectoral development and offer investor companies reward for investing upfront with the possibility of income and capital gain in the long run and accordingly serve to counter the investment strike and stimulate investment in the local economy which at a sectoral level should lead to job creation (Marx *et al.*, 2021). For SPAC companies it would provide the startup capital that is needed to fund SME businesses.

2.3 Development Finance Institution

The Industrial Development Corporation (IDC) as a development finance institution has the mandate to maximize development impact through job-rich industrialisation, while contributing to an inclusive economy by, among others, funding black-owned and empowered companies, black industrialists, women, and youth-owned and empowered enterprises (IDC, 2021). The IDC also promotes entrepreneurial development and growing the Small to Medium Enterprise (SME) sector. The geographic reach extends beyond the borders of South Africa and covers the whole of Africa to promote regional economic growth (IDC, 2019).

Who does the IDC lend to?

According to IDC (2020), the IDC lends to private sector companies that are operating in one of the sectors serviced by its strategic business units (SBUs). There are 13 SBUs and within each unit, certain sub-sectors or focus areas are covered in that unit's strategy. The SBUs include:

- Agro-Processing and Agriculture
- Chemical Products and Pharmaceuticals
- Basic and Specialty Chemicals
- Clothing and Textiles
- Heavy Manufacturing
- Light Manufacturing
- Media and Audio Visual
- Machinery and Equipment
- New Industries
- Tourism
- Automotive and Transport Equipment
- Industrial Infrastructure
- Basic Metals and Mining

The IDC also invests in projects along the various stages of the project development life cycle: pre-feasibility, bankable feasibility, pre-implementation, and implementation. Some of the SBUs listed above are project focused with inhouse project development skills available (IDC, 2020).

2.4 Private Equity industry

Literature on venture capital (VC) and private equity (PE) depicts a broadly positive view of their activities (Manigart & Wright, 2013). Most empirical studies have found that the post-investment growth and/or performance of investors' portfolio companies is higher than that of no-venture capital-backed companies (Manigart & Wright, 2012; Wright *et al.*, 2009). This positive effect is attributed to investment managers' selection skills, their value-adding activities leading to professionalization of portfolio companies, the tightened post-investment governance of portfolio companies including monitoring activities the provision of additional financial resources, and the transfer of reputation and legitimacy to portfolio companies (Manigart & Wright, 2013). It is these positive effects that have been of interest to the authors when reviewing PE value creation principles in order to inform the mechanics of the functioning of the SPAC.

The Southern African Venture Capital and Private Equity Association

The Southern African Venture Capital and Private Equity Association (SAVCA) is the industry body and public advocate for private equity and venture capital asset classes in Southern Africa (SAVCA,

2020) . SAVCA plays a meaningful role in the sector by conducting industry-specific research, providing guidelines and standards for the industry as well as promoting the private equity and venture capital asset classes.

Private Equity Explained

According to SAVCA (2020), a private equity fund is a long-term, alternative asset class, which entails fund managers raising third-party funds from various classes of investors, to buy assets that are predominantly privately held. Radu & Mihaela (2014) define a private equity fund as a source of capital for companies that need capital. It acts as an intermediary between capital holders and a company that needs financing in order to develop. According to Miller (2011) PE, as a financial instrument, has become an important element of the financing spectrum of private companies. Further, as an asset class, it is labelled to generate the highest returns on the capital market mainly due to the main strategies of PE companies to create value being active ownership (Miller, 2011).

Performance of PE is to a large extent the consequence of a strong alignment of interests between the managers (general partners) at the private equity firm, the management teams at the portfolio companies, and the investors (limited partners) in the funds (van Swaay, Leleux, Megally and Leleux, 2015). Further, incentives in private equity are generally stronger, more focused, performance-driven, and internally consistent than those available to managers in other firms or public institutions. These strong incentives, and the means to deliver on value-creating strategies, unleash performance at all levels (van Swaay et al., 2015).

The economic impact made by PE lies in channelling available equity capital to companies that have no access to public equity markets (Miller, 2011) . As a result, PE turns out to be significant, particularly for companies, which have not established themselves yet or are facing transformational challenges to survive (Miller, 2011) . Further, PE is a financing instrument that addresses young companies focusing on corporate growth. PE fosters innovation, generates high-skilled jobs, and more fundamentally it creates new employment and new wealth by investing in new technologies and innovative concepts (Miller, 2011).

One of the true advantages of PE investment lies in the increase of the investee company's equity capital and the improvement of its balance sheet structure, which again has a positive impact on its credit ratings and its negotiating position. But perhaps even more important, it provides stability and liquidity during investment-intensive years. As a result, companies are able to develop their products and grow continuously (Miller, 2011).

There are three key types of private equity investment strategies or categories: Venture Capital, Growth Equity, and Buyouts (Cote, 2021). Venture Capital refers to 'Seed Capital' and 'Start-up and early stage', Growth Equity also known as Development Capital refers to the 'Expansion and Development' stages of business development (SAVCA, 2020). Buyouts are excluded from the scope of this study since the focus of this paper is promoting re-industrialisation through SMEs i.e. SME growth and sustainability.

The majority of SMEs require investment capital to pursue their growth strategies, however displaying low equity ratio and possessing bad credit worthiness they have not been within the risk appetite of banks and credit institutions. In this regard, PE represents a good alternative solution providing investment capital (Miller, 2011) at different stages of business development. However, PE is not without controversy. There are arguments not in favour of positing that PE investors "in their function as majority shareholders neglect the sustainable development of their portfolio companies in favour of their temporary value increase" (Miller, 2011).

PE fund managers are considered to be important drivers of economic growth, job creation, and generating above-average returns for investors (SAVCA, 2019). Investors are increasingly looking to private equity for investment performance as well as investments that have a positive influence on the company and the communities around them (Liedtke, 2020). Recent performance indicators of the

listed market have not been great, however, figures from a financial perspective indicated that private equity was doing better than the listed space (Liedtke, 2020). Investors continue to look for private equity investments because the investment performance of private equity funds continues to grow despite a tough market for listed products.

PE provides an alternate exposure and access to sectors under-represented in the listed markets, and access to high-growth developing markets that don't already have a stock exchange. As an alternative, public equity is exposed to sectors that are represented only in the listed markets (van Lill, 2020). It is evident from industry research that PE funds recover the initial investment and further obtain a multiplied gain over the invested sums. The possibility exists that private equity funds are successful due to the long-term nature of the investment. Companies seek private equity investing for business expansion, developing new technologies and products, making acquisitions, buying out shareholders, and restructuring ownership and management (SAVCA, 2020). These types of investments are considered to be long-term in nature and therefore potentially suitable for investors looking for long-term investments.

The purpose of a private equity fund per the definitions above appears to be similar to that of a SPAC. A SPAC is a vehicle for raising capital to enable the acquisition of viable assets. The viable asset would, in this case, be the small and medium businesses in the SME sector in need of capital for growth. Unlike a private equity firm that would manage the private equity fund, a SPAC can raise funds without any operational assets, and funds are kept in escrow during the period before an acquisition or listing and are refunded when there is an exit (Jooste, 2019).

3. Methodology

The researchers reiterate that the specific objective of this work is to propose the SPAC based on the principles observed from the IDC processes and SAVCA. This is an exploratory qualitative study that used unstructured interviews to review the existing IDC processes and SAVCA PE value creation principles. An unstructured interview is sometimes referred to as an in-depth interview due to the tendency of engaging with the units of analysis to the real generation of crucial information about personal experiences and perspectives (Bihu & Ghafoor, 2020).

Two independent experts were purposively invited for an unstructured interview to obtain information about the IDC processes and the PE industry value creation principles. The researchers interviewed a manager in a business unit at the IDC, Mr. Kofi Amparheng, and interviewed the CEO of SAVCA, Ms. Tanya van Lill.

4. Findings

4.1 IDC processes

The interview conducted with a manager in a business unit at the IDC provided insights into the inner workings of the IDC and the process followed to identify and select a prospective investee. When asked how the IDC decides on which companies to invest in, the following response was noted.

Applying to the IDC is an evergreen process. A potential client can apply at any point and the key documentation required for the IDC to consider their proposal is a detailed business plan. Depending on where the client's business is located, the business plan will be appraised by either the Pre-Investment Business Unit (PIBC) – for all applicants based in Gauteng, or one of the Regional Offices – for applicants based outside Gauteng. There are 15 satellite / regional offices with at least one office based in each one of the 8 other Provinces (excluding Gauteng). An employee that works in PIBC or the Regional Offices would perform a 'Basic Assessment' once the employee receives the business plan. They will gather information and documents to assess whether the potential client complies with the IDC funding requirements, including whether it falls within the SBU's mandate. This also serves as a preliminary risk assessment. The outcome of the Basic Assessment is to either propose that the SBU should do a more detailed investigation i.e. a due diligence to verify the merit of the transaction. Alternatively, they may decide not to proceed further given several reasons including the proposal falling outside of IDC mandate, or no economic viability could be ascertained.

The due diligence process is managed by the relevant SBU. This is an investigation into the economic merit of an application, which includes all aspects that could influence the sustainability and profitability of the entity. The due diligence team will have individuals with competencies in the various areas that are assessed in detail including financial, marketing, technical, legal, environmental, and asset valuation. The team will conduct the due diligence based on first principles as far as possible rather than relying on the client's assumptions. This is effectively creating budgets from scratch based on the team's analysis of the various drivers of the business.

The team will formulate a view on whether to support the deal primarily based on the ability of the company to repay the IDC funding in line with the general terms of finance. The key tools used to assess this is the financial model that would have been constructed independently. They will also evaluate the key findings from the marketing, technical, legal, environmental, and asset valuation due diligence as part of the decision. Another important consideration is an assessment of the key management running the business and their ability to deliver on the business plan.

A submission is prepared to recommend the terms and conditions for IDC's investment and this is considered by the IDC's Investment Committee (IC). The IC has the final authority on approving or rejecting the deal and agreeing to the recommended terms of financing or modifying them (Amparibeng, 2019).

The authors are of the view that the process discussed above is thorough and detailed to identify risks and potential returns from businesses looking for support and funding from the IDC. Based on this process followed, the post-1994 era has seen the IDC contribute significantly to the expansion and diversification of SA's industrial base and in the process facilitate job creation, reducing inequality and promoting economic growth. Given South Africa's history, inclusive growth and structural economic transformation have been key focus areas for both government and the private sector as they seek to help the country realise its full economic potential. The role of the IDC has been critical in helping the country achieve these objectives (IDC, 2016). However, the full extent of the objectives has not been achieved.

It is the authors' view that the applications of similar principles used at the IDC in a SPAC may produce similar or even better results. The thorough and detailed approach to investing is a good foundation for identifying SMEs who will be effective in contributing to the achievement of the economic objectives of South Africa.

4.2 PE value creation principles

The globalization of the financial system has introduced access to capital markets. This has meant that investors looking for profit opportunities have increased their activity in this market regardless of their financial power (Radu & Mihaela, 2014). This attraction suggests that SMEs seeking funding no longer have to go to banks to obtain loans for expansion but may consider accessing investors that now reside in the capital markets. Where the bank used to be the lender of choice for smaller businesses they are "gradually being replaced by associations or consulting and/or investment groups, identified as private equity investment funds" (Radu & Mihaela, 2014) amongst others. For this study, investment groups are considered to be government-owned funding vehicles such as the IDC and privately owned funding vehicles such as private equity funds.

PE funds differ from traditional investments in listed shares or bonds in that they are illiquid and long-term (Buchner, 2017). Due to the typical maturity period being ten years it may appear that to exit the investment before the maturity period would be costly for an investor. Further, private equity differs in that the investor first makes an initial capital commitment which is transmitted at a future date in response to a capital drawdown by the private equity fund (Tabo, 2019). The capital drawdowns are not known to suggest that an investor is investing in an underlying asset where what is only known, for example, the fund size, investment mandate, industries, geographic focus, and life stages of the company (van Lill, 2020). Despite not knowing the timing of drawdowns, private equity funds continue to be the number one consideration for investment performance.

According to SAVCA (2020) and van Lill (2020), the following are the contributing factors to private equity returns:

- PE Funds make equity investments directly into portfolio companies.
- PE is a long-term investment, improving sustainability in changing and/or volatile market conditions.
- Fund Manager's work with the management of the portfolio companies to improve company performance.
- Alignment of interest between the PE fund managers and the management of the managers of the businesses in the portfolio.
- Good PE firms also excel at identifying the 1 or 2 critical strategic levers that drive improved performance.
- They are renowned for excellent financial controls and for a relentless focus on enhancing the performance basics – revenue, operating margins, and cash flow.
- They can introduce skills and networks into the operating companies to help scale the business.
- The PE fund manager takes ownership – it is the ultimate accountability model and a significant driver of return.
- PE fund managers invest their money alongside their investors' money.
- They have skin in the game.
- PE plays a crucial role in the growth and survival of portfolio companies (investee businesses), increasing employment, innovation, and economic growth.

Superior returns would have to be expected to incentivize companies to invest in SPACs. SPACs, in partnership with the government, established with the specific intention of stimulating South Africa's second economy would have to be structured with the above contributing factors to PE returns as a framework.

5. Conclusion and recommendations for future research

The objective of this work was to propose the SPAC, based on the IDC processes and PE value creation principles observed from SAVCA, as a possible vehicle for promoting re-industrialisation through small and medium-sized enterprises. Firstly, this was done by providing background information about SMEs in South Africa and current government policy on small businesses. Secondly, the paper provided an overview of the literature currently available on SPACs, SME sector challenges, the purpose of DFIs as well as an overview of the PE industry. Research on the SPAC not used solely to finance SMEs through debt and being used as a mechanism to operationalize the social compact that is a fundamental approach of a developmental state is scarce. This paper makes a significant contribution to the existing body of knowledge. The findings are relevant given that public sector programmes to stimulate sustainable growth of the SME sector are struggling.

The paper finds that SPACs, when structured according to PE value creation principles, offer a unique opportunity to stimulate growth in the second economy and SME sector in the form of an element of taking on an equity ownership stake as well as management skills transfer. It also finds when SPAC is benchmarked with IDC and SAVCA the results for the SMEs would be: an introduction of skills leading to the professionalization of the business; networks to help scale the business; excellent financial controls with a relentless focus on enhancing revenue, operating margins and cash flow; investments made to solidify or improve their position among the competitors; and tightened post-investment governance which includes monitoring activities, the provision of additional financial resources and the transfer of reputation and legitimacy to the business.

Future research could consider the funding mechanism for the SPAC to be realised by JSE-listed entities. The authors are of the view that JSE-listed entities could contribute a percentage of their profits to the SPAC as an equity contribution, much like the provisions of the mining SETA requiring mines to pay 1% of their payroll as a skills development levy (Minerals Council South Africa, 2022). The benefit of this to

the JSE listed entity is that the organisation then has equity in the SPAC and will enjoy any benefits of dividends declared by the SPAC.

Evaluating the Influence of Specific Macroeconomic Variables on Business Confidence In South Africa

Lerato Mothibi^{1,*}, Anton Van Wyk²

^{1,2} School of Economic Sciences, North-West University, Potchefstroom, South Africa

Keywords

Business confidence; inflation, consumer confidence, exchange rate, unemployment rate, South Africa.

Abstract

The current macroeconomic environment in South Africa is in uncertain times, with high levels of inflation, unemployment and lower levels of economic growth. These factors, and more, all have an impact on business confidence. This study employs a quantitative approach to investigate which macroeconomic variables have the biggest influence on business confidence in South Africa for the period Q12010 to Q42019 with the use of the autoregressive distributed lag model (ARDL). The findings revealed that variables such as inflation, unemployment and the rand/US dollar exchange rate harm business confidence, with increased levels of GDP having a positive influence. Consequently, the study suggests that getting inflation, exchange rate volatility and unemployment under control would lead to higher levels of business confidence and an influx of foreign companies wanting to do business in South Africa.

1. Introduction

1.1. Problem statement

Investment decisions are undoubtedly guided by feelings and expectations about the country's business and economy (Lucey and Bowling, 2005). The evolving business environments in the country, together with the changing consumer requirements, are putting pressure on business owners operating a high-risk-bearing business to in fact manage the business more flexibly and efficiently (Olkiewicz, 2022). Business confidence (BC) is one of the most significant tools used to track output growth as well as predict possible economic contraction and expansion because business activities in the country cover all sectors of the economy (Oluwaseguna and Olivide, 2021). Therefore, confidence and trust are important components in business today, because Oluwaseguna and Olivide (2021) identify the well-being of the business (*based on the ease of doing business*), the perception of businesspeople and firms, and the predictability of the future growth path of the economy as important aspects of business confidence. Business confidence, therefore, refers to the level of pessimism or optimism that managers have about the prospects of their businesses (Mendicino and Punzi, 2013).

Having confidence in the country's financial system and economy at large is what contributes to economic and financial stability in the country. This is supported by the fact that business confidence has an impact on the various factors that affect a nation's economy, where if business confidence is low, the 'wait and see' attitude is adopted by various stakeholders, such as the business sector, consumers, and investors – foreign and domestic – because of the fear of the unknown (Maredza and Nyamazunzu, 2016). It is also common that when business confidence is low, consumers tend to defer their spending into the future rather than spending in the present. Conversely so, consumers tend to spend more when they feel confident about the prospects of the economy, and this occurs when business confidence is high, thereby implying favourable economic conditions prevailing in the country. It is, however, interesting that a decline in BC does not contribute positively to the economy, while on the other hand, a deteriorating economy does not positively contribute to business confidence either (Maredza and Nyamazunzu, 2016). Due to this, researchers and policymakers have

² E-mail address: anton.vanwyk@nwu.ac.za

been constrained by the need to analyse which macroeconomic variables influence business confidence and unfortunately not much has been done on an empirical level to identify this.

According to the South African Chamber of Commerce and Industry SACCI (2016), a record peak in business confidence was recorded in December 2006, when the business confidence index (BCI) stood at 141.2 (2015=100). Be that as it may, a steady decline in business confidence has been recorded since 2008, and South Africa, unlike many other developing countries, has since struggled to attain post-crisis confidence levels in its economy for more than a decade now (Smit, 2021). According to SACCI (2022:3), an annual 0.4 index point decline was recorded for South Africa between January 2021 and January 2022, whereas a 94.1 BCI was recorded for January 2022. Additionally, a decline to 91.0 in BCI was recorded in September 2021, after a high of 97.0 in May 2021 was recorded (SACCI, 2021:3). Moreover, the lowest business confidence index point since its inception in 1985 was recorded in May 2020, where BCI was recorded at 70.1 (SACCI, 2021:3). As such, SACCI (2020:3) asserts that from an annual perspective, between April 2019 and April 2020, South Africa's BCI was recorded to have declined by 15.9 index points. The deterioration in business confidence has been further exacerbated by the Covid-19 pandemic, which brought about increased volatility in global financial markets, increased financing costs, continuous power outages (load-shedding), reduced trading volumes, increased vandalism, and looting, which all did not help to restore confidence in business in SA (Sibeko, 2022).

As the country tries to pull itself out of the economic downturn exacerbated by the Covid-19 pandemic, business confidence is still lagging, and this could pose a serious constraint on improving the country's economy, especially in terms of acquiring investments. As such, the concept of business confidence is consequently important as it is a significant tool to assess the prevailing economic climate in a country (Van Rooyen, 2011). Although many studies have attempted to analyse business confidence, many researchers have analysed the impact of one variable on business confidence. For example, the study of Kirchner (2020) analysed the effect of changes in monetary policy on consumer and business confidence, while the study of Sum (2014) analysed the effect of business and consumer confidence on stock market returns, while Khan and Upadhyaya (2020) investigated whether business confidence matters for investments. Although some studies have investigated some economic variables (one or two) with other variables such as consumer confidence, and business confidence, very few studies have evaluated specific macroeconomic variables and their influence on business confidence in South Africa, yet it plays a pivotal role in attracting the much-needed investments for the country's growth and development. This paper is therefore unique in the sense that it analyses the influence of specific macroeconomic variables only on business confidence in South Africa.

Research regarding the influence of macroeconomic variables on business confidence remains an untapped area of research, mainly due to difficulties in measuring and identifying these significant economic variables (Barsky and Sims, 2012). Therefore, this paper aims to contribute to the growing body of literature on the role, magnitude, and significance of specific macroeconomic variables that cause a change in business confidence, specifically within the South African context. By so doing, the primary objective of this paper is therefore to critically analyse and identify which macroeconomic variables cause an increase or decrease in business confidence in South Africa. By so doing, this will allow policymakers to put more focus on stabilising the country's macroeconomy in such a way that positively contributes toward an increase in business confidence in the country.

2. Literature review

Business confidence can be analysed from different perspectives, and consequently, it affects many research fields. According to Olekiewicz (2022), business confidence was first considered a part of ethics, theology, and human philosophy. However, he further postulates that, over time, business confidence included aspects of social psychology as well as sociology. Be that as it may, Rehman (2020) and Rudzewicz (2016) assert that business confidence is currently a phenomenon in the business and economic environment due to its impact on a nation's economic system at large. This, therefore, increases the growing interest in business confidence by practitioners and scientists in

management sciences, economics and business. Therefore, sentiments can be used to define the economic participants' views on the future economic developments that could influence the economy because they can influence the participants' current decisions (Nowzohour and Stracca, 2017).

According to John Maynard Keynes (1936), incoherent thoughts might affect people when they pursue their financial self-interests, especially during times of economic instability. Maynard further indicates that during times of economic uncertainty, people make financial decisions based on what he called the 'animal spirit' (Keynes, 1936). As such, this 'animal spirit' is used as a euphemism to describe the emotion of pessimism, hope, confidence, and fear that can affect a person or business' decision-making process. Therefore, the confidence level will be low when the 'animal spirit' is low and conversely so, when the 'animal spirit' is high, this simply translates to high confidence among economic participants. This is because increasing business confidence in a nation results in positive economic sentiments, which translates to more people being hired by businesses. When certain disruptive circumstances such as trade barriers, political instability, health pandemics, peace and other disturbances arise in the economy, affecting business confidence in the country, businesses are most likely not to take on new risks (Camba, 2020). This, therefore, damages the general morale in the economy, causing significant job losses and leading to an overall increase in unemployment in the country. Moreover, businesses that cannot protect their existence will therefore without a doubt contribute to the dangerous cycle of unemployment (Camba, 2020). Additionally, because the gross domestic product, commonly known as GDP, is among the most important indicators used to measure a nation's economic performance at large, GDP represents economic production and growth, and this has an impact on all economic participants of a country. This is because, when GDP is high or strong, consumers increase their spending on goods and services (Stats, SA, 2013). Therefore, when economic growth is strong, firms, businesses and investors have more confidence to invest, and the opposite is true when GDP is low (StatsSA, 2013).

On the other hand, the implementation of effective monetary policy also plays a critical role in ensuring confidence in the economy, since the SARB can directly or indirectly influence the exchange rate, inflation, and interest rates. Furthermore, factors such as inflation expectations, the exchange rate, and the interest rate all play a significant role in ensuring business confidence in the economy. Monetary policy uncertainty is characterised by constant changing interest rates and high inflation, where various macroeconomic indicators can be used to assist and shape consumer and business expectations about the future (Kurov and Stan, 2018) since monetary policy stability has a significant role in maintaining private sector confidence. Additionally, the literature has also shown that during times of exchange rate crisis, it seems as though exchange rate volatility matters more to sentiments, and that effect of exchange rate volatility on sentiment seems to be more visible under extreme economic conditions (De Brouwer, 2004). This is because the exchange rate crisis itself is more costly than the exchange rate volatility, and therefore he asserts the importance and implication of the careful selection of an exchange rate regime that minimises the risk of having a crisis. Additionally, he further asserts that in countries that follow a flexible currency regime, people might get accustomed to living with exchange rate volatility, to a point where this volatility tends to create less uncertainty in the long run and therefore leads to a reduced negative impact on confidence because people would have been used to the fact that the exchange rates can go up and down without causing significant distress to the economy at large.

According to O'reilly (2022), business confidence data is one of the most powerful sources that move forex prices as well as other markets. The literature also further postulates that when business confidence is high, the market will, in general, perceive this as positive for the country's currency because increased confidence shows signs of growth and expansion. O'reilly (2022) does also highlight that confidence indexes or surveys are not necessarily good predictors of currency movements. Additionally, the link between inflation and business confidence is quite straightforward; as per the definition of inflation, the continuous price increases in goods and services cause negative shocks in terms of how businesspeople and managers perceive future business prospects. Therefore, the impact of inflation on a business may be insignificant in the short run, but this can, however, quickly make a significant impact on the business in the long run because, when inflation increases,

this causes a reduction in consumers' purchasing power, thereby implying that businesses will be selling less of their products, which also means reduced profits for the business. As such, the reduced profits become a constraint on the ability to grow and invest in the business.

Although attempts have been made to evaluate the influence of certain economic variables on business confidence, from an empirical perspective, researchers have not reached a consensus. For example, making use of a regional spatial panel approach, Coetzee (2014) investigated the relationship between business confidence indicators and real GDP. The results obtained from this study found a positive relationship between business confidence and real GDP. Furthermore, the study of De Jong and Mncayi (2018) investigated the impact of business confidence and investment on economic growth in post-apartheid South Africa. The study used time series data starting from quarter 1 of 1995 to quarter 4 of 2014. A one-way causal relationship was found between the repurchase rate of the South African Reserve Bank (SARB) also known as the repo rate and business confidence, while a bidirectional causality was found between GDP and business confidence. The result, therefore, suggests that the repo rate Granger causes fluctuations in business confidence in the short run, while fluctuations in GDP and business confidence Granger cause fluctuations in each of the variables, respectively. Additionally, Ndou et al. (2017) found evidence that GDP growth in SA and consumption expenditure tend to decrease more when there are negative shocks in business confidence.

Another study also showed that business confidence is not only an important indicator of economic growth; however, but it is also a leading indicator of business fluctuations occurring in SA (Kershoff, 2000). Using the ARDL approach, the study of Maredza and Nyamazunzu (2016) used quarterly time-series data from 1975 to 2015 and 2002 to 2015, respectively, and investigated business confidence and financial services business confidence in South Africa by identifying the key domestic drivers and the nature of their impact. The findings of this study suggested that the exchange rate, inflation outlook, economic growth, stock market performance, and interest rates have a significant impact on business confidence in South Africa. The study therefore concluded and emphasised that macroeconomic stability drives business confidence in the country.

Moreover, Olekiewicz (2022) investigated the impact of economic indicators on the evolution of business confidence during the COVID-19 pandemic period, where the study assessed the G7 and E27 countries and Poland for comparative purposes for the years 2015 to 2021. The results of the study revealed a negative relationship between GDP, unemployment, inflation, and business confidence during the Covid-19 pandemic. Additionally, the study by Kumalo (2013) made use of quarterly data from the first quarter of 1993 until the first quarter of 2013 to investigate business confidence and inflation in South Africa, using the variance decomposition and GIRF method. The study revealed that fluctuations in inflation cause negative shocks to how business owners and managers in SA perceive the prospects of their business.

The study of de Mendonça and Almerida (2018) investigated the importance of credibility for business confidence with evidence from an emerging economy, i.e., Brazil. The study asserted the importance of monetary policy and concluded that a credible monetary policy encourages improved decision-making; however, the study also highlighted that institutional uncertainty discourages business confidence. Moreover, the study of De Brouwer (2004) investigated the empirical relationship between exchange rate volatility and survey measures of household and business confidence in Malaysia, Japan, Singapore, Australia and Korea, and consequently emphasised that business sentiments are sensitive to exchange rate volatility. As such, empirical evidence on macroeconomic variables that cause changes in business confidence seems to not have been in consensus for more than a decade now. As such, against the limited evidence in the literature, this study, therefore, investigates the influence of specific macroeconomic variables on business confidence in South Africa.

3. Data and methodology

3.1 Data and data sources

This study follows a quantitative approach in reaching its objective, where secondary time series data was used. The data was sourced from the South African Reserve Bank (SARB) and from the Bureau for Economic Research (BER), which was established in 1944 and recorded the first BCI index value in the first quarter of 1969 (Bureau for Economic Research, 2022). This study used the BCI index formulated by the BER because the BER forecasts, analyses, monitors, and identifies economic trends – domestically and internationally – that have an impact on the South African business environment (University of Stellenbosch, 2022). Moreover, the BER index is quite popular among researchers who are conducting quantitative analyses of business confidence, such as the study by De Jongh and Mncayi (2018) and Maredza and Nyamazunzu (2016). The time series data utilised in the study consists of 40 observations, which are over the $n=30$ rule of thumb for sample sizes. Quarterly time series data was used, ranging from quarter 2010 Q1 until 2019 Q4. This period was chosen due to the availability of data. The study, therefore, made use of the BCI as the dependent variable. The explanatory macroeconomic variables selected were chosen because of the significant role they play in the South African economy, and these are summarised in table 1 below. Additionally, these variables are key macroeconomic indicators that are used by various policymakers and institutions such as the South African Reserve Bank (SARB) and Statistics South Africa (Stats SA) in analysing the progress of the country’s macroeconomic environment. Table 1 below therefore provides a summary of the data description as well as the expected signs.

Table 1: Description of the variables

Variable	Abbreviation used	Description	Expected sign (+/-)
Business confidence	BC	This is the recorded business confidence level index.	This is the dependent variable of the study
Real gross domestic product	GDP	GDP at constant prices	As GDP increases, so will the business confidence in SA increase. A positive (+) sign is expected
Inflation	CPI	Consumer price index	If there is an increase in the inflation rate, everyday life and products will become more expensive and business confidence will decrease. A negative (-) sign is expected
Unemployment rate	UNEMP	The quarterly unemployment rate as published by Stats SA.	With an increase in the unemployment rate, there will be a negative effect on business confidence in SA. A negative (-) sign is expected
Real exchange rate	EXCH	The rand/dollar exchange rate.	With the rand depreciating against the US dollar, the cost of doing business in SA increases and this has a negative effect on business confidence. A negative (-) sign is expected

Source: Authors own table

3.2 Methodology

Since this study follows a quantitative research approach using time series data, the first step in the analysis requires testing the variables used for stationarity, using the unit root test. It is through the unit root test the model selection can be confirmed. The study, therefore, used the Augmented Dickey-Fuller (ADF) unit root test to ensure that all variables are stationary and that no variable is integrated at the order I (2). When the null hypothesis is rejected, this infers that the series is stationary and that the series doesn't have a unit root.

The study made use of the Autoregressive Distributed Lag (ARDL) model developed by Pesaran and Shin (1996), and later modified by Pesaran et al. (2001) to evaluate the influence of selected macroeconomic variables on business confidence in South Africa. The ARDL model was chosen because of the numerous advantages it has over other models which includes allowing for stability in the model, even with a limited sample size (Kharusi and Ada, 2018). The ARDL model also allows for variables to be integrated at different orders of integration, i.e. integration at either I (0), I (1) or a combination of both (Meyer and Mothibi, 2021). Another advantage of the ARDL model is that it's able to analyse the relationship between the variables using a certain number of lags for each selected variable, unlike the Vector Auto-Regressive (VAR) model for example (Hababakize et al., 2021). Moreover, the ARDL model can simultaneously provide short and long-run estimations, hence why this model was chosen by the study.

The following model was formulated to evaluate the influence of specific macroeconomic variables on business confidence in SA.

$$\Delta LBC_t = \alpha_0 + \sum_{i=1}^n \beta_1 \Delta LBC_{t-i} + \sum_{i=1}^{q1} \beta_1 LGDP_{t-i} + \sum_{i=1}^{q2} \vartheta_1 LCPI_{t-i} + \sum_{i=1}^{q3} \alpha_1 LEXCH_{t-i} + \sum_{i=1}^{q4} \delta_1 LUNEMP_{t-1} + \gamma_1 LBC_t + \gamma_2 LGDP_t + \gamma_3 CPI_t + \gamma_4 LEXCH_t + \gamma_5 LEXCH_t + \varepsilon_t \quad (1)$$

Where LBC is denoted by the logarithm of business confidence at a time t , which is then followed by $LGDP$ which is the logarithm of economic growth at a time t , followed by $LCPI$ which is the logarithm of inflation at a time t , followed by $LEXCH$, the logarithm of the real effective exchange rate at a time t and lastly, $LUNEMP$ denotes the logarithm of the unemployment rate at a time t . Moreover, ε_t denotes the error term, Δ denotes the difference operator, while n and $q_1 \sim q_4$ denote the optimal lag length, while the long-run dynamics are denoted by $\gamma_1 \sim \gamma_5$.

Once the ARDL model has been formulated, the next step is to establish if a cointegrating relationship exists between the variables, through the following hypothesis:

$$H_0 = \gamma_1 = \gamma_2 = \gamma_3 = \gamma_4 = \gamma_5 = 0 \text{ (no cointegration)}$$

$$H_1 = \gamma_1 \neq \gamma_2 \neq \gamma_3 \neq \gamma_4 \neq \gamma_5 \neq 0 \text{ (cointegration)}$$

By comparing the critical bounds value and the F-statistic value, the conclusion of the hypothesis can be made. When the F-statistic value is greater than the upper bound critical values, then the conclusion of cointegration between the variables can be made, thus the rejection of the null hypothesis. Alternatively, when the F-statistic value is lower than the lower bound critical value, then the conclusion of no cointegration between the variables can be made, thus indicating that there is no long-run relationship between the variables, thus the null hypothesis is not rejected. Furthermore, when the F-statistic lies between the lower and upper critical bound values, then the results obtained are inconclusive (Pesaran et al., 2001). Furthermore, once cointegration is confirmed, the next step in the ARDL method requires the estimation of the Error Correction Model (ECM), which is estimated in the following equation below:

$$\Delta LBC_t = \alpha_0 + \sum_{i=1}^P \beta_i LBC_{t-i} + \sum_{i=1}^{q1} \delta_i LGDP_{t-i} + \sum_{i=1}^{q2} \theta_i LCPI_{t-i} + \sum_{i=1}^{q3} \mu_i LEXCH_{t-i} + \sum_{i=1}^{q4} \sigma_i LUNEMP_{t-i} + \varphi ECT_{t-i} + \varepsilon_t \quad (2)$$

The error correction term which is denoted by *ECT* and its coefficient which is denoted by φ are used to measure the speed of adjustment towards long-run equilibrium. As such, Da ̃gdevire (2012) confirms that the ECM captured the degree to which short-run shocks are corrected to equilibrium. Moreover, the rule of thumb is that the error correction term (ECT) must be negative and have a statistically significant probability value, to show convergence to equilibrium and a cointegrating relationship between the variable used by the study (Meyer and Mothibi, 2021). The last step in the analysis requires stability and diagnostic testing, where several diagnostics and stability tests such as the serial correlation tests, heteroscedasticity test, normality test and stability tests will be conducted.

4. Results and discussions

The section below provides the findings and discussions of the results obtained by the study.

4.1 Unit root test results

To evaluate specific macroeconomic variables on business confidence in South Africa, the ARDL method requires that all variables should be stationary and that no variable be integrated at order I (2), as this would lead to spurious results (Asteriou and Hall, 2015). Therefore, table 2 below provides the results of the ADF unit root test.

Table 2: ADF unit root test

Variables	Model	Levels	1 st Difference	Integration order
LBC	Intercept	0.2742	0.0068***	I (1)
LGDP	Intercept	0.0050*	-	I (0)
LCPI	Intercept	0.0018*	-	I (0)
LUNEMP	Intercept	0.9930	0.0317**	I (1)
LEXCH	Intercept	0.8043	0.0001*	I (1)
Note: ***, **, *: 1%, 5% and 10% significant level respectively.				

Source: Compiled by authors

The results obtained from the ADF unit root test show that no variable is integrated at order I (2), indicating that all variables used in the study are stationary. The results from the ADF test also confirm that variables LBC, LUNEMP and LEXCH are stationary at first difference I (1) level of integration, while LGDP and LCPI are stationary at I (0) level of integration.

4.2 ARDL Bounds testing results

The Schwartz Information Criterion (SIC) was used to select the best ARDL model, where the ARDL model (3, 3, 0, 1, 1) was selected and applied to the bounds testing procedure. The results from the bounds test are therefore summarised in table 3 below.

Table 3: Bounds test results

Selected model (3, 3, 0, 1, 1)			Order of integration	
Test statistics	Value	Significance	I (0)	I (1)
F-statistics	10.05373	10%	2.2	3.09
k	4	5%	2.56	3.49
		1%	3.29	4.37

The results obtained from the Bounds test indicate that the F-statistic, 10.05373 is greater than the upper critical bound value I (1) at 1% and 0.01 level of significance. The results indicate that the null hypothesis of no cointegration is rejected, and the alternative hypothesis of cointegration is accepted. This, therefore, indicates that there is a long-run relationship between the variables used in the study. Additionally, the results indicate that the long-run behaviour of business confidence in South Africa is influenced by the selected macroeconomic variables namely, economic growth, unemployment, inflation and the real effective exchange rate.

4.3 Long-run relationship estimation results

From the estimation of the ARDL model results, the following long-run equation is discussed below:

$$LBC = 2.834^{**}LGDP - 0.305^{*}LEXCH - 0.190^{*}LCPI - 3.718^{***}UNEMP - 27.1143 \quad (3)$$

A positive and significant relationship is observed between business confidence and economic growth, where a one per cent increase in economic growth will on average result in a 2.83 per cent increase in business confidence in South Africa. This, therefore, indicates that when South Africa's GDP increases, business confidence in the country will also increase, which alludes to the fact that when people in the country earn more income thus business confidence will also rise. Similar results were also found by Coetzee (2014) and De Jongh and Mncayi (2018) who also found a positive relationship between business confidence and economic growth. A negative and significant relationship is observed between business confidence and the real effective exchange rate, where a one per cent increase in the exchange rate will on average result in a 0.30 per cent decline in business confidence in South Africa. This is essentially true because when the rand depreciates against the US dollar, there will be a decline in business confidence as it becomes more expensive to do business in South Africa. Similar results were also found in the study of Maredza and Nyamazunzu (2016), who also found a negative and significant relationship between business confidence and the exchange rate.

Moreover, a negative and significant relationship was observed between business confidence and inflation, where a one per cent increase in inflation will on average result in a 0.19 per cent decline in business confidence in South Africa. In the case of South Africa, this is true, because when the general prices of all goods and services rise, conducting business in the country becomes more expensive, thus leading to a decline in business confidence. Maredza and Nyamazunzu (2016) found corroborating findings, who also observed that inflation has a significant impact on business confidence. Furthermore, a negative and significant relationship was also observed between business confidence and the unemployment rate in South Africa, where a one per cent increase in the unemployment rate will on average result in a 3.71 per cent decrease in business confidence. High levels of unemployment in a country puts strain on government resources and chase away potential investment opportunities, making the business environment in the country unstable thus causing a decline in business confidence. Similar results were also found by Olekiewicz (2022) who also found a negative relationship between business confidence and unemployment.

4.4 Error correction and short-run dynamics result

The findings of the error correction model are summarised in table 3 below.

Table 4: Error correction and short-run results

Variable	Coefficient	Std. Error	t-Statistic	Prob.
D(LOGBC(-1))	0.308646	0.121322	2.544020	0.0178***
D(LOGGDP(-1))	0.331761	0.117110	2.832892	0.0092***
D(LOGEXCH)	-1.225433	0.233552	-5.246946	0.0000***
D(LOGEXCH(-1))	-0.605027	0.269365	-2.246126	0.0342**
D(LOGEXCH(-2))	-0.448233	0.255262	-1.755975	0.0918*
D(LOGCPI)	-0.129650	0.049288	-2.630452	0.0147***
D(LOGUNEMP)	-1.804913	0.445831	-4.048428	0.0005***
CointEq(-1)*	-0.786916	0.119195	-6.601904	0.0000***

Note: ***, **, *: 1%, 5% and 10% significant level respectively.

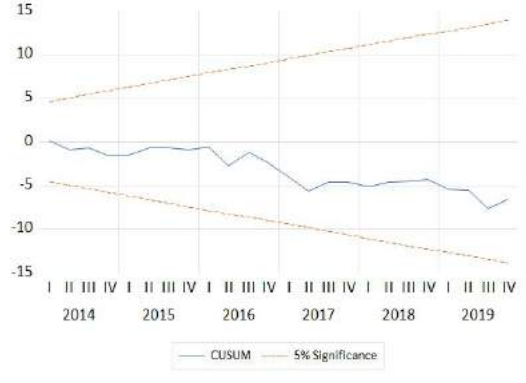

Since the long-run relationship has been confirmed, this suggests determining the speed of adjustments of short-run shocks towards long-run equilibrium. To achieve this, the error correction model was estimated. As shown in Table 3 above, the error correction term (-0.786916) is negative and statistically significant. This value, therefore, suggests that approximately 78 per cent of the models' short-term fluctuations are corrected in the long run. Furthermore, similar to the results obtained in the long run, the outcomes of the short run results suggest that all the explanatory

variables are statistically significant to influence short term changes in business confidence in South Africa. The real effective exchange rate and unemployment have the largest negative impact on the short-term behaviour of business confidence. Therefore, a one per cent increase in the real effective exchange rate will on average result in a 1.22 per cent decline in business confidence, and the lagged value of this variable also has a negative impact on business confidence, while a one per cent increase in the unemployment rate will on average result in a 1.80 per cent decline in business confidence. Additionally, an increase in economic growth has a positive effect on business confidence, as a one per cent increase in economic growth will cause short-term business confidence to grow by 0.33 per cent. While on the other hand, a one per cent increase in inflation will on average cause a 0.12 per cent decline in business confidence in the short run. Based on both the long and short-run results, the study can conclude that business confidence is affected positively by economic growth and negatively by rising inflation, unemployment and depreciating exchange rates.

4.5 Diagnostics and stability test results

To confirm and ensure that the model used was reliable and stable, various diagnostic and stability tests were conducted as summarised in table 5 below.

Table 5: Diagnostics and stability test results

Test	Null hypothesis (H_0)	P-value	Decision
Breusch-Pagen-Godfrey	Homoskedasticity	0.9910	H_0 not rejected
Breusch-Godfrey Serial Correlation LM Test	No serial correlation	0.4601	H_0 not rejected
Jarque-Bera (JB)	There is normality	0.6156	H_0 not rejected
Ransey RESET	The model is accurately specified	0.213	H_0 not rejected
CUSUM	Model is stable		

From the results obtained, table 5 above suggests that the ARDL model (3, 3, 0, 1, 1) is reliable and accurate because the null hypothesis of no serial correlation, residuals are normally distributed, and homoscedasticity are not rejected. Furthermore, the results from the Ramsey RESET test also indicate that the model used by the study was accurately specified. Additionally, the outcome of the Ramsey RESET test was also confirmed by the CUSUM test, where the graph also showed that the model is stable with it being in the 5% significance parameters. Therefore, the stability in the parameters of the study conducted indicates that the relationship between business confidence (dependent variable) and the selected explanatory variables was reliable during the sample period evaluated by the study.

5. Conclusion

This study investigated the influence of specific macroeconomic variables on business confidence in South Africa using quarterly time series data from 2010Q1 to 2019Q4 using the ARDL method. The findings of this study revealed a negative and significant relationship between the exchange rate, inflation, unemployment, and business confidence, while a positive and significant relationship between GDP and business confidence was found. The findings, therefore, suggest that lower levels of business confidence are driven by a depreciating rand/US dollar exchange rate, rising inflation rate, and rising unemployment (*the opposite is also true*), while economic growth increases levels of business confidence in South Africa. Findings are therefore consistent with the theory and the study's expectations. The findings also suggest that policymakers, government officials and the SARB need to work together in coordination to direct more resources towards ensuring that unemployment remains as low as possible and that exchange rate volatility is limited. Additionally, policymakers and the SARB need to direct resources towards keeping inflation as low as possible between the inflation target set by the SARB of between 3 and 6%, which is currently a big problem in SA, since inflation rates were recorded at 6.5% in May 2022, which was a five-year record high (SARB, 2022). Even though the findings of the study are appropriate and applicable for policymakers and economic authorities in the country, the study was however limited to using the chosen five explanatory variables due to the availability of data. Therefore, further studies should consider using other explanatory and economic variables that might also have an influence on business confidence and are not used by this study. In addition, the study used the quarterly business confidence index data obtained from the BER. Future studies could use annual business confidence index data provided by SACCI. Overall, policymakers should ensure continued economic growth in the country, as this will improve and encourage business confidence in South Africa. It is therefore important to get this important variable that can harm business confidence in the country under control, because only then would there be proper levels of confidence in South African businesses, and this will result in an influx of foreign companies wanting to do business in South Africa.

BUSINESS EDUCATION

A Conceptual Framework For Enacting Flow State in MBA Teaching and Learning

Dr. Jacobus H Oosthuizen^{1,*}

¹ Milpark Business School, Cape Town, South Africa

Keywords

Flow state; MBA; teaching; learning; pedagogy; andragogy; heutagogy; business schools.

Abstract

The Master of Business Administration (MBA), first introduced at Harvard in 1908, remains in high demand to this day, and over more than a century of existence, have clearly been a key scholarly research domain. Notwithstanding the global demand and research efforts, the homogeneity of teaching and learning practices is noticeable, and arguably this habituation over time may have unfavourably impacted on curriculum, teaching and learning innovation. This position paper argues that the excessive focus on pedagogy created a neglect of andragogy and heutagogy and proposes a case for enacting flow state into MBA teaching and learning. MBA educators are challenged by the dilemma of transitioning from pedagogy to andragogy, and ultimately heutagogy, along with the elusive goal of facilitating deep engagement in learning activities. Flow theory proposes that when in flow, a person becomes totally involved in an activity and experiences numerous positive experiential characteristics. This position paper argues that by creating the conditions for flow, deep engagement, and improved academic performance may be achieved. By applying Critical Interpretive Synthesis (CIS), a conceptual framework for enacting flow state in MBA teaching and learning is proposed to support academic leadership of business schools with guidelines to initiate experimentation with flow state enactment.

1. Introduction

The Master of Business Administration (MBA) degree, first introduced by Harvard University Graduate School of Administration in 1908 (now Harvard Business School) (Garner, 2021), is a widely sought-after qualification for career progression and personal growth (Herrington, 2010), and regarded as an important differentiator in the employment market (Herrington, 2010). Globally, the MBA remains in high demand as evidenced in the Association of MBA's (AMBA) Application and Enrolment Report of 2021 indicating that globally, the volume of MBA applications received increased by an average of 7% from 2019 to 2020 (AMBA, 2021). Similarly, the Graduate Management Admission Council (GMAC) Corporate Recruiters Survey 2021 indicate that the demand for graduate management talent is returning to pre-pandemic levels (GMAC, 2021). Locally, in South Africa, with the first MBA programme offered beyond North America in 1949 at the University of Pretoria (Garner, 2021), the trend is similar, with the compound annual growth rate of MBA applications being 2.7% over the past decade (2011 – 2020) (South African Business Schools Association (SABSA), 2020).

Over more than a century of existence, MBA programmes have obviously also been a key research area by business schools, with Muposhi, Dhurup, Martin and Bhadury (2019) stating that previous research mainly focused on curriculum (Thomas and Cornuel, 2012; Datar et al., 2010; Rubin and Dierdoff, 2009), impact of MBA programmes (Kretovics, 1999; Bennis and O'Toole, 2005) and assessments (Cullen, 2013; Camuffo and Gerli, 2004). However, when considering global MBA curricula in general, one cannot help but notice the homogeneity of teaching and learning practices. In addition, while various kinds of academic discipline experts within a business school may differ from one another, they exhibit much similarity to their discipline expert counterparts in other institutions. How can this be explained?

The sociological theory of isomorphism, which refers to the similarity of the processes or structure of one organisation to those of another, proves useful in explaining this homogeneity. DiMaggio and Powell (1983) identified three mechanisms through which institutional isomorphic change occurs, each with its own antecedents: (1) *Coercive isomorphism* results from both formal and informal pressures exerted on organisations by other organisations upon which they are dependent and by cultural expectations in the society within which organisations function. (2) *Mimetic isomorphism* results from uncertainty that encourages imitation. When technologies are not clearly understood, goals are ambiguous, or when the environment creates uncertainty, organisations may model themselves on other organisations. (3) *Normative isomorphism* results primarily from professionalisation, which is the collective effort of members of an occupation to define the conditions and methods of their work and to establish a cognitive base and legitimation for their occupational autonomy.

It is hence probable that isomorphism is a key contributor to the homogeneity of teaching and learning practices in MBA programmes globally, i.e.:

- *Coercive isomorphism* resulting, for example, from pressures exerted by regulatory bodies upon which business schools are dependent for legitimate operation.
- *Mimetic isomorphism* resulting, for example, from business schools modelling themselves on the so-called Ivy League type institutions believed to be the “gold standard” of MBA education.
- *Normative isomorphism* resulting, for example, from supposed standards, best-practice, and methods of accreditation and association bodies that have established a cognitive base and legitimation for the MBA’s autonomy.

It is argued that this “conditioning” over time has adversely impacted on curriculum, and teaching and learning innovation, and that the excessive focus on pedagogy created a scotoma towards andragogy and heutagogy, which appear to enjoy limited consideration in teaching and learning practice. By drawing on the theoretical foundations of pedagogy, andragogy and heutagogy, this position paper argues a case for enacting flow state into MBA teaching and learning and proposes a conceptual framework as foundation for future research.

2. Problem Investigated

Traditionally education has been viewed as a pedagogic relationship between the teacher and the learner (Kenyon & Hase, 2001), with many faculty therefore clinging to pedagogy because it is what they know (Halupa, 2015). McAuliffe, Hargreaves, Winter, and Chadwick (2008) however posit that although there are educators who employ the principles of either student-centred (andragogy) and self-determined (heutagogy) learning, it is not possible to fully implement either theory. Halupa (2015) further argues that although pedagogy and andragogy are usually presented upon a continuum, some students’ educational maturity make them feel restrained by pedagogical practices, whilst others are not ready for andragogical practices and still need pedagogical methods. McAuliffe, Hargreaves, Winter and Chadwick (2008) also highlight the tendency of educators to return to the customary practice of pedagogy because they do not understand how to facilitate andragogical and heutagogical learning. Chacko (2018) further adds that educators face the dilemma in transitioning from pedagogy, with a high degree of teacher control with associated low learner maturity (“sage-on-stage”) and letting go of power and control to andragogy (“guide-on-the side”) as students become more autonomous.

Exacerbating the above, is the fact that “nearly every educator holds the primary, though often elusive, goal of facilitating students’ deep engagement in learning activities” (Schmidt, 2010, p. 605). Schulze (2016) refers to engagement as a student’s active involvement in a task or a pursuit and lists the sources of disengagement as a lack of autonomy, the inability to manage time effectively, feeling isolated from the academic community of practice (CoP), and situational factors at home. Conversely, Schulze (2016) posit that intrinsic motivation, autonomy, individual goal setting, and a sense of belonging to the academic CoP are sources of engagement.

Schmidt (2010) asserts that Mihaly Csikszentmihalyi's flow model has advanced scholars' understanding of the experience of deep engagement, along with the individual and contextual factors that may promote it. The model has implications for both research and practice, and has seen application in fields, including education, psychology, psychiatry, anthropology, and business (Schmidt, 2010, p. 605). The flow theory is based on an individual's state of mind characterised by high concentration and focus on activities that cause high pleasure and intense intrinsic motivation (Csikszentmihalyi, 1990), and the postulate of this position paper is that it holds promise for enacting students' deep engagement in learning activities. It is thus hypothesised that if MBA educators can create a learning environment that unlocks flow state in students, deep engagement in learning activities may be achieved, thereby enabling students to learn at accelerated rates and perform at their best.

3. Research Objectives

Against this backdrop, the primary objective of this study is to develop a conceptual framework for the enactment of flow state in MBA teaching and learning. In support of the primary objective, secondary objectives are to (1) critically review literature pertaining to pedagogy, andragogy and heutagogy, (2) critically review literature pertaining to the flow state, (3) critically interpret and synthesise the reviewed literature

4. Literature Review

Pursuant to the primary objective, the literature review to follow covers the theoretical foundations of pedagogy, andragogy and heutagogy, as well as the psychological state called 'flow'.

4.1. Pedagogy, Andragogy and Heutagogy

Pedagogy has its origins in the monastic schools of Europe in the Middle Ages, with the tradition later adopted in the secular schooling systems of Europe and America in the 18th and 19th century. It is largely a content model concerned with the transmission of information and skills, where the teacher decides what knowledge or skill needs to be transmitted and arranges a body of content into logical units, selects the most efficient means for transmitting this content (e.g., lectures, readings), followed by developing a plan for the presentation of these units into some sequence. Pedagogy is a teaching theory rather than a learning theory and is usually based on transmission (McAuliffe et al, 2008).

Andragogy was introduced into the learning community by Knowles in the 1970s who proposed that adults learn differently than children and developed five assumptions that form the foundation of his theory, namely: (1) Adults are self-directed learners, (2) adults bring extensive experience into the classroom, (3) adults who seek education are ready to learn, (4) adults are internally motivated, and (5) adults want problem-based learning (Knowles, 1970).

According to Halupa (2015), Knowles did not view andragogy as a true epistemology, rather as a concept than a theory. Knowles (1980) outlined a seven-step process for faculty to promote andragogy:

- Develop cooperative learning environments
- Involve learner in the setting of goals
- Diagnose learner needs and interests
- Help learners formulate objectives based on interests and needs
- Design sequential learning experiences to meet these objectives
- Meet objectives with materials and resources
- Evaluate the quality of learning and impact on future learning

Heutagogy was first defined by Hase and Kenyon (2000, p. 1) as a "form of self-determined learning", developed on the concepts of double-loop learning outlined by Argyris and Schon (1974) who noted all students have mental maps and governing variables (Halupa, 2015). McAuliffe et al (2008) propose the following key principles of heutagogy: (1) Knowing how to learn is a crucial skill, (2) educators should focus on learning process rather than content, (3) learning goes beyond specific

discipline, and (4) learning occurs through self-chosen and self-directive action. Halupa (2015) also argues that although heutagogy is an emerging epistemology, it is more transformative than pedagogy or andragogy.

Chacko (2018, p. 280) observes that heutagogy is “most effective when directed to adult learners who are already professionally qualified and are self-motivated and self-determined to improve practice due to the challenges and complexities at the workplace.” Heutagogy hence needs to be viewed as a continuum of andragogical adult learning theory in line with the transition in postgraduate management education directed toward becoming competent using core andragogy of self-directed learning to an autonomous, self-determined learner once the student graduates and focus now shifts from competency to capability (proficient and then on to the state of expertise) (Chacko, 2018).

Table 1 below summarises the key essentials of pedagogy, andragogy and heutagogy.

Table 1: Difference between pedagogy, andragogy and heutagogy

	Pedagogy Children’s learning	Andragogy Adults learning	Heutagogy Self-directed learning
Dependence	The student is a dependent personality. Teacher determines what, how and when anything is learned.	Adults are independent. They strive for autonomy and self-directed learning.	Learners are interdependent. They identify the potential to learn from novel experiences as a matter of course.
Resources for learning	The student has few resources – the teacher devises transmission techniques to store knowledge in the learner’s head	Adults use their own and other’s experience.	Teacher provides some resources, but the learner decides the path by negotiating the learning.
Reason for learning	Learn in order to advance to the next stage.	Adults learn when they experience a need to know or to perform more effectively.	Learning is not necessarily planned or linear. Learning is not necessarily based on need but on the identification of the potential to learn in novel situations.
Focus of learning	Learning is subject centred, focussed on prescribed curriculum and planned sequences according to the logic of the subject matter.	Adult learning is task or problem centred.	Students can go beyond problem solving by enabling pro-activity. Students use their own and others’ experiences and internal processes such as reflection, environmental scanning, experience, interaction with others, and pro-active as well as problem-solving behaviours.
Motivation	Motivation comes from external sources – usually parents, teachers, and a sense of competition.	Motivation stems from internal sources – the increased self-esteem, confidence and recognition that come from successful performance.	Self-efficacy, knowing how to learn, creativity, ability to use these qualities in novel as well as familiar situations and working with others.
Role of teacher / instructor / facilitator	Designs the learning process, imposes material, is assumed to know best.	Enabler or facilitator, climate of collaboration, respect, and openness.	Develop the students’ capability. Capable people: Know how to learn; are creative; have a high degree of efficacy; apply competencies in novel as well as familiar situations; can work well with others

Source: Adapted from Heick (2022)

Richardson, McGowan and Styger (2018, p. 1841) posit that “the focus of an MBA is for students to obtain the skills to undertake their professions and be able to be analytical, problem solvers, research savvy, critical thinkers that are reflective lifelong learners that will equip them to cope in a dynamic, multifaceted and complex environment.” Hence, Richardson et al (2018) argue that it is important to embrace a philosophy to higher education that would support these requirements, and that heutagogy has surfaced as the more optimal approach to adult education comparable to the initial focus on pedagogy and the later shift to andragogy. Stoten (2022) adds “although much has been written about the possible benefits of heutagogy in the promotion of personalised learning, less has been published on how we can implement it in practice.” Stoten (2022) contributes to the discourse on heutagogy in management education in providing an evidential base of heutagogy in practice and highlights the benefits for management education and offers a model of heutagogic learning through the OEPA model. The model describes four distinct phases in the heutagogic journey, beginning with orientation (O) to learning, followed by the exploration (E) and pathfinding (P) phases, and ending with the arrival (A) at the desired learning outcome (Stoten, 2022, p. 90).

4.2 Flow state

Flow is an optimal psychological state that has been described extensively by Csikszentmihalyi (1975, 1990, 1993) and substantiated by others in a variety of settings, including work, education, leisure, and sports. When in flow, a person becomes totally involved in an activity and experiences several positive experiential characteristics, including freedom from self-consciousness and great enjoyment of the process. Flow is an intrinsically enjoyable state and is accompanied by an order in consciousness whereby the person experiences clarity of goals and knowledge of performance, complete concentration, feelings of control, and feelings of being totally in tune with the performance (Jackson & Marsh, 1996). Csikszentmihalyi (1990, p. 4) found that flow occurs when individuals are “so intensely involved in an activity that nothing else seems to matter; the experience itself is so enjoyable that people will do it even at great cost, for the sheer sake of doing it.”

Dietrich (2004, p. 747) asserts that “a flow state ensues when one becomes so deeply focused on a task and pursues it with such passion that all else disappears, including a sense of time or the worry of failure. The person experiences an almost euphoric state of joy and pleasure, in which the task is performed, without strain or effort, to the best of the person’s ability.”

Nakamura and Csikszentmihalyi (2002, p. 90) assert that the conditions of flow include (1) perceived challenges, or opportunities for action, that stretch (neither overmatching nor underutilising) existing skills; a sense that one is engaging challenges at a level appropriate to one’s capacities, and (2) clear proximal goals and immediate feedback about the progress that is being made. Under these conditions, experience seamlessly unfolds from moment to moment, and one enters a subjective state with the following characteristics:

- Intense and focused concentration on what one is doing in the present moment
- Merging of action and awareness
- Loss of reflective self-consciousness (i.e., loss of awareness of oneself as a social actor)
- A sense that one can control one’s actions; that is, a sense that one can in principle deal with the situation because one knows how to respond to whatever happens next
- Distortion of temporal experience (typically, a sense that time has passed faster than normal)
- Experience of the activity as intrinsically rewarding, such that often the end goal is just an excuse for the process

Schmidt (2010, p. 605) further explains that from the pursuit to understand intrinsically motivated activity, flow refers to a state of optimal experience characterised by total absorption in the task at hand, thus a merging of action and awareness in which the individual loses track of both time and self. The flow state is experientially positive, and out of the flow experience emerges a desire to replicate the experience. Ilies, Wagner, Wilson, Ceja, Johnson, DeRue and Ilgen (2017) concur that flow experiences are associated with high levels of focus, concentration, action, and progress, and in a

study on flow at work and its effects on well-being, found that a type of experiential well-being, i.e. flow, was positively related to measures of declarative well-being, and that the fulfilment of individuals' needs for competence and autonomy partially mediated the influence of flow on declarative well-being outcomes.

4.3 Flow in education

Citing Alivernini and Lucidi (2011), Heublein (2014), Lassibille and Navarro Gómez (2008), Silva, Rodrigues and Leal (2019) highlight the high rates of lack of interest and boredom towards the learning process by students, claiming the time spent studying is truly tedious, and, as articulated by Kastantin and Novicevic (2008), that educators must find strategies to increase students' engagement in the teaching-learning process (Silva et al., 2019). Schmidt (2010) refers to Csikszentmihalyi that observed art students as they worked on their artistic creations to understand what led them to be passionate about their creative pursuits and found that students often became so absorbed in their work that they would effectively cut out any external distractions or obligations. Students would lose track of time, missing appointments, or meals, working late into the night, seemingly sustaining deep levels of both concentration and enjoyment for extended periods (Schmidt, 2010, p. 605).

In terms of the flow model and its application in the study of education, Schmidt (2010) states that studies of the flow experience have revealed consistency in the conditions under which these optimal states most often occur, referring to several researchers who confirm shared aims both in optimal experiences and in their underlying conditions, such as Csikszentmihalyi (1975/2000, 1990, 1996), Jackson (1995, 1996), Massimini and Carli (1988), and Perry (1999).

Schmidt (2010) observes that even though the flow model was developed more generally as a model of engagement, multiple applications to academic engagement is evident. Numerous conditions that facilitate flow can be found in classroom environments, and while most academic activities are not the result of student choice, opportunities to offer choice in learning activities are possible. Schmidt (2010) argues that the balance between challenges and skills can undoubtedly be modified to promote a state of optimal equilibrium for students. Additionally, goal setting and feedback are both standard practice of most classroom settings, and lecturers can curtail distractions to encourage attention to the task at hand. According to the model, Schmidt (2010) believes that students are likely to experience flow when engaged in academic tasks and have positive learning experiences if some or all the flow model conditions could be facilitated in classrooms.

Schmidt (2010) concludes that these positive experiences would motivate students to continue their deep engagement in tasks, desirous to maintain flow state. "As it is a dynamic process that keeps one in a flow state, learning would occur in order to keep one's skills in balance with the ever-increasing challenges presented by the classroom environment. Over time, such engagement would develop into long-term commitments to particular academic endeavours, and ideally, to increased success with related academic tasks" (Schmidt, 2010, p. 607).

In a study on gamification and its impact on flow state of accounting and marketing students, Silva et al (2019) found that educational games may be an effective means to create conditions for the flow, which may make game-based learning easier, arguing that games used in the teaching and learning process can reduce the boredom factor, increase the intrinsic and extrinsic motivation, concentration, and interest of students to learn. dos Santos et al (2018) highlights three benefits of flow state in education, namely (1) increase in students' learning, (2) more in-depth reflection, and (3) students' satisfaction. Their findings also suggest that Flow Theory can potentially be useful to deal with several concerns that could be addressed, such as students' feeling of achievement, creativity and imagination enforcement, exploratory behaviour, facility to accept changes and adaptations, feeling happy, satisfied, and cheerful, focussed intensity, influences on empathy and interest in games, internal locus of control, perceived usefulness and ease of use and sense of cognitive presence.

It is subsequently argued that by creating the conditions for flow in the teaching and learning experience of MBA students could enhance deep engagement, and improved academic performance.

Albeit that empirical studies on the application of Flow Theory in teaching and learning are fragmented and theoretically inconclusive in terms of, for example, (1) the lack of automatic mechanisms to identify if a student is in the flow state, (2) the impact of students' flow experience, (3) the need for techniques to measure flow state levels and (4) the need of adaptive mechanisms to aid students achieving the flow state based on student modelling (dos Santos et al., 2018), this essay proposes a conceptual framework for enacting flow state in teaching and learning of MBA students.

5. Research methodology

The literature on topics and themes related to pedagogy, andragogy, heutagogy and flow state is large, and diverse, including both qualitative and quantitative empirical work, editorial commentaries, theoretical work and case studies. A conventional systematic review methodology was deemed ill-suited to the challenges that conducting such a review would pose, and critical interpretive synthesis (CIS) (Dixon-Woods et al., 2006, p. 38) was decided upon as methodological approach. CIS starts with an ambiguous and tentatively defined phenomenon; conducts extensive albeit not complete searching; strategically samples from the literature; conducts appraisal and critique of the included literature and, through a process similar to primary qualitative research, aims to produce a theoretical output in the form of a synthesised argument (Dixon-Woods et al., 2005, p. 6). Otherwise explained by Bales and Sare (2014, p. 144) as (1) formulating the review question, (2) searching the literature, (3) sampling, (4) determination of quality, (5) data extraction, and (6) interpretive synthesis. According to Dixon-Woods et al. (2006, p. 39) CIS explicitly sanctions the integration of qualitative and quantitative evidence through an interpretive process.

A distinguishing feature of CIS is its recognition of the authorial voice in that it does not lay claim to a set of techniques that allows a 'reproducible' synthesis. Instead, the interpretive work required to produce an account of disparate forms of evidence is acknowledged, and it appreciates that alternative accounts of the same evidence might be possible using different authorial voices. However, all accounts should be grounded in the evidence, verifiable and probable, and that reflexivity will be a principal requirement. (Dixon-Woods et al., 2006).

In terms of formulating the review question in this study, the approach was highly iterative, modifying the question in response to search results and findings from retrieved literature. Searching the literature, generated extensive potentially relevant items, proving to be unmanageable, and subsequently only potentially relevant literature was identified to provide a sampling frame. For purposes of the synthesis, purposive sampling was initially applied to select literature that were clearly concerned with aspects of pedagogy, andragogy, heutagogy and flow state, partly informed by the scoping running up to the study. Sampling therefore involved a constant dialectic process conducted concurrently with concept generation.

As far as determination of quality is concerned, literature that appeared relevant was prioritised, rather than particular study types or literature that met specific methodological standards; hence the application of a low threshold was utilised to maximise the inclusion and contribution of a wide variety of literature at the conceptual level. Data extraction concerned systematically identifying themes pertinent to pedagogy, andragogy, heutagogy and flow state. In conducting the interpretive synthesis, a detailed inspection of the literature was the point of departure, gradually identifying recurring themes and developing a critique. Themes were then generated to help develop an argument, comparing the argument developed against the literature, and attempting to specify the reasoning and the relationship with the existing body of knowledge.

6. Results and discussion

Bertram (2022) asserts that "life's purest and most deeply satisfying moments come when we tap into a state of consciousness known as flow. The experience of being in flow comes when the past is suddenly forgotten, the future is irrelevant, and the mind is plunged into "the deep now" – a heightened state of effortless presence wherein we are able to learn at accelerated rates and perform at our best." Csikszentmihalyi (1996, pp. 111-113), describes nine main elements defining the characteristics of flow, which is as applicable in education as in other endeavours (ibid):

1. **Clear goals every step of the way.** Describing this element in terms such as, “the musician knows what note to play next” and “the surgeon is aware of how the incision should proceed moment by moment” indicates that, although the activity ultimately advances towards a higher goal, it is driven by the progressive realisation of the next small goal (Dietrich, 2004, p. 757).
2. **Immediate feedback to one’s action.** This element is closely related to the first. In this instance the “musician hears right away whether the note played is the one,” demonstrating the characteristic feature of the implicit system² that, due to the lack of higher-order representations, the event is not subjected to detailed analysis and feedback is binary and immediate. This also relates back to the first point in that the “musician knows what note to play next,” building a sequence with each step dependent upon the last (Dietrich, 2004, p. 757).
3. **Balance between challenges and skills.** Faced with a task that exceeds the skill level entrenched in the implicit system, we feel we must enlist the help of the explicit system³ to improve performance. However, this negatively affects performance and leads to frustration and anxiety. In contrast, tasks that do not test the implicit system’s full ability allow for the low-end interference of the explicit system. This leads to daydreaming or boredom but not feelings of self-actualisation (Dietrich, 2004, p. 757).
4. **Action and awareness are unified.** This element describes concentration as being “focused on what we do.” Phenomenologically, people in a state of flow report narratives that is consistent with decreased prefrontal function, such as the disappearance of self-consciousness, no worry of failure, a sense of timelessness, and no distractions (see below). Thus, flow is a state of hypofrontality⁴ with the notable exception of executive attention, which enables single-mindedness by means of selectively disengaging other higher cognitive abilities of the prefrontal cortex (Dietrich, 2004, p. 757).
5. **Distractions are excluded from consciousness.** This element of flow is a result of point 4. Humans appear to have significant control over what they attend to, and in flow, attentional resources are utilised to actively magnify the task at hand until it becomes the exclusive substance in the working memory buffer. It is this attentional endeavour that works to exclude other intruding information, whether sensory, emotional, or cognitive. The phenomenological result is an awareness that is limited to the here and now, without cognitive flexibility – akin to a “mental singularity” (Dietrich, 2004, p. 757).
6. **There is no concern of failure.** This element of flow is due to the singlemindedness. Without the ability to bring into focus additional information, worry of failure, along with other peripheral content, is barred from entering consciousness. Evidence suggests that a person’s cultural values and belief system reside in the prefrontal cortex (Damasio, 1994), flow is possibly characterised by several such phenomenological deductions (Dietrich, 2004, p. 757).
7. **Self-consciousness disappears.** Self-consciousness is a meta-representation of the highest order and possibly one of the first phenomenological subtractions to manifest itself in flow. There are simply not enough resources left to compute this highly sophisticated feature of consciousness (Dietrich, 2004, p. 757).
8. **Sense of time becomes distorted.** As mentioned above, temporal integration is a prefrontal function and the subtle modification of the perception of time is predicted in hypofrontality.

² The implicit system is skill or experience-based, its content is not verbalizable and can only be conveyed through task performance, and it is inaccessible to conscious awareness (Ashby & Casale, 2002; Dienes & Perner, 1999; Schacter & Bruckner, 1998).

³ The explicit system is rule-based, its content can be expressed by verbal communication, and it is tied to conscious awareness (Dietrich, 2004).

⁴ Flow necessitates a state of transient hypofrontality that empowers the implicit system to execute a task at maximum skill level with maximum efficiency (Dietrich, 2003, 2004)

Indeed, a sense of timelessness is one of the hallmarks of any altered state of consciousness (Dietrich, 2003).

9. *Activity becomes autotelic*⁵. This final element is an emphasising property of the state of flow (Dietrich, 2004, p. 757).

These nine elements defining the characteristics of flow serves as an empirically validated foundation on which to craft teaching and learning experiences for MBA students. The proposition being that if flow state could be enacted, deeper engagement will ensue and may improve student performance.

Another important consideration in pursuing flow state in students is assessments. To instil, for example, critical thinking in students, the relevant problem-based assessments used in andragogy will be more appropriate in most cases (Halupa, 2015). Furthermore, an obvious first challenge is to attempt to meet the needs of all students, and the second is to attempt to increase the educational maturity level of those students who may still be at the pedagogical level. It would be ideal for all MBA students to reach the level of heutagogy, but even with the advances in technology to enhance the journey towards heutagogy, it will be a challenging pursuit. MBA educators must deal with students from an educational system who are used to basic pedagogy and memorisation learning, and it can be difficult to assist these students to the next level where the pursuit of knowledge outweighs the pursuit of completion and results. In addition, the regulatory scrutiny of higher education institutions, for example on student retention and pass rates may make some faculty wary of experimenting with new methods that make students life-long learners, educated discerners and seekers of knowledge (Halupa, 2015). The journey from memorising information to finding and applying information is a long one, but a responsibility of MBA educators to pursue.

It is nonetheless argued that the endeavour to shift towards heutagogy could potentially be quickened by means of enacting flow state in the student experience. Considering, for example, Stoten's (2022) mapping of the formal heutagogic learning journey via the OEPA model described as orientation [O] (expectations, context, aspirations, purpose); exploration [E] (evaluating the challenge, defining the boundaries of focus, using abstract thinking); pathfinding [P] (strategising, coordinating resources, connecting with others); and arrival [A] (evaluating learning "distance travelled", Metacognition and setting future goals, reflexive thought), flow state holds significant potential in optimising the four phases.

6.1. Towards a conceptual framework for enacting flow state in MBA teaching and learning

Building on the flow state preconditions narrative, Kotler (2021) refers to "flow triggers", and states that researchers have to date identified twenty-two different flow triggers (Table 2) that all share one common denominator: "*flow follows focus.*" The flow state can only arise when all attention is directed at the present moment, and flow triggers drive attention into the now.

⁵ Flow research and theory had its origin in a desire to understand this phenomenon of intrinsically motivated, or autotelic, activity: activity rewarding in and of itself (auto = self, telos = goal), quite apart from its end product or any extrinsic good that might result from the activity (Nakamura and Csikszentmihalyi, 2002)

Table 2: 22 Flow Triggers (Kotler, 2021)

Individual triggers	Group triggers
<ul style="list-style-type: none"> • Curiosity / Passion / Purpose • Autonomy • Complete concentration • Risk • Novelty • Complexity • Unpredictability • Deep embodiment • Immediate feedback • Clear goals • Challenge / Skills ratio • Creativity / Pattern recognition 	<ul style="list-style-type: none"> • Complete concentration • Shared goals • Shared risks • Yes and... (additive interactions) • Close listening • Autonomy / Sense of control • Blending egos • Familiarity • Equal participation • Open communication

The categorisation of flow triggers into individual and group triggers is also valuable when considering the strong emphasis on syndication in MBA programmes. Although it can be argued that Kotler’s (2021) flow triggers are all contained, in one shape, form or the other, in Csikszentmihalyi’s (1996) main elements of flow, it nonetheless provides further semantic clarity to assist in crafting experiences in the teaching and learning design of MBA programmes.

In pursuit of this paper’s objective to develop a conceptual framework for the enactment of flow state in MBA teaching and learning, Figure 1 below illustrates the proposed approach.

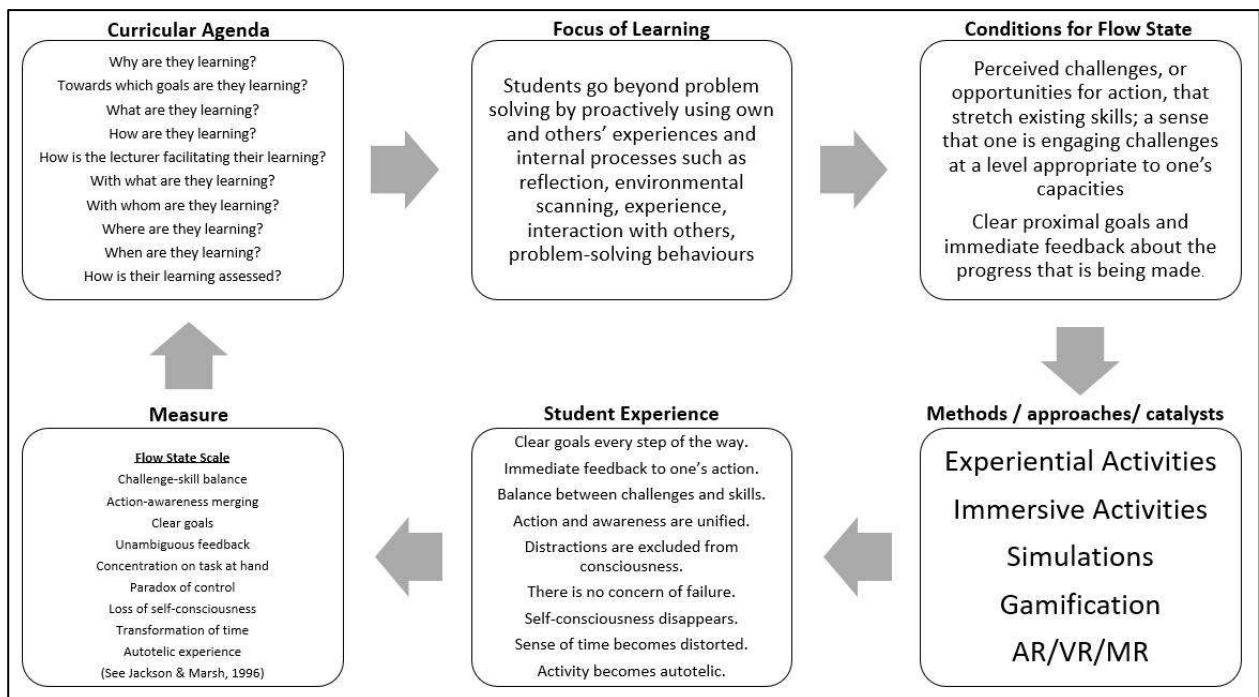

Figure 1: A conceptual framework for enacting flow state in MBA teaching and learning

The point of departure is to clarify the curricular design and drawing on Van den Akker’s (2010, p. 39) ten components that address ten specific questions about the planning of student learning, framing the components succinctly. The components being (*ibid*):

1. Rationale or Vision: Why are they learning?
2. Aims and Objectives: Toward which goals are they learning?
3. Content: What are they learning?

4. Learning activities: How are they learning?
5. Facilitator role: How is the lecturer facilitating learning?
6. Materials & Resources: With what are they learning?
7. Grouping: With whom are they learning?
8. Location: Where are they learning?
9. Time: When are they learning?
10. Assessment: How to measure how far learning has progressed?

Comprehensively addressing these questions will set the scene and establish the context within which to pursue experimentation with flow state enactment.

A next layer to consider would be the focus of learning to move towards a stronger heutagogic (self-directed learning going beyond problem-solving) orientation, as andragogy alone mainly emphasises task or problem centeredness as the focus of learning. The aim should, therefore, be to shift students' orientation beyond problem solving for them to proactively use their own and others' experiences and internal processes such as reflection, environmental scanning, experience, interaction with others, and higher order problem-solving behaviours - involving the complete being, i.e., head (cognitive), heart (emotion) and hands (physical). The impact of the three modes stimulated together can shift a student's perspective in a way that a focus on the cognitive part alone cannot. Instruction that uses only description and lecture becomes trapped within the repetition of its own jargon and can be meaningless to students.

In reflecting on the appropriate environment to create to facilitate the enactment of flow, the conditions for flow state (Nakamura & Csikszentmihalyi, 2002) and flow triggers (Kotler, 2021) must carefully be considered. The conditions must, for example, provide perceived challenges, or opportunities for action, that stretch existing skills. Students must have a sense that they are engaging challenges at a level appropriate to their capacities, along with clear proximal goals and immediate feedback about the progress that is being made. The evidence from literature suggest that these conditions are critical, and the importance of ensuring that they are met should not be underestimated. Note should also be taken of flow triggers at the individual level as well as the group level.

The methods / approaches / tools will require research, experimentation, and piloting initially to determine which methods / approaches / tools produce the best results in helping to enact flow in the various subjects covered in a typical MBA programme, and the integration of modules. Methods / approaches / tools could, among others, include experiential activities, immersive activities, action learning, simulations, gamification, augmented reality (AR), virtual reality (VR) and mixed reality (MR). It is the author's view that case studies will not suffice as method to enact flow state, because the case study perspective encourages the separation of thinking (formulation) from acting (implementation) and assumes that the world stands still while the formulation process takes place.

The achievement of the aforementioned milestones should result in students experiencing the elements that characterise flow (Csikszentmihalyi, 1996), i.e., clear goals every step of the way, immediate feedback, balance between challenges and skills, action and awareness are unified, distractions are excluded from consciousness, no concern of failure, self-consciousness disappears, the sense of time becomes distorted, and activity becomes autotelic.

Measuring the interventions is critical to identify gaps and inform improvements to feed back into the process again in pursuit of optimising deep engagement by students through the enactment of flow state experiences. The interventions can be measured by means of adapting the Flow State Scale of Jackson and March (1996) for purpose of fit to the MBA education context.

7. Academic leadership implications

To believe all approaches to teaching and learning on MBA programmes have been exhausted is not only parochial, but also irresponsible. Responsible management education also calls for a

commitment to continuous improvement to ensure relevance and meeting the needs of industry and society in general.

Saying we find ourselves in a complex, chaotic, and hence unpredictable age would be stating the obvious, not to mention the unprecedented change driven by the smart machine era. The demands on leadership and management practitioners to effectively lead and manage in this context mean that management educators must make curriculum innovation top priority and find creative ways in creating learning environments that immerse students in experiences as close to the real world as possible.

The conventional professorial approach of “sage-on-stage” to MBA teaching and learning will not suffice. Instead, MBA educators should adopt a “guide-on-the side” approach that develop capable students that know how to learn, are creative, have a high degree of efficacy, apply competencies in novel as well as familiar situations, and can work well with others. It is against this backdrop that deep engagement is essential, and where flow state enactment holds promise and potential. The conceptual framework, at the least, provides academic leadership of business schools with broad guidance to initiate experimentation with flow state enactment.

8. Limitations and suggestions for future research

The study attempted to contribute to address the challenge of facilitating students’ deep engagement in learning activities on MBA programmes by proposing a conceptual framework to enact flow state in the student experience.

The author recognises the multiplicity and complexity of teaching and learning on postgraduate level, as well as the impact of context and culture on higher education, and by no means position the conceptual framework as all-encompassing. It is argued, nonetheless, that an important foundation has been laid in the quest for facilitating students’ deep engagement in learning activities on MBA programmes.

Future research could be directed towards the development of a measuring instrument to measure MBA students’ experience in relation to the flow state constructs. Measurements in relation to student experience could furthermore inform curriculum design and be correlated with students’ academic performance to determine flow state intervention impact.

Abstract

Business schools are encouraged to incorporate internationalisation strategies as a component of their MBA curriculum to become globally competitive and create internationally aware students, which is a requirement of global accreditation bodies. One internationalisation strategy incorporates international study tours, which is a niche segment of educational travel. Reflective writing, which involves experiencing something, reflecting and analysing the experience and then learning from the experience is a technique that is incorporated into these study tours. This study aims to explore the reflective essays of eleven second-year MBA students written daily during their tour to Germany. A qualitative approach was applied and data were analysed using a thematic analysis. Their experiences were organised into five major themes, namely (1) Applying Critical Thinking; (2) Gaining Knowledge about Destination Country/Company Processes; (3) Applying Cross-Country Comparisons; (4) Cultural Immersion and Sensitivity; and (5) Revealing Self-Awareness and Development. The findings indicated that the international tour increased their self-awareness, a broader understanding of German culture, while the industry visits and business seminars facilitated the students' ability to bridge theory with practice in line with the entrepreneurship curriculum. In addition, the study shows that such experiential learning programmes increase transferability of knowledge, which provides implications for management education.

1. Introduction

Contemporary labour markets seek business graduates who can operate in the global knowledge economy, given that the future of work is changing and challenging traditional labour markets (Grimshaw, 2020). Business schools have the responsibility to graduate business students with leadership and managerial competencies that can adapt to cultural diversity across different contexts (Le et al., 2018; Park et al., 2018). In response to the global changes, business schools are internationalising their curricula to aid students to effectively operate in the global business environment, while benchmarking their teaching, research and societal impact activities to maintain reputation and prestige (Borsetto, 2021; Ghani et al., 2021).

Internationalisation of the curriculum is based on the inclusion of dimensions related to international and intercultural as well as teaching and learning arrangements, whilst being mindful of the learning outcomes. The dimensions of an internationalised curriculum are connected with entrenching globally specific knowledge acquisition and sustainability (Ghani et al., 2021). In terms of the international and intercultural dimension, leadership capabilities can be developed through international exposure, such as, international study tours for students to expose themselves to local conditions, enrich their cultural understanding and create intellectual and cognitive knowledge growth. Thus, geared towards

developing critical thinking, industry and peer networks and adding to broadened views of economic markets and local regulations.

A method of internationalisation is through experiential education programmes, such as international tours, which are specialised educational travel whereby students receive business-place experience through business seminars, meeting with industry experts, cultural excursions and networking. Some MBA programmes include the international tour as part of an elective course and expect students to include a reflective report, which integrates their observations and experiences (Stern & Powell, 2020). There is a strong movement in experiential learning programmes to foster reflective practice, which is valuable for learning and critical thinking. According to Kolb's Experiential Learning Theory (Kolb, 1984, 2015; Kolb & Kolb, 2017), the reflection is part of the abstract conceptualisation whereby students' reflections, observations and experiences form new avenues of critical decision making in a global context (Gomez-Lanier, 2017; Stern & Powell, 2020).

Against this background, in the context of this study, MBA students who participated in this international study tour were required to maintain a reflective journal of their experiences. Mezirow (1998) defines critical reflection as a way for students to integrate theory with practice, which can facilitate self-development and growth, which is beyond the traditional classroom setting. Reflective journals aid in reinforcing learning through critical reflection, synthesis of perceptions, finding meaning from experiences and connecting theory to practice (Kuechler & Stedham, 2018).

Reflection supports continuous learning in practice. In this line, students were requested to document their daily experiences by making two entries per day, prior to a visit and after a visit. Thus, the reflective journal acted as a method to express their satisfaction, learnings and provide constructive criticism about the international tour. The study is centred on the effects of such an experiential learning trip on their cultural immersion, self-development and new knowledge acquisition. The study used a thematic analysis to explore the reflective narratives of MBA students who travelled to Germany in June 2017 and addresses the following research question: *How does an international study tour support MBA students' learning experience?*

The structure of this paper consists of the following sections: First, the problem, research objectives and hypothesis are presented. This is followed by a literature review, which begins by outlining the *a priori* theory used as a conceptual lens for this paper. The literature review continues with a brief overview of strategies of internationalisation in developed countries and South Africa, a conceptualisation of internationalisation in business education and an overview of international study tours. Thereafter, a brief description about the context of this study, sampling, data collection procedures and analysis are discussed. The analysis includes an interpretation of the data and follows with the implications for business school management. Finally, the conclusions are presented, which includes the limitations of the study and avenues for future research.

2. Problem Investigated

Many researchers have paid attention to the transformational learning practices that lead to international awareness, knowledge spillovers and reflection among business students (Leal-Rodríguez & Albort-Morant, 2019; Stern & Powell, 2020; Kosnikov et al., 2021). Excursions to learn and see foreign companies' operations, including technologies driving future developments enhance students' knowledge of opportunities and challenges in the global business environment. By applying Kolb's learning cycles (Kolb, 1984, 2015; Kolb & Kolb, 2017), the knowledge gained through concrete experiences, such as participation in international industry excursions lead students to grasp global concepts, which are reinforced by reflection of their experience.

In this line, the promotion of experiential learning programmes into curricula allows business students to comprehend theoretical concepts better and to operate at a global level. Knowledge spillovers originate from an (initial) stock of knowledge that is continuously updated and extended via experiential learning, in this case experiential learning through International tours (Lattacher et al., 2021). Therefore, the problem statement of this research is that the learning experience of MBA

students from international study tours for South African business schools to facilitate knowledge acquisition, cultural intelligence and critical thinking has been under-explored.

3. Research Objectives

The research objective of the study was “*To gain deep and rich understanding of the second-year MBA students’ learning experiences from an international study tour*”. The secondary research objectives were as follows:

- To explore whether the international study tour experiences enhanced the knowledge transfer from the classroom to the students’ international management capabilities;
- To explore whether experience-based practices promote business school students’ cognitive knowledge growth; and
- To explore whether experience-based practices promote business school students’ socio-cultural intelligence.

4. Hypotheses

Experiential learning presents positive externalities for the MBA students, but also for business schools and other areas of social sciences, such as economics and entrepreneurship (Kosnikov et al., 2021). This study hypothesises that international tours are based on the perception that experiential learning programmes form part of transformational learning, which improves students' learning and experience (Kuechler & Stedham, 2018; Kosnikov et al., 2021). In this study, the written narratives (reflective essays) of eleven second-year MBA students were thematically analysed, which aids in gaining a rich understanding of their learning experience during their international study tour in Germany during June 2017. The themes that emerge from the analysis will underscore that internationalisation strategies should be positioned as a central part of the business education curriculum.

5. Literature Review

5.1. Theoretical Perspective

The Experiential Learning Theory (ELT) stems from the work of Dewey (1897, 1938) and Kolb (1984), who argued that learning is a dynamic, multi-dimensional and circular process, which leads to increased human adaptability. Furthermore, ELT is widely used in the management discipline and an appropriate guiding framework in the context of this study, as student international study tours (a form of field trips) is commonly associated with experiential learning in curricula (Gomez-Lanier, 2017; Stern & Powell, 2020).

ELT emphasises the role that experience exerts on learning, from the action of grasping to transformation. The action of grasping in ELT is cyclical, which includes concrete experiences, reflective observation, abstract conceptualisation and active experimentation (Kolb et al., 2001; Kolb, 2015; Kolb & Kolb, 2017). Concrete experiences refer to the knowledge acquisition through participation, followed by reflection of the experience to determine methods of approach. Abstract conceptualisation is the process whereby students integrate reflections, observations and experiences toward a logical theory followed by active experimentation that includes new avenues of decision making (Gomez-Lanier, 2017; Stern & Powell, 2020).

Against this background, ELT involves the translation of direct experience to reflection and new learning. For example, an empirical study about experiential learning practices in a Spanish Business School found that the inclusion of the methodology increased students understanding and competencies as their performance revealed that they were able to bridge theory and practice (Leal-Rodríguez & Albort-Morant, 2019). In addition, research conducted on a study tour to India by a group of final-year Information Systems students found that the study visits coupled with industry excursions enhanced students’ understanding of local culture, ethics and local social norms, through their lived experiences on the tour (Hol et al., 2016). Thus, the experiential learning cycle is

advocated as a methodology that offers a holistic experience that can enhance learners' inductive abilities and cognitive growth.

5.2. Strategies for Internationalisation of Higher Education (IoHE)

Internationalisation is a key change agent in developing and developed economies (De Wit & Deca, 2020). In response, international organisations, such as the World Bank, UNESCO, OECD and higher education institutions (International Association of Universities and European Universities Association) have prioritised internationalisation in their reform mandate (de Wit & Deca, 2020; de Wit & Altbach, 2021). Countries leading in IoHE are Europe (EU), Canada and the USA (de Wit et al., 2015). These countries have advocated that internationalisation promotes inclusion and cultural awareness and have been intentional in their process of integrating international, intercultural and global dimensions into their post-secondary education. Table 1 shows various strategic approaches undertaken by these countries.

Despite differences in the internationalisation strategies of countries, synergies are observed in their philosophies. For example, there are principal philosophies, such as internationalisation at home, student mobility, student and staff exchange (Department of Education and Skills, 2016; DHET, 2017; Department of International Trade Diversification, 2019).

Table 1: Strategic Approaches by Europe, Canada and the USA

		Building on Success: International Education Strategy 2019-2024		

On the African continent, South Africa holds a pivotal position for student mobility as it attracts a high number of students from the Southern African Development Community countries (Bhandari et al., 2011; Lee & Schoole, 2015). The South African government's efforts to promote internationalisation commenced with the restructuring of the higher education sector (Bhandari et al., 2011) and includes the ministry of Higher Education and Training and Basic Education. Furthermore, the government promulgated the Draft Policy Framework for Internationalisation of Higher Education in South Africa in 2017 (DHET, 2017). Table 2 provides an overview of the strategic approach.

Table 2: Strategic Approach by South Africa

South Africa	Strategic Approach	Description	Literature Source
Department of Higher Education and Training (DHET)	Draft Policy Framework for Internationalisation of Higher Education in South Africa	National framework for internationalisation of higher education whereby HEIs can develop and align their institutional policies and strategies. The rationale is as follows: <ul style="list-style-type: none"> To position the higher education system to be competitive in a globalised world; To advance the quality of higher education; and To benefit society and enhance opportunities for higher education to contribute to the public good. 	DHET, 2017, p. 19

5.3. Conceptualising Internationalisation in Business Education and Entrepreneurship Education

The twenty-first century has created significant changes in the global economy, which has necessitated the need for higher education institutions, such as business schools to develop leaders with differentiated business capabilities (Hawawini, 2016; AMBA, 2019; Ghani et al., 2021). As a response to the need for global leadership competencies, business schools apply internationalisation strategies to equip students with the skills necessary in a global business environment. Similarly, internationalisation strategies distinguish business schools and increase their competitive advantage, which boosts accreditation, global rankings, student demand and revenue (Guillotín & Mangematin, 2015; Hawawini, 2016). Additionally, internationally accreditation bodies, such as the Association of MBAs (AMBA) and the European Foundation for Management Development (EFMD) states that internationalisation of higher education is proven to promote quality education and a response to globalisation (AMBA, 2019; Borsetto, 2021; EFMD Global, 2022).

Business education follows an interdisciplinary practice, which includes various functional areas, such as strategic marketing, operations management, financial management and accounting (Kosnikov et al., 2021). This form of education also expands into other areas of the social sciences, such as economics. Thus, the nature of business education is that it transcends borders and often applies comparative studies to understand how businesses interact in the macro and international environment. For instance, developing economies are becoming important in the global arena, which requires business educators to coordinate curricula that extend knowledge on the heterogenous nature of developing countries as markets expand.

Globalisation has reduced trade barriers and boosted technological progress, which has afforded small and medium sized enterprises to access the supply chains of overseas companies. This opportunity has allowed modules such as entrepreneurship to integrate international elements into its teaching (Gonzalez-Perez & Leonard, 2015; Kosnikov et al., 2021). In line with the SDGs, entrepreneurship education, which includes innovation is becoming an urgent area for contemporary research and teaching. Entrepreneurship is a driving force for job creation, innovation and economic growth and supports pillar eight of the SDGs, which aims to “*promote inclusive and sustainable economic growth, employment and decent work for all*” (United Nations, 2015). In developed economies, small businesses account for over 90% of all formal businesses and contribute significantly to GDP, while creating employment (World Bank, 2020). Therefore, entrepreneurship education cannot be taught using traditional pedagogies, which increases the need for business schools to increase experiential learning programmes that incorporate international exposure to present business students with modern and relevant knowledge acquisition (Hol et al., 2016).

5.4. The Importance of International Study Tours

Business schools include international study tours to meet internationalisation priorities and Ortiz (2004) explains that this form of experiential learning is a unique method to function in the global economy. International study tours may be non-credit bearing, credit bearing or part of a Global Immersion Programme (Brennan & Bae, 2018b). Some MBA programmes include the international tour as part of an elective course and expect students to include a reflective report, which integrates their observations and experiences (Stern & Powell, 2020).

Thus, the mobility of students, through international study tours creates both learning opportunities and knowledge transfer that result in the spill over of ideas, knowledge and experiences (Leal-Rodríguez & Albort-Morant, 2019; Stern & Powell, 2020). Dishman (2016) asserts that business school students need to engage in problem solving as a crucial competency for innovation and business operations. The interactions through international study tours allow for collaboration, which can lead to the sharing of challenges and present an opportunity to debate solutions across fields. For example, it is argued that connectivity and interactions allow for knowledge acquisition and create positive spill over effects in learning and innovation (Clarysse et al., 2014; Woolley, 2017; O'Connor et al., 2018). In economic terms, this results in a positive externality for the country of origin, which echoes the intention of internationalisation reform.

Business schools that underinvest in the international mobility of students can cause negative externalities for knowledge transfer, which influence a region and country's endogenous growth (Konno, 2016; Fujiwara, 2017; Ferraz et al., 2018). Furthermore, business schools need to package international study tours insofar that they meet the internationalisation reform agenda priorities and allow for cultural immersion, self-development and the appropriate knowledge acquisition for MBA graduates.

6. Research Methodology

6.1. Context and Sample

The current study used the reflective essays of eleven (n=11) second-year MBA students in a business school from a large public university in South Africa. All the MBA students who participated in the international study tour to Germany were informed of the study orally and in written format. The students travelled to Germany in 2017, as part of an experiential learning programme, which formed part of an entrepreneurship and innovation themed international study tour. The international study tour was non-credit bearing and was optional for the MBA students. However, there were specific criteria of acceptance onto the tour, such as the final assessment of their business plan, amongst others. The objective of the entrepreneurship and innovation theme-based international study tour was as follows:

“To expose students to new possibilities by visiting a variety of sectors. This trip must take them out of their 'comfort zones' - in other words, start them thinking about new fields or innovation in their existing field.” (Professor of Entrepreneurship)

Prior to departure, the responsible faculty member (Professor of Entrepreneurship) discussed the academic content, history of the destination country and cultural aspects to improve the student readiness for the tour. During the tour, the accompanying faculty (Professor of Entrepreneurship and Professor of Computer Science) supported the overall objectives of the programme to enrich the experience and applied reflective practises in the post-trip follow up phase. Essentially, summarising the academic staff support into three categories: providing clear tour expectations; subject matter preparation; and reflective practices. Figure 1 provides a summary of the structure of the tour after the acceptance phase.

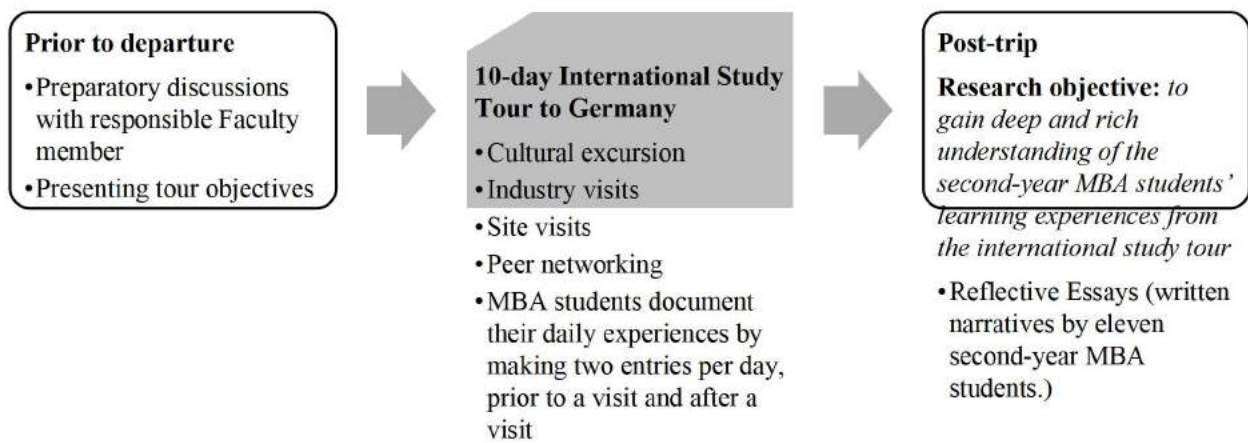

Figure 1: International Study Tour Summary Structure (Post-Acceptance Phase)

The final phase of the international study tour comprised of a reflective essay after their return. Reflective essays provide a narrated account of students' lived experiences, which provides a rich source of information about the educational experience and supports curricular improvement. Thus, the aim of the research was to gain deep and rich understanding of the second-year MBA students' learning experiences from the international study tour.

6.2. Data Collection and Analysis Procedure

The current study followed a qualitative approach and written narratives (reflective essays) were analysed using thematic analysis. The aim of the thematic analysis was to find patterns derived from the participants' perspectives, both their similarities and differences (King, 2004; Braun & Clarke, 2006). Prior to beginning the analysis, the student essays were collected and anonymised. The three authors' (S.B., M.C., A.C.) read the essays independently and coded segments of the text data using the participant perspective coding schema (Vaismoradi et al., 2016). Codes were labelled, defined and described in the initial iteration and an open coding schema was applied. Data were analysed deductively, using the semantic level and the approach was driven by the research question: *How does an international study tour support MBA students' learning experience?* Following the open coding, a codebook was developed after consensus was reached between S.B; M.C; A.C. Consensus was reached by encouraging the development and consideration of each contributor's unique perspective (Schielke et al., 2009).

After the codebook was developed, a theme search was performed. Codes were examined to see how well they fitted together to form a theme. Using Atlas.ti, a qualitative data analysis (QDA) software application, codes were created and organised using a colour scheme and allocated to a Code Group in the QDA software (Friese, 2016). Table 3 provides a selection of student quotations exported from Atlas.ti, which includes associated themes. Student quotations selected to illustrate the themes are provided in the Results (Section 4) section with pseudonyms, such as *MBA Student Female*. To increase the validity in the findings, S.B, M.C and A.C. discussed potential biases, the data analysis procedure and linked the findings to the current literature (Table 4).

Table 3: Sample participant quotations and themes (ATLAS.ti Scientific Software Development GmbH [ATLAS.ti 9 Windows], 2021)

Sample participant quotations	Participant Identifier	Major Themes
<i>Berlin became the deep tech cluster and businesses like Sirius minds is a prime example of how businesses who understand their interdependency on government, researchers and each other can thrive if they work together.</i>	MBA Student-Female Ref ID (1:2)	Applying Critical Thinking
<i>Interesting area, and again links back to the entrepreneurship ecosystem that we discussed at length in class. Really brings home the idea that once all the key pieces are in place such as transport, energy, water, government, funding, schooling and trades schools, venture capitalists and tech innovators are combined in a small space and given access to each other, things happen rather quickly!</i>	MBA Student-Male (Ref ID 9:9)	Applying Critical Thinking
<i>This company is a perfect example of that is possible if Government realise the potential of entrepreneurship. This company for me can help decrease the failure rate of start-ups as many problems can be addressed and ironed out before the company is even started.</i>	MBA Student-Female (Ref ID 2:3)	Applying critical thinking Applying Cross-Country Comparisons
<i>The greatest learning for me as someone who works with small businesses was the support system they get from different organisations such as Sirius Minds. If our government and business were to support and fund such initiatives, the chances of success for our start-ups would be greatly improved</i>	MBA Student-Female (Ref ID 11:7)	Applying Cross-Country Comparisons
<i>What stood out for me is the patriotism and optimism of the German people who have a past almost as difficult as ours to overcome but have grown in leaps and bounds to create a united future Germany.</i>	MBA Student-Male (Ref ID 15:5)	Cultural Immersion and Sensitivity
<i>I like the controls that are in place, the cleanliness of the pump house and the non-chlorinated water, all very surprising for us. Surplus water and surplus energy seems to be a great asset to Berlin, and I can understand why opening a manufacturing operation in the outskirts of Berlin, makes sense</i>	MBA Student-Male (Ref ID 9:6)	Gaining knowledge about destination country/company processes Applying critical thinking

Table 4: Relating themes to literature (S.B; M.C; A.C) for validity consensus

Theme	Theme Definition	Literature Support
Applying critical thinking	Refers to students' increased understanding of theoretical concepts through business seminars, site tours and presentations. Thus, leading to an increased understanding of theoretical concepts through experience-based practices, which means that students applies inductive and deductive reasoning by processing previous and new information.	Ortiz, 2004; Dishman, 2016; Hol, 2016; Gomez-Lanier, 2017; Brennan & Bae, 2018a; Leal-Rodríguez & Albort-Morant, 2019; Fedesco et al., 2020; Ghani et al., 2021
Cultural immersion and sensitivity	Refers to a students' exposure to a different country's local conditions, cultures, customs and social norms leading to a consolidated understanding about the foreign country. For example, the concrete experience provides students with a story leading to reflective practices for them to draw conclusions.	Hol, 2016; Hol et al., 2016; Brennan & Bae, 2018a, 2018b; Le et al., 2018; Park et al., 2018; Stern & Powell, 2020
Revealing self-awareness and development	Refers to the personal and social development, which is a product from experiential learning programmes. For example, higher degree of motivation, autonomy and academic performance.	Ortiz, 2004; Hol et al., 2016; Gomez-Lanier, 2017; Larsen et al., 2017; Brennan & Bae, 2018b; Ryan & Deci, 2018
Applying cross-country comparisons	Refers to students' acquisition of knowledge of the host country way of doing business. In entrepreneurship theory, such knowledge acquisition leads to positive spill over effects in learning and innovation.	Clarysse, Wright, Bruneel & Mahajan, 2014; Woolley, 2017; O'Connor, Stam, Sussan & Audretsch, 2018
Gaining knowledge about destination country/company processes		

Additionally, a global overview of the frequencies of the codes (themes) was created, and, *albeit* a quantitative approach, it assisted to easily locate the density of codes. This was achieved by using the *Code-Document Table* function in Atlas.ti. The Code-Document Table revealed the number of code labels and the absolute number of quotations (Kalpokaite & Radivojevic, 2019).

Codes that were repeated in a patterned way in multiple cases were grouped to establish a theme. The judgment was based on the comparison of codes that revealed links between codes to allow for the nomination of themes. Themes were descriptive as they described the general pattern in the data to address the research question and five major themes were developed: (1) *Applying Critical Thinking*; (2) *Gaining Knowledge about Destination Country/Company Processes*; (3) *Applying Cross-Country Comparisons*; (4) *Cultural Immersion and Sensitivity*; and (5) *Revealing Self-Awareness and Development*. The network diagram in Figure 2 provides a broad overview of the five major themes and semantic links extracted from the reflective essays, which is driven by the research question: *How does an international study tour support MBA students' learning experience?*

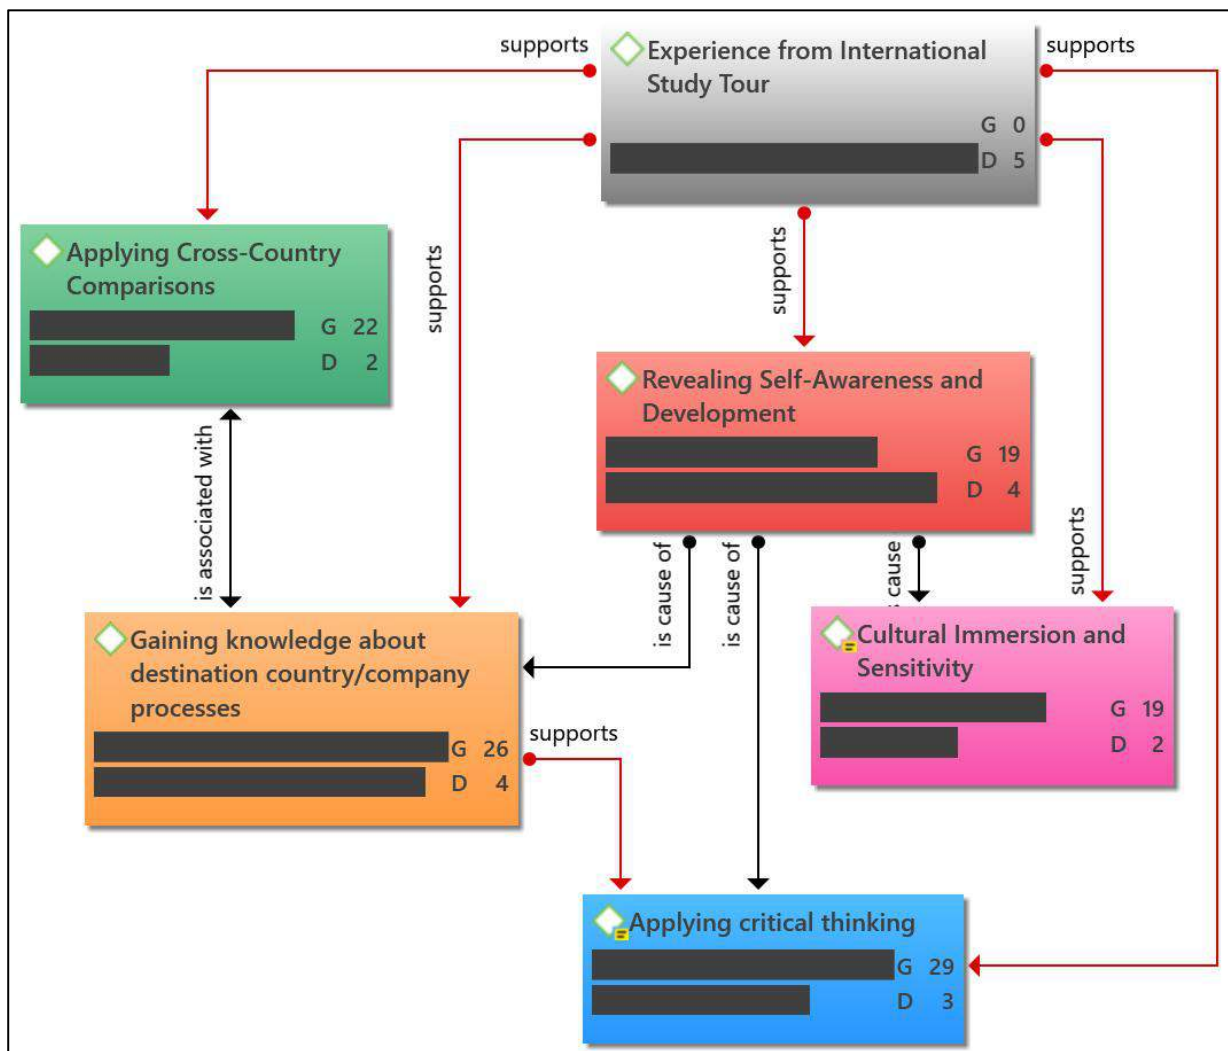

Figure 2: Major Themes (ATLAS.ti Scientific Software Development GmbH [ATLAS.ti 9 Windows], 2021)

7. Results and Findings

Five major themes describing the students' learning experiences from the international study tour to Germany were developed. The students expressed these themes repeatedly and they made similar statements about them. All MBA students reported positive experiences in their reflective essays and the themes were developed from the accounts of their excursion to industries, seminars with industry professionals and cultural experiences, such as visiting historical sites. Overall, the MBA students showed a strong appreciation of their international study tour.

7.1. Theme: Applying Critical Thinking

A major challenge for business schools is to develop a curriculum that presents a holistic overview of conditions in the market that relates to the social, legal, economic, political and technological dimensions (Ortiz, 2004; Hol et al., 2016; Gomez-Lanier, 2017). Business students need to engage in

problem solving as a crucial competency for innovation and business operations (Dishman, 2016). Most of the MBA students stated that the direct experience from industry visits, business seminars and cultural excursions created learning opportunities on topics affecting South Africa's endogenous growth, both positive and negative externalities. Thus, showing their ability to critically reflect and connect with the entrepreneurship curriculum. One participant stated the following:

“Berlin became the deep tech cluster and businesses like Sirius minds is a prime example of how businesses who understand their interdependency on government, researchers and each other can thrive if they work together.” (MBA Student Female_lines 2:4)

As previously stated, the students reported an ability to connect concepts from their entrepreneurship module, leading them to critically reflect as expressed in their essays. They expressed links to the economic issues prevalent in South Africa, such as poor targeted government policies. In fact, students were able to link previous seminars on topics of hidden champions to their exposure on the international study tour. Three excerpts are provided, which act as data evidence:

“IHP (which struck me as one of the “hidden champions” we had heard about earlier in the year.” (MBA Student_Male, lines 8:2)

“If our government and business were to support and fund such initiatives, the chances of success for our start-ups would be greatly improved. This together with the spirit of collaboration found between Slubice and Frankfurt Oder would go a long way towards contributing to a greater economy.” (MBA Student_Female, lines 11:8)

“But the concept is very good and stimulates innovation. The fact that the rent is low for start-ups and that these businesses are fostered was quite an incredible concept.” (MBA Student_Female, lines 2:6)

7.2. Theme: Gaining knowledge about Destination Country/Company Processes

The students' essays highlighted that innovation was a central driver to Germany's success and indicated that the country focuses on innovative processes in their business models. In their reflective essays, the students explained that companies that were visited were innovative in their operations. One site visit, to a company in the steel and mining sector provided students with a factory tour followed by a presentation with a question-and-answer opportunity. All the students complimented the technology employed in terms of processes, the sustainability measures in place as well as the level of automation replacing labour what is deemed labour-intensive in South Africa. One feature of the entrepreneurship course is on Industry 4.0 and students were able to apply theory to practice in their reflective accounts. Three excerpts are provided, which are representative of the students' reflective essays:

“The ‘technology’ employed for potable water production at the Water Purification Plant bowled me over. Yes, it is true that Berlin has an abundance of groundwater, but for the fact that they do not use chemicals to purify their potable water was just amazing for me.” (MBA Student_Female, lines 3:9)

“The first company we visited was ArcelorMittal, one of the biggest companies in the manufacture of steel. It was breath taking to notice how steel is manufactured. I would have expected to see a massively labour-intensive plant but, surprisingly, there were few labourers, and the plant is techno-driven.” (MBA Student_Male, lines 1:6)

Furthermore, the entrepreneurship course teaches students about the importance of networks as a catalyst for co-creation, which can lead businesses into the supply chains within specific sectors. Students' are taught that connections can create spinoffs as well as knowledge spillovers (Brown & Mason, 2017; Stam & Spigel, 2018). The site visit to Deutsche Bank afforded the students an opportunity to learn and see how a German bank supports local entrepreneurs to improve their competencies, networks and promote their services or products. The following excerpt is taken from a student who reflected on the site visit to Deutsche Bank:

“The workshops for expats that the bank offers and the functions that they host I found genius. The level of interaction and going the extra mile to have that personal relationship with their customers, even giving them space (for free) to promote their products is super innovative.” (MBA Student_Female, lines 2:17)

7.3. Theme: Applying Cross-Country Comparisons

The entrepreneurship and innovation course teaches MBA students that formal institutions have a twin ability to reinforce or weaken local economic development (Fuentelsaz et al., 2019). The concept of reinforcement is linked to high quality government bureaucracy and policy and the opposition of weak policies. The narratives from the reflective essays showcased that the MBA students acknowledged the economic and socio-economic challenges faced by Africa and reflected on the value of stakeholders, such as government to facilitate economic development. The following quotations are representative of the students’ comments:

“The collaboration between government parastatals, agencies and institutions with corporate was exemplary. The dynamics are different than here in South Africa; but they showed how efficient one can be when they have the right people in place.” (MBA Student_Male, lines 16:1)

“The greatest learning for me as someone who works with small businesses was the support system they get from different organisations such as Sirius Minds. If our government and business were to support and fund such initiatives, the chances of success for our start-ups would be greatly improved.” (MBA Student_Female, lines 11:6)

“I also found the co-operation between businesses, public organisations and universities quite amusing. Something that we can learn as a country.” (MBA Student_Female, lines 10:6)

The narratives indicated that the international study tours allowed students to critically compare the status quo in South Africa with Germany. A product of such exposure can lead to opportunities and knowledge transfer that result in the spill over of ideas, knowledge and experiences (Leal-Rodríguez & Albort-Morant, 2019; Stern & Powell, 2020). In particular, the critical comparison can result in a positive externality for the country of origin.

7.4. Theme: Cultural Immersion and Sensitivity

Students reported that they enjoyed the opportunity to experience a foreign culture, indicating that the excursions to historical sites enhanced their understanding of local culture and social norms. In addition, students positively described the architecture and cuisine, which played a role in immersing themselves into a different culture. Students also showed sensitivity in learning about German history, the effects from the World War and the strides the country has taken to bridge the past. The following quotes are representative of the students’ comments:

“Wow, the church and the church gardens were magnificent. The whole town was majestic and the art and detail inside the church was way over the top, but an experience to see.” (MBA Student_Female, lines 2:11)

“German history is very interesting, it has a strangely familiar but fading pain that comes up as they tell it and yet the Germans do not shun it, but they embrace it. It is almost as though these old buildings and monuments have been reduced to mere spectators to how far the nation has since come, and telling the history it is not painful for them anymore.” (MBA Student_Female, lines 3:4)

The entrepreneurship course teaches students about the role of culture and social norms on developing entrepreneurial attitudes and behaviour (Kibler, Kautonen & Fink, 2014; Fritsch & Wyrwich, 2014, 2018; Fritsch, Obschonka & Wyrwich, 2019). Culture is explicated as a catalyst for individuals to start a business and the following quotation is representative of the students’ reflections, which underlines the social norms in Germany:

“During these visits I began to appreciate the German system of enabling and creating opportunities for all. I always believed that Germany was a very individualistic society, it is actually quite a collectivist society and very open to the world.” (MBA Student_Female, lines 14:6)

Against this background, international study tours present an opportunity for students to experience a foreign culture, business dynamics in a foreign business environment and improve their cultural intelligence (Brennan & Bae, 2018a).

7.5. Theme: Revealing Self-Awareness and Development

International study tours present an opportunity for students to experience a foreign culture, business dynamics in a foreign business environment and improve their cultural intelligence (Brennan & Bae, 2018a). Thus, the expectation of experiential learning programmes, as they pertain to international study tours is a combination of personal reflection (inward and outward) and self-development. Several reflections from MBA students focused on their self-awareness and development. Three students described their experiences as follows:

“I recommend that the Business School should continue to pursue such international study tours as they will enlighten the students about how the first world countries operate. This will enable the students to tap into the good things that are done by developed countries with a view to address some of the challenges that are faced by our emerging economy.” (MBA Student_Male, lines 1:10)

“I came away from there pondering what true innovation meant, versus what being a merchant of goods already produced meant. Are we being innovative? Can we be? Or are we only following others and simply being the man in the middle between the buyers and the sellers.” (MBA Student_Male, lines 9:11)

“It was obvious that the German culture is not one of entitlement or “sit back and wait until someone else gives me a handout”, but rather of “what can I do today to make this work”.” (MBA Student_Female, lines 2:24)

By having the opportunity to engage on international study tours the students showcased an increased self-awareness, which is a product of cultural immersion, new knowledge acquisition and critical reflection. According to Ghani et al. (2021), leadership capabilities are formed through immersion into the local conditions, which enriches their cultural understanding and cognitive knowledge growth. Thus, international study tours are geared towards developing critical thinking, industry and peer networks and adding to broadened views of economic markets and local regulations.

8. Managerial Implications

Most management classes in MBA curricula are taught using traditional techniques, however subjects such as entrepreneurship cannot be limited to traditional pedagogies. Kuechler and Stedham (2018) assert that transformational learning, which includes a mindfulness practice are essential for MBA courses that are constantly faced with shifting worldviews. The current study aimed at understanding MBA students’ learning experiences during the entrepreneurship and innovation international study tour to Germany by analysing their reflective essays.

The results from the thematic analysis of the MBA students suggest experience-based practices, through international study tours is an effective method to develop their competencies. The discovery within the narratives allowed for five major themes to emerge, namely (1) Applying Critical Thinking; (2) Gaining Knowledge about Destination Country/Company Processes; (3) Applying Cross-Country Comparisons; (4) Cultural Immersion and Sensitivity; and (5) Revealing Self-Awareness and Development. Thus, the thematic analysis allowed the researchers to elicit meaning from the students and the essence of their experiences, which supported existing literature.

The participation in the site visits and excursions allowed the students to transfer the knowledge from the classroom to their management competencies. For instance, the students integrated the

entrepreneurship concepts to their site visits insofar that they were able to reflect on challenges prevalent in South Africa. Thereby, students were able to conduct cross-country comparisons in the current business environment.

Furthermore, international tour experiences can provide business graduates a competitive advantage as they learn about the local environments of the countries' visited as well as the business expectations of those countries and regions. For example, one student stated: *"But the concept is very good and stimulates innovation. The fact that the rent is low for start-ups and that these businesses are fostered was quite an incredible concept"*. Herein, the student was able to critically connect the concept of targeted policies in Germany as a growth incentive to promote entrepreneurship and show a comparison to the situation of weak enterprise promotion policies in South Africa.

By having the opportunity to engage, students can increase their self-awareness and resilience so that they are equipped with skills required to deal with unfamiliar circumstances. Additionally, 21st century recruiters and organisations seek business graduates that have problem solving and negotiating skills, which are shaped by different conditions, cultures and behaviours. By participating in international study tours, students can learn how to operate in a different cultural setting and acquire differentiated business capabilities, so that they can swiftly respond to unique and unexpected circumstances (Hawawini, 2016; AMBA, 2019; Ghani et al., 2021). In this line, business students who engage in international study tours develop a better understanding about global concepts, which in turn equip them with the leadership and managerial competencies that adapt to culturally diverse contexts (Le et al., 2018; Park et al., 2018).

