According to Pallant (2010) correlation analysis is a method used to determine the strength and direction of two variable's linear relationships. The correlation coefficients can only be represented in two values, namely, -1 and +1, where -1 means perfect negative correlation and + 1 means perfect positive correlation, 0 means there is no relationship at all between the measured variables (Pallant, 2010). The strength of the relationship can be divided into 3 categories, weak, moderate and strong relationship. To determine the strength of the relationship and interpret the values between 0 and 1, Pallant (2010) suggested the following guidelines, as per the table below:

Table 4: Correlation analysis

Correlation strength	Value of correlation coefficient
Weak	r = .10 to .29
Moderate	r = .30 to .49
Strong	r = .50 to 1.0

Source: Pallant (2010)

7.3.1.1 Correlation between EPMS, motivation and career advancement and development

The study's hypothesis were as follows:

Hypothesis 1: H₀: There is no positive significant correlations between EPMS and motivation.

Hypothesis 2: H₀: There are no positive significant correlations between career advancement and development and motivation.

Hypothesis 3: H₀: There are no positive significant correlations between EPMS and career advancement and development.

To test the above hypothesis, a correlation analysis was performed. Correlation analysis was performed to determine if there is a relationship between EPMS and motivation. The results of the correlations are shown in the table 5 below.

Table 5: Pearson's Correlation analysis

Correlation Analysis				
		Employee Performance Management System	Career Advancement and Development	Motivation
Employee Performance Management System	Pearson Correlation	1		
	Sig. (2-tailed)			
	N	153		
Career Advancement and Development	Pearson Correlation	.400**	1	
	Sig. (2-tailed)	0		
	N	153	153	
Motivation	Pearson Correlation	.424**	.323**	1
	Sig. (2-tailed)	0	0	
	N	153	153	153

As shown in the above table 4, there is a statistically significant (p-value <0.05) positive correlation (r = 0.424) between EPMS and motivation. Therefore, the hypothesis is rejected.

The result of this study is corroborated by the result of a study conducted in Indonesia by Amri and Ramdani (2021). The study results showed motivation has a positive and significant influence on performance. Amri and Ramdani (2021) further states that the higher levels of motivation contribute to higher levels of employee performance. Supportive to this view, Hendricks (2015) states that an effective EPMS process has certain benefits, enhanced employee performance, alignment of skills and tasks and keep employees motivated. A study done in South Africa steel industry by Sono (2014) support the finding of this study. The study by Sono (2014) found that there is statistical significant positive relationship between feedback from EPMS and motivation.

There is a statistically significant (p-value<0.05) positive correlation between motivation and career advancement and development. Therefore, the hypothesis is rejected.

Makhbedu (2017) postulates that career advancement and development have an extensive range of direct and indirect benefits. Direct benefit includes change in employee attitude towards their jobs, high levels of productivity and ultimately motivation. Indirect benefits range from positive attitude towards their communities to caring about the environments. He further states that development and training of

employees helps to improve their confidence, problem solving skills and assist them to make better decisions.

There is a statistically significant ($p\text{-value}<0.05$) moderate correlation between career advancement and EPMS. Therefore, the hypothesis is rejected.

This is supported by a study by Mohamud, Ibrahim and Hussein (2017), in which they postulate that training and development has a significant impact on the performance of employees and ultimately their motivation. When employees are fully trained and considered to be competent, they understand and value their work, which results in high levels of motivation.

8. Managerial Implications

The study has added to the body of knowledge to understand the influence that EPMS and career advancement and development on the motivation of operational employees. The study has brought to the fore the significant difference that exists between the lower echelon operational employees and higher echelon operational employees regarding the perception of EPMS and career advancement and development.

The study's contribution to management of the organization under studies is as follows:

- Revealed the significant correlation between EPMS, career advancement and development, and motivation.
- Providing insight to reviewing and structuring of their retention strategy.
- Highlighted the pledge to optimize human capital investment.
- Provided insight into the cost of employee turnover and its long-term implication.
- Recommended scientific techniques to deal with higher echelon employees.

The findings of this study benefited the organization under study and other corporates as well, considering that this is a South African phenomenon. The research also empirically validated the relationship between EPMS, career advancement and development, and motivation. In addition, the study expanded the current scientific body of knowledge about EPMS, thus serving as a future reference for researchers on the subjects of EPMS, career advancement and development and its influence on motivation.

9. Conclusion

Although the study attempted to be factual and objective, there were several limitations identified:

The research was based on the one selected organization with a limited number of participants; therefore, the findings may not be generalized to other organizations in the alcoholic beverage industry in particular or the corporate world in general. Researchers may examine whether Employee Performance Management System's most essential features are transferrable to other work environments, such as manufacturing companies. The study was cross-sectional. The results should be taken in this context, as perceptions of participants may change over time to a given phenomenon. The phenomenon itself may change over time, impacting on the way employees react to it. The EPMS must do more than complete an annual performance review or provide a confidential yearly report. Managers must recognise that setting KPIs and placing pressure on people are not synonymous. The first step in achieving corporate goals should be identifying the EPMS, motivation and career advancement and development outcomes-related components. They can then work with the EPMS team to achieve organisational goals. Moreover, a performance-linked incentive program should also link performers with performance and incentives with performance. Therefore, EPMS, motivation and career advancement and development should be controlled equitably to reduce distrust, tension, and conflict and foster a good attitude toward EPMS in an alcoholic beverage producer in South Africa. Subjectivity and inappropriateness may be solved by providing the required information, skills, and resources, boosting employee motivation, career advancement and development, providing adequate and timely EPMS training, and adjusting performance measurements and standards to reduce subjectivity. Alcoholic beverage industry should employ objective assessment standards, conduct assessments appropriately, and disclose the consequences of good and bad performance.

Exploring Sustainable Leadership Practices in a South African Seaport

Nontobeko Londiwe Zungu^{1,*} & MacDonald Isaac Kanyangale²

^{1,2} University of KwaZulu-Natal, Durban, South Africa

Keywords

Sustainable leadership practices; sustainable leadership; strategic leadership; sustainable seaport leadership; seaport sustainability practices

Abstract

The Top Management Team (TMT) members are critical for seaport sustainability and business growth. However, scholars know little about what these leaders at the top do to lead sustainably in South African ports. The objective of this qualitative study is to identify the sustainable leadership practices of Port Executives at one of the seaports in South Africa. Nine experienced Port Executives who participated in this study were selected using the purposive sampling technique. Data were collected using in-depth and semi-structured interviews. The thematic analysis helped analyse data and get dominant themes.

Results reveal five key practices which depict the nature of sustainable leadership displayed by Port Executives. These include guiding and prioritising environmental sustainability, commitment to strategic partnerships, strategic thinking about the business and people, community building and corporate social responsibility, and green innovation. The article concludes that sustainable leadership practices are diverse and strategic but less systemic to integrate sustainability. They are undermined by poor cross-functional collaboration, lack of sustainability literacy within the upper echelon, and inadequate expertise on sustainability among employees.

Port Executives need to shift from practices that predominantly emphasise environmental audit and compliance paradigm to practices of multi-faceted sustainability as a catalyst of systemic integration and inclusive stakeholder management. Implications for sustainable leadership of a seaport and areas for future research are highlighted.

1. Introduction

Leaders capable of integrating sustainability into every port activity are needed for the sustainable future of seaports in South Africa. Seaports in South Africa are significant gateways to metropolitan areas and the sub-Saharan African countries, yet little is known about sustainable leadership in this setting (Kinyua, 2020).

While proficient seaports are critical to the economic development of the port's surrounding areas, they also cause several negative environmental impacts on the host communities (Kinyua, 2020). The adverse effects do not arise only from internal port activities (e.g. shipping traffic, cargo-related activities, storage, warehousing, packing, shipbuilding and repair services) but also emissions from intermodal transports (e.g. road and rail traffic to and from the port region) (Hossain, Adams and Walker, 2021:1). Generally, the discourse on seaport sustainability highlight that the top five environmental challenges include quality of water, disposal of waste, air quality, conservation of habitat and noise (Hossain et al., 2021). Leaders of different organisations, including ports, are increasingly aware of the adverse effects of not balancing the triple bottom line, generally known as the three P's – planet, profit, and people (Stephanie, 2021).

Hossain et al. (2021:1) lament that “while many seaports claim to operate green or sustainably, sustainable port initiatives and approaches are poorly described in the academic literature”. Scholars such as Tsai and Lu (2021) are raising the question of how leaders of seaports exercise sustainable leadership. Seaports are among the most polluting sectors due to their nature.

According to the seminal work of Katz and Kahn (1966), there are three levels or categories of leadership in any organisation, namely the tactical, operational and strategic. Tactical leadership focuses on the “here and now,” with short-term decisions and risk management for immediate gains (Kanyangale and Pearse, 2014). Operational leaders guide teams in analysing and comprehending the organisation's strategic and tactical realities. These leaders design the infrastructure and framework (e.g. operational processes, structures, and systems) that enable employees to work tactically toward the organisation's strategy. Samimi, Cortes, Anderson and Herrmann (2019) are cogent that leaders at the strategic level provide long-term direction (e.g. vision, mission, strategy), motivate and influence employees, create and change organisational culture, and drive and align strategy during execution. Strategic leaders, also known as members of the Top Management Team (TMT) or upper echelon of the organisation, perform symbolic and ceremonial roles (e.g. attending or representing the organisation at functions) and relational work (e.g. building relationships and trust across sectors and organisations, networking with key external stakeholders) (Kanyangale, 2017). While all three levels of leadership are essential to embedding sustainability in an organisation, members of the TMT are critical as all the other members of the organisation take cues from them.

The seminal work by Hambrick and Mason (1984) is precise that the upper echelon theory helps understand the importance of strategic leaders as influential members of the organisation. In the upper echelon theory, Hambrick and Mason (1984:193) underscore that “organisational outcomes – both strategies and effectiveness – are viewed as reflections of powerful actors' values and cognitive bases in the organisation”. Strategic leadership theories are about the leadership “of” organisations and their changing aims and capabilities (Kanyangale, 2017). As the world faces more significant environmental, economic and social challenges, sustainable leadership is one of the new corporate priorities. However, Tsai and Lu (2021) are explicit that there is “little literature that examines how sustainability leadership influences employees' sustainability behaviour in the port sector”. To lead others and the system they operate into a sustainable future, strategic leaders need to model sustainable leadership. This study focuses on Port Executives as strategic leaders who constitute the TMT and have the overall responsibility for the port.

This qualitative study aims to identify sustainable leadership practices of Port Executives at a seaport in South Africa. The main research question is: How do Port Executives as strategic leaders of a seaport in South Africa practice sustainable leadership? This article underscores that sustainability literacy, systemic thinking, human capital development for sustainability, and inclusive stakeholder management are cardinal for systemic integration of sustainability.

First, this article begins by unravelling the ontology of sustainability and the distinction between green and sustainable ports before focusing on the phenomenon of sustainable leadership. Second, the article presents the research methods and findings. Lastly, there is a discussion of results, implications for sustainable leadership in a seaport, and areas for future research.

2. Ontological Aspects of Sustainability

First, it is crucial to delve into the ontology of sustainability in terms of its complexity and multi-dimensional nature. The triple bottom line approach (TBL) exhibits that sustainability is complex. It centres around three domains: social, economic and environmental. In this regard, the environmental aspect of sustainability includes the reduction of people's negative impacts on the environment and the protection of nature and ecosystems (Tsaia and Lu, 2021). Human beings must act responsibly and sensitively to the use of all resources as they have a limit. The economic dimension relates to the link between economic activities, growth, and effects, while the social dimension refers to human, institutional, cultural, and societal aspects. The three spheres of sustainability are interdependent, interconnected and interact in non-linear ways. A shift in one can, in turn, cause a series of knock-on

effects in the others. This interconnection brings to the fore the dynamic and temporal aspects of sustainability where the cause and effect are subtle, and the results of interventions are not immediately apparent. Transnet (2020:24), which runs eight seaports in South Africa, asserts that sustainable operations involve a balance “between business activities, the environment and community stakeholders”. It entails a conscious effort to create long-term synergy and shared value achieved in the mutual balance of all interests. Shared value reflects a win-win scenario that differs from the concept of ‘trade-offs’ as a ‘win/lose’ scenario (Transnet, 2020:24).

The Brundtland Report for the World Commission on Environment and Development (WCED) (1987:8) defines sustainability as “meeting the needs of the present without compromising the ability of future generations to meet their own needs”. This definition has aspects of dynamic and temporal complexity. At its core, sustainability implies the continued flourishing of human societies in a constantly changing world with competing social, economic and environmental conditions. Complexity arises from "inter-relationship, inter-action, and inter-connectivity of elements within a system" among elements that make up the system (micro-level), and among different systems (macro-level)"(Turner, Baker and Morris, 2018:65-66). Sustainability is a complex process of continuous adaptation to change. The processual perspective opposes the view of sustainability as an outcome, or a specific end state best captured by static outcome indicators (Hammond, 2020).

Path dependencies help deal with sustainability problems but may stifle an organisation or society from reflexively adapting to existing change or allowing radically new conditions to be possible. Complexity may also arise from counter intuitiveness which occurs when interactions intended to produce the desired outcome generate opposite results (Turner et al., 2018).

Second, sustainability is also a multi-dimensional phenomenon. Four dimensions of sustainability proposed by Ashrafi, Acciaro, Walker, Magnan and Adams (2019) are (1) environmental-based sustainability, (2) corporate sustainability, (2) business-related sustainability, and (4) sustainability in education. Scholars are labelling the proactive and environmentally friendly behaviours that people perform in the natural environment or the behaviours that try to reduce the negative impact of their activities on the natural environment as pro-environmental behaviours (Li, Xue, Li, Chen and Wang, 2020). Employees can choose whether or not to implement pro-environmental behaviours in the workplace (e.g. actively recycling paper, saving water and electricity).

2.1 Green port and Sustainable Port

In scholarly work, sustainable ports are related to green ports, although they are not the same. Green port is concerned with environmental issues (Ashrafi et al., 2019). According to Acciaro (2015:295), green ports are "engaged in the proactive development, execution, and monitoring practices targeted at reducing environmental effects beyond compliance". The concept of a green port is traceable to two issues. First is the need for ports to improve their environmental performance due to local communities' and port users' increasing demand for environmental accountability (Hossain et al., 2021). Notably, local communities demand to know the types of cargo going through the port and the environmental risks associated with port operations. Ports are paying attention to oil pollution from oil spills, air pollution, climate change, extinction of endangered species and habitat loss, and water pollution (e.g. contaminants from ballast water, cargo residue, oil waste, garbage disposal and petroleum spills being discharged), among others (Hossain et al., 2021). Green ports help conform to environmental rules and allow the firm to evaluate its actions, engage workers in environmental concerns, and plan for future environmental development activities (Woo and Kang, 2020).

Second, the concept of a green Port is also traceable to the motivation of port leaders to redevelop the waterfronts for tourism and improve port environmental performance (Hossain et al., 2021). In this way, green ports go beyond regulation as they also encourage voluntary action to ensure eco-friendly systems and processes in a port (Hossain et al., 2021). Ports are trying to modernise and meet the green management standards as they seek to leverage the strategy of the green port. However, port modernisation comes at a price as it brings societal and ecological challenges, trade-offs and congestion (Acciaro, 2015).

While sustainable or blue port incorporates the green port concept, they stress the role of societal impacts and the economic viability of port strategies. Long ago, Avery and Bergsteiner (2011:5) elaborated that by "sustainable, we do not just mean a firm is being green and socially responsible". In the American Association of Port Authorities (AAPA) parlance, port sustainability refers to strategies and activities that meet port stakeholders' current and future needs while protecting and sustaining human and natural resources (AAPA, 2007). Lam and Van De Voorde (2012) proposed a combined framework to reconcile the green and sustainability perspectives. This framework includes stakeholder involvement, green market development, cost-effective environmental policy, and sustainable operations and development as significant elements of a sustainable port strategy. Agile port strategies must comply with established regulations and respond to stakeholder demands in a VUCA (Balasubramanian, 2021). This type of port also focuses on influencing upcoming regulations. Given the complexity and multi-dimensional nature of sustainability, organisational and business scholars struggle to pinpoint the nature of leadership necessary to lead sustainably in a seaport.

2.2 Sustainable leadership

Mindful that the phenomenon of sustainable leadership embraces two different concepts of sustainable and leadership, it is sensible to understand the core of leadership. Drath, McCauley, Palus, Van Velsor, O'Connor, and McGuire (2008) assert that leadership is a tripod characterised by social interactions between leaders, followers, and shared goals. To elaborate on this tripod ontology of leadership, Drath et al. (2008: 635) summarise that:

"In its simplest form, [leadership] is a tripod- leader or leaders, followers, and a common goal they want to achieve" (Bennis, 2007:3). This is not a definition of leadership but something much more fundamental: It is an expression of commitment to the entities (leaders, followers, common goals) essential and indispensable to leadership and about which any theory of leadership must, therefore, speak."

The tripod ontology of leadership is insightful to any scholar trying to situate the phenomenon of leadership in the context of sustainability. Leadership is social influence – not a mere personality trait. Some scholars study leadership from the micro-view of leadership, which focuses exclusively on the individual characteristics of a leader. However, Suriyankietkaew and Gayle Avery (2016:1) argue that "sustainable leadership needs to be researched from the macro-level perspective of leadership. This perspective relates leadership to an organisation's strategic and overall leadership system. Balancing people, profits, and the planet with a long-term view is critical for sustainable leadership. Shaping a sustainability culture that includes others to limit the negative impact of organisational activities on people, the planet, and profit is crucial for sustainable leadership (Stephanie, 2020). Thus, sustainable leadership in an organisation needs to manage the tension between economic and environmental pressure rather than tilt their leadership practices towards profits only in the short-term at the expense of people and the planet in the long term (Stephanie, 2021).

2.2.1 The honey bee approach to sustainable leadership

Avery and Bergsteiner (2011a) proposed the first framework of sustainable leadership based on what is labelled as "honey bee philosophy" that facilitates outcomes within and beyond the triple bottom line. This philosophy assumes that an organisation can be sustainable only if its operating context is sustainable and the basic needs of all involved are met (Laburn,2011). Honeybee leadership is characterised by stakeholder orientation, long-term focus, and delivery of outcomes more responsibly (Laburn, 2011). Honeybee philosophy informs leaders to pursue three key issues: care for and develop people in an organisation, protect the planet, care for the local communities in which they operate and protect organisational image and brand through ethical behaviour.

The opposite of honey bee philosophy is called the locust approach to business. It upholds the belief that the only goal of business is to generate profit and growth for its shareholders (Avery and Bergsteiner, 2011b). The locust approach pronounces the belief of shareholders first and profits at all costs in leading an organisation. Locust leadership calls for one to be tough, ruthless and do whatever

is necessary to perform well in the short term (Laburn, 2011). The core idea is that an individual or organisation gains an advantage only by making others suffer. At the centre of locust philosophy is the idea of a zero-sum game (Laburn, 2011). Honeybee and locust behaviours depict two different types of leadership philosophies. Avery and Bergsteiner (2011a) developed the first comprehensive framework of sustainable leadership based on the honey bee philosophy. This framework constitutes 23 practices clustered into three groups: foundation, higher-level, and key performance drivers. Table 1 compares the sustainable "Honeybee" leadership approach and the shareholder-first or "locust" approach.

Table 1: Criteria distinguishing typical sustainable leadership and shareholder-first perspectives

Leadership elements	Sustainable "honeybee" leadership philosophy Sophisticated, stakeholder, social, sharing	Shareholder-first philosophy Tough, ruthless, asocial, profit-at-any-cost
Foundation principles		
1. Developing people	Developing everyone continuously	Develops people selectively
2. Labour relations	Seeks cooperation	Acts antagonistically
3. Retaining staff	Values long tenure at all levels	Accepts high turnover
4. Succession planning	Promotes from within wherever possible	Appoints from outside wherever possible
5. Valuing staff	is concerned about employees' welfare	Treats people as interchangeable and a cost
6. CEO and top team	CEO works as a top team member or speaker	CEO is a decision-maker, a hero
7. Ethical behaviour	"Doing the right thing" as an explicit core value	Ambivalent, negotiable, an assessable risk
8. Long-or short-term perspective	Prefers the long-term over the short-term	Short-term profits and growth prevail
9. Organisational change	Change is an evolving and considered process	Change is a fast adjustment, volatile, can be ad hoc
10. Financial markets orientation	Seeks maximum independence from others	Follows its masters' will, often slavishly
11. Responsibility for environment	Protects the environment	Is prepared to exploit the environment
12. Social responsibility (CSR)	Values people and the community	Exploits people and the community
13. Stakeholders	Everyone matters	The future does not necessarily drive the business
14. Vision's role in the business	A shared view of the future is an essential strategic tool	The future does not necessarily drive the business
Higher-level practices		
15. Decision making	Is consensual and developed	Is primarily manager-centred
16. Self-management	Staff are mostly self-managing	Managers manage
17. Team orientation	Teams are extensive and empowered	Teams are limited and manager-centred
18. Culture	Fosters an enabling, widely-shared culture	Culture is weak except for a focus on short-term results that may or may not be shared.
19. Knowledge sharing and retention	Spreads throughout the organisation	Limits knowledge to a few "gatekeepers."
20. Trust	High trust through relationships	Control and monitoring compensate

	and goodwill	for low trust
Key Performance drivers		
21. Innovation	Strong, systemic, strategic innovation is evident at all levels	Innovation is limited and selective, buys in expertise
22. Staff engagement	Values emotionally-committed staff and the resulting commitment	Financial rewards suffice as motivators; no emotional commitment expected
23. Quality	Is embedded in the culture	Is a matter of control

Source Avery and Bergsteiner (2011a:7)

Researchers have investigated sustainable leadership practices in various geographical contexts (including South Africa) and organisational settings. For example, Kantabutra and Saratun (2013) researched sustainable leadership in a University; Kantabutra and Avery (2013) focused on sustainable leadership in a cement conglomerate, while Suriyankietkaew and Avery(2016) investigated sustainable leadership in SMEs.

In this study, sustainable leadership is the social influence of internal and external stakeholders in pursuit of shared sustainable goals and systemic consideration of the impact of human actions on broader stakeholder groups, the environmental and economic spheres within which an organisation operate and its limits. This definition is suitable because it is mindful that what sustainable leaders do relates to social influence, which seeks to balance social, economic and environmental outcomes in a port. The notion of practice is critical in this study. Practice researchers aim to uncover the specific actions, interactions, and consequences to understand practice as “what actors do”.

3. Methodology

This section describes how Port Executives as strategic leaders were selected and how data were collected and analysed.

3.1 Research paradigm

This exploratory study adopted a social constructivist paradigm to gain multiple and subjective perspectives on sustainable leadership practices from the lived experience of Port Executives in South Africa.

3.2 Sampling

Purposive sampling was used to identify nine Port Executives at a seaport in South Africa- six (6) males and three (3) females. The selection criteria were: (1) membership of the Port Executive committee and being involved in strategic issues shaping the strategic direction of shipping and seaport activities; (2) a minimum of three years of experience as a strategic leader to have hands-on experience of leading self and others at the port; and (3) willingness and openness to reflect on own leadership practices and that of others at a seaport. Participants were 38 to 55 years old and had a minimum of 5 and a maximum of 20 years of experience working at a seaport.

3.3 Data collection

Data were gathered through audio-recorded, in-depth, and semi-structured interviews with nine Port Executives as strategic leaders. Follow up interviews were used to seek clarity from interviewees. An interview guide helped Port Executive, as strategic leaders, reflect on what they were doing, which they consider sustainable leadership practices at the seaport. The guide focused on (1) patterns of regular or repeated actions, and behaviours by Port Executives which reflect the social, economic, and environmental dimensions or aspects of sustainability in a port environment; and (2) challenges to displaying sustainable leadership practices in a seaport and (3) consequences of displaying practices of sustainable leadership. Data collection ceased after reaching saturation. This type of saturation is when further interviews could not generate any new data (Saunders et al., 2018). The exclusion of middle-level managers in the sample and exclusive use of interviews are limitations—such that the

results are only transferable to a similar level of leadership and context of a seaport, hence not generalisable.

3.4 Data analysis

The study made use of thematic analysis to identify sustainable leadership practice by Port Executives. The focus was on a pattern of regular or repeated actions and behaviours by Port Executives which were related to any dimension or aspect of sustainability in a port environment. Thematic analysis is one of the most common forms of analysis within qualitative research. It emphasizes identifying, analysing, and interpreting patterns of meaning (or "themes") within qualitative data (Creswell, 2009). Transcribed data were subjected to member check prior to analysis using open coding and constant comparison. Key categories were induced from data and were subsequently developed into dominant themes of practices reflecting what Port Executives, as strategic leaders were doing in their endeavour to lead the port sustainably. Details of the research process and direct quotes from participants are given to serve as an audit trail, and to enhance dependability and credibility.

4. Results

The results depict five key practices of sustainable leadership by Port Executive presented in detail as follows:

4.1. Directing and prioritising environmental sustainability

Port Executives were directing and prioritising the environmental sustainability of the Port by relying on the environmental management system, guidelines, policies, regulations, and precinct forums for monthly engagement to ensure that the various operators within the port and their activities were eco-friendly and complying with standards.

We have an environmental management system and guidelines for our port users, i.e., Commercial tenants, Section 56 operators and licenced terminal operators occupying space in various port precincts. The Port Executive committee formed precincts forums. Every month, we have a session with our port users to discuss port precincts developments, environmental issues, and compliance with legislation (Participant 1).

Below is how Participant 5 reflected on safety, health, and environmental audit as a mechanism to ensure regulatory and internal policy compliance by employees and tenants as port users.

We ensure that port users comply with the safety, health and environmental (SHE) Act and policies. The port's slogan is to be a smart, green, and friendly port; hence the port wants a safe environment for port users.

Environmental audits by environmental specialists were not very effective due to the lack of green leases. At the same time, tenants were discouraged from taking voluntary initiatives of green innovation as they could not see a win-win relationship between the port and the tenants. Participant 2 elaborated on the limitation of environmental audit and the tenant's mindset of complying with the minimum requirements as follows:

Our leases are not saying much concerning green management initiatives that port users should consider. So, it is difficult for some port users to invest in green innovation technologies in their respective areas of operations when the contract is silent, short, or they do not know whether or not the port will renew the lease agreements. Tenants just do the minimum. Lease agreements also compromise our environmental audit as we cannot reinforce what is not in the standard lease to make our port green.

The weak collaborative behaviours manifested by employees in turf wars harmed cross-functional cooperation and sharing of information at the port. Participant 1 had the following to say regarding this systemic hurdle for integrating sustainability faced by Port Executives:

Some members are not displaying sustainable leadership practices because they work in isolation within their department. They have a mindset of "I need to cover my back and look after my space". They cannot work freely and share information because they think people will take their positions or occupy better positions than them. This mentality creates stumbling blocks in the entire system, which we are trying to deal with.

4.2 Commitment to Strategic Partnerships

The Port Executives built and maintained strategic engagement with internal and external port stakeholders to cooperate on strategic initiatives. One of the Port Executives exemplified this by focusing on the execution of energy management strategies such as renewable energy and reduction of energy consumption as follows:

We are working constructively with our internal stakeholders: our electrical power supplies depot, building and marine depot, and project team members to put various energy initiatives around the port. We have put building management systems, Air conditioning timer systems, geyser blankets, heat pumps, LED Street, and high mast lighting. All of these contribute positively to reducing energy consumption (Participant 7).

Furthermore, close partnerships between departments and port tenants served as a tool to demonstrate that addressing environmental problems demands collective actions, as revealed by participant 3: *Facilitating close partnerships and cooperation between departments and port tenants has been crucial in coordinating important initiatives and solutions within the port. For example, addressing environmental issues is not just the responsibility of the Port management, but it is something that we must get everyone involved in.*

Port Executives were pursuing external stakeholder engagement through a variety of forums not only to share developments and up-dates but also to get stakeholder's expectations:

Cargo leaving the port uses the premises of the city of Durban impacts Sanral in terms of using national roads. We have different forums where we engage these other stakeholders. National Port consultative forum takes place quarterly; Port consultative also happens quarterly, South African Association of ship operators & Agents every month, and precincts forums every month. We discuss port development plans and status updates for any development affected in these forums. We also try to understand their expectations concerning harbour activities (Participant 5).

The practices of Port Executives show that partnerships were a critical part of an integral strategy in the seaport. For example, one participant exemplified the collective efforts and consequences by various external stakeholders to address the old and growing problem of road traffic congestion in the city as follows:

Bayhead Road traffic congestion has been a significant issue for many years in the port. We collaborate effectively with the eThekweni Municipality, Port Terminals, Freight Rail, Department of Public Enterprises, KwaZulu Natal Department of Transport, Economic Development, Tourism & Environmental Affairs, eThekweni Metro Police and Durban Chamber of Commerce & Industry and other stakeholders to find feasible traffic management measures to alleviate congestion at the port and surrounding road networks. We already see positive results in the Bayhead precinct because of effective engagements and joint efforts (Participant 8).

4.3 Strategic thinking about the business and people

Practices of Port Executives reveal a strategic approach to business as they scan the environment to set a forward-looking business agenda and link individual and collective efforts to add value within the port. Participant 9 had the following to say:

Each area sees itself as a business and scans the environment to understand the future while striving to perform now and grow. The ideas are realised by creating mini businesses around the port from the concept of mission-directed work teams. Employees at all levels see themselves adding value and understanding the organisation's vision. Also, we have charts introduced in various areas of the port to outline daily team members' responsibilities. The strategic approach forces every member in the port to deliver and account for their work to ensure the business continues at the port into the future.

Another Port Executive focused on how they were pursuing a sustainable vision of the port through renewable energy sources as an alternative in the light of the electricity crisis in South Africa.

I have been pushing for the introduction of renewable electricity generating system. This will cater for establishing sustainable energy solutions as the country is facing an electricity crisis. I had to rally all the relevant support, encourage the team and ensure that the project came to life because it is an environmentally viable project to transform the Port (Participant7).

Participant 4 illuminated how bureaucratic processes at the port undermined strategic agility, which is critical for agile port operations.

We are slow in reaction. There are many committees within the organisation that the leaders have to undergo either for approval of capital funding or, rather say, for business case approval and for requesting permission to go out to the market or award projects. We have a gate review committee, port acquisition council, investment forum, and division committee. All these committees are checking the same thing, which delays the processes, and you will find that each person requires two weeks to review a document.

Additionally, strategic thinking about the business by the Port Executive was less systemic as it lacked investment in human capital with sustainability expertise and literacy. Participant 9 described not only the scarcity of sustainability training, and inadequacy of sustainability knowledge among employees, but also reliance on external expertise on sustainability:

Sustainability training is scarce in our organisation. Port Executives and employees need to be trained and reskilled. Adequately skilled human resources are a necessity in the organisation. The organisation have limited employees with sustainability knowledge. As a result, we hire professional specialists on contracts to provide services in the port.

Another participant focused on how most employees' lack of exposure to greener ports contributed to the challenges of anticipating and responding quickly and flexibly to changes in the port environment. Participant 8 reported the lack of green adaptive capacity by human resources as follows:

Lack of experience and exposure to greener ports is the biggest challenge to our human resources. It affects one's anticipation, reaction and response to changes in this environment. So, with changes coming in, sometimes it becomes prolonged and challenging to adapt.

4.4 Community building and corporate social responsibility

Port Executives were explicit about facilitating efforts for the port to develop closer relationships with many interest groups, not just with owners, shareholders, and employees. The port was maintaining local relevance and seeking social recognition through annual port festivals, support of tourism, cultural diversity and heritage and career opportunities, as surmised below by Participant 6:

The Port Executives display positive social sustainability practices. They introduced annual Port festivals for the locals and international visitors to come to the port to celebrate the busiest commercial port in South Africa. As the port leadership, we are at the forefront and taking the lead in facilitating the event's success, which focuses on the community, tourism industry, history

and heritage of the Durban port, diverse cultures, career opportunities and fun activities for visitors.

Another participant echoed how the Port Executives were recognising and strengthening stakeholder relations with the host city by using its technical capability to help the city maintain beaches and contribute to the social life of the community and tourism:

We are responsible for collecting the sand trapped in the harbour. We pump it back into the Durban beaches using our dredgers to nourish our beaches so the community and tourists can enjoy the Durban beaches (Participant 1).

In a slightly different vein, participant 5 revealed how the port nurtured goodwill in nearby communities by providing land for community gardens and promoting gender by opening up the port to inspire the girl child.

For instance, the port leadership has identified an area around the port that will be used as a garden for planting vegetables. So, as part of social initiatives, this area will be accessible and maintained by nearby communities. We also have a "take a girl child to work campaign" here in the port as part of corporate social investment.

Participant 9 focused on support beyond the direct neighbouring community in the form of social investment in schools reported in this way:

We partner with different government departments, such as the ministry of education, to support local township schools by building classrooms and supporting various initiatives. It is part of our responsibility to ensure that children get educated as they are the future of our economy (Participant 9).

4.5 Green innovation

The practices of Port Executives reflect the effort to spread green innovations throughout the organisation's operational processes. Below is what participant 6 had to say specifically on the new operational efforts to restrict debris from getting into the harbour after flooding or heavy rains:

We have initiated a project to restrict waste from the city and neighbouring communities into the Durban harbour. We are installing booms in the port stormwater reticulation system to restrict ingress waste in stormwater reticulation inlets and outlets from getting into the Durban harbour.

Another participant focused on how they were facilitating technological and environmental solutions for air quality monitoring within the port. Participant 3 had the following to say, which revealed innovation at the operational level:

We work with our port operators and support them in providing relevant technological and environmental solutions in various port precincts. For example, implementing an air quality monitoring control system which ensures that the system detects and assesses air quality produced from operational activities undertaken by port users. So, as the leader, I can say the port leaders are the change agents.

5. Discussion

This study has revealed that there are five key practices of sustainable leadership which are predominantly oriented toward environmental responsibility and environmental audit in the port. Clearly, this finding shows that environmental issues are indispensable aspects of port sustainability. Similar results are reported in a study of sustainability leadership in the South African Post Office by Khotsa and van Rooyen (2020). This study revealed that sustainability leaders focused on waste management policies to mitigate the possible negative environmental impact(s) associated with postal services.

However, it is critical to underscore that leaders' basic assumptions, beliefs, and practices that predominantly emphasise green or environmental dimensions are narrow and inconsistent with the multi-faceted and holistic lens of sustainability (Woo and Kang, 2020). Sustainability entails pronouncing not just one but all the three dimensions of social, environmental, and economical as equally necessary (Balta, Chawla, Dencik, and Lin, 2022:8-10). It is also essential to underscore that sustainable leadership practices by Port Executives at the seaport were less systemic and undermined by various internal elements. For example, bureaucratic processes affected strategic agility, while turf wars impeded sharing information and collaborative work for sustainability at the port. If Port Executives are to enhance port sustainability, there is a compelling need to reinforce internal alignment and strategic agility in the organisational architecture of the port. Practices of Port Executives which embed sustainability consciousness within the whole HRM process at the port (e.g. green recruitment, selection, training, performance management, pay and reward, and green involvement) are pivotal to addressing the identified impediments of sustainability. Tang, Chen., Jiang, Paille and Jia (2018) refer to green training and development as key to preparing multi-talented workers and improving competencies, knowledge, and skills necessary to achieve sustainability. Mishra (2017) has highlighted that support of TMT and mutual learning among departments are crucial to facilitating green behaviours among employees.

In the honeybee philosophy of sustainable leadership, Avery and Bergsteiner (2011b) are explicit that employees empowered with sustainability literacy transcend functional boundaries and fundamentally rethink and challenge traditional approaches. It is foundational that sustainable leaders develop employees capable of identifying leverage points where a small shift in one thing can produce significant sustainability-related changes in everything. Effective, sustainable leaders build a strong sustainability culture. It is salient that leaders promote the importance and imperatives of sustainability, establish a sustainability vision and priorities, and behave in ways that support sustainability in the port (e.g. rewarding sustainability behaviour, rituals). Hammond (2020) views sustainability as a cultural transformation that affects the shared pattern of basic assumptions of people to collectively construct social reality, shape how people cope with internal and external sustainability problems and exploit sustainability opportunities.

Second, the findings of this study are explicit that the practices of Port Executives reflect the reliance on environmental audits and regulatory compliance by port users. In a review of the extant studies on corporate responsibility at ports which used the theory of institution, Acciaro (2015) observed a strong effect of institutional pressures on sustainability behaviours. Institutional pressure was coercive (e.g. strong external stakeholders such as government or non-government organisations imposing intense pressures, compulsory and mandatory regulations) and normative pressures (e.g. expectations, values and norms and standards within the company culture). While rule-based and coercive internal policies help ensure sustainability, they are not always based on port users' explicit and internalised norms and values. These institutional pressures may not easily result in sustainability stewardship (Mathevet, Bousquet, and Raymond, 2018) and sustainability citizenship behaviour which are often discretionary behaviours (Anwar, Nik Mahmood, Yusliza, Rmayah, Faezah and Khalid, 2020. Aslam., Azeem, Bajwa, Ramish and Saeed (2021) argues that "organisational citizenship for sustainability is a set of unrewarded, voluntary, individual, discretionary behaviours that promotes sustainability". Often, many organisations fall short as they fail to create and sustain organisational citizenship for sustainability and sustainability stewardship by everyone in the organisation. It is pivotal for Port Executives to adopt the view of proactive stakeholders who are capable of doing more than mere compliance. This approach entails ensuring that practices do not nurture conformance which fosters a "meets minimum" mindset by both the port and its tenants. Green lease agreements are necessary to specify clear green obligations, responsibilities and win-win relationships between the port and tenant. This aspect may persuade port tenants to pursue voluntary, non-contractual responsibility and efforts for green innovation.

Third, it is intriguing that sustainable leadership practices of Port Executives contribute to port sustainability through a multi-level stakeholder approach across all boundaries to address complex

problems collectively, actively seek expectations, and update stakeholders on developments. The of the key competencies of sustainable leaders is the collaborative approach to responding to the difficulties and concerns of multiple stakeholders, both inside and outside the organisation (Tsaia and Lu, 2021). In this study, stakeholder involvement involved building close relationships with the community and host city in many ways (e.g. annual festival, building classrooms, maintaining the beach), which reflect corporate social responsibility and investment. This finding resonates with the honeybee philosophy of sustainable leadership, which underscores that valuing people and the community is critical for an organisation's success. Internally, Port Executive created interactive, consultative and precinct forums with internal stakeholders to engage in conversations to reduce environmental contamination and ensure that terminal operators within the port and their activities are eco-friendly and comply with environmental policies and regulations. Engaging stakeholders upfront can align mutual interests and create trust preventing the rise of conflicts and misunderstandings during the project implementation. In this study, Port Executives maintained and promoted sustainability across traditional functions and boundaries in the port, although efforts were undermined in many ways. Engaging multiple stakeholders requires skills to create value with all stakeholders, exhibit an understanding of individuals across cultures, and build productive long-term relationships. This study concludes that the foundation for employees and leaders to develop sustainable leaders needs to be diverse by focusing on sustainability expertise and literacy, collaborative behaviours, inclusive stakeholder management, and the systemic integration of sustainability into all port activities. This conclusion resonates with Knight and Paterson (2018:5), who identified five critical behavioural competencies of sustainability leaders. These competencies are results-driven, inclusive operator, change agent, ethically oriented, and visionary thinker, maximising leadership impact on sustainability initiatives.

Given the above findings, this study is explicit that there is a compelling need to enhance sustainable leadership practices of Port Executives to drive integrated and systemic sustainability rather than just environmental and social sustainability. The holistic lens of sustainability is critical in influencing practices of sustainable leadership. The study calls for a fundamental shift from practices which predominantly rely on the environmental audit and compliance paradigm to practices which promote sustainability as a catalyst of sustainability integration, inclusive stakeholder engagement and sustainability citizenship behaviours in a systemic way which addresses limitations in the predominantly green, environmental audit and compliance paradigm at the seaport.

In the parlance of Balta et al. (2022:8-10), an organisation is characterised as a sustainability trailblazer if it does not simply comply with the minimum but leans into the sustainability opportunity and actively embraces its transformational potential. The trailblazers integrate commitment and effective execution of sustainability holistically, mindful of the opportunities for digital transformation. Sustainable leaders in a port need to use sustainability as the prism through which port activities are strategised, executed, and success is defined and achieved. The results of this study are not generalisable because of the small sample size but are transferable to a similar context.

6. Implications for Sustainable Leadership of a Seaport and Future Research

The findings have two significant implications: clarity of the multi-faceted foundation for developing sustainable leadership and reconceptualising sustainability as a catalyst.