The findings from this study contribute to management education by exploring the lived experiences of a group of South African MBA students. In particular, the findings reveal that traditional pedagogical approaches of passive learning are outdated and leadership of business schools are well advised to implement complementary pedagogical strategies aimed at enhancing business students' competencies in line with global economic needs. For example, international study tours should be compulsory component of MBA programmes through cross-collaboration with overseas partners.

9. Conclusions, Limitations and Future Research

The product of experiential learning programmes in business education, such as international study tours, expose students to market economies outside of their country of origin. Thus, the outgrowth of the experience is to stimulate their worldviews and in a globalised economy, business graduates need to have the capabilities to intersect theory with practice. An objective of the study was to explore whether MBA students' international study tour experiences enhanced the knowledge transfer from the classroom to the students' international management capabilities and to gain a deep and rich understanding of the second-year MBA students' learning experiences from an international study tour.

The research study findings indicate that the MBA students' benefit from the international study tours. For example, the participants indicated a significant cultural immersion, which supports literature regarding benefits from immersion in a foreign culture. Findings further support that the collaborative site excursions, observations of local cultures and reflective notes were an integral part of the experiential learning. Overall, the participants expressed appreciation for the learning experience. ELT involves the translation of direct experience through reflection to create new knowledge. The findings support ELT, which emphasises the role that experience exerts on a student's learning and includes concrete experiences, reflective observation and active experimentation (Kolb et al., 2001; Kolb, 2015; Kolb & Kolb, 2017). Reflective writing, which was the basis for the study involved experiencing something, reflecting and analysing the experience and then learning from the experience which was achieved in this study tour.

The limitations of this study are that the findings are based on a small sample size (n=11) of MBA students from a business school in a South African University and the recollections of their lived experiences may change over time. Therefore, the findings cannot be generalised as their reflections

may not represent other MBA students from other universities, *albeit* the narratives provided rich descriptions and the methodological process was suitable. Future research should aim at replicating this study in a different institutional setting in order to validate the study's findings. Similarly, researchers should explore best practises of the diffusion of experiential learning programmes in curricula as a response to the call for increased global leadership competencies from business schools. In light of the global shocks from the COVID-19 pandemic, it is advised that leadership and educators of business schools should undertake research on innovative pedagogical approaches to study international study tours combined with new technological learning and teaching advances.

Do University Employees Practice What They Preach? Evaluating The Value of Internal Communication

Mrs Adri Meyer^{1,*}, Mrs Carly Smith²

^{1,2}University of South Africa, Pretoria, South Africa

Keywords

Internal communication, E-newsletters, Employee Engagement, Information and Knowledge Management, South Africa, Technology Acceptance Model

Abstract

In a world of information, misinformation, news, and fake news, the value of reliable information has never been more important. Information that originates from large organisations is constantly being shared with customers and employees and the assumption is that all the information is being consumed, believed, and acted on. The aim of this research article was to explore if university employees practice what they preach when it comes to reading and engaging with written communication. This article explores the value of internal e-newsletters by exploring the perceptions of university employees regarding how much they engage with internal communication and how useful they find the content therein. Using a quantitative research approach and a cross-sectional design, the research paper applied variables from the technology acceptance model (TAM) to explore university employee engagement with an internal newsletter. Results indicate that although university employees do perceive internal e-newsletters as useful, they do not regard engaging with internal communication as important for their job. The paper concludes with opportunities for future research in the field of internal communication in a post-Covid-19 world.

1. Introduction

In this age of globalisation and digitisation, institutions like universities along with corporate organisations have to engage employees to ensure the smooth functioning of operations. Keeping employees engaged for better performance and reaching institutional objectives is often achieved through a formal internal communication system like internal emails, corporate newsletters and even departmental messaging like WhatsApp group chats (Ali, Sabir & Mehreen, 2019:764). Internal communication enables improved employee performance via improved employee engagement (Ali, et al.: 2019:767). In contrast, poor communication causes disengagement, which becomes a barrier to employee performance, morale and motivation. Therefore, the value of disseminating organisational information to employees, is significant as it assists in fulfilling organisational objectives by providing the right information to employees at the right time, improving the performance of daily tasks, increasing productivity and positively influencing job improvements (Berndt & Tait, 2014:95,–97; Habib, 2017; Men, 2014:256; Rezaei, Rezaei, Zare, Akbarzadeh & Zare, 2014:1208). The institutional knowledge transferred via internal communication like newsletters enables employees to perform their operational tasks and to fulfil organisational goals (Happ, 2021; Kinzey, 2013:156; Smith, 2013:254; Trivellas, Akrivouli, Tsifora & Tsoutsas, 2015:239; Vidgen, Sims & Powell, 2011:93).

A common complaint across higher education institutions across the world is that students do not read the communication sent to them. In the case of distance education for example, students are required to read through study material, engage on websites via a learning management system (LMS) and familiarise themselves with rules of study before submitting assessments; and the common outcry by academics is that students do not read the instructions (Dunham, Lee, Adam & Persky, 2020:1053-1054). The question that this paper seeks to address is whether or not the university employees read the internal communication sent to them, find it useful, or ignore written communication like some of their students do?

*Corresponding Author

In one of the largest higher education institutions in South Africa, the preferred internal communication channel is the electronic newsletter (e-newsletter). E-newsletters provide organisational information to employees and are considered one of the most useful communication channels for increasing efficiency and morale in the workplace (Habib, 2017). E-newsletters particularly cater to the sentiment as explained by Hannah (Goldman, 2018) that ‘the mobility, speed, and accessibility of news and information have transformed the way we communicate in our everyday lives. In an academic environment, e-newsletters are commonly used to communicate with both students and employees. Communicating with employees of academic institutions is essential considering that they represent the mechanism that moves the entire organisation (Pastae, 2016:178). Although higher education generates a substantial number of internal e-newsletters, the literature lacks evidence of their perceived usefulness and how much university employees engage with the content of these e-newsletters.

Since internal communication is known to increase the level of employee engagement (Ali, et al., 2019:775), it is in the best interest of an institution to understand the communication needs of employees in order to feel more engaged, but also to understand the effectiveness of the e-newsletter in terms of its usefulness (Kinzey, 2013:156; Smith, 2013:254; Vidgen et al., 2011:93).

The purpose of this article is, therefore, to explore the perceptions of university employees regarding how much they engage with internal communication and how useful they find the content therein. Ultimately, the paper will consider if university employees practices what they preach when it comes to reading and engaging with written communication.

2. Literature Review

2.1. Internal communication

Communication within an organisational setting is known as internal communication, which is the management of communication and the resulting interactions between stakeholders of the organisation regarding organisational matters (Mazzei, 2014:83). Men & Stacks (2014:256) posit that internal communication enables employees of an organisation to share information, form relationships, build organisational values and culture, and assist in achieving organisational goals and objectives (King & Lee, 2016:2667; De Lange & Mulder, 2017:29; Slabbert, 2018:130). Furthermore, internal communication can be utilised to align the behaviours and attitudes within the organisation in delivering a uniform service to the customers (Garas, Mahran & Mohamed, 2018:80).

There are, however, also barriers to effective internal communication that may constrain employee engagement. Barriers to effective internal communication include a lack of transparency and authenticity. Transparency refers to the extent to which information is shared with employees to make informed decisions (Men & Hung-Baesecke, 2015:450). Transparent communication also fosters trust amongst employees towards their organisation through being truthful or useful, having the buy-in from employees and being balanced, objective, and accountable. Authenticity refers to aligning actions to one’s true self without explicit consideration of others (Men & Hung-Baesecke, 2015:451). Internal communication should ideally be authentic by representing the organisation and engaging with employees by providing truthful and respectful communication (Men & Hung-Baesecke, 2015:452). As such, the purpose of internal communication should go beyond only conveying information, but also include gaining acceptance and understanding from employees (Men & Hung-Baesecke, 2015:452). Internal communication, merits employees’ organisational commitment that in turn leads to job satisfaction and productivity (Men & Stacks, 2014:301; Slabbert, 2015:43; Verwey, Benecke & Muir, 2017:68; Woldearegay, Angelopulo & Teketel, 2015:3).

2.2. Internal e-newsletters

To convey the shared goals and objectives of an organisation, internal communication utilises various channels to communicate information to employees (Bourland-Davis & Graham, 2017:203). These internal communication channels include e-mails, face-to-face meetings, internal advertising, radio, bulletin boards, newsletters, videoconferencing, etc. (Men & Hung-Baesecke, 2015:449; Yildiz,

2015:46). Despite the numerous forms of internal communication channels, the focus of this research paper is on internal e-newsletters due to its versatility and low-cost advantages (Kaufman, 2016).

E-newsletters serve as a reliable communication method whereby employees' basic need for information to perform their daily tasks more efficiently, can be satisfied (Rezaei et al., 2014:1208; Yildiz, 2015:46). As indicated in a study by Yildiz (2015:46) individuals can only interact, engage and learn about organisational activities through internal communication, enabling successful achievement of organisational tasks and the efficiency of organisations. In support of this, a global study of 26 000 LinkedIn members has shown that 73% of the employees who work at a 'purpose-driven' organisation feel engaged when communicated with, and therefore feel their job matters (Lockley, 2017). Swink & Schoenherr (2015:72) take this notion further, indicating that, through an internal communication channel, information transfer of a single plan leads to more consistent and synchronised employee focus.

F-

The main advantages of utilising internal e-newsletters include (Celarity, 2018; EDK and Company, 2018; Habib, 2017; Happ, 2021; Johnson, 2016; Luzajic, 2016; SnapComms, 2018; Vulcan, 2018; Woodard, 2018):

- immediate, extensive and frequent dissemination of organisational information,
- providing updates, goals, objectives, policies, campaigns, special events and employee recognition
- boost employee engagement
- reducing information overload by using content targeting,
- decluttering the inbox, boosting the relevance of what appears in the inbox,
- giving insight into the organisational culture,
- breaking down barriers between employees, especially in large organisations with multiple departments.
- The low cost advantage,
- the possibility of sharing activities and resources,
- building relationships with employees, and
- versatility, in that they can contain an announcement or news.

Despite its advantages, disadvantages of internal e-newsletters may include the concern of information overload, which leads to employees adopting a filtering system, meaning that they only read what they believe is important to them (Desrochers, 2016). The filtering system even extends so far as to employees deleting internal e-newsletters before they are read, thus employees ignore organisational information (Bacak, 2015; Forneris, 2018; Huang, 2018; Williamson, 2017). Alternatively, communication inefficiency refers to a lack of communication which leads to employees mistrusting the organisation because information about organisational matters is left to the imagination of the employees (Grossman, 2016).

2.3. Significance of internal e-newsletters in academia

In recent years, higher education institutions experienced significant changes, and subsequently, experienced more pressure in a highly competitive environment for students, academics and resource allocation. These higher educational changes include access to the higher education, massification, international benchmark processes, increased demand for internal and external quality assurance, changes in pedagogy due to technology enhancements, quality research outputs, changes in organisational culture and the increase in employees and student mobility (Council on Higher Education, 2016:28; Sabagh, Hall and Saroyan, 2018: 1). Accordingly, these changes have contributed to a demanding academic employment climate that poses challenges for professional development and institutional productivity (Sabagh et al., 2018:1). With the emphasis on access and massification to academic institutions, a greater number of employees are required to handle the more complex nature of activities that take place in higher education environments (Council on Higher Education, 2016:12). Keeping these higher educational challenges in mind, an academic institution in

South Africa, with an African focus and with many geographical wide-spread regional offices was chosen as the focus of the current study.

Seraphin (2018) points out that, although universities are unique organisations, they have similar hierarchies to other large and diverse organisations. For instance, the leader of the institution in academia is the president or chancellor which is the equivalent of the CEO in a typical private organisation. Other administrators (vice presidents, provosts and deans) represent top management. Faculty are the professional employees and mid-level managers (directors, department heads) are found at the center of organisations. Other employees are workers that range from administrative assistants, to computer experts, to custodians. The similarities to other complex organisations are greater than the differences, making the findings of this article applicable to a variety of types of large organisations.

2.4. Employee engagement

Employee engagement refers to the willingness of employees to invest their authentic selves in terms of their physical, cognitive and emotional selves in their work. This promotes connections with the workplace and stakeholders for a more conducive work environment (Nienaber & Martins, 2019:477). Engagement is identified as a determinant of organisational competency, improvement and efficiency (Ali et al., 2019:764). It is also related to fulfilment and a work-related mind-set through vigour, dedication and absorption (Kang & Sung, 2016:86).

Employee engagement is increasingly influenced by excellent internal communication, an innovative culture and a reputation for integrity (Kang & Sung, 2016:86). In particular, substantial and truthful communication is essential for the improvement of employee engagement (Ali et al., 2019:764; Men & Hung-Baesecke, 2015:460). Thus, internal communication, if used effectively, is essential in establishing a shared understanding and buy-in from employees and management alike. Shared understanding as well as employee's buy-in creates a more conducive environment for strategy implementation and in turn, organisational effectiveness (Nienaber & Martins, 2019:480).

2.5. Perceived usefulness of internal e-newsletters

According to the Technology Acceptance Model (TAM), acceptance of technology is determined by how useful and easy to use the system is, as perceived by the potential user (Davis, 1989; Iriberrri, Kwon & Henson, 2015:101). The objective of TAM is to examine why users' attitudes and beliefs influence their acceptance or rejection of information technology, looking at perceived ease of use (PEOU) and perceived usefulness (PU) of information technology (Elkaseh, Wong & Fung 2016:192). PEOU is defined as 'the degree to which a person believes that the use of a system would be free of effort' (Davis in Chauhan, 2015:60) and that 'less time spent on learning how to use an application means more time spent on using the application' (Aharony, 2015:139). PU is defined as 'the degree to which a person believes that using a particular system would enhance his or her job performance' (Davis in Camarero, Rodríguez & San José, 2012, 5; Wang & Sun, 2016:61). Lacka & Chong (2016:83) reiterate this by explaining that PU focuses on the individual's perception of whether the desired goal can be achieved while using specific technology. In other words, the more an application improves effectiveness within the organisation, the more the application will be considered helpful (Aharony, 2015:139). If a user perceives a specific technology as useful, this will most likely produce a positive user-performance relationship. For the purpose of this research paper, focus was placed on the PU construct of the TAM model and applied to internal e-newsletters in an academic environment.

3. Research Methodology

This exploratory study adopted a quantitative approach with a cross-sectional design whereby data was collected from employees at a South African higher education institution utilising an online survey. A margin error of 5% and confidence level of 95% were deemed acceptable when considering a population size of 5 656 (from the institutional employee database). The minimum number of employees required to respond to the survey was calculated at 357 respondents. Systematic sampling was utilised, which resulted in a sample that was almost random (Zikmund, Babin, Carr & Griffin,

2013:397). Every 16th name (calculated based on sampling interval calculations) on the institutional employee database was selected and invited to participate in the study.

In order to establish if university employees actually read the internal communication (Int_Com) and whether they found it useful to the performance of their duties, the instrument was designed using Likert scales, allowing respondents to report on the importance of specific characteristics of the internal communication. An online survey tool collected data which was exported to an Excel sheet and cleaned. The data for the study was analysed using basic descriptive statistics as well as Exploratory Factor Analysis utilising the Statistical Package for the Social Sciences 25 (SPSS 25). The validity of elements of the TAM, specifically 'perceived usefulness' were also tested with exploratory factor analysis.

3.1. Sample

The resultant sample for the study consisted of 403 respondents. The majority of the respondents were female (59.6%, n = 240) while 35% (n = 141) were male (5.5% declined to indicate gender). The research revealed that 57.3% of respondents have been employed at a higher education institution for 10 years or less and 31.5% have been employed at a higher education institution for more than 15 years. Almost half of the respondents were aged between 46-65 years (49.5%), followed by the age category of 36-45 years (26.8%).

4. Results and Findings

4.1. Exploratory factor analysis (EFA): Perceived Usefulness (PU)

The KMO measures the sampling adequacy (which determines if the responses given by the sample are adequate or not) and should be 0.5 or higher for a satisfactory factor analysis to proceed. Kaiser (in Watson, 2017, 232) suggests that a KMO value of 0.5 can be considered as the bare minimum (barely acceptable), anything between 0.7 and 0.8 as acceptable and anything above 0.9 as superb. The KMO measure indicated for Perceived Usefulness (PU) in Table 1 is 0.926, which indicates that the data is well suited for an EFA. Bartlett's Test of Sphericity (also indicated in Table 1) revealed a Chi-Square figure of 2975.178 and $p < .000$ confirming that there were patterned relationships between the items.

Table 1: KMO and Bartlett's Test: Perceived Usefulness

Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		.926
Bartlett's Test of Sphericity	Approx. Chi-Square	2975.178
	df	21
	Sig.	.000**
** Significant at the $p < .001$ level		

Source: Authors' own compilation

When evaluating the communality of the items, 92% of the variance (illustrated in Table 2) in the statement 'Using the information from 'the e-newsletter increases my productivity' is accounted for in the EFA. Furthermore, 88% of the variance can be accounted for within the statement 'using the information from the e-newsletter improves my job performance'. All statements accounted for at least 84% of the variance.

Table 2: Communalities within Perceived Usefulness

	Raw	
	Initial	Extraction
Using Int_Com improves the quality of work I do	1.121	.877
Using the information from Int_Com gives me greater control over my work	1.118	.889
Int_Com supports critical aspects of my job	1.126	.878
Using the information from Int_Com increases my productivity	1.129	.921
Using the information from Int_Com improves my job performance	1.045	.884
Using the information from Int_Com makes it easier to do my job	1.080	7.875
Overall, I find the Int_Com system useful in my job	1.102	.845

Source: Authors' own compilation

In terms of the total variance explained, (Table 3) all of the variables listed relating to perceived usefulness loaded on the same factor thereby accounting for 79.89% of the total variance.

Table 3: Total Variance Explained: Perceived Usefulness

	Component	Initial Eigenvalues			Extraction Sums of Squared Loadings		
		Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
Raw	1	6.168	79.892	79.892	6.168	79.892	79.892
	2	.422	5.463	85.355			
	3	.325	4.215	89.570			
	4	.294	3.813	93.384			
	5	.210	2.724	96.108			
	6	.170	2.208	98.316			
	7	.130	1.684	100.000			

Source: Authors' own compilation

In addition, it can be highlighted that item five in the matrix, 'using the information from the e-newsletter improves my job performance' showed to have the highest factor loading. Furthermore, all the scores were similar in their factor loading strength, indicating that respondents responded positively to questions regarding the usefulness of the e-newsletter.

Table 4: Component Factor Matrix: Perceived Usefulness

	Raw	Rescaled
	Component 1	Component 1
Using Int_Com improves the quality of work I do	.937	.885
Using the information from Int_Com gives me greater control over my work	.943	.891
Int_Com supports critical aspects of my job	.937	.883
Using the information from Int_Com increases my productivity	.960	.903
Using the information from Int_Com improves my job performance	.940	.920
Using the information from Int_Com makes it easier to do my job	.935	.900
Overall, I find the Int_Com system useful in my job	.919	.876

Source: Authors' own compilation

The outcome of the TAM is usually an indication of the intention to use the technology in question. For the purposes of this study, the instrument also considered the behavioural intention to use the Int_Com as well as the perceived importance of the use thereof by using descriptive analytics to describe the respondents' perceptions. Respondent perceptions are illustrated in Table 5.

Table 5: Descriptive statistics of adapted TAM

Construct	Mean	Std. Deviation	Cronbach's Alpha
Attitude and behavioural intention to use Int_Com	3.71	0.69	0.92
Actual use of Int_Com	4.15	0.81	0.803

It is clear from Table 5 that respondents recognised the importance of using Int_Com (Mean of 4.95), yet their intention to actually use it was much closer to a neutral value of 3 (Mean 3.71).

5. Discussion

The EFA demonstrated that the variables making up the construct PU loaded heavily to the same factor, reinforcing the validity of the construct. It becomes clear that university employees can see the value in the internal communication and recognise that it has the potential to improve their productivity and job performance. Counterintuitively, the item that reflected on the actual perceived usefulness of Int_Com in their day-to-day activities loaded the least heavily on the factor (Overall, I find the Int_Com system useful in my job). It appears that university employees can clearly identify value in internal communication, but they are not sure that it is currently useful to their jobs. It may well be that university employees see the Int_Com as having *potential* usefulness, but they do not wish to expend the energy in making use of the tool. It is also necessary to consider communication fatigue or overload for both employees and students. It is not uncommon to hear complaints of being "swamped" by too many emails or being unable to get to all the messages employees receive. It would be interesting to discover how students feel about the written communication that is provided to them as maybe they too recognise the usefulness thereof, but do not always feel it is currently adding value to their studies. Students are also overwhelmed by messages from the university ranging from administrative text messages about finances and registration to multi-page emails about academic content.

University employees were also demonstrating contradictory behaviours in their attitudinal and behavioural intentions to use Int_Com versus their perceived importance of the use thereof. University employees rated the importance of using Int_Com as highly important with a mean value of 4.15, yet their behavioural intentions were much lower at 3.71- possibly indicating a case of "do as I say and not as I do".

6. Limitations

Findings from the present study should be considered in light of potential limitations. The study focused on the perceptions of respondents regarding the perceived usefulness of the internal e-newsletters, therefore only using one construct from the TAM model. The study was conducted within a single specific South African higher education institution only, therefore, this does not constitute a representative sample of all higher education institutions. Moreover, the nature of factor analysis does not allow for the full exploration of the e-newsletter and e-newsletters holistically, therefore, this study was also limited in the technique imposed.

7. Managerial implications and Future Research

The purpose of this study was to explore the perceptions of university employees with regard to how much they engage with internal communication and how useful they find the content therein. The findings clearly indicated that while employees agreed to the overall value of the internal communication, they were not convinced of the usefulness to their daily work. This implies that there is room for improvement in the 'marketing' of the internal communication to staff. One of the basic principles of marketing is to tailor the product to the consumer's needs, and by applying the same logic to the internal communication, it can be argued that the institution should design the internal communication to address the needs of the staff members. Content could for example be adapted to reflect 'just-in-time' information nuggets that are useful to staff at a specific moment in time. Common deadlines, urgent policy changes, or

adjustments to registration dates are just some examples of information that staff may find more relevant to their daily tasks, if such information was presented in the internal communication. Since the data was collected prior to the global COVID-19 pandemic, the relative importance of internal communication may have changed since then. At the start of the pandemic in 2020, numerous businesses in all industries underwent necessary communication shifts. In order to meet the needs of rapid technology changes and remote working policies, organisations often had to adapt to new internal communication strategies (Defilippiks, Impink, Singell, Polzer & Sadun, 2022:180); and had to rethink how they communicate with a geographically dispersed employee compliment.

It is proposed that internal communication plays a more important role than ever before in keeping organisations connected and employees engaged. Internal communication that can reduce the distance-gap between remote working staff and the organisation will result in improved morale, motivation, and feelings of connectedness. Remote working conditions will require more creative means of attracting staff attention, the use of video and multimedia in internal communications may be one possible solution, while adjusting the frequency of communication may be another. Internal communication in a post-covid reality will need to be more employee-centric in order to improve on the perceived usefulness to daily work and technology allows for customised, personalised messages that could be tailor-made for individual departments, schools or colleges. A social-media styled approach that allows for two-way communication will increase employee engagement and allow for knowledge sharing and collaboration in a way that was never possible with electronic newsletters alone. In many organisations, a common problem is email fatigue resulting from too many emails being received on a daily basis, and all too often, internal communications are one of the items that are ignored or placed on a to-do list that is never completed. A managerial imperative going forward, should therefore be to investigate the filtering mechanisms of employees and to design internal communication in such a way that filters are bypassed. Employees should recognise the value in the internal communication and prioritise reading it. Berry (2020) reports that 60% of employees use mobile apps to conduct work while off-site. Higher education institutions could consider the use of an app to facilitate their internal communication. Apps allow for push messaging that can deliver timeous reminders, invitations and critical information. It is necessary for organisations to continually examine their internal communication strategies and, therefore, the main suggestion for future research is to replicate this and related studies on internal communication in an academic environment following the COVID-19 pandemic. The importance and potential changes of internal communication in the post-pandemic world should ideally be investigated for the smooth continuation of business processes and organisational alignment, especially in a working-from-home and working remotely environment.

Further suggestions for future research are:

- to provide insight on the predictive nature of items included in the survey used in this study. In addition, a Discriminant Function Analysis (DFA) along with step-wise Logistic Regression can be performed to illuminate whether the presence of the e-newsletter or the presence of e-newsletters may indeed predict positive or negative behaviour among employees at the same and other higher education institutions within South Africa.
- to focus on both constructs from the TAM model (PU and PEOU) in order to get the holistic picture of university employees' behavioural intention and actual use of internal e-newsletters.
- to investigate how managers/organisations can formulate e-newsletters differently to increase their usefulness for employees.
- to explore employee 'filters' when it comes to incoming communication

8. Conclusion

This research paper explored the value of internal communication in an academic environment. In order to determine whether university employees practiced what the preach, the purpose of this paper was to explore if university employees perceived internal e-newsletters as useful and if they engaged with the content within the internal e-newsletters.

The results indicated that university employees' do perceive internal e-newsletters as useful, yet they do not regard engaging with such internal communication as important for their jobs. University staff did, however, express the attitudinal and behavioural intentions to make more use of such communication. Based on these findings it could be concluded that university employees do indeed practice what they preach, albeit with some caveats. Finally, when considering that this data was collected prior to the start of the COVID-19 pandemic, the main future research suggestion is to duplicate this study, and internal communication research studies alike, to explore the trends and best ways forward for employees to fully utilise and engage with internal e-newsletters in a post-COVID-19 environment.

^{2,3} DHET-NRF SARChI Entrepreneurship Education, University of Johannesburg

Keywords

Business schools; Education; Fourth industrial revolution; MBA; Skills for future.

Abstract

The world of work is rapidly changing due to extraneous international and local conditions. These conditions include aspects such as the Covid-19 Pandemic and the advancement of modern technology ushered by the 4th industrial revolution. Business schools have a strategic role in developing the skills required for leaders to succeed in challenging business landscapes. This study explores the skills necessary for the 4th industrial revolution and international and local business schools' focus on these skills. This study reviewed related literature to identify the skills required for the 4th industrial revolution. This included a review of the top-ranked international and South African business schools to identify the current MBA focus areas. These were compared to identify alignment and/or gaps to provide managerial recommendations. The study found that the skills required for the 4th industrial revolution could be classified into four primary groups: work readiness skills, soft skills, technical skills, and entrepreneurial skills. Further findings revealed whilst there is a similar focus on soft skills for both international and local business schools, there is a distinct gap between the focus on technology-linked technical skills in the current South African MBA. Furthermore, from the literature reviewed, it was evident that technology-linked technical skills were the most sought-after skills in the 4th industrial revolution.

1. Introduction

The business and economic landscape of the 21st century has been riddled with complexities for traditional business. Aspects such as the Covid-19 pandemic, international political instability and the advent of technology, and increasingly prominent interest in aspects such as the 'internet of things' (IoT), artificial intelligence (AI), and machine learning have alluded to the premise that the 4th industrial revolution is not a theory prophesized by futurists, but rather a reality that businesses must adapt to. For Ghobakhloo (2018), the 4th industrial revolution or industry 4.0 as it is commonly known, is currently upon us, and for businesses to remain relevant and sustainable, they need to embrace the revolution and find creative ways to thrive within it or fail by holding onto traditional business practices. However, in addition to the 4th industrial revolution, the nature of business has fundamentally changed. Walker and Lloyd-Walker (2019) suggest that the new world of work is characterised by several changing variables, including increased competition, increased technological development, and changing demographics. Researchers such as Dasi *et al.* (2019) classify the changing nature of work according to the VUCA principles, which argue that business is volatile, uncertain, complex, and ambiguous (VUCA).

As the business landscape moves into a world of increasing complexity, the skills required in the future will be essential in terms of an organisation's success. The World Economic Forum (2016) adds that the skills required for the 4th industrial revolution range from technical expertise to cognitive

³ E-mail address: cecilen@uj.ac.za

expertise, and one of the most important skills that will be required for the future world of work is creativity, as creativity will be one of the primary areas that distinguish humans from machines. However, in addition to skills such as creativity, skills such as emotional intelligence, complex problem solving, and entrepreneurial mindset will be required in the new world of work (World Economic Forum, 2016). Bughin *et al.* (2018) add that the most relevant skills for the future world of work include digital skills, leadership, and entrepreneurship, as organisations must be far more agile in much more complex operating environments.

Business schools have a significant role to play in developing and cultivating the skills required for the future. Sewchurran (2019) contends that the traditional Masters in Business Administration (MBA) degrees have decreased in stature due to being removed from the realities of the current and future world of work. White (2018) and Seedat (2019) propose that the modern MBA should move away from the traditional focus, develop the skills required for the future world of work and should consider the changing business landscape. The manager of the future requires a unique set of skills which will allow them to succeed in a world of uncertainty and limited predictability and, as such, needs to draw on aspects such as complex problem solving, critical thinking, entrepreneurship, imagination, and creativity (Bughin *et al.*, 2018).

2. Problem Investigated

As the world of work continuously changes due to factors such as the 4th industrial revolution and the Covid-19 pandemic, the skills required for the future world of work may differ from previous periods. Business schools are perceived to play a critical role in developing the skills and competencies required for the working world. This study investigated the skills required for the changing world of work and the current MBA focus areas of a sample of South African and International business schools.

3. Research Objectives

This study explores the skills necessary for the 4th industrial revolution and international and local business schools' focus on these skills. This was done by reviewing related literature and curriculum content from several local and international top-ranked business schools to identify the skills required for the 4th industrial revolution. This included a review of the top-ranked international and South African business schools to identify the current MBA focus areas. These were compared to identify alignment and/or gaps to provide managerial recommendations.

4. Literature Review

4.1 Changing world of work and the 4th industrial revolution

According to a study published by Bughin *et al.* (2018), the skills required for the 4th industrial revolution and the future world of work vary significantly from those required a decade ago. Bughin *et al.* (2018) argue that skills that require basic cognitive ability such as data processing will sharply decrease, and skills such as adaptability, critical thinking, creativity, and entrepreneurship will increase greatly. Kazancoglu and Ozkkan-Ozen (2018) agree with the above in that the increasing reliance on technology and machines will result in less physical and basic cognitive requirements from employees. This will lead to a change in job profiles. Kazancoglu and Ozkkan-Ozen (2018) found that the workforce in the 4th industrial revolution will require much more focus on teamwork, problem-solving, and opportunity identification. The workforce of the future will move away from execution to strategic cooperation. This will affect the traditional hierarchical structures of a business and force employees to break down internal silos and focus more effort and energy on aspects such as innovation and new market penetration.

Morgan (2020) found that business complexity has continued to increase as there are several unknown variables that businesses must contend with to succeed. The introduction of the novel Covid-19 pandemic has resulted in increased disruption to business for many organisations, even further emphasising that change is needed in how we do business and the type of skills taught. This supports the premise that skills such as problem-solving, creative thinking, and analytical skills are required to assist individuals in dealing with the new world of work.

The Covid-19 pandemic is a global health contagion affecting hundreds of thousands of people worldwide. The virus is spread through human-to-human contact and has resulted in a change in human behaviour. The Board of Innovation (2020) regards this as the new state of the economy for the modern world. The coronavirus or Covid-19 has altered the way that business is done. It has resulted in reduced physical interactions, physical distancing, travel bans, limitations on gatherings and imposed lockdowns, and ultimately shutting down business as we know it in certain areas. All of this resulted in a new low-touch economy. Even though the introduction of vaccinations has reduced the magnitude of the virus, the result thereof has significantly changed how business is done. Some say even fast-tracked the progression of the 4th industrial revolution.

Morgan (2020) found that whilst in the 21st century, most companies had shared digital transformation objectives due to the 4th industrial revolution, the Covid-19 pandemic has forced businesses to accept and implement digital processes to remain sustainable rapidly. Unfortunately, this rapid forced change has left much smaller (and even bigger) businesses behind. Marr (2020) argues that it is imperative for businesses in the 21st century to rethink their business models and foster digital transformation to achieve a competitive position. The Board of Innovation (2020) has regarded this move as a pivot toward new business models, as traditional businesses are rethinking their current offerings in a new low-touch economy. Psaropoulos (2020) believes that the Covid-19 pandemic has forced employees, organisations, governments, and consumers to embrace digital platforms as a necessity for daily functioning. The necessity of moving onto digital platforms caused by the Covid-19 virus has spurred development that was required for individuals and organisations to partake in the 4th industrial revolution effectively.

4.2 Skills required for the changing world of work and the 4th industrial revolution

As the world of business changes, new skills and competencies are required in the workplace. Business schools need to understand the changing world of work and produce future-fit students who can function optimally in a changing business landscape. PWC (2019) argues that the role of business schools and universities will also change with the introduction of the 4th industrial revolution. Business schools and universities need to act as critical centres of thought leadership that develop the skills required for the new world of work but also centres of innovation that continuously feed new ideas into the business world. For a business school to remain relevant, they need to be ahead of the change expected in business. This can be achieved through continuous research, which is then interpreted and translated into revised, updated, and adaptable course curricula (Seedat, 2019). Deloitte (2018) suggests that the skills landscape of the 4th industrial revolution differs greatly from the skills set required a decade ago. Human-centred aspects such as creativity, automation, leadership, and negotiation are growing as core skills required for the future world of work. Deloitte (2018) classifies the skills required for the 4th industrial revolution within four broad categories: readiness skills, soft skills, technical skills, and entrepreneurship. According to Deloitte (2018), workforce readiness skills could be categorised in terms of the skills required to achieve ongoing success in the workplace. These skills include aspects such as professionalism, time management, self-presentation, and digital literacy. Trkman (2020) defines soft skills as intangible traits and characteristics and argues that the most important soft skills required for the 4th industrial revolution include leadership ability, flexibility, adaptability, people management, creativity, and the ability to deal with pressure and uncertainty.

Persuad (2019) defines technical skills in the 4th industrial revolution as the understanding and ability to use new technologies, infrastructure, and analytics for business success. Rasaki and Abioye (2018) define technical skills as the competence and capabilities to use tools and techniques within a specified discipline or area. Deloitte (2018) contends that leaders will need to understand core technical skills that drive innovation in the 4th industrial revolution. These skills need to be understood from a functional perspective instead of a deep specialised level for leaders and managers as the 4th industrial revolution requires digitally capable and interdisciplinary managers. Entrepreneurial traits are also considered a critical skill in the 4th industrial revolution. Deloitte (2018) defines entrepreneurship in the context of the 4th industrial revolution as the abilities, competencies, and capabilities required to identify and nurture opportunities or ideas for business or social success.

The skills required to foster entrepreneurial capability include aspects such as initiative, innovation, resilience, creativity, curiosity, and risk appetite. Beliaeva *et al.* (2019) define entrepreneurial behaviour as the ability to identify and recognise opportunities that may create value and the ability to pursue those opportunities.

4.3 Value of a business school in the 4th Industrial Revolution

Business schools have been a resounding pillar of the knowledge economy for the last decade. They have assisted in progressively developing leaders that can cope and succeed in complex working and trading environments. Trkman (2020) suggests that whilst the business model of business schools has not changed significantly over the last 30 years, business schools remain credible institutions that provide immense public and social value to the communities they operate within and serve. This value is further characterised through teaching and learning activities as well as through research output. Koris and Aav (2019) assert that business schools and business education are believed to develop critical skills required to succeed in the world of business. They provide a foundation through various theories, case studies and practicals, allowing graduates to understand the world of business better. Sunley *et al.* (2019) add that studying in a business school provides significant opportunities for development, which expands further than intellectual development but also provides personal and professional development.

Soni (2020) asserts that the business landscape is changing due to the introduction of the 4th industrial revolution, and therefore the role that a business school plays should also change. Furthermore, in times of uncertainty, as witnessed with the introduction of the Covid-19 pandemic, the focus of business schools should also change. There is a need for a paradigm shift for business schools as the competencies and activities focused on in the 20th century are becoming irrelevant. Soni (2020) believes that the role of a business school in the context of the 4th industrial revolution is to develop graduates who understand new disciplines related to the changing times and business needs. Business schools should develop intellectual ability across disciplines and provide students with a globally focused mindset of best practice whilst remaining flexible to local contexts. Meziered (2016) purports that institutions of learning should become incubators for innovation and that higher education institutions need to move away from reacting to the 4th industrial revolution and become more involved in shaping the outcome of the revolution. PWC (2019) agrees with the findings of Meziered (2016) and adds that universities and business schools need to understand the changing nature of skills required by industry and ensure that they can produce graduates that manifest the skills required for the 4th industrial revolution.

4.4 Value of an MBA in the 4th Industrial Revolution

Marino *et al.* (2019) found that the MBA is regarded as a key developmental tool that provides professional competencies that allow individuals to be more successful in the business world. Muposhi *et al.* (2019) contend that the MBA is seen as a flagship programme by several business schools worldwide and similarly has the most gravitas of all business school degrees. Similarly, Marino *et al.* (2019) extend that the reputation of the MBA is widely recognised across the business world. Fisher (2019) adds that the MBA maintains a significant legacy as the qualification has existed for over 100 years. It is considered the leading business management programme for senior and executive managers. The MBA is, by nature, a generalist qualification that allows individuals to enhance critical skills and competencies related to business management. Whilst exact figures are vague and ambiguous, it is anticipated that over 500 000 professionals graduate from an MBA programme each year (Fisher, 2019).

Seedat (2019) asserts that the MBA qualifications could be of tremendous value in the 4th industrial revolution if it allows individuals to upskill in a multidisciplinary approach whilst fostering an understanding of digital and new technologies. This is, however, based on whether the MBA has been designed based on future-focused content and relevance. The business has changed, and for an MBA to be relevant, it needs to align with the business's changes. Oxford (2019) found that whilst the MBA has faced significant criticism, it is still regarded as a sound qualification that allows for the transfer of apt business competencies. The MBA was designed to assist leaders and managers in achieving

sustainable value within their businesses. This notion remains true today, and as such, the MBA is relevant as leaders in the new world of work still have a responsibility to provide value to their stakeholders. This, however, becomes even more complex in an increasingly changing business landscape. Therefore, for an MBA to hold value, it needs to evolve and embrace aspects such as technology, digitalisation, creativity, and innovation, as these are the skills required for leaders to succeed in the new world of work.

Shimpi (2019) purports that the value of the MBA in the 4th industrial revolution needs to be achieved by reviewing the current curriculum and redesigning the content specific to the changes in business, thus creating an MBA 4.0. This revision would be based on techno-managerial content allowing for the understanding and integrating of theoretical and applied skills for the 4th industrial revolution. Some business schools have progressively started redesigning their programmes to be more future-focused. However, several business schools still offer a traditional MBA. Barber (2018) argues that traditional business schools regard their MBA as transformative whilst they are based on tried curricula that are largely becoming irrelevant. The MBA's value is that it can develop industry leaders to become "masters of business administration tomorrow". However, to achieve this, the MBA needs to be practical, relevant, and geared for the changing world and changing skills required by the 4th industrial revolution. Stroufe (2020) argues that business schools should equip students with the tools to deal with increasing complexity and uncertainty in the workplace. These skills are needed to deal with challenging business terrains such as the Covid-19 pandemic.

It is therefore evident that business schools and the MBA are still seen as potentially valuable aspects as they are positioned to deliver change. However, for the MBA to provide the value it warrants in the 4th industrial revolution, it needs to be relevant, practical, and future-focused.

The current focus area of an MBA across most business schools worldwide is business management. Marino *et al.* (2019) classify the MBA as a generalist management programme that covers the major aspects of effective and efficient business management. Muposhi *et al.* (2019) assert that whilst the general manager in the 21st century has become more than just a general manager due to change and complexity, the current MBA's focus in South Africa consists entirely of general management skills.

4.5 Criticisms of the relevance of MBA programmes

Tan and Ko (2019) believe that the key criticism levied against MBA programmes is that they are largely becoming irrelevant. The MBA in the 21st century is developing skills that were required in the 20th century and are therefore misaligned with the needs of the business. In a study by Nakavachara (2020), the success of CEOs with MBAs was considered concerning CEOs without MBAs. The findings presented were that CEOs with an MBA do not perform better than CEOs without one. These findings called into question the relevance of the MBA in the 21st century as the skills developed did not significantly assist individuals to outperform their counterparts without the skills attained.

Jing *et al.* (2019), comparing international branches of business schools, found that the curricula provided in programmes such as the MBA in developing countries are almost a replica of curricula in developed countries. Whilst it is commonly understood that these business landscapes differ, having the same curricula often raises questions of relevance for programmes such as the MBA. Muposhi *et al.* (2019) have also criticised the MBA about African relevance, as it is often based on western curricula.

5. Research Methodology

This study made use of a qualitative research approach. A document analysis was used to gather information regarding the skills needed for the 4th industrial revolution and those that business schools are currently presenting. This method allowed for a critical examination of content collected from trustworthy and reliable documents, in this case, mostly from the websites of the selected business schools (syllabus content) and other documents related to the research objective. Bowen (2009) states that using this approach allows for an organised technique in which various documents

are reviewed to extract important themes based on the research question or problem. Additionally, Corbin and Strauss (2008) opined that this method could help advance the understanding of the topic. Document analysis is seen as a social research method; the rationale behind it is the triangulation of information. It is unobtrusive and, therefore, eliminates the possible bias from interactions with the sample audience. It also promotes contextual and conceptual investigation (Webb et al., 1999; Babbie, 2001; Berryman, 2019); verifying findings and information from different sources can create a convergence of information and strengthen credibility (Bowen, 2009).

To assess and review the current syllabus of leading MBA business schools, the top five MBA business schools globally and the top five MBA business schools in South Africa were selected from these respective ranking agencies. Their curriculum was reviewed to understand whether the focus areas of current MBA programmes align with the skills required for the 4th industrial revolution. The top five local and international business schools were selected using the rankings of two evaluation agencies.

Eduniversal (2019) is a global business school ranking and evaluation agency that has independently ranked over 1000 business schools in 154 countries. The methodology used by Eduniversal (2019) to rank business schools includes qualitative and quantitative criteria, and aspects such as students, accreditations, memberships, and partnerships are considered. In addition, another well-respected MBA ranking is the Financial Times MBA Ranking. The Financial Times MBA Ranking (2021) has ranked 129 MBA programmes. It follows a methodology that collects data from participating schools and alumni who have completed MBA programmes at these respective schools. The data collected includes information about individual career progression, aims achieved through the programme, quality and experience of faculty and overall satisfaction of alumni.

The two rankings' agencies were selected to review the ranking and syllabus of MBA programmes as this provided a more unbiased view and additionally because the Financial Times Ranking provides a more global focus, whereas the Eduniversal rankings provide dedicated continental rankings. Therefore, Financial Times rankings were used to identify the top five MBA business schools worldwide, and the Eduniversal rankings were used to identify the top five MBA business schools in South Africa. The selected business schools were anonymised to protect their identity and consequently referred to as business schools 1 to 5 (local) and business schools 1 to 5 (international).

6. Results and Findings: Business schools – international and local comparison

To understand whether current MBA programmes are offering the subjects required by the 4th industrial revolution, an analysis of the curriculum and focus of leading international and South African business schools was completed. This was done by reviewing the respective curricula content for the selected MBA programmes. The focus areas of top-ranked international and South African business schools are listed in Tables 1 and 2, respectively:

Table 1: Curriculum review – International Business Schools

7. Business school curriculum comparison preliminary findings

The findings from the analysis were as follows:

Figure 1: South African MBA curriculum focus areas – compulsory modules and electives

Figure 2: International MBA curriculum focus areas – compulsory modules and electives

Figures 1 and 2 represent the South African and international curriculum focus areas of reviewed business schools. The curriculum focus areas were categorised according to three key areas, modules relating to the technology or the 4th industrial revolution, modules relating to change or complexity and modules relating to entrepreneurship. These categories were used for this analysis as they align to

the areas of the critical importance of the 4th industrial revolution as suggested by Deloitte (2018). In addition, this analysis considered both compulsory and elective modules to assess whether the category areas were currently a focus area of South African and international business schools. If all five business schools had either a compulsory or elective module in a certain focus area, they would score 100%, whereas if only one business school had a focus on an area, they would score 20%. This analysis of the business school curriculum comparison aligned to specific themes is explored further in points 7.1 – 7.3.

7.1 Module relating to entrepreneurship

This theme explored whether the reviewed business schools offered either a compulsory or an elective module on entrepreneurship. It was found that 100% of the local business schools reviewed have a module in their MBA on entrepreneurship. Three of the five local business schools offer a module on entrepreneurship as an elective. Two of the five business schools offer this module as a compulsory module in their MBA programme. The focus of South African business schools on entrepreneurship was similar to the focus of international business schools. All the international business schools reviewed had either a compulsory or elective module on entrepreneurship. Three of the five international business schools offer a module on entrepreneurship as an elective, whereas two of the five business schools offer this module as a compulsory module in their MBA programme.

7.2 Module relating to dealing with change or complexity

This theme explored whether business schools reviewed have a focus on change or complexity in their MBA programme. A total of 80% of the international business schools have a direct focus on change or complexity, and 60% of them have a compulsory module on change or complexity. This is compared to only 20% of local business schools with a change or complexity module. In addition, the one local business school that currently has this module offers it as an elective.

7.3 Module relating to technology or the 4th industrial revolution

All the international business schools reviewed focus on technology or digital transformation, with 60% offering this module as compulsory. This is compared to 40% of business schools in South Africa, which focus on this area, and only two business schools offer this as a compulsory module.

The above suggests that whilst there is a correlation between international and local business schools in some areas, such as entrepreneurship, there are notable gaps in the focus of other skills required for the 4th industrial revolution. A key gap identified is the current focus on technology-linked technical skills dealing with change or complexity.

8. Discussion

The following findings are primarily descriptive with the support of figures and tables where necessary. The skills required for the 4th industrial revolution are notably different from those required in previous revolutions. While some of the skills may still be applicable, such as traditional management technical skills and soft skills, leaders need to understand aspects such as technology and entrepreneurship to leverage the opportunities presented by these skills into business success. Researchers such as Kazancoglu and Ozkan-Ozen (2018) contend that the skills required for the 4th industrial revolution include both technical and soft skills and emerging skills such as complex and critical thinking to deal with the changing world of work. Persuad (2019) adds that technical skills in terms of understanding and effectively using new technologies are an important skill for leaders in the 21st century as the 4th industrial Revolution has ushered in a new wave of technology that is shaping and influencing the way that business is done. Figures 2 and 3 compare South African and International Business School's focus areas.

Deloitte (2018) classifies the skills required for the 4th industrial revolution within four broad categories: readiness skills, soft skills, technical skills, and entrepreneurship. These categories were used to categorise and classify the skills currently offered by local and international business schools in Figures 3 and 4.

Figure 3: South African MBA curriculum focus – Core modules

Figure 4: International MBA curriculum focus – Core modules

When comparing the MBA curriculum's focus for local and international business schools, it was found that soft skills and work readiness skills bear a similar focus. There are variations between the focus on technical, technology, and entrepreneurial skills. Most notably, there is a significant variation in technology-linked technical skills between international and South African business schools. It was found that international business school MBA curriculums place far more emphasis on technology skills and entrepreneurial skills as part of their core curriculum when compared to South African business schools. Adversely, South African business schools focus more aspects of their curriculum on traditional technical skills. In addition, international business schools (except one) offer far more elective or optional modules than South African business schools. This could be cited as an intentional strategy for MBA students to design their own learning path which is relevant to their areas of focus or development. In the South African context, fewer optional or elective modules are offered.

There is a current disconnect as the literature, found that technology-related skills were the most required skill for leaders in the 4th industrial revolution. However, technology-related skills consist of only 4.2% of the focus of the current South African MBA curriculum, compared to a focus of 22.7% by international business schools. Similarly, South African business schools' current focus on entrepreneurial skills as a core module is 2.8% compared to 7.9% focus at international business schools. Furthermore, the findings from the literature show that technology-related-technical skills are regarded as the most critical skill required for the 4th industrial revolution. However, this skill is, on average underrepresented in the five South African business schools reviewed. A focus on technology-related technical skills should be seen as an important aspect for both South African and South African business schools. According to Rodrik (2018) technology could be used in developing countries to both improve social conditions as well as lead to sustained national GDP growth. In contrast in the Cisco Global Digital Readiness Index, South Africa ranks 78 out of 141 and reports that aspects such as technology adoption and technology infrastructure in South Africa are still left

wanting (Mzekandaba, 2020). A renewed focus on technology-related technical skills in South African business schools could assist in increasing the technology adoption rate and the potential use of technology for further growth and development.

This conclusion draws significant consideration relating to the efficacy of South African business schools in developing leaders fit for the 4th industrial revolution and indicates that South African business schools need to identify ways to enhance and ensure that their curriculum and programs, such as the MBA, are aligned to the need of the changing business environment and current and future stakeholders.

9. Recommendations and managerial implications

The study focused on reviewing five South African and five international MBA programmes offered in an attempt to determine if they include key critical skills required for the 4th industrial revolution. This study identified key skills required by leaders for the 4th industrial revolution, which was suggested through the literature reviewed. These skills could be broadly grouped into four categories, work readiness skills, soft skills, technical skills, and entrepreneurial skills.

This study found that whilst the current focus on soft skills in the MBA concerning the skills required for the future world of work is adequate, there are evident gaps in the technical skills required as suggested by the literature. This focuses on technology-related technical skills not adequately represented in South African MBA programmes but is considered a key skill for leaders in the 21st century. The lack of focus on technology-related technical skills was evident compared to international and local MBA curriculums. Furthermore, technology-related technical skills were the most common identified skills required for the 4th industrial revolution. Therefore, this study recommends a review of the current MBA curriculum and including critical skills related to the 4th industrial revolution, such as technology-linked technical skills.

10. Limitations and future research

A limitation identified in this study was the approach of this study. Based on curriculum content, this study reviewed 5 top-ranked South African business schools and 5 top-ranked international business schools. This study does not consider individual school strengths or focus on skills related to the 4th industrial revolution through in-depth case analysis and interviews. This may be considered a limitation, as some schools may have more adequately prepared their institution to provide current and relevant information skills. In addition, a limitation identified in this study was the sample size. Given that this study focused on 5 local and 5 international business schools, it may have inherently excluded (*based on rankings*) specific business schools with a more explicit focus on the skills required for the 4th industrial revolution. It is therefore recommended that for future research, in-depth qualitative interviews be conducted with all stakeholders relating to a business school to assess, understand and improve the efficacy of South African business schools in the 4th industrial revolution.

11. Conclusions

The business environment is changing rapidly due to external factors such as the Covid-19 pandemic, global political instability and the advancement of technology ushered by the 4th industrial revolution. Business schools have a strategic role in developing leaders that can respond to the changing business landscape to achieve business success. Programmes such as the MBA are regarded as flagship business offerings for executives and leaders to enhance their abilities and capabilities. Based on the literature and curriculum content reviewed, this study found that whilst there is significant perceived value in the current MBA offered by South African business schools, there are critical gaps in the approach adopted. This includes a lack of adequate focus on aspects such as technology-related technical skills and entrepreneurial skills. This study, therefore, recommends a review of the current focus of the MBA programme with a lens to include specific focus areas on technology-related technical skills and entrepreneurial skills. This will assist in cultivating leaders equipped with the necessary skills, competencies, and abilities to deal with the changing world of work and the 4th industrial revolution.

BUSINESS MANAGEMENT

The Influence Of Political Branding On Voter Intention In South Africa

Danie Ferreira^{1,*}, Marlé van Eyk²

^{1,2} Department of Marketing Nelson Mandela University Gqeberha South Africa

Keywords

Allegiance, Fanaticism, Political Branding, Voter intention.

Abstract

The aim of the research was to determine the variables of political branding that influence voter intention in South Africa (SA). Using exploratory research and a quantitative research paradigm, a survey was conducted using a structured self-administered questionnaire. The initial items used were self-generated and based on the work of Ahmed, Lodhi and Ahmad (2017) and Banerjee and Chaudhuri (2016). The measuring instrument was validated by conducting an exploratory factor analysis (EFA), whereafter the Cronbach's alpha values were calculated for each of the valid components to confirm inter-item reliability. Within the premise of political branding, three independent variables emerged, while two dependent variables emerged within the premise of voter intention. This exploratory study can be considered one of the first in SA to identify political branding variables used by voters when they cast their vote.

1. Introduction and problem statement

The global political environment is constantly changing and is regarded as extremely volatile (Gibson, 2019:5). Changes within the political sphere of a country can have devastating effects on the country's economy (Filippou, Gozluklu & Taylor, 2018:1741) and the way in which a country is governed, and the political party at the helm, can influence how a country is perceived internationally (Aisen & Veiga, 2011:1380). Due to the latter, the awareness of political branding amongst political parties has increased (Needham & Smith 2015). Political branding builds on the premise that political parties, candidates and the causes that they associate themselves with can be managed as products, and that these political entities can be managed and studied as brands (Milewicz & Milewicz, 2014:258).

Although theories used in political branding research come from various fields including politics, marketing and communication, Farhan and Ahmad (2015:344) believe that the concept of branding in politics is unexplored in contemporary research. Almohammad (2014:190) and Ahmed, Lodhi and Ahmad (2015:149) put forward that there are several similarities between the method that voters use to choose their political parties and the way they choose their commercial brands. This view confirms the sentiments of Smith and French (2009:215) who state that a consumer based cognitive learning approach should be adopted when parties consider how voters perceive the political brand. According to Cosgrove and Shrader (2022:49), if political leaders ran a campaign based on personal branding instead of a coordinated campaign including the political party's values, it will provide mixed results at the poll. Political parties are thus, more than ever, embracing the concept and strategies of brand management to make their political product attractive, appealing, trustworthy and differentiable. Parties nowadays intentionally create a basis for long-term relationships and provide sources to act as decision-making drivers. It is therefore important that political parties focus on shaping the voters' opinion and attitude to generate positive voting preferences (Butler & Powell, 2014:495) and ensure voter loyalty (Ahmed *et al.*, 2017:158). Similar to customer loyalty, voter loyalty is a behavioural impulse to buy (vote) repeatedly from the same organisation (political party) (Suaib, Jusoff, Abdullah,

Zuada & Suacana, 2017:1019). Slipetska (2021:18) asserts that, to create a strong and effective political brand, political parties should have a high quality visual political product, that is compliant with the political brand and values, which ultimately meets the needs of the target electoral group. Since the county's first democratic election in 1994, the political landscape in South Africa has become increasingly competitive (Mattes, 2012:140). South African citizens have a wide array of choices in political parties (Mattes & Richmond, 2014:154). The latter was evident in the 2019 national election, where 48 different parties successfully registered for the elections (Nemakonde, 2019:1). Hlungwani's (2021:vi) results indicate that communication alone is not enough to lure voters in SA, voters seek material benefits as well. Booysen (2014:15) and Dabula (2016:40) put forward that South African political parties lack understanding and expertise on political branding, specifically about how this can influence their election campaigns, voters' loyalty, trust and voting intention. Although the number of political parties has significantly increased in SA since 1994, little research has been conducted on political branding in SA, and political parties in SA lack expertise in political branding, especially on how it influences voting intention of voters. The latter has led to the research question of this exploratory study, namely: What variables shape political branding and which of these variables have an influence on voter intention in SA?

The primary objective of this study is thus to identify the variables that influence political branding in SA and determine which of the identified variables have an influence on voter intention. To achieve the primary objective of this study the following secondary objectives were developed:

- to conduct a literature overview on the importance of political branding, the variables that shape political branding and the variables that influence voting intention;
- to empirically test valid and reliable variables to measure political branding in SA;
- to empirically establish if, and how, these identified variables influence voter intention; and
- to provide conclusions and provide recommendations to political parties on how to use political branding to influence voters' intentions in SA.

2. Literature Review

A brand can be viewed as a "distinctive name and or symbol" and can be viewed as a differentiating feature in an increasingly competitive environment (Farhana & Ahmad, 2015:345; Gong, Wang, Yan, Liu & Ali 2020:1). Building on this definition, Kimbarovsky (2021:1) puts forward that a brand is not only distinctive through its name or logo, but it provides additional value based on aspects over and above its expected performance. A brand can thus be viewed as a dynamic interplay of strategically oriented elements used as a means of communication which represents the values, character and personality of an organisation, product or service (Peng & Hackley, 2009:180; Milewicz & Milewicz, 2014:236). A strong brand, therefore, should have a clear identity that resonates with both internal and external stakeholders (Pich & Dean, 2015:132). The concept of branding has expanded significantly from the fast moving consumer goods industries in which it was initially applied (Phipps, Brace-Govan & Jevons, 2010:496; Jacobs & Mafini, 2019:8), and is increasingly used in non-traditional, social markets such as politics (Smith & French, 2009:209; Smith & Speed, 2011:1316; Ahmed, Lodhi & Shahzad, 2011:31). Via their names and ideological postures, political parties are modelled as brands that send a message to voters and other stakeholders, such as sponsors. A party's past and current actions influence its brand image, and the personalities forming the party's leadership structure often account for whether or not such a party would be seen as a brand worthy of being patronized (Nwanganga, Peter & Mirian, 2017:3).

Although Farhan and Ahmad (2015:342) state that the implementation of branding in politics is under-researched, Grimmer and Grube (2019:269) note that in the last two decades, literature on political branding has developed its own distinct trajectory and is now viewed as a subfield of political marketing. Authors (Ahmed *et al.*, 2017:148; Pich & Dean, 2015:133; Slipetska 2021:25) agree that the concept of branding in politics is important for both practical and theoretical reasons. The practical reasons are related to economic as well as social cost associated with voting intention; with the theoretical importance being that it encourages researchers to study the factors behind the voters' or communities' thought process that influence their behaviour towards voting for a specific political party (Foos & Rooij, 2017:291). Despite this wide acknowledgement of the importance of

branding in politics, research on the concept of branding in politics is not well established and shows limited consideration regarding the extent to which political brand choices by voters can be conceptualised in relation to customer brands (Smith & Speed, 2011:1319; Almohammad, 2014:190; Milewicz & Milewicz, 2014:244). Based on the importance of the decision about which party to vote for in a democratic society, political parties are continuously concerned with gaining an understanding of the factors that influence their potential voters in making their decision (Banerjee & Chaudhri 2016:559).

Research by Banerjee and Chaudhri (2016:560), which was informed by an extensive literature survey, identified five key variables of associations with the overall political party, namely campaign effectiveness, image of its leaders, tenure effect, meaning and trust attached to the party. These five variables of overall association were explored in the current study by conducting an exploratory factor analysis (EFA) on the data collected. Based on the validity and reliability results, only three variables were deemed relevant for the current data set, namely the image of the party leaders; political brand meaning; and political brand trust. The remainder of the literature review will focus on the three variables of branding that emerged.

Brand trust is the expectations of a brand's reliability and intentions (of the party) in an uncertain situation (Delgado-Ballester, 2004:532; Geurkink, Zaslove, Sluiter & Jacobs, 2020:250). Purwanto, Deviny and Mutahar (2020:268) put forward that the primary objective in marketing is to develop an intensive connection between the brand and its customer, and trust plays the most noteworthy role in building this connection. It therefore comes as no surprise that research shows that trust is the core binding force in strengthening the relationship between political leaders and voters (Thanh, Ngo & Aureliano-Silva, 2021:4). Despite the view by Marland and Flanagan (2013:562) that politicians have increasingly embraced commercial branding techniques to grow trust in their political brands, researchers, such as Smith and French (2009:213) and Ahmed *et al.* (2011:133), note that prior literature points to the fact that trust in politics is declining. The decline in trust can be attributed to the various sources of the development of brand trust, for example candidates making promises during the election campaign which are not fulfilled once taking office, and a lack of transparency in policy-making which negatively affects trust in a party. Banerjee and Chaudhri (2016:560), however, are of the opinion that the political brand can offer the voter result oriented benefits such as safety and security, prospects of economic development, financial growth and improvement of quality of life to ensure trust in the brand.

Brand meaning refers to a distinctive and evolving emotional and cognitive understanding associated with a brand as a result of a publicly negotiated process (Tierney, Karpen & Westberg, 2016:914). Political brand meaning is, however, unique as the majority of voters never have the opportunity to meet any politicians, and therefore do not form their opinions directly and unfiltered (Phipps *et al.*, 2010:499). Voters thus have to depend on a lot of different sources of information (such as logos and party manifestos) to understand the brand meaning (Gong *et al.*, 2020:1; Banerjee & Chaudhri, 2016:561). These sources of information assist political parties to convey brand meaning in order to assist voters to build knowledge and make informed decisions when selecting a party to vote for. The transfer of party meaning is often influenced by the trustworthiness, knowledge and attractiveness of the political party leader (Gorbaniuk, Wilczewski, Ivanova, Bevez & Gorbaniuk, 2021:210).

Brand image refers to the "perceptions about a brand as reflected by the brand associations held in the consumer memory" (Keller 1993:3). Brand image is one of the most extensively researched themes in political branding studies (Grobaniuk *et al.*, 2021:211). A study by Khatib (2012) pointed to the importance of brand image in politics and states that a candidate's or a party's image can influence the success of political marketing. Accordingly, Guzmán, Paswan and Steenburg (2014:180) believe that voters see themselves, and the candidate, as a distinct brand. Farhan and Ahmad (2015:343) continue that this view of a voter's personal-brand influences their perception of a political candidate's brand image. The party leader often has the most impactful meaning, as leaders' image is more easily identifiable and communicated. A leader is, therefore, important in the transfer of his/her associations to the party brand. Leaders who are perceived to have a good reputation (Rachmat, 2014:61) and are

viewed as competent and knowledgeable are positively perceived and instil trust (Grobanuik *et al.*, 2021:211).

A political party is viewed as powerful when it has the support of the majority of the voters in a given area/country (Nwanganga *et al.*, 2017:7). It is therefore important for parties to ensure that their offering appeals to the relevant stakeholders. The simple fact that political parties invest substantial financial resources into their marketing campaigns suggests that they want to have some influence on voters' intentions which could be viewed as a return on their investment (Krupnikov, 2011:801). With regards to voting intention, two dependent variables were developed based on the works of Olson (2009), Thorne and Bruner (2006) and Cengiz and Cengiz (2016) to measure voting intention for this exploratory study, namely allegiance and fanaticism. After conducting the EFA both variables proved to be valid and reliable.

Brand allegiance is viewed as “the biased behavioural response expressed over time by some decision-making unit, with respect to one or more alternative brands out of a set of such brands” (Cengiz & Cengiz, 2016:425). Brand allegiance further has an influence on the repeat purchasing behaviour of customers and limits customers from switching to competitive brands. Needham (2006:179) argues that, similarly to business organisations, political parties need to focus on repeat business. This is particularly due to changeable and unpredictable political policies (products) (Grobanuik *et al.*, 2021:211). Contemporary consumers increasingly demonstrate public displays of loyalty and passion (Nyadzayo, Leckie & McDonald, 2016:888), and are more willing to go to extremes to pursue or support various firms, consumption activities or experiences (Chung, Farrelly, Beverland & Karpen, 2018:15). The devotion amongst these customers is significant, which manifests via their behaviour (Quach, Hewege & Thaichon, 2019: 325). Ahmed *et al.* (2017:150) highlight the important role of party allegiance in shaping the attitude and perceptions of voters. Chung *et al.* (2018:17) denote that there has been limited studies that examine allegiance in political branding.

Fanaticism is an intense form of loyalty that goes beyond the average, ordinary or common level (Samra & Wos, 2014:270). Fanaticism is often regarded as an individual temperament, a state caused by desperation and/or psychological instability that drives a person to engage in political activity that goes well beyond the mainstream (such as, for example, terrorism activities) in an attempt not to come to terms with an opponent, but defeat it (Olson, 2009:83). The result of an extensive literature review by Chung *et al.* (2018:24) show that research explicitly addressing the phenomenon of consumer fanaticism has been scant and reflects conflicting perspectives. Despite the fact that the vast majority of past studies have emphasized fanaticism as demonstrated through extreme activities and behaviour, a study by Thorne and Bruner (2006:59) provides empirical support that there are common characteristics of consumer fanaticism, which are not associated with negativity as was often reported. These four characteristics are internal involvement, external involvement, a desire for interaction with others and a wish to acquire source-related material. Therefore, while much of the existing literature is dominated by negative depictions of fanaticism (Thorne & Bruner, 2006:52), fanaticism can also be viewed as a strong, intense, extreme level of commitment (Chung, Beverland, Farrelly & Qeuster, 2008:333) that could serve as a strategy to achieve power (Olson, 2009:83). Based on the above literature the hypothesised model (Figure 1) was developed.

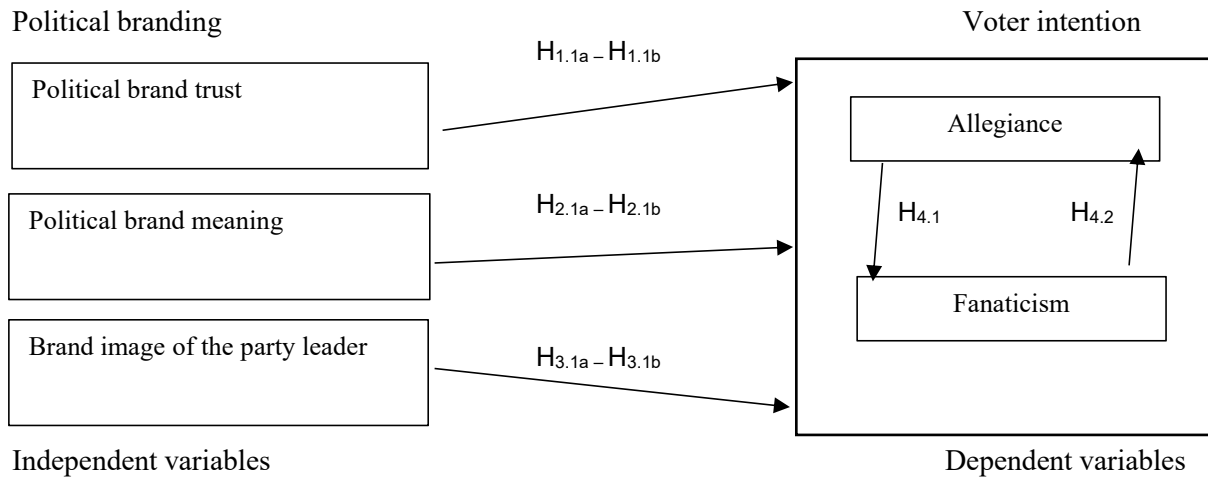

Figure 1: Hypothesised model

3. Results and Findings

Based on the hypothesised model (Figure 1) the variables that can possibly influence voters' loyalty are divided into four sets of hypotheses.

First set of hypotheses: The influence of political brand trust on voter intention

- H_{1.1a}: Political brand trust influences allegiance.
- H_{1.1b}: Political brand trust influences fanaticism.

Second set of hypotheses: The influence of political brand meaning on voter intention

- H_{2.1a}: Political brand meaning influences allegiance.
- H_{2.1b}: Political brand meaning influences fanaticism.

Third set of hypotheses: The influence of the brand image of the party leader on voter intention

- H_{3.1a}: The brand image of the party leader influences allegiance.
- H_{3.1b}: The brand image of the party leader influences fanaticism.

Fourth set of hypotheses: The influence of the inter-relationships between allegiance and fanaticism.

- H_{4.1}: Allegiance influences fanaticism.
- H_{4.2}: Fanaticism influences allegiance.

4. Methodology

The exploratory study sought the perceptions of the residents of a selected geographical area in South Africa and utilised the quantitative research paradigm. According to Struwig and Stead (2013:3), quantitative research is a useful tool to quantify behaviours, opinions and attitudes, thus assisting in answering the research questions of this paper. Furthermore, quantitative research is suitable for testing hypotheses and the results obtained from this method can be condensed into statistics, allowing precision and standardisation (Eriksson & Kovalainen, 2016:23; Plooy-Cilliers, Davis & Bezuidenhout, 2016:10).

For the purpose of this study, the exploratory research design was utilised. Exploratory research is concerned with clarifying ambiguous problems or gaining better understanding of a problem. Exploratory research is conducted when insight is needed into a problem, and the variables need to be considered (Aaker, Kumar & Day, 2017:156). Exploratory research, is also used in the understanding of underlying reasons, opinions and motivations of individuals. This research approach is predominantly used in analysing a problem about which there is little or no in-depth information (Jennings, 2010:17). Exploratory research can be carried out by using various methods which include the use of case analysis, focus groups or surveys (questionnaires) (Rahi, 2017:2; Struwig & Stead, 2013:7). The current research can therefore be viewed as exploratory, as it acquired insight into the influence of political branding on voter intention in SA. This research will serve as preliminary

research in preparation of a more structured research project, identify limitations and determine priorities for further research.

The initial items used in the questionnaire were based on the work of Ahmed *et al.* (2017) and Banerjee and Chaudhuri (2016). After an extensive literature review additional items for inclusion in the questionnaire were self-generated. A total of 20 items were included in the questionnaire. Respondents were asked to give their level of importance for the stated items, with 1 = unimportant, and 5 = utmost importance. The measuring instrument was validated by conducting an EFA, whereafter the Cronbach's alpha values were used to confirm inter-item reliability. As suggested by George and Mallery (2003:50), the study used the Cronbach's alpha cut-off point of 0.7 and higher to be considered as good. All items with a factor loading of less than 0.5 were disregarded for further statistical analysis. In addition, items with a factor loading of 0.5 or higher loading on more than one variable (cross-loading), were also disregarded (Zikmund, Babin, Carr & Griffen, 2009:594).

The sample design for this study was a combination of convenience sampling (any individual above 18 years and above, being an SA citizen) at a given location at a given time). A survey was conducted by means of a structured self-administered questionnaire. Screening questions were posed (all respondents had to be 18 years or older and be a South African citizen), and informed consent was secured. Respondents were also informed of the voluntary nature of participation and that they might withdraw at any point without any consequences. A total of 157 useable questionnaires were collected.

5. Results and Findings

A total of 157 respondents formed the sample of this study. Table 1 represents the demographic data of the respondents.

Table 1: Demographic information of respondents

Variable		Percentage
Gender	Female	52
	Male	48
Age group	18-23	17
	24-33	30
	34-43	20
	44-53	19
	54-72	12
	73 +	2
Ethnic affiliation	Black	57
	Indian	3
	Coloured	15
	White	25
Home language	Afrikaans	20
	English	21
	Xhosa	45
	Zulu	14
Employment status	Full-time employed	40
	Part-time employed	17
	Self-employed	12
	Unemployed	31
Level of education	Grade 12 and below	30
	Certificate	11
	Diploma	24
	Degree	18
	Post Graduate Degree/Diploma	17

As can be seen from Table 1, the gender of the respondents was almost equally distributed with females representing 52% of the sample. Half of the respondents was between the ages of 24 – 43

(30% + 20%). More than half of the respondents were of the Black ethnic group (57%), while 25% of the respondents were of the White ethnic group. With regards to home language, 45% of the respondents indicated Xhosa to be their home language, while 21% of the respondents were English-speaking. When reviewing the employment status of the respondents, it can be noted from Table 1 that 40% are full-time employed, and 31% of the respondents are unemployed. The educational background of the respondents shows that 30% of them has an educational level of Grade 12 and below, 24% holds a diploma qualification and 17% has a post graduate degree/diploma.

4.1 Data analysis

The following section of this paper discusses the results of the EFA construct extraction and Cronbach's alpha coefficients analyses employed to determine the validity and reliability of the measuring instrument used in this study.

4.1.1 Validity and reliability

This study made use of an EFA to extract the variables and to determine the validity of the measuring instrument. According to Van Voorhis and Morgan (2007:49), a sample size of 157 is considered acceptable for EFA as the minimum requirement for sample size accuracy for exploratory factor analysis is 150 respondents. The items with factor loadings greater than 0.5 and those that only loaded onto one factor were considered significant in this study. This is in line with what is suggested by Van Voorhis and Morgan (2007:50). Eigenvalues were calculated and utilised as the point estimates to determine which of the extracted variables were to be retained, with only those items with an Eigenvalue above 1.0 being retained (Cokluk & Kocak, 2016:540). In addition, all variables had to have at least three retained items, as a construct with fewer than three items is generally regarded as weak and unstable (Costello & Osborne, 2005:5). The retained variables and items were then assessed for reliability in line with the categorisations of the Cronbach's alpha coefficients (α). Cronbach's alpha coefficients of 0.7 and above were regarded as acceptable for this study. George and Mallery (2003:50) state that a Cronbach's alpha coefficient of 0.7 and higher is considered acceptable. Table 2 presents the validity and reliability results for the independent variables.

Table 2: Validity and reliability of the independent variables

Variables	M	SD	Eigen value	Factor loadings	Cronbach's alpha
Political brand trust	4.10	1.05	4.00		0.873
Is interested in me as a person and not just in getting my vote	4.09	1.07		0.733	
Is committed to listening to their voters' views	4.31	0.98		0.854	
Expedites the promises made by the party's electoral campaign after being elected	4.16	1.09		0.752	
Is concerned with the present and future interests of their voters	4.26	0.88		0.771	
Is transparent in sharing information	3.98	1.09		0.703	
Meets my personal expectations about the future of our country	3.97	1.10		0.528	
Shares my political ideologies	3.91	1.14		0.566	
Political brand meaning	3.60	1.16	2.41		0.774
Has an innovative logo	3.38	1.30		0.863	
Has an inventive slogan	3.52	1.27		0.861	
Has a clear party manifesto	4.17	0.91		0.549	
Receives favourable publicity in the media	3.54	1.08		0.523	
Brand image of party leader	4.30	0.93	4.55		0.877
Promotes youth leadership within the party	4.36	0.89		0.579	
Does not play the blame game with other	3.84	1.21		0.678	

Variables	M	SD	Eigen value	Factor loadings	Cronbach's alpha
political parties					
Is sincere	4.29	0.94		0.704	
Has a dynamic personality	3.84	1.00		0.627	
Takes into account the repercussions of his/her actions	4.26	1.05		0.622	
Avoids posting social media messages encouraging violence	4.40	1.06		0.719	
Promotes equal opportunities for all	4.55	0.83		0.647	
Is competent to become the president of the country	4.56	0.74		0.649	
Acts with integrity	4.68	0.67		0.701	

As can be seen in Table 2, the variable *political brand trust* retained all seven items designed to measure the variable, with factor loadings ranging between 0.528 and 0.854. The variable had an Eigenvalue of 4.00. The Cronbach's alpha coefficient of 0.873 indicates that the items measuring this construct are deemed reliable. The individual item mean scores ranged from M=3.91 to M=4.31, It is interesting to note that the items relating to the political party being interested in the present and future interest of the voters (M= 4.26) and the commitment of the party to listen to their voter's views (M=4.31) attracted such high mean scores. The variables had an overall mean score of 4.10, indicating that, on average, the respondents were in agreement with the items listed. The standard deviation for this construct was 1.05, which indicates that the responses are fairly similar.

As per Table 2, the variable *political brand meaning* had four retained items, all with factor loadings of above the 0.5 cut-off point adopted for this study. The Eigenvalue was 2.41 and the variable had a Cronbach's alpha coefficient of 0.774 which indicates that the four items measuring this construct are deemed reliable. The individual mean scores ranged from M=3.38 to M=4.17. The item with the highest mean score related to the party having a clear manifesto. The variable had an overall mean score of 3.60 (tending to 4) which indicates that, on average, the respondents were in agreement with the items measuring this variable. The standard deviation for this this construct was 1.16, which indicates that the responses are fairly similar.

The variable *brand image of the party leader* has nine retained items with factor loadings ranging between 0.579 and 0.719 and an Eigenvalue of 4.55 (as per Table 2). The Cronbach's alpha coefficient of 0.877 indicates that the items measuring this construct are deemed reliable. Individual item mean scores ranged from M=3.84 to M=4.68. Acts of integrity attracted the highest mean score (M=4.68), with the item relating to the party leader being competent to become the president of the country attracting the second highest mean score (M=4.56). The variable had an overall mean score of 4.30 which indicates that, on average, the respondents was in agreement with the items measuring this variable. The standard deviation for this construct was relatively low at 0.93, which indicates that the responses are fairly similar. Table 3 presents the validity and reliability results for the dependent variables.

Table 3: Validity and reliability of the dependent variables

Variables	M	SD	Eigen value	Factor loadings	Cronbach's alpha
Allegiance	3.83	0.95	2.36		0.765
Cast a vote for my political party even if my family is against it	4.35	0.85		0.749	
Defend my political party at social gatherings	3.77	0.98		0.838	

Variables	M	SD	Eigen value	Factor loadings	Cronbach's alpha
Recommend my political party to friends and family to join	3.94	0.95		0.723	
Invest my time and energy towards my political party	3.29	1.02		0.573	
Fanaticism	3.74	1.16	2.89		0.869
Remain committed to my preferred political party and its leader even after reading negative media comments about the party and its leader	3.63	1.15		0.588	
Stay loyal to my political party even if leadership changes to someone I may not personally like	3.86	1.10		0.792	
Vote for my political party even if other political parties provide better electoral campaigns	3.80	1.19		0.914	
Vote for my political party even if other political parties have leaders that I can relate to	3.70	1.22		0.924	

The variable *allegiance* had four retained items (Table 3), with factor loadings ranging between 0.573 and 0.838. The variable had an Eigenvalue of 2.36 and a Cronbach's alpha coefficient of 0.765 which indicates that the items measuring this variable are deemed reliable. Individual item mean scores ranged from M=3.29 to M=4.35, with the item "cast a vote for my political party even if my family is against it" attracting the highest score. The variable had an overall mean score of 3.83 which indicates that, on average, the respondents were in agreement with the items measuring this variable. The standard deviation for this construct was 0.95, which indicates that the responses from the respondents are fairly similar.

As per Table 3, the variable *fanaticism* retained all four items designed to measure the variable, as all had factor loadings above the 0.5 cut-off point adopted for this study. The Eigenvalue was 2.89 and the variable had a Cronbach's alpha coefficient of 0.869 which indicates that the four items measuring this variable are deemed reliable. It is interesting to note that the mean scores for all four items were quite similar, ranging from M=3.63 to M=3.86. The variable had an overall mean score of 3.74 which indicates that, on average, the respondents were in agreement with the items measuring this variable. The standard deviation for this this variable was 1.16, which indicates that the responses are fairly similar. In the section to follow the independent and dependent variables will be operationalised based on the validity and reliability results presented.

4.1.2 Operationalisation

Operationalisation is the process of conceptualising a concept, so that the concept can be clearly defined and outlined by a theoretical foundation (Williamson, 2016:1). Shuttleworth (2019:1) concurs and states that operationalisation is the process of strictly defining items into measurable variables. Cohen, Manion and Morrison (2007:81) indicate that operationalisation is needed to conduct good research, while Thompson (2017:1) is of the opinion that operationalisation is an imperative step, especially in conducting quantitative research. With the latter taken into consideration, Table 4 presents the operationalisation of the independent and dependent variables.

Table 4: Operationalisation of independent and dependent variables

Variable	Construct	Operationalisation
Independent	Political brand trust	Political parties expedite the promises made by the party's electoral campaign after being elected, while being concerned with the present and future interests of their voters and not just in getting their votes. The political party must be transparent in their dealings, listen to their voters' view and have similar expectations about the future of the country as their voters.
	Political brand meaning	Political parties have an innovative logo and inventive slogan, have a clear manifesto in place and receive favourable publicity in the media.
	Brand image of the party leader	A political party leader is sincere, acts with integrity and has a dynamic personality. The leader promotes equal opportunities to all, as well as youth leadership, within the political party. The party leader does not play the blame game with other political parties. The party leader considers the repercussions of his/her actions and does not engage in posting social media messages that promote violence. Above all, a political party leader is competent in becoming President of the country.
Dependent	Allegiance	A political party member defends, recommends and invests their time and energy in the party; who will cast their vote even if their family members are against it.
	Fanaticism	A member of a political party will keep voting for their party even if leadership changes to someone he/she may not personally like, other political parties provide better electoral campaigns, or other political parties have leaders who he/she can better relate to; and even after reading negative media comments about the party and its leader.

The next section will present the results of the Pearson product-moment correlation coefficient calculated for this study.

4.1.3 Pearson product-moment correlation coefficient

The Pearson product-moment correlation coefficient is used to determine the strength and the linear relationship between two variables (Struwig *et al.*, 2013:168). According to Struwig *et al.* (2013:167) Pearson product-moment correlation values range between 1 to -1, where -1 represents a perfect negative relationship between the two continuous variables and 1 represents a perfect positive relationship between the two continuous variables. The strength of the correlations is guided by the following values; a weak correlation ≥ 0.29 ; a moderate correlation ≥ 0.49 and a strong correlation ≥ 0.50 (Cohen, 1988:77). Table 5 presents the results of the Pearson product-moment correlation coefficients that were calculated for this study.

Table 5: Correlation matrix of the dependent and independent variables

Variables	A	F	PBT	PBM	BIL
Allegiance (A)	1				
Fanaticism (F)	0.501	1			
Political brand trust (PBT)	0.355	0.258	1		
Political brand meaning (PBM)	0.375	0.374	0.351	1	
Brand image of the party leader (BIL)	0.146	0.213	0.538	0.335	1

As can be seen from Table 5, all the variables had positive Pearson product-moment correlation coefficients. However, a weak correlation was found between three sets of variables, and five of the correlations were of moderate strength (≥ 0.49). Allegiance, however, reported a strong correlation with fanaticism ($r = 0.501$). This strong correlation is supported by Decrop and Berbaix (2014) and Fillis and Mackay (2014), who indicate that fanaticism can be perceived as an extreme level of allegiance. Political brand trust reported a strong correlation with brand image of the party leader ($r = 0.538$). This is in line with findings of Banerjee and Chaudhuri (2016), who found a statistically significant relationship between political brand meaning and the party leader's brand. It is further supported by Cwalina, Falkowski and Kaid (2000) who state that political brand meaning, and the brand of the political leader are considered simultaneously by voters in determining which party to cast their vote for. The next section will discuss the findings of the multi-collinearity diagnostics testing done to eliminate multi-collinearity and enable a sound multiple regression analysis.

4.1.4 Multi-collinearity diagnostics testing

It is necessary to establish whether the data is free from multi-collinearity prior to multiple regression analysis testing. Multi-collinearity diagnostics analysis facilitates the identification of measuring items or variables that have a high correlation among themselves (Kraha, Turner, Nimon, Zientek & Henson, 2012:10). Variance Inflated Factor (VIF) values greater than 10 indicate a collinearity problem. Multi-collinearity diagnostics testing was conducted on all the independent and dependent variables. The tolerance values for both the independent and dependent variables were larger than 0.1, ranging between 0.332 and 0.558. Relatedly, the VIF values of the variables were below the threshold of 10, ranging between 1.325 and 3.072. These results suggest that the both the independent and dependent variables were free from collinearity. As the data set is free from multi-collinearity problems, multiple regression analysis could be conducted.

4.1.4 Multiple regression analysis

Multiple regression analysis is a tool that can be used to forecast the dependent variable based on numerous independent variables of a hypothesised model (Kothari, 2004:130). Three separate multiple regression analyses were conducted for this study. According to Mugenda and Mugenda (2003:142), when a t-value of a factor is less than 1.96 at a significance level of 0.05 or between 1.96 and 3.09 at a significance level of 0.001, the null hypothesis is then rejected.

Table 6: Multiple regression results of independent variables influencing Allegiance

Dependent variable: Allegiance		Adjusted R ² = 0.193			Hypothesis number	Hypothesis
Independent	Beta	t-value	Sig. (p)			
Political brand trust	0.292	3.620	0.000*	H _{1.1a}	Accepted	
Political brand meaning	0.251	3.927	0.000*	H _{2.1a}	Accepted	
Brand image of the party leader	-0.139	-1.46090	0.146	H _{3.1a}	Rejected	

* $p < 0.001$

From Table 6, it is clear that about 19% of the variance in allegiance can be explained by the variances in the independent variables. Evidence of statistically significant relationships was found (at $p < 0.001$) among the independent variables (political brand trust and political brand meaning) and allegiance (dependent variable). These variables therefore influence allegiance in SA. This is also evident from the t-values which exceed the critical value of 3.09 at $p < 0.001$. Therefore, H_{1.1a}, and H_{2.1a} are accepted. The path coefficients (Beta values) for these significant relationships were weak. Brand image of the party leader (see Table 6) had a critical value of less than the 1.96 cut-off point, the hypothesis H_{3.1a}, was thus rejected. The result suggests that brand image of the political leader does not influence allegiance in SA.

Table 7: Multiple regression results of independent variables influencing fanaticism

Dependent variable: Fanaticism		Adjusted R ² = 0.143			Hypothesis number	Hypothesis
Independent	Beta	t-value	Sig. (p)			

Political brand trust	0.157	1.392	0.165	H _{1.1b}	Rejected
Political brand meaning	0.352	3.943	0.000*	H _{2.1b}	Accepted
Brand image of the party leader	0.058	0.438	0.661	H _{3.1b}	Rejected

* p<0.001

From Table 7, it is evident that about 14% of the variance in fanaticism can be explained by the variances in the independent variables. Evidence of statistically significant relationships was found (at p<0.001) among the independent variable (political brand meaning) and fanaticism (dependent variable). This is also evident from the t-values which exceed the critical value of 3.09 at p <0.001. Therefore, H_{2.1b} was accepted. The path coefficients (Beta values) for these significant relationships were weak. Based on these findings political brand meaning influences fanaticism in SA.

As can be seen in Table 7, political brand trust and brand image of the party leader had critical values of less than the 1.96 cut-off point. The hypotheses, H_{1.1b} and H_{3.1b}, were thus rejected. The results suggest that political brand trust and brand image of the political leader do not influence fanaticism in SA. Table 8 presents a summary of the multiple regression analysis results for the inter-relationship between allegiance and fanaticism.

Table 8: Summary of multiple regression analysis results for the inter-relationship between allegiance and fanaticism

Independent variables	Dependent variable	Beta	t-value	Sig. (p)	Hypothesis number	Hypothesis
Fanaticism	Allegiance	0.370	7.207	0.000*	H _{4.1}	Accepted
Allegiance	Fanaticism	0.678	7.207	0.000*	H _{4.2}	Accepted

* p<0.001

As is evident in Table 8, the multiple regression analysis revealed a total of two statistically significant relationships. Evidence of a statistical relationship (p<0.001) was found between allegiance and fanaticism in SA and vice versa. This is also evident from the t-values which exceed the critical value of 3.09; therefore H_{4.1} and H_{4.2} are supported. Both presented an R² value of 0.162, which explains about 16% of the variance in both cases. Thus, allegiance and fanaticism should be seen as interlinked in gaining voters' loyalty in SA and not as two separate concepts. It should be noted that the strength of the Beta value for the influence of allegiance on fanaticism (0.678) is higher than the strength of the Beta value for the influence of fanaticism on allegiance (0.370). This indicates that allegiance influences fanaticism more than fanaticism influences allegiance in SA. Figure 2 presents a summary of the statistically significant results obtained from the multiple regression analysis.

Figure 2: Summary of the statistically significant results

Of interest is that the construct political brand meaning influences both allegiance and fanaticism (Figure 2). Political brand meaning is thus very important in obtaining voters' loyalty in SA. Political

brand trust only influences allegiance in SA. What is significant to note, is that the variable brand image of the party leader does not influence either allegiance nor fanaticism in SA. These results indicate that in SA, the brand of the leader of the political party does not influence voters' loyalty. Therefore, one can assume that in SA, voters' loyalty is centred around political brand meaning and to some extent political brand trust and not the brand image of the political leader. This is in contradiction to studies carried out in the United States of America by Anderson (2013), where brand image of the political leader had an overwhelming influence on voters' intention regarding political parties.

5. Conclusion and managerial implications

The aim of the research was to determine the variables of political branding that influence voter intention in South Africa. By applying the concept of consumer branding to political branding the objectives of the study were to identify from literature the variables that shape political branding and empirically investigate the identified variables that influence voting intention. After conducting an EFA on the five variables identified by Banerjee and Chaudhri (2016:560), namely campaign effectiveness, image of its leaders, tenure effect, meaning and trust attached to the party, three variables were deemed relevant for the further investigation in the current study. These variables include the image of the party leaders, political brand meaning and political brand trust.

When considering political brand trust, voters expect the party that they vote for to listen to them and focus on present and future interests of the voters. The high level of agreement with these two items confirms the findings of Ahmed *et al.* (2011:131) that trust plays a significant role in creating long-term relationships with voters. In developing marketing strategies, attention should thus be placed on focus group discussion with potential voters to understand and acknowledge the needs and expectations of the voters, taking into consideration both present and future interests. In planning electoral campaigns, time should thus be allocated to interact with voters to gain a better understanding of their situation. This interaction could be in the form of roadshows to specific areas interacting informally with potential voters, or a planned listening campaign in community centres.

Communication with voters was also highlighted in the testing of perceptions with regard to brand meaning where the highest mean score for an individual item was for the item "The party has a clear manifesto" (M=4.17). The results of the study indicated that political brand meaning influences both allegiance and fanaticism. The latter is aligned with Phipps *et al.* (2010:499) who state that brand meaning is significant because most voters never have the opportunity to personally meet any politicians, and therefore cannot form their opinion directly and unfiltered. As the political party brand meaning is formed in voters' minds and is an important factor in voter preference (Banerjee & Chaudhuri 2016: 564), political parties need to be aware of the publicity that they receive on different media platforms and intentionally communicate and create awareness of their brand, slogan and manifesto. Allocating resources to continuously monitor social media platforms will assist parties to be proactive in identifying where interventions are needed and where attention should be focused on specific communication strategies. Furthermore, to be more visible and relatable, political parties should be actively involved in community projects and strategically select initiatives that the communities associate with.

The highest individual mean score for the independent variables is attributed to the factor relating to the brand image of the party leader (M=4.30), with the individual item "Acts with integrity" attracting the highest individual mean score (M=4.68). Despite the high mean score, the multiple regression analysis indicated that the brand image of the party leader does not influence either allegiance nor fanaticism in SA. This might explain the Jacob Zuma presidency that can only be described as controversial as he was accused of allegations of bribes from arms deals, corruption, racketeering, fraud and money laundering. Despite the above, the political party still won the elections during the time that he was the leader of the political party (Ferreira & Perks, 2016:268).

It is evident that political branding has an increasingly emerging role in the literature and that scholars apply consumer branding principles to candidates and parties, thereby acknowledging the

multifaceted nature of branding, and specifically the value of political branding (Milewicz & Milewicz, 2014: 244; Needham & Speed, 2015:1). The researchers thus agree with Ahmed *et al.* (2011:131) that the political parties in SA will have to plan their political campaigns in a more responsive, accountable and professional manner.

Although it must be noted that this research forms part of a bigger project, it is acknowledged that a bigger sample size could have led to the results being more generalisable. Based on the increasing changes in the number of political parties and the political climate in SA post COVID-19, a longitudinal study is needed to determine if the results of the study are due to perceptions formed in the run-up to the upcoming 2024 elections, or whether the results reflect typical voter perceptions of the influence of political branding on their voter choice.

Keywords

digitalisation; digital transformation models; leadership; technology; strategy; organisational culture; fourth industrial revolution; systematic review

Abstract

Enterprises have embraced digital change to protect current margins, attract new clients and grow the business while staying relevant in their sectors. Although digital transformation can boost service and develop cost-effective products, challenges such as poor implementation, weak infrastructure, a lack of digital expertise, culture, and resistance to change persist. The main objectives of this article were (1) to identify and conduct a systematic literature review on current and prior digital transformation models with critical dimensions and (2) to develop a conceptual digital transformation model. A systematic literature review methodology was followed. Twenty-three publications analysing the digital transformation models were found after searching major academic databases (EBSCOhost, Science Direct, ProQuest SciTech, AISEL, and Google Scholar) covering a broad range of fields. The authors found that the most adopted dimensions were technology, strategy, data/insight, products/services, and processes. Technology was referenced by seventeen models (74%), strategy and data/insight by eleven models (48%), and products/services by nine models (39%). In comparison, the process was referenced by eight (35%) of the twenty-three digital transformation models evaluated. More than 60% of the models were designed and tested in the United States of America (USA), Europe, and Asia. Only three of the twenty-three models were researched in South Africa, representing 13% of the total sample, while researchers in Morocco created one model, amounting to 4% of the total sample. The study provides researchers and practitioners with a clear picture of various digital transformation dimensions and enables them to select dimensions suitable for their context.

1. Introduction

The fourth industrial revolution and accompanying digital transformation has progressed dramatically in recent years (Dikhanbayeva et al., 2020). Digital transformation is a considerably broader term that signifies customer-driven strategic business transformation requiring far-reaching and cross-cutting organisational change in addition to the implementation of digital technologies (Larsson & Teigland, 2020). In recent years, the concept of digital transformation (DT) has reached a solid and high position in the discussion of leading elements that influence the development and survival of

contemporary organisations (Kotarba, 2018). Becoming a digitally mature organisation incorporates the entire organisation and touches people, processes and communications as well as hardware and software choices (Fletcher & Griffiths, 2020).

According to Sainger (2018), successful digital transformation depends on how leaders use digital technology for the growth of the organisation. Phillip (2021) mentions that in planned digital transformation, leaders maintain a highly positive and enthusiastic attitude as this type of transformation is almost always initiated from top management. Klein (2020) expresses that the most distinguished leadership characteristic in the era of digital transformation, which is an extensive process that challenges companies today, is to be an innovative visionary. Kane et al. (2018) emphasise that digitally maturing organisations have organisational cultures that share common features. Hartl and Hess (2017) further indicate that an organisational culture should be flexible in order to support digital transformation. Hanelt et al. (2021) assert that digital transformation has consequences for organisations, from the way they engage with external stakeholders, to their internal processes, down to each individual product.

Kotarba (2018) stresses that the effects of digital transformation on an organisation's business model can be either voluntary, where the organisation actively shapes its future strategies through optimisations and investments, or reactive, where unforeseen and unpredicted changes have a negative impact on the business model and necessitate restructuring or emergency operations. Regrettably, many executives continue to struggle with designing and implementing digital ideologies because they are unfamiliar with the process, concepts, and setup (Bumann & Peter, 2020). Therefore, as is often the case, the intention becomes fixated on the technology piece, with little or no thought given to the mechanism of transformation, particularly of resources, the underlying process, and the mediating effect of pervasive organisational practices (Orji, 2019). Thus, digital transformation typically involves a thorough revision of the firm's operational and functional models (Correani et al., 2020).

1.1. Problem Statement

Butt (2020) contends that digital transformation initiatives fail for a variety of reasons, including a business attempting to do too much without a clear focus or goal, bringing new technologies without appraising their role within the business, compartmentalising digital initiatives from the rest of the business, or a large-scale digitalisation implementation without a realistic understanding of return on investment. Several impediments to digitisation exist around the world, including obsolete and complex legislative frameworks, deficiencies in digital infrastructure, and a scarcity of new skills (Accenture & World Economic Forum, 2019).

Another major reason why many businesses fail to thrive in digital transformation is a lack of clarity about their strategic direction and a failure to recognise that business models and strategies must provide value to customers (Udovita, 2020). Furthermore, most businesses that have started the digital transformation process fail due to passive organisational cultures that are resistant to change (Hartl & Hess, 2017). According to Zhang et al. (2019), developing the framework and evaluation tool is a prerequisite within the bigger context of digital transformation because it will represent a scan tool, tracking, and assessment method for digital transformation. Digital competency models, for most top managers, can function as the first step towards a more in-depth assessment of issues regarding a firm's digital transformation (Chanias & Hess, 2016). As a result, techniques to assist businesses in initiating and speeding up their digital transformation journey are required, and if businesses select an appropriate roadmap and oversee a process which includes not only technology but the entire organisation, the likelihood that the digitisation projects will fail, decreases (Gökşen & Gökşen, 2021).

According to Teichert (2019), there is evidence that many models are too broad to be implemented in any particular sector and, as a result, are not designed to provide specific guidelines. Acquiring the appropriate digital transformation model with the correct dimensions would help reduce the high failure rate of digital transformation initiatives. With this article the authors undertake a systematic

literature review of past digital transformation models with the ultimate objective of developing a conceptual digital transformation model with key dimensions.

1.2. Methodology

1.2.1 Search strategy

In this study the authors adopted three important generic steps in systematic review methodology: (1) a search strategy, (2) the selection of relevant studies using inclusion and exclusion criteria, and (3) an appropriate analysis of the studies selected. In the search, many combinations of phrases and key words were employed. The keywords ("digitalisation" or "digital transformation" or "digital transformation model" or "fourth industrial revolution" or "industry 4.0") were the search strings applied. The keywords, "digitalisation" and "digitisation"; "framework" and "model", were included in the search because they are regularly used interchangeably in the literature. The selection criteria were that the publication had to be pertinent to digital transformation and the research topics, in full text, published in English between 2015 and 2022, and the study must have originated from credible sources and publications. Unpublished papers, editorial studies, summary reports, master theses, and tutorials were excluded. Figure 1 illustrates a flow chart representing the article selection process.

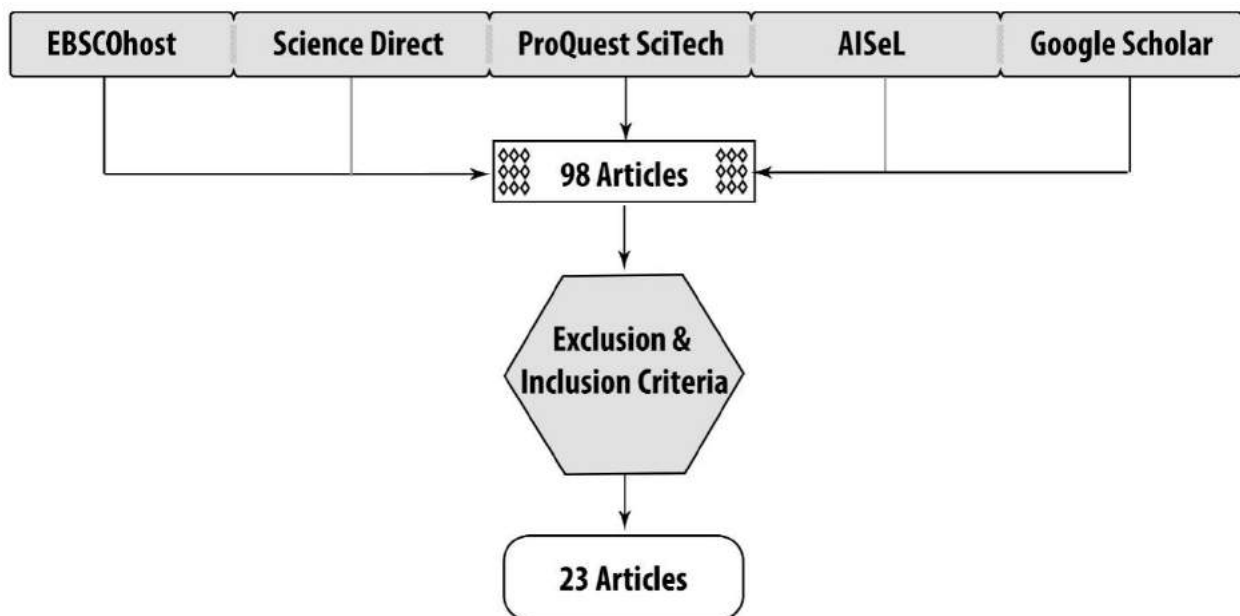

Figure 1: Search strategy flow chart

After having searched four major databases, EBSCOhost, Science Direct, ProQuest SciTech, and AISeL, a total of 86 articles were discovered. The authors used Google Scholar to broaden the scope of the search, yielding an additional 12 papers. The publications found through the keyword search were examined to determine whether they explored or theorised digitisation, digitalisation, digital transformation and the fourth industrial revolution. Because of the broad search strings, a large number of papers that did not satisfy these criteria were discarded. Papers of which the abstracts or summaries did not include the terms "digital transformation, digitalisation, digitisation" or "fourth industrial revolution", were excluded. In the end, only 23 articles fulfilled the requirements (cf. Table 1).

1.2.2 Data analysis

The articles were assessed based on (1) the study's location, (2) the frequency with which various digital transformation models adopted each dimension, (3) the synthesis of the main findings (i.e., change management dimension integrated into culture dimension, and the roadmap dimension as part of the strategy dimension rather than referenced independently), and (4) the conceptualisation of the digital transformation model with critical dimensions.

1.3. Research Objectives

The following research objectives were formulated for the study:

- To identify and analyse existing digital transformation models with key dimensions
- To develop a conceptual model for digital transformation

2. Literature Review

The following section begins with an overview of digitalisation, digital transformation, digital transformation models and a synopsis of the systematic literature review.

2.1 Digitalisation

Digitalisation, as defined by Hagberg et al. (2016), incorporates new technologies into ordinary living through the automation of something that can be digitised. According to Verina and Titko (2019), digitalisation uses digital technologies and information of which the increased connectivity ultimately results in new or altered activities. Sanchez (2017) asserts that digitisation is the transformation of established standards caused by digital transformation and supplementary inventions in the nation's economy. According to Gartner (2021), digitalisation would be the use of new technologies to modify a business strategy and generate new income and value; it is the procedure of making the transition to a digital phase. Parida et al. (2019) define digitalisation as the use of digital technologies to innovate a business model and to provide new revenue streams and value-producing opportunities in industrial ecosystems.

2.2 Digital transformation

According to Teichert (2019), digital transformation is a continuous process of adapting to a rapidly altering digital environment in order to satisfy the workers', partners', and digital clients' expectations. Parviainen et al. (2017) state that digital transformation is attributed to variations in methods of working, duties, and business offerings adopted by utilising digital technologies in a company or the organisation's operating environment. Vial (2019) contends that digital transformation is a means of improving an enterprise by causing major changes in its attributes through data, computing, information exchange, and interconnection technologies. Berghaus and Back (2016) define digital transformation as a transition forced by digital initiatives on several levels in the company that encompasses the use of new technologies to enhance internal practices and the examination of digital innovation, which has the potential to transform the business model.

Morakanyane et al. (2017) define digital transformation as an evolution method that involves digital skills and systems to enable the creation of value in business models, internal operations, and consumer experience. According to Hess et al. (2016), digital transformation (DT) is associated with the adjustments that digital technologies can yield in a company's business model, goods, methods, and organisational structure. Damle and Grover (2020) articulate that digital transformation is the acceptance of a substantial digital realm in order to meet the needs of stakeholders, staff members, and clients. Schuchmann and Seufert (2015) express that digital transformation is the reconfiguration of innovation and modern business models to more successfully serve digital consumers at every point of interaction in the experience value chain. Solis (2015) defines digital transformation as a reshaping of, or increased investment in future technologies, operating models, and processes to achieve a competitive edge in an ever-changing digital world.

2.3 Digital transformation models

Piccinini et al. (2015) argue that recent advancements in digitalisation are causing massive and unprecedented transformations in many aspects of our social and economic lives. Vial (2019) indicates that a digital transformation framework results in digital technologies playing a crucial part in the formation and reinforcement of disruptions occurring at societal and industry levels, and these disruptions elicit strategic responses from organisations. It outlines the fundamental difficulties that arise during a business transition and specifies how the new business model's efficacy, efficiency, and long-term viability are ensured (Mugge et al., 2020). The framework provides a tool to organise the reflection on digitally-driven business strategies in the perspective of building a company's digital transformation process (Zaoui & Souissi, 2021).

2.3.1 Digital maturity and digital transformation models

Although the terms "digital maturity framework" and "digital transformation model" are frequently used interchangeably, there is a distinction between the two constructs, which is discussed in the following section. According to Schumacher et al. (2016), maturity models are widely used as a tool to fully comprehend and measure the maturity of an organisation or a process relevant to a particular desired goal. Zhang et al. (2019) suggest that a maturity model specifies a collection of discrete, incremental levels or stages, describes the entity's advancement and includes specific, measurable measured objects, abilities, or multi-dimensional metrics. Unlike the maturity model, which focuses on a firm's digital maturity levels and steps, Ershova and Hohlov (2021) argue that the digital transformation model is critical to the successful implementation of a digitalisation development programme by establishing an integrated ecosystem of digital transition and control. A digital transformation framework is an outline that represents a strategy about how an organisation paves its way through a period of significant change because of the current evolving business transformation (Damle & Grover, 2020). In this study the authors focussed primarily on digital transformation models.

2.4 Systematic literature review

The purpose of a systematic literature review is to find all research on a specific topic; the techniques for performing systematic reviews have been created to reduce the risk of selecting and publishing data extraction bias in the review (Nightingale, 2009). Systematic reviews, which have their origins in medical science, differ from traditional narrative reviews in that they use a repeatable, scientific, and transparent process, or in other words, a detailed technology, to reduce bias through extensive literature searches of published and unpublished studies (Tranfield et al., 2003). A systematic literature review employs specific, detailed processes to locate, select, assess, and synthesise a set of research papers on a well-defined topic; as a result, systematic review findings are less susceptible to the biases of a single researcher than narrative review findings (Robson et al., 2007). In order to address the problem statement given above, the authors used a systematic literature review technique for this article. This research focuses on the systematic literature review of previous and existing digital transformation frameworks or models, followed by the development of a conceptual digital transformation model.

3. Results and Findings

As presented in Table 1, all the digital transformation models examined were developed between 2015 and 2021. Most digital transformation models were created in 2020, accounting for 43% (Articles 1, 2, 4, 5, 7, 11, 12, 13, 14 & 17) of the analysed models, while 13% (Articles 15, 16 & 18) were formulated in 2021. Approximately 17% (Articles 8, 21, 22 & 23) of the models were produced in 2018 and a further 17% (Articles 3, 6, 9 & 20) were designed in 2019. One model was created in 2015 (Article 10), while another was developed in 2017 (Article 19).

Source: Authors

3.1 Sample

From the sample of 23 studies, over 60% of the models were developed and tested in the USA, Europe, and Asia, demonstrating Western and Asian dominance in the field of digitalisation (Articles 1, 4, 5, 7, 8, 9, 11, 12, 13, 17, 19, 20, 21, 22 & 23). Only three of the twenty-three models were studied in South Africa (Articles 2, 9 & 14), accounting for 13% of the models studied. Moroccan researchers developed only one model representing 4% of the models analysed.

3.2 Dimensions of digital transformation

Twenty-three digital transformation models (Table 1: Digital transformation models) comprising twenty-two digital transformation dimensions (Table 2: Digital transformation dimensions) were identified and analysed. Table 2 presents an analysis of all twenty-two dimensions, from the most extensively adopted to the least widely used.

3.2.1 Technology

Predictably, more digital transformation models (seventeen of the twenty-three) adopted the technology dimension (Articles 5, 6, 7, 8, 9, 10, 11, 14, 15, 16, 17, 18, 19, 20, 21, 22 & 23) accounting for 73% of the total models analysed. The accelerated advancement of digital technology has altered personal lives, workplaces, and societies, while digital technology has changed the shape of businesses (Article 5). Research has revealed (prior results on IT-enabled transformation) that technology is only one piece of the complicated jigsaw puzzle that must be addressed for firms to stay competitive in a digital age (Article 6). Therefore, establishing a data-driven culture across firms, investing in relevant technology, nurturing technical knowledge and skills, and building an institutional learning climate are essential components of achieving value (Article 8).

3.2.2 Strategy

Strategy was used by eleven of the twenty-three digital transformation models examined (Articles 2, 4, 6, 7, 12, 15, 16, 19, 20, 21 & 22). Although differing views exist regarding the formulation of strategy, it was clear from the literature that there is a need to develop a sophisticated digital strategy for successful digital transformation (Article 7). As a result, corporate leaders must develop a bolder strategy and culture that foster employee creativity and encourage them to experiment with new technologies across their business models (Article 2).

3.2.3 Data/Insight

Similar to the strategy dimension above, the data/insight dimension was embraced by eleven digital transformation models, representing almost half of the models studied (Articles 1, 8, 9, 11, 13, 15, 16, 18, 21, 22 & 23). Big data and business analytics ecosystems have the ability to drive digital transformation while also transforming concepts and methods in data systems, leadership, technologies, and invention (Article 8). Therefore, data and data analytics that drive the creation of digital solutions are just as crucial as the digital solutions themselves (Article 18).

3.2.4 Products and services

Nine of the twenty-three digital transformation models analysed used the products/services dimension (Articles 2, 7, 10, 13, 15, 16, 17, 18 & 23). A common effect of digital components is increased personalisation and individualisation of products and services, with offerings often given in brief periods of time and on the fly (Article 10). For example, a cloud infrastructure service could be executed by either constructing a physical data centre that meets the above availability and security standards, or by licensing a public cloud and subletting infrastructure and services to subordinate entities (Article 18).

3.2.5 Process

Approximately 35% of the twenty-three digital transformation models evaluated adopted the process dimension (Articles 3, 8, 13, 15, 16, 19, 20 & 21). Creating a digital business is based on the digitalisation of core and business processes, as well as the creation of new digital products and services (Article 16). Operations, such as automating and standardising processes, must be digitalised to produce a great client experience through digitised products and services (Article 2).

3.2.6 People

Seven different digital transformation models (Articles 7, 8, 15, 18, 19, 20 & 23) adopted the people dimension, representing only 30% of the models studied. People at the forefront of digital change must collaborate closely with recruitment teams in order to find the suitable type of digital talent (Article 20). Moreover, big data and business analytics knowledge can be used to target people with specific information in order to affect perceptions, opinions, or conduct over time (Article 7).

Table 2: Digital transformation dimensions

Digital transformation dimensions	Article number																						
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23

3.2.7 Finance/Investment

Six of the twenty-three models used finance/investment as a dimension (Articles 5, 9, 11, 12, 16 & 19) accounting for 26% of the total models analysed. Firms are facing a high risk of losing their investments and missing crucial possibilities for growth and competition, thus many must begin to implement digital transformation in order to stay competitive (Article 5). Therefore, both government and corporate partners must set aside finances and investment for digital tools, technologies, and skills development (Article 9).

3.2.8 Innovation

Similar to the investment dimension, only six different digital transformation models adopted an innovation dimension (Articles 10, 15, 16, 17, 21 & 23). Digital systems and applicable digital systems are a new paradigm for economic and technological innovation that promotes collaboration, information sharing, and the creation of open and flexible technologies (Article 17). Hence, the innovation dimension includes innovation in technology design, technology processes and ICT Management (Article 16).

3.2.9 Leadership

What appeared to be out of the ordinary was that only five of the twenty-three digital transformation models (Articles 6, 14, 15, 16 & 22) adopted the leadership dimension, accounting for only 21% of the total models evaluated. Studies on digital transformation emphasise the importance of altering organisational leadership structure as a crucial enabler of new business models and that digital transformation requires firms to designate chief digital officers (CDOs) to assist them in their transformation (Article 6). Digital transformation is about change – nothing will ever transform if the company's leadership does not ensure that members agree to the transformation journey (Article 14).

3.2.10 Organisational culture

It is particularly concerning that the culture dimension was only mentioned in four of the twenty-three models (Articles 3, 4, 14 & 17). This represents only 17% of the total number of digital transformation models investigated. Digital transformation failures are primarily caused by business factors such as inadequate planning and delivery, corporate culture, and an inability to capitalise on IT's potential. Therefore, companies that prioritise organisational culture are projected to be five times more effective in digital transformation than those that do not (Article 4).

3.2.11 Customer

The customer dimension was cited in four of the twenty-three models representing only 17% of the total models evaluated (Articles 2, 7, 11 & 13). Identifying and comprehending the needs of the twenty-first-century consumer will necessitate shifts in consumer service delivery, which will result in enhanced client satisfaction and a positive customer experience via digital platforms (Article 2). Furthermore, one of the action fields that provides a vital framework for firms to succeed in digital transitions, is customer centricity (Article 7).

3.2.12 Organisational structure

Similar to the culture dimension above, organisational structure was only used in four of the twenty-three digital transformation models, accounting for 17% of the models studied (Articles 5, 6, 7 & 16). Adjustments to an organisation's structure and culture, in the context of digital transformation, lead to people taking on duties that were previously not included in their roles (Article 6). Accordingly, implementing a distributed or hybrid organisational structure during digital transformation can help Agile and DevOps teams achieve a competitive edge (Article 5).

3.2.13 Ecosystem

The ecosystem dimension was only referenced in four (Article 1, 8, 11 & 13) of the twenty-three models, representing only 17% of the total number of digital transformation models analysed. Digital transformation has spawned new methods of arranging enterprises' value chains and linkages between companies, progressively occurring, not in seclusion, but rather in so-called digital ecosystems and digital markets (Article 1). Therefore, none of the stakeholders in the ecosystems of the twenty-first

century can operate in exclusion; instead, they must cooperate closely to foster learning and innovation while advancing their interrelationships, giving rise to new technological solutions and businesses, and adding value (Article 8).

3.2.14 Other dimensions

Dimensions 14 to 22 were used by less than a quarter of the total models reviewed and are analysed jointly. Only three different digital transformation models adopted the following dimensions: platform (Articles 1, 11 & 23), agility and scalability (Articles 4, 12 & 13), and collaboration (Articles 10, 13 & 16). The roadmap (Articles 12 & 16), governance (Articles 16 & 18), digital channels (Articles 13 & 16), and resources (Articles 2 & 3) dimensions were used by two digital transformation models. The research and development (Article 11) and change management (Article 12) dimensions were each referenced by only one model.

3.3 Discussion

3.3.1 Discussion pertaining to objective 1

The first objective was to identify and analyse existing digital transformation models with key dimensions. Twenty-three digital transformation models comprising twenty-two dimensions were identified and analysed. All of the digital transformation models analysed were created between 2015 and 2021, according to the 23 publications obtained. The majority of the models were developed in 2020, accounting for 43% of the total, while 13% were developed in 2021. Approximately 17% of the models were created in 2018 while another 17% were produced in 2019. Over 60% of the models found were developed and tested in the USA, Europe, and Asia, proving Western and Asian dominance in the digitalisation sector. South Africa only produced three of the twenty-three models, showing a void in the country's digital transformation model design. It also shows that South Africa is still in the early stages of digital transformation.

From the analysis, twenty-two dimensions were found as listed (cf. Table 2). The top ten dimensions that were adopted most frequently were technology, strategy, people, data/insight, processes, products and services, investment/finance, leadership, organisational culture, and innovation. According to the analysis, some dimensions employed different semantics interchangeably. The client dimension, for example, is interchangeable with the customer dimension, while the employee dimension is interchangeable with the dimension of persons in the workplace. Platforms, data, and digital channels, on the other hand, are not classified as sub-dimensions of technology but rather as distinct dimensions that are not part of the technology dimension. Similarly, the roadmap dimension was employed independently of the strategy dimension rather than as its subdimension.

3.3.2 Discussion pertaining to objective 2

The second objective was to develop a conceptual digital transformation model. It was evident from the analysis of the twenty-two digital transformation dimensions that technology, strategy, data/insight, products and services, and processes were the most popular dimensions (cf. Tables 1 and 2). Technology was referenced by 17 models (74%), strategy by 11 models (48%), data/insight also by 11 models (48%), products/services by nine (39%) and process by eight (35%) of the twenty-three digital transformation models evaluated.

Given how researchers emphasise the importance of this dimension in facilitating digital transformation, it was unusual to observe that only 21% of the models studied used the leadership dimension. Even though organisational culture was mentioned in only 17% of the total number of digital transformation models studied, many researchers have pointed to culture as one of the primary factors in the failure of digital transformation, as digital transformation, like any radical transition, presupposes a shift in people's mindsets and new ways of doing things. Similarly, it was surprising that the governance dimension was only adopted by two models (Articles 16 & 18). Failure to adequately manage changes is a different issue for corporate transformation, whether digitally driven or not, because the conversion of vision into action is aided by a solid governance structure (Article 3).

Rather than applying several digital transformation dimensions individually or independently, as observed in the analysis, the authors merged some of them into single dimensions. For instance, change management was combined with the culture dimension. Furthermore, the authors found that four digital transformation models used platforms (Articles 1, 11 & 23) and digital channels (Articles 13 & 16) independently when they could have been combined in the technology dimension. Similarly, two models embraced the roadmap dimension (Articles 12 & 16). A roadmap could be incorporated into the strategy dimension, as developing a strategy without an implementation plan or roadmap is equivalent to having no strategy, since most digital transformation projects fail at the execution level. By merging the above dimensions, a vital dimension that could favourably influence the digital transformation path could be formulated.

It is important to stress that the following dimensions for the conceptual digital transformation model were selected based on their effectiveness and positive impact on the successful implementation of digital transformation as determined through the literature review, and not only selected based on their popularity or how broadly they have been applied before. Figure 2 and 3 represents the conceptual digital transformation model along with ten essential dimensions developed by the authors. The dimensions are strategy, leadership, culture, data/insight, innovation, customer, people, process, technology and governance.

4. Conclusion and Managerial Implication

The development of digital transformation models has been left to consulting firms for far too long. Consulting firms' primary goal is to maximise profit margins like any profit-generating firm. These models are generic and, most of them adopt a Western perspective (cf. Table1). Researchers are being urged to create digital transformation models with dimensions specific to the industries and countries where they will be used, taking into account the unique challenges that different countries and sectors face, such as poor infrastructure, digital illiteracy, the digital divide, culture, and leadership, including political and digital leadership, among others.

Furthermore, the literature review revealed that, for various reasons, digital transformation projects have a higher failure rate, particularly at the execution level, hence the dimensions chosen should focus on making practical implementation easier. Moreover, most of these models are focused on technology – 73% of the models examined applied technology (cf. Table1).

From the literature review it is clear that digital transformation entails more than just purchasing cutting-edge technology; it also entails a company-wide transformation that includes a review of operations, business models, and culture. Underdeveloped countries' common challenges, such as weak infrastructure, digital illiteracy, the digital divide, culture, and poor leadership, persist. These challenges are cited among the critical reasons for unsuccessful digital transformation journeys and need to be addressed before companies embark on digital transformation programmes.

5. Limitations and Future research

This research has some limitations. Firstly, although the authors used five major databases, EBSCOhost, Science Direct, ProQuest SciTech, AISEL, and Google Scholar, it is unclear whether the results would have been different if other databases had been explored. Secondly, it is unknown whether the dimensions chosen for this study would have differed if IT practitioners such as chief information officers, chief digital officers, and other IT professionals had been interviewed. Future research should develop digital transformation models that are not general but are tailored to unique challenges faced by specific countries and sectors. Since research reveals that digital transformation initiatives fail at the execution level, such models and their dimensions must pay particular attention to execution plans and make the implementation of digital projects more pragmatic.

Exploring the Information and Communication Technology Readiness Factors That Affect The Promotion of Local Economic Development Activities in Mandeni Local Municipality of Kwazulu-Natal

Bibi Z. Chummun^{1,*}, Ntokozo R. Hlongwa²

^{1,2} Graduate School of Business, UKZN, Durban Westville, South Africa,

Keywords

ICT readiness; local economic development; local government.

Abstract

The study is predicated on the notion that the increased availability of information and communication technology (ICT) holds an increased potential to place municipalities at a higher level where they are mainly to promote their local economic development activities. However, this has not been the case in Mandeni Local Municipality in KwaZulu-Natal. The study's main aim is to investigate factors that prevent the ICT readiness of the Mandeni Local Municipality to promote local economic development. A qualitative methodology predicated on the phenomenological approach was chosen for this study to gather information from participants with regards to the perceived challenges. The study adopted selected a sample of eight senior managers of the municipality. An interview guide was used for data collection. Thematic data analysis was conducted where emerging themes were identified. The study revealed that non-alignment of relevant legislative frameworks with the municipality's integrated development plan (IDP) was one factor undermining developmental efforts in this municipality. A business reengineering and change management is needed as well as the awareness workshops to the larger community for their role and participation on LED issues.