First, this study has clarified the multi-faceted nature of the foundation for developing sustainable employees and leaders in a South African port environment. If sustainable leadership practices are to develop in a South African port, there is a need for Port Executives to focus more on the diverse and relevant practices which collectively constitute sustainable leadership. The variety of these practices depicts that sustainable leadership is complex and goes beyond sustainability literacy. Sustainable leadership practices also embrace systemic thinking to integrate sustainability, multi-level stakeholder engagement, and the development of sustainable human resources in a port to create and shape a sustainability culture. It is doubtful that Port Executives may embed sustainability in all activities

holistically but also create and nurture a sustainability culture in a port without paying attention to these four practices as building blocks.

Second, this study calls for reconceptualising sustainability as the catalyst of sustainability integration, inclusive stakeholder involvement and sustainability citizenship behaviours in a systemic way to enhance port sustainability. This is necessary to address the shortfalls in the prevailing paradigm of environmental audit and compliance, which compromises efforts of the port to ensure sustainability while also limiting sustainable citizenship behaviours by some port stakeholders. The way environmental audit is implemented should not restrict but support a sustainability mindset for leaders and employees to align all aspects of running a port with the core values, beliefs and holistic lens of sustainability; and allow organisational citizenship for sustainability to flourish among all port users. Enhancing the size and diversity of the sample size by involving more seaports is key for future research on sustainable leadership practices by the TMT. On the other hand, there is also a need to investigate sustainable leadership of middle managers or low-level employees in various seaports. Research of this type is crucial to avoid the notion of sustainability as an elite-led managerial challenge in the port. Studies which seek scholarly clarity on how sustainable leadership shapes sustainable citizenship behaviour or sustainability stewardship of employees are more required in developing countries, which have poorly implemented environmental regulations by government and weak development of human resources for sustainability at organisational levels.

A Conceptual Framework for Evaluating the Impact of Transformational Leadership on Job Satisfaction Using Employee Empowerment and Intrinsic Motivation as Modifying Factors

Ms Keletsang Motsepe¹, Prof Sugandren Naidoo^{2,*}

¹ School of Business Leadership, University of South Africa, Johannesburg, South Africa

² Department of Operations Management, University of South Africa, Tshwane, South Africa

Keywords

employee empowerment, intrinsic motivation, job satisfaction, leader-member exchange, organisational behaviour, transformational leadership

Abstract

Drawing from transformational leadership theory, a model of organisational-level prognosticators was tested regarding employee empowerment. In particular, we determined the effect of transformational leadership on job satisfaction. This study employed an empirical paradigm, using a cross-sectional design and quantitative analysis. An independent, quantitative census sample was used to examine the effect of transformational leadership theory on job satisfaction. Based on a sample of 100 employees who received the survey across a single organisation, 91 per cent completed the online survey developed by the researchers. Data were subsequently analysed using descriptive statistics and inferential statistics. The results indicate that transformational leadership is positively related to job satisfaction, organisational behaviour, leader-member exchange and employee empowerment. The study recommends using transformational leadership practice to address issues related to employee empowerment and intrinsic motivation.

1. Introduction

To promote positively engaged and empowered employees, Schedule 3A entities in the South African government are urged to invest in transformational leadership (TFL) practices. However, is that a simple exercise to put into practice? Universally, studies on employee empowerment have become significant across organisations, as management styles have shifted the attention to having several leaders, as an alternative for managers, within the corporate world. A leader inspires and involves his/her subordinates in their work, which is achieved by motivating them (Banutu-Gomez, 2015). A correlational cross-sectional field research study by Dahou and Hacini (2018), which investigated the impact of adopting an employee empowerment approach, revealed that organisations that embrace empowerment and have highly dedicated staff see increased creativity and innovation as improved productivity. Furthermore, according to Dahou and Hacini (2018), numerous direct reversion studies have reported that information distribution, job model, TFL and decision-making power had a beneficial impact on employee empowerment. McClean et al. (2021) contend that individual job satisfaction must be encouraged for such a person to become self-actualised. Even though TFL is critical to individual, team, and organisational performance, as well as employee empowerment, many managers fail to regularly demonstrate the behaviours outlined in this approach. Unfortunately, little is known about the elements that influence TFL and empowerment on a daily basis (McClean et al., 2021).

The study concentrated on the field of TFL and employee empowerment in a Schedule 3A entity of the state, within the Water Research and Development (R&D) sector (referred to hereafter as "Entity A"). Entity A, which operates as the R&D associate of the department leader, the Department of

Water and Sanitation (DWS), offers the department knowledge dissemination and the ability to certify the ecological management of water sources, and improve water services. The organisation's performance is wholly shaped by the health and safety of its employees. Its operative portfolio and strategic purpose are to ensure organisational transformation, with an emphasis on enhancing successful leadership and increasing the level of employee competency. Notably, the intended principles encompass accelerating empowerment and effecting social change. Public service transfer organisations include (but are not restricted to) community water combined with hygiene, ecological activities, provincial government, and other governmental and parastatal agency. Such entities thus require TFL if they are to enhance ethical, quality, unbiased and balanced public provision. Importantly, since employee empowerment cannot be achieved without an intrinsically motivated labour force led by TFL, employees in a Schedule 3A entity find it difficult to be empowered and intrinsically motivated within their work environment.

2. Problem Investigated

Public service transfer organisations include (but are not restricted to) community water combined with hygiene, ecological activities, provincial government, and another governmental and parastatal agencies. Such entities thus require TFL if they are to enhance ethical, quality, unbiased and balanced public provision. Importantly, since employee empowerment cannot be achieved without an intrinsically motivated labour force led by TFL, employees in a Schedule 3A entity find it challenging to be empowered and intrinsically motivated within their work environment. In addition, lately, there has been a rise in qualified employee resignations in non-profit organisations such as Schedule 3A entities. Arguably, therefore, TFL-related techniques are not as simple as they appear and necessitate a high level of commitment and desire to succeed.

This research investigated a cross-level prototype for the organisational-level evaluation of leader-member empowerment. In particular, the study tested whether employee empowerment and intrinsic motivation were affected by TFL through organisational behavioural support and leader-member exchange. In doing so, the study attempted to fill a gap in observational work in the field of TFL, empowerment and motivation success. Also, to understand why the concept of employee empowerment emerged in the first place and gained popularity and which problems it promised to solve.

3. Research Objectives

1. To determine the effect of transformational leadership practices on employee empowerment.
2. To determine the effect of transformational leadership on job satisfaction.
3. To evaluate the effect of transformational leadership practices on intrinsic motivation.

4. Research Questions

1. What effect does transformational leadership practices have on employee empowerment?
2. How transformational leadership effects job satisfaction?
3. What effect does transformational leadership practises have on intrinsic motivation?

5. Hypotheses

The following hypotheses were formulated for the study:

1. H₁: Hypothesis 1
Transformational leadership has a positive relationship with intrinsic motivation and employee empowerment,
2. H₂: Hypothesis 2
Transformational leadership has a positive effect on job satisfaction and trust.
3. H₃: Hypothesis 3
Intrinsic motivation mediates the relationship between employee empowerment and transformational leadership.

6. Literature Review

Although the notion of employee empowerment dates back to the human relations movement of the 1930s, the broad implementation of employee empowerment initiatives did not emerge until the 1990s (Kim & Fernandez, 2017). In South Africa, empowerment involves transferring power from individuals, through constructive power, to the lowest possible position within an organisation or society. It includes enhanced openness among lower levels, 'improved employees' problem-solving skills, and assistance in taking responsibility for their actions (Travern et al., 2021; Werner et al., 2016). 'A manager should warrant that employees in the lower positions receive the precise combination of information, skills, authority and motivation to allow them to function unconventionally or in a self-reliant manner, free from management control and direction. The observed findings propose that employee empowerment influences work-linked opinions (Fernandez & Moldogaziev, 2015; Naidoo & Ramphal, 2020).

Despite the importance of employee empowerment in the industrial sector, little is believed to impact contextual variables or empowerment outcomes (Kim & Shin, 2017; Travern et al., 2021). According to Kim and Fernandez (2017), few studies have investigated the influence of employee empowerment – as a multidimensional managerial strategy – on turnover possibilities in the public sector. As a result, Dahou and Hacini (2018) urge that future studies and/or researchers should identify other variables that might influence employee empowerment in companies and expand the number of scenarios to which it applies. Different from transactional leaders, transformational leaders accentuate positivity, mutual respect and employee empowerment, which enhance employees' intrinsic motivation. Consequently, TFL may possibly be one of the few leadership variables that organisations can use, to influence and drive the desired transformation (Chitiga, 2018).

6.1. The Business Landscape of a South African Research Organisation

Schedule 3A entities are usually extensions of a government organisation whose mission is to fulfil a certain economic or social duty. They rely on government and public funds, whether through a transfer from the revenue fund or statutory funds. According to the National Treasury regulations (National Treasury, 2015), an institution can include a public entity or constitutional institution listed in Schedule 3A of the Public Finance Management Act 1 of 1999 (PFMA) (RSA, 1999). State-owned firms (also known as public entities) are private companies that the government partially or entirely owns. They have distinct responsibilities and act in line with a set of laws. In South Africa, corporatisation, or the transfer of state assets or agencies into state-owned businesses, was adopted in several areas (Kikeri, 2016). Although the identity of the chosen organisation is not disclosed in this study, and is referred here to as "Entity A", it is one of the institutions listed under the PFMA's Schedule 3A entities. Entity A was established under the Water Research Act 34 of 1971 (RSA, 1971) after a period of severe water scarcity. In the 21st century, one of South Africa's most limiting elements will be water, so the production of new data and the advancement of water research are deemed to be of national importance. The goal is to provide information to policy- and decision-makers and develop innovative products, services and technologies for socioeconomic development (WRC Corporate Services, 2018).

With the help of leaders, TFL focuses on practices that strengthen followers' trust and morale (Han et al., 2016). Workers in the public sector must be resilient enough to cope with increasingly unpredictable situations and must be able to respond in a resilient manner to ongoing problems in the face of conflicts and contradictions (Han et al., 2016; Travern et al., 2021).

6.2. The Concept of Leadership

The process whereby a leader seeks the participation of all members of an organisation, influences relationships, and motivates or empowers others, is known as leadership (Candra & Sundiman, 2020; Chhotray et al., 2018; Kelloway & Gilbert, 2019; Naidoo & Ramphal, 2020). In football, for example, the current leadership philosophy strongly emphasises individual leadership. Regardless of his/her leadership style, a true or effective leader inspires, motivates and guides efforts to attain his/her objectives (Naidoo & Rajcoomar, 2020; Travern et al., 2021). TFL theory should be considered a possible replacement for current leaders, as it prioritises basic needs over higher desires while

encouraging proponents to come up with ever-newer solutions. Mostafa et al. (2015), who examined the role of leadership in the workplace, concluded that TFL is a valuable leadership style.

6.2.1 Transformational Leadership

Saira et al. (2020) state that TFL is "the capacity of managers or supervisors to widen and raise followers' aims by inspiring and equipping them with the confidence to execute above the employment agreement's defined expectations". Such leaders encourage workers to go above and beyond the tasks specified in their job descriptions, by making them aware of their real potential, fostering contentment, creating supportive settings, and empowering them psychologically (Naidoo & Ramphal, 2020; Saira et al., 2020; Travern et al., 2021).

TFL has a tremendous impact on large organisational transitions in that it fosters collectivism and influences individual attitudes and beliefs.

6.2.2 Transformational Leadership Practices

Organisations are constantly looking for new ways to improve. TFL practices are well suited to developing responsible citizens wherever they are located in the world (Ewest, 2015; Naidoo & Rajcoomar, 2020). Such leaders are known for their idealised impact, inspiring motivation, individualised consideration, and intellectual stimulation. Employees become more dedicated to their organisations' objectives when they perceive their leaders as offering support and inspiration. In support of the above argument, Werner et al. (2016) elaborate on the following TFL dimensions:

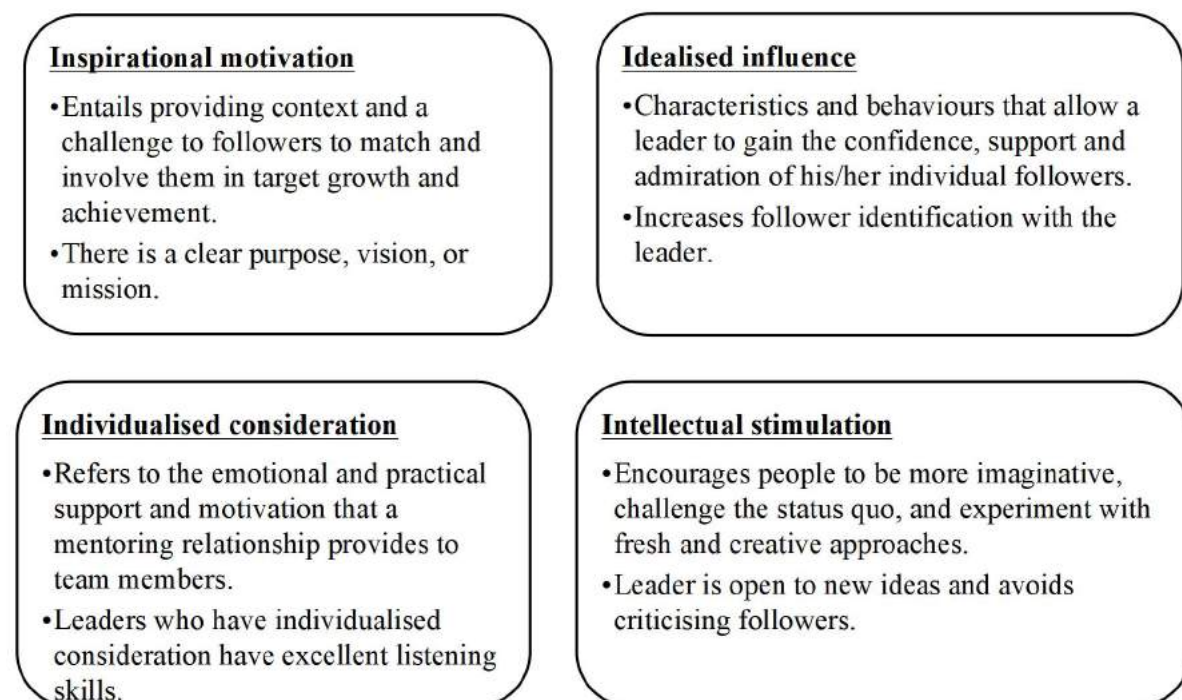

Figure 1: TFL Dimensions
Source: Werner et al. (2016)

6.3 Transformational Leadership Factors in an Organisational Context

A transformational leader inspires and encourages his/her followers while cultivating a creative environment. Employees with TFL qualities were found to be more adaptable and persistent (Baškarada et al., 2017; Naidoo & Rajcoomar, 2020).

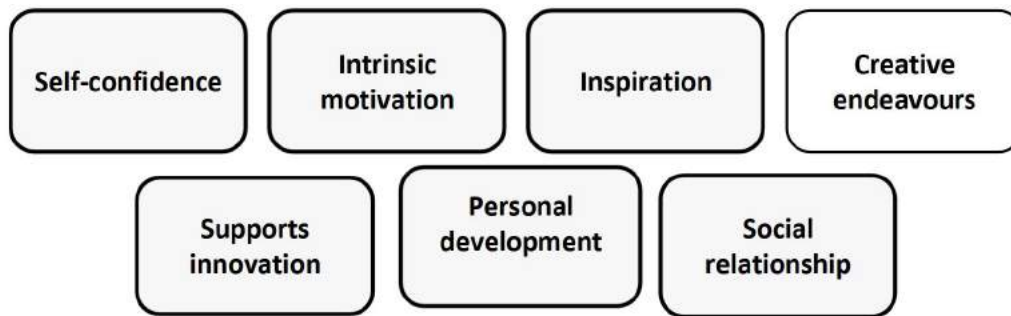

Figure 2: TFL Factors
Source: Al-Harbi et al. (2019)

Al-Zefeiti and Mohamad (2015) state that perceptions of support for innovation and psychological empowerment enhance employee creativity. Within TFL, a better explanation of how leaders create a shared vision of trust and collaboration, empowerment, and collective recognition, effectiveness and knowledge, has strengthened related theory. A leadership style such as TFL strengthens self-efficacy, improves intrinsic motivation, and empowers employees psychologically. To understand the relationship of TFL to other factors of leadership, Kesting et al. (2015) identify three types of leaders: the authentic, the pseudo-transformational and the power-hungry. They propose a mix of charismatic and instrumental leadership for bringing about organisational transformation (Kesting et al., 2015).

6.3.1 Employee Empowerment

Bindurani (2015, p. 1) defines employee empowerment as a "process of providing employees a certain degree of independence and accountability for decision-making related to their precise organisational responsibilities and allowing decisions to be made at lower levels of an organisation where employees have a unique perspective on problems and issues affecting the organisation at a certain level". Chhotray et al. (2018, p. 7) expand on this definition, stating that employee empowerment is a multifaceted term that explains how leaders lead, how individuals react, how peers engage, and how work-related procedures are structured (see also Tavern et al., 2021).

The definition by Choi et al. (2016, p. 4) states that employee empowerment is a management strategy that can encourage employees to go beyond the call of duty and complete tasks more flexibly. For them, the emphasis is thus on the flexible completion of tasks, relative to granting employees independence yet emphasising accountability, where problems affecting their work are identified. Bindurani et al. (2015) confirm that employee empowerment is a valuable tool for motivating and encouraging accountability. There is no distinction between how employees should engage when faced with decisions at a certain level and how they will be developed. Where effective ethics strategies are implemented, employees' wellbeing will directly impact organisational performance (Bindurani et al., 2015). Hence, Bindurani's (2015) definition is more relevant to the current study in that the management model shows that employees are empowered by fostering open communication, rewarding self-improvement, clearly defining roles, and supporting their independence. Delegating power from top to bottom, with defined boundaries and restrictions, as well as rigorous measures of accountability, enhances management control (Perkins, 2019). According to Baird et al. (2018), employee empowerment increases self-efficacy, job motivation and organisational identity among employees. The theory of employee empowerment, as well as the elements that drive it, is becoming increasingly relevant in A-type enterprises: as the findings from a census survey performed by the researcher in Entity A revealed, a lack of morale, happiness, loyalty and efficiency stemmed from the absence of leadership empowerment (Baird et al., 2018). Little attention has, however, been paid to how leaders affect subordinates' attitudes towards empowerment and innovation.

6.3.2 Intrinsic Motivation

According to Baldé et al. (2018, p. 6), intrinsic motivation is a "knowledge transfer hub that plays an important role in determining effective knowledge transfer as motivated by organisational members to deal with structured situations more easily and effectively and to transfer knowledge more quickly".

For Legault (2020), intrinsic motivation is a type of behaviour that is intrinsically rewarding or enjoyable (see also Naidoo & Rajcoomar, 2020). Employees who do not have their basic needs (Maslow, 1970) addressed at work, will not perform as well as they can (Werner et al., 2016). Baldé et al. (2018) add that "[m]anagers should be aware of their employees' requirements".

Empowering leadership, according to Naidoo and Rajcoomar (2020), can improve the extent to which individuals' creativity flourishes in organisations. Ethical standards and high expectations must drive transformational leaders (Zaman et al., 2019) to promote self-esteem, help them meet the high expectations of customers, and fulfil the drive to inspire (Fareed & Su, 2021).

6.3.3 Leader–Member Exchange

In many South African workplaces, there are leadership problems aplenty, notably those connected to employment relations between members and leaders. Given the work–family conflicts that employees experience, establishing good relationships at work is critical (Visagie, 2019). It is thus impossible to exaggerate the importance of the leader–member relationship (Omilion-Hodges & Baker, 2017). Receiving developmental feedback from a superior was positively correlated with an employee thriving at work (Lin et al., 2020). Leaders who have developed high-quality strategies for expressing their thoughts and ideas to their followers, are more likely to be open and honest with them (Visagie, 2019). Here, the focus is on the characteristics that promote creative thinking. Despite the government's growing demand for innovation, some businesses may restrict employees from trying out new ideas, with hierarchies, risk avoidance, and the formalisation of work and decision making being to blame, according to Omilion-Hodges and Baker (2017). As a result, many employees have experienced a lack of organisational dedication, involvement and job happiness. To combat this, governments – like private-sector organisations – have been under strong pressure to work more efficiently and effectively over the past decade.

6.3.4 Organisational Behaviour

Werner et al. (2016) and Travern et al. (2021) outline organisational behaviour as a scientific field of study devoted to understanding, explaining and appreciating the many forces that influence the activities of an organisation and how making sound decisions (about how to motivate and coordinate people and other resources) can contribute towards achieving organisational goals. The qualities and behaviours of employees in isolation and the people who make up an organisation are the focus of organisational behaviour. The level of analysis in organisational behaviour is concerned with activities, the management process, their relationships with the outside world, and how they interact with one another. Naidoo and Rajcoomar (2020) argue that having a working grasp of contemporary organisational theories, research and practice, can assist in establishing a holistic understanding of why employees believe and act in the way they do. Thus, the organisation influences (and is influenced by) individuals working within its various structures (Naidoo & Ramphal, 2020; Werner et al., 2016). If Entity A intends to embrace integrated cooperation, diversity, creativity and empowerment, it must examine its organisational behaviour from a meso viewpoint, and foster an atmosphere of mutual trust, respect, honesty and personal integrity.

6.4 Relationship Between TFL and Employee Empowerment

Leadership that fosters a strong bond between employees and the organisation, aids in the achievement of organisational goals. TFL gives employees the perception that the organisation cares about them and fosters attachments among its members. The process involves people in the organisation, through a socialisation process (Choi et al., 2016). In the long term, one of the mechanisms used to promote employee development, is empowerment. Research indicates that four TFL characteristics (see Figure 3) serve as referents to employee empowerment in organisations. TFL is especially important in terms of motivating and cognitively empowering employees, and while it is relatively effective within organisations, its effectiveness is dependent on employees' attributes (Kim & Shin, 2017; Naidoo & Ramphal, 2020; Travern et al., 2021). The role of TFL and employees in organisations can be positively mediated through empowerment.

6.5 Conceptual Framework

The conceptual framework in Figure 2 arose from research in the field of employee empowerment success, and the influences of leadership support, motivated by TFL. TFL and decision-making authority contribute to employee empowerment (Dahou & Hacini, 2018), which is necessary for improving job satisfaction and serves as a mediator between TFL and job satisfaction. Policy interventions and corporate plans should thus include both TFL and empowerment to successfully improve job satisfaction in the workplace (Choi et al., 2016). The model outlines the steps required in a researcher's methodology, to assess the problem from a unique approach.

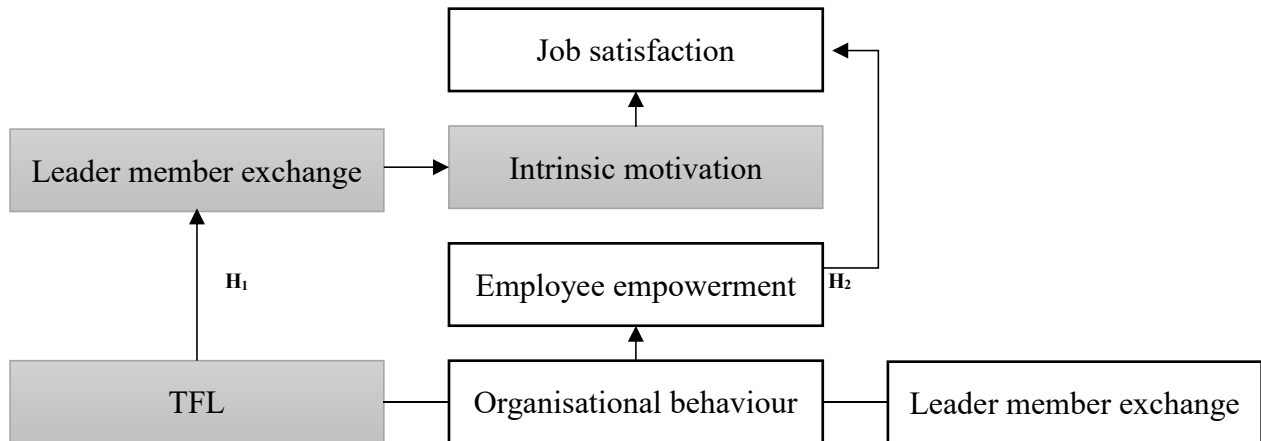

Figure 3: Hypothesised framework

7. Research Methodology

7.1 Research Design

This study employed an empirical paradigm, using a cross-sectional design and quantitative analysis, since it is dependent on dimensions that evaluate and explore numerous variables. Data on employee empowerment, intrinsic motivation, leader-member exchange, and job satisfaction were gathered at a given time with the primary goal of identifying correlations between the variables that will guide methodological choices. Furthermore, independent, quantitative census sample was used to examine the effect of TFL on the variables.

7.2 Approach

A deductive technique was utilised to allow the researcher to test theories based on previously gathered material. One or more premises are used in deductive reasoning – premises being assertions or beliefs that the researcher considers to be true, at first (Leedy & Ormrod, 2016). Data are utilised to test the hypotheses or assertions connected to an existing theory (Lewis & Thornhill, 2019; Saunders et al., 2019). Non-profit organisations lack the adaptation of employing TFL as a leadership strategy, as evidenced by the literature (Chitiga, 2018), and the aforementioned hypotheses will be investigated to acquire empirical proof. The intention of the deductive methodology was used to examine the notion of a link between TFL, employee empowerment and intrinsic motivation.

7.3 Strategy

The research strategy has a significant impact on the nature of the research being conducted, and the manner in which data are subsequently interpreted (Saunders et al., 2019). The relationship between a manager's TFL attributes and employee empowerment, as well as leadership limits in organisations, were studied using a survey method. The data-gathering approach was explicitly detailed as a census survey, the questions of which were related to all three hypotheses.

7.4 Quantitative Research Design

Quantitative research designs are used to either describe the characteristics of a phenomenon that has been observed, or to look into possible relationships between two or more occurrences (Leedy & Ormrod, 2016). A quantitative approach was used to examine how these factors interact (McCusker & Gunaydin, 2015).

7.5 Time Scales/Horizons

A cross-sectional study of the complete population chosen for the study was conducted, to determine whether TFL has a good influence on employee empowerment, resulting in an intrinsically motivated and engaged workforce in Entity A. Cross-sectional studies, according to Leedy and Ormrod (2016), are easier and faster to perform, since the researcher can gather all the necessary data at once.

7.6 Technique and Procedure

Web-based interviews are a type of self-administered survey with benefits and limitations that are similar to those of mail surveys (Blumberg et al., 2014). Here, the purpose of the questionnaire was to conduct a sample survey, using a five-point Likert scale, of a comprehensive population within Entity A. The medium for distributing the online surveys was Survey Monkey. With the questionnaire as primary tool for gathering data, it was delivered in the same way (via email) to all respondents.

7.7 Population of the Study

The outcomes of this study were extrapolated to a single research organisation with a staff complement of 100 employees. The study omitted contractors and temporary employees, with only permanent employees being considered. The actual name of the Schedule 3 entity (research organisation) need not be used in this kind of study, as stated by Blumberg et al. (2014).

7.8 Sample framework

A census counts the entire population in a specific area (Cooper et al., 2014). Censuses are generally regarded as surveys, even though they frequently seek to count an entire population explicitly rather than making an estimate based on a small segment or sample (Leeman, 2016). A random sample was chosen, to avoid sampling errors or biases due to the population size.

Table 1: Population and Sample Framework

Operational unit	Total population	Sample size	%	of
Finance	14	14	14	
Innovation & Impact	13	13	13	
Research & Development	43	43	43	
Corporate Services	30	30	30	
Total	100	100	100	

The population and sample framework were based on the total number of participants from the organisation under study. Of a population of 100 respondents, 91 participated in the census survey.

7.9 Data Collection

The purpose of data collection was to gather primary data for the study on which this paper is based, and to that end, an indirect communication method was employed using an online web-based survey.

7.10 Data Analysis

In this study, data were managed and transferred from Microsoft Forms into Excel Spreadsheets. Microsoft Forms was only used to extract completed questionnaires. All of the questions in the survey were marked as compulsory.

7.11 Reliability and Validity of Data Gathering

This study measurement was established to warrant its validity and reliability. To ensure that the study instrument offered accurate data, a five-point Likert scale was used. The data were gathered on the scale and translated from basic data values to numerical data, for statistical analysis. We can only reliably measure something if we can measure it consistently, hence improving the reliability of measurement equipment may also improve its validity. We cannot collect valuable data unless we have reasonably valid and reliable measures of the traits and phenomena being studied. The extent of the inaccuracy of measurements, is reflected in both their validity and reliability (Leedy & Ormrod,

2016). To collect responses and create graphical interpretations of each question's numeric figure centred on the Likert scale, a web-based survey programme was employed. To ensure data accuracy, the report focused on only the most important components, such as identifying employees in the R&D environment. The survey was piloted with a smaller group of respondents as part of a process to help identify both potential problems and potential solutions, particularly in terms of how respondents comprehend and respond to surveys. The questionnaire was fine-tuned after receiving feedback from the respondents to verify the data's validity and reliability. The questionnaire's pilot study proved the significance of the theories and ideas, as well as their precision and applicability, and the content's completeness. For data analysis, Stata was utilised, a statistician was engaged to assure authoritative and reliable results. Cronbach alpha coefficient (α) was applied to examine the internal reliability of the hypotheses in the research instrument.

8. Results and findings

Based on the reliability statistics for the constructs, shown in Table 1, it can be concluded that the reliability of all the constructs was satisfactory.

Table 1: Reliability statistics

Cronbach's Alpha index	Cronbach's Alpha index based on standardised items	No. of items
Transformational leadership	0.903	8
Employee empowerment	0.843	6
Employees' intrinsic motivation	0.764	5
Job satisfaction	0.822	6
Leader–member exchange (relationship)	0.848	6
Organisational behaviour	0.808	5

8.1 Response rate

Fincham (2008) stresses that the response rate for a survey should be in the range of 60 per cent as a minimum goal for the researcher. A total of 91 of the 100 employees who were sent questionnaires to fill out participated in this survey, resulting in a response rate of 91 per cent. According to Fincham (2008), and Mellahi and Harris (2016), this suggests that the study's findings are credible. The researcher thus determined that the response level was satisfactory, and that the findings were reliable, valid, and generalisable to the focus population.

8.2 Descriptive data analysis

This section presents the descriptive data analysis of the demographic data and general information. These data were collected under the first section of the questionnaire. Of the 91 respondents, 37 (40.7%) were male and 54 (59.3%) female, while around 85 per cent of the respondents were between the ages of 21 and 50.

8.3 Inferential data analysis

8.3.1 Correlation analysis

The results indicate that all of the correlations between the variables were highly significant, but the multicollinearity problem was not suspected. The correlation coefficients ranged between 0.540 (between transformational leadership and leader–member exchange (relationship)) and 0.843 (between transformational leadership and employee empowerment). This gave the researchers the confidence to proceed with regression analysis. It was also indicated that all of the independent variables were highly correlated with the dependent variable, which was employee empowerment at the one per cent level of significance.

8.3.2 Regression Analysis

t-test

The t-distribution was used to compare the mean scores on the Likert scale with the undecided or neutral score of 3, which was the mid-point between "disagree" and "agree", by applying the one-sample t-test.

$$T = \frac{\bar{X} - \mu}{S/\sqrt{n}}$$

By testing the null hypothesis that the calculated (or assumed) mean score for a particular question was equal to 3 (meaning that the respondents were undecided on the statement or question), the level of significance used was 0.050. As an example, for Statement 1 (Section B of the questionnaire "Leadership behaviour in your organisation is related to subordinate satisfaction and task commitment"), the computed mean score for the respondents was 3.374 (std. dev. = 1.082), which was more than 3 (and $t = 3.295$, $p\text{-value} = 0.001 < 0.010$). This suggests that the respondents concurred with the statement.

In respect of TFL, for all of the items except item 7, "Employees feel trust, admiration, loyalty and respect toward the leader" ($t = 0.732$, $P\text{-value} = 0.233 > 0.050$), the null hypothesis was rejected ($p\text{-value} < 0.05$) and so the alternative hypothesis (where the mean score was greater than 3) was accepted. This implies that most respondents agreed with almost all of the items. In general, the respondents were undecided on the statement that "Employees feel trust, admiration, loyalty and respect toward the leader".

Employee Empowerment: The respondents generally agreed with four statements, but were undecided on two of them, namely: "There is a rise in morale, happiness, loyalty and efficiency as a result of leader empowerment" ($t = 0.185$, $P\text{-value} = 0.427 > 0.050$); and "My organisation is flexible, hence transferring power, authority with responsibility and accountability to the employees is easy" ($t = 0.537$, $P\text{-value} = 0.296 > 0.050$).

Employee Intrinsic Motivation: The respondents agreed with three statements, but disagreed with two, namely "Promotional opportunities: The organisation has created clear criteria for promotions based on meritocracy and transparent processes" ($t = -4.657$, $P\text{-value} = 0.000 < 0.010$); and "I will most likely not look for work outside of the organisation" ($t = -2.080$, $P\text{-value} = 0.020$).

Job satisfaction: The respondents agreed with four statements, but were undecided on one statement, namely "My organisation is comfortable with change" ($t = 0.662$, $P\text{-value} = 0.255 > 0.050$); and disagreed with one statement, namely "I believe that management is open and honest" ($t = -1.938$, $P\text{-value} = 0.028 < 0.050$).

The results indicate that the respondents generally agreed with all the leader-member exchange (relationship) statements. The mean scores for all six statements were significantly above 3 (undecided).

Organisational Behaviour: The respondents agreed with four of the statements, but were undecided about one, namely "The acknowledgment or rewards for attaining goals, as well as the criteria for promotion, are motivated by the organisation" ($t = 0.500$, $P\text{-value} = 0.309 > 0.050$).

8.4 Mediating Variable

In this study, firstly, a regression model was fitted to include the independent variables, which were transformational leadership, job satisfaction, leader-member exchange (relationship) and organisational behaviour.

8.4.1 Employee Empowerment

The results in Table 1 indicate that the fitted regression model ($F=77.15$, $P\text{-value} = 0.000$) was highly significant. The adjusted R-square was 0.772, which means that the model explains 77.2 per cent of the variation of the employee empowerment variable. Of the four independent variables, only two were significant and affected employee empowerment positively, namely transformational leadership ($t = 7.91$, $P\text{-value} = 0.001 < 0.010$) and leader-member exchange (relationship) ($t = 3.53$, $P\text{-value} = 0.001 < 0.01$). Job Satisfaction ($t=0.74$, $P\text{-value}= 0.459$) was not found to affect employee empowerment. This implies that transformational leadership practices and the leader-member exchange relationship helped to enhance employee empowerment in the organisation.

Table 1: Regression Model for Employee Empowerment (without Employee Intrinsic Motivation)

Observations	Parms	RMSE	Adj. R-Sq.	F (4, 86)	P-value		
91	4	0.397	0.772	77.15	0.000		
Variable		Coeff. Limit	Std. Error	t	P-value	Lower Limit	Upper
• Transformational leadership		0.581	0.073	7.910	0.000	0.435	0.727
• Job satisfaction		0.069	0.093	0.740	0.459	-0.115	0.253
• Leader-member exchange (relationship)		0.285	0.081	3.530	0.001	0.124	0.445
• Organisational behaviour		0.110		0.095	1.160	0.249	-0.078
• Constant		0.298					
		-0.231		0.237	-0.970	0.333	-0.702
		0.240					

Table 1 shows the results when the mediating variable, employee intrinsic motivation, was included in the regression model. The fitted regression model ($F=72.20$, $Prob. = 0.000$) was also highly significant. The adjusted R-square slightly increased to 0.798, which means that the model explained 79.8 per cent of the variation of the dependent variable. Apart from transformational leadership ($t=7.340$, $P\text{-value}=0.000 < 0.050$) and leader-member exchange (relationship) ($t=3.23$, $P\text{-value}=0.002 < 0.01$), employee intrinsic motivation ($t= 3.49$, $P\text{-value}=0.001 < 0.01$) was also highly significant, and hence, also affected employee empowerment positively, as expected. Since the changes in the coefficient of transformational leadership between the first and second regression models (i.e., 7.91 and 7.34) did not seem significant, this implies that employee intrinsic motivation did not mediate the relationship between transformational leadership practices and employee empowerment.

Table 2: Regression Model for Employee Empowerment (with Employee Intrinsic Motivation)

Observations	Parms	RMSE	Adj. R-Sq.	F (5, 86)	P-value		
91	4	0.373	0.798	72.20	0.000		
Variable		Coeff. Limit	Std. Error	t	P-value	Lower	Upper
• Transformational leadership		0.522	0.071	7.340	0.000	0.381	0.663
• Job satisfaction		-0.117	0.102	-1.150	0.255	-0.320	0.086
• Leader-member exchange (relationship)		0.248	0.077	3.230	0.002	0.095	0.400
• Organisational behaviour		0.074	0.090	0.830	0.411	-0.104	0.252
• Employee intrinsic motivation		0.340	0.097	3.490	0.001	0.147	0.534
• Constant		-0.199	0.223	-0.890	0.374	-0.643	0.245

8.4.2 Employee Intrinsic Motivation

Table 3 shows the fitted regression model of employee intrinsic motivation, where transformational leadership and organisational behaviour were the independent variables.

Table 3: Regression Model for Employee Intrinsic Motivation

Observations	Parms	RMSE	R-Sq	F	Prob.		
91	2	0.504	0.561	58.58	0.000		
Variable	Coeff. Limit	Std. Error	t	P-value	Lower Limit	Upper	
• Transformational leadership	393	0.085	4.500	0.000	0.214	0.553	
• Organisational behaviour	0.422	0.105	4.030	0.000	0.214	0.631	
• Constant	0.341	0.268	1.270	0.206	-0.191	0.873	

The results indicate that both variables affected employee intrinsic motivation; while transformational leadership ($t=4.500$, $P\text{-value}=0.000<0.010$) and organisational behaviour ($t=4.030$, $P\text{-value}=0.000<0.010$) affected employee intrinsic motivation positively. The higher the levels of transformational leadership, the higher the levels of employee intrinsic motivation; and the higher the levels of organisational behaviour, the higher the levels of employee intrinsic motivation.

9. Discussion

The findings of the quantitative research instruments were presented and reviewed. The study's quantitative approach yielded a wealth of data and descriptive insights from Entity A employees, who faced empowerment and intrinsic motivation challenges that required TFL practices to succeed. The survey elicited responses that answered the research questions in a manner that gave a clear picture of the entity's core challenges. The application of statistical analysis allowed for the creation of correlations and the drawing of conclusions regarding the quantitative results. Employee empowerment statements such as "There is a rise in morale, happiness, loyalty and efficiency as a result of leader empowerment" and "My organisation is flexible, thus transferring power, authority with responsibility and accountability to the employees is easy" did not elicit conclusive responses, as the majority of respondents were undecided on this issue. The respondents disagreed with two statements regarding employee intrinsic motivation, namely "Promotional opportunities: The organisation has created clear criteria for promotions based on meritocracy and transparent processes" and "I will most likely not look for work outside of the organisation". They were also undecided about the statement "My organisation is a great place to work", when it came to job satisfaction. The findings point to a problem with power transfer and opportunities for promotion, which might lead to employees looking for work elsewhere. The results reported, largely supported the theoretical framework, and offered several implications for employee empowerment-related research.

To address the research challenge, the study employed a census as quantitative method. Thus, the primary means of gathering input from Entity A entailed a quantitative technique with a maximum sample size ($n=100$) based on the total number of employees. The study questions were answered using the major findings from participant responses.

The paper was set out to answer the following two research objectives:

1. To determine the effect of the transformational leadership practices on employee empowerment.
2. To evaluate the effect of the transformational leadership practices on intrinsic motivation.

First, TFL practices were found to be significantly and positively related to employee empowerment, which offers further evidence that those practices, along with leader–member exchange relationships, enhance employee empowerment in the workplace. Job satisfaction, however, was found not to have an impact on employee empowerment. The results further indicated that both TFL and organisational

behaviour affected employees' intrinsic motivation positively, which rose in direct proportion to the level of TFL, and in direct proportion to the level of organisational behaviour.

1. H1: Hypothesis 1 (Accepted) - Transformational leadership has a positive relationship with intrinsic motivation and employee empowerment,
2. H2: Hypothesis 2 (Accepted) - Transformational leadership has a positive effect on job satisfaction and trust.
3. H3: Hypothesis 3 (Accepted)

Intrinsic motivation mediates the relationship between employee empowerment and transformational leadership.