1. Introduction

The contemporary world is constantly changing and evolving to become a global village through technology. The survival of organizations will, in the near future, be mainly dependent on these technologies. At countries' level, the ability to sustain economies supporting citizens is largely dependent on technology. To have a sustained impact on citizens, resources focusing on technology readiness should be directed to local spheres of government. Local government's primary goal is to promote local economic development. With the available resources, municipalities must put the right strategy to grow the local economies facilitated by technology. Investment on ICT will ensure a bottom-up approach to sustainability as indeed "Do we live an information society? Does it matter?" (Zadeh, 2013:362).

While most regions are joining the information society, it is disturbing that the digital divide is growing between urban and rural communities. Other continents have become superpowers due to their technological advancement and progressive mindset relating to information communication technology. Developed countries are often associated with an information society. In order to evolve to an information society level, three stages are critical. Firstly, the readiness of ICT serves to measure the level of infrastructure and its overall accessibility. Secondly is the use of ICT supported by the skills availability. Third is the ICT impact towards sustainable development (ITU Report, 2016:3). ICT Development Index (IDI) includes 11 indicators used to measure the information society in 167 countries. Within the scoring range of 0 to 10, the average for all countries was, for the first time in 2015, 5.03 Chad was the lowest at 1.17, and the Republic of Korea heads the chart at 8.92. This chart,

in essence, highlights the disparity between developed and developing countries; developed countries have amongst the highest scores. However, what keeps such developed countries scoring high is the early adoption of new technologies that are trending, which includes improved capabilities and quality of networks and devices, particularly on bandwidth and speed of connectivity, the use of smartphones and tablets, social media services, cloud computing, big data analysis, the Internet of Things (IoT) and machine-to-machine (M2M) communications.

The motivating factors to the study are the benefits that can be enjoyed should the municipality be ready with ICT. The main benefit is the alignment of policy development to ensure community participation in the affairs of local economic development (Chummun, 2012). There will be greater influence to redirect resources towards the programs that improves livelihood. Better skilled municipal workers on ICT are better prepared and ready to facilitate the promotion of LED. Councilors as the key stakeholder will perform better oversight. Municipalities in the country will have a benchmark on ICT readiness. The study will make a unique contribution in this discipline by changing the mind set of everybody involved that municipalities are drivers of development beyond services delivery imperatives.

The benefit from the study will also immensely accrue to adjacent municipalities since they are undergoing similar challenges facing Mandeni Local Municipality in terms of ICT readiness. Other spheres of government and departments will also benefit from the study by getting tips on how to improve the monitoring of programs and projects on E-government.

2. Problem Investigated

It is well known that Information Society plays a big level of impact on economic development (Kumar, K., 2020:103). This level is the highlight of the Local Economic Development (LED) as it is known today (Laszlo, 2007:10). To stimulate growth in the economy government spending is necessary. However, the spending must support sustainable development. In spending, governments have certain priorities. One such priority is basic service delivery (Chummun & Ojah, 2016). Three spheres of government were established to support transformation in serving the interest of citizens in South Africa. Local government as one of those spheres is at the cold face of service delivery. Local government is faced with a dilemma at this stage in prioritizing spending. Should they spend on basic service delivery or to spend on sustainable development projects? These projects are associated with the third wave of economic development (e.g., public-private partnerships, technology transfers, infrastructure development, and education) (Hanley and Douglass, 2014:220). The developed countries used these strategies to emerge from eminent poverty that is currently engulfing developing and third world countries many of which are in Africa.

The Mandeni municipality is surrounded by a perceived fairly established ICT infrastructure. This threatens the governance of the municipality. If ICT is ready and is the key enabler to economic development, why then the benefits of the municipality's LED are the benefits of the municipality's LED not being realized? This may demonstrate unwillingness by the municipality to tap into the ICT infrastructure available for use to address the community issues or otherwise a possible lack of capacity. This may also be linked to the credibility of the ICT readiness.

Municipalities are expected to have an alignment of their IDPs, the National development plan, and the Provincial Growth and Development Strategy. This alignment should have the ability to support the local economies rather than a top-down approach implementation.

3. Research Objectives

The primary objective of this research is to investigate the factors that affect the ICT readiness to promote LED in Mandeni.

The major research questions are:

- (i) What are the ICT readiness factors that affect Mandeni municipality to promote local economic development?

- (ii) What legislation and policy frameworks at a municipal level are applicable to ICT readiness and LED?
- (iii) Are the resources optimally used to promote LED in Mandeni municipality?
- (iv) What recommendations are being proposed?

Having gone through the importance of the study and its impact on the municipalities, it is equally important to have context of the ICT readiness and LED. The next section will deal with the literature review on the topic.

4. Literature Review

4.1 ICT Readiness

Increasing levels of ICT readiness being achieved are being praised since they are regarded as the critical success factor in achieving the digital economy, hence promoting LED. ICT readiness is characterized by the factors that include ICT infrastructure, hardware, software and human resource (Chanyagorn & Kungwannarongkun, 2011:99). As observed by Chanyagorn et al. (2011), there are assessment tools to measure the success of ICT readiness. E-health is the success story in government in the recent past to implement ICT (Gholamhosseini & Ayatollahi, 2017:32).

In the municipal environment, the community plays a big role. Therefore, Gichoya (2005:182) proposes factors further include financial resources, attitudes, collaboration and strategy (legislation and policies). Tools such as mobile phone is at the center of community mobilization, therefore promotion of LED (Nhamo, Chapungu. and Nyika, 2021:39)

The focus of the study is to investigate the ICT readiness factors that affect the promotion of LED in Mandeni area.

The extent of success or failure of ICT interventions to support development depends on how managers conceptualize ICT readiness and development (Sean & Harindranath, 2007:15). The ICT Readiness framework was used to guide understanding in this study.

This study adopted the proven framework that was developed by Sean et al. (2007) which identify three different conceptualization of ICT readiness that includes, namely 1) the use of ICT, 2) how ICT is viewed, and 3) the impact ICT has to development. The theoretical framework was used as depicted Figure 1. Figure 1 shows the LED's dependency on the municipality's ICT readiness. In turn, the ICT readiness is greatly affected firstly by the ability to align the municipal processes with the legislation applicable to municipalities (Nhamo, Chapungu. and Nyika, 2021:39). The ICT charter should lead the way in spelling out clearly how the ICT environment must be treated. This includes the form and nature of participation of the communities. Clear roles and responsibilities must be detailed to ensure an oversight role and monitoring of ICT functions.

Secondly, the ICT readiness is affected by nature and the kind of resources available to the municipality. Network infrastructure at the municipality's disposal includes access to broadband and internet connectivity, pervasive ICT gadgets, ability to use and ownership of mobile phones. Funding of ICT units adequately goes a long way to support ICT programs.

Thirdly, is the component that makes all this gel. The human resource that is given the task of implementing ICT successfully is crucial. The skills must be available to those employees entrusted with the task. The communities must be encouraged to participate in ICT programs of the municipality by engaging in awareness campaigns (Kumar, K., 2020:103). At the center of this factor is the attitude of managers that must ensure the achievement of the municipal vision. Collaboration among key stakeholders is the key to consolidating resources.

4.2 ICT for Development

For a complete picture, there is a need to link the role of ICT to the development needs of the nation or province or local government. There is a general understanding that the ICT will bring about economic development. Therefore, developing countries could leapfrog stages of development and become advanced information societies (Bornman, 2012:278). When discussing ICT, information is conceptualized in economic terms (Madikiza & Bomman, 2007:12). This means that it is a commodity by which the market can determine its price. Clearly, the highest bidder can influence the economy as well as its social behaviour. If ICT is meant for development, the state must intervene to regulate the market. Development is not only about economic growth, but it is also concerned with the standard of living. However, there is a pessimistic view supported by Van Dyk (1999) that ICT can lead to unemployment and increase the gap between the poor and the rich (Bornman, 2012:279).

The growing expectation that ICT will assist African countries to come out of poverty is faced with many challenges (Soriano, 2007:15). Over time, this has created an impression that there is no evidence that ICT has got a positive correlation with economic development as suggested by Ngwenyama et al. (2006). Jaffer, Ngámbe & Czerniewicz (2007) continue to mention the challenges facing Africa. On top of the list of challenges is the investment on infrastructure for ICT. This investment is competing with many other socio-economic investments. A word of caution from Ngwenyama et al. (2006) is that it is unwise to disaggregate education and health infrastructure issues from ICT infrastructure development issues. The other challenge is the acceptance of colonial developmentalism. Developmental funded projects to Africa sometimes come pre-packaged with assumptions and solutions, leaving no space for local knowledge and expertise.

Mobile phones are the widest used tools where hopes for development are pinned especially in developing countries. In Sub Saharan Africa, 60% of the population have mobile phone coverage (Jenny, Aker & Mbiti, 2010: 208). This mode is frustrated by the lack of infrastructure and the cost involved. It is estimated that in Africa only 14.1 % of the continent's world population has got access to internet as at 2006 (Internet World Statistics, 2006). There are great opportunities in Sub-Saharan Africa for the ICT sector to prosper in the form of industrialisation of ICT, growth of business process off shoring sector, leveraging open-source software adoption, and encouraging Foreign Direct Investment (FDI) - (ICT Competitiveness in Africa).

All these good stories of ICT for development (ICT4D) in Africa are under scrutiny from its critics. Heeks (2010: 626), has posed a fundamental question that seeks to evaluate these contributions. Does ICT contribute to development? He contends that the developing countries spend so much on ICT gadgets especially mobile phones at the expense of important needs such as education and food. Much of this expenditure will find its way back to developed countries where these multinational companies are owned. Heeks (2006), using the research by Donner and Escobar (2010:64) noted that there is a shortage of research on the implications of mobile phones beyond the increase of their use. Little research is found on the functionalities of mobile phones and their translation into economic impact. However, Heeks (2010) gave guidance to managers of ICT4D that they must attend to designs

aligned to local realities; that the governance structure draws on the strength of multiple actors, and that sustainability is in terms of economic and socio-political perspective.

For the ICT readiness to look appealing for development, it must be judged against the following benefits of efficiency, effectiveness and growth as depicted in Figure 3 below.

Efficiency	
Time	Accelerating business processes and activities
Distance	Reducing geographical and distance inhibitors/barriers
Creativity	Enhancing existing business processes and activities
Effectiveness	
Time	Improving the flow of information and business intelligence throughout the supply and the value chain components
Distance	Enabling integrated control of the supply and the value chain processes
Creativity	Enabling new (and/or modified) processes
Growth	
Time	Obtaining early market entry/presence
Distance	Introducing new products to new markets
Creativity	Developing new products and services

Figure 2: The strategic value of e-Technologies (Adapted from Chanyagorn & Kungwannarongkun, 2011)

In the context of local economic development, the efficiency and effectiveness in ICT tools is the turn-around time at which customers receive goods and services. The key is streamlining activities by reengineering business processes to support that goal. The current processes are not necessarily thrown out of the window but become the building block to maintain the character of local processes. If time factor is favourably achieved, it means distance is shortened. With ICT, geographic locations are eliminated as a barrier to development. Globalization comes handy to this process.

Often comes as a concern that most African countries supply raw materials to be exported without any beneficiation in the value chain. Along the value chain in the intellectual property the local must benefit through the ownership and control of the tool used in ICT. Industrialisation as a proposal will facilitate the process in the context of South Africa for job creation.

Growth in the economy is not only income that is considered to support development. Standard of living is a measure if the development is sustainability. Identifying blue oceans and innovation on existing markets is critical for the economic growth. ICT should facilitate this to leapfrog developing countries to sustainable development. The ICT tools being donated to developing countries must ensure the skilling of local people for employability.

4.3 Research Methodology

The primary aim of this research is to investigate factors that affect the ICT readiness to promote LED in Mandeni. The question is whether the municipality is ready to deliver LED as expected using ICT. The research paradigm is an interpretivist paradigm. This paradigm is informed by the assumption that human beings construct meanings as they engage with the world they are interpreting (Crotty, 1998; Creswell, 2014). The use of open questions ended allows the participants to share their views and experiences. The qualitative method was chosen using the phenomenological study as participants are expected to give qualitative information on the perceived challenges and their impact on ICT readiness for LED in Mandeni. An in-depth interview is chosen for this study. This research technique involves managing intensive one-on-one interviews with a small number of participants to explore their perceptions on a particular idea (Struwig & Stead, 2004:12). It offered a more complete picture of what was happening in the field of study.

The researchers used structured interview questions to draw data. The structured interview method is chosen since it does not require interviewing skills and it is easy to analyze.

The population consisted of managers in the municipality. There are 20 managers that qualified for the study. The total population was targeted and invited to partake in the study. Eight managers agreed and were interviewed. Although only eight of the twenty managers partook in the study, rich data was collected, and partial saturation was achieved.

The added value of the interview is that one draws knowledge from known interviewees at a good response rate. A thematic analysis technique was adopted to analyze data collected. Various themes that came up in interviews, were analyzed. The answers identified patterns and organized into logical categories from the text. Content analysis is convenient for all research approaches that use written data (Cooper & Schindler, 2011:295). The process followed was to collect answers from a question for understanding and decide on responses should they come up over and over again. Themes are then formulated from repetitive responses, which were then grouped into one of the themes. The interviews were recorded.

The topic requires that the challenges facing the municipality's ICT be explored and their impact on LED be understood. Therefore, this requires focus on senior managers in the municipality and key stakeholders in the business community that are strategic partners of the municipality. Interviews are conducted guided by the interview questions prepared for all sample size of eight people. Since the topic requires a deep theoretical background, the skills and knowledge these attributes could be found when specific sample biased to these attributes is selected. According to (Visagie, 2008, p. 58), in judgmental sampling the researcher is concerned with analysis only on determined types of subjects and this sample is chosen based on expert judgement.

5. Results and Findings

Four central themes were identified from the interviews.

5.1 Theme 1: Challenges and limitations in legislation

Based on the findings MFMA section 83 is the basis of departure for the ICT office to function optimally for LED. The level of efficiency observed and praise from ICT manager acknowledging the knowledge acquired shows the effectiveness of the unit standards on minimum competency levels. Exposure to financial aspects of the municipal budget interpretation makes everyone appreciate the ability of the municipality to serve the community aspirations (Caba, Pedro, and López, 2008: 379). The shortcomings of none-involvement of ICT staff at management committee meetings are glaring. The IDP as the main driver for development in Mandeni has an inherent risk of not being customised around ICT methodologies in solving some of the challenges of the community (Khan, Ludlow, Loibl, and Soomro, 2014: 205). Lack of accountability in management reflects the need to improve awareness by drilling section 83 of MFMA (Sibanda, 2017:313).

5.2 Theme 2: The skill shortage amongst ICT staff in relation to understanding LED

In this finding, one identifies reciprocal lack of skills between the ICT office staff and the strategic management level. The ICT office staff is blaming top management's ignorance of not involving them on decision making platforms. It is management that sees no value on ICT. Things can happen without ICT (Hendriks,2013: 1). The lack of skills on the side of management sees ICT as threat to their environment.

On the other side ICT office is accused of being ignorant on IDP issues. This ignorance is detrimental to the objectives of economic development at local level through IDP. ICT staff must involve themselves on IDP matters. Their focus is mainly internal operational projects. The municipality must take upon itself to create space for further development of ICT skills within the workplace (Kolding, Sundblad, Alexa, Stone, Aravopoulou, and Evans, 2018).

5.3 Theme 3: The resource shortage

The finding highlights three major observations hindering ICT development (Awuor, Rabah, and Maake, 2013: 252). The question of access to the internet, exclusion and the vastness of the area dominate. Internet access involves internal infrastructure readiness. The Mandeni Municipality comes

from the era where the internet was outsourced. Being hosted outside the municipal premises, it is still a challenge to quickly implement ICT projects. New technologies need to be funded in partnership with National or provincial initiatives. Low-cost or subsidized broadband need to be explored. (Mawela, Ochara, and Twinomurinzi, 2017).

5.4 Theme 4: Council Oversight role and awareness of ICT and LED

The consensus from the finding is that councilors do not pay much attention to ICT matters (Memeti, and Kreci, 2016: 2). This is due to lack of ICT skills. The finding is pointing the deficiency in the ICT legal framework. ICT charter does not give priority to LED objectives in the IDP. Anything below the standard of IDP to councilors is worthless. Hence no focus is given. The key performance indicators must be bold as driver of achieving vision that ICT should lead to development (Dauber, and Bendrat, 2014: 1017). Training and awareness to councilors is something that needs to be prioritized. The tone of reports sent to Council is not helping the engagements to take place and constructive decisions.

5.5 Theme 5: Support from management and other structures

All responses from interviewees points to one direction. The municipality lacks synergy due to shortcomings inherent with management. The management must give support to the council through proper engagement of municipality's business. The delivery that is expected is first recommended by management. The problem is structural. The way the council's committees are structured, give problem to management. Management has to fix this (Prager, 2010: 711). The fact that ICT has its stand-alone committee gives a perception that this is a different business process that must be dealt with in isolation.

It is noticeable that all findings are in concurrence with the research question. Should these become recommendations? This is the function of the next chapter. Most of these observations are within the control of the Mandeni Municipality. Leadership must prevail.

6. Managerial Implications

The implications of this research findings are strong. The Mandeni Municipality might need to transform to adapt to new practices. The managerial mindset has got to change. This will change the attitude of governance structures of the institution when reviewing the policies to drive for better service delivery. The legal framework will have to be reviewed, especially the Municipality's internal policy that only addresses ICT operations. The document has to be strategic. It must lay a foundation for LED to flourish by aligning to the IDP. Every business process of the municipality must be driven by ICT. Reprioritization aligned to LED must be the basis for budget. Collaboration with other stakeholders has to be the business of the day. Reengineering of business processes must take place. This study might influence the industry since some policies are generic causing the inherent risk to other municipalities. The study will add in the existing body of knowledge in that the area of the municipality will receive the focused study that can be replicated to other municipalities of equivalent size and environment.

The recommendations then are:

- (i) To focus on the Integration of ICT as a mainstream function of the municipality. This will mean the elevation of ICT Manager as part of the top management structure of the municipality.
- (ii) To set clear objectives for the role of ICT in the IDP of the municipality. This will mean the review of all policies and business processes are based on ICT being the vehicle to deliver on IDP deliverables.
- (iii) To strategic collaboration with stakeholders who have resources to fund infrastructure and explore Private Public Partnership mechanism on ICT projects.
- (iv) To initiate focused training for councilors on ICT solutions and implementation of policies supporting LED.
- (v) To focus on organizational reengineering and change the management focused to Mandeni management team towards ICT's role as a primary system driver.
- (vi) To facilitate workshops and initiate an awareness to the larger community to be provided on the involvement of the municipality and facilities to engage LED.

7. Conclusion

The study showed that the Mandeni municipality is faced with many challenges that undermine its ICT readiness to promote local economic development that affect the lives of communities it serves. The chapter also presented specific recommendations based on findings. The findings are clear. Firstly, the municipality is not capitalizing on the legislation that is present currently to align the organizational structure to ICT function. This goes a long way to ICT readiness. ICT charter does not reflect ICT function as an integral part of the strategic management in the municipality. Secondly, there is no constant skilling of personnel and the exposure of management to ICT issues in order to break the barrier of silo mentality. Thirdly, resources are not prioritized in the municipal's budget, as ICT is identified as a strategic tool. Due to limited resources, strategic partners must be identified to assist. This may include municipal bankers, state organs and collaboration with private partners. Fourthly, those given powers to do monitoring and oversight are not capacitated to perform those duties. This include extending the ICT services to communities to ensure participation on economic development issues. These findings if are addressed, will ensure municipal ICT readiness.

Investigating the use of the Advancing Management Information System In Deposit Money Banks In Southwest Nigeria

Benjamin Oludotun Lisoyi¹, Prof Vannie Naidoo^{2,*}

^{1,2} School of Management, IT and Governance, UKZN, Durban, South Africa

Keywords

Decision making; deposit money banks; management information system; policy making

Abstract

Information management and application for banking operations and organisational success remain a major factor to sustain and retain potential customers. The study appraised the utilisation of Management Information System (MIS) in decision making and policy making processes in the management of deposit money banks in southwest, Nigeria. Correlational research design was adopted using stratified random sampling technique, deposit money banks were first stratified into public, private and foreign banks, and then staffs were stratified to executive and non-executive staff with 300 participants that took part in the study. Data were collected using self-developed questionnaire and analysed with Pearson Product Moment Correlation (PPMC) and One-Way Analysis of Variance (ANOVA) statistics. The results revealed that there is a significant relationship between MIS and decision making and policy making, respectively. It also shows a significant difference between public, private and foreign banks in the utilization of MIS in their mode of operations. The study concluded that MIS forms the central operations unit of commercial banks as there is the need for coordination within and between sections and departments in the banks. It was recommended that effort must be intensified to advance information for effective and efficient management of the commercial banks in the southwestern states of Nigeria.

1. Introduction

In recent times, technology has transformed the role of information in the deposit money banks as it has become the lifeblood of an organisation (Kolhe, M. S. 2020). Information is described as a powerful tool in the present global village (Isah, 2014). The consensus in the study of information is that it forms the central operations unit of any organization including deposit money banks (Kolhe, M. S. 2020). In Nigeria, information resources and information management are part of the major issues and indices in the management of deposit money banks. These include recording, storage, retrieval, and use of data meaningfully to plan and make decisions and operating policy of deposit money banks (Ighofovwe, 2015). Therefore, information is central to the management of deposit money banks, hence the more complex a deposit money bank administration structure is, the greater the need for coordination within and between sections and departments. In line with this position, the Central Bank of Nigeria (CBN, 2018) supported the initiative of introducing the computerized Management Information System (MIS) for the deposit money banks in all six geo-political zones in Nigeria. According to Anh, P., Huy, D. T. N., & Phuc, D. M. (2021), in this modern era of digital technology, MIS play a very crucial role in today's banking sector. Van Thuy, N. (2022) posits that the role of MIS has become valuable in the banking sector. Al-Faihani, M., & Al-Alawi, A. I. (2020) also stated that due to the advancement of digital technology, organisations need to fully embrace MIS in order to survive and combat various forms of threats.

1.1 Problem Statement

Poor management of information system leads to inadequate planning and inappropriate decision making which alters and aggravate defective programming or scheduling of actions, this could be as a result of dearth of information and data to complete actions. Furthermore, MIS was conceptualised as a process of collecting, processing, storing and transmitting relevant information to support management functions of planning, directing, decision making and policy making (Sha, 2013). It is a system which comprises the user, the information, and the enabling environment; thus, it is an integral part of management process within the commercial banks. The discrepancy between information and proper management of deposit money banks is really a matter of concern in the banking sector in Nigeria, hence this study. Therefore, MIS enhances managerial functioning which is identified as important system because of its content, form and timing of data presentation. However, it is noted that administrative actions can be effective if the MIS strategy is adequately supported by an organised information system expert. The foregoing on MIS imply that techniques, processes and structures concerned with systemic and accurate data collection, storage, and for retrieval when needed are more essential. In the context of this study, MIS is used to refer to the process of accessing and utilizing processed information to support deposit money bank management in policy and decision making. This logic forms the basis of this study, which examines the relationship between MIS and deposit money banks management. In the light of the foregoing, the following objectives were formulated to:

1.2 Methodology

1.2.1 Research Design

The study adopted a quantitative research design to examine the objectives on the management staff of the deposit money banks to extract operational information. This design is considered apt for this study as it seeks to elicit information from executive and management (non-executive) staff in the deposit money banks to establish the relationship between MIS and the bank management. There was no conscious manipulations of the variables since the interaction among them have been completed.

1.2.2 Participants

The population comprised of both executive and management staff in 10 deposit money banks located in all six states of the Nigeria federation that make up the southwestern Nigeria. The banks were stratified into public, private and foreign money deposit banks. Two each of the public, private and foreign deposit money banks were randomly selected for the study. A purposive sample of 50 management staff were selected from each of the public, private and foreign deposit money banks to make a total sample size of 300 participants based on Taro's model. The management staff comprised both executive and non-executive staff at the managerial level that have the responsibility of being the heads of department, team, unit, branch, or directorate in the bank. The purposive sampling technique was used because of their peculiar roles as decision makers.

1.2.3 Research Instrument

The instrument used for the study was a self-developed questionnaire titled "Management Information System Utilisation Questionnaire (MISUQ)" and it is structured on a 4-point Likert scale of Strongly Agree (SA), Agree (A), Disagree (D), and Strongly Disagree (SD). The instrument consisted of 20 items based on the variables under investigation as contained in null hypotheses. Ten items were raised for the variable use of MIS, while 5 items relate to the variable each of the decision making and policy making respectively.

The instrument (MISUQ) was validated by experts in the field of Management Information System (MIS), Information Communication Technology (ICT), and Measurement Specialists. Reliability and internal consistency of the instrument were established using test-retest reliability method. This involves the double administration of the instrument on 20 bank staff with an interval of two-week difference. Pearson product moment correlation co-efficient (PPMC) formula was used for data analysis and reliability co-efficient of $r = 0.827$ was obtained. Consequently, the instrument was confirmed as being stable and consistent over time.

1.2.4 Procedure for Data Collection

The researchers made use of two trained research assistants in administering copies of the questionnaire to participants in the selected six deposit money banks in the southwest, Nigeria. Two hundred and eighty copies of the questionnaire were retrieved out of 300 administered, representing a 93% retrieval rate. Each positive item on the MISUQ was scored in descending order from 4 to 1, while the reverse order was used for the negative items.

1.2.5 Procedure for Data Analysis

The data collected for this study to test the hypotheses were analysed with the use of Pearson product moment correlation and One-Way Analysis of Variance (ANOVA) statistical techniques. All hypotheses formulated were tested at 0.05 level of significance.

1.2.6 Hypotheses

Specifically, the following null hypotheses are formulated and tested at 0.05 level of significance, namely:

1. There is no significant relationship between the use of MIS and decision-making process in the deposit money banks.
2. There is no significant relationship between the use of MIS and policy making process in the deposit money banks
3. There is no significant difference between public, private and foreign commercial banks in their utilization of MIS in their mode of operations.

2 Literature Review

According to Emetarom (2011), deposit money banks are expanding, and the problems of planning, administration and control are also on the increase. They are confronted with decision making constraints posted by lack of appropriate and organized information. Consequently, the need for increased information management capacity becomes imperative. Johnson (2017) found that Management Information System (MIS) has helped to facilitate decision making for effective administration in deposit money banks in Nigeria.

The design and development of MIS have been covered in different perspectives leading to various definitions which sometimes depend on authors' prejudices. MIS is an organized method of providing management with necessary information needed for decision in a form that aids understating and stimulates actions (Bello, 2018). Baskerville and Myers (2012) defined MIS as "the development, use and application of information system by individuals, organizations and society".

Adebayo (2017), states that the essential role of MIS is to transform data into meaningful information that can be used in administrative planning, operational management and decision-making process. This will put employees on their toes especially on the issues affecting human and material resources development and allocations. This points to the fact that MIS can be used at various levels of management, from the top to the middle and even by the operational staff, as a support for decision making that aims to meet strategic goals and objectives of the deposit money banks.

In line with the foregoing, the aim of MIS is to develop a viable system to maximize the effective application of modern data approach to management practices and to produce timely and accurate information, not only to decide present and future operations, but also to pinpoint potential issues that need to be resolved in the management of deposit money banks in addition to enhancing policy making (Ajayi & Omirin, 2017).

Furthermore, Obi (2013) posits that information is the foundation in planning, policy making, implementation, evaluation and decision making. Obi (2013) further argued that this is a major problem in deposit money banks as information are not provided as at when needed, and when they are provided, it's either inaccurate or poorly scheduled, which without accurate and up-to-date information cannot produce effective decision. Gathering information is the first step in making

rational decisions that will improve the worth of the deposit money banks. This view supports Adesina (2018) who pointed out that the quality and quantity of information available for decision making affects the effectiveness of the group. To this end, decision should be based solely on appropriate, accurate and timely information provided by MIS; this is consistent with Emetarom (2011) that the utilization of computerized MIS in banks improves their services.

In addition, MIS is required for need assessment, logistics and planning, resources allocation and utilization, operations control, management and evaluation of information. Thus, where the MIS (manual or computerized) is weak, poor, and slow, the decision-making capacity at all levels will be ineffective. Hagg, Cummings, and McCubbrey (2012) affirm that for information to be useful in decision making, it must be relevant, accurate and timely, MIS does not necessarily imply improved decision making since the accuracy of MIS is not absolute. The quality of information depends on the analysis, system maintenance, and cost effectiveness.

Though, there have been positive contributions of MIS to management of deposit money banks, there are still bottleneck in its design and utilization. Nwanko (2015) noted that the existing MIS have had little success in providing deposit money banks' management with information that they need. This is a result of lack of management involvement in the design of MIS, inadequate technological skills, undue concentration on low level data processing, inadequate knowledge, and management of computer operations. Furthermore, there is poor planning and management in the banks as a result of non-availability of reliable, timely, and up-to-date information, which is attributed to the traditional method of collecting, storing, and retrieving data. MIS is usually affected negatively because of poor coding, encoding and coordination between technical and end users' inability to favourably connect to the functional areas in the deposit money banks. For example, in many banks today, individual and group businesses do not have their accounts assembled, compiled and published via MIS. Ajayi and Omirin (2017) revealed that MIS was not adequately used in making decisions in deposit money banks. In addition, they found that adequate use of MIS is not affected by proprietorship of banks (public, private and foreign).

Poor management of information system leads to inadequate planning and inappropriate decision making which alters and aggravate defective programming or scheduling of actions, this could be as a result of dearth of information and data to complete actions. The discrepancy between information and proper management of deposit money banks is really a matter of concern in the banking sector in Nigeria, hence this study. Therefore, MIS enhances managerial functioning which is identified as important system because of its content, form and timing of data presentation. However, it is noted that administrative actions can be effective if the MIS strategy is adequately supported by an organised information system expert. This logic forms the basis of this study, which examines the relationship between MIS and deposit money banks management. In the light of the foregoing, the following objectives were formulated to:

1. Examine the relationship between the dissemination of information and decision-making process in the deposit money banks.
2. Determine the relationship between the use of MIS and policy making process in the deposit money banks.
3. Investigate whether difference exists between public, private and foreign banks utilization of MIS in their mode of operations.

3 Results and Finding

3.1 Descriptive Analysis

Age

The age distributions of participants are presented in Table 1 below. Table 1 shows that at age, a preponderant majority (49.7%) of the participants were between 31-40 years age bracket, followed by 36.2% of the participants whose ages ranged between 21-30 years. Further, 9.6% and 4.5% of the participants were between the ages 41-50 and 51-60-years age brackets respectively.

Table 1: Percent Distribution of Respondents by Age

Current Age	Frequency	Percent
21 – 30	120	36.2
31 – 40	165	49.7
41 – 50	32	9.6
51 – 60	15	4.5
Total	332	100

For clarity, the percentage distributions of respondents based on their ages indicated in Table 1 are presented in Figure 1 below:

Figure 1: Age of respondents

Figure 1 presents the age distribution of respondents in the study. It shows that a preponderant majority (49.7%) of the participants were between 31-40 years age bracket that participated in the study while approximately 9.6% and 4.5% of the participants were between the ages 41-50 and 51-60-years age brackets respectively. Therefore, most of the respondents that participated in this study were between 31-40 years age bracket. This could also mean that this category of middle-aged respondents were more easily accessible to the researcher.

Gender

The gender distributions of participants are presented in Table 2. Table 2 indicates that at gender, a vast majority (51.8%) of the participants are women, as against 48.2% of the participants who were men. This shows that more women participated in the study than men without gender bias in the study.

Table 2: Percent Distribution of Respondents by Gender

Gender	Frequency	Percent
Male	160	48.2
Female	172	51.8
Total	332	100

For clarity, the percentage distributions of respondents based on their gender indicated in Table 2 are presented in Figure 2 below:

Figure 2: Gender of respondents

Figure 2 shows the gender distribution of respondents in the study. It shows that a vast majority (51.8%) of the participants are women, as against 48.2% of the participants who were men. Therefore, this implies that more women participated in the study than men without gender bias in the study. It also means that the researcher has more access to women than men in the study.

Educational Qualification

The educational qualification distributions of participants are presented in Table 3. Table 3 reveals that at level of education, the majority (50.6%) of the participants are first degree (Bachelor) holders, followed by 21.7% with Higher National Diploma (HND) as well as 18.7% with master’s degrees. Also, 8.7% and 0.3% of the participants are National Diploma (HND) and doctorate holders respectively.

Table 3: Percent Distribution of Respondents by Educational Qualification

Educational Qualification	Frequency	Percentage
ND	29	8.7
HND	72	21.7
Bachelor’s Degree	168	50.6
Master’s Degree	62	18.7
Doctorate (Ph.D.)	1	0.3
Total	332	100

For clarity, the percentage distributions of respondents based on their educational qualifications indicated in Table 8 are presented in Figure 3 below:

EDUCATIONAL QUALIFICATION

Figure 3: Educational qualification of respondents

Figure 3 reveals educational qualification distribution of respondents in the study. It shows that at level of education, the majority (50.6%) of the participants are first degree (Bachelor) holders, while a handful of the participants were doctorate holders. Therefore, this implies that more participants with their first degrees participated in the study than participants with higher degrees. It also means that the researcher has more access to participants with first degree certificates than participants with higher degrees in the study.

Work Experience

The working experience distributions of participants are presented in Table 4. Table 4 reveals that at working experience, a vast majority (58.4%) of the participants have spent between 5-10 years on the job; 37.1% participants claimed to have spent between 11-16 years on the job, as against 4.5% participants who claimed to have spent 16 years and above on the job in the bank.

Table 4: Percent Distribution of Respondents by Working Experience

Working Experience	Frequency	Percentage
5-10 years	194	58.4
11-16 years	123	37.1
17 years & above	15	4.5
Total	332	100

For clarity, the percentage distributions of respondents based on their working experience indicated in Table 9 are presented in Figure 4 below:

WORKING EXPERIENCE

Figure 4: Working experience of respondents

Figure 4 reveals working experience distribution of respondents in the study. It shows that at working experience, a vast majority (58.4%) of the participants have spent between 5-10 years on the job; while a handful of participants (4.5%) have spent 16 years and above on the job in the bank. Therefore, this implies that more participants who have had 5-10 years working experience participated in the study than participants who have spent 16 years and above on the job in the bank. It also means that the researcher has more access to participants who have had 5-10 years working experience than participants who have spent 16 years and above on the job in the study.

Bank Department

The working at the department distributions of participants are presented in Table 5. Table 5 reveals that at work department, a vast majority (39.2%) of the participants were working at the marketing department, 25.3% were at operations department as against 8.4% and 8.1% participants who were either at fund transfer department or human resources department respectively.

Table 5: Percent Distribution of Respondents by Bank Department

Department	Frequency	Percentage
Marketing	130	39.2
Operations	84	25.3
Corporate Service	40	12.1
Fund Transfer	28	8.4
Human Resources	27	8.1
Recovery	23	6.9
Total	332	100

For clarity, the percentage distributions of respondents based on their working at departments indicated in Table 10 are presented in Figure 8 below:

WORK DEPARTMENT

Figure 5: Work department of respondents

Figure 5 shows work at department distribution of respondents in the study. It shows that at work department, a vast majority (39.2%) of the participants were working at the marketing department, while a handful of participants (8.1%) were at the human resources department. Therefore, this implies that more participants with experience working at marketing department participated in the study than participants with experience working at human resources department in the bank. It also means that the researcher has more access to participants in the marketing department in the banks than participants in other departments of the bank in the study.

Number of Employees

The number of employees' distributions of participants is presented in Table 6. Table 6 shows that at the approximate number of employees in the bank, the most (89.8%) of the participants indicate that their bank have more than 300 employees in its branches, followed by 4.2% participants who have held the believe that their bank have between 100-149 workers in its employment, and 3.6% participants who have claimed that there were between 200-249 workers in their bank's employment. Also, a handful (2.4%) of the participants claimed that their bank has less than 100 employees in its employment.

Table 6: Percent Distribution of Respondents by Number of Employees

Number of Employees	Frequency	Percentage
Less than 100	8	2.4
100 -149	14	4.2
200 - 249	12	3.6
Over 300	298	89.8
Total	332	100

For clarity, the percentage distributions of respondents based on number of employees indicated in Table 6 are presented in Figure 6 below:

NUMBER OF EMPLOYEES

Figure 6: Number of Employees

Figure 6 shows number of employees' distributions as respondents in the study. It shows that at the number of employees in the bank, the majority (89.8%) of the participants indicate that their bank have more than 300 employees in its branches, while a handful (2.4%) of the participants claimed that their bank has less than 100 employees in its employment. Therefore, this implies that more participants from commercial banks with more than 300 employees in Nigeria participated in the study than participants from commercial banks with less than 100 employees. It also means that the researcher has more access to participants from banks with more than 300 employees across Nigeria than participants from banks with less than 100 employees in the study.

Job Title

The job title distributions of participants are presented in Table 7. Table 7 shows that at job title as bank employees, a vast majority (56.9%) of the participants were marketers. This is followed by 13% of the participants who were relationship managers, while 12.1% of the participants were revenue collectors, and 7.5% of the participants were fund transfers and ICT managers respectively. Also, 3% of the participants were bank managers.

Table 7: Percent Distribution of Respondents by Job Title

Job Title	Frequency	Percentage
Marketers	189	56.9
Relationship Managers	43	13.0
ICT Maintenance	25	7.5
Revenue Collectors	40	12.1
Fund Transfers	25	7.5
Bank managers	10	3.0
Total	332	100

For clarity, the percentage distributions of respondents based on their job title indicated in Table 7 are presented in Figure 7 below:

Figure 7: Job title of employees as respondents

Figure 7 shows job title of employees' distributions as respondents in the study. It shows that at job title, a vast majority (56.9%) of the participants were marketers, while a negligible few (3%) of the participants were bank managers. Therefore, this implies that more participants were marketers participated in the study than a handful of the participants who were bank managers. It also means that the researcher has more access to marketers as participants across banks in Nigeria than participants as bank managers in the study.

Inferential Analysis

There was a significant relationship between the use of MIS and decision-making process in the deposit money banks ($r = 0.487$; $df. = 278$; $p < 0.05$). This suggest that MIS provides a valuable function such as collating unimaginable volumes of data into a coherent report useful for decision making. The finding does not pose any surprise considering the role of MIS in effective decision making. It suggests that deposit money banks will not be efficient and effective in its operation without information resources; hence MIS is needed for effective decisions in the deposit money banks. The finding is consistent with Emetarom (2011) that utilization of computerised MIS in banks does improve their services in recent times. On the contrary, it contradicts Emechebe and Garba (2016) who found that MIS is not fulfilling its objectives in its ability to help make quick decisions and in the day-to-day management of the banks. Also, Hagg et al., (2012) affirm that for information to be useful in decision making, it must be relevant, accurate, and timely. The authors affirm that MIS does not necessarily imply improved decision making; that is because the accuracy of MIS is not absolute, and the quality of information depends on analysis, system maintenance, and cost effectiveness (Hagg et al., 2012).

There was a significant relationship between the use of MIS and policy making process in the deposit money banks ($r = 0.538$; $df. = 278$; $p < 0.05$). This has implications not just on planning and management but also on policies guiding the operations of the banks. This implies that the deposit money bank authorities place premium on information in making viable policies as well as implementing the policies. This has constituted one of the potent ways of ensuring quality standards in the deposit money banks; hence the introduction of the computerised MIS in the deposit money banks in southwest, Nigeria. However, Ajayi and Omirin (2017) found that policy making processes in the deposit money banks are based on other factors other than information at hand. This could be as a result of problems encountered in MIS which sometimes delay information needed for making policies.

There was a significant difference between public, private and foreign deposit money banks in their utilization of MIS in their mode of operations ($F_c (2, 277) = 9.49$; $p < 0.05$). Not only this, but also it

was found that public-owned deposit money banks exhibit significantly higher tendency towards utilization of MIS in their mode of operations when compared with Privately-owned deposit money banks and foreign-owned deposit money banks. These findings point to the fact that most public or government owned deposit money banks utilize MIS in their operation to perform functions such as registration of customers and businesses, lodgement of complaints, notification of results, interactive process, and dissemination of important notices, more so than their private and foreign counterparts. The reason adduced for this finding is the fact that state governments in the six states that comprised southwest in the country cooperatively and jointly established, owned and funded deposit money banks and equipped with the state of arts and modern technology under the auspices of Oodu'a Investment Company Limited. The six owner states (Oyo, Osun, Ogun, Ondo, Ekiti and Lagos) meet regularly and deliberate on many issues and business interests that bordered on the Oodu'a Investment Company Limited since its incorporation in 1976.

Table 8: Correlation between Management Information System and Decision-Making Process in the deposit money Banks

Variable	Mean	SD	N	Df	r-cal	r-critical	Remark
Use of MIS	25.28	3.22	280	278	0.487	0.113	Significant
Decision -Making Processes	23.71	4.53	280				

Table 8 shows that the calculated R-value of 0.487 is greater than the critical R-value of 0.113 given 278 degree of freedom at 0.05 level of significance. Therefore, the null hypothesis was rejected, and alternative hypothesis accepted. There is a positive correlation, though weak, between the variables of MIS and decision-making process in the deposit money banks. This means that as MIS usage increases, decision-making process in the banks is disrupted and it enhances innovation, application and development.

Table 9: Correlation between Management Information System and Policy Making Process in Commercial Banks

Variable	Mean	SD	N	Df	r-cal	r-critical	Remark
Use of MIS	25.28	3.22	280	278	0.538	0.113	Significant
Policy Making Processes	24.13	4.06	280				

Table: 9 shows that the calculated R-value of 0.538 is greater than the critical R-value of 0.113 given 278 degree of freedom at 0.05 level of significance. Therefore, the null hypothesis was rejected, and alternative hypothesis accepted. There is a significant positive relationship of moderate strength between MIS and policy making process in the deposit money banks. This means that as MIS usage increases, policy making process in the banks is altered to channel for new cause and application for day to day operations.

Table 10: One-Way Analysis of variance on difference in the Utilisation of Management Information System in Operations of Commercial Banks

Commercial Banks	N	Mean (\bar{x})	SD	
Public	78	12.17	4.21	
Private	163	12.24	4.96	
Foreign	39	11.95	3.90	
Sources of Variance	Sum of Squares	Degrees of Freedom	Mean of Squares	F-ratio
Between Groups (Level of Commitment)	270.80	2	135.40	9.79*
Within Group (Error)	3826.91	277	13.82	
Total	4097.71	279		

*Significant; $p < 0.05$; $df = 2/326$; critical $F = 3.04$

Table: 10 revealed that a calculated F-value of 9.79 is greater than the critical F-value of 3.04 given 2 and 277 degrees of freedom at 0.05 level of significance. Consequently, the null hypothesis was rejected, and the alternative hypothesis confirmed. This means that there is a significant difference between public, private and foreign deposit money banks in their utilization of MIS in their mode of operations.

Due to the significant difference in F-test observed, it became necessary to do a pair-wise comparison of group means to determine which group differ from the other on the variable and the pattern of the difference in the commercial banks utilization of MIS in their mode of operations. Fisher's protected t-test technique was used to achieve this objective. The result of the analysis is presented in Table 11.

Table 11: Fisher's protected t-test on commercial banks utilization of MIS in their mode of operations

Group	Public (n = 78)	Private (n = 163)	Foreign (n = 39)
Public	12.17a	3.04*	2.42*
Private	-0.07	12.24	0.68
Foreign	0.22	0.29	11.95

* Significant, $p < 0.05$

a = Group means (\bar{x}) are bolded in the diagonal; differences in group means (\bar{x}) are below the diagonal, while protected t-test values are above the diagonal.

Table: 11 revealed the pair-wise comparison of group means. It was observed that public-owned Deposit money banks exhibit significantly higher tendency towards utilization of MIS in their mode of operations when compared with Privately-owned Deposit money banks ($t = 3.04$; $df = 239$; $p < .05$) and foreign-owned deposit money banks ($t = 2.42$, $df = 115$; $p < .05$). However, a non-significant difference was observed when Privately-owned banks were compared with the foreign-owned deposit money banks in their exhibition of tendency towards utilization of MIS in their mode of operations ($t = 0.68$; $df = 200$; $p > .05$).

6 Conclusion

This study through the findings concluded that, there existed a significant relationship between the use of MIS and decision-making process in the deposit money, this will assist the banks mode of operation to discharge their organisational culture aiming to achieving the vision, mission and to maintain and retain their client for the bank's growth and development. There was a significant relationship between the use of MIS and policy making process in the deposit money banks which leads to introduction of different policies and strategy for health and standard practice especially during the global economic disruption and re-fertilisation. This aids continental and global best practices in the sector and allows for more financial institutions to boost dying economy and investment. There was a significant difference between public, private and foreign deposit money banks in their utilization of MIS in their mode of operations.

Management should use the findings of this study in whole or in part to increase their banks' market efficiency and performance. Management needs to have proper MIS in place in order to increase employee satisfaction and retention, and attract new employees. If a commercial bank has proper MIS, this will trigger a chain reaction which will ultimately lead to improved bank performance. Management should adopt MIS policies in order to improve the bank's operations as the effect of new technologies on banking marketing operations should be examined from time to time in relation to their effect on productivity in terms of utilisation of resources to achieve market efficiency and performance.

Management should focus on market research in the areas of MIS hence new product development would be discovered to attract the unbanked. This will result in adequate exploitation of its benefits as well as offer appropriate value to the banking public which will ultimately enhance performance in the banking sector.

Management should focus on market efficiency in the areas of MIS which plays an important role in enhancing banks' performance and ensuring their continued existence. Effectiveness and efficiency of MIS and diversification of resources promote customer loyalty and the safety of customers' deposits, protect shareholders' funds, and improve public confidence as well as assure the regulatory authorities that the bank is safe.

Management should promote efficiency by motivating employees in MIS and standardising work methods.

7 Managerial Implications

This study is limited to the deposit money banks in the Southwest Nigeria being the region where there is concentration of the banks and commercial nerve of west African nations that host two third (2/3) of the banks head office and the cadre of the study population. Based on the findings of the study, the following recommendations were made: The deposit money banks management should educate staff on the benefit of utilizing MIS and its technical know-how skills by management and staff in the banks. This will enable them to process required information for meaningful use. This should be a continuous learning exercise (on the job training) on computer gadgets to facilitate MIS application. Considering the importance of MIS in producing reliable information for the management of the banks, it is recommended that the Federal government supports MIS projects with adequate funding. The Central Bank of Nigeria (CBN) as the nation apex bank should enshrine in the financial policy that all deposit money banks embrace the use of MIS for management functions. There should also be staff involvement and commitment in the use of MIS to bring about significant changes within the banking system in Western states of Nigeria, and Nigeria as a whole. Further study should extend the study coverage to involve all the financial institutions knowing that MIS is the bedrock of any successful organisation.

Diversity management, non-profit organisation, individual factors, intergroup factors, organisational factors

Abstract

Globalisation, migration, affirmative action laws and other factors have led to diverse communities and, inevitably, a diverse workforce. The realisation that all people are different in many ways has led to the need to accommodate these differences and ensure that everyone is valued and feels recognised as an individual. The primary objective of the study was to establish employees' lived experiences of the factors that affect diversity management in a non-profit organisation (NPO). A qualitative case study was conducted with a census sample of all employees at the NPO. Themes were manually deduced from the data using qualitative content analysis and then interpreted using graphs and charts. Factors affecting diversity management emerged at organisational, intergroup and individual levels. These factors included but were not limited to prejudice, stereotyping, gender and age discrimination, cultural differences, ethnocentrism, structural integration, organisational culture, resources, political environment, ethnocentrism and lack of strategy. The study unearthed various unique factors affecting diversity management in NPOs. The findings also confirmed that over and above the unique factors, NPOs are affected by the same factors that affect public and private-sector organisations.

1. Introduction

Managing the most important resource in the workplace – the workforce – can be complex, considering that humanity is not homogeneous. Acknowledging diversity is the first step in ensuring that all employees are valued and perform optimally. Chigudu (2018:1-15) opined that valuing and managing diversity is key to effective human resource management (HRM), which can improve workplace productivity.

Optimum productivity is easily attained when HRM is viewed as a critical part of achieving the organisation's goals. Strategic human resource management (SHRM) brings together the organisation's goals and policies with the factors that affect its human capital to develop strategies to achieve or gain a competitive advantage (Sanghvi, 2019:153-161). It can be deduced that diversity management is indeed strategic and should be incorporated into SHRM.

Despite the strategic importance of human resources, most SHRM models consider them as a generic and homogeneous category, and do not consider the diversity of the employees. Martín-Alcázar (2013:39-49) concluded that managing a heterogeneous workforce requires a holistic transformation of human resource strategies and that efforts to define cross-cultural (Lambert, 2016:68) and diversity-oriented models remain undeveloped. A global study by Morgan Stanley (2016:1) proved that more gender and racial diversity, particularly in corporate settings, can translate to increased productivity, greater innovation and better decision-making, as well as higher employee retention, commitment and satisfaction. Ohunakin, Adeniji, Ogunnaike, Igbadume and Akintayo (2019:93-102) defined diversity management as an HRM practice of variations in human capital and ensuring that

such variations do not have a negative influence towards the achievement of the organisational goals and objectives.

This study is motivated to address the lacuna of diversity management research conducted in non-profit organisations (NPOs) in the South African context. The NPO sector, popularly known as civil society (Do Carmo Guerra, De Sousa Teodosio & Mswaka, 2016:65) and sometimes referred to as the third sector (Tomlinson & Schwabenland, 2010:101-121), has contributed to development in South Africa and the world over. The sector is made up of NPOs, community-based organisations and civil-society organisations, which are neither profit making nor part of the government and are funded by local and international donors to contribute to socio-economic development.

The sector is a major social development contributor as NPOs are established to address several problems, such as social, health, cultural, education and advocacy problems; therefore, it is important that HRM contributes sufficiently to these goals (Baluch & Ridder, 2021:598-625). There were 220,116 NPOs registered by the department of Social Service in 2019 suggesting that they contribute to reducing unemployment rate in South Africa (Statistics South Africa, 2021:3).

Diversity management in non-profit organisations

Unlike private-sector entities, NPOs are not driven by profits but by their passion to act as intermediaries and monitors of the public good and expanding access to social and economic services that create jobs and eradicate poverty (Jones, Harvey & Godfrey-Wood, 2016:1). Thus, South African NPOs act as social watch and service delivery agents (Swilling & Russell, 2002:6). With governments facing the difficulty of dealing with the increasing demand for public services, NPOs have been growing in economic and social importance internationally, shifting their scope of action from complementing the public sector to collaborating with it in the provision of services (Torres, Pina & Acerete, 2005:217-238).

The NPO mandate is not driven by profits; hence, there is sometimes a lack of initiative when it comes to management strategies that are not a necessity. Traditionally, NPOs depend on funding from local and mostly international donors for survival. Donor funding is usually aimed at supporting the core business of these organisations, leaving them with little to use for investing in human capital management initiatives, including diversity management. This implies that NPOs do not need to follow conventional business interventions to deliver on their mandate, despite having a diverse workforce.

However, peer competition, lack of sustainable resource management and dwindling resources have led to NPOs working towards better competencies to increase their efficiency and attract funding, which is crucial for their survival (Liaoa & Huang, 2016:20-27). Liaoa and Huang (2016:20-27) asserted that the performance of an NPO's management will affect not only its survival but also its donations and mandate of establishment. Liaoa and Huang (2016:20-27) further stated that improving NPOs' performance and service quality has become a crucial task.

Workforce diversity in South Africa

South Africa is one of the most diverse countries in the world, with 11 official languages and people from different ethnic backgrounds and cultures. Having realised the effects of its unfortunate past, the government of South Africa passed a number of acts to redress the inequality and diversify in the workplaces, such as the Employment Equity Act (55/1998) (Erasmus & Schenk, 2008:98). The purpose of the Employment Equity Act (55/1998) is to achieve equity in the workplace by:

- promoting equal opportunity and fair treatment in employment through the elimination of unfair discrimination; and
- implementing affirmative action measures to redress the disadvantages in employment experienced by designated groups, in order to ensure their equitable representation in all occupation categories and levels in the workforce.

Even though these efforts were not enough, they saw previously disadvantaged people entering the labour market and some climbing the corporate ladder because organisations had to conform to the legal framework. However, it is good to note that some organisations have since moved from conformance to embracing the diversity of the workforce, with positive results. The apartheid era in South Africa was characterised by massive racial divides in education and the workplace (Herman, 2017:1). However, due to the influx of black labour, it is now imperative for employers to shift their mind-set to embracing the black labour as part of the human resources. This is just one example of the struggles of South African employers as they are also faced with a rise in migrant workers and other diversity dimensions, such as gender, religious beliefs and sexual orientation.

In 1982, the South African Board for People Practices (SABPP) was founded as a standards and professional registration body to ensure the professionalisation of the HRM profession. The work of the body has seen the establishment of the SABPP HR systems standards, which provide guidance on the management of HRM programmes, the conduct of HRM systems and the competence of HR professionals applying the standards, as well as providing a framework for HR service providers operating as consultants and learning providers (SABPP, 2013:5). The standards also advocate for the alignment of the HRM strategy to the business strategy. These standards are largely adopted by organisations to improve their HR practice. The absence of diversity management from the 13 pillars of the national HR system standards is an area of concern. Diversity management is only covered under the standard of employment relations management, which aims to improve employment relations, promote diversity and prevent unfair discrimination (Šukalová & Ceniga, 2020:9-24).

1.1 Problem statement

Some of the authors cited in section 1.1 have shown that the NPO sector is not spared from the diversity management challenges faced by public and private-sector organisations (Liaoa & Huang, 2016:20-27). Despite their contribution to job creation (Statistics South Africa, 2021:3), little research has been conducted on diversity management in NPOs in South Africa. In order to address this gap, the purpose of this study was to address these objectives:

The aims are as follow:

- to explore how employees view individual factors that affect diversity management at an NPO;
- to explore how employees view intergroup factors that affect diversity management at an NPO; and
- to explore how employees view organisational factors that affect diversity management at an NPO.

1.2 Methodology

The study was influenced by the interpretivist paradigm, as the aim of the study was to achieve a further understanding of the employees' lived experiences of the factors affecting diversity management at an NPO. Therefore, the focus of the study was to understand and interpret human behaviour to bring further understanding about the research topic, rather than to generalise and predict causes and effects (Bryman, 2012:28; Saunders, Lewis & Thornhill, 2019:128-171).

The cross-sectional research design allowed the researchers to observe and analyse the experiences of the study participants at the same time (Setia, 2016:261-264). In addition, a case study was used because the study was conducted in a single organisation (Bryman & Bell, 2011:531).

Population and sampling

For the purposes of this study, the target population consisted of 8 NPO employees. The study was conducted in one NPO in Gauteng because the researchers only had access to that specific organisation. The role of the NPO is to enable access to justice and legal empowerment for marginalized communities in South Africa. A census was used to get more accurate information as the population was small. The census was within the range of 4 to 20 participants suggested by

Kothari (2004:55) for the study with a homogenous sample (i.e. the one that is dominated by certain biographical characteristic like gender or race).

Data collection

Semi-structured face-to-face and telephone interviews were used to collect data since this study was conducted before the COVID-19 pandemic. Semi-structured interviews were the most suitable as they guided the researchers to probe participants for short essay responses to specific open-ended questions with room to follow up (Zikmund, Babin, Carr & Griffin, 2013:151). An interview protocol comprising two sections was used to collect the data. Section A included biographical questions and Section B consisted of open-ended questions related to individual, intergroup and organisational factors. Some of the questions asked were as follows:

- How would you explain the relationship between employees of different ethnic backgrounds?
- How does cultural background influence how you fit into the organisation with employees of different backgrounds?
- How do you think your personal identity affects how other employees perceive you?
- How would you describe the relations between people from different cultural groups in the organisation?
- In your view, what are the factors that influence diversity management in a positive way at the NPO?

Research procedure

The researchers were given ethical clearance (FCRE2019:FR/05/06-MS-02) before the data were collected. The participants gave verbal consent before participating in the study. In addition, the researcher who collected the data informed the participants that their participation was voluntary and that they had the right to withdraw or not respond to any questions that they were uncomfortable with. In order to enhance the participants' anonymity and confidentiality they were given pseudonyms (i.e. P1- P8).

Data analysis

Qualitative content analysis was used to simultaneously describe the employees' lived experiences of factors affecting diversity and develop a framework on factors affecting diversity management in NPOs (Kuckartz, 2019:181-197). The flexibility and dualism of qualitative content analysis allowed the researchers to use both inductive and deductive approaches to data analysis (Armat *et al.*, 2018:219-221). The deductive approach allowed the researchers to begin with the IMCD as the foundation of the data collection tool and initial coding framework (DeCarlo, 2018:160).

Data rigour

Data rigour was achieved by doing the following as suggested by Denzin and Lincoln (2018):

- **Peer review:** The researchers gave the manuscript to an academic and diversity czar to review its contents. The manuscript was reviewed based on the czar's feedback.
- **Member checking:** This study was conducted just before the COVID-19 pandemic and finalised during the hard lockdown, so the researchers could not go back to the participants to do member checking.
- **Quasi-statistics:** Using word counting, the researchers were able to generate graphs, count the number of participants and calculate descriptive statistics like means.
- **Saturation:** The sample size utilised in this study is within the range that is acceptable in the qualitative research. Earlier it was opined that in a homogenous sample, the sample size ranging from 4 to 20 participants is sufficient (Kothari, 2004:55)
- **Seeking concordance:** This was achieved by comparing and contrasting the study results with the results of other studies.
- **Audit trail:** Upon request, the researchers will make the data available for other researchers to verify that the data presented in this study were not fabricated.

2. Literature review

The diversity management model developed by Cox was deemed appropriate for this study because it addresses classified diversity management at individual, intergroup and organisational levels.

2.1 The Cox Interactional Model of the Impact of Diversity

The study was grounded in the Cox Interactional Model of the Impact of Diversity (IMCD), which explores the factors affecting diversity management within an organisation. The model emphasises diversity based on three dimensions, which are racial ethnicity, gender and nationality, and proposes that people affiliate to groups according to these three diversity dimensions (Cox, 1994:9). The model analyses the effects of a person's affiliations such as gender, race and nationality at three levels, which are:

- individual factors, which include personal identity structures, prejudice, stereotyping and personality type;
- group or intergroup factors, which include cultural differences, ethnocentrism and intergroup conflict; and
- organisational factors, which include the organisational culture and acculturation process, structural integration and institutional bias.

Individual factors

The model specifies that these three levels jointly define the diversity climate in an organisation. It further suggests that the diversity climate also influences career experiences and outcomes in two ways: affective outcomes, which refer to how people feel about their work and their employer, and the actual career achievement of individuals as measured by job performance ratings (Cox, 1994:10). The interaction between individuals with different personalities from different backgrounds and cultural groups may lead to conflict. Cox (1994:42) identifies four main factors that affect the management of diversity at the individual level, namely, group identity structures, prejudice, personality and stereotyping.

In terms of stereotyping, Cox the model suggests that members of certain identity groups are inhibited from gaining entrance into organisations or may experience status or career incongruence after joining (Samuel & Mokoaleli, 2017:55-56). The relationship between diversity and personality was analysed in this study using the Five Factor Model or Big Five Traits Theory on personality which was proposed by famous scientist Louis Thurstone in 1934 but has only drawn interest in recent years (Wiggins, 1996:1). The model identifies the following five personality traits: openness to experience, agreeableness, extraversion, neuroticism and conscientiousness (Han & Pistole, 2017:752-766).

Intergroup factors

A group identity is a personal affiliation with other people with whom one has certain things in common (Cox, 1994:43). This definition is supported by the social identity theory, which contemplates when and why people consider themselves members of groups (Robbins & Judge, 2017:315). Brewer and Miller (1984:281) also capture this concept as they suggest that a person's personal identity is highly distinguished and based on membership in substantial social groups, along with the value and emotional importance attached to that membership.

Cox model classifies three sources of prejudice: intrapersonal sources of prejudice, interpersonal sources of prejudice and societal reinforcement of prejudice. Verniers and Vala (2018:2) found that prejudice and discrimination are still prevalent in organisations, mostly against women and the contemporary dimensions of diversity such as the lesbian, gay, bisexual, transgender, intersex, and queer or questioning (LGBTIQ) community.

The concept of cultural differences hinges on the belief that cultural differences are not only limited to people of different nationalities but that there are significant culture group differences within society (Cox, 1994:128). Cultural differences are believed to make it difficult for affected parties to complete their tasks and work productively (Tran, Admiraal & Saab, 2017:91-110). Ethnocentric behaviour is

typical to many culture groups and is not limited to the dominant culture group. The concept of ethnocentrism states that the beliefs, behaviours and values of one's own group are evaluated more positively than those of out-groups.

Fernández-Salinero and Topa (2020:1-9) assert that conflict has a significant presence in any context that involves different people, groups or departments. Cox (1994:137) notes that sources of conflict in the workplace relating to diversity include power discrepancies, cultural discrepancies, competing goals, competition for resources and forced assimilation with the dominant group as opposed to the preservation of people's own identities.

Organisational factors

In the model, Cox (1991:34-47) adopted Milton Gordon's seven dimensions suggesting how the integration of people from different ethnic backgrounds into a host society should be analysed. These dimensions, described in Table 2, form the basis for the organisational factors which impact organisational effectiveness.

Table 1: Conceptual framework for analysing an organisation's capability to effectively integrate culturally diverse personnel

Dimension	Definition
Acculturation	Modes by which two groups adapt to each other and resolve cultural differences
Structural integration	Cultural profiles of organisational members, including hiring, job placement and job status profiles
Informal integration	Inclusion of minority-culture members in informal networks and activities outside of normal working hours
Cultural bias	Prejudice and discrimination
Organisational identification	Feelings of belonging, loyalty and commitment to the organisation
Intergroup conflict	Friction, tension and power struggles between cultural groups

Source: Cox (1991:34-47)

The concept of organisational culture and acculturation touches on the macro culture of the organisation and its dimensions that either enable or hinder acculturation or the ability of micro cultures to assimilate into the organisation (Cox, 1994:162). On the other hand, structural integration refers to levels of heterogeneity or the presence of people from different cultural backgrounds in the formal structure of an organisation (Cox, 1991:34-47). Levels of heterogeneity are measured by how well the overall employment profile represents various culture groups in the total workforce and participation in the power structure, which is analysed by assessing power distribution in a way that is meaningful to the organisation's development work on diversity (Cox, 1994:182).

Informal integration looks at levels of inclusion of minority-culture members in lunch and dinner meetings, golf and other athletic outings, and social clubs frequented by leaders of the organisation (Strydom & Erwee, 1998:1-14). The concept of informal integration recognises that participation in informal groups plays a vital role in individuals' career success. Strydom and Erwee (1998:9-14) and Tolbert and Zucker (1983:23) suggest that some management practices often unintentionally hinder the full participation of outgroup members.

Organisational factors can be classified into three groups, namely, monolithic organisations where structural integration is minimal and the organisation is highly homogeneous, plural organisations with a heterogeneous membership that are nonetheless culturally monolithic and do not value and use the differences for the benefit of the organisation, and multicultural organisations that embrace diversity and ensure that the organisation is a safe place for all (Cox, 1991:39; Cox & Blake, 1991:53). The framework suggests that, if the above factors are managed properly, they can result in effective organisations with more satisfied employees, group cohesion, high performance and less absenteeism (Cox, 1994:7).

Table 2: Relationship between organisational form and dimensions of the diversity climate

Dimension	Organisational form		
	Monolithic	Plural	Multicultural
Culture	Ignores or actively discourages diversity	Ignores or tolerates diversity	Values diversity
Acculturation	Assimilation	Assimilation	Pluralism
Degree of structural integration	Minimal	Partial	Full
Degree of informal integration	Minimal	Limited	Full
Institutional bias in HR systems	Omnipresent	Prevalent	Minimised or eliminated
Intergroup conflict	Minimal, due to identity homogeneity	Significant	Minimised by management attention

Source: Cox (1991:34-47)

In summary, the Cox diversity management model mentions that the diversity climate is defined by individual, intergroup and organisational factors. The results are discussed in the next section.

3. Results and Findings

The biographical distribution of participants is shown in Table 3. The results indicated a mean age of 33.38 years and median age of 31 years, with an age range of 30 years. The majority of the participants were women, with only one male participant. The results also showed that the NGO predominantly employed highly qualified people, as 75% of the staff had a university degree. The organisation was registered in 2012 and the average tenure was 3.5 years. This seems to suggest that the participants were still new as their tenure were less than 5 years.

Table 3: Participants biographical information

Variable	Frequency
Age	<ul style="list-style-type: none"> • 25 (n=1) • 29 (n=1) • 30 (n=1) • 31 (n=3) • 39 (n=1) • 51 (n=1)
Gender	<ul style="list-style-type: none"> • Female (n=7) • Male (n=1)
Qualification	<ul style="list-style-type: none"> • Grade 11 (n=1) • Certificate (n=1) • Degree (n=2) • Honours degree (n=3) • Masters (n=1)
Tenure	<ul style="list-style-type: none"> • 0.75 (n=1) • 1 (n=1) • 2 (n=1) • 3 (n=1) • 4 (n=3) • 5 (n=1)

Source: Authors

3.1 Individual factors

The participants' biographical factors like language and age were some of the individual factors that influenced diversity at the NPO. "So, my identity as a migrant influenced, people were looking at me in a different way they say okay even if you're on your phone speaking your own language people say what was that you were saying," mentioned P1. P2 said, "There was also quite fundamental issues of ageism and patriarchy that were entrenched in the organisation that needed to be respected and I

struggled to do that.” Race was also mentioned as an individual factor influencing on how employees related at the NPO. P8 responded by saying, *“Yes. But not to a large extent. I mean, I remember when K and I had debates about blackness and K accused me of not being black enough.”*

Participants’ different personality types also affected how they related with their colleagues. P3 responded by saying, *“I think that NPO had a strong clique culture that disallowed for my personality then at the time to show up.”* P4’s response was as follows: *“Yes, I can communicate with other people very well and understand and respect them but there are certain parts in my life where I’m not comfortable maybe speaking in an open group discussion where there are a lot of people.”* Other personality types that emerged from the data were as follows: *“Confrontation”* P2, *“Non-confrontational”* P5, *“Reserved or introvert”* P4, and *“Extrovert”* P6. P7 responded by saying the following, *“From my side, people they will look at me in a good way. I do not know because I do not think there was something that can make them to treat me bad or what?”*

Sometimes being honest was mentioned as a factor that soured the relationship at the NPO. P6 mentioned that *“I’m honest about life but also with the negative part in terms of the honesty part because some people are offended when we are trying to be honest with them, they don’t take it as being honest.”* On the other hand, P1 mentioned that the relationship was based on prejudice, *“So, my identity as a migrant influenced, people were looking at me in a different way they say okay even if you’re on your phone speaking your own language people say what was that you were saying. Clearly, stereotyping, prejudice was there.”* P2 mentioned that the relationship was influenced by age and patriarchy, *“There was also quite fundamental issues of ageism and patriarchy that were entrenched in the organisation that needed to be respected and I struggled to do that. But, of course you assimilate and you learn and you start acting like the child that you’re and life goes by because that’s how you fit in the group.”*

3.2 Intergroup factors

According to the findings, the majority of the participants (75%) responded that their cultural background did not adversely how they assimilated in the NPO. They attributed this to similarities between their cultural backgrounds with the aspect of mutual respect cutting across their African cultures.

Three (3) out of 8 participants responded that their relationship was harmonious. P4’s response was, *“Okay, for me the relation between us I think it is okay. Okay, in the organisation firstly with the Xhosa because I think they were dominant in their time, so we had to learn their ways more because we had to learn their culture because they were dominant, so they will speak Xhosa most of the time so then you learn to learn a bit of Xhosa, so that you can understand what they are saying.”* P7 mentioned opined as follows. *“The background I think it was different. There was nothing bad that happened. Because you know sometimes, we can say, ‘you are a Xhosa, you are a Zulu’ no there was nothing like that. I did not see something like that.”* In addition, P2 response was, *“So, I think the relationships were harmonious.”*

P1 and P8, however, mentioned that the relationship was difficult. P1 said, *“I think it is a difficult relationship really.”* P8 said, *“I think there’s always that thing, maybe among the paralegals themselves when you go closer to them you will see that they really do not like each other because of their different languages, and background.”* Conversely, P3 mentioned that the relationship was regular: *“Umm, I genuinely did not see anything and perhaps I am misunderstanding difference to be negative but there was not, it genuinely didn’t stand out, it was just regular.”* P5 added that the relationship should be professional – it must be based on the organisational structure or reporting line and other things are secondary: *“Because the first ... your engagement is not about where they come from, but it is about who this person is in relation to who I am. Is this person my director, is this person my boss, you know? Is this person my subordinate? How is the working relationship with the person, you know? And then everything else is secondary to the fact that I must report to this person.”*

3.3 Organisational factors

Referring to the organisational factors at the NPO, some of the participants said it was challenging to implement diversity due to lack communication, strategy and policies. In terms of the latter, P3 opined that, *“So, it would be the reverse, the fact that in my experience I wasn’t aware of any policy that spoke specifically to diversity or an induction process that would have taught me through that, the values of the organisation were very much tied to the work of the organisation as opposed to the people in the organisation.”* P4 mentioned that *“there’s no communication in the organisation or maybe someone has no leadership skills in the organisation, so it does affect the progress of the organisation.”* Other factors that stymied the implementation of diversity management were a *“lack of strategy”* according to P2 and a *“lack of resources”* as mentioned by P1.

Organisational culture was also mentioned as a factor that can adversely affect diversity management and strategy implementation. P8 mentioned the following about organisational culture: *“There is a saying which is ‘culture eats strategy for breakfast.’”* The same participant added that, *“A culture is a factor because you may have a policy that does appreciate diversity. You want diverse news. We recruit diversely but then if the culture of the organisation is silencing of different views and perspectives, then cultures become a factor.”* When talking organisational culture, P2 opined that, *“I don’t know but I think when you’re in an organisation that is very personality driven so you kind of follow the lead of whoever is leading. So, you follow the leader really.”* P1 added that the organisational culture should be *“inclusive”*.

Stagnation, political environment and ethnocentrism were also mentioned as organisational factors that affect diversity management. P5 said the following about organisational stagnation: *“You get used to doing things with certain type of people, with a certain type of skill and nothing new is introduced in terms of doing things differently.”* When talking about political environment, P1 said: *“So, let us talk about the xenophobic movement that happens frequently so you start suspecting your people you’re working with or vice versa because the political environment is not favouring that integration.”* P1 added the following with regard to ethnocentrism: *“There is what they call in my area ethnocentrism where people feel like okay, they look at other culture from their own perspective without understanding that I can also look the same way I am looking at other cultures so I think people should remove ethnocentrism and be open to other ideas of what’s happening around, that what I must say.”*

Based on the results the authors of this paper developed a framework, shown in Figure 1, which the NPO can use to implement diversity management.

4. Conclusion

The primary objective of the study was to establish employees' lived experiences of the factors that affect diversity management in an NPO. The literature review showed that diversity management is under-researched in the NPO sector in the South African context. Hence, this study contributes to the diversity management body of knowledge to close this gap and has also developed a framework that can be used by NPO management. It is noteworthy that since this study was deductive in nature, it used the Cox model to develop questions and themes that were used by researchers to develop the diversity management framework.

Consistent with the literature (Samuel & Mokoaleli, 2017:55-56), this study revealed that the individual factors were sociological (i.e. discrimination, prejudice and patriarchy). It is interesting that patriarchy was mentioned, because the data showed that 7 out of the 8 participants were female. The interpretation is that, since the highest office bearer on the sample was a man and possibly portrayed patriarchal behaviours, the NPO environment was perceived to be patriarchal. The data revealed that issues of discrimination were related to ethnicity and xenophobia, which Cox (1994:43) classified as group identity. The other finding was related to organisational psychology or HRM, specifically personality types. The data showed that the personality types were similar to the Five Factor Model or Big Five Traits Theory on personality (Wiggins, 1996:1).

The intergroup factors that emerged from the data were linked to cultural differences and how participants related to each other. It is noteworthy that the participants perceived that the cultural differences did not cause intergroup conflict. Intergroup conflict emerges from cultural and ethnic discrimination and stereotypes of different people, groups or departments, according to Berray (2019:149) and Fernández-Salinero and Topa (2020:1-9). The unintended consequence of a difficult relationship is that it prevents other employees from completing their tasks and working productively

(Tran *et al.*, 2017:91-110). Hence, some participants were of the view that the work relationships in NPOs should be professional.

The data showed the NPO did not include diversity management in its strategic pillars. This finding is contrary to Sanghvi's (2019:153-161) argument that diversity management should form part of the organisational strategy. Since it emerged from the data that diversity management was not part of the strategy, it was not surprising that the NPO did not have a diversity management policy. Despite the lack of such a policy, those who were in leadership were perceived as embracing diversity management. This finding seems to suggest that the NPO was monolithic, according to Cox's (1991:34-47) classification. In monolithic organisations, the culture is not diverse (Cox,1991:34-47). Even though this study was conducted in the under-researched NPO sector and unearthed insights in the diversity management body of knowledge, it had its own limitations. Firstly, it was conducted in a single NPO, and from a quantitative lens it lacked external validity. However, since this was a qualitative study, it was not intended to be externally generalisable but to create a further understanding about diversity management. Using a cross-sectional research has its own challenges, as it only paints a once-off picture about the study. The sample was skewed towards women (7 out of 8 participants).

Based on these limitations, it is recommended that in the future a follow-up study be conducted to further establish whether the NPO is still monolithic. Researchers can replicate this study in other NPOs using bigger sample sizes and mixed-methods research designs so that they can triangulate the data.

The managerial recommendations are as follows:

- including diversity management in the strategy and developing the diversity management policy;
- creating opportunities for informal integration;
- formulating a diversity management policy;
- investing in teambuilding activities to create strong bonds between diverse employees;
- creating an organisational culture that is welcoming to all;
- creating an organisational culture embedded in professionalism; and
- shifting the approach from monolithic to multicultural.

It can be concluded that the NPO's commitment to managing diversity was minimal as there was no policy, strategy and resource to guide the management of diversity and there was a lack of initiative with regard to structural integration efforts. Some of the participants suggested that the lack of structural integration could have been due to the lack of resources as NPOs do not have the liberty to spend on human resource practices when there are pressing social justice issues around them and the pressure to deliver to funders.

5. Managerial Implications

Monolithic NPOs and organisations struggle with having diverse views. In addition, they have been found to be less productive; they lack innovation and better decision-making; and they have higher attrition rates and a less committed and satisfied workforce (Morgan Stanley, 2016:1). This makes them uncompetitive, and they often struggle to offer excellent service to their customers.

Managers who work in monolithic organisations do not focus on acculturation issues. This means that their employees easily assimilate into the organisations. This is also evident in the current case study or NPO (refer to Figure 2). This is good for the organisation because it does not delay employees from hitting the ground running. The other advantage of a monolithic organisation is that intergroup conflict is minimal. This means that employees do not find it difficult to achieve their tasks (Tran *et al.*, 2017:91-110). In addition, in such organisations, managers are treated with respect.

According to Cox (1991:34-47) the challenge with monolithic organisations is HR bias, which can take the form of developing policies that are discriminatory in nature, specifically against gender, sex and religious beliefs. Such HR policies are not in line with Section 9 of the South African constitution (Act 108/1996) and Section 6 of the Employment Equity Act (55/1998).

Abstract

This paper explores the strategy and success factors in the merger and acquisition between two companies in the medical technology industry. The research provides an overview of the medical technology cluster in general and more specifically in Germany to gain a better understanding of the environment the two companies are operating in. By examining the backgrounds and using the Business Canvas Model, the initial strategies and gains contributing to the deal are presented. Afterward, the merger and acquisition deal details are discussed, focusing on the acquisition details and the main strategic objectives for both sides. Finally, the future innovations estimations of the joined company are discussed, as well as their combined long-term vision.

1. Introduction

Nowadays one of the most rapidly developing markets worldwide is the medical technology sector. Since there is a growing need for global healthcare innovations development, due to the aging population and in general increasingly challenging health environment, the medical sector is a center of broad interest. Therefore, this sector has attractive growth opportunities with generally stable demand. But the possibilities for high margins and profitability in the field also foster high industry competition (Jangra, 2021). In order to overcome the competition and maintain positioning, most companies need to boost innovation in their offers of products and services. This is very often achieved by increasing collaboration between companies in the medical device industry, because by combining their strengths, they broaden their portfolios in offering various products and services and facilitate innovation to develop. Mentioning the combining of strengths in the sense of internationalisation and expansion leads to the main aim of this paper - to present the strategic background of the merger deal between Siemens Healthineers and Varian and how this merger could shape a part of the future of innovations in the medical technology cluster overall, while contributing to the two companies overcoming the competition and potentially becoming a joined market leader.

2. Problem Investigated

The problem investigated includes the necessity to clarify how did two market leaders in their fields - Siemens Healthineers AG and Varian Medical Systems Inc develop to join forces, what are the reasons and tactical advantages behind this deal, as well as what are the future perspectives of it.

Firstly, an overview is provided of the environment that these two companies are operating in - from the medical device industry, through medical technology clusters to the increasingly emerging need for innovation. Moreover, an overview of the two companies, providing essential information about the companies themselves and their strategies contributes to painting the merger background. Via analysing the two companies' characteristics and strategies, their synergies in the deal and compatibility are estimated. But it is not only these two participants that define the whole medical device industry. Observing the medical technologies market is of great importance, in order to understand why many companies in this field are opting for acquisition expansion strategies for

¹ E-mail address: kai.uwe-wellner@th-nuernberg.de

expansion. The next observed issue is the vision of the future of the joined company and what has been accomplished so far in this development. This analysis gives an insight into the potential future of the two companies and what their mutual goals are.

3. Research Objectives

The purpose of this study includes three major points, which will be analyzed in-depth in order to provide a better understanding of the problem at hand. These main points include:

- Analysis of the medical technology market, describing the German medical cluster's development in-depth;
- A description of the two companies' profiles - Siemens Healthineers and Varian, according to the Business Canvas Model, which provides a good overview on their most distinguished values and strategies before the merger deal;
- The third essential part of the Research Objective is the merger deal itself, which includes analysis of the background story since the companies' earlier partnership, main strategic objectives and how is the future foreseen for the newly joined company.

4. Hypotheses

The following hypotheses were formulated for the study, based on the perception that according to McKinsey, approximately 70% of mergers fail to achieve their expected revenue synergies, due to numerous reasons (Early, 2004). In the following study, the Siemens Healthineers and Varian merger is observed as an example of a successful merger, representing the remaining 30% of mergers, while emphasizing the success factors leading to their efficient cooperation. Such factors include a description of the M&A process and the final reasons for success - from the beginning of their long-lasting partnership of above 10 years to the operational excellence of both companies and being stronger in the digital and medical machine market together.

5. Literature Review

5.1 Medical Technology Industry

The development of the medical technology industry remains a challenging dynamic environment to keep track of. Innovation is increasingly required and is becoming an essential part of academics and industry, especially considering challenges the average citizen must face, such as Covid-19, for instance (Lateef and Keikhosrokiani, 2022).

According to Maresova et al. (2015), the medical technology industry, presented using the PESTEL analysis framework has promising future estimations. It reflects the increasing need for healthcare personnel. Furthermore, from an economical perspective, the industry provides many job opportunities, as well as facilitates the level of support, contribution and investment into R&D, and improves the communication with the end-users. All characteristics described and set up can be observed as correlated in the strategies of Siemens and Varian, aiming to further improve the medical device industry.

To remain competitive and reach market dominance, many companies have had to resort to partnering or acquiring a small-to-medium enterprise (Russel and Tippett, 2008). Such collaborations are not only increasing the competitiveness of the participating companies, but they also very often demonstrate the breakthrough innovation that led to them. It is more common, when discussing the medical industry, to refer to the bigger key players, waiting for their innovation, but sometimes more expertise is required (Ray et al., 2017). In fact, this is a strategic benefit for Siemens Healthineers, in their collaboration with Varian as a leading medical devices manufacturer in the oncology sector. Furthermore, taking the countries involved into consideration, an important role plays the economic strength of the two participants, such as the fact that Germany has become the most sought destination for M&A in the European Union since 2011 (Wellner, 2018b), while the American M&A is also strongly developing (Rhaman. et. al, 2018).

5.2 Mergers and Acquisitions

In general, many companies and company leaders have been looking for ways to improve company performances and results. As there are two main methods of executing this, the first one is called organic growth - to invest internally in innovation and new product development. The second one, inorganic growth, means investing outside of the own company, by executing mergers and acquisitions. This is often preferred as the companies often benefit from immediate advantages, such as client expansion and using it as a fast track to a given market (Jacob, 2020; Eckardt and Skaggs, 2018). Larger organisations have especially been interested in the inorganic methods, or more precisely M&A transactions (Sinclair and Keller, 2017).

But, M&A deals can also pose challenges if certain measures are not taken. According to the study made by Jacob the main six themes analysed by his qualitative analysis results, used to perform successful M&As are: (a) leadership focus, (b) value creation, (c) integration strategy, (d) the review process, (e) relationship development and (f) organisational governance. This combination of values can be used by leaders to base their decision-making and strategies on in order to avoid disruption or failure (Jacob, 2020, p.178). According to Olcay et al. date between 70 and 90% of M&As end up poorly performed, mainly due to a lack of strategies to execute the successful M&A processes (Jacob, 2019). But certain measures can be considered during the strategy planning stage. For example, compatibility can be analysed in detail between the merger participants, as certain metrics can be already assumed, such as innovation levels (Wellner, 2021a).

What plays a role in defining the success of M&A transactions is the innovation levels and accelerations of technological changes (Zhao, Lin and Hao, 2019). Furthermore, there are different scholarly opinions on the effect of M&A on innovation performances, positive and negative and a correlation has been found for company's sizes reflecting innovation performances at a later stage (Ma and Liu, 2017, p. 962).

5.3 M&A as a growth strategy for medical technology companies

During the last years the 'inorganic' choice of market growth (Jacob, 2020) has prevailed in the medical technology industry (Awasthi and Stanick, n.d., p.17). As one of the biggest trends nowadays, investing in M&A has promising opportunities, including market expansions, along with a wide focus on the development of innovative medical devices, boosting revenue growth (Awasthi and Stanick, n.d.).

Companies choose to act abroad with consideration to many different factors. According to Wellner factors, such as customer proximity, market proximity, strategy, demand, cost reasons are different reasons for strategic internationalization, as in the specific case the motion is that strategy is the strongest drive for this internationalization move abroad (Wellner, 2016, p.179).

According to a McKinsey report, medical-technology companies rely on M&A for market and profit growth and are dependent on this approach. Analyzing the 30 largest medical technology companies for that period McKinsey identified a direct correlation between success and M&A activity. These companies' activities represented 70% of the total deals of M&A in the medical-technology sector and out of them the 20% that used the 'organic' method (Jacob, 2020), only 2 of them reached \$2 billion annual revenue by 2016 (Copp et al., 2018). These results support the previous notion that very often Medical device leaders need to rely on M&As in order to keep their market dominance (Cha, Copp and Pellumi, 2014).

5.4 Value added by M&A transactions in the medical industry

A study by Nazarova analysed the effectiveness of healthcare M&A transactions in the USA and European countries in detail, identifying how to assess the additional value for purchasers and all M&A deal participants in the healthcare industry (Nazarova, 2018, p.375). There are many theories suggesting a positive impact on excess returns for purchasers, such as Moeller, Schlingemann, and Stulz (2004), as well as a study conducted by Martynova and Renneboog (2009), further supporting this theory (Boston Consulting Group, 2017). The study by Nazarova also supported the thesis of

positive excess returns for purchasers and further proved that the multi-directional impact of deal value, the method of payment and the size of the companies ensure a higher quality financial jurisdiction for the formation of an optimal business portfolio for medical companies. These findings support the notion of the effectiveness of these deals and identify key factors for efficient acquisitions in the medical industry (Nazarova, 2018, p.393).

Furthermore, the M&A transactions in the medical industry are not only defined by innovation level increase, revenue growth, or value-added. They also contribute to the general healthcare standards and breakthroughs. Therefore, adding new capabilities to their portfolio is a new strive for many companies. In fact, there has been an increase in the top 250 largest transactions aiming to add new capabilities from 11% in 2017 to 18% in 2021 (Haxer et al., 2022), showing an increase in the importance of this performance indicator.

All these success indicators described in the literature will present what to look for in the success rates of the Siemens Healthineers AG and Varian Medical Systems Inc. Merger in the long run.

6. Research Methodology

In this study the main research methodology used for data collection and analysis is qualitative descriptive desk research, due to the high availability of multiple company press releases and articles on the acquisition deal background and future prognoses. For the purpose of describing the overall Medtech segment development, there is also the methodology of desk research being executed in order to provide a clearly structured overview of how the medical device and technology industry is expected to develop in the upcoming years. Furthermore, using various companies' financial statements, a competitor analysis is executed in order to provide a better understanding of the global medical device market. When analysing the two companies' descriptions and merger deal details, the research mainly focuses on the newly joined company's cyber presence, where they revealed their future strategies and company models, as well as a full disclosure of the strategies they are planning to follow in order to achieve set goals, whether technical or financial. The two companies are analysed using the Business Canvas Model as a theoretical framework.

7. Results and Findings

7.1 Global Overview of the medical device and instruments' market

Global Overview

Before diving into the in-depth analysis of the two companies and the merger deal details, a highly essential part to be considered is the environment that these companies and the newly formed joined company operate in.

Starting with general market information, the medical device market is seen as one of the fastest developing markets worldwide and is expected to continue growing steadily. With an estimated market size of \$63423.6 Million by the year 2027, the medical device market is forecasted to continue increasing at a CAGR of 23.20%. This steady growth is influenced by many factors, such as the increased elderly population, rising life expectancy and the introduction of many healthcare challenges, which Covid-19 is an example. Furthermore, a crucial factor in the growth of the medical technology market is the increasing demand for medical equipment for the detection and treatment of various diseases (Market Research Future, 2021).

Generally, the healthcare market is divided into five main regions – Americas, Europe, Asia-Pacific and the Middle East and Africa. During the last years, the Americas and Europe have had the biggest impact and highest market share of the medical device market (Market Research Future, 2021). As the two strongest regions in the field, though, there lies a strategic benefit from the German and the American companies' merger deal, which will be explained below more in-depth.

The U.S.- the largest medical device market

Firstly, for the Americas region and for the whole globe, the U.S. is the largest medical device market, comprising over 40% of the global medical technology market. During the period 1980 – 2017, the medical device market has had an enormous impact on people in the U.S., more specifically by adding 5 years to the average citizen’s life expectancy and reducing the number of patient-days spent in hospitals by 58% due to medical technologies. Moreover, the MedTech industry is responsible for an increase in job creation and higher employment rates – the industry directly accounts for approximately 519,000 U.S. jobs (Advanced Medical Technology Association, n.d.). This improvement of the medical device industry and the healthcare system in the USA specifically during these decades can be reflected in future forecasts, further estimating an increase in standards of healthcare and subsequently life in the long term.

Competitive environment

When discussing the competitive overview of the medical technology sector worldwide, there are representatives of many sizes, despite similar strategies. Companies usually use various internationalisation methods to extend their footprints across the globe, while keeping collaboration as the main tactic for expanding the client base abroad and still successfully maintaining their brand identity (Market Research Future, 2021).

Some of the key players are presented in the following Competitor analysis (Table 1) for major worldwide players. The ranking is based on revenue achieved and growth realized in the period 2019-2020. The criteria shown in the columns of the table include the country of origin of the respective companies, the revenue achieved, and the workforce of the company.

Table 1: Top 10 medtech competitors: Revenues for the period 2019/2020

Company Name	Country of origin	Revenue (in \$ Billion)	Workforce
1. Medtronic	USA	28.9	90,000
2. Johnson and Johnson	USA	26	144,000
3. Thermo Fisher Scientific	USA	25.5	13,000
4. Abbott	USA	20	107,000
5. GE Healthcare	USA	19.9	54,000
6. Philips	The Netherlands	19	81,500
7. Fresenius Medical care	Germany	19	30,000
8. Siemens Healthineers	Germany	17.6	54,300
9. Beckton Dickinson and Company.	USA	17.3	50,000
10. Cardinal Health	USA	15.4	50,000

Source: Own compilation, Based on QTC recruitment, 2020; Own research

Most of the above-mentioned companies operate on a global scale and use various internationalisation strategies, from subsidiaries, organic investments and partnerships to acquisitions, such as for example the German key players’ methods for international expansion.

As it can be seen from the table above (Table 1), the dominant players are the USA and Europe, but despite their dominance in sales, emerging markets are also observed as promising with prompting growth opportunities and growth rates two to five times those of already developed markets. What makes them highly attractive are the changes in demographics, relating to the aging population, driving higher disease prevalence, rising income, availability of various insurances and increasing consumer demand, with more emerging-market consumers seeking a higher quality of care and greater financial possibility to afford it (Donoghoe et al., 2012).

7.2 Germany’s share in the Global Healthcare Market

Having gained insights into the global MedTech industry characteristics, the next step is to realise that the environment these companies operate in is highly influenced by the German share of the industry

since Siemens Healthineers is a German medical company, founded in Berlin and having today's headquarters in Erlangen, Germany. Therefore, after the global overview, an analysis of the German medical technology cluster and its perspectives are further benefits for the understanding of the future estimations of the joined company.

The medical device industry in Germany is highly developed in many instances, such as quality standards, known worldwide, as well as the high reliability for end consumers. Germany is also popular for its automotive and technology industries, boosting the economy further successfully and providing many job opportunities in the technology sector. According to the Germany Trade and Invest Agency (GTAI) Germany is Europe's biggest healthcare market with EUR 30 billion in sales generated in 2018 solely by the German medical technology industry. However, out of these sales generated, in 2018 almost 2/3 were exported to international markets, dominantly in the European Union, followed by North America and Asia. This contributes to Germany's reputation as the world's largest manufacturing nation, enjoying almost a 10% share of global medical technology production, after the USA (GTAI, 2020).

The German medical technology industry is also well developed in the aspect of the density of companies and clusters. The industry is home to over 1,300 medical device manufacturers and their 140,000 employees, gathered into around 30 clusters for the year 2018. Most of the companies are small and medium-sized enterprises, allowing tighter collaboration with nearby academic and scientific partners, increasing innovation possibilities (GTAI, 2020).

In general, there is a broad variety of clusters in Germany, differentiating by size and location mainly. The biggest ones with above 40 companies belong to cities Tübingen, Berlin and Düsseldorf, while the smaller clusters between 20-40 companies can be found in Nürnberg + Erlangen, München, Stuttgart, Frankfurt, Hamburg and many other German cities (GTAI, 2020).

By combining in such clusters, the companies can benefit greatly from many advantages. The closeness to higher education institutions does provide them not only with scientific breakthroughs first-hand, but it also provides great opportunity to ensure well-trained employees after graduation by keeping tight relations to the universities and offering dual study programmes or internship placements, for example. Furthermore, the proximity to manufacturing companies is also advantageous, due to quick accessibility and availability to parts and less resources demanded in order to obtain the needed parts.

Another important part of the German economy are the Hidden champions, representing small and medium-sized companies, focusing on niche markets very often and becoming global leaders. The Hidden champions benefits also highly from the forming of clusters and the proximity to universities, due to higher investments in R&D as a resource (GTAI, 2020).

Figure 1: German Medical Industry Clusters by count of companies, universities or research institutes
 Source: Own compilation, Adapted from GTAI, 2020

As it can be seen from Figure 1, there is great variety on the consistency of the biggest clusters on the count of companies, count of resources or universities. Siemens Healthineers is among the most influential medical technology companies in the European Metropolitan region Nürnberg and Erlangen. It is one of the biggest German clusters with above 500 companies, 2 partnering universities, as well as access to 21 Research institutes. The cluster focuses mainly on Medical devices production, diagnostic imaging, telemedicine, Healthcare IT (GTAI, 2020).

The analysed clusters are influential and could pose as many success opportunities, as failure possibilities due to various external factors. Nevertheless, the German medical technology industry currently has promising future expectations for expanding, if standards are kept high.

Furthermore, Germany is increasingly becoming more attractive for foreign investors to pursue internationalisation expansion in the medical sector, but also in other industries. For example, Germany has become the most sought destination for M&A deals in the European Union (Wellner, 2019b), leading to a more in-depth evaluation of the first company, starting with Siemens Healthineers, headquartered in Germany.

7.3 Company Profiles according to the Business Canvas Model

7.3.1 Siemens Healthineers

Starting with the company Siemens Healthineers AG, which is a German-founded global medical device company, having achieved approximately 18 million EUR revenues for the fiscal year 2021 (Siemens Healthineers, 2021a). The company has sustained a significant growth of employees recently mainly due to the acquisition of Varian Medical Systems - from 54,300 to about 66,000 employees all over the world (Siemens Healthineers AG, 2021b). The company will be evaluated, using the Business Canvas Model as a theoretical framework and the major characteristics will be briefly discussed below in Figure 2:

Key Partners <ul style="list-style-type: none"> - Admiral De Ruyter Ziekenhuis, Netherlands - Cartagena and Mar Menor Hospitals, Spain - Barts Hospital NHS Trust, United Kingdom - Kantonsspital Baden (KSB), Switzerland - Medical University of South Caroline (MUSC), United States - >90% of global top 100 providers partnering 	Key Activities <ul style="list-style-type: none"> - Research and development - Customer meetings - Sales and marketing - External environment analysis 	Value Propositions <ul style="list-style-type: none"> - High quality after-sales service - High quality products and services - More efficient workflows - Personalized care - Add new capabilities and scale up existing ones to transform care delivery 	Customer Relationship <ul style="list-style-type: none"> - Long-term relationship with strong personal contact - Partnership with custom-made solutions 	Customer Segments <ul style="list-style-type: none"> - Public Sector - Private Sector
	Key Resources <ul style="list-style-type: none"> - Employees - Engineering know-how - Internal programs for employees 		Channels <ul style="list-style-type: none"> - Salesmen - Digital marketing - Referrals - Exhibitions and conferences 	
Costs <ul style="list-style-type: none"> - R&D - Employees - Marketing - Education through internal programs 			Revenues <ul style="list-style-type: none"> - Contracts for maintenance - Contracts for education - One-time payments - Revenue streams categorized by 	

Figure 2: Business Canvas Model of Siemens Healthineers

Revenue streams and Cost structure

Further describing the characteristics of Siemens Healthineers, a more in-depth observation is being done, based on the framework of the Business Canvas Model, shown in the framework above. Starting with the Revenue streams and cost structure, an important remark for the company is the division of Siemens Healthineers into operational segments and respective regions. The company is divided into three main segments - Imaging, Diagnostics, and Advanced Therapies. Ever since the Merger deal with Varian, there is a fourth category added to the operations segment's division - Varian. It represents the full scope of products and services Varian works in, which is described in the following structure.

Table 2: Revenue of Siemens Healthineers by segment for the fiscal years 2020 and 2021

(in millions of €)	2020	2021
Siemens Healthineers	17,997	14,460
Therein:		
Imaging	9,821	9,090
Diagnostics	5,418	3,924
Varian	1,300	-
Advanced Therapies	1,716	1,628

Source: Siemens Healthineers, 2021a, p.12

From the Table 2 seen above, the various segments' share of the company revenues is described. As it can be seen, the Imaging sector accounts for roughly 55% of Siemens Healthineers' revenues, followed by Diagnostics with 30%, the new category Varian, accounting for more than 7%, and the Advanced therapies section, covering roughly 9.5%. It is of high importance to be mentioned that Siemens Healthineers is a leading global provider in its three main operating segments so far – Imaging, Diagnostics and Advanced Therapies. It is important also to highlight the portion of recurring revenue that the company generates is quite significant. Fifty-five percent of total revenue is recurring revenue, owing to Healthineers' new highly customized business models and value partnerships (Siemens Healthineers, 2021a).

From a geographical perspective, Siemens Healthineers has businesses all over the world (Figure 3) with fair distribution of sales, which indicates a solid customer base, due to the fact that their sales are not solely dependent on a few countries with a possibility of conflicts (politics, economic and other possible external aspects), but in broader regions all across the globe. The total sales are fairly distributed in the geographical regions, with 35% sales from the Americas, then 38% from Europe, the Middle East and Africa (EMEA) and 27% from the Asia-Australian region. The United States is the biggest single customer of Siemens Healthineers, same as already mentioned worldwide, accounting for 30% of total revenue, followed by China and Germany (13% and 10% of total revenue) (Siemens Healthineers, 2021a, p.12).

Figure 3: Revenue of Siemens Healthineers by region for the fiscal year 2021
 Source: Own compilation, Adapted from Siemens Healthineers, 2021a, p.12.

Value proposition and key activities

Continuing with the next step of the Business Canvas Model, Siemens Healthineers' focus on engineering resulted in a value proposition that offered high-quality products, in compliance with already discussed German standards, that attained high status on the market. In the current era of digitalisation, technological advancement results in a modified value proposition, providing the customer with better high-tech medical equipment that is more integrated with AI and cloud technology. Due to a transformation in the medical technology industry, Siemens Healthineers is forced to adapt to high demands for better outcomes at lower costs. According to Siemens' annual report from 2017, drivers of this transformation include increasing societal resistance to healthcare costs, payers becoming more professional, a shift to value-based reimbursement, chronic disease burdens, and rapid scientific progress. As a result, healthcare providers are consolidating into networked structures, resulting in larger clinic and laboratory chains, often internationally, which act as large enterprises. Applying this industrial logic to the healthcare market can lead to systematic improvements in quality, while at the same time reducing costs (Siemens Healthineers, 2021e).

As a further attempt to adapt to the industry, Siemens Healthineers does not stop with the innovation of their business model. They have come up with more innovative and customised solutions for

healthcare financing, such as the unitary payment model, where customers can allocate the heavy up-front capital investments to other more important initiatives, such as expanding clinical capabilities, hiring new talent, etc. by bundling the expenses of equipment, maintenance, operation and consulting service expenses in a single fixed payment over a regular interval. Another highly innovative solution from Siemens Healthineers is a pay-per-use model, where a healthcare provider pays a given fee per usage of medical technology assets. A hybrid of both unitary and pay-per-use models is also available in the subscription model. Providers seeking to combine flexibility and stability pay a fixed payment for specified volume and variable payments for overage fees (Siemens Healthcare GmbH, 2019).

Customer segments, relationships and partnerships

Moving to the next point based on the Business Canvas Model, Siemens Healthineers has a wide range of customers from the private sector as well as the public sector. Some examples of Healthineers' partners or customers are hospitals, healthcare providers, medical universities, etc. In terms of partnership and customer relationship, Siemens Healthineers has successfully secured long-term relationships with their customers due to 10 years plus contracts or partnerships. Admiral De Ruyter Ziekenhuis (ADRZ), a hospital and healthcare company based in the Netherlands, is a Siemens Healthineers' 10-year strategic partner for providing medical equipment, construction, financing, and management services. Another example is where Healthineers procures, installs, and delivers management services for 20.000 medical devices for Cartagena and Mar Menor Hospitals in a 15-year partnership. The last example of the partnership is Barts Hospital NHS Trust, the UK's largest hospital. The 35-year partnership, worth £370 million, for which Siemens Healthineers was trusted to supply imaging, radiotherapy equipment, and ultrasound systems (Siemens Healthineers, 2021d).

Siemens Healthineers offers value partnerships, where customers are getting help in optimising operations and processes, expanding, or adding new capabilities and advancing the degree of innovation in quality and precision of care delivery. In the next point below, value partnership and its innovative business model can offer as a value proposition for the company will be discussed. Additionally, Siemens Healthineers provides a package of service plans, such as equipment maintenance service, technical and clinical support, education and training for workforce know-how, consulting and optimisation for equipment and workflows, program updates and upgrades for cybersecurity (Siemens Healthineers, 2021d).

Strategic priorities

Since the main objective of this paper is to discuss the strategic background of the deal, let's start with the first company's strategy description. As part of its strategy to capture short-term potential and maintain leadership beyond 2025, Siemens Healthineers has defined strategic priorities in Phases. In the Siemens Healthineers Strategy 2025, the first phase, "Reinforcing Phase," was completed by the end of the fiscal year 2019. The goal of this phase was to introduce new products and platforms to the market and implement a cost-saving program that included productivity enhancements (Siemens AG, 2020).

Siemens Healthineers has defined clear priorities for its segments for the second phase of its strategy 2025, which began in the fiscal year 2020. It was planned for the "Upgrading phase" to continue until the end of the fiscal year 2022.

Siemens Healthineers has stated three cross-segment priorities: Gain market share in geographic growth markets; Gain market share with leading healthcare providers and Drive forward digital transformation. However, as of November 17th, 2021, Siemens Healthineers has entered the third phase – the "Upgrading" phase of the strategy 2025, the "New Ambition" phase and has managed to complete it one year in advance of original planning (Siemens Healthineers, 2021c). In the current stage, Siemens Healthineers will be focusing on their unique capabilities: Patent Twinning, Precision Therapy, Digital, Data and AI, all of which are major future focus consequences of the Merger deal with Varian, which will be explained in the following pages. And then the last phase of the "Strategy 2025" will follow, which is Market leadership as a joined company.

7.3.2 Varian Medical Systems

Having evaluated Siemens Healthineers' Business Canvas Model and strategic inputs, the second company follows - Varian Medical Systems Inc. Business Canvas Model is presented in Figure 4 below. Varian is the world's leading manufacturer of medical devices and software for treating cancer and other medical conditions with radiotherapy, stereotactic radiosurgery, stereotactic body radiotherapy, brachytherapy, and proton therapy. Having started its journey of helping patients in California in 1948 as Varian Associates, Inc, Varian now has over 10,000 employees worldwide (United States Securities and Exchange Commission, 2020a).

Key Partners <ul style="list-style-type: none"> - Siemens AG - McKesson Corp. - Google Cloud AI - Vantage Oncology - Icon group, South Africa - China Medical University Hospital - Penn Medicine Lancaster General Health's Ann B. Barshinger Cancer Institute 	Key Activities <ul style="list-style-type: none"> - R&D - Manufacturing and supplies - Government regulation 	Value Propositions <ul style="list-style-type: none"> - Leveraging AI and cloud-based solutions - Highly versatile, interoperable, and automated systems - Greater precision, short treatment times and cost effective 	Customer Relationship <ul style="list-style-type: none"> - Customer service representative - Long-term relationship with technical, operation, and maintenance support 	Customer Segments <ul style="list-style-type: none"> - University research - Community hospitals - Private and governmental institutions - Healthcare agencies - Cancer care clinics
	Key Resources <ul style="list-style-type: none"> - Human capital - IT Infrastructure - Cloud technologies - Over 120 active clinical collaborations at Varian 		Channels <ul style="list-style-type: none"> - Direct sales force - Network of distributors - Resellers 	
Cost Structures <ul style="list-style-type: none"> - R&D - Employees - Raw materials and manufacturing costs - Shipping and handling 			Revenues <ul style="list-style-type: none"> - Hardware products - Software products - Service revenues - Contract revenues 	

Figure 4: Business Canvas Model of Varian Medical Systems

Source: Own compilation, Adapted from Siemens Healthineers, 2020

Following the Business Canvas Model, shown below in Figure 4, Varian's main areas of operation are in oncology systems and proton solutions.

Table 3: Revenue of Varian by segment for the fiscal years 2019 and 2020

(in millions of \$)	2019	2020
Varian Medical Systems Inc.	3,225.1	3,168.2
Therein:		
Oncology Systems	3,061.8	2,997.8
Proton Solutions	143.9	121.1
Others	19.4	49.3

Source: Varian, 2020c, p.56

Revenue streams and cost structure

For Varian oncology systems remains the primary source of revenue and comprises about 95% of the total revenues. Of that 95%, of oncology systems are sold in the form of products (49% sales) and services (51% sales). The oncology system product revenues in the fiscal year 2020 decreased over the fiscal year 2019, resulting in a decline in hardware product revenues as a consequence of COVID-19-related delays, including site access restrictions and delays to customer installation readiness in the second half of the fiscal year 2020. The oncology systems service revenues, including performance obligations for installation, training, and warranty, increased in the fiscal year 2020 over the fiscal year 2019. This increase is possible, due to the ongoing customer adoption of service contracts as the warranty periods on their systems expire, and the number of customers as the installed base of our products continues to grow (Varian, 2020b; United States Securities and Exchange Commission, 2020b).

Focusing on the company’s biggest strengths, one of the most innovative aspects of the oncology segment is Proton therapy, which is a preferred way to treat cancer, because of its inherent physical properties, particularly in tumors near critical structures, such as the base of the skull, spine, optic nerve and most pediatric cancers. Even though proton therapy has been used in clinical settings for over four decades, it has not been widely adopted, because of its high capital cost. It is difficult and time-consuming to construct proton therapy facilities on a large scale, involves significant customer investment, as well as complicated financing structures. The decision-making process for patients is complex and slow and orders involve many variables (Varian, 2020b; United States Securities and Exchange Commission, 2020b).

The funding environment for large capital projects, such as proton therapy remains challenging and volatile nowadays (Kunze-Szikszay, Euler and Perl, 2021). In order to get proton therapy to be more widely accepted and deployed, Varian is focused on reducing the total cost of ownership and applying its knowledge in traditional radiation therapy to this treatment method, thus enhancing its clinical utility and reducing its cost of treatment per patient. From the financial perspective, the Proton solutions segment accounted for about 4 to 5% of total revenue and this business has not been profitable historically (\$65.5 million loss in the fiscal year 2020). The sales dropped 15% from the fiscal year 2019 to the fiscal year 2020 and the overall decline indicates a downtrend in this segment for the last four years due to various aspects mentioned earlier (Varian, 2020b; United States Securities and Exchange Commission, 2020b).

As per following the Business Canvas framework further, in terms of geographical revenue segment (Figure 5), the revenue predominantly comes from America, followed by EMEA (Europe, Middle East and Africa) and APAC (Asia-Pacific region), which is 48%, 32%, and 20% respectively. North America accounted for about 94% of the sales in America. International sales contributed to 54% of the total revenues of Varian (Varian, 2020b); (United States Securities and Exchange Commission, 2020b).

Figure 5: Revenue of Varian Medical Systems Inc. by region for the fiscal year 2020

Source: Own compilation, Adapted from Varian, 2020

After the spin off its imaging business in the fiscal year 2017, Varian has developed a new oncology focus strategy for the company, called ‘Intelligent Cancer Care’. Since the prognosis show that by the year 2030, the global cancer cases will grow to 25 million new cases every year, Varian remains committed to developing and delivering more efficient and advanced technologies with a multidisciplinary approach leveraging artificial intelligence to build a comprehensive oncology ecosystem with data-driven insights that help simplify workflows. Better personalised and accelerated care are the benefits that can be received by patients. With all the technology mentioned above, Varian works to innovate next-generation solutions to bring efficient and evidence-based care to all people around the globe (Varian, 2021c).

Customer Segments, Customer Relationship and Key Partners

When considering the customer segments graph from the Business Canvas Model, Varian provides cancer care products to university research and community hospitals, private and governmental institutions, healthcare agencies, physicians’ offices, medical oncology practices, radiotherapy centers and cancer care clinics worldwide. Varian offers superior services, such as field service personnel, oncology systems education, a network of service engineers and a network of regional distributors worldwide for their customer support. Varian generates service revenues and maintains long-term customer relationships by providing the customers with time-and-materials services, replacement part sales, post-warranty equipment service contracts, and software support contracts (Varian, 2020c; United States Securities and Exchange Commission, 2020b).

Another important factor of the Business Canvas Model is Key Partners. Varian has numerous crucial partnerships with leaders in certain segments of the radiation therapy and radiosurgery market. The strategic agreement with McKesson Corporation to supply its US oncology network and to collaborate and establish interoperability between Varian’s ARIA product and McKesson IT solutions. Varian has a partnership with Siemens AG, through which Varian represents Siemens’ diagnostic imaging products to radiation oncology clinics in the United States and agreed-upon countries, and Siemens represents Varian’s equipment and software products for radiotherapy and radiosurgery to its healthcare customers in agreed-upon countries (United States Securities and Exchange Commission, 2020b). The last example of Varian’s key partner is the partnership with Google Cloud AI Platform to create Artificial Intelligence (AI) models for organ segmentation. The segmented images are then used to create radiotherapy treatment plans that describe where and how much radiation needs to be exposed during the treatment. This is a labor-intensive process that can take a clinician hours per patient. This partnership enables innovation in cancer care using Google Cloud AI’s state-of-the-art technology (Varian, 2021b).

Strategic Priorities of Varian

Varian’s commitment to developing more advanced technology and their unique multidisciplinary approach put them in a good position to overcome the challenges, associated with cancer treatment. “Intelligent Cancer Care” framework, which Varian has developed harnessed the power of advanced technologies, like artificial intelligence, machine learning, and data analytics to ensure coordination and connectivity at every point of care. With the goal of becoming a global leader in multidisciplinary cancer care, Varian has four strategic enablers, part of its long-term development strategy, as follows (Varian, 2019):

1) Innovating in radiation therapy

Varian maintains their market leadership with over 50% market share in global radiation therapy market. Both of their new products Eclipse™ treatment planning system, for fast and precise advanced cancer care planning, and TrueBeam, Varian’s key radiotherapy solutions, were recognised as part of their innovation effort.

2) Leveraging artificial intelligence, machine learning, and cloud-based solutions
Ethos therapy, an innovative solution for adaptive therapy, is powered by artificial intelligence. This AI adoption enables the healthcare providers to use multimodality images and they can now better visualize changes to anatomy. Another substantial progress has also been made in the deployment of Noona, their software application for capturing patient-reported outcomes. Noona provides the data that allow clinicians to manage their cancer patients' symptoms.

3) Growing emerging businesses and technologies
In the fiscal year 2019, Varian accomplished the acquisition of CTSI and CyberHeart to address the growing global cancer burden and bridge the human capital skills gap. The acquisition of CTSI has made a significant contribution toward building a broad global data lake to power new technology-enabled services. Furthermore, Varian entered the VT (ventricular tachycardia) market space with the acquisition of CyberHeart. This acquisition gives Varian the capability to innovate in the area of cardiac diseases. The acquisitions of Austin, Texas-based Endocare and Hangzhou, China-based, Aicon, as well as the acquisition of Boston Scientific beads portfolio, are the first steps in creating a comprehensive interventional solutions platform leveraging Varian's unique software expertise. As a result of these acquisitions, Varian is now the first and only provider that offers an end-to-end solution, including both hardware and software, for the fast-growing interventional oncology market.

4) Improving operational, financial, and capital efficiency
Varian aims for a balance of growth, profitability and liquidity to ensure long-term growth and value creation. Investing in innovation will continue to be a core part of the growth strategy. Varian continues to make investment decisions based on the internal rate of return for the investment being greater than the cost of capital for the shareholders (Varian, 2019; Varian, 2021c).

7.4 The merger and acquisition deal details between Siemens Healthineers and Varian

When analysing such influential deals, many factors and aspects can be taken into consideration. For example, critical success factors, serving as objectives, could include deal characteristics, strategy development, future prognosis, post-merger integration, etc. (Wellner, 2019 a, p.67). In the following paragraphs, the aspects that will be discussed include the initial partnership, leading to the deal, the main objectives of the deal, divided into various categories and a SWOT analysis of the M&A. These aspects lead to making reliable future estimations of how the joined company is expected to develop.

The 'EnVision' Partnership and Its Development

As one of the greatest healthcare challenges nowadays, Covid-19 has presented 'a humanitarian crisis', creating unprecedented challenges for everyone around the globe. Not only have frontline healthcare workers been greatly affected, but also the MedTech industry has been a center of attention with growing demand for diagnostic tests, protective equipment and ventilators (Chadha et al., 2020). This increasing demand has affected decisions by MedTech companies to seek solutions for gaining a competitive advantage. History has shown that one of the most successful strategies is a merger and acquisition investment strategy, helping companies to grow during challenging times and emerge stronger together (Anoshchenko, 2021). This leads to one of the biggest M&A deals in the industry - between Siemens Healthineers and Varian Medical Systems and what led to it, which is the main objective which follows below.

From the beginning, this collaboration did not suddenly emerge as the announcement of the Merger deal on August 2, 2020, from Siemens' side. The mutual cooperation already started in 2012 as a partnership, called 'EnVision', aiming to streamline processes from stimulation to planning and treatment delivery in radiation oncology. This partnership represented the combination of the "Energy" of Varian's powerful delivery systems and treatment planning tools with the "Vision" of Siemens Healthineers' advanced imaging capabilities, resulting in energy and vision to help healthcare professionals detect, diagnose and treat cancer while paving the way for 'the future of cancer care'. What this partnership contributed to was realising connectivity to Varian's IT networks in order to integrate Siemens' discontinued linear accelerators, providing both companies with enhanced sales opportunities and a greater competitive advantage (Varian, 2021).

Following the timeline of the two companies' background stories, the next important milestone is on August 2, 2020. It represents the date when the partnership 'EnVision' eventually grew into an Acquisition announcement by Siemens Healthineers Holding I GmbH, a wholly owned subsidiary of Siemens Healthineers AG, presented by a merger agreement and a letter of support. According to the merger agreement, Falcon Sub Inc, which is an entity formed by Siemens Healthineers Holding for the sole purpose of effecting the acquisition, will be merged into Varian and Varian will become a wholly owned subsidiary of Siemens Healthineers. On the side of Siemens' part of the deal, the 'Guarantor' is Siemens Medical Solutions USA Inc., a Delaware company - a US operating subsidiary of Siemens Healthineers (United States Securities and Exchange Commission, 2020a).

On the other side, Siemens Healthineers, an 85% owned and fully consolidated subsidiary of Siemens AG, benefits further from the deal by reducing Siemens AG's effective control to 72% after the deal (Fitch Ratings, 2020).

After various regulatory clearances, confirmation and approval of all parties, including the European Commission and the resulting vote from Varian's holders of a majority of outstanding shares' Special meeting, the merger deal was closed on April 15, 2021, as an all-cash transaction, valued at 16.4 US \$, letting Siemens Healthineers acquire the shares of Varian for \$177.50 per share in cash. This represented a premium of approximately 42% to the 30-day volume-weighted average closing price of Varian's common stock as of July 31, 2020, the last trading day prior to the announcement of the transaction (Varian, 2020a).

Main Strategic Objectives of the Merger Deal

Having discussed the details around the Merger earlier in the text, an important question arises. 'Why?'. It leads to the strategic reasons behind that deal, the objectives that the two companies have set, or an answer to the equation 'How does one plus one add to three?'.

Starting with the factual background of the suggested deal from August 2, 2020, in Siemens Healthineers' official presentation, sent to Varian as the Merger plans, Siemens Healthineers have described the potential benefits not only for the two participants but on a global level. It follows the mutual strategy derivatives and the joined power synergies after the completion of the deal. The main strategies and compatibilities behind the deal are shown in Figure 6.

Figure 6: Deal potential synergies and major reasons for Merger
Source: Own compilation, Adapted from Siemens Healthineers AG, 2020

Cultural Fit and Shared values

Starting with the cultural fit aspect, both companies have essential shared values in common. These include not only common aspiration to help people live longer and healthier lives, but longevity in the industry - above 70 years for Varian and more than 120 years in Siemens' history. This mutual aspiration also contributes to their further shared purpose of driving innovation and helping healthcare personnel improve quality and provide broader access to needed care (Siemens Healthineers AG, 2020).

Combining Scales

Moving clockwise in Figure 6, the next important aspect for collaboration between the two companies is ‘Scale synergies’ or otherwise called - combining scales. As there is an expected high demand for cancer patients needing ongoing therapy all over the world, it is certainly beneficial for the companies to expand in the geographical sense. Together they leave a footprint in around 75 countries and they are realising an impactful combination of Varian’s 11,000 employees + 55,000 employees of Siemens Healthineers, resulting in 66,000 people sharing a joined purpose for the overall wellbeing. This makes an enormous impact since both companies have a strong positioning in their fields. More than 4 million patients are annually touched by Varian products and since Siemens Healthineers is a global leader in the medical devices industry, there are approximately 240,000 patients examined per hour using their products all over the world (Siemens Healthineers AG, 2020).

Innovation Synergies

Probably one of the most important factors that the companies took into consideration was Innovation synergies. Firstly, it would be beneficial to show the growth of the medical device technology industry, which is the main field of innovations and investments, especially for cancer and cardiovascular diagnosis and treatment. The medical technology industry has high growth estimations, proven by the growth of +6.3% between 2019 and 2020 in total revenues for the industry, resulting in 446 billion USD positive growth for the fourth consecutive year. Moreover, despite the disruption of COVID-19, the medical technology industry in the EU and the U.S. show a 4.6% growth in the number of employees from 2019 to 2020, resulting in overall 878,900 employees (EY, 2021). These positive industry trends contribute highly to the innovation investments synergy factor of the Merger deal, along with these facts:

- 1) There has been around 1.5 billion USD totally invested over the last 4 years in innovation, leading to the highest rates of Research and development (R&D) intensity in the industry. As both companies are strong in the innovation aspect of healthcare developments, the joined power brings over 1,000 Varian R&D engineers to over 9,000 Siemens Healthineers R&D employees. This has the potential to achieve some of the great technological ambitions, that the companies have set in their Strategy plans.
- 2) Another very important aspect of the joined innovation power of the Merger is the combining of more than 120 active clinical collaborations at Varian with the partnerships of Siemens Healthineers, including more than 90% of global top providers, mentioned in the Business Canvas Models of the two companies. This expansion of resources, and operational and sales networks gives them the opportunity to create a unique value creation (Siemens Healthineers AG, 2020).

Revenue Synergies

A further aspect of the reasons for this Merger deal is the Revenue synergies. Forecasts of Siemens Healthineers estimate steep growth over the next few years since there is high demand for their products and services and the overall healthcare industry is in a constant increase. However, the combination with Varian provides both vendors with stronger positioning in these high-growth markets. Entering another attractive market creates an unprecedented highly integrated portfolio for the global fight against cancer and is therefore expecting an increase in their revenue growth profile of more than 5% annually above Siemens Healthineers’ forecasts, effective immediately after closing the deal.

The deal is estimated to generate at least € 300 million of EBIT synergies per annum in the fiscal year 2025 and a further significant increase after, despite the disruption of the Covid-19 pandemic (Siemens Healthineers AG, 2020).

One step - Two Leaps Strategy

As can be seen from the equation ‘1+1=3’, the Merger also has another strategic motive behind it. But first of all, the placement of Varian into Siemens Healthineers’ Strategy, described in detail above, is very intriguing and ambitious. The first phase of its ‘Strategy 2025’, called ‘Reinforcing Phase’, Siemens Healthineers already completed at the end of the fiscal year 2020 by successfully implementing its IPO and launching important innovations, such as AI-Rad Companions - AI-powered augmented workflow solutions, helping reduce the burden of repetitive tasks. Siemens

Healthineers then entered their second phase towards the Market leadership 2025 Plan, which is called the 'Upgrading phase', providing the company with profitable growth. During this phase, Siemens Healthineers acquired the companies Corindus and ECG Management Consulting and with the perfectly aligned to the phase Merger and acquisition process with Varian, they are strengthening their position as 'a holistic partner in healthcare', growing in existing markets, increasing in familiar fields and making new markets (Siemens Healthineers, 2021c).