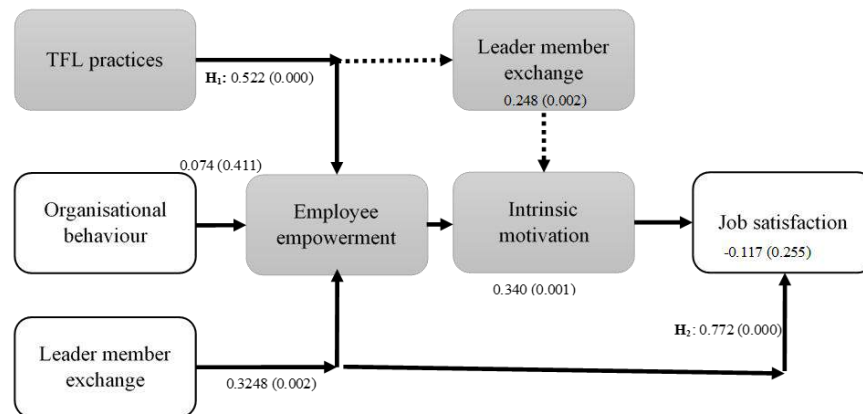

Figure 4: Empirically derived conceptual framework

Furthermore, based on the hypotheses derived from the findings, it is clear that TFL, organisational behaviour and leader–member exchange have a positive effect on employee empowerment.

Furthermore, TFL and leader–member exchange have a positive effect on intrinsic motivation. Therefore intrinsic motivation does not mediate the relationship with TFL, and employee empowerment are not affected by employee empowerment, is accepted. Therefore organisations' requires employees to be highly motivated, to be satisfied with their jobs.

The respondents were found to have a certain perception of their leaders, based on their views of the leader–member exchange, which requires attention to achieve trust, autonomy, motivation and empowerment. While clear communication was in evidence, leaders can change and build stronger relationships with their employees as a means of motivating them to use their skills to advance into leadership positions. In Entity A, the followers' perceptions of their leaders had an impact on their individual performance in working toward a common goal.

9.1 The Existence of TFL

For factors such as accelerated development and high turnover, change and successful change management have become amongst the top goals of all corporate organisations, regardless of the nature of their operations. Since change the world over is occurring at an increasingly rapid rate, and becoming increasingly complex, leadership and change may have become major headaches for modern organisations. As a result, organisations do not rely solely on managers, but also on the capacity of leaders to persuade others to sufficiently believe in the organisation's vision and mission, to make the necessary changes (Alqatawenh, 2018). The ability to deal with change effectively, calls for leadership behaviour that is aligned with the job of the organisation – something Burns (1978) refers to as transformational leadership. As the results of this study indicate, the working relationship between TFL, leader–member exchange, and organisational behaviour enhanced employee empowerment in the organisation under investigation. Those factors correlate, to a certain extent, with intrinsic motivation. Since the differences in the coefficient of TFL between the first and second

regression models (i.e., 7.91 and 7.34) do not appear to be significant, it suggests that employee intrinsic motivation did not moderate the correlation between TFL practices and employee empowerment. The existence of transformational leaders in an organisation indicates that such leaders have charisma, provide intellectual stimulation and motivate their people, to improve communication, trust and information sharing. Such leaders are critical in creating an environment that promotes organisational learning (Para-González et al., 2018).

10. Managerial Implications

This study provided empirical evidence and closed an identified gap in the literature, by offering a detailed view of the factors influencing employee empowerment and intrinsic motivation in a Schedule 3A entity. TFL was positively associated with employee motivation, and thus acted as a catalyst to energise, direct, and maintain the types of employee behaviour that are ultimately linked to employee performance. Transformational leaders assist employees in gaining a sense of direction, and assign new assignments to enable them to contribute to that vision.

Transformational leaders change the organisational culture so that employees believe in themselves, can accomplish more than they would imagine; they foster self-assurance, and confirm to followers that their contribution counts. Such leaders value employees' opinions, regardless of their position in the organisation/

11. Conclusion

The study began by interrogating how to promote positively engaged and empowered employees, through Schedule 3A entities of the South African government investing in TFL practices. This begged the question whether it is a simple exercise to put into practice. From the findings it appeared that it need not be a complicated process, provided an organisation had engaged transformational leaders and implemented the correct practices. As deduced from the respondents', TFL practices were significantly and positively related to job satisfaction which provided further evidence that TFL practices and leader-member exchange relationships enhanced employee empowerment in the workplace.

Generation Y

Abstract

Constant learning to adapt and evolve is a strategic imperative for organisations that wish to remain competitive. But do managers from different age groups agree on the importance of organizational learning?

This study focused on agricultural businesses as learning organisations to determine whether different generational cohorts of managers would characterise their organisations as learning organisations. The results obtained were compared to determine trends and biases in this regard.

The Learning Organization Survey was distributed among 200 managers from three different agricultural organisations in South Africa and 136 responses were received. The results showed that, overall, managers in agricultural organisations do not perceive their organisational units to be learning organisations. Although the magnitude of differences between age cohorts varied, it was furthermore clear that managers from different generational cohorts might be susceptible to biases affecting aspects of organizational learning and which may influence their strategies to drive innovation.

This study brings new insights that can contribute towards the more effective management of food production as a strategic resource. Managers are sensitised to valuable information on how to become a learning organisation and how to develop strategies to maximise the involvement and contribution of managers from all the different generational cohorts.

1. Introduction

In Africa there are specific historical challenges for development in the agricultural sector, such as a high disease burden, generally poor soil quality, historic mobility of workers due to the slave trade, forced labour schemes, export of raw materials, introduction of foreign crops, and more recently climate change, natural resource degradation, rapid population growth, rural poverty, lack of smallholder agricultural development, land ownership and availability and technological stagnation (Cilliers, 2020). Addressing these challenges calls for organisations (and leadership in these organisations) that can evolve and provide specific solutions for the African continent.

The key success factor affecting organisational performance is the mechanism of an organisation to train the organisational members' capabilities of participation and innovation (Shieh, 2011). Considering this, an organisation with high performance has to be one that can adapt fast, because of the need to promptly adapt to environmental changes, in the face of challenges (Shieh, 2011). Like people, organisations should learn to adapt successfully to the ever-changing business reality, and therefore it is a critical success factor for an organisation to gain any kind of competitive advantage to have the ability to learn and exploit its existing knowledge base (Singh, 2011). Unless agricultural organisations become learning organisations, they will not survive in the new competitive, globally connected world where organisations must be high-performance organisations in the face of fierce challenges (Shieh, 2011).

An organisational workforce needs to be led by a manager cohort, and this organisational cohort probably consists of many different types of people, who may have very diverse ways of thinking, feeling and behaving. One way of delineating the differences and categorizing managers is to look at generational trends. Generational dynamics can explain much of who people are and why organisations function the way they do, because it provides a mechanism to understand the forces that shape us as individuals and societies, even though it is merely one important part of managerial dynamics (Duffy, 2021). Systemic generational thinking encourages long-term thinking that includes the period, lifecycle and cohort effects and forces that fuel the differences experienced by each generational cohort (Duffy, 2021).

Studies (Abma et al, 2016; Prillentsky and Prillentsky, 2021) have shown that having a well-functioning workforce is dependent on their well-being mattering in the organisation. It is essential to create sustainable employability conditions for the workforce that include (amongst others) that they feel valued, that they believe they are adding value, and that they get to use and develop their knowledge and skills in their work. This links back to an organisation's capability to strive towards entrenching the values and ways of doing and being to be a continuously learning organisation that understands the needs of its workforce.

2. Problem Investigated

Research about learning organisations within the South African context is limited - there seems to have been one previous study in this regard to determine the extent to which a learning organisation culture influences employee engagement (Knox-Davies, 2010). As far as we know, research about learning organisations in the South African agricultural environment has never been done. Furthermore, managers do not necessarily know how to build a learning organisation, because they do not know the precise steps to build a learning organisation. Organisations and managers lack tools for assessing how learning is benefiting the organisation and whether their teams are learning (Garvin, *et al.*, 2008).

Inherent biases may also manifest in managers (Wright, 2019), and may include being afraid of failure, a fixed mindset, past performance, deficient reflection, being convinced of a need to conform, and insufficient frontline participation and action in addressing problems (Gino & Staats, 2015). There are several different strategies managers could use to prevent such biases. Generational bias is one aspect that may hinder business expansion and production (Sorbelllo, 2021). Previous studies suggest that there are significant differences across generations regarding family values and situations (Wong *et al.*, 2008), core values and attributes, workforce values and expectations (Magni & Manzoni, 2020), education, communication (Zemke *et al.*, 2013), dealing with money and business risks (Petráková, 2021), psychological ownership (Olckers & Booysen, 2021), and other workplace-related dimensions and leadership practices (Stevanin et al, 2020; Van Rossum, 2021), but not for employee engagement, meaningfulness, availability and safety (Muselman, 2021) or intrinsic and extrinsic motivational preferences that may influence behaviour at work (Kerr & Heyns, 2018).

The demographic profile of the agricultural sector displays a large tendency towards having the bulk of employees and managers from Generation X, thereby creating a predominant Generation X organisation. The majority of agricultural organisations are also managed by managers from the Generation X era (managers with ages ranging from 41 to 52 years in 2017 (The Center for Generational Kinetics, 2016). There could be a possibility that cross-generational management styles, therefore, influence the capability of agricultural organisations to learn and be productive.

3. Research Objectives

The primary aim of the study was to determine agricultural organisations in South Africa are experienced as learning organisations by their managers and how this differs for the different generational cohorts of managers in these organisations.

4. Hypotheses

The following hypotheses were formulated for the study:

- H₁: Agricultural organisations in South Africa are experienced as learning organisations by their managers.
- H₂: There are differences between the perceptions of managers from different generational cohorts relating to their perception of their organisational units' functionality as learning organisations.

5. Literature Review

The purpose of the literature review is to provide insight into and define the two key concepts relevant to this study, namely what a learning organisation is, and secondly, to provide some insight into the different generational cohorts represented in the workplace.

5.1. Learning organisations

Themes that describe the values, enabling conditions and realization of outcomes (Abma et al., 2016) that form part of a learning organisation have been included in various definitions and frameworks (Alerasoul et al., 2022). In learning organisations shared learning values and principles are visible throughout the organisations' culture and fibre (Watkins & Marsick, 1992; Aggestam, 2006; Pnnuswamy & Manohar, 2016, Klak, 2021). A common vision (Senge, 1990; Pedler et al., 1991; Shieh, 2011) based on organisational trust (Senge et al., 2005), inform the explicit and professed aim of facilitating and realising learning at a wide level and of wanting to learn (Pedler et al., 1991; Malizia, 2012). The strategic objectives, which are reliant on continuous learning or trial and error (Shieh, 2011) includes a process of knowledge creation that plays a crucial role and forms an underlying basis or principle of the organisation (Swart et al., 2005, Klak, 2021; Rudančić, 2021). Personal capability, intellectual methods, team learning and systems thinking is entrenched in the organisation's functionality. A continuous process of generating, obtaining and conveying knowledge (Moilanen, 2001; Garvin et al., 2008, Klak, 2021) is easily conducted through the whole structure (Malizia, 2012), with the skilled communication (Shieh, 2011) and sharing of information among organisational members (Swart et al., 2005, Rudančić, 2021) enabling the organisation and individuals to reflect on their behaviours and actions, as well as the consequences of their behaviour, to gain insight into the environment where the organisation operates ((Desai, 2011; Tortorella & Fogliatto, 2014), to understand the organisational environment and consequently to understand and interpret the meaning thereof and react to it in a more accurate manner (Jones et al., 2003; Singh, 2011; Alerasoul, 2022).

Leadership and management act as change agents who set out to build on the knowledge and understanding of their own structures and processes in time, playing a key role in leading and managing the learning of the organisation as a whole (Senge, 1990; Maniam, 2013; Dewah, 2016; Kerin, 2022). They create a learning environment with the needed infrastructure and facilities (Moilanen, 2001), making employees available, reimbursing them for participating and recognising their development (Dearborn, 2015), and mitigating threats to achieving a learning organisation (Kerin, 2022).

A high value and emphasis is placed on the sustainability of learning and innovation (Huysman, 2000; Tortorella & Fogliatto, 2014) and continuous development of individuals, organisations and communities influenced by them (Pedler & Burgoyne, 2017), and implementing processes (Moilanen, 2001) that include all members (Senge, 1990; Pedler et al., 1991, Armstrong, 2019), on all levels of the organisation (Pedler et al., 1991). Both employees and leaders display an ongoing, tireless and ceaseless thirst for innovation and progression (Senge, 1994; Ponnuswamy & Manohar, 2016), recognising learning as a daily priority that has to be embedded into everyday roles (Dearborn, 2015). This starts with encouraging and then using learning at individual level ((Malizia, 2012), calling on individuals to expand their capacity to continuously learn together and create the results desired (Huysman, 2000; Tortorella & Fogliatto, 2014). This learning is not only for the sake of doing merely enough continuous learning in itself (Malizia, 2012), but in order for people to obtain personal mastery and to improve mental models (Shieh, 2011). This creates the opportunity to continually expand their capacity to create the results they envisage (Senge, 1990); positive results such as

innovation, efficiency, improved alignment with the environment, and competitive advantage (Langer, 2005; Dewah, 2016; Ponnuswamy & Manohar, 2016). It also enables them to search for processes to solve problems and difficulties, to drive quality (Malizia, 2012; Klak, 2021), and to promote purposeful improvement and intensify the organisation's competitiveness and profitability (Daft, 2021; Huysman, 2000; Tortorella & Fogliatto, 2014).

Amongst other 21st century skills (Lonka, 2018), a high value is placed on autonomous and critical thinking, where new and expansive patterns of thinking are nurtured and diffused through all organisational levels (Senge, 1990; Malizia, 2012). Innovation is supported (Aggestam, 2006; Ponnuswamy & Manohar, 2016) based on whole-system cooperation and collaboration (Watkins & Marsick, 1992; Senge, 1990). In the constant transformation process of a learning organisation, members become and stay learning agile, achieving knowledge, belief and behavioural changes to reflect the new learning and insights (Swart et al., 2005; Moilanen, 2001), which change the organisations' outcomes with regard to growth and innovation (Heraty, 2004; Örtenblad, 2002; Tortorella & Fogliatto, 2014).

All these themes create a foundational environment where employees can take advantage of structured opportunities (Wood & Reynolds, 2013; Mathafena & Grobler, 2020) for professional development (Dearborn, 2015) where evaluation methods and tools are used to evaluate and promote learning processes (Govender, 2009; Moilanen, 1999; Maniam, 2013; Dewah, 2016) and remove barriers and biases that prevent individuals from using their expertise (Gino & Staats, 2015). In such learning organisations collective aspiration is set free (Senge, 1990; Mathafena & Grobler, 2020; Rudančić, 2021), failure is seen as part of learning (Mellat-Parast, 2013; Wang & Noe, 2010, Mathafena & Grobler, 2020) and used to improve the performance of the organisation (Desai, 2011; Tortorella & Fogliatto, 2014), in order to keep transforming itself (Pedler et al., 1991),

The benefits and advantages of organisational learning are well acknowledged in developing competence (Pedler, 2002), improving innovation (Chanal, 2004; Sethumadavan et al., 2020) and achieving and sustaining change (Boyce, 2003). Continuous learning will lead to success over the long term when captured knowledge gives leverage when applied to reality; it will increase innovative knowledge giving a competitive advantage (Liedtka, 1999; Singh, 2011, Amarakoon et al., 2018). Studies conducted on 25 companies implementing the learning organisation found that productivity, profit, market share, and customer satisfaction were raised in these companies (Bennett & O'Brine, 1994). Other studies revealed that the ability of an organisation to develop new knowledge assets that create core competencies governs competitive success (Pemberton & Stonehouse, 2000; Aktharsha & Anisa, 2011). Organisational learning needs to enhance productivity levels to be able to sustain a competitive advantage (Dunphy *et al.*, 1997; Papariodamis, 2005; Ghobadian & O'Regan, 2006) and is able to manage change, increase energy, joy and commitment of human resources in work (Binza, 2005).

Therefore, although there seem to be varying definitions and characteristics of a learning organisation (Hiremani 2011), a learning organisation is defined in this study as how an organisation's activity responds to the challenges and changes it is faced with, and how these motivate organisations to continue learning (Rudančić et al, 2021).

5.2. Generational cohorts in organisations

A generation is a group of people born in a particular consecutive series of years, sharing the same experiences, events and stages of life in the socio-cultural environment during their forming years or historical time frame in which they grew up (Kupperschmidt, 1998; Kupperschmidt, 2000; Kowske et al., 2010; Hoole & Bonnema, 2015). This definition views a generation as a group that is identifiable by years of birth and significant life events at critical stages of development such as going to educational institutions more or less at the same time, start working more or less at the same time, getting involved in marriage and reaching retirement age at the same time. Although researchers differ slightly about the precise years of birth to differentiate between the different generations, most agree that there are five broad generations of employees: Veterans (1925-1944), Baby Boomers (1945-

1964), Generation X (1965-1981), and Generation Y (1982-2000) (Hart, 2006; Wong et al., 2008), Generation Z (2001 – 2012; Dolot, 2018), and Generation Alpha (Dimock, 2019). The way that people in a generation develop is shared by historical and social life experiences, as well as certain happenings and phenomena in their society, and this distinguishes one generational group from another (Schewe & Noble, 2000). A person's feelings towards authority, their values and beliefs about organisations, their work ethic, why and how they work and their goals and aspirations for their work life are impacted by the social context within which a generational group develops (Smola & Sutton, 2002). Furthermore, it is likely that each generation will develop its own distinct preferences or traits that distinguish their feelings toward work and what they desire from work (Jurkiewicz, 2000; Kupperschmidt, 2000).

The generational cohort theory explains the differences and changes across generations (Edmunds & Turner, 2005; D'Amato & Herzfeldt, 2008). According to this theory, the values, attitudes, beliefs and inclinations of individuals are affected by important historical events and social changes. Inclusive into these events are traumatic occurrences such as wars, huge shifts in resource distribution, heroic figures such as Martin Luther King, or huge experiences, e.g. Woodstock that symbolises an ideology (Sessa et al., 2007). Especially consequential are the events during the formative rather than the later years of individuals. Moreover, individuals corresponding to the same cohort or born during a specific period in time often share specific inclinations and cognitive styles. It is assumed that, over time, these effects will persist (Jurkiewicz & Brown, 1998). In short, our lives and attitudes shift as we age, individual events can bring change for whole populations and circumstances that we grow up in shape us throughout our lives (Duffy, 2021). The generational cohort perspective focuses more on changes across generations being fundamentally a function of social events, that incorporates (but is not limited to) biological processes such as age and maturity only (Sessa *et al.*, 2007). Such generational cohorts may differ, because of the history of a certain demographic group or geographic region that could be the core determinant of its generational cohorts (Sessa, *et al.*, 2007; Kingstone, 2021). South Africa is no exception and its recent history, such as the Bush war, the socio-political landscape, as well as heroic and iconic figures such as Nelson Mandela should not be any different in determining generational cohorts. Studies show that there are distinct differences between the cohorts of different regions or countries (Kupperschmidt, 1998; Kupperschmidt, 2000). For this reason, the birth years described by the Center for Generational Kinetics (2016) fit the best into the South African history.

There are currently five generations that make up South African work society (The Center for Generational Kinetics, 2016), with all five generations be represented in the workplace (Dearborn, 2015), namely the Silent Generation, the Baby Boomers, Generation X, Generation Y and Generation Z. Table 1 provides background detail about each generational cohort.

5.2.1. Silent Generation (Traditionalists) - born 1945 and before

Theirs was the period of English rule in South Africa, where colonial governance was in place. This generation potentially experienced the South African Anglo Boer War (1899 – 1902) and both World Wars (1914-18; 1939 – 1945), starting life in a preindustrial state where agriculture and mining were the normative living, including displacement in concentration camps, and then adapting to industrial influence bringing stronger industrialization and urbanization trends and the formation of townships. This generation makes up a very small remaining minority in the workforce, and then only in very specific contextual circumstances.

5.2.2. Baby Boomers - born 1946 to 1964

This falls in the time period after the end of World War II, during a period of economic growth, also characterised by political and ideological unrest in the 1960s, and are a large component of employees in the workforce (Hoole & Bonnema, 2015). Baby Boomers value on-job security and a stable working environment (Hart, 2006; Smola & Sutton, 2002; Loomis, 2000). Another characteristic of the Baby Boomers is that they are most likely to remain loyal and attached to an organisation, are idealistic, optimistic and driven (Hart, 2006; Loomis, 2000). Baby Boomers are also described as diligent on the job (Hui-Chun & Miller, 2003), and as having a high degree of power in the organisation (McCrinkle & Hooper, 2006). Baby Boomers have, among other things, been

stereotyped as being excellent mentors and are more likely to focus on consensus building (Hart, 2006; Kupperschmidt, 2000; Wong *et al.*, 2008). Baby Boomers are currently nearing retirement (Parry & Urwin, 2009).

5.2.3. Generation X - born 1965 to 1976

The 16 June, 1976 uprising that began in Soweto and spread countrywide profoundly changed the socio-political landscape in South Africa. This incident made headlines around the world that have since become known as the Soweto uprising. 16 June is now a public holiday in South Africa, named Youth Day (Anon., 2013). Generation X are the first generation to grow up without parental supervision or with minimal supervision while their parents worked, and therefore Generation X are considered independent (Hoole & Bonnema, 2015). Cynical, pessimistic and individualist are typical characteristics of people in Generation X (Kupperschmidt, 2000; Smola & Sutton, 2002). Generation X's are not likely to display loyalty, as they are portrayed as comfortable with change and diversity. In the workplace, they are more independent and self-sufficient than people from previous generations (Hart, 2006), resulting them being more likely to leave one job and seeking other more challenging options, or a higher salary, or improved benefits (Hays, 1999; Loomis, 2000). Comparing Generation X with Baby Boomers, Generation X require immediate, continuous feedback and are seen as unimpressed with authority and being sceptical (Hart, 2006). The work approach has been characterised as having a strong work-life balance as a value (Howe, *et al.*, 2000), implicating that it is likely that organisational goals are regarded as less important than personal values and goals. The demographic profile of the agricultural sector displays a large tendency towards having the bulk of employees and managers from Generation X, thereby creating a predominant Generation X organisation. The majority of agricultural organisations are also managed by managers from the Generation X era.

5.2.4. Generation Y (Millennials) - born 1977 to 1994

In South Africa, 1995 marks the birth of the first so-called Born-free generation. This was one year after the first democratic South African general elections in 1994. General elections were held in South Africa on 27 April 1994 and the new National Assembly's first act was to elect Nelson Mandela as President, making him the country's first black chief executive. The date 27 April is now a public holiday in South Africa, Freedom Day. Generation Y grew up with technology and in the era of social media and cyber space, and in terms of technological skills, Generation Y have a significant advantage over the Baby Boomers (Deal, *et al.*, 2010; Hoole & Bonnema, 2015). Job security in the workplace is a less important factor and they are comfortable with change (Hart, 2006). Generation Y value skill development and enjoy the challenge of new opportunities. Generation Y, similar to the Baby Boomers, are viewed as driven, more likely to be optimistic and can be demanding of the work environment (Oliver & Huntley, 2007; Smola & Sutton, 2002; Wong *et al.*, 2008). Other characteristics attributed to Generation Y are that they are highly socialised (team players) and enjoy collective action with a strong desire to be included in groups (Hart, 2006; Smola & Sutton, 2002; Martin & Tulgan, 2001; Hoole & Bonnema, 2015). Other characteristics that Generation Y value are having input into decisions and actions, and having responsibility (McCrinkle & Hooper, 2006).

5.2.5. Generation Z (iGeneration/Centennial) - born 1995 and later

This Generation is thought to be realistic, open-minded, motivated, inclusive and connected digitally (Schroth, 2019), being comfortable with technology and operative in the digital world (Chicca & Shellenbarger, 2018; Christensen *et al.*, 2018). They communicate constantly using mobile technology and are more versed in traversing reality in virtual mode, in comparison to other generations; living much of their lives online interacting with family and friends, and making major purchases via smartphones (Tripathi *et al.*, 2022). Yet, due to their constant presence with and use of technology, Generation Z has an increased risk of physical isolation, insecurity, and mental health issues, such as anxiety and depression (Middleton *et al.*, 2022). This generation has also been shown to have underdeveloped social and relationships skills and limited attention spans (Chicca & Shellenbarger, 2018). On the work front they prefer pursuing versatility than job stability (Dolot, 2018). This could have profound implications for organisational functioning, affecting everything from their work

relationships (amongst others), their learning styles, how they adapt to virtual reality training and problem-solving (The Center for Generational Kinetics, 2016).

Although the generational perspective is not all that matters in understanding dynamics and change, they remain powerful, as they are interwoven in the basics of human existence; showing how - as society continues in time - each cohort's presence and eventual absence makes an impact on that society, with the interplay between cohorts also shaping how society changes (Duffy, 2021).

6. Research Methodology

This study employed a quantitative, cross-sectional study design.

6.1. Population and sample

The study population was managers employed in the agricultural sector and related industries. Three of the biggest companies in the agricultural sector were utilised as a convenience sample. These organisations are spread over several provinces of South Africa and are engaged in a diversity of agricultural activities. A purposive, survey sampling strategy was followed to obtain the respondents to specifically include the employees in managerial positions, whether it is junior, middle, senior or top management, as well as directors. Of the initial 200 possible respondents, a total of 136 usable answer sets were received. Most respondents (92) indicated themselves as male and 43 as female. The composition of respondents from the different generations was as follows: Generation Y was 49% (67), Generation X 31% (42) and Baby Boomers 20% (27). Generation Z and the Silent Generation (pre-1974) were not included as part of the study population for this research, as they had either already exited the workplace (the Silent Generation) or were too young (Generation Z) to have been active as managers in the workplace.

6.2. Measuring instrument

The measuring instrument utilised was the Learning Organization Survey (Garvin et al., 2008) consisting of 55 Likert-scored items (some of which are reverse scored) that covered three organisation learning building block dimensions: supportive learning environment, concrete learning processes and practices, and leadership that reinforces learning. The *supportive learning environment* dimension included four components, namely, *psychological safety* (5 items; for example, "In this unit, it is easy to speak up about what is on your mind."), *appreciation of differences* (4 items; for example, "In this unit, people are open to alternative ways of getting work done."), *openness to new ideas* (4 items; for example, "In this unit, people are interested in better ways of doing things."), and *time for reflection* (5 items; for example, "Despite the workload, people in this unit find time to review how the work is going."). The *concrete learning processes and practices* dimension included five components, namely *experimentation* (4 items; for example, "This unit experiments frequently with new product or service offerings."), *information collection* (6 items; for example, "This unit systematically collects information on economic and social trends."), *analysis* (5 items; for example, "This unit engages in productive conflict and debate during discussions."), *education and training* (6 items; for example, "In this unit, training is valued."), and *information transfer* (8 items; for example, "This unit has forums for meeting with and learning from customers and clients."). The *leadership that reinforces learning* dimension consisted of one component (8 items; for example, "My managers provide time, resources and venues to reflect and improve on past performance.").

The first two building block dimensions require a participant to rate their organisation on a seven-point scale (ranging from "highly inaccurate" to "highly accurate") on how accurate the statements are with regard to the organisational unit they are working in. The third building block dimension requires rating on a five-point rating scale (Never to Always) how often a certain behaviour is exemplified by the managers (or manager) higher up in the hierarchical structure to whom they report. The instrument has been established to have acceptable reliability and validity (Garvin *et al.*, 2008; Knox-Davies, 2010).

6.3. Ethical considerations

The research was vetted and approved as a low-risk study by a reputable SA university. Gatekeepers and mediators at the various organisations were used to facilitate awareness and access to the target population, who could then follow an electronic link to complete an online survey should they wish to participate. The survey questionnaires were anonymous and did not request personal information over and above codes utilised to identify the demographic details needed for the study, and all information gathered was treated as confidential. Participation and completion of the survey was completely voluntary, and participants were free to withdraw at any stage without penalty.

6.4. Data collection

The data were collected through an online internet survey platform. Participants received a cover letter with the electronic survey that explained the purpose of the research. Consent and completion of the survey were submitted online, and the responses were then exported into a Microsoft Excel database for data analysis purposes.

6.5. Statistical analysis

The collected data were analysed by the North-West University's Statistical Consultation Service using the Statistical Package for Social Sciences.

Descriptive statistics (means and standard deviations) were calculated to establish central tendencies of the constructs that were measured. Standard deviation expresses how much the individual members of a group differ from the mean value for the group and is known to produce greater variability when the sample group is diverse (Tredoux & Durheim, 2013).

Internal consistency of the scales was determined by computing Cronbach's Alpha values. Considering that reliability can be influenced by the number of items per scale, variability of the test sample (Tredoux & Durheim, 2013) and negatively phrased items (Pallant, 2010), Cronbach alpha values equal to or higher than .6 is considered acceptable (Malhorta, 2010), however values of .70 or higher are preferred (Tredoux & Durrheim, 2013).

To evaluate sampling adequacy and factor structures of the sub-scales, the Kaiser-Meyer-Olkin measure of sampling adequacy and the Bartlett's test of sphericity were used. KMO eigenvalues greater than 1.0 were used as criterion for factor selection, as recommended by Field (2014).

The grouping of the different generations of managers was done and an attempt was made to demonstrate a positive relation between the managers of the different generations towards the variables. This second set of results was analysed according to ANOVA, the Welsch's independent t-test and Cohen's effect size (d-values) to analyse and compare the responses from the generational cohorts. Cohen's (1988) guidelines for the interpretation of d-values were followed, namely: d=0.2 equates to a small effect signifying no practically significant difference, d=0.5 to a medium effect or practically visible difference and d=0.8 to a large effect or practically significant difference (Cohen 1988; Ellis & Steyn, 2003).

7. Results and Findings

7.1. Reliability and validity of findings

Table 2 provides the reliability and validity statistics for each of the component results.

Table 2: Reliability and validity per learning organisation dimension and components

Dimension	Component	Factors	Cronbach's alpha	Kaiser-Meyer-Olkin	Bartlett's test of sphericity	Determinant	Total variance explained
<i>Statistical benchmark</i>			$\alpha \geq 0.6+$	$0.6 - 0.9$	$p \leq .05$	< 1	$> 50\%$
Supportive learning environment	Psychological safety	2	.76 / .60	.70	.00	.28	71.18%
	Appreciation of differences	2	.82 / .82	.62	.00	.29	81.05%
	Openness to new ideas	2	.79 / .68	.65	.00	.33	56.40%
	Time for reflection	1	.83	.82	.00	.18	57.97%
Concrete learning processes and practices	Experimentation	1	.79	.69	.00	.22	62.03%
	Information collection	1	.92	.83	.00	.01	72.18%
	Analysis	2	.86 / .86	.68	.00	.12	77.90%
	Education and training	1	.92	.88	.00	.01	72.70%
	Information transfer	1	.93	.92	.00	.00	67.58%
Leadership that reinforces learning		1	.92	.88	.00	.00	66.23%

Source: Own compilation

The reliability and validity results of each dimension were established by analysing the separate components of each dimension. Initial analysis revealed that a reversed-scored item in the *time for reflection* component was problematic – once it was removed the reliability improved drastically from an initial $\alpha = .58$ to $\alpha = 0.83$. For the *openness to new ideas* component, the Cronbach alpha value for the two components respectively obtained reliabilities of $\alpha = 0.79$ for the first component which reflected positively-stated questions and $\alpha = 0.68$ for the second component which was represented by two negatively-stated questions. The Kaiser-Meyer-Olkin measure of sampling adequacy indicated that sampling was adequate on all scales, and the Bartlett's test of sphericity indicated that there was a sufficiently large correlation between the statements in all the components. No severe multicollinearity were present in any of the scales. Scales explained between 56.4 -81.05% of variance. Overall, the results for each dimension and its underlying components were found to be valid and reliable.

7.2. Whole group results

Statistical analysis was undertaken on the group of managers in agricultural organisations as a whole. Each learning organisation building block dimension was analysed in terms of number of respondents (and the percentage) that gave a particular rating, as well as each item mean and standard deviation. A mean score for each component was also provided.

Interpretation was made on the basis that a mean score of 5.5-7 (1-2.5 for reversed scored items) would indicate generally positive experiences of the specified item or component, while a mean score of 1-2.5 (5.5-7 on reversed score items) would indicate generally negative experiences of the specified item or component. Scores were also benchmarked against baseline data derived from surveys of large groups of senior executives in a variety of industries (Garvin et al., 2008).

7.2.1. Supportive learning environment whole group results

Table 3 further below provides the descriptive statistics of the supportive learning environment's components.

The results show that, in general, between 41.3 – 67.4% of respondents reported positive experiences for *psychological safety*. Most respondents indicated experiencing this in terms of voicing opinions and sharing information, with between 66.0 – 67.4% indicating positive experiences in this regard, but only 41.3% felt that they could make mistakes without it being held against them. Also, only 44.2% indicated that they felt that it was safe to put your cards on the table in the organisation. The mean score of 4.64 for this component fell in the second quartile (below the median) benchmark score

of 5.32 and the high standard deviations of the different items show that respondents differed widely in their agreement to the different items ($SD > 1.00$).

When it comes to *appreciation of differences*, the indications are that between 18.8 – 54.4% experienced this positively. Most notable was that 54.4% felt that their organisations were open to alternative ways of getting things done, but only 18.8% experienced their organisations sorting out differences of opinion in groups (a positive practice), with 35.5% experiencing that their organisations sorted these out privately (off-line). The mean score for this component (4.03) fell in the second quartile (below the median) benchmark score of 4.48 and the high standard deviations of the different items show that respondents differed widely in their agreement to the different items ($SD > 1.00$).

Table 3: Descriptive analysis of whole group findings for supportive learning environment

		Item	1	2	3	4	5	6	7	Mean	SD
Supportive learning environment*	Psychological safety (Mean = 4.64)	In this unit, it is easy to speak up about what is on your mind	7 (5.1)	9 (6.5)	6 (4.3)	5 (3.6)	20 (14.5)	56 (40.6)	35 (25.4)	5.39	1.70
		If you make a mistake in this unit, it is often held against you. (R)	31 (22.5)	26 (18.8)	13 (9.4)	13 (9.4)	30 (21.7)	21 (15.2)	4 (2.9)	3.46	1.922
		People in this unit are usually comfortable talking about problems and disagreements.	7 (5.1)	9 (6.5)	9 (6.5)	9 (6.5)	29 (21.0)	56 (40.6)	19 (13.8)	5.09	1.641
		People in this unit are eager to share information about what does and does not work.	3 (2.2)	9 (6.5)	6 (4.3)	6 (4.3)	21 (15.2)	57 (41.3)	36 (26.1)	5.52	1.534
		Keeping your cards close to your chest is the best way to get ahead in this unit. (R)	29 (21.0)	32 (23.2)	16 (11.6)	21 (15.2)	12 (8.7)	20 (14.5)	8 (5.8)	3.34	1.928
	Appreciation of differences (Mean = 4.03)	Differences in opinion are welcome in this unit	3 (2.2)	9 (6.5)	11 (8)	12 (8.7)	44 (31.9)	39 (28.3)	20 (14.5)	5.04	1.489
		Unless an opinion is consistent with what most people in this unit believe, it will not be valued. (R)	22 (15.9)	27 (19.6)	18 (13)	24 (17.4)	23 (16.7)	19 (13.8)	5 (3.6)	3.55	1.792
		This unit tends to handle differences of opinion privately or off-line, rather than addressing them directly with the group. (R)	8 (5.8)	18 (13)	12 (8.7)	18 (13)	33 (13.9)	34 (24.6)	15 (10.9)	4.54	1.752
		In this unit, people are open to alternative ways of getting work done.	5 (3.6)	9 (6.5)	9 (6.5)	5 (3.6)	35 (25.4)	51 (37)	24 (17.4)	5.21	1.582
	Openness to new ideas (Mean = 4.54)	this unit, people value new ideas.	3 (2.2)	8 (5.8)	10 (7.2)	8 (5.8)	28 (20.3)	48 (34.8)	33 (23.9)	5.36	1.552
		Unless an idea has been around for a long time, no one in this unit wants to hear it. (R)	28 (20.3)	30 (21.7)	23 (16.7)	21 (15.2)	17 (12.3)	14 (10.1)	5 (3.6)	3.22	1.772
		In this unit, people are interested in better ways of doing things	3 (2.2)	6 (4.3)	8 (5.8)	7 (5.1)	23 (16.7)	54 (39.1)	37 (26.8)	5.54	1.485
		In this unit, people often resist untried approaches. (R)	9 (6.5)	20 (14.5)	20 (14.5)	31 (22.5)	29 (21)	24 (17.4)	5 (3.6)	4.04	1.600
	Time for reflection (Mean = 3.91)	People in this unit are overly stressed. (R)	9 (6.5)	32 (23.2)	20 (14.5)	19 (13.8)	24 (17.4)	22 (15.9)	12 (8.7)	3.95	1.810
		Despite the workload, people in this unit find time to review how the work is going.	4 (2.9)	8 (5.8)	8 (5.8)	12 (8.7)	39 (28.3)	49 (35.5)	18 (13)	5.12	1.477
		In this unit, schedule pressure gets in the way of doing a good job. (R)	13 (9.4)	43 (31.2)	15 (10.9)	19 (13.8)	23 (16.7)	21 (15.2)	4 (2.9)	3.54	1.747
In this unit, people are too busy to invest time in improvement. (R)		16 (11.6)	29 (21)	19 (13.8)	23 (16.7)	21 (15.2)	26 (18.8)	4 (2.9)	3.71	1.768	
There is simply no time for reflection in this unit. (R)		22 (15.9)	30 (21.7)	32 (23.2)	20 (14.5)	21 (15.2)	9 (6.5)	4 (2.9)	3.22	1.621	

*Means are out of a maximum of 7. (R) indicates a reverse-scored item

Results indicate that 21.0 – 58.7% of respondents experienced their organisations positively in terms of *openness to new ideas*, while 6.5 – 21.0% did not. Furthermore, 58.7% of respondents agreed that new ideas were valued and 55.9% indicated that people were open to better ways of doing things. However, 21% of respondents indicated that new untried approaches were welcomed (therefore not resisted), with another 21% indicated that such were being resisted in their organisations. The mean score for this component (4.54) fell in the bottom quartile (far below the median) benchmark score of 6.30, and the high standard deviations of the different items show that respondents differed widely in their agreement to the different items ($SD > 1.00$).

In terms of *time for reflection*, results indicate that 29.7 – 48.5% of respondents have a positive experience in their organisational units, with 48, 5% indicating that time for reflection is found in spite of the workloads and only 8.7% disagreeing with this. However, only 29.7% indicated that people in their organisation were not overly stressed, with 24.6% indicating that they experienced people as overly stressed. Moreover, 21.7% indicated that their organisational units were too busy to invest time in improving practices, with 32.6% indicating the opposite. The mean score for this component (3.91) fell in the second quartile, below the median benchmark score of 3.5, and the high standard deviations of the different items show that respondents differed widely in their agreement to the different items ($SD > 1.00$).

For the entire *supportive learning environment* dimension in general, the mean component scores seemed to be highest for psychological safety (4.64) and lowest for time for reflection (3.91), but, regardless, all the scores were indicated as below the median benchmark scores. The overall mean dimension score of 4.28 for having a *supportive learning environment* also fell in the second quartile – below the median benchmark score of 4.97. This is indicative that the respondent group as a whole generally does not experience their agricultural organisational units as being supportive learning environments, specifically in terms of the opportunity to reflect, but also in terms of the experience of there being an openness to new ideas, an appreciation of differences and feeling psychologically safe.

7.2.2. Concrete learning processes and practices whole group results

Table 4 further below provides the descriptive statistics of the concrete learning processes and practices' components of the group of managers in agricultural organisations.

In terms of *experimentation*, 23.9 – 55.1% of respondents indicated having positive experiences in this regard, and between 8.0 – 18.1% indicating negative experiences in this regard. Of the overall group, 55.1% indicated that their organisational units frequently experiment with new products or service offerings, but only 23.9% indicated that their organisation employed prototypes or simulations when trying out new ideas. The overall mean for this component was 4.84, falling in the second quartile, below the median benchmark score of 4.97. The high standard deviations of the different items show that respondents differed widely in their agreement to the different items ($SD > 1.00$).

The *information collection* component results indicated that in general respondents experienced their organisational units positively (59.4 – 76.1%) in their collection and benchmarking of data on competitors, customers, social and economic trends and technological data. The overall mean for this component was 5.51, which, however, still fell in the second quartile, below the median benchmark score of 5.6, and the high standard deviations of the different items show that respondents differed widely in their agreement to the different items ($SD > 1.00$).

In terms of the *analysis* component 39.1-50.8% of respondents indicated generally positive experiences and trends in their organisational units, with 50.8% indicating the frequent identification and discussion of underlying assumptions that might affect key decisions as a positive and 50.7% experiencing engagement in productive conflict and debate during discussions.

Table 4: Descriptive analysis of whole group findings for concrete learning processes and practices

		Item	1	2	3	4	5	6	7	Mean	SD
Concrete learning processes and practices	Experimentation (Mean = 4.84)	This unit experiments frequently with new ways of working.	3 (2.2)	9 (6.5)	13 (9.4)	14 (10.1)	38 (27.5)	42 (30.4)	19 (13.8)	5.01	1.51 1
		This unit experiments frequently with new products or service offerings.	3 (2.2)	8 (5.8)	4 (2.9)	13 (9.4)	34 (24.6)	48 (34.8)	28 (20.3)	5.34	1.46 2
		This unit has a formal process for conducting and evaluating experiments or new ideas.	7 (5.1)	11 (8)	10 (7.2)	21 (15.2)	41 (29.7)	36 (26.1)	12 (8.7)	4.70	1.58 3
		This unit frequently employs prototypes or simulations when trying out new ideas.	7 (5.1)	18 (13)	9 (6.5)	38 (27.5)	33 (23.9)	25 (18.1)	8 (5.8)	4.30	1.56 8
	Information collection (Mean = 5.51)	This unit systematically collects information on competitors	4 (2.9)	6 (4.3)	6 (4.3)	10 (7.3)	28 (20.3)	55 (39.9)	29 (21)	5.41	1.47 8
		This unit systematically collects information on customers	4 (2.9)	2 (1.4)	3 (2.2)	5 (3.6)	19 (13.8)	62 (44.9)	43 (31.2)	5.83	1.31 6
		This unit systematically collects information on economic and social trends	6 (4.3)	3 (2.2)	6 (4.3)	10 (7.2)	29 (21)	51 (37)	33 (23.9)	5.45	1.50 9
		This unit systematically collects information on technological trends	5 (3.6)	3 (2.2)	8 (5.8)	8 (5.8)	32 (23.2)	45 (32.6)	37 (26.8)	5.48	1.50 0
		This unit frequently compares its performance with that of competitors	5 (3.6)	7 (5.1)	2 (1.4)	8 (5.8)	32 (23.2)	48 (34.8)	36 (26.1)	5.49	1.52 5
		This unit frequently compares its performance with that of best-in-class organisations	4 (2.9)	9 (6.5)	5 (3.6)	11 (8)	26 (18.8)	48 (34.8)	35 (25.4)	5.39	1.58 2
	Analysis (Mean = 4.60)	This unit engages in productive conflict and debate during discussions.	7 (5.1)	10 (7.2)	7 (5.2)	13 (9.4)	31 (22.5)	54 (39.1)	16 (11.6)	5.01	1.62 3
		This unit seeks out dissenting views during discussions.	3 (2.2)	15 (10.9)	9 (6.5)	11 (8)	37 (26.8)	47 (34.1)	16 (11.6)	4.95	1.57 7
		This unit never revisits well-established perspectives during discussions. (R)	12 (8.7)	42 (30.4)	24 (17.5)	24 (17.5)	26 (18.8)	7 (5.1)	3 (2.2)	3.31	1.51 8
		This unit frequently identifies and discusses underlying assumptions that might affect key decisions.	1 (0.7)	6 (4.3)	10 (7.2)	18 (13)	33 (23.9)	55 (39.9)	15 (10.9)	5.18	1.31 9
		This unit never pays attention to different views during discussions. (R)	33 (23.9)	35 (25.4)	31 (22.5)	15 (10.9)	18 (13)	3 (2.2)	3 (2.2)	2.79	1.53 5

Table 4 (continued): Descriptive analysis of whole group findings for concrete learning processes and practices

		Item	1	2	3	4	5	6	7	Mean	SD
Concrete learning processes and practices (continued)	Education and training (Mean = 5.24)	Newly hired employees in this unit receive adequate training.	8 (5.8)	11 (8)	6 (4.3)	11 (8)	22 (15.9)	51 (37)	29 (21)	5.15	1.763
		Experienced employees in this unit receive periodic training and training updates	7 (5.1)	5 (3.6)	9 (6.5)	11 (8)	33 (23.9)	44 (31.9)	29 (21)	5.22	1.615
		Experienced employees in this unit receive training when switching to a new position	9 (6.5)	13 (9.4)	10 (7.2)	13 (9.4)	29 (21)	42 (30.4)	22 (15.9)	4.84	1.793
		Experienced employees in this unit receive training when new initiatives are launched.	7 (5.1)	12 (8.7)	8 (5.8)	9 (6.5)	29 (21)	45 (32.6)	28 (20.3)	5.09	1.745
		In this unit, training is valued.	4 (2.9)	4 (2.9)	4 (2.9)	8 (5.8)	15 (10.9)	56 (40.6)	47 (34.1)	5.77	1.446
		In this unit, time is made available for education and training activities.	5 (3.6)	7 (5.1)	7 (5.1)	11 (8)	30 (21.7)	42 (30.4)	36 (26.1)	5.35	1.601
	Information transfer (Mean = 5.20)	This unit has forums for meeting with and learning from experts from other departments, teams, or divisions	11 (8)	5 (3.6)	7 (5.1)	9 (6.5)	24 (17.4)	52 (37.7)	30 (21.7)	5.22	1.758
		This unit has forums for meeting with and learning from experts from outside the organisation	7 (5.1)	6 (4.3)	7 (5.1)	14 (10.1)	33 (23.9)	44 (31.9)	27 (19.6)	5.17	1.612
		This unit has forums for meeting with and learning from customers and clients	4 (2.9)	7 (5.1)	10 (7.2)	14 (10.1)	33 (23.9)	44 (31.9)	26 (18.8)	5.18	1.539
		This unit has forums for meeting with and learning from suppliers	5 (3.6)	5 (3.6)	7 (5.1)	12 (8.7)	36 (26.1)	38 (27.5)	35 (25.4)	5.34	1.545
		This unit regularly shares information with networks of experts within the organisation.	3 (2.2)	7 (5.1)	7 (5.1)	9 (6.5)	34 (24.6)	48 (34.8)	30 (21.7)	5.38	1.471
		This unit regularly shares information with networks of experts outside the organisation.	11 (8)	14 (10.1)	9 (6.5)	24 (17.4)	31 (22.5)	33 (23.9)	16 (11.6)	4.54	1.772
		This unit quickly and accurately communicates new knowledge to key decision-makers.	3 (2.2)	6 (4.3)	5 (3.6)	7 (5.1)	35 (25.4)	56 (40.6)	26 (18.8)	5.44	1.383
		This unit regularly conducts post-audits and after-action reviews.	2 (1.4)	5 (3.6)	9 (6.5)	17 (12.3)	29 (21)	50 (36.2)	26 (18.8)	5.32	1.404

However, 4.4 – 13.1% indicated generally negative experiences regarding analysis. Specifically, 13.1% of respondents indicated that their organisational units did not revisit well-established perspectives during discussion, and 12.3% indicated that they did not experience engagement in productive conflict and debate during discussions. The overall mean for this component was 4.6, which fell in the second quartile, below the median benchmark score of 4.97. The high standard deviations of the different items show that respondents differed widely in their agreement to the different items ($SD > 1.00$).

The *education and training* component results showed that 46.3 – 74.7% of respondents generally have positive experiences and 5.8 – 13.8% experienced their organisational units negatively in this regard. A majority (74.7%) indicated that training is valued in their organisational units. A smaller majority (58%) indicated that new employees get adequate training, while 52.9% indicated that experienced employees get opportunities for training updates. Also, 56.5% indicated that time is made available for education and training activities. The overall mean for this component was 5.24, which fell in the second quartile, below the median benchmark score of 5.60. The high standard deviations of the different items show that respondents differed widely in their agreement to the different items ($SD > 1.00$).

Respondent experiences in terms of the *information transfer* component indicated that 35.5 – 59.4% generally experienced it positively in their organisational units, while 5.0 – 18.1% generally experienced it negatively. More specifically, only 35.5% of respondents indicated that their organisations shared information with networks of experts outside the organisation, and 18.1% indicated that this was not the case. More respondents (59.4%) indicated that their organisational units had forums for meeting with and learning from experts from other departments, teams, or divisions, and that new knowledge was quickly and accurately communicated to key decision-makers. Generally, the perception seemed to be that information transfer seemed to take place more between internal stakeholders than between the organisational units and external stakeholders. The overall mean for this component was 5.20, which, fell in the third quartile, above the median benchmark score of 4.97. The high standard deviations of the different items show that respondents differed widely in their agreement to the different items ($SD > 1.00$).

For the *concrete learning processes and practices* dimension as a whole, the mean score for *information collection* was highest (5.51), although the only component score that was indicated as being above the benchmark median score was that of the *information transfer* component. The overall mean score for the whole dimension was 5.08, which fell in the second quartile, still below the median benchmark score of 5.18. This indicates that as a whole the respondents did not generally experience their organisational units to have the necessary learning processes and practices in place, specifically in terms of the opportunity to experiment, collect and analyse information, and receive adequate education and training. They did, however, indicate that they experienced information transfer to be adequate.

7.2.3. Leadership that reinforces learning whole group results

This dimension was measured on a 5-point scale and interpreted as scores between 4-5 indicating positive experiences and scores between 1-2 indicating negative experiences. Table 5 provides the responses for managers as a whole in agricultural organisations in terms the *leadership that reinforces learning* dimension.

Generally, managers seemed to experience their leaders as reinforcers of learning positively. Positive experiences were indicated by 52.9 – 79.7% of respondents, while 5.7 – 21.0% indicated negative experiences in this regard. Specifically, 79.7% indicated that their managers invited input from others during discussions, and 72.1% indicated that their managers asked probing questions, and 71.7% indicated that their managers listened attentively (although 14.4% indicated that they did not experience this). Also, 21% of respondents indicated that they experienced their managers as criticising points of view that differed from theirs, and 52.9% indicated the opposite experience in this regard.

Table 5: Descriptive analysis of whole group findings for leadership that reinforces learning

	Item	1	2	3	4	5	Mean	SD
Leadership that reinforces learning** (Mean = 3.65)**	My managers invite input from others in discussions.	1 (0.7)	8 (5.8)	19 (13.8)	52 (37.7)	58 (42)	4.14	0.917
	My managers acknowledge their own limitations with respect to knowledge, information, or expertise.	2 (1.4)	13 (9.4)	28 (20.3)	53 (38.4)	42 (30.4)	3.87	1.002
	My managers ask probing questions.	2 (1.4)	6 (4.3)	18 (13)	50 (36.2)	62 (44.9)	4.19	0.925
	My managers listen attentively.	2 (1.4)	18 (13)	19 (13.8)	46 (33.3)	53 (38.4)	3.94	1.086
	My managers encourage multiple points of view.	3 (2.2)	15 (10.9)	27 (19.6)	48 (34.8)	45 (32.6)	3.85	1.066
	My managers establish forums for and provides time and resources for identifying problems and organisational challenges.	5 (3.6)	10 (7.2)	25 (18.1)	56 (40.6)	42 (30.4)	3.87	1.045
	My managers provide time, resources, and venues for reflecting and improving on past performance.	6 (4.3)	7 (5.1)	29 (21)	53 (38.4)	43 (31.2)	3.87	1.052
	My managers criticise views different from their own point of view. (R)	7 (5.1)	22 (15.9)	36 (26.1)	37 (26.8)	36 (26.1)	3.53	1.185

**Means are out of a maximum of 5. (R) indicates a reverse-scored item.

The mean score for this dimension was 3.65, which falls in the second quartile, below the benchmark median score of 3.80.

7.2.4. Summary of whole group results

The results, overall, indicate that, generally, managers in agricultural organisations do not experience their organisational units as learning organisations. This is indicated by most of the component score means, as well as the fact that these fall below the median of the benchmark scores. Even so, some of the components experienced more positively by respondents include the *collection of information* and *collection transfer*, while components experienced less positively include *time for reflection* and *appreciation of differences*, *psychological safety* and *analysis*.

7.3. Generational cohort results

A comparison between the scores of managers from the different generations measured against the different composites from the three building block dimensions of a learning organisation.

As can be seen from **Error! Not a valid bookmark self-reference.**, the standard deviations show very high values for all the constructs and these high values are visible throughout on all dimensions and components, indicating that there are large variations in opinions between participants from the same generational cohorts. It is therefore clear that everyone in a particular group does not necessarily share the same views and as a result one can only perceive a tendency, and findings must therefore be interpreted relative rather than definitive.

7.3.1. Supportive learning environment - generational cohort results

In terms of *psychological safety*, although results fall above the statistical significance level, there is an indication that there may be practically (though not statistical) significant differences between the generational cohorts. The effect size values showed very little difference between the respondents of Generation X and Generation Y, but there was a small-approaching-medium effect size difference found between the experiences of Baby Boomers and Generation X, and a small effect size difference between the Baby Boomers and Generation Y, indicating in both cases that Baby Boomers seem to experience more psychological safety in their organisational units than the other two generational cohorts.

About *appreciation of differences*, mean scores differences between the three cohorts were statistically and practically insignificant, reflecting very small effect sizes between the cohorts.

The *openness to new ideas* component results indicates that there are statistical and practical differences between the different generational cohorts. Baby Boomers showed the highest mean for this component, with the effect size difference between them and the Generation Y cohort being medium-approaching-large effect, while the effect size between the Baby Boomers and Generation X indicated a medium effect. The Baby Boomers seem to experience their organisational units significantly more open to new ideas than do the Generation X and Generation Y cohorts.

For the *time for reflection* component, it was noted that the mean score for all generational cohorts indicated that time for reflection was experienced the least of all the components by all three generational cohorts. Differences between the generations fell above the statistically significant level, but effect sizes were noted between the Baby Boomers and both Generations X and Y (although these were small), with Baby Boomers' experience of time to reflect being indicated as slightly higher than those of the other two generational cohorts.

Table 6: Generational cohort analysis

Dimension	Component	Cohort	M	SD	p ¹	p ²	d	
							Gen Y	Gen X
Supportive learning environment	Psychological safety	Gen Y	64.65	9.88	0.086	0.16		
		Gen X	64.08	11.60			0.05	
		Baby Boomers	69.74	13.08			0.39	0.43
	Appreciation of differences	Gen Y	65.30	9.13	0.886	0.92

* Significance level $p \leq 0.05$; *SD* = Standard Deviation; *M* = Mean; p^1 = ANOVA significance value; p^2 = Welch's t-test significance value; *d* = Cohen's effect size

For the *supportive learning environment* dimension there seem to be specific differences between the generational cohorts in terms of their experiences of *openness to new ideas*, where it is statistically significantly indicated that the Baby Boomers experience their organisational units as more open than do the Generation Y and Z cohorts. There is also a possibility that Baby Boomers experience slightly more *psychological safety* in their organisational units than do Generations X and Y, although these results were reported as slightly above the norms for statistical significance. Results on differences between the different generational cohorts were found to be insignificant with very small effect size for *appreciation of differences*, while differences in terms of *time for reflection* were also statistically insignificant, but small effect sizes were noted between the Baby Boomers and the other two generational cohorts, with Baby Boomers indicating a higher experience of this component than the other two generations.

7.3.2. Concrete learning processes and practices - generational cohort results

For the *experimentation* component, differences between generational cohorts were found to be statistically insignificant and the effect sizes very small, although a bigger (yet still small) effect size was noted between the Baby Boomers and Generation X, which may indicate that on a practical level, Baby Boomers seem to experience more *experimentation* in their organisational units than do the Generation X cohort.

The *information collection* component generally received higher mean scores from all the generational cohorts. However, these differences between the different generational cohorts were found to be statistically and practically insignificant, with very small effect sizes indicated between cohorts.

Differences between the different generational cohorts in terms of the analysis component were indicated as statistically insignificant. However, a small-approaching-medium effect size was found in differences between the Baby Boomers and Generation Y, and a small effect size noted between the Baby Boomers and Generation X, indicating that Baby Boomers experience more *analysis* taking place in their organisational units than do either Generation X or Y.

For the *education and training* component, it was noted that differences between generational cohorts were found to be statistically insignificant, but small effect size differences were found between Generation X and Y, and between the Baby Boomers and Generation X, with Generation X reporting experiencing less *education and training* in their organisational units than Generation Y, and the Baby Boomers seeming to experience more education and training than Generation X.

For the *information transfer* component, the mean scores indicate that, the differences between generational cohorts were shown to be statistically insignificant, although the effect size showed that there were small effect differences between Generation Y and Generation X, with Generation Y experiencing more information transfer taking place in their organisational units.

For the *concrete learning processes and practices* dimension as a whole there were no statistically significant differences found between the generational cohorts on any of the components, although small effect sizes were reported between the Baby Boomers and Generation X for *experimentation*, small-approaching-medium effect sizes between the Baby Boomers and Generation Y, as well as a small effect between the Baby Boomers and Generation X for *analysis*, small effect between Generation X and Y, and between the Baby Boomers and Generation X for *education and training*, and small effect differences between Generation Y and Generation X for their experience of *information transfer* in their organisational units. Very little difference was found between the cohorts in terms of their experience of *information collection* in their organisational units.

7.3.3. Leadership that reinforces learning - generational cohort results

For *leadership reinforcing learning*, differences found between the cohorts were reported to be statistically insignificant, and any effect sizes very small.

7.3.4. Summary of generational cohort results

Overall, Baby Boomers indicated an overall higher average mean score of 70.11 than Generation X, with an average mean score of 64.20 and Generation Y with an average mean score of 63.27.

Component differences between the three generational cohorts were found to be above the statistical significance level ($p \geq 0.05$) in all but the *openness to new ideas* component, and effect sizes were negligible for the *appreciation of differences*, *information collection*, and *leadership that reinforces learning* components. There were, however, notable differences between the cohorts for all the other components, with the Baby Boomers seeming to experience more *psychological safety*, *openness to new ideas*, *time for reflection*, *experimentation*, *analysis*, *education and training* in their organisational units than the other two cohorts. Another result to be noted is that Generation Y seemed to experience slightly more *education and training* and *information transfer* than Generation X.

7.4. Summary of overall results

The primary objective of the study was to determine whether agricultural organisations are learning organisations. The processed data from the assessment tool were compared against the baseline data used as benchmark scores. Overall, the mean scores for the different dimensions were indicated to fall in the second quartile for all the mentioned dimensions, which is well below the median for each. The

results of this research showed, therefore, that agricultural organisational units are not experienced by their managers to be learning organisations.

The secondary objective of the study was to compare the experiences of managers in different generational cohorts with regards to the building block components. Indications are that, although all the cohorts showed high standard deviations on all the components, the Baby Boomers show mostly the highest standard deviation of all the generational cohorts and that the variance in opinions within groups tends to decrease to the younger generations and, although still large, they are roughly considered likely to be more uniform in their opinions on the different components. Generation Y seem to be the most inclined to uniformed thinking, while Generation X tends to indicate greater individuality of opinions similar to the Baby Boomers. There was little difference between the generational cohorts' experience of *appreciation of differences*, and *time for reflection* was indicated as being the least experienced by all the generational cohorts. *Information collection* was given the highest mean scores by all generational cohorts, indicating that they all experienced this component more in their organisational units relative to other components. The results also indicated that the Baby Boomers and Generation Y are closer in their ratings of the experience of the assessed components than the Baby Boomers and Generation X are.

8. Managerial Implications

Although this study was limited to only managers employed by three of the biggest companies in the agricultural sector and the assessment tool was not specifically designed to measure the influence of managers from different generational cohorts to the assessment criteria in the assessment tool, the results did show an inclination, or natural tendency, from managers from the same generational cohorts to behave in a particular way different to the other cohorts. Implications of this may be that managers from the different generational cohorts will have different influences on organisational learning based on the characteristics of the generational cohort that they are born to and therefore may drive learning and performance in the organisation in very different ways. For instance, the Baby Boomers generally seem to experience their current organisational units more positively in terms of learning than the younger generational cohorts. This is important for a few reasons, namely, that the Baby Boomers are still in many instances the senior managers and leaders in organisations, indicating that they may possibly be in a comfort zone that is not inclusive of the needs of all the upcoming managers that are coming after them (such as Generations X, Y and Z), and may not be as aware of the need for change or learning in the organisations as the younger cohorts coming after them, which may potentially lead to stagnation in the organisations that may take too long time to change. Baby Boomers can potentially be valuable mentors to the younger generations, if their awareness of the need for changes to accommodate the younger generations can reach the levels of maturity needed to be able to adapt to such changes.

9. Conclusion

In terms of the research objectives and the outcomes reached, it was established that the managers in agricultural organisations studied during this research do not experience their organisational units as being learning organisations. Furthermore, it was also clear that there may be differences between how managers from different generational cohorts experience their organisational units as learning organisations.

The results of the research may produce information that will advocate additional probing and investigations into the research field as to whether other organisations from other disciplines are learning organisations and what the experiences of managers from different cultures and genders is relating to their organisational units as learning organisations. The survival and continued existence of agricultural organisations may rely on the mere fact of sharing experiences and reflecting on the past to attempt to influence the present and the future. The study may contribute to a better understanding of generational differences within the South African context in that it provides further comparisons and possibilities on how generational differences manifest within different organisational contexts as well as inter-organisational contexts. Research on this topic is extremely limited from a South African perspective, and this research may contribute to filling the existing gap in available research. Also,

due to the data being available, a further contribution would be to draw a comparison between the different genders. This would also be valuable with women becoming more prominent as part of the management teams in organisations in South Africa.

The study also provides new information about how generational disparities in the agricultural sector manifest, and this forms a new addition to the pre-existing literature concerning an organisational learning culture. In addition, comparisons between generations and learning organisations can influence how organisations think about the role of managers from the different future generational cohorts. The influence of managers from the different generational cohorts on the future of organisations can be organised in such a way that these dynamics are to the benefit of the organisation, and to mitigate problems that may arise with the increasing challenges of intergenerational management that comes with – for the first time in history - five generational cohorts being part of the current workforce.

The growing percentage of younger people in South Africa makes it essential to specifically understand what their views and opinions are pertaining to specific trends and issues. Future studies can further contribute to what the important issues are for the different generational cohorts and comparing trends between the cohorts and find ways to apply these findings to maximise the contributions of the different cohorts and to ensure that they can work and learn together to create and build effective learning organisations. Lastly, determining how agricultural learning organisations can work to prepare the workforce to meet the critical 21st century competitiveness and skills requirements would also be valuable as future research.

Building learning organisations in the agricultural sector is critical for maintenance and progression of their role in society in providing food and sustaining society at large. The dimensions and components of the utilised assessment tool can be used as guidelines and a frame of reference on how to build such learning organisations. The findings of this study can also be utilised to proactively understand and forecast gaps and needs that may arise as each generation passes into and out of the workplace, in order to put strategies in place to mitigate weaknesses and leverage on the strengths of each generational cohort.

Abstract

The financial performance of companies is usually measured by single financial indicators, such as return on equity, return on assets or return on sales, and Tobin's Q or stock prices. But a company's financial health is the product of many indicators at the same time. Therefore, the aim of the research is to construct a class of synthetic measures that will describe the standing of companies in the multidimensional space of financial indicators and will be useful for comparisons among companies. Methodology of vector taxonomic measures was adapted and vector synthetic measures of firm effectiveness VSME were constructed. For the measure construction financial indicators retrieved from annual reports were used. The research is based on financial and non-financial companies listed on the Warsaw Stock Exchange for the years 2010-2019. But only companies that were listed during the whole period and had full records of the distinguished financial indicators were qualified for the study. Finally, 90 companies were selected (73 non-financial and 17 financial) described by more than 20 financial indicators. The study showed that the proposed VSME vector measures of firm effectiveness reflected well the financial condition (standing) of the companies and allowed them to be effectively distinguished, also over the time.

1. Introduction

According to the theory of the firm, the main purpose of an enterprise is to maximize its wealth. Evaluation of firm value has attracted great attention of researchers because it creates the competitive position of the enterprise. The increasing of firm value causes that the enterprise can obtain many benefits, among others, access to source of fund from financial market, high selling price or value when the firm is bought or merged. Company value is also very important, because it affects stockholders' prosperity and it influences investors' decisions, especially those who use fundamental analysis to determine their decisions (Dietrich & Krafft, 2014).

The share prices which represent market value depend on internal and external factors. Assessing a firm equity value bases on the analysis of published financial statements and other information. This analysis attempts to measure a company's intrinsic value by examining related economic and financial factors including the balance sheet, strategic initiatives, microeconomic and macroeconomic indicators, together with consumer behavior.

A modern approach to assessing the economic and financial condition of enterprises is applying the multidimensional comparative analysis methods. These methods allow to construct aggregated measures on the basis of many different variables, describing the condition of the company. In other words, to examine the state of the enterprise, its major economic and financial factors such as financial liquidity, level of debt, management effectiveness, profitability, etc. are taken into account (Bacidore et al., 1997; Bulgurcu, 2012).

Our hypothesis states that it is possible to construct a class of vector synthetic measures, applying the methodology proposed by Nermend (2010), that will describe the standing of companies in the multidimensional space of financial indicators and will be useful for comparisons among companies over time. Due to the space of explanatory variables, i.e., financial ratios, such a measure will be called the vector synthetic measure of firm effectiveness VSME. The aim of our research is to construct the VSME measures and verify their applicability using companies listed on Warsaw Stock Exchange (Poland)³.

The research covers companies from the portfolios of the WIG20, WIG30, mWIG40 and sWIG80 indices of the Warsaw Stock Exchange for the period 2010-2019. However, only those companies were selected which were listed throughout the study period and had a full record of distinguished financial indicators. Finally, 90 companies were qualified (73 non-financial and 17 financial, including 9 banks), which were described by more than 20 financial indicators. Investigation was provided using multidimensional measures constructed separately for nonfinancial and financial companies, and for all analyzed companies.

2. Literature Review

There is a great body of studies concerning value of a firm. Let's mention at least some of them to position our research within such a background. Thus, many approaches are based on trade-off, pecking order, agency, and signaling theories (Sudiyatno et al., 2020), in addition to the theory of dividend irrelevancy and the theory of the bird in the hand (Winarto, 2015). Firm value is also often considered in the context of resourced-based view (Pachowski, 2016; Sładkiewicz, 2015) and value created idea, which employ willingness-to-pay concept (Brandenburger & Stuart, 1996). Preference theory, expectation theory or behavioral economic theory are also used (Skrzek-Lubasińska, 2020). However, we are particularly close to the approach of Thavikulwat (2004), who determines the value of a company through the five different components: book value, market value, capitalized value, deductive judgment and adjusted net worth.

Determinants of firm's value are also discussed in studies by Bacidore et al. (1997), Bulgurcu (2012), Endri & Fathony (2020), Myšková & Hájek (2017), Nguyen et al. (2021), Sampurna & Romawati (2020) or Saona & San Martin (2018) among others. In these studies, the determinants of a company's value are sought among:

- internal factors such as ownership concentration, size of firm, capital structure, and dividend policy together with performance factors, including liquidity, profitability, sales indicators, cash flows, assets, and
- external factors such as legal enforcement and regulatory systems together with the development of the financial system,

and investigations were performed using panel regression models for data on public companies listed on national stock exchanges.

The first proposal of using a taxonomic measure to compare public companies in the process of investment portfolio construction was so-called taxonomic measure of investment attractiveness (Tarczyński, 1994; Łuniewska & Tarczyński, 2022). There have been many attempts to construct taxonomic measures which have been used:

- to evaluate the state of enterprises (Fura, 2019; Kompa, 2019; Tarczyński & Tarczyńska-Łuniewska, 2017);
- to select companies for the investment portfolio construction (Tarczyński, 2002; Witkowska, Kompa, Staszak, 2021) and

³ The choice of public companies for our study is due to the fact that only such companies are required to publish their financial reports. The data provider for this study is the Notoria Serwis information agency, an authorized distributor of data on companies listed on the Warsaw Stock Exchange. The data were accessed free of charge for research purposes.

- to find out the relation between financial condition of companies and their performance (Juszczak, 2015; Staszak, 2018; Witkowska & Kuźnik, 2019).

These research examples used the synthetic measure of development proposed by Hellwig (1968), which is a linear ordering method. The majority of variables in the constructed measures based on financial coefficients evaluated from the data in the balance sheets of investigated companies. The idea of Hellwig's indicator bases on the taxonomic distance of analyzed objects from the pattern which is distinguished by the measure constructor. In other words, each object which is described by selected diagnostic variables is compared to the multidimensional pattern which may be either the real or hypothetical object. However, this indicator cannot recognize the objects which are better than a pattern. Therefore, the disadvantage of this measure application in temporal analyses is the necessity to find out a new pattern in every investigated period or to define a global pattern for the entire time span. However, it should be noted that: (1) the measure values obtained from cross-period research, with benchmarks defined for each period separately, are not comparable over time, while only the positions of the objects being ordered are comparable; (2) calculation of measures with the new global benchmark does produce comparable results for all panels, but the results are not comparable to the previous ones.

The novelty of our approach lies in the use of the vector measures methodology proposed by Nermend (2010) for the synthetic measurement of companies' effectiveness. The choice of vector measures was not made by chance. This is because they are free from many disadvantages of other taxonomic measures. Thus, we will (a) construct vector taxonomic measures of firm effectiveness VSME, (b) use them for grouping firms into four homogeneous clusters, and (c) check the stability of firms' positioning to the distinguished clusters in subsequent years (i.e., the persistence of firms' standings). Persistence of firm positioning will be tested using a synthetic measure of distance between the clusters in which the evaluated firms are located.

3. Data and Methods

Companies listed on the Warsaw Stock Exchange in the years 2010-2019 were used to achieve the assumed purpose of the study. Only those companies were taken into account that on 30 December 2019 created index portfolios: WIG20, WIG30, mWIG40, sWIG80 and were simultaneously listed throughout the period covered by the study. An additional condition for qualifying companies for the analysis was the availability of annual reports in the resources of Notoria Serwis. Finally, 90 companies were selected for the study - 73 non-financial companies and 17 financial companies, including 8 banks.

Table 1. List of financial ratios used to assess banking and non-banking companies

Ratios	Banks	Other companies	Type of variable
Current ratio		X	S
Quick ratio		X	S
Debt ratio		X	D
Equity ratio in financing fixed assets	X		S
Return on assets ROA	X	X	S
Return on equity ROE	X	X	S
Return in sales ROS	X	X	S
Operating profit margin OPM	X	X	S
Income assets ratio	X		S
Days inventory outstanding		X	D
Days sales outstanding		X	D
Days payable outstanding		X	D
Asset turnover ratio		X	S
Productivity of fixed assets	X		S
Operating costs / assets	X		D
Operating costs / results on banking activities	X		D
Operating costs / core business income	X		D
Earnings yield P/E	X	X	S
Book-to-market ratio P/BV	X	X	S
Capital adequacy ratio CAR	X		S
Liquidity ratio IMF	X		S
EBITDA/assets		X	S

Note: X indicates a selection of financial ratios for banks and non-banking companies; borders indicate the variables used in the combined study including all companies; S, D denote variables being stimulants or de-stimulants respectively.

Source: own elaboration

The status and changes in the condition of the evaluated enterprises are mapped in various ways, most often by single financial indicators such as return on equity (ROE) and assets (ROA), return on sales (ROS), return on invested capital (ROIC), total shareholder return (TSR), the company's market value or Tobin's Q index.

In the presented study, the vector measure of development was used, which allows a dynamic assessment of the studied objects without the need to modify the pattern every year. It was assumed that the condition of the company in the subsequent years of the analysis was expressed by the value of the vector synthetic measure, constructed for the needs of this study in a multidimensional space of selected financial ratios. Table 1 contains a list of selected ratios along with information whether the ratio has a positive (S – stimulant) or negative (D – de-stimulant) impact on the company's condition. It was also marked which indicators were used to build measures for banks and which for other companies.

Due to the diversity of the set of variables which describe the companies of various types, synthetic measures were determined separately for (a) banks and for other companies, broken down into (b) financial companies other than banks and (c) non-financial companies, as well as for (d) all companies. These synthetic measures for companies classified as (a)-(c) were calculated using different sets of 14 variables whereas the measures for all companies were based on 6 common variables. All measures were determined separately for each year of the 2010-2019 analysis with a common pattern (distinguished for each group of companies separately) from the first year of the study.

It should be noted that the selection of variables for the synthetic measure construction is always arbitrary unless there exists the function which extremum should be obtained⁴. Our study uses indicators that are most often applied in the evaluation of enterprises, trying to take into account representatives of all groups of financial ratios, which also have appropriate statistical properties. At that, all selected indicators have the same impact to the measure value (i.e., they are not weighted). This approach is well established in the referenced literature.

The methodology for Vector Synthetic Measure of Effectiveness (VSME) calculation is based on Vector Measure Construction Method techniques (Nermend, 2017; Kompa & Witkowska, 2021) and is as following. Let the situation of each of N companies ($i = 1, 2, \dots, N$) be described by M diagnostic variables x_{jt}^i (where $i = 1, 2, \dots, N; j = 1, 2, \dots, M$), and observed in t ($t = 1, 2, \dots, T$) consecutive periods. Let the state of enterprises be evaluated in the following periods relative to the reference period $t_0 \in [1, T]$. It is assumed that evaluated objects are represented by vectors $\bar{X}_t^i = (x_{1t}^i, x_{2t}^i, \dots, x_{jt}^i, \dots, x_{Mt}^i)$ in the M -dimensional feature space. There are analyzed projections of these vectors onto some measuring vector $\vec{\omega}_{t_0} = (\omega_{1t_0}, \omega_{2t_0}, \dots, \omega_{Mt_0})$, which is spanned between ends of two vectors: $\vec{X}_{t_0}^p = (x_{1t_0}^p, x_{2t_0}^p, \dots, x_{Mt_0}^p)$ – vector of the pattern, and $\vec{X}_{t_0}^{ap} = (x_{1t_0}^{ap}, x_{2t_0}^{ap}, \dots, x_{Mt_0}^{ap})$ – vector of the anti-pattern, determined for the reference period t_0 and remaining constant throughout the study time span. The pattern is understood as the hypothetically best object according to the adopted criteria, and the anti-pattern – the worst object⁵. In result, the length of each vector \bar{X}_t^i (company vector) along the vector $\vec{\omega}_{t_0}$ (measuring vector) is determined, as a multiple of the length of vector $\vec{\omega}_{t_0}$. Thus, defined here vector synthetic measure of effectiveness $VSME$ has the following form:

$$VSME_{it} = \frac{\sum_j [(z_{jt}^i - z_{jt_0}^{ap}) \omega_{jt_0}]}{\sum_j \omega_{jt_0}} \quad \text{for } i=1, 2, \dots, N, \quad j=1, 2, \dots, M, \quad t=1, 2, \dots, T \quad (1)$$

where i indicates number of the company under investigation (i -th company), N – the total number of companies, j – number of explanatory variable (j -th indicator), M – number of ratios describing the company (dimension of vector space), t – year of the study, t_0 – reference year of the study, T – total number of research periods, ω_{jt_0} – difference of normalized j -th coordinates of pattern and anti-pattern in M -dimensional vector space:

$$\omega_{jt_0} = z_{jt_0}^p - z_{jt_0}^{ap} \quad (2)$$

and $z_{jt_0}^p, z_{jt_0}^{ap}, z_{jt_0}^i$ – normalized j -th components of the vectors of the pattern, the anti-pattern and the i -th company, respectively, for the reference period t_0 , z_{jt}^i – i -th company vector components normalized for the other t research periods. All components are determined from sets of stimulant \mathbb{S} and destimulant \mathbb{D} values as:

$$z_{jt_0}^p = (x_{jt_0}^i - \bar{x}_{jt_0}^i) / S_{jt_0} \quad t \neq t_0 \quad (3a)$$

$$z_{jt}^p = (x_{jt}^i - \bar{x}_{jt_0}^i) / S_{jt_0} \quad t \neq t_0 \quad (3b)$$

$$z_{jt_0}^p = \begin{cases} \max_{i=1,2,\dots,N} \{z_{jt}^i\} & \text{for } x_{jt}^i \in \mathbb{S} \\ \min_{i=1,2,\dots,N} \{z_{jt}^i\} & \text{for } x_{jt}^i \in \mathbb{D} \end{cases}, \quad t = t_0 \quad (3c)$$

⁴ For instance, Witkowska et al. (2021) selected a set of financial ratios which should be used for the synthetic measure construction which is to be used to optimize investment portfolio construction. In this research functions describing rates of return from portfolio and its risk were optimized.

⁵ The more detailed discussion of pattern and anti-pattern selection can be found in the work of Nermend (2010).

$$z_{jt_0}^{ap} = \begin{cases} \max_{i=1,2,\dots,N} \{z_{jt}^i\} & \text{for } x_{jt}^i \in \mathbb{D} \\ \min_{i=1,2,\dots,N} \{z_{jt}^i\} & \text{for } x_{jt}^i \in \mathbb{S} \end{cases}, \quad t = t_0 \quad (3d)$$

where: \bar{x}_{jt_0}, S_{jt_0} – mean value and standard deviation of j -th variable, respectively:

$$\bar{x}_{jt_0} = \frac{1}{N} \sum_{i=1}^N x_{jt_0}^i, \quad S_{jt_0} = \sqrt{\frac{1}{N} \sum_{i=1}^N (x_{jt_0}^i - \bar{x}_{jt_0})^2} \quad (4)$$

Although the value of the measure itself has no economic interpretation⁶, the higher the value, the better the situation of the assessed object. It should be noted that the VSME measure is robust to the occurrence of facilities that are better than the benchmark. Thus, it can be applied to both cross-sectional and cross-temporal data without changing the pattern established in the first sub-period of the study, and the calculated aggregate values are comparable throughout the study interval.

Clustering of all investigated companies into four clusters is made according to the following decision rules:

$$\text{I. the best firms in the sector} \quad \text{when} \quad VSME_{it} \geq \overline{VSME}_t + S_{VSMEt}; \quad (5)$$

$$\text{II. good firms in the sector} \quad \text{when} \quad \overline{VSME}_t + S_{VSMEt} > VSME_{it} \geq \overline{VSME}_t; \quad (6)$$

$$\text{III. catching up firm in the sector} \quad \text{when} \quad \overline{VSME}_t > VSME_{it} \geq \overline{VSME}_t - S_{VSMEt} \quad (7)$$

$$\text{IV. poor firms in the sector} \quad \text{when} \quad \overline{VSME}_t - S_{VSMEt} > VSME_{it} \quad (8)$$

where, for each $t=2010, 2011, \dots, 2019$: $VSME_{it}$ – measure value evaluated for i -th company in t -th year,

\overline{VSME}_t – average value of the measure in t -th year, S_{VSMEt} – standard deviation of the measure in t -th year.

Classification according to rules (5)-(8) results in four ordered clusters of companies, although each company may be recognized to belong to a different cluster during different research years. To decide about the cluster to which the companies belong within the whole research period, the majority voting rule is applied. In other words, the firm belongs to the cluster to which the firm belongs the most often. It is also interesting to find out which companies are classified into the same clusters in the following years, and which change the clusters the most often. To evaluate the level of persistency (“instability of standing over time”), the following measure is applied:

$$W = \sum_{k=0}^3 \frac{y_k}{2^k} \cdot 100\% \quad (9)$$

where y_k – the share of the distance equals k ($k=0, 1, 2, 3$) among classes. Value of the measure W equals 100% if the company does not change the class. The smaller value of W means less stability of the company effectiveness.

4. Empirical Results

As it was already mentioned, companies are evaluated using vector taxonomic measures of effectiveness (1) which were constructed for all 90 companies, and separately for banks, other financial companies and nonfinancial companies on the basis of different sets of variables (see Table 1). Values of the VSME

- evaluated using 14 financial coefficients are presented in Tables 2 and A1, A2 (in the Appendix), and
- evaluated on the basis of 6 variables common to all companies are shown in Tables A3 and A4.

⁶ The value of all taxonomic measures has no economic interpretation, and it is devoid of measurement units, see for instance the best-known synthetic measures such as Human Development Index or Human Poverty Index.

Tables 3 - 7 present clusters containing enterprises qualified according to rules (5)-(8).

It is worth mentioning that the highest values of the measure evaluated for banks were in 2012, and the smallest in 2015. In other words, the highest effectiveness of banks appeared in 2012 whereas the lowest in 2015. The classes to which the banks belong are presented in Table 3. Taking into account, all years of investigation and all banks, they are classified to the second cluster the most often (i.e. 34 among 80 cases), then to the third cluster (24 cases), and to the first and the fourth cluster (11 cases each).

Table 2. Values of synthetic measures VSME evaluated for banks using 14 variables due to (1)

Year	Handlowy	Millennium	BOŚ	PEKAO	ING	MBank	PKO_BP	Santander

Analyzing the rest of financial companies, which were evaluated using 14 variables⁷, it may be noticed that the highest values of the measures was in 2010 and the smallest in 2018 and 2019. As one may notice in Table 4, classification to the third cluster was the most often (27 times among 80 cases), then to the second one (28 times), to the fourth cluster (13 times) and to the first cluster (12 times).

Non-financial companies (Table 5) are evaluated using the measure which was constructed on the basis of the same variables as nonbanks. Considering these firms, the highest effectiveness was obtained in 2010, and the lowest in 2019. However, these differences are not so visible as in financial institutions. The second class contains the majority of cases (41.8%), then the third cluster (37.8%), the last one (12.25%), and the first cluster (8.5%).