Having finished the second phase of their progress follows the third 'New Ambition Phase'. In this phase, Varian is integrated as a very important part to create unique capabilities in the overall medical industry development - to be 'pioneering breakthrough' by making 'One Step in Two Leaps'. This is evaluated as the biggest motivation behind this deal and it represents the '+ 1' of our equation. It highlights the combination of the two companies by benefitting from each other's greatest strengths. On the one side, the two companies realize an advancement in the cancer care field by Varian cooperating with Siemens Healthineers, expanding their portfolio and bringing cancer care to the next level with cutting-edge intelligent therapy and a comprehensive digital ecosystem. On the other side, Siemens Healthineers realizes a 'jump' in impact, defined by shaping the future of healthcare together with Varian, as merging their synergies and realizing strong positioning and market growth. More specifically, with Varian, Siemens Healthineers will leverage AI-assisted analytics to advance the development and delivery of data-driven precision care and redefine cancer diagnosis, care delivery, and post-treatment survivorship overall (Stephens, 2021; Siemens Healthineers AG, 2020).

From the analysis of the 'One Step. Two Leaps' motivation and potential strategic impacts on the companies follow their involvement into the already mentioned 'New Ambition Phase'.

In the heart of this phase lay potential unique capabilities, which are digitally very innovative for the industry and would have an exponential impact on healthcare in general. These capabilities include 'Patient Twinning', 'Precision therapy', and 'Digital data and artificial intelligence (AI)' concepts, set up as the main goals for the next period (Siemens Healthineers, 2021c).

Hosting the Siemens Healthineers Shape 22 Keynote, Dr. Bernd Montag (a chief executive officer of Siemens Healthineers since 2015) presented in detail the results and joined purposes of the accomplished Merger and acquisition process with Varian as a perspective on the year 2022. He highlighted the biggest and most important goal of the joint companies. 'Pioneer breakthrough, For everyone, Everywhere'. Therefore, to achieve this aim, the three aspects of the 'New Ambition Phase' come in handy and are the foundation of the new company.

Starting with the first competence required for fulfilling future objectives - The Patient twinning, it is the first pillar, driving ambitious innovations. It is envisioned by building a Patient Twin, representing each patient's full digital copy, based on overall history, health data, molecular diagnostics, tests, lab results, targeted scans and it supports clinical decision making, as well as helps predict outcomes of procedures and success respectively in recovery times. It is refining imaging and diagnostics and combining the two for personalisation of diagnosis and treatment, therapy selection, guidance, recovery and managing health overall. Since it is a highly digitalized technology, it would be possible to remotely follow up on patients' conditions and keep in constant touch with them.

The second competency is Precision therapy, which is presented as the key to fighting the most prevalent diseases in today's world including cancer, cardiovascular and neurovascular diseases. This highly innovative technology is designed to make therapies and treatments more accurate and precise - for example when considering cancer cases, thanks to this technology it would be possible to exactly target tumors only and spare the surrounding healthy tissue in minimally invasive procedures, leading to easier and faster recovery of the patients. Such interventions are still risky nowadays and robotics can highly influence the field and be out of unimaginable importance for the precise realisation of interventions.

The third critical competence is digitalisation or digital data and Artificial intelligence (AI). This aspect connects the two competencies before and in practice, realize them, since the future of innovations, especially in the medical field, lies in fully embracing technological capabilities and successful digitalization. This factor brings to the forefront the linkage between diagnosis and treatment and guiding treatment. The usage of AI would provide increased efficiency, and fewer errors and it could have a major role in making the patients’ care better and more fulfilled (Siemens Healthineers Shape 22 Keynote, 2021).

Hence, after the Merger between the two companies (now the newly joined company) is able to take full advantage of their capabilities and fulfill the ‘New Ambition Phase’ together. Using Varian’s software, technological expertise, software development capabilities, and Siemens Healthineers’ medical devices technologies, such as advanced screening devices, opens the door for a new era, combining talent and capabilities on a high level, thriving innovations. Furthermore, a SWOT analysis was executed of the deal below (Figure 7):

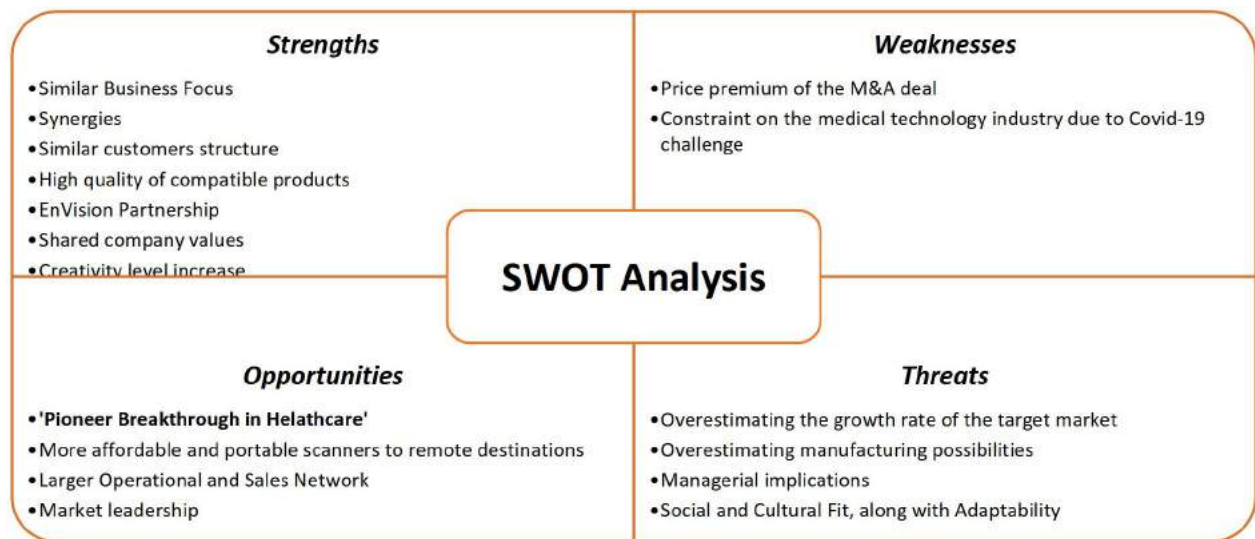

Figure 7: Deal potential synergies and major reasons for Merger; own compilation

Based on Leigh’s SWOT analysis (2009), the merger deal has been analysed with the main bullet points emphasizing possibilities regarding the future of the two companies, with regard to opportunities and threats of the merger, as well as strengths and weaknesses at the time of signing. As it can be seen from the Figure, the strengths in the substance outweigh the weaknesses when entering the deal, with the biggest opportunity of improving healthcare and making it available to people with no access. But neither factor should be excluded. For example, from the SWOT analysis, made by Wellner, we can see how important adaptability is, especially at the beginning of such a collaboration (Okl and Wellner, 2019). Despite this particular deal is a special case, due to the fact that Varian remains with its existing operations characteristics and there is less cultural adaptability, due to different not overlapping locations. That decreases the need for very often high threats, along with expenses, considering different circumstances (Wellner and Intelmann, 2017).

7.5 Future estimations and Long-term vision of the Joined company

Having analyzed the strategic background of the Merger and Acquisition between Siemens Healthineers and Varian in detail , the newly joined team has also set up not only potential strategies for realizing the combination but also has set up a plan for future actions in order to continue with the ‘New Ambition Phase’, conclude it and gain Market leadership in the year 2025 as one.

Chris Toth, CEO of Varian, now a Siemens Healthineers company also contributed to the Siemens Healthineers Shape 22 Keynote by highlighting these future perspectives and how via successful mutual collaboration between the two companies they can achieve their respective objectives.

As previously mentioned, the main objective is to provide pioneering breakthrough in healthcare - for everyone, everywhere. That also includes Intelligent Cancer care as a major perspective effect of the Merger, combining Imaging, laboratory and robotics of Siemens Healthineers, Digital data and AI and Cancer care of Varian, the joint team can achieve better care and outcomes for patients and more lightness on physicians. In order to realize this motive, the company has differentiated four main focus areas to deliver (Siemens Healthineers Shape 22 Keynote, 2021):

1) Accelerating the path to treatment

One Goal or a Challenge that the company set themselves is reducing the time from diagnosis to treatment from 2 weeks to 2 hours, by reducing manual process steps and introducing more authorized solutions. Early detection in most cases is incredibly crucial for the effectiveness of the treatment so accelerating this process can be of very high importance.

2) Development of an ecosystem based on data-driven insights

In order to provide a better more effective workflow, now after the deal it is possible to seamlessly connect Siemens Healthineers' imaging solutions to Varian's ecosystem. Using the AI system could deliver more precision in the scanning using different contours of various anatomical structures and this could be beneficial for localizing organs at risk and guiding treatment plans.

3) Focus on more personalized care

By developing the Patient Twinning, this integration of data and using data from various sources brings individualization of the consultations, diagnosis, treatment, and overall care of the patient. By making use of Artificial Intelligence software and professional expertise, patients receive more detailed individual current and future health status.

4) Improve access to advanced care

Today there are roughly 3 to 4 billion people without sufficient access to healthcare and treatment. Using AI, data analytics software from Varian, and already automatized testing devices from Siemens Healthineers, the joined efforts can expand into further areas, starting with Magnetom Free Star, which is a cost-effective magnetic resonance imaging scanner, that can be used by untrained personnel or Atellica CI1900 System, which makes testing possible for mid-to-lower volumes processing laboratories, providing accessibility to patients all over the world.

In order to achieve these goals as fast as possible, the new company is expecting to increase its Research and development by investing roughly 2.2 billion USD over the next 5 years, keeping in mind the Final Goal → of offering patients the highest level of care at reduced costs, in a less time-consuming manner and more accessibility to enable better final outcomes for people's overall wellbeing (Siemens Healthineers Shape 22 Keynote, 2021).

Furthermore, as Siemens Healthineers has now entered the third phase of its Strategy 2025 – the Upgrading phase, the company has set its cultural, strategic, and financial goals. It predicts growth in revenues of 6 to 8% annually for the period 2023-2025. Siemens Healthineers is going to focus on the three capabilities within the New Ambition goals, including 'patient twinning', 'precision therapy', and 'digital and artificial intelligence'. These goals would enable people to fight the most threatening diseases so far, make usage and operations of most devices more effective, and provide access to affordable healthcare to people with no access to it currently (Siemens Healthineers, 2021f).

Apart from the set up medical innovations' goals, Siemens Healthineers has also set up clear frameworks and guidelines for this period with the regard to ESC compliance. The company has broad targets to support sustainability, strengthen activities for decarbonization along the value chain and promote equality, diversity and inclusion.

Considering the financial future perspectives of the company, Siemens Healthineers in combination with Varian has changed its initial synergy targets to EUR 350 million by 2025. Furthermore, the company is estimating an increase in innovation via investing 8 to 9% of revenues in Research and

development, as well as fostering profitability and strengthening its financial ‘soundness’, focusing on recurring revenue streams, which are about 55% of total revenue (Siemens Healthineers, 2021f).

8. Managerial Implications

This study offers insights into market developments and merger deal strategy mainly, which contributions to managerial practice. When trying to analyse a similar M&A based on strategic motivations, assessing the risks can be challenging. Therefore, an analysis, presented in the form of a case study can present insightful input into what is important to be considered as a key performance indicator and how to find the suitability of the market operate in. The acquiring firms in the medical technology industry can integrate these findings into criteria for future use and the strategic insights of the deal can be useful in order to assess the return of the deal in the long term for the acquiring firm in terms of innovation breakthroughs mainly.

9. Conclusion

Following the framework during the length of this paper, first an analysis was made of the two participant companies of the Merger - Siemens Healthineers and Varian Medical Systems, using the Business Canvas Model, focusing each on several main aspects of the model and evaluating them in-depth. The Business Canvas Model further contributed to the main objective of this paper - a strategic analysis describing the way the companies operate, create, deliver and capture value (Osterwalder, 2004).

A very important factor in the analysis of the companies was the Strategies of both Siemens Healthineers and Varian since they both had visions for their individual companies in terms of impact, but the realization of what they could achieve together led to something bigger - the combination of the two companies adding an added-value as strategical impact in their future goals and importance for the global healthcare industry. Despite the companies being in a partnership since 2012 in EnVision, they saw the opportunity for further impacts and growth. This leads to the meaning behind the equation ‘one plus one equals three’, which is the heart of this report and of the deal. It emphasizes the difference that the two companies can make not only in their own development but for the whole world and healthcare industry.

Siemens Healthineers is indeed interested in increasing its portfolio of imaging, laboratory diagnostics, artificial intelligence, and treatment and Varian has the opportunity to accelerate its mission to reduce uncertainty for cancer patients and increase the level of survivorship. But together they have the possibility of radically changing the world in many aspects. Cloning people into their own digital twin, constant monitoring of patients’ health and realizing precision therapy are incredibly advanced innovations, and achieving them would be the ‘+1’, the added value to the world, saving more lives, to offering people a higher level of care (Siemens Healthineers Shape 2022 Keynote, 2021).

Moreover, all factors considered have major perspectives on the deal since the times we live in have drastically changed healthcare and the combination these two companies provide is very intriguing and promising for the future of healthcare. In their report on healthcare industry change, Deloitte systemizes major global issues of healthcare, starting with digital transformation and interoperable data (Deloitte, 2021); (Schivone and Ferretti, 2021). Indeed, this challenge nowadays can be overcome with the Goals that the joined forces plan to fulfill. The fact that the industries that the joined company is operating in and dominating, brings forward also possibilities of profits gains and potential for unique value creation, along with numerous further opportunities for market and portfolio expansions, as well as technological innovation and advancement.

Based on the hypothesis of the success of this merger, there are promising facts as to why it has been a success and an exception from the original statistics of 70% failure in the medical device industry M&As (Early, 2004). For the first quarter of 2022, revenues for Siemens Healthineers rose 31% to almost 5.1 billion euros, which are benefiting from the Varian segment contributions. The new integrated segment into the Siemens Healthineers company has a promising profitable start with revenue of EUR 750 million only for the first quarter of the fiscal year 2022, half of which was

obtained from the Americas region (Siemens Healthineers, 2022). Therefore, based on the good results so far, Siemens Healthineers has defined clearer goals for the Varian segment. That includes an increase in their synergies to an expected EUR 350 million by 2025, as well as an expected revenue increase in the Imaging, Diagnostics, and Advanced therapies segments between 5 to 8 percent, and Varian's fully synergized plan to show a revenue growth between 9 and 12 percent by the fiscal year 2025 (Siemens Healthineers, 2021f).

This implies promising expectations for the predicted future of the joined company, implying the success of this merger transaction. But even though profits are estimated to a relatively reliable level, the innovation levels increase is still to come with the company having ambitious goals set up for their next phase towards market leadership.

Cultural Barriers Limiting Professional African Women Leadership in South African Higher Education

Hazvineyi Saurombe^{*,1} and Yvonne du Plessis²

^{1,2} NWU Business School, North-West University, South Africa

Keywords

Africa; cultural barriers; detrimental cultural practices; gender inequality; higher education; black African women leaders

Abstract

Black African professional women in leadership positions often experience barriers that hinder their optimal organisational participation and career growth. This paper surfaces some of the hidden cultural barriers that are still experienced by African professional women in higher education leadership, the systems that perpetuate it, and how these limiting cultural practices can be managed. Data were gathered using a qualitative approach; interviews (face-to-face) were carried out with 10 purposively selected African women holding senior leadership positions in higher education, and the data were inductively organised into themes. Participant narratives gave insight into what constitutes deeply rooted cultural practices that work against women's career progress in leadership positions, which are mainly: cultural upbringing, patriarchy, gender discrimination, and lack of support from family. This study highlights prevailing practices that continue to act as retrogressive forces in the advancement of black African women into leadership positions in higher education. Women are capable of positively transforming and adding value to organisations and society. Ending cultural practices that inhibit women will not only affect women as individuals positively, it will also enhance the overall wellbeing of societies. The solution to cultural inhibition relies on multiple levels, from government to institutional governance and management, and requires creating awareness and taking positive action in co-operation with societal leaders.

1. Introduction

Researchers and policymakers have noted that the actualisation of women's aspirations to positions of leadership worldwide continue to be challenged by notions anchored in a patriarchal philosophy. Some powerful cultural and social norms that present women as unequal to men are severely restricting the ability of women to optimally engage both economically and socially (Unilever, 2017). The Advocates for Human Rights (2018) paints a deeply disturbing picture of the status accorded the girl child by society:

“Historically, the girl child has been disadvantaged. Daily, girls are traded, bought, and sold across national borders as commodities to be put to use as prostitutes or slaves, or merely to be sold again at a profit. Many girls are even victimized before birth, as technology and greater access to medicine have given rise to prenatal sex selection and selective abortion based on sex. Girls continue to face the threat of sexual harassment and abuse in workplaces and schools. Violence against the girl child is perpetrated on every continent, wielded by every social and economic class, and sanctioned to varying degrees by every form of government, every major religion, and every kind of communal or familial structure. There is no place of complete refuge for the girl child,

only promises of stronger legal regimes and more robust non-governmental assistance.”

Detrimental cultural practices against women and girls, according to The Advocates for Human Rights (2018), continue to be defended, with proponents citing tradition and culture, male supremacy, and norms that are accepted as religion and supported by men who hold patriarchal biases. Such practices give rise to gender inequality, skewed power relations between women and men, and rigid gender roles that place women on a lower status in society, thereby minimising their potential opportunities in social, economic, and political life (The International Planned Parenthood Federation [IPPF], 2015). While these detrimental practices differ from culture to culture, one thing remains common: they keep women in subordinate roles.

In many countries, gender discrimination is still woven through legal and social norms (United Nations [UN], 2016). Half the workforce of nearly every country around the world is made up of women (Fetterolf, 2017), but without sufficient representativity at the highest levels. In addition, the increased participation of women at all levels of organisational hierarchy is needed if the issue of labour shortages is to be addressed (Ledbetter, 2014). It is indeed time to change the status quo and appoint more women to positions of influence and leadership (Ledbetter, 2014).

The values and beliefs held by members of a community are enacted through their traditional and cultural practices. Every social group in the world has specific traditional and cultural practices and beliefs, some of which are beneficial and some are harmful (Maluleke, 2012; Office of the UN High Commissioner for Human Rights [OHCHR], 1979). Some harmful practices prevent women and girls from reaching their maximum potential and contributing to their country's economic development (Banda & Atansah, 2016). These traditional practices, upheld across generations, come about as a product of social norms upholding cultural ideas about gender roles and social relations (Wadesango, Rembe, & Chabaya, 2011). Despite their detrimental nature and consistent violation of both national and international human rights laws, such practices continue to be upheld because they are neither questioned nor challenged. They are often condoned as being part of established tradition and social norms and, as such, have reached a level of acceptability (Maluleke, 2012; OHCHR, 1995). These practices are often the manifestation of hidden or unconscious biases, which only come to the fore when questioned (Bohnet, 2016).

Ledbetter (2014), in her global review of women in the workforce and leadership, highlighted several practices of a discriminatory nature, amongst which cultural factors stand out as the strongest barriers that hinder women from participating in leadership positions (Nyamweya, Ogwora, & Nyamwange, 2018). It is declared that neither culture nor tradition should be used to justify detrimental practices that militate against the leadership of women. Women's attitude to such barriers further complicates the issue. Women and girls have come to accept these detrimental practices as their lot, believing that it is acceptable that such practices be perpetrated against them. It is vital that organisations respond to and facilitate women's determination to succeed if organisations want to benefit from the widely acknowledged contribution of women's energy and capabilities (Jaffe, 2018).

In this regard, the work of the UN is commendable. Within the framework of the UN Sustainable Development Goals (SDGs), adopted in September 2015, the international agenda took a twist from its predecessor, the Millennium Development Goals, by having a separate goal that seeks to achieve gender equality and to empower all women and girls — SDG 5, which targets, among other issues, putting an end to all forms of discrimination against women and girls everywhere, and to eliminate all detrimental practices. The purpose of this study was therefore to identify and interrogate prevalent beliefs that are detrimental to the social standing and career advancement of women, with a focus on women in higher education.

1.1. Problem Statement

In the media and scientific socio-cultural literature, there is evidently an assumption, and indeed even a celebration, that women have succeeded in achieving equity in the workplace, when, in reality, that

is not the case (Froehlicher, Knuckles Griek, Nematzadeh, Hall, & Stovall, 2021). Societal expectations of women and girls are still limiting their opportunities in social, economic, and political life (Unilever, 2017), and women are still underrepresented, particularly in the top echelons of most organisations (Hackston, 2020). Around the world and in many cultures, it is rare for a woman to be in a leadership position, because there are stereotypes that need to be overcome along the way, most of which concern the woman's gender (Moriarty, 2019). The problem that the present study addressed was: While the world is rapidly changing, seeing an increasingly globalised economy, which has achieved significant advances in legislation, technology, and communication, the ideal of gender equity remains out of reach for most women and girls. Institutions of higher learning are no exception. Many detrimental cultural and traditional practices, as well as mindsets, still exist as barriers that continue to influence the ability of women to actively participate in and advance up the organisational ladder (Unilever, 2017), even in faculty ranks. Many of these practices fail to make headlines and policy memorandums of governments, because the practices are localised; their occurrence seldom transcends district- or country borders (Banda & Atansah, 2016). Although specialised agencies of both the UN and other human rights bodies, as early as the 1950s, began to focus on detrimental traditional and cultural practices affecting women (OHCHR, 1979), such practices have still not been given due recognition. Rather, whatever action, if any, to try and bring about any substantial change has been very slow and rather superficial. Blind adherence to these cultural practices, coupled with the apparent inaction of several governments in as far as these traditions and customs are concerned, has perpetuated large-scale discrimination against women.

The silence that shrouds these detrimental cultural practices, together with prevailing beliefs that the customs are in women's best interests, has made the playing field uneven. Of the many barriers that exist that prevent women from reaching top positions in organisations, this paper examines the cultural issues (notable beliefs, stereotypes, and values) that have created — and continue to feed — biased perceptions regarding women's ability to be effective leaders. Women leaders, particularly those in institutions of higher learning, can accomplish and exert much influence, given that universities are economic engines and are considered hubs of innovation and entrepreneurship (Addie, 2017). Blocking women's career path to leadership in these critical areas does not benefit society. Therefore, it is critical to unearth detrimental cultural practices, name them, and advocate for the development of a research agenda that places such barriers to women leadership at the centre of policy and action in universities.

1.2. Research Questions (RQs) and Research Objectives (ROs)

Against this background, this study addressed the following research questions:

RQ1: What are the cultural practices that militate against women assuming top leadership positions in institutions of higher education, despite the enforcement of employment equity?

RQ2: How can these hindering cultural practices be addressed while, at the same time, respecting the cultural identities of the perpetrator communities?

The ROs linked to the RQs were:

RO1: To explore the existing cultural practices that militate against women assuming top leadership positions in institutions of higher education, despite the enforcement of employment equity; and

RO2: To suggest possible ways of addressing these hindrances to women's progression to top leadership positions.

The next sections present the methodology, method of data collection and analysis, the findings, and, finally, the conclusion, and managerial implications and recommendations.

1.3. Methodology

The present study was qualitative, and an interpretivist paradigm was followed, which assumes that social reality is not singular or objective but, instead, is shaped by human experiences and social contexts (INTgrty, 2016). The researchers therefore had to interpret and make sense of the experiences of the participants. The target population for this research was black African professional women in leadership positions at a selected South African higher education institution. A sample of ten women

in positions of leadership, who originated from different African countries, were purposively selected, i.e. using a non-probability sampling strategy.

1.3.1. Data Collection

The data for the study were obtained in 2020, before COVID-19 lockdowns were implemented; therefore, it was possible to conduct face-to-face interviews. Data were collected using open-ended questions to allow the women to freely discuss inhibiting cultural practices in their societies that they considered detrimental to their career progress, particularly towards leadership positions. The duration of the interviews was approximately 30 minutes each. Consent to conduct and audio-record the interview was obtained in writing from each participant (*cf.* Creswell, 2007). The inclusion criteria were as follows: participants had to be black African women occupying a middle- or senior management position in higher education. The researcher purposively selected women from different cultural backgrounds. African countries whose cultures were represented in this study were: South Africa, Lesotho, Zambia, Nigeria, Malawi, and Zimbabwe, but the participants were resident in South Africa. The participants' biographical information remains confidential, in compliance with the South African Protection of Personal Information (POPI) Act (SA Government Gazette, 2013). Personal identifiers of the participants were removed in the reporting, to ensure participants' anonymity (*cf.* Myers, 2009).

The interview questions focused on gaining insights in order to answer the research questions, specifically the cultural barriers and systems that prevent women from participating in positions of leadership; the origins of these barriers, from birth to adulthood; and, finally, possible ways in which these barriers can be addressed to enable black African women to fully participate in leadership.

The same interview schedule was used for all participants, ensuring that all would be exposed to the same set of questions, i.e., as mentioned by Seakamela (2011), "so that their views and perceptions can be measured against the same instrument" (p. 250). The sample size was limited at 10, as data saturation had been reached (*cf.* Saunders, Sim, Kingstone, Baker, Waterfield, Bartlam, Burroughs, & Jinks, 2017).

1.3.2. Data Analysis

Analysis commenced with the researchers personally transcribing each of the recorded interviews verbatim, in order to become deeply immersed in the data. The researchers then repeatedly and closely read the texts, creating familiarity with the contents (*cf.* Thomas, 2003). Qualitative data analysis was employed, whereby coding was used to identify themes in the transcribed interview texts, as recommended by Strauss and Corbin (1990) and Miles and Huberman (1994).

The main themes that emerged were: cultural upbringing, patriarchy, gender discrimination, and lack of support from family. These findings are discussed with supporting verbatim quotes and related extant literature.

The next section provides an overview of the literature in this domain.

2. Literature Review

The review highlights extant literature on women in leadership, followed by a description of role congruity theory, in which this study is embedded, and definitions of culture.

2.1. Women in organisational leadership

More women in organisational leadership means that more diversified skills and experiences presented at the decision-making table, which enables groups or divisions to be more capable of weathering problems and issues in a better way, as well as to quickly identify innovative solutions (Deloitte, 2017; Williamson & Wilkie, n.d.). Having more women in leadership leads to a wider lens on strategic thinking. Women have ideas, information, and opinions that can provide constructive ways to improve tasks and organisations. They provide diverse business perspectives when making decisions, and they approach risk in a different manner to their male counterparts, which, in turn, leads to improved performance and greater competitive advantage (McKinsey & Company, 2010).

Women create an economic engine when they work and lead (Organisation for Economic Co-operation and Development [OECD], 2008), and their contribution has significantly raised the GDP of several countries around the globe (Anon, 2014; Aguirre, Hoteit, Rupp, & Sabbagh, 2012). Women are critical agents for enabling meaningful change in workplaces, and by excluding them from the top echelons of organisational hierarchy, organisations are losing out on profits and competitive advantage (Taneja, Pryor, & Oyler, 2012). The governance of organisations, communities, and nations would be more efficient (Mizrahi & Fraser-Moleketi, 2015), yet despite the social and economic advantages of involving women, they are still largely excluded from the most powerful corporate positions (Miller & Vagins, 2018), mostly due to inhibiting ethnical cultural reasons, and these remain as barriers that prevent women from navigating in their career lives and taking up leadership positions.

2.2. The role congruity theory

Role congruity theory originates from social role theory, which describes the dissimilar social positions of men and women and how these create differing gender roles (Eagly, Wood, & Diekmann, 2000). Role congruity theory, developed by Eagly and Karau (2002), proposes that the perceived incongruity between the female gender role and leadership roles leads to two forms of prejudice: (1) perceiving women less favourably than men as potential occupants of leadership roles and (2) evaluating behaviour that fulfils the prescriptions of a leader role less favourably when it is enacted by a woman. The theory provides a theoretical foundation for understanding the dynamics and diverse assessments of women and men in managerial positions. It explains the reason for the low number of women in top-level management, considering a perceived incongruity between the attributes of a strong leader and attributes assigned to women's gender roles (IGI Global, n.d.). As a result, attitudes are less positive towards female leaders and potential leaders than those who are male. Other consequences are that it is more difficult for women to become leaders and to achieve success in leadership roles. Evidence from varied research paradigms substantiates these consequences, especially in situations that heighten perceptions of incongruity between the female gender role and leadership roles (Eagly & Karau, 2002).

2.3 Ethnic culture

An ethnic culture is what is generally accepted as a way of life for a particular group of people, and includes their behaviours, beliefs, values, and the symbols they accept, usually without question. Every social grouping in the world has specific traditional cultural practices and beliefs (Ntuli, 2019). The culture and its norms and beliefs are passed along by communication and imitation from one generation to the next (Idang, 2015). While cultures safeguard the identities of black Africans (Birch-Jeffrey, 2019), some cultural practices may hamper advancement of the continent by weighing down women and girls (Banda & Atansah, 2016). Cultural expectations influence the beliefs, behaviours, and experiences of people, in both society and organisations, regarding the expectations they have of women (Longman, Daniels, Bray, & Liddell, 2018).

2.4 Cultural practices militating against the advancement of women to leadership

Previous research has identified several cultural barriers that may contribute to the gender gap in leadership. Amongst the most prominent cultural barriers are socialisation of gender norms (Enaifoghe, 2018), discriminatory treatment of the girl child by society (Okunola, 2020), boy-child preference (Rossi & Rouanet, 2015), patriarchy (Wood, 2019), the role of family in the socialisation of women (Eagle, 1988), and embedded traditional cultural beliefs (Ssenyonjo, 2007).

Certain cultural beliefs stand as barriers that make it near impossible for women to advance to positions of leadership in political, social, and religious spheres (Lwanga, 2008; O'Neil & Domingo, 2016). These beliefs obstruct women from participation in any area in the public domain, as they are seen as a challenge to the established traditional order. Across Africa, beliefs regarding domestic roles and women not being suited to top leadership positions are deeply entrenched. The cultural domestic burdens that women are expected bear further reinforce perceptions that women cannot perform effectively in leadership (Oteino, 2012; Pew Research Centre, 2015). Ndungo, as far back as 2006, concluded:

“Cultural perceptions undermine women’s abilities, and portray women as ineffective, irresponsible and incompetent, and people who lack ambition, never to be taken seriously”. Such perceptions, which are mere creations of traditional norms and customs, act against women, and because of their socialisation, women simply accept or become resigned to the notion that they are incapable of operating in the so-called ‘male territories’.

Some women internalise the notion that they are less capable of taking on leadership roles, and they then cease to identify with potential leadership positions, which ultimately deflates their motivation and lowers their performance (Fogliati & Bussey, 2013). Women themselves may fuel barriers to their advancement by responding in unhelpful or destructive ways, such as avoiding the career altogether (Schwanke, 2013). Furthermore, women fear being associated with stereotypes of women in leadership, a phenomenon known as ‘stereotype threat’ (Steele, 1997; Schmader & Hall, 2014).

Smith (1984) noted that: “many women have to a certain degree internalized the attitudes and role expectations about women, to the extent that they have learnt to fit neatly into the stereotypes” (p. 58). This can be a serious handicap in the development of their individual personalities, their abilities, and their career potential. Sebakwane (1994), Chabaya, Rembe, and Wadesango (2009), and Mapuranga and Chikumbu (2015) note that gender socialisation should be practised in such a way as not to teach prejudice against the opposite sex, but to allow the child to grow ‘naturally’ and fit into her assigned role and to make her look forward to her allotted task with pleasure. It should occur in such a way that both men and women freely accept it. The existent problematic beliefs and perceptions are even held by some women. In a study carried out in the Southern African Development Community (SADC), it was found that women find it difficult to change their mindset for fear of ostracization (Sadie, 2005; Bernstein, Kattau, & Ndinda, 2009).

2.4.1 Socialisation according to gendered norms

Socialisation according to gendered norms across the world bears some of the blame for the way women are viewed socially. According to Rosen (2000), it is the society that assigns to its members gender roles that are socially constructed, as well as their activities, behaviours, and other attributes. Gender stereotyping is underestimated as a factor contributing to the slow advancement of women to high-level management positions (Jonsen, Maznevski, & Schneider, 2010). Due to stereotyping, women and men tend to develop their skill sets and occupational skills based on what is culturally considered appropriate for each gender. These ascribed gender roles, while limiting for both sexes (IPPF, 2015), ultimately lead to more discrimination being perpetrated against women. They are expected to conform to the way they were socialised, and when they deviate, they invite the ire of society, as they are regarded as defying their assigned gender role. This particular socialisation seems prevalent across the globe (Blackstone, 2003).

In several communities across Africa, women are expected to take on a variety of specific roles for which they are not paid, such as being wives, mothers, caretakers, as well as other — sometimes very onerous — duties (Mbalcogu, in Nyamweya, Ogwora, & Nyamwange, 2018; Hoh, 2009). Girls are socialised from childhood regarding the importance of such roles, starting from an early age, when they are indoctrinated to believe that men and women have different gender roles to play in society. These children will then go on to perpetuate these damaging and restrictive roles in adulthood (UN Office on Drugs and Crime, 2018).

This socialisation is evident in the toys assigned to genders — boys get toy vehicles, action figures, and construction equipment, and girls get dolls and toy kitchen sets. The society thus constructs ‘the ideal woman’, which becomes ingrained in the woman, to her great disadvantage later in life (Saurombe & Du Plessis, 2018), particularly evident in her lack of participation in leadership. The burden of care work placed upon women further impinges on her opportunities in the field of work, and prevents her from realising her maximum potential (IPPF, 2015).

2.4.1.1 Discriminatory treatment of the girl child

Deeply entrenched at the core of detrimental cultural practices is a mind-set that discriminates and devalues girls, beginning from the day the girl is born and continuing to manifest strongly in her socialisation at the household level — ultimately justifying underinvestment in the girl child (Banda & Atansah, 2016). According to an Asian proverb (OHCHR, 1979):

"Bringing up girls is like watering the neighbour's garden."

Girls are taught to believe that women are inferior to men, that their rightful place is in the home, and that they are only to be seen and have to remain silent (Dorsey, 1996). It is instilled in them that their wellbeing and ultimate success is dependent upon acting in certain stereotypical ways, such as being timid, soft-spoken, and compliant — behaviours utterly unfit for the boardroom — and relation-oriented. The expectation of these behaviours is further reinforced through the media, family, and social messages. Women do not deliberately act in ways that tend to sabotage themselves, they simply act in consistence with their childhood learning experiences (Frankel, 2004). The resultant effect of all this is society's internalisation of the low value attributed to the girl child. The socialisation of the girl child puts her on the wrong footing, and it is to blame for her perceived inability to successfully fulfil leadership roles in later life.

2.4.1.2 Boy-child preference

The preference for a boy child is prevalent around the world, which means that a girl child is at a disadvantage from birth. The preference determines the quantity as well as quality of parental care and of investment in the child's development and wellbeing (OHCHR, 1979). The preference for a son is a cultural practice that is embedded in the value systems of most societies, and it guides the behaviour of family members. This preference plays a pivotal role in the resultant low valuation and neglect of female children. Giving birth to a son is welcomed with celebration in many cultures, as he is considered an asset, whereas a girl is seen as a liability, an impending economic drain.

Through the World Health Organization (WHO, 2011), the OHCHR, the UN Population Fund (UNFPA), UNICEF, UN Women, and the WHO issued an interagency statement in which they denounced the preference for a son, stating that sex selection in favour of boys is a symptom of pervasive social, cultural, political, and economic injustices against women, and that it is a violation of women's human rights. While many domestic, regional, and international measures have been put in place to address the detrimental practice of differentiating the treatment of the sexes from infancy, the efficacy of such mechanisms has been seriously compromised because many of these practices and beliefs are grounded in widely accepted cultural and religious norms (The Advocates for Human Rights, 2018).

A firmly rooted cultural practice among many nations is son preference, which is a manifestation of gender discrimination that is deeply entrenched, as well as a symptom of a pervasive social, cultural, political and economic injustice system against women. It has, for a long time, avoided international and national scrutiny because it is considered a cultural practice that is worthy of tolerance and respect. In essence, from birth to adulthood, society has already defined the girl child: 'she is a nobody' (Saurombe & Du Plessis, 2018).

2.5 Patriarchy

A traditional patriarchal value system in many African societies typically favours power over women allows men to establish "male control and dominance", not only in relationships, but also in the beliefs and structures of society (Andt, 2002), which tend to impede the advancement, progress, and participation of women in society. A patriarchal culture obstructs women's intention to take on leadership roles, as it tends to place them 'at home', and therefore far from public leadership (Kadaga, 2013).

In masculine societies, the portrayal of the African woman is determined by the socio-cultural and patriarchal ideologies that present her as docile, modest, and tender — one who does not question

male authority (Ebila, 2015), while the men are presented as assertive and tough. These perceptions, coupled with persistent assertions that women have no rights, no value, and are not equal to their male counterparts, eventually force women to submit and conform to the socially sanctioned and acceptable norms in their society. Such detrimental cultural beliefs are normally prevalent in an environment where the society places a low value on women and girls (Ebila, 2015).

Impediments to women's progression to leadership roles are, to a large extent, due to negative perceptions of women's ability to lead. A deduction was made that many men believe that women cannot lead, and that they are better suited to supportive roles, in which they must be given guidance, direction, and even protection (Chesania, in Nyamweya, Ogwora, & Nyamwange, 2018). Men are convinced that, by making decisions *for* women, they are protecting them; they see it as an act of beneficence, yet many women view such protection as a means of limiting their autonomy (Princewill, Jegede, Nordström, Lanre-Abass, & Elger, 2017). Adjusting these beliefs will require a cultural change over the long term (Sanders, Hrdlicka, Hellicar, & Cottrell, 2011).

Women are often reminded that they are unreliable and unpredictable, and, hence, the suitable place for them is the kitchen (Kasily & Onkware, in Nyamweya, Ogwora, & Nyamwange, 2018). Such a role, which has been culturally carved out for women, denies them access to information, exposure, and experience (Gouw, in Nyamweya, Ogwora, & Nyamwange, 2018). Japan is a case in point. Due to cultural and role expectations, of the approximately 70% of women who exited the workforce in 2012 to look after their children and to take care of their families, most did not return to employment. Research by Daimon (2013) concluded that Japan's economy was negatively affected during this period.

Cultural beliefs and traditions shape personality (Mbalcogu, in Nyamweya, Ogwora, & Nyamwange, 2018) and social behaviours, with patriarchy requiring of women to be submissive and quiet. Any behaviour that is contrary to this expected personality is considered an embarrassment to the family (Moodly & Toni, 2017). As a result, women feel they are socially obliged to not only be submissive, but to keep the peace at home.

In patriarchal societies, negative perceptions of women are used as strong tools for group control. The detrimental patriarchal myths that are upheld include that certain jobs, especially those that involve decision-making and leadership, should be reserved for men (Tabassum & Nayak, 2021).. As a result, few women have been able to prove their ability in top leadership positions in institutions, organisations, and politics, evidenced by the fact that Africa has had only two female presidents to date

2.6 Role of family in women's socialisation

The family should be the centre of civic education. Most detrimental cultural practices take place in secrecy within the confines of the home, forcing the creation of a conspiracy of silence between young girls and the female community leaders who safeguard and uphold harmful traditions (Banda & Atansah, 2016). Many girls do not receive the familial support they needed to start, continue with, or complete their education (Segobye, 2016; Addaney, 2016), as they are not accorded the same value as boys.

The socialisation of children is such that, from the start, girls are taught to participate in household duties, while the boys are nurtured and groomed for leadership roles. The grooming of girl children is focused on marital roles — a good wife, mother, and housekeeper. They are conditioned to believe and accept that a woman is inferior to a man in the business context; he wields the upper hand, while her place is in the home, far from areas of power. Girls are taught that they are 'away children', and thus they do not assume leadership positions in the home. Research findings show that the few women who have assumed top leadership positions had been groomed for such a role by a family member who had also previously taken on some form of leadership position. The lived experience of one female leader, Joyce Banda (Banda & Antasah, 2016), former president of Malawi, is a case in point:

“As a young child, my parents protected me from traditions they believed detrimental. At home, my father raised me and my sisters as he would raise sons—engaging and valuing our potential in a way deemed unusual in those times. I ended up in the State House.”

The effectiveness of the family unit in the socialisation of women is notable. In research by Madsen (2010) on women leaders in the United Arab Emirates and the influences believed to have been most critical in preparing them for leadership, it was found that the presence of, and interaction with, male siblings during their formative years and ‘more open-minded’ fathers were the most decisive factors in the later development of the women’s leadership capabilities. Conversely, lack of support from family members has been cited as one of the many causes of women’s under-representation (Bismark, Morris, Thomas, Loh, Phelps, & Dickinson, 2015). The Department for International Development (DFID, 2014) notes that the absence of parental and community support can hinder the effective delivery of girls’ leadership programmes, as it limits girls’ participation. As these girls develop into women, this background will continue to haunt them and hamper their progress towards leadership positions. It is thus clear that there is a need to counter the damage caused by harmful cultural practices and norms, starting with the household unit.

The next section reports the findings of the study, substantiated by verbatim quotes from the interview transcripts.

3. Findings

The themes that emerged from the data are reported according to the interview questions.

Interview Question 1: *According to you, what is an inhibiting cultural practice?*

P3: “An inhibiting cultural practice is a form of violence which is committed primarily against women and girls in their communities or societies because they are considered by the perpetrators to be part of accepted cultural practices.”

P6: “... those practices that are known to have bad effects on people’s well-being, or which tend to obstruct one’s path to equality or equal treatment, but are still practised.”

P7: “...forms of violations which are perpetrated against some individuals and are accepted as part of the traditional cultural practice in specific countries and in specific contexts.”

Interview Question 2: *What are the detrimental cultural factors that impede women from taking on leadership positions?*

Discriminatory socialisation of girls:

The responses of the participants indicated that, culturally, women are not supposed to be heard. The man is the head of the house; he rules, and they have no voice. If a woman talks too much, she is labelled a woman of loose morals, a cultural deviant. A strong, powerful woman is rejected by society. As a result of this upbringing, women not only evade responsibility, they shun it. Almost all the participants pointed out the cultural upbringing of the girl child as discriminatory.

P1: “As a girl, you are raised being told that you are a woman; your role is in the kitchen, raising children. You do not tread in the men’s domain.”

P3: “Societal upbringing is a problem. As a woman, you are supposed to assume the back seat and let the men lead. You do not count for anything; you are a nonentity.”

P7: “Even dating back to the time when Jesus was on Earth. You find that, according to the Jewish culture and tradition, women and children were not counted; it was only the males. When the Bible says Jesus fed 5 000 people, this statistic excluded women; they were bundled up with their children. Today, this is deeply engrained in society. Even if you fight to be an equal, society will reject you. They will question your authority.”

P4: “You remain silent as a woman. ‘If you think you have important things to say, tell your husband’. If it’s a good idea, he is the one who will put it across, and credit will go to him.

That is how the chiefs of old ruled; it was through their wives, but the women remained in the background. Today, girls are still being taught to follow suit.”

P9: “Cultural upbringing... Today, as women, we are limited in terms of what we are capable of giving to society.”

P10: “We were taught that men are superior, and, as such, you do not challenge them.”

Patriarchy:

Participants indicated that patriarchy is a detrimental cultural practice that is holding women back from assuming leadership positions.

P6: “Patriarchy... Most of the African countries are under patriarchy ... this needs to be deconstructed, to be transformed. It starts in the home...”

P8: “For women born in the 60s or 70s ... the cultural practice of patriarchy really pulled them down. They were taught men are superior; you do not challenge them, and, to this day, this has not changed. Women are failing to fight this.”

Male superiority:

Participants pointed out that the notion of male superiority is a causative factor in women failing to take up leadership positions. This practice begins from the moment the gender of the child is known. Universally, son preference is a cultural practice that plays a crucial role in the low valuation and neglect of the girl child. The boy child is nurtured and groomed for leadership roles, while the girl is neglected in many areas.

P6: “Culturally, the boy has power over the girl child. The girl does not have a say, for example, in the usual sibling rivalries. I have a twin brother, and this brother of mine has rights over me. Even brothers that are younger than me. I was taught to mellow down, told not to talk back at them. I cannot challenge them, because they are boys!”

P7: “Right from a young age, society teaches boys about role differences. I have to battle to get my six-year-old son to go and wash his plate, as he argues that his sister should instead do it. As a boy, he cannot. Where did he learn that from? Society has dictated that is how it should be.”

P9: “There are underlying cultural forces that exist, which pin the girl child down and presents an uneven ground. As a grown woman, she cannot shirk off these forces. Son preference exists, and it is widely accepted as normal by most cultures around the world. It has to be addressed in order to change it. Because of its wide acceptance as normal, its role in the slow progress of women assuming leadership positions has been brushed aside and underestimated.”

Unsupportive family unit

Participants’ views were aligned with that of Hartmann (2010), who notes that, in reality, the household unit still has a traditional structure that makes males the dominant gender. In black African families, “parents view their daughters as little more than a drain on limited family resources. They do not invest money in a daughter’s education and skills acquisition, preferring to marry her off at an early age. The dowry received reduces the perceived ‘burden’ on a girl’s family” (Segobye, 2016).

P2: “In the family setting, young girls are groomed for marriage. They are taught how to assume wifely duties in the family they are going to get married into, while the son is groomed to be a leader, head of the house. No wonder then that, when it comes to assuming leadership positions in the workplace, the boy already has an upper hand; the ground is not level. The norms in many

P5: “Girls are raised and socialised as ‘away children’. They cannot be groomed for leadership; it is a waste of time. They will get married and go to another family.”

Interview Question 3: *In what ways are women responding to these detrimental cultural practices?*

Take action and change the way:

The participants noted that women have become aware that they need to act against the detrimental cultural practices that hamper their progress in assuming leadership roles. To a great extent, it is incumbent upon themselves to change the status quo. Participants noted that women have realised that trying to change grown men and women is difficult, and may even be in vain, are that they are attempting to change the belief system at the midway point, instead of addressing it at the root. Older people do not easily change their beliefs; hence the call to take action and instil the correct values while they still have the future society under their guidance.

P4: “ ‘Women, be the change that you want to see.’ Change begins at individual level ... we are the ones to initiate this; we need to change our mind-sets. We raise the children, so we can instil in them the right values that we wish to see.”

P9: “We need to teach the children to be sensitive to the right culture that we want to propagate. We have a societal problem, but [we], as women, in our small corners, can do something to change the way society thinks and behaves.”

Unite in action for equity:

Participants indicated the need for a united front in addressing detrimental cultural practices.

P2: “We need to speak with one voice, speak out against the gender imbalance.”

P4: “No-one will come to the woman’s rescue. She must get up and fight, begin to see herself as an equal.”

P9: “Let’s continue fighting. We are not trying to push the men down under; no, we still respect them. All we are saying is: when it comes to our professions, let there be equity.”

Dissolve patriarchy:

A number of participants suggested that, in order to establish equality, patriarchy has to end. This view is aligned with literature, with the Commission on the Status of Women (2018) stating that removing patriarchal laws and forming strong partnerships across all sectors of society are important steps in removing barriers to progress in gender equality. However, Wood (2019) notes that the roots of patriarchy run deep in the fabric of society, and that it is so deeply entrenched in the societal principles of control, male dominance, identification, and centeredness that it is difficult to change.

P7: “Deconstruct [sic] patriarchy, advocate for its transformation. Introduce it in early primary school, right from the grassroots level”

P8: “Teach children that there are no ascribed gender roles. If this is taught at school and reinforced at home and in the community they live in, society may change its way of thinking and relating to the different genders.”

One participant, who had witnessed generations of women in her family suffering discrimination, noted having called on God for ***supernatural intervention***, as, according to her, everything else had failed to bring about equality.

P1: “Rely on the supernatural for support. As women, we have been advocating for change for quite some now, but we still do not see the change. Women simply talk; nothing changes. Why engage in battles of a lifetime? May God Himself intervene. If not, the situation will remain as it is.”

Interview Question 4: *How can these detrimental cultural issues be addressed, while at the same time respecting the cultural identities of the perpetrator communities?*

To realise the aspirations of the global SDGs by 2030, Africa must learn to value her womenfolk and free them from the cultural practices that continue to block their progress towards leadership. Participants noted that preserving African cultures and traditions is important, but that certain practices need to be revisited. They suggested initiating cultural change through processes of education, communication, and training. Bringing about change is indeed difficult, as it requires shifting existent underlying beliefs and behaviours (Sanders, Hrdlicka, Hellicar, Cottrell, & Knox, 2011). Participants reiterated the need for education of adults and children and regardless of gender.

P3: “People need to become educated...”

P8: “Education, education...”

School is considered one of the primary socialising agents. Schools have a duty, as one of its main roles, to teach learners societal norms and values (Haralambos, 1995). The school should therefore be active in offering a curriculum that assists boys and girls to develop new orientations about the roles and capabilities of both men and women. Existent literature posits that such a curriculum should be introduced quite early in the school years, as behavioural and attitudinal approaches are best introduced in early childhood (Kar, Choudhury, & Singh, 2015). With the right orientation, children would realise at an early age that they are equal, and that no sex group should feel superior or inferior to the other.

However, the OHCHR (1979) has noted that access to education in itself is not enough to eliminate negative values held by society, as, in most countries, such values are transmitted through educational curricula in which women are depicted as passive and domestically oriented, while men are depicted as dominant and the breadwinners. A lot more needs to be done to challenge the status quo and norms in order to give women access from an early age to orientations that point towards leadership. Female children need to be raised as equal to male children.

P1: “There is a need to change the societal mentality that women in leadership cannot achieve much. In fact, we want to be known for more than having assumed positions of leadership; we want to be known for our achievements in those positions. Once that is done, we will feel emboldened to ask for inclusivity with our male counterparts.”

In this regard, Onyango, Simatwa, and Ondigi (2011) pointed out that societal attitudes towards women are heavily biased, and that the language used in referring to women in children’s socialisation is indeed negative. In many African cultures, children sit around the fire with an elderly person telling them character-building stories and folktales. These stories almost always portray women as ineffective, stupid, passive, invisible, and inferior, while men are portrayed as intelligent, curious, brave, inventive, and powerful (Onyango, Simatwa & Ondigi, 2011). To assume leadership positions, one needs high abilities and ambition, which are considered lacking in women. Due to these notions of inferiority, women are denied access to leadership. Participants noted a need to advocate for changes to such attitudes, beliefs, practices, and discriminatory social norms.

Address gender stereotyping:

P3: “Appropriately address gender stereotyping issues. Within the family, and right from an early age, teach the girl child to be assertive. Socialise girls to form strong personalities and mould their characters towards leadership by encouraging specific beliefs and attitudes.”

Stereotypes can be defined as widely held beliefs about the characteristics, behaviours, and roles of men and women (Endendijk, Groeneveld, Van Berkel, Hallers-Haalboom, Mesman & Bakermans-Kranenburg, 2013). Gender stereotypes are passed from one generation to the next, with one

generation cultivating the notion held onto by the next that women are born into an inferior status (Wood, 2019). This demeans women, which then holds them back from realising their full potential. Such stereotyping also leads to women being marginalised and discriminated against, ultimately bringing about unfair and unequal treatment.

We live in a dynamic world, and there is a need to shift mindsets and behaviours, especially at household level, where young girls are most devalued, leading to society's negative understanding of women's capabilities. While discriminatory mindsets are hard to change, progress can be made by investing in methods that have been proven effective in bringing about long-lasting changes in both parental and community behaviour (Banda & Atansah, 2016). A changed mindset will assist women to think and see themselves as capable of participating in leadership positions.

P4: "Mentoring and nurturing women's attitudes and characteristics ... this helps women to share and gather valuable information from others, to remould their beliefs and psych them to rise above these negative cultural obstacles. With time, women will build self-esteem and confidence."

P10: "Eradicating patriarchal laws and lifting off the heavy physical, psychological, and social burdens imposed by traditions."

Rural and traditional leaders need to garner the requisite skills to allow them to change negative mindsets pertaining to perceptions of women. Doing away with patriarchal laws and creating strong partnerships across all sectors of society are critical if barriers blocking progress in gender equality are to be removed (Commission on the Status of Women, 2018). Co-operation with societal elders who are gatekeepers of culture and tradition is critical in addressing patriarchy (Segobye, 2016).

P5: "Gender sensitivity needs to become part of government policy. There is still a lot of work to be done to change the concept and thinking of society; that mentality whereby 'to be a woman in our society means to be a nobody' needs to be combatted."

Gender differences need to be understood. Therefore, courses in gender awareness need to be introduced at every level, including the workplace, and made mandatory for all, to effect change right up to the top echelons. Governments need to adopt legislation prohibiting detrimental traditional practices, review existing and proposed laws and make the necessary amendments to discriminatory statutes and enforce gender equity, and formulate innovative methods of challenging and shifting detrimental socially shared cultural practices.

In this regard, P4 noted: "Sexist remarks should be criminalised and even banned in society... Governments should be seen to be more involved in workplaces, at home, in schools ... in fact, in the communities that we live in."

Women are devalued for the mere fact that they are women. Criminalising sexist remarks and attitudes could offer women greater protection against exploitation, discouragement, and devaluation and, instead, create a positive and more honourable position for women in their societies. If they enjoy legal protection, vulnerable women could feel more comfortable and confident in speaking out against societal abuse and discrimination. This could have a ripple effect in the form of women's positive attitudes, in turn leading the society to greater confidence in and respect for women and placing faith in them as capable leaders. Interventions from the highest levels will signify a commitment to addressing the detrimental cultural practices that militate against women's advancement to leadership positions.

Education of both sexes:

Participants noted an urgent need for education of both sexes regarding equality.

P2: "Educate both males and females, right from grassroots level [about equality of the sexes]."

P5: “Educating the women themselves not to pull each other down, to begin to trust in the capability of the other woman, to work together, to get rid of the ‘pull down’ syndrome and be supportive of each other.”

P8: “Let the woman herself be educated. Some of these detrimental but culturally imposed behaviours will tend to fall off as one becomes enlightened.”

Government intervention:

Banda and Atansah (2016), on government intervention, mention that in order to challenge detrimental practices and norms against young girls while still respecting cultural identities, African governments, in co-operation with development partners, need to throw their weight behind interventions to address inhibiting cultural practices. This needs to include bringing the various forms of detrimental traditional practices to light, as these do not make news headlines or become the subject of policy memorandums, due to the fact that they are extremely localised, rarely going beyond district- or country borders (Banda & Atansah, 2016). There is a silence surrounding detrimental cultural practices, because of beliefs that these customs are in women’s best interests.

P6: “In government, the ministries responsible for culture should be proactive. They should garner the support of experts for help in propagating positive cultural practices and habits that do not undervalue and degrade women. I am looking at traditional chiefs and other traditional legislatures who are in a position to exert positive influences.”

Banda and Atansah (2016) emphasise the need to embark on a nationwide study of detrimental cultural practices within different countries, and that this be done with the co-operation of both traditional and religious leaders. Such an exercise will enable the development of country-specific provisions to react to these practices. Having gathered evidence, both descriptive and of a quantitative nature, educational institutions will be in a position to examine the motivation behind certain practices and implement education to address them (Banda & Atansah, 2016). Collecting women’s stories of their experiences of detrimental cultural practices will add credible data to such studies, and will assist in determining best practice for changing a particular behaviour. Effective interventions will assist in creating greater alignment between cultural practices and human rights as enshrined in Constitutions.

4. Conclusion

Detrimental cultural practices as part of a patriarchal societal approach are directly linked to women’s subordination to take action and lead willingly. Women find it difficult to liberate themselves from this subordination and make great strides in their careers and valuable contributions to societal wellbeing through leadership. If cultural practices are inhibiting women from being equal, they need to be done away with, regardless of why they were instituted in the first place. It is time to highlight and address the negative cultural practices that continue to be perpetrated against women through targeted and informed interventions. Ending inhibiting cultural practices will benefit not only women, but society as a whole.

5. Managerial Implications

Managerial implications brought forth by this paper are that, if the harmful cultural practices inhibiting the rise of women to positions of leadership in institutions of higher education in South Africa are done away with, the institutions would benefit from having more women in managerial positions, the benefits of which are well-documented. Addressing cultural inhibition of women leadership, including in higher education, requires action on multiple levels, including government, institutional governance, and management.

Entrepreneurial Orientation among Academics in Nigeria's Universities

Caleb Muyiwa Adelowo^{1,*}, Alfred Henrico²

^{1,2} Economic and Management Sciences, North-West University, Potchefstroom, South Africa

Keywords:

Entrepreneurial Orientation, academic entrepreneurship, entrepreneurial university, innovation

Abstract

Academic entrepreneurship has received greater attention today than in the past decades, particularly in developing countries. Universities in these countries are now conscious of the need to engage in demand-driven research and foster industry collaboration in a bid to address societal challenges and translate research outputs into products, processes, and services. To encourage this development, university administrators and stakeholders have supported the establishment of technology transfer offices, technology incubators/hubs, and entrepreneurship development centres. Despite similar efforts in Nigeria, the existing weak linkage with industry and poor technology commercialisation persist. These challenges may be connected to a lack of entrepreneurial passion/mindset among the faculties. This article, therefore, maps the entrepreneurial orientation of faculty members in Nigeria to quantify their level of preparedness/readiness to incorporate market and societal needs in their research endeavours. Understanding the EO of faculties will further help university administrators and stakeholders devise robust incentives/interventions required to spur innovations among them. Data were collected from two hundred and twenty-nine (229) academic members across the fields of Science, Technology, and Engineering in thirteen selected universities. The universities were mainly from South-West Nigeria. Data were analysed using exploratory factor analysis. The results show that competitiveness, autonomy, innovativeness, and proactiveness explained 54.3% of the variance among the factors that constitute EO while risk-taking and opportunity recognition explained 4.6% and 4.5% variances respectively. The results further show that Bartlett's Test of Sphericity was statistically significant (2391.7. $df = 300$, $p < 0.01$), and the Kaiser-Meyer-Olkin index of 0.883 was 'meritorious', suggesting that the six EO components should be retained. The study concludes that for the universities to capitalise on the high EO among the academics, improving university's entrepreneurial ecosystems by providing robust incentives and infrastructure is germane.

1. Introduction

The global economy and competitiveness of nations are driven by knowledge, innovation, and creativity. Nations at the frontiers of technological progress and economic development today emerged as a result of deliberate investment in knowledge production and commercialisation (Siyanbola, 2019; Adelowo et al., 2019). Therefore, investment in new knowledge production and the commercialisation thereof have become the main strategy for firms and nations to stay competitive. Contributing to industry growth and development, higher education institutions (HEIs), and especially

universities, are urged by governments and other stakeholders to contribute more than mere teaching and research (Clark, 1998; Etzkowitz et al., 2000; Slaughter and Rhoades, 2009; OECD, 2012; Rubin and Callaghan, 2019; Adelowo and Surujlal, 2020). In fact, universities are now seen as strategic partners to industry and government (Jones et al., 2021). There is also intense pressure on the universities to fulfil the third mission or follow the mode II³ knowledge production which requires a shift in the mindset of academics and re-configuration of the university system (Siyanbola, 2019). Achieving the third mission or mode II knowledge production implies that universities are able to successfully engage in a series of activities such as technology transfer, industry collaborations, and commercialisation of research outputs without negative consequences on traditional activities (Foss and Gibson, 2015). Universities that have been able to master and demonstrate a sufficient level of confidence in technology commercialisation and industry collaborations have been referred to as entrepreneurial universities. Similarly, faculty members in these universities with vast knowledge and engagements in technology transfer and commercialisation are academic entrepreneurs. The main argument that support entrepreneurial university or academic entrepreneur is the need for the university to justify public investment in research and development (R&D) and provide solutions that address societal challenges (Guerrero et al., 2016; Etzkowitz and Zhou, 2017; Adelowo, 2018). Also, it has been argued that knowledge accumulation in the universities is a strategic resource that provides entrepreneurial ideas and opportunities capable of providing solutions to industry and societal challenges, through knowledge spill-over (Audretsch, 2014). Universities may also leverage on their knowledge production and commercialisation potential to improve industry collaboration, thereby attracting industry funding for further research (De Silva 2015; Adelowo, 2018).

Moreover, several initiatives have been advanced to entrench the culture of entrepreneurship in the universities, particularly the creation of technology transfer offices, start-up incubators, innovation hubs, key interdisciplinary research units, directorate of research and innovation, and designated centres of entrepreneurship among others (OECD, 2012; Doh, 2018; Adelowo, 2021). These initiatives are to provide necessary guidance and infrastructure to students and faculty with commercialisable research ideas on how they could be nurtured for venture creation. In developing countries, particularly on the African continent where many of these initiatives have been adopted to unleash entrepreneurial passion among the academics in the universities, there appear to be limited progress towards technology commercialisation and industry collaboration (Adelowo, 2020; Ruba et al., 2021; Adelowo, 2021). Recent studies have shown that universities with high entrepreneurial orientation (EO) tend to do better in fostering innovation and entrepreneurship among its community than those with weak EO (Torodovic et al., 2005; 2011; Van Doorn et al. 2013; Balasubramanian et al., 2020). Here, entrepreneurial orientation (EO) addresses the mindset of firms or individuals in the pursuits of new ventures and provides a useful framework for researching entrepreneurial activities, even among the academics (Lumpkin and Dess, 2014). EO generally represents a configuration of policies, practices, and processes that provide insights into the basis of entrepreneurial decisions and actions. Gauging entrepreneurial orientation (EO) of academics is therefore important for policy and practice. It allows the university administrators/stakeholders to quantify the perception and disposition of academics to technology transfer and commercialisation, thereby enabling them to propose possible interventions required to strengthen university's entrepreneurial ecosystems. The higher education institutions are also caught in the web of competition where universities' rankings play important roles in attracting student and talents and sustained industry patronage for research uptakes. The EO of academics signals the level of readiness of universities in developing countries to embrace the third mission, thereby allowing government, administrators and university managers to design appropriate policy incentives required to catalyse innovation among them. It should also be noted that EO have been established to impact positively on performance, be it at meso or micro levels (Torodovic et al., 2011; Hormiga et al., 2017; Balasubramanian et al., 2020; Ruba et al., 2021). Building on existing streams of literature on EO, particularly the work of Miller (1983), Lumpkin and Dess (1996), Covin and Lumpkin (2011) and Torodovic et al. (2011), this article maps and summarises the entrepreneurial orientation of academics from thirteen universities across South-West Nigeria. This is with a view to

³ The mode II knowledge production relates to the multidisciplinary and transdisciplinary nature of research where the focus is on creating practical solution to industry and societal needs, coupled with the drive to commercialise them.

providing rich information that university administrators, policy makers and economic planners could leverage to improve technology transfer and commercialisation in the universities. The objective of this study is achieved through empirical exploratory analysis of the entrepreneurial orientation of faculty members in thirteen selected universities in Nigeria. The rest of the article is organised thus: literature review and empirical foundation of EO and how it connects to universities are presented in the section 2; methodology is presented in section three and sections four and five present results and discussion and policy recommendations respectively.

2. Literature Review

2.1 Entrepreneurial Orientation: Theoretical Perspectives

Entrepreneurial Orientation (EO) have been viewed as a strategy-making process used by decision makers to enact and sustain organisational purpose, mission, vision and competition (Rauch et al., 2009; Lumpkin and Dess, 2015; Akinwale et al. 2022). EO defines firms' capability to garner and deploy resources effectively to attain business objectives or strategic move to capture values in the highly competitive market. It has been argued that the concept of EO does not only apply to for-profit ventures alone, as public institutions and non-profit institutions are now devising strategies to improve their relevance, performance and resource utilisations. In fact, Doetsch and Lindberg (2013) have argued that thinking and behaving in entrepreneurial manner impact on career, as enterprising individuals can successfully navigate through the environment of their operation to identify and seize opportunities for maximizing career goals. Institutions, regardless of their depth and breadth, are known risk takers (be it socio or economic) gather resources to exploit identified opportunities that benefit society. In the process of marshalling the scarce resources to create values, diverse strategies present themselves to entrepreneurs, and choice or course of action taken could be determined by the depth of entrepreneurial orientation (EO) (Doetsch and Lindberg, 2013). Mintzberg (1973) sees EO as the entrepreneurial strategy-making mode in which entrepreneurs actively search for new opportunities in the context of uncertain environments. The decision making in an uncertain condition is a fundamental component of EO that links it more appropriately to entrepreneurship, making it more relevant to all institutions and in all context. Broadly described, EO are practices, philosophies, and strategic behaviours in decision making process that are entrepreneurial in nature (Anderson et al., 2015).

EO have been broken down into different constructs which could either be unidimensional or multidimensional. For instance, the work of Miller (1983) recognised unidimensional constructs of EO, that is, the three dimensions of risk-taking, innovativeness and proactiveness could be unified. Over time, other constructs such as decision making, autonomy, competitive aggressiveness and proactiveness have also been identified as germane to EO (Fredrickson, 1986; Lumpkin and Dess, 1996; 2001; 2014). EO have also brought the relevance of Schumpeterian 'innovation and creative destruction' approach to entrepreneurship to the fore. Global experiences have equally shown the relevance of innovation to firms and institutional survivals. The global pandemic occasioned by the Covid-19 has changed the way workplaces are organised, including how higher educational institutions offer their services and the depth of collaboration with industry to come up with relevant solutions. In this case, the innovativeness component of EO becomes relevant for institutions or firms to continuously introduce new products, processes or services that significantly displaces existing ones in the market, thereby creating new equilibrium or setting new pace in the market (UNCTAD, 2021). In today's globally connected world, innovation is central to business survival and competitive advantage, particularly that knowledge production and commercialization remain intense and product life cycle are fast shortening. The main means of survival therefore remains the propensity of firm to generate new ideas, gain new markets and exploit them profitably.

Within the confine of EO, innovativeness is defined as the predisposition of an entity or individual to engage in creative experimentation by introducing new product or services to the market, as well as the development of new technological leadership (Miller, 1983). Risk-taking is the ability to take bold actions by venturing into the unknown and or committing significant resources to ventures in uncertain environments. Proactiveness is an opportunity-seeking, forward-looking perspectives characterised by the introduction of products or service ahead of competition in anticipation of future

demands. Other essential components of EO construct include autonomy and competitive aggressiveness as advanced in Lumpkin and Dess (1996 and 2014). Competitive aggressiveness is the intensity of effort to outperform rivals and is characterised by a strong offensive posture or aggressive response to the actions of competitors. Finally, autonomy is the independent action undertaken by entrepreneurial leaders or team directed at bringing about a new venture and seeing it to fruition. Moreover, EO has been linked to high productivity and improved performance at firms' and individual levels. For instance, Riviezzo et al. (2019) and Da Cruz et al. (2021) have linked positive impact of launching spin-offs and registration of patents on the EO of the Higher Education Institutions. These further show the relevance of EO within the academic settings.

2.2 Entrepreneurial Orientation in Universities

Covin and Wales (2019) have argued that EO is present in all organisation at varying degrees, depending on the focus or nature of business being undertaken. In addition, Lumpkin and Dess (2014) have equally stressed that EO could be applied to individuals or organisations. For the university to act entrepreneurially and achieve the third mission objective, the management and administrators have to engage different perspectives or approaches when conducting university businesses or routines. The changes have to reflect in the mission and vision statements, articulation of strategies, the configuration and the injection of new mindset into the university. The need for universities to compete for research funds, either from the public agencies or private sectors compels them to learn and deploy entrepreneurial skills that could guarantee competitive advantage or success. For continuous survival therefore, teaching and research engagements are to be approached entrepreneurially. Within the university for instance, Todorovic et al. (2011) have examined and mapped EO among academic department in Canadian universities through a survey. Their results, using confirmatory factor analysis, showed four dimensions of EO in the universities, including research mobilisation, unconventionality, industry collaboration and perceptions on university policies. These four dimensions tend to predict academic department's involvement in the third mission activities. Interestingly, the construct used for the EO in their study was adapted from existing studies such as Covin and Slevin (1989), Flynn and Percy (2001), Stratman and Roth (2002), Wilklund and Shepherd (2003) and Lumpkin and Dess (1996) among others. Balasubramanian et al. (2020) also examined the influence of EO on the performance of a university in the United States, using the unidimensional constructs of EO as advanced in Miller (1983). The unidimensional construct of EO hinges on the believe that EO is the intersection of, or shared variance among the trio of innovativeness, proactiveness and risk-taking, as earlier discussed. It should be noted that while some organisation or individual may exhibit all the dimensions of EO, others may not (Lumpkin and Dess, 1996; Dal-Soto et al., 2021).

Moreover, universities represent a bundle resources that may be strategically positioned to attain competitive advantage at regional and national levels (Penrose, 1989). Therefore, developing appropriate entrepreneurial competences among the elements within the universities presents greater opportunities for innovation and competitiveness. EO becomes more relevant to the academic context as university makes efforts to transition from traditional activities to entrepreneurial endeavours, making them more relevant to industry and society. The shift to entrepreneurial universities comes with some challenges and opportunities, particularly considering the strength, weaknesses, opportunities and threats associated with the transition process. While some universities can easily adapt to entrepreneurial requirements, others may take longer depending on their degree of EO and internal/external constraints. For instance, entrepreneurial universities adopt new structure, mindset, incentives policies and strategy to promote behavioural and managerial changes in the academic community (Tijssen, 2006; Etzkowitz, 2013; Siyanbola, 2019; Dal-Soto et al., 2021). The amount of resources available to the universities and the context are very significant to the transitioning process (Clark, 2001; OECD, 2012).

What is more, universities with high level of EO have the propensity to engage with industry and exploit entrepreneurial opportunities or develop her internal routines to support technology transfer and commercialisation among the faculty members. Thus, EO serves to integrate and focus resources, potentially resulting in a competitive advantage (Torodovic et al., 2005). Prior studies have also

established links between EO and performance of firms, including knowledge-based firms (Wiklund and Shepherd, 2003; Zahra and Garvis, 2000; Rauch et al., 2009). In this study, the level of EO among the academics in Nigerian universities was assessed using complete constructs from Miller (1983)-innovativeness, risk taking, proactiveness, and opportunity recognition and Lumpkin and Dess (1996; 2014)-autonomy and competitiveness. In this wise, EO have been studied at the university-wide level, taking university as the unit of analysis, others have examined EO at individual academic level (Torodovic et al., 2011, Dal-Soto et al., 2021; Ruba et. al., 2021; Hassan et al., 2021; Perkmann et al., 2021 and Atta-Owusu, 2021). The work of Kalar and Antoncic (2015) examined EO and academic involvement using quantitative analysis and their results showed that faculties' perception of EO of their department have significant impacts on both traditional and entrepreneurial involvement. For Akram et al. (2017), they found that EO of the faculty members have significant impact on their potential to commercialise research outputs, although trust mediates the relationship. Given that little is known about how EO is configured among faculties in African universities, this article builds on existing literature to examine the EO of academics within Science, Technology and Engineering (STE) fields from thirteen selected universities in Nigeria. The next section details the methodology, research instrument and variables and measurement.

3. Methodology

3.1 Research Design

This paper uses a cross-sectional research design where primary data were collected from two hundred and twenty-nine academics from science, technology and engineering (STE) departments in Nigeria (Adelowo, 2017; 2018; Adelowo and Surujlal, 2020; 2021). The focus on the STE departments was borne out of the argument that they conduct R&D which have potential for commercialisation or capable of being transferred to the industry (Prodan and Drnovsek, 2010; Pries and Guild, 2011; Siegel and Wright, 2015). The universities and research institutions have been charged to pursue the commercialisation of research outputs to support industrial growth in Nigeria, with clear articulation in the National Science, Technology and Innovation (STI) Policy of 2012. The Tertiary Education Trust Fund (TETFund) and the recent push by the National Universities Commission for all universities to embrace innovation and entrepreneurship as an important way of showing relevance and impacts in the society. To further promote innovation and entrepreneurship in the universities, all universities were mandated to establish a directorate of research and innovation, in addition to some existing structures such as technology transfer offices, business incubators and science parks (Adelowo, 2021). Nigeria boasts of two hundred and two universities but with fewer lecturers and researchers to cater for large population of undergraduate and postgraduate students (Okebukola, 2015; NUC, 2021; 2022).

Due to unavailability of database containing the list and number of academics in the Nigerian universities and those in the specific fields of interest, a multi-stage sampling technique was adopted. Here, universities were first selected based on research intensity, presence of technology transfer and entrepreneurship infrastructure (Adelowo and Surujlal, 2020). Given that the study focused essentially on the South-West geopolitical zone of the country, thirteen universities made the sample. All the STE departments were targeted in these universities. However, only interested academic members who were available during the survey visit participated in the survey (Adelowo, 2018). The basic criteria for academic member's participation is that they must possess at least a master degree, with potentials to undertake doctoral degree. The minimum academic qualification for lecturing in Nigerian universities is PhD, but those with masters and on doctoral programmes are also recognised. This criterion is important because they might have gained some level of research experience and be able to recognise potential application of the research outputs. In terms of position in the university, a minimum of Lecturer II who fit perfectly into the criterion were surveyed. A total number of three hundred and fifty (350) academics participated in the survey which took over four months to complete. After repeated reminders and visits, two hundred and twenty-nine (229) academics returned the completed survey instruments.

3.2 Variables and Measurement

Diverse metrics have been advanced in the literature to capture EO among firms or universities and among individual academic entrepreneurs (Miller, 1983; Lumpkin and Dess, 1996; Stull and Sigh, 2005; Todorovic et al., 2011; De Silva et al., 2015; Ruba et al., 2021; Dal-Soto, 2021). The theoretical basis for the indicators used is traceable to the earlier work of Miller (1983) and Lumpkin and Dess (1996), regardless of research paradigms. For instance, Da-Soto et al. (2021) adopted a multiple case study, using qualitative data collected from the head of research groups across Sweden, and Brazil. The recurring EO metrics they found in the universities across these countries include pro-activeness, risk-taking and innovativeness (Da-Soto et al., 2021). Ruba et al. (2021) adopted quantitative technique to estimate the influence of EO on the university performance in Congo. The authors adapted EO constructs from Lumpkin and Dess (1996; 2001) and Covin and Slevin (1989) to demonstrate that innovativeness, proactiveness and competitive aggressiveness significantly influence performance in the university. The work of Torodovic et al. (2011) constitute a significant progress towards developing relevant metrics for EO within the knowledge institutions, particularly universities. Although their work is also empirical, following quantitative paradigm but the unit of analysis were departments. For the purpose of this study therefore, a number of metrics were adapted from Lumpkin and Dess (1996), Campos, Nuno, and Parellada, F. S. (2012), and Todorovic et al. (2011).

In all, a total of twenty-five items were developed to capture the EO of academics in the study areas. The items cut across all the established EO in literature, including innovativeness, opportunity recognition, risk-taking, proactiveness, competitive aggressiveness and autonomy. All items were measured on a five point likert scale from 1 'strongly disagree' to '5 'strongly agree'. Data collected were analysed using principal component analysis (PCA), a data reduction strategy, and it produced six core elements of EO.

4. Results and Findings

The entrepreneurial orientation of faculty members was captured by their level of innovativeness, risk taking, proactiveness, competitiveness, autonomy and opportunity recognition potential as advanced by various authors (Miller, 1983; Lumpkin and Dess, 1996; Torodovic *et al.*, 2005; 2011; Lumpkin and Dess, 2014) with slight modifications to take care of the context of the study.

The entire twenty-five items that captured the entrepreneurial orientation of faculty members were subjected to exploratory factor analysis (EFA) to summarise and categorise them into fewer manageable variables. This transformation prepares the reduced variables for robust statistical tests and analysis. The EFA was conducted using Principal Component Analysis (PCA) extraction with Kaiser Normalisation as suggested by Costello and Osborne (2005) which produced an oblique rotation and allows factors to share variance. The results showed that the Barlett's Test of Sphericity was statistically significant (2391.7. $df = 300$, $p < 0.01$), and the Keiser-Meyer-Olkin index of 0.883 was 'meritorious' (using the thresholds proposed by Kaiser, 1974). The analysis identified seven factors with Eigenvalues greater than 1 accounting for 67.4% of the variance. However, it was determined that six factors be retained as they explained sufficiently the entrepreneurial orientation of the faculty members (63.4% of the variance in the data). The 'elbow' in the scree plot and 'principle of parsimony' (Handfield and Melnyk, 1998) suggested retaining those six variables.

The first factor dimension is dominant, accounting for 35.5% of the variance, while others accounted for 8.4%, 5.3%, 5.1%, 4.6% and 4.5% respectively. In addition, these factors followed sound theoretical arguments in literature that acting entrepreneurial required a threshold level of industry orientation (Lumpkin and Dess, 1996; 2014; Todorovic et al., 2011; Akinwale, Adelowo, Surujal, 2022).

Therefore, these factors represent entrepreneurial orientation of faculty members in the study area. The structure matrix, as presented in Table 1, shows the correlations between the items and the factors. The coefficients reflect all paths from items to a factor, since the factors are themselves correlated. In

naming the variables, the paths from items to factors were considered (structure matrix) as suggested in Henson and Roberts (2006) and Williams, Brown and Onsmann (2010).

Factor one, with seven strong items correlations, relates to ‘*competitiveness*’ aspect of the entrepreneurial orientation of faculty members. The seven items are: (a) *Interested in supplying research results to companies and facilitate rapid development of marketable products*; (b) *Obligated to transfer my knowledge to industry for the purpose of commercialisation*; (c) *positioning my activities relative to industry requirement*; (d) *measuring my quality and results against industry practices*; (e) *responding to new discoveries in industry with my research*; (f) *I anticipate future market needs in my research*; (g) *I am interested in pursuing spin off creation*. These factors were pooled together and named ‘**competitiveness**’.

Five items load strongly on the second and they tend to describe the perception of the faculty members on the degree of freedom they have to pursue industry-relevant research. These items are: (a) *I am free to pursue innovative research with industry focus*; (b) *I am free to address industry specific needs in my research*; (c) *I am free to apply for joint industry research grants*; (d) *I am free to adjust my industry focused research, if required*; (e) *I am free to integrate business partners in my research projects*. The factor two is named **autonomy**.

Four items load on the third factor and the items relate to the ‘**innovativeness**’ component of the entrepreneurial orientation of the academics. These items are: (a) *I have achieved successful industry relevant innovation*; (b) *I incorporate industry specific ideas into my research projects*; (c) *I placed great emphasis on innovation in my research*; (d) *I am motivated to pursue new research to create radical innovation*.

The fourth factor is named ‘**proactiveness**’ based on the components of the three items that load firmly on it. These items are: (a) *I pursue ideas that may materialise into profitable enterprises*; (b) *I share my results with investors*; (c) *I discuss my research result with industry and ask for feedback*. Item (a) was reversed coded before the analysis was performed.

The fifth factor has four items loading on it and they represent risk-taking propensity of the faculties. Therefore, it is named ‘**risk-taking**’. The items are: (a) *Willingness to accept the risks needed to initiate a spin-off*; (b) *eagerness to exploit new research opportunities with an industry, though they might be risky*; (c) *I dedicated a significant resource to risky industry-focused projects*; (d) *I can accept the risks of lower academic credential in favour of entrepreneurial activities*.

The last factor has just two item loading and they relate to **opportunity recognition** ability of the faculties. These items are: (a) *I generate ideas that can be converted into new product or services (even though I may not pursue)*; and (b) *I identify opportunities to start up new businesses (even though I may not pursue them)*.

Table 1: Factor Loadings from Exploratory Factor Analysis

Structure Matrix	Components					
	1	2	3	4	5	6
COMP1: interested in supplying research results to companies and facilitate rapid development of marketable products	.785					
COMP2: Obligated to transfer my knowledge to industry for the purpose of commercialisation	.766					
COMP3: positioning my activities relative to industry requirement	.756					
COMP4: measuring my quality and results against industry practices	.728					
COMP5: responding to new discoveries in industry with my research	.708					

COMP6: I anticipate future market needs in my research	.683					
COMP7: I am interested in pursuing spin off creation	.585					
AUT1: I am free to pursue innovative research with industry focus		.842				
AUT2: I am free to address industry specific needs in my research		.798				
AUT3: I am free to apply for joint industry research grants		.745				
AUT4: I am free to adjust my industry focused research, if required		.729				
AUT5: I am free to integrate business partners in my research projects		.681				
INNOV1: I have achieved successful industry relevant innovation			.792			
INNOV2: I incorporate industry specific ideas into my research projects			.742			
INNOV3: I placed great emphasis on innovation in my research			.657			
INNOV4: I am motivated to pursue new research to create radical innovation			.596			
PROACT1: I pursue idea that may materialise into profitable enterprises				.786		
PROACT2: I share my results with investors				.660		
PROACT3: I discuss my research result with industry and ask for feedback				.659		
RISKT1: Willingness to accept the risks needed to initiate a spin-off					.874	
RISKT2: Eagerness to exploit new research opportunities with an industry, though they might be risky					.681	
RISKT3: I dedicated a significant resources to risky industry-focused projects					.660	
RISKT4: I can accept the risks of lower academics credential in favour of entrepreneurial activities					.583	
OPPREG1: I generate ideas that can be converted into new product or services (even though I may not pursue)						.849
OPPREG2: I identify opportunities to start up new businesses (even though I may not pursue them)						.831
Variance Explained (%)	35.5	8.4	5.3	5.1	4.6	4.5

Extraction Method: Principal Component Analysis.

Rotation Method: Promax with Kaiser Normalization

Key: Factor 1- competitiveness, Factor 2-Autonomy, Factor 3-innovativeness, Factor 4-proactiveness, Factor 5-risk taking, Factor 6-opportunity recognition

The inter-correlation matrix among the six factors, as presented in Table 2, shows strong significant correlations among the entrepreneurial orientation factors which signified that these factors are fit and could be useful for regression analysis. Comparing the correlation coefficients of EO with COMP, it was observed that relationships with AUT ($r=0.58$), OPPREG ($r=0.48$), INNOV ($r=0.47$)

and RISKT ($r=0.38$) produces high correlations. The least correlation is observed in the relationship with PROACT ($r=0.27$).

Table 2: Component's Correlation Matrix

EO Variables	COMP	AUT	INNOV	PROACT	RISKT	OPPREG
COMP	1					
AUT	0.583**	1				
INNOV	0.476**	0.372**	1			
PROACT	0.265**	0.113	0.296**	1		
RISKT	0.380**	0.253**	0.296**	0.279**	1	
OPPREG	0.482**	0.468**	0.398**	0.192**	0.236**	1

** $p<0.01$

Key: COMP= competitiveness, AUT=Autonomy, INNOV=innovativeness, PROACT= proactiveness, RISKT=risk taking, OPPREG= Opportunity recognition.

Moreover, construct reliability (CR) test was performed on the items that load highly on each of the EO components. The result, presented in Table 3, shows a good overall construct reliability with Cronbach Alfa of 0.92, mean of 3.79 and significant relationship among the items ($F=34.94$, $p<0.01$). For each of the EO construct therefore, ANOVA was constructed to provide further information on the construct reliability, relationships among the items and indicate the mean values. Competitiveness produces a mean of 3.89, Cronbach Alpha of 85% with highly significant relationships among its seven items ($F=10.6$, $p<0.001$). The Autonomy (AUT) component of EO produced the least F-ratio although still significant with good Cronbach Alpha (84%) depicting strong internal consistencies among its five variables. The mean value for AUT is observed to be greater than the computed mean value of other EO items. The proactiveness (PROACT) have the least Cronbach Alpha (0.67), which is within the acceptable level and the strong significant F-ratio. In general, it is observed from the results of the analysis that the overall internal consistency of the scale is very good, given high Cronbach Alphas, means and the F-ratios.

Table 3: Summary Statistics of the EO components among the Academics

Components of EO	N	Number of items	Mean	ANOVA	Cronbach Alpha
COMP	213	7	3.89	10.60**	0.85
AUT	214	5	4.03	6.42**	0.84
INNOV	229	4	3.89	35.69**	0.72
PROACT	213	3	3.27	34.63**	0.67
RISKT	229	4	3.53	51.55**	0.73
OPPREG	218	2	3.83	11.56**	0.71
Overall	229	25	3.79	34.94**	0.92

** $p<0.001$

5. Conclusion

This article sets to examine the pattern and structure of entrepreneurial orientation among the academics in selected Nigerian universities, with specific focus on faculty members in Science, Technology and Engineering fields. Acs et al. (2014) have argued that knowledge institutions are repository of knowledge capital and intellectual assets with great potential for industrial and societal applications. By this proposition, universities as an element of knowledge institutions have been perceived differently by stakeholders, thereby expecting them to contribute to national competitiveness through technology transfer and commercialisation. For the universities to play active roles in technology transfer and commercialisation, it is evidently clear that knowledge production approaches have to shift from Mode I to Mode II, that is, moving beyond mere publication to

patenting and commercialisation (Adelowo and Surujal, 2020; Adelowo and Surujal, 2021). Attitudinal change and institutional reconfiguration are required in the universities to play the new roles more effectively, hence the need for the introduction of entrepreneurship programmes and infrastructure (Olofinyehun, et al., 2018; Adelowo et al., 2021). Despite the introduction of entrepreneurship infrastructure in the universities, Adelowo et al (forthcoming) observes weak technology transfer, industry collaboration and commercialisation among universities in Nigeria. This could be traced to the entrepreneurial attitude or weak perception of the phenomenon in the universities. This study therefore provides detailed information on the entrepreneurial orientation (EO) of academics in the STE fields. The study builds on Entrepreneurial Orientation frameworks advanced in Lumpkin and Dess (1996), Rauch et al. (2009), Covin and Lumpkin (2011), Torodovic et al. (2011), Hormiga et al. (2017), Balasubramanian et al. (2020) and Ruba et al. (2021). EO becomes applicable to universities as they tend to position themselves strategically and attract funding from industry, compete to attract talented students and faculty members as well as striving to improve teaching and innovation performance (Torodovic et al., 2011; Balasubramanian et al., 2020; Ruba et al., 2021).

The study requires data and information on the entrepreneurial orientation of academics in the universities but such data is non-existence in Nigeria. Therefore, a questionnaire was designed based on the aforementioned frameworks to obtain relevant information from the academics, the instrument was pre-tested before the main survey was conducted (Adelowo, 2018). The ethical issues were properly taken care of, as the participant gave informed consent to participate in the survey.

The key findings indicate that the greater the readiness of academics to anticipate or target industry-relevant solutions, the higher their level of competitiveness. Also, competitiveness accounts for the highest number of items and variance observed from the elements of EO in the datasets. This suggest that majority of the academics within science, technology and engineering fields are already taking initiatives to tailor their research to suite industry needs. The realities could be that they may not have the wherewithal and experience required to create spin-off or transfer the inventions to the industry. In this case, the existing intellectual property and technology transfer offices need to intensify their efforts towards the training and awareness creation programme that can empower academics in the pursuit of commercialisation and industry linkage. There is also greater autonomy among the academics to tailor their research towards addressing practical industry and societal needs. In this case, university stakeholders and administrators could create event such as entrepreneurship-spark to showcase some of the innovative projects, allow innovators to address academic colleagues, and where possible, provide initial grant to further refine the invention or technology for commercialisation. Other constructs of EO, such as innovativeness, proactiveness, risk-taking and opportunity recognition ability are high among the academics in the study areas. This further suggests that there are high entrepreneurial tendencies among the academics, a vital sign of readiness for university to become entrepreneurial. In fact, Ismail et al. (2015) have argued that in addition to strong entrepreneurial intention, strong EO is important to propel technology commercialisation and industry linkage among the academia.

To promote the transition of universities to entrepreneurial ones, the study concludes that to sustain and improve the entrepreneurial orientation among the academics, university administrators should provide relevant support and strive to create entrepreneurial champions within the ecosystem. This can be done by strengthening existing technology transfer infrastructures in the universities and scale up the entrepreneurship education programmes to develop competencies among the academics as well.

6. Managerial Implications

The study has important implications for policy and practice. First, academic administrators and stakeholders have the opportunity to leverage high entrepreneurial orientation of academics in the study areas by creating appropriate mechanisms such as innovation hub, innovation exhibition lab and entrepreneurship ignition and counselling unit for them to try out their ideas in the form of business concepts development. In the process of creating these entrepreneurial infrastructures, all faculties and department should be in the known such that anyone with viable ideas could access units to visit in the university. To the academics who have already demonstrated sound entrepreneurial orientation,

there is a need to further encourage them to create ‘entrepreneurial academic club’ where they can share ideas, co-create solutions that will help them realise full scale commercialisation of their inventions. Secondly, government and policymakers need to wake up to robust funding mechanisms for R&D and innovation in the universities, more than ever. There is the need to create Innovation Chair across all universities to further strengthen existing directorates of research and innovation. The Innovation Chair should be coordinated by renown innovators and professors with considerable experience in technology transfer and commercialisation, and strong capacity to provide mentorship to young scholars and innovators in the universities. On the innovation fund that could be mobilised for improved funding mechanisms in the universities, existing arrays of funding such as national research and innovation fund, TETFund-Innovation Foundation and TETFund could be leveraged. Key innovation awards such as Presidential Initiative for Inventors and Innovators and National Technology Exposition Programme which brings inventors and innovators from all walks of life together once a year could be expanded to motivate more academics in the universities.

The Influence of Demographics on Manager Perceptions Regarding Shared Value In The South African Mining Industry

Dr Talifhani Khubana^{1,*}, Prof Chantal Rootman², Prof Elroy Smith³

^{1,2,3} Department of Business Management, Nelson Mandela University, Gqeberha, South Africa

Keywords

Perceptions; Shared Value (SV); Demographics; Mining industry

Abstract

Shared Value (SV) has become a management concept and a strategy among corporations for gaining competitiveness and sustainability while solving societal problems. The purpose of this study is to establish whether demographics influence perceptions regarding SV and selected SV antecedents within the South African mining industry. After conducting a literature overview of SV, and by considering relevant variables that were validated in a previous mining study, a hypothesised model was formulated for this study. This study used a quantitative research methodology. A survey with a structured questionnaire was used to collect data. Non-probability sampling was used and 340 respondents participated in the study. Analysis of Variance (ANOVA) tests and resultant post-hoc tests, where applicable, identified the influence of demographics on SV and its antecedents. The study's results revealed that respondents' gender, work experience and occupational level as well as the corporations' size significantly influenced mining managers' SV perceptions. This study expands on SV literature by explaining the connection between mines' SV and managers' demographics. Recommendations could better inform mining managers about SV and encourage its implementation.

1. Introduction

Mining is central to South Africa's social and economic narrative, serving not only as a foundation for other industries but also as a driver of investment, employment, government revenue and infrastructure development (Lane, Guzek & Van Antwerpen 2015; MCSA 2021). Due to the abundance of local mineral resources, the country has established itself as Africa's economic gateway into the global economy (PwC 2021). South Africa is the world's leading producer and exporter of chromium and vanadium, as well as gold, gem diamonds, ferrochromium, platinum, and manganese (Department of Mineral Resources and Energy 2019). Furthermore, the country is the world's third-largest coal exporter and a major producer of cobalt and copper, both of which are essential in the energy industry (MCSA 2021).

However, despite the country's abundance of the world's most sought-after mineral deposits, South Africa's mining industry is unique in that it has not catalysed shared prosperity (World Bank 2019). Regardless the potential to distribute benefits to various stakeholders, mining corporations have mostly failed to create inclusive growth, creating a difficult policy nexus between encouraging mining investments while ensuring that benefits and costs are shared equitably (Cooper & Harvey 2018; Khubana 2021).

Despite building the economy, in a variety of ways, the mining industry has also facilitated social and environmental problems, such as wealth accumulation while at the same time increasing migrant workers, widening wage disparities, community displacements, and causing diseases as a result of the

industry occupations that have left many families child headed (Khubana, Rootman & Smith 2022; Leonard 2018). The persistence of societal issues and climate change in South Africa are two indicators that mining has not translated into inclusive growth (McKinsey 2019; PwC 2021). For example, the slow action to address climate change and other environmental degradation endangers the most vulnerable citizens (Mpanza, Adam & Moolla 2020; Stewart 2020). Climate change effects include devastating floods and widespread droughts, which not only cripple agriculture and water supply, but also endanger food security (OCED 2019). Furthermore, the mining value chain in South Africa is heavily reliant on foreign capital, skills or expertise, and technology, which sometimes inhibits citizens from getting the maximum benefits of natural resource abundance (Fine & Rustonjce 2018).

Accordingly, to remain competitive, mining corporations have to internalise the costs imposed by their activities and adopt strategies that pivot the potential to create suitability (Deloitte 2018). In this regard, some researchers argue that the discovery of mineral resources and the revenue generated from these helped countries address important socioeconomic issues like poverty and unemployment as well as issues relating to health, infrastructure and education (Du Plessis 2013; Elbra 2013; Poncian 2019). Therefore, mining corporations should develop business strategies that balance community value creation with increased profitability. The failure of Corporate Social Responsibility (CSR) initiatives and Black Economic Empowerment (BEE) policies to create inclusive growth (Diale 2014; Mosala, Venter & Bain 2017; Strydom 2019), which can bring about real socioeconomic transformation, provide the foundation for this study. Research studies in diverse industries such as Food, Beverages, Agriculture, Pharmaceutical, Healthcare, Financial services, Extractives and Natural resources advocate that corporations can enhance their competitiveness by embracing the Shared Value (SV) concept in their business strategy (Hills, Russell, Borgonovi, Doty & Iyer 2012).

Porter and Kramer (2011) define SV as the implementation of organisational policies and practices that establish and sustain a corporation's competitive advantage over current and potential industry rivals while simultaneously advancing social and economic conditions in the communities in which it operates. Since SV means that mining corporations use their capital, access to resources, and unique influence to implement competitive strategies that balance the creation of value for communities with increased profitability for the mines, it is important to identify what influences perceptions on SV and its antecedents, as this could influence its effective implementation. Abrahamsson, Segerstedt, Nygren, Johansson, Johansson, Edman and Akerlund (2014) further postulate that the existing body of knowledge is scanty and insufficiently deals with the interactions between the mining industry and social life in and around the mines. The social dimension encompassing aspects such as gender, diversity and working conditions is relatively underdeveloped in studies of sustainable development in general and the mining industry in particular. Hence the focus of this study to assess the influence of demographics on managerial perceptions regarding SV in the mining industry of South Africa.

2. Problem Investigated

Corporations across various industries, geographies, and sizes are facing increasing demands and expectations from stakeholders to move beyond a profit-making mindset and to act in a responsible manner while attempting to solve societal problems, regardless of their connection to the challenges (McGahan 2020). The focus on and incorporation of SV represents a paradigm shift from the profit-first ideology. However, Awale and Rowlinson (2014) reported that corporations from various industries expanded their business prospects through product or service innovation, re-engineered value chains, and local cluster development, which shows that SV can positively impact corporations. South Africa, as a developing country, offers SV opportunities for inclusive growth (meaning for both communities and corporations) due to its wide range of economic inequalities, social imbalances, and a large population living below the poverty line (Khubana 2022). The unique impact that mining has in South Africa's economy presents corporations with numerous opportunities to ensure lasting value for all stakeholders, in other words, to implement SV.

However, despite South African corporations' opportunity to implement SV, limited studies exist on SV and only a few studies or reports examined aspects relating to SV, such as sustainability, the

environment, innovation, value chains and regulatory conditions (AngloAmerican.org. 2022; Koen 2018; Wachira, Barnard, Lutseke & Ger 2020). There is also no study specifically considering the influence of demographic variables on perceptions regarding SV (Holtbrügge & Oberhauser 2019; Nicolson 2017) and its antecedents. Anecdotal evidence is also limited, with the exception of corporations that adopted SV early on, possibly as a result of the Porter Force (Menghwar & Dawood 2021). In South Africa, the Shared Value Africa Initiative lists only a few. Nicholson (2017) studies SV in a case study assessing the SV that a company is creating through a protected area and its unique relationship with local communities. Another study was undertaken by Mughogho (2020) to understand how organisations create SV from a business model perspective. This study attempts to explore whether respondents' and corporation characteristics (thus demographic variables) impact mining managers' perceptions on SV and selected SV antecedents. Therefore, the question guiding this study is:

Which demographic variables influence SV perceptions among managers within the South African mining industry?

3. Research Objectives

This study's primary objective is to evaluate whether demographics influence perceptions regarding SV and selected SV antecedents within the South African mining industry. The study's secondary objectives are:

- To critically review literature pertaining to SV and its antecedents, and the role of demographics on these concepts.
- To empirically assess SV perceptions in the mining industry, with specific reference to the role of demographics.
- To provide relevant recommendations to the mining industry regarding the role of demographics in SV.

The study assists SV practitioners, policy makers and mining corporations to strategise towards creating and focusing on SV.

4. Literature Review

This study demystifies SV by providing an overview of SV and its antecedents, as well as demographic variables possibly influencing these.

4.1. Shared Value conceptualisation

SV, according to Ollivier de Leth and Ros-Tonen (2022), is about "business" rethinking corporate strategy or competitive strategies, and it can help businesses reduce their long-term societal impact while also addressing all aspects of inclusivity and maintaining a competitive advantage. Blowfield and Dolan (2014) also state that SV is based on the premise of expanding economic benefits for corporations through the creation of societal value, which leads to social change within coexistence communities. Freeman (2017) defines SV as a strategic process, strategy required to bring a corporate strategic plan to completion and implemented through the reconfiguration of a corporation's value chain, which involves a series of activities such as creating, reconfiguring, or sustaining its products or services. Thus, SV is not a single pursuit of short-term economic gains at the expense of communities and the environment advocated for by classical capitalism (Gupta & Pouw 2017), the SV concept rather focuses on creating greater value for all stakeholders. SV is creating a potential win-win outcome situation (De los Reyes, Scholz & Smith 2017). In essence, corporations must solve societal issues at the strategic level that are related to the core value chain (business model), and must generate profits (Rachmawati 2019; Porter & Kramer 2011).

Some critics argue that while the concept changes mindsets, in practice it modifies existing policies and ideas to bring about significant transformation (Corazza, Scagnelli & Mio 2017; Crane, Palazzo, Spence & Matten 2014). SV, in contrast to CSR, aims to reinvent capitalism by commercialising

social and environmental issues and turning them into new profit-maximising frontiers (Voltan, Hervieux & Mills 2017). Porter and Kramer (2011:17) assert that SV “unleashes a wave of innovation and growth” by reinventing capitalism and shifting the paradigm on the relationship between corporations and society. In other words, SV views social issues through the lens of market opportunities, production processes, and profitable products or services. Porter and Kramer (2011) also assert that SV represents a major step towards reconnecting organisations with communities and the environment. As a result, SV constitutes a significant step forward in CSR as it aligns both the performance of corporations and social concerns from the value creation perspective.

The primary distinction between SV and CSR is that the former is the core of the business, founded on the premise that “both economic and social progress are interwoven” (Khubana 2021). SV emerged as a response to CSR’s failure to address societal issues and the effects of climate change caused by traditional “business” approaches (Corazza et al. 2017). SV, supported by stakeholder theory, focus on the development of integrated business approaches (models) that generate both positive economic and societal effects (Crane et al. 2014). SV means a corporation has a better understanding of the competitive environment and creates economic value by addressing social issues (Porter & Kramer 2011).

SV strategy has three approaches, according to Porter and Kramer (2011:7): “reconceiving products, services, and markets, redefining productivity in the value chain, and enabling local cluster development”. Only if a corporation’s social project meets the three criteria listed above, which are interdependent and complementary to one another, and are critical in distinguishing SV from related concepts, can it be classified as SV. To this end, Pfitzer, Bockstette and Stamp (2013) proposes a five-step process for corporations to adopt SV: embedding a social mission; rigorously identifying the social need; measuring the business and social value; creating the optimal innovation structure; and co-creating with external stakeholders.

A few examples of anecdotal evidence of SV’s successful model include Nestlé’s Model (2020) and Anglo American (2017)’s water reticulation project focusing on value chain innovation. Despite the fact that the existing literature on effective SV strategic interventions focuses on large multinational corporations (Odia 2018), the impact of demographics on SV and its antecedents have yet to be empirically established.

4.2. Shared Value antecedents

Although SV is interpreted differently by different corporations, some see it as a competitive strategy, while others see it as a simple sustainability strategy (Corazza et al. 2017), there are some consensus on the variables that can lead to SV. The rationale for the selection of the antecedents stems from various studies or models (see for example Nestlé Creating Shared Value Report, 2020; Network for Business Sustainability, 2016 and Porter & Kramer, 2011). A recent study by Khubana (2021) investigated six antecedents (environmental impact; employment conditions; value chain considerations; automation and innovation; infrastructure development as well as regulatory and legislative conditions) and found after conducting an exploratory factor analysis that *Automation and innovation*, *Mineral resource governance* as well as *Employment conditions* could influence SV in South Africa’s mining corporations.

The concept of innovation and automation has been widely applied across several dimensions, encompassing business model innovation, research and development, digitalisation (artificial intelligence), and product redesign (solution) (Schwab 2017). While automation is defined as the intelligent control of systems utilising appropriate technologies to operate without human intervention, innovation is concerned with the creation of new solutions that fulfil unmet requirements and have a long-term impact (Ralston, Hargrave & Dunn, 2017). According to Hoerlsberger (2019), digital transformation is the use of digital technologies to modify a business model and develop new income and value-creating opportunities. As a result, the connections between automation and innovation could create SV and sustainability. Accordingly, Wachira et al. (2020) assert that mining corporations can develop SV by rethinking new goods and services, markets, mining processes, supply of energy

and water in addition to traditional mining products. This study defines innovation and automation as “the development of technological ingenuity that enables corporations to redesign the processes and products to competitively meet the requirements of stakeholders with sustainable solutions which require minimal human intervention” (Khubana 2021).

Governance necessitates a successful, verifiable execution as well as the commitment of all stakeholders with an interest in a certain project or activity to this framework (Christmann 2021). PwC (2021) defines mineral resource governance as government policy interventions that promote economic and social advancement, including building resilience to climate change. While mining corporations should comply with industry governance frameworks, they should also recognise the need to address societal and environmental concerns profitably (Dufwa & Meconnen 2016). Hence Deloitte (2019) argues that mining corporations have the unique potential to lead the way in bringing the industry, government, and society closer together and creating SV beyond legal compliance. In other words, mining corporations have the opportunity to explore profit-maximizing opportunities that are linked with local community progress because mining has influence over different industries and a value chain with various stakeholders (Khubana 2022). Given the growing consensus that too much regulation and/or regulatory uncertainty can lead to negative outcomes (Hayes & Cloete 2019), mining corporations should lead efforts to develop policies and strategies that create solutions that are unique to each society's needs beyond the minimum legal requirements (OECD 2019). This study defines mineral resource governance as system of laws, rules, voluntary initiatives, standards, norms, practices, and institutions used by industry stakeholders aimed at stimulating inclusive growth.

Mustafa and Ali (2019) described employment conditions as operational procedures whereby the workplace develops specific attributes that result in individuals performing better at work and utilising their potential to meet stakeholder needs while creating long-term competitive advantage. Strikes for higher salaries and improvement of other working conditions have frequently hindered production at numerous mines, while communities have also expressed unhappiness with the appointment of expatriates in the face of rising local unemployment (Wegenast, Krauser, Strüver & Giesen, 2019). This study defines employment conditions as aspects of a person's working environment that influence his or her quality of life, and these factors include contract terms, compensation and benefits, health and safety at work, inclusion and diversity, career progression and how tasks are assigned, as well as management of human resources (Khubana 2021). This study posits that by focusing efforts on improving employment conditions, the mining corporations will be able to increase productivity and profitability while addressing the needs of the communities. The Responsible Mining Index (2018) argued in favour of this observation by claiming that mining corporations that attempt to improve employment conditions are more likely to increase their profitability and competitive advantage while promoting sustainable development, thus SV.

The perceptions of managers regarding mining corporations' focus on and implementation of SV, and its antecedents, might differ based on managers' demographics.

4.3. Demographics' influence on Shared Value perceptions

The competitiveness and sustainability performance, which are known SV outcomes as found by Khubana (2021), as well as other business performance parameters, can be influenced by various factors such as the complexity of the business, market conditions, geographical settings and other internal or external factors (Awale & Rowlinson 2014). Thus, demographic variables relating to corporations' employees (including managers) and the corporations' characteristics might influence SV perceptions. A limited number of studies have examined the impact of demographics on perceptions regarding SV and aspects relating to or part of SV, for example sustainability, innovation, automation and environment (Masood, Alam & Alam 2021; Wang, Fan, Wu & Liang 2019; Moradhaseli, Ataei & Norouzi 2017). However, some demographic variables have been found to influence perceptions, and gender, age as well as education level, to mention a few, are some of the demographics.

Gender, as a demographic variable, has yielded mixed results in terms of perceptions; however, females have frequently been found to be sensitive to issues of sustainability (Fisher, Bashyal & Bachman 2012; Koehler 2016; Swim, Gillis, & Hamaty 2020). Recent studies have also shown positive correlations between environmental consciousness and age as well as level of education, with the youth and higher-educated people being more sensitive to environmental aspects (Kuppusamy & Mari 2017; Nahar, Hossain & Mahiuddin 2022; Wang, Niu, Gan & Cai 2022). In terms of population group, environmental factors can condition the expectations, thus perceptions, and behaviour of a specific population group (Ugolini, Massetti, Galaza-Martinez, Carinanos, Dobbs, Osoic, Marin, Pearlmutter, Saaroni, Sauliene, Simoneti, Verlic, Vuletic & Sanesi 2020).

SV is related to long-term strategic planning aligned to a corporation's core competencies, experience, knowledge and expertise (Masood et al. 2021). In explaining SV, Kramer and Pfitzer (2016) claimed that solving many of the world's problems, from income inequality to climate change, requires the expertise and scalable business models developed by corporations with management and employees who are experienced and involved in significant SV initiatives. This shows that experience and occupational level might be relevant to SV perceptions. Wachira et al. (2020) also found that SV is a strategy or policy that should be driven by experienced leadership of corporations. The employees' work experience and levels of occupation in a corporation influence the adoption SV as a strategy for competitiveness and sustainability (Masood et al. 2021). SV initiatives often begin with the top executives' strategic intent, employing a top-down approach in which their inspiring vision propel the corporation towards a specific mission. According to Odia (2018), SV is driven by top management with a top-down approach across corporations. The cascading effects have an impact on the entire corporation (Bockstette & Stamp 2011; Porter & Kramer 2011). This supports the argument that level of occupation influence SV perceptions. In a study by Wachira et al. (2020), 92% of the respondents acknowledged that SV has to be directed from top management, especially from Chief Executive Officers or Directors. Odia (2018) also confirmed the association between occupational level and SV by supporting the top-down management driven and leadership approach when SV is a key strategy.

Research on SV practices revealed several initiatives that while generating economic value, enabled consequential and sustained market-based solutions for social issues; and these were displayed by conglomerates as well as small social businesses (Borgonovi, Meier, Sharda & Vaidyanathan 2011). Accordingly, SV is used not only by large corporations as a competitive or sustainability performance strategy, but also used by smaller social enterprises (Masood et al. 2021). Porter and Kramer (2011) show that larger organisations like Coca-Cola and Nestlé have resolved the problems of communities as the early adopters of SV. Wachira et al. (2020:17) also argue that in Africa, although small organisations create SV, their impact is yet to be reflected in literature the same way as the impact of large organisations which implement SV as a strategy. Amah and Nwuche (2013) also state that both small and large organisations have their unique characteristics, enabling them to expand market share and revenue jointly while transforming communities. These discussions suggest that the size of corporations might lead to specific SV perceptions.

Based on the above discussions, which shows how demographics may influence people's perceptions regarding aspects relating to SV, for example sustainability, environmental consciousness, SV leadership and strategy, and SV outcomes such as competitiveness, it is worthwhile to evaluate whether demographics influence perceptions regarding SV and selected SV antecedents within the South African mining industry.

5. Hypotheses

The following hypotheses were formulated for the study:

- H¹: Demographic variables influence mining managers' perceptions on the Shared Value antecedent *Automation and innovation*.
- H²: Demographic variables influence mining managers' perceptions on the Shared Value antecedent *Mineral resource governance*.

- H³: Demographic variables influence mining managers' perceptions on the Shared Value antecedent *Employment conditions*.
- H⁴: Demographic variables influence mining managers' perceptions on *Shared Value*.

Figure 1 presents the hypothesised model of the study.

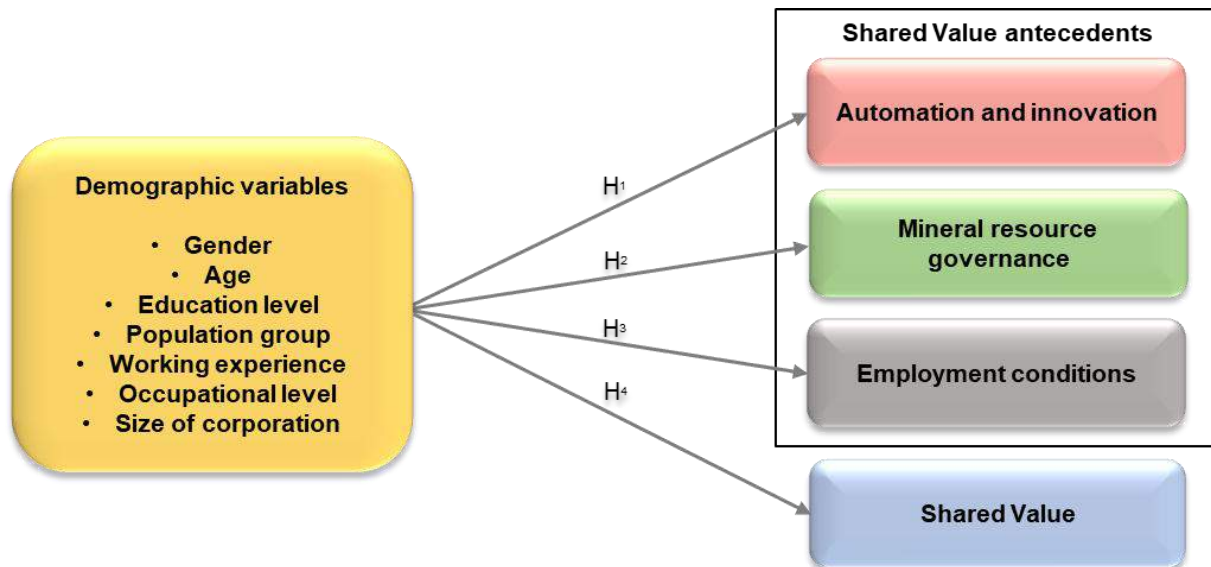

Figure 1: Hypothetical Model of the Study

6. Research Methodology

The study aims to establish whether perceptions regarding SV and selected SV antecedents are influenced by demographic variables, including manager characteristics and characteristics of these corporations. Therefore, in addition to data on respondents' SV perceptions, the aim was to collect data on respondents' gender, age, population group, education level, work experience and occupational level as well as the corporation's size. Since these variables could be easily measured statistically, the study adopted a positivistic research design with quantitative research during the empirical investigation. The study was descriptive and exploratory in nature.

The variables of this study, hypotheses and items in the questionnaire were supported by secondary data gathered from the literature review. In addition, previous studies' validity results supported the four SV-related variables (Khubana 2021) used in this study. The survey questionnaire was constructed accordingly and before the main data collection, consultation with academic experts and a pilot study were conducted to confirm face and content validity respectively. Section A of the questionnaire collected respondents' biographic and demographic data. The instrument also used a seven-point Likert-type scale ranging from 'strongly disagree' (1) to 'strongly agree' (7) for the subsequent sections. Sections B and C comprised of 45 items measuring SV and its antecedents.

The population and sample of the study was made up of managers of mining corporations listed with the Mineral Council of South Africa. The selection of the sample was done through non-probability purposive sampling and therefore respondents from 21 of the 78 mines were selected. The self-administered survey was distributed to potential respondents on corporate professional social media platforms and by means of direct emails. The institutional ethics clearance was received before the commencement of the survey, and respondents were informed of the study's purpose and that their participation was voluntary and anonymous, as well as that all data was confidential. A total of 450 professionals were targeted through the survey and 340 usable questionnaires were obtained and considered for this study's quantitative data analysis steps to evaluate the set hypotheses (Lochmiller & Lester 2017). The rate of return of questionnaires was 76%.

To test the hypotheses of the study, the t-test and Analysis of Variance (ANOVA) techniques were used to determine the influence of demographics on perceptions regarding SV and its antecedents. Following the t-test and ANOVA tests, if significance were evident, resultant post-hoc Tukey HSD tests were performed to differences in the means of different groups. A t-test compares means of two different groups. According to Cooper and Schindler (2011), ANOVA is a statistical procedure used to compare means of several samples, while a post-hoc test is a procedure utilised to determine significant differences between the mean scores of the various categories within each demographic variable. In both the ANOVA the post-hoc tests, scores were considered to reveal significant difference when $p < 0.05$ within the extant means (Gravetter & Wallnau 2012). Practical significance was also measured by calculating Cohen's D where a result < 0.35 showed small practical significance, a result between 0.35 and 0.65 showed moderate practical significance and a result above 0.65 showed large practical significance (Goulet-Pelletier & Cousineau 2018).

7. Empirical Results

The results of the study's empirical investigation are detailed through the sample description as well as the t-test, ANOVA and resultant post-hoc results, where applicable. Finally, the decisions regarding the hypotheses' acceptance are provided.

7.1. Sample Description

Table 1 shows the demographic profile of the respondents. The table summarises the descriptive statistics about the respondents' characteristics including their gender, age, population group, education level, working experience and occupational level as well as the corporations' size.

Table 1: Demographic profile of the sample

Demographic variable	Categories	Frequency	Percent
Gender	Male	203	59.7
	Female	134	39.4
	Not willing to say	3	0.9
Age	20 – 29 years	66	19.4
	30 – 39 years	136	40.0
	40 – 49 years	74	21.8
	50 – 59 years	61	17.9
	60+ years	3	0.9

Demographic variable	Categories	Frequency	Percent
Population group	Asian	4	1.2
	Black	230	67.6
	Coloured	11	3.2
	Indian	14	4.1
	White	81	23.8
Education level	Senior certificate	9	2.7
	Undergraduate	121	35.6
	Postgraduate	210	61.7
Working experience	1 – 5 years	134	39.4
	6 – 10 years	111	32.6
	11 – 15 years	56	16.5
	16 – 20 years	19	5.6
	20+ years	20	5.9
Occupational level	Director	14	4.1
	Executive level	65	19.1
	Middle level	168	49.4
	Lower level	93	27.4
Size of corporation	1 – 50 employees	21	6.2
	51 – 199 employees	19	5.6
	200+ employees	300	88.2

Source: Own compilation

Table 1 shows that the majority of the respondents were males (59.7%), between the age of 30 and 39 years (40%), Black (nearly 68%), middle level (nearly 50%) managers with 10 years or less' working experience (72%). Most of the corporations were large (88% with 200+ employees).

7.2. T-test and Analysis of Variance Results

Tables 2 to 5 display the t-test, ANOVA and post hoc tests' results that reveal the influence of demographics on SV and its antecedents. Within the South African mining industry, the validity of *Automation and Innovation*, *Mineral resource governance* and *Employment conditions* as SV antecedents as well as SV itself, were established in a previous study (Khubana 2021). Therefore, in this study, the influence of demographics on these four variables were tested.

Influence of gender on Shared Value and its antecedents

Table 2 presents the results pertaining to gender.

Table 2: Gender – ANOVA results and significant mean differences from post-hoc tests

Demographic variable	Categories	Mean	Standard deviation	F-Statistic	p-value
PERCEPTIONS REGARDING AUTOMATION AND INNOVATION					
Gender	Male	4.610	1.540	10.104	0.000
	Female	3.844	1.539		
PERCEPTIONS REGARDING MINERAL RESOURCE GOVERNANCE					
Gender	Male	5.250	1.350	10.567	0.000
	Female	4.537	1.451		
PERCEPTIONS REGARDING EMPLOYMENT CONDITIONS					
Gender	Male	5.631	1.091	4.242	0.015
	Female	5.295	0.959		
PERCEPTIONS REGARDING SHARED VALUE					
Gender	Male	4.813	1.399	12.525	0.000
	Female	4.157	1.270		

Source: Own compilation

The t-test result revealed that the gender of respondents has a significant ($p < 0.05$) influence on perceptions regarding SV and all three selected SV antecedents within the South African mining industry. The post-hoc Tukey HSD tests showed that females had significantly lower mean scores for *Automation and innovation* ($M = 3.844$), *Mineral resource governance* ($M = 4.37$), *Employment conditions* ($M = 5.295$) and SV ($M = 4.157$) than their male counterparts. This shows that male managers are more inclined to focus on SV ($M = 4.813$) in the mining industry and perceive automation and innovation ($M = 4.610$), mineral resource governance ($M = 5.250$) and employment conditions ($M = 5.631$) as contributing factors towards SV.

Influence of working experience on Shared Value and its antecedents

The results regarding Working experience are evident in Table 3.

Table 3: Working experience – ANOVA results and significant mean differences from post-hoc tests

Demographic variable	Categories	Mean	Standard deviation	F-Statistic	p-value
PERCEPTIONS REGARDING AUTOMATION AND INNOVATION					
Working experience	1 – 5 years	4.598	1.540	4.294	0.002
	6 – 10 years	3.998	1.641		
	11 – 15 years	4.451	1.421547		
	16 – 20 years	3.331	1.603079		
	20+ years	4.482	1.542053		

Demographic variable	Categories	Mean	Standard deviation	F-Statistic	p-value
PERCEPTIONS REGARDING MINERAL RESOURCE GOVERNANCE					
Working experience	1 – 5 years	5.213	1.279	4.070	0.003
	6 – 10 years	4.646	1.512		
	11 – 15 years	5.143	1.279

	6 – 10 years	4.291	1.437		
	11 – 15 years	4.671	1.390		
	16 – 20 years	3.772	1.463		
	20+ years	4.767	1.085		

Source: Own compilation

As presented in Table 3, mining managers' years of working experience significantly ($p < 0.05$) influence their perceptions regarding *SV* and two of the selected *SV* antecedents, namely *Automation and innovation* as well as *Mineral resource governance*. Through the post-hoc Tukey HSD tests it was found that respondents with a tenure of 16 to 20 years have significantly lower mean scores, with regard to *Automation and innovation* ($M = 3.331$) and *Mineral resource governance* ($M = 4.272$), than those with 6 to 10 years' experience ($M = 3.998$ and $M = 4.646$ respectively). In addition, the post-hoc analysis showed that respondents with the least working experience (less than 6 years) significantly focus more on *SV* (higher mean of $M = 4.755$) than those with 16 to 20 years' experience ($M = 3.772$).

Influence of occupational levels on Shared Value and its antecedents

The significant influence of occupational level on *SV* and its antecedents is shown in Table 4.