⁷ Evaluation of the vector taxonomic measure using 14 variables distinguished for financial companies not being banks was provided for 8 companies since we excluded Insurance Company PZU from this analysis because there was lack of data concerning several ratios e.g. days inventory outstanding.

Taxonomic measures were also evaluated for all companies using 6 factors. If all companies are taken into account, 2010 is the year when these companies were the most effective whereas 2019 characterized the least effectiveness of firms. The same situation is observed for nonfinancial companies, and the similar for all financial companies although the lowest effectiveness is observed in 2018 and 2019. All analyzed companies belong to the third cluster the most often i.e., 61.2% of cases, then to the second one (26.4%), to the first cluster (7.2%) and to the fourth class (5.1%). Dividing companies into two groups, we notice that among:

- nonfinancial firms 6.3% of cases belong to the first cluster, 29% to the second class, 58.8% to the third cluster and 5.9% to the fourth one;
- financial firms 11.2% of cases belong to the first cluster, 15.3% to the second one, 71.8% to the third cluster and 1.8% to the last class.

Source: own elaboration on the basis of Table A3

In the last step of our research, we examined the stability of companies' positions by checking how often and "how far" the companies change their positions. To obtain this aim the majority voting rule and the measure (9) were used. The obtained results are presented in Tables 8, 9 and 10. If all companies are used to evaluate taxonomic measures of effectiveness (i.e., using 6 variables) all banks except ING keeps the same positions in the third cluster. For the VSME evaluated for banks only (i.e., using 14 variables), the investigated companies belong to all clusters in different years. According to these measures, the most stable banks are ING and Santander. PEKAO is the least stable bank, and it belongs to the clusters 1, 2 and 3 the same times (3 years in each cluster). It is also difficult to distinguish the dominated cluster for Millenium, because it was classified to the second and the third cluster for the same number of years.

Due to VSME evaluated for all companies (Table 9), two financial companies (MWTrade and Pragma_F) stay in the third cluster together with Ipopema, which was classified to this cluster in nine years and Pragma_I which was classified to this cluster in seven years. Other three financial companies – ECO, GPW and VOTUM belong to the second cluster most often, and Quertus – to the first one in 9 years. Insurance company PZU belongs to the second and the third clusters in five years. Applying VSME evaluated for the rest of financial firms, eight companies are classified to different clusters. Among them Quertus seemed to be the most stable being classified to the first cluster in nine years.

Table 8. Banks: Stability of VSME measure and dominated clusters due to (9)

Non-financial companies are classified to all classes regardless the way of evaluation of the measures VSME. Using VSME calculated for all companies, eight companies are stable – six of them belong to the third class, one to the second and one to the first class. Using VSME evaluated for nonfinancial companies, there are 16 firms which were classified to the same class in all 10 years. Two of them belong to the first class, ten to the second class, one to the third class, and three to the fourth class.

4. Managerial Implications

Assessing the health of companies is a key issue in the economy, in economic policy, for financial markets and in their economic environment, and company ratings are an integral element of decision-making in all spheres of activity of modern societies. Just as there is no one-size-fits-all method of assessing a company's situation, there is no one-size-fits-all methodology for comparative studies of

economic objects. In our research, we affirm a multidimensional approach to the firms' taxonomy and focus on aggregated synthetic measures.

The vector synthetic measures of firm effectiveness (VSME) presented here transform the M-dimensional space of values of company ratios, into a single numerical value. This allows unambiguous positioning of the N companies under study from the point of view of all the factors considered simultaneously.

The presented methodology can be applied, among other things, in the broadly understood management in the creation of all kinds of rankings of firms and their cross-temporal comparisons for the purposes of cohesion or budgetary policies (e.g., subsidies). At the same time, it opens the field for the development of other applications, depending on the set of explanatory variables used.

5. Conclusion

Taxonomic measures have universal character and according to the set of diagnostic variables selection can be adequate and reliable to the firm's taxonomy in various aspects - in the context of intrinsic enterprise value, enterprise efficiency, effectiveness, productivity, etc. Synthetic measures could be also used when evaluating and comparing different companies over panels and over time.

The purpose of our research was to construct a synthetic measure of firm effectiveness VSME applying Vector Measure Construction Method and verify VSME applicability for selected public companies. The vector synthetic measure we constructed can be applied to any of the listed aspects in the companies' taxonomy. Its essence is determined by the chosen set of descriptive variables and the way they are treated. We used rigorously selected balance sheet financial indicators, which authorizes us to treat it as a synthetic vector measure of firm effectiveness VSME in the multidimensional space of financial indicators.

The study showed that the proposed VSME vector measures of firm effectiveness reflected well the financial condition (standing) of the companies and allowed to distinguish them effectively, also over the time. It was shown in presented Tables that the larger set of diagnostic variables allows to construct a measure that better differentiate enterprises. It is also visible that factors used for the measure construction should be unique for the particular type of companies, such as banks. Therefore, it is recommended to use different variables for sets of companies representing different sectors of the economy.

systematic literature
review

Abstract

With the growing pressures of being a manager in recent times, it is a fair assumption that some errors can occur during their task execution. Sometimes, these errors happen due to incompetence, and other times they happen due cognitive biases. This manuscript presents a systematic literature review that sought to answer the following question: How does cognitive bias affect managers' skills? The reviewers obtained records from three research databases. After the implementation of inclusion and exclusion criteria, 20 records were analysed to answer the research question. This resulted in tabulated summaries that informed the creation of a conceptual framework. Overconfidence was the cognitive bias found to be most prominent among managers and entrepreneurs. This had mostly negative and some positive impact on managers' conceptual skills, leading to various consequences. Additionally, it was found that there is a need for more research in medium and small businesses in the agricultural, wholesale and property industries in Africa and Australia, among other trends and suggestions for future research. The authors of this review present some possible solutions for the consideration of managers and training providers. To conclude, the reviewers suggest combining similar cognitive biases such as overconfidence and the Dunning-Kruger effect to test the proposed moderating and mediating effects depicted in the conceptual framework. In addition to this, the reviewers also propose that future researchers and managers should consider the ability to deal with cognitive biases as an additional, technical managerial skill that requires consideration and mastering.

1. Introduction

The business world is placing many demands on managers. Not only are they expected to be kept abreast of the constant changes in their environments, be innovative in harsh economic settings and satisfy ever-more informed consumers; they have to do it all at the least cost to their bottom-line (Doroodi & Mohammadi, 2015:301; Faysse & Onsamrarn, 2018:23; Keh *et al.*, 2002:138; Tjosvold & Poon, 1998). Under these circumstances, managers are often required to make quick decisions without the consideration of the factors involved, leading to errors in decision-making (Pitz & Sachs, 1984:139; Tversky & Kahneman, 1974:1130) and possible long-lasting consequences in the business and managers themselves. This paper is an attempt at providing a comprehensive overview of these consequences by implementing principles of a systematic literature review (Grant & Booth, 2009:94-95). The authors of this paper are particularly interested in the impact of cognitive biases on managers, and the possible outcomes of this impact.

Managerial skills can broadly be described as the aptitude to decide business directions and strategies and lead their subordinates. The three most common approaches to managerial skills were identified

² E-mail address: Lerato.Mohalajeng@nwu.ac.za

by Katz (1974:90-102). These three categories are still relevant in recent times (Rudansky-Kloppers, 2019:208). The first is human skills, which are the capacity to interact with and motivate others. Technical skills are the ability to apply gained knowledge to trade and job-specific tasks. Lastly, conceptual skills refer to the ability to understand concepts, devise ideas and implement strategies (Rudansky-Kloppers, 2019:208-209).

Research on the constructs under discussion clearly is not novel; authors have been investigating them since as early as 1974. There is still much to learn, there are around 50 established cognitive biases that could be investigated within the managerial context and measuring all of them in one empirical study pertaining managers' skills is a daunting task. As such, the authors believe that a systematic literature review may be a good place to start elucidating the issue at hand. The current study sought to understand the relevant cognitive biases investigated in management spheres, what their impact is on managerial skills and how they can be solved, mitigated and/or eradicated. The authors mapped the current literature to highlight best practices, lessons learned from the sources and discuss future directives.

Much research on cognitive bias is in the psychological fields. From those studies, we deduce that there is a need for research in this construct in the field of business management as it potentially has an influence on managers' task execution. Cognitive bias has implication on thinking, which clearly impacts managers on many aspects of their managerial functioning (Shepherd *et al.*, 2015:11).

In the past, researchers have reported both positive and negative effects of cognitive biases on managers and particularly entrepreneurs (Busenitz & Barney, 1997). However, the comprehensive scope of the consequences of these findings on managers, entrepreneurs, and the business itself is not readily available. The current study addresses this issue by summarising the available articles and presenting the empirical findings in a condensed and approachable conceptual framework. As a common feature of systematic literature review, the current paper also makes numerous suggestions for future empirical and review studies that can be implemented by academics. The paper presents the numerous managerial implications in an accessible manner for the benefit of managers who have an interest in the topic and training programme developers who may seek to proactively address the issues or solve them retroactively.

To the best of the reviewers' knowledge, no systematic literature review has attempted to map the empirical studies investigating the consequences of the impact of cognitive biases on managerial skills. Notably, Thomas (2018) investigated cognitive biases over 20 years. This review, however, was limited to entrepreneurs, and the latest included source was from more than five years ago (2016). One database was consulted (EBSCOhost). and no PRISMA statement was given, which goes against the best practices proposed for systematic literature reviews in social sciences (Pahlevan Sharif *et al.*, 2019:32). Additionally, that reviewer was not interested in the impact of the cognitive biases on skills, choosing to focus on determinants such as the environment, personal factors and the business wherein the entrepreneurs function (Thomas, 2018:131).

Therefore, the current review sought to answer the following research question: How does cognitive bias impact managers' skills?

2. Methodology

The current review can be described as an overview with elements of a systematic literature review (Grant & Booth, 2009:94-95). The reviewers implemented a systematic search for the inclusion of research articles, summarised and tabulated characteristics of relevant studies and presents a conceptual framework that answers the research question. The rest of this section discusses the search strategy implemented, and also explains the section criteria, quality assessment and data extraction.

2.1 Search strategy

In this systematic review, the authors developed a search strategy to identify relevant literature sources. This search strategy was tailored to three comprehensive databases: Web of Science, Scopus and Science Direct, and the following search terms were used:

- Cognitive bias
- Managers
- Skills

All searches covered sources published until and including 2022; only English research journal articles, review papers and conference proceedings were included. The 2022 sources were included to provide as many records as possible and report the most up-to-date findings and trends. Table 1 shows the search strings used in the three selected databases.

Table 1: Search strings

Database	Search string
Web of Science	“Cognitive bias*” (Title) AND Manage* (Abstract) AND Skill* (Abstract) OR “Cognitive bias*” (Author Keywords) AND Manage* (Author Keywords)
Scopus	(TITLE-ABS-KEY ("Cognitive bias*") AND TITLE-ABS-KEY (skill*) AND TITLE-ABS-KEY (manage*))
ScienceDirect	Title, abstract, keywords: “Cognitive bias” AND Manager

Source: Own compilation

2.2 Selection criteria

Page *et al.'s* (2020) guidelines were implemented in the development of the PRISMA (Preferred Reporting Items for Systematic Reviews and Meta-Analyses) statement presented below. The study was focused on mapping available literature on cognitive bias in the field of social sciences, business and economics and business management. The authors narrowed the subject to management sciences fields. The research span was from inception to 2022 (ending the inclusion of sources in the month June of 2022), which allowed the authors to include some of the most recent records of the current year of the conduction of the research. No geographical limitations have been put on the records included as the initial results provided the scope of the inquiry to already be sufficiently narrow. A total of 138 research articles were identified at this stage of the review process. Five records were then removed for not being presented in English, leaving a total 133 potential sources extracted from the three databases (59 from Web of Science; 46 from Scopus and 33 from Science Direct).

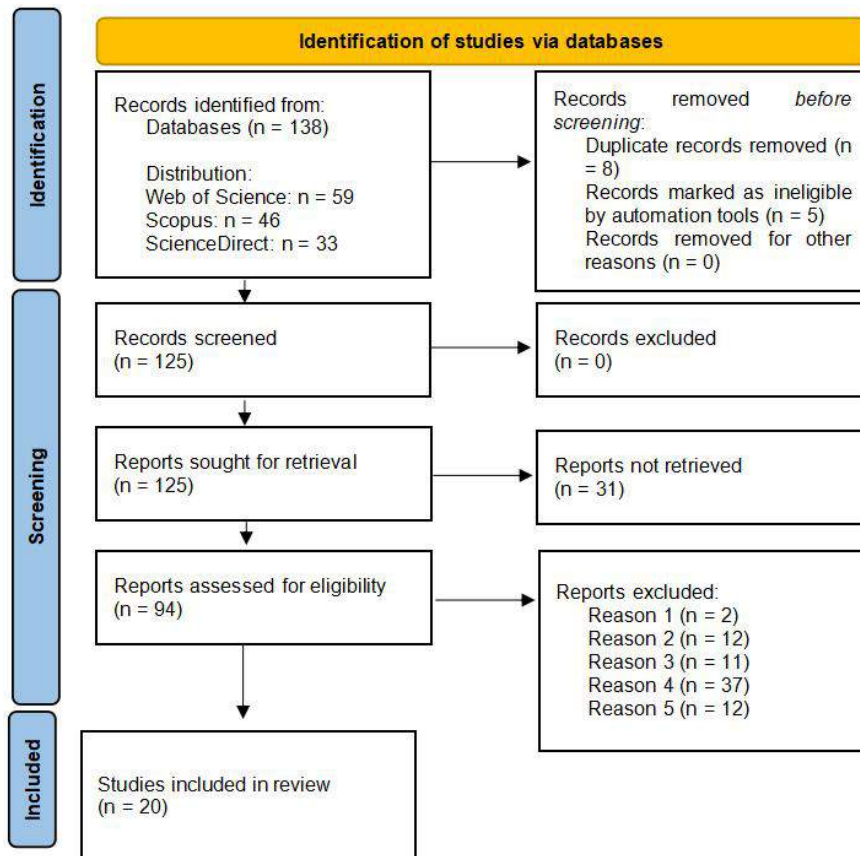

Figure 1: PRISMA statement

Table 2: Disclosure of additional reasons for record exclusions

Reason	Description
1	The publication language is not entirely English.
2	The publication is not an empirical study.
3	The publication is either not a research article or not a conference proceeding.
4	The participants of the published study are either not managers or not entrepreneurs.
5	The publication does not mention any cognitive bias in the abstract.

Source: Own compilation

*Automated removal of non-English papers.

2.3 Quality assessment

This study was only based on original research articles, review papers and conference papers. For the purpose of elevating the quality of this review, duplications were identified electronically using the reference management tool (Mendeley). All identified duplications were checked manually and confirmed to be duplicates before their removal from the records to be reviewed. This resulted in the removal of five articles. The remaining articles' abstracts were read thoroughly to assess their relevance for inclusion into the review process and initial analysis. In-depth analysis of the included articles was carried out at a later stage. The next manual exclusion criterion was to limit the sources to papers published entirely in the English language. There were only two articles that had an English title and an abstract written in French, which were excluded for additional further analysis. Furthermore, for the purpose of this study, the articles also had to mention a skill in the abstract of the article, the bias mentioned in the abstract must be a cognitive bias and there must be managerial implication of the article in the abstract. After additional filtration by the authors, 85 more publications were excluded from the study. Consequently, the authors selected 20 articles after screening and assessing each article's abstract on the inclusion and exclusion criteria. For inclusion in this systematic review, the authors had to have been able to access the full paper. One article was excluded due to lack of access to the full publication. Figure 1 (PRISMA statement) below illustrates inclusion and exclusion at every stage of the systematic literature review.

2.4 Data extraction

In the data extraction phase of this study, 20 articles were selected, and the characteristics extracted were:

- Original research papers that were peer-reviewed and published as articles, conferences papers or review studies. Conceptual papers, reports and pure case studies were excluded.
- The outputs must have been published in English in the discipline of managerial sciences.

From this literature, the authors were interested in the following aspects of the papers:

- The abstract of the research article;
- The literature review of the publication;
- The methodology followed in the study;
- The results and/or findings of the study; and
- The recommendations and/or conclusion made by the authors.

3. Results, discussion and recommendations for future research

3.1 Records distribution over the years

Figure 2: Publications and citations
Source: Own compilation

Figure 2 depicts the number of publications and citations from the 1990s to 2020s. The articles included in this study had a total of 2 966 citations, leading to an average of 148 citations per paper, possibly indicating significant interest and relevance of the topics under discussion. Even though there was no timeframe placed on eligibility of the papers, the earliest paper was from 1997; this paper also had the most citations. With only one eligible paper in the 2000s, there was a decline in the interest of cognitive bias in researchers studying managers. There is a significant growth in interest seen in the topics under discussion from the 2010s up to the 2020s. This growth trend is likely to continue as management science researchers become more aware of various psychology constructs due to the increase of academics and access to such information becomes more accessible. There are also many cognitive biases and combinations of biases and skills that are yet to be empirically explored.

Figure 3: Skills approach focus by decades
Source: Own compilation

Figure 3 is a Sankey diagram exported from ATLAS.ti 22. The figure represents the skills approach (categorised skills) focus of the publications included in this review. It is apparent from this diagram and proceeding tables and the conceptual framework presented near the end of this paper that researchers focused mostly on the conceptual skills of managers over the years. The interest in empirically exploring managers' interpersonal and technical skills seems to have subsided recently.

The 1990s featured collaborative decision-making, communication; investment decisions; problem-solving; risk perception; strategic decision-making and thinking skills, showing relative distribution between conceptual, interpersonal, and technical skills. The publications at this time only showed that managers' skills were being affected by the overconfidence and representativeness cognitive biases.

The single 2000s article focused on conceptual skills, namely strategic decision-making, thinking skills and decision comprehensiveness. The skills were impacted by the overconfidence cognitive bias. As the quantity of articles rose drastically in the 2010s, so did the variety in skills under investigation. These publications included commercial awareness, emotional intelligence, hiring decisions, networking, opportunity discovery and forecasting, representing all three skill approaches relatively equally. The authors in this period added anchoring bias, attribution bias, a combination of framing bias with fixed-pie, Einstellung effect, loss aversion, optimism, and self-serving bias to the discussion of the types of cognitive biases impacting managers' skills.

In the 2020s, authors included ability to learn, persistence, delegation and problem-solving to the skills to the scope of managerial aptitudes impacted by cognitive biases. Evident in Figure 2, these were mostly conceptual skills. In the current decade, anchoring bias was combined with availability bias and hubris was combined with brakes bias. Future researchers could also combine some cognitive biases together in their investigation of their impact on managers' skills. The publications added base-rate fallacy, confirmation bias, groupthink, halo effect and hindsight bias.

3.2 Regional distribution

Table 3: Regional summary

Author(s) (publication)	Regions			
	Single country	Multi-country	Not stated	Continent
Busenitz & Barney (1997)	USA			North America
Tjosvold & Poon (1998)	Canada			North America
Hodgkinson <i>et al.</i> (1999)	UK			Europe
Forbes (2005)	USA			North America
Hilary & Hsu (2011)			X	N/A
Magazinius <i>et al.</i> (2012)			X	N/A
Azouzi & Jarboui (2013)	Tunisia			Africa
Caputo (2016)		USA; Italy; Other European		North America; Europe
Shu <i>et al.</i> (2018)	China			Asia
Almeida <i>et al.</i> (2019)	Australia			Australia
Zhang, Zhao <i>et al.</i> (2020)	China			Asia
Fink & Pinchovski (2020)		Brazil; Canada; India; UK; USA. Canada; Germany; Israel; Italy; UK; USA; Other.		South America; North America; Asia; Europe
Zorn <i>et al.</i> (2020)	USA			North America
Thelisson & Meier (2021)	France			Europe
Hristov <i>et al.</i> (2022)	Italy			Europe
Gu & Lin (2021)	China			Asia
Barlach & Plonski (2021)	Brazil			South America
Zhang, Bij <i>et al.</i> (2020)	USA			North America
Breiter <i>et al.</i> (2022)			X	N/A
De Sordi <i>et al.</i> (2022)			X	N/A

Source: Own compilation

Even though some authors did not specify the regional particulars of their respondents, the regional summary above shows a relatively wide distribution of interest in the research topics under discussion. However, there is a clear concentration of interest in the Americas, particularly North America, representing 35% of the studies included in this systematic literature review. The table also indicates that there is a need for more research to be conducted on African and Australian continent.

3.3 Businesses investigated

Figure 4: Industries
Source: Own compilation

Figure 4 above indicates the spread of interest in research topics according to the industry of the various businesses that the managers operated in. This indicates that managerial skills are impacted by cognitive bias from various contexts. Additionally, the impact of cognitive bias on managerial skills is not industry specific. From the figure, one can also conclude that a large emphasis is placed on the information and technology as well as manufacturing industries. Some authors did not indicate the industry where the study was conducted; yet there is a clear need for research in the property, wholesale, and agricultural industries. Future researchers can either choose to add to the body of knowledge by focusing on the industries that have been extensively covered or they may try to uncover trends and behaviour in the industries that are least explored.

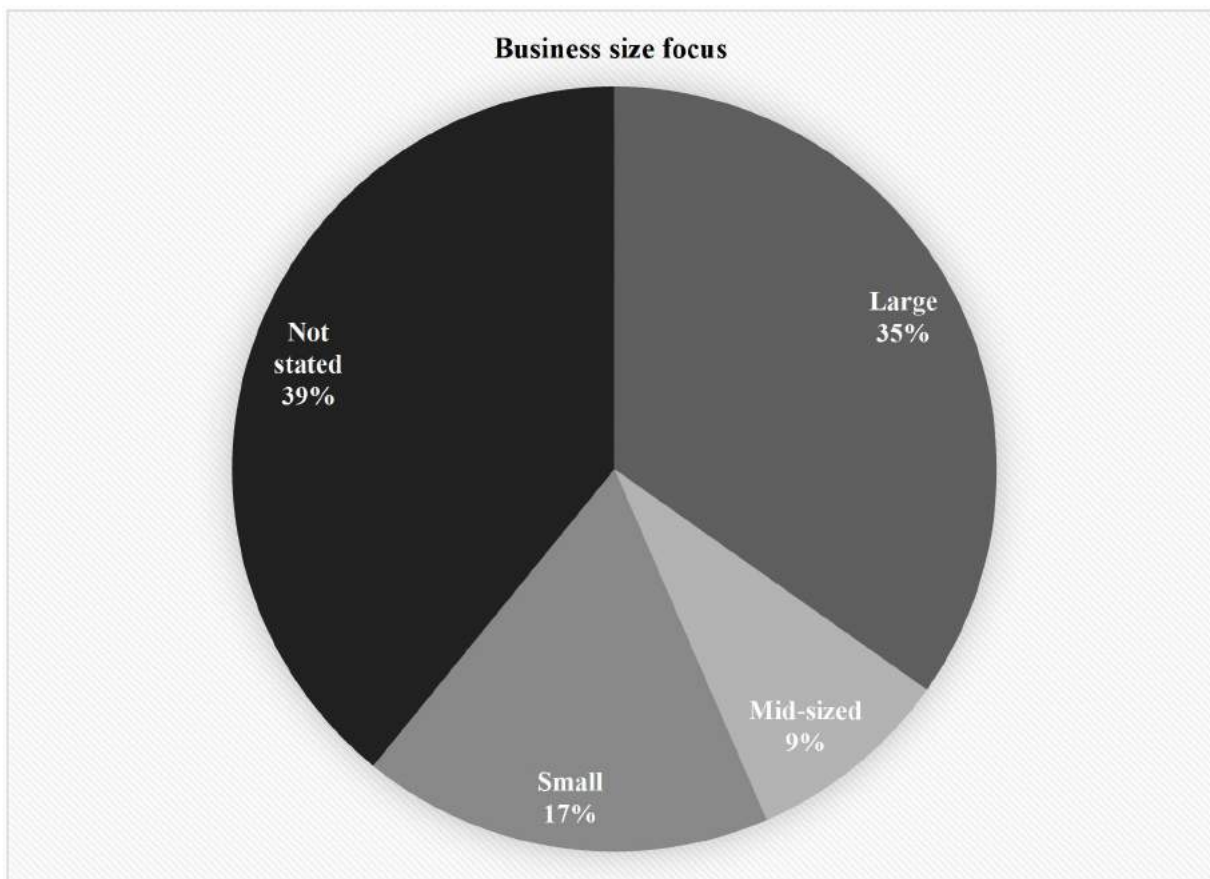

Figure 5: Business sizes
Source: Own compilation

Figure 5 shows the business size focus of the articles included in this systematic literature review. The sizes are based on the size as stated by the authors or deduced from the number of employees the business had (as stated by the authors). When not explicitly stated, the reviewers classified small businesses as those with six to 50 employees, medium-sized businesses as those with 51 to 200 employees and large businesses as those with more than 200 employees (Nieuwenhuizen, 2011:365-366; van Nieuwenhuizen & Duke, 2020:31-32). As is the case relating to the industries, it can be concluded that the affect that cognitive bias has on managers is not business-size specific. Most included publications did not state the size of the businesses that they investigated; those who did, favoured targeting large businesses. Analysis of the included studies showed that small and medium-sized business managers were most likely to only be affected by attribution, anchoring, optimism and overconfidence bias. Future publications can investigate whether managers in large business are more susceptible to cognitive biases than those of smaller businesses.

3.4 Methodological distribution

Table 4: Methodological summary

Author(s) (Publication)	Research design			Data collection method				Data collection instrument						Response rate (Theme)	Analysis approach	
	Exploratory	Descriptive	Causal	Quantitative	Qualitative	Mixed methods	Other	Survey	Interview	Experimental	Observation	Archival	Vignettes			Literature review
Busenitz & Barney (1997)		X		X				X							31%	Logistic regression analysis; bivariate analysis

Hodgkinson <i>et al.</i> (1999)			X							X			X		26%	Raw frequencies; association percentages; chi-square tests
Forbes (2005)		X				X		X				X			20%	Analysis of variance
Hilary & Hsu (2011)		X		X								X			X	Estimate logit regression analysis
Magazinius <i>et al.</i> (2012)	X				X				X						X	Document analysis; theoretical coding
Azouzi & Jarboui (2013)		X		X				X							50%	Linear regression analysis
Caputo (2016)	X					X		X					X			Zero-order correlation; analysis of variance, binary logistic regression
Shu <i>et al.</i> (2018)		X		X				X							49%	Regression analysis; exploratory factor analysis; confirmatory factor analysis
Almeida <i>et al.</i> (2019)	X					X		X	X						10%	Examination of skewness; Q plots; manual coding
Zhang, Zhao <i>et al.</i> (2020)		X		X				X							43%	Structural equation modelling
Fink & Pinchovski (2020)			X			X			X	X					17%; 27%	Rotated component matrix; mixed-effects logistic regression model
Zorn <i>et al.</i> (2020)	X					X						X			X	Asymmetry scores; variance inflation factors; analysis of variance; correlation matrix
Thelisson & Meier (2021)	X					X	X		X		X	X			X	Content analysis; Nvivo coding
Hristov <i>et al.</i> (2022)	X					X		X	X						21%	Thematic analysis; triangulation
Gu & Lin (2021)		X		X				X							41%	Partial least squares; Correlation coefficient; variance inflation factor; regression analysis
Barlach & Plonski (2021)			X			X		X	X						X	Interpretative phenomenological analysis
Zhang, Bij <i>et al.</i> (2020)		X		X				X							33%	Profile-deviation approach; zero-truncated Poisson

																regression; zero-truncated negative binomial regression
Breiter <i>et al.</i> (2022)	X					X			X					X	X	Scoping review; data overlap; triangulation
De Sordi <i>et al.</i> (2022)	X					X			X					X	X	Structured review; content analysis
Total (and average)	9	8	3	7	2	10	1	11	9	2	1	4	2	2	33%	

Source: Own compilation

The methodical summary above shows that there is a wide range of methods used in studies focusing on cognitive biases among managers. There is an emphasis placed on exploratory research designs when investigating these phenomena; correspondingly, mixed methods are commonly used to collect data from respondents. In addition to this, the table above also shows that surveys and interviews are preferred collection instruments in the research articles reviewed. Naturally, the authors of the papers above frequently implemented either regression analysis or content analysis. Empirical researchers may consider this table during the methodological planning and design of their study. The analysis approaches can then be adapted for their respective papers for comparative and conceptualisation purposes.

There is also a clear trend shown with the response rates in these studies; an average of response rates of 33% in the studies that reported response rates might indicate that there is a certain level of discomfort for managers in participating in studies of this nature. Perhaps future studies can put more emphasis on guaranteeing the anonymity when recruiting managers to participating in these kinds of studies. This might increase the level of responses gained when conducting this type of research. Additionally, researchers could begin the research process by emphasising the importance of this type of research, highlighting the mere-measurement effect beforehand (Hristov *et al.*, 2022:19; Thaler & Sunstein, 2008:70). Two of the most recent included research articles implemented a systematic literature review, which is triangulated and vindicated by conducting interviews. This trend could be the avenue taken by future academics to circumvent the low response rates among managers.

3.5 Settings and samples

Table 5: Setting and sample summary

Publication	Additional context	Sample population	Sample distribution									
		n (n =)	Sample totals	Includes non-managerial	Top management	Middle management	Lower	Entrepreneur	Mixed (Not separated in number)	Non-managerial employees	Students	Papers / records
Busenitz & Barney (1997)	Managers included were responsible for at least two functional areas. Entrepreneurs were founder-managers and currently in the process of another start-up.	219					24	124	95

Source: Own compilation

Table 5 summarises respondent types and management levels in the articles included in this systematic literature review. The constructs have been investigated in various settings. The topics under discussion seem to be most relevant in project management, fictional case study perceptions, mergers and negotiations, start-up businesses and post-business failure. Future reviews can consider these contextual variations for inclusion and exclusion criteria in their systematic literature reviews. These settings may also indicate triggers to the occurrence of the cognitive biases. Empirical academics may use them as indicators for the commencement of similar research projects. The impact of cognitive biases on managers was mostly explored among entrepreneurs with a total of 995 individuals participating in the studies that were included for this systematic literature review. Even

though there was an effort made to only include empirical studies with either managers or entrepreneurs, seven studies included students, non-managerial employees, and other records. This is probably due to publications being mostly mixed-method papers and the low response rates of managers and entrepreneurs, which was clearly a prominent feature of the included studies. Future systematic reviews can consider excluding mixed-method papers to avoid this dilution of sample inclusion. Authors investigating students as the sample population is a common occurrence in studies investigating cognitive biases; this is also a reason for the exclusion of many articles that could have been part of the current review. Future reviews can consider following this trend by excluding managers and focusing on students and non-managerial samples. However, this practice is discouraged by some authors (Caputo, 2016). Empirical researchers can also choose to focus on entrepreneurs as the sample included in their papers or even top managers to continue the trend seen in the current review. However, there is an apparent need for studies of the impact of cognitive biases among middle managers, as it is unlikely that their affect is managerial level specific. Furthermore, authors could endeavour to discover whether there are differences in the susceptibility of managers to cognitive biases based on their managerial level. Researchers are encouraged to emphasise respondent anonymity to possibly gain higher response rates, gaining acceptance before conducting this type of study among managers may also ensure more engagement from managers.

Managers' current level has a role in the tasks they execute in a business, which impacts the skills approach that they would mostly be expected to call upon in their daily activities; less exposure to conceptually challenging tasks will ultimately impact their level of susceptibility to cognitive bias (Amie-Ogan & Godsplan, 2021:59; Lugmayr & Grueblbauer, 2017:41). Notwithstanding, the included articles make no mention of this; future studies could investigate this suggested research gap.

Figure 6: Skill approach by sample
Source: Own compilation

Figure 6 above is a Sankey diagram representing the skill approach focus by managerial sample (according to their publication classification). From this figure, it can be concluded that cognitive biases were more likely to affect managers' technical skills and entrepreneurs' interpersonal skills during their task execution. Further content analysis of the included articles showed that the managers were uniquely more likely to be affected by nine cognitive biases, namely choice-supportive bias, the Einstellung effect, groupthink, halo-effect, loss aversion, saliency bias, self-interested bias, sunk cost and affect heuristic. While publications with entrepreneurs had base-rate fallacy, hindsight bias, illusion of control, illusory correlation and regression fallacy as biases that seemed to impact entrepreneurs more than managers. This could be a coincidence of the impartially selected articles; nevertheless, it does present an intriguing avenue for additional comparative, empirical research.

3.6 Theories, definitions and contributions

This section explored the various definitions used by authors for the term cognitive bias; it also maps the various theories explored in the included works and provides a summary of the various theoretical contributions and managerial implications of the articles presented in this review.

Table 6: Summary of definitions and contributions

Publication	Theoretical underpinning	Theoretical contributions	Managerial implications
Busenitz & Barney (1997)	Behavioural decision theory	Confirms that skilled entrepreneurs do not necessarily make skilled managers.	Biased managers/entrepreneurs are beneficial during the fledgeling years of a business. Biased managers/entrepreneurs should be allowed to function in situations where their bias can allow the possible benefits (efficacy, creativity) while having limited detriment to the business.
Tjosvold & Poon (1998)	Theory of interdependence; cooperation theory	Postulates that relationships between managers and non-managers mitigate some cognitive biases.	Managers should promote healthy, collaborative relationships between managers and non-managers.
Hodgkinson <i>et al.</i> (1999)	Organisation theory	Cognitive mapping has a mitigating effect on cognitive biases.	Managers ought to equate current problems with passed ones to learn from past successes during the decision-making process.
Forbes (2005)	-	Overconfidence in entrepreneurs is influenced by their ownership of the business. Entrepreneurs who founded established businesses tend to be more overconfident than new-venture entrepreneurs.	Determining which managers are most susceptible to cognitive biases may have preventative effects on cognitive biases.
Hilary & Hsu (2011)	Theory of self-attribution	Confirms that people place less emphasis on the forecasts made by overconfident managers.	Managers should be alert to the fact that various stakeholders take the estimations made by overly confident managers less seriously than they probably should.
Magazinius <i>et al.</i> (2012)	-	In addition to bias having an influence on the occurrence of inaccuracies, people sometimes purposefully make inaccurate estimations.	Managers should be aware that more technically superior forecasting techniques may mitigate, but do not entirely eliminate inaccuracies.
Azouzi & Jarboui (2013)	Agency theory	Emotional intelligence scores can be used to employ managers who will likely be the least susceptible to cognitive biases.	Encourages early access to emotional intelligence training.

Caputo (2016)	Social cognition theory	Confirms that cognitive biases can be mitigated by external interventions as well as third parties.	Framing techniques can be used to de-bias negotiation processes.
Shu <i>et al.</i> (2018)	Generation theory; strategic management theory; network management theory; dimensional social theory; social exchange theory	Confirms a positive relationship between networking, opportunity recognition, cognitive biases and political skills.	Managers should seek to enhance their networks in the political sphere.
Almeida <i>et al.</i> (2019)	Intelligent career theory; RBV theory; theory of human capital	Denotes the importance of culturally diverse staff and their inclusion in decision making.	Managers should opt for diversity in their team and ensure that vast opinions are sought and considered during decision-making processes.
Zhang, Zhao, <i>et al.</i> (2020)	Social cognition theory; special network theory	Provides insights into the effect of cognitive bias on entrepreneurs' effectuation and causation behaviour during interpersonal interactions.	Managers are encouraged to seek comprehensive information.
Fink & Pinchovski (2020)	Substitution theory	Agile framing leads to increased bias when compared with plan-based framing. Confirms that access to the most relevant information limits the time-saving bias; however, it does not irradiate it.	People who support managers ought to provide them with the most relevant and most timeous information during the decision-making process.
Zorn <i>et al.</i> (2020)	Social exchange theory	Confirms that the more experienced top management is, the less likely they are to make cognitive bias-related errors.	It is recommended that managers continuously seek to improve their awareness of cognitive bias to dampen their impact. Less experienced managers should seek the inputs of more senior managers before making decisions.
Thelisson & Meier (2021)	-	Sheds light on the impact of cognitive biases as a hinderance to the negation processes; adding to merger and acquisition literature.	Managers should be made aware of the potentially divisive impact of cognitive bias in mergers. They can proactively reduce their impact if they can pre-emptively recognise them.

Hristov <i>et al.</i> (2022)	Strategic management theory	The proposed framework integrates cognitive psychology insights and suggests possible solutions to cognitive biases.	The paper provides a roadmap for managers to use to attain effective and efficient performance.
Gu & Lin, (2021)	Cognitive bias theory; theory of social and economic organisation	Managers in smaller business are more affected by cognitive biases.	Less experienced managers in small businesses should be monitored by more experienced managers; they should be accessible to assist in decision-making.
Barlach & Plonski (2021)	Gestalt theory; classic economic theory; leadership theory	More knowledgeable managers tend to have an easier time finding contradicting information than novice ones do. Found no significant difference between managers' exhibition of cognitive bias and the amount of experience they had.	Suggests that managers actively seek contradicting points of view before deciding on a course of action.
Zhang, Bij <i>et al.</i> (2020)	Logic theory; probability theory	The paper proves that a normative rule based on statistics and probability theory does not benefit entrepreneurial behaviour or performance.	The study uses Kahneman's (2003) typology to categorise relevant cognitive biases into two broader biases (availability and representative).
Breiter <i>et al.</i> (2022)	-	Operations managers may benefit from increased awareness of cognitive biases.	Suggests that even just participating in a cognitive bias study may have rudimental improvements on managers ability to deal with cognitive biases. Provides a jump-off point for managers and researchers in operations management for the lessening of disruptions and improvement of reliability of managers and operations systems.
De Sordi <i>et al.</i> (2022)	Theory of entrepreneurship	Confirms and elaborates major risks of entrepreneurships; aiming to mitigate cognitive bias that blindly encourage entrepreneurial thinking and behaviour.	Managers should be aware of the detrimental effects of entrepreneurial behaviour. Particularly the impact of their failure.

Source: Own compilation

The authors (Barlach & Plonski, 2021; Busenitz & Barney, 1997; Fink & Pinchovski, 2020; Hodgkinson *et al.*, 1999; Zorn *et al.*, 2020) mostly cited Tversky and Kahneman (1974) when providing a definition of cognitive biases. Moreover, other than social cognitive bias theory, the table above shows no clear theoretical uniformity in the included studies.

Caputo (2016) makes a notable methodological contribution by straying from the common trope of using students and/or inexperienced individuals as its sample. It also incorporates vignettes and other experiment tools from other research areas to investigate behaviour during negotiations within realistic contexts. As mentioned earlier, Breiter *et al.* (2022) and De Sordi *et al.* (2022) make use of a combination of interviews and systematic literature reviews to bolster the relevance of their investigations. These articles might be pioneering the way forward to dealing with low response rates in research dealing with cognitive biases among managers.

3.7 Empirical advancements

In this section, the reviewers summarise the specific cognitive biases that impact specific managerial skills along with what that impact is, the possible moderators and mediators identified by the authors on an article-by-article basis. The table presented below also indicates the consequences of these impacts by first listing the negative outcomes and then the positive ones where applicable.

Table 7: Summary of empirical advancement gained from included articles

Publication	Themes		Impact			Moderation	Mediation	Outcome
	Cognitive bias(es) investigated	Skill(s)	Negative	Positive	Neutral			
Busenitz & Barney (1997)	Overconfidence bias; representativeness	Strategic decision-making; thinking skills; problem-solving; risk perception	X	X		Commercial awareness	-	<p>Unrealistic expectation of outcome; Warped perception; Inability to recognise potential opportunities; Inability to recognise core/cause of problems; Inability to see interconnected nature of problems and/or behaviour; Making unnecessarily risky decisions; Diminished accuracy.</p> <p>Enables quick decision-making; Improved efficiency; Enables timely seizure upon opportunities; Increased opportunity recognition; Allows simplified approach to problem-identification; Enhanced understanding of the business environment; Allows simplified approach to problem-solving; Improved entrepreneurial performance; More creative product development.</p>
Tjosvold & Poon (1998)	General reference to cognitive bias (not explicitly distinguished)	Ability to collaborate; ability to deal with interference; communication	X			-	-	Inability to recognise potential opportunities; Limits varying inputs; Inhibits effective problem-solving
Hodgkinson <i>et al.</i> (1999)	Framing bias	Strategic decision-making; problem-solving; thinking skills; investment decision-making	X	X	X	Cognitive mapping	-	Unaddressed bias compound with others. Decisions made based on manipulated perception instead of reality; Increased risk-aversion decision-making; Increased risk-

								seeking decision-making; Warped perceptions. Allows simplified approach to problem-identification.
Forbes (2005)	Overconfidence bias	Strategic decision-making; decision comprehensiveness; thinking skills	X			Education; Awareness	Past success; Age; External equity funding	Causes disruptions during the decision-making process; Diminished accuracy.
Hilary & Hsu (2011)	Overconfidence bias; attribution bias	Managerial credibility; ability to make forecasts	X	X			Past success	Loss of managerial credibility; Increased forecast precision
Magazinius <i>et al.</i> (2012)	Overconfidence bias; anchoring bias; optimism bias	Ability to make forecasts	X			-	-	Decreased managerial awareness; Unaddressed bias compound with others; Diminished accuracy; Warped perceptions.
Azouzi & Jarboui (2013)	Einstellung effect (lack of mental flexibility); loss aversion bias; optimism bias	Emotional intelligent	X			Emotional consciousness	-	Decreased efficiency of governance mechanisms
Caputo (2016)	Anchoring bias; framing bias with fixed-pie; self-serving bias	Ability to negotiate	X			Education; Informative framing techniques; Ability to learn; Experience; Agreeableness; Emotional stability	Extraversion	Decreased information processing; Inability to recognise potential opportunities.
Shu <i>et al.</i> (2018)	General reference to cognitive bias (not explicitly distinguished)	Commercial awareness; opportunity discovery; networking	X	X		Experience	Prior success; Susceptibility to cognitive bias	Decreased access to information; Inability to recognise potential opportunities. Enables timeous seizure upon opportunities.

Almeida <i>et al.</i> (2019)	General reference to cognitive bias (not explicitly distinguished)	Hiring decisions	X			Training; Experience	Hierarchal rigidity	Causes disruptions during the decision-making process; Decreased diversity in human resources; Disrupts communication; Decreased access to varying points of view; Warped perceptions
Zhang, Zhao, <i>et al.</i> (2020)	Illusion of control; Overconfidence bias	Strategic decision-making	X	X		-	-	Overestimation of accuracy Improved business survival; Increased persistence; Increased use of effectuation in new ventures
Fink & Pinchovski (2020)	Framing bias; time-saving bias	Time-related decision-making	X			Experience; Access to information	-	Decreased goal realisation; Unrealistic expectation of outcomes
Zorn <i>et al.</i> (2020)	Choice-supportive bias	Hiring decisions	X			Experience; Access to information	-	Decisions made based on manipulated perception instead of reality; Loss of managerial credibility; Warped perceptions
Thelisson & Meier (2021)	Anchoring bias with availability bias; temporal bias; Hubris bias with brakes	Thinking skills; ability to negotiate	X	X			Social pressure; Expert's role (Failure to recognise the contributions of others)	Decreased managerial awareness; Disrupts communication; Inability to see interconnected nature of problem and/or behaviour; Loss of managerial credibility; Perpetuates ignorance of cultural differences Enables timeous seizure upon opportunities.
Hristov <i>et al.</i> (2022)	Affect heuristic; anchoring bias; availability bias; overconfidence bias; groupthink; optimism bias; halo effect; saliency bias; self-interested bias; sunk cost fallacy	Strategic decision-making; thinking skills	X			-	-	Decreased managerial awareness; Inability to see interconnected nature of problems and/or behaviour; Unrealistic expectation of outcomes

Gu & Lin, (2021)	Anchoring bias; attribution bias	Collaborative decision-making; ability to delegate	X			Experience	Business size; Past success.	Decreased trust between managers and subordinates; Loss of managerial credibility; Hinders rational thought; Limits ability to learn; Limits varying inputs; Managerial burnout. Enables timeous seizure upon opportunities.
Barlach & Plonski (2021)	Einstellung effect	Problem-solving; risk perception	X			-	-	Increased likelihood of business failure
Zhang, Bij <i>et al.</i> (2020)	Availability bias; representativeness heuristic; hindsight bias; illusory correlation; availability bias; base-rate fallacy; illusion of control; regression fallacy	Strategic decision-making		X		-	-	Improved entrepreneurial performance
Breiter <i>et al.</i> (2022)	Anchoring bias; attribution bias; confirmation bias	Managerial credibility	X			-	-	Inability to recognise core/cause of problems; Inability to see interconnected nature of problems and/or behaviour
De Sordi <i>et al.</i> (2022)	Optimism bias	Commercial awareness	X			-	-	Unrealistic expectation of outcomes; Warped perceptions
Total			19	7	1

Table 7 above summarises all the themes found in the studies that were included in this systematic literature review. The themes found are the skills under investigation (either explicitly stated or derived from analysing each article) and the cognitive biases that have an impact on the skills. The table also articulates whether the impact on these skills was negative, positive or neutral. This table explains the outcomes and/or consequences of the impact of the cognitive biases on the managerial skills. Unsurprisingly, the majority of authors describe negative impacts of cognitive bias on managers' skills. Interestingly, there are seven instances (Busenitz & Barney, 1997; Hilary & Hsu, 2011; Hodgkinson *et al.*, 1999; Hong *et al.*, 2019; Shu *et al.*, 2018; Thelisson & Meier, 2021; Zhang, Bij, *et al.*, 2020; Zhang, Zhao, *et al.*, 2020) of cognitive biases having a positive effect on managerial skills and subsequently, describing

favourable outcomes. The findings of this table are synthesised and presented as the conceptual framework below, answering this systematic review's research question.

3.8 Conceptual framework

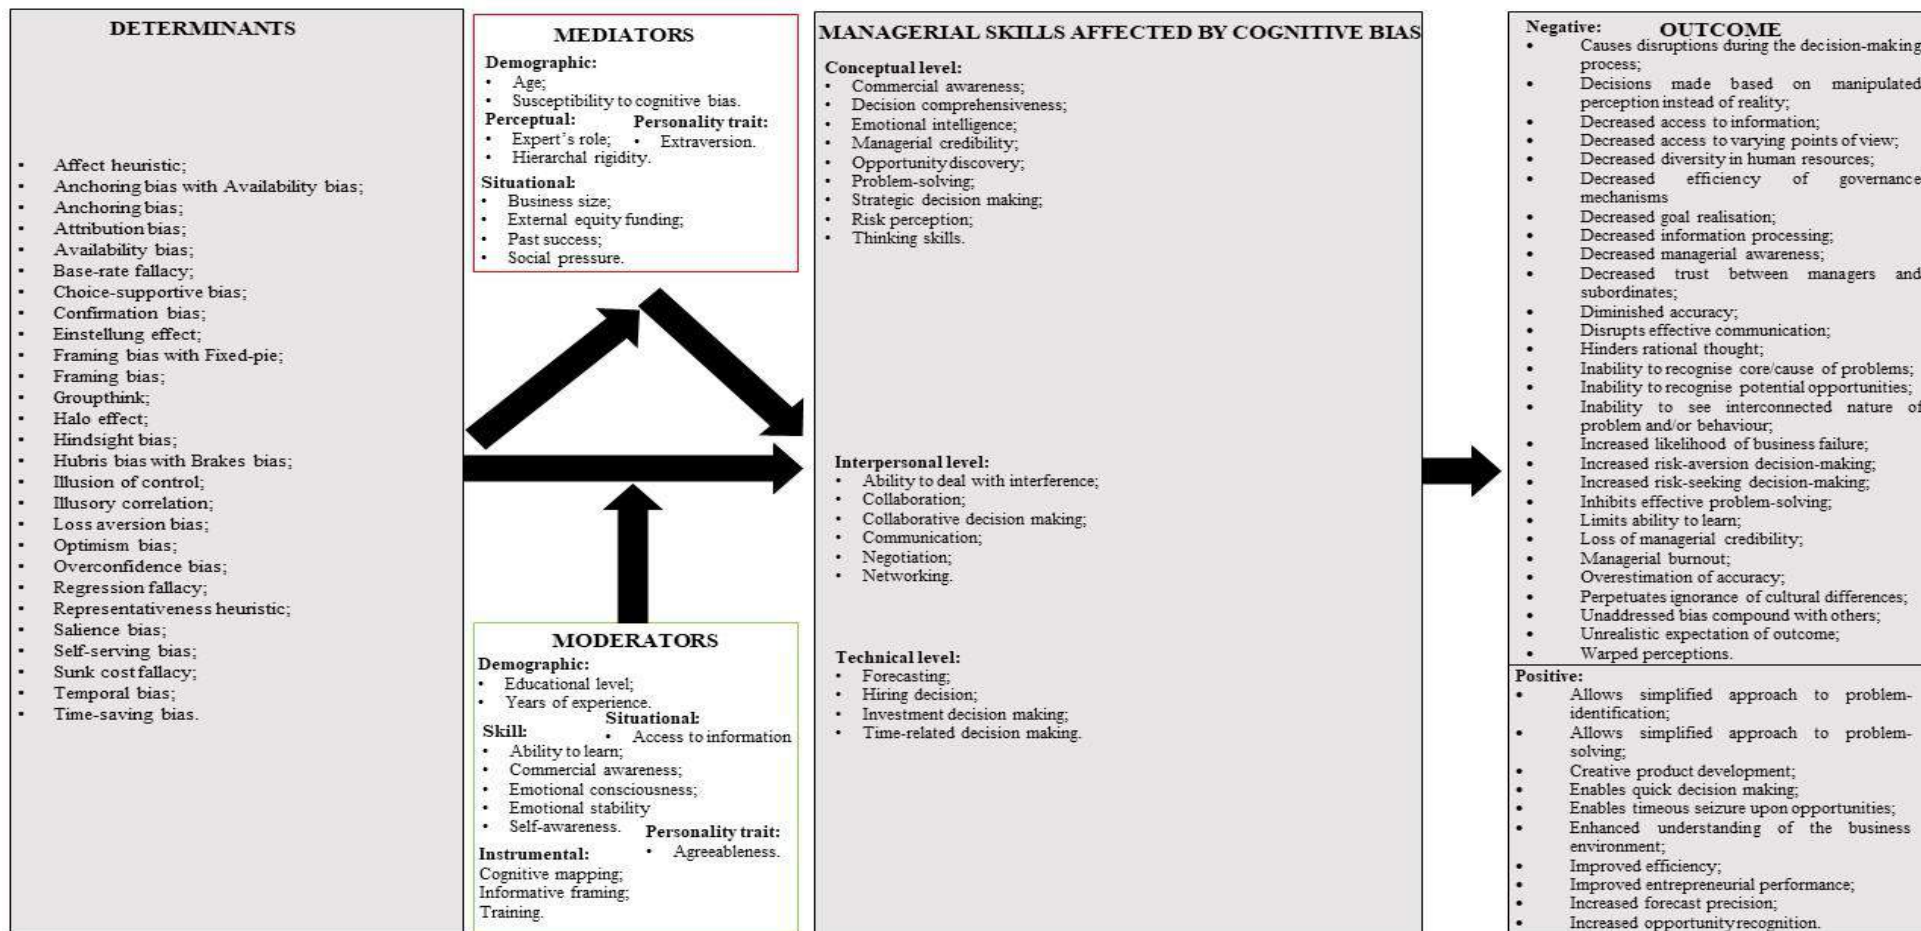

Figure 7: Consequences of the impact of cognitive bias on managers' skills

The conceptual framework presented above can be considered a snapshot of Table 7's findings; or as a derivative of an antecedents, determinants, and outcomes (ADO) model that gives a bird's eye view of the topic under discussion and the answer to the research question (Goyal *et al.*, 2021:1183; Pahlevan Sharif *et al.*, 2019:163). Future researchers can attempt to empirically confirm or discount the various moderators and mediators presented in the figure

Managerial implications
The preceding sections highlighted various issues regarding the impact of cognitive biases on skills for the consideration of managers and entrepreneurs. In this section, the reviewers present pertinent possible solutions for managers to consider.

Senior managers are encouraged to ensure the fostering of informative interactions between managers and subordinates, and promote collaborative relationships between managers and subordinates (Tjosvold & Poon, 1998:328). This enables access to information and promoting trust and credibility. Correspondingly, mapping thoughts during the decision-making process (Hodgkinson *et al.*, 1999:997) create audit trails that can be used for reflections and gaining awareness of the emergence of cognitive biases.

Forbes (2005:623) proposes preventive measures for dealing with cognitive bias. During the recruitment of managers and other employees, the human resources department can implement an assessment of cognitive biases to indicate which cognitive bias the individual is most susceptible to. The department can then provide the necessary training to either mitigate vulnerability through awareness or allay the cognitive biases before ever suffering their consequences.

Framing, which is based on fairness, can be utilised to accelerate the achieving agreement between parties in negotiation processes (Caputo, 2016:4304). Managers are also encourage to increase their awareness by attending cross-cultural training programmes that highlight the importance of diversity backgrounds and points of view (Almeida *et al.*, 2019:332). Finally, making information more accessible and digestible also assists in de-biasing managers, increasing accuracy and enhancing managerial credibility (Breiter *et al.*, 2022:1402; Fink & Pinchovski, 2020:99).

4. Conclusion

By highlighting the articles included, this systematic literature review reinforces the foundation of the body knowledge and eases its accessibility to novice researchers and managers. The current study can serve as a starting point for managers and academics that seek to delve into the cognitive biases that impact managers' skills. It outlined the abilities, specific skill approach as well as the outcomes of the various interactions. The content analysis showed some mediating as well as moderating variables that respectively enhance or mitigate the suggested relationships. Future empirical studies can determine whether the presented conceptual framework is relevant and can be confirmed through statistical methods. Furthermore, the suggested model can be tested in various comparative settings, including but not limited to determining whether the model holds water in different functional areas such as marketing and operations departments.

Overconfidence is the most prevalent cognitive bias; typically impacting managers' conceptual skills. This conclusion echoes the findings of Thomas (2018:139). Following the examples of Caputo (2016) and Thelisson and Meier (2021), future empirical researchers could combine ubiquitous cognitive biases (like overconfidence) with a similar and/or seemingly related, yet unexplored cognitive bias, such as the Dunning-Kruger effect (Dunning & Kruger, 1999) among managers. Furthermore, since there has been a trend to focus on conceptual skills in recent years, future authors could investigate this combination as it relates to strategic decision-making, opportunity discovery, thinking skills and problem-solving in the various gaps and existent settings covered throughout this systematic literature review.

The reviewers conclude that the ability to deal with cognitive biases, similar to dealing with interference during communication, should be considered to be a managerial skill by academics and business leaders in the future.

Acknowledgments

The researchers would like to thank Dr Aloe Meintjes who availed himself as independent reviewer of inclusion of sources in case of inclusion discrepancy among the authors.

Keywords

Career progression,
Academic leadership,
Women inclusiveness,
higher education

Abstract

There is evidence that efforts to empower women in academia in South African universities over the past number of decades have not borne significant fruit. The objective of this study was to determine ways in which to advance and empower women for positions of academic leadership in a South African university. This study was motivated by the existing gap revealed in previous literature addressing leadership and decision-making positions with a limited number of women in South African universities. A qualitative research method was employed with strict adherence to participatory action design, involving Walter Sisulu University's permanent academic staff. The respondents participated in a qualitative interview during which they shared their subjective views on the challenges women academics face in their career path in attaining leadership roles within the selected South African university. An extensive literature review was conducted to support the information collected from respondents, providing contextual insights on the topic under investigation. The findings reported on existing structures that the university has put in place to address the challenges of aspiring women leaders; the measures to improve and sustain the representation of women in leadership roles; and the ways to empower aspiring women leaders at the university. The study revealed that measures such as the eradication of verbal and emotional harassment against women in academia; the enforcement of gender equality measures in the workplace; and the transparent process of shortlisting and employment of academic leadership positions, among other factors, were vital to improving the representation of women in academic leadership roles in a South African university. It is recommended that measures such as women's mentorship initiatives, regular professional leadership development programmes focused on women, and recognition for the outstanding performances of women, among other factors, could be significant in advancing aspiring women in academic leadership within a selected South African university..

1. Introduction

Notwithstanding government regulations and policies, women continue to be underrepresented in leadership roles in organisations in general and universities in particular (Coe, Piggott, Davis, Hall, Goodell, Joo & South-Paul, 2020; Herbst, 2020). Prior studies, such as Blumenau (2021) and Dappa, Bhatti and Aljarah (2019), have acknowledged that organisations with a fair representation of women in leadership roles are incredibly efficient in terms of operations, productivity and adherence to work ethics. According to Flabbi, Macis, Moro and Schivardi (2019) and Catalyst (2013), there is a link between the number of women on boards of directors and in senior leadership roles and organisational effectiveness. According to a study of Fortune 500 companies in the United States of America (USA), firms with three or more women on their boards of directors and in executive positions typically achieve superior organisational and financial performance, improved corporate governance, less unethical behaviour, increased corporate social investment and improved corporate reputation (Catalyst, 2013).

Women leaders are gradually becoming more visible in work contexts, which is seen as a sign that women leaders are distressingly underrepresented (Coe et al., 2020; Sandler, 2014). Concerning their academic career, it is evident that women join the academic workforce far later than males, owing to cultural and patriarchal constraints that confine women to childrearing, support for their husbands, and practically all other household obligations (Herbst, 2020; Post, Latu & Belkin, 2019). Consequently, progressive nations across the globe have enacted various legal frameworks to enhance women's leadership development and growth within universities and in other sectors of engagement (Isaacs, Strydom & Mbukanma, 2022).

In the South African context, Post, Latu and Belkin (2019) and Eagly and Carli (2003) emphasised an understanding that women do not approach academic leadership in the same way that men do. Additional awareness of the value of female leaders in South African universities is based on the realisation that globalisation and national cultures require that women adopt male-determined leadership styles if they want to access leadership positions. Workplaces are becoming more diversified, and women's leadership approaches are acknowledged as contemporary. Ramohai (2019) and Atkinson, Wyatt and Senkhane (1993) support the notion that the majority of women are latecomers to leadership positions in South African universities and the public service, arguing that women constitute South Africa's 'true unmined treasure'. To emphasise women's leadership in the public service, the South African government designed and approved an equity-related regulatory framework that must be enforced to preserve and promote women's rights (McIlongo & Strydom, 2021).

As designed by the South African government, these legal frameworks are meant to prioritise and foster women leaders' growth and develop procedures to promote equality. These legal frameworks include, but are not limited to, the Constitution of the Republic of South Africa Act 108 of 1996; the Public Service Act 38 of 1994; the Commission for Gender Equality Act 30 of 1996; the Employment Equity Act 55 of 1998; the Skills Development Act 97 of 1998; the Skills Development Levies Act 9 of 1999; the Promotion of Equality and Prevention of Unfair Discrimination Act 4 of 2000; and the National Qualifications Framework Act 67 of 2008. In addition, HERS-SA (Higher Education Resource Services South Africa) and HELM (Higher Education Leadership and Management), under the umbrella of Universities South Africa (USAF), are dedicated to promoting and supporting women in higher education to solve global equality and access concerns, as well as local leadership management demands. Currently, women are still underrepresented in the leadership positions in South African universities (Herbst, 2020; Moodly & Toni, 2019) and it appears as though an enabling and supporting legal framework does not yield the desired outcomes. As such, the need to investigate the variables that impede women leaders from progressing to higher levels of academic leadership, despite their recognised worth to optimal performance, emerges.

2. Problem Statement

This study was undertaken to ascertain the ways to advance the prospects of women in academic leadership at a selected South African university; motivated by the underrepresentation of women in leadership positions in South African universities. Previous studies, such as Herbst (2020) and Ramohai (2019), emphasised that males have continually dominated leadership roles in South African universities, with few positions given to women. In most cases, this situation becomes untenable because the limited number of leadership positions filled by women are, for the most part, acting positions (Herbst, 2020; Moodly & Toni, 2019). As a result of this reality, the gender imbalance in academia and women's underrepresentation in senior academic positions have both been a source of concern for scholars worldwide. However, it is well documented that women often face obstacles in their professional trajectories as they advance to senior roles in several different organisations (Jalilianhasanpour, Chen, Caffo, Johnson, Beheshtian & Yousem, 2020; Sarseke, 2018). Perhaps, when examining gender representation trends in South African universities, it is critical to consider both women's underrepresentation and men's overrepresentation in academic leadership roles.

While there is a tendency toward equity between all academic employees in many nations, statistics on the number of women employees occupying leadership positions across institutions of higher

learning drop dramatically in relation to other positions (Idahosa, 2020; Ramohai, 2019). Women's employability at universities has been hindered by male dominance and the restrictive career path patterns in many institutions (O'Connor, 2019). As a result, gender identity has become a critical factor in the professional advancement and the social acceptability of men and women (Jalilianhasanpour et al., 2020; Nyoni & He, 2019). The fact that women are underrepresented in our institutions and in our society does not diminish the importance of their role in promoting solid values and good education in our society. Measures to promote women's career advancement in academia are complex because of the persistent dominance of males, which impedes attempts to achieve gender equality (Liani, Nyamongo & Tolhurst, 2020; Rutledge, 2020). It may be necessary to design and execute evidence-based intervention programmes to improve gender equality, particularly in South African institutions of higher learning because of the known benefits of staff diversity (Strydom, 2017).

Nevertheless, because of the gender disparity in academic leadership in South African universities, ambitious academic women in our society have expressed conflicting views, varied interpretations and mixed thoughts about their academic career progression (Sadiq, Barnes, Price, Gumedze & Morrell, 2019; Urban & Chantson, 2019). In other words, the current trend of male dominance in academia has a significant influence on women's participation and gender equity. As a result, the ability of South African universities to effectively represent women's interests and beliefs is negatively impacted on by rising gender discrepancy in decision-making positions (Sadiq et al., 2019; Urban & Chantson, 2019). Considering that women are underrepresented in academic leadership positions, it is critical to identify strategies that will increase their chances of advancement. Against this backdrop, this research sought to find measures to improve women's chances of getting into academic leadership positions in South African institutions. The research objectives for the study conducted at Walter Sisulu University in South Africa:

- To recognise existing structures the university has put in place to address the challenges aspiring women leaders face in attaining decision-making positions;
- To identify measures to improve and sustain the representation of women in leadership roles at the university; and
- To ascertain ways to empower aspiring women leaders at the university.

The rationale of this study is that the findings will assist academia by providing significant recommendations that could be implemented to improve the number of women in academic leadership positions in a South African university.

3. Theoretical Framework

Everyday experience may be better understood with the application of theory. A theory is a broad description of how a variety of events are related systematically; placing objects in an expanded context deepens our knowledge of both the whole and the components that make up the whole, according to York College of Pennsylvania (2015). Numerous theories have been developed regarding whether men and women differ in their approach to leadership; whether this difference is one of style or substance; whether the differences are accurate or perceived; whether one leadership approach is more impactful than another; and which approach is more likely to result in success. Thus, in conceptualising the subject under investigation in this study, four selected schools of thought, namely biology and sex; gender role; casual factors; and attitudinal drivers, are discussed below because they can assist in providing logical insights into advancing the prospects of women in academic leadership. It is important to note that these schools of thought are seen from the point of view of men and women aspiring or occupying leadership roles.

3.1 Biology and Gender

This school of thought appears to be predicated on the assumption that leadership is biologically determined; inherent in males; and that males have an intrinsic ability for leadership that is governed by biology, behaviour and culture; hence unachievable by women (Oko-Otu & Chidume, 2021;

Hoffman, Woehr, Maldagen-Youngjohn & Lyons, 2011). As a result, only men can take on the role of a successful leader. A large portion of the supporting theories, such as the great man theory and the trait theory of 18th and 19th century ideologies posited by Hoffman et al. (2011) and Organ (1996), confine leadership studies to males. Biological sex is premised on the idea that males are meant to be leaders, which seems to be skewed. An underlying assumption of this biologically motivated approach may have been that women could ascend to leadership positions just as quickly as they could become men.

Unsurprisingly, subsequent research findings do not support this approach and limit further research in this dimension. While a few studies have established gender differences in leadership style, other research indicates that they do not exist (Oko-Otu & Chidume, 2021; Shaked, Gross & Glanz, 2019). In their studies, Joshi, Wakslak, Appel and Huang (2020) and Heintz, Kramm and Ruch (2019) show that men and women have significantly more in common than differences in their leadership practices and are equally successful. As a result, with little evidence supporting biological sex as a viable study hypothesis for differentiating male from female leadership, the biological sex method loses its place in more comprehensive investigations. Interestingly, as learning evolves, the biological method seems to persist. Even though several researchers have discovered negligible differences between the inherent ability of male and female managers, even within university communities, stereotypes exist that depict women as less capable leaders. Such stereotyping, among other assumptions, becomes a significant factor that fuels the underrepresentation of women in leadership positions in universities and needs to be eradicated.

3.2 Gender Role

This approach acknowledges the role of socialisation and explores the notion of gender role as a determinant of leadership. Some studies, such as Joshi et al. (2020) and Heintz et al. (2019), investigated the broader notion of the gender role to see whether leadership effectiveness or the rise of new leaders could be connected to traits considered to be more usually male or female in the workforce. Simply put, the study found that gender role is a more significant predictor of the development of a leader than sex (Joshi et al., 2020; Heintz et al., 2019). However, gender roles have a new dimension, with male, female and androgynous currently being included in the mix of genders in most organisations. It is fascinating to think about what androgyny findings in terms of leadership position might entail. Even in today's workplace, many people believe that the stereotypical masculine traits of men are critical to success, without considering a range of behaviours and attitudes that are generally acceptable, appropriate and desirable for a person to function in a leadership position. Nevertheless, considering the gender role approach is vital in this study because this approach enables an institutional structure that identifies an individual's intrinsic ability and development towards leadership positions.

3.3 Causal Factors

A causal factor is described as any significant unintentional, unintended contributor to an incident (an adverse event or unpleasant situation) that, if avoided, would have either prevented the incident from occurring, decreased its severity or prevent a recurrence (Martin, Hughes, Epitropaki & Thomas, 2021; Karlou, Afarinesh & Zargar, 2019). As applicable to this study, causal factors involve identifying and considering a variety of other contributing factors challenging the advancement of women in attaining academic leadership positions. A comprehensive examination of all the elements influencing leadership effectiveness, or the emergence thereof, and their consequences for analysing genuine or perceived male versus female differences is undoubtedly beyond the scope of this study. The emphasis of this ideology, on the other hand, is on a selection of causative factors presented to give the reader a feeling of the themes under consideration. Consideration of the underlying causes offers some insight into this problem. A woman's attitude, self-esteem and previous work experience, as well as the sociocultural and corporate environment, are all factors that could risk her potential to be a successful leader (Martin et al., 2021). Managing these incidental elements to enhance the prospects of women in academic leadership requires the participation of individuals, university institutions and the government. Individuals may identify and learn the necessary skills and programmes to increase their capability. As a result, academic institutions and the government could collaborate to provide a

platform for training, development, and equipping people to acquire the necessary knowledge for leadership.

3.4 Feminine Attitudinal Drivers

Abid (2020) and Guillet, Pavesi, Hsu and Weber (2019) assert that new ideologies, often referred to as feminine values, have emerged in management. These ideologies, centred on consensual relationships, contrast with the competitive and authoritative attitude often associated with conventional masculine management. They encourage a distinct management approach to communication, leadership, negotiation, organisation and control (Miranda, 2021; Abid, 2020). This balance of values is increasingly seen as critical to organisational success, most especially in institutions of higher learning and corporate organisations (Guillet et al., 2019). However, most current thought conceptualises a feminine leadership style markedly distinct from its masculine counterpart. According to Bauer (2020), some feminine qualities provide an advantage to female leaders.

Feminine characteristics include enhanced communication abilities (particularly the capacity to listen effectively and be empathic), excellent intermediary skills (for negotiation and dispute resolution), well-developed interpersonal skills and a soft approach to dealing with people (Guillet et al., 2019). However, providing an opportunity for these feminine qualities to be exercised in South African universities does not eliminate the efforts of males but rather provides a platform where women's interests are fairly represented and for the transformation of the entire organisation. Thus, a growing body of research confirms the substance of this direction, namely that feminine attributes are more conducive to transformational leadership, while male characteristics are more conducive to transactional leadership (Bauer, 2020; Appelbaum, Audet & Miller, 2003).

4. Literature Review

Segregationist policies created substantial racial and gender inequities in South Africa. Men and women were equally victimised by exploitation and discrimination (Van Hout & Wessels, 2021; Ndinga-Kanga, Van der Merwe & Hartford, 2020). The issues faced by women academics at South African universities have been explored in concept. Some scholars, such as Letsoalo and Rankhumise (2020), Liani et al. (2020) and Walker (2020), blamed the fundamental issue on women's sociocultural beliefs. Contrary to the South African constitution, sociocultural gender constructions promote male dominance and female servitude. In South African universities, institutional sexism is subtle when the viewpoints and actions of male academics are prioritised over those of female academics (Albertus, 2019; Nordling, 2019). These contexts support institutional sexism and have a negative impact on the careers of women academics.

Women academics have traditionally faced several challenges in advancing to leadership positions in higher education. The hegemony prevailing during the apartheid years was patriarchal. Thus, both the patriarchal hegemony of the time and apartheid excluded women from the workplace. During apartheid, women academics were systematically excluded from mainstream South African intellectual culture and denied opportunities to establish themselves inside universities (Mokhele, 2013; Naicker, 2013). Multiple forms of discrimination and prejudice hampered those determined to pursue leadership in their academic careers. The gender gap continues to grow since most younger female academics must manage work, education and family. However, Breeze and Taylor (2020) and Walker (2020) claim that African women's identity within our cultures and communities prevents academic development and advancement to academic leadership since most women are expected to manage home duties and not pursue a job. Compared to their male colleagues, most South African women lack the ambition to further their professions in academics and in other fields (Nieuwoudt, Dickie, Coetsee, Engelbrecht & Terblanche, 2020). Mukorera (2020) and Sá, Cowley, Martinez, Kachynska and Sabzalieva (2020) claimed that the South African context inhibits the required efforts of women empowerment initiatives on training and career orientation towards promoting women's academic careers. However, more aggressive actions are necessary to erase the considerable gender inequality within South African universities.

The new democratic system had to confront a significant degree of gender inequality, and higher education institutions were among those most in need of adjustment. In their studies on women in academic leadership, Mokhele (2013) and Mazibuko (2006) praised the efforts of South African institutions to promote gender and equity promotion activities. Higher education governance and administration must contend with many power sources, competing agendas, decentralised organisations and limited resources to achieve women's inclusiveness in academic leadership. Power centres included schools, faculties, colleges, executive management, senates, and councils. Although major institutional restructuring to enhance women's progress, especially black women's progress, has happened since South Africa's democratic birth, old prejudices continue (Coe, Piggott, Davis, Hall, Goodell, Joo & South-Paul, 2020; Walker, 2020). These prejudices continue to damage rather than empower women. In South Africa, the reality is that merely 5 percent of the total number of professors at higher education institutions are black women. And only six of the 26 vice-chancellors at public universities in the country are women.

Discrimination within professional hierarchies and the structure of opportunities for women must be addressed if leadership in the academic careers of women is to be advanced (Letsoalo & Rankhumise, 2020; Liani et al., 2020 & Walker 2020). The South African Employment Equity Act 55 of 1998 regulates the standards and structures of employment within South African institutions. In keeping with the Employment Equity Act of 1998, a transparent recruiting procedure will improve women's participation in and advancement into leadership positions in South African universities. Similarly, gender development and mentoring programmes for ambitious female academics promote the inclusion of women in the leadership structures of South African universities (Liani et al., 2020 & Sadiq et al., 2019). As a result, poor self-esteem is addressed by the implementation of empowerment and mentoring programmes (Isaacs, Strydom & Mbukanma, 2022; Mcilongo & Strydom, 2021). A positive outcome and thus a greater sense of self-efficacy is expected since women's career paths should be unrestrained by institutional norms or assumptions about women, especially black women (Netnou & Strydom, 2020).

5. Research Methodology

In this study, a qualitative research technique was used. A qualitative research technique, in essence, assists researchers to investigate and comprehend the significance of a social or human problem in order to propose answers to real-life socioeconomic difficulties (Creswell, 2014:32). The creation of ideas that assist researchers to comprehend social phenomena in natural (as opposed to experimental) contexts, with proper attention to the participant's experiences, opinions and interpretations of real-life circumstances, is a significant element of qualitative research (Fletcher, 2017:184; McCusker & Gunaydin, 2015). As a result, this study adopted a participatory action research design. Participatory action research entails researchers and people collaborating in order to understand and improve a problematic situation (Fine & Torre, 2019). Participatory action research focuses on social change that promotes diplomacy and challenges inequality; it is context-specific, frequently focusing on the needs of a particular group; it is iterative, involving research, action, and reflection; and it frequently aims to 'liberate' participants by increasing their awareness of their situation and empowering them to act (Husni, 2020; Fine & Torre, 2019).

Walter Sisulu University (WSU), a developmental, comprehensive university with four campuses located in the Eastern Cape was sampled for this study. As a result, 30 permanent academic staff members of both genders (male and female) at WSU were interviewed for qualitative data collection purposes. To analyse the interview responses, the researchers used a thematic approach to data analysis using ATLAS.ti version 9, which helped to categorise the themes that emerged from the participant responses. Given the nature of this research, which included engaging with participants using interviews, ethical clearance was acquired from WSU, with certificate number 2021/01/BCEL/EXTERNAL. The sample for this study was confined to permanent staff members at WSU, which is consistent with the study's objectives and the logistical limitations of collecting primary data during the Covid-19 pandemic. However, it was anticipated that permanent academic staff at WSU would provide the critical data necessary to accomplish the study's goals.

6. Data Analysis and Presentation

Data analysis is the act of assembling and interpreting enormous amounts of data. It involves a complex, time-consuming, innovative, and intriguing process of data interpretation (Lester, Cho & Lochmiller, 2020; Michael & Schucany, 2017). Saturation of responses occurred with the 19th participant out of 30 anticipated participants (permanent academic staff of WSU, including both males and females). As a result, 19 fully completed responses from participants were obtained. In summary, this study relied heavily on the subjective responses of the participants to determine the best strategies for advancing women's academic leadership prospects in a selected South African university.

A thematic analysis was conducted to guarantee that the opinions of each participant were grouped and classified into distinct themes and sub-themes. Thus, the researchers used the processes and methodology established by theme analysis to analyse and present qualitative interview data succinctly. Table 1 indicates the steps and methods in the thematic analysis.

Table 1: Steps and Methods in Thematic Analysis

Step	Method	Explanation
1	Organising data	Questions were numbered, sorted, and prepared for data analysis.
2	Review of transcripts	The researchers reviewed the data to familiarise themselves with the data collected and ensure that the collected data reflected the direction of the study.
3	Stage one coding	Initial emerging themes were labelled and categorised.
4	Stage two final coding	The coding process was used to sort related data, so that related headings with similar content were grouped. These formed the categories under the themes.
5	Representation of data	The findings in the themes were represented through ATLAS.ti version 9 in figures and network linkages, followed by thematic presentations of participants' verbatim words.

To guarantee the utmost confidentiality and anonymity of the respondent, as stipulated in the ethical clearance permission, pseudonyms were given to the respondents who participated in the study (see Table 2).

Table 2: Pseudonyms of the Participants

Participants	Pseudo Names	Job Designation
Participant 1	WSU1	Lecturer
Participant 2	WSU2	Deputy Director
Participant 3	WSU3	Professor
Participant 4	WSU4	Professor
Participant 5	WSU5	Senior Lecturer
Participant 6	WSU6	Senior Lecturer
Participant 7	WSU7	Senior Lecturer
Participant 8	WSU8	Head of Department (HOD)
Participant 9	WSU9	Lecturer
Participant 10	WSU10	Professor
Participant 11	WSU11	Lecturer
Participant 12	WSU12	Senior Lecturer

Participant 13	WSU13	Professor
Participant 14	WSU14	Professor
Participant 15	WSU15	Lecturer
Participant 16	WSU16	HOD
Participant 17	WSU17	Senior Lecturer
Participant 18	WSU18	Professor
Participant 19	WSU19	Lecturer

There are several ways to code data but, according to Deterding and Waters (2021), coding is an approach used to evaluate the transcribed information and categorise it into the relevant unit and sub-unit groups. For theme presentations of participants' verbatim responses, pseudonyms were used to help with the logical presentation of the responses. Following this step, the transcribed data were classified into themes and categories to find ideas relevant to the study's research objectives. The themes and categories of this study are presented below.

6.1 Themes on the Existing Institutional Structures at a South African University that Address the Challenges Women Face in Attaining Decision-Making Positions

This section of the study explores the participants' understanding of the existing institutional structures at the university that address the challenges women face in attaining leadership/decision-making positions. This theme aligns with the study objective that seeks to identify existing structures the university has put in place to advance aspiring women leaders. Thus, participants were asked to provide their views based on their experience, and ATLAS.ti was used to identify the participant's perceptions, as presented in Figure 1.

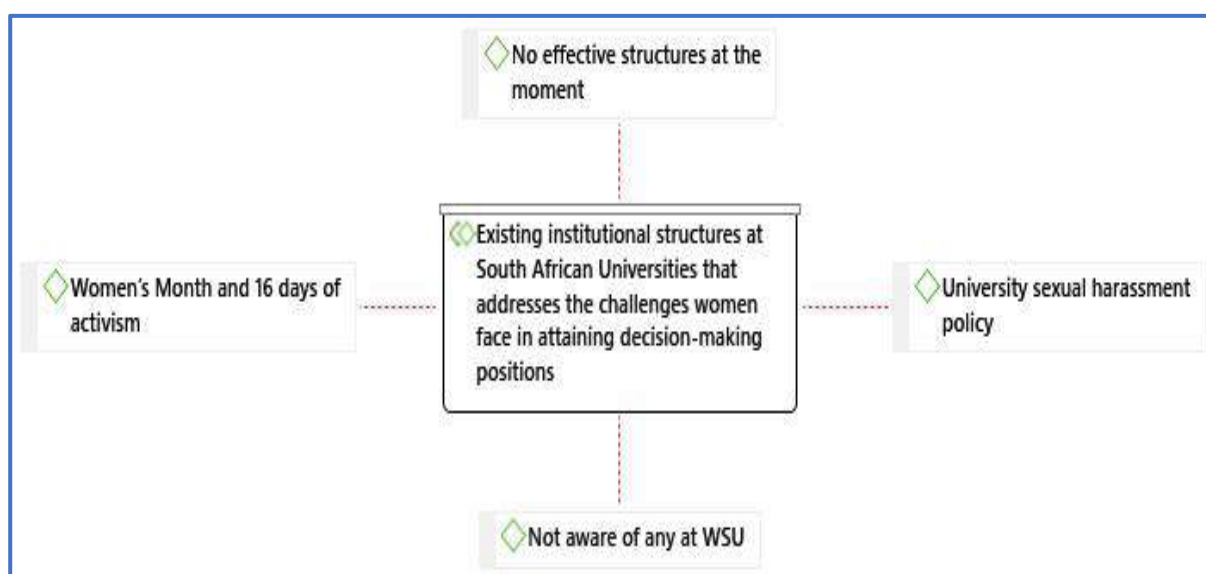

Figure 1: Response to the question about existing institutional structures in a South African university that address women's challenges in attaining decision-making positions

Figure 1 provides a network diagram depicting the participants' views on existing institutional structures at a South African university that address the challenges women face in attaining decision-making positions. It was ascertained from the responses gathered from participants that universities in South Africa, in general, and in WSU, in particular, have no existing structures that help with advancing the prospects of women in academic leadership, besides the university sexual harassment policies. However, some of the participants added that the only time women's interests are considered is during women's month and the 16 days of activism against gender-based violence, which has not

significantly influenced the leadership succession structures of South African universities. See below verbatim extracts from participant comments.

WSU1 said 'it is mostly lip service':

We live in a country where we have a 'Women's Month' and '16 days of activism'. As if the other months and the other days are not important for women, too. Also, the whole 'women and children' dialogue clumps women together with children.

WSU5 said 'none':

I only know of HERS and HELM, which are external structures as resources, but no structure I know within the few universities in South Africa.

WSU6 said 'none at WSU':

There might be limited access to women holding decision-making positions, and even then, they are usually under severe scrutiny.

WSU19 said 'I am not aware of any specific one'.

Hypothetically, there is this assumption that employment equity policies secure and guarantee the representation of all genders within the university community. Perhaps, the question arises whether the employment equity policy has enhanced the succession of academic leadership positions with the inclusion of women. Conceptualising the responses gathered from the participants in this study, it is significant that the university communities have no structures that aid in advancing the prospects of women in academic leadership. This gap in academic leadership structures or policies is in line with the arguments of Moodly and Toni (2019) and Ramohai (2019), who emphasised the notion that proactive structures for women to represent their interests within South African universities are lacking, and that there is an urgent need to resolve this situation by gathering holistic ideas from academics of both genders about the nature of such proactive structures.

6.2 Themes on the Measures to Improve and Sustain the Representation of Women in Leadership Roles in a South African University

This part of the study examined the participant's understanding of the measures taken to improve and sustain the representation of women in leadership roles at the university. This theme aligns with the study objective that seeks to identify ways to advance women's prospects in academic leadership roles at a South African university. Thus, participants were asked to state their opinions about these factors, and ATLAS.ti helped to identify the theme from the participant's responses, as presented in Figure 2.