Table 4: Occupational level – ANOVA results and significant mean differences from post-hoc tests

Demographic variable	Categories	Mean	Standard deviation	F-Statistic	p-value
PERCEPTIONS REGARDING AUTOMATION AND INNOVATION					
Occupational level	Director	5.370	1.103	5.741	0.000
	Executive level	3.702	1.668		
	Middle level	4.367	1.554		
	Lower level	4.437	1.536		
PERCEPTIONS REGARDING MINERAL RESOURCE GOVERNANCE					
Occupational level	Director	5.869	0.717	5.213	0.001
	Executive level	4.446	1.669		
	Middle level	5.029	1.403		
	Lower level	5.081	1.275		
PERCEPTIONS REGARDING SHARED VALUE					
Occupational level	Director	5.371	1.308	4.178	0.006
	Executive level	4.097	1.324		
	Middle level	4.622	1.375		
	Lower level	4.559	1.405		

Source: Own compilation

For *SV* and two of the selected *SV* antecedents, *Automation and innovation* as well as *Mineral resource governance*, the occupational level of mining managers significantly ($p < 0.05$) influences their perceptions. According to the post-hoc Tukey HSD tests Executives had a significantly lower mean scores for *Automation and innovation* ($M = 3.702$) as well as *Mineral resource governance* ($M = 4.446$) compared to Directors ($M = 5.370$ and 5.869 respectively), Middle- ($M = 4.367$ and 5.029

respectively) and Lower-level (M = 4.437 and 5.081 respectively) managers. In terms of *SV*, Executives also had a significantly lower mean (M = 4.097) than Directors (M = 5.371) and Middle-level (M=4.622) management.

Influence of size of the corporation on Shared Value and its antecedents

The results pertaining to differences in *SV* perceptions based on corporation size are revealed in Table 5.

Table 5: Size of corporation – ANOVA results and significant mean differences from post-hoc tests

Demographic variable	Categories	Mean	Standard deviation	F-Statistic	p-value
PERCEPTIONS REGARDING AUTOMATION AND INNOVATION					
Size (number employees)	1 – 50	5.297	1.232	8.106	0.000
	51 – 199	3.316	1.761		
	200+	4.293	1.563		
PERCEPTIONS REGARDING MINERAL RESOURCE GOVERNANCE					
Size (number employees)	1 – 50	5.548	0.986	7.383	0.001
	51 – 199	3.895	1.716		
	200+	4.993	1.408		
PERCEPTIONS REGARDING EMPLOYMENT CONDITIONS					
Size (number employees)	1 – 50	5.884	0.804	9.573	0.000
	51 – 199	4.564	1.239		
	200+	5.531	1.022		
PERCEPTIONS REGARDING SHARED VALUE					
Size (number employees)	1 – 50	5.368	1.272	7.305	0.001
	51 – 199	3.719	1.691		
	200+	4.529	1.349		

Source: Own compilation

The results of ANOVA test confirm that size of the organisation (based on number of employees) significantly ($p < 0.05$) influence on South African mine managers' perceptions regarding *SV* and all three selected *SV* antecedents. The post-hoc Tukey HSD tests showed that managers of organisations that have between 51 and 199 employees (the mid-size organisations in the sample) were less agreeable to the importance of *SV* and its antecedents. These managers had significant lower means for *Automation and innovation* (M = 3.316), *Mineral resource governance* (M = 3.895), *Employment conditions* (M = 4.564) and *SV* (M = 3.719) compared to both the smaller (M = 5.297; 5.548; 5.884 and 5.368 respectively) and larger organisations (M = 4.293; 4.993; 5.531 and 4.529 respectively). Thus, managers within small and larger mining organisations were more agreeable to the importance and significance of *SV* and its antecedents within their organisations than respondents from medium-sized organisations.

Cohen's D calculations revealed that the influence of demographics on *SV* perceptions were of moderate practical significance based on gender (Cohen's D = 0.49), occupational level (Cohen's D = 0.39) and size of corporation (Cohen's D = 0.59). A Cohen's D of 0.74 showed that the influence of working experience on *SV* perceptions was of large practical significance.

The results of this study show that perceptions regarding *SV* and its antecedents varied significantly based on different demographics, namely respondents' gender, working experience, occupational level and the size of the corporations. Based on the empirical results, the hypotheses were evaluated (see Table 6).

Table 6: Decisions regarding the hypotheses

Hypothesis number	Hypothesis	Decision
H ¹	Demographic variables influence mining managers' perceptions on the Shared Value antecedent <i>Automation and innovation</i> .	Partially accepted; only for gender, working experience, occupational level and size
H ²	Demographic variables influence mining managers' perceptions on Shared Value antecedent <i>Mineral resource governance</i> .	Partially accepted; only for gender, working experience, occupational level and size
H ³	Demographic variables influence mining managers' perceptions on Shared Value antecedent <i>Employment conditions</i> .	Partially accepted; only for gender and size
H ⁴	Demographic variables influence mining managers' perceptions on <i>Shared Value</i> .	Partially accepted; only for gender, working experience, occupational level and size

Source: Own compilation

It is clear that age, population group and education level do not significantly influence mining managers' perceptions regarding SV and its antecedents. Table 3 confirms the hypotheses' partial acceptance and shows that there are two demographic variables, namely gender and size, that significantly influence perceptions on all four variables considered in this study (*SV*, *Automation and innovation*, *Mineral resource governance* and *Employment conditions*). Two more demographic variables, namely working experience and occupational level influence perceptions on two SV antecedents namely *Automation and innovation* and *Mineral resource governance* as well as perceptions on SV itself.

The study's results are also visually presented in Figure 2.

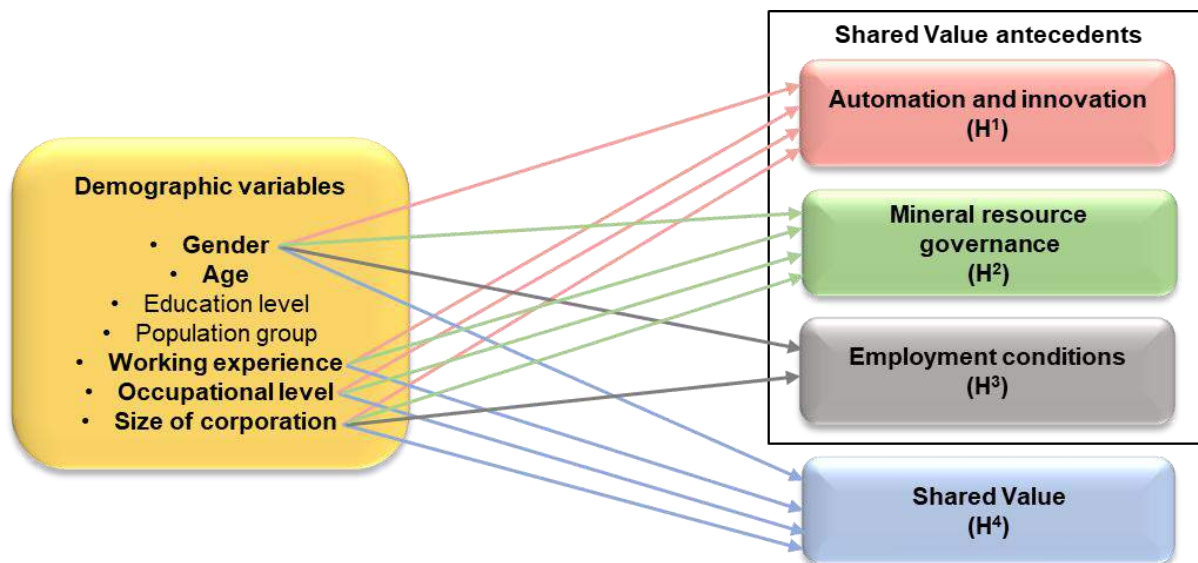

Figure 2: Demographic influences on Shared Value perceptions

8. Managerial and industry Implications

Since age, population group and education level do not significantly influence perceptions regarding SV and its antecedents, the focus of SV training should rather ensure the inclusion of male and female managers, in different working experience and occupational level categories, of medium and large mines.

To improve the focus on the *Automation and innovation* SV antecedent, mines' training should aim to involve and increase female managers' focus on automation. In addition, it is useful for mines to identify that those with less than 6 year's working experience are more inclined towards Automation

and innovation as an SV antecedent. Therefore, mines should train these less experienced managers extensively on mining automation and how it can contribute to SV, as they could still contribute positively towards the mining industry for years to come. A concern is mining Executives' lower focus on Automation and innovation. Wachira et al. (2020) state that SV has to be directed from top management, especially Chief Executive Officers, and therefore mining Executives should be educated on the impact of Automation and innovation on SV so that these leaders could direct corporations' focus on it from the top. Although larger mines had a stronger focus on Automation and innovation than mid-sized mines, their focus was still lower than that of smaller mines. As the most mining corporations in the South African industry are large (also shown by the sample distribution), Automation and innovation towards SV should be more stressed in these corporations.

As for Automation and innovation, the same demographics influence perceptions on *Mineral resource governance* as an SV antecedent. Therefore, managerial implications are similar: training for managers on the importance of governing mineral resources should focus on females, those with working experience less than 6 years and Executives. To ensure mid-size mines also focus on Mineral resource governance, as is the case with smaller and larger mines, they could be targeted on training in this regard.

Since only gender and size of the corporation influence perceptions on *Employment conditions* as an SV antecedent, mining corporations should focus on female managers in medium-sized mines. These managers should be educated on employment conditions – what is required; the status thereof; how acceptable conditions, with which employees are satisfied, could contribute to SV – and they should be encouraged to facilitate these employment conditions.

Finally, an overall increase of the focus on and implementation of SV in mining corporations could be ensured if these corporations involve female managers, those with 16 to 20 years' experience, executives and medium-sized mines. These managers should be trained on SV, what it entails, its antecedents and how it can practically be facilitated in mines. The study's results correspond with Von Liel (2016) and Wachira et al (2020) that reveal that respondents from large corporations show higher SV inclinations. However, with regards to working experience, it was interesting to note that managers in this study with less experience (shorter than 6 years) were more positive towards SV in mines. Thus, training could also focus on this group of managers that still has many years to offer employment in the industry. Another size-related implication: because corporations cannot solve all societal problems, each corporation should identify societal issues (SV opportunities) that are aligned with the corporation's size to ensure viable SV focus areas.

Based on the significant relationships found between the antecedents of SV and demographics, the following general recommendations are suggested:

- Mining policies and practices need to be gender-sensitive, especially in a male-dominated workplace environment.
- Mine management need to tap into the working experience of mine workers who know the tricks of the trade and have a wealth of knowledge that could be shared with younger or less experienced mine workers. Mentorship programmes using seasoned and experienced workers could be invaluable.
- Although executive management might be far removed from the daily mining operations it is important to be in-touch with what is happening on the ground as to be able to draft policies and institute work practices that could enhance shared value.
- Smaller mines could learn much from larger operating mines regarding effective best practices for sustainability and creating SV.

With the possible influence of these demographics (gender, working experience, occupational level and size of the mine), some general recommendations and strategies for leveraging *automation and*

innovation to create SV are outlined below. These aspects could be incorporated in training and mentorship programmes as well as workplace policies and practices for mines.

- *Inclusive value chain innovation:*
 - Promote inclusive value chain development through stakeholder engagement with suppliers and communities.
 - Integrate the Mining Charter and BEE transformation strategies with a Supply Chain Management Policy.
 - Adopt an asset-based model for community capacity building programmes – technical, business and financial services support – which will align sustainable development priorities of communities and the need for profit maximisation or productivity.
 - Innovate through external collaborations for joint learning and continuous improvement.
- *Automation and business model innovation:*
 - Integrate technology and human resource modernisation plans.
 - Collaborate to influence curricula, learning and teaching to build a skilled future ready workforce.
 - Accelerate the establishment of a Mining Centre of Excellence (HUB).
 - Adopt a new digitally-enabled business model – ‘Intelligent Digital Mines’
- *Infrastructure development:*
 - Ensure collaborative infrastructure development through Public-Private Partnerships and shared infrastructure initiatives.
 - Invest in sustainable community development projects.
 - Catalyse the development of the Special Economic Zones.

General recommendations and strategies for leveraging *employment conditions* to create SV are highlighted below.

- Adopt a socially-focused employment strategy – SV Employment Plan.
- Integrate sustainability planning in training and development.
- Strategically collaborate with employees and trade unions to nurture employee engagement and involvement.
- Adopt the shared productive ownership structure.
- Collaborate with government, civil society and communities for the establishment of a centralised royalty system/agency.
- Implement innovative performance management and reward systems.
- Instill a positive culture and working environment.

General recommendations and strategies for leveraging *mineral resource governance* to create SV are outlined below.

- Create mechanisms that could guide decision-making by instilling a culture of shared responsibility and accountability for control and use of natural resources in a sustainable and mutually beneficial way for mining organisations, governments and surrounding communities.
- Exploit opportunities for mining organisations and government to harness their extractive wealth to advance economic development and well-being of communities.
- Translate mineral wealth into broad-based economic, human and social development.
- Mining regulations should not only focus on enhancing state control of resource revenues or private investors’ independence, but rather focus on balancing the role of government in job generation, technological transfer, and broad socio-economic development.
- Ensure that regulatory and legislative conditions related to compliance with the Carbon Tax Act and the Mining Charter are adhered to.

9. Conclusion

The study gathered perceptions of managers working in South African mines. In future research, a comparative study could be conducted among different types of (e.g. gold, diamond, coal, etc.) mines to identify whether different industry mines regard SV differently. This could guide mining corporations on which industries focus on and possibly gain from SV. In addition, more in-depth views could be gained through a qualitative study by means of semi-structured interviews with mining stakeholders.

Overall, this study contributes to the field of SV within the context of the South African mining industry. The study is unique in presenting the SV perceptions of mining managers employees, those responsible for leading mines to “succeed” both financially and socially. It reveals that gender, working experience, occupational level and the size of mines influence SV perceptions. Mining corporations planning to implement SV as a strategy should consider these demographics and ensure inclusivity, i.e. in terms of experience and occupational level to ensure all employees work towards SV. Thus, SV training in mining corporations should focus on specific manager groups, for example less experienced executives, in order to increase the SV focus. Ultimately, as per the definition of SV and the known outcomes of SV such as competitiveness and sustainability (Odia 2018), this could lead to mining and national economy benefits.

Keywords

Small businesses; start-up lifecycle; entrepreneurship education; business training

Abstract

Background: Small business growth rates are generally high in developing countries, and government initiatives exist to support small businesses. However, the small business sector continues to report high failure rates, particularly within the first five years of operation. Researchers have suggested that if challenges that contribute to early-stage business failure can be identified and isolated, measures can be put in place to avoid critical start-up pitfalls. Although these challenges are well described in the academic literature, little is known about where these challenges are experienced throughout the start-up lifecycle. It is therefore vital to investigate where in the start-up lifecycle entrepreneurs face challenges.

Purpose: The challenges facing small businesses throughout each stage of the start-up lifecycle were investigated in this article.

Methods: A quantitative research method using self-administered questionnaires was utilised for collecting data from 54 respondents in Free State and Gauteng province through snowball sampling.

Findings: Results indicate that respondents experience personal challenges during the initial stages of the start-up lifecycle while managerial and financial challenges are experienced throughout all stages of the start-up lifecycle.

Conclusions: This article suggests that the risks associated with business failure should be mitigated through entrepreneurship education and business training designed to prepare start-up owners for the key challenges facing the business at every stage of the start-up lifecycle.

1. Introduction

1.1 Problem Statement

Developing countries are characterised by high Total early-stage Entrepreneurial Activity (TEA) rates and low Gross Domestic Product (GDP) per capita income (Herrington, Kew & Kew, 2017:39). TEA rate refers to the prevalence rate of individuals in the working-age population who are actively involved in business start-ups, either in the stage of starting a new business or within the first 3 years after the start of the business (Dantas, Moreira & Valente, 2015:2; Mohalajeng & Kroon, 2016:893).

The impact of small businesses on economic growth is recognized internationally as small businesses play a key role in employment, wealth creation and innovation (Liñán, Paul & Fayolle, 2019:2). Economic growth is often strongly associated with innovation and entrepreneurship as new and

² E-mail address: piet.ntema@nwu.ac.za

competitive businesses are created through new ideas and inventions (Liñán et al., 2019:3; Urbancová, 2013:84).

Like elsewhere in developing countries, the South African business landscape is dominated by small businesses as they contribute significantly to the development of the country's economy with 60% of South Africa's job opportunities and 36% of GDP coming from small businesses (Herrington et al., 2017:8). Furthermore, the South African government has run a number of initiatives to support small businesses. Through the Department of Trade and Industry (DTI) and the ministry of small businesses, financial and non-financial support to small businesses continues to be provided. Accordingly, a number of state agencies have been established, for example, Khula, Ntsika, the National Youth Development Agency (NYDA) and the Small Enterprise Development Agency (SEDA).

For developing countries, the development and advancement of entrepreneurship are said to be fundamental and crucial for the growth of the economy (Mohalajeng & Kroon, 2016:898). Small businesses play a key role in employment, wealth creation and innovation not only nationally but in the global economy. In South Africa, small businesses create 60% of job opportunities and contribute 36% towards gross domestic product (Herrington et al., 2017:8) As a result, the South African government has prioritised, through policy and legislative frameworks, the creation and promotion of small business as one of the key ways to address the high unemployment rate and alleviate poverty especially amongst poor masses who are historically marginalised and thus, denied participation in the mainstream economy of the country (Garg & Phaahla 2018:54, Jone, 2016).

In spite of conclusions by Herrington et al. (2017:56) that small business growth rates are generally high in developing countries, and the government initiatives designed to support small business (Department of Trade and Industry, 1995); South Africa still faces challenges regarding sustaining small business growth. The small business sector continues to report between 70% and 80% failure rates, particularly within the first five years of operation (Msimango-Galawe & Urban, 2019:146). Researchers have suggested that if the factors that contribute to early-stage business failure can be identified and isolated, measures can be put in place to avoid critical start-up pitfalls (Garg & Phaahla, 2018:55). Although challenges facing start-ups are well described in the academic literature, little is known about where these challenges are experienced throughout the stages of the start-up lifecycle. It is understood in the literature that businesses go through various stages of the start-up lifecycle from idea generation, concept development, commercialisation and market penetration and survival (Mohalajeng & Kroon, 2016:897). It is therefore vital to investigate where in the stages of the start-up lifecycle entrepreneurs face challenges.

Thus, the main purpose of this study is to investigate the challenges facing small businesses throughout every stage of the start-up lifecycle. Mapping the key challenges to each stage of the start-up lifecycle provides a novel view of the challenges small businesses face in South Africa. Furthermore, this study aims to suggest that these challenges should be mitigated through entrepreneurial education and training designed to prepare start-up entrepreneurs for the key challenges faced at every stage.

1.2 Methodology

This study utilised a quantitative descriptive research design to gather information (Burns, Veeck & Bush, 2017:120). The targeted population included early-stage small businesses in South Africa. The sampling frame and units were narrowed down to include small business entrepreneurs operating in rural areas of the Free State Province in South Africa, particularly Kroonstad, Edenville and Heilbron. Additionally, the sampling frame included entrepreneurs registered with the NYDA (National Youth Development Agency) Johannesburg. A non-probability snowball sampling method was utilised enabling data to be obtained from a larger number of respondents in a relatively short period of time as respondents refer the researcher to additional potential respondents, thus allowing for a cost-effective and simpler means of sampling (Shiu Hair, Bush & Ortinau, 2009:480).

A sample size of 54 respondents was obtained through the snowball sampling method. The choice of using the snowball method was influenced by the difficulty in obtaining lists of respondents from South African agencies that give support to small businesses due to confidentiality agreements signed with small business owners to prevent third-party access to their information as well as the POPIA ACT.

1.2.1 The measuring instruments

A self-administered questionnaire was designed to correspond with the objectives set out for this research (McDaniel & Gates 2016:110). Demographic variables were measured in the first section of the questionnaire and comprised of close-ended multiple-choice questions. Questions related to gender, age, the location of the small business, the sector in which the business operates, the level of education and business training received by respondents as well as the number of businesses each respondent started. Subsequent sections measured the perceptions of respondents regarding the challenges faced in the start-up lifecycle of their business.

A pilot-test was conducted by distributing the self-administered questionnaire to a small fraction of the respondents in order to test for clarity (Malhotra, 2019:441). The validity of the self-administered questionnaire was checked using a face validity process by asking a sample of five entrepreneurs to critique whether, according to them, the questions adequately represented the factors required to answer the research questions (Bryman and Bell, 2015:178). Feedback regarding the questionnaire was incorporated as the researcher ensured that it adhered with the code of ethics formulated by the North-West University. Post piloting, respondents were asked to complete the corrected and updated the self-administrated questionnaire.

Respondents were assured of anonymity as their names and any confidential information did not appear on the questionnaire nor reported in the results. Questionnaires were distributed to respondents electronically. To increase the response rate, after a certain period of time, respondents were sent another email reminding them to complete the questionnaire and also requested to refer additional potential respondents for the study.

1.2.2 Data analysis

Upon collecting data from the self-administered questionnaires, the data obtained were entered, cleaned and analysed by the use of Statistical Package for Social Sciences (SPSS) version 23.

In order to summarise the sample data distribution, descriptive statistics such as the mean, and frequency distributions, were calculated. This was done for the individual items and the summated scores relating to the number of businesses for each small business owner-manager and business training completed.

Cross tabulations were carried out so as to establish the relationship between challenges faced and the stages of small business development. Cross tabulations based on the chi-square test, were also carried out for the relationship between the business sector and the nature of training completed.

1.3 Research objectives

To achieve the primary objective of this study, the following secondary objectives were formulated:

- Examine the demographic profile of small business entrepreneurs operating in rural areas of the Free State Province and Johannesburg in South Africa.
- Identify and summarise the stages found in the start-up lifecycle through literature review.
- Determine the challenges faced by small business entrepreneurs within each stage of the start-up lifecycle.
- Investigate the relationship between small business entrepreneurs' business focus and the nature of business training they have completed, if any.

2. Literature Review

Throughout the years, various scholars have developed frameworks for categorising small business development and growth (Churchill & Lewis, 1983; Hansen & Birkinshaw, 2007; Kazanjian, 1988;

Marais & Schutte, 2010; McAdam & McAdam, 2008). By proposing typologies that categorise businesses into several profiles and framing a developmental sequence among these types of businesses, various stages of small business growth have been identified and examined. Seminal work by Witt (2004) identified the stages of small business development as “measures of start-up success” arguing that the success of a small business depends on its developmental stage. Since then, various modern-day authors have referred to the early stages of small business development as the start-up lifecycle. As such, these stages proposed by Witt (2004) are adapted in this study whilst reviewing the various start-up lifecycles proposed from recent contemporary studies.

2.1 Idea: Develop a business idea and determine need and feasibility

The first stage of the start-up lifecycle, idea development, was understood by Witt (2004:397) to relate entirely to the entrepreneur and not to the business. As such during this stage, the entrepreneur considers his or her entrepreneurial intention. Carrete and De Faria (2019:70) refer to this stage as “the research stage”, arguing a small business is created based on results achieved through basic and applied research conducted by the entrepreneur. During this stage, which Fisher, Kotha and Lahiri (2016:385) refer to as the conception stage, the primary focus of the entrepreneur is on the invention and development of a product or a technology. Creativity is imperative as ideas stem from unexpected incidences, process needs, demographic and behavioural changes, industry and market trends, as well as new knowledge as a result of individual genius (Mohalajeng & Kroon, 2016: 895). As the feasibility of ideas is evaluated through ensuring that ideas integrate with financial objectives of the business, new business opportunities are identified. This stage is referred to as idea generation and screening by Mohalajeng and Kroon (2016:895)

2.2 Plan: Develop a detailed business plan

According to Bessant and Tidd (2018:437), the aptitude of a business to execute an idea and meet its future demand can be evaluated through ranking, profiling and scenario building. These are key activities related to planning. The second stage of the start-up lifecycle is thus, planning (Witt, 2004:397). From Fisher’s (2016:385) perspective, planning forms an integral part of development as all activity is focused on technical issues as defined and directed by the entrepreneur. Thus, during planning, entrepreneurial commitment is determined (Witt, 2004:397). For Filho, Albuquerque, Nagano, Philippsen and De Oliveria (2017:5), this stage is referred to as the “genesis” stage during which the preliminary preparation for starting the business occurs. The entrepreneur begins to envision the possibility to satisfy a personal need and/or a gap in a visualised target-market. Oftentimes the direction of the business is outlined in the business plan. Additionally, Albuquerque, Filho, Nagano and Junior (2016:6) mention that during this stage, the business is not yet constituted as a company, but rather represents a plan of turning the idea into a business.

Mansoori and Lackéus (2019:6) explain that for small businesses the business plan serves as a written document describing the anticipated future outcomes of a business through careful examination of the trends and available historical data. Here, the entrepreneur provides an overview of business’ potential, describing its core product or service, presenting market research, offering marketing and sales plans, stipulating operational and implementation details, and detailing financial projections (Bridge & Hegarty, 2013:29). Accordingly, small business owners and entrepreneurs are often strongly encouraged to write a thorough business plan before implementing their business.

2.3 Create: Set up the business

According to Witt (2004:397), at this stage, the entrepreneur has moved from idea development and business planning to creation. At the creation stage, the business model is rather simple, the entrepreneur is the business. In other words, systems and a formal business strategy are minimal to non-existent as the entrepreneur performs all the important tasks (McAdam & McAdam, 2008:280). Commercialisation, which Fisher et al. (2016:386) referred to as the second stage start-up life cycle, entails the entrepreneur focusing primarily on learning how to make the product work well and on how to produce it beyond the model and prototype. Commercialisation serves as a key part of setting up the business. This stage, according to Filho et al. (2017:5) is the start of the struggle for consumers and results of the business as the entrepreneur seeks a market share to reach positive results for the

business. However, for Carrete and De Faria (2019:70) and Mohalajeng and Kroon (2016:896) setting up the business serves the last stage of small business development placing prototyping, testing and market entry as preconditions for setting up the business.

2.4 Prove: Test and refine the business operation

For Witt (2004: 399), proving is the fourth stage of the start-up lifecycle during which the business tests and refines its operation. Fisher et al. (2016:386) emphasise the importance of building an organisational task system and thus creating business functions that include manufacturing and engineering while other additional activities remain embryonic. For Carrete and De Faria (2019:70), the fourth stage is referred to as “customer portfolio” and regards the attraction of the first customers and the beginning of revenue generation.

Mohalajeng and Kroon (2016:897), on the other hand, point out that during this stage the conceptualised ideas are developed, implemented, and tested. As a result, the initial implementation and deployment of ideas may be refined and further developed. Albuquerque et al. (2016:6) and Filho et al. (2017:5) add that during the prove stage - which they refer to as “Existence” - the entrepreneur produces, sells and delivers the product as a market test for the business idea. Here, the entrepreneur determines whether the product being offered will satisfy a need from the market. In order to reach the next stage of the start-up lifecycle the small business needs to have shown that it is economically viable.

2.5 Operation: Full business operation, survival, and growth

Mohalajeng and Kroon (2016:896) point out that often the final stages of the start-up life cycle – prove and operation- overlap since the developed concept frequently requires buy-in from the targeted market as concepts are tested and implemented in the market for further development opportunities and feasibility studies. Witts (2004:399) identifies the final stage of the start-up lifecycle as the full operation and growth of the business. During this stage, the profitability of the business is determined as the business begins to earn marginal returns on invested time and capital.

For Mohalajeng and Kroon (2016: 896), once products have been refined, formalised and market-tested on a limited scale first, the final stage commences. It involves launching the final product for entrance into the market and thus adding significance to the value chain by creating profits for the business, social advantages for communities, and personal benefits for consumers (Mohalajeng & Kroon 2016: 896). Carrete and De Faria (2019:71) refer to the final stage of the start-up lifecycle as “Expansion” stating that the entrepreneur invests in the marketing and infrastructure of the business to provide the business with the capacity to increase its production scale and meet the high product demand. Collaboration becomes imperative for the survival of the business.

Albuquerque et al. (2016:6) highlight that at this stage the business grows from negative cash flow to break-even. During the survival stage, the small business may grow in size and profit allowing the entrepreneur to receive income without investing large amounts of time or capital (Filho et al., 2017:5). Naturally, at this stage, the challenges associated with product development are overcome and the product has achieved a degree of market success. Here, the entrepreneur persists until the small business reaches a growth rate consistent with market growth (Fisher et al., 2016:385).

Additionally, work by Cole and Lysiak (2017:223) categorises the start-up lifecycle into two main stages: (1) “Early-stage financing” which encompasses refining the product, commencing the marketing, and generating cash flow as well as (2) Execution. Here, the initial product has been developed, marketed, and sold. The entrepreneur seeks out larger injections of funding by relinquishing part ownership or equity of the small business to the venture capital firm. At this stage (execution) if the small business proves to be lucrative and profit exceeds initial funding, the entrepreneur will bridge the expansion and development stages to one of several avenues of more mature financing (Cole and Lysiak 2017:223).

2.6 Challenges faced by small businesses

Both industry and academia have noted that small businesses in South Africa face numerous challenges. These challenges fall within all the start-up, development and growth stages of the business (Mthusi, 2015:12). The lack of managerial and entrepreneurial skills, a fundamental success factor for businesses, serves as one of the main challenges throughout the start-up lifecycle (Garg & Phaahla, 2018:55). This challenge is oftentimes preceded by a lacking of planning. Karadag (2015:29) emphasis that entrepreneurs continue to neglect to formulate strategic plans for their new businesses. Finances have also been identified in the literature as a constant challenge faced by small business. Yadav, Jain, Mittal, Panwar & Lyons (2019:857) mention that not only is the lack of funding a challenge but the entrepreneur's lack of the needed know-how to manage the business' finances. The poor choice in the location and infrastructure of the business have also been noted to lead unforeseen challenges which include inflated rental costs and unreliable electricity supply for example (Ndege, 2015:83).

Prior literature has extensively looked into the challenges and risks entrepreneurs face in small business growth (Bezuidenhout & Nenungwi, 2012, Cant and Wiid, 2013, Churchill & Lewis, 1983, Neneh & Van Zyl, 2012). Thus, these challenges have been summarised into economic, financial, management, social, personal, infrastructural, and planning challenges. Table 2 serves to provide a brief description of these challenges as the purpose of this study was to not examine these challenges but to determine where in the stages of the start-up lifecycle are these challenges prominent.

Table 2: Challenges faced by small businesses identified in the literature

Challenge	Description
Economic	Includes factors such as high-interest rates, high taxes, and high inflation rates.
Financial	Includes difficulty in obtaining funds or credit for business start-up, operating

	expenses/high production costs, poor financial planning, and poor cash flow management.
Infrastructure	Includes unreliable electricity supply, inadequate transport, poor roads, poor water supply, and poor telecommunication.
Market	Includes the inadequate location of the business, high competition, and high transport costs.
Management	Managerial skills include marketing, financial and human, business risk management, business planning, sales and advertising skills. Indications of managerial competencies can be the education of the founder, managerial experience, entrepreneurial experience and start-up experience.
Social	Includes an increase in expenditure or investment in security measures to eliminate or reduce and minimise the likelihood and impact of crime and corruption on the business
Personal	Entrepreneurial competencies, mindsets, personal traits, skills, and knowledge required to succeed in a new venture. Entrepreneurial characteristics will typically include being: creative/innovative, ambitious, motivated, ability to identify opportunities, risk-taking, ethical, problem-solving, adaptable, decisive, friendly, a leader, a team player, tolerant of ambiguity and uncertainty, hardworking and persevering.
Business plan development	The development of an adequate and workable business plan is seen as another key challenge for the success of a new business.

Source: Bezuidenhout & Nenungwi (2012), Cant and Wiid (2013), Garg & Phaahla (2018), Karadag (2015), Ndege (2015), Sarwoko and Frisdiartara (2016), Yadav et al. (2019), Zarefard & Cho (2018)

3. Results and Findings Demographic profile of respondents

The demographic profile of the respondents is shown in Tables 1 – 3. Table 1 indicates that the sample consisted of 54 respondents. Most of the respondents were men (74%) while only 26% were women. The majority of respondents were between 18 and 40 years old (87%) while 13% of respondents were older than 40 years. The sample consisted of only black South Africans. The sample included respondents from the Johannesburg branch supported by NYDA and three rural towns in the Free State province supported by SEDA (Small Enterprise Development Agency). The majority of respondents (57%) completed the questionnaire in Johannesburg, 17% in Edenville, 17% in Kroonstad and 9% in Heilbron.

The respondents were asked to indicate in which business sector their businesses operated as well as the level of education or training they had obtained. Table 3 further points out that the majority of respondents operated in agriculture (30%) and “other” (26%) including education and training, finance, marketing and information technology sectors. The remaining respondents operated in construction (22%), manufacturing (11%), trade (9%) and transport (2%). The majority (59%) of respondents obtained high school education as the highest level of education followed by 30% with a college education (diploma). Only 5% of respondents attained a university bachelor's level degree. Very few (2%) of the respondents had obtained a post-graduate qualification at university while 4% indicated 'other' as their highest educational level. Most (63%) of respondents indicated that they have completed business training against 37% who had not.

Table 3: Sample profile

VARIABLES		F	%
Gender	Men	14	25.9
	Women	40	74.0
Age in years	18 – 40 years	47	87.1
	Older than 40 years	6	12.9
Geographic area	Johannesburg	31	57.4
	Kroonstad	9	16.6
	Edenville	9	16.6
	Heilbron	5	9.3

	Post-graduate degree	1	2
	Other	2	4
Business training	Completed	34	63
	Not completed	20	37

Source: Own compilation from data analysis

Respondents were further asked to indicate the total number of businesses they have started. From the total number of businesses started, respondents were asked to indicate the number of active, sold or closed/dormant businesses. Amongst the 54 respondents, 38 small businesses are active, while 16 businesses have been sold and 17 are closed. Table 3 indicates the maximum number of active start-ups that one entrepreneur operated was 4, the minimum value of zero active start-ups indicates that the entrepreneur is not yet operational, but the business idea has been developed and the feasibility of the idea was researched. The maximum number of sold and closed businesses for a single entrepreneur were 1 and 3 respectively.

Table 4: Total businesses amongst respondents

	Number of businesses	Min per respondent	Max per respondent	Mean	Standard deviation
Active businesses	38	0	4	1.5	0.9
Sold businesses	16	0	1	0.3	0.4
Closed businesses	17	0	3	0.8	1.0

Source: Own compilation from data analysis

Taken together, Tables 3 and 4 provide sufficient evidence for secondary objective 1: To examine the demographic profile of small business owner-managers operating in rural areas of the Free State Province and Johannesburg in South Africa.

3.2 Challenges faced by respondents throughout the stages of small business development

From the literature, the typical challenges leading to increased risk of failure experienced by small businesses have been divided into eight categories namely economic, financial, infrastructure, market, management, social, personal and business plan development. The literature reviewed the stages of start-up lifecycle. In order to understand the challenges entrepreneurs' face when starting businesses, the researcher asked respondents to describe the main challenges they experienced within each stage of the start-up lifecycle. For the purpose of the analysis, the researcher categorised the responses according to the eight challenge categories identified in the literature review. Categorising challenges according to stages of the start-up lifecycle gives an indication of which challenge areas require the most attention per stage. The results are summarised in Table 5.

Table 5: Summary of the challenges faced by respondents per small business development stage.

Small business development stage	Main challenges							
	Economic	Financial	Infrastructure	Market	Management	Social	Personal	Business plan development
1. Idea: Develop business idea and determine need and feasibility	6%	14%	8%	3%	8%	0%	58%	3%
2. Plan: Develop detailed business plan	0%	15%	5%	0%	13%	0%	0%	67%
3. Create: Set up the business	7%	26%	22%	7%	30%	4%	4%	0%
4. Prove: Test and refine the business operation	0%	22%	17%	13%	39%	0%	9%	0%
5. Operation: Full business operation, survival and growth	0%	22%	4%	13%	57%	4%	0%	0%

Source: Own compilation from data analysis

3.2.1 Idea: Develop a business idea and determine need and feasibility

In the idea stage, entrepreneurs develop a business idea and conduct a feasibility study. Respondents indicated that personal challenges (58%) were a major challenge during this stage. From the respondents' responses, personal challenges included their lack of ability to identify the gap in the market; a fear to start; their lack of discipline and passion to continue; an ignorance of market research; their lack of creativity to find new business ideas; and their deficiency in conducting research to determine the feasibility of the business. Respondents also pointed out that they often want to do too much, making the idea too complex and are often overconfident about the business idea.

Table 5 also indicates that respondents found financial constraints (14%) to be another contributor to the challenges they face during the idea generation stage. Respondents pointed out that they often had inadequate capital to fund the idea and later start the business.

3.2.2 Plan: Develop a detailed business plan

In the planning stage, the entrepreneur is expected to develop a detailed business plan. As a result, developing a business plan (67%) was a major challenge as respondents indicated that this is one of the obstacles hindering the development of their business. The respondents listed some of the difficulties they face in developing a business plan. They outlined the challenge of having to define exactly what the business proposal and value proportion is; how much potential customers should be charged for the product or service and the lack of entrepreneurial training on the analysis of the business' needs and resources.

Table 5 further indicates that similar to the idea stages, respondents found financial constraints (15%) to be another contributor to the challenges they face when developing a business plan. Respondents pointed out that this is often related to rejection from financial institutions when applying for funding.

3.2.3 Create: Set up the business

In the create stage, entrepreneurs set up the business. Respondents indicated that management (30%), financial (26%) and infrastructural (22%) encounters proved to key challenges during the creation of the business. From the respondents' responses, management challenges included failure to find a viable business model; difficulty in recruiting skilled employees, unrealistic targets set for businesses and the incorrect implementation of business strategies. Respondents pointed out that their lack of business management skills and experience and knowledge about the business industry they operate in are also contributors to the challenges they face in setting up a business.

Infrastructure challenges during the create stages included difficulty in gathering the necessary resources to set up a business; difficulty in finding a suitable location for business; and difficulty in securing a location that included functional infrastructures such as electricity, security and telecommunication networks.

3.2.4 Prove: Test and refine the business operation

The main challenges facing the business in the prove stage cover a wider range. Respondents highlighted the key challenges within the prove stage include management (39%), financial (22%), infrastructure (17%) and market-related challenges (13%). In this stage, management challenges included the difficulty in recruiting skilled employees; their lack of management skills and management experience; as well as not being able to attend or not being aware of business workshops and training for sustaining the business. Financial challenges, in this stage, involved rejection from financial institutions, inadequate capital to set up the business and inadequate finances to employ a skilled labour force.

Respondents further outlined that market-related challenges mainly entailed trouble in finding customers; failing to meet customer demand and specified needs which in turn has led to a loss of clientele; high levels of competition; as well as a lack of knowledge resources and inexperience in sales, marketing and advertising (both their products and the business).

3.2.5 Operation: Full business operation, survival and growth

For the operational stage, management challenges (57%), financial challenges (22%) and market-related challenges (13%) were identified as a contributor to business failure. Similar to previous stages, respondents highlighted that the incorrect implementation and execution of business strategies and the lack of knowledge relating to the industry in which the business operates, hinder the growth and survival of the business. Other market-related challenges included their inability to identify opportunities in the market; the increasing levels of competition and the lack of communication and networking skills needed to build the overall business and increasing stakeholder engagement and participation.

Although social and economic challenges were not recognised as the most critical challenges faced in starting and running a small business, respondents found to experience social challenges within the create stage (4%) and the operational stage (4%). They noted that social challenges included corruption with the business industry; and lastly theft and crime within the location of the business as well as within operational aspects of the business. When considering the magnitude of the social problems in the areas where respondents' businesses operate, it is interesting that social challenges were rated as least important across all stages.

Economic challenges were indicated for the idea stages (6%) and the create stage (7%). These challenges related to the respondents' lack of knowledge on how to comply with legislation, how one should go about registering for VAT in addition to a lack of understanding of interest rates and taxation in South Africa.

Drawing from the results indicated in Table 5, the secondary objective (3) is reached as the challenges faced by small business entrepreneurs within each stage of the start-up lifecycle have been determined.

3.3 Entrepreneurship and business training

Respondents who had indicated that they have completed business-related training (see Table 3) were asked to specify the nature of business training they had completed. A majority of respondents (58%) indicated that they had completed introductory business training while 15% indicated that they had completed advanced business training. Only 12% of respondents indicated that they had completed formal business training that leads to a qualification. Table 6 below summarises the nature of business training the respondents had completed.

Table 6: Nature of business training completed

VARIABLES		F	%
Business training	Introductory business training - awareness	20	58
	Advanced business training	5	15
	Formal business training for qualification	4	12
	Other	5	15

Source: Own compilation from data analysis

A cross-tabulation, based on the chi-square test, was carried out to determine whether any association exists between respondents' sector and the nature of business training completed. The result of the chi-square test is reported in table 7 along with the results of the cross-tabulation.

Table 7: Cross-tabulation of sector and nature of business training completed

Business sector	N	Nature of business training			
		Introductory	Advanced	Formal	Other
Chi-square (p) = 0.577	34	20 (58%)	5 (15%)	4 (12%)	5 (15%)
Agriculture	9	8 (88%)	0	1 (12%)	0
Construction	7	4 (57%)	0	0	3 (43%)
Manufacturing	3	0	2 (67%)	1 (33%)	0
Transport	1	0	0	1 (100%)	0
Trade	3	2 (67%)	1 (33%)	0	0
Other	11	6 (55%)	2 (18%)	1 (9%)	2 (18%)

Source: Own compilation from data analysis

From Table 7 it is clear that a large majority of respondents (58%) have only completed introductory business training providing awareness on business while only 15% have completed advanced and other types of business training (also seen in table 2). 88% of the respondents from the agricultural sector had only completed introductory business training while only 1 (12%) respondent had completed formal business training that leads to a qualification. Respondents in this sector have not completed any advanced business training. Respondents from the construction sector completed introductory business training (57%) and other kinds of business training respectively. Respondents in this sector have completed no advanced or formal business training. Only 2 (67%) respondents in manufacturing have completed advanced business training while 1 (33%) has completed formal business training. Only 1 respondent in the transport sector has completed formal business training. Respondents in the trade sector have completed both introductory (67%) and advanced (33%) business training. Respondents who had indicated that they are from other sectors have either completed introductory business training (67%), advanced business training (18%) or other forms of business training (18%). Only 1 respondent indicated that they had completed formal business training. The Chi-square test determined whether an association exists between variables, resulting in no significant differences among the respondents' business sector (Chi-square (p) = 0.577) and the nature of business training completed by respondents.

Table 7 provides sufficient evidence of secondary objective 4: To investigate the relationship between small business owner-managers' business focus and the nature of business training they have completed if any.

4. Discussion and Conclusion

Mazzarol, Volery, Doss and Thein (1999) motioned that demographic factors such as age, gender, education and work experience have a considerable impact on entrepreneurial intention and venture success. However, the findings in this study demonstrate that respondents, regardless of their demographics, experience various challenges throughout the stages of the start-up lifecycle. Thus, this study supports the findings of Amidžić (2019:52) that demographics such as age are no barrier to entrepreneurship success.

Personal challenges refer to the entrepreneurial characteristics of respondents. These typically include being creative, innovative, ambitious, their ability to identify opportunities, calculated risk-taking, problem-solving, adaptable, decisive, a leader, a team player, tolerant of ambiguity and uncertainty, hardworking and persevering (Garg & Phaahla, 2018:55). Personal challenges were mostly experienced in the idea stage of the start-up lifecycle. These results confirm the argument made by Bird (1988) that at the business inception, the business outcomes such as its development, written plans, growth and change are based on the entrepreneurs' state of mind. One can expect that if the personal challenges are not adequately addressed at this initial stage of the start-up lifecycle, the success of other stages will also be negatively affected.

Management challenges played an increasingly significant role from the Create to the Operation stages of the start-up lifecycle. Managerial challenges include lack of marketing, financial and human resource management skills. The inability to formulate business plans and operational strategy also serve as indicators of a lack of managerial competencies. This can be attributed to the entrepreneur's education, managerial experience and entrepreneurial experience (Zarefard & Cho, 2018:5). This result confirms the findings of Henrico and Botes (2016:150) and Hutchinson and De Beer (2013:238) that small business entrepreneurs lack certain managerial skills and competencies necessary to operate their business successfully. The lack of business knowledge and managerial competency often contributes to an inability to access funding or managing the finances of business correctly.

Finances are a major concern for small business entrepreneurs (Karadag, 2015:30). As such, financial challenges were reported to have a negative impact on businesses across all stages of the start-up lifecycle. This finding corresponds to Garg and Phaahla (2018:54) who found financial challenges to be the main business start-up risk factor. Herrington et al. (2017:56) report in the Global Entrepreneurship Monitor that a lack of access to finance and poor profitability are among the chief reasons for business discontinuance in South Africa. Within the Plan and Create stages, financial challenges include poor financial planning and difficulty in obtaining funds or credit for the business. During the Prove and Operation stages, financial challenges include high production costs as the product is brought to market and high operating expenses and poor cash flow management.

To limit some of the challenges experienced by entrepreneurs throughout the stages of the start-up lifecycle, extensive and continuous entrepreneurship education and training is required. In the literature, education and training were pointed out as positive contributors to the management capacity of new businesses in South Africa. The lack thereof reduces management capacity which leads to a low level of entrepreneurial creation and the high failure rate of new businesses (Herrington et al., 2017:53). Findings in this study reveal that entrepreneurs mostly complete introductory training for business and entrepreneurship awareness failing to advance into deeper entrepreneurial and management knowledge. Findings also indicate that entrepreneurship and business training is imperative regardless of the industry and focus of the business. This finding is supported by Sarwoko and Frisdiantara (2016:39) who argue that the successful growth of a small business is often hindered by a lack of managerial and entrepreneurial competency regardless of the sector in which the business operates.

5. Recommendations and Managerial Implications

From the findings and discussion, this study proposes extensive entrepreneurship education and business training for small business owners as a means to mitigate the challenges entrepreneurs face throughout the stages of start-up lifecycle.

The education and training proposed should be formulated to help entrepreneurs and managers in identifying possible contributors to the key challenges facing the business at every start-up stage and how to overcome the contributors early. In other words, entrepreneurship education and business training should include risk assessment training during the Planning and Proving stages of the start-up lifecycle as well as risk management actions throughout the business Operation stage.

Entrepreneurship education and training should focus on developing business research skills, particularly as a way to curb challenges faced within the Ideation and Creation stages of the start-up lifecycle. In doing so, small business owners and entrepreneurs acquire the know-how on evaluating and refining the business idea and identifying corresponding opportunities and markets (including the demands of potential customers).

Additionally, entrepreneurship education and training with particular focus on bootstrapping as a financial strategy during the initial stages of the start-up lifecycle could reduce the entrepreneurs' reliance on corporate funding institutions to start the businesses as these are risk-averse and accompanied by high-interest rates. Thus, expanding and strengthening entrepreneurship education and business training with particular focus on the stages of the start-up lifecycle will assist in reducing the challenges within each stage and in essence improve the intellectual capacity of entrepreneurs and small business owners.

The findings reported in this article provide implications to both private and public sector by suggesting that these challenges should be mitigated through entrepreneurial education and training designed to prepare start-up owner-managers for the key challenges faced at every stage of small business development. The study assists policymakers in making better decisions about what entrepreneurial and managerial skills are needed to encourage successes in taking business ideas to market and in essence promoting a total early-stage entrepreneurial activity in South Africa.

Abstract

This paper focuses on the comparison of Hidden Champions in the United States of America (USA) and Germany using financial and non-financial Key Performance Indicators (KPIs). Two companies (NuVasive Inc., USA and Karl Storz SE & Co. KG, Germany) from the medical device industry were analysed and compared in terms of their success factors. The comparison of the two countries was important to understand the nature of their businesses in each country and also to determine the special characteristics of Hidden Champions in one country compared to the other country.

The research shows that American Hidden Champions are younger than those in Germany. This made it more difficult to compare because the companies are in different lifecycle stages. The study however still found that the Hidden Champions in both countries have a high export ratio as well as a high R&D expenses to revenue ratio in common. The data further showed that the Hidden Champions were affected by Covid-19, regardless of their location. It was also found that the managerial styles of Hidden Champions were heavily influenced by the culture and structure of the respective countries. The fact that an in-depth analysis of a limited number of companies was done complicated the conclusions on some of the KPIs. This paper can be used as a base to do further similar research on Hidden Champions in other industries within Germany and the US.

1. Introduction

The term Hidden Champions (HC) consists of two contradicting words “Hidden” and “Champion”: The question can in fact be asked: How can a company be a champion, but at the same time be hidden? Hidden Champions as a term had originally been used to describe unknown world market leaders in a niche by Hermann Simon in his German management journal in 1990 (Simon, 1990, pp. 875–890). Hidden Champions companies in Germany are responsible for 70% of all exports in the ‘Mittelstand’ of the German economy (Simon, 2015, p. 30). Therefore, comprehensive research was done about German Hidden Champions in Germany. We have however not been able to find in-depth research about Hidden Champions in the USA, although they have the second most Hidden Champions (Zitelmann, 2019) in the world. This discovery motivated the research for this paper namely to do research about companies in the same industry but with different KPIs and to analyze the difference in Hidden Champions between the two countries. The manufacturing healthcare device industry was selected as it is growing rapidly and is innovative, digital and future oriented (Ok/Wellner, 2019 I, II, III). Two companies were selected namely: NuVasive Inc. San Diego, USA and Karl Storz SE & Co. KG, Tuttlingen, Germany. Both are operating in the healthcare device industry and are world market leaders in their respective niches.

2. Problem Investigated

The main objective of the paper is to compare and provide an overview of the Hidden Champions' environments in these two countries – Germany and USA, by using company examples in the medical devices industry. Firstly an understanding of what Hidden Champions are should be provided for a better understanding of the problem to be investigated.

In the following sections, the paper discusses the market trends of Hidden Champions in terms of a global perspective, and for the two countries specifically. The KPIs to be used for analysis of the companies are also defined. Thereafter follows in-depth research about the two companies from the medical device industry. Finally, a comparison between the characteristics of Hidden Champions in the two countries is made. This can be deduced from the analysis of the two companies and the general market knowledge obtained.

3. Research Objectives

The main research objective of this paper is to compare the Hidden Champions from Germany and those from the US using financial KPIs and non-financial KPIs. This will identify special characteristics for the country specifics, and, furthermore, assist future Hidden Champions companies to become successful market leaders. Furthermore, an analysis of the medical device industry is provided not only for the two companies discussed, but also on a global level.

4. Hypotheses

The following hypothesis was formulated for the study, based on the existing knowledge of Hidden Champions market in Germany and the very scarce information of this segment in the US. The hypothesis is made that gaining a better understanding of the two markets could provide a better understanding of the reasons for the dominance of German Hidden Champions, in comparison to the US Hidden Champions.

5. Literature Review

The aim of the literature review is to expand the current understanding and knowledge on available literature, considering the two main topics: Hidden Champions and the Medical Technology Industry.

5.1. Hidden Champions

There has been for a very long period a shortage of available resources of information on Hidden Champions. Research on the topic has nevertheless been growing over the past years, overcoming this lack of information (Schenkenhofer, 2022). In his literature review of sources on Hidden Champions, Schenkenhofer summarizes previous research on Hidden Champions. He explained firstly the definition of Hidden Champions, starting with Simon, who not only defined them via using clear characteristics on the requirements of companies to be Hidden Champions, but also updated the study, based on changing market demands, leading to more competitors (Simon, 1990, 2009). Wellner further also identifies the different leadership styles of Hidden Champions (Okl/Wellner, 2019 I, II, III).

5.2. Medical technology industry

The importance of the health care sector for people's overall health and wellbeing is an important assumption in analysing this sector. Furthermore, according to Maresova et al (2015), the most important part of the health care sector is the medical technology industry. The medical technology industry therefore warrants further academic research and analyses.

6. Research Methodology

Relevant published books, online sources from company official websites, and published articles were used in the literature study for this paper. The research further uses mainly qualitative data, including existing sources on the problem investigated, as well as interviews with companies' representatives. Additional quantitative data is presented in a KPI analysis.

Furthermore, as the conclusions in this paper are mainly based on comparing two Hidden Champions in two countries, there were multiple key performance indicators (KPIs) identified. In the following subsection eight KPIs will be presented, along with their descriptions in two main categories: four financial and four non-financial KPIs.

Aside from the eight common KPIs, 2 KPIs will be chosen specific to the industry, since the important KPIs needed in the industry might vary. One will be financial KPIs and the other will be a non-financial KPI. Formulas used and the reasons of choice will now be further discussed.

6.1. Financial KPIs

As established, for the financial KPIs : Net Profit Margin, Equity Ratio, Operating Cash flow Margin and R&D Expense Ratio were chosen to evaluate the companies in a quantitative aspect.

Net Profit Margin Ratio

The formula for net profit margin ratio is as follows:

$$\text{Net profit margin} = \frac{\text{Net profit (Net income)}}{\text{Revenue}} \times 100$$

With the net profit margin ratio, we can assess the companies' productivity and ability to expand their target market, even with a negative net profit margin.

Operating Cash flow Margin

The formula for operating cash flow margin is as follows (Kenton, 2021):

$$\text{Operating Cashflow Margin} = \frac{\text{Cash Flow from Operations}}{\text{Revenue}} \times 100$$

Operating cash flow margin is another KPI that indicates the profitability of the company in terms of cash. The operating cash flow margin shows the cash earned by the operation and include amortization and depreciation, relevant to operation. A high operating cash flow margin is good for the company as it shows that the company is running efficiently.

Equity Ratio

The formula for equity ratio is as follows (Institute, Corporate Finance 2020):

$$\text{Equity ratio} = \frac{\text{Total Equity}}{\text{Total Asset}} \times 100$$

The equity ratio indicates how much debt the company has. A high equity ratio shows that the company is willing to keep the ownership of the business with their shareholders and not willing to accept external sources of the funding. A low equity ratio does not necessarily indicate that the company is struggling but can also mean that the company is trying to grow aggressively with debt (Marr, 2012). Based on the equity ratio, we can assess how willing the company is to take external funding and expand the business.

R&D Expense Ratio

The formula for R&D expense ratio is as follows (Y Charts, n.d.):

$$\text{R\&D expense ratio} = \frac{\text{Research and Development Expense}}{\text{Revenue}}$$

The R&D expense ratio shows how much the company spend on research and development in comparison to revenue. By looking at this KPIs, we are going to assess where the company seeks growth. It can be possible that the company is not spending on R&D, but rather on actively acquiring

smaller companies with new technology. Whether to invest heavily into the R&D or to acquire a new company can vary due to different managerial styles, which need to be analyzed.

6.2. Non-Financial KPIs

For the non-financial KPIs, we are more focused on qualitative analysis. Since available data on non-KPIs vary from company to company, these KPIs have broader definitions than the financial KPIs explained before.

The non-financial KPIs that will be used to analyze the Hidden Champions companies are Managerial style, Innovation Approach, Customer Relationships and Export Ratios.

Managerial Style

Managerial style can be defined by various aspects, but this paper is focusing on ownership structure, levels of organization and the employment process of employees and managers. By focusing on these topics, we can assess the impact of the company culture (Okl/Wellner, 2019 I, II, III).

Innovation Approach

Innovation of the company can be achieved through internal or external sources. Choosing organic growth or searching for external growth remain the respective companies' choice. Internal sources include active investment in R&D, compared to revenue. On the other hand, companies can seek growth from external sources, more costly, but also less risky, compared to R&D investments.

Customer Relationships

Customer relationship is the strategy utilized by the company to manage the channels to communicate to their retained customers or to introduce themselves to new customers.

Hidden Champions are not actively advertising to the public, therefore the marketing approach of the companies will be interesting to analyze. To show that their products are the best in the industry, Hidden Champions must have their products' quantitative or qualitative information.

Export Ratio

Export ratio is a quantitative KPI that shows how much revenue is derived from abroad. Hidden Champions base their revenue on the global market, and therefore has a high export quota of 61.5% (Simon, 2015). The export quota of the companies throughout the recent years will be analyzed with this KPI, and will determine how this influences the strategy of the company.

7. Results and Findings

As already mentioned, to gain understanding of the Hidden Champions market differences between the two countries we firstly need to clarify what a Hidden Champion is.

7.1. General Overviews on Hidden Champions

A company should meet the following requirements to be classified as a Hidden Champion:

1. The company should either be first, second or third in the global market, or must be first on its continent, in terms of market share. Should the company's exact market share, relative market share is used, or the market share information that is provided by the company is used.
2. The Revenue of the company should be below 5 billion US dollars.
3. The company should have low level of public awareness (Simon, 2009, p. 15).

As the market is growing, the upper bar of defining Hidden Champions has increased from 3 billion dollars in Simon's original paper to 5 billion dollars in a recent publication (Okl/Wellner, 2019 I, II, III).

When discussing Hidden Champions, it is important to note in which sectors they are mostly operating. According to Simon 69.1% of the Hidden Champions are operating in industrial goods,

followed by 20.1% in consumer goods and 10.8% are service providers. Many of the Hidden Champions are operating in engineering, electronics, metal processing and chemical sectors (Simon, 2009, pp. 20–21).

Looking from a financial perspective, Hidden Champions have an average of 434 million dollars revenue in 2009, which is three times higher than in Simon’s original 1999 study. Growing average revenue indicates rapid growth of the market (Wellner, 2018).

The most common characteristics of Hidden Champions are globalization, innovation, and profitability. As Hidden Champions are the market leaders, they do not limit themselves to domestic markets, but also target the global market. Export quota of Hidden Champions is on average 61.5%, which shows that the Hidden Champions are the driving force behind a country’s export ratio (Simon, 2015, p. 31). They also invest heavily in innovations and R&D. This often leads to technological innovations, allowing them to gain competitive advantage and focus on specific technology or niche markets with the finest technology (Simon, 2009). The most recent trends for Hidden Champions include an increase in merger and acquisition transactions from Chinese companies, due to the ability for Chinese companies to acquire a string market representative with advanced R&D resources (Wellner, 2018).

Lastly, as shown in Figure 1, the Germany and US hold the highest positions in the number of Hidden Champions worldwide (Zitelmann, 2019). The decision to focus on these two markets for this study, is therefore justified.

Figure 1: Number of Hidden Champions Global vs countries (Wellner, 2018)

7.1.1. Hidden Champions Market Trends in Germany

Germany is the country in the world with the largest numbers of Hidden Champions. More than 1300 of the World’s 2734 are headquartered in the country (Benz, Block & Johann, 2021).

German Hidden Champions have developed using Innovation/ Customization-based business strategies that focus on technological excellence in markets with few competitor companies, leading to world market leadership attained as a consequence of entering these niche markets (Schlepphorst, Schlömer-Laufen & Holz, 2016).

The factor specialization and continuous innovation of these companies have continued throughout the years, and most of the country’s hidden Champions remained owned by families. According to IFM (Automation made in Germany) definition, up to two natural persons or their family members (directly or indirectly) holding at least 50% of the shares of such companies. Amongst the Hidden Champions in Germany, this is the case in more than 62% of these companies, according to Schenkenhofer (2022). German Hidden Champions average the founding year at 1917, bringing up another important aspect of German HCs, which is the continuation of family traditions. (Rammer &

Spielkamp, 2019). More than just having financial goals, German HCs have more intrinsic goals that relate to the honor and inner sense of duty of the successors.

The distribution of the industries of German Hidden Champions is led by the mechanical engineering industry, with 33.15% of HCs, followed by the electrical engineering companies (10.94%), then automotive (9.17%), chemistry & pharmaceuticals (5.86%) and metal ware (4.53%). However, because of its niche market nature, over 84% of all German Hidden Champions are focused on B2B business and 70% of their revenue comes from exports. This illustrates another aspect of German HCs, namely how international focused these companies are. A niche strategy approach naturally involves intense internationalization for each market that exhibits a need for the product (Wellner 2018), as demand would just not be high enough if the company would stay only in its own country (Okf/Wellner, 2019 I, II, III).

It is interesting to point out that over two thirds of German Hidden Champions are located in rural areas (Schenkenhofer, 2022). The German states where most HCs are located, are Nordrhein-Westfalen, followed by Baden-Württemberg, then Bayern and Hessen (Benz, Block & Johann 2021). It has been proven that German Hidden Champions have had an excellent past success record and have a positive impact on the German Economy. The Covid-19 pandemic has however also exposed some of the shortcomings of these German companies and digitalization has now become a top priority for most of the Hidden Champions (Rietmann, 2021).

7.1.2. Hidden Champions Market Trends in the USA

The USA is the second largest country in the world with Hidden Champions. However, research on Hidden Champions in the US is not as active as in Germany. Research that was done analyzing 101 Hidden Champions located in the USA showed that out of 101 companies analyzed, 19.8% are located in California, followed by New York 12.9%, Texas 7.9%, Florida 6.9% (Hoffower, 2020). 35% of the Hidden Champions that is located in California are in the aerospace and defense industries. Most of the Hidden Champions in the US are operating in electrical equipment & parts (19.6%), followed by aerospace and defense (14.7%) and security & protection services (7.8%). Relatively new areas, such as security protection and services, and pollution treatment controls have added up to 13.6%. This shows that the Hidden Champions in the US are mostly interested in future focused industries.

The average operating years of Hidden Champions in the US is 21.2 years. Hidden Champions in the US are relatively new companies compared to those of rest of the world. Only 10.2% of the Hidden Champions have been operating for more than 50 years. An interesting fact is that 25.0% of the Hidden Champions have been operating less than 5 years (Refinitiv).

The average number of employees of these companies are 3,156. This number is higher than the world average of 2,037 (Simon, 2009, pp. 257–261). The average revenue of Hidden Champions in the US is 585 million dollars which is higher than the average revenue in the world. However, the average of the US is for the year of 2020, and we cannot therefore conclude that the Hidden Champions in US has higher revenue in general than the rest of the world.

Since most of the Hidden Champions base their revenues on exports, the shutting down of the countries due to Covid-19 had a negative impact on the revenue of the Hidden Champions resulting in them struggling to recover from this post-covid period. The American Hidden Champions showed that despite the global disturbance, the companies had the ability to manage their companies, resulting in a positive earnings before interest, taxation, depreciation and amortization (EBITDA).

7.2. Medical Device Industry

Having analysed the Hidden Champions market specifics worldwide and for the two countries analysed, now follows an overview of the medical device industry, as this is the focus industry of the two companies, and subsequently, of the paper. First, this sector will be briefly introduced to provide an overview. This is followed by a description and explanation of the selected sector specific KPIs.

After gaining understanding of the medical industry, the two companies, Karl Storz SE & Co. KG, Germany and NuVasive Inc., USA will be examined in detail.

7.2.1. Industry Overview

Medical technology is a global growth market characterized by a fast pace of innovation (Freiland, Phillipi & Yzer, 2020). Based on the Spectaris annual report (2021/22), the global market value for medical technology was \$446 bn in 2020 with the minimally invasive sector, owning the highest market share of 10.8%, followed by Cardiology (10.4%) and Orthopedics (8.5%). According to a conservative estimate, the global market for medical technology is expected to grow at an average annual growth rate of more than six percent, and is forecasted to reach a value of \$582 bn by 2025.

North America is the leading market for medical technology with a market share of 38.6% in 2020, followed by Asia and Pacific (27.4%) and Europe (25.7%) (*SPECTARIS Jahrbuch 2021-2022 2021/2022*). Seven out of ten MedTech companies with highest turnover are US companies (Freiland, Phillipi & Yzer, 2020). In addition, 6500 small and medium sized companies are in North America. Asia is the second largest market for medical technology after North America, leaving Europe behind. Several Asian countries, such as Singapore and China, are very open to innovations and are providing immense support for technical developments. Europe is the third largest market with 27,000 MedTech companies, out of which half are based in Germany, and are characterized as small and medium-sized businesses. In Europe, 650,000 people work for MedTech companies, out of which 210,000 are in Germany alone (Freiland, Phillipi & Yzer, 2020). Siemens Healthiness and Fresenius Medical Care are the German based companies with the highest turnover. A further three of the top ten companies worldwide are situated in Europe, being Philips, which is based in the Netherlands and Novartis and Roche in Switzerland.

Based on an analysis by Ernst & Young for the U.S. and European MedTech public companies, the industry revenue grew by 6.3% despite the global Covid-19 pandemic and supply chain disruptions of 2020 (Ernst & Young, 2021). The strongest performing segment is conglomerates with 10.2% growth. The seven best conglomerates (Fresenius, Danaher, Avantor, Abbott, Roche, Merck KGaA and Philips) boasted a revenue growth of at least \$ 1.5 bn in spite of the decline in investment in technologies resulting from COVID-19. Seven of the ten pure-play MedTech's had a declining revenue due to the impact of COVID-19. Medtronic, Siemens Healthineers and Edwards Lifesciences did however not experience this decline. (Ernst & Young, 2021). The MedTech industry heavily invests in R&D. Eight of the top ten performing companies allocated more capital to R&D than to shareholder return, suggesting a readiness to invest in organic growth rather than seeking acquisitions. Pure-play MedTech's reinvested heavily in R&D in 2020, recording the largest annual growth rate in R&D spending (+17.2%). This signals the industry's confidence in its ability to keep innovating. The MedTech companies employed around 878,900 people in 2020, which is 4.6% higher than in 2019. Pure-play MedTechs' net income fell from \$24 bn to \$20 bn due to COVID-19's impact.

7.2.2. Sector Specific KPIs

In addition to the eight general KPIs presented and explained in the Research Methodology section, three more sector specific KPIs exist for the medical sector. These are the financial KPIs, sales & marketing ratio and inventory turnover. The employer rating was also selected as a non-financial KPI. These sector specific KPIs were selected as they are particularly important to the medical sector and allow for a good comparison of companies from these sectors.

Sales and Marketing Ratio

The formula for sales & marketing ratio is as follows:

$$\text{Sales \& Marketing Ratio} = \frac{\text{Distribution Costs}}{\text{Revenue}} \times 100$$

The sales & marketing ratio allows a comparison of sales expenses in relation to revenues. In the case of companies in the medical sector, sales expenses generally consist mainly of the cost of distribution

of products, marketing expenses and commission payments. A high sales and marketing ratio indicates that a company spends a lot of money to make sales. On the other hand, a low ratio shows fewer costs incurred when selling products. A low sales & marketing ratio is therefore preferable (Kenton, 2021).

Inventory Turnover

The formula for inventory turnover ratio is as follows:

$$\text{Inventory Turnover} = \frac{\text{Cost of Goods Sold}}{\text{Average Inventory}}$$

Inventory turnover is a key figure for measuring the inventory turnover rate. For this purpose, the cost of goods sold is divided by the average inventory level. This indicator is normally important to manufacturing companies, as high inventories can be a decisive cost factor. A high inventory turnover rate means that the goods and finished products in the warehouse are processed and sold relatively quickly. A low inventory turnover rate means it takes more time for the warehouses to be emptied. This is often associated with higher storage and transportation costs. Therefore, companies usually prefer a high inventory turnover rate (Hai, 2019, pp 13–14).

Employer Rating

No formula is used to determine an employer rating. Instead, job rating platforms are used to analyze how popular the specific company is amongst its employees. The non-financial KPI employer rating determines how successful companies are in attracting new employees.

7.3. Companies Research

As previously mentioned, the two companies to be discussed as a base for comparison between the two markets are Karl Storz SE & Co. KG and NuVasive Inc., and are both from the medical sector. In the next two subsections brief company overviews, along with a detailed analysis on the companies' business models, according to the already established KPIs, will be presented. Following the two companies' respective descriptions, a company comparison, according to the KPIs is presented. Finally, a joint analysis of the medical device industry is created, based on the results of the companies' analysis.

7.3.1. Karl Storz SE & Co. KG, Tuttlingen, Baden Württemberg, Germany

The first company to be analysed will be presented with a brief company overview, followed by the KPI analysis, revealing distinctive characteristics of Hidden Champions situated in Germany.

a) Company Overview

The company Karl Storz SE & Co. KG, based in Tuttlingen, Baden-Württemberg Germany and founded in 1945, is a family-owned company producing and selling medical instruments and devices. This medical technology manufacturer is the world market leader in human medicine instruments for minimally invasive surgery and rigid endoscopes for the examination of body cavities, and is also one of the leading manufacturers in the industrial endoscopy business segment (Bauer, 2011).

Surgical mechanic Karl Storz founded the company right after the end of World War Two. It initially manufactured mainly instruments and lamps for ear, nose and throat medicine. Following consistent growth of the company during the 1960s, the first subsidiary in the USA, Karl Storz Endoscopy-America Inc. was founded in 1971 (Karl Storz SE & Co. KG, Unser Weg, 2022).

Nowadays the Karl Storz Group is a company interacting globally, boasting more than 50 local branches or subsidiaries in more than 40 countries worldwide. The Karl Storz Group focuses on the European market where most of its branches are situated. Other important markets for this group are North America and Asia (Karl Storz SE & Co. KG, 2020).

Tuttlingen in the Southwest of Germany in the state Baden Württemberg where the company is situated had been renowned for the manufacturing and trade of medical technology products since the 19th century. Today, a medical technology cluster extends far beyond the city of Tuttlingen and roughly 450 companies is part of the Medical Mountain Cluster, the biggest medical device cluster worldwide (Medical Mountains, 2022). In Tuttlingen, more than 400 companies are attributed to the cluster (Nadvi & Halder, 2005). The vast majority of these companies employ less than 20 people, whilst the largest provide work for around 3,600 people at the Tuttlingen site alone. Karl Storz SE & Co KG is considered one of the largest Tuttlingen based companies. Tuttlingen is considered the biggest medical cluster in Germany (Mauch, 2017, pp 5–9).

b) Key Products

Karl Storz SE & Co. KG mainly operates within the human medicine, veterinary and industrial sectors. The human medicine sector deliver more than 98% of the entire group's revenues. Therefore, this division is the most important for the company. The key segment within the human medicine sector is the production and distribution of endoscopes for various surgeries and medical examinations. In addition to human medicine, Karl Storz Group also offers endoscopic systems for veterinary medicine and technical application areas such as aviation, automotive engineering and traffic, power generation, process industry, safety and infrastructure (Karl Storz SE & Co. KG, 2020, p 21).

Another interesting field in which Karl Storz Group operates is neurosurgery. Neurosurgery is a specialty of Karl Storz Group that is continuously and rapidly evolving and thus often plays a pioneering role regarding new technologies in the neurological segment (Nikova & Birbilis, 2017, pp 297–300).

Another strong-selling product is the fully integrated operating room 'OR1' that can be expanded on a module basis. This product enables Karl Storz to sell not only individual medical instruments, but also a complete operating room as a platform for its own core products. The focus is on improving workflows, ergonomic and efficient workplace design, and future-proof technologies (Karl Storz SE & Co. KG, OR1, 2022).

c) Financial KPIs

The financial KPIs of Karl Storz SE & Co. KG will now be examined and analyzed in more detail. To ensure a good informative value of the key figures, they should be considered over a longer period. A short-term view would fail to recognize earlier years' data or once off effects. As of 17 June 2022, no financial data for the year 2021 has been published by Karl Storz SE & Co. KG. The annual reports with financial data from 31.12.2020 are therefore the most recent (Bundesanzeiger, 2022).

Net Profit Margin

Return on sales is an important key indicator for managing operating success for the Karl Storz Group. To gain a better understanding of this key performance indicator, the following figure illustrates the total sales and earnings developments for the period from 2009 until 2020.

Figure 2: Revenue and Net Income Development (Karl Storz SE & Co. KG, 2020)

In terms of net income, 2020 was the company's most successful year to date, with earnings of €155 million (Karl Storz SE & Co. KG, 2020). During the Covid 19 crisis, the Karl Storz Group fully compensated for this decline in sales and increased earnings through short-time work and cost savings (Schwäbische Zeitung, 2020). Karl Storz Group expects Covid-19-related make-up effects and thus rising sales worldwide in 2021 and 2022. The Karl Storz Group expects to catch up on the negative effect of the Covid-19 pandemic by a worldwide rise in sales in 2021 and 2022. This should also be reflected in an increased net profit margin (Karl Storz SE & Co. KG, 2020).

Operating Cash flow margin

The Karl Storz Group's operating cash flow margin is an important key figure for managing operating success. To gain a better understanding of this key performance indicator, the following table illustrates the development of the total amount of operating cash flow generated, as well as the performance of the operating cash flow margin for the period between 2015 and 2020.

Table 1: Operating Cash flow Margin Development Karl Stolz SE & Co. KG

Million EUR	2015	2016	2017	2018	2019	2020
Operating Cash flow	106	150	165	130	194	182
<i>Growth YoY</i>	-	41.5%	10.0%	-21.2%	49.2%	-4.1%
Total Revenue	1,477	1,574	1,643	1,710	1,896	1,763
Operat. CF Margin	7.2%	9.5%	10.0%	7.6%	10.2%	10.3%
<i>Growth YoY</i>	-	18.1%	5.3%	-24.0%	34.2%	1.0%

Source: Own compilation, based on Karl Stolz SE & Co, 2020.

The operating cash flow margin generally developed positively from 2015 to 2020. While it was still 7.2% in 2015, it rose to 10.3% by 2020. This increase corresponds to a growth of 43.1%. However, the operating cash flow margin development was also subject to considerable fluctuations. This is due to changes in the operating cash flow (Karl Storz SE & Co. KG, 2020).

Equity Ratio

Karl Storz SE & Co. KG is characterized by a high equity ratio of 44.6% (as of 2020). This is due to the particular ownership structure. The Storz family is still the sole owner of the group, which means that the company's links to the capital markets are weak. Consequently, investments are made through bank loans, promissory note loans or equity (Karl Storz SE & Co. KG, 2020). The development of the equity ratio from 2015 until 2020 is shown in the table below. The growth rates of the balance sheet volume and equity are also shown.

Table 2: Equity Ratio Development Karl Stolz SE & Co. KG

Million EUR	2015	2016	2017	2018	2019	2020
Total Assets	1,124	1,200	1,338	1,498	1,624	1,652
<i>Growth YoY</i>	7.7%	6,8%	11.5%	12.0%	8.4%	1.7%
Equity	450	537	560	663	748	738
<i>Growth YoY</i>	6.4%	19.3%	4.3%	18.4%	12.8%	-1.4%
Debt	674	663	778	835	876	914
Equity Ratio	40.0%	44.8%	41.9%	44.3%	46.0%	44.6%

Source: Own compilation, based on Karl Stolz SE & Co, 2020.

The total assets of the Karl Storz Group increased since 2015 at an average growth rate of 8.0%. As seen in the sales development, the development of total assets also suffered from the Covid-19 pandemic. Total assets increased by 1.7% only from 2019 until 2020 (Karl Storz SE & Co. KG, 2020).

R&D Ratio

The Karl Storz Group is a technology-oriented company that primarily researches technologies developed independently, within a group of companies, or on behalf of others. In a constantly developing world market characterized by the progress of minimally invasive medical technologies combined with new methods of electronic image acquisition and processing, the Karl Storz Group has focused on developing new therapeutic and diagnostic products. Against this background, research and development are central corporate areas for the company. In the following table, the research and development expenses for the latest years are shown (Karl Storz SE & Co. KG, 2020).

Table 3: Research & Development Ratio of Karl Stolz SE & Co. KG 2015-2020

Million EUR	2015	2016	2017	2018	2019	2020
R&D Expenses	90	85	90	95	103	120
<i>Growth YoY</i>	36.3%	-5.6%	5.9%	5.6%	8.4%	16.5%
Total Revenue	1,477	1,574	1,643	1,710	1,896	1,763
R&D Ratio	6.1%	5.4%	5.5%	5.5%	5.5%	6.8%

Source: Own compilation, based on Karl Stolz SE & Co., 2020.

Research and development expenses have been rising continuously since 2015. In 2015 this expenditure was still € 90 million, but increased to € 120 million during the Covid year 2020. This shows the enormous importance of investments in research and development for Karl Storz Group (Karl Storz SE & Co. KG, 2020). In 2020, expenditure was primarily related to the implementation of the European Medical Device Regulation. This regulation, which was to be implemented by 2021, will lead to significant additional expenses for the approval and development of medical products. Karl Storz Group expects future additional expenses to increase into the double-digit million range (Knieps, 2021).

Sales & Marketing Ratio

The Karl Storz Group maintains its own sales and marketing companies in the most important international countries and regions. In some parts of the world, the Karl Storz Group also cooperates with licensees and agents. The sales and marketing ratio is the first of two sector specific KPIs for the medical industry. The following table shows the development of distribution costs incurred and the corresponding sales & marketing ratio (Karl Storz SE & Co. KG, 2020).

Table 4: Sales and Marketing Ratio of Karl Storz SE & Co. KG 2015-2020

Million EUR	2015	2016	2017	2018	2019	2020
Distribution Costs	475	488	491	512	566	480
Growth YoY	13.9%	2.7%	0.6%	4.3%	10.5%	-15.2%
Total Revenue	1,477	1,574	1,643	1,710	1,896	1,763
S&M Ratio	32.2%	31.0%	29.9%	29.9%	29.8%	27.2%

Source: Own compilation, based on Karl Storz SE & Co., 2020.

The above table 4 shows increasing sales expenses, in line with increased sales, for the period 2015 until 2019. Distribution costs increased from €475 million in 2015 to €566 million in 2019. The sales and marketing ratio decreased from 32.2% to 29.8% for the same period. This means that sales increased more than distribution costs during this period. The sales costs decreased disproportionately due to the Covid-19 pandemic in 2020. Consequently, the sales and marketing ratio also decreased to a value of 27.2%. This indicates that the Karl Storz Group managed to keep distribution costs so low during the crisis that the sales and marketing ratio improved (Karl Storz SE & Co. KG, 2020).

Inventory Turnover

The second sector specific KPI for the medical sector is inventory turnover. Karl Storz is operating in the manufacturing business sector where correct inventory levels are paramount to be able to produce enough products when they are required. As described previously, the inventory turnover ratio is calculated by dividing the cost of goods sold by the average inventory. In the case of Karl Storz, this results in an inventory turnover ratio of between 2.2 and 2.7. It is significant to note that the inventory turnover continuously increased from 2015 until 2019. This indicates that finished products had been sold increasingly fast. Inventory turnover declined for the first time in 2020 as a result of the challenges posed by the pandemic. The Karl Storz Group had to contend with falling sales and slumping demand during this time. Due to catch-up effects, the inventory turnover ratio is expected to increase again for 2021 and 2022 (Karl Storz SE & Co. KG, 2020).

d) Non-financial KPIs

This section analyses the selected non-financial KPIs. The non-financial KPI 'employer rating' was selected as a sector specific KPI and is therefore only of particular importance to the two medical technology companies.

Managerial Style

Karl Storz SE & Co. KG is a German family-owned company. The company's transformation into the current legal form of SE & Co. KG took place in 2015. The company still had the German legal form of a GmbH & Co. KG before 2015. The owners of the general partner, Karl Storz Verwaltungs SE and Karl Storz SE & Co. KG, are all descended from the Storz family (Karl Storz SE & Co. KG, 2020). Karl-Christian Storz has been the sole managing director of Karl Storz SE & Co. KG since January 2019. The family business thus continues the tradition in the third generation, and is supported by an eight-member Executive Management Team. Critical decisions are in essence still made by the family Storz (Karl Storz SE & Co. KG Annual Report, 2020, p.21). This family run ownership structure also leads to corresponding organizational structures. Employees consider the hierarchies to be relatively rigid. The company is furthermore considered to be more traditional and conservative, and less innovative and agile than other companies in the medical sector (Kununu, 2022). The Karl Storz Group considers employees' training and further education in particular of importance. There are currently 24 training and study programs run for young professionals alone.

The Karl Storz Group currently boasts around 200 trainees inside these programs (Karl Storz SE & Co. KG, Ausbildung, 2022).

Innovation Approach

Two inventions, above all others, gave endoscopy an unimagined boost in the second half of the 20th century. These two inventions, namely the cold light source and the Hopkins rod lens optics are closely associated with the name Karl Storz. The Karl Storz Group has accompanied this revolutionary developments, which is still ongoing. (Karl Storz SE & Co. KG, Unser Weg, 2022).

The Karl Storz Group also resorts to acquisitions of competitors to gain a foothold in new business areas. The 'Gastroenterology' business unit was for example acquired from Xion GmbH in 2003 (Xion GmbH, 2022). Through such strategic acquisitions, the Karl Storz Group secures know-how and important patents. From an entrepreneurial point of view, such decisions raise the question of whether an acquisition or an in-house development would be more advantageous. The answer to this question will depend on the case for the Karl Storz Group. The Karl Storz Group also regularly receives awards for innovative strength in developing new types of endoscopic instruments. An example of these includes the HYDOME duodenoscopy system, which received the Red Dot Award in the category 'Product Design' in 2019 (Müller, 2019, p 64). The Karl Storz Group also won the German Innovation Award for the video laryngoscope in 2017. This is used in emergency medicine for difficult-to-access airways and saves lives (Der Deutsche Innovationspreis, 2017).

Customer Relationship

A large part of the worldwide sales companies belongs directly to the Karl Storz Group as subsidiaries. The only activities in niche markets are sales made via external partners or joint ventures. Customer relations and customer satisfaction are cornerstones of a successful sales concept for the Karl Storz Group (Karl Storz SE & Co. KG, 2020). One way of measuring customer satisfaction is the NPS. To determine the NPS, customers are asked how likely they would recommend these products from Karl Storz to others. A score is calculated based on the answers. This score lies in a range from -100 to 100. The Karl Storz Group has a current NPS score of 28. This score shows that most customers, in this case, 55%, would recommend Karl Storz products. 27% of customers would not recommend the products, and 18% are undecided (Comparably, 2022).

Export Ratio

The business strategy of Karl Storz SE & Co. KG is very internationally focused. The company maintains subsidiaries on all major continents and has production facilities in Europe and the USA. This is also reflected in the geographical distribution of sales. Sales on the North American continent accounted for nearly 42% of total company sales in 2020. This means that the USA and Canada represent the most important markets for the Karl Storz Group. The European market is of particular importance as the Karl Storz Group generates around 32% of its sales here. 8.1% of European sales was generated in Germany in 2020. Thus, the German domestic market accounts for only a small part of the company's sales. The rest of the world accounts for 26% of sales. This includes important sales markets in Russia and South-East Asia (Karl Storz SE & Co. KG, 2020, p.12). Consequently, the Karl Storz group has a high export ratio. This has been relatively constant at around 92% from 2015 until 2020. The high export ratio has grown historically due to the global market leadership in the field of endoscopes. Such a high export ratio also offers the opportunity to benefit from the current global boom in the healthcare industry. Exchange rate fluctuations and crises in export countries on the other hand can lead to future sales losses (Karl Storz SE & Co. KG, 2020).

Employer Rating

Well-trained specialists and employees are key factors for to the success of a company. Due to a shortage of skilled workers, the market power of employees has increased in recent years. Companies must therefore compete more intensively for new employees and make the workplace more attractive for them. The Karl Storz Group has also recognized this and offers certain additional company benefits in addition to a normal salary. According to the Kununu website, the following benefits are offered to employees by the Karl Storz Group: access to company doctors, flexible working hours, a

company pension plan, a company cell phone, a home office, a cafeteria and childcare (Kununu, 2022). Employees negatively noted the lack of a works council and the suppression of elections for one (Wiesenberger, 2017).

A survey on the Glassdoor website provides initial indications of how satisfied Karl Storz Group employees are with their employer. A total of 446 people were asked whether they would recommend their employer to a friend and 73% of the participants answered in the affirmative. They were also asked whether they agreed with the current chief executive officer. This was answered in the affirmative by 69% of the participants. Most employees are therefore overall satisfied with their job and the company's management (Glassdoor, 2022). A second survey from the website comparably also asked whether employees would recommend the employer to a friend and 64% of respondents agree. On the other hand, 27% of the respondents would not recommend the Karl Storz Group as an employer to a friend. This leads to an Employee Net Promoter Score of 37 (Comparably, 2022). In summary, the Karl Storz Group is a rather popular employer. In both surveys, a clear majority of respondents were prepared to make a recommendation.

7.3.2. NuVasive Inc. San Diego, California, USA

NuVasive Inc. is the second company operating in the medical technology sector which will be discussed in this section. The section comprises a brief company overview, followed by the introduction of main products of the company and thereafter the key financial and non-financial indicators will be analyzed.

a) Company Overview

NuVasive Inc. (NUVA) was founded in 1997 and is based in California, USA. It is a global medical technology company focused on developing, manufacturing, selling, and providing solutions for minimally invasive spine surgery (MISS) (NuVasive Annual Reports, 2015-2021). The company not only supplies products, but also enable technology with the products to offer a comprehensive solution for spine surgery.

NuVasive is an American Hidden Champion according to criteria cited by Hermann Simon. The criteria show it is the second-largest global leader in the minimally invasive spinal implant market after Medtronic Inc. NuVasive has a revenue of less than \$5 billion (\$1.1 billion revenue in 2021), and offers unique products and services (Simon, 2022). The company is serving patients, surgeons, and healthcare providers with its innovative products in more than 50 countries (NuVasive Annual Reports, 2015-2021). As of 2021, 2400 employees of NuVasive are in the U.S., and 500 employees are located outside the U.S., primarily throughout Europe and Asia. The primary corporate offices are in Broomfield, Colorado and San Diego, California in the United States and the international headquarter is in Amsterdam, the Netherlands.

Competition within the industry is based on technology, innovation, quality, reputation, and customer service (NuVasive Annual Reports, 2015-2021). In core spine business, NuVasive faces competition from Medtronic, DePuy/Synthes, a Johnson & Johnson company, Stryker Spine, Globus Medical, and Zimmer Biomet Spine, which together represent a significant portion of the spine market. A few small competitors with more limited product offerings and geographic reach are Orthofix International, Alphatec Holdings, SeaSpine Holdings, and others. Despite the COVID-19 pandemic and supply chain crisis, the company continued developing innovative products for less-invasive surgery, continued to invest in research and development, and provide training to surgeons in both live and virtual settings (NuVasive Annual Reports, 2015-2021).

b) Key Products

NuVasive mainly provides spine surgery solutions which allows surgeons to perform less invasive spine surgeries from various approaches which cause less tissue disruption of the spine (NuVasive Annual Reports, 2015-2021). In addition, the company also supplies specialized orthopedics products. More complementary products by NuVasive are products for implants and fixation systems (NuVasive Annual Reports, 2015-2021). These implant products are available in a variety of shapes,

sizes, and options to accommodate specific approaches during surgery. NuVasive’s long-term business strategy is oriented towards providing innovative solutions for less invasive spine surgery by a continual flow of new products and procedures to fulfill unmet clinical needs. This distinguishes them from traditional spine implant companies. In 2021, the company had issued 1700 pending patents worldwide, including over 730 U.S. issued patents and 400 trademark registrations in both domestic and foreign regions (NuVasive Annual Reports, 2015-2021).

c) Financial KPIs

In this chapter, the financial overview and the five key financial KPIs for NuVasive Inc. will be discussed. The key KPIs considered are assumed to give the long-term view. The data is taken from the company’s annual report for the period of 7 years; from 2015 until 2021.

Financial Overview

For a better understanding, the table below illustrates the development of the key figures for the period between 2015 and 2021.

Table 5: Financial Overview NuVasive 2015-2021

Million \$	2015	2016	2017	2018	2019	2020	2021
Revenues	811	962	1.026	1.101	1.168	1.051	1.139
Growth	6%	19%	7%	7%	6%	-10%	8%
Gross Profit	617	722	761	791	856	729	817
Gross Margin	76%	75%	74%	72%	73%	69%	72%
EBITDA	152	166	162	105	174	90	45
EBITDA Margin	19%	17%	16%	10%	15%	9%	4%
EBIT	139	124	114	54	123	38	-12
Operating Margin	17%	13%	11%	5%	11%	4%	-1%
Net Income	66	37	82	12	65	-37	66
Net Margin	8%	4%	8%	1%	6%	-4%	6%

Source: Own compilation, based on NuVasive Annual Reports, 2015-2021.

NuVasive’s revenue has been increasing steadily over the past seven financial years, except for 2020, resulting from the COVID-19 effect on surgery volumes. (NuVasive Annual Reports, 2015-2021). Calculating gross profit margin, cost of goods sold (COGS) which consists primarily of purchased goods, raw materials, labor and overhead costs, inventory-related costs and royalty expenses, and the cost of providing IOM services, which includes personnel and physician oversight costs, is accounted. The trend for EBITDA margin is decreasing as the company is incurring the cost of sales and marketing expenses, research, and development expenses and business transition cost (costs related to acquisitions) to provide continual flow of innovative solutions. The trend for operating margin is also decreasing as company has depreciation and amortization expenses for tangible assets such as property, plant and equipment, buildings etc. and for intangible assets such as software’s, patents, trademarks, and tradenames. The operating margin was 17% in 2015 to -1% in 2021. The net profit margin will be discussed in detail in the next section with the five key financial KPIs.

Net Profit Margin

From the Financial Overview Table 5 it can be seen that positive and growing revenue has been observed for NuVasive, except during 2020, when the revenue went down from 1.16 billion to \$1.05 billion due to reduction in surgeries because of the COVID-19 pandemic (NuVasive Annual Reports, 2015-2021). The company also experienced unfavorable pricing impacts during 2020. The trend for net income is fluctuating, yet positive, except for the years 2020 and 2021, due to the impact of COVID-19. The fluctuating trend is observed as the company invests in growth and innovative solutions by spending more on research and development and doing mergers and acquisitions.

Operating Cash flow Margin

The operating cash flow of NuVasive increased from \$ 89 million in 2015 to \$ 219 million during 2019 (NuVasive Annual Reports, 2015-2021). This is due to a higher net income in years 2017 and 2019, and non-cash expenses (depreciation and amortization) and inventories being less for the years 2015, 2016 and 2019. The operating cash flow however declined in 2020 and 2021, because of a lower net income due to more research and development (R&D) expenditure, selling and marketing expenses and the revenue generally being lower due to the COVID-19 impact. The operating cash flow margin also developed positively and continuously rose from 11% in 2015 to 20% in 2019 (NuVasive Annual Reports, 2015-2021).

Equity Ratio

NuVasive is a company listed on the NASDAQ. The shareholder structure is divided into multiple equity shareholders. The Vanguard Group Inc. has the highest share of 9.43% followed by Capital Research & Management Co with 5.62% and Hartford Investment Management Co. with 5.11%.

Table 6: Equity Ratio NuVasive 2015-2021

Million \$	2015	2016	2017	2018	2019	2020	2021
Total Assets	1,302	1,570	1,640	1,707	1,885	2,693	2,154
Growth YoY	-3%	21%	4%	4%	10%	43%	-20%
Equity	718	700	799	834	915	918	795
Growth YoY	11%	-3%	14%	4%	10%	0,33%	-13%
Debt	584	870	841	873	970	1,775	1,359
Equity Ratio	55%	45%	49%	49%	49%	34%	37%

Source: Own compilation, based on NuVasive Annual Reports, 2015-2021.

As it can be seen from the table above, equity grew at an average growth rate of 3%. In 2015, equity amounted to \$ 718 million, leading to an equity ratio of 55% (NuVasive Annual Reports, 2015-2021). The ratio decreased to 34% with equity of \$ 918 million by 2020, as the company issued new senior convertible notes. The ratio increased again in 2021 to 37% with equity at \$ 795 million, while the company settled the outstanding payments for older convertible notes. NuVasive's equity ratio is in line with the market standards, which is at 51% (Yahoo Finance, 2021).

R&D Ratio

The trend for R&D ratio has continuously been increasing from 2015 until 2021. This ratio was at 4% in 2015 with \$ 36 million spent on R&D, going up to 8% in 2021 with \$ 93 million spent on R&D (NuVasive Annual Reports, 2015-2021). According to most recent reporting the company spent 14% on average on R&D costs. The company is spending on its employees, new products and further development of products acquired in M&A process. Despite COVID-19, NuVasive stayed committed to investments in research and development to further advance their leadership position in the spine surgery.

Sales & Marketing Ratio

The below shown figure 3 shows the development of sales and distribution costs incurred out of revenue:

Figure 3: Selling and Marketing Ratio NuVasive (NuVasive Annual Reports, 2015-2021)

It can be observed that the selling and marketing expenses are above 50% for all years from 2015 until 2021. The trend is fluctuating, starting from 56% in 2015, then 55% in 2016 and 53% in 2017, as sales increased stronger than S&M costs. In 2020, the S&M growth is negative due to the impact of COVID-19. The company has however increased selling and marketing expenditure with an average of 4% during 2021, to meet the needs of the market.

Inventory Turnover Ratio

Inventory turnover ratio is the second sector specific KPI selected for the medical sector. It is important for NuVasive to maintain its inventory levels and the speed at which inventory can be moved to meet surgeons' and patients' needs. Their inventory turnover ratio is between 1.21x in 2015 and 1.05x in 2021 (NuVasive Annual Reports, 2015-2021). The average inventory turnover ratio is 1.15x, which is less than the average ratio of 2.2x for the healthcare sector (Finbox, 2022). Overall, the ratio is fluctuating with a higher ratio in 2016 at 1.28x, and going down in 2017 to 1.18x. This is reflected by COGS and inventory as in 2016; the inventory had increased comparatively less than COGS, which led to a higher ratio. Since 2019 the ratio has been quite low, compared to relatively higher inventory in comparison with COGS with 1.07x and 1.05x in 2019, 2020 and 2021 respectively. The company should be able to catch up from 2022 onwards.

d) Non-financial KPIs

In the following section, the five key non-financial KPIs will be illustrated. The main statistics for NuVasive will be shown for the period of 7 years, from 2015 until 2021 to gain a better understanding thereof.

Managerial Style

NuVasive is a privately owned company and has a hierarchical organizational structure with a chairman, independent directors and chief executive officers (CEO) as members of the board.

As of 2021, NuVasive has 2900 employees worldwide, of which 2400 are in the U.S. and 500 employees are located outside the U.S., primarily in Europe and Asia (NuVasive Inc., 2021). 41% of employees are female and 59% male. In the U.S. none of their employees is represented by a labor union. The employees in their sole owned subsidiary in Europe, NuVasive Netherlands B.V., are

however covered by the Works Council. The company launched Women in Spine (WIS): their employee resource group focused on global diversity (NuVasive Women in Spine WIS, 2021).

The company's employee resource groups aim to raise awareness of the importance of diversity, inclusion, and engagement while providing professional development opportunities for women and employees of all genders, ethnicities and minority groups, backgrounds, experience levels, and locations. Creating a more diverse and inclusive workforce, the company began to monitor voluntarily disclosed diversity data to review hiring, promotion and attrition in the company overall, and at departmental level.

Innovation Approach

As the leader in spine technology innovation NuVasive is devoted to outcome-driven innovation that benefits their surgeons, providers, and, most importantly, patients. The innovative products in anterior, posterior, and cervical spine surgery—and enabling technology—is helping the company deliver near- and long-term growth. The company continued to invest in procedurally integrated technologies in less invasive spine surgery affording surgeons the flexibility to treat any patient pathology—all from NuVasive.

Customer Relationship

NuVasive customers are surgeons, patients, and hospitals. As customer relationship and satisfaction are important to NuVasive, the company created an application to keep in touch with their patients after surgery. This enables them to maintain customer relationships and at the same time assists surgeons with a quick check up on their patients post-surgery. The SpineTRACK registry (NuVasive® SpineTRACK Registry, 2022) is a data collection platform that captures important patient-reported and clinical outcomes of patients with spine illness to improve quality and delivery.

The net promoter score (NPS) for NuVasive is considered to assess customer satisfaction. Customers are asked how they would recommend the products from NuVasive to others, and the customer experience score is calculated from these answers (Comparably - Net Promoter Score, 2022).

The customers fall into three categories, being promoters, passives, and detractors, based on their responses. NuVasive has an overall score of 31, with the majority being promoters. This means that 54% of the customers would recommend NuVasive's products, followed by 23% who would not recommend their products, and 23% who are indecisive (Comparably - Net Promoter Score, 2022).

Export Ratio

NuVasive also has an international market focus. The company operates internationally in Europe, Asia-Pacific, and Latin American markets. Their global footprint covers over 25 locations around the world, including manufacturing facilities and cadaver-labs.

The international sales of the company had continuously been growing from 2015 (\$ 105 million) until 2019 (\$ 236 million), but fell in 2020 (\$ 234 million) due to COVID-19's effect on volumes of sales in spinal hardware and surgical support segments. The company sales in international business rose in 2021 to \$ 262 million as they are recovering from the previous decline.

Figure 4: Export Ratio NuVasive (Own compilation, based on NuVasive Annual Report, 2015-2021)

In the figure above the development of export ratio for the years 2015 until 2021 is illustrated. The trend for export ratio has continuously been rising from 2015 to 2021, as the company is expanding internationally. The company is investing to tailor their products and technologies to meet various international patient, surgeon, and market requirements.

Employer Rating

Employer rating is taken as the sector specific non-financial KPI. Employee satisfaction is considered to determine the rating of the company from the employees’ perspective. In this section the reviews from various employer rating platforms are gathered– Comparably and Glassdoor.

According to the employees rating for culture as a factor, the rating given to the company on the Comparably platform is B-, with 3.7 stars out of a possible 5 stars (Comparably- Culture Assessment, 2022). Employees overall gave 80% positive reviews about NuVasive and 20% of reviews reflected employees who are unhappy. The majority of NuVasive employees believe that the work environment at NuVasive is positive (Comparably review for NuVasive, 2022). NuVasive received an overall rating of 3.9 out of a possible 5 stars based on over 581 anonymous employee reviews on the Glasdoor platform. 75% of employees would recommend NuVasive as an employer to a friend and 67% are positive about the future of the company (Glassdoor review for NuVasive, 2022). In summary, NuVasive is a popular employer as analyzed from both platforms. However, caution is required when interpreting the website statistics as it cannot be ascertained that a participant in the survey actually is a (former) employee.

7.4. Comparison between Germany and the USA

We now have presented the definition of a Hidden Champions, the main characteristics of Hidden Champions in USA and Germany, and made a detailed analysis of two medical device Hidden Champions from the two countries. We will now proceed to the comparison of the companies’ main financial KPIs and thereafter provide a comparison of the countries of the Hidden Champions, in a macro manner, using Hofstede’s cultural dimensions to serve as basis for the non-financial KPIs comparisons.

7.4.1. Financial KPIs Comparison

We used public data available about the two Hidden Champions in the medical device sector, namely America’s NuVasive and Germany’s Karl Storz, for the period from 2015 until 2020 for the comparison of the two companies.

Net Profit Margin

The first KPI to be compared is the revenue margin.

Figure 5: Net Profit Margin Medical device industry (in %) (Own compilation)

NuVasive has had a rather volatile revenue margin. In the beginning of the comparison period, the company had a revenue margin of eight percent. This number decreased in 2016 to 4%, and increased back to 8% in 2017. It went down to 1% in 2018, going up again to 6% in the following year and reached the lowest point in this comparison period with -4% in 2020.

Karl Storz presented a tendency of high growth in the comparison period, starting from 0% in 2015 to 4% in 2016 and up to 8% in 2017, with small variations of plus or minus 1% in the following years.

Comparison of Revenue Growth

The next KPI to be analyzed and compared between the two Hidden Champions is the revenue growth.

Figure 6: Revenue Growth Medical device industry (in %) (Own compilation)

The two companies in the medical device sector presented quite similar revenue growths over the comparison period. With exception of the first year analyzed, when NuVasive had its revenue grow 19% and Karl Storz only 7%, the companies had relatively constant growths between 4 and 11%, excluding the special case of the year 2020. Comprehensibly, this 2020 negative growth happened for

both companies due to the Covid-19 pandemic and postponing of elective medical surgeries worldwide.

Both these companies in the medical sector are in matured stages and thus already have consolidated revenues. They therefore do not present such high volatility, except for the year of 2020 due to the Covid-19 pandemic.

Operating Cash flow Margin

An important KPI to be compared is the operating cash flow margin. After all, companies cannot survive in the long term if they lack cash. The operating cash flow margin from NuVasive remained higher than that of Karl Storz's during the past 6 years. The American company's figure has increased from 11% in 2015 up to 20% in 2018 and 2019 and went slightly down to 18% in 2020. The German company's figures have remained constant at 10% for 4 of the 6 years, with two slightly lower ones of 7% and 8% in 2015 and 2018 respectively. This shows a consistency in operating cash flow margins at Karl Storz, which can be seen with other Hidden Champions as well. The American company NuVasive presented higher operating cash flow margins than the German Hidden Champion, Karl Storz. In general, we see a higher cash flow margin for American companies when compared to German ones.

Equity Ratio

The comparison will now be made using the KPI Equity Ratio as a basis.

Figure 7: Equity Ratio Medical device industry (in %) (Own compilation)

NuVasive had a relatively high equity ratio of over fifty percent at the start of the comparison period. This number decreased in 2016 to 45% and slightly increased to 49% over the following three years. In 2020 the number significantly decreased to 34%. Karl Storz remained rather constant during the comparison period, varying from 40% in 2015 to 45% in 2020, showing small variations in the years in between. The companies in the medical sector presented similar numbers, which are compatible with the market standards for this KPI.

R&D Ratio

An important characteristic of Hidden Champions is their ability to innovate, and the emphasis they therefore place on research and development, as mentioned before. The comparison between the two companies' R&D ratios shows that both companies in the medical device sector spend similar percentages of their revenue on research and development – between 4% and 8%. NuVasive doubled its ratio, from 4% in 2015 to 8% in 2020, with a constant ratio of 5% to 6% in the years in between. The German company's constant ratio of 6%, varying one percent up or down during the 6 years

considered for the comparison period. Both companies showed that they care about innovation and presented good levels of spending on research and development. This illustrates the innovation orientation of the sector.

7.4.2. Non-Financial KPIs Comparison

Having analyzed and compared the financial KPIs of the two Hidden Champions, the next topics to be compared are the non-financial KPIs. First the export ratios will be compared and then an analysis will be made of the countries as a whole, to observe and compare the non-metric KPIs previously presented.

Non-metric non-financial KPIs

A common way to compare two or more countries is through the Hofstede's cultural dimensions, which is a theory that evaluates and quantifies characteristics of a country's society. This framework started while working at IBM, Hofstede realized that although the enterprise had a well established culture, the very different cultural backgrounds of employees from different countries created some unpleasant challenges. Hofstede created a questionnaire for over 70 subsidiaries covering different questions about values to enhance the understanding of cultural differences and prepare managers to handle their subordinates. More than 100,000 surveys had been done to explore the differences in thinking and social interaction that existed amongst members of more than 50 modern nations (Shi & Wang, 2011). Nowadays he uses different factor analyzing methods to show the effects of a society's culture on the values of its members, and how these values impact behavior in five different dimensions: power distance, individualism, internationalization, uncertainty avoidance, and long-term orientation (Hofstede, 2022).

We used Hofstede's cultural dimensions of USA and Germany as a basis for the comparison of the two countries and their Hidden Champions.

Export Ratio

A company cannot be a Hidden Champions if it only sells in its domestic market, as mentioned previously. A good indication of the importance of international sales is the company's export ratio. The comparison is seen below.

Figure 8: Export Ratio Medical device industry (in %) (Own compilation)

The greatest difference seen between these two companies in the medical device sector is without a doubt in the export ratio. The German company has had a constant extremely high export ratio of 92~93%. NuVasive showed a tendency to increase its export ratio, increasing from 13% in 2015 to up to 22% in 2020. The difference between both markets is quite significant.

The United States of America's medical device manufacturer's market size was valued at USD 176.7 billion in 2020. This accounts for more than one third of the world's USD 432.23 billion size. This is

the reason why NuVasive do not have such a high need to have an export ratio as high as that of Karl Storz's; The size of the German market being only USD 35.8 billion (Fortune business insight, 2022.).

Managerial Style/ Leadership and customer relationship

We use Hofstede's first three dimensions for these non-financial KPIs to illustrate how managers work in both countries:

- Power distance: The European country has a very strong middle class and is very decentralized with a score of 35 (Hofstede, 2022). German managers are known for being direct and leaders are usually expected to be experts in their fields. Strong unions also help to diminish the power distance within companies. This power distance seems to be higher amongst German Hidden Champions. Karl Storz is one of the over 62% HCs that are family owned. The distance between the leader and employees tends to be bigger in such companies.

US organizations usually have hierarchies established for mere convenience. Managers are accessible and rely on individual employees and teams for their expertise. People expect to have information shared frequently, and this is usually done in an informal way. That explains the below average score of 40 (Hofstede, 2022). NuVasive can be seen as a good example of this, as they have many groups as shareholders and executives are relatively young.

- Individualism: Shows the level of interdependence the society keeps between its members. The German society is an individualist society with a score of 67 (Hofstede, 2022). German Hidden Champions usually care significantly about their name and how they make the company a part of their personal identity (often they carry the family name, as in the case of Karl Storz). The importance of close relationships, typical of German Hidden Champions such as Karl Storz, providing each customer with an individual contact person to assess clients' needs, is another characteristic of individualism.

The USA's promise of being the "land of the free" is seen by the focus of the American society and government on equal rights. This contributes to NuVasive's high score of 91 in this dimension (Hofstede, 2022). People are expected to be self-reliant and proactive in business. The American Hidden Champions analyzed here, illustrates this fact. For example, none of their employees in the USA is part of any labor union. Close relationships are also important in the USA. NuVasive illustrated this characteristic very well by creating an application to keep in touch with their patients and surgeons post-surgery to maintain the customer relationship and bond very strongly.

- Masculinity: Germany is a masculine society, based on its score of 66 (Hofstede, 2022). Performance is highly valued since early ages, for example children are separated into different types of schools at the age of ten. This mentality motivate people to "live in order to work" and obtain a lot of their self-esteem from their jobs. That is another fact that explains why family owned German Hidden Champions are so keen on being best and carrying forward the leadership in a niche. Karl Storz illustrates this very well.

USA is another high masculine society, with a score of 62. This is explained by the fact that American people believe they should "be the best they can be" and that "the winner takes all". US citizens "live to work" to get monetary rewards and achieve a higher status based on how good one can be (Hofstede, 2022).

Innovation

We use two of Hofstede's dimensions to illustrate how innovative both countries and their two Hidden Champions are: long term orientation and uncertainty avoidance are observed:

- Uncertainty avoidance: Germany is amongst the uncertainty avoidant countries with a score of 65 (Hofstede, 2022). In combination with the country's low power distance, where the certainty of the outcome of own decisions is not covered by the larger responsibility of the boss, Germans prefer to compensate their higher uncertainty by strongly relying on processes/bureaucracy and on expertise.

This explains why German Hidden Champions are so specialized and niche oriented. They choose to be experts in a specific area and other companies choose to do business with them exactly because of this expertise.

USA has a below average score of 46 in Uncertainty avoidance (Hofstede, 2022). This contributes to the notion that the acceptance of new ideas, innovative products, and a willingness to try something new or different is a common practice for Americans within many different sectors. NuVasive shows these characteristics with its high innovative integrated technologies in less-invasive surgeries and integrated systems.

- **Long term orientation:** Every society must keep some links with its past while facing the challenges of the present and future. Germany has a high score of 83, which indicates how pragmatic this country is (Hofstede, 2022). Germany also has an ability to adapt traditions to unstable conditions, a quite strong propensity to save and invest, resilience and skills in achieving results. This pragmatism and propensity to invest is well displayed by how some Hidden Champions tend to innovate by acquiring smaller companies focused on innovation. One example is Karl Storz's purchase of the 'Gastroenterology' business unit from Xion GmbH.

USA has a relatively low long-term orientation score of 26 (Hofstede, 2022). Americans are prone to analyze new information to check whether it is true. Therefore, for the more traditional areas within the American society, changes take longer to be affected. This also explains why the most disruptive changes come from less traditional states where the Hidden Champions are located, such as California, where NuVasive's headquarter is situated.

7.4.3. Sector-specific KPIs Comparison/ Medical device industry

The last comparisons to be made, after having compared the non-financial KPIs of the two companies, analyzing United States and Germany in a macro perspective and the non-financial KPIs of its Hidden Champions, are regarding each sector's previously mentioned specific KPIs. Since only the medical device industry sector is evaluated, the three additional KPIs reflect strongly on that industry. These include Selling and Marketing Ratio, Inventory Turnover and Employer Rating.

S&M Ratio

Starting with the Selling and Marketing Ratio, the following figure shows the comparison of the two Hidden Champions in this aspect.

Figure 9: Selling and Marketing Ratio Medical device industry (in %) (Own compilation)

Both companies presented a constant S&M ratio. NuVasive maintained a figure above 50% throughout the whole comparison period, with the numbers not varying more than 4% from the 56% in 2015 to 52% in 2020. The German Hidden Champions had an S&M ratio of 32% in 2015 and kept it at a constant of 30% for the next 4 years and saw it going down to 27% in 2020. This indicates that the American company tends to spend more of its revenue on efforts to increase its sales.

Inventory Turnover

The next aspect to be considered is Inventory Turnover, presented in the Figure below, analysing the Inventory turnover ratio over time.

Figure 10: Inventory Turnover Medical device industry (in times) (Own compilation)

Karl Storz's inventory turnover had been twice that of NuVasive throughout the whole comparison period, varying around ten percent up or down from the initial 2, 43 registered in 2015. NuVasive had a 1, 21 inventory turnover in 2015, which remained constant during the following 4 years and slightly decreased to 1, 07 and 1, 05 in 2019 and 2020 respectively. This shows that Karl Storz keeps a lower inventory than NuVasive.

Employer Rating

Both companies have similar ratings about their employers from the employees. While the American NuVasive had a score of 3, 7, the German Hidden Champions got a mark of 3, 9, implying similar results.

8. Managerial Implications

The study offers insights into Hidden Champions market developments and comparisons between two different companies and markets, respectively. All the analysed aspects can be used successfully in a managerial practice, especially in the Hidden Champions' context or in the medical industry. The analysis, presented in the form of a case study, can present insightful input regarding what is deemed important to be considered as a key performance indicator, and how to determine the suitability of a market to emerge in growth. The two businesses discussed, operate in the medical technology industry. They display examples of reaching market dominance in certain niches, and highlights specific characteristics businesses to be aware of prior to entering either the American or German markets.

9. Conclusion

In this paper, the differences between German and American Hidden Champions in the medical device industry were investigated. The first difference already became apparent in the number of Hidden Champions in the two countries. The number of 1307 German Hidden Champions significantly exceeds the number of 366 US Hidden Champions. It was also noticed that American Hidden Champions are in age significantly younger on average than their German counterparts.

The investigation of and comparison between Hidden Champions in Germany and the USA indicated that financial KPIs are more similar between sectors, whereas non-financial or qualitative KPIs are indicating similarities between the two countries. Even though the two medical industry companies

have been in existence for decades and both have established business models, the data showed that the impact of the Covid-19 affected the Hidden Champions, regardless their locations.

Common characteristics that were shown in the data area high export ratio and a high R&D expense to revenue ratio. German Hidden Champions have a higher export ratio than that of the US. This is because of the German domestic market being significantly smaller than that of the US market. Export ratios still are overall an average of 61% as of 2021, showing that Hidden Champions generally generate a high profit from abroad.

Managerial style and customer relationships are significantly influenced by the cultural and structural background of the countries. Different managerial styles and ownership structures lead to different management decisions. Whereas in the USA, companies are frequently owned by financial investors, there are often family-run corporations in Germany. The German company seems to be much more focused on strategic sustainability with a strong focus on penetrating international markets. The US Company is more focused on the American market and more short term, financially driven.

Both businesses displayed a very strong innovation potential in the past and also towards the future. Cooperation with hospitals, universities and doctors is regarded as essential by both companies. Interesting to note is the cluster organization of the German Mittelstand (mid-size companies) and of the Medical Mountains in Tuttlingen, Germany.

This scientific work showed that Hidden Champions in Germany and the USA are well prepared for their future developments. Their innovative strength and the advanced implementation of Industry 4.0, equip them well to meet future challenges. Due to a limited number of in-depth analyses of Hidden Champions, some of the KPIs were hard to conclude. Based on this paper, further research on different Hidden Champions in the two countries could draw more precise common characteristics between the countries.

Perceptions, Aspirations, Female sports students, Sports leadership

Abstract

Sport is an ever-growing industry that presents many employment opportunities in sports administration, sports management, and sports leadership. Despite these significant opportunities, females remain marginalised from pursuing or acquiring leadership positions in sports. This low representation of existing female sports leaders in South Africa prompted the need to investigate the perceptions and aspirations of female sports students toward sports leadership. The study adopts a quantitative research method, and data was collected using a self-administered questionnaire from a conveniently sampled 97 female sports students studying at a South African university. The study reveals that the female sports students' general perceptions are neither influenced by the leader's gender nor physical characteristics but rather by the leader's ability to make a change. The participants felt that the media plays a role in influencing perceptions by giving male sports more media coverage in comparison to the female sport. The study also found that female sports students believe females can pursue careers in sports leadership and that these careers and opportunities were not only suitable for males. Therefore, strategies for developing and affording students aspiring to become future sports leaders need to be developed. There is a further need for aspirant sports leaders to have role models and mentors who will also help them to develop skills and to introduce them to networks that will enable them to achieve their career goals of becoming sports leaders.

1. Introduction

Social and gender-based ideologies inform perceptions and aspirations. According to Coakley and Burnett (2014), ideologies are a defining aspect of our lives, and sport tends to reaffirm social and gender ideologies that already exist in society. Ideologies are "a shared interpretive framework that people use to make sense of and evaluate themselves, others, and events in their social worlds". Satore and Cunningham (2007) contemplate those existing societal ideologies may be partially responsible for the low representation of females in leadership positions in sports.

Males dominate leadership positions in national and international sports organisations, and females remain underrepresented in these positions (Spoor & Hoye, 2013). The overwhelming presence of males in leadership positions in sports not only perpetuates the perceptions of sport being a male arena but also reaffirms their masculine dominance in the industry (Massengale & Lough, 2010). Burton (2015) also confirms this notion by citing that sport is organised around the values of masculinity. What these perceptions and values then do almost nullify the presence of female leaders in sports because they are less visible. Thus, the low representation of females in leadership positions in sports has received considerable attention over the past decade (Satore & Cunningham, 2007). Scholars and professionals continue to seek a better understanding of this persisting trend. Through

interrogating the imbalance of power and authority in sports leadership, it is necessary to investigate the isolated views of female sports students towards sports leadership and to assess their ambition further to become sports leaders.

The emerging body of literature focuses extensively on the barriers females face in acquiring leadership positions in sports. The glass ceiling is the most prominent barrier hindering females from accessing sports leadership positions (Mwisukha, Gitonga & Wanderi, 2010). Literature also demonstrates how the perceptions of sport being a male domain maintain the status quo in the industry (Massengale & Lough, 2010), with the media also playing a role in influencing the public's values and beliefs (Fink, 2013). Sport as an academic field has advanced tremendously quickly, and sport-related courses are being offered worldwide (Mathner & Martin, 2012). Sports students pursue sports careers for different reasons; however, their exposure to the realities of the sports industry, in the media, for example, has the potential to influence their perceptions and aspirations towards sports careers. According to Betzer-Tayar, Zach, Galily and Henry (2017), there is a belief that females are entering spaces, such as sports, that were previously considered to be reserved for males. Despite this belief, very few females hold leadership positions in sports organisations. This results from females facing barriers such as the glass ceiling, gender stereotyping, and male-oriented organisational cultures are favouring their male counterparts. These barriers ultimately influence their career aspirations and hinder their career development and growth (Betzer-Tayar et al., 2017; Deaconu & Rasca, 2015).

Despite the notable progress in females' inclusion in the sports industry, females still occupy a mere fraction of leadership positions compared to their male counterparts (Lovelin & Hanold, 2014). Various studies delve into the underrepresentation of females in leadership positions in sports (Ndimande-Hlongwa, 2016; Burton, 2015; Goslin & Kluka, 2014; Spoor & Hoye, 2013; Massengale & Lough, 2010; Satore & Cunningham, 2007), and use existing female leaders, working professionals or student-athletes as their subjects of interest. Given that universities are in the business of developing the next generation of sports leaders through their sports programs (Wesse & Beard, 2012), among their reasons, it is essential to establish the perception and aspirations of female students towards sports leadership. Knowledge and a better understanding of these aspirations will enable the design of appropriate interventions to improve the gender imbalance.

South Africa has expressed the urgency to promote females at all levels of leadership structures in sports (Ogunniyi, 2015). The earliest deliberate efforts are defined in the Gender Act 39 of 1996, which according to Ndimande-Hlongwa (2016), promotes females' right to gender equality across all industries, including sports. Over two decades later, however, South African females remain underrepresented in leadership positions in sports (Goslin & Kluka 2014). The challenges faced in sports and the need for leader and leadership development are recognised by academic researchers and sports administrators as areas that need to be addressed to advance more females into sports leadership positions (Ngwakwe, Egba & Mong, 2015). Even though this issue necessitates detailed study, it's unrealistic to attempt to research the entire sports industry. Therefore, to make a meaningful contribution to the existing body of literature, this study isolates the perceptions and aspirations of females, specifically female sports students, and focuses solely on leadership within the context of sport. Therefore, the study aims to investigate female sports students' perceptions and aspirations toward sports leadership.

2. Problem investigated

There is a belief that females are entering spaces such as sports that were previously considered to have been reserved for males (Betzer – Tayar, Zack, Galily and Henry: 2017:418). Despite this belief, very few females hold leadership positions in sports organisations. This is a result of females facing barriers such as the glass ceiling, gender stereotyping and male-oriented organisational cultures that favour their male counterparts. These barriers ultimately influence their career aspirations and hinder their career development and growth. So, the study's purpose is to investigate the perceptions and aspirations of female sports students towards sports leadership.

3. Research objectives

The research objectives of this study comprise the following eight research objectives

- a. To investigate the perceptions of female sports students towards sports leaders in general
- b. To investigate female sports students' perceptions of the media 's role in influencing perceptions towards sports leadership.
- c. To determine female sports students' perceptions towards perceived barriers towards pursuing or acquiring sports leadership positions

4. Hypotheses

The following main and sub-hypotheses were developed and tested based on the existing theory and literature.

Hypothesis 1: There is a significant statistical difference in the perceptions and aspirations of undergraduate and postgraduate female sports students towards;

- Sports leaders in general (Hypothesis 1.1)
- Perceptions of sports leaders in the context of South Africa (Hypothesis 1.2)
- Careers in sports leadership (Hypothesis 1.3)

Hypothesis 2: There is no significant statistical difference in the perceptions and aspirations of female sports students in different academic courses towards:

- Sports leaders in general (Hypothesis 2.1)
- Perceptions of sports leaders in the context of South Africa (Hypothesis 2.2)
- Careers in sports leadership (Hypothesis 2.3)

Hypothesis 3: There is a significant statistical difference in the aspirations of female sports students in different academic courses at a South African tertiary institution:

- Between those studying sports management and those studying sports science (Hypothesis 3.1)
- Between those studying sports management and those studying biokinetics (Hypothesis 3.2)
- Between those studying sports science and those studying biokinetics (Hypothesis 3.3)

5. Literature review

5.1 leadership in the sports industry

Since the late 1900s, academics have identified the growing significance of leadership in the sports industry (Peachey, Damon, Zhou & Burton, 2015). That is, the earliest contributions of sports leadership emerged from Chelladurai in the 1990s, who undertook the initial investigation of sports leadership literature (Peachy et al., 2015). Later, with the growing professionalism of the sports industry, the need for more formal organisational structures and specialised leadership has become significantly apparent for sports organisations to adapt and cope with the sector's growth (Naidoo, Coopoo & Surujlal, 2015). The way that leaders are perceived despite their qualifications or experience is influenced by the perceptions and stereotypes that people hold towards leaders (Schull, 2014). However, limited research has been conducted on leadership within the sporting context (Kim, Magnusen, Andrew & Stoll, 2012). Heer Peachey et al. (2015) have noted its recent importance. WiNaidoo et al. (2015) examine the perceived leadership styles of sports administrators within the sports setting. Results reveal that the most dominating leadership style adopted by sports administrators, who play an important role in influencing the success of sports organisations, is the transformational leadership style.