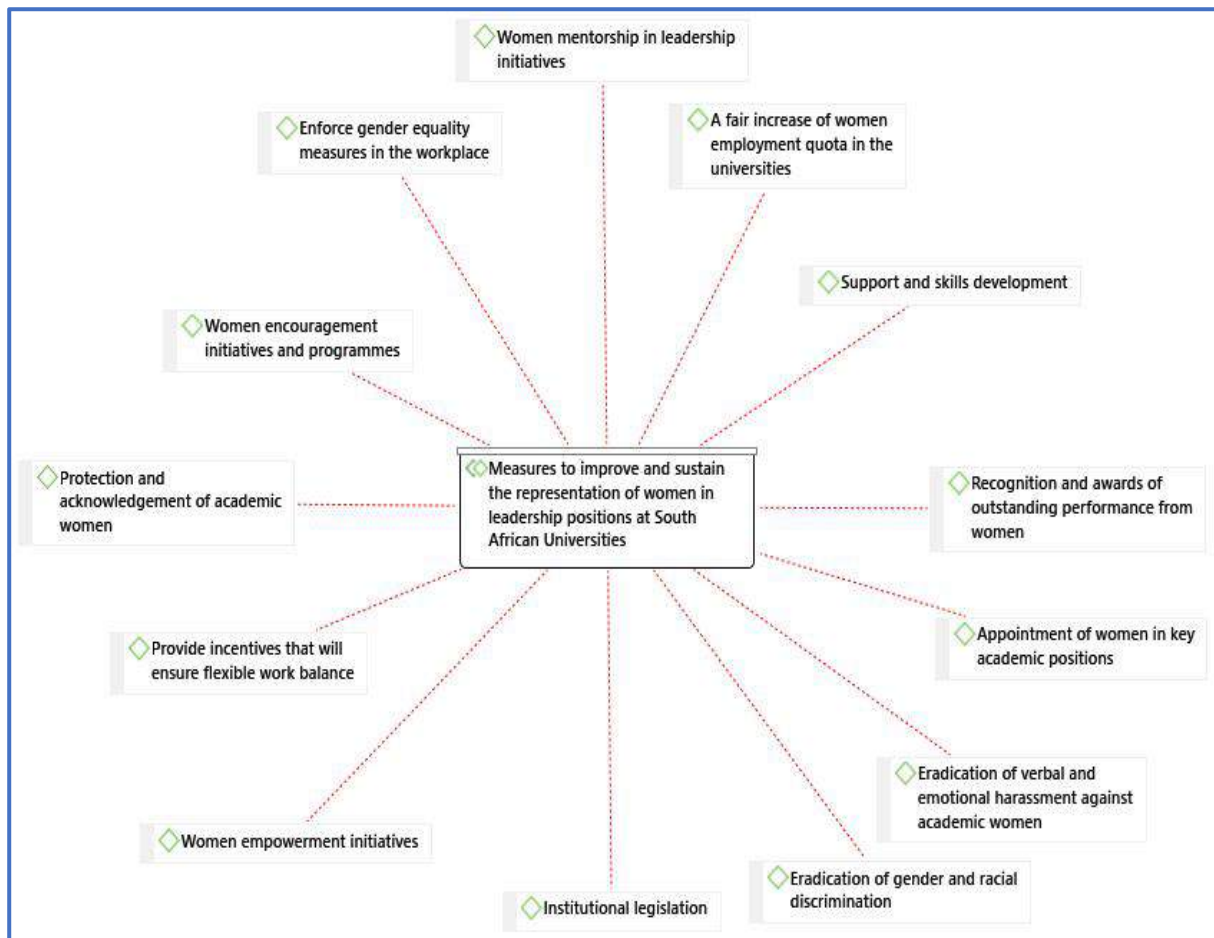

Figure 2: Measures to improve and sustain the representation of women in leadership roles in a South African university

Figure 2 provides a network diagram depicting participants' views on measures that could be taken to improve and sustain the representation of women in leadership roles within a South African university. It was ascertained from the responses gathered from the participants that measures such as eradication of verbal and emotional harassment against academic women; a modest increase of the women employment quota in the universities; women empowerment initiatives; women mentorship in leadership initiatives; the eradication of gender and racial discrimination; recognition and awards for outstanding performance by women; and enforcing gender equality measures in the workplace were mentioned as a vital element for improving and sustaining the representation of women in leadership roles in South African universities. Some verbatim extracts from the participant's comments are presented below.

WSU1 said that:

the perpetuation of the inferiority status of women maintained by the academic institutions must end with redress of the unjust practices. Increase the percentage of women in academic leadership or management positions. Create forums to discuss and address verbal and emotional harassment.

WSU2 said that:

more effort should be made on women empowerment initiatives. Specific policies should be developed in this regard, and women should be groomed for leadership early in their careers. Institutions must also have well thought, sustainable programmes geared towards growing their timber. This could include retaining student leaders and grooming them (through relevant studies and leadership programmes) into future management positions. Furthermore, women should be recognised and awarded for their outstanding leadership.

WSU8 said that:

institutions should develop a policy on 50:50 male to female representation in administrative and senior academic positions just as they have done in parliament.

WSU9 said that:

there is a need to review the existing policies that resulted in women being marginalised or mistreated.

WSU15 said that:

legislation from the institution would aid in this regard and design programmes that equip specifically women in leadership positions with unique skills meant for women.

In line with the views of the participants, Al-Qahtani, Ibrahim, Elgzar, Sayed and Essa (2021) and Avolio et al. (2020) argue that providing incentives that will ensure flexible work balance, support and skills development are essential in the workplace, as well as the eradication of gender and racial discrimination. In addition, women empowerment and mentorship initiatives are vital for improving and sustaining the representation of women in leadership roles in South Africa (Mcilongo & Strydom, 2021). Nevertheless, women also have a responsibility to acquire the skills and knowledge required to prepare them for the possibility of attaining leadership positions in a university (Al-Qahtani et al., 2021; Breeze & Taylor, 2020).

6.3 Themes on the Ways to Empower Aspiring Women Leaders in a South African University

This part of the study examined the participant's understanding of empowering aspiring women leaders in South African universities. This theme emerged from the study objective which sought to ascertain ways to empower aspiring women leaders at the university. Participants were asked to provide their views in this regard and the use of ATLAS.ti helped to identify a theme from the participant's responses, as presented in Figure 3.

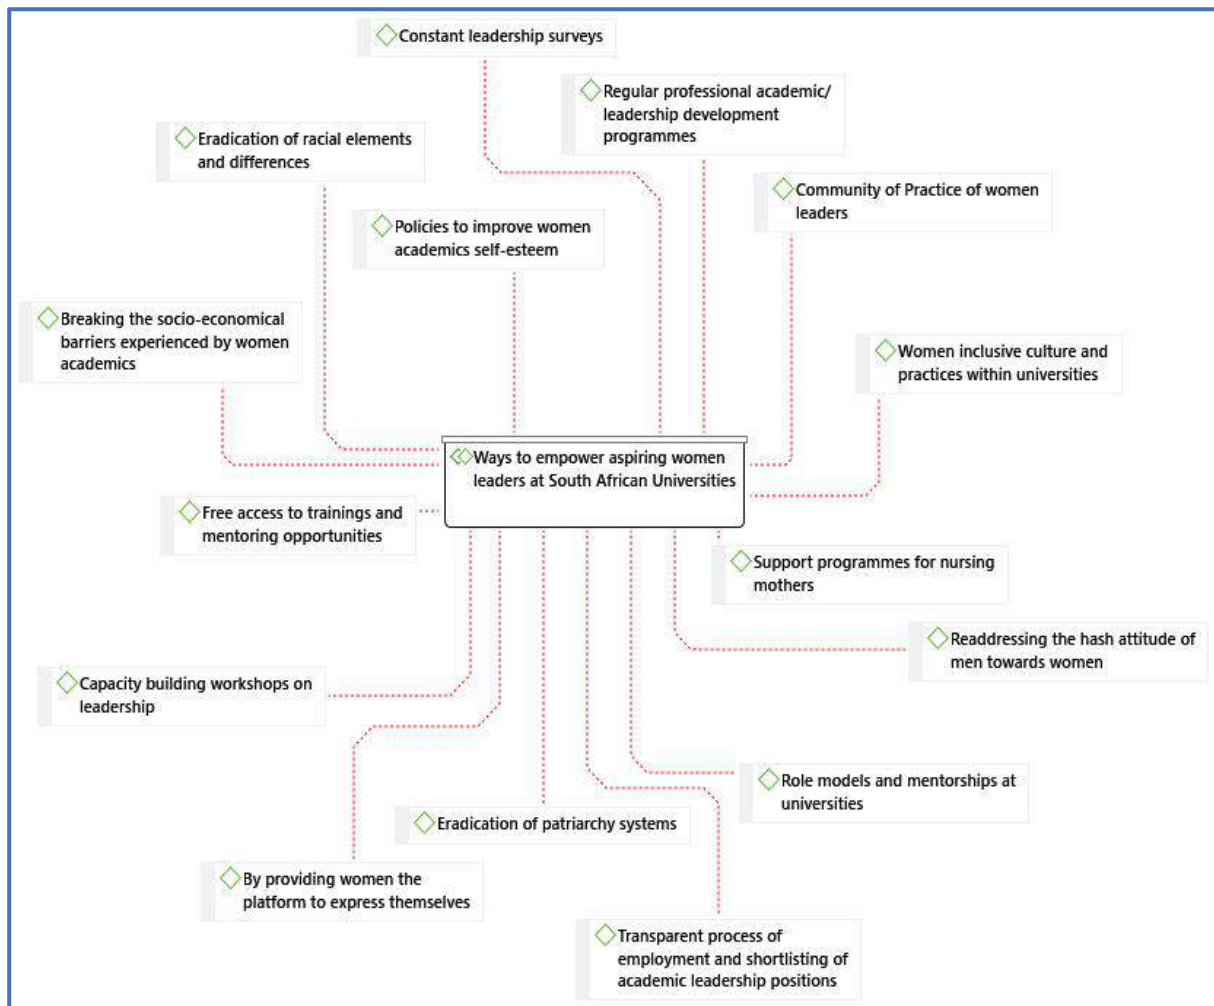

Figure 3: Ways to empower aspiring women leaders in a South African university

Among other mechanisms to empower aspiring women leaders in a selected South African university, as depicted in Figure 3, emphasis was placed on free access to training and mentoring opportunities; the breaking down of socioeconomic barriers experienced by women academics; policies to improve the self-esteem of women academics; the use of role models and mentorships by universities; addressing the hash attitude of men towards women; and support programmes for nursing mothers. However, it was also ascertained that the institutions, the government, and women, themselves, as individuals, have a role to play in empowering aspiring women leaders in South African universities. Some verbatim extracts from the participants’ comments are presented below.

WSU1 said that:

breaking the socioeconomical barriers experienced by women academics will not happen overnight. There is much resistance to change, clearly visible in many academic institutions, where women continue to be undermined and denied leadership positions. Women who aspire to leadership positions must show determination, perseverance, courage, and patience. Role models and mentors can help mould and empower the young generations of women leaders.

WSU3 said that:

women should partake in mentoring other women. This is difficult, as there are few women, especially at our institution (WSU). They should be encouraged to apply and know that they will not be undermined by men in their departments/divisions when they are appointed. As far as I am concerned, having women in leadership positions will not work until the men change their attitudes.

WSU6 said that:

there must be some severe amendments on the parts of the HEI's systems. I would advocate that the critical starting point is the recruitment stages; the adverts must be clear and directly target women; the shortlisting processes should be more transparent, especially as most shortlisting and interview panels are male-dominated. It is also important to take cognisance of institutional culture that primarily reflects SA patriarchy systems with its beliefs, values, and norms. Whether acknowledged or not, there are still racial undertones and differences of whether it is 'white woman or black woman' in decision-making positions; and the institution concerned.

WSU7 said that:

women need to freely access training and mentoring opportunities and regular professional academic/leadership development programs.

WSU10 said that:

it is vital to provide capacity-building workshops with topics relevant to women's struggles in leadership.

WSU13 said that:

there is a need for a community of practice of women leaders who share their experiences and challenges with other women to come up with solutions and plan for succession from women to other women. Continued leadership surveys to identify challenges for both men and women so that aspiring women leaders can learn.

The role of the university communities in empowering women towards attaining academic leadership positions cannot be overemphasised. As Breeze and Taylor (2020) and Moodly and Toni (2019) rightly posit, the starting point to establish women's interests in the workplace is at the employment stage. This assertion implies that the employment process must be transparent, properly recognising fair employment quotas allocated to both males and women. Perhaps, when a fair opportunity is given to both men and women, advancing to compete for academic leadership positions would be reconciled with gender equity (Liani et al., 2020; Naicker, 2013; Mazibuko, 2006).

7. Key Findings and Managerial Implications

The objective of this study was to find measures to advance the prospects of women attaining academic leadership positions in a South African university. The outcome of the literature review and the data gathered from the participants revealed that a concerted effort on the part of women as individuals, universities as institutions and the government is required to advance women's academic leadership prospects in South African universities. The key findings and managerial implications are listed below:

- **Existing institutional structures put in place to address the challenges of aspiring women leaders:**

The findings of this study revealed that there is virtually no existing institutional structure (with regard to the scope of this study) in place to address the challenges women face in attaining decision-making roles in academic leadership. However, some of the participants added that the only time when women's interests are considered is during special women's day celebrations or events by women's rights movements, neither of these activities have significantly influenced the leadership succession structures in academia. As a result, although it is evident that there is a gap in academic leadership succession structures in South African universities, the establishment of proactive structures and policies for women to promote their interests inside South African universities is recommended. Hence, there is an urgent need to resolve this impasse in order to acquire comprehensive and equal input from members of the various genders involved in academic leadership and decision-making.

- Measures to improve and sustain the representation of women in academic leadership roles:**

In ascertaining the views of the participants in this study on the measures required to improve and sustain the representation of women in leadership roles in a South African university, considering the existing limited number of women in the leadership and decision-making structures, the following action should be considered by management: measures such as the eradication of verbal and emotional harassment against female academics; women mentorship and leadership initiatives; eradication of gender and racial discrimination; recognition and awards of outstanding performance of women; and the enforcement of gender equality measures in the workplace are recommended as vital measures for improving and sustaining the representation of women in leadership roles at South African universities.
- Ways to empower aspiring women leaders at a South African university:** Empowering aspiring women leaders in academia is a complementary dimension to the other measures required for advancing the prospect of women in academic leadership and decision-making positions. Accordingly, the findings from the study revealed that management should implement mechanisms, such as free access to training and mentoring opportunities; assist in breaking the socioeconomic barriers experienced by women academics; offer programmes to improve the self-esteem of women academics; provide role models and coaching programmes at universities; assist in readdressing organisational culture, especially the harsh attitude of some men towards women; and implement support programmes for nursing mothers. All these initiatives could aid in the advancement of women and would be significant in the empowerment of aspiring women leaders at a South African university.

8. Conclusion

Prospective academic women encounter gender inequities, under-representation and numerous hurdles in attempting to advance their academic leadership and decision-making careers. Previous researchers have investigated these barriers faced by women in academia. The aim of this research was to determine ways to advance the prospects of women attaining academic leadership positions in a South African university. To achieve this, a qualitative research approach was adopted, with careful adherence to the participation action design, which serves as the study's foundation. Qualitative interview responses were collected from permanent academic staff at WSU and analysed. From the findings of the analysis, the researchers recommend that the generalisation of the findings of this study should be treated with the utmost care, since the study's findings remain within the scope of the sampled population.

This study was able to build in-depth knowledge on the theoretical approach and previous authors' contributions on the subject of the advancement of women's leadership in South African universities. Accordingly, the findings of this study revealed that a significant gap exists in the structures designed to advance and promote the prospects of women towards attaining leadership positions. In closing this gap in academic leadership succession structures, measures such as women's mentorship in leadership initiatives; the enforcement of gender equality measures in the workplace; the appointment of women in key academic positions; the provision of incentives that could ensure flexible work balance; the eradication of gender and racial discrimination; and the eradication of verbal and emotional harassment against academic women are recommended.

The findings also revealed that advancing the prospect of women in academic leadership requires empowering them with the requisite platform from which they could promote their ambitions. In line with advancing aspiring women in academic leadership, measures such as the transparent process of employment and shortlisting of academic leadership positions; regular professional leadership development programmes for women; a community of practice of women leaders; a women inclusive culture within universities; free access to training and mentoring opportunities; programmes to improve the self-esteem of women academics; role models and coaching opportunities; and support programmes for nursing mothers were ascertained as ways to empower aspiring women academic leadership in the selected South African university.

A Conceptual Framework to Improve Efficiency within a Public Health Facility

Ms. Elbie Vosloo^{1,*} & Dr. P.A. Croucamp²

¹ Western Cape Government Health, Worcester, South Africa

² North West University, Potchefstroom, South Africa

Keywords

Cost efficiency;
wrangling data

Abstract

The literature reiterates the complexities in healthcare management due to multi-factorial influences, variables, and differences within healthcare ecosystems. What many before grappled with is how to determine if a Public Health Facility is delivering services efficiently. Is the existing indicator measuring cost per patient day equivalent (C/PDE) sufficient to draw conclusions or applicable for decision-making purposes? Should other indicators also be considered simultaneously? The link between performance indicators and the budget process remains limited and could be strengthened. If these links can be established through the wrangling of data, a more scientific way of budget allocation for specialist-specific services on a like-to-like basis might be possible. This exploratory study's primary purpose is to determine if the available electronic systems can monitor specialist hospital efficiency. A mixed method is applied to determine if the wrangling of data leads to improved quality information. A conceptual framework based on specific operational management and supportive financial activity and clinical productivity per specialty can guide the way to efficiency measurement of hospitals in South Africa. The guiding principle will be that general management and health specialists should be equally involved in the process, narrowing the gap between administration and clinical expertise.

1. Introduction

Access to healthcare in South Africa is a human right as stipulated in the South African constitution Section 27 1. (a) (Act No 108, 1996). While the average life expectancy increases at a steady pace of 0,4% per annum as reported in the United Nations World population trends, the burden of disease is increasing in size and complexity, and the consequent patient demands on the service platforms are escalating. This increasing demand on the health system, asks for extensive budget allocation to be realized. Hospital management is known for its complexity as very few hospitals can be compared due to the differences in services delivered and population needs. Acknowledging the economic situation of South Africa and the depreciation of the Rand value against international currencies, there is a need to figure out the cost efficiencies of curative hospital-centred healthcare. The health department must operate within an environment of competing needs for limited resources (Engelbrecht, 2016). Leleu *et al.*, (2018:34) reported that with the rise in healthcare spending worldwide, there is a strong incentive to better understand healthcare spending.

As part of the transformation of the Health System in South Africa that started post-1994 and with the promulgation of the National Health Act of 2003, integration of the previously fragmented health departments was initiated. One aspect was the implementation of District Health Systems (DHS). District health systems are aligned with the 3 tiers of Government in South Africa: National, Provincial, and Local. Each district health management team is responsible for the delivery of health services to a specific geographic area and its population.

Four years ago, the Western Cape health department realigned Regional Specialist level 2 (L2) hospitals to resort under the management of either the metro or rural health services directorates. Previously, specialist services and hospitals were clustered under one directorate with Emergency and Forensic services. The purpose of the de-clustering was to further integrate L2 hospitals to form part of the DHS and the geographic area or ecosystem they serve. This results in all the L2 hospitals having a PHC responsibility towards the sub-district population where they are situated. Chikobvu (2016:146) mentioned that providing lower-level care at a higher-level institution is inefficient as the cost provision scale is higher. The possibility exists that through the NHI, services may be purchased from both the public and private health sectors, raising questions about the relative pricing between the two sectors (Ramjee, 2013). This further emphasizes the need to determine the underlying cost of services despite the different models applied in the public and private health sectors in South Africa.

The South African National Treasury adopted the indicator logic model. This logic model is also embedded in the Policy Framework for the Government-wide Monitoring and Evaluation System. The indicators that focus on hospital efficiency include, ALOS (average length of stay), BUR (bed utilization rate), and Exp/PDE (expenditure per patient day equivalent). Ratio measurement seems very easy but does have some pitfalls. Ramjee (2013:9) also mentioned that ratio analysis is relatively easy to apply but the single-input and single-output scenario is unlikely to happen in any hospital environment. Chikobvu (2016:54) reported that managers in the public health sector's use of hospital efficiency indicators are currently strained, unlike their counterparts in the private sector. Although data is collected regularly, the interpretation of patterns is seldomly understood.

Apart from the DHIS software, there are numerous electronic systems in the Western Cape Health Department. For hospital services, there are the patient administration system, Clinicom, the pharmacy administration, and dispensing system, JAC, and the PACS/Ris radiology system are but a few of many. None of these electronic systems are interoperable and all function as standalone systems. An electronic software system, the FBU (functional business unit) Dashboard, was created to serve as a platform to receive raw data from different systems and aggregate and process data to give hospital performance information. This software package organizes raw data according to geographic areas in hospitals and provides ratios with multiple inputs and outputs that are not organized per clinical specialty and thus not meaningful for management information for decision-making, as per the defined management roles and responsibilities. The focus of this study was on applying a different approach to the use of the FBU application. Wrangling data as described by Westraadt *et al.*, (2019:334), is the process of mapping data, and transforming data to make it more appropriate and valuable for analysis.

2. Problem Investigated

Primary healthcare is the cornerstone of universal health coverage as again underpinned by the United Nations National Assembly in 2015. Despite the focus on PHC and taking the service to the people in South Africa and specifically, the Western Cape province, the majority of the provincial health budget is still funding hospi-centered curative care. The implementation of the DHS realized a vertical integration of services to address the patient care pathway. This may have resulted in specialist services covering PHC services. With that said, it is unknown how much primary health care is provided by L2 hospitals rather than by primary healthcare platforms and L1 hospitals. Although numerous national data include output, outcome, and health impact of services, apart from the efficiency indicator Exp/PDE, no further proof is evident that other available information is used for budget allocation towards specialist services. It has been noticed that efforts to improve the quality of population health maximization and resource measurement shift the focus to be directed at data collection for the sake of compliance (Chikobvu, 2016:1). A situation where a lot of data is collected but never fully utilized is indicative of a knowledge gap or possible opportunity.

In a resource-strained health environment, the “one size fits all“ allocative and technical efficiency should be reconsidered. Suppose a sole purchaser is to be established using the NHI finance model. In that case, it is of utmost importance to enable the efficiency measurement of specific specialist activities on a like-to-like basis between hospitals. The separation of variable and fixed costs during

the expenditure monitoring should be of value while a specific value to the personnel or medical staff component is separately available. No solution or system has been developed, connected, or tested so far that contributes to the position that enables public health facilities to measure efficiency per speciality service. What is available are standalone electronic information and operational systems, each developed to address single aspects of public health or performance, not interoperable, and with little management information ready for decision-making or planning purposes. Purportedly health managers in South Africa are not adequately capacitated and skilled to manage facilities (Michel, *et al.*, 2020:2). The question of whether health managers have intelligent information to make decisions, plan, monitor, and control has not been answered yet. While McIntyre and Ataguba (2017:31) mention the lack of decision-making authority at the operational level, Leleu *et al.*, (2018:36) argue that managers in non-competitive markets are not as motivated as their counterparts in competitive markets to increase efficiencies.

No evidence could be found of a scientific approach to public health hospital budget allocation based on operational performance (outputs) on a like-to-like basis. Maphumulo and Bhengu (2019:7), and Coovadia *et al.*, (2009:832) indicated that further efforts and studies are needed to assess the efficiency of strategies that are used to evaluate healthcare outcomes and improve the stewardship and management of the health systems. In the health market inquiry, competition commission report of 2017, it is clearly stated that there is an asymmetry in South African health care with inadequate health information, making it difficult to understand and compare services and facilities.

3. Research objectives

The primary objective is to investigate if wrangling, which is described as mapping and re-organizing information (Westraadt *et al.*, 2019), can lead to improved information for decision-making at an operational level, enabling hospital managers to execute their managerial roles as accountable persons within a health facility. A second objective would be to determine if this application will result in improved cost efficiency and reduce wastage.

4. Literature Review

4.1 What measures are available to determine hospital efficiency?

Donabedian (1989) recognizes Ernest Codman's 1910 contribution to quality assessment and beyond and for his central role in "the end results" idea. Codman advocated for monitoring as we know it today as health outcomes and the standardization of hospitals. Donabedian describes how Codman saw the end result idea becoming the vital link between the science of medicine and the science of management (1989:242). It is emphasized that the contribution to the desired end results should determine how money is spent and how hospitals are managed (1989:246). The South African National Department of Health issued notice 667 of 1997, wherein Chapter 6 is dedicated to Health Information. One of the major obstacles that prevented effective health service planning in South Africa was reliable information. A priority was thus given to the establishment of a central health information system. In 1994, a committee National Health Information System for South Africa (NHISSA) was established to develop a central health information system to support the effective delivery of services and monitor the implementation and successes of priority programs.

The National Department of Health, District Management Information system policy of 2011 reports that the Committee for NHISSA issued the first data set for PHC in 1999. The district health information software was adopted for collection, capturing, storage and analysis. This is referred to today as the DHIS. Over time it was expanded and now includes the PHC data, hospital information, and priority program data sets. DHIS data and information contributes to the planning for health service management. There are also weaknesses identified in the system that contribute to compromised data quality and sub-optimal use of data and information.

National Treasury issued a Framework for Managing Programme Performance Information in 2007 (NT, 86/2007). This document discusses key performance indicators and their use to measure performance against input, process, output, outcome, and impact. The purpose of indicators is explained, and emphasis is placed on the need to have a thorough understanding of the nature of

inputs, processes, and outputs as well as knowledge of the desirable outcome and impact. The following figure is used to demonstrate the relationship between the performance concepts.

Figure 1, Logic model - Indicators of economy, efficiency, effectiveness, equity (NT 86/2007:7).

The Treasury Framework further gives clear criteria for indicators that include, reliability, verifiability, well-defined, cost-effective, appropriate and relevant. The logic model is used to demonstrate the conceptualization of efficiency, economy, effectivity, and equity. The Department of Planning, Monitoring, and Evaluation (DPME) is a statutory institution within the presidency since 2011 and is charged with the task of monitoring and evaluating government delivery and performance. At an operational level such as a hospital or health facility, the focus will be on the lower 3 parts of the logic model, inputs, activities, and outputs. Economic efficiency which includes technical and allocative efficiency at the operational level is thus of importance and the investigation focus of this study.

Key performance indicators are used globally to measure access to health, equity in health, and health financial expenditure (Leeder, 2016:22). The use of indicators to measure managerial and clinical processes, and financial performance of health systems or units, is by now deeply entrenched. Wronski (2021:10) found in a study with a geographic approach, applying the Delphi method during an online survey, that participants only used indicators that were relevant to them and understandable. It is further stated that a kind of “indicator chaos” can be observed, mainly due to the high number of sector-specific indicators and data (Wronski, 2021:2). Leeder (2016:23) made a statement that policymakers should be asked how performance indicator data are being used in practice. There are lessons to learn from leading countries such as the United Kingdom and many problems can be avoided by, for one, making use of “soft” data to assist with interpretation.

As already mentioned, South Africa introduced the use of indicators in the public health sector in 1999. The National Indicator Dataset (NIDS) like any other indicator framework is complex as they are structured and grouped according to multiple dimensions according (Chikobvu, 2016:35). This structuring is according to the logic model, global and local health priority programs such as maternal health, HIV/Aids and TB. The main purpose of any indicator is to act as a standardized method of measurement, either an input, activity, or output as per the logic framework or for the outcome or impact measurement. Indicators should further aid managers in the execution of their managerial functions and responsibilities. Chikobvu (2016) emphasized the situation where hospital managers receive voluminous data sets monthly, but still, need to extract the strategic information they need for decision-making. It is also reported that empirical literature on evidence-based management and decision-making processes in the public health sector is sparse. The fact that public health facility managers still need to extract strategic information from raw data, may be attributed to this reported sparsity (Chikobvu, 2016:73). Not much is known about the inferences drawn, patterns, and other managerial use of indicator data.

In the NIDS (2017), four indicators are grouped under efficiency indicators. ALOS, BUR, C-section rate, and Exp/PDE. Three of the indicators are operational or activity proxy ratio indicators, while the fourth indicator is a financial resource input vs. patient day output proxy ratio. Ramjee (2013) confirmed in his commissioned report that productivity ratios are an acceptable measure of an entity's performance, it has the advantage of being simple to apply and supplying useful information on a day-to-day managerial level. Three of the four indicators are assumed to be under the management of the facility's control, while the C-section rate is a clinical activity ratio. These four indicators and many more are reported monthly and form part of a facility's monthly routine performance data in totality. Situations arise daily or weekly where a sudden clinical care pressure or surge asks for an urgent bed availability due to overpopulation (100%+BUR) in a specific specialty while another clinical specialty may experience low bed occupancy (65% BUR). The aggregated proxy ratio will be 81% BUR and is still below the recommended 85%. In a case like this, a quick decision should take place to re-allocate beds within one facility between specialties. On hand, daily summaries or live data in the best circumstances will be able to assist with decision-making.

The requirements for using proxy ratios to measure productivity are homogenous input and output measures, which are difficult in complex multiple input and output measure scenarios. No empirical inference could be found of proxy productivity ratios applied for comparative measurement of specific specialties. ALOS or average length of stay is dependent on the reason for admission. The baseline for specialties differs where a patient under the care of a physician may stay on average 4,5 days, a patient in the orthopaedic department may stay for 6 days, and an obstetrics patient for 3 days. The hospital ALOS proxy score will be 4,5 days. The score of 4,5 days is not meaningful for decision-making if the individual ALOS is not known.

It is reported by Leleu *et al.* (2018:33) that improving efficiency only by increasing the output or lowering the input is of no value to healthcare as it does not address the maintenance or surety of quality. It is also emphasized and noted in the literature that the need to control or lower costs, while quality is accounted for has become an urgent, complex problem (Leleu *et al.*, 2018; Ramjee, 2013).

Various methods have been found in published literature, described, used, and applied to determine the efficiency in hospitals. Some include the "ingredient approach" an economical approach to estimate future costs (Olukuga, 2007:144). A step-down costing method was also applied to establish a cost per patient day (Than *et al.*, 2017:1). Several studies were found that applied the Pabon Lasso model to compare the outputs of different hospitals using proxy indicators. But the majority of studies used the Data Envelope Assessment (DEA) and variations thereof, with or without the Stochastic Frontier Analysis (SFA). Amado *et al.* (2020:1256) found an inference that both the DEA and SFA are the most widely used methods to assess technical efficiency in health systems. The reporting of DEA as the most popular mathematical method is also confirmed by Omrani *et al.*, (2022).

The Data Envelope Assessment is a mathematical programming technique that can be applied to measure the relative performance of several similar or homogenous decision-making units (DMU) (Surange, 2019:3). The DEA method was developed by Charnes *et al.*, in 1978, originally for the production industry (Simoões & Marques, 2009:41). Non-parametric linear data is used to build a technical frontier to establish a benchmark that can be used to measure other production lines. This mathematical method aims to determine the efficiency with which a DMU used the available inputs to produce a certain output. The measurement is relative to the DMU that performs the best or shows itself to be the most efficient in a group. The rest of the DMUs will be scored relative to the best-performing unit. The best performing unit will be assigned a score of 100% and the other comparing units will be assigned a score between 0 – 100% (Surange, 2019:3).

Omrani *et al.* (2022) confirm that the conventional DEA model is unable to consider uncertainty in input and output data. Small perturbations in data can cause big changes in the DEA approach's feasibility, ranking, and evaluation. To use the DEA on an annual or quarterly basis to assist with management decisions at a facility level is not possible. The credibility of the mathematical method deteriorates over shorter periods, adding to this, less data cannot compensate for the sensitivity of the

slightest perturbations. It is stated by Amado *et al.* (2020:1256), that both the DEA and the SFA address efficiency with a very naïve view, considering only the flow between input and output. The complexity of hospitals with multiple variables influences contributes to the agreement with Amado *et al.*, (2020:1256), that the application of the DEA and variations of linear non-parametric approaches to decide efficiency are naïve and not fit for purpose in this study.

Another method regularly applied is the Pabon Lasso model. It was originally developed by Pabon Lasso in 1986. This model applies 3 indices or key performance indicators, ALOS, BOR, and bed turnover rate (BTR), and given a mathematical correlation are then plotted on a graph divided into 4 quadrants by perpendicular lines derived from the average BOR on the X-axis and the average of the BTR on the Y-axis. Caution should be applied when using the average or the mean during the construction of the perpendicular lines as outliers of overly long stays in specific specialties may skew the outcome of other participants (Mehrtak *et al.*, 2014:108).

Applying the Pabon Lasso model is a well-tested and proven method to portray a graphical picture of hospitals based on their efficiency according to the 3 indices. The model, however, does not address the economic impact or provide measures speaking to the economies of scale. This confirms the recommendation of Aloh *et al.* (2020) that this method should not be used on its own, results cannot provide detailed information or confirmed reasons for the determined performance. The model can address the comparative measure of performance efficiency if it is possible to create a situation where specialties can be compared on a like-to-like basis and not hospitals per se. The economic efficiencies of specialty departments will, however still not be measurable.

Another method applied to group or cluster specialty activities is the Diagnostic-related Groups (DRG) system. The DRG system is the most used grouped package to determine activity and a payment method for services provided but not applied to measure efficiency. DRG was originally developed in the 1970s as an information tool (Ensor *et al.*, 2009:6).

Ensor *et al.* (2009:6) give a very clear description of the development of a DRG system to cost. Firstly, the cost of illnesses in specific major diagnostic groups is done. Illnesses or episodes are rather grouped per major diagnostic group as per the clinical department. The reason is that the same illness or episode may happen or get treated within another clinical department as well. The International Classification of Diseases (ICD) version 9 or 10 is mostly used to classify incidents. Criticism of the DRG system as a reimbursement or billing system is the complexity of the many options within the coding system. Only clinicians are allowed by law to make a clinical diagnosis, usually in the clinical notes, and administration staff performs the capturing of codes for billing purposes. Ensor *et al.* (2009:7) reported a 7-14% abuse of the DRG system or “DRG creep” where the DRG classifier or case manager becomes more important than the clinician. The main aim of the DRG system is to improve revenue generation and act as a costing model.

The public health sector in South Africa does not currently use a DRG system, but clinicians in this sector are expected to provide ICD 9 and 10 codes for diagnosis and treatment procedures. Compliance with the ICD 10 coding is not near 100% compliant and may compromise the application of such a system. If the use of the DRG system is an option on the table for South Africa, careful consideration should be given to pitfalls. A possible focus shift from quality and value for patients to revenue collection to artificially increase the cost for claims from a central purchaser to increase budget allocations.

4.2 Why is it necessary to have reliable information?

According to the Mintzberg management theory, management roles can be grouped into three overlapping groups (Smit *et al.*, 2007:15): interpersonal, information, and decision-making. It is explained that managers need to use the information available to introduce new ideas or restructure an organization to solve problems and allocate resources to allow for efficiency.

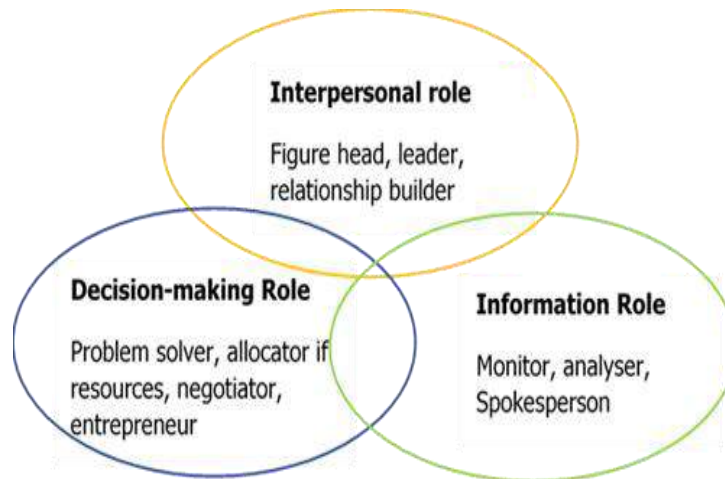

Figure 2. The overlapping role distribution of managers (According to Mintzberg) Smit *et al.*, 2007:16

Pacheco Junior and Gomez (2016) conducted a qualitative study using open interviews and applying the Method for Interpreting Meaning (MIM), based on hermeneutic-dialectical principles that seek to interpret meaning. Their purpose was to establish the decision-making of senior managers during the application of change projects that covers clinical management in Brazilian hospitals. They specifically wanted to gain an analytical understanding of innovation in hospitals or develop a new perspective of management in a hospital environment (Pacheco Junior & Gomez, 2016:2486). They reiterated that managers should not only be knowledgeable in technical scientific and predictable aspects of their organizations but should also be knowledgeable about the informal and unpredictable factors in their organizations. It is further highlighted that the decision is inseparable from the decision-making process, and action and information analysis are needed in the process (Pacheco Junior & Gomez, 2016:2487). They further found that most managers in a hospital setting had to deal with problems very quickly, and most managers use technical rationality for their decision-making. In their recommendation, they state that hospitals need more autonomy in decision-making.

Beley *et al.*, (2021) in their study on knowledge management and decision-making in Ethiopian hospitals stated that knowledge management is key to achieving and sustaining hospital efficiency. They applied a qualitative design, using an ethnographic methodology within an interpretive paradigm. They report that knowledge management is central to product-, and process innovation, and executive management decision-making. And therefore, the success of an organization depends on knowledge management (Beley *et al.*, 2021:3). It is also reported that a substantive amount of literature is available on knowledge management but there remains a gap in how administrative knowledge and clinical knowledge in hospitals can be aligned. Their survey confirmed that there are no methods or techniques to manage knowledge in hospitals. Due to this, decision-making processes in hospitals are not well supported with well-managed knowledge.

The notion that knowledge is not well managed, is supported by Alfawaz and Alharthi (2019) in an analytical descriptive study. In the conclusive remarks, it is stated that there is a statistically significant relationship between the retrieval of data for decision-making, both for administrative and clinical purposes. Health information should thus be available for decision-making. A health information system on its own will not improve efficiency, there is a need to develop an integration of systems (Alfawaz & Alharthi, 2019:65).

4.3 How can integrated information be attained

Muinga *et al.*, (2020) surveyed the levels of IT system adoption within public sector health facilities in Kenya. They indicated that hospital managers name financial accountability as their primary motivation for purchasing electronic systems. Seamless data exchange is essential for data integration. The success of interoperability depends on senior management's position on HL7. HL7 or Health Level 7 refers to a set of international standards for the transfer of clinical or administrative data between software applications. If this standard is not available, data exchange cannot happen from a

patient administration to a laboratory software system or backward for example. Usually, the billing system is the only system that does have the HL7 standard in the software package. Recommendations by Muinga *et al.*, (2020) mainly focussed on solutions including digital health systems that may improve the quality of health for patients. No empirical inference was found where HL7 standards were applied to provide an improved monitoring system that can also provide insight into economic efficiency or assist hospital managers with decision-making. Cashin *et al.*, (2017) indicated that the many standalone electronic systems such as the cash-based basic accounting system (BAS), a separate payroll (PERSAL), and a separate logistics systems (LOGIS) that is inoperable, make it difficult to aggregate and analyze data. It is also noted that due to the inoperability, it is difficult to predict the demand for services. The inoperability also makes it difficult to identify and reward efficiencies. Most countries, move away from provider or input-based budgets to purchaser or output-based budgets such as capitation or case-based methods. To achieve this, interoperability is of the essence.

The Western Cape government health has developed a dashboard to provide integrated information for managers at an operational level. It was developed by Ernst & Young in cooperation with the department in 2012. The dashboard approach was a model developed from a cost center department, aligning wards or geographic areas in a hospital to capture all financial and patient activities per ward. This dashboard, however, can't provide accurate information per clinical speciality.

4.4 Why is it necessary to wrangle data to get the right information

Empirical inferences were found in the literature that refers to the leadership and governance competencies in the public sector and that knowledge and skill among managers are still inadequate and contributing to x-inefficiencies (Michel *et al.*, 2020; Christian & Crisp 2012:734; Chikobvu, 2016:48). “The increase in the cost of inaccurate costing information and the decrease in the cost of operating more complex cost systems created a demand for more accurate product costing systems to be developed” (Botha & Vermaak, 2015:520). Ensor *et al.*, (2009) confirm this statement by indicating those past supply-driven methods where capacity and historic utilization are used and penalizing more efficient use by reducing budgets from those that can provide the same services but using fewer resources. Christian and Crisp (2012) refer to Leibenstein's comment from 1979 that incentives form part of the external measures that motivate individuals to increase their performance.