According to Mwisukha et al. (2010), the involvement of females in sports remains a controversial topic and dates to ancient times. It was not until the Greek era whereby organised sports activities were available to females. History has revealed that females have remained side-lined and

underrepresented in several aspects of the sport (Mwisukha et al., 2010). Goslin and Kluka (2014) studied perceptions of Malawian females educated in sports business leadership. The results show that completing an education programme positively influenced an individual's self-worth and the 'voice' of female leaders in Malawi. Although sport is an ever-growing industry, and this growth subsequently presents plenty of employment opportunities, the reality is that females remain underrepresented in leadership positions across sports organisations (Lovelin & Hanold, 2014). Schull (2014) attributes the absence of females in these roles to the fact that leadership positions in sports are entrenched in the production of hegemonic masculinity.

5.2 Perceptions toward sports leadership

One of the leading perceptions regarding leadership is that females are gaining momentum in achieving equality in leadership roles (Schwanke, 2013). According to Massengale and Lough (2010), the notion of sport being a male arena reinforces the culture of male superiority, which is maintained through unfair and discriminatory hiring processes by sports organisations. In Africa, for example, patriarchal structures dictate the lives of females and influence the opportunities to which they have access (Goslin & Kluka, 2014). This ultimately prevents females from pursuing sports careers and acquiring sports leadership positions. Brown and Light (2012) suggest that the sports industry is a man's world because very few females occupy decision-making positions in national and international sports organisations (Leberman & Palmer, 2009).

Sport is arguably one of modern society's most hegemonic social institutions (Betzer-Tayar et al., 2017). What this means is that sport promotes the dominance of a particular social group over others (Burton, 2015). Goslin and Kluka (2014) state that gender stereotyping plays a role in the overall under-representation of females in leadership positions for various reasons, which are highlighted in the following discussions. Even though sports may be considered a male arena, the literature suggests that the existing gender disparity in sports leadership is not static and can be shifted to be more inclusive of both genders. Meier (2015) believes that having more visible females as decision-makers can encourage all ages to participate in sports and pursue careers in sports leadership.

5.3 The media's role in shaping perceptions towards sport and sports leadership

The media have influenced people's perceptions since the late 1930s (Kin, 2015) and today, the media still plays a significant role in shaping perceptions (Tamir & Galily, 2010). For purposes of this study, media refers to "any form of communication that simultaneously reaches a large number of people, including, but not limited to, radio, television, newspapers, magazines, billboards, films, recordings, books, and the internet" (Kin, 2015). There have been repeated confirmation of the media's role in shaping public perception through various strategies. As it stands, male sport receives approximately 90 per cent of media coverage (Coakley & Burnett, 2014). This perception is attributed to how the media emphasises the physical attributes of female athletes as opposed to their physical performance (Walker & Bopp, 2011). Sexist language and visuals in the reporting sports also contribute to how females are perceived (Darvin & Sagas, 2017). Therefore, for females to develop beyond the narrative promoted by the media, they need to be cognisant that their competence is generally perceived and reported differently from that of their male counterparts.

The media can influence the public's perception of sport-related matters, careers, notions, and narratives. For example, the lack of media coverage of females in sports leadership careers significantly creates the absence of female role models (Goslin & Kluka, 2014). The lack of coverage of males in sports and the subsequent 'absence' of female role models almost imply that female role models don't exist because they aren't visible. Media content can therefore be considered fictitious, depending on what narrative the media is trying to promote. It is important to note that people who work in the media industry (i.e., producers and journalists) edit media content to achieve goals such as influencing the public and societal values and gaining financial profits (Coakley & Burnett, 2014:264).

5.4 Aspirations toward careers in sports leadership

From early adolescence, individuals tend to select careers that seem to be exciting and enjoyable. As they transition into early adulthood, however, career selection begins to get complicated (Hutchinson,

2008:1). Generally, career selection is a complex event, which makes it difficult to predict the outcomes, because individuals will pursue a particular career based on various reasons (i.e., to improve society, for personal satisfaction, achievement, security, or monetary reasons) (Sibson, 2011:3). According to Aman, Yusof, Ismail and Mohamed Razali (2018:154), males generally have well-planned careers that target leadership positions. At the same time, females tackle career plans with minimal intention or confidence to pursue leadership positions. Goslin and Kluka (2014:94) attribute this to the lack of reporting of female sports leaders, making it seem as though they don't exist. It may also seem like a far-fetched goal for females to aspire towards leadership in sport. In the study, aspirations refer to the ambition or desire of a female sports student to pursue a career in sports leadership.

A comparison study that was conducted on the types of jobs that males and females were most likely to pursue revealed that males are more likely to apply for jobs in which they were less qualified, whilst females would only do so upon confirmation that they were qualified for the role (Aman et al., 2018:154). Their reluctance to aggressively pursue these leadership positions stretches the gap of female sports leaders even wider (Wesse & Beard, 2012:1). Sports leadership amongst females in sport is, however, a pressing issue, and the consensus is that perhaps it is a poorly understood area of sport (Ngwakwe et al., 2015:1126). Simon and Hoyt (2012:233) note that increasing the voice of females in sports is an important by-product of expanding the representation of females in leadership positions.

5.5 Underrepresentation of females in leadership positions in sport: A recurring global theme

The underrepresentation of females in careers in sports leadership is a historical phenomenon, and measures to address this imbalance are continuously being explored (Mwisukha et al., 2010). According to Aman et al. (2018), sports organisations, National and International Sports Federations, and even the International Olympic Committee continue to struggle with meeting the 20% representation dispensation of females on executive boards. For example, leadership positions in the South African Football Association (SAFA) are undeniably dominated by males. The long-standing domination of males in South African football is the result of the sport being regarded as a male domain (Ndimande-Hlongwa, 2016). More and more females are participating in sports at various levels and are enjoying the physical and health benefits of their participation in sports. They also build character and develop life skills such as discipline, teamwork, and leadership from their involvement in sports (Schull, 2014). This involvement is somehow hindered, and females seldom get the opportunity to use the skills they have acquired through participation in sports in the professional workspace (Mwisukha et al., 2010). Walker and Bopp (2011) cite that the lack of representation of females in sports can lead to the overall loss of the female voice in the sport.

The increased participation in sports by females implies that although the sport has become more inclusive of and accessible to females through various strategies, such as gender equality policies (Schull, 2014; Shaw & Frisby, 2006), leadership positions remain linked to sex-role stereotypes (Betzer-Tayar et al., 2017). For example, a male coach is more likely to have the opportunity to coach both male' and female sports, whilst female coaches are limited to coaching female teams (Walker & Bopp, 2011). It is important to note that females were denied administrative positions in the International Olympic Committee (IOC) for a very long time. The first female was appointed to the IOC only in 1981, almost a century after the inaugural Modern Olympic Games in 1896. The trend is no different in Africa; males have dominated the sport for a long time (Mwisukha et al., 2010). Literature notes that patriarchy is a recurring theme that governs and influences how males and females access leadership opportunities and positions (Goslin & Kluka, 2014).

According to an enquiry conducted by the Australian Federal Government in 2006, there was a modest representation of females in leadership and decision-making positions in sports. This was despite the government's efforts to rectify gender inequality through sports policies and affirmative action laws (Brown & Light, 2012). In Kenya, the Affirmative Action Bill of 2007 centres on promoting education, participation, and representation of females in public sector jobs. However, females in sports leadership remain underrepresented. According to M'mbaha and Chepyator-

Thomson (2018), this is because of historical, political, and social structures during colonial periods that have continued to marginalise females from working through the sport's ranks. The reality of the underrepresentation of females in sports leadership is no different in South Africa, which is a nation that is characterised by progressive political policies regarding gender equality (Ogunniyi, 2015). The National Sport and Recreation Act 110 of 1998 "... provides measures aimed at correcting imbalances in sport and recreation ..." and is supplemented with The National Sport and Recreation Amendment Act 18 of 2007, which "... provides guidelines for the promotion of equity, representation and redress in sport and recreation ...". Despite this existing legislation, there has been a failure to show for this in the form of a discernible reality in industries such as sport.

The study sought to contribute to the existing literature by exploring how female sports students at a South African tertiary institution perceive matters relating to gender and leadership in sports.

5.6 Perceived barriers toward leadership positions in sport

Controversy about the involvement of females in sports dates to ancient times and various factors are perceived to be barriers to attaining leadership positions in sports. However, the glass ceiling has been cited as a major barrier (Mwisukha et al., 2010). The term glass ceiling was initially used in *The Wall Street Journal* in 1986 and is a phenomenon that implies that there is a transparent barrier that keeps females and minorities from accessing top-level positions (Ström & Burvall, 2018). In recent years, there have been assertions that the glass ceiling barriers have decreased because females have started to enter positions that were once reserved solely for males. The previous discussion paints a different story. Females continue to face barriers to career advancement that favour males (Betzer-Tayar et al., 2017). Diaconu and Rasca (2015) believe that despite the apparent improvements that have been made recently in terms of females' career choices and female empowerment policies, the lack of females in leadership positions suggests that the glass ceiling is far from disappearing. Other barriers that restrict females from attaining leadership positions in sports include the absence of professional networks for females, the lack of same-sex role modelling, self-limiting behaviours, and societal expectations of motherhood.

6. Research methodology

6.1 Research approach and design

The most practical philosophy to the study is the philosophy of positivism. Positivism can be applied to the social world. Positivists aim to describe an experience through observation to predict the world around us and make accurate and unbiased generalisations (Mackenzie & Knipe, 2006). Hence the decision to undertake a positivist research philosophy. It encourages understanding of the perceptions and aspirations that female sports students hold towards sports leadership. Besides, a deductive research approach is undertaken in the study to test the relationship between concepts and variables. That is, the concept is sports leadership, and the variables are female sports students' perceptions and aspirations. The research design of the study is a mono-quantitative method. This means that only one method, namely a questionnaire, is used to investigate the study's research objectives. The study further undertakes a cross-sectional approach due to its relevance in assessing attitudes (perceptions and aspirations). This is because a cross-sectional study is characterised by the collection of data at a particular point in time (Kesmodel, 2018) and allows the researcher to establish a relationship between the variables of interest (perceptions and aspirations) that exist within a particular population (female sports students).

6.2 Research sample

The study's target population was all female sports students at universities in South Africa. The total population is approximately 7,500 female sports students. The study is conducted on a convenience sample of 97 female sports students studying at one higher education institution in Johannesburg. The participants within the convenience sample are either undergraduate or postgraduate students. They are studying towards either an academic diploma or degree and sports management, sports development, sports science or biokinetics. The targeted sample at this institution (i.e., the total number of female sports students) was 200. The response rate was, therefore 48.5%.

6.3 Data collection

The research instrument that is used to collect data was a questionnaire. The questionnaire is organised into three sections, Section A: The demographic profile of each participant, Section B: The perceptions of each participant towards sports leadership, and Section C: The aspirations of each participant towards sports leadership. Section B includes statements such as, “My perception of a leader is influenced by the gender of the leader”, “Media plays a role in the lack of media coverage of female sports leaders”, and “I believe that females can also pursue leadership positions in sport”. Section C comprised of statements such as, “My goal is to become a sports leader in the future”, “I have the capabilities and skills to become a sports leader”, and “I want to become a role model when I become a sports leader”. The participants were requested to rate their responses to a series of statements in Sections B and C along a five-point Likert rating scale. The points on the scale ranged from strongly disagree to strongly agree, with neutral placed at the centre of the scale.

6.4 Data analysis plan

The data of the study was coded and captured by the University of Johannesburg’s (UJ) Statistical Consultation Services (STATKON). Statistical Package for the Social Science (SPSS) 25.0 software program was used to analyse the data coded by STATKON. The following statistical data tools were used to generate outputs from the data: descriptive statistics, reliability analysis, correlation analysis, independent sample T-tests, and one-way ANOVA.

6.5 Validity and reliability

The six constructs of the questionnaire are presented in table 1. Each construct is tested for validity and reliability using Cronbach's Alpha Coefficient, and the results of the statistical tests are presented in Table 4.1. The universally preferred coefficient value of 0.7 and higher indicates that the statements that make up each construct measure the same thing (Saunders et al., 2016:451), demonstrating reliability.

Table 1: Results of tests for validity and reliability using Cronbach's Alpha Coefficient

Research Constructs	Number of participants	Number of items	Cronbach's Alpha Coefficient
Perceptions toward leaders in general	95	9	0.603
Media's role in influencing perceptions	93	9	0,883
Perceived barriers to pursuing or acquiring sports leadership positions	95	18	0,676
Perception of sports leaders within the context of South Africa	97	6	0,763
Perceived importance of academic qualification in sports leadership	96	6	0,757
Aspirations toward sports leadership	94	15	0,888

The construct that reflects the lowest Cronbach's Alpha Coefficient of 0.603 relates to the participants' perceptions of leaders, tested in Section B of the questionnaire. This value is below the preferred coefficient value of 0.7. However, a value above 0.5 is still considered to be reliable. The highest coefficient value is 0.888, well over the preferred value of 0.7 and relates to the participants' aspirations towards sports leadership, which is tested in Section C of the questionnaire. The rest of the constructs reflect coefficient values which are higher than 0.7, therefore demonstrating the validity and reliability of the constructs. One statement (n) is omitted from the construct relating to the participants' perceived importance of an academic qualification concerning sports leadership during the statistical analysis for validity and reliability. This statement is omitted because it has a low inter-item correlation value, which subsequently decreases the combined coefficient for the construct to a value below the preferred value of 0.7. The coefficient value relating to the construct of the participants' perceived barriers towards pursuing or acquiring sports leadership positions is 0.676, slightly below the preferred 0.7 coefficient value. This is attributed to the large number of statements that comprise the construct, which tends to result in a reduced coefficient value.

7. Findings and discussion of results

Participants were asked to rate their responses to a series of statements in the questionnaire along a five-point Likert rating scale. The selection of responses ranged from strong disagreement to strong agreement to a statement, each with a mean score of one and five, respectively. Each objective is measured using descriptive statistics such as mean, standard deviation and ANOVA. An overall mean score of each statement of 4.00 and above indicates the participants' full agreement with a statement, while a score of less than 3.00 indicates the participants' full disagreement with a statement. A mean score of 3.50 represents a moderate agreement by the participants to the statements and the mean score is the most frequently used measure of the central tendency of data (Saunders et al., 2016).

7.1 Demographic characteristics

The demographic profile of the participants, such as age groups, racial groups, academic levels, academic courses, and type of academic qualifications, is presented in table 1. It describes the different age groups, in years, of the female sports students who participated in the study.

Table 1: Respondent's demographic characteristics

Variables	Options	Frequency	Percentage
Age	19-24	6	6.2
	25-30	89	91.8
	>=30	2	2.1
	Total	97	100.0
Race	Black	49	50.5
	Coloured	8	8.2
	Indian	5	5.2
	White	34	35.1
	Total	96	99.0
Study level	Undergraduate	69	71.1
	Postgraduate	26	26.8
	Total	95	97.9
Type of academic qualification	Diploma	43	44.3
	Degree	54	55.7
	Total	97	100.0

Source: Own compilation

Most of the participants (89 participants) were between the ages of 19 and 24 years old (91.8%), six participants were 18 years or younger (6.1%), and two participants were between the ages of 25 and 30 (2.1%). Consistently, according to a report that Statistics South Africa published on Higher Education and Skills in South Africa (2017), attendance at higher learning institutions is highest among the youth aged between 20 and 22 years. The participants are split into four racial groups based on their indications on the questionnaire. According to the data set, 49 (51%) participants of the study are black, 34 (35.4%) participants are white, eight participants represent the coloured racial group (8.3%), and five (5.2%) participants belong to the Indian racial group. The representation of the various racial groups in the study is closely linked to an online article by News24 in 2017 on the generic racial representation of students at South African universities. According to the article, of the 766 812 students who were enrolled in various South African higher education institutions in 2016, 66,4 per cent were black, 18,7 per cent were white, 7,8 per cent were Indian/Asian and 7,1 per cent were coloured (News24, 2019).

Regarding the academic levels, most participants were undergraduate students and comprised 9 participants) of the study. Similarly, the undergraduate and postgraduate split amongst the participants is parallel to the 2016 Statistics on Post-School Education and Training, contained in a report released in March 2018 by the South African Department of Higher Education and Training. The report gives a generic account of all students enrolled at one of the 26 South

African higher education institutions that comprise the public higher education sector in 2016. 80.4% of these students were undergraduate students, while 17.5% were postgraduate students. This data was extracted from The Higher Education Management Information System database in 2017 (Statistics South Africa, 2017).

Besides, over half of the study participants, 56.7%, were studying towards a qualification in sports management. According to Wesse and Beard (2012), universities are in the business of offering the best sports management qualifications with the deliberate intention of developing the next generation of sports leaders. Also, table 1 indicates that 56% of the participants in the study were studying toward a degree, and 44% were studying toward a diploma. This means that many of the female sports students were pursuing a degree qualification instead of a diploma qualification. These findings are consistent with those in the 2016 Statistics on Post-School Education and Training report. The report reveals that of the 80.4% of students who were undergraduate students, as mentioned above, 54.3% were studying for a degree, while only 26.1% were studying for a degree (Statistics South Africa, 2017).

7.2 Females' perceptions of sports leadership and media role

7.2.1. Perceptions toward sports leaders

Table 2: female's aspirations toward sports leadership

My perception of a leader:	Mean	Std. Dev.
Is influenced by the gender of the leader.	1,78	0,915
Is influenced by the physical characteristics of the leader.	2,38	1,334
Is influenced by the leader's level of education.	3,67	1,028
Is influenced by the work experience the leader has.	4,03	0,864
Has been influenced by what I taught about leaders when I was younger.	3,38	0,951
Has been influenced by what I have experienced about leaders when I was younger.	3,65	0,817
Is that she/he can make a change.	4,46	0,664
Is that she/he earns a high salary.	2,48	0,991
Is that she/he works long hours.	3,14	1,164

An objective of the study was to investigate the perceptions of female sports students towards sports leaders in general. Most of the participants perceive that leadership is not influenced by gender ($M=1.76$, $SD=.915$), physical characteristics of the leader ($M=2.38$, $SD=1.334$), and level of salary ($M=2.48$, $SD=0.991$). The highest mean score ($M=4.46$, $SD=0.664$) stated that participants perceive that a leader can make a change. Here, the lowest standard deviation indicates that the respondent's response is not highly deviated or the perception of most of the respondents are similar. The respondents also believe that a leader is influenced by the work experience they have ($M=4.03$, $SD=0.864$). On the other hand, the respondents chose neutrality on their thought that leader works long hours ($M=3.14$, $SD=1,164$).

7.2.2. Media's role in influencing perceptions

Table 3 presents the results of the study participants' opinions on the statements relating to the media's role in influencing perceptions.

Table 3: Media's role in influencing perceptions

Media plays a role in:	Mean	Std. Dev.
The lack of media coverage of female sports leaders.	4,02	0,973
Making female sports leaders less visible than male sports leaders.	3,99	1,005
Making male sports leaders more visible than female sports leaders.	4,14	0,913
Promoting negative stereotypes towards female sports leaders.	3,56	1,094
Giving male athletes more media coverage than female athletes.	4,22	0,915
Giving male sports more media coverage than female sports.	4,29	0,807

Promoting sexist language and visuals towards female athletes.	3,45	0,905
Overemphasising the physical characteristics of female athletes.	3,76	0,987
Downplaying the sporting achievements of female athletes.	3,96	0,900

The results reveal that most of the statements score high regarding the mean, which indicates the participants' agreement with the assertions made regarding the media's role in influencing perceptions. The highest mean score of 4.29 belongs to the statement "Media plays a role in giving male sports more media coverage than female sports which reflects the participants' agreement with this statement. The lowest mean score of 3.45 reports that the participants neither agree nor disagree. That is, the participants display some neutrality towards the media's role in promoting sexist language and visuals toward female athletes. A careful analysis of the results indicates that only one of the statements in Table 3 reflects a mean score lower than 3.50. That is, they have a neutral perception of the media's role in promoting sexist language and visuals toward female athletes. This further indicates the participants' overall agreement with the statements regarding the media's role in influencing perceptions. Further, the highest standard deviation 1.094 indicate that the respondents have no similar perception of the media's role in promoting negative stereotypes towards female sport leaders

7.2.3. Perceptions of sports leaders within the context of South Africa

Another objective of the study is to investigate female sports students' perceptions of sports leaders within the context of South Africa. Table 4 presents the results of how sports leaders within the South African context are perceived by the participants.

Table 4: Perceptions of sports leaders within the context of South Africa

My perception of sports leaders in the context of South Africa is that:	Mean	Std. Dev.
There are few female sports leaders in South Africa.	4,29	0,577
There are few female sports leaders in Africa.	4,07	0,649
There are few female sports leaders in the rest of the world.	3,54	0,990
Leadership positions in sports are dominated by males.	4,40	0,759
Sports organisations are led by males.	4,36	0,806
Females are side-lined from acquiring decision-making and sports leadership positions.	3,96	0,877

Table 4 shows that the mean scores across this section are all higher than 3.50, indicating the participants' strong agreement with all statements. The lowest mean score of 3.54 relates to the statement, "My perception of sports leaders in the context of South Africa is that there are few female sports leaders in the rest of the world." This means score size, although it reflects an agreement to the statement by the participants in comparison to the rest of the mean scores, could possibly indicate a lack of awareness by the participants of the presence of internationally based female sports leaders. The highest mean score of 4.40 indicates that the leadership positions in sports are dominated by males. That is, over 90% of the participants are of the perception that leadership positions in sports are dominated by males. The second highest mean score of 4.36 indicates the perception that sports organisations are predominantly led by males. Similarly, the mean score of 4.29 suggests that the participants hold the perception that there are few South African sports leaders.

7.3 Perceived barriers toward pursuing or acquiring sports leadership positions

Table 5 details the results pertaining to the barriers that exist in the pursuit or acquisition of sports leadership positions, as perceived by the participants in the study.

Table 5: Perceived barriers toward pursuing or acquiring sports leadership positions

I believe that:	Mean	Std. Dev.
Sport is not gender neutral.	3.92	1.304
It is natural for males to be sports leaders.	2.49	1.209
It is unnatural for females to be sports leaders.	1.65	0.962
Careers in sports leadership are only suitable for males.	1.33	0.608
Females can also pursue leadership positions in sports.	4.88	0.331
Males have more opportunities to become sports leaders.	3.99	0.974
Females have fewer opportunities to become sports leaders.	3.94	1.008
There are more male sports leaders than female sports leaders.	4.32	0.700
The promotion of the male gender over the female gender creates inequalities in sport.	4.30	0.632
A male-masculine culture is promoted over a female-feminine culture in sport.	4.09	0.792
An invisible barrier (glass ceiling) prevents females from reaching leadership positions in sports.	3.86	0.913
Gender stereotypes indicate which leadership positions are suitable for males and females (e.g. Males = CEO; females = receptionist).	3.97	1.094
The use of sexist language discourages females from pursuing or acquiring leadership positions in sports.	3.93	0.938
Self-limiting behaviours of females prevent them from pursuing or acquiring leadership positions in sports.	3.70	0.915
The demands of motherhood prevent females from pursuing or acquiring sports leadership positions.	3,06	1,221
The absence of professional networks specifically for females prevents females from pursuing or acquiring sports leadership positions.	3,67	0,863
The lack of female leader role models creates an unrealistic goal for females who aspire to become sports leaders.	3,75	1,051
Established female sports leaders prevent other females from acquiring leadership positions in sports for various reasons.	2,61	0,995

Table 5 shows that the lowest mean score, 1.33 revealed that the respondents did not believe that careers in sports leadership are only suitable for males. This is followed by a mean score of 1.65, which reflected that they believe that it is not unnatural for females to be sports leaders. The participants strongly disagree with the statement as well. The strong disagreement by the participants, between the two statements which reflects the two lowest means, shows a consistency in the participants' perceptions when the highest mean score in Table 5 is reflected upon. The highest mean score of 4.88 stated that the participants' perceptions toward females is that females were being able to pursue leadership positions in sports. This reveals that the participants believe that females can also pursue leadership positions in sports and that careers in sports leadership are not only suitable for males. It is interesting to note that just only a few of the statements in Table 5 reflect mean scores of over 3.50, suggesting that there is a significant agreement among the participants towards the statements relating to the perceived barriers to pursuing or acquiring sports partnership positions. Besides, a mean score of 3.99 suggests that the study participants agree with the statement that males have more opportunities to become sports leaders.

The statement "I believe that a male-masculine culture is promoted over a female-feminine culture in sport,". It has a mean score of 4.09 which reflects a strong agreement by the participants to this statement. The third statement, which measures the participants' belief towards the promotion of males over females, reveals creating inequalities between the genders in sport. A mean score of 4.30 shows that the female sports students believe that the promotion of the male gender over the female gender indeed creates sporting inequalities. Lastly, a statement that reads, "I believe that there are more male sports leaders than female sports leaders" indicates the respondent's agreement with the mean score of 4.32, which is also the second highest mean score under this construct. It is worthy to

note the mean score of 3.06, suggests that the participants display a certain level of neutrality towards the statement, “I believe that the demands of motherhood prevent females from pursuing or acquiring sports leadership positions.” This is possibly attributed to the fact that the participants have not experienced motherhood yet, and therefore are unable to objectively respond.

7.4 Aspirations toward sports leadership

Table 6 details the results of female sports on students’ aspirations towards careers or positions in sports leadership.

Table 6: Aspirations toward sports leadership

My <u>aspirations</u> toward careers in sports leadership.	Mean	Std. Dev.
Careers in sports leadership seem exciting, therefore I aspire to become a sports leader in the future.	4,01	0,860
Careers in sports leadership seem enjoyable therefore I aspire to become a sports leader in the future.	3,92	0,799
I have an interest in becoming a sports leader in the future.	4,06	0,818
My goal is to become a sports leader in the future.	3,87	0,931
I am working towards becoming a sports leader in the future.	3,88	0,949
I have the capabilities and skills to become a sports leader.	4,16	0,701
I am interested in becoming a sports leader because I’m attracted to the salary associated with the leadership position.	2,84	1,017
I am interested in becoming a sports leader because I want to make a change.	4,25	0,830
I am interested in becoming a sports leader because there are few female sports leaders in South Africa and the rest of the world.	3,82	1,010
I am not put off from becoming a future sports leader by the long working hours required from a sports leader.	3,71	0,951
I am not put off in becoming a future sports leader by the gender stereotypes associated with female sports leaders.	3,90	0,872
I am not put off by the media in becoming a future sports leader.	3,93	0,857
I am not put off by the barriers that prevent me from becoming a sports leader in the future.	3,99	0,770
I have a mentor who is assisting me to develop into a sports leader in the future.	2,71	1,127
I want to become a role model when I become a sports leader.	4,40	0,702

The mean scores in Table 6 range between 2.71 and 4.40. The lowest mean score of 2.71 indicates that over 50% of the participants disagree with the statement, “I have a mentor who is assisting me to develop into a sports leader in the future.” The second lowest mean score 2.84, relates to a statement, “I am interested in becoming a sports leader because I am attracted to the salary associated with the leadership position”, shows disagreement by the participants. It is however worthy to note that 38% of the participants express some neutrality towards the attractiveness of the salary associated with being a sports leader. This result is consistent with another result, whereby over 50 per cent of the participants do not believe that leaders earn a high salary. Therefore, if this is their belief, the associated salary of being a leader won’t necessarily be a motivating factor for them aspiring to become future sports leaders.

90% of the female sports students “... want to be role models when they become sports leaders.” This statement reflects the highest mean score of 4.40, which indicates that there is a strong agreement toward this statement among the participants. Only one per cent of the participants disagree with this statement, while just over 9 per cent are impartial to the desire of becoming role models when they are sports leaders in the future. The remaining statements, each reflect a mean score of over 3.50. This indicates that the participants have an overall moderate to a strong agreement with the statements. An

analysis of the statements and the results reveals that there is a strong ambition by the female sports students to become sports leaders.

7.5. Differences in perception and aspiration between different levels of study, academic courses, and sports leadership

To better understand the perceptions and aspirations of female sports students towards sports leadership, the study sought to establish if there is a significant difference in perceptions towards sports leadership between undergraduate and postgraduate female sports students. Also, it tends to establish if there is a significant difference in perceptions towards sports leadership among female sports students in different academic courses. Accordingly, three hypotheses relating to the aforementioned objectives were postulated and each hypothesis is broken down into sub-hypotheses.

7.5.1 Differences in levels of study

The study applies a t-test analysis to test the statistical significance of the difference in the perceptions and aspirations of undergraduate and postgraduate female sports students. The results of the test are presented in Table 4.8 and discussed below.

Table 8: One-way ANOVA Test – Academic courses

		Sum of Squares	Df	Mean Square	F	Sig. (p-value)
Perception of leaders	Between Groups	0,246	2	0,123	0,339	0,713
	Within Groups	33,716	93	0,363		
	Total	33,962	95			
Perception of sports leaders in the context of South Africa	Between Groups	0,916	2	0,458	1,614	0,205
	Within Groups	26,376	93	0,284		
	Total	27,292	95			
Aspirations toward careers in sports leadership	Between Groups	9,945	2	4,972	24,192	0,000
	Within Groups	19,115	93	0,206		
	Total	29,060	95			

The results from the one-way ANOVA test in Table 8 show that the p-values, which are tested at a significance level of 0.05, reflect that there is no significant statistical difference in the perceptions of different groups of female sports students. There is however a significant statistical difference in the aspirations of female sports students studying different academic courses, which is reflected in the p-value of 0,00. The result indicates that there was no significant statistical difference in the participants' perceptions of leaders, who are studying different courses. Besides, the result shows that there is no significant statistical difference in the participants' perceptions, who are studying different courses, regarding sports leaders in the context of South Africa. Also, there is a significant statistical difference in the participants' aspirations, who are studying different courses, in sports leadership. When an ANOVA test concludes that a significant statistical difference exists within a data set, a post-hoc test needs to be done to establish which groups of students are significantly different from the other groups. This is done using the Dunnett T3 Post Hoc Test.

7.5.2 Academic courses and aspirations toward sports leadership

The results from the one-way ANOVA test revealed that there is a significant statistical difference in the aspirations of the female sports students who are studying different academic courses, towards careers in sports leadership. Therefore, the purpose of this test is to establish amongst which groups the statistical difference occurs. The results from the posthoc test are presented in Table 9.

Table 9: Dunnett T3 Post-hoc Test – Academic courses and aspirations towards sports leadership

Hypothesis	Variables	Items	Mean difference	Std. Error	Sig. (p-value)	95% Confidence Interval	
						Lower Bound	Upper Bound
Aspirations toward careers in leadership	Sport Management	Sport Science	0,19186	0,10106	0,198	-0,0723	0,4560
		Biokinetics	0,71449	0,11976	0,000	0,4175	1,0115
	Sport Science	Sport Management	-0,19186	0,10106	0,198	-0,4560	0,0723
		Biokinetics	0,52263	0,13789	0,002	0,1778	0,8674
	Biokinetics	Sport Management	-0,71449	0,11976	0,000	-1,0115	-0,4175
		Sport Science	-0,52263	0,13789	0,002	-0,8674	-0,1778

Hypothesis 3 is accepted because there is indeed a significant statistical difference in the aspirations of female sports students studying different academic courses, towards sports leadership. This is reflected in all the p-values in Table 9 that are below 0.05. Table 9 also shows that there was no statistically significant difference in the aspirations towards careers in sports leadership, of the female sports students studying sports management and sports science. This lack of significant difference is expressed in the p-value of 0,198, which is tested at a significance level of 0.05. A significant difference in aspirations towards careers in sport leadership exist between female sports students studying sports management and biokinetics, and female sports students studying sports science and biokinetics, as indicated by the p-values 0.000 and 0.002 respectively in Table 9. Similarly, there are significant statistical differences exist between the aspirations of female sports students studying sports management and those studying biokinetics and between those studying sports science and those studying biokinetics.

7.5.3 Discussions

The aim of this study was to investigate the perceptions and aspirations of female sports students toward sports leadership. Ultimately, the reporting of the perceptions and aspirations of female sports students can potentially enable sports institutions to re-evaluate their organisational values to be more inclusive and receptive to females. In addition to this, sports organisations may be compelled to restructure their recruitment and selection processes for leadership positions to be fair and transparent. These strategies can all be implemented to address the underrepresentation of female sports leaders. It is revealed in the background of the study that most leadership positions in national and international sports organisations are largely occupied by males, and that females remain marginalised across these roles (Spoor & Hoye, 2013). The study’s problem statement further articulated those females are often faced with barriers that ultimately hinder their career development and growth (Betzer-Tayar et al., 2017; Deaconu & Rasca, 2015). The literature review of the study highlighted the media’s role in influencing perceptions, particularly regarding sports and sports leadership. An example of how the media does this, is by prioritising media coverage of male sports leaders over female sports leaders, making the already few female sports leaders less quantifiable (Goslin & Kluka, 2014:94). Existing literature regarding the aspirations towards careers in sport was also explored in the review. A key assertion that was made regarding these aspirations toward sports leadership positions was that males are the ones who generally target leadership positions in their career paths (Aman et al., 2018:154).

The study reveals that the participant’s perception of a leader is neither influenced by an individual’s gender nor physical characteristics. The participants’ most prominent perception of a leader is influenced by the leader’s ability to make a positive change. The study further found that female sports students are of the view that there are few female sports leaders in South Africa. They further perceive leadership positions in sports to be dominated by males, because sports organisations are mostly led by males. Besides, the study found that the participants hold relatively negative perceptions of the role that the media plays in influencing people’s perceptions. The participants are of this view because of the media’s role in giving male sports more media coverage than female sports, offering male athletes more media coverage than female athletes, and by making female sports leaders less visible than male sports leaders through their lack of media coverage. The study also revealed that female sports students do not perceive careers in sports leadership to be only suitable for males. They

hold the strong sentiment that females can also pursue leadership positions in sports, like their male counterparts. Parallel to this sentiment, the participants believe that there are more male sports leaders than female sports leaders.

The study found that female sports students are of the perception that there are few female sports leaders in South Africa. They further perceive leadership positions in sports to be dominated by males, because sports organisations are mostly led by males. Also, the participants emphasise an overall positive perception of the importance of academic qualification in relation to sports leadership. Female sports students believe the following in terms of their academic qualifications: that it is preparing them for a future career in sports leadership because it is helping them develop the necessary skills and capabilities, and that it will enable them to make a positive change when they become sports leaders in the future. Moreover, the study reveals three prominent views by the participants in terms of their ambition toward careers in sports leadership. Firstly, those female sports students have an interest in becoming sports leaders because they want to bring about change. Secondly, they aspire toward careers in sports leadership because they want to become role models when they become sports leaders in the future. Lastly, most of the participants do not have a mentor who was helping them develop into future sports leaders.

The study found that there is indeed no significant statistical difference in the perceptions and aspirations of undergraduate and postgraduate female sports students. This implies that both undergraduate and postgraduate female sports students in the tertiary institution hold similar perceptions towards leaders and, sports leaders within the context of South Africa. Furthermore, they also have similar aspirations toward careers in sports leadership. The study found that there is indeed no significant statistical difference in the perceptions of the participants studying different academic courses, regarding sports leadership. This means that the female sports students studying sports management, sports science and biokinetics, all hold similar views towards leaders and sports leaders within the context of South Africa. There is, however, a statistical difference that is observed in the aspirations of female sports students studying different academic courses, towards sports leadership. The study found that a significant statistical difference exists in the aspirations of the female students studying biokinetics, towards sports leadership when compared to the aspirations of those studying sports management and sports science. There is also no statistical difference exists amongst sports management and sports science female sports students' aspirations towards sports leadership.

8. Managerial implications

The study focused on the perceptions and aspirations of female sports students towards sports leadership, and therefore the study did not reflect on the perceptions of male sports students. However, the study did not examine the perceptions and aspirations of female students studying for other university academic qualifications or studying sports at other institutions in the country. The reported perpetual underrepresentation of female sports leaders was the catalyst for the study, and the decision to focus on sports students was motivated by the fact that universities are in the line of work of developing the next generation of sports leaders through their sports programmes (Wesse & Beard, 2012). It is worthy to note the study was conducted on female sports students who were all studying at the same South African tertiary institution, and therefore the results may potentially be different should a similar research study be conducted on female sports students studying in another tertiary institution in South Africa. The results of this study are therefore limited to the institution studied and may not be generalised to other universities without taking their environment into context. The data is representative of current female sports students and therefore the findings of the study may not be generalised to females who are already sporting professionals in the sports industry, as they may hold different perceptions and aspirations towards sports leadership, given their exposure to the practicalities and realities of the sports industry.

Lastly, the lack of previous studies in sports leadership, particularly within the South African context, also proves to be a limitation in terms of gaining richer insights into this research area. Further studies need to be conducted on more female sports students studying in different South African universities to establish a holistic picture of the perceptions and aspirations of female sports students towards

sports leadership. Future research should also be carried out on female sports students over a longer period to establish how their perceptions of sports leadership potentially evolve from their final year of study to a few years after entering the workforce. Furthermore, future research can test and establish whether this evolution in their perceptions has an impact on their intention to pursue sports leadership positions.

9. Conclusion and recommendations

Female sports students have an overall agreement with the statements, pertaining to the perceptions of sports leaders, in the context of South Africa. They believe that sports leadership positions in sport are dominated by males and that sports organisations are mostly led by males. They believe that they are few female sports leaders in South Africa and that females are side-lined from acquiring decision-making and leadership positions in sports. Despite these potentially discouraging beliefs held by female sports students, they still aspire to be leaders in the future. It's important that strategies on how to best absorb those who aspire towards a career in sports leadership are developed to address the overall underrepresentation of females in sports leadership positions. An example of a strategy of this nature includes more meaningful internship opportunities for female graduates in sports organisations, which have the potential to lead to permanent employment upon successful completion.

The study indicates that the two groups of female sports students at different levels of study, namely undergraduate students, and postgraduate students, do not hold significantly different perceptions in terms of leaders in general, and South African sports leaders. This demonstrates that both groups have similar understandings of what a leader is and hold similar impressions of sports leaders within the context of South Africa. The study further reveals that there are no significant differences in the aspirations of undergraduate and postgraduate female sports students, towards sports leadership. This implies that both undergraduate and postgraduate hold similar ambitions towards pursuing careers in sports leadership. Given these revelations, the recommendation is that there should be no differentiation in discussions pertaining to sports leadership, and the lecturing of sports leadership-related modules to undergraduate and postgraduate sports students. In addition to this, both undergraduate and postgraduate students should be groomed toward careers in sports leadership, given the similarities in their appetite and ambition for careers in sports leadership.

Literature cautions us of the fact that media content is produced and edited by a host of media practitioners (i.e. publication editors, journalists, bloggers, commentators, influencers) in order to achieve certain goals (Coakley & Burnett, 2014). These goals range from achieving financial profits to rallying support behind a specific team. Therefore in order to ensure fairness in media reporting and overcome bias in media coverage, leaders in media institutions (i.e. television and radio broadcasters, written publications, online platforms) should mandate their staff with strategies such as (1) unrelenting profiling of females in sport, (2) giving prominent media coverage to good performance in sport, regardless of gender, (3) having staff that will specifically and consistently focus on covering females in sport, (4) encouraging males to take an intentional interest in females in sport, or (5) creating platforms or initiatives aimed at giving females in sport a voice in terms of visibility.

The results of the study indicate that the participants do not believe that careers in sports leadership are only suitable for males and that females could also pursue leadership positions in sports. They also did not believe that it is natural for males to be sports leaders. These results relate to the perceived barriers that exist in the pursuit or acquirement of sports leadership positions. A solution on how to overcome the existing barriers that prevent female sports students from pursuing or acquiring leadership positions in sports remains in female advocacy and the application of its by-products thereof. Gender equality policies that challenge the status quo by mandating organisations to shift in their social values and structure, to be more inclusive of females, will be functional in creating opportunities for females who wish to enter the industry and acquire top sports leadership positions. On the other hand, universities, and lecturers alike, have the responsibility of structuring their academic programmes in such a way that it will provide the necessary skills and knowledge that will allow for university students to develop into future leaders who are educated and knowledgeable. They can do this by benchmarking the scope of their programmes against similar programmes and

qualifications that other higher learning institutions all over the world offer. They can further form relationships with sports organisations to gather information on skills shortages in the industry, and then fill these gaps by teaching sports students those skills. These new programmes will hopefully assist in making sports students more employable upon graduating from university.

Equation Modelling

Abstract

Empirical findings affirm the complex relationships between transport infrastructure, economic development, and environmental degradation. Most studies scrutinising the relationship among these variables have focused on economic growth instead of socioeconomic development. This paper analyses the relationships between transport infrastructure, socioeconomic development, and environmental degradation. The findings show that transport infrastructure stimulates socioeconomic development but leads to environmental degradation. Socioeconomic development increases environmental degradation and transport infrastructure. Environmental degradation adversely affects socioeconomic development. Further analyses reveal a significant indirect effect (55%) of transport infrastructure on environmental degradation through its contribution to socioeconomic development. A challenge for policymakers is that 45% of the total effect of transport infrastructure on environmental degradation is not associated with its contribution to socioeconomic development. Policy interventions to abate the effect of transport infrastructure on environmental degradation that has nothing to do with the socioeconomic benefits should be the priority.

1. Introduction

Transport infrastructure in Africa is lagging behind other regions in the world. The Export-Import Bank of India (2018) maintains that this problem is more pronounced in the rural areas, where the density of the road network is low, and the existing roads lack regular maintenance and upgrades. Policymakers consider transport infrastructure shortages as an obstacle to Africa's growth trajectory, as mobility and integration on the continent and to the rest of the world, is restricted. African governments face budget constraints that have grown the need for effective transport infrastructure policies to promote private investment (IDEP, 2015), which involves the critical role of the African Development Bank (AfDB). Transport infrastructure development remains the major priority underpinning the AfDB's assistance; the financial commitment of AfDB increased more than six-fold between 2000 and 2011 (IDEV, 2014).

The investment in transport infrastructure can help to address the non-stop demand for transport (TEST Network, 2012). Practitioners and policymakers are increasingly concerned with the balance required to increase the transport infrastructure to improve socioeconomic development, whilst minimising environmental degradation. Transportation is among the major sources of pollution, which threatens sustainable development. Many studies focus on the paradoxical nature of the relationship of transport, environmental degradation (often presented by growth in CO₂ emissions), energy consumption and economic growth. Early theories, such as Rostow's (1956), realised the necessity of social overhead capital, like railway- and road infrastructures in economic development. While empirical studies (Hlotywa & Ndaguba, 2017; Cigu, Agheorghiesei, Toader, 2018) support transport's positive contribution to economic growth, other studies, such as those by Vlahinić, Skender and Mirković (2018) and Njoh (2012), found evidence against hypothesis (particularly concerning the railways). In terms of the strength of roads to stimulate growth, Bryceson, Bradbury and Bradbury

(2008:459) stated that "... there is no consensus on precisely how roads become critical to economic development and if they actually warrant the faith vested in them."

The major problem is whether or not the transport infrastructure can boost socioeconomic development. Yet governments are not only challenged by whether or not transport infrastructure development yields significant socioeconomic returns but also the effect on the environment, including CO₂ emissions, soil erosion and climate change. Empirical studies have generally supported the significant contribution of transport to CO₂ emissions (Saidi & Hammami, 2017; Steenhof, Woudsma & Sparling, 2006). The deterioration in environmental quality, largely from greenhouse gases, has raised concern regarding global warming. Besides transport, the literature shows that environmental degradation or rising CO₂ emissions is mainly caused by economic activity. Several studies have investigated the Environmental Kuznets Curve (EKC) hypothesis. This hypothesis claims that the association between economic growth and environmental degradation is an inverted-U-shaped. The validity of the EKC hypothesis remained questionable in the literature, with empirical evidence supporting (Borhan, Ahmed & Hitam, 2012.; Charfeddine & Mrabet, 2017) or opposing (Adu & Denkyirah, 2017; Beşe & Kalayci, 2019; Inglesi-Lotz & Bohlmann, 2014) the hypothesis. With regards to the direction of causality, Saidi and Hammami (2017) found evidence of bidirectional causality between CO₂ emissions and economic growth in high-income states, but a unilateral causation from economic growth to environmental degradation in the low- and medium- income group.

Despite the vast literature on transportation, CO₂ emissions and economic growth, there exist outstanding issues that need to be addressed. Studies are lacking that have scrutinised the associations among transportation, CO₂ emissions and socioeconomic development. Issaoui, Toumi and Touili (2015) highlighted that studies on the effect of CO₂ emissions on welfare are limited, as are the social aspects (e.g., poverty, inequality, and life expectancy) in the connections among transport, CO₂ emissions and a country's development.

Given the hypothesised significant effects of transport on both environmental degradation and economic development, we are not aware of studies that have applied structural equation modelling (SEM) to distinguish the direct and indirect effects of transport infrastructure development on environmental degradation, with socioeconomic development treated as a mediator. Thus, another knowledge gap exists in how transport infrastructure may influence CO₂ emissions through its contribution to socioeconomic development. Consequently, to handle these deficiencies, the aim of this article is to investigate the relationships between transport infrastructure, socioeconomic development, and environmental degradation. The socioeconomic development measure accounts for economic growth (i.e., change in income per capita) and poverty levels in 33 African countries. Therefore, in terms of contribution, the first novelty of this study is the construction of a socioeconomic development measure that simultaneously accounts for economic growth and poverty levels in the sampled countries. Besides the commonly estimated transport, environmental degradation, and economic growth nexus, we substitute socioeconomic development for economic growth. We also built a transport infrastructure measure that captures the quantities of roads and airports. Another novelty of this research is the mediation analysis using SEM to distinguish the indirect effect of the transport infrastructure on CO₂ emissions (via socioeconomic development) from the direct effect. Figure 1 depicts the proposed model and the hypotheses of interest.

This study is the first of its kind to provide a comprehensive analysis of how transport infrastructure, socioeconomic development and environmental degradation are connected based on the GMM and SEM. It concludes with a proposed intervention model that does not only show the positions of action but also the ones that need greater attention.

This study is organised as follows: section one introduces the research, section two argues the problem to be investigated, section three presents the research objectives while section four shows the hypotheses, section five reviews the literature, section six discusses the research methods, section

seven presents and discusses the findings, section eight provides the key implications and recommendations derived from the findings, and section nine concludes the research.

2. Problem Investigated

The complex nature of the relationship between transport infrastructure development, socioeconomic development and CO₂ emissions is the problem to be investigated in this research. As detailed in the introduction, there are limited studies on the topic that focused on socioeconomic development, but rather economic development. Moreover, even those that applied economic development, there are mixed findings whether it is significantly influenced by infrastructure development. On the downside, transport has been among the notable sectors responsible for CO₂ emissions. Empirically, the extent to which transport infrastructure development can lead to increased CO₂ emissions but through its contribution to socioeconomic development (indirect effect) has not been properly interrogated. Subsequently, this study aims to narrow these research gaps by using the SEM technique to untangle the complex nexus between transport infrastructure development, socioeconomic development, and CO₂ emissions in Africa.

3. Research Objectives

This section presents the main objectives of this study. Firstly, this study investigates the effect of transport infrastructure development on socioeconomic development. Secondly, the effect of socioeconomic development on CO₂ emissions is investigated. Thirdly, this research ascertains the effect of transport infrastructure development on CO₂ emissions. Lastly, this study examines the indirect effect of transport infrastructure development on CO₂ emissions through its contribution to socioeconomic development.

4. Hypotheses

It seems there is a desirable direct path from Transport infrastructure (TRANS) to socioeconomic development (SEDev) that must be promoted, but it is accompanied by an undesirable direct path from TRANS to CO₂ emissions (CO₂) plus another hidden undesirable indirect path of the effect of TRANS on CO₂ via SEDev. Figure 1 shows the hypothesised model.

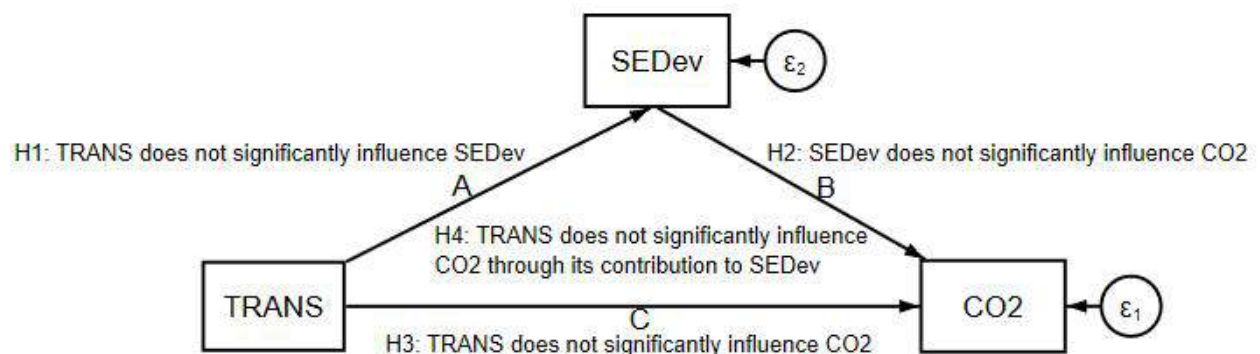

Figure 1. The estimated proposed model
Source: Own compilation

Given this argument, the following null hypotheses were formulated for the study:

- H₁: TRANS does not significantly influence SEDev
- H₂: SEDev does not significantly influence CO₂
- H₃: TRANS does not significantly influence CO₂
- H₄: TRANS does not significantly influence CO₂ through its contribution to SEDev (indirect effect)

5. Literature Review

This section contextualises transport infrastructure, socioeconomic development, and environmental degradation in Africa. This is followed by a review of past studies on the topic.

5.1. Context of Transport Infrastructure in Africa

5.1.1 Transport infrastructure

The Export-Import Bank of India's (2018) report indicated that roads dominate the transport sector in many African states, inclusive of 80-90% of freight and passenger traffic. Approximately US\$200 billion of trade on the continent is transported using the region's trunk road network, encompassing strategic trading corridors, which connect deep seaports to economic hinterlands. Azolibe and Okonkwo (2020) showed that SSA's network of roads encompasses strategic trading corridors that do not surpass 10000 km and carry approximately US\$200 billion worth of trade every year.

While road infrastructure plays a fundamental role, road density remained low in Africa. According to Azolibe and Okonkwo (2020), road density in SSA and the Middle East & North Africa (MENA) was 0.002 km/sq km and 0.006 km/sq km in 2014, respectively. In the same year, the road density was slightly higher in other less developed areas, for example, East Asia and the Pacific (0.007), Latin America & the Caribbean (0.007) and South Asia (0.016). SSA is the only region where road density has fallen over the past 20 years (World Bank, 2017). According to the AfDB (2018), road freight tariffs in Africa are more than double the tariffs in the United States, and the time to travel along major export corridors is 2-3 times higher than those in Asia. Another key issue raised is that many roads in Africa are unpaved, isolating people from economic opportunities, transport corridors, trade hubs, health, and basic education centres. Moreover, the safety of roads is another problem, resulting in high fatalities rates.

Besides the poor road network, many ports in SSA face problems such as low capacity, inefficiency and poorly equipped (Azolibe and Okonkwo, 2020; Foster and Brice~no-Garmendia, 2009). Africa has a total rail network of 82 000km, of which 84% are operational, while the rest are not functional for various reasons, including natural disasters, war, lack of funds and general neglect (Export-Import Bank of India, 2018).

As for the performance of air transport, Africa is behind many other regions. The Export-Import Bank of India (2018) showed that despite Africa having more than 4 000 airports and airfields, the majority are not up to standard and do not meet the International Civil Aviation Organization's recommended practices. Furthermore, the African aviation sector faces many other challenges, including unpaved runways (only a quarter are paved), a lack of human and physical resources, a lack of transit facilities, and limited connectivity. Moreover, the share of Africa in the global aviation industry is smaller than that of other regions, contributing about US\$72.5 billion to Africa and supporting 6.8 million jobs in the continent (Export-Import Bank of India, 2018).

The poor transportation networks in Africa impede the ability of manufacturers to capitalise on regional economies of scale (Azolibe and Okonkwo, 2020), and lead to 30-40% extra costs for commodity trading among African states (OECD, 2019). The shortage and poor state of transport infrastructure in many African countries are among the obstacles to socioeconomic development.

5.1.2 Socioeconomic development

AfDB (2020) indicated that the economic outlook of Africa improves continuously, with the continent's real GDP growth projected at 3.4% in 2019, anticipated to rise to 3.9% in 2020 and 4.1% in 2021. Ghana, Rwanda, Tanzania, Ethiopia, Benin, and Côte d'Ivoire were mentioned among the world's 10 fastest growers. Irrespective of the promising growth prospects, it is not clear how the COVID-19 pandemic may have adversely affected Africa's future economic performance.

For instance, the World Bank (2020) report shows that despite SSA countries controlling the spread of coronavirus, the pandemic is persistently taking lives and adversely affecting economic undertakings, which is expected to drop significantly in 2020. It is argued in this report that this significant slump in economic undertakings will lead to more than US\$115 billion of output losses in 2020 due to poor investment and domestic consumption that follow the COVID-19 control measures. The World Bank expected African countries to revitalise in 2021, but the countries will experience varying growth rates, with poor recovery expected in the case of South Africa. The total growth in southern and

eastern Africa is predicted to average 2.7%, and about 1.4% in the central and western African regions (World Bank, 2020).

Despite the impressive growth rate in Africa, it has not been adequate to address the unemployment and poverty challenges (Pityana, 2019). In the case of SSA, one out of four people is undernourished (Adzawla, Sawaneh & Yusuf, 2019; FAO, 2015). In this regard, the AfDB (2020) stipulates that only a third of African economies achieved inclusive growth, whereby economic growth was associated with a reduction in poverty and inequality. According to the World Bank (2020), the challenge of the COVID-19 pandemic could thrust about 40 million African people into extreme poverty. Consequently, addressing social issues such as poverty and inequality in Africa worries policymakers. This is why this study is concerned about socioeconomic development rather than economic growth per se.

5.1.3 Environmental degradation

Section 2.1 and 2.2 reveal that Africa has a major gap to close in terms of transport infrastructure development and socioeconomic development. With increasing concern for the environment, boosting transportation and stimulating socioeconomic development, is insufficient, but doing so in a sustainable way (including lowering CO₂ emissions (CO₂) and greenhouse gases) should be the priority. Statistics show that Africa is not a major contributor to CO₂ emissions from industry and energy sources (responsible for only 2% to 3% of world emission; but the continent is a significant source of greenhouse gas emissions (United Nations, 2006). Although Africa is the lowest producer of CO₂ emissions, it is threatened by climate change, with an increased risk of droughts, floods and waterborne diseases. Adzawla et al. (2019) argue that CO₂ emissions are the major source of climate change.

Hogarth, Haywood and Whitley (2015) made crucial observations in the case of SSA, including that (i) transportation emissions are produced largely by motor vehicles powered by oil-fuelled internal combustion engines, (ii) Extending road networks often open access to forested areas for exploitation, resulting in GHG emissions from forest degradation and deforestation. (iii) Except for South Africa, countries in SSA have no vehicle manufacturing industry, and most vehicles are imported into the continent, usually second-hand. The design, age and condition of these vehicles influence the quantity of fuel consumption and gas emissions produced (fuel efficiency is poor). Despite these factors, Africa's global share of greenhouse emissions will remain lower than other continents. However, emissions are problematic for sustainable development.

Information concerning the relationship between economic development and greenhouse gas emissions is limited in SSA (Adzawla et al., 2019). This paper argues that an even more critical problem is the lack of knowledge about the association between socioeconomic development and CO₂ emissions in Africa.

5.2. Review of past studies on the topic

There are two interesting views about the CO₂ emissions versus economic development nexus as shown in Issaoui et al. (2015). An economic view suggest that CO₂ emissions are a by-product of strong economic development and value-added processes. An environmental view suggests that sustainable development could not be built in polluting industries since it is achieved at the cost of social welfare. Therefore, it is crucial to consider the adverse effects of emissions on health, the environment and climate, among other aspects. Transportation is among the major contributors to CO₂ emissions, despite its role in facilitating economic activity. At least three distinct areas of literature exist concerning transport, economic growth, and environmental degradation/CO₂ emissions. Many studies consider economic growth instead of socioeconomic development.

The first aspect focused primarily on the effect of transport on economic development and/or vice versa. Early theories, such as Rostow's (1956) theory of economic growth, emphasised the importance of social overhead capital, such as roads and railways to economic development. Canning and Fay (1993) showed that transport infrastructure has moderate rates of returns in less-developed countries,

normal rates in developed countries and extraordinarily large returns in industrialised countries. This is among the earlier studies that showed varied returns of the transportation sector across various groups of economies. Bryceson et al.'s (2008) results indicated that the improvement of roads in the Ethiopian remote areas could speed-up the expansion of social-service provision although, those roads were inadequate to improve mobility in rural areas because the poor do not have motor vehicles.

Cigu et al. (2018) scrutinised the effect of transport infrastructure on economic performance in 28 European Union countries. They found transport infrastructure to have a significant impact on economic growth. Vlahinić et al. (2018) analysed the association between the transport (road and rail) infrastructure and growth in the Central and Eastern European countries. Their findings suggested that rail infrastructure investment can negatively affect economic growth, while roads showed positive effects.

In Sub Saharan Africa, Njoh (2000) analysed the association between the transport infrastructure (road density per capita) and economic growth. They found these two variables to have a positive relationship, which was more robust for roads in good condition. Moreover, in the case of East Africa and the Indian Ocean, Njoh (2012) observed a positive association between transportation (represented by different forms of transport infrastructure) and development. However, the research also found that railway infrastructure negatively impacted development, owing to neglect and insufficient utilisation.

Boopen (2006) examined the economic role of transport in Sub Saharan Africa and in small island developing states (SIDS). Their results indicated that transport contributed significantly to economic growth. Compared to the overall capital stock, the productivity of capital for SSA economies was stronger, while for the SIDS, it was the same as the average productivity level. Studying the connection between investment in road transport and economic development in South Africa, the findings of Hlotywa and Ndaguba (2017) revealed a positive association between these two indicators.

The second group of literature has focused on the connection between economic development and CO₂ emissions. Grossman and Krueger (1991) provided an important association between economic growth and environmental quality. They found that the pollutant concentration increased with the income at low levels of national income but declined with the income at higher levels. This was described statistically as evidence of an EKC relationship (Borhan et al., 2012). Similarly, the EKC hypothesis was supported by Charfeddine and Mrabet (2017) in the Middle East and North African (MENA) oil-exporting nations. Borhan et al.'s (2012) results also showed evidence of the EKC relationship in East Asian 8. On the contrary, the EKC hypothesis was not supported in other studies. Beşe and Kalayci (2019) did not confirm the EKC hypothesis in Kenya, Turkey, and Egypt. They concluded that these three countries can realise increased economic growth without pressure on the environment since causation does not exist between GDP and CO₂. Inglesi-Lotz and Bohlmann (2014) and Adu and Denkyirah (2017) are among the studies whose results did not support the EKC hypothesis in South Africa and West Africa, respectively.

Furthermore, Beyene and Kotosz (2020) found that the economic undertakings in East African states did not result in environmental degradation. Magazzino (2016) examined the association between economic growth, energy use and CO₂ emissions in ten Middle East economies. In six Gulf Cooperation Council (GCC) economies, their VAR estimate indicated a negative response of economic growth to CO₂ emissions. However, in four non-GCC states, both energy-use and CO₂ emissions did not influence economic growth. Kais and Sami (2016) demonstrated that GDP per capita significantly impact CO₂ emissions in North Africa, sub-Saharan Africa, Europe, Middle East and North Asia. The same result holds when the global panel was used. Farhani, Chaibi and Rault (2014) analysed the association among GDP, CO₂ emissions, trade, and energy consumption in Tunisia, using the ARDL approach. Their findings suggested long run bidirectional relationships between the indicators and a unidirectional causality from both energy consumption and GDP to CO₂ emissions in the short run. In the case of Tunisia, short run and long run unidirectional causal relationships from income to environment were demonstrated by Fodha and Zaghoud (2010).

Omri and Sassi-Tmar (2014) investigated three regional panels i.e. (i) Middle East, North Africa (MENA) and Sub-Saharan Africa (SSA), (ii) Central Asia and Europe, and (iii) Latin America and the Caribbean. The authors' findings showed a one-way causality from environmental degradation to economic growth, except for the MENA-SSA panel that revealed a two-way causality. Menyah and Wolde-Rufael (2010) establishes a one-way causal from emissions to economic growth in South Africa.

The problem of limited literature on the effect of CO₂ emissions on well-being was mentioned by Issaoui et al. (2015). They examined the link between CO₂ emissions and some social and economic indicators in the MENA countries. Their findings proved that for all the countries in the sample, energy consumption and economic growth determined the carbon emissions in the short-term. Per capita income revealed a negative impact on CO₂ emissions. Similarly, Aye and Edoja's (2017) findings suggested a negative effect of economic growth on emissions in the low growth regime, yet it was positive in the high growth regime. Jorgenson and Givens' (2015) results suggested that the impact of economic development on the carbon intensity of well-being (CIWB) increases with time, whereby CIWB describes the trade-offs between the well-being of humans and pressure exerted on the environment due to fossil fuel usage.

The other group of literature examined the association between transport, CO₂ emissions, energy use and economic growth. Saidi and Hammami (2017) analysed the associations between economic growth, freight transport and environmental degradation in seventy nations; they found evidence of feedback effects between transport and income. A two-way causal relationship was revealed between economic growth and environmental degradation in the high-income group, while one-way causation was observed from transport to environmental deterioration. For low-income and middle-income groups, environmental degradation was found to be largely influenced by freight transport and economic growth, but the effects were weak in the opposite direction and not significant.

In the MENA countries, Saidi, Shahbaz and Akhtar (2018) studied how transport infrastructure and energy consumption are related to economic growth. It was found that growth was influenced by transport energy consumption. Feedback effects were also revealed from transport infrastructure and transport energy consumption to a country's growth. Abdallah, Belloumi and Wolf (2013) scrutinised the relationship between road infrastructure, transport value-added, fuel price, road transport-related energy consumption and CO₂ emissions in Tunisia. The findings suggested that transport value-added, road transport-related energy consumption, transport CO₂ emissions and road infrastructure are related in the long-run.

Based on the OECD countries, Saboori, Sapri and Baba's (2014) findings indicated that there were significant positive long-run bi-directional causal relations found for CO₂ emissions versus road sector energy consumption, CO₂ emissions versus economic growth as well as road sector energy consumption versus economic growth. Ssali, Du, Mensah and Hongo (2019) examined the association between economic growth, energy use, environmental degradation, and foreign direct investment in SSA countries. They found that 1% of economic growth could lead to a 16% rise in CO₂ emissions, and the squared economic growth indicator diminishes CO₂ by 46%, which confirms the EKC theory.

Overall, despite many attempts with different techniques and the use of new datasets to understand the connection between transport, environmental degradation and economic growth, the nature of the relationship remains inconclusive. The relationship can be positive, negative or insignificant. This ongoing debate still calls for critical investigations. This paper has two major contributions to the body of literature: (i) it considers a socioeconomic development indicator instead of the commonly researched per capita GDP (or economic growth) indicator, and (ii) it considers a mediation analysis using the SEM approach.

6. Research Methodology

6.1. Data information

This research used the annual data of 33 African countries from 2000 to 2007³. The data included: per capita GDP (at constant 2010 USD); Human Poverty Index (HPI); roads (km); airports (number); CO₂ emissions, measured in metric tons per capita; capital stock (millions of U.S. Dollars) which based on purchasing power parities of the countries; domestic credit to the private sector, measured as a percentage of GDP; trade, measured as a percentage of GDP; population (total). The World Development Indicators' (WDI) 2019 database is the source of per capita GDP, trade, CO₂ emissions, population and domestic credit to the private sector. HPI data was obtained from the African Development Bank, while roads and airports variables were from the CIA factbook database. Capital stock was obtained from the FRED database.

The principal component analysis (PCA) was used to create a transport infrastructure (TRANS) indicator that accounts for road and airport infrastructures. A change in per capita GDP (GDP_k) (or economic growth) and HPI were used to construct a socioeconomic development (SEDev) indicator using PCA.

Therefore, PCA was used to construct both the socioeconomic development and transport infrastructure indicators. This approach is often used to reduce data whereby only critical information is reserved (Karamizadeh et al., 2013; Chakamera and Alagidede, 2016). This study retains only the first principal component (PC1) for transport infrastructure, while the first and second principal components were retained for SEDev. As for how many components should be retained, the criterion was to consider only components with eigenvalues more than the average of the eigenvalues (or greater than unit). However, for the SEDev principal component analysis, the second component (PC2) with an eigenvalue of 0.9553 was also retained. The reason for this was because the first principal component explained only 52% of the variation in data, leaving 48% unexplained. It was plausible to raise the proportion of the data explained by the new variables by considering both PC1 and PC2. Table A1 in the Appendix presents the PCA results for the selected components. The TRANS variable accounts for 87% of the dataset composed of the air and road infrastructures. To have a single measure of SEDev, for this study the average of PC1 and PC2 was taken; hence, creating a single index that represents socioeconomic development.

6.2. Models

Following other studies, such as that of Saidi and Hammami (2017), the major aim of this one was to examine the causal connections between transport, socioeconomic development and environmental degradation. Transport combines the features of road and airport infrastructure development; socioeconomic development combines economic growth and poverty; CO₂ emissions is the proxy for environmental degradation. This research initially investigated the effects of socioeconomic development and CO₂ emissions on transport infrastructure by estimating the following model:

$$\ln TRANS_{i,t} = \delta_0 + \ln TRANS_{i,t-1} + \delta_1 \ln SEDev_{i,t} + \alpha_2 \ln CO2_{i,t} + \alpha \ln \Gamma_{i,t} + \pi_i + \rho_t + \varepsilon_{i,t} \quad (1)$$

where $CO2_{i,t}$ denotes CO₂ emissions, $TRANS_{i,t}$ represents transport infrastructure that accounts for air and road infrastructures, $SEDev_{i,t}$ is socio-economic development, $\Gamma_{i,t}$ is a set of control indicators (capital stock, financial depth, trade openness, population), π_i controls for the specific effects of the countries, ρ_t controls for periodic (or time)-specific effects, and $\varepsilon_{i,t}$ is the disturbance term. We further estimate Equation (2) to ascertain the effects of transport and CO₂ emissions on socio-economic development.

³ Benin, Burkina Faso, Botswana, Burundi, Democratic Republic of Congo, Cameroon, Central Africa Republic, Comoros, Gabon, Congo Republic, Madagascar, Cote d'Ivoire, Mauritius, Chad, Egypt, Eswatini, Ghana, Kenya, Malawi, Niger, Mali, Mauritania, Mozambique, Namibia, Togo, South Africa, Nigeria, Rwanda, Zimbabwe, Tunisia, Senegal, Tanzania and Uganda.

$$\ln SEDev_{i,t} = \delta_0 + \ln SEDev_{i,t-1} + \delta_1 \ln TR_{i,t} + \alpha_2 \ln CO2_{i,t} + \acute{\alpha} \ln \Psi_{i,t} + \pi_i + \rho_t + \varepsilon_{i,t} \quad (2)$$

where $\Psi_{i,t}$ is a set of control indicators (capital stock, financial depth, trade openness), and the other indicators are defined in Equation (1). To capture the effects of transport and socioeconomic development on CO₂ emissions, the following model was estimated:

$$\ln CO2_{i,t} = \alpha_0 + \ln CO2_{i,t-1} + \alpha_1 \ln TR_{i,t} + \alpha_2 \ln SEDev_{i,t} + \acute{\alpha} \ln Z_{i,t} + \pi_i + \rho_t + \varepsilon_{i,t} \quad (3)$$

where $Z_{i,t}$ is a set of control indicators (capital stock, trade openness, population), and Equation (1) describes the rest of the variables. The above models (Equations 1-3) are estimated using the Generalised Method of Moments approach.

Our fourth model, which is represented in Figure 1, investigated how much transport infrastructure development can influence CO₂ emissions through socioeconomic development. This model comprised moderation analysis to determine how transport infrastructure leads to CO₂ emissions directly and indirect via socioeconomic development. Socioeconomic development was assumed to be the mediator. A Structural Equation Model with no latent variables, two endogenous (economic growth and CO₂ emissions) and one exogenous variable (transport) was subsequently computed.

6.3. Estimation approaches

6.3.1 Generalised Method of Moments (GMM)

This research first applied the GMM technique for dynamic panel data models to estimate equations 1 to 3. This method by Arellano and Bond (1991) and Arellano and Bover (1995) has several advantages. GMM uses the instruments of the variables to address the problem of endogeneity which is probable between the covariates and the error terms. Periodic-specific effects are controlled for by including time dummies in the equations. It also addresses the specific effects of the countries by taking the differences in the indicators. The dynamic model to be estimated was of the form:

$$\ln Y_{i,t} = \theta \ln Y_{i,t-1} + \acute{\beta} \ln X_{i,t} + \acute{\gamma} \ln Z_{i,t} + \pi_i + \rho_t + \varepsilon_{i,t} \quad (4)$$

where $Y_{i,t}$ denotes the explained variable, $X_{i,t}$ is a set of covariates, $Z_{i,t}$ is a set of control indicators, π_i , ρ_t and $\varepsilon_{i,t}$ are described in Equation (1). The GMM technique was most appropriate in this study to address the potential reverse causality of the variables. Following Roodman (2009), to estimate our equations, we apply the two-step system-GMM, which is more robust in the presence of serial correlation and heteroscedasticity. System-GMM also uses a greater number of moment conditions and lowers sample bias. It is appropriate when the explained variable is persistent, and the period covered by the data is short.

6.3.2 Structural equation modelling (SEM)

Model four was represented in Figure 1 with socioeconomic development taken as a mediator by which transport can influence CO₂ emissions. The model was estimated using SEM in Stata. SEM is a powerful technique for analysing complex relationships among exogenous and endogenous variables (Zhao et al., 2019). In this study, it was an appropriate approach to ascertain the indirect effect and the direct effect of transport on CO₂ emissions. It allowed for simultaneous processing and analysis of the underlying associations between the variables in the model.

For the adequacy of the structural equation model, this study employed the comparative fit index (CFI), the Tucker-Lewis index (TLI), the root mean square error of approximation (RMSEA) and the standardised root mean squared residual (SRMR).

7. Results and Findings

This section presents and discusses the findings of this study.

7.1. Descriptive statistics

The descriptive statistics of the variables are shown in Table 1.

Table 1: Descriptive statistics

Variable	Obs	Unit	Average	Std. Deviation.	Minimum	Maximum
HPI	264	Index	45.929	13.311	11.305	77.945
GDP _k	264	US dollars	1869.866	2236.979	221.096	10160.340
SEDev	231	Index	0.000	0.709	-2.313	1.409
TRANS	263	Index	0.000	1.324	-1.001	6.751
CO ₂	264	Metric tons/capita	0.885	1.643	0.017	9.519
CAP	264	Millions of 2011 U.S. Dollars	113271.700	204581.300	5790.397	1281388.000
FDEP	256	% of GDP	21.073	26.841	0.491	160.125
TO	264	% of GDP	67.300	30.772	20.964	170.407
POP	264	Total	19300000	26100000	542357	146000000

SEDev was created using the logs of HPI and GDP_k. TRANS was created using the logs of airport and road infrastructures.

Source: Own compilation

The mean for human poverty index (HPI) suggests that on average, 46% of the population in the African countries under investigation, were living in abject poverty. The country with a relatively low poverty level, had 11% (Mauritius) of its population being poor during the investigated period. The mean annual GDP per capita (GDP_k) was US\$1869.87 (equivalently US\$155.82 per month) while that of CO₂ emissions (CO₂) was 0.88 metric tons per capita. The annual average financial depth (FDEP) was 21%, with the maximum being 160% that was reported by South Africa in 2007. The investigated countries had an annual average capital stock (CAP) worth US\$113,27 billion; trade openness (TO) was 67% of GDP and total population (POP) was 19.3 million. Note that TRANS and SEDev are measures of transport infrastructure and socioeconomic development constructed in this study using principal component analysis.

7.2. Correlation analysis

As a preliminary analysis, Table 2 presents the correlation coefficients of the variables. A correlation coefficient estimates the degree of linear association between each pair of variables. Except for population, the correlation coefficients suggest a positive linear association between socioeconomic development and transport, CO₂ emissions, capital stock, financial depth and trade openness. Transport infrastructure development is positively associated with CO₂ emissions and financial depth, but negatively related to population. While our expectation was that as the population increases, the governments may also raise the number of transport infrastructure (roads and airports), the negative coefficient may imply that as the population increases, resources may be shifted from transport infrastructure development to other social needs, such as social nets.

Table 2: Correlation matrix

	SEDev	TRAN	CO ₂	CAP	FDEP	TO	POP
SEDev	1.000						
TRAN	0.436***	1.000					
CO ₂	0.333***	0.232***	1.000

Source: Own compilation

It is shown that CO₂ emissions is positively correlated with capital stock, financial depth and trade openness. Despite an idea of the relationships among variables that are suggested by the correlation coefficients, the limitation is that the correlation analysis assumes a linear association. Some variables may have a non-linear association and a result this paper used the GMM technique for a detailed analysis.

7.3. Unit root tests

The ADF stationarity test method was used to determine the stationarity properties of the variables. Table 3 displays the unit root findings based on the ADF P statistic (Inverse chi-squared) and Pm statistic (Modified inv. chi-squared). Note that with the P statistic, finite number of panels are required, while the Pm statistic is appropriate for both infinite and finite number of panels. Both statistics indicate that while SEDev and TRANS become stationary in the first differences, the rest of the variables are stationary in level.

Table 3: Stationarity test outcomes

Variable	Undifferenced (Level)		1st Differences	
	P statistic	Pm statistic	P statistic	Pm statistic
SEDev	81.881	1.382	309.602***	21.203***

7.4. GMM estimates

This section begins by estimating the effects of socioeconomic development and CO₂ emissions on transport infrastructure. Model 1 in Table 4 shows the findings. The instruments are valid given that the Hansen statistics are not statistically significant at the 5% level. Arellano-Bond tests for AR(2) show that the models do not suffer from 2nd-order serial autocorrelation. Model 1 shows that transport infrastructure development is positively influenced by socioeconomic development, while the CO₂ emissions' effect is insignificant. In a related study, Saidi and Hammami (2017), who investigated 75 countries, including some African ones, did not find CO₂ emissions to have a significant effect on freight transport, while per capita GDP contributed to freight transport. As socioeconomic development (GDP per capita growth and poverty reduction) improves, many people can afford to use transport services, which promotes the demand for a transport infrastructure. As for control variables, an increase in population and financial depth resulted in transport infrastructure development.

Table 4: GMM estimates

Source: Own compilation

A possible explanation is that financial depth may increase demand for transport services and hence transport infrastructure provision. However, the results suggest that as capital stock increases, transport infrastructure tends to decline. In this case, there might be a possible trade-off that occurs between investments in capital stock and transport infrastructure.

Models 2 was to determine the effects of transport infrastructure and CO₂ emissions on socioeconomic development. While there is plenty of work about on the influence of transport, on economic growth (measured by a change in GDP_k), this paper aimed to ascertain whether or not the transport infrastructure can influence socioeconomic development. Our results revealed a percentage rise in transport infrastructure increases socioeconomic development by 0.05%. Despite the positive effect, the magnitude of contribution is small compared to 0.212% effect of transport infrastructure on growth in MENA countries, which was estimated by Saidi et al. (2018). Overall gains of transport infrastructure to socioeconomic development may be hindered by the abject living conditions of many African people, who cannot afford transportation services. The existence of road and airport infrastructure per se is not a sufficient condition, but access to the facilities by the poor is a paramount factor, which several African states are struggling to address.

The CO₂ emissions suggested a negative effect on socioeconomic development. A percentage rise in CO₂ emissions reduces socioeconomic development by 0.06%. Among the explanations, rising CO₂ emissions cause a greenhouse effect, climate change, affect agricultural production, lead to health problems, exert pressure on health expenses and costs of addressing environmental degradation. These adverse effects of CO₂ emissions may hinder socioeconomic development.

In terms of control variables, improvement in the capital stock and trade openness contributes to socioeconomic development. An investment in capital stock often stimulates economic activity in a country, more people get employed and disposable income increases. However, to optimise the benefits of capital stock in Africa, it is imperative to ensure that the existing capital stocks are used productively. For example, there are economies, such as Zimbabwe, where there are industries and capital equipment that have not been productive (Nguwi, 2019). Trade openness increases access to foreign products, broadens markets, increases competition, which potentially reduce the prices of products. The poor are likely to gain from reduced prices, for example, many poor people in Africa have been benefiting from cheaper Chinese products. Although reservations are attached to the durability of the Chinese products and the pressure they have on domestic production, there are products many people are now affording from foreign markets. Most of the African population seem to benefit from trade openness, although we admit that the debate regarding the socioeconomic benefits of increased trade openness is outstanding.

The effect of financial depth on socioeconomic development is not significant. Financial development in many African countries has remained fragile. This problem was also indicated in Ibrahim and Alagidede's (2018) paper, which may also be connected to the lack of institutional qualities Singh, Kpodar and Ghura (2009). Financial access by the poor is largely restricted, as they do not have collateral to get credit and loans from financial institutions. Access to banking and financial services in remote areas is even harder.

Model 3 shows that transport infrastructure development significantly influence CO₂ emissions. In particular, CO₂ emissions may grow by 0.02% if the transport infrastructure increases by a percentage point. This finding is supported by Saidi and Hammami (2017), who investigated several countries, including some African countries and found that freight transport contributes to CO₂ emissions. As an explanation, as transport infrastructure increases, there will be a rise in the consumption of petrol and diesel fuel for road transport, as well as aviation gasoline and jet kerosene for air transport, which ultimately raises the level of CO₂ emissions. There have been significant emissions from the African transport sector. Nkem and Njeri (2016) stated that the disaggregation of the global greenhouse gas (GHG) emissions due to fuel combustion by sector, puts the transport sector at the top with 42%, more than for electricity and heat production (32%).

The second focus variable, SEDev is also contributes to rising CO₂ emissions. A 0.02% rise in CO₂ emissions is because of a percentage increase in socioeconomic development. Socioeconomic development is associated with industrialisation and increased energy consumption and other economic activities, which are part of the factors for increased emissions. Related studies such as Ameyaw and Yao (2018) who focused on West Africa, found a one-way causality from GDP to CO₂ emissions; implying that improved economic activity contributes to environmental degradation.

Controlling for population, this study is among those, for example, Aye and Edoja (2017) and Saidi and Hammami (2017) that reported the positive and significant effect of population on CO₂ emissions. Mostly in rural areas, an increased population in many African countries has been associated with deforestation and increased use of firewood, which cause environmental degradation.

The results also suggest that trade openness results in increased CO₂ emissions. Trade openness is expected to widen the market for domestic products, boost production, improve exports and imports, and increase demand for transportation, which may raise CO₂ emissions. There is also evidence that capital stock reduces CO₂ emissions. This might mean an increase in capital stock in the respective countries is accompanied by investments in green technologies (e.g., electric locomotives, renewable energy such as solar & wind) that reduce greenhouse gases.

7.5. SEM estimates

The GMM estimator indicates that both socioeconomic development and transport infrastructure development significantly increase CO₂ emissions. As the literature review shows, the development of transport infrastructure has been recognised among the strategies for achieving economic growth. Our GMM estimates indicate that transport infrastructure contributes to socioeconomic development. The challenge for policymakers is to achieve socioeconomic development through infrastructure development, without causing environmental degradation. Based on our hypothetical model (Figure 1), this study decomposed the effect of transport (TRANS) on CO₂ emissions (CO₂), with socioeconomic development (SEDev) playing a mediator role between TRANS and CO₂. This analysis aims to determine how much TR development in Africa influences CO₂ emissions through SEDev (indirect effect) and how much TR influences CO₂ directly (direct effect).

Figure 2. Estimated SEM: A mediation analysis
Source: Own compilation

In Figure 2, path A is the direct effect of TRANS on SEDev. A percentage increase in TRANS increases SEDev by 0.43%. Path B shows a percentage increase in SEDev increase CO₂ by 0.29%. Path C is the direct effect (0.10) of TRANS on CO₂. These findings confirm the GMM estimates in Table 4, although the SEM estimates are greater. We confirmed all the three hypotheses (H1, H2 and H3) that are specified in Figure 1. Table 5 displays detailed SEM results with the diagnostics checks for model fit. We checked the adequacy of the SEM model using RMSEA, CFI, TLI and SRMR. The statistics suggest that the model is accepted as the fitted values meet their standards. This section purposes to decompose the total effect of TRANS on CO₂ when SEDev is assumed to be a mediator. As Table 5 reveals, the direct effect (DE) of TRANS on CO₂ is 0.1023% (i.e. *path C*), the indirect effect (IE) of TRANS on CO₂ is 0.1257% (i.e. *path A x path B*), and the total effect (TE) is 0.2280% (i.e. DE + IE = TE). All the paths are statistically significant. The indirect effect result suggests that TRANS can significantly influence CO₂ through increased SEDev. Consequently, we illustrate in Figure 2 that the indirect effect accounts for 55% of the total effect of TRANS on CO₂, leaving the direct effect accounting for 45%. Although a larger portion of the total explanation of TRANS on CO₂ occurs indirectly, the 45% effect that is not related to SEDev, is also huge.

Table 5: Decomposition of transport effects on CO₂ emissions: SEM

	Direction	Coefficient	
<i>Direct effects</i>			
Path A	TRANS to SEDev	0.4348***	
Path B	SEDev to CO ₂	0.2890***	
Path C	TRANS to CO ₂	0.1023***	
<i>Indirect effect of TRANS on CO₂ through SEDev</i>			
Path A x Path B	TRANS to CO ₂	0.1257***	
<i>Total effect of TRANS on CO₂</i>			
Direct effect (path C) + Indirect effect	TRANS to CO ₂	0.2280***

The GMM and the SEM estimates support Xie et al. (2017), among other authors, who indicated that transport infrastructure development spurs economic growth, it leads to increased CO₂ emissions. The next section provides the implications and recommendations of the key findings.

8. Managerial Implications

Our findings have many implications and recommendations. First, transport infrastructure development drives the level of CO₂ emissions in Africa. It implies that improving the transport network on the continent results in environmental degradation. While improving road and air networks, it is also crucial to promote the use of fuel-efficient vehicles, use of public transport, walking and biking (smart driving) in order to improve mobility and accessibility, while maintaining the socioeconomic contribution of transportation sector.

Furthermore, Africa's socioeconomic development is raising CO₂ emissions. This implies that most economic activities on the continent occur in polluting industries/sectors. Improving the efficiency of the polluting industries is crucial. Relevant legislation and laws to monitor and control the amount of CO₂ emissions from polluting industries and companies must be enforced. Possibly long-term strategies should aim to shift as much economic activity to the non-polluting industries/sectors. This should abate CO₂ emissions and promote sustainable socioeconomic development in Africa.

The results further imply that transport infrastructure can stimulate socioeconomic development in Africa. From a policy perspective, African governments can promote development on the continent through transport infrastructure development. The financial investment commitment towards the transportation sector from the AfDB is worth it, since transportation yields socioeconomic benefits. Green transport strategies must be implemented to promote the benefits of the transport sector on socioeconomic development.

Another key implication derived from the results is that the impact of transport on socioeconomic development is not small. This might suggest that given the low income per capita and severe poverty in Africa, most of the poor do not productively gain from increased numbers of roads and airports. The presence of airports and roads is not a sufficient condition to improve welfare, therefore, affordability and use of the existing transport infrastructure becomes an issue for policymakers.

In the reverse direction, CO₂ emissions harm socioeconomic development. The findings imply a two-way association between socioeconomic development and environmental degradation. This implied a causal connection delays economic development since the realised socioeconomic development raises CO₂, which in turn reduces socioeconomic development. Accordingly, policymakers need to worry about the adverse effect of CO₂ emissions on socioeconomic development. Among other considerations, it is important to push for green technologies (e.g. renewable sources of energy like solar and wind), environmental conservation strategies and carbon capping. Governments can place 'caps' on CO₂ emissions that can be generated in their respective countries, and firms are given carbon allowances that can either be traded or used by other firms.

A unilateral causal relationship from transport to environmental degradation implies that policymakers may implement environmental conservation measures without affecting the development of the transport sector. For example, carbon taxes can be implemented without affecting the transport sector.

Our SEM findings reveal that transport can significantly influence CO₂ emissions through socioeconomic development. On the policy front, it implies that transport's total effect on CO₂ emissions could be separated into indirect and direct effects. The direct effect shows emissions that have nothing to do with socioeconomic development. The splitting of the effect provides policymakers with detailed information on how the influence of transport on CO₂ emissions occurs, given they aim to achieve socioeconomic development but at the same time minimising CO₂ emissions.

The key implication, which is shown in Figure 2, is that 55% of the transport's effect on CO₂ occurs through increased socioeconomic development, and the remaining 45% is the direct effect. Policy-wise, this outcome is problematic since 45%, which is not related to increased socioeconomic development, is still large. Deduced from Figure 2, policymakers may aim to achieve three better outcomes: (i) while it can be difficult to eradicate the significant effect of TRANS on CO₂, policymakers may aim to attain full mediation, where the effect of TRANS on CO₂ primarily occurs through increased socioeconomic development (*i.e.*, *path A x path B*). This may require improving the productive use of transport infrastructure and its effect on socioeconomic development. In this case, at least a much larger proportion of CO₂ emissions from TRANS will be a by-product of the productivity use of transport infrastructures.

However, aiming for a full mediation where (*path A x path B*) is almost 100%, while *path C* is almost zero, is not the optimum solution if *path B* is significantly large, but a compromise that at least CO₂ from TRANS is linked to increased socioeconomic benefits. (ii) a better outcome is one where (*path A x path B*) is greater than *path C*, with *path A* statistically significant and higher than *B*, which is also statistically significant. For example, in Figure 2, we envision that the coefficient of *path B* (0.29) needs to be reduced, while that of *path A* is raised and *path C* reduced. (iii) probably the optimum outcome that is difficult to attain is one that renders *paths C and B* insignificant, while *path A* is strong and significant. In this case, the economy would have successfully boosted transport

infrastructure development and the contribution to socioeconomic development without significant harm to the environment.

To attain our envisioned improved outcomes, policymakers require an integrated intervention approach. We hypothesise and recommend an integrated intervention model be implemented, as represented in Figure 3, which allows for TRANS, SEDev and CO₂ related policies or interventions to be taken but cognisant of each other.

The three variables have a special relationship, which often conflicts policymakers, as they seek to increase TRANS and SEDev, while simultaneously minimising CO₂. The hypothesised integrated intervention model requires three sets of interventions, which are moderators. ModSet 1 should contain moderators required to stimulate the socioeconomic development contribution of the transportation sector. In this study, TRANS represents the quantities of roads and airports. We assume, by increasing TRANS it is an insufficient condition to effectively increase SEDev and hence, some interventions/moderators are required to boost the impact of TRANS on SEDev. Therefore, interventions (Ma1, Ma2, ...Ma_n) in ModSet1 may include (i) upgrading existing transport infrastructure (e.g. raise the ratio of paveways), and (iii) consider policies to increase affordability and productive use of transport.

ModSet2 has moderators to abate CO₂ emissions from SEDev, which include (i) carbon capping, (ii) promoting much more economic activity to non-polluting industries, (iii) improving the efficiency of polluting industries, and (iv) consider a carbon tax for all polluting firms. Moderations in ModSet3 aim to minimise the direct effect of TRANS on CO₂. Potential moderators or interventions may include (i) promoting fuel-efficient vehicles, (ii) a carbon tax for vehicles, and (iii) promoting smart driving (public transport, walking, biking).

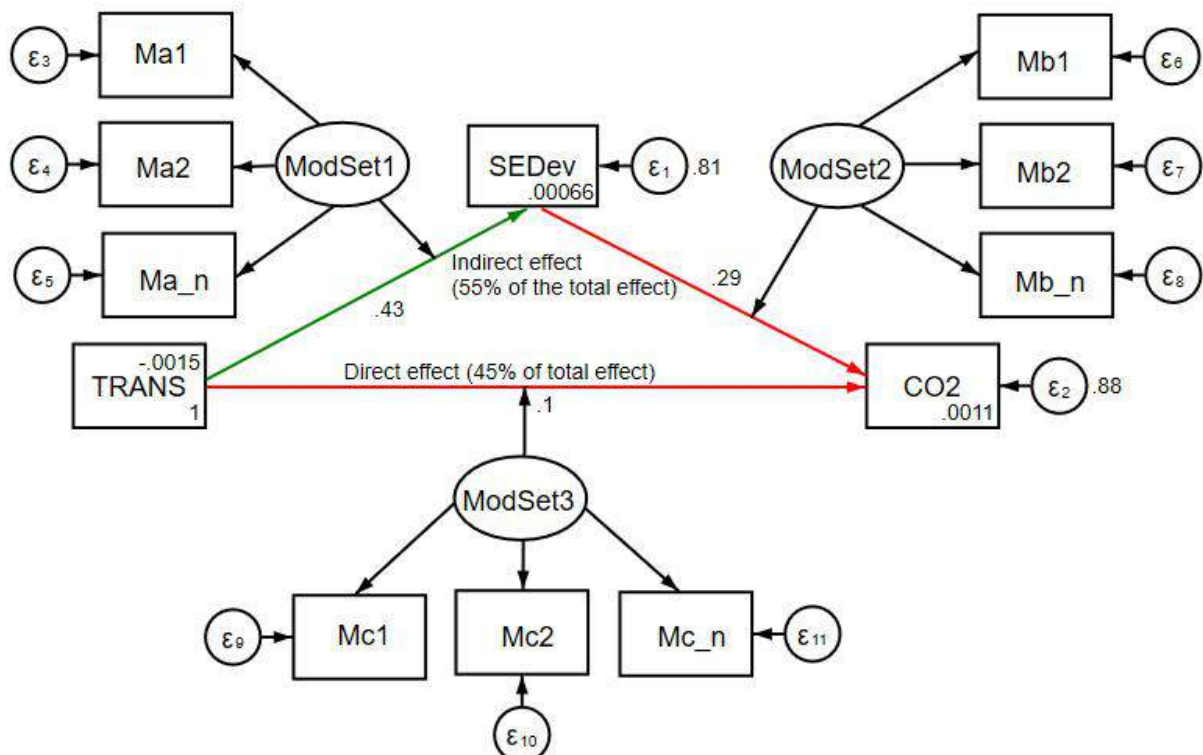

Figure 3. Proposed intervention model.
Source: Own compilation

While these measures/interventions are already in practice, the emphasis of the hypothesised model is that moderators must be integrated and work together to attain an optimum solution. Given 45% of the effect of TRANS on CO₂ has nothing to do with increased SEDev, policymakers may first place more

attention on measures that reduce the direct effect of TRANS on CO₂ and increase the indirect effect. *Path A* is desirable while B & C are not, thus, dealing with B & C should not compromise *path A*. Disintegrated methods may not be effective, since focusing on one path may adversely affect other paths.

9. Conclusion

This research examined the associations among transport infrastructure, socioeconomic development and environmental degradation in 33 African countries. Economic growth and poverty indicators were used to construct a socioeconomic development measure. The transport infrastructure measure accounts for airport and road infrastructures. Environmental degradation was represented by CO₂ emissions. It was found that transport infrastructure and socioeconomic development increase CO₂ emissions, and hence lead to environmental degradation. Transport infrastructure development stimulates socioeconomic development, while environmental degradation reduces socioeconomic development. However, the impact of transport infrastructure on socioeconomic development is small and may be due to poor affordability and the use of transport infrastructure by the poor. It was also shown in this study that socioeconomic development contributes to transport infrastructure development. The effect of environmental degradation on transport infrastructure is insignificant. Thus, the findings imply feedback effects between transport infrastructure and socioeconomic development; feedback effects between socioeconomic development and environmental degradation; and a one-way relationship between transport infrastructure and environmental degradation.

Structural equation modelling is used to distinguish the indirect and direct effects of transport infrastructure on environmental degradation, with socioeconomic development used as the mediator. The results confirmed a significant indirect effect, where 55% of transport's effect on CO₂ emissions occur through increased socioeconomic development. The remaining 45% of the total effect is the direct effect of transport on CO₂ emissions. To achieve an optimum solution when dealing with the inter-linkages among transport, socioeconomic development and CO₂ emissions, this article proposes an integrated intervention model. The key recommendation is that African governments should focusing more on minimising the direct contribution of transport infrastructure development on environmental degradations, which is not linked to social development.

The major shortcoming in this paper is the poverty data which was only available up to 2007 and hence out social development measure and the whole analysis was restricted to this date. Future studies may advance this analysis by looking for extended data. They may also consider multiple mediators in SEM. Estimating the model with potential moderators can also improve the analysis. This will show how the relationships among transport, socioeconomic development, and CO₂ emissions change when moderators or interventions are introduced.

Abstract

The World Health Organisation's country strategic priority is "strengthening national efforts towards the attainment of universal health coverage". In response to this, and South Africa's section 27 (a) of the constitution, the government established the national health insurance (NHI) policy. Acceptance and compliance to policies like this according to a study and the health belief model, require the assessment of the public's awareness, attitudes, perceptions and adoption intentions. This study questions the extent to which South Africans are aware of, have developed positive attitudes, perceive the benefits and costs of NHI, and have developed the intentions to use the NHI. Quantitative data was collected from 201 students and non-students with online questionnaires. Mean scores and percentages were used to assess the degrees of agreements and disagreements to the studied constructs. The results revealed that the levels of South African public's awareness, attitudes, perceptions and intentions to adopt the NHI policy has not improved much from results obtained in 2014 and 2017 studies. This is an indication that the government, Department of Health and other interest groups need to use communication channels with greater reach and impact to create greater awareness and build stronger attitudes and perceptions of NHI benefits.

1. Introduction

The national health insurance (NHI) responds to the World Health Organisation's country strategic priority aimed at "strengthening national efforts towards the attainment of universal health coverage" (Laws, 2018, p. 2). NHI is also in response to South Africa's section 27 (a) of the constitution, which is "to achieve universal access to quality health care services in the country. Specifically, section 27 of the constitution is aimed at establishing a NHI fund and to set out its powers, functions and governance structures; to provide a framework for the strategic purchasing of health care services by the fund on behalf of users; to create mechanisms for the equitable, effective and efficient utilisation of the resources of the fund to meet the health needs of the population; to preclude or limit undesirable, unethical and unlawful practices in relation to the fund and its users" (Health, 2019, p. 2).

The awareness, positive attitudes and perceptions of the NHI is important for garnering public support and success of the new NHI. A study conducted during the phase 1 of the programme, revealed that while there was some public awareness of NHI, education and perception of the program was poor. There was also a weak understanding of the costs to be borne by NHI and the public (Setswe, Nyasulu & Witthuhn, 2014). Setswe et al. (2014) recommended that consultation of communities and a mobilization plan be put in place in order to increase knowledge and understanding of NHI using different strategies, such as house to house campaigns, town hall-type of meetings, workplace consultations, consultations at significant sites in communities like clinics, schools, mines, farms and pension pay points.

Setswe et al. (2014) contend that these social marketing communication strategies may improve people's attitudes and perceptions about the NHI. How much these strategies have eventually created awareness, attitudes and perceptions of the NHI warrant a study. In 2020, Weir-Smith, Mokhele and

*Corresponding Author

¹ E-mail address: helen.duh@wits.ac.za

Dlamini (2022) assessed how much urban residents are in favour of South Africa's NHI. They found that 77.5% of South African urban residents are in favour of NHI. Does this indicate that awareness, attitudes and perceptions of NHI have improved from 2014, when Setswe et al. (2014) conducted their study?

2. Problem Investigated

A large percentage of South Africa's population cannot afford private health services and must make use of public health services in an already congested public sector, thus leading to slower and unresponsive services. This has seen health transforming into a commodity rather than a human right. The people in need of health services the most are less likely to access quality healthcare than those who can afford private health services. Thus, the National Health Insurance (NHI) was introduced to address these disparities by strengthening the South African health system and developing an NHI fund to deliver quality, affordable healthcare. The main objective of the NHI is to cater for the health needs of many South Africans, especially the low income earners who make up the bulk of the population (Ataguba & McIntyre, 2018). How much these income earners and the South African population are aware of, perceive the costs and benefits of, and have developed positive attitudes towards the NHI needs examination.

Akhtar, Afroz, Masud, Rahman, Khalid and Duasa (2018) show that awareness and attitudes are important if perceptions are to drive behavioural intentions and actual behaviour concerning pro-environmental behaviour. In terms of health-related behaviour, Duh and Dabula (2021) show that when awareness of the importance of donating blood increases, it goes a long way to impact perceptions, motivations and attitudes, which in turn positively drives behavioural intentions to donate blood. Using the health belief model (HBM) and theory of planned behaviour (TPB), Ahkter et al. (2018) also revealed that awareness, attitude and perceived susceptibility, perceived severity, perceived benefits and barriers are important for a behaviour or action. Considering the importance of awareness, attitudes and perceptions, this study questions the extent to which South Africans are aware of, have developed positive attitudes, perceive the benefits and costs of NHI, and have developed the intentions to use the NHI. The findings will assist the South African department of health to ascertain if their efforts to create awareness and understanding of the benefits of NHI is yielding required results in changing perceptions and attitudes towards NHI.

3. Research Objectives

The main purpose of this study is to assess South Africans' level of awareness, attitudes perceptions of the costs and benefits of the NHI, and the intentions to use NHI.

4. Hypotheses

The following hypotheses were formulated for the study:

- H₁: South Africans are aware of the NHI.
- H₂: There is a positive attitude of South Africans towards the NHI.
- H₃: South Africans will agree to positively perceiving the NHI.
- H₄: South Africans will agree to perceiving benefits from the NHI.
- H₅: South Africans will perceive that NHI will reduce medical costs.
- H₆: South Africans will agree to having intentions to use NHI.

5. Literature Review

The literature introduces the NHI in South Africa and its benefits, defines, and discusses the studied constructs, i.e. perception, awareness, attitude, and intentions.

5.1 The introduction of the NHI and its objectives

South Africa faces several challenges in providing quality healthcare services to a large proportion of its citizens. This is amidst South Africa spending 8.9% of its GDP on health care (National Treasury, 2017, p. 57). This amount is high according to world standard. However, over half of this spending

exists within the private health sector, which represents less than 16 percent of the South African population (National Department of Health, 2017, p. 42). A large percentage of the country's population cannot afford private health services and must make use of public health services in a public sector that is already overcrowded, leading to delayed and less responsive services. This has turned health into a privilege rather than a moral right. The citizens most in need of public insurance are less likely than those who can afford private health coverage to provide access to affordable healthcare (Setswe et al., 2014).

The existing South African health care sector support structure consists of two components: a substantial proportion is funded by insurance services, hospital treatment plans and pocket fees. The other portion is financed by the monetary framework that includes mostly ordinary citizens who may not afford the insurance cover. This is the portion that needs to be converted into a single payer and equitable health care plan under the new NHI (Weimann, 2013, p. 15). This will not only yield to the call for universal health cover (UHC) by the WHO, but the implementation of the NHI program will satisfy the mandate of section 27(1a) of the South African Constitution (1996), which states that *“everyone has the right to access healthcare services including reproductive healthcare”*. The National Development Plan (NDP) 2030 suggests that the government must tackle the exorbitant fees of private health care and quality of public health issues (National Planning Commission, 2017). It is also expected that the NHI addresses both the quality of care and the affordability of care through strengthening activities in health systems and through the development of the NHI Fund (National Health Department, 2017, p. 42-43). The objectives of the NHI are outlined in Table 1.

Table 1: Objectives of NHI in South Africa

- | |
|---|
| <ol style="list-style-type: none"> 1. Ensure UHC for all South Africans; 2. Improve access to quality of health services irrespective of socio-economic status; 3. Promote equity and social solidarity through the pooling of risks and funds; 4. Create a single, publicly owned and administered health fund with adequate reserves and funds to plan for and effectively meet the health needs of the entire population; 5. Accelerate national health system transformation; 6. Create a single health purchaser that will ensure that health services and health products are purchased and procured at reasonable costs that recognise healthcare as a public good; 7. Promote efficient and effective service delivery in both public and private sectors that will be achieved through evidence-based interventions; 8. Strengthen the under-resourced and strained public sector so as to improve health systems performance; 9. Adopt appropriate, innovative health service delivery models to respond to local needs; and 10. Ensure continuity and portability of health service benefits across the country. |
|---|

Sources: NHI Green Paper (2011); NHI White Paper (2017); NHI Bill (2018)

The information in Table 1 are partly from a South African department of Health (NDoH) green paper released in 2011 with the intention of introducing the National Health Insurance (Weimann, 2013). The objectives of the NHI are to achieve universal health coverage through three phased implementation spanning over fourteen years that started 10 August 2011 and ending in 2025. Each phase was planned to be implemented in a five-year period.

5.1.1. Phases of the NHI implementation, successes and failures

Phase 1 of the NHI started in 2012 and ended in 2017. It involved piloting different health system while reinforcing interventions aimed at the primary health care level. Phase 2 started in 2017 and will be completed in 2022. Phase 2 aims to ensure that the NHI Fund is fully operational and has the requisite governance and management frameworks to allow the procurement of services and population registration to commence. This phase also includes adopting the NHI Bill and amending several parts of the bill. Phase 3 begins in 2022 through 2026 and will signal the emergence of compulsory prepayment and the contracting of approved private hospital and specialist services and the completion of the Medical Schemes Amendment Act (Department of Health, 2019, p. 12).

Phase 1 of NHI implementation included piloting 11 provincial districts. Districts were chosen on the basis of disease severity, socio-economic factors, health service performance and district management capability to introduce phase 1 NHI. During phase 1, numerous health programs were piloted to improve interventions at the level of primary health care (PHC) (National Department of Health, 2019 p. 12-22).

A survey evaluating phase 1 implementation interventions was conducted by NDoH in 2019 and it found that in areas where success was evident, strong political commitment, sufficient human and financial implementing resources, effective planning and cooperation and good management mechanisms were in place at the time of implementation. However, the interventions encountered a range of challenges that hampered implementation, i.e. poor planning, lack of funding, unreliable communication, lack of cooperation where necessary and insufficient processes to track progress and ensure the correction of courses. In certain cases, managers carried out programs in silos and tended to miss the overarching goal of the NHI project, which was to increase access to and efficiency of services at health facilities. In these situations, there was a shortage of frequent contact at various departmental level on progress towards achieving the NHI Phase 1 objectives. Additionally, the organizational culture within certain departments was viewed by staff as being overly bureaucratic. Culture also did not promote problem-solving and left no space for creativity or ingenuity. No recourse was made for poor performance, lack of transparency and insufficient use of data to track progress (National Department of Health, 2019, p.16).

Another study conducted during the introduction of phase 1 NHI revealed that while there was some public awareness of NHI, education and perception of the program was poor. There was also weak understanding of the cost to be borne by NHI and the public (Setswe et al., 2015 p. 228). Booyesen (2017, p. 7) also found that awareness and knowledge of NHI was relatively low among South African households with and without medical scheme cover during phase 1 stage. He recommended that a concerted effort is needed to establish a robust communication plan for disseminating information and gaining support for the national health insurance program of the country. Overall, the key recommendations for measuring NHI going forward include a shared common vision for NHI explicitly articulated in the plan, improved stakeholder communication, a well-defined results matrix, and strong monitoring and evaluation followed by corrective action (Zondi and Day, 2019 p. 56). These results can be achieved if there is adequate awareness, positive attitudes and the right perceptions of the benefits of NHI.

South Africa is currently in the third year of phase 2 adoption of the NHI (2018-2022), which entails the development of NHI legislation, the functional NHI Fund and its mechanisms, and the procurement of personal health facilities for disadvantaged communities (Zondi & Day, 2019 p. 55). There is not much literature and data published on this phase of NHI implementation. The dissemination of the results of the current study will inform awareness, knowledge, attitudes and perceptions of South Africans of the NHI and guide appropriate legislation development and resources allocations.

5.2 Definitions and Discussions on Constructs' Benefits Within the Marketing and Health Contexts

5.2.1 Awareness

Marketers describe awareness as the level of consumers' knowledge of a brand, an organization or company and its services and products (Kilei, Iravo & Omwenga, 2016). The awareness of a company or organization and what it offers as services, products or ideas is one of the initial and fundamental steps in not only customer buying process (Ishak & Zabil, 2012), but in the formation of perceptions, attitudes and resultant behavioural intentions (Duh & Dubula, 2021). Social marketers who strive to change behaviours lay enormous emphases on stimulating consumer and public awareness in order to elicit desired responses and behaviour from targeted audience. Financial resources, time and efforts are being invested to engender more awareness, change attitudes, beliefs and behaviour (Foroudi, 2019). A product, brand, service or organisation that enjoys significant levels of awareness among

consumers is usually regarded positively and associated with good and positive reputation (Asamoah, 2014); hence it is regarded as the cornerstone in transforming consumer attitude and behaviour towards products (Abdolvand, Farzin, Asl & Sadeghian, 2016).

In the health space, Sampogna, Bakolis, Evans-Lacko, Robinson, Thornicroft and Henderson (2016) examined how much awareness creation on anti-stigma mental health campaign in England assisted in lowering mental illness stigma. They found that increased awareness levels increased tolerance, support and acceptance of mental illness. In terms of NHI in South Africa, Weir-Smith, Mokhele and Dlamini (2022) speculate that South Africans will favour the programme more when knowledge and awareness of its benefits increase.

5.2.2 Attitudes

While sociologists see attitudes to be a mental inclination to act, expressed by evaluating a particular thing or person with some degree of approval or disapproval (Huang, Beatson & Lings, 2015), marketers describe it as a combination of consumers' feelings and beliefs capable of igniting behavioural intentions towards some objects assert that and emanating from the assessment of several facets in the consumer's mind. Attitudes results in either negative or positive images of companies, their products and ideas in the consumer's mind (Pande & Soodan, 2015). Depending on whether positive or negative attitudes are developed, consumers' spending and purchase behaviours are impacted (Griffin, Grace & O'cass, 2014).

For health-related behaviour, and using the social cognition theory, Lee and Li (2021) found that the publics' attitudes and perceptions of social distancing developed from transparent communication which comprises accountability, information substantiality, and participation predicted social distancing behaviour during the outbreak. Moreover, when there is organizational trust positive attitudes and perceptions are formed of their policies and actions (Lee & Li, 2021). Applying the theory of planned behaviour, Duh and Dabula (2021) found that positive attitudes toward a health-related behaviour is a strong predictor of behavioural intentions to act. The attitude in itself is determined by perceptions.

5.2.3 Perception

In consumer behaviour studies, perception is defined in terms of as a process of consumers receiving, selecting, organizing, interpreting stimuli and translating it into a meaningful and coherent picture or response (Kazmi, 2012; Endo & Roque, 2017). These activities happen after consumers are exposed and their attention are drawn to the stimuli. The interpretations and translations are subjective and depend on the receivers' socio-economic status, such as income/wealth, employment statuses, age, gender, race, education level, and place of residence (rural/ urban/regional location). In the health sector, what is perceived could be previous and expected experiences, healthcare service quality, activities and opportunities in healthcare (Weir-Smith et al. 2022).

In addition to various beliefs that patients may have that prevents them for undertaking desirable behavioural, the health belief model or theory posits that perceptions of susceptibility, self-efficacy, health benefits and costs may propel and prevent people from engaging in a health activity or behavior (Akhtar et al., 2018). The current study examines two types of these perceptions general perception, perceived cost and benefits of NHI. Weir-Smith et al. (2022, p. 3) contend that these perceptions matter in South Africa because of the high income inequalities and "the impact they may have on the two-tier private-public health system in the country", especially as it was found that the South Africa government is perceived to be more in favour of the public than the private sector. The government is also perceived to have inadequate administrative capacity and funding to enact the NHI.

5.2.4 Intentions

In marketing, technology adoption, pro-social and pro-environmental studies, intentions have been variously studied. Marketers study intentions in terms of purchase intentions while technology adoption and pro-social and pro-environmental studies view the concept in terms of behavioural intentions. Despite these contexts, intentions are viewed as either the willingness to act now or in the

future or to repeat a behaviour (Duh & Dabula, 2021). Intentions, also viewed as a good motivation to act have been consistently been found as a strong and positive driver of adoption and purchase behaviour (Lai & Cheng, 2016; Dilotsotlhe, 2021; Duh & Dabula, 2021). To comply in paying health insurance premium, Sunjaya et al. (2022) found that intentions are important and the intentions are driven by the people's internal factors such as awareness and knowledge of the NHI, attitudes and financial abilities and external factors such as perception of the health care quality and good operational health system.

From the literature reviewed, it can be concluded that when adequate awareness is created around the benefits and affordability of the NHI, positive attitudes and perceptions are built, which all lead to behavioural intentions, which is in turn a strong driver for purchase behaviour. The research methods to collect data and assess the awareness, attitudes, perceptions and intentions to use South Africa's NHI are discussed in the next section.

6. Research Methodology

Considering the nature of the research objectives, quantitative methods were used to collect and analyse the data. The analyses started with descriptive statistics, followed by a test of the construct reliability before assessing the mean in terms of the degree of agreement to the statements measuring the constructs.

6.1 Sample

The sample was both students and non-students in Gauteng Province. Specifically, the target population were University of Witwatersrand (Wits) students above the age of 18 and young adults (18-34) and adult workers mostly from Sasol (35-65), and both male and female who will be needing the national health insurance in the Gauteng Province. Since it was impossible to get the total number of the Wits students and the Sasol workers willing to participate in the study for a probability sampling technique, a non-probability convenient sampling method was used. A snowballing method was used for the Sasol workers. After obtaining ethics clearance from the Wits Ethics Committee with ethics number CBUSE/1574, fully completed data was collected from 201 respondents.

6.2 Measurement instruments and data collection

A self-administered questionnaire was used with scales and instruments from previous studies measurement to measure the constructs of this study. The questionnaire comprised of two sections: section A had ten (10) questions regarding the demographics of the respondents and section B had forty-two (42) questions regarding respondents' awareness, perception, attitude towards NHI and intentions to use NHI. The questionnaires were distributed electronically to the respondents. Respondents were informed that completing the questionnaires indicates their consent to participate in the study. This was done to ascertain that responses of the participants cannot be linked to their identity thus assuring their anonymity. Respondents completed the questionnaire over a period of two weeks in 2020. The link to the electronic questionnaire was sent to Wits students' emails obtained from course coordinators after obtaining permission from the registrar. For the Sasol workers, the link was sent to some few workers whose WhatsApp numbers were known and they later snowballed to other workers. All these methods were used due to the Covid-19 pandemic measures of non-physical contacts. Awareness and knowledge of the existence of NHI was measured with adapted items from Setswe et al. (2015) and Oladimeji, Alabi and Adeniyi (2017); attitudes (Setswe et al., 2015); perceived benefits (Kaufmann, Petrovici, Filho, & Ayres, 2016), perceived cost (Booyesen & Hongoro, 2018) and intentions (Dilotsotlhe, 2021). A five point Likert scale was used to measure the constructs whereby 1= strongly disagree and 5 = strongly agree.

Table 2: Descriptive Statistics

Gender	Percentage
Male	45.8%
Female	50.7%
Prefer not to say	3.5%
Respondents age distribution	Percentage
18 to 24 years	35.3%
25 to 34 years	24.9%
35 to 44 years	21.9%
45 to 54 years	17.4%
55 years+	0.5%
Total	100%
Level of Education	Percentage
Matric graduate	29.4%
Undergraduate	30.3%
Postgraduate	37.8%
Other	2.5%
Household Income	Percentage
Unemployed	32.3%
Less than R5000	6.5%
R5000-R10000	7%
R11000-R15000	5.5%
R16000-20000	9.5%
R21000+	39.3%
Health Spend	Percentage
Use medical aid	49.8%
Pay cash out of pocket	16.4%
Use free public healthcare	33.8%
Private Medical Aid Use	Percentage
Yes	48.3%
No	51.7%
Use Private or Public Health Facilities	Percentage
Private health use	57.2%
Public health use	42.8%

7. Results and Findings

7.1 Descriptive statistics

For the descriptive statistics, data was collected in terms of gender, age, highest level of education, household monthly income, health spend, use of private medical aid, use of healthcare facilities, and where health information is gathered. The results are in Table 2.

7.2: Constructs' reliability and hypotheses results

The constructs' reliability was measured with both Cronbach alpha and composite reliability before checking the means to assess whether there were high or low agreements to the studied constructs. The results are in Tables 3-8.

Table 3 Attitude towards NHI

Measurement items for Attitudes	Strongly disagree (%)	Disagree (%)	Neutral (%)	Agree (%)	Strongly agree (%)
I am confident that the NHI is government's plan to take care of everyone's health in the future	14.9	19.4	22.4	31.3	11.9
I believe that the NHI Fund will belong to all South African citizens so hospitals and health care professionals can be paid for the service they provide	16.4	17.9	18.4	35.3	11.9
With the NHI, I am hopeful that both the	20.4	17.9	19.9	29.9	11.9

rich and the poor will receive proper healthcare of the same quality					
I have the feeling that NHI will allow people to have equal and fair access to skilled health professionals and equal and fair access to finance for healthcare	17.4	20.9	19.4	29.9	12.4
I am hopeful that under NHI, healthcare will be provided to all, whether you are employed or unemployed	15.4	19.9	18.4	34.3	11.9

Source: Own compilation

Table 3 shows that there was greater percentage of agreement to all the statements measuring attitudes, than neutrality and disagreement. This means that there are some positive attitudes toward NHI.

Table 4 Awareness and knowledge of NHI.

Measurement items for Awareness	Strongly disagree (%)	Disagree (%)	Neutral (%)	Agree (%)	Strongly agree (%)
You have knowledge of what the NHI is About	5.0	7.0	17.9	59.2	10.9
You have knowledge of how the concept of NHI was developed in South Africa	6.5	12.9	28.9	43.3	8.5
You have knowledge of the meaning of "health insurance" in the NHI concept	6.0	7.0	23.4	53.2	10.4
You have knowledge of why South Africa needs the NHI	7.0	8.5	19.4	57.7	7.5
You are aware of the existence of the NHI green paper	8.5	16.4	16.9	49.8	8.5
You are aware and knowledgeable on the objectives of the NHI	9.5	10.0	14.9	55.7	7.0

Source: Own compilation

Table 4 indicates that there a greater percentage of agreements to the statements measuring awareness. Thus, respondents are aware of the NHI but not strongly.

Table 5: General perception about NHI

Measurement items for General Perception	Strongly disagree (%)	Disagree (%)	Neutral (%)	Agree (%)	Strongly agree (%)
NHI will increase access to health care services	13.9	15.9	19.9	39.8	10.4
NHI will assist in health care costs that limits access to quality health services	13.9	16.9	18.4	38.3	12.4
NHI will increase access to health services for majority of people	14.4	17.4	17.9	37.8	12.4
NHI will improve quality of health services you receive	16.4	18.4	22.4	30.3	12.4
Majority of people will utilise health care services under the NHI system	12.4	17.9	18.4	38.8	12.4
Rollout of NHI should be a policy priority	15.9	16.9	16.9	33.8	16.4

Source: Own compilation

Table 5 indicates that majority of respondents agree to having a positive general perception about what NHI will do.

Table 6: Perceived benefits of NHI

Measurement items for Perceived Benefits of NHI	Strongly disagree (%)	Disagree (%)	Neutral (%)	Agree (%)	Strongly agree (%)
There will be Improved quality of health care under NHI	12.9	19.9	25.9	35.8	5.5
There'll be reduced medical errors under NHI	13.9	23.9	31.3	26.9	4.0
There will be increased professionals' productivity under NHI	12.9	24.9	27.4	30.8	4.0
There will increased healthcare users' satisfaction under NHI	12.9	23.4	25.4	33.8	4.5
There will be reduced costs of medicine under NHI	12.9	16.9	23.9	39.3	7.0

Source: Own compilation

Table 6 shows that as much as there was agreement to the perceived benefits expected from NHI there were fairly neutrality and some disagreements. For example, there was more neutrality than agreement for the statement, “there'll be reduced medical errors under NHI”.

Table 7: Perceived Cost of NHI

Measurement items for Perceived Cost	Strongly disagree (%)	Disagree (%)	Neutral (%)	Agree (%)	Strongly agree (%)
NHI will be more affordable	5.5	6.0	41.3	38.8	8.5
NHI will be cheaper than current medical aid cost	5.0	5.0	38.8	44.3	7.0
Your family will be financially better off under NHI	7.5	6.0	46.8	33.3	6.5
NHI will lessen your difficulties in affording cost of healthcare	8.5	5.0	43.3	36.3	7.0
Prescription medicine will be more affordable under NHI.	8.5	5.0	45.8	34.8	6.0

Source: Own compilation

Except for the statement, “NHI will be cheaper than current medical aid cost”, Table 7 shows that respondents were more neutral than agreement to the perceived cost of NHI. This shows that they are not confident that NHI will lessen their medical costs.

Table 8: Intentions to adopt NHI

Measurement items for Intentions to adopt NHI	Strongly disagree (%)	Disagree (%)	Neutral (%)	Strongly agree (%)	Strongly agree (%)
I will be happy to subscribe to NHI	20.4	12.9	26.4	31.3	9.0
I will be satisfied to be enrolled in the NHI program	18.9	12.9	27.4	32.3	8.5
Being a member of NHI will be the right thing to do especially as it would cost less	18.4	13.9	27.4	30.8	9.5
I will be happy to use the NHI services offered by the government	18.4	14.4	23.9	33.3	10.0
The acceptance of NHI will not be a problem to me	19.9	14.4	23.4	33.3	10.0

Source: Own compilation

Table 8 indicates that majority of respondents agree to having the intentions to adopt NHI than they are neutral or disagree. The overall mean scores of agreements to statements measuring the constructs are in Table 9.

Table 9: Constructs' Reliability and Mean

Constructs	Cronbach Alpha	Composite Reliability	Mean
Attitudes	0.963	0.971	3.03
Awareness	0.954	0.963	3.47
General perception	0.973	0.978	3.15
Perceived benefits	0.969	0.976	2.95
Perceived cost	0.953	0.964	3.32
Intensions to use NHI	0.987	0.990	2.98

Source: Own compilation

Table 9 shows that all the studied constructs had very good reliability. In terms of the agreement or disagreement to the statements (items) measuring the constructs, mean scores below 2.5 on the five point Likert scale indicates disagreement, between 2.5 and 3 indicate neutral and scores above 3 indicate agreement to the statements. According to Table 3, and with the exception of perceived benefits, intentions to use NHI and attitudes, which show that respondents are neutral, respondents are fairly aware of NHI (M = 3.47), fairly favourably perceive NHI (M = 3.15) and regrettably perceive NHI as costly (M = 3.32).

Table 10: Decisions on the Hypotheses

Hypotheses	Mean	Decision
H ₁ : South Africans are aware of the NHI.	3.47	agree
H ₂ : There is a positive attitude of South Africans towards the NHI.	3.03	neutral
H ₃ : South Africans will agree to positively perceiving the NHI.	3.15	agree
H ₄ : South Africans will agree to perceiving benefits from the NHI.	2.95	neutral
H ₅ : South Africans will perceive that NHI will reduce medical cost.	3.32	agree
H ₆ : South Africans will agree to having intentions to use NHI	2.98	neutral

Source: Own compilation

Although there were fair agreements and neutrality of South Africans to their awareness, attitudes, perceptions and intentions to use NHI, it is encouraging to know that they are not disagreeing to the statements measuring these constructs.

8. Managerial Implications

The World Health Organization (WHO) 2015 report shows that about 150 million people globally struggle with affordability of healthcare. Thus, nations are seeking ways to provide and improve affordable and quality healthcare for all their citizens. In South Africa, the private healthcare caters for only 16% of the population and the cost of medical insurance is increasingly becoming unaffordable (Weir-Smith et al, 2022). To achieve the Millennium Development Goals and comply with the WHO recommendation of a universal health cover for all, the South African government like many other nations are establishing a NHI which as reported by Weir-Smith et al. (2022, p. 2) is to “to integrate the various healthcare systems in the country by providing a healthcare system that improves access to healthcare services, provides quality healthcare for all, and reduces the inequalities in healthcare based on the ‘haves’ and the ‘have-nots’ reality”. For all to accept and comply with the terms of the NHI, Sunjaya et al. (2022) recommend the study of the publics’ internal factors such awareness, attitudes, perception of financial cost and affordability and intentions.

This study assessed the levels of awareness, attitudes, perceptions of cost and benefits and the intentions to adopt South Africa’s NHI. The results will inform the South African department of health on how much their efforts to create awareness and understanding has yielded results in changing perceptions and attitudes towards NHI. It specifically informs the department that although the NHI is at the last year (i.e., 2022) of its second phase, the level of awareness, perceptions, attitudes and intentions has slightly improved but still low.

9. Conclusion

This study questioned the extent to which South Africans are aware of, have developed positive attitudes, perceive the benefits and costs of NHI, and have developed the intentions to use the NHI. It was found that the respondents are neutral and fairly agree to the statements measuring these studied constructs. At the start of the second phase of the NHI, Booysen (2017) found that awareness and knowledge of NHI was relatively low among South African households. Regrettably and according to the findings of this study, the awareness, attitudes, perceptions and intentions to adopt South Africa's NHI have not improved much. As Booysen (2017, p. 7) recommends that "concerted efforts are required to develop proper communications strategies to disseminate information and garner support for the country's national health insurance policy, it is recommended here that greater reach communication strategies such as social media should be used. This is particularly important because Duh and Dubula (2021) found that social media communication positively impacted awareness, perceptions, attitudes, which in turn strongly drive behavioural intentions to donate blood.

The Life Force Needed for the Force of Life: Strategy Implementation at a South African Water Board

Niriya Palani¹, Geoff A Goldman^{2,*}

^{1,2} Department of Business Management, University of Johannesburg, Johannesburg, RSA

Keywords

Strategy implementation; water sector, challenges, commitment, government, stakeholders.

Abstract

Strategy implementation remains the most problematic aspect of strategic management, and implementation challenges impede on the successful roll out of intended strategy. This study highlights strategy implementation challenges at a South African water board, where strategy is compounded by the importance of water as a scarce resource, and by the agenda of government. The study was interpretive and qualitative in nature, with semi-structured interviews conducted amongst 16 senior managers at the water board. Findings show that this water board is facing immense challenges with implementation, stemming from the expectations of governmental bodies, which override the expectations and needs of other stakeholders, leading to an unhealthy situation where the water board is at risk of not fulfilling its primary mandate.

1. Introduction and background

Strategy implementation is regarded as the most challenging phase of the strategic management process. (Muthoni & Kavale, 2015; Greer, Lusch & Hitt, 2017). Successful strategy implementation has become a key issue for many organisations, and is viewed as a key contributor to a sustained competitive advantage (Bounds, Mbombo & Rossouw, 2018; Ferreira, Neto & da Silveira Batista, 2019). However, challenges surrounding strategy implementation persist, and it still gains much attention from researchers and practitioners alike (Cândido & Santos, 2015).

Mitchell (2015) concluded that 61% of organisations studied found it difficult to deal with strategy implementation challenges, while more than 50% of organisations believed their strategic endeavours were successful, and 88% of organisations believed that achieving their intended strategic initiatives was ‘essential’ for their competitiveness and sustainability. Another study (Carucci, 2017) concluded that 67% of well-developed strategies fail due to poor implementation, and that 61% of executives are not effectively equipped for the strategic challenges they are confronted with. This low ‘conversion rate’ of intended strategy into realised strategy is apportioned to senior managers not being equipped with the necessary skills, and difficulty in translating developed strategy into functional and operational activities. (Carucci, 2017). Further obstacles to strategy implementation include (*inter alia*): a lack of involvement during strategy development, a lack of effective communication about strategy, and a lack of resources devoted to strategy implementation (Engert & Baumgartner 2016; Cândido & Santos, 2019).

This paper focusses on strategy implementation issues at a South African Water Board. As a natural resource pivotal to our economy, water is essential to the daily running of households, businesses and industries (Landie, 2016). Therefore, water resources must be managed effectively to ensure water security and sustainable utilisation. Water is not only a national asset, but also a scarce resource and water resource management is vital to maintain a balance between social and economic needs and water sustainability (Masindi & Duncker, 2016).

According to Gumbo, Kapangaziwiri, Chikoore, Pienaar and Mathivha (2021), water resource management is one of the greatest global challenges of the 21st century, due to rapid population

² E-mail address: ggoldman@uj.ac.za

growth, as well as increased agricultural and industrial outputs. As a water-stressed country striving to adopt a rational, just and equitable way to manage water (Oosthuizen, Hughes, Kapangaziwiri, Kahinda & Mvandaba, 2018), South Africa faces growing water demands to meet the needs of a rapidly growing and urbanising population. Coupled with climate change, driving the country towards a warmer, drier future, less water will be available to meet water needs in future (Viljoen & van der Walt, 2018).

Business, government and policy makers need to work together to ensure water supply, improve the productive potential of current resources, and lessen the potential impact of climate change on water security (Viljoen & van der Walt, 2018; Rand Water, 2019). According to Masindi and Duncker (2016), there are various role players involved in the management of water services in South Africa, including the Department of Water and Sanitation, Municipalities, and government owned water boards. A feature that distinguishes the South African water sector is the existence of an important institutional tier between the national and local government, in the form of water boards. Water Boards have an essential role to play in terms of the purification of water, managing the regional bulk potable water distribution, and operating water resource infrastructure (Masindi & Duncker, 2016).

2. Purpose of the study

Water boards in South Africa provide an interesting context for the study of strategy implementation, as they experience challenges that are unique in the water sector, and they are a form of organisation unique to the South African water sector (Mosai, 2019). The constant changes experienced in the water sector in South Africa require these water boards to continually adapt and assess their strategies and implementation practices to address and overcome any challenges that might arise. This also assists water boards in achieving their mandate of supplying bulk potable water without interruption (Mosai, 2019).

The underlying problem this study is concerned with, is the apparent inability of organisations to bridge the gap between strategy development and strategy implementation, resulting in strategy implementation challenges and failure. Water boards too have strategic targets that need to be met to ensure water security, and they also run the risk of encountering strategy implementation challenges. Without effective strategy implementation practices, and if implementation challenges are not effectively addressed, the water boards' ability to achieve their strategic targets will be diminished.

With this research problem in mind, this study addresses the following research question:

What are the current challenges hindering strategy implementation at a water board in South Africa?

To answer the stated research question, the following research objective is pursued in this paper:

To understand the dynamics of strategy implementation at a South African water board in order to ensure more effective functioning and water provision.

This study aims to explore the strategy implementation practices at a water board, and focuses on implementation practices, but does not lose sight of the strategy formulation aspect of strategy.

3. Literature review

To understand the role of strategy implementation in the management of an organisations' strategy, this section will take a step back and briefly consider the strategic management process. Thereafter the implementation of strategy will be expounded upon and contextualised to the water sector in South Africa.

3.1 The Strategic Management Process

It would appear as though the contemporary, dynamic and turbulent business environment has compelled organisations to place greater emphasis on strategic issues (Misankova & Kocisova, 2014;

Mufudza, 2018). As such, organisations need to develop and implement strategies that can propel them to greater heights (Muthoni & Kavale, 2015). This implies that individuals or teams involved in the strategic management process need to decide upon strategies that are appropriate to remain relevant, competitive and sustainable. Effective strategic management is therefore a function of people actively considering strategy in day-to-day decisions that are required in an ever-changing world.

Strategy not only explains what an organisation's purpose is, it also defines an organisations long term direction, and acts as a guide toward achievement of its purpose (Misankova & Kocisova, 2014; Gamble, Peteraf & Thompson Jr, 2015). It is therefore essential that developed strategy is achieved as intended. However, research indicates, that this is not necessarily the case, and a significant gap exists between strategy on paper and the realisation of strategy (Kimotho, 2012).

3.2 Strategy Implementation

Strategy implementation is the execution of a crafted, developed strategy, and is considered the most significant, and undervalued, part of the strategic management process (Gamble, et al., 2015). Strategy implementation sets out to incorporate strategy into organisational 'life', to let it form part of the daily decision-making procedures of the organisation. It is therefore essential to ascribe suitable indicators describing organisational activities, and a method for assessing effective implementation.

Strategy implementation encompasses the total design of the organisation, to assign and manage people to take on responsibilities that will lead to the realisation of formulated strategies (Grant, 2016). Strategy implementation involves anticipating challenges that could negatively affect the outcome of implementation initiatives, and therefore needs to be linked to key aspects and functions of the organisation to find the most appropriate way to implement strategy (Rajasekar, 2014). Implementation is, therefore, also more challenging than strategy development, as it requires a coordinated effort from the entire organisation (Sull, Homkes & Sull, 2015).

3.3 Strategy Implementation Challenges

Support and coordination from internal and external role players are seen as obstacles to the implementation of strategy (Sull, et al., 2015; Ivancic, Mencer, Jelenc & Dulcic, 2017). Internal factors under the direct control of management are regarded as a fundamental challenge to successful strategy implementation (Candido & Santos 2019). These internal challenges mainly stem from top management over emphasising strategy formulation and strategic planning, but not paying enough attention to also adopting a problem solving mind-set for effective strategy implementation (Tawse, Patrick & Vera, 2019). In the process, strategy formulation and strategy implementation are misaligned, creating the impression that management knows where they want to go, but don't know how to get there, and that they are more committed to the goal itself than in achieving the goal.

Middle- and supervisory level managers often have requisite skills to help formulate strategy, but seldom possess the skills to implement it (Greer, et al., 2017). Managers therefore act reactively to implementation issues that arise, but lack the ability to proactively put measures in place to foresee and negate the effect of any potential issues associated with implementation (Sull, et al., 2015).

As strategy formulation and implementation go hand in hand, employees who are not part of the formulation of strategy, will not be able to effectively implement the strategy (Ramgulam, 2015). Therefore, employees at all levels of the organisation need to be involved in the entire strategic management process. Furthermore, here also seems to be a misalignment between strategic goals and operational goals in organisations, and this obstructs the process of strategy implementation, and can lead to dramatic drops in productivity and misallocation of resources (Viljoen, 2015).

Other factors such as persistent errors on the part of management, key personnel leaving the organisation, ineffective change management initiatives, excessive daily tasks that detract from strategy implementation, communication breakdowns centring around selective attention and

retention of key pieces of information, and conflicting organisational priorities all contribute to the complexity of strategy implementation (Speculand, 2014; Heracleous & Werres, 2016)

3.4 Key Success Factors for strategy implementation

Although various challenges may hinder strategy implementation, factors also exist that expedite strategy implementation. According to Mistry, Barrick, Kirkman & Hitt (2016) strategy implementation relies on engagement and communication at every level of the organisation. Easterling (2016) states two activities necessary for successful strategy implementation, namely to operationalise the strategy in terms of detailed functions, activities, and performance measures for employees, and to create an organisational structure conducive to implementing the actions that the strategy requires. Engert and Baumgartner (2016) add to this that organisational culture, leadership, control of activities, and employee motivation are key factors that reduce the gap between corporate strategy development and implementation. Misankova and Kocisova (2014) expand, *inter alia*, upon the employee motivation aspect, adding that personal involvement and sharing responsibility for actions assist in effective strategy implementation.

3.5 Strategy Implementation and the South African Water Sector

Water resource management plays a critical role in sustainable economic development of South Africa (Muller, Chikozho & Hollingworth, 2015). For water resource management, water boards are vital role players in water purification, the operation and maintenance of water infrastructure, and the provision of water, and emphasise the need to strategically manage this resource for optimal economic benefit (Masindi & Duncker, 2016). Climate change, people not having access to basic water and sanitation, mismanagement of funds, and degradation of infrastructure is not only stretching the resource, but also bringing to question how it is managed strategically (Ruiters & Matji, 2015).

All these challenges create compounded challenges when one speaks of trying to implement strategy expediently at role players such as water boards, as they continually have to adapt and assess their strategies and implementation practices (Mosai, 2019). This is echoed by the Mena Report (2018), stating that South Africa must close the gap between strategy planning and implementation in the water sector to focus on water provision and utilisation, and to expeditiously deal with the challenges the sector faces.

Despite capacity building initiatives from within the sector, requisite skill levels within the sector are dwindling, with a shortage of engineers, water scientists, technicians and artisans (Mvulirwenande, Wehn de Montalvo & Alaerts, 2013; Moyo & Wehn, 2017). This places doubts over the sectors' ability to provide services effectively (Masindi & Duncker, 2016). However, parastatals constitute key role players in the water sector, and are therefore subject to governmental agendas (Moyo & Wehn, 2017). Changes in government policies regarding these agendas will impact on strategy implementation, as these changes don't always align with the goals of water provision, but are more politically motivated (Kimotho, 2012).

Specific to water boards, certain key success factors need to be in place for strategy to be implemented successfully (Muthoni & Kavale, 2015). These include: intra and inter-organisational coordination, effective communication, streamlining of processes, aligning structure to strategy, motivating employees, and effective leadership. Of all the factors, Muthoni and Kavale (2015) single out effective leadership as the force that binds the other factors into an effective whole. In reality, however, these key success factors are seldom in place, due in part to overlapping responsibilities of key personnel and an inability to achieve stated objectives (Musonda, 2016), but also due to political infighting amongst different role players (Pahl-Wostl, 2019; Van Buuren, van Meerkerk & Tortajada, 2019).

Effective monitoring and evaluation are essential in the implementation of strategy, as it assists in understanding trends, and acts as input for adapting implementation plans as the need arises. However, current monitoring systems in the sector provide such poor data that it poses a risk to the achievement of organisational goals (Viljoen & van der Walt, 2018). In order for strategy to be implemented

properly, proper resource allocation (which includes funding) is required (Moyo & Wehn, 2017). The right mix of resources is needed – including financial, human, and otherwise – at the right time and place to fulfil the requirements in water provisioning and water services management (Kimotho, 2012).

4. Methodology employed in this study

This study employed an interpretivist paradigm, as the primary objective of the study focuses on understanding the dynamics of strategy implementation at a South African water board. Interpretivism focuses on understanding the world through first-hand experience and truthful reporting about the social world (Babbie & Mouton, 2014; Hallebone & Priest, 2017). In line with the interpretivist philosophy, the study used a qualitative research approach to gain an understanding of the challenges associated with strategy implementation at a water board in South Africa. Qualitative research provides rich, detailed and thick descriptions of social phenomena, as participants are encouraged to converse freely about their experiences with these phenomena (Collis & Hussey, 2014; Antwi & Hamza, 2015).

Furthermore, a single case study design was pursued in this study, and more particularly, a South African water board was selected as object of inquiry. Case study research is suited for in-depth investigation of current events in actual contexts (Yin, 2012), and in this case, the issue of strategy implementation is studied in the context of a water board. The selection of the case was purposive, as the water board selected is the largest water board in South Africa in terms of scope of operation, and can therefore be seen as an archetypal case of a South African water board.

From this water board, a sample of 16 research participants was selected on a purposive basis from the ranks of senior and middle management across various functional areas and geographic locations of the water board. Data collection was facilitated through the use of semi-structured face-to-face interviews, as they allow for deep probing of complex issues, and can realise rich, descriptive data (Saunders, Lewis & Thornhill, 2012; Babbie & Mouton, 2014).

Data were analysed by means of directed content analysis, which validates, refines and adds onto existing theory in new fashions and contexts (Mayring, 2014). Directed content analysis was facilitated by a four stage analytical process, as proposed by Erlingsson and Brysiewicz (2017):

- 1 – Identify and develop codes from raw data
- 2 – Develop relationships and connections between the codes
- 3 – Develop categories
- 4 – Develop themes from interrelated categories

This process allowed for the underlying meaning in the content to be expressed as well as in-depth conclusions to be made from the data obtained.

To ensure that ethical principles were upheld, ethical clearance was obtained from the College of Business and Economics at the University of Johannesburg, as this paper is extracted from an MCom study for which ethical clearance was needed. In addition to gaining permission from the water board in question to conduct this research, informed, voluntary consent was sought from research participants. Participants were reassured that data would be treated with the requisite confidentiality, and that anonymity would be ensured. It was also reiterated that participation was voluntary, with the right to withdraw at any stage.

5. Findings forthcoming

When this study was planned, face-to-face, semi-structured interviews were decided upon. However, with COVID-19 and the ensuing lockdowns, face-to-face meetings were not possible. It was decided to utilise Zoom to facilitate the interviews. This turned out to be advantageous, as the record function of Zoom seems to be less invasive than the presence of a recording device in a face-to-face interview, and no participant objected to being recorded on Zoom. Participants varied in age between 34 and 63

years, occupied middle and senior managerial positions, and had been employed for between two and 25 years, with two participants being employed at the water board for less than 10 years. Participants had occupied their current position for between three months and 24 years. Of the 16 participants, most had worked their way ‘through the ranks’ to their current position, and four participants were employed at the water board in the position they currently occupy. From the coding and analytical process employed, five key themes emerged, which will now be unpacked in turn. Evidence in support of the claims made has been kept to a minimum in the interests of brevity, but further evidence is obtainable from the authors.

5.1. Theme 1: Understanding strategy development and strategy implementation

This theme provided a detailed description of what strategy development and strategy implementation was all about at the water board. Participants seemed to give very theoretical ‘text-book’ explanations of strategy and the importance thereof, which seems to reflect more of what participants would like to see happening regarding strategy, and less of what is happening.

Participants opined that strategy development is a definite top management responsibility, whereas strategy execution was a definite middle or even operational level responsibility. Although this is a ‘textbook’ definition, it seems to absolve different levels of management from certain responsibilities insofar as formulation and implementation of strategy are concerned, which does not help in terms of overall buy-in and a sense of ownership in strategy. However, participants definitely do see strategy as a process and not a once-off event, with a definite link between formulation and implementation of strategy. (Gamble, et al., 2015; Mufudza, 2018).

Participants recognised the water board’s vision, mission, goals, and performance targets as the ‘visible’ elements of both strategy formulation and strategy implementation, which are devised during strategy formulation, but act as the target or goal that the strategy aspires to achieve through current activity. Thus, there is an awareness amongst participants that implementation implies transferring crafted strategy into action, which is consistent with the views of Gamble, et al., (2015), and Verweire (2019).

Research participants were all aware that strategy implementation is exceedingly complex, as it requires various internal and external elements, resources, good leadership, clear communication, and good stakeholder management to spell out the ‘road map’ of the organisation’s strategic intent. Literature also highlights this complexity (Sull, et al., 2015; Grant, 2016), stressing that strategy implementation requires design and coordination of effort across the entire organisation, as well as outside of it. In line with Misankova and Kocisova’s (2014) view that strategy implementation plays an important role in organisational competitiveness, some participants felt that strategy implementation is vital to ensure the success of the water board. Although this is what water board aspires to, it does not seem to be happening.

The table below contains quotations extracted from the interviews in support of the claims made above:

Participant 5: *“Strategy implementation follows strategy formulation. It’s often the most difficult and is dependent on many variables; for example, maybe the strength of the strategy, whether it’s focused enough, properly communicated with guidelines on how to operationalise or implement and monitoring and tracking performance against set objectives.”*

Participant 13: *“Well, before a strategy can be implemented it must first be crafted to set direction for the organisation. A vision of the organisation’s long-term goals must be set, a mission that describes the purpose of the organisation and a set of values to support the vision and mission must be set. Also, objectives must be set to convert the vision and mission into specific performance targets, to move the organisation along its strategic intent.”*

Participant 16: *“Yes there is. Strategy without implementation is just a nice idea on paper. Strategy has to be shared and implemented if it is to have a meaningful impact.”*

Participant 15: *“Strategy development can be seen as an analytical and systematic process of selecting the best course of action required for the organisation to achieve its objectives, prescribed by its vision, mission and values. Strategy implementation is more an operational process aimed at managing the various elements during execution to achieve success.”*

5.2. Theme 2: Stakeholder involvement in strategy development and strategy implementation.

This theme provides insights into research participants’ involvement in the organisation’s strategy development and implementation processes at various levels within the organisation, as well as their experience of how various stakeholders are involved in strategy development and implementation.

All participants mentioned that the water board has a dedicated strategy department known as ‘Strategy Portfolio’ or ‘Group Strategy’, and strategy development is conducted at executive level with the input of various internal and external stakeholders. Internal stakeholders include the CEO, the CEO’s team, the Strategy Portfolio and the Portfolio Integrating Committee. This coincides with views from literature that strategy is a top management responsibility (Greer, et al., 2017; Wheelen, Hunger, Hoffman & Bamford, 2017). However, literature stresses that successful strategic management requires total organisational effort, but several participants mentioned that strategy development takes place at executive level only, and does not involve the rest of the water board, which was problematic. This will be further addressed in Theme III.

Participants did mention external stakeholders, such as the Department of Water and Sanitation, who help shape the water board’s strategy, as it ultimately needs to align with the objectives of Government. This underscores Moyo and When’s (2017) sentiment that water boards are bound to the goals and vision of the ruling party, and shows participants awareness of the interconnectedness of external stakeholders to the management of strategy at the water board.

Due to the water board’s size, each portfolio, department, and division needs to ensure that they align their business plans to the overall organisational strategies, vision, mission, values and objectives of the water board, and that this is translated into realistic, workable and relevant Key Performance Areas. This seems in line with the views of Easterling (2016), who purports that successful strategy implementation requires strategy to be operationalised in terms of function, activities and performance measures for employees. Again, participants noted that only certain people had the opportunity to contribute to strategy during the development phase, which is disconcerting. This will be discussed further under Theme III.

Certain participants mentioned that due to strategy implementation being the concern of all employees, everybody needs to know, understand and buy into the strategy for it to work. However, this does not seem to be the case at the water board. Chroust (2014) mentions that leaders and managers play a substantial role in identifying the necessary implementation process, as they have influence on various strategic drivers that assist organisational performance, and it is therefore crucial for all concerned at the water board to break down silos that exist to work together in order to improve alignment between strategy development and strategy implementation.

The excerpts contained below are from the interviews support the findings presented above:

Participant 2: *“The Chief Executive, the strategy portfolio, the Portfolio Integrating Committee (PIC), General Managers (GM), planning crew and staff reporting to the GM’s. The PIC sets the mode of what is critical in a particular year and then the strategy portfolio will take it to a lower level for inputs and implementation as pillars and targets for the financial year.”*

Participant 7: *“Yes, we have the Group Strategy Portfolio comprising corporate planning, corporate research and development and financial and economic planning.”*

Participant 9: *“My involvement is in terms of developing strategies at a departmental, division level that supports the corporate strategy. In addition, I am involved in the implementing of these strategies to support the corporate strategy.”*

5.3. Theme 3: Challenges experienced with strategy implementation

Respondents delved deeply into the implementation challenges experienced at the water board, and many challenges emerged, indicating that this is an area of concern for respondents and that many of the things that go wrong in the water board seem to be attributable to strategy implementation issues.

All 16 participants eluded to numerous and immense internal challenges to strategy implementation faced by the water board. Resistance to change, lack of commitment to change, and lack of flexibility to respond to changes presented a huge challenge. Many participants have been employed by the water board for more than 15 years, and openly resist change. This not only hinders strategy implementation, but also created friction with others who are more open to change. Kloppenborg, et al., (2014) also found that the fears and concerns associated with a change event, such as the implementation of a new strategy, stem from the associated disruption that accompanies change. Also, many participants noted that a lack of skill and/or capacity to implement the developed strategy properly was a growing concern. This is indicative of a growing gap between requisite and current managerial capacity and skill levels at the water board, despite efforts to develop skills and capabilities of staff members. Mvulirwenande, et al., (2013) attest that deficiency of knowledge and capacity has been noted as one of the main challenges facing the implementation of water sector related strategies and policies.

Those research participants occupying managerial positions mentioned that insufficient communication was forthcoming regarding strategy from local and provincial government, and the Department of Water and Sanitation, which has resulted in confusion and a lack of understanding of what is expected from, and by, governmental bodies. This creates the impression that the water board's management are incompetent and unable to provide clear direction for employees to understand what is expected. It was stressed that this has resulted in costly mistakes and inefficiencies. Communication has been cited as essential for the success of strategy implementation (Heracleous & Werres, 2016; Cândido & Santos, 2019), as without open, transparent, two-way communication, the successful roll-out of any strategy is seriously impeded. Those in managerial positions also noted a lack of support for strategy implementation initiatives, which is symptomatic of a lack of buy-in to the water boards' strategy, as noted under Theme II. Inadequate performance measure and incentives were also mentioned as factors that inhibited support of the strategy at the water board. The adequacy of existing performance were questioned, as they were not linked to KPA's. Participants felt better performance measures could help create support for strategy implementation initiatives, which is a view that is also imminent in literature (Ho, Wu & Wu, 2014; Cândido & Santos, 2019).

On an organisational level, participants commented that the water board's preparedness for strategy implementation is hampered by a lack of resources, a lack of infrastructure, insufficient budgets and financial constraints, supply chain issues, and the availability of materials. Many of these issues are also cited in literature (Ruiters & Matji, 2015; Cândido & Santos, 2019), purporting that many of the challenges experienced at water institutions are attributed to insufficient investments, uncompromising government fiscal policies, high budget deficits, and a shortage of debt reduction strategies in the public sector, all of which have a direct effect on infrastructure development and strategy implementation. Participants also mentioned that the organisational culture seems not to be aligned with the strategy the water board is pursuing, with divisions working in 'silos', and much bureaucracy in approvals processes. This is consistent with Heracleous and Werres (2016) conclusion that strategy implementation is dependent on a conducive and supportive organisational culture and climate. An interesting observation was made about a COO who left the employ of the water board. This person was seen as pivotal to strategy implementation, and their departure left a definite void, underscoring the view that strategy implementation is often hampered by key people leaving the organisation (Heracleous & Werres, 2016).

Participants mentioned that the misalignment between strategy formulation and strategy implementation across different portfolios and divisions leads to functional objectives which yield results that do not link up with the overall strategic plan of the water board. This creates the impression that departments, divisions and portfolios are not working together and that no synergy

exists in support of one another when it comes to strategy both strategy formulation and implementation. All participants commented on a lack of feedback on implementation progress, stating that the only feedback received was when goals were not achieved, or if stakeholders were not aware of the consequences of not achieving goals. This is consistent with views in literature that insufficient feedback is a challenge to strategy implementation (Kloppenborg, et al., 2014; Heracleous and Werres, 2016),

Challenges emanating from outside the water board impacting on strategy implementation were also mentioned by the research participants. Due to the nature of its business as a water board, this particular water board is accountable to various stakeholders, and its strategic plans have to align to the agenda of the government. Trying to align to government often results in many of the water board's intended plans having to be abandoned (Moyo & When, 2017). Factors such as economic indicators, volatile exchange rates, political uncertainty, changing legislation, and Covid-19, forced a rethink of the strategic plans and reallocation of resources, as the water board considered its' role in stabilising the economy without compromising the integrity of existing business and meeting demand, a sentiment echoed in literature (Kapangaziwiri, 2018), as constant external changes in the South African water sector necessitated role players to adapt their strategies and implementation processes.

The table below contains quotations from the interviews in support of the findings presented above:

<p>Participant 7: <i>“In my opinion, the organisation is utilising sound management systems and processes in the development of the strategy and for it to transcend into implementation thereof. However, there may be room for improvement in monitoring and evaluating how effective the alignment and cascading of the corporate strategy is in an organisation that is divided into various portfolios and divisions.”</i></p>
<p>Participant 8: <i>“...the gaps possibly occur because as a water institution we are an essential service and thus answerable to our shareholder which is the water ministry now known as The Department of Human Settlements, Water and Sanitation. Therefore, the strategic plan has to be aligned with the vision, as set out by the government. In attempting to align to government quite often the operational plans become secondary.”</i></p>
<p>Participant 1: <i>“Another challenge I believe there is, is with regards to feedback loops. There must be well established committees tracking progress, providing direction and guidance, as well as approvals.”</i></p>
<p>Participant 6: <i>“As mentioned earlier, we have brilliant strategies but the environment and culture we operate in, is not conducive to its application.”</i></p>

5.4. Theme 4: Key success factors that contribute to the organisation's strategy implementation success

Participants tended to reflect on what should be done to improve efficiency and overall success of strategy implementation initiatives. These views can be translated into key success factors needed to successfully implement the water board's strategy.

Communicating the strategy effectively stood out as the most pertinent issue for participants. Not only should this communication be regular and transparent, but should also be inclusive of internal and external stakeholders. Transparent and effective communication with internal and external stakeholders is also cited in literature as essential to implement strategy successfully (Engert & Baumgartner, 2016; Jaoua, 2018). Effective change management was also mentioned as a key issue in order to react quickly to unexpected events and to be flexible enough to respond to changing demands of government. Participants mentioned, *inter alia*, that change management should focus on understanding the strategic intent of the water board, expectations of key role players and processes. It is felt that this would go far in reducing resistance to strategy implementation initiatives, as also cited in literature (Misankova & Kocisova, 2014; Jaoua, 2018).

Research participants also felt a key issue in the overall strategic management of the water board was appointing competent people in key positions with the requisite skills and experience of the water

sector, as confirmed by literature (Engert & Baumgartner, 2016; Bounds, et al., 2018) that having the right people with the necessary skills in key positions helps in achieving organisations' strategic intent. Another important issue mentioned by research participants was visible leadership and management support, stressing the value of managers who lead from the front by being visible and exemplary. This not only helps eliminate any uncertainties that might exist of what is expected, but it also helps create buy-in, which is also mentioned in literature (Simas, et al., 2013; Engert & Baumgartner, 2016).

Some participants mentioned rewards and incentives for staff to achieve set objectives as a key issue, which need to be coupled to clear implementation plans, linked to clearly defined KPA's. This reflects views in literature (Bounds, et al., 2018; Engert & Baumgartner, 2016) that incentives linked to clear performance indicators can improve employee motivation, which in turn contributes in achieving organisational objectives. Furthermore, greater employee involvement in the strategic management process was also noted as a key issue by research participants, as it will create greater buy-in, improve understanding of the strategic direction, and will provide employees with a sense of ownership. This is consistent with the views of Misankova and Kocisova (2014), and Birkinshaw, (2017).

The table below contains excerpts from the interviews in support of the claims made above:

<p>Participant 5: <i>"I would say a good clearly communicated strategy with enough resources to implement the strategy. In addition to this a clear framework to allow for alignment of the implementation plans with clear accountability and key performance area and indicators and also constant monitoring and evaluation of the latter is important."</i></p>
<p>Participant 10: <i>"...leadership and management support, participation and application, competent and professional staff to execute the strategic objectives, an enabling culture and also incentives and rewards for staff."</i></p>
<p>Participant 11: <i>"One of the key success factors that our organisation is successfully maintaining or improving through implementing its strategy is attracting, developing and retaining leading edge skills in water services."</i></p>

5.5. Theme 5: Suggestions to overcome strategy implementation challenges

Interviews tended to veer toward participants suggesting solutions to challenges faced by the water board, forming the basis of this theme. Most pertinent for participants was a need to conduct critical reviews of implementation progress, identifying implementation risks and developing measures to mitigate these risks at departmental and divisional level. Adversely, some participants suggested more proactive approaches, such as pilot projects before rolling out projects and strategies, or root cause analysis of all the business process barriers.

Some participants suggested the removal of bureaucratic processes and empowering divisions with more accountability, which overlaps with other participants desire to promote a culture of inclusivity for strategy development at all levels of management. It is hoped that this would increase buy in, commitment, and understanding of the strategic process.

Participants felt a need for feedback sessions to not only share results, progress, and post implementation lessons, but also to address questions and queries are addressed. The information forthcoming at such sessions can also be used as input for future planning. The need for feedback was expressed differently by some participants, expressing a need for communication in the form of roadshows to disseminate information regarding the water board's strategy, as well as training and education initiatives to empower employees to understand the strategy.

Some participants also suggested aligning organisational structure to strategy with policies and processes to govern and integrate the development of the strategic plans across the water board, with clear accountability and KPAs.

The table below contains excerpts extracted from interviews in support of the claims presented above:

Participant 3: <i>“A solution I would recommend is to promote a culture of inclusivity for strategy formulation that includes all levels of management. Another solution is to measure KPI’s and communicate results clearly, as well as reasons for not achieving goals.”</i>
Participant 8: <i>“I believe that one of the key challenges is people. In this regard, a route to take is to train, educate, equip and empower employees to feel confident when it comes to implementation of the strategy.”</i>
Participant 13: <i>“I would say, critically appraise the direction of the organisation. Leadership skills should be evaluated. Communication should be directed to all staff. There should be buy in and also staff should feel part of the process and the organisation. Also, measurable and objectives must be constantly monitored with corrective actions where needed.”</i>

6. Main conclusions resultant from the study

Emergent from the findings it is apparent that, however obvious it might seem, it must be emphasised that strategy development and strategy implementation are interconnected parts of a holistic, strategic management process. The importance of strategy, and the management thereof, needs to be emphasised at all levels of the water board, and to all stakeholders, in order to create greater understanding and buy in to the process, and in order to foster greater cohesion in working toward a common goal.

It is also apparent that the water board is experiencing a multitude of challenges in strategy implementation, including resistance to change, lack of direction and a clearly articulated implementation plan, lack of understanding of the strategy, as well as ill-defined roles, responsibilities, and expectations of staff responsible for implementation. There are not enough resources required, including employees with the necessary skills, to effectively implement strategy in the water board. There is also little or fragmented ownership and accountability for the water board’s strategy amongst those involved, and infrequent as well as ineffective communication regarding strategy development and implementation, which creates confusion. Insufficient feedback exists regarding implementation progress and achievements. All of this contributes to a pervasiveness of failure and results in costly mistakes and errors.

The impact of economic, political, and social forces requires a rethink of the water board’s overall strategy. As the water board is a parastatal institution, it is regarded an essential service and is answerable to public sector stakeholders such as National Treasury and The Department of Human Settlements, Water and Sanitation, which presents various challenges in itself. The bureaucracy, restrictive controls and regulations, and codes of practice reduces the water board’s autonomy and freedom to innovate.

At the end of the day, this case study seems to be an exemplary case of how strategy should not be implemented, as all challenges that could negatively impact an organisation as far as strategy implementation issues are concerned, seem to befall this particular water board. However, in the final analysis, an overall lack of direction seems to be at the heart of all these challenges the water board is facing. This lack of direction is mainly due to constant interference by governmental bodies, who themselves lack clear direction and focus. Unfortunately, as the findings have shown, the interests of the ruling party enjoy preference, and in so doing, the interests of stakeholders are not prioritised accordingly and the water board could run the risk of not fulfilling its basic mandate in future.

7. Recommendations and managerial implications

The water board needs to carefully and regularly assess its environment to fully understand the challenges they are faced with regarding strategy implementation. This should include an analysis of key success factors required to implement strategy effectively, and in-depth analysis of the solutions that need to be developed to overcome these challenges and ultimately achieve the water board’s mandate.

To successfully implement the water board's strategy and achieve its mandate, it is pivotal that an innovative culture is created and embedded, as such a culture will most likely foster more frequent and more effective communication with employees. It is hoped that this will translate into greater inclusivity regarding strategy development and implementation processes, which will nurture buy in. It is also vital for managers and employees to understand the interdependence between strategy development and implementation, and to understand the constant 'back and forth' between them, so that corrective action can be taken to ensure effective strategy implementation in the attainment of the water boards' goals.

All stakeholders have to work together and create synergy and alignment between strategy development and implementation in their respective areas. An emphasis on monitoring, evaluation and feedback is also essential, as it helps in understanding the progress of each process, in ensuring continuous improvement, and in assisting ineffective change management. It is crucial to continually attract, develop, upskill and retain employees with the necessary skills required to effectively implement the organisation's strategy. Having the right people with the right skills makes it easier for any organisation to work towards achieving its strategic intent.

8. Limitations of the study and avenues for future research

Although a single case study allows for detailed, in-depth understanding of a particular phenomenon, it is somewhat limited, and a fuller picture of strategy implementation across the entire South African water sector could be more insightful. For this, either more single case studies have to be embarked upon, or multiple case study research could be undertaken.

9. Concluding remarks

This study has provided evidence of strategy implementation challenges at a South African water board. It is clear that there are numerous problems at this water board, to the extent that this case can be seen as archetypal of how *not* to implement strategy. The disconcerting reality, however, is twofold. Firstly, that such challenges are actually quite commonplace, which is exactly why strategy implementation presents such a problem for organisations. Secondly, and more disconcerting, is the fact that this is the situation at a water board, who are tasked with providing water and sanitation to the citizens of the country. With electricity provision already being in such a state of ill-repair, South Africa cannot afford water provision to also teeter on the brink of disaster, as this will surely result in South Africa being a failed state.

Success

Abstract

This study aimed to explore Entrepreneurial Orientation (EO) and business success in township-based small businesses. This study was administered through a survey to a target population of 100 small businesses. From the 100 questionnaires distributed electronically via email and WhatsApp, only 79 responses were received back, and statistical analysis was conducted. The survey reliability was tested and calculated using Cronbach Alpha Coefficients for all entrepreneurial orientation and business success variables. The standard deviations and the mean of individual responses for all the variables were calculated from the evidence. The information obtained from the survey was used in decision-making and in making recommendations. The study concluded with suggestions concerning future research and achieving the objectives.

1. Introduction

Amidst the initial business period, an entrepreneur should have specific characteristics that may comprise the will to act and bring out innovativeness (Littunen, 2000:20). Entrepreneurial orientation (EO) is a firm strategy. It relates to simple practices and policies enhancing entrepreneurial actions to create a competitive environment (Martens, Machado, Martens & Freight, 2017:255). It is important to note and understand that the dimensions of EO, which are innovativeness, risk-taking, pro-activeness, autonomy and competitive aggressiveness, can impact business performance and assist firms in gaining competitiveness (Martens *et al.*, 2017:255).

Entrepreneurial orientation dimensions are a crucial matter, as Lumpkin and Dess (1996:135) argued, stating that not all dimensions of EO will impact the business performance positively or directly under circumstances that are not similar. In agreement, Kraus, Rigtering, Hughes and Hosman (2011:166) state that EO dimensions should be evaluated separately. In addition, Lumpkin and Dess (1996:135) stated that EO variables might differ, and not all variables may contribute to business performance significantly.

The steady increase of small businesses has contributed to stable economic growth and stimulation of national development of most economies around the continent (Soiminen, Martikainen, Puumalainen & Kylaheiko, 2011:274). Jasra, Muhammad, Ahmed, Rana, and Raf (2011:274) add that most governments around the globe have realised the benefits of small businesses to their gross domestic product (GDP). Poverty reduction through creating jobs is one of the most critical roles of small businesses (Fatoki & Asah, 2011:170).

The study aimed to assess the level of entrepreneurial orientation and its impact on the business performance of township-based small and medium-sized businesses. According to The National Small Business Act (102 of 1996), a business is small if it has less than 50 employees, an annual profit of below R25 million and a total gross asset of less than R4.5 million.

2. Problem Statement

The world is rapidly changing, and because of these changes, non-entrepreneurial organisations are faced with the risk of becoming obsolete. Many researchers continue to seek solutions regarding the factors that directly influence business performance (Ndang, 2017:5).

Furthermore, Ndang (2017:5) states that scholars attempted to define these factors by looking at the effects of different aspects such as managerial competencies, educational level, company characteristics, and business environment on small business performance. The contribution made by SMEs to the South African economy is remarkable, and their high rate of failure is a call for concern (Ndang, 2017:5). The rate of the loss of South African SMMEs is approximately between 70 per cent to 80 per cent (Brink & Cant, 2010:2).

Entrepreneurial orientation significantly affects performance and small business success (Amengot, Parellada & Carbonell, 2010:379). However, their study was focused mainly on African immigrant-owned small businesses. Rua *et al.* (2018:25) add that EO impacts the performance of an organisation when organisations deliberately secure, leverage and develop resources to exploit opportunities to gain a competitive advantage. Even though SMMEs are identified as critical correspondents to the current economy, the apprehension of this prosperity in a progressively competitive environment and growth attainment remains limited (Anderson & Eshima, 2013:413). Stouraitis, Harun and Kyritsis (2017:35) agree that the factors differentiating SMME growth should be thoroughly researched.

Conclusions on the relationships of entrepreneurial orientation on business performance of small businesses are still needed, varying from a significant positive relationship to a weak relationship (Ndang, 2017:5).

Wiklund and Shepherd (1999:39) further articulate that concerning the individual variables of EO, preceding research proposes that each dimension may significantly influence performance. A gap in literature still exists concerning the assessment of entrepreneurial orientation, mainly in township-based small businesses. This absence of research in township entrepreneurship could suggest a lack of knowledge in understanding township businesses. This paper assesses EO and its contributions to business success in township-based SMMEs.

3. Objectives Of The Study

3.1 Primary objective

The primary objective of this study was to assess the relationship between entrepreneurial orientation in selected township-based small businesses and the success of those businesses.

3.2 Secondary objectives

To support the primary objective, the secondary objectives included:

- To review entrepreneurial orientation and business success.
- To assess the relationship between entrepreneurial orientation and business success in selected small businesses.
- To suggest recommendations and managerial implications from the results of the study.

4. Literature Review

Lumpkin and Dess (2005:146) state that it is a necessity for entrepreneurs that wish to sustain successful small businesses to have an entrepreneurial mindset. Moreover, regardless of their size, all firms must expand their capability to differentiate the value of new ideas, integrate them, and employ them in business opportunities (Descotes & Walliser, 2013:178). Ndang (2017:81) further articulated that the entrepreneurial orientation concept attempts to elaborate the thinking of entrepreneurs in a context where strategy development is considered a central factor of economic operation. However, Venter (2013:12) states that researchers have not agreed on a uniform definition of an

entrepreneurially orientated firm. This may have resulted from the idea of positioning towards entrepreneurial activity has owned many names in preceding research (Covin & Wales, 2012:678).

Edmund and Wiklund (2010:143) argue regarding the entrepreneurial orientation dissimilarity as to whether the new aspects previously developed by Lumpkin and Dess (1996) should be considered together with the three main dimensions. Two new dimensions, autonomy and competitive aggressiveness were added to the previously existing dimensions: risk-taking, innovativeness, and pro-activeness (Lumpkin and Dess, 1996:136). However, the two new dimensions received criticism, particularly competitive aggressiveness, as it was said to fall outside the scope of the entrepreneurship realm (Venter, 2013:14). Edmond and Wiklund (2010:145) add that other EO dimensions have been challenged as well. Experts believe that autonomy is more relevant to the individual than to an organisation and is a precursor of an entrepreneurial orientation.

George (2011:1292) states that an area of perturbing for entrepreneurial orientation is whether its dimensions are independent or dependent and if they could be suitably tested against firm performance. Covin and Slevin (1989) worked on the concept of entrepreneurial orientation. They treated the dimensions as one-dimensional, and their findings indicated a strong positive relationship between entrepreneurial orientation and firm performance. Kwak, Jaju, Ruzakova and Rocereto (2013:143) later argued that their research showed that entrepreneurial orientation dimensions should be treated as a multi-dimensional concept instead. In this way, individual dimensions should be individually tested against firm performance. In agreement, Runyan, Ge, Dong and Swinney (2012:820) posit that researchers who deliberated on entrepreneurial orientation as a unidimensional, bi-dimensional and multi-dimensional phenomenon found a strong base on the multi-dimensional analyses process. Similarly, Vij and Bedi (2012:12) add that each of EO's sub-dimensions may have a different relationship with performance. A unified and sound methodology is yet to be absorbed to measure entrepreneurial orientation, so long these dissimilarities have led to various inconsistent findings (Rauch *et al.* 2009:763).

4.1 Dependent Variable

Many ways measure and define business performance depending on the purpose (Cho & Lee, 2018:128). South Africa is one of the emerging countries, and the main objectives are continuous development, which may be attained through constant innovation and entrepreneurial orientation (Urban, 2016). Urban and Verachia (2019:140) state that research in Africa holistically may be deemed highly valuable. Only a handful of studies have been conducted in the past which focused on the relationship between EO, business performance, and organisational performance antecedents. Business performance may be categorised into two categories, namely, financial and non-financial business performance (Cho & Lee, 2018:128). The authors add that financial measures are centred around short-term goals, and non-financial measures relate to long-term goals and growth potential.

Verheul, Thurik, Hessels and Van der Zwan state that for small businesses to achieve high performance, the business has to apply an entrepreneurial strategy which means having an entrepreneurially inclined mindset. Furthermore, this implementation process exists within small businesses participating in the market or product innovation, proactively tackling risk (Fatoki, 2012:122). Small businesses with a high level of EO should present high performance instead of those with a low inclination towards EO (Gruman & Saks, 2010:124).

A study previously conducted by Urban and Verachia (2019) on organisational antecedents of innovative firms in the African context revealed that the antecedents of the support from management, rewards and reinforcement notably influence entrepreneurial orientation, which in turn has a strong influence on firm performance (Urban & Verachia, 2019:140). Similarly, Hornsby, Kuratko and Zara (2002:254) conducted a similar study in the USA and Canada, and they concluded that support from management was indeed the most crucial factor in entrepreneurial orientation. Furthermore, the study's findings follow previously conducted research where entrepreneurial orientation dimensions are associated with high firm performance. According to Urban and Verachia (2019:141), innovation is more inclined towards high firm performance and often performs well when entering an unstable

market environment. These unstable market environments ignite demand for innovative gestures, resulting in higher firm performance. Research on 132 Swedish organisations revealed that EO influenced business performance for three consecutive years (Wiklund,1999:38).

In their study, Cho and Lee (2018:132) concluded that continuous innovation affected non-financial business performance and that risk-taking proclivity had no influence on financial and non-financial business performance.

A study by Campos, Acuna, Parra and Valenzuela (2013:16) pointed out that innovativeness is not necessary to maintain competitiveness regarding entrepreneurial orientation. In their research, entrepreneurial orientation only accounted for approximately 16 per cent of the firm's performance. Li *et al.* (2009:443) stress that a merger of financial and non-financial factors may result in a more holistic assessment of an organisation. Rodriguez-Gutierrez (2015:156) suggests that performance may be assessed by evaluating customer loyalty, employee satisfaction, brand equity and customer satisfaction. For firms to add value to their businesses and improve their planning in a dynamic economy, entrepreneurial orientation needs to be converted into practical and workable strategies (Ndang, 2017:71).

However, Hughe and Morgan (2007:652) posit that the impact of the dimensions of EO being competitively aggressive and contributing to firm performance is still questionable.

For this paper, the dependent variable Business Performance consisting of two variables, business growth and business development and improvement, will be assessed using all five entrepreneurial orientation dimensions: innovativeness, autonomy, risk-taking, pro-activeness and competitive aggressiveness.

Figure 1 displays the dimensions of entrepreneurial orientation (*Autonomy, Innovativeness, Risk-taking, Pro-activeness* and *Competitive aggressiveness*) hypothesised as influencing the dependent variable, *Perceived business success*. The dependent variable, *Perceived business success*, for the purpose of this study, has been measured by two variables, *Business growth* and *Business development and improvement*.

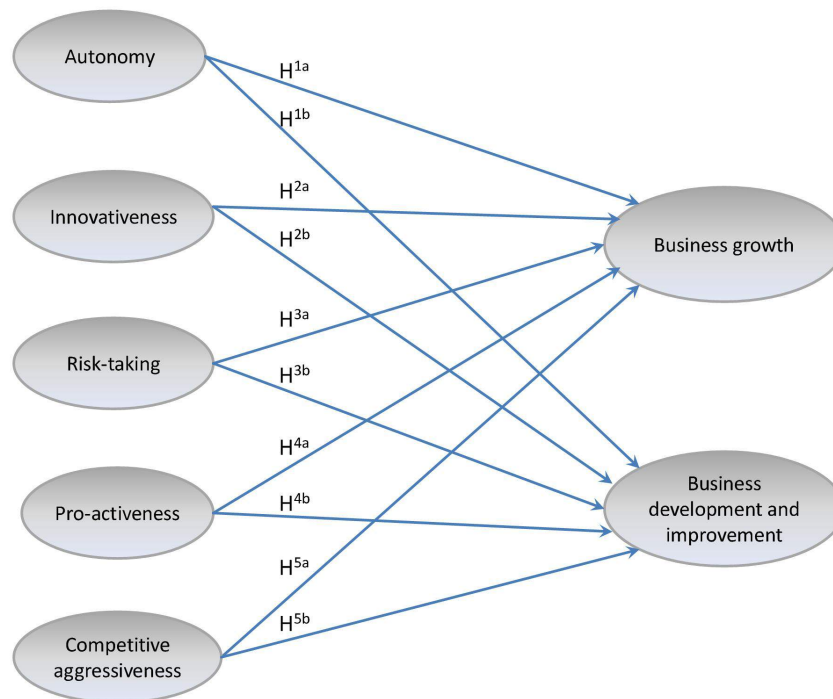

Figure 1: The theoretical model

4.2 Independent variables

Autonomy

Lumpkin and Dess (2001:431) defined autonomy as a self-sufficient measure taken by teams or individuals to bring forth a business vision and ensure its success. Within the entrepreneurial orientation realm, autonomy refers to one's ability to make autonomous and independent decisions based on thinking or reasoning (Venter, 2013:17).

By applying the term to the firm's context, autonomy refers to measures taken independently to suffocate the firm's restrictions (Lumpkin & Dess, 1996:140). This concerns the self-directed and independent pursuit of new opportunities through empowerment and motivation of individuals to uphold and contribute to business endeavours by promoting initiative development and independent action (Lumpkin *et al.*, 2010:251).

Quinn and Spreitzer (1997:38) indicate that, historically, entrepreneurship started as a result of individuals seeking the opportunity to exit the world of work and become independent through the initiation of their ventures, thus portraying some level of autonomy. As Janz and Prasarnphanich (2005:4) described, autonomy is the degree to which one person or several people have the privilege and choice of deciding what measures are needed and how to fulfil them better. Krauss, Frese, Frederich and Unger (2005:320) posit that autonomy orientation suggests that business owners appreciate making their own decisions and do not like getting orders. For a successful drive of entrepreneurial behaviour in an organisation, autonomy must be incorporated into everyday business operations because it drives an environment of intrapreneurship (Houh & Scheepers, 2008:20).

Autonomy does not only apply to those in a firm setting but may also include all stakeholders (Zellweger, Nason, Nordqvist, 2011:138). Lumpkin *et al.* (2009:47) argue that autonomy is a notable constituent of entrepreneurial orientation as it offers members of its organisation independence and flexibility to grow and act in entrepreneurial activities. Moreover, autonomy gives employees power as far as trust is concerned, motivating them (Ndang, 2017:69).

Furthermore, when employees are encouraged, they tend to perform better (Ndang, 2017:87). Lee and Peterson (2000:406) emphasise autonomy's importance by stating that independence and freedom are

catalysts in driving entrepreneurial activity and are necessary to create new ventures. Venter (2013:28) adds that entrepreneurial behaviour usually emanates from strategic leadership, thus making it critical for firms to support and evolve entrepreneurial orientation.

Autonomy gives individuals the independence and freedom to make critical decisions, develop new ideas, and effectively implement those ideas (Ndang, 2017:69).

For autonomy to function fully, inducement programmes are necessary for rewarding self-sufficient thoughts and autonomous decision-making (Chen & Sengupta, 2014:1091). Lotz and Van der Merwe (2013:18) state that the bottom-up and top-down management concepts should be applied to establish autonomy in business. Spies (2014:24) adds that firms use bottom-up and top-down management concepts to support autonomy. The top-down approach is a typical well-known organisational structure that hinders the initiation of autonomy (Kuratko, Hornsby & Ireland, 2001:61).

Many top managers and owners of businesses have conflicting views on which method better the possibility of introducing autonomy in an organisation (Quinn & Spreitzer, 1997:40). Lumpkin *et al.* (2009:49) state that strategies driving the bottom-up approach require special inducement and a supportive business structure.

Businesses must initiate autonomy and support their habits (Mumford, Scott, Gaddis & Stange, 2002:742). Dess and Lumpkin (2005:149) suggest that entrepreneurial thoughts in a business may be prompted by either the top-down or bottom-up management style. However, extra inducement should be for unique ideas because many best ideas come from the bottom in a business setting. Venter (2013:17) adds that organisations need to understand both these approaches, which may be used to identify the required actions to execute autonomy within a firm. Structural changes only form changes in the hierarchy, be it flattening it or authority delegation may not be adequate (Lotz, 2009:47). Dess and Lumpkin (2005:150) believe that autonomy should continuously be monitored and measured. A balance should exist between giving rise to autonomy and having a structure in place. To stop unsuccessful initiatives, these initiatives should be attempted to gain a sustainable competitive advantage (Spies, 2014:25).

The above research already indicates that there is to some extent a relationship between entrepreneurial orientation and perceived business success. It is therefore hypothesised that:

- H^{1a}: There is a significant relationship between *Autonomy* in the business environment and *Business growth* in the participating small businesses
- H^{1b}: There is a significant relationship between *Autonomy* in the business environment and *Business development and improvement* in the participating small businesses

Innovativeness

According to Antonites and Van Vuuren (2005:257), innovation refers to the actual execution of the notion to ensure the attainment of the set objectives of a business, profits are achieved, and the idea should be aligned with the concept of an identified market opportunity. In agreement, Lumpkin, Brigham and Moss (2010:247) state that innovativeness indicates an organisation's endeavours in finding new services and products in commercial markets while amplifying the existing systems and processes. Thereby, the quality of being original is sustained and ongoing problem solving through creative thinking and experimentation. Top management needs to facilitate experiments, risk management initiatives and encourage innovative gestures through systems and processes, indistinguishable at individual and team levels (Lumpkin, Cogliser & Schneider, 2009:49).

Venter (2013:29) emphasises the importance of innovation as an element and should be embraced by firms to intensify the firm's capabilities of realising improved performance over a long period. Bruderl and Preisendorfer (2000:46) affirm that innovation is a critical element that may lead to continued growth.

Innovation may not only be restricted to designing and creating a new product or enhancing what already exists. Innovation can also be considered a solution in administrative systems applied in decision-making (Li, Huang & Tsai, 2009:443). Similarly, Tayauova (2011:572) suggest that the approval of new ideas and the deviation from old and traditional practices could give rise to the recent propensity of a process of operation. Innovativeness usually carries considerable costs, which may decrease performance measures over the short term (Hughes and Morgan, 2000:653). However, innovation permits small businesses to grow in a monopolistic position which helps them improve business performance, so funding this innovative pursuit requires financial resources and an excellent economic history (Forseman & Temel, 2011:641).

According to Ndang (2017:63), innovation can be grouped into three main classes: product-market innovation perception, which requires marketing research, advertisement and promotion, and product design. Organisational innovativeness consists of a structural organisation, an innovative management style, and an innovative control system (Potocan & Mulej, 2009:4). A technology innovation perspective mainly comprises research and engineering inputs in developing new products or processes (Ndang, 2017:63). Entrepreneurial orientation can initiate change through the innovativeness of people who can come up with value-adding products. Xaba and Malidi (2010:77) add that the ability of the business to combine resources will determine this value addition. Resources are critical if businesses' intention is to thrive (Botha & Nyanjom, 2011:35).

Lumpkin *et al.* (2010:247) articulate that innovativeness is necessary for maintaining a firm's success. It is a crucial driver of new idea development, leading to new product introduction, service improvements, and managerial initiatives that aid company growth. Innovation quickly became necessary in the changing business environment due to shifting customer needs, product service, and technology. The competitive state of the firms is extremely vigorous (Kropp, Lindsay & Shoham, 2008:104).

Based on this background, the following hypotheses were formulated:

- H^{2a}: There is a significant relationship between the implementation of Innovativeness in the business environment and Business growth in the participating small businesses
- H^{2b}: There is a significant relationship between the implementation of Innovativeness in the business environment and Business development and improvement in the participating small businesses

Risk-taking

In the context of EO, taking a risk can be defined as activities that require taking courageous measures, such as stepping out of comfort zone and pursuing new ventures while acquiring significant amounts of funds or allocating necessary firm resources to ventures in environments of uncertainty (Vij & Bedi, 2012:21, Rauch *et al.*, 2009:763). Similarly, Lumpkin and Dess (2001:431) further elaborated on risk-taking as the likelihood of an organisation making brave decisions, such as taking on new markets and making commitments by investing large portions of the resources in ventures of uncertainty and borrowing large amounts of capital. Risk is the unpredictability of a decision, or whether it will be notable or disheartening when the idea comes to realisation (Dewett, 2004:258).

According to Morris *et al.* (2008:620), high risk is indirectly proportional to high entrepreneurial activity, and however, it is an instance of arbitrating the risk through a structured approach. Entrepreneurially orientated firms in the market are categorised by their risk-taking ability (Wang, Hermens, Huang & Chelliah, 2015:73). Furthermore, Tang, Tang and Katz (2013:1) found that entrepreneurial firms that practice risk-taking experience growth positively in the business. Also, Hoonsopon and Ruerom (2012:252) assert that risk-taking is a critical factor that prompts innovative measures to initiate growth and small business performance.

Risks should be manageable to control new products and resource development (Chang, 2015:3). Vij and Bedi (2012:21) add that risk management concerns the firms' actions to analyse, identify,

alleviate, and avert problems that could negatively affect the business status. SMMEs need to take more calculated and manageable risks to fully utilise their innovative and proactive abilities (Keith *et al.*, 2015:1166). Al-Swidi and Mamhood (2011:31) assert that when small businesses use their abilities, they become more inclined to entrepreneurial orientation, taking calculated risks with a higher potential of success during operation. Entebang, Harison and Cyril de Run (2010:76) are of the view that for small businesses to adopt the growth strategy as a way of doing business, they may follow risk-taking by venturing into unknown new activities (business risk); or investing their financial resources (financial risk) or taking a stand in favour of action (personal risk). Dess and Lumpkin (2005:152) warn that only careful management of risk can probably lead to a high competitive advantage. Actions taken without ample research, care, and thorough planning may cost the business.

Against this background, the following hypothesis is subjected to further testing:

- H^{3a}: There is a significant relationship between the practice of Risk-taking in the business environment and Business growth in the participating small businesses
- H^{3b}: There is a significant relationship between the practice of Risk-taking in the business environment and Business development and improvement in the participating small businesses

Pro-activeness

Short, Payne, Brigham, Lumpkin and Broberg (2009:14) state that pro-activeness is successfully crafting a business's strategic vision to seek different growth opportunities. Rauch *et al.* (2009:763) explained that pro-activeness is an opportunity to pursue a progressive perspective characterised by initiating products and services before the competitors and predicting demand for the future. Madsen (2007:187) agrees that pro-activeness anticipates future needs and wants in the market environment. When a firm is proactive, it seeks new ventures while taking advantage of the existing ones, while at the same time updating and tracking itself about different market changes in the business sector.

An organisation creates a competitive advantage by anticipating fluctuations in future demand, by changing the market by not becoming a nonparticipating observer or giving in to external pressures, but by being a diligent contributor in building their market environment (Kraus, Rigtering, Hughes & Hoseman, 2012:166). Lumpkin and Dess (1996:142) assert that despite an ongoing debate about which approach appears to be more successful, both methods carry their benefits concerning the fast follower and the first-to-market approaches. Sharma and Davi (2011:47) view that pro-activeness is limited to acting but anticipating customer expectations in the future and looking for new products well ahead of their competitors, which may or may not be related to the current business.

Pro-activeness also involves maintaining the lead over competitors by anticipating new issues or opportunities. Furthermore, pro-activeness recognises the importance of strategy in the entrepreneurial process (Ndang, 2017:65). Pro-activeness pivots on the firm's ability to continuously assess the marketplace, as demonstrated in 1) aggressive behaviour aimed at rival firms and 2) Pursuing organisational opportunities favourable to the business (Vij & Bedi, 2012:20).

A proactive attitude can ignite the entrepreneur's innovativeness since small businesses with such an orientation typically want to meet their customer's needs in a marketplace (Oni, 2012:94). Also, Alt, Diez-de-Castro and Llorens-Montes (2015:168) assert that this can magnify the identification and growth of the existing product and services related to the business. Ndang (2017:66) states that proactive firms can forecast trends and customer needs. Keith, Nakos and Dimitratos (2015:1165) add that these kinds of firms are in a quest for better ways to compete successfully and stay ahead of their competitors.

Advantages of pro-activeness are acquired by first-movers when new opportunities are identified and implemented while assuming the responsibility of the idea and ensuring its success (Wiklund & Shepherd, 2005:82). Kreiser, Marino, Dickson and Weaver (2010:960) hold that pro-activeness is

not a concept as simple as it is made to be. They state that the firm's capability to be proactive is usually influenced by societal and cultural characteristics among employees. Willingness to engage will always be welcomed by uncertain welcoming societies, while certainty-avoiding organisations reject engagement (Kreiser *et al.*, 2010:960). Gurbuz and Aykol (2009:323) summarised pro-activeness as a business owner who is more a figurehead than an acolyte. Spies (2014:30) add that these business owners plan to identify new opportunities even if they are not the first to move on it.

Against this background, the following hypothesis is subjected to further testing:

- H^{3a}: There is a significant relationship between the practice of Risk-taking in the business environment and Business growth in the participating small businesses
- H^{3b}: There is a significant relationship between the practice of Risk-taking in the business environment and Business *development and improvement* in the participating small businesses

Competitive aggressiveness

According to Lumpkin and Dess (2001:430), competitive aggressiveness is how firms generally respond to competition and trends. Vij and Bedi (2012:21) assert competitive aggressiveness is the firm's tendency to directly and intensely challenge its competitors while achieving entry or surpassing position. One common attribute of competitive aggressiveness is the aggressive attitude and aggressive response towards competitors to overcome the competitors' threat (Zellweger & Sieger, 2012:70).

Firms sometimes opt to be reactive, in that the business would apply price lowering strategies to challenge the competitor responsively. Blackfort (2014:143) states that businesses might begin a price reduction journey at the expense of their profit margin to gain more market share. The essence of competitive aggressiveness is no longer taking the uniform competitive pattern between firms (Ndang, 2017:68). Stambaugh, Yu and Dumbinsky (2011:51) add that businesses now lean towards unique competition techniques rather than standard techniques. In agreement, Spies (2014:30) complements that the willingness to act differently rather than following traditional competitive practices lines up with the competitive aggressiveness of the company. Lumpkin and Dess (2001:434) posit that this may pose a challenge to industry leaders through unconventional methods and strategies while exploiting competitors' weaknesses by analysing their approach and thus focusing on a value-added strategy. Although small businesses are more inclined to take risks than larger entities, entrepreneurs applying the usual traditional business technique often overlook the competitive aggressiveness aspect, which had to grow the business market through significant changes (Ndang, 2017:68).

Pro-activeness and competitive aggressiveness are usually combined as one variable (Venter, 2013:18). However, the difference with regards to pro-activeness was highlighted clearly by Lumpkin and Dess (1996:147), by stating that there exists a difference in the measures of a firm where pro-activeness aligns with the firm's response to a new idea and while competitive aggressiveness aligns with the firm's response to competitors. Small businesses need to acquire, create, integrate and retain knowledge to sustain a competitive approach (Ndang, 2017:68). Li *et al.* (2009:441) agree that employees could use the knowledge collected through knowledge retention. Keh, Nguyen and Ng (2007:596) assert that as much as learning is considered essential for business decision-making, it can be deemed worthless if not utilised properly.

It is important to note that the firm's strategy should define a company's competitive aggressiveness to perform better than its peers, not only by the marketing and operations divisions (Venter, 2013:18). Ndang (2017:68) states that information search about a market is a common practice by small businesses to compete aggressively. This early acquisition of information gives them a competitive advantage in terms of product performance or product categories in the market (Keh *et al.*, 2007:598). Furthermore, absorbing new ideas will enable the business to challenge its competitors and improve its market position.

In their study, Boso, Cadogan and Story (2012:17) found a positive relationship between firm performance and competitiveness. It is reasonable to note that firms can sometimes over or under-invest in the quest to outperform their competitors, which can lead to a damaging effect if the competitors retaliate.

Based on the literature review, the following hypotheses were formulated:

- H^{5a}: There is a significant relationship between the Competitive aggressiveness of the business and Business growth in the participating small businesses
- H^{5b}: There is a significant relationship between the Competitive aggressiveness of the business and Business development *and improvement* in the participating small businesses

5. Research Methodology

In this section, the research method will be discussed, focusing on the research method, the measuring instrument, the sample and population of the study, the data collection, and statistical analysis.

5.1 The research method

The researcher has chosen a quantitative method for this study to assess the relationship between entrepreneurial orientation and business success in selected township SMME's. Quantitative methods have generalisable results from structured information and follow the positivist approach.

5.2 Measuring instrument

There are a few methods of data collection that exist. From these methods, data collection through questionnaires, observation or interviews exists, to name a few. This study used a structured questionnaire to collect primary data. A questionnaire approach is considered the most effective and removes any possibility of the researcher influencing responses. The method also comes out to be less costly. Lotz and Van der Merwe (2013) developed a questionnaire that measures entrepreneurial orientation in a business using the five EO dimensions that may influence a business's success and performance. It is, furthermore, a cross-sectional study.

5.3 Study population and sampling

A population from a research project is a group from which the researcher chooses a sample (Kumar, 2012:194). The population target for the study consisted of small township-based businesses.

As Cooper and Schindler (2006:434) defined, sampling is the process of choosing sections within a study population, either by using a probability method, non-probability method, or combined methods to represent the targeted population in a survey. There is no database available with a list of businesses in townships. The researcher, therefore, used a convenient or purposive sample, and the snowball technique sampling was employed to conduct this research. Businesses were selected conveniently in the identified townships, and the population included product- and service-oriented businesses.

Approximately 100 small township-based businesses were approached to form part of the study to gather reliable data to realise the primary and secondary objectives. New ventures or new businesses were not part of the study due to the possibility of them not having entrepreneurial orientation history. Businesses of a year or more were considered suitable to form part of this research investigation.

5.4 Data collection

The data collection tool was distributed to the businesses of interest by personal delivery, while some were sent electronically via email. Participating businesses were assured confidentiality through a consent letter detailing the process in which data will be collected and ethical considerations of the study. Furthermore, the study only started after full ethical authorisation from the relevant ethical committee of the North-West University. Participants were given a reasonable amount of time to complete the questionnaire without help from the researcher. The hand-delivered questionnaires were handed out in an envelope, and participants were informed to put the completed questionnaires back

in the envelope and seal them. After approximately two weeks, the participants collected these envelopes, and only fully completed questionnaires were analysed for the study. Questionnaires received by email were safeguarded in a password-protected computer.

5.5 Statistical analysis

Babbie and Mouton (2001:237) state that all data gathered through research processes should be analysed and interpreted to conclude the research while achieving the study objectives.

Data collected were statistically analysed to realise the objectives of the study. The North-West University Statistical Consultation Service was approached to assist in capturing and analysing the completed questionnaires. The acquired data was then analysed using descriptive analyses, Cronbach Alfa coefficients and multiple linear regression analyses, as recommended by (Babbie, 2013:56). The presentation of the findings is through tables and graphs.

6. Results and Discussion

6.1 Biographical information results

The population is primarily characterised by the age group of **26-35** (49.4%), followed by **36-45** with 27.8% and the ages of **25 and below** with 12.7%. The age group of **46-55** followed with a percentage of 6.3%, and the smallest age group of the population was participants over the age of **55**, with a percentage of 3.8%. In addition, most respondents were females, with 50.6% and males at 49.4%. All 79 businesses that took part in this study can be referred to as small businesses with less than 200 permanent employees operating in the townships from different industries such as retail (26.6%), services (21.1%) and food (10.1%).

6.2 Reliability of the measuring instrument

Reliability refers to a study's outcomes, mainly concerned with the integrity of its findings (Welman *et al.*, 2005:145). Similarly, Zikmund (2003:11) defined reliability as the potentiality of the measure to yield constant outcomes and be free from mistakes. According to Maree (2011:215), there are different types of reliability, noted as follows: "an equivalent form of reliability, split-half reliability, internal reliability and test-retest reliability".

For this study, Cronbach's alpha coefficient was employed to measure the reliability of the questionnaire. Below are the accepted guidelines for interpreting Cronbach's alpha coefficients (Maree, 2011:212).

- "0.90 high reliability"
- "0.80 moderate reliability"
- "0.70 low reliability"

The following table represents Cronbach coefficients for entrepreneurial orientation variables and the study's perceived business success.

Table 1: Cronbach coefficients

Variable	Cronbach Coefficients
Autonomy	0.71
Innovativeness	0.90
Risk-taking	0.84
Competitive aggressiveness	0.78
Pro-activeness	0.89
Business growth	0.86
Business development and improvement	0.90

The results presented in the table above indicated that the questionnaire employed in this study to measure EO dimensions and business performance in township-based small businesses had acceptable

reliability. All the **Cronbach coefficients** were above the acceptable value of **0.7** with innovativeness and business development and improvement, with the highest coefficient of 0.90, followed by pro-activeness at 0.89.

6.3 Multiple regression analysis results

A multiple regression analysis was carried out to determine the effect of the EO dimensions (independent variables) on perceived business success (dependent variable). The respondents responded to all questions meaning no replacement values were necessary. Multiple regression results will be presented in two separate tables, with business growth and business development and improvement being the dependent variables of perceived business success.

Table 2: Multiple regression results: Impact of EO on Business growth

Model	Unstandardised Coefficients		Standardised coefficients	t-value	p-level
	B	Std. Error	Beta		
Constant	(2.755)	0.477		5.773	0.000
Autonomy	-0.360	0.165	-0.311	-2.182	0.032
Innovativeness	0.661	0.188	0.661	3.505	0.001
Risk-taking	-0.213	0.157	-0.224	-1.362	0.177
Pro-activeness	0.229	0.147	0.251	1.565	0.122
Competitive aggressiveness	-0.040	0.156	-0.257	-0.257	0.798

R square= 0.293 (p<0.05)

The results indicate that, in practice, a **significant percentage** (29.3%) of the variation in the dependent variable, *Business growth* in the participating small businesses in townships, is explained by the five entrepreneurial orientation variables, i.e. *Autonomy*, *Innovativeness*, *Risk-taking*, *Pro-activeness* and *Competitive aggressiveness*.

The multiple regression analysis indicates significant positive relationships between the independent variables *Innovativeness* ($p = 0.001$) and *Autonomy* ($p = 0.032$) and the dependent variable *Business growth*. No significant relationship emerged between the independent variables *Risk-taking* ($p = 0.177$), *Pro-activeness* ($p = 0.122$) and *Competitive Aggressiveness* ($p = 0.798$), and *Business growth*, respectively.

The hypotheses that there is a significant relationship between the independent variables *Autonomy* (H^{1a}) and *Innovativeness* (H^{2a}) and the dependent variable, *Business growth* respectively could therefore not be rejected. The hypotheses that there is a significant relationship between the independent variables *Risk-taking* (H^{3a}), *Pro-activeness* (H^{4a}) and *Competitive aggressiveness* (H^{5a}) and *Business growth* were rejected.

The table below represents the second multiple regression analysis between **EO variables** and **business development and improvement**.

Table 3: Multiple regression results: Impact of EO on business development and improvement

Model	Unstandardised Coefficients		Standardised coefficients	t-value	p-level
	B	Std. Error	Beta		
Constant	1.163	0.286		4.073	0.000
Autonomy	-0.106	0.099	-0.103	-1.078	0.285
Innovativeness	0.532	0.113	0.599	4.715	0.000
Risk-taking	-0.054	0.094	-0.064	-0.581	0.563
Pro-activeness	0.287	0.088	0.354	3.275	0.002
Competitive aggressiveness	0.058	0.093	0.064	0.622	0.536

R squared = 0.680 ($p < 0.05$)

The results indicate that, in practice, a significant percentage (68.0%) of the variation in the dependent variable, *Business development and innovation* in the participating small businesses in townships, is explained by the five entrepreneurial orientation variables, i.e. *Autonomy*, *Innovativeness*, *Risk-taking*, *Pro-activeness* and *Competitive aggressiveness*.

The multiple regression analysis indicates significant positive relationships between the independent variables *Innovativeness* ($p < 0.001$) and *Pro-activeness* ($p = 0.002$) and the dependent variable *Business development and innovation*. No significant relationship emerged between the independent variables *Autonomy* ($p = 0.285$), *Risk-taking* ($p = 0.563$) and *Competitive aggressiveness* ($p = 0.536$) and *Business development and innovation*, respectively.

The hypotheses that there is a significant relationship between the independent variables *Innovativeness* (H^{2b}) and *Pro-activeness* (H^{4b}) and the dependent variable, *Business development and innovation*, respectively could therefore not be rejected.

The hypotheses that there is a significant relationship between the independent variables *Autonomy* (H^{1b}), *Risk-taking* (H^{3b}) and *Competitive aggressiveness* (H^{5b}) and *Business development and innovation* were rejected.

7. Conclusions

The purpose of the empirical study was to determine the reliability of the measuring scales utilised in this study; to investigate the influence of an entrepreneurial orientation in small businesses on the perceived success/business performance of these businesses and, based on the findings, make recommendations to ensure the effective management of small businesses.

The results of this study suggest that the proposed instrument is reliable.

With regard to the relationships between the dependent and independent variables, the results show that small business owner-managers in the participating businesses believe that one independent variable measuring an entrepreneurial orientation, namely *Innovativeness*, influence both dependent factors measuring the perceived success of the businesses, namely *Business growth* and *Business development and improvement*.

The results also indicated positive relationships between *Autonomy* and *Business growth* and between *Pro-activeness* and *Business development and improvement*, respectively.

No significant relationships were found between *Risk-taking* and *Competitive aggressiveness* and the constructs measuring the perceived business success of the participating small businesses.

8. Managerial Implications

- Firstly, because an entrepreneurial orientation has its roots in the strategy-making process, it is recommended that entrepreneurship becomes the strategic way of thinking (dominant logic) within these businesses.
- Small businesses should actively search for innovation in the business. Innovation should, therefore, be part of the DNA of the business.
- The type of innovation, for instance process innovation, new products, services or results, should depend on the business environment in which the particular business operates.
- New opportunities and ideas, therefore, need to culminate into new products, services and processes.
- Goals and objectives need to be set for innovation.
- Small township businesses should furthermore, based on the findings of this study, should be pro-active and allow for autonomous behaviour in their businesses.
- Although no statistically significant relationships were found between *Competitive aggressiveness* and *Risk-taking Autonomy* and *Business success*, in this study, small business owner-managers should be aware of it.

9. Suggestions For Future Research

The questionnaire was distributed to only a few township-based small businesses in Gauteng. Therefore, because it was only distributed to a few businesses, it cannot accurately represent townships' entire small business sector. It is imperative not to generalise the findings of this study throughout the township's small business industry.

There is widespread agreement concerning EO dimensions and perceived success. However, the literature concerning township-based small businesses is relatively small. Therefore more comprehensive research must be done on this aspect. Data should be collected to bridge the existing gap. Future research may focus on wage distribution and turnover per business to highlight a few points.

The outcome of this study may only be referred to gain insight into the area under investigation and cannot be generalised to the entire small business sector. Small township-based businesses that choose to implement the recommendations of this study would be interesting for future research to track progress during and after the implementation process.

Assessing Business Process Gaps Affecting Performance at a Selected South African Government Entity

Prof Barnes Sookdeo^{1,*}, Amelia Naidoo²

¹ Productivity South Africa, Midrand, South Africa

² Operations Management, University of South Africa, Pretoria, South Africa

Keywords

Business processes, performance, operational gaps, Public Enterprises, Productivity SA.

Abstract

This paper reports on a study to assess business process gaps which affect the performance of public enterprises, in particular Productivity South Africa. Central to this effort was the re-examination of existing processes towards delivering more value to their customers whilst remaining cost-effective. The study utilised a mixed-methods research approach using two research instruments. A census and purposive sampling were adopted for the survey and interviews, respectively. Collected data were analysed via thematic analysis and inferential statistics. The findings revealed that the largest contributors to operational gaps were lack of planning, bottlenecks, inconsistent work levels, organisational politics, and human error. The recommendations included the need for integration of strategic objectives, improving utilisation of resources, reducing waste, implementing TQM, and motivating employees. This paper succeeds in assessing business process gaps which affect the performance of the organisation. The recommendations will assist the organisation by reducing inefficiencies caused by gaps within the process, therefore impacting organisational performance. As further research, this study could be replicated in other public enterprises.

1. Introduction

Public enterprises play a pivotal role in achieving service delivery mandates for the government, whilst still undertaking it in the most efficient and effective manner and remaining competitive. It is vital for such institutions to have their current operations evaluated, and their internal processes reviewed to ensure it remains functional. Public Enterprise's business processes have a great influence on service delivery for societal and public value creation. Thus, to ensure efficient and effective service delivery and realisation of the various organisational goals, it is imperative for Public Enterprises, like Productivity SA, to follow the various business processes as well as evaluate and monitor these existing business processes. This can be accomplished by removing non-value adding activities, or inefficiencies and wastes within the processes, thereby re-engineering processes where need be, and identifying improvement opportunities.

In February 2018, the South African President, revealed that many Public Enterprises, were experiencing severe financial, operational and governance challenges, which had impacted the performance of these entities, and the economy thereby placing pressure on the fiscus. He stated that government will take further measures to ensure that all state-owned companies fulfil their economic and developmental mandates, (South Africa, 2018).

The likes of South African Airways (SAA), who recently requested a further five-billion-rand bailout, have resulted in the country's leadership relooking at the functions, processes, governance, and viability of Public Enterprises. Whilst focusing on leadership from the Board level, operational efficiency, specifically business process efficiencies is essentially one of the largest influences on service delivery across the public sector.

It is therefore imperative for Public Enterprises in South Africa, to re-examine their existing processes to deliver more value to the customer whilst remaining cost-effective. Therefore, Public Enterprises' current business processes must be evaluated to ascertain if these processes are efficiently and effectively meeting the entities mandate. A business process that is found to be ineffective should be strategically re-designed and re-engineered, whereas Public Enterprises decrease organisational layers and eliminate unproductive activities. Radical redesign of core business processes known as Business Process Redesign (BPR), is needed by Public Enterprises, as Browne and O'Sullivan (2013) mention to 'achieve dramatic improvements', real pronounced improvements in performance as many private organisations have done so in the past.

This study was conducted at Productivity SA which was established in terms of section 31 of the Employment Services Act, No. 4 of 2014 (South Africa, 2014), as a juristic person and an Entity of the Department of Employment and Labour (DEoL), regarded as a public enterprise. Its mandate is to promote employment growth and productivity, thereby contributing to South Africa's socio-economic development and competitiveness, AS its core business. When Public Enterprises, like Productivity SA, have service delivery mandates to achieve, whilst doing it in the most efficient and effective manner and remaining both financially viable and competitive, it's important that the entity evaluates its current business model and ensures that internal processes and systems are reviewed to be functional and optimal. Due to the changes in the external environment and the poor performance of Productivity SA in the past financial years, a review of the business model was a priority for the board of directors.

The essential contribution of this paper is to assess business process gaps which affect the performance of Productivity SA as a public enterprise. As such, this paper will aid Productivity SA by reducing inefficiencies caused by gaps within processes, therefore positively impacting organisational performance.

2. Problem Investigated

Public enterprises, including Productivity SA, face major financial challenges as they often do not have sufficient revenue streams to fund their operational costs. Productivity SA reports to Parliament, on the Annual Performance Plan (APP) targets set for the programmes which are linked to the entity's functions. In the past five years, these targets could not be achieved without major financial implications, with quality of work being questioned and time constraints on delivery have been affecting the reporting on the achievement of the APP targets. In 2015/16 the organisation made a loss of R5.6 million, by 2016/17 the loss grew to R23 million, with an annual performance of 41% and 53% respectively (Productivity SA, 2016). For Productivity SA to improve on its current financial situation, service delivery, quality of work and timeliness of reporting, it is imperative to determine key areas of weaknesses which are affecting their businesses' performance. The study aimed to assess the key business process gaps that are affecting productivity and overall organisational performance within Productivity SA, with the intent to provide recommendations that will lead to improvements in productivity, quality of work, and turnaround times.

3. Research Objectives

The research objectives of this paper are three-fold, namely, determining the key factors affecting operational efficiencies, identifying gaps and its impact on operational efficiencies, recommending strategies to improve efficiency and identifying the impact measures that will be used to evaluate the proposed changes.

4. Literature Review

The theoretical framework for this paper consists of a gap analysis, Productivity SA's actual performance, world-class performance standards, business performance measures, business process gaps, process analysis tools, and business strategies for performance. These are discussed below:

4.1. Gap analysis

Gap analysis compares organisations' actual performance with their potential performance. According to Uhl and Gollenia (2012), a gap analysis is a management tool which assists a business to identify both strategic and operational gaps. The gaps are said to be identified by, "analysing the difference between the target and probable development of its basic business." The steps of a gap analysis are identifying organisational goals, obtaining historical data of actual performance, analysing data to identify reasons for poor performance, and identifying improvement opportunities to achieve organisational goals, (Investopedia, 2018). Gap analysis, therefore, allows the researcher to review and analyse the gaps that might exist which affect the Balanced Scorecard of an organisation

Kaur (2022) states that gap analysis allows for the comparison between an organisation's actual performance with its potential performance. In the case of Productivity SA, their performance dropped from 49% in 2014/15 to 36% in 2015/16 but improved to 68% in 2016/17, and further improved to 71% in 2017/18 (Productivity SA, 2017). However, with such improvements, there is still a need to consider world-class standards. Kennedy (2018) indicates that the world class standard is to achieve an eighty-five per cent (85%) performance level.

4.2. Productivity SA's performance

According to Productivity SA's Annual Performance Plan (APP) (Productivity SA, 2018), The National Development Plan (NDP), Vision 2030 articulates that, for South Africa to stay competitive and to move up the value chain, the following three interventions are necessary:

- i) labour-market reforms aimed at promoting employment, particularly for young people.
- ii) action to promote productivity gains and new entry by firms; and
- iii) research and development for innovation.

Coupled with this, Government has, through the promulgation of the Employment Services Act, No. 4 of 2014 (South Africa, 2014) changed the legal form and expanded the mandate of Productivity SA to include promoting employment, growth, and workplace productivity. This mandate is aligned to and fits well within the mandate of the DEoL, which is to regulate the labour market through policies and programmes developed in consultation with social partners, which are aimed at, amongst others, "Improved economic efficiency and productivity." (Productivity SA, 2017).

Furthermore, the mandate and programmes of Productivity SA are acknowledged by the Portfolio Committee on Labour, to annually assess the performance of the Entity and hold it accountable for the delivery and attainment of its strategic goals and contribute to service delivery as well as financial accountability. To this end, the Committee has recommended in its Budgetary Review and Recommendation Report (BRRR), dated 27 October 2016 that, the Minister of Employment and Labour should ensure that Productivity SA is appropriately capitalised to be able to extend its services to areas where they are currently not operating and to ensure the entity is rendered more visible. Table 1 illustrates the APP results of Productivity SA from 2014/15 to 2017/18.

Table 1: Productivity SA's APP performance

Year	Planned Targets	Overall Achieved	Percentage Achieved
APP 2014-15	40	30	49%
APP 2015-16	42	15	36%
APP 2016-17	41	28	68%
APP 2017-18	28	20	71%

4.3. World-class performance standards

De Waal (2002) states that to be successful, organisations need to become and stay world-class in everything they do. De Felice, Petrillo and Monfreda (2013) assert that global competition has caused fundamental changes in the competitive environment of organisations. It is incumbent on organisations to develop strategic objectives which, upon achievement, result in a competitive advantage in the marketplace. However, for almost all organisations, increased productivity and better

overall efficiency are the most important goals. To identify if there are performance issues or factors affecting performance, the set standards or targets need to be clearly understood by employees.

Overall equipment effectiveness (OEE) is the premier standard for measuring efficiency and productivity (Trout 2022). This standard can be applied in any industry. The world-class standard is to achieve an eighty-five per cent (85%) performance level (Kennedy, 2018). Monitoring performance through the APP and Balanced Scorecards, allows organisations to identify areas for improvement and set targets accordingly. Rumburg (2020) states that implementing balanced scorecards, has the effect of reducing the total cost of ownership and improving customer satisfaction. With Productivity SA achieving a performance level of 71% in 2017/18, the improvement plan is to achieve the world class standard of 85% (Productivity SA, 2018).

4.4. Business performance measures

High-performing organisations in both private and public sectors invest in performance management and measurement systems. It is contended that there are different measures deployed to monitor organisational performance. One is “outcomes” (outputs) which are an assessment of the results of a program compared with its intended purpose, output, and impact. The other is “inputs” which are measures used to monitor the performance of organisations and employees, (Osano & Okwena, 2015). There are measurements which consist of complaints, customer satisfaction levels, timeliness or response time, adherence to schedule and responsiveness. For effective performance measurement, an organisation needs to include a mix of the outcome, output, and efficiency measures. These should be linked with the strategic business goals and should be integrated into an organisation-wide performance measurement system. These are considered key performance measurements that describe how an organisation is successfully achieving its goals, (Wang, Dang, Nguyen & Le, 2020).

Gopal, Rana, and Krishna (2022) state that organisations are facing increased pressure to improve their overall performance to gain a competitive advantage over rivals. Performance monitoring and evaluation is a strategic approach to management, which allows them to measure and review the performance of the organisation in terms of indicators for efficiency, effectiveness, and impact. Figure 1 provides an analysis of the performance indicators which indicate that Productivity SA has twenty-two output indicators and six impact indicators out of the twenty-eight APP targets.

4.5. Business process gaps

A business process is a set of activities that are followed to realise an organisational goal. Business process gaps are inefficiencies that make a business process less efficient than it should be. They are also inefficiencies or weaknesses which affect the process negatively, thereby resulting in it not functioning in the most effective manner. Spacey (2017) identifies fourteen causes of operational gaps of which the top five are a lack of planning, low-quality data, unnecessary dependencies, bottlenecks, and inconsistent work levels. These fourteen process gaps are the most common that have been identified within businesses in any sector. The questionnaire was developed using these fourteen process gaps.

4.6. Business process analysis

Proctor (2021) states that business process gap analysis is an important and powerful technique in business analysis and business systems. Businesses normally formulate and group their core business capabilities in processes which are measured and managed. Rosing, Scheel, and Scheer (2014) add that a business process is a collection of tasks and activities that have been structured in a way to design, create and deliver a product or service to the customer. Organisations that have efficient and effective processes enjoy a positive financial performance, reduced cost, high levels of quality, on-time delivery of their products and services thereby achieving competitive advantage. According to Brandenburg (2022), a business process model is a technique used for business analysis. It captures how a business process works and ultimately links how teams work to achieve a business goal. The use of a balanced scorecard, in a service industry, also allows businesses to measure and manage their performance, and ensure that actions to correct and align to objectives, can be taken. Businesses can use various theoretical frameworks such as lean systems theories or Lean Manufacturing, Six Sigma,

Total Quality Management (TQM), and Business Process Reengineering (BPR) to improve business process workflow.

4.7. Process analysis tools

Lean systems theory focuses on creating a lean organisation that can efficiently adapt to market dynamics and instability. Barret (2015) explains that organisations can use any of the lean theories on to base their workflow. They could use the basic concepts of the theory along with their own experiences and feedback to structure workflow. It speaks to experimenting and then analysing whether the introduced changes have been successful. Business process review with reengineering is the analysis and design of workflows and processes within and between organisations (Zhongyu, 2012). Every business contains processes to achieve an end goal, and there are several tools to analyse processes, for example, process mapping, value stream mapping and waste elimination.

4.8. Business strategies for performance

A strategic intent for Productivity SA is to decrease the amount of time and cost for service delivery and to increase the magnitude of the overall impact of all its programme interventions. Through the review of the business model, Productivity SA has sought ways to redefine its competitive advantage and link it to meet its developmental mandate which aligns with national strategic policy priorities espoused in the National Development Plan (NDP). When an organisation sustains profits that exceed the average for its industry, the organisation possesses a competitive advantage over its rivals. The goal of business strategy is to achieve sustainable competitive advantage. Kotler and Keller (2015) indicate that an organisation can achieve higher profitability over its competitors either through cost leadership, focus and differentiation.

Capabilities refer to the organisation’s ability to utilise its resources effectively. Such capabilities are embedded in the routine of the organisation, are not easily documented as procedures, and thus are difficult for competitors to replicate. These are termed best practices. The organisation’s resources and capabilities together form its distinctive competencies. These competencies enable innovation, efficiency, quality, and customer responsiveness, all of which can be leveraged to create a cost advantage or a differentiation advantage. By combining the two types of competitive advantage with the organisation’s choice of scope, broad market versus narrow, Porter (2008) has defined five competitive strategies for staking out a market position, operating a business and delivering value to customers. These are shown in Figure 2 below:

Figure 1: Five competitive strategies
Adapted from Porter, (2008)

To assess the business process gaps that affect performance of public enterprises, there was a need to understand the topics reviewed in the literature above.

5. Research Methodology

5.1. The research design and instrument

The research design consisted of a mixed-methods research approach using evaluative research. The quantitative phase of the study utilised a positivism approach whilst the qualitative phase used an interpretivism approach. The study made use of a survey questionnaire and an interview schedule which were compiled using indicators from the literature review and aligned to the research objectives. This enabled the researcher to come to conclusions and to make recommendations regarding the assessment of key business process gaps affecting productivity and organisational performance at Productivity SA. The collected data were analysed via thematic analysis and inferential and descriptive statistics.

The research instruments were piloted and amended for inaccuracies. The questionnaire was sent via email and the participants were given one week to complete the questionnaire and return. The interview participants were contacted, and dates set for face-to-face interviews. A note regarding confidentiality was added in the cover letter.

5.2. The population and sampling in the study

The target population of the study reported in this paper was composed of selected employees (n = 106) of which forty were in the operations department of Productivity South Africa. A census and purposive sampling were adopted for the survey and interviews, respectively. Hence, the questionnaire was sent to all forty employees of the operations department. The interviews comprised of four senior managers/executives, representing the operational units. The response rate for the questionnaire survey was 78% and was found to be acceptable for the purposes of this study.

5.3. Data collection and analysis

Data was collected by means of a survey questionnaire and an interview schedule. The questionnaire was utilised to elicit responses to the assessment of key business process gaps that affect productivity and performance at Productivity SA. The quantitative phase included inferential and descriptive statistical analyses were used to identify and show patterns in the data. Descriptive and inferential analyses of questions were performed to look at the distribution of the respondents. The results were analysed and interpreted from responses generated through the questionnaire. SPSS was then used to do inferential statistics. Correlations between two variables were also considered.

The qualitative phase utilised a thematic analysis to link the objectives to the responses within themes. Content analysis was then used to categorise verbal data to classify, summarise and tabulate the data. The key factors affecting performance were further reviewed by analysing the operational data, to identify the largest contributors to poor performance.

6. Results and Findings

6.1 Presentation of analysis and findings

The findings and results are aligned to the objectives and the three main constructs of this study. It includes results and findings from both qualitative and quantitative phases.

6.1.1. Analysis of data:

Objective 1: To determine the key factors affecting operational efficiencies at Productivity SA.

6.1.1.1. Key factors affecting operational efficiency:

In the qualitative phase, respondents were asked 3 sub-questions relating to most common causes of inefficiencies within the organisation, factors contributing to these causes and recommendations to address each cause. The themes which emerged were:

Table 2: Thematic analysis

Core-theme	Sub-themes	Interpretation
Strategy Integration and planning	Need for a strategic focus, building cohesive teams, having common objectives, integration, proper planning, and accurate decision making.	<p>Strategy needs to be integrated into the operational planning. There is a lack of cohesion. Integration would lead to having common objectives, which drives the strategy. This affects planning and execution of the strategy. Also directly affects the performance. Regarding individual contracting and targets: an average of 64% answered positively, knowing their quarterly and yearly income targets.</p> <p>Actual APP results reflect that operational units achieved an average of 75%. A total of 34% confirmed that their units made a deficit. The planning failures resulted in overproduction, seen where units exceed on APP targets but still are in a deficit.</p> <p>Lack of planning or planning failures, which result in under achievement or over-achievements were number 1 with 77% responses agreeing.</p> <p>Based on the findings, planning, and the integration of the strategy to the operational plan need to be addressed to ensure performance targets are met and ensure financial stability.</p>
Leadership and communication	Need for good leadership, skills cohesion, eliminating bureaucracy, being decisive, encouraging empowerment, and improving communication.	<p>The results indicated that there is no cohesion at leadership level. Excessive bureaucracy, with “in-fighting”, priorities are not set by Executive committee, which reflects indecisiveness, lack of empowerment of staff and, communication failures.</p> <p>On average, 20% were unsure of their unit’s overall performance. 19% indicated they were uncertain if the business unit exceeded their performance targets, and 37% were uncertain if their units made a deficit.</p> <p>Only 63% positively responded that performance results are captured on a centralised system and updated weekly. The remaining 37% were either uncertain or disagreed.</p> <p>Systems were not in place to support processes efficiently, with an average of 40% indicating the uncertainty and lack thereof.</p> <p>Politics within a team was the fourth highest reason for gaps that affect the business unit’s operations.</p> <p>Leadership plays a huge role in communication, empowerment, and authority, which are gaps that exist. An average of 40% reflected negatively to problem solving. Staff are empowered to solve problems as they occur, which results in a slow decision-making process.</p>
Execution and service delivery	Need for improving service offerings, Improving processes and policies, Proper standard operating procedures (SOP’s), understanding your market; flexibility; and improve knowledge.	<p>Review of service offerings are necessary. Not all projects have clear and defined processes, including SOP’s and work instructions.</p> <p>Markets are changing, and we need to understand the needs of the customer. Due to market flexibility, we are unable to deliver relevant service offering and improve knowledge.</p> <p>As much as 55% agreed that the service offerings were reviewed in the past year and 52% positively responded that they are meeting clients’ needs.</p> <p>Bottlenecks, relating to slow or overloaded resources, inconsistent work levels, when targets are not the same according to work levels, and human error are three of the five gaps highlighted. These gaps directly affect execution and service delivery.</p> <p>Customer satisfaction is not measured, therefore even with flexibility and review of products and services, they are unable to gauge if they meet client needs or not.</p> <p>The performance results highlighted in the literature review, indicated 2014/15 APP results dropped from 49% to a dismal 36% in 2015/16. The following year 2016/17 it improved to 68% and a further improvement to 71% in 2017/18. The world class standard is to achieve 85% or more, therefore the researcher can confirm service delivery has been affected.</p>

In the quantitative phase, using Spacey’s (2017) operational gaps, the survey highlighted common causes within the business that the participants may identify and relate to, in terms of common causes of operational gaps. The gaps were further categorised into three areas, namely: Planning and Performance; Skills, Systems and Tools and Products, Services and Quality.

Planning and performance:

The unit’s performance for the last financial year: the analysis indicated that on average 20% were unsure of their unit’s overall performance. A high 97% had a positive response to knowing the business unit’s annual performance plan and 42% indicated their business unit exceeded their performance targets. Actual APP results as per Productivity (2018), reflects that operational units achieved an average of 75 of APP targets.

Figure 2: Planning and Performance

Skills, Systems and Tools:

All (100%) indicated that they knew the tools required for their jobs. A high 66% added that they had been trained on tools and processes. Regarding standards and skills, 87% indicated that they knew the standard time to deliver on their targets. A total of 60% indicated that the systems and tools that support the process efficiently. Similarly, 58% indicated that there is a centralised database of clients that is kept to access client information and status. As much as 60% indicated that problems are solved within 48hrs by managers and 63% added that performance results are captured on a centralised system available for anyone to view and having performance results updated weekly.

Figure 3: Skills, systems and tools

Products, services, and quality:

Regarding products and services, 55% agreed or strongly agreed that the service offerings were reviewed in the past year. The findings indicated that 83% agree that they are flexible to expand/

change their service offerings according to the client’s needs. Only 52% indicated that they are meeting clients’ needs. A high 77% indicated that clients do evaluate the service offerings at the end of a project. When evaluating the quality, 71% agreed that there are standard templates for reporting, whilst 58% indicated that quality controls are in place.

Figure 4: Products, services, and quality

Objective 2: To identify the gaps within the business processes at Productivity SA.

6.1.1.2. Identify gaps within processes:

In the qualitative phase, respondents were requested to reply to three questions relating to whether processes were standardised within the organisation, were processes within your unit standardise and what are the gaps within your unit’s business processes?

Figure 5: Standardised Processes

Figure 5 indicates the responses to SOP’s. All (100%) of respondents agreed that processes are not standardised within the organisation. Respondents further explained that there was no “attempt for integration”, they have ISO in place, but it’s not integrated into the processes. There is “total fragmentation”. Half (50%) indicated that processes are standardised within their own business units. The results indicated that one of the top five operational gaps are human error, where errors are a result of process, system or training gaps that allow people to make mistakes. With only 50% of qualitative study respondents indicating processes are standardised within their own business units, the human error gap can be addressed with SOP’s and templates being used.

In the qualitative phase, using Spacey’s (2017) 14 most common operational gaps, respondents provided feedback on gaps within their unit and the factors it may affect, which were quality and efficiency, utilisation or/and cost.

Gaps:

The following top five operational gaps emanated from the findings:

- Lack of planning or planning failures, which result in under achievement or overachievements, (77%);
- Bottlenecks, relating to slow or overloaded resources, (77%);
- Inconsistent work levels when targets are not the same according to work levels, (74%);
- Politics, when teams may slow a process down due to political/ulterior motives, (71%); and
- Human error, when errors that are a result of process, system or training gaps that allow people to make mistakes, (68%).

Impact on quality/efficiency/utilisation/cost:

Planning: The gaps in planning have the highest effect on efficiency (32%), followed by quality and cost (23% respectively) and on utilisation (21%). The impact of these gaps on all the above stated measures directly affects the achievement of targets. According to Spacey (2017), lack of planning or planning failures can result in overproduction, as well as underproduction/ not meeting targets on time.

Bottlenecks: According to Antony, Vinodh, and Gijo (2017), bottlenecks relate to a process which stops or slows down the flow of work and they could have a huge impact on efficiency. A total of 33% respondents indicating that bottlenecks exist in their processes. This was followed by quality and utilisation of resources with 27% and 25% of respondents agreeing, respectively. Only 15% of respondents indicated it would affect cost, which indicates that bottlenecks might not directly impact the cost as much as it would impact quality, efficiency, and utilisation.

Inconsistent work levels: These refer to resources that have little to do, constant overworking and when targets are not the same according to work levels or job grades. The largest impact of inconsistent work levels would be on utilisation of resources. A total of 41% of respondents indicated that utilisation would be affected. Efficiency was also highlighted by 27% of respondents as another factor to be influenced. As much as 20% and 12% of respondents agreed that quality and cost respectively, would also be affected.

Effects of politics: Politics, in the context of this study refers to instances when teams slow down a process due to political motives and/or informal leadership. This affects efficiency, drive up costs, and impact utilisation as well as quality of service or products. The largest result was the impact on cost. A total of 28% of respondents indicated that cost had been affected, 23% indicated that both quality and utilisation had also been affected by politics within a team and 26% responded that efficiency was also affected by politics within their business units.

Effects of human error: Human error contributes to efficiency, cost, quality, and utilisation. Spacey (2017) mentions that human errors are a result of process, system or training gaps that allow people to make mistakes. A total of 27% of respondents agreed that efficiency and cost had been affected, whilst 25% indicated that quality was affected, and 20% indicated that utilisation was also affected.

7. Limitations of the research

Only forty of the one hundred and six population partook in the study. This meant that the sample size was too small for factor analysis to be employed and due to the nature of business at Productivity SA. The literature was found to be limited since the nature of this study was a first for public enterprises. The location of respondents was another challenge. Staff are based at multiple sites nationally, therefore responding to the questionnaires and planning the interviews were more time consuming, than those based in the same office as the researcher.

8. Conclusion and Recommendations

The conclusions of this study are based on the research findings in line with the objectives of the study. The following note-worthy conclusions were drawn from the findings:

8.1 Research objective 1: *To determine the key factors affecting operational efficiencies at Productivity SA*

It can be concluded that there are key factors that affect operational efficiencies, namely planning, performance measurements, skills, systems and tools, products, services, and quality. Planning impacts that of achievement/non-achievement of targets. The feedback can relate to lack of planning or planning failures, lack of communication and commitment. The planning failures can result in overproduction, seen where units exceed on APP targets but still are in a deficit. There was a lack of commitment to perform their duties and meet targets or their lack of interest in the sustainability of the organisation.

The gaps that may exist are having low quality data, due to the lack of customer information or too many databases, with no clear one database. Also, systems are not in place to support processes efficiently. Empowerment and authority are another gap that do exist. Staff may not be empowered to solve problems as they occur, which results in a slow decision-making process. Regarding quality control, the conclusion is that staff are unsure and disagree that the organisation has formal quality control procedures in place as per the Productivity SA quality policy (Productivity SA, 2016). Furthermore, poor quality control result in compromised service. Human errors can contribute to low quality of service delivery since templates and standards are not in place.

8.2 Research objective 2: *To identify the gaps within the business processes at Productivity SA.*

It is concluded that Productivity SA experiences all fourteen of the common gaps within processes, with thirteen confirmed by majority of the operational respondents. The top five operational gaps are, lack of planning or planning failures, which resulted in under achievement or overachievements; bottlenecks, relating to slow or overloaded resources; inconsistent work levels, when targets are not the same according to work levels; politics, when teams may slow a process down due to political/ulterior motives; and human error, when errors that are a result of process, system or training gaps that allow people to make mistakes, mainly due to standard operating procedures not in place for all programmes.

8.3. Research objective 3: *To recommend strategies to improve efficiency and identify the impact measures that will be used to evaluate the proposed changes.*

The following recommendations will assist the organisation by reducing inefficiencies caused by gaps within process, therefore impacting organisational performance.

To recommend strategies to improve efficiency and identify the impact measures that will be used to evaluate the proposed changes. A competitiveness strategy will need to be selected; therefore, the cost leadership strategy is recommended to improve efficiency and impact the organisations performance. A cost leadership strategy strives to achieve lower overall costs. Cost leadership can be achieved through various means, namely:

- Capacity utilisation by streamlining the process and eliminate waste;
- Implement TQM, which controls and reduces variations;
- Economies of scale, using lower input costs without sacrificing quality to get more services/output;
- Automation/Production technology and design;
- Cost advantage of outsourcing or vertical integration and;
- Motivating employees through performance management systems.

Further recommendations speak to the following:

Integration of strategic objectives with the operational plans: The organisation must ensure that there is an integration between the strategic objectives and the operational plans. Also ensure that

operational plans are actionable and communicated to the achievement of both performance targets (APP) and financial targets (viability).

Improve utilisation of resources: Improve utilisation of resources by setting performance targets according to work levels (same across the board), breaking down performance targets into quarterly, and monthly individual financial and programme/project targets, and using dashboards to monitor both individual and business unit performance weekly, monthly, and quarterly.

Reduction of waste within processes: Reduce/eliminate waste within processes, streamline processes, approve SOPs, train staff on approved SOPs, use dashboards to monitor timelines on the project, review the strategy for implementation, and create templates for the deliverables to reduce rework.

Implement TQM: TQM visible efforts include controlling and reducing variation and empowering their workforce. Implement a structured approach to overall organisational management through dashboards, to measure and manage performance, ensure that improvement targets are set and reviewed, worker control, processes are determined and controlled by the workforce, without reliance on a separate function, problem solving, cross functional teams solve problems instead of individuals from a specific discipline, and evaluate customer satisfaction consistently.

Motivate and empower employees: Empower staff and give them the freedom and authority to solve problems and make decisions, remove unnecessary dependencies of approval within processes, create platforms for communication through weekly meeting/ and monthly team meetings, create and implement performance incentives/ rewards and recognition policies and top management to communicate more often on overall organisational performance.

9. Managerial Implications

In summary of the meaning of the results, it is incumbent upon management of the organisation to take necessary actions to address poor performance. Management needs to integrate their strategic objectives in line with the results of this study to improve performance. Furthermore, management need to compare the results with the need to improve the utilisation of resources, reduce waste, implement TQM, and motivating and empower employees.

10. Final conclusions

The research study assessed business process gaps that affect performance of Public Enterprises. The strategic intent for Public Enterprises is to decrease the amount of time and cost for service delivery and to increase the magnitude of the overall impact of all its programme interventions.

For Productivity SA to improve on its current financial situation, service delivery, quality of work and timeliness of reporting, it was imperative to establish the key areas of blockages and weaknesses that are affecting the businesses performance. The study concluded that there are several operational gaps that exist within processes, which can be resolved using the process analysis tools and recommendations to address the gaps. The study thus identified and assessed the process gaps, by using process analysis tools.

The assessment of business process gaps, initiates the need for strategically designed and reengineered processes, ensuring efficiency and effectiveness of an organisation, resulting in enhanced business performance and service delivery.

This study is original, and the paper succeeds in assessing business process gaps which affect the performance of the organisation. As further research, this study could be replicated in another Public Enterprises.

Ecopreneurship;
Intentions; Generation
Y; South Africa

Abstract

The world as we know it is facing several highly complicated environmental issues. It has been argued that the earth's environmental problems are directly linked to mankind's continuous endeavour for global urbanization. As a result, consumers environmental concerns coupled with their need to preserve the environment has increased. This had led to increased pressure on the corporate sector to become more environmentally responsible and sustainable in their day-to-day operations. Similarly, traditional entrepreneurs have been driven by environmental concerns for the environment and not just by profits, and the term "ecopreneur" was born. Characterised as one of the largest and most educated generations to date, the Generation Y cohort has also said to display high levels of environmental concern and entrepreneurial intent. This paper collected data from 520 Generation Y students in South Africa. To assess which factors, influence ecopreneurship in Generation Y students, various statistical methods were employed. The findings indicated that attitudes towards ecopreneurship, subjective norms and environmental knowledge positively influence intention to become ecopreneurs. Furthermore, no real statistically significant differences were detected regarding gender. As such, when marketing to Generation Y students in South Africa emphasis should be placed on education and increasing ecological awareness.

1. Introduction

The world as we know it is facing several highly complicated environmental issues. It has been argued on several occasions that the earth's environmental problems are directly linked to mankind's continuous endeavour for global urbanisation (Wang & Dong, 2019; Jeff, Marla, Jha, Levy & McEntee, 2015). Several environmental issues such as natural resource depletion, water contamination, global warming, carbon dioxide emissions and climate change have thus emerged due to persistent industrialisation (Jeff *et al.*, 2015; Mayerl & Best, 2019; Taufique & Vaithianathan, 2018). Increased pressure has therefore been placed on the corporate sector to become more environmentally responsible and sustainable in their day-to-day operations. (Nikolaou, Tsagarakis & Tasopoulou, 2018; Oláh, Aburumman, Popp, Khan, Haddad & Kitukutha, 2020). The traditional entrepreneur has taken on a new shape in the late 1900s, the new term "ecopreneur" are entrepreneurs that are driven by environmental concerns for the environment and not just by profits ecopreneurs (Farinelli, Bottini, Akkoyunlu, & Aerni, 2011; Schuyler, 1998). In recent years, a growing understanding of the importance of ecopreneurship has become apparent as market innovations such as green buildings, natural products, and renewable energy become more common. (Li, Long, Chen, Chen & Wang, 2020; Kibert 2016). Along with being characterised as one of the largest and most educated generations to date, the Generation Y cohort is also said to display high levels of environmental concern and entrepreneurial intent (Fry, 2020; Iwu, Ezeuduji, Eresia-Eke & Tengeh, 2016; Malebane & Swanepoel, 2015; Marire, 2015). To add on, Ottman (2011) explains that the youth are the future of the environment as they are the future leaders, policy makers and governmental figures which will have a tremendous influence on the environment. To date, however, research regarding Generation Y's intentions to become ecopreneurs is still in short supply, especially within the South African context.

2. Research objectives

The following research objectives have been set out for the study:

- To determine Generation Y students' attitude and subjective norms towards ecopreneurship
- To determine if Generation Y students show an inclination towards environmental knowledge and intent to become ecopreneurs.
- To test a causal model of factors that influence the intent of Generation Y students to become ecopreneurs in the South African context.

The proceeding section delves into the literature of ecopreneurship and Generation Y students.

3. Literature Review

3.1. Ecopreneurship

As increasing scientific evidence links the deterioration of the natural environment to anthropogenic activity, pressure on the corporate sector to become more sustainable and environmentally responsible in business practices has also intensified. (Nikolaou *et al.*, 2018; Oláh *et al.*, 2020; Ripple, Wolf, Newsome, Galetti, Alamgir, Crist, Mahmoud & Laurance, 2017; Wolfgramm, 2016). Despite greater government restrictions, environmental advocacy activities, and business greening plans introduced in recent years, much more must be done to reverse existing environmental harm around the world (Barbier & Hochard, 2018). Innovation is therefore required to effectively manage the earth's natural resources and ensure sustainable growth at present and for future generations (Lee & Trimi, 2018; Rodríguez-García, Guijarro-García & Carrilero-Castillo, 2019). Authors Panackal, Singh and Sharma (2016) observe that a strong correlation exists between entrepreneurship and environmentalism as eco-innovations are predicted to be a competitive advantage for both businesses and countries. By developing new technology that benefits the environment, ecopreneurs play a significant role in preserving natural resources for present and future generations (Hestad, Tåbara & Thornton, 2020). According to existing literature, ecopreneurship can be defined in both broader or more limited terms as no consensus has yet been reached on a single all-encompassing definition (Santini, 2017). For the purposes of this study, McEwan's (2013) broader definition is applied: "any entrepreneurial action that contributes to preserving the natural environment".

3.2. Ecopreneurial intention

Some say that people can only act effectively to bring about preferred outcomes once they have sufficient knowledge (Ajzen, Joyce, Sheikh, & Cote, 2011). This holds true for pro-environmental behaviour and ecopreneurship as well. Authors such as Li, Li, Jin and Wang (2019), Panackal *et al.* (2016), Latif, Omar, Bidin and Awang (2013) and Fielding, McDonald and Louis (2008) agree that a positive correlation exists between environmental knowledge (EK) and pro-environmental behaviour. In other words, the higher the levels of environmental knowledge a person possesses, the more likely they are to engage or behave in a pro-environmental manner. Similarly, Li *et al.* (2020) and Mostafa (2007) found that perceived environmental knowledge was a good predictor of positive attitude and behaviour towards the natural environment. A lack of knowledge proved to be a barrier towards pro-environmental behaviour.

According to the theory of planned behaviour, personal attitude (PA) refers to an individual's overall assessment of the desirability of engaging in a specific behaviour, whether positive or negative in nature (Chipeta, 2015; Fielding *et al.*, 2008; Ajzen, 1991). Researchers suggest that having a positive attitude toward a particular behaviour increases one's desire to engage in that behaviour, whereas a negative attitude has the opposite effect (Li *et al.*, 2019). Studies pertaining to eco-behavioural intention as well as entrepreneurial intention have also found a robust relationship between personal attitude and intention (Chipeta, 2015; Fielding *et al.*, 2008).

A study by Lee (2008), regarding the prediction of green purchasing behaviour of adolescents, stated that the greatest predictor of green purchasing behaviour was social influence. The theory of planned behaviour defines subjective norms (SN) as the degree to which a person perceives their peers, family

and society support or do not support a type of behaviour (Chipeta, 2015; Fielding *et al.*, 2008; Ajzen, 1991). This variable premises that a person will be more likely to behave in a given way if they believe that major social influencers approve of or promote it, and less likely if they do not (Li *et al.*, 2019).

3.3. Generation Y University Students

The necessity of environmental awareness and ecologically responsible behaviour has been taught to Generation Y individuals from as early as pre-school through higher education. (Williams, 2017). This is considerable as the youth are often considered to be the world's future leaders and subsequently, hold the future of the environment in their hands (Gruzina, Firsova & Melnichuk, 2020; Ottman, 2011). Generation Y members are more likely to take part in large protest movements and promote environmental causes because they feel that by working together, they can make the world a better place (Barton, Fromm & Egan, 2012). Earlier research conducted in the South African context have revealed strong levels of entrepreneurial intention among Generation Y students (Iwu *et al.*, 2016; Malebane & Swanepoel, 2015; Marire, 2015). Furthermore, A study by Abina *et al.* (2015) indicated that university students display positive intentions towards ecopreneurship. For the purposes of this study, members of the Generation Y cohort include individuals born between the years of 1986 and 2005 (ages 15–34) in accordance with the research of Bevan-Dye (2016) and Markert (2004). Since this study focuses on Generation Y university students, however, participants' ages only range from 18 to 34 years.

Based on the literature explained in prior sections the following theoretical is proposed:

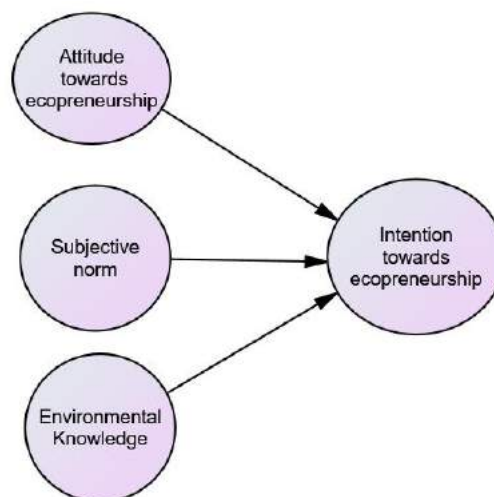

Figure 1: Proposed Theoretical Model

4. Research Methodology

The following section highlights the methodology used for this study.

4.1. Sampling procedure

The sample for this study was selected by incorporating a mix of convenience and judgement, non-probability sampling techniques. The convenience method involved intercepting and selecting sample units that were opportunely accessible in high-traffic areas, which in this case, meant drawing a sample from students conveniently available in proximity to university campuses (Burns & Bush, 2014). The judgement sampling technique was also utilised by only drawing a sample of students that formed part of the Generation Y cohort. The original sample size was made up of 600 university students. Once the questionnaires had been screened a final number of 520 viable questionnaires remained for analysis. Considering the sample size for this study, an historical reference approach was followed. This approach entailed observing comparable studies and using its sample sizes as a guide. Similar studies concerning entrepreneurial intention and environmental concern include Marire (2015) with a sample size of 400 students; Synodinos (2014) with a sample size of 500 students; Cheah and

Phau (2011) with a sample size of 600 and Minton and Rose (1997) with a sample size of 500. The sample population comprised both male and female students, ranging from the ages of 18 to 33, who were enrolled in one of three registered public South African higher education institutions (HEIs) at the time. Of the three HEIs, one was a traditional university, the second a comprehensive university and the third a technical university.

4.2. Data collection

As the data needed to be collected from a relatively large sample numerically, a single cross-sectional, descriptive, quantitative research approach was considered the most suitable means of collecting and quantifying the required data for the study. Self-administered structured questionnaires were designed and used to obtain primary data from the sample population. A cover letter was included in the questionnaire which contained a brief explanation of the study's purpose as well as assurance of the participants' anonymity. Participation in this study was entirely optional, and students were free to withdraw at any point in time. The remainder of the questionnaire consisted of three sections. Section A set out to gather demographic information from participants pertaining to their field of study, level of study, gender, home language and current age. Section B aimed to collect information relating to factors known to contribute positively to intentions towards pro-environmental behaviour, such as environmental concern; environmental behaviour; perceived effectiveness of pro-environmental behaviour; and perceived environmental knowledge. The scales used in Section B were adapted from Mostafa (2007) and Lee (2008). Finally, Section C aimed to extract information regarding participants' overall intention towards becoming ecopreneurs. Questions included in this section relate to the student's attitude towards ecopreneurship, subjective norm, perceived behavioural control and ecopreneurial intention. The scales in Section C were adapted from Fielding *et al.* (2008) and Liñán and Chen (2009). All scaled responses were measured using a six-point Likert scale ranging from (1) strongly disagree to (6) strongly agree.

5. Results and Findings

To analyse the captured data IBM's Statistical Package for Social Sciences (SPSS), version 27 was used. To achieve the set-out objectives various statistical methods were conducted including internal-consistency reliability, descriptive statistics, correlation analysis, regression analyses and an independent sample t-test.

5.1. Internal-consistency reliability

Reliability analysis is used to validate the astuteness of the measuring scale, this is done as a precaution for disseminating accurate results to the general population. The reliability of this study was assured using the Cronbach alpha statistic (a widely renowned measurement tool). The range of the Cronbach alpha values are as follows: $\alpha \leq 0.50$ are unacceptable and considered unreliable; $\alpha \geq 0.60$ shows acceptable reliability and $\alpha \geq 0.70$ implies good to excellent reliability (Zikmund & Babin, 2013; Malhotra, 2010). Table 1 below presents the Cronbach alpha values for the measuring constructs.

Table 1: Reliability analysis

Constructs	Items	Cronbach alpha
Attitude towards ecopreneurship	5	0.87
Subjective norm	3	0.76
Environmental knowledge	4	0.75
Intention towards ecopreneurship	6	0.93

Source: Own compilation

As indicated in Table 1, all measuring constructs recorded a Cronbach statistic of above 0.70, this is indicative of good to excellent internal-consistency reliability. The intentions towards ecopreneurship construct achieved the highest value of 0.93 ensuing excellent reliability for that construct. As the remaining constructs achieved values greater than 0.70, it may be inferred that the measurement instrument possesses good internal-consistency reliability. The following section details the descriptive statistics of the data.

5.2. Descriptive statistics

Descriptive statistics characterises the captured data using various statistical tools such as means, standard deviations (SD), skewness and kurtosis. In addition, a samples t-test was carried out on each of the constructs means to test for their significance. Owing to the use of a 6-point Likert scale in the study, an expected threshold mean was set at 3.50 with a significance level of $\alpha = 0.05$. the results are tabulated in Table 2.

Table 2: Descriptive statistics

N=520	Means	SD	t-value	p-value	Skewness	Kurtosis
Attitude towards ecopreneurship	3.95	1.11	80.73	0.000	-0.38	-0.29
Subjective norm	3.97	1.06	85.29	0.000	-0.37	0.12
Environmental knowledge	4.03	0.94	96.80	0.000	-0.29	-0.14
Intention towards ecopreneurship	3.30	1.32	56.89	0.000	-0.05	-0.87

Source: Own compilation

The results in Table show that each measuring construct recorded a mean greater than the expected mean threshold of 3.50. Furthermore, the samples t-test of each measuring construct returned a statically significant value of 0.000 at the $p \leq 0.05$ level. These results bode well for the future of ecopreneurs as Generation Y students have favourable attitudes towards ecopreneurship and value the opinions of their peers regarding environmental issues. Furthermore, these individuals regard themselves as knowledgeable over environmental issues which would aid in their future consumption decisions and methods of operations should they become entrepreneurs. In terms of intent to become ecopreneurs, Generation Y students show positive intent for incorporating environmentally friendly practices in future ventures.

Skewness and kurtosis values of the data set were all in the acceptable range and warranted to cause for concern. The distribution was considered normal as the skewness values were recorded between the recommended range of -2 and +2 and between -7 and +7 for kurtosis indicating normally distributed data (Kalkbrenner, 2022; Berndt & Petzer, 2011).

5.3. Correlation analysis

A correlation analysis is a good tool to evaluate if any relationships are present amongst constructs of a measuring scale. As such a correlation analysis was undertaken using the popular Pearson's Product-Moment coefficient. This statistical tool utilises the average means to produce Pearson values (r) which range from 0 (no relationship) to 1 (perfect relationship). The strengths of the r values are represented as follows: a weak relationship, $0.10 \leq r \leq 0.29$; a medium relationship as, $0.30 \leq r \leq 0.49$, and a strong relationship as $0.50 \leq r \leq 1.0$ between measuring constructs respectively (Pallant, 2016). The correlation matrix can be found in Table 3.

Table 3: Correlation matrix

Constructs	1	2	3	4
Attitude towards ecopreneurship	1			
Subjective norm	0.59**S	1		
Environmental knowledge	0.46**M	0.44**M	1	
Intention towards ecopreneurship	0.69**S	0.523**S	0.40**M	1
**Correlation is significant at the 0.01 level (2-tailed)				
W = Weak relationship; M = Moderate relationship; S = Strong relationship				

Source: Own compilation

The correlation matrix in Table 3 demonstrates statistically significant positive relationships amongst all measuring constructs at the $p = 0.000 \leq 0.01$ level. The relationships were evenly split between medium and strong correlation strengths. The strongest relationship was recorded between attitude and intention towards ecopreneurship ($r = 0.69$, $p = 0.000 < 0.01$), this association was expected and follows the current literature (Li *et al.*, 2019; Zhang *et al.*, 2019; Pan *et al.*, 2018). The weakest yet still significant, ($r = 0.40$, $p = 0.000 < 0.01$), relationship was found between environmental knowledge

and intention to become an ecopreneur. The results from the correlation analysis showcase that the independent factors of attitude, subjective norm and environmental knowledge have a positive influence over Generation Y students' intent to become ecopreneurs.

The Pearson's Product-Moment coefficient also bodes as a multicollinearity detector tool between construct relationships. Owing to that no (*r*) coefficients were greater than 0.90, no concerns for multicollinearity were present. In addition, each correlation relationship was significant at the 0.01 level, thus it may be inferred that the data set has nomological validity (Malhotra, 2010).

5.4. Regression analysis:

The influence of independent variables on dependent variables is determined through the use of regression analysis. The study made use of a regression analysis to determine the how much predictability the factors of attitude towards ecopreneurship, subjective norms and environmental knowledge have towards intention of ecopreneurship of Generation Y students. The results are tabulated below.

Table 4: Regression analysis

Constructs	Standardised Beta	Adjusted R2	t-value	Significance level
Dependent variable: Intention towards ecopreneurship				
Independent variables: Attitude towards ecopreneurship	0.67		14.17	0.000*
Subjective Norm	0.19		3.89	0.000*
Environmental knowledge	0.12	0.50	2.31	0.021*
*Significance at the 0.05 level (2-tailed)				

Source: Own compilation

As can be seen in Table 4, Generation Y students' intentions towards ecopreneurship is significantly positively influenced by attitude towards ecopreneurship ($\beta = 0.67, p = 0.000 < 0.05$), subjective norms ($\beta = 0.19, p = 0.000 < 0.05$) and environmental knowledge ($\beta = 0.12, p = 0.000 < 0.05$). It is notable that attitude towards ecopreneurship played the largest role towards the intention of becoming an ecopreneur, these results are echoed in the current literature (Li *et al.*, 2019; Zhang *et al.*, 2019; Pan *et al.*, 2018; McEwen, 2013). Unexpectedly, environmental knowledge had the weakest predicting effect, this result warrants further investigation as generally a higher knowledge over a subject often results in a higher predictability thereof. Collectively, the three independent variables explained 50 percent of the variance in the intent to become an ecopreneur. Therefore, it may be inferred that the independent variables of this study successfully predict Generation Y students' intention towards ecopreneurship.

5.5. Independent samples t-test

Often gender bias plays a role in environmental issues in which females have been seen to more prone to saving the environment versus their male counterparts. Therefore, it is pertinent to assess if this sentiment holds true for the intent of ecopreneurship of today's Generation Y cohort. This comparison was done using an independent samples t-test and the results have been tabulated in Table 5 below.

Table 5: Independent samples t-test

Constructs	Gender Differences						
	Male Mean	Male SD	Female Mean	Female SD	t- value	p-value	Cohen's D
Male n=241 Female n=263							
Attitude towards ecopreneurship	3.83	1.17	4.04	1.06	-2.16	0.03	0.19**
Subjective norm	3.94	1.08	3.98	1.03	-0.50	0.62	*****
Environmental knowledge	4.00	0.97	4.03	0.92	-0.44	0.66	*****
Intention towards ecopreneurship	3.21	1.33	3.35	1.30	-1.15	0.25	*****
Note: 16 respondents did not indicate their gender and were subsequently excluded from the analysis.							
*	Statistically significant at $p < 0.05$						
**	Small effect, practically non-significant						
***	Medium effect and moving toward practical significance						
****	Large effect, practically significant						
*****	Cohen's D-statistic not calculated as the variable was not statistically significant						

Source: Own compilation

As Table 5 shows, there was no statistically difference between subjective norm ($p = 0.62 > 0.05$), environmental knowledge ($p = 0.66 > 0.05$) and intention towards ecopreneurship ($p = 0.25 > 0.05$) of male and female students. However, attitudes towards ecopreneurship amongst Generation Y students showed a statistical difference in gender ($p = 0.03 < 0.05$). Therefore, female students display a slightly more positive attitude towards becoming ecopreneurs than male students. To ascertain if this difference in attitude between the two genders was statistically significant a Cohens D calculation was performed. The attitude towards ecopreneurship construct achieved a Cohen's D statistic of 0.19, this value represents a small effect which is practically non-significant.

6. Managerial Implications

Despite the increase of knowledge and awareness in the environmental movement that has led to the increase of environmentally friendly business practices (Dean & McMullen, 2007), at the current rate, the natural environment will reach it's breaking soon if more is not done. Even though governments, policy makers and non-governmental institutions have implemented regulations to minimise natural environmental degradation, more emphasis must be placed on increasing mass awareness in ecological preservation which can start from entrepreneurs researching and finding solutions. Furthermore, this environmental notion should be made available in the early schooling system to make future generations accustomed with these problems. Installing these notions at a young age would increase the likelihood of an entrepreneur to become an ecopreneur or in the very least apply environmentally friendly business practices in their day-to-day operations.

Currently, Generation Y consumers show a high level of entrepreneurial intent which could possibly manifest into ecopreneurial intent. However, barriers such as lack of knowledge and governmental assistance may hinder the intent building process to become an ecopreneur. Therefore, it is imperative to increase ecopreneurship amongst the Generation Y student cohort. This may be accomplished by implanting campaigns to the masses for the purpose of conveying positive attitudes amongst consumers and their peers alike. Furthermore, this would make environmental problems a social norm that needs be addressed.

Environmental problems affect both males and females, as such, talking these problems should then be done by both genders. Despite, Generation Y student females showing a slightly higher positive attitude towards ecopreneurship, the difference is of no significance. As a result, any campaign or activity that seeks to increase ecopreneurship should not be gender bias and focus on both genders equally.

7. Conclusion

This study showed that Generation Y students show high intent to become ecopreneurs. They display favourable attitudes and are influenced by their peers in a positive manner. Generation Y students are more knowledgeable over environmental issues than their predecessor generations cohorts which bodes well for future entrepreneurs to incorporate environmental practices and processes into their

business operations. Environmental problems must be solved through the use of innovation and not merely regulations or policies. Innovation stems from youthful, energetic minds that have a tenacious hunger and passion for problem solving. Therefore, it is up to young ecopreneurs to tackle this problem head on. This cohort is the future of ecopreneurship and are seen the agents of change within the organisation and business sectors, furthermore, this cohort will pave the way for future generational ecopreneurs. Finally, it is imperative to educate future leaders in these matters from a young age as this will create a culture norm in which solving environmental problems is a necessity.

Abstract

The South African Reserve Bank (2021) reported December 2013 as the commencement date of the longest downward phase in the South African business cycle since 1945, when such analyses commenced — this is the longest downward phase since World War II. Like most African countries, South Africa finds itself challenged by the so-called ‘resource curse’. Although the continent holds the majority of the world’s known resources, African countries have not been able to leverage these assets to create prosperity for their people.

Various ministers, and, over the past few years, also President Cyril Ramaphosa of South Africa, have expressed support for the industrialisation of the South African value chain. The government started to introduce mechanisms such as export taxation in the scrap steel industry to increase local beneficiation. A chrome ore export tax was approved by Cabinet in October 2020 but is yet to be implemented.

Taking the lead, the North-West Business School conducted extensive multi-disciplinary scientific research to study the merits of a proposed export tax on chrome ore and the influence thereof on the chrome–ferrochrome value chain. This document gives a synopsis of the research report. The research approach was one of the mixed methods, and, because of the multi-disciplinary nature of the problems facing the industry, the PESTEL analyses technique was followed.

From the research, it is evident that there are mostly positive but also some negative effects of the proposed chrome ore export taxation. Currently, many South Africa platinum producers sell South African chrome ore as a by-product in their mining process into the world, mostly China, at very low prices without beneficiating the ore in South Africa. This being the Chinese producers' main cost drivers and the only item over which South Africa has control over blessed with over 72% of the world's chrome resources together with the energy crisis and, specifically, Eskom pricing creates a major challenge for South Africa, but also for energy-intensive industries such as ferrochrome smelting. The rising electricity pricing resulted in China overtaking South Africa as the largest ferrochrome manufacturer, although South Africa holds over 72% of the world’s chrome resources.

The research made use of the Revealed Trade Index developed by Vollrath in

*Corresponding Author

¹ E-mail address: ronnie.lotriet@nwu.ac.za

1991, which showed that South Africa has a high level of competitiveness in both chrome ore and ferrochrome. However, it disturbing is to note that the level of competitiveness in ferrochrome shows a decreasing trend over time, whilst chrome ore is increasing. The opposite would be more favourable from an economic development perspective.

Making use of the SMART software (Software for Market Analyses and Restrictions on Trade), the analysis shows that chrome exports will decrease depending on the level of taxation but could potentially increase domestic ferrochrome production by between 53% and 107%, again depending on the level of taxation.

The study revealed that it is important to differentiate taxation between the various types of chrome ore — cheap UG2 (low-grade chrome ore produced as a by-product in the platinum process) should be levied at a higher rate than traditional mining of chromite seams. From the research, a differentiation of between 30% to 40% should be considered. Using the proposed taxation percentage of TIPS (2019, updated 2020) of 30% would result in 30% export taxation on traditional chromite seams and 60% to 70% on the by-product low-grade seams. Similar, using 10% as a base for the traditional seams will result in a 40% to 50% taxation on the low-grade seams.

Of late, case studies on interventions in countries such as Indonesia, India, Russia, Zimbabwe, and many others have shown that, when specific criteria are met, interventions such as export taxation are, overall, positive for the country.

The latest taxation applied as an interventionist measure is Indonesia, which has already banned several unprocessed ore exports, including nickel, tin, and copper, to stimulate downstream industry development, including batteries for electric vehicles and the aluminium industry. The country's president, Joko Widodo, said the country is planning to "hit the brakes" on the export of all commodities, to encourage investment and create jobs in the domestic economy.

With more detail given in this synopsis, it is evident that export taxation on chrome ore can be successful if it meets the following criteria: South Africa has significant market power, there is beneficiation capacity downstream, South African chrome ore cannot easily be displaced, and the country has the necessary know-how, knowledge, and capacity to beneficiate. From the research, it is apparent that South Africa meets these criteria in terms of the chrome sector. This said taxation should only be used as a short- to medium-term intervention to create a period within which to address domestic challenges such as energy.

In a question-and-answer session between President Ramaphosa and the North-West Chamber of Commerce and Industry on 8 October 2021, President Ramaphosa confirmed the government's intent to implement export taxation on chrome ore, to improve the chrome–ferrochrome value chain beneficiation narrative in South Africa.

“It is our time to proudly have South African decisions made for South Africans, which will, in turn, benefit the ailing South African economy.”

– Gadifele Mokgabudi (2021)

1. Introduction

Mining remains a sunrise sector that can still sustainably develop our country – DMRE, 2021

The sustainable development and subsequent growth of the chrome-ferrochrome value chain and its integration into the world economy becomes relevant in the context of South Africa losing out on its

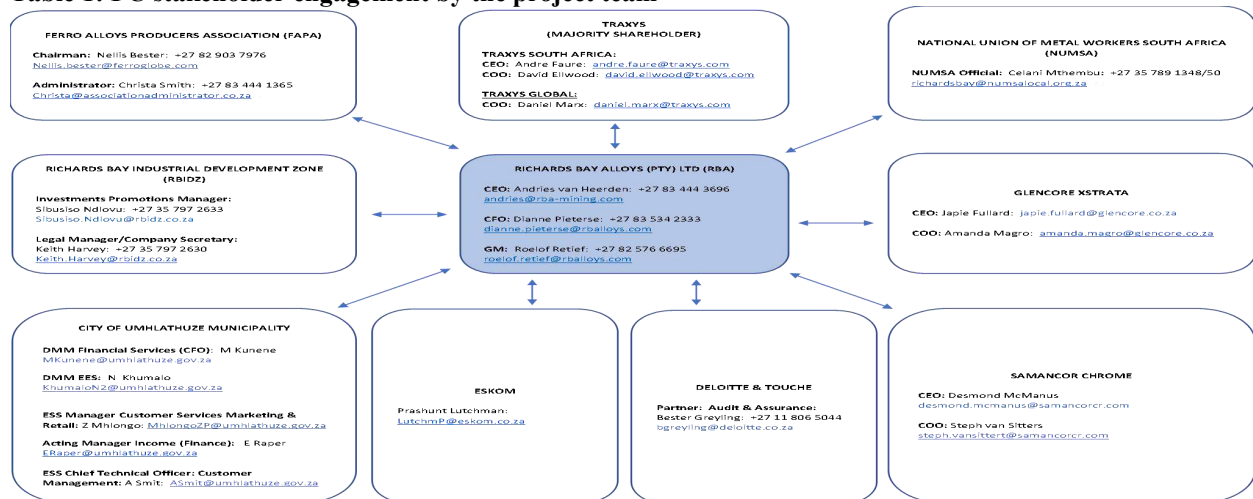

competitive position in terms of mineral raw materials reserves and related production. This research report argues the strategic importance to develop a sustainable and thriving ferrochrome industry in South Africa. The focus was on the broad (external) environmental context that affects the business of ferrochrome and its industry incumbents. Some of the research results from the Master Report (Lotriet et al.,2021) are documented in the next number of sections with its focus on some political developments, the macro economy, the micro-economic focus on export tax and the ferrochrome industry as such, some social issues, technology in this smelting space and the environmental changes that are going to be a big driver going forward.

2. Research Methodology

The research approach was one of the mixed methods, where secondary data were mined and qualitative data were generated through interviews with several influencers including C-suite executives, local government, organised labour, investors, a special economic zone representative and financiers of the broader ferrochrome ecosystem. The figure below illustrates the main stakeholders in the CFcVC-ecosystem.

The research team surveyed a comprehensive range of scientific publications (industry-specific news clips, textbooks, journals, authoritative websites, and existing datasets). It only included studies that have direct relevance to the title of the research project and reviewed cases where export taxes have been successfully utilised to further and protect the narrative of socio-economic beneficiation. Because of the multi-disciplinary nature of the problems facing the ferrochrome industry, the PESTEL analysis technique (Political, Economic, Social, Technological, Environmental, and *not* Legal factors) was followed to clarify the dominant threats to and opportunities for the industry going forward. Limitations to the study are also noted in the master report. The research focus on the context of the FC industry stakeholders – both from the private and public sectors of the economy, as a micro-economic consideration of the issues arising.

Table 1: FC stakeholder engagement by the project team

3. Political Issues²

The political landscape research spans the period from 2022 to 2029. Each society's political culture reflects the importance of the government, the legal system, the independence of the media, the nature of civil society, the formal and informal economies, and the architecture of the informal political economy. Issues for foreign investors include the governing party's views on sovereignty, political risk, taxes, equity dilution, and expropriation. When perceived risks are high, countries find it challenging to attract foreign investment. Political risk is, to a significant extent, impacted by economic risk. Despite beneficiation being official government policy, most South African commodities are exported with very limited beneficiation or benefit to the fiscus. President

² Only SOME of the issues are highlighted in this report. The full report is available.

Ramaphosa and the Minister of Trade, Industry, and Competition, Ebrahim Patel, have expressed, through numerous policy documents, support for the industrialisation of the South African value chain. With an unemployment rate of 34.4% in the second quarter of 2021, it seems logical and obvious that government would use all statutory means possible to encourage beneficiation. The ideal is for capital owners to find value in an evolving value chain.

It is assumed that the optimistic scenario of the current leadership being re-elected will prevail and justifications are provided. The political risks to stability are measured as high. The identified risks emanate from economic conditions of prolonged contracted growth and policy instability. The potential impact of stable supply chains and diversified value chains are presented as solutions, especially in mining and manufacturing. The political interests of the government weighed heavily on the mining and manufacturing industry. From 1990 to 2020, mining houses would gradually disinvest from the local economy as capital and shareholders sought more investment-friendly destinations. Value chains and beneficiation stabilize local political systems, allow communities access to socioeconomic mobility, and increase the prospects for a greater good negotiated between contending interests or adversaries. Disruptions in operations due to labour instabilities have always been a significant impact on the productivity of the South African mining industry. However, disruptions due to wages and conditions of employment are generally well managed by both unions and the mining industry. Bargaining forums and cyclical wage agreements mitigate prolonged strike actions.

The *Globaleconomy (2021)* assessment - see table 2, reflects the reason for concern in several indexes compiled to measure government frailty. With a value of 70/120, it is evident that the South African government is vulnerable to societal and economic instability. It is also apparent that the government's institutional capacity to pre-empt instability and manage volatility is challenged by budgetary constraints, poor management, and inadequate human resources. Factionalised elites (6.30/10), a result of government capture and the fragmentation of the governing party, security threats (6.40/10), uneven economic development (6.70/10), economic decline (8.30/10), and demographic pressures (7.10/10) culminated in the combustion that left the government disempowered and businesses exposed to violence and destruction – and as a consequence, disinvestment out of South Africa.

Table 2: Fragile Government Index

Fragile state index	Measure	Latest value	Reference
Fragile state index, 0 (low) - 120 (high)	index points	70.00	2021
Security threats index, 0 (low) - 10 (high)	index points	6.40	2021
Factionalized elites index, 0 (low) - 10 (high)	index points	6.30	2021
Group grievance index, 0 (low) - 10 (high)	index points	5.90	2021
Economic decline index, 0 (low) - 10 (high)	index points	8.30	2021
Uneven economic development index, 0 (low) - 10 (high)	index points	6.70	2021

External interventions index, 0 (low) - 10 (high)	index points	3.20	2021

Source: (*Globaleconomy, 2021*)

Perhaps the most concerning indicator is the Fragile Government Index, which is a general assessment of a large number of defining variables reflecting the durability of the government or democratic regime. At 70/120, the government is considered vulnerable — at the high end of the measure - see the aggregate report for further deliberations on risk indicators, and the subsequent strengths and weaknesses of the South African political-economic environment.

4. The Broader Macro-Economic Context

The economic section of the report provided a comprehensive view of the South African economy as a whole, and the position in which the ferrochrome industry finds itself. The decline in the quality of services and logistical infrastructure and the exponential increase in energy cost exacerbated the almost impossible circumstances for exploration, manufacturing and beneficiation. South Africa remained a primary exporter of raw materials and an importer of luxury, finished products.

Major weaknesses exist in the South African economy, of which electricity generation and supply problems are the most important. Economic performance for 2020 is distorted owing to extended periods of Covid-19 lockdown, with an accompanying increase in unemployment to disturbing levels. With subdued growth, a downward phase of the business cycle and population growth at some 1.5% per annum, South Africa will not overcome current problems without renewed growth in investment. *Consequently, the most dismaying outcome of the disinvestment in the mining industry and investor hesitance in the other spheres of the South African economy is the absence of the urge to invest in value chains. Value chains result in a multiplier effect that generates employment opportunities and is at the heart of economic growth as it creates an environment conducive to reimagined economic opportunities.*

Changes in real GDP and other measures of the performance of the economy are shown in Table 3. One of the most disconcerting trends in the last few years has been the slow growth or decline in gross fixed capital formation, i.e. fixed investment in the economy. Low rates of investment lead to a reduced rate of increase in productive capacity in the economy and lower productivity, harming the future growth of the economy. Real investment spending fell by 3.5% in 2016, followed by a small increase of 1.0% in 2017, which was insufficient to eradicate the decline recorded in 2016. Since 2018, a declining trend was recorded (South African Reserve Bank, 2021). The sharp acceleration in the declining trend in 2020 can, in part, be ascribed to the impact of the Covid-19 pandemic regulations.

Table 3: The South African economy: Summary of performance 2015–2020

	2015A	2016A	2017A	2018A	2019A	2020A

Sources: Statistics South Africa, South African Reserve Bank, and own calculations from various sources

Lower economic growth plus lower tax collections put government revenue under pressure, which resulted in substantial borrowing to fund government deficits as expenditure continued unabated. This has brought South Africa close to the brink of the *fiscal cliff*, i.e. the point where civil service remuneration, social grant payments, and interest on government debt will exceed 100% of government revenue (Joubert & Rossouw, 2021). This measurement is done on the revenue side, rather than on the expenditure side, as overspending by the government has the perverse outcome of expenditure items, expressed as a percentage of total expenditure, improving for statistical reasons, without any real improvement taking place. The growth in government debt as a percentage of GDP is shown in Figure 1.

Figure 1: Government debt as a percentage of GDP since 1990 (South African Reserve Bank and National Treasury — Budget Review (various issues))

The growth in government debt is the result of escalating annual budget deficits of the government. The government recorded a surplus of revenue over expenditure in the years running up to the global financial crisis but subsequently ran substantial budget deficits, *inter alia*, in a failed attempt to rejuvenate and stimulate economic growth. However, the strategy focused on consumption expenditure, rather than investment expenditure, and did not deliver the desired result of increasing the rate of growth in the economy. It resulted in a substantial increase in government debt as a percentage of the GDP, depicted in Figure 1, above.

Using the above technique, unemployment as a function of various macroeconomic variables was modelled, including GDP and inflation. Also included in the model are various qualitative binary variables, often referred to as ‘dummy’ variables. These variables are essentially a device to classify data into mutually exclusive categories, and often assume values of zero and 1 (Gujarati & Porter, 2009). Dummy variables are included to capture large fluctuations in the level of the unemployment rate observed for the various years in the analysis period, notably from 2000 to 2003 (strong surge) and 2003 to 2008 (decline). These movements are likely linked to structural effects in the economy (qualitative aspects such as labour laws, ‘sentiment’, etc.), which are extremely difficult to capture in quantitative modelling, therefore justifying the inclusion of dummies. Figure 2 illustrates how the unemployment rate in South Africa has been generally trending upwards since the country became a democracy, while sharp (up and down) fluctuations are evident from 2000 to 2008.

Figure 2: Model of unemployment and scenarios, 1993–2019 (Statistics South Africa and own estimates and calculations)

With more rapid economic growth, the growth in government revenue would have been higher than what has been recorded since 2014. By again using co-integration econometrics techniques, the impact of GDP growth on revenue could be analysed. Macroeconomic variables used for this purpose included the GDP, real interest rates, and money supply. *Two scenarios* were included, namely a constant GDP growth of 2.5% and 4.0% per annum respectively for the period 2014 to 2019. As expected, a positive correlation was found between GDP and government revenue, i.e. the amount of revenue collected is expected to rise as higher GDP growth is achieved (see Figure 3).

Figure 3: Model of revenue and scenarios 1990–2019 (National Treasury and own calculations)

- For **Scenario 1 (constant GDP growth of 2.5% for the period 2014 to 2019)**, the additional government revenue from actual tax rates for the respective years was estimated to rise from R0.1 billion in 2015 to R50.5 billion in 2019. On average, this was about 1.5% higher than the actual revenue collected in those years.
- For **Scenario 2 (sustained 4% economic growth rate for the same period)**, the impact was even larger, with as much as R129.3 billion (or 9.8% above actual collections) collected in 2019.

This highlights the importance of achieving sustained higher growth economic rates to have a meaningful impact.

5. Broad Mining Industry

Many parts of Africa have long been known to be rich in mineral resources. Eleven of its countries, especially in southern and western Africa, rank among the top ten sources of at least one major mineral. Many African countries have been perceived as posing high political and economic risks for investors, and subsequently, now less appetite for the relatively high risk that usually comes with mining. According to the latest South African Reserve Bank Quarterly Bulletin (SARB, 2021) the mining sector as a whole contributed about 55% to South Africa's total merchandise exports. This figure alone indicates that South Africa is resource-driven and highly dependent on this sector. South Africa dominates in connection with more than one resource holding in the Top 10 globally. The mining value chain in South Africa is the historic bedrock of South Africa's economy. It directly contributes more than 300 billion Rands to GDP, employs more than 450,000 people and is the economic anchor of many communities around the country (Cassim *et al.*, 2019). Unfortunately, much of the news about South African mining in recent years has been negative. Total mining employment has fallen by approximately one-tenth in the last 10 years—a net loss of more than 50,000 jobs. Moreover, McKinsey analysis shows that the productivity of South African mining operations for key commodities has declined over the past five years, even as mining companies in other regions have made rapid gains in productivity. *To date, resource-driven countries have tended to underperform those without significant resources*: almost 80% of the former have a per-capita income below the global average. More than half of these countries have failed to match the average growth rate of all countries. Only one-third have maintained growth beyond the resource boom

In the main, South African minerals have been extracted, subjected to processing and then, the majority of that exported as ores without beneficiation. In this regard, SEZ (Special Economic Zones) have been established some years ago, but are found lacking in the development of value chain businesses. The SEZ programs should be part of the national or regional development strategy and based on the most suitable model which depends on the local comparative or competitive advantages. One of the key objectives of SEZs is to overcome the constraints of doing business in an economy. In line with the operational realities on the ground, the World Bank's latest metrics indicate that South Africa has deteriorated further in this regard. South Africa is ranked 84 among 190 economies in the ease of doing business, according to the latest World Bank annual ratings (Trading Economics, 2021). The Ease of Doing Business Index ranks countries against each other based on the extent to which the regulatory environment is conducive to business operations and the strength of protection of property rights. Economies with a high rank (1 to 20) have simpler and more friendly regulations for businesses. The rank of South Africa deteriorated to 84 in 2019, from 82 in 2018 (Trading Economics, 2021, World Bank).

Figure 4: The ease of doing business in South Africa (Tradingeconomics,2021)

In the pioneering Chinese zones, all basic infrastructures are provided with high quality and with one-stop-shop services and efficient aftercare. In the case of SA, our SEZs are not that special after all. The key driver of ferrochrome demand is the Chinese stainless steel demand, and ferrochrome supply is highly dependent on electricity supply and pricing. The chrome ore sector is not very power intensive. However, beneficiation of ore, i.e. FeCr sector is high power dependent. This said it stands to reason that since the kwh/USc stayed flat and since SA switched off furnaces, not due to constraint in power but rather due to China being cheaper, the issue lies somewhere else. In this regard a mining executive commented - *SA has the potential to control one of the highest expenditures of Chinese FeCr, i.e. ore price. Especially also considering that you need to transport 2.2t of chrome ore across to the far east to make 1 tonne of FeCr. To be honest, I don't know of one smelter in SA that closed because Eskom did not have power. Secondly, since 2010 (i.e. before we were pushed down from the biggest to second biggest producer of FeCr, electricity pricing in USD terms stayed relatively flat).*

SA dump millions of tonnes of UG2 chrome ore at very low price levels, hence SA reducing China's COP on behalf of China. Power stays an issue, but not the biggest contributor to the demise in the beneficiation industry is the dumping of ore.

This research confirms South Africa's strong market position in the chrome and ferrochrome industries, with China being the dominant export market. Even though South Africa has a high level of revealed competitiveness, the country experienced a slowly declining trend over time for ferrochrome production, while chrome ore production is increasing. *This means that the country's level of specialisation is now higher for raw materials than for the processed products.* As one mining executive remarked- *"Power is a concern, however we exported the industry to China, by making its highest cost component dirt cheap by dumping ore in China. With subsidising power to their smelters and having low-cost labour they could take over the industry"*. The revealed level of competitiveness of South Africa's exports of chrome ore and ferrochrome for the period 2002 to 2020 is calculated with the Revealed Trade Index (RTA). *The concern is that since 2012 the country's level of specialisation in raw materials is now higher than for the processed product.* This is cumbersome from an economic development perspective as the opposite would be more favourable.

One of the options that have been proposed for South Africa to regain its competitive position in the ferrochrome industry, is the implementation of an export tax on specific chrome ores. The report argues that an export tax can only be beneficial in cases where the country has significant market power with no real substitution options and, according to industry executives no significant retaliation is expected as a backlash. Hence, countries with dominant ore reserves have the incentive to apply an

optimal export tax rate that maximises welfare. “Producers of FeCr in SA reduced production as it could not compete against China. Interestingly we now see the subsidies for power in China are removed, smaller smelters are closed down (look at South of China), and labour is not as cheap anymore. SA should be able to beat them hands down as we control ore” (Mining executive, 2021).

Even though export control measures can have a positive effect on countries with market power, the question is whether it leads to increased downstream-, side-stream-and upstream processing in the domestic market. Export taxes have had varied effects in different countries around the world and in certain instances, they did not have the desired effect to increase downward processing or value-added activities, as an export tax alone cannot drive such an effect. An export tax can achieve the goal of decreasing the volumes of products exported to the foreign market, but to gain in the domestic market the product retained domestically should be converted into a successful domestic downstream industry.

Figure 5 shows South Africa’s broad product³ composition of chrome exports for 2002, 2010 and 2020. Exports have been dominated by chrome ores and ferroalloys with >4% carbon. In 2002 there were some exports of ferroalloys with <4% carbon as well as some other chromium products, however, their proportion in exports has diminished by 2020. The main structural trend derived from the Figure is the significant proportional contribution of chrome ores. In 2002, only 7% of chrome exports consisted of ore and by 2020 this share increased to 40%. Hence, the contribution of processed ferroalloy (HS720241) became much smaller over time, indicating that South Africa is exporting more raw materials and less processing is being done locally for these products.

Figure 5: South Africa’s export composition of chromium products: 2002, 2010, 2020 (Source: Authors’ own compilation based on data from UNCOMtrade, 2021)

In 2020, China was still the dominant export market, but its share decreased slightly to 61%. and a small share directly to Indonesia (4%). Compared to 2002 and 2010, the proportion of exports to other markets decreased to 11% by 2020. Overall, the export markets for chrome ore have become more concentrated over time. This would indicate that all processing of chrome ores is now occurring in China, and as indicated in the previous graphs, the processing of ferrochrome has been moving to the Chinese producers over time. It clearly emphasizes the “export” of the ferrochrome industry to China, with more ore sold than beneficiated ferrochrome.

³ Classified at the six-digit level of the 2020 version of the Harmonised System (HS)

Figure 6: Trend in SA's main export markets of chromium ores (2002/2010/2020) (Source: Authors' own compilation based on data from UNCOMTrade (2021))

Revealed competitiveness

The revealed level of competitiveness of South Africa's exports of chrome ore and ferrochrome for the period 2002 to 2020, was calculated as the Revealed Trade Index (RTA). The RTA index is deemed a good proxy for the revealed level of a country's product specialisation. An index value of more than zero implies a revealed specialisation in production. Figure 7 presents the results of the analysis. Given the relative level of the RTA indices, it is an event that South Africa has a high level of revealed competitiveness in both chrome ore and ferrochrome. The level of competitiveness in ferrochrome shows a slowly decreasing trend over the depicted period, while the level of competitiveness of chrome ores shows an increasing trend. In 2012, chrome ores surpassed ferrochrome in terms of competitiveness. **This implies that since 2012 the country's level of specialisation in raw materials is now higher than for the processed product.** This is cumbersome from an economic development perspective as the opposite would be more favourable.

Figure 7: Trend in South Africa's revealed competitiveness of selected chromium products (2002 - 2019). Source: Authors' own calculations based on data from UNCOMtrade (2021)

China is South Africa's main export market for chrome and ferrochrome. For chrome ores, South Africa's closest competition is Turkey and Zimbabwe (see next figure), however, these suppliers have not been able to come close to the export figures of South Africa in the last decade. *This could*

indicate that South Africa can not easily be displaced as a global supplier, and should in theory be a price setter globally.

Figure 8: China’s imports of chrome ore and concentrates – HS code 2610 (2009 - 2020) *Source: Authors’ own calculations based on data from ITC (2021)*

With South Africa’s strong global position in the chrome sector, as a clear market leader, it is crucial to sustaining this industry, especially the production of ferrochrome in the local market to increase South Africa’s competitiveness. But, the above graph indicates again. Thus, the suggestion to implement export taxes as a means to grow local beneficiation and further developments of the sector. It is also important to consider how the export tax should be implemented: it would be best to implement it as an ad valorem tax, and it would be economically efficient if it is kept simple and could utilise existing legislative and operational frameworks such as the new Customs & Excise Act of 2020. An export tax does not sever the link between domestic and global markets but rather creates a wedge between domestic and international prices. This gives domestic consumers a cost advantage. Due to the vast differences between the cost of producing UG2 and the cost of production of traditional chrome ore, it follows that export tax rates or tariffs would have to differentiate between different seams. It will also be necessary to create new HS-codes for the different forms of ferrochrome since it does not exist in the current taxation framework of SARS⁴.

It now seems that South Africa has exported its competitive advantage in the production of ferrochrome to China. The next section focuses on issues in the ferrochrome industry.

Some issues in the Ferrochrome Industry in South Africa

Data from Trade and Industrial Policy Strategy (TIPS) (Unpublished Report, 2021) indicate that chrome ore export prices have eroded, which can be explained by the increase in the availability of a low-cost by-product — UG2 chrome concentrates — produced by operational platinum mines. Trends in the pricing of chrome ore are detailed in the table below.

⁴⁴ This also limits the data analysis that could be done up to this point, as current export and import data for ferrochrome is only captured at a high level (as indicated in the economic section of the report) and the data does not distinguish between UG2 and other levels of ferrochrome.

Table 4: Chrome ore pricing history

Year	40/42 UG-2 Publication	38/40 ROM ⁵ Publication	Premium/Discount to UG2	40/42 ROM Publication	Premium/Discount to UG2
2017	US\$215/Mt	US\$201/Mt	-US\$14/Mt	US\$219/Mt	US\$4/Mt
2018	US\$190/Mt	US\$182/Mt	-US\$8/Mt	US\$202/Mt	US\$12/Mt
2019	US\$155/Mt	US\$152/Mt	-US\$3/Mt	US\$168/Mt	US\$13/Mt
2020	US\$135/Mt	US\$140/Mt	\$US5/Mt	US\$154/Mt	US\$18/Mt

Source: TIPS (2021)

TIPS (2021) also provided a comparison of Chinese and South African ferrochrome production costs for the period 2017 to 2019. The 2019 figures were used to create the table below. As can be seen from this table, based on the 2019 figures, at least USc/lb of 3.70 is required to even out cost. This relates to an 11% increase in the 2019 ore price based on a USc/lb basis.

Table 5: Ore price increase to even out costs based on TIPS (2021)

	China 2019		South Africa 2019		% Difference China vs SA
	USc/lb	%	USc/lb	%	
Ore	33.3	45.00%	16.3	20.98%	51%
Power	15.7	21.22%	23.4	30.12%	-49%
Labor	2.8	3.78%	3.7	4.76%	-32%
Reductants	11.3	15.27%	15.4	19.82%	-36%
Other	9	12.16%	12.3	15.83%	-37%
Delivery Cost	1.9	2.57%	6.6	8.49%	-247%
Total	74	100.00%	77.7	100.00%	
Requirement to get prices equal USc/lb				3.70	
New ore price required in China				37.00	
% increase in ferrochrome ore input cost required based on 2019				11%	

(Source: Reworked table from TIPS, 2021)

These tables indicate the impact of increasing electricity prices and reductions on the price of ore imported by China. China and others have consequently been able to produce ferrochrome at costs lower than those of South Africa. Electricity pricing remains a concern, as the South African electricity price is not only relatively higher than that of China and Indonesia but is increasing while others have been able to contain these costs. This, together with the low-cost ore supplied into China, resulted in a continuous decline of the South African ferrochrome industry.

The sector is a significant contributor to the South African mining sector, and South Africa plays a significant role in China's stainless steel value chain. Mining Weekly (2021) indicated that China is responsible for 53% of global stainless steel production, using several inputs, including ferrochrome, and, South Africa is the main supplier of ferrochrome. However, China's local ferrochrome production has continued to increase, while South Africa's production continues to fall, mainly due to rapid increases in the cost and the unreliability of electricity supply, as well as the selling⁶ of UG2 ore.

⁵ ROM = Run-of-mine ore, referring to unbeneficiated or untreated ore.

⁶ Note: Information is drawn from CRU cost data which has been calculated as weighted average based on total production and individual company costs)

Export composition

Figure 5 earlier indicated South Africa's broad product⁷ composition of chrome exports for 2002, 2010, and 2020. Exports have been dominated by chrome ore and ferrochrome with > 4% carbon. In 2002, there were some exports of ferrochrome with < 4% carbon and other chromium products; however, their proportion in exports diminished by 2020. The main trend evident from the figure is the significant proportional contribution of chrome ores. In 2002, only 7% of chrome exports consisted of ore, and, by 2020, this share had increased to 40%. Hence, the contribution of processed ferroalloy (HS720241) became much smaller over time, indicating that South Africa is exporting more raw materials, and less processing of these products is being done locally.

Export markets in chrome

Overall, the export markets for chrome ore have become more concentrated over time. This is shown in Figure 9, which depicts the number of export markets and their respective share in chrome exports for 2002, 2010, and 2020. In 2002, the export destinations for chrome ore were relatively diversified, with the USA, the Netherlands, Japan, and the UK as the main destinations. In the same year, a large proportion was also exported to a wide range of other countries (41%). By 2010, the number of export markets was much more limited and was dominated by China, which absorbed 74% of total South African chrome ore exports in that year

In 2020, China was still the dominant export market, but its share decreased slightly to 61%. Figure 11 also shows that Mozambique was the second-largest export market in that year with a share of 24%. It is important to note here that the ultimate destination for chromium exported to Mozambique is mainly China. This is also evident from the Tax Report (October 28, 2021) that indicates that, in 2020, an amount of 11 723 104 tonnes was exported to China, out of a total of 14 321 951 tonnes. Therefore, South Africa's direct and indirect exports to China added up to 85% in 2020. Furthermore, in 2020 a small share was exported to Indonesia (4%), mainly because of tax-like interventions by the Indonesian government (in line with the argument of this report).

Compared to 2002 and 2010, the proportion of exports to other markets had decreased to 11% by 2020. Overall, the export markets for chrome ore have become more concentrated and more focused on China over time. This indicates that the processing of chrome ore in China has increased - aggravated through the woes of Transnet, implying that Mozambique (the Maputo port) is just the "new" gate increasingly servicing China

Figure 9: Trend in SA's main export markets of chromium ores (2002/2010/2020) (Own compilation based on data from UN ComTrade, 2021)

Figure 10 shows the changes in the export patterns for ferrochrome. In 2002, most ferrochrome was exported to Japan, Germany, Italy, and France. Combined, these markets absorbed 52% of South

⁷ Classified at the six-digit level of the 2020 version of the Harmonised System (HS)

Africa's exports. In 2010, the proportions exported to Japan and Germany decreased, and exports to China and South Korea gained momentum, with shares of 25% and 11% respectively. Exports to Italy and France had halted by 2010. By 2020, exports to Japan had also diminished, and exports to Germany had ceased. However, new export markets such as the USA, the United Arab Emirates (UAE), and Indonesia surged to a combined share of 32% of exports. China had consolidated its position as the dominant export market by 2020, with a share of 41% in South Africa's ferrochrome exports.

Figure 10: Trend in South Africa's main export markets of ferrochrome: 2002, 2010, and 2020 (Own calculations based on data from UNComTrade, 2021)

Comparison with other chrome producers

The following graph shows that South Africa remains the largest exporter of both chrome ore (HS Code 2610) and ferrochrome containing more than 4% carbon (HS Code 720241). Note that China is the largest ferrochrome producer; however, China uses ferrochrome directly in its downstream stainless steel industry, leading to insignificant chrome ore exports from China. South Africa's exports of chrome ore are significantly larger than those of any of the competing nations, i.e. Turkey, Pakistan, Kazakhstan, and Zimbabwe. Zimbabwe banned all exports of lump ore, and will ban all concentrate exports from June 2022 — this will reduce imports into China from Zimbabwe by at least 568 843 tonne, based on 2020 figures. Furthermore, Kazakhstan exports only to Commonwealth of Independent States (CIS) countries, mainly Russia, which explains some of the declining trends illustrated in Figure 12. The graph does, however, show a large spike in 2017, and thereafter a significant decline up to 2020 (note that, although China is not in the top 10 countries exporting chrome ores, it was added to the graph for purposes of comparison between South Africa and China). Therefore, *displacement of South African chrome ore will not be easy*, especially when considering interventions implemented by many countries.

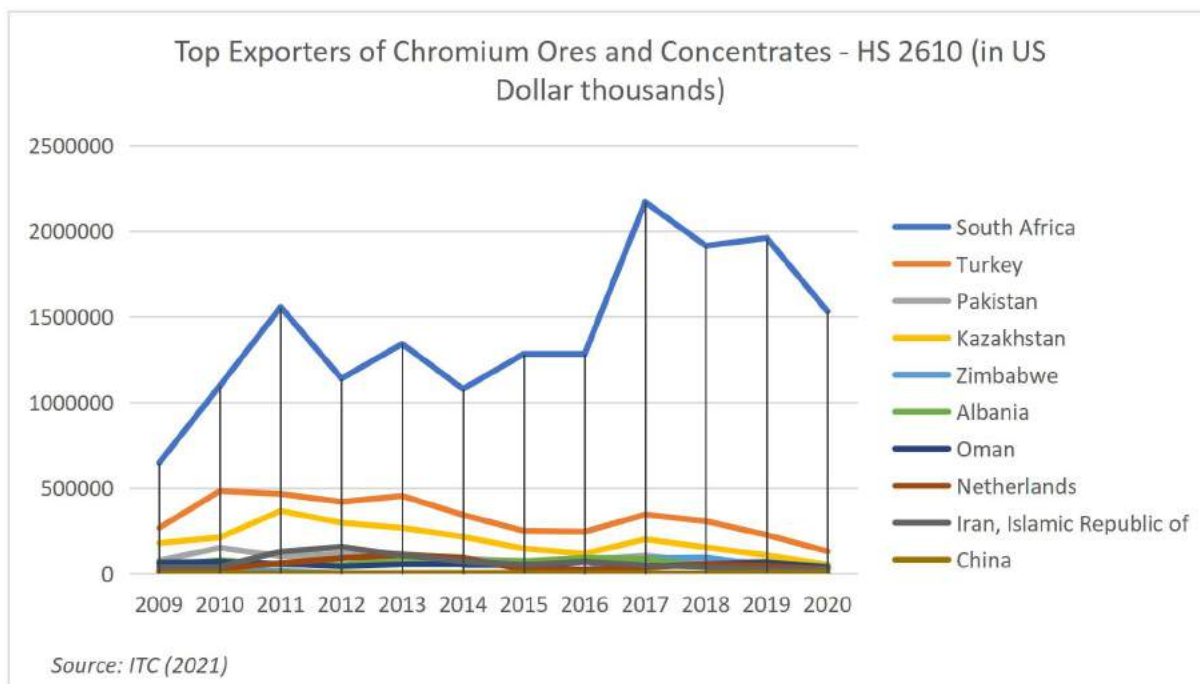

Figure 11: Top exporters of chromium ores and concentrates (HS code 2610) 2009–2020. (Own calculations based on data from ITC, 2021)

South Africa has been the leading exporter of ferrochrome (containing > 4% carbon — HS Code 720241); however, the competing nation of Kazakhstan was able to match South Africa’s export figures in 2012. Thereafter, South Africa remained in the top position, but the data show a declining trend over time.

6. Export Restrictions

Genesis Analytics contradicted the TIPS (2020a) report significantly in their unpublished report (“GA 2020”). GA 2020 highlights the potential impact that a decrease in exports due to an export tax could have on mining employment, especially in non-integrated mining. They also indicate a series of “leakages” that would undermine the goal of increasing the global ferrochrome prices, including the exercise of countering power by Chinese purchasers against SA chrome exporters, the absorption of the additional cost by the government-supported Chinese ferrochrome and stainless steel industries to retain market share, and retaliatory measures by the Chinese government against South African ferrochrome exports.

The GA 2020 analysis predicts significant impacts on employment in the South African non-integrated chrome mines and no compensating increase in employment in the integrated mines. This, together with no guarantee that the downstream industry will benefit from an export tax, will therefore not necessarily achieve the intended outcome. GA 2020’s analysis also suggests that South Africa is not immune to competitive constraints and that the introduction of a 30% export tax would materially impact the competitive structure of global supply.

In contradiction, the 2021 TIPS issued a response to the GA 2020 report in which they argue that the export tax would be an incentive to local ore producers to sell their product locally and for the chrome ore to be beneficiated locally rather than incurring an export tax. Domestic ferrochrome producers would have a price advantage over ferrochrome importers which are reliant on SA ore. The objective of the tax would be to create the conditions to add more value to chrome ore in South Africa, and further develop South Africa’s mineral wealth.

Besides the two counter-arguments by TIPS and Genesis Analytics, there have been several other voices in the media raised for and against the export tax on chrome exports. SaveSA Smelters have

been very vocal in terms of the large number of jobs that are on the line if the government fails to implement the export tax (Mining Review, 2021).

The main argument is therefore to stop the exports of raw materials so that it can benefit local production through local development of the industry. In the past, South Africa was a leader in the supply of steel and they argue that South Africa can again be repositioned as a country of choice to international investors in the steel and stainless steel value chain. The export tax can be used as a mechanism to establish such a local value chain.

The main advantage of the PE vs the Computable General Equilibrium (CGE)⁸ approach, which analyses all markets simultaneously, is that relatively few data items are necessary. The only required data for a PE analysis is trade flows, the trade policy (e.g. tariffs), and values for some behavioural parameters (mainly elasticities). Another advantage is that it permits analysis at a relatively disaggregated level so that the decision-maker can focus on a particular product (e.g. a specific tariff line). Moreover, PE models look at the market for one product at one time, ignoring cross-product effects and ignoring general equilibrium effects (such as changes in wages, GDP, aggregate demand, etc.) and how those variables may, in turn, affect the markets for chrome ores. If the shifts in the markets in question are small concerning the overall economy, this is a somewhat reasonable simplification.

The next figure presents the likely impact of three simulation scenarios on South Africa’s exports of chrome ore to China. *It is evident from the figure that the impact will be significant for all three scenarios and ranges from potentially 32 to 65% less exports.* Recall that 61% of South Africa’s exports of chrome ore in 2020 was destined for China. The export levy will thus have a relatively large impact on total chrome exports as well.

Figure 12: Simulation results of changes in South Africa’s exports of chrome ores
(Source: Authors’ own calculations based on SMART simulations, 2021)

The impact of the likely increase in the local supply of chrome ores on the production of ferrochromium is depicted in column five of the next table. The proportional effect of this increase on South Africa’s total ferrochrome production is shown in the last column. Hence, an export levy of 20% on chrome ores will likely lead to an increase in local ferrochrome production of 5%, a levy of 30% to an increase of 80% and an export levy of 40% to an increase of 107%percent.

Table 6: Potential impact of the trade effects on the local chrome industry

⁸ In a general equilibrium setup, all markets are simultaneously modelled and interact with each other.

	Potential decrease in total chrome ore export value (% change)	Potential volumes of chrome ore available for the local market (Kt)	Potential increase in chrome ore volumes available for the local market (% change)	Potential increase in ferrochrome production (Kt)*	Potential increase in total ferrochrome production (% change)
Scenario 1-20%	-28%	3 982	18%	1 731	53%
Scenario 2-30%	-43%	5 995	26%	2 606	80%
Scenario 3 80%	-57%	8 023	35%	3 488	107%

Note: *chrome ore / ferro-chrome production ratio: 2.3 (Source: authors' own calculations based on data from SMART model, CRU and DMR, 2021)

Finally, Figure 14 breaks down the total trade effect of the three scenarios into *trade creation and trade diversion effects*. From the perspective of South Africa, these are both negative but from China's perspective, only the trade creation effect would be negative. It is evident that the negative trade creation, which reflects the effect of South African chrome exports becoming more expensive, contributes the most (73% of the total effect) to lower export levels in all three scenarios. Trade diversion, which reflects the effect of relative prices between South Africa and other chrome ore exporters to China, has a lower impact (28% of the total effect). The latter thus reflects the extra export flows to China from other suppliers because South Africa's exports have become more expensive as a result of the proposed export levy, but only true if the other countries have the material to supply.

Figure 13: Simulation results of the trade effects on South Africa's exports of chrome ore to China (Source: Authors' own calculations based on SMART simulations, 2021)

Some reflection on other countries to eliminate competition

Countries apply export restrictions as trade policy instruments, to either control or ban the exports of certain products. These restrictions can have a direct impact on the volume of the products' export, or indirectly by increasing the cost of exporting the product. Direct measures usually include export quotas, which restrict the volume of products exported, or export bans, which completely prohibit the exports of products (Estrades *et al.*, 2017). Indirect measures mostly take the form of export taxes. These can be explained as an *ad valorem* rate, a specific rate, or a combination of both and in many cases, a combination is used. Other export restrictions can include non-automatic export licenses, refusal of reimbursement of value-added-tax (VAT) on exports, or mandatory registration of exporting firms, among others.

In England, export taxes were applied to raw wool and hides as early as 1275 to 1660 to promote domestic industry processing. As wool-manufacturing capacity grew in England “so did the export duties, until England had the sufficient production capacity to process all the wool they produced” (Reinert, 2008: 80). Many have attributed the Tudor Plan as being the foundation of England’s industrial greatness. The Florentines were not able to compete with their English counterparts because the export duties on English raw wool ensured that raw wool was going to domestic producers for processing (Reinert, 2008: 80). Like Venice and Holland, and by the same methods, England had acquired the same triple rent situation: a strong industrial sector, a raw material monopoly (wool), and overseas trade.

Meanwhile, the United States was attempting to develop a smelter industry; however, they needed to import raw tin from the British Colonies. The larger export tax made this difficult for the US and eventually all the new smelters in the US were forced to shut down since the industry was not able to compete. According to the Governor of the Federated Malay States, the export tax had accomplished its intended objective. He stated that the export tax was exacted “*for the purpose of preventing the transfer of the smelting industry to the United States*” (James, 1924: 57).

Therefore, the implementation of an export restriction or export control measure, is greatly dependent on the sector itself, other local factors that contribute to the cost of exports, as well as the country’s position in the world market. However, as indicated earlier, in theory, countries that have market power in a certain product, may gain from implementing an export tax measure. This is the case of the Chrome Iron Ore sector in South Africa, from trade figures depicted in the previous sub-section, and it is possible that the implementation of such a tax in a sector where South Africa is a market leader, may have potential benefits.

The implementation of an export tax has had varied effects in several industries and countries around the world. Data from the World Bank in the table below indicates the % of export taxes in total tax revenue in several countries from 2000 to 2017. The data was sorted from the highest to lowest and the table shows the top 20 countries according to the contribution of export taxes to total tax revenue. South Africa is added for this report’s focus.

Table 7: Export taxes as % of total tax revenue: 2000 – 2017

Country	2000	2005	2010	2011	2012	2013	2014	2015	2016	2017

Source: World Bank (2021)

The table indicates that the top 5 countries that gain some advantage from export taxes as revenue, are the Solomon Islands, Russia (although there is a declining trend between 2010 and 2017), Kazakhstan, Cote d'Ivoire and Belarus (which has seen a drastic increase in export taxes as a % of tax revenue). South Africa, on the other hand, has only imposed export levies on unpolished diamonds, and some agricultural goods (Sandrey, 2014) and recently on the export of scrap metal. The data shows that some countries gain some revenue advantages from export taxes, and South Africa not really utilising this trade intervention despite being a resource-rich economy. If we calculate for 2020 the contribution of the mining sector to total merchandise exports (R767422 / R1394346), then this sector alone contributed 55% to our total merchandise exports (SAResbank, 2021)

Zimbabwe has the world's second-largest reserves of high-grade chromium ore after South Africa (12% of the global total). Z banned the exports of chrome ore in 2011 and removed the export restrictions in 2015. Z has banned exports of raw chrome ore with immediate effect this year and will ban exports of *chrome ore concentrate* from 2022 **to secure its ferrochrome industry**. Although the ban on chrome concentrates is yet to be effected (The Standard, 2022) it is reported the Chinese are currently producing chrome concentrates in Zimbabwe which finds its way outside the country. The export ban of chrome in Zimbabwe also emphasizes the rationale of an export tax for South Africa – **with a total of 22 smelters now operational and are shared among several foreign and local mining companies**. It was pointed out that unless chrome mining capacity is expanded, the smelting operations could face the challenge of insufficient feedstock. The balance of what is not consumed domestically by the ferrochrome industry, is exported to China (4% of China's chrome ore imports of roughly 14 million tonnes). The competitive price of Zimbabwe's ore – similar to that of Turkey, Albania, Iran and Pakistan) had gained it an increasing amount of interest from Chinese buyers recently. Briefly, the consequence was that Turkish chrome ore prices increased and the export ban increased prices further. Subsequently, production costs for Chinese smelters will be higher as well, according to ferrochrome producers in China. Market analysts believe that the FC sector could attract more foreign investment. China's Tsingshan Holding Group is developing a \$1 million composite project for a steel plant, an iron ore mine and a ferrochrome plant in Zimbabwe.

The South African National Treasury announced on 11 March 2020 a call for written comments on the proposal considering the taxes to alleviate pressure from unfair trade practices on domestic metals industries. Subsequently, South Africa's government announced in July 2020 that it is banning all exports of ferrous and non-ferrous scrap metal for two months to safeguard domestic supply while it considers measures to support the domestic industry (Murphy, 2020). The following figure illustrates the vast amount of ferrochrome scrap that is being sold by South African dealers -

The implementation of an export tax has had varied effects on several industries and countries around the globe. Overall, the results from the data analysis show that the implementation of an export tax can potentially result in a significant reduction in exports of chrome from South Africa to China. The analysis can however not simulate for how long that will be the case, and it is also not possible to establish from this analysis what effect a possible retaliation from China might have. The results must also be considered in conjunction with the desired policy goals. If the goals are to direct more chrome and ferrochrome to the domestic market for further production of value-added products, then an export tax can be one mechanism to create the desired effect, as the analysis clearly shows a significant potential reduction in exports to China.

For South Africa, it is a business case of rationalising the narrative of *successfully acquiring the “triple rent situation”*: A strong industrial sector, a raw material monopoly (chrome) and overseas trade.

An export tax can achieve the goal of decreasing the volumes of products exported to the foreign market, however to convert that into successful domestic downstream industries that produce value-added products, will not be dependent on the raising of an export tax alone. It is much more related to the ability of the country to sufficiently invest and develop such a downstream industry, which will require a set of inputs such as stable and affordable electricity, labour supply, technological developments and other infrastructure developments.

Overall, for an export tax to be successful, one can deduct the following criteria must be in place:

- An exporting country should have a significant level of market power.
- The exporter goods should have few real substitutes from other supplying countries
- An export tax can only really be used as an effective measure over the short to medium term, as the expansion of the local industry, or local beneficiation, will not only be dependent on the export tax alone but also on the supporting environment (including infrastructure, institutions, investment climate and labour supply)

7. Technology

The world’s latest and most effective technologies already exist in South Africa, and these are complemented by the best world-class technical skills and know-how, but their application is sub-optimal. Of the total estimated installed ferrochrome smelting capacity of more than 5 000 kt per year, 22% was unavailable in 2018 due to smelters being closed or mothballed (Table 8). A possible reason is a lack of competitiveness of the local ferrochrome industry due to high energy costs, international ferrochrome market prices and volumes, and little cooperation and coordination between chrome ore producers (especially UG2 miners) and the smelters.

Table 8: Ferrochrome smelting capacity and production in South Africa in 2018 (TIPS, 2021; Retief, 2021)

Smelter	Technology	Capacity (kt per annum)	Not operating (kt per annum)
Rustenburg	Open SAF-PSP ⁹	430	
Boshoek	Closed SAF-PSP	240	
Wonderkop	Open SAF-PSP	533	
Lydenburg	Premus	396	396
Lion	Premus	720

Middelburg Ferrochrome	Direct reduction / 2 x DC furnaces / 2 x Open SAF-PSP	471	
Tubatse Ferrochrome	Open SAF-PSP	435	
Tubatse Alloys	2 x Closed SAF-PSP / 2 x Open SAF	426	172
TC Smelter	Closed SAF-PSP	270	
Dikwena	Closed SAF-PSP	394	140
Mogale	2 x Closed DC / 2 x Open SAF	110	110
RBA	Brush	130	130
Total		5 090	1 102

⁹ SAF-PSP: submerged arc furnace plus a pelletisation and sintering plant

New smelting technologies already available in South Africa can enable the processing of a wider range of feedstock ores at lower energy costs. A further advantage is a reduced dependence on imported coke reductants, with local anthracite as a substitute. It is clear that, from a purely technical point of view, there is no reason why South Africa can become one of the major ferrochrome producers in the world.

8. Some Social Issues

The greatest threat to supply chain development through beneficiation is the rise of opportunistic entrepreneurs in the informal political economy, who operate beyond the reach of statutory prescriptions and the legal regime. Communities in peri-urban South Africa are rife with factors of instability that undermine families, local entrepreneurship, and economic development. The destruction often originates in policies with unintended consequences. As a comparative example, a reference could be made to the decline of the garment and textile sector of South Africa. While protectionism encourages inefficiency, the failure to design and implement policies that would promote a competitive industrial environment led to the near destruction of South Africa's textile industry through unfettered imports from strictly controlled political economies. Sustainable development needs to be enshrined in and emanate from policy directives that promote local economic development and institutionalise industrialisation value chains.

The composition of South Africa's trade with most parts of the world is characterised by the export of raw materials and the import of manufactured goods. In reality, South Africa is also exporting potential jobs *en masse*. In practice, South African manufacturers have to pay import parity prices to the mining companies, which causes our manufacturers to be uncompetitive. When this difficulty is added to the problem posed by cheap manufactured goods from China and India, South African manufacturing operates on a very uneven playing field, therefore the proposition of the export levy in this CFcVC space. As such, the ferrochrome industry and its value chain beneficiation present a window of opportunity to develop niche markets.

The export of raw ore has steadily risen over the past decade, and the multiplying benefits of value added to the value chain will develop a more conducive socio-economic environment through job creation, contributions to skills enhancement, diversification of the economy, and a move away from primary producer status towards manufacturing-based industrialisation and increasing foreign direct investment (as happened when Zimbabwe announced trade protection of its chrome resources). This will turn the comparative advantages of being resource-rich into a competitive advantage and enhance the creation of small and medium enterprises (Turok, 2013). President Ramaphosa's stance on industrialisation has been supported by some of his key ministers. Mineral Resources Minister Gwede Mantashe argued in his budget speech that "*beneficiation ... was adopted as government policy in 2011*", a reference to his own department's beneficiation strategy. In the introduction to South Africa's 10th iteration of the Industrial Policy Action Plan (IPAP), then Minister of Trade and Industry, Rob Davies, said, "*The key challenge to industrial policy is to incentivise investment in plant, technologies and skills that would have medium to long-term benefits to the economy.*"

Unless the South African mining industry can improve its cost competitiveness, even sharper declines in its fortunes could be ahead. Stakeholders in ferrochrome operations agree that there are "*many ingredients to running a proper ferrochrome industry — it's not just about the ore, but electricity, too, as the two biggest inputs*" (Interviewee Categories 5 and 7). McKinsey & Company (2019) research found that 47% of South African mining jobs, along with 42% of revenues, are in the vulnerable bottom quartile of global cost competitiveness.

The mining sector will be critical to accelerated growth in South Africa's broader economy as a key source of stimulus for other sectors of the economy, including infrastructure, energy, and transportation. A renewed mining industry can once again be a primary engine of growth, job creation, and development for South Africa. In the main, in South Africa, minerals have been extracted, subjected to some basic processing, and then exported as ores without a great deal of beneficiation or

fabrication. This limited process creates a large gap between mining and manufacturing, to the detriment of both sectors and the national economy. The value chain and linkages so necessary for the efficient and competitive production of finished goods have been seriously undermined. As Turok (2013) already pointed out years ago to parliament, a mineral resource endowment does not necessarily translate into manufacturing beneficiation. The isolation of ore mining from the total industrial value chain also has consequences for labour policy. Thousands of mining job losses caused displacement of these workers into other activities.

One of the serious escalating safety and security issues the last number of years is the direct consequence of the absence of the government and poor service delivery leave communities vulnerable to exploitation by strongmen and opportunistic political interests in the informal political economy. *Illegal mining* in South Africa occurs in the context of an informal political economy operative beyond the government's extractive and managerial regime. A 2018 report by the Global Initiative Against Transnational Organized Crime calculated the cost (lost sales, royalties, and taxes) to the Treasury to be approximately R15 billion annually. In most provinces of South Africa, illegal mining occurs without sanction and in the context of government corruption. So-called '*zama zamas*', called '*maiteke-teka's*' ('We try') in the CFcVC, are illegal miners, often heavily armed, who invade operating mines and attack security personnel with paramilitary capacity. These illegal mining activities have many undesired impacts on the mining environment, even leading to capital flight as investors disinvest in the unstable mining industry.

9. Conclusion And Recommendations

The macro-economic overview showed that there are major structural weaknesses in the South African economy, of which electricity generation and supply problems are the most important. South African business cycle phases show that the country has been in a downward phase since December 2013, i.e., for more than seven years. South Africa will not overcome current problems without renewed growth in investment. But, even though electricity generation is of concern, it is not the most important one for the Ferrochrome industry. The reason for switching off furnaces is China buying millions of tonnes of UG2 chrome ore at very low price levels. This is a great contributor to the detriment of the beneficiation industry.

Even though South Africa has a high level of revealed competitiveness, the country experienced a slowly declining trend over time for ferrochrome production, while chrome ore production is increasing. This means that the country's level of specialisation is now higher for raw materials than for processed products. This is problematic from an economic development perspective as the opposite would be more favourable.

One of the options that have been proposed for South Africa to regain its competitive position in the ferrochrome industry, is the implementation of an export tax on specific chrome ores. An export tax can only be beneficial in cases where the country has significant market power. Thus resource-rich countries may have the incentive to apply an optimal export tax rate that maximises welfare. If this increase in revenues exceeds the producer and deadweight losses, export taxes improve the national welfare of a large country.

Even though export control measures can have a positive effect on countries with market power, the question is whether it leads to increased downstream processing in the domestic market. The research shows that export taxes have had varied effects in different industries and countries around the world. In many instances, an export tax did not have the desired effect to increase downstream processing or value-added activities, as an export tax alone cannot drive such an effect. An export tax can achieve the goal of decreasing the volumes of products exported to the foreign market, but to gain in the domestic market the product retained domestically should be converted into a successful domestic downstream industry. This is reliant on the ability of the country to sufficiently invest and develop such a downstream industry, which will require a set of inputs such as stable and affordable electricity, stable institutions, labour supply, technological developments and other infrastructure developments.

South Africa failed to use the fact that it produced more than half of the gold on the planet, and was the dominant gold producer for more than a hundred years. South Africa's Industrial policy is missing the trend change of global best practices as outlined by the IMF (Chipfupa, 2019:7). The Asian Tigers are a good benchmark in this regard, because of the drive to reindustrialisation by government intervention (and not the lack of it). State intervention promotes the development of sophisticated export-oriented industrial sectors (the case of the chrome beneficiation argument). The ferrochrome under existential threat is a point in case here-it needs this "moonshot" approach that is not about import substitution nor just broad-based investment promotion. This moonshot industrial policy approach differs significantly from the traditional IMF and World Bank suggestions to developing economies. The reason is that the global markets are quite different since the financial crisis of 2008 (Chipfua,2019:7). According to moonshot, the mildly interventionist nature of government intervention should be calibrated to one of an activist government looking at reconnecting to areas that promise success going forward.

The risk is that if the identified issues are not addressed, South Africa will have lost its market power in chrome ore over the longer run, and be replaced by other suppliers, or China will likely implement other retaliatory measures to keep its stainless steel industry competitive. There is also the risk over the longer term that export restrictions will be recognised more formally in multilateral and regional trade agreement arenas, such as the WTO, with more stringent measures put in place to regulate the application of export restrictions to prevent countries from gaining unfair trade advantages using such measures.

From the research, it is clear that the proposed export taxation pathway will work if certain conditions are put in place and that an active PPP and political will be in place to operationalise the beneficiation - a glimpse of a fully-fledged stainless steel value chain? **Does this present a window of opportunity to address the narrative of the "resource curse" that seemingly is busily occurring in the chrome-ferrochrome industry?**

Sustainable Supply Chain Management Practices And Dynamic Capability Effects On Sme Performance In a Pandemic

Dr Shallone Munongo^{1,*}, Prof David Poee²

^{1,2} Department of Business Management, University of Johannesburg, Johannesburg, South Africa

Keywords

Covid-19; sustainable supply chain management practices; dynamic capability, SME performance

Abstract

Background: Small and medium enterprises (SMES) play a critical role towards economic development globally, more so in developing countries. However, the uncertainties from the current COVID-19 pandemic have led to widespread global supply chain disruptions, which in turn, have severely affected the SMEs' performance.

Motivation: The study is motivated by the dearth in empirical literature on sustainable supply chain management practices and dynamic capability effects on SMEs' performance in a disruptive environment from a developing country's perspective.

Aim: Premised on the Dynamic Capabilities Theory, our study investigates the impact of sustainable supply chain management practices and dynamic capability on SMEs' performance as measured by the triple bottom line indicators.

Methods: Determinants were identified from extant literature. The study utilised a quantitative research approach. A cross-sectional research survey collected data from 174 SMEs across the 10 Provinces in Zimbabwe. Structural equation modelling (SEM) was used to analyse the conceptual structural model.

Results: Results of the study indicate that sustainable supply chain management practices have a significant positive influence on SMEs' environmental, economic, social performance and dynamic capability. Furthermore, while dynamic capability is positively related to economic and environmental performance, it however has no effect on social outcomes; these require relationships to be established on a long-term basis. Conclusion: The study highlights the overwhelming need for SMEs to be aware and promptly implement of sustainable supply chain management practices if enterprises are to improve performance amid and post the Covid-19 induced supply chain disruptions. The research contributes to developing literature and assists SMEs and other stakeholders to design and implement sustainable supply chain management practices, create dynamic capability, monitor and evaluate their impact of such on business performance during and after a disruptive era.

1. Introduction

Small and medium enterprises (SMEs) are hailed as an effective means of promoting national, regional and global and economic development through employment creation, technological advancements, and poverty reduction (Mishal et al., 2019; Putra, 2016). The World Trade Organisation (WTO, 2016) reports that SMEs are the backbone of the world economy, accounting for 95% of firms across the globe, 60% of the world's total employment, 35% of the Gross Domestic Product (GDP) in developing countries and 50% in developed countries. Notwithstanding the importance of SMEs to the global economy, studies reveal that during severe crises, SMEs have a higher likelihood of closure as the subsequent socio-economic impacts severely weaken their operations and performance (Saturwa, Suharno and Ahmad, 2021; Mason & Harrison, 2015). The

Covid-19 pandemic for instance, has adversely affected the global economy and disrupted supply chains. Furthermore, similar to large corporations, SMEs are plagued by severe climate change, aggressive competition, trade and regional wars as well as general global unrests. These uncertainties have led to substantial disruptions in SMEs' operational efficiency, and performance owing to their inherent fragilities compared to their larger counterparts (Guan et al., 2020; Ivanov, 2020a; Ivanov and Dolgui, 2020a). Hence, an important question emerges; how can SME performance be enhanced amid and post the Covid-19 pandemic?

In response, recent literature has increasingly paid attention to the issue of sustainability (Raza et al., 2021; Joshi and Sharma, 2022; 2021a; Bui et al., 2021). As illustrated by triple bottom line (TBL) paradigm, a sustainable enterprise has to associate its operations to maintain profits, environmental and social performance (Sharma et al., 2022). Since disruptions occur abruptly, oftentimes without forewarning, firms require special know-how to recognize such disruptions, strategize and plan to develop and implement sustainable supply chain management practices (SSCMP) that proactively organise and reorganize assets to achieve sustainability (Dolgui and Ivanov, 2021; Baral et al., 2021; Chowdhury et al., 2021; Bodenheimer & Leidenberger, 2020). Prior studies indicate non-adherence to SSCMP leads to wrong decision making, which in turn negatively impacts on a firm's organisational productivity, customer satisfaction while decreasing shareholder value and overall organisational performance (Udofia et al., 2021; Bag et al., 2021c; Corrales-Estrada et al., 2021). Literature is replete with studies on the strong positive link between SSCMP and financial performance (Prasad et al., 2020; Amjad et al., 2017; Grenwatsch & Klendienst, 2017; Joshi & Sharma, 2022, Eccles, Ioannou & Sarafeim, 2014; Tipu and Fantazy, 2018). Other studies (Vijayan & Kamarulzaman, 2020; Hong et al., 2018) on the governance mechanisms for business performance further contend that the positive effects of SSCMP are significantly shown through an organization's dynamic capabilities; that is sources of a firm's competitive advantage which in turn enhance performance. Thus, the dynamic capacities of the firm can help it to build resilience and improve on performance outcome to survive against risk (Hernández-Linares et al., 2021; Kusriani and Maswadi, 2021; Lu et al., 2021; Prasad et al., 2015). Other studies submit that dynamic capabilities purposely alter, adjust, and reinstate organizational resources are a source of sustainable competitive advantage in a dynamic and highly competitive environment that is typically characterised unpredictable and rapid fluctuations (Teece, 1994; Teece et al., 2007; Ambrosini & Bowman, 2009; Kilubi & Rogers, 2018). Hence, it would be interesting to know whether the same holds true for our study.

While theoretical literature indicates the theoretical linkages between firm SSCMP environmental, social, and economic performances amid the Covid-19 pandemic, the studies are however embryonic (Joshi and Sharma, 2022; Chowdry et al., 2021; Iyengar et al., 2020; Bier et al., 2020; Kamble et al., 2020; Raza et al., 2021). Similarly, despite the high significance of dynamic capabilities to both theory and practice (Nath & Agrawal, 2020; Eikelenboom & de Jong, 2019; Ciccullo et al., 2018), currently, dynamic capabilities remain largely ignored, particularly in studies on SSCMP and firm performance. In response to the call for more in-depth research, we undertook this study to conceptualize further the SSCMP-dynamic capability-SME performance nexus. Our research is also motivated by the observation by the scarcity of research on the domain from developing countries as the majority of extant studies are from developed economies. The few studies on developing economies predominantly focus on Asia (Joshi & Sharma, 2022; He et al., 2020; Mani et al., 2020; Sabuj et al., 2021). Therefore, presently, little is known about the subject from an African perspective despite the undeniable importance of SMEs to African countries. Hence, to the best of our knowledge, this is one of emergent studies in Zimbabwe. The current study seeks to close the current research gap by answering the following research questions:

1. Which sustainable supply chain management practices are currently in use by SMEs in a developing economy amid the Covid-19 pandemic?
2. What is the link between SME sustainable supply chain management practices and dynamic capability?
3. How do SSCMP and dynamic capability influence SME performance?

The remainder of this paper is organized as follows. Section 2 provides the literature review. Section 3 describes the research methodology. The results are presented in Section 4 while Section 5 concludes the research.

2. Literature Review

SMEs in Zimbabwe

SMEs globally have been particularly vulnerable to the economic impacts of the Covid-19 pandemic due to their limited resources; they tend to have fewer assets, smaller cash reserves and lower levels of productivity (Saturwa et al., 2020). Research further reveals that SMEs that have been hardest hit by the COVID-19 as they operate predominantly from the retail, hospitality, food services, entertainment services, and construction industries (Albaz, Mansour, Rida, & Schubert, 2020; Sonobe et al., 2021). In all these challenges similar to other developing countries, Zimbabwean SMEs have not been spared. SMEs are critical to the country's economy as statistics from A FinScope survey indicate that they currently contribute more than 60% of the country's employment, GDP and the fiscal base (FinScope, 2012). The also shows that in Zimbabwe, there are 2.8 million adult SME owners with 3.5 million businesses, employing a total of 2.9 million people across all ages, excluding the business owners themselves. The sector therefore contributes significantly to employment with a total of 5.7 million of the 5.9 million adults in the country. Thus, almost all adults in Zimbabwe are involved in small business activities either as SME owners, managers or employees (Munongo and Chimwai, 2021).

Sustainable supply chain management practices

Sustainability is a concept which endeavours to safeguard the extensive expression of functioning of a company, its supply chains, and its society (Kottala, 2021:2). Literature on sustainable supply chain management and uncertainty has systematically grown over the past few years (Bentahar and Benzidia, 2018; Govindan et al., 2020, Joshi and Sharma, 2022). Interestingly, however, there is no consensus over the meaning of sustainable supply chain management (SSCM). The majority of the scientific work on SSCM refers to the or the triple bottom line (TBL) coined by Elkington (1997) where companies focus on three pillars of social or people, environmental and economic sustainability. This widely accepted definition builds on the Brundtland report from the World Commission on Environment and Development (WCED, 1987), wherein sustainability is a development that meets the need of present generations without compromising the needs of future generations. other studies many consider SSCM as supply chain management, the emphasis of which is to preserve stability relating to environment, economic and social activities to achieve further long-term sustainable growth (Ciccullo et al., 2018; Fahimnia et al., 2015). Sustainable supply chain management practices (SSCMP) as a result have been defined in different ways. For instance, according to Pagell and Wu (2009) in Raza et al (2021:2), they refer to "particular managerial activities relating to the supply chain that aim to make them genuinely sustainable". SSCMP include coordinating and fostering trustworthiness among supply chain partners; promoting sustainable organisational learning amid a Covid-19 pandemic; implementing sustainable organisational-wide strategic orientation; employee welfare programmes, supplier and customer relationship management; risk management; undertaking supply chain continuity management; and instituting active environmental awareness and management (Raza, 2021).

Dynamic capability

A firm's dynamic capability (DC) of the firm seeks to improve continuously through routine actions during uncertain business environments (Robertson et al., 2021; Nayal et al., 2021). Hence, the dynamic capability (DC) viewpoint focuses on special know-how, which fosters an organization's source of competitive advantage (Teece et al., 2007; Kähkönen et al., 2018; Sharma and Joshi, 2020a), implementing strategies for evolving novel capabilities which enhance long-term performance. Organizational dynamic capabilities stem from SSCMP (Joshi & Sharma, 2022; Chowdry et al., 2021) and include collaboration, technology adoption, and knowledge creation through strategic planning to restructure and stimulate awareness among supply chain stakeholders (Sharma et al., 2020a; Sharma and Joshi, 2019c; Teece, 2014). While scanty, recent studies have indicated a significant positive between SSCMP and DC; firms that adopt SSCMP create DC, which in turn leads to improved social-

economic and ecological performances during uncertainty (Tripathi, and Joshi, 2019; Queiroz et al., 2020). Interestingly, Joshi and Sharma (2022) and Klassen et al (2012) found that while DC amplifies both the ecological and profit performance of the firm, it has no effect on the social performance.

Firm performance

According to Gualandris et al. (2014:263) define firm performance as a “firm’s performance regarding environment and society”. Conversely, firm performance is conventionally defined as economic achievement measured by financial performance benchmarks standards such as the return on investment, profit, asset efficiency (Orlitzky et al., 2003). Studies (Haneburg, 2021; Joshi et al., 2020; Joshi and Sharma, 2022) indicated that firm performance in SSCM should attain both objectives of traditional measures of revenue and cost and highlighted the importance of comprehensively including environmental and social dimensions thereto, especially in the wake of Covid-19. Likewise, recent SSCM literature (Davis-Sramek et al., 2018; Ghadimi et al., 2019; Hong et al., 2018) affirm the need for organisation performance analysis beyond instrumental logic, where the sole focus is on economic and financial performance. Similarly, Sharma et al (2021c) contend that the true measure of firm performance in turbulent times is reflected in the triple bottom-line measures of performance, which is a relatively less studied area. Hence, this study pays attention to all three perspectives; people, economic and environmental.

Presently, literature is replete with studies on the strong positive link between SSCMP and financial performance (Prasad et al, 2020; Amjad et al., 2017; Grenwatsch & Klendienst, 2017; Joshi & Sharma, 2022, Eccles, Ioannou & Sarafeim, 2014; Tipu and Fantazy, 2018). Take to results section. Business enterprises in both developed and developing countries are increasingly paying attention to environmental initiatives in the sustainable supply chain (Esfahbodi, Zhang & Watson, 2016) because of their strategic importance in firm performance. Recent literature suggests a strong positive relationship between an environmentally friendly firm’s sustainable supply chain management practices (raising awareness, sourcing from “green suppliers”, using recyclable packaging, carbon emission reduction and tracking) and its environmental performance as measured by outcomes such as reduced solid and liquid waste reverse logistics, smarter production through innovative technology, greening packaging, sourcing of raw materials, waste management, greenhouse gas emission reduction, improvement in using clean energy sources and improving usage efficiency (Joshi & Sharma, 2022; Chowdry et al., 2021; Fritz, 2019; Hasan, 2013).

Studies establish that incorporating SSCMP such as active social inclusion and firm-level social responsibility plays a vital role in enhancing social performance. Finsterwalder and Kuppelwieser, (2020), Joshi and Sharma (2022) established that during disruptive turbulent times, an enterprise’s supply chain reconfiguration through corporate social responsibility (CSR) and employee friendly and wellness initiatives including increased awareness of health, equity, education, security, and bonded labour and corporate ethical practices have a strong positive link improved stakeholder awareness, increase employee commitment and motivation, which lead to increase productivity, sales and ultimately profits, communication, information transparency, and the organization’s goodwill. Furthermore, their study revealed that the social practices assist an enterprise to solve challenges associated with equilibrating resources due to disruption-induced shortages.

Theoretical framework

This study’s theoretical framework is premised on the dynamic capabilities theory.

Dynamic capabilities theory

The Dynamic Capabilities Theory (DCT) coined by Teece and Pisano (1994) emerged as “both an extension to and a reaction against the inability of the resource-based view (RBV)” (Bleady, Ali & Ibrahim, 2018:1) and explains how competitive advantage is achieved in rapidly changing environments. According to the theory, while the RBV recognizes the mechanisms that facilitate competitive advantage; resources that are simultaneously valuable, rare, imperfectly imitable and non-substitutable, (Bowman & Ambrosini, 2003), it fails to describe how these operate (Teece, Pisano & Shuen, 1997). In response, the DCT contends that in the global market place, successful firms are

characterised by timely and flexible responsiveness to market dynamics and rapid product innovation, effective coordination and redeploying internal and external competence (Teece et al., 1997:515). The term “dynamic” is defined in the DCT as “the capacity to renew competences so as to achieve congruence with the changing business environment; this is relevant in situations where time to market is critical and the nature of competition is difficult to determine”. On the other hand, capabilities are described as “the key role of strategic management in appropriately adapting, integrating and reconfiguring, internal and external organizational skills, resources, and functional competences to match the requirements of a changing environment” (Teece et al., 1997:515). Hence, a firm’s dynamic capability is its ability to attain competitive advantage. The approach takes into account three classes of factors that help explain where competitive advantages namely; processes, positions and paths. Processes comprise the way things are done in organizations and they have three roles; coordination, learning and reconfiguration (Teece et al., 1997:518). Positions define specific endowments of technology, intellectual property, complementary assets, customer base, and its external relations with suppliers and complementors (Teece et al., 1997:521). Paths refer to the strategic alternatives available to the firm, these are defined by path dependencies and technological opportunities (Teece et al., 1997:522). 1994, p. 552). As rivalry is inevitable in business, the DCT therefore implies that a firm’s ability to improve or develop new types of competences is essential in developing long-term competitive advantage. In essence, DCT tries adds to the RBV by simultaneously explaining the nature of a firm’s sustainable competitive advantage and intending to inform managerial practices (Teece et al., 1997:510). Its superiority over RBV is the inclusion of key variables and linkages that need to be manipulated to create, protect, and leverage intangible assets so as to achieve superior performance and avoid bankruptcy (El Gizawi, 2014).

Grounded on the DCT, the present study posits that an SME’s ability to quickly and effectively respond to the Covid-19 induced supply chain disruptions through various sustainable supply chain management practices such as coordinating and fostering trustworthiness among supply chain partners; promoting sustainable organisational learning amid a Covid-19 pandemic; implementing sustainable organisational-wide strategic orientation; risk management; undertaking supply chain continuity management; and instituting active environmental management not only yield enhanced performance (economic, environmental and social), it is positively linked to the creation of an SMEs “know how”, the dynamic capability in the form of specialist and “real-time” knowledge, market orientation and innovation through technology adoption. The DC in turn has a positive effect on SME performance.

Conceptual model

The conceptual model proposed for the study is depicted in Figure 1 below.

Figure1: Conceptual model

Hypotheses

Based on the grounding theories and literature review, the following hypotheses were postulated to test the inter-relationships between SSCMP, dynamic capabilities and SME performance.

SSCMP and SME performance

H1_a: SSCMP positively influence SME economic performance.

H1_b: SSCMP positively influence SME environmental performance.

H1_c: SSCMP positively influence SME people performance.

SSCMP and SME dynamic capability

H2: SSCMP have a positive impact on SME dynamic capability.

Dynamic capability and SME performance

H3_a: Dynamic capability positively influences SME economic performance.

H3_b: Dynamic capability positively influences SME environmental performance.

H3_c: Dynamic capability has no influence on SME people performance.

3. Methodology

3.1 The data

The exploratory study employed a quantitative approach. To analyse the proposed conceptual model, the primary data were collected through a cross-sectional survey using an online questionnaire using Google Forms. Ideally, the population to be studied should comprise all SMEs in Zimbabwe. However, time and cost constraints together with privacy concerns made it difficult to incorporate all SMEs. Hence, survey respondents were selected through purposive sampling, a type of non-probability sampling method wherein strategic choices about whom to under study are consistent with the research objectives (Palys, 2008). The targeted 250 respondents were SME owners or managers from the 10 provinces in Zimbabwe whose business were consistent with the Small and Medium Enterprise Development Corporation (SMEDCO 2010:3) definition of SMEs in Zimbabwe, that 'a business employing no more than 100 employees and generating a maximum annual revenue of USD830 000'. The respondent SMEs spanned across six industrial domains; food, logistics, agriculture, mining, tourism and hospitality, information and communications technology. The study utilised the online questionnaire owing to cost effectiveness, flexibility, speed, accuracy, the ability to incorporate a large sample size (Evans & Mathur, 2005), and the need to observe social distancing amid the Covid-19 pandemic.

3.2 Study variables

Our study investigated the effects of sustainable supply chain management practices and dynamic capability on SME performance in a pandemic. To ensure both validity and reliability, the items used to operationalise the individual constructs were adapted from closely related literature (Joshi & Sharma, 2022; Raza et al., 2021; Hong et al., 2018). The online questionnaire comprised four sections. First was the data of the individual respondent's profile and SME characteristics. The second section focused on SSCMP (coordinating and fostering trustworthiness among supply chain partners; promoting sustainable organisational learning amid a Covid-19 pandemic; implementing sustainable organisational-wide strategic orientation; risk management; undertaking supply chain continuity management; and instituting active environmental management) while the third covered the SMEs' dynamic capabilities (knowledge, market orientation, innovation through technology adoption). The last section covered the impact of SSCMP on the environmental, people, and economic (financial) performance of the company. The survey instrument was validated for content by seeking expert opinions on areas of ambiguity through a pre-test and immediately effecting recommended amendments. Thereafter, the corrected questionnaire was piloted on 25 randomly selected respondents who complied with the study's inclusion criteria before final use in the online survey. All the ethical requirements were observed. Informed consent was sought from all the potential respondents. To encourage openness, we provided with assurance and reassurance of confidentiality of responses. The responses are collected using a five-point Likert scale was used for the majority of the questions in sections 2-4, with responses ranging from 1 = 'Strongly Disagree' to 'Agree' to 5 = 'Strongly Agree'. A total of 187 responses were obtained from purposive sampling, and after elimination of incomplete responses, 174 cases (93%) were usable for analysis in the study.

4. Data analysis and results

4.1 Descriptive statistics

Table 1 below shows the descriptive statistics of the study.

Table 1: Descriptive Statistics

Variable		Frequency	Percent (%)
Gender	Male	114	66
	Female	60	34
Age	18-25 years	9	5.20
	26-30 years	17	9.80
	31-35 years	22	12.64
	36-40 years	39	22.41
	41-45 years	63	36.21
	46-50 years	18	10.34
	51 years+	6	3.40
Education	Primary	6	3.40
	Secondary	61	35.05
	Tertiary: Technical College	40	23.00
	Tertiary: Undergraduate	48	25.60
	Tertiary: Postgraduate	19	10.92
SME Age	Less than 1 year	13	7.47
	3-5 years	35	20.11
	6-10 years	56	32.18
	11-15 years	43	24.71
	16 years+	27	15.52
Employees	0 to <10	96	55.17
	10 to <25	73	41.93
	25 to < 100	5	2.90
Revenue last 12 months (USD)	0 to < 10 000	61	35.05
	10 000 to < 20 000	23	13.22
	20 000 to < 50 000	70	40.23
	50 000 to < 100 000	11	6.32
	100 000 to 830 000	9	5.17
SME's Business Sector	Food	23	13.22
	Logistics	14	8.04
	Agriculture	18	10.34
	Tourism & Hospitality	39	22.41
	ICT	56	32.18
	Mining	24	13.79

Table 1 shows that 66% (114) of the respondents were male, the highest proportion (36.21%) of SME owners/managers were from the 41-45 years' category while 35.05% (61) had completed secondary education. A total of 32.18% (56) of the SMEs had been operational for 6-10 years, 55.17% (96) had between 10 to less than 25 employees, 40.23% (70) had generated an annual income of between USD20 000 and USD 50 000 over the past year, while only 5.17% (9) earned USD 100 000 up to the maximum SME definition threshold of USD 830 000. Furthermore, the descriptive statistics revealed that the respondent SMEs were from the food, logistics, agriculture, information and communications technology (ICT), mining and tourism and hospitality industries.

4.2 Data analysis

Consistent with Kumar (2018), Raza et al. (2021) and Joshi and Sharma (2022) the structural equation modelling was preferred over traditional statistical techniques as the study involved validation of multi-relation structural model. Hence, the partial least squares structural equation modelling (PLS-

SEM) with SmartPLS 3.2.9 software was used to analyse the structural relationship in SEM. The PLS-SEM was selected owing to its efficient in measuring the strength of structural and complex relationships between model constructs and in examining the theoretical soundness of relationships between variables (Chin et al., 2003). A step-by-step analysis was undertaken by first checking for validity and robustness of the planned measurement model. Thereafter, we established the model's goodness of model fit, and lastly, tested the hypotheses of the proposed structural model in line with Hair Jr et al (2016).

Measurement model

Confirmatory factor analysis (CFA) was undertaken to using Amos Version 27.0 and the measurement model was tested for latent and reflective variables to ensure the validity and reliability of the constructs. Factor loadings, composite reliability (CR), average variance extracted (AVE) were used to evaluate construct validity as suggested by Hair Jr et al (2017). The Cronbach's alpha (α) measurement was employed to ensure reliability of each construct; the values in Table 2 below are larger than 0.7, ensuring the internal consistency of each construct (Taber, 2018). In addition, the convergent validities of each construct were also computed. There are three requirements that should be considered when measuring the convergent validity: 1) composite reliability (CR) of each construct had a value of at least 0.7; 2) average variance extracted (AVE) which should have a value of at least 0.5; and 3) standardized factor loading has statistical significance of at least 0.5 (Awang, 2015). Table 2 below indicates that all three conditions for convergent validity were met; the CR values ranged between 0.722 and 0.923; for the AVE and standardized factor loading, all constructs had values above the threshold of 0.50. Three items (Coord_Trust3, SCRMgt2, Pollution3) from various constructs with loadings below 0.50 were deleted in order to improve construct reliability.

Table 2: Confirmatory factor analysis

Construct	Items	Standard Loading	CR	AVE	Cronbach's Alpha
SSCMP			0.891	0.653	0.816
	Coord_Trust1	0.811	-	-	-

	EmpPersp1	0.625	-	-	-
	EmpPersp2	0.699	-	-	-
	EmpPersp3	0.707	-	-	-
	EntPersp1	0.813	-	-	-
	EntPersp2	0.639	-	-	-

Discriminant validity

Discriminant validity measures the degree of distinctness of each construct, and exists when ‘each measurement item correlates weakly with all other constructs except for the one to which it is theoretically associated’ (Gefen and Starub, 2005:92). The study examined discriminant validity by using the widely accepted benchmark by Fornell and Larckers (1981). As indicated in Table 3 below, all the other cross-correlations between the constructs in the model were less than the square root of its AVE, hence, indicating acceptable discriminant validity and the study proceeded to further analysis.

Table 3: The correlation coefficient and average variance extracted

	SSCMP	DC	EcoPerf	EnvPerf	PeoPerf
SSCMP	0.808	-	-	-	-
Dynamic Capability (DC)	0.462	0.786	-	-	-
Environmental Performance	0.417	0.330	0.820	-	-
Economic Performance	0.394	0.285	0.394	0.831	-
People performance	0.411	0.609	0.401	0.217	0.817

Note: Matrix diagonals in bold show the square root of average variance extracted (AVE) while the others indicate inter-construct correlations.

Goodness of fit

The goodness of fit shows how well a model fits the data. The following are the indications of the goodness-of-fit indices for the study. The Chi-square/degree of freedom (CMIN/df) = 1.83 indicates an acceptable fit since it is less than 3 (Hair et al., 2010) ; Goodness-of-fit index (GFI) = 0.91, it must be greater than or equal to 0.90 (Marsh et al., 2020); Comparative fit index (CFI) = 0.937, it must be greater than or equal to 0.90 (Hu & Bentler, 1999); Tucker—Lewis index (TLI) = 0.915 and must should be greater than or equal to 0.90 (Hox et al., 2017); while the root mean residual (RMR) = Root mean square error of approximation (RMSEA) = 0.051 and the root mean square error of approximation (RMSEA) were , both below the 0.08 benchmark (0.051 and 0.053 respectively) suggested by Meyers et al. (2005). Therefore, the above findings suggest good model fit and the study proceeded to hypothesis testing.

Hypotheses assessment

The results of the hypotheses are shown below in Table 4. The R^2 value is 0.714, suggesting that 71.4% of the variance in SME performance is attributable to SSCMP and dynamic capability. All hypotheses are found to be statistically significant and supported. While SSCMP positively influence SME performance, they are most significantly associated with an increase in people performance, H_{1c} ($\beta = 0.759$, $p < 0.05$), followed by environmental performance, H_{1b} ($\beta = 0.693$, $p < 0.05$) and economic performance, H_{1a} ($\beta = 0.519$, $p < 0.05$). These results corroborate the findings by (Finsterwalder and Kuppelwieser, 2020; Chowdry et al., 2021; Fritz, 2019; Prasad et al, 2020; Joshi & Sharma, 2022, Eccles, Ioannou & Sarafeim, 2014; Tipu and Fantazy, 2018).

The positive and significant association between SSCMP and DC, H_2 ($\beta = 0.782$, $p < 0.05$) confirms corroborate literature (Joshi & Sharma, 2022; Chowdry et al., 2021, Teece et al., 2014). Regarding the significant positive influence of DC on economic performance, H_{3a} ($\beta = 0.673$, $p < 0.05$) and environmental performance H_{3b} ($\beta = 0.511$, $p < 0.05$), our study affirms prior studies by Tripathi, and Joshi (2019); and Queiroz et al 2020) who determined that DC has significant positive importance in increasing economic and ecological performances during uncertainty. Furthermore, our study shows no significant association between DC and people performance H_{3b} . This finding affirms results from Klassen et al (2012) and Joshi and Sharma (2022) who concluded that since social capabilities take time to build up, the short-term effects of DC is therefore not explicitly evident in the people performance dimension.

Table 4: Hypotheses and results

Hypothesis	Predicted relationships	Standard path	t	P	Hypothesis test decision
H_{1a}	SSCMP → EcoPerf	0.519	13.116	0.02	Supported
H_{1b}	SSCMP → EnvPerf	0.693		0.00	Supported
H_{1c}	SSCMP → PeoPerf	0.759	9.855	0.03	Supported
H_2	SSCM → DC	0.782	8.681	0.00	Supported
H_{3a}	DC → EcoPerf	0.673	11.592	0.01	Supported
H_{3b}	DC → EnvPerf	0.511	10.744	0.04	Supported
H_{3b}	DC → PeoPerf	0.408	7.293	0.08	Supported

5. Conclusion

The objective of the study was to determine the effects of sustainable supply chain management practices and dynamic capability on SME performance in a developing country during and post the Covid-19 pandemic. The combined effect of SSCMP and DC in managing disruptions to enhance SME performance has received scarce attention, with literature indicating that there is a dearth of research focused on all three perspectives of the TBL concept. The study provides a critical understanding of how SSCMP currently used by SMEs create dynamic capability, and in turn, how these two aforementioned factors influence SME performance grounded on the DCT. From the study, we conclude that SSCM practices have considerable effect on the dynamic capability, and ultimately

on SME performance. As hypothesised, this study found that SSCMP positively and significantly influence SME performance as measured from three perspectives; economic, environment and people. Hence, continuous and committed use of SSCMP such as sustainable coordination and trustworthiness among supply chain partners, learning amidst a covid-19 situation, strategic orientation, data-informed supply chains risk management, supply chain continuity contingencies, environmental 'greening' awareness and auditing policies and strategies enhance SME financial, environmental and social outcomes. Also, the study established that dynamic capability (knowledge, market orientation, innovation and reconstruction) is positively and significantly related to SSCMP, and in turn, the former has a significant positive influence on SME environmental and economic performance.

While still early, the study indicates that increased environment protection awareness, government strict policies through the Environmental Management Agency (EMA) and other stakeholders have realigned SME to adopt environment-friendly measures. Subsequently, such SSCMP efforts have a significant positive effect on how the SMEs coordinate with their supply chain partners to have a greener supply chain with a regard for effluent emissions, smart technology and efficient energy consumptions. Likewise, consistent with government policies and in a bid to advance their public image, SMEs now actively involved corporate social responsibility initiatives. Furthermore, the SMEs are now targeting to implement SSCMP that are employee friendly to drive people's performance. This study focuses on a contemporary global discussion on firm sustainability amid the Covid-19 pandemic; it responds to the need for theory development and empirical work on firstly SMEs, secondly from developing countries, and thirdly from Africa. Furthermore, this study revealed that while SMEs are keen to improve their performance, their current SSCMP are however resource constrained (monetary, knowledge, time) due to the effects of the Covid-19 pandemic. Our study is also valuable in providing guidance to Zimbabwean policymakers, researchers, SME owners/managers, and other relevant stakeholders in the implementation of sustainable supply chain management practices and to increase their performance given their importance to the economy.

Several implications are derived from our study. First, to enable sustainable coordination and trustworthiness among supply chain partners, it is essential for SME owners/manager quickly and aptly manage Covid-19 induced supply chain disruptions caused through stakeholder involvement and implementation of disaster communication strategies. Identification of suitable communication resources by SMEs to interact with focal firms and other partners for flawless real-time information, knowledge, and exchange of strategic plans related to supply chain decisions. Furthermore, SMEs can initiate Collaborative innovations and co-creation for 'customized' value-added products to fulfil the changing demand during emergencies raised by covid-19. Second, regarding sustainable learning management practices, amidst a Covid-19 state, SMEs need to develop themselves as a sustainable learning organisations, continuously disseminate the knowledge to their partners to enhance coordination in supply chain activities by actively adopting digital technologies. To this end, SME owner/managers could deploy of industrial innovations and business model transformation, which in turn, improve performance a dynamic business environment. Furthermore, SMEs should reinvent, invest and co-create their enablers to.

Third, looking at strategic enterprise orientation, for SMEs aptly create a balance between sustainability and performance during uncertainty, they should develop strategic thinking skills amongst decision-makers. This will assist businesses to sustain continuous improvement in the triple bottom line performance. Fourth, it is also necessary for SME owners/mangers to be flexible enough to experiment with various novel ways of sustaining the supply chains, forecasting and mitigation measures that are emerging on the market. To this end, in undertaking reconstruction practices, SMEs need to consider a variety of methods such as optimization, network analysis which during the Covid-19 pandemic are effective in assessing viability of existing supply chains, restructuring and reconfiguring the same for improved performance. Fifth, given the increasingly amplified concern on 'greening supply chains', SMEs need to pay more attention and invest in alternative energy sources, smart operations that promote the reduction of greenhouse gas emissions through 4IR technologies that improve energy efficiency and allow preservation of the natural environment for the future generations. In addition, there is an overwhelming need for government to create a permissive

operating environment through raising sustainable business awareness, offering tax holidays and smart energy subsidies to SMEs that undertake SSCMP for improved performance, and distinct SME environmental awareness and sustainability support programmes.

Whilst this study contributes to the nascent literature on the SSCMP-dynamic capability-SME performance nexus from a developing country's perspective, it is not without its limitations. Due to resource constraints, the results of the study cannot be generalised to other countries as it was confined to Zimbabwe and the use of a small sample size and non-probability sampling procedure. Also, the use of cross-sectional data means that we only managed to collect and analyse survey data from only at a single point in time, without a nuanced trend analysis to understand the long-term impacts of SSCMP and dynamic capability on the SMEs' economic, environmental and people performance. It is recommended that future studies replicate the in other countries, possibly undertake cross-country comparative analyses, incorporate mediating effects and employ probability sampling method to ensure increased participation by SMEs from all the country's provinces. In addition, future studies can also carry out a longitudinal survey that captures the SSCMP-dynamic capability-SME performance linkages for more rigorous findings, which, in turn, would be more effective for all stakeholders in implementing dynamic policy changes over the long term given the importance of SMEs in developing economies.

COVID19 RESEARCH

Social Entrepreneurial Organisations' Responsiveness To Environmental Disruptions During The Covid-19 Pandemic: a Multiple Case Study

Adelaid Margaret Sheik¹

¹ University of Johannesburg, Johannesburg, South Africa

Keywords

Social entrepreneurial organisations; dual mission; agility; adaptive leadership; disruptive economic environment.

Abstract

Social entrepreneurial organisations have been acknowledged for balancing dual social and financial objectives in a less than enabling economic environment. However, in addition to the existing challenges of balancing the dual mission within the current business climate, Covid-19 added a unique complexity, negatively affecting this environment at a macro-level. This paper reports on a section of a study that focused on social entrepreneurial organisational effectiveness in South Africa. This study evaluates how social entrepreneurial organisations are able to respond to a disruptive economic environment, with the sole motivation of keeping the dual mission intact. Utilising a multiple case study research design, including five social entrepreneurial organisations selected through purposive criteria. The qualitative research style included semi-structured interviews with the organisational leader, employees, stakeholders, and beneficiaries. A thematic analysis approach was applied to analyse the various cases. The findings point to a few organisations' abilities to apply suitable responses and others' continual struggle to maintain the delicate balance of maintaining the dual mission as their primary intent while trying to survive external environmental disruptions during the pandemic. A deeper understanding of the unique nature of dual missions and the importance of agility and adaptability during turbulent times is investigated. The paper concludes with recommendations and practical applications for social entrepreneurial organisations in a South African context.

1. Introduction

Globally, organisations commonly work dynamically through ever-changing environmental uncertainties and socio-economic disruptions (Žitkienė & Deksnys, 2018; Singh, Sharma, Hill & Schnackenberg, 2013). Likewise, social entrepreneurial organisations have not escaped the pressure of being exposed to the current disruptive economic environment (Perera, 2021; Bacq & Lumpkin, 2020; Weaver, 2020), influenced by the Covid-19 pandemic. Social entrepreneurial organisations face a complex balancing act in managing their dual mission, with a quest to be financially stable while doing social good (Siebold, Günzel-Jensen & Müller, 2019; Reiser, 2010). However, the onset of the Covid-19 pandemic added unforeseen complexities to the existing challenges affecting social entrepreneurial organisations (Chirisa, Mutambisi, Chivenge, Mabas, Matamanda & Ncube, 2022; Odeku, 2021).

The Covid-19 pandemic created tumultuous times and major social challenges due to the traumatic nature of the event. The intensity of the pandemic introduced new ways of living (Alon et al., 2020) and unusual practices of social distancing, wearing masks and limited physical contact with other individuals (Kraus et al., 2020). The unexpected nature and sudden arrival of the Covid-19 pandemic created a great deal of uncertainty about how to manage its effects and negative impact. However, Covid-19 was not an isolated occurrence and has had a traumatic effect on society. The virus presented as a global threat to the physical well-being of individuals (World Health Organisation, 2020), resulted in a downward turn of multiple economies globally (Meahjohn & Persad, 2020; Khambule, 2020), and the crises redefined the way societal needs had to be met (Ratten, 2020). The

¹ E-mail address:adelaides@uj.ac.za

Covid-19 pandemic was disruptive, and finding innovative ways to manage the crisis was uncertain. The significant impact on the environment and society was evident, recognising the importance of incorporating a social component to entrepreneurship (Bacq et al., 2020). Social entrepreneurship addresses social challenges and aims to meet societal needs.

The purpose of this paper was to discuss the ways social entrepreneurial organisations managed disruptions created by the pandemic. A multiple-case exploratory study was conducted to understand the challenges five purposively selected social enterprises faced during the pandemic. Furthermore, the paper explored the adaptive approaches that were taken to mitigate the pandemic's challenges on the social entrepreneurial organisations in the multiple case study. The next section explains the problem investigated in this study.

2. Problem Investigated

Reports indicate that the Covid-19 pandemic exacerbated existing socio-economic challenges in developing countries like South Africa (United Nations Development Programme, 2020), particularly impacting the most vulnerable communities. There is significant evidence of strained health facilities, a downward turn in economic performance, limited resources in rural parts of the country, and inadequate living space (Ozili, 2020). Arguably, in a developing country like South Africa, social entrepreneurial organisations face several local challenges in addition to the current environmental uncertainties and the Covid-19 pandemic (Khambule, 2020). Therefore, this study sought to examine how social entrepreneurial organisations in a South African setting were able to adapt to environmental disruptions during the Covid-19 pandemic period while avoiding mission drift.

3. Research Question and Objectives

Research question: How did social entrepreneurial organisations respond to environmental disruptions during the Covid-19 pandemic while attempting to maintain the dual mission?

The primary research objective was to investigate social entrepreneurial organisations' responsiveness to local environmental disruptions during the Covid-19 pandemic.

Furthermore, two secondary objectives were considered in support of the primary objective, namely:

- to explore what challenges social entrepreneurial organisations encountered during the Covid-19 pandemic, and
- to identify how social entrepreneurial organisations responded to the challenges with the aim of retaining the dual mission.

4. Literature Review

This section will cover management principles that deal with challenging and disruptive business environments. First, adaptive leadership is discussed in relation to organisational adaptability. Secondly, followed by a discussion on the importance of organisational agility and responsiveness to disruptive environments as it relates to social entrepreneurial organisations follows.

4.1 Adaptive Leadership and Organisational Adaptability

Adaptability is an organisation's response to environmental change or disruptions. Adaptability can be defined as an organisation's ability to recognise and make the most of emerging market and technological opportunities (Chakravarthy, 1992) involving changes in an organisation's strategic position (Oktemgil & Greenley, 1997). Recent empirical evidence suggests that adaptive ability is based on competitive advantage, developing new products, and commercialisation (Hurley & Hult, 1998). Ultimately, an organisation is in a state of adaptation when it aims to achieve a fit with the changing environment (Tuominen, Rajala & Möller, 2004). The organisation goes through an adaptive process of realigning with the environment utilising available human, informational, and technological resources to achieve a feasible outcome.

Organisational realignment to a changing environment forms part of strategic development and requires the direction of adaptive leadership. Adaptation can be spontaneous or intentional and be implemented in response to or in anticipation of changes in environments (Bodlaj, Coenders, &

Zabkar, 2012). Adaptive leadership involves changing individual behaviours in suitable ways as the circumstances changes (Yukl and Mahsud, 2010). Individual or adaptive leadership is not sufficient for the spontaneous transmission to organisational adaptability. Organisational adaptability is about setting expectations for the individual and the organisation to realign with the dynamic and disruptive environment and mobilise the organisational team to overcome challenges and improve the organisation (Heifetz, Grashow & Linsky, 2009). An adaptable organisation is able to both expect and react to changes in the environment (Bodlaj, & Čater, 2019). Creating an organisation's capacity for adaptability allows the organisation to convert the culture by developing processes and actions that foster both proactive and reactive approaches during implementation. Adaptive organisations are agile and prompt in responding to changing environments.

4.2 Organisational Agility

Organisational agility is described as an organisation's ability to proactively respond, survive and progress or adapt to the uncertainty of environmental changes (Bessant, Knowles, Francis & Meredith, 2001; Dove, 1999). One of the essential requirements for organisational agility is a fast-paced response to change in complex turbulent environments (Darvishmotevali, Altinay & Köseoglu, 2020; Govuzela & Mafini, 2019; Sharifi & Zhang, 2001). Agility also implies an organisation's ability to maintain high performance, responsiveness and customer satisfaction (Yusuf, Sarhadi & Gunasekaran, 1999). However, this kind of responsiveness often requires flexible organisational leadership (Nadkarni & Hermann, 2010).

An organisational leader must manage and direct resources to attain strategic objectives (Mathew, Esowe, Udo & Ajagbe, 2016), particularly during turbulent periods. As reported in a McKinsey and Company (2021) survey article "*The impact of agility: How to shape your organization to compete*", instead of an organisation waiting for agility to happen from the bottom up (waiting for employees to initiate), organisational leaders need to take the lead. Therefore, organisational leadership plays an essential role in realigning the organisation to dynamic environmental changes, making effective strategic decisions (Akkaya & Tabak, 2020), and navigating through turbulent environments (Wageeh, 2016).

In contrast to the emphasis on leadership and organisational strategy to manage agile organisations, Bundtzen and Hinrichs (2021) point to the link between organisational agility and the VUCA elements. Their conceptual paper designed a new corporate agility model that linked the four elements (volatility, uncertainty, complexity, and ambiguity) necessitating organisational agility in response to disruptive periods. The result of their research is a model that defines distinct enablers of agility. Conversely, leadership and strategy are not incorporated as elements but rather seen as conditions secondary to the model's iterative learning approach (Bundtzen & Hinrichs, 2021).

Subsequently, attaining the organisational mission in a social entrepreneurial organisation is considered a primary focus and is associated with organisational success. Organisational success is described as the organisation's ability to attain its objectives over an extended period through growth, innovation and survival (Whetten, 1987). Furthermore, a study conducted at Menoufia University Hospitals in Egypt proved there is a positive and significant relationship between organisational agility and organisational success. Nafei (2016) also states that organisational leaders should place the focus regarding organisational agility on certain organisational factors, namely (a) sensing agility – the ability to scrutinise and monitor changes in customer preferences and trends among new competitors in the surrounding environment, including technological changes (Park, 2011); (b) decision-making agility – the ability to collate relevant information, identify opportunities and threats, interpret the information based on current events, efficiently coordinate available resources and be decisive about planning the next steps to circumvent disruptions to the organisation (Houghton, El Sawy, Gray, Donegan & Joshi, 2008); and (c) acting agility – taking action to coordinate organisational tasks and modifying business processes based on disruptive changes in the surrounding environment (Eisenhardt & Martin, 2000). Organisational agility thus seems to be activated during turbulent times, particularly for social entrepreneurial organisations attempting to balance a dual mission.

4.3 Social Entrepreneurial Organisations with a Dual Mission

Social entrepreneurial organisations are complex due to their dual mission that primarily focuses on meeting beneficiary needs and finding creative ways of ensuring the organisation's continued financial stability and sustainability (Lee, 2020). Furthermore, social entrepreneurial organisations have a social or environmental mission, viewed as their primary purpose, with the objective of having a significant developmental impact on local communities (Esposito, Brescia, Fantauzzi & Frondizi, 2021; Secinaro, Corvo, Brescia & Iannaci, 2019; Navarrete Moreno, 2017; Seelos & Mair, 2009). Mission drift occurs when the enterprise concentrates on one aspect of its mission at the expense of another, resulting in the intent of the social mission being weakened (Battilana, Besharov & Mitzineck, 2017; Micheline & Fiorentino, 2012). Thus, the social mission primarily drives strategic decisions in social entrepreneurial organisations.

In some countries, social entrepreneurial organisations are known as the Social and Solidarity Economy (ILO, 2020; Utting, 2018). Examples of the type of legal entities included in the social economy are a non-profit company with an income-generation initiative, a cooperative, a social enterprise, or even a hybrid social business. Therefore, a business that combines for-profit and non-profit legal entities is known as a hybrid social business (Claeyé, 2017). Moreover, a socially orientated organisation with an income-generating component ensures organisational stability, and a socially orientated organisation that strategically includes an entrepreneurial emphasis improves its chances of sustainability (Diochon & Anderson, 2009).

Viewed from a South African context, social entrepreneurial organisations currently deal with various environmental uncertainties and setbacks. A few highlighted challenges are the absence of a social economy policy, an unclear legal framework governing local social entrepreneurial organisations (Littlewood & Holt, 2015; Claeyé, 2017), and a less than supportive business ecosystem. In addition, there is donor fatigue (Moboya, 2017), the emergence of technological advances creates new social challenges (Karajz, 2021), and the complexity of the Covid-19 pandemic impacts the social economy sector. Ultimately, the ability to respond to challenging and disruptive environments may depend on the social entrepreneurial organisation's responsiveness.

However, the approach adopted by social entrepreneurial organisations to maintain the dual mission during unpredictable and turbulent times, as prompted by a pandemic such as Covid-19, is not yet apparent in the literature. For this study, the researcher thus considered social entrepreneurial organisations in a South African setting.

5. Research Methodology

A qualitative research method was applied (Creswell, 2013; Patton, 2002) using an exploratory approach (Saunders, Lewis & Thornhill, 2012). The researcher explored each case study, which promoted a deeper investigation into each of the social entrepreneurial organisations. Furthermore, the investigation determined the phenomenon of agility in a specific context, namely that of social entrepreneurial organisations in a developing country like South Africa.

5.1 Research Design and Sampling

A multiple case study (Yin, 2013) research design was used, including five social entrepreneurial organisations as the unit of analysis (Marshall & Rossman, 2011). The benefit of a multiple case study is that it allows for a deeper empirical investigation of each case to make sense of the phenomenon in context and its natural settings. A further advantage is the ability to do a cross-case study investigation exposing similarities and differences between the cases. The specific phenomenon was social entrepreneurial organisations' ability to respond to the uncertainty created by the pandemic while maintaining their dual mission.

Table 1: Summary of case studies - Social entrepreneurial organisations included in the study

ORGANISATION	LEGAL BUSINESS FORM	ORGANISATIONAL OBJECTIVES
Organisation A Gauteng urban	A non-profit company	Organisation A provides information and digital literacy training through community knowledge centres (CKCs) nationally, providing access to computer equipment, the internet and training. Its vision is to empower, educate and e-connect.
Organisation B Gauteng urban	A hybrid social enterprise (a for-profit company and non-profit organisation)	Organisation B recycles used and new clothes, focusing on empowering people with disabilities (PWDs). Recycling: In partnership with schools and private businesses, reusable clothes are resold through micro-businesses. Upcycling: repair and upcycle into toys for early childhood development in low resourced crèches. On-Route Inclusion: Through on-route life skills and supported employment, PWDs are placed in meaningful jobs in Organisation B and partner businesses.
Organisation C Gauteng peri-urban	A hybrid social enterprise that includes Organisation C (non-profit organisation and a for-profit company)	The vision, as stated by CK01, is ' <i>sparkling personal and community essence</i> '. Organisation C intends to come alongside, spark potential (essence), and support individuals and groups until they can continue independently. Also, it aims to develop Organisation C1's programme to uplift orphan children in the Zandspruit community through jewellery making and community development.
Organisation D Free State Rural	A non-profit organisation	Organisation D focuses on community development. It runs various programmes with the youth and the community, such as education programmes, after-school care, social behaviour change programmes, entrepreneurship and crime prevention workshops.
Organisation E Free State peri-urban	A non-profit organisation	Organisation E serves and develops the most vulnerable individuals in the community. Key areas are educational development through early childhood development programmes, social development through a multi-purpose centre and after-school care, and entrepreneurship development through training and workshops.

Source: Own compilation

Purposive sampling (Creswell, 2013) was utilised when selecting the social entrepreneurial organisations included in the study. The sample frame for the selection of the social enterprises included social enterprises that were acknowledged and recognised for making a social impact. The researcher initiated the sampling by including a minimum of four provinces, namely Cape Town, Gauteng, KwaZulu-Natal and the Free State. The unexpected arrival of the Covid-19 pandemic created uncertainty and a lack of organisations committing to participate in research. The five cases, as represented in Table 1, were selected from nomination lists of social entrepreneurial organisations making a difference at the local community level. The nominations were from the private sector and a community engagement department in a higher education institution.

The cases had to fit the following criteria: (1) the organisation had to have a mission addressing a socio-economic or environmental need; (2) the critical informant had to be available to participate in the study; and (3) the social enterprise had to have a social media or website presence as a source for secondary data, as well as available reports or articles. To enhance consistency, (4) the organisations needed to be a formally registered entity in South Africa, operational for three years or longer.

5.2 Data collection

Semi-structured interviews were used as a primary data collection method. Data saturation was reached after the participants of the first three social enterprises were interviewed, including two Gauteng and one Free State organisation. The researcher decided to add one more organisation from each province, which brought the total to five social enterprises included in the study. The managing director, social entrepreneur of the social enterprise, or the founding members of their organisations were nominated as the key informants and main study participants in each case study (Merriam, 2009). The key informant assisted the researcher in identifying additional individuals associated with the social enterprise to be included as interviewees.

Table 2: Total number of participants across all five case studies

Social Enterprises Total Case Studies	Key Informant(s)	Employees	Beneficiaries	Stakeholders	Total number of study participants
n=5	n=6	n=8	n=11	n=5	n=30

Source: Own compilation

Initially, 35 individuals were approached to participate in the study. However, as presented in Table 2 only $n=30$ individuals were available to participate in the study. The additional participants associated with each organisation were the employees, stakeholders, and beneficiaries. In summary, 30 interviews were conducted between the five organisations. The number of individuals interviewed from each organisation included in the study follows: Organisation A included $n=8$ participants, Organisation B included $n=7$ participants, Organisation C included $n=4$ participants, Organisation D included $n=5$ participants, and Organisation E had $n=6$ participants. The inclusion of different groups of participants added an important element of credibility to the study, making participants' voices part of the collected data (Pelser, Bosch & Schurink, 2016). The different participant groups associated with each social enterprise provided an array of insights reflected in the data collected.

To maintain anonymity, the researcher renamed each social enterprise, and participant code were allocated to each participant included in the study. For example, Organisation A was assigned the abbreviation 'A'. The participant's organisational role was added; for example, a beneficiary was labelled 'B', followed by a number, such as '01' for the first beneficiary interviewed, hence AB01. Similarly, abbreviations were assigned to each participant group: 'K' for the key informant, 'E' for the employee, 'B' for the beneficiary, and 'S' for the stakeholder. The key informants also provided secondary data relevant to the organisation, including website information, reports available online, social media posts, and online articles. The collection of data happened between November 2020 and January 2021. The researcher utilised Zoom (an online communication application) and face-to-face interviews following the Covid-19 protocols of social distancing and wearing masks. After setting the date of the interview, the researcher followed up with a call to confirm all participant details and ensured each participant received the schedule of questions so they had an opportunity to clarify any uncertainties. After the data collection, all the interviews were transcribed. The transcribed documents were sent to each participant, who had an opportunity to make corrections to enhance the integrity and validity of the data (Creswell, 2013; Strauss & Corbin, 1998).

5.3 Data analysis

All the interviews were audio-recorded, transcribed and imported into ATLAS.ti a data analysis software tool for coding and data analysis. The researcher read through the transcripts multiple times to make sure there was an understanding between the researcher's description of participants'

feedback and their actual perspectives (Bitsch, 2005), determined by internal validity and credibility in quantitative research (Bryman, 2012). The researcher also did a line-by-line exploration by adding descriptive and in vivo codes (Saldaña, 2015) or notes to highlight ideas or cluster concepts in the dataset, looking for patterns or relationships in the complete dataset relevant to the research questions. The secondary data provided by the key informants were copied into word format documents for each case study and also imported into the ATLAS.ti software for coding. The codes were allocated using the ATLAS.ti software, reflected on the right margin of the document, which helped minimise errors and reflected any duplication or overlapping in the code allocations.

Each of the five case studies was analysed separately. The researcher employed a thematic analysis (Saldaña, 2015) in this study. A coding process was applied to each transcript (Saldaña, 2013) of each interview conducted to provide descriptive markers to portions of data and identify either concepts or ideas embedded in the dataset. Followed by the categorisation of codes, the researcher grouped or arranged similar codes that shared similar characteristics. A code in qualitative research is a word or short phrase that representatively assigns an essence-capturing attribute for a portion of information or visual data (Saldaña, 2015). Once the codes were categorised and organised based on shared characteristics, the next step the researcher used was to combine multiple categories to create high-level categories to identify themes (Miles et al., 2013; Saldaña, 2015). A theme is a phrase that describes a piece or pieces of data across the complete dataset (Saldaña, 2015). As part of the thematic analysis process, similarities and differences in the data were identified based on the cross-case analysis; overarching themes were labelled (Boyatzis, 1998; Kiger & Varpio, 2020). All themes were then compared across the five case studies, and standardised themes were checked against data to enhance validity. New themes or categories were reviewed by peers. The themes that specifically associated to adaptability and agility were used in this paper.

6 Findings