In their qualitative study to review the seminal work of Leibenstein, Christian and Crisp (2012) linked Leibenstein's theory to a modern-day complexity theory. It is recommended that more qualitative research is conducted to investigate the emergence of x-inefficiency in the public health sector in South Africa. The lack of an external measure to motivate hospital managers to increase economic performance may be a contributing factor. Ensor *et al.* (2009:1) reported that more countries outside the OECD countries are asking for formulae-based budget allocation. The basis for most formula allocations is proxy measures of need and the population of the catchment area. One of the key concerns about the fee for service payments is the possibility of “over-servicing” and the risk is shifted to the payer or insurer. With a third party responsible for purchasing services, there is no incentive for the patient or provider to limit or restrict the services to only the necessary. Ensor *et al.* (2009:5) further caution that payment for services rendered by a third party is cited as the major contributing factor to the escalation in health costs and notably so the United States. Case-based payments, such as the DRG model, have become increasingly popular to cap the excessive inputs and activities in a fee-for-service system. In a simpler form, the purchaser or provider may develop packages that are all-inclusive of treatment related to a specific procedure or condition. These case-based payments can be taken a step further and also be according to specific clinical departments (Ensor *et al.*, 2009:5).

Literature confirmed that statistical non-parametric and parametric mathematical methods do not fit to develop a framework for short-term decision-making at an operational level. Applying the DRG model on its own, will not necessarily measure cost efficiency but rather just record activities and assign a cost to the services provided. The underpinning principle applied in the DRG model of clustering services per clinical intervention together with key performance efficiency indices applied in the Pabon Lasso model can be applied to establish a conceptual framework for shorter-term

monitoring and decision making. The need for information and an easy way to monitor health activities on a day-to-day is possible with proxy indicators (Ramjee, 2017). At the same time, the science of medicine and management can be linked (Donabedian, 1989:242) in a framework that enhances decision-making. This will only be possible if mapping and organization of data can happen via a digital platform to compensate for the lack of HL7 messaging between standalone electronic systems.

5. Research methodology

The methodology used in this study is underpinned by the Theory of Change (ToC). The ToC is a pragmatic framework that describes how interventions affect outcomes or outputs. To apply complex interventions, the evaluator does not only need to understand whether but also why and how an intervention has an impact on results. Previously, the evaluation of complex interventions was criticized for not providing clear explanations on how interventions lead to real-world impact and for not examining how the interventions interact with context. ToC is a theory of how and why it works. (De Silva *et al.*, 2014:2). Logical frameworks, on the other hand, are rigid frameworks with inputs, processes, outputs, outcomes, and impact assumptions with indicators to measure success and milestones. This framework, however, does not make provision or necessarily explain how different components work together or impact the causal pathway to achieve impact nor link the activities to outcomes (De Silva *et al.*, 2014:3)

An explorative study was conducted applying a mixed method to determine the experience of stakeholders involved and do a comparative analysis of data before and after interventions were applied. A strategic focus on quality data capturing started in 2013 and went into 2014. The phased approach to mapping data and systems started in 2015. It was realized that the central system coordinators were doubtful and coding was not implemented as requested for fear of losing historical data. In 2017, refined coding took place. Secondary data from existing electronic systems were used for analysis while open interviews were conducted with stakeholders after full implementation.

The FBU dashboard was used as a digital platform to wrangle data according to clinical specialities or cluster groups, a principle borrowed from the DRG method. The principle from the Pabon Lasso to plot efficiency indices was also applied to compare data from before and after the changes were implemented to note any changes in performance outputs. The efficiency key indicator Exp/PDE was just used as a comparative proxy measure to determine the economic impact of the changes that were affected. The starting point was to sanitize the coding on the Clinicom or patient administration system. Each clinical speciality was given its unique identifier code, also referred to as the functional business unit (FBU) code. The same was done to supporting functions in the hospital with a specific Central management identifier to accommodate overhead or fixed costs. Clinicians have been involved in specifying the information they would prefer to receive on the services they deliver. Each FBU was then divided into the following sub-sections on Clinicom, making provision for inpatients, outpatients, and an administrative function.

Some specialities indicated the need to have sub-sections under their outpatient component as specific outpatient clinics are expensive and labour-intensive services, such as cardiology clinics. The next step was to sanitize the Logis or supply chain interface system, allocating a unique identifier to each Clinicom code. This will enable any financial activity for procuring goods and services with a specific FBU, whether inpatients or outpatients. The same steps were followed for the following systems as well. The JAC or pharmaceutical dispensing and warehouse system. Linking JAC activities with specific specialities within inpatient or outpatient departments. Linking the PACS/Ris or radiology picture imaging and information system, all requests and images were also linked to an FBU.

The NHLS or laboratory services and WCBS or Western Cape Blood services are systems outside the Department of Health's control, but through the unique identifiers, their expenses and reports can be aligned with the FBU mapping. The PERSAL or personnel system has limited access, but through background coding, each post was linked to feeding into the FBU dashboard to provide personnel costs per FBU.

The diagram below is an extract to indicate how some patient activities and data mapping relates to an FBU. The example indicates the tracking of general expenditure activities, laboratory usage and expenditure, medicine usage and cost implication from the pharmacy, and blood and blood products related cost. Information can be drilled down to specific detail that includes top 10 diagnoses and top medicine prescriptions as well as expired medicine per FBU. A cost-centre approach is used with a focus on the clustering of clinical services per discipline.

Figure 3. Extraction from the FBU mapping structure

At the same time, when the mapping changes were implemented, a functional change in the management structure of the executive management was also implemented. As recommended in a national protocol that was published in October 2013, giving guidelines on how to improve hospital management. One of the directives states explicitly that the executive management of hospitals should include all senior clinical managers or Heads of Clinical Units (HCU).

A functional matrix reporting system was adopted as opposed to the traditional hierarchy reporting system in the Public sector. This arrangement allowed for continued feedback improved sharing of information and shared accountability for service outputs within the facility. The process was initially intense as head clinicians are not familiar with all financial and people management policies and practices, while at the same time corporate functionaries had to learn about the impact of their services and functions on the clinical service delivery ability within specialty departments. Corporate or administrative functionaries started collecting, grouping, monitoring, and reporting per FBU, applying the clustered approach for all available data. It should be noted that there is no specific medical management position as the head clinicians took over the management roles for their own units.

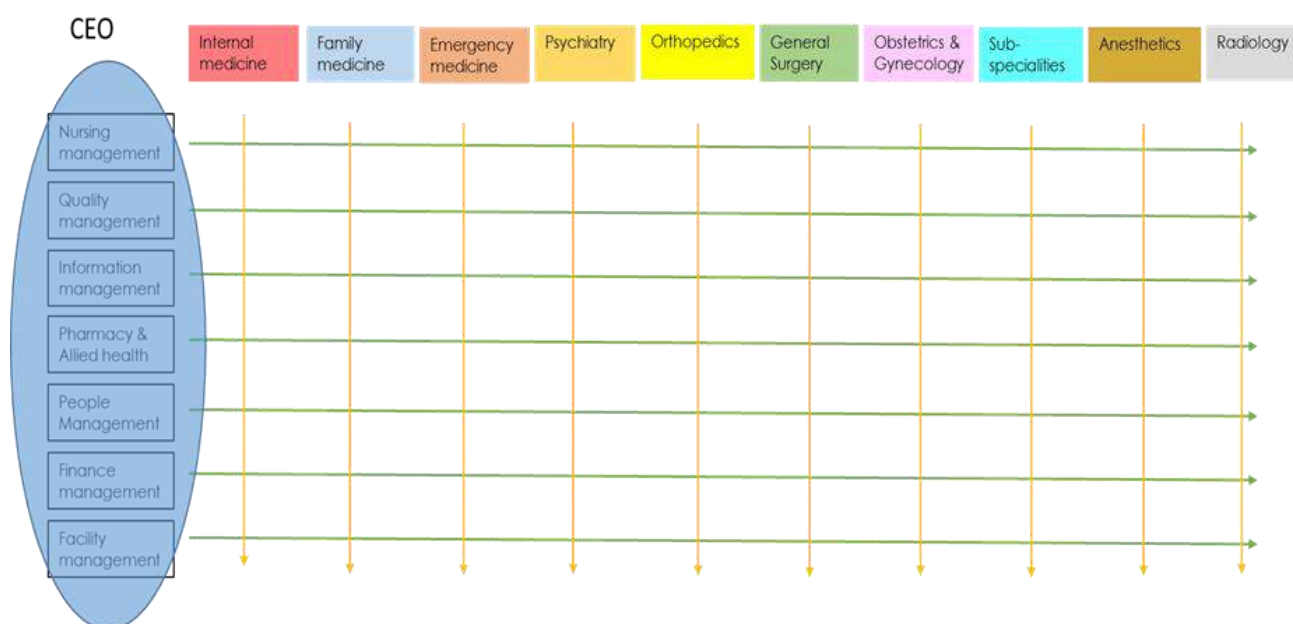

Figure 4. Management matrix structure

6. Results and Findings

The data analysis for the hospital as a unit showed remarked improvements in all patient activity indicators. The unreliable data and poor quality of data were initially of grave concern and efforts were made to focus on quality capturing. Additional resources were prioritized in 2015 to ensure enough administrative support for patient administration.

Since the inclusion of senior clinicians in the executive management in 2014, and the strategic focus on quality data, a steady increase was seen in the number of inpatient days while the separations also steadily increased. These indicators measure the number of patients admitted and discharged. Using these indicators an additional indicator was introduced, this was borrowed from the principle of the Pabon Lasso model. The Bed turnover rate was raised to measure the patient throughput per bed per annum. The implication of improved governance allowed that from the 2012/13 financial year each bed in the hospital only admitted 76,7 patients in a year, by 2018/19 each bed accommodated 83 patients in a year. The second additional indicator applied was the interval rate. The interval rate measures the time a bed is empty before another patient is received in the bed. The interval rate also improved from a little more than one day in 2012/13 to a little more than half a day before the next patient is received in a bed. Theatre efficiency improved the most with 3000 cases additional from 2012/13 to 2018/19. This while the Exp/PDE only increased with only R300 over the same period. Taking into consideration the inflation rate and increases in price indices, excellent technical efficiency was achieved considering the increase in overall PDE or patient activity.

The ALOS stayed the same over the same period, but the bed utilization BUR increased to the expected 85%. The statement made by Chikobvu (2016:149) that ALOS at a ward level or per clinical condition is a much better indicator of the severity of illness or disease than at a hospital level. This can be confirmed by evidence found in the basic analysis of data in the tables below.

Table 1. Seven-year results of Key indicator data

	2012/13	2013/14	2014/15	2015/16	2016/17	2017/18	2018/19
Actual beds	269	277	277	277	271	271	275
Inpatient days	74,950	81,149	78,433	77,401	77,942	79,808	83,355
Patient days	76,797	83,229	80,083	79,697	80,285	82,271	85,789
Day patients	3,694	4,159	3,299	4,591	4,686	4,926	4,868

Separations	20,263	22,450	20,842	21,992	22,048	22,683	22,832

Being able to provide specific information to clinical specialties, them having a better understanding of the impact of performance, and measuring technical efficiency resulted in competition and internal motivation to perform better. Below are specialties-specific improvements driven by the Heads of clinical Units (HCU) without any external interference.

Table 2. Comparison at speciality or clustered level before and after sanitizing of data and mapping codes.

	Surgery		Orthopaedics		Internal medicine	
	2013/14	2018/19	2013/14	2018/19	2013/14	2018/19
BUR	71%	84%	94%	93%	95%	90%
BTR	63,7	101,3	72,5	78,2	83,6	90,41
ALOS	4	3	5	4	4	4

The additional indicator bed turnover rate (BTR) is calculated by dividing the total separations by the number of beds. In each discipline, there was a remarkable increase in the patient throughput per bed, while the ALOS in two of the disciplines was reduced. This can translate into improved inpatient care access as more people could be admitted in one period. The possibility that part of the improvement seen may also be attributed to improved quality data capturing should not be dismissed.

The re-organization of the coding system allowed support services to start reporting per clinical cluster or FBU. The most remarkable improvement was observed in the decrease in expired medicine. The response from the Pharmacy manager in the open interviews conducted is the following;

The improvement in stocktake shortages and surpluses overtime (also attached) was mostly due to the implementation of stock management principles, assigning correct access and segregation of duties on JAC, and rebuilding the JAC location. Strict monitoring of JAC errors also curbed losses and minimising bulk issues[sic] to wards and rather issuing medication per patient from the pharmacy

Annual Value of expired medication per FBU

Support service functions also started reporting per FBU such as linen losses in the facility, meals ordered and wasted, and telephone bills. Without any active project initiation, the reporting alone has seen a reduction in wastage. Only the catering services adjusted their meal order system and over R1million was saved in one financial year due to a reduction in wastage. The wasted meals were reduced from 1223 in FY 2015/16 to 143 in FY 2018/19.

Table 3. Reduced linen losses from 10% to 2%

Open interviews were conducted and videos were recorded with permission from various unit managers, not only members of the executive management. The feedback is overall positive and includes comments such as;

For the first time, it felt for me as a clinician that everything is about clinical services as opposed to previously HR and finance compliance. It meant for me that I as an HCU can make decisions on how I run my unit.

Now I see the bigger picture of what the running of a hospital is all about... I understand now why a no is a no now as there are other priorities that supersede what I as a clinician wanted....

It broke down some of the old rivalries between clinical specialties as we work together now and learn about others' problems and challenges as well.....

It put me in charge of not only clinical services and doctors, but also allow me to make decisions regarding the finances, what we use in the unit and the cost implications...

We break down reports and provide feedback to each FBU manager instead of the hospital as a whole. This helps with other managers taking responsibility for HR compliance within their units.....

The exploration of both the statistical analysis as well as the qualitative feedback confirmed that the proposed framework leads to positive results in performance efficiency, not only in the clinical components of a hospital environment but also in other support services.

7. Managerial Implications

Based on the findings obtained from the framework application, there is merit to reconsider the hierarchy in reporting structures to provide a platform where senior clinicians are part of the executive management of health facilities. The qualitative findings in this study confirm bridging the gap between clinical and administrative managers, bringing together the medical and the managerial science as referred to by Donabedian (1989:242).

Opportunities and challenges that were identified in the findings seek clarity and development of guidelines to address;

- A guideline on wrangling data using a digital dashboard to sanitize systems while providing appropriate data and information for management decision-making. The main focus of such a development should be built around the unique clinical identifiers and the unique financial identifiers to link cost with patient activities within each clinical cluster.
- Development of electronic systems for support service reporting per clinical cluster to link with a dashboard. The awareness and access to knowledge already proved cost-saving initiatives and reduction in wastage.
- The access to information and ability to compare performance within one hospital proved to stimulate competition amongst FBU managers to improve performance outputs. This includes the development and innovation of processes that enhance patient referrals and timeous transfers. Theatre efficiency initiatives and arthroplasty supply chain systems were developed to ensure timeous processing and payments of consumables. These benchmark processes should be developed into standard operating procedures for use in other facilities.

8. Conclusion

The anticipated outcome of this framework development was to include all stakeholders in the decision-making process within the hospital. There is merit in applying the conceptual framework as evidence was found through data analysis that an improvement in performance output indicators was observed. Clinicians became aware and involved in monitoring their own departments' efficiency related to ALOS and the impact on Exp/PDE. Monthly reports and feedback from support service functionaries also impacted behaviour and a remarkable reduction in wastage was observed. Improved responsibility and shared accountability were observed in quarterly monitoring and evaluation meetings where clinicians raise concerns if patient data was not correctly captured and impacting their overall performance.

Further research is recommended to determine if the framework can be applied across hospitals in the same setting and create a situation where clinical specialities can be compared on a like-to-like basis rather than comparing hospitals using one economic proxy indicator only. While it may not be possible to change the hierarchical structure of other hospitals to enhance the communication platform to include heads of clinical units in the executive management, other platforms may also be created to counter the hierarchical structures. The majority of studies in health systems focus on the clinical

science and integration of clinical data toward improved value-based outcomes for patients, with limited focus on the managerial science that enables clinical service outcomes.

Limitations to the study include access to system coordination, currently, most digital and other electronic health systems are centrally controlled. It is strongly recommended that measures be put in place to address the organizational design of hospital staff structures, including information technology support, as it became part of the day-to-day functioning of health within health facilities. Refinement of the FBU dashboard should improve the quality of data and more systems integration.

Keywords

Business model innovation, Digital Transformation, Strategic Renewal, SMEs

Abstract

The purpose of this study was twofold, (1) to determine if business model innovation through digital transformation impact business performance and (2) if strategic renewal positively moderates the impact of business model innovation through digital transformation on business performance. The methodology employed in this study was quantitative, through surveys, by conducting research on small and medium-sized enterprises (SMEs) from South Africa and the Netherlands, yielding 426 responses in total. The study employed an exploratory factor analysis, followed by regression analysis and Multivariate analysis of variance to determine any significant difference between SMEs in South-Africa and the Netherlands. The results showed that business model innovation (BMI) through digital transformation positively impacts business performance. Secondly, strategic renewal, acting as a moderator, also positively increases the relationship's impact. Lastly, no significant differences were identified between South Africa and the Netherlands. This study contributes theoretically to the knowledge of the role of BMI and digital transformation on business performance and the role of strategic renewal in the successful execution of BMI through digital transformation.

Introduction

Small and medium-sized enterprises (SMEs) play an essential role across economies worldwide (North and Varvakis, 2016), having the competitive advantage of flexibility and faster decision-making over larger organisations (Fedouaki, Okar, and El Alami, 2013) which is one of the critical factors for successful digital transformation. The digital age has presented many opportunities to ensure sustainability and a competitive market position, but it has also contributed to many challenges for SMEs. One such opportunity and challenge is digital transformation, generally defined as changes to a business' structure, processes, strategy, and culture due to adopting digital technologies (Fitzgerald *et al.*, 2014; Matt *et al.*, 2015). This phenomenon has captured the attention of many scholars, practitioners, and policymakers urgent imperative, despite the long trajectory of rigorous research across multiple industries (Trenerry *et al.*, 2021). The digital age requires businesses to undergo a strategic renewal process, which includes transforming their business models to create and maintain their competitive advantage and ensure their survival (Musa and Mamun, 2018). Schmitt, Raisch and Volberda (2016, p.5) defines strategic renewal as “(a) a transformation of the firm's core capabilities associated with competitive advantage, (b) concerns the entire organization and has implications across organizational levels and (c) is essential to break path dependence and ensure the firm's long-term survival”.

However, strategic renewal can be challenging due to the uncertainty of its outcomes. It requires a business to align its organisational structures, culture and human capital to ensure it works congruently (Teece, 2019). Many authors have argued that organisational changes must be made to accomplish digital transformation (Gehrke et al., 2015; Matt et al., 2015; Duerr et al., 2017). Business model innovation encourages practitioners to renew their strategy as it offers businesses a new way of creating value for their customers and maintaining a sustainable competitive advantage. Literature on BMI and digital transformation and its importance has increased over the past decade (Sony & Naik, 2020; Vial, 2019; Warner & Wäger, 2019). However, Imran, Shahzad Butt, and Kantola (2021) claim that there is a lack of understanding of organisational change in digital transformation. This article seeks to answer the following research questions:

- *RQ 1: Does business model innovation through digital transformation impact business performance?*
- *RQ 2: Does strategic renewal positively moderate the impact of business model innovation through digital transformation on business performance?*

Theoretical foundations and development of hypotheses

Digital transformation

Digital transformation is revolutionising industries through adopting digital technologies, also referred to as the fourth industrial revolution or Industry 4.0. It has become a buzzword amongst researchers and practitioners worldwide (Bharadwaj et al., 2013; Fitzgerald et al., 2013). This has forced businesses to change their operations and value creation by introducing new digital technologies (Vial, 2019). This, for example, includes the internet of things (IoT), cloud computing, big data, data analytics, artificial intelligence, automation, etc. (Gilchrist, 2016). These changes require businesses to revisit strategies that enable using and exploiting these digital technologies to result in better business performance (Hesse, 2018). The relationship between digital transformation and BMI has received much attention from scholars and practitioners (Vaska et al., 2021). Vial (2019) argues that adopting digital technologies is only one part of the digital transformation process, and businesses need to do much more to transform their business model digitally. Business models enable one to examine and determine the effects of digital technologies on the value creation and capturing process. In addition, BMI can enhance and improve the value creation and capturing process (Zott and Amit, 2010) and business performance (Foss and Saebi, 2017). Thus, BMI driven by digital transformation can support innovative efforts (Cenamor et al., 2019), better understand customer needs (Metallo et al., 2018), increase efficiency and revenue growth (Visnjic et al., 2018) and create sustainable collaborative efforts with external partners (Rajala et al., 2018).

Business model innovation and SMEs

Business model innovation (BMI) allows businesses to transform their business model digitally. A business model is defined as the business logic that describes how value is created for the customer and value is captured by the business (Bouwman et al., 2017). Simply put, BMI is defined as how a business identifies new ways to create value for their customers (Foss and Saebi, 2017). BMI is a process of innovation that does not only include new product or service innovation but can include, for example, making changes to production systems, new product or service offerings that enable an innovative way that customers can interact with the business, such as getting real-time updates on the manufacturing progress of a product. This can improve customer relationships (Arnold, Kiel, and Voigt, 2016). Making such changes can put a business in a competitive position; therefore, SMEs need to keep up with the business model changes and use of the digital technologies of their competitors (Gibson and Jetter, 2014). Bouwman et al. (2017) state that the fastest trend in business history is technology advancements and development, which directly impact businesses. SMEs, in particular, should be able to adapt to the disruptive technological environment, which might require a wholly new or adapted business model (Gerlitz, 2016). Marolt et al. (2018) reported that technology influences the level of BMI, which ultimately has an impact on the overall business performance of an SME. Latifi, Nikou, and Bouwman (2021) also found that if a business engages with BMI, its overall business performance will increase. The following hypothesis is thus made:

H1 + Business model innovation through digital transformation positively impacts business performance

Strategic renewal

A critical factor in achieving successful digital transformation is aligning all the changes resulting from digital transformation activities and the existing strategy. Several authors (Jafarzadeh et al., 2015; Gudergan and Mugg, 2017) have acknowledged the importance of a digital business strategy. Bharadwaj et al. (2013, p.472) define it as an “organisational strategy formulated and executed by leveraging digital resources to create differential value.” Kane et al. (2017) agree that digital transformation depends on the leadership team’s implementation of the digital strategy and not merely the use of technology. Implementing a digital strategy portrays a picture of the leadership teams’ digital abilities, the agility and scalability of operations, a digitally enabled customer experience, and digital innovations (Leischnig et al., 2017). Businesses should adopt the right digital technologies and once this is done, the organisational strategy should be revised, alongside the right skillset to ensure that the digital transformation-induced business model innovation is executed effectively (Westerman et al., 2011; Fitzgerland et al., 2014; Morakanyane et al., 2020). Many researchers (Finkelstein and Hambrick, 1996; Hambrick, 2007) found that top-level managers significantly influence an organisation’s strategy and performance. The first step in creating a strategy is communication that flows from top management and filters down to the rest of the organisation, which is a critical factor in implementing a digital strategy. It should be clear that top management is the driver behind the digital transformation process (Bonnet and Nandan, 2011). Constant communication from top management is key to ensuring all employees are informed of the changes implemented (Kotter and Cohen, 2014). Additionally, all employees should be informed that digital transformation is for the betterment of the entire organisation. To ensure survival and sustain a competitive position requires agility, an open mindset, and accepting failure (Tamm et al., 2011). Many authors have emphasised the importance of strategic renewal in the digital transformation process (Rothmann and Koch, 2014; Blatz et al., 2018; Szedlak et al., 2019; Verhoef et al., 2021). The following hypothesis is thus made:

H2 + Strategy renewal positively moderates the impact of business model innovation through digital transformation on business performance.

Research model

The research model used in this study was developed based on the literature review on business model innovation, digital transformation, and strategy. The literature reported that strategic changes are required for the successful digital transformation of the business model, which is relevant to achieving and enhancing business performance. Therefore, the research model and hypotheses are shown in Figure 1 below.

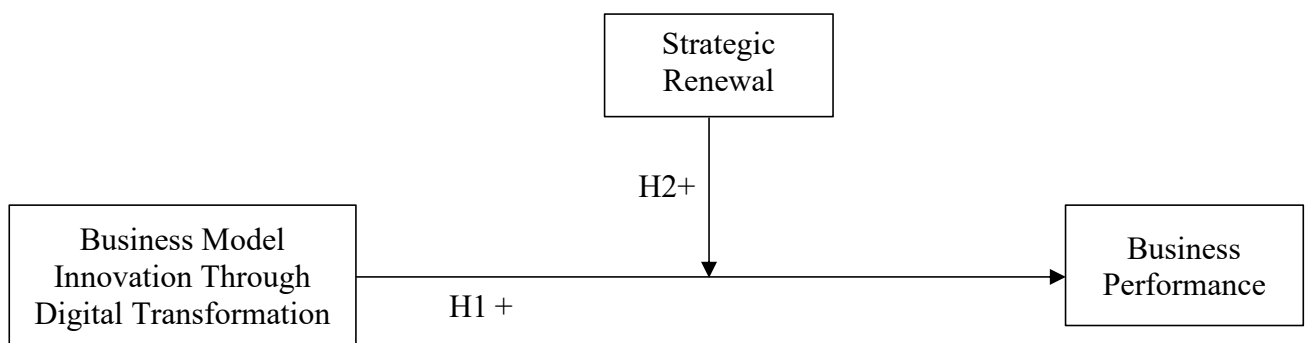

Figure 1 Research model and hypotheses

Research methodology

This section will elaborate on the dataset, variables, and methods used in this study to examine and evaluate the proposed research model. Based on the above discussion, an empirical research study is performed to determine the impact of business model innovation through digital transformation on business performance and the impact of strategic renewal as a moderator on this relationship.

Empirical setting and sample size

The target population of this study includes SMEs in South Africa and the Netherlands. As per the definition of the South-African National Small Enterprises Act, 2004 (Act No. 29 of 2004) and the European Union's (EU) recommendation 2003/361, an SME is defined based on the number of employees and turnover. The number of employees cannot exceed 250; the highest net turnover is R220 million for South-African SMEs and €40 million for Dutch SMEs. The total number of SMEs in 2019 in South Africa in the third quarter was 2 653 424, with only 779 297 SMEs in the formal sector as opposed to 1 791 431 in the informal sector (SEDA, 2019). Compared to the Netherlands, there were 1 188 786 SMEs in 2019 (SBA Factsheet, 2019). SMEs in both countries contribute significantly to job creation and the economic growth of these countries (SBA Factsheet, 2019; StatsSA, 2020). For statistical analysis, a minimum sample size of 5 times the number of items included in the data instrument is acceptable (Fox and Bayat, 2013). Thus, for this study, 40 questions were included in the instrument. Therefore a sample size of 200 is acceptable.

Data collection

The methodology employed in this study was quantitative, through the use of surveys. From January 2022 - May 2022, questionnaires were distributed online to South African and Dutch SMEs using a research company in each country to assist with data collection. In addition, contact details for South-African SMEs were obtained from YelloSA and the Small Business Directory. A total yield of 198 responses was obtained from South-African SMEs and 226 from Dutch SMEs, resulting in 424 responses.

Development of survey instrument

The item scales in the survey were developed based on extensive research on BMI, digital transformation, strategy, and business performance. Brislin (1986) stated that the official language should be used to conduct the survey to ensure the translation is accurate. Therefore the survey was constructed in English and distributed to the South-African SMEs. The English survey was then translated by a native Dutch speaker and distributed to Dutch SMEs. A five-point Likert scale ranged from 1 (strongly disagree) to 5 (strongly agree). The independent variable (BMI through digital transformation) consisted of nine scale items, the moderator variable (strategic renewal) consisted of four scale items, and the dependent variable (business performance) consisted of seven scale items.

Data analysis

The data were analysed on the Statistical Package for Social Science (SPSS). The data set was analysed using regression analysis to identify the relationships among constructs with business performance as the dependent variable, business model innovation through digital transformation as an independent variable, and strategic renewal as a moderator. The relationships between the variables were first explored using exploratory factor analyses (EFA) to determine which factors should be grouped (Yong and Pearce, 2013). The Kaiser–Meyer–Olkin (KMO) test was performed to measure the sampling adequacy and Bartlett's sphericity test to investigate the data's factorability. Following this, a regression analysis was conducted to (1) assess the relationship between the independent variable (business model innovation through digital transformation) and the dependent variable (business performance) and (2) to determine the interaction between business model innovation through digital transformation and the strategic moderator renewal. The correlation was also used to deeply explore the interrelationships between the variables and assess the strength of the linear relationship using Pearson's correlation coefficient, which also checked for multicollinearity (Pallant, 2007). Reliability was determined using Cronbach's alpha (α) to analyse the internal consistency of the sub-scales. Lastly, Multivariate analysis of variance (MANOVA) was conducted to determine any significant differences between the South African and Dutch business performance.

Findings

The demographic results of the respondents are presented in Table 1 for both countries.

Table 1: Demographic results of South Africa and the Netherlands

South-Africa			Netherlands		
	Frequency			Frequency	
	n	%		n	%
Number of employees					
Only myself (no employees)	14	7.1	Only myself (no employees)	84	37.2
< 5 employees	77	38.9	< 5 employees	37	16.4

Exploratory factor analysis

Exploratory factor analysis (EFA) is used to analyse the relationships between variables that can determine which scale items intercorrelate. Before an EFA can be conducted, the dataset must be tested to determine if it is suitable for factor analysis (Williams, Onsman, and Brown, 2012). We used the Kaiser-Meyer-Olkin measure of sampling adequacy (KMO), where the value should be greater than 0.6, and Barlett’s test of sphericity, where the significant value (Sig) should be less than 0.05 (p-value < 0.05). Table 2 indicates the results of these two tests.

Table 2 KMO and Bartlett’s Test for independent variables

KMO and Bartlett’s Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0.947
Bartlett’s Test of Sphericity	Approx. Chi-Square	7836.172
	df	325
	Sig.	0.000

Source: Own compilation

From Table 2, it is clear that the KMO value is 0.947, which is above the acceptable norm of 0.6. Bartlett's sphericity tests are significant (0.000) with the $p < 0.05$, indicating that the data is suitable for factor analysis. The next step was to conduct a factor extraction method using the principal component analysis to see which scale items were intercorrelated. Principal axis factoring was used as the rotation method, showing both factors of eigenvalues of 1.018 and above as seen in Table 3 below.

Table 2 Total Variance

Factor	Total Variance Explained								
	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
SR	2.596	9.986	56.893	2.158	8.299	53.748	3.467	13.336	36.111
BMI_DT	1.018	3.917	65.551	0.656	2.525	59.579	2.773	10.667	59.579

Source: Own compilation

The rotation indicated that scale items C1 and C2 correlated stronger (0.557; 0.531) with variable 2, contrary to the initial instrument. Pallant (2007) indicates that values above 0.3 indicate a moderate relationship that is acceptable. This resulted in four scale items remaining in factor 1 (strategic renewal) and nine scale items in factor 2 (business model innovation through digital transformation). Literature suggests that digital transformation is an ongoing strategic renewal process that uses digital technologies to develop capabilities to change a business's business model and culture (Warner and Wäger, 2019). Furthermore, Kane et al. (2015) claim that digital transformation requires a change in leadership, attitudes, and culture that is more open toward innovation, change, and acceptance of ambiguity. This explains the rotation results which was used to conduct the regression analysis.

Regression analysis

A regression analysis was performed to determine the following (1) the impact of business model innovation through digital transformation on business performance and (2) the interaction between business model innovation through digital transformation and strategic renewal on business performance. The regression analyses were performed separately on both countries (SA= South Africa; NL = Netherlands). Firstly, the results of H1+ indicate that the independent variable and dependant variable is significant with the $p\text{-value} \leq 0.05$. Thus, the null hypothesis was rejected, and the alternative hypothesis was accepted. Turkmen's (2013) argues that an r value between 0.3 to 0.5 represents a moderate relationship. Therefore we can conclude that a moderate relationship exist between the dependent variable (business performance) and the independent variable (BMI_DT) for both countries, (SA = $r = 0.393$; NL = $r = 0.411$) as seen in Table 4.

Table 4 Correlations of hypothesis 1

		Correlations			
		Business Performance	BMI_DT	Business Performance	Factor1
		South-Africa		Netherlands	
Pearson Correlation	Business Performance	1.000	0.393	1.000	0.411
	BMI_DT	0.393	1.000	0.411	1.000
Sig. (1-tailed)	Business Performance		0.000		0.000
	BMI_DT	0.000		0.000	
N	Business Performance	198	198	226	226
	BMI_DT	198	198	226	226

Source: Own compilation

In addition, Pallant (2013) states that the R-square value must be between 0 and 1. For both countries the R-square is appropriate (SA = 0.154; NL = 0.169). The coefficient values are used to assess the strength of a relationship. Values can range between - 1 and + 1; if a value is 0, there is no relationship, and if a value is 1, there is a relationship (Pallant, 2013). Tables 5 and 6 indicate that both countries have a sig value of $p \leq 0.05$. Furthermore, the unstandardised beta (SA = 0.330; NL = 0.316) indicates that for every one unit that BMI_DT increase, business performance will increase with 0.330 for South Africa and 0.316 for the Netherlands.

Table 5 South-African Coefficients of hypothesis 1

Coefficients								
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	95,0% Confidence Interval for B	
		B	Std. Error	Beta			Lower Bound	Upper Bound
1	(Constant)	2.181	0.216		10.091	0.000	1.755	2.608
	BMI_DT	0.330	0.055	0.393	5.983	0.000	0.221	0.438

a. Dependent Variable: Performance

	BMI_DT	0.316	0.047	0.411	6.750	0.000	0.224	0.408

a. Dependent Variable: Performance

Source: Own compilation

The second objective of the regression analysis was to determine the interaction between BMI_DT and the moderator SR (strategic renewal) on business performance (H2+), which was also conducted separately in both countries. Table 7 below presents the correlations for both countries.

Table 7 Correlations of hypothesis 2

Correlations									
		Business Performance	BMI_DT	SR	Int. SR	Business Performance	BMI_DT	SR	Int. SR
		South-Africa				Netherlands			
Pearson Correlation	Business Performance	1.000	0.393	0.333	-0.029	1.000	0.411	0.415	0.143
	BMI_DT	0.393	1.000	0.730	-0.404	0.411	1.000	0.771	-0.193
	SR	0.333	0.730	1.000	-0.331	0.415	0.771	1.000	-0.194
	Int. SR	-0.029	-0.404	-0.331	1.000	0.143	-0.193	-0.194	1.000

Sig. (1-tailed)	Business Performance		0.000	0.000	0.340		0.000	0.000	0.016
	BMI_DT	0.000		0.000	0.000	0.000		0.000	0.002
	SR	0.000	0.000		0.000	0.000	0.000		0.002
	Int. SR	0.340	0.000	0.000		0.016	0.002	0.002	
N	Business Performance	198	198	198	198	226	226	226	226
	BMI_DT	198	198	198	198	226	226	226	226
	SR	198	198	198	198	226	226	226	226
	Int. SR	198	198	198	198	226	226	226	226

Source: Own compilation

Table 7 shows that the independent variable BMI_DT has a p-value ≤ 0.05 . The null hypothesis was rejected, and the alternative hypothesis was accepted. Therefore SR does have a strong impact on the relationship between BMI_DT and business performance (SA = $r = 0.730$; NL = $r = 0.771$) for both countries. The effect of the moderation is indicated below in figure 2 (SA) and figure 3 (NL), showing the positive interaction between business model innovation through digital transformation and strategic renewal on the predicted business performance.

Figure 2 Interaction between business model innovation through digital transformation and strategic renewal on business performance for South-Africa

Figure 3 Interaction between business model innovation through digital transformation and strategic renewal on business performance for the Netherlands

The results also did not indicate any normality concerns or multicollinearity, as all VIF values were below ten and all tolerance values below 0.1 (Pallant, 2007). Reliability was also used to measure how well the variables measure a single construct. Cronbach's alpha (α) coefficient was calculated. Both values were above 0.7, BMI_DT (0.932) and SR (0.851), which is regarded as a reliable scale (Tavakol and Dennick, 2011).

Lastly, Multivariate analysis of variance (MANOVA) was conducted to determine any significant differences between the South African and Dutch business performance. The dataset of both countries was combined to perform the MANOVA tests. Firstly, we tested for any outliers, and in total, six outliers were evident based on the Mahalanobis distance value of 29.777, which is above the critical value of 16.27, indicating multivariate outliers (Pallant, 2007). After the outliers were removed, the Box's Test of Equality of Covariance Matrices was conducted. The results indicated that the data had not violated the assumption of homogeneity of variance-covariance matrices as the sig value is $p \geq 0.001$ (0.021). In addition, Levene's test indicates that none of the variables have a sig value of $p \leq 0.05$ as all values exceed 0.3, suggesting that we have not violated the assumption of the equality of variance for these variables. Finally, we conducted the Wilks' Lambda test to determine any significant differences between the two countries. The results show no significant difference between South Africa and the Netherlands regarding their overall business performance (Wilks Lambda = 0.847; sig = 0.000, partial eta squared = 0.153). In addition, the results of the tests of between subject's effect indicate that the sig value for the independent variables (*business model innovation through digital transformation and strategic renewal*) is $p \leq 0.05$. However, the sig value for *business performance* is $p \geq 0.05$, showing no significant difference between the two countries in terms of business performance. The same result is evident if we use the Bonferroni adjustment and divide the p-value by the number of dependent variables (3). The sig value remains $p \geq 0.05$.

Discussion

Implications for Theory and Research

The purpose of this study was to analyse the relationship between business model innovation through digital transformation and business performance by incorporating strategic renewal as a moderator that facilitates the relation between BMI through digital transformation and business performance. Strategic renewal has been noted in the literature as a contributor to digital transformation success, but not as a moderator that can strengthen the relationship. Therefore the findings forms the novelty of the study by indicating that strategic renewal acts as moderator that can strengthen the relationship. Firstly, the study contributes to the literature on the role BMI plays in digital transformation and how this can impact the overall business performance. This topic is mainly explored in literature through the impact of BMI or digital transformation on business performance and the lack of findings on this as a combined factor impacting business performance. Furthermore, this study focused on specific business performance indicators, which enhances and widens the current research. The results of hypothesis 1 show that BMI through digital transformation positively influences business performance. The results are supported by Foss and Saebi (2017) and Latifi et al. (2020), who reported that a business that engages with BMI would see an increase in its overall business performance. In addition, other studies indicated that digital transformation impacts the level of BMI, which can then impact business performance (Hesse, 2018; Marolt et al., 2018).

The second theoretical contribution of the study is the role that strategic renewal plays as a moderator in the relationship between business model innovation through digital transformation and business performance. Previous literature has reported that managerial capabilities foster strategic changes such as digital transformation, leading to improved business performance (Helfat and Martin, 2015; Li et al., 2018). In addition, many studies have reported that digital transformation is a managerial responsibility as it moves beyond technical requirements and involves changes to the business model, employee motivations, attitudes, and skill requirements (Li et al., 2018). Various authors (Rothmann and Koch, 2014; Blatz et al., 2018; Szedlak et al., 2019; Verhoef et al., 2021) have emphasised the need for strategic renewal for digital transformation, however, none of the studies analysed the impact of strategic renewal on the relationship, which is a novel contribution of this study. The results of

hypothesis 2 indicate that strategic renewal positively moderates the relationship between BMI through digital transformation and business performance. As the level of BMI through digital transformation increases, the impact of strategic renewal also increases. SMEs should therefore focus on renewing their strategy to accommodate digital transformation. This can be achieved by implementing a digital strategy and transformation plan. SMEs should also align their employee training with the new strategy to ensure employees are skilled and capable of using digital technologies. Strategic decisions should also be based on data and analytics. These findings are supported by literature with many authors (Bonnet and Nandan, 2011; Kane et al., 2015; Leischnig et al., 2017; Zhang et al., 2022) stating that a digital strategy should be implemented by the leadership team, which will portray the digital abilities and skills of the leadership team. Human and financial resources should also be integrated and controlled during the digital transformation (Zhang et al., 2022).

The data was collected from SMEs from both an emerging economy (South Africa) and a developed economy (Netherlands) which is the third theoretical contribution of this study. The results indicate that there was no significant difference in business performance between the SMEs of the two countries. This broadens the analytical findings of the research towards the execution of BMI through digital transformation and its impact on business performance. This offers a future research opportunity to test the same model in other emerging and developed countries to strengthen the findings. In addition, the reasons for these results were not explored and can be examined and explored in future research studies.

Managerial implications

The findings of this study will assist SMEs in adjusting their focus on the importance and contribution of digital transformation to business performance. Firstly, the study sheds light on the need for BMI, particularly through digital transformation, as it positively influences business performance. This can be achieved by renewing its strategy to accommodate changes in digital technologies driven by top-level management. SMEs should adopt digital technologies to create new value for their customers, introduce new products or services, improve internal processes, train employees regularly to develop digital capabilities, collaborate with external partners, and use digital technologies to develop additional revenue streams. Secondly, strategic renewal is required. SME business owners need to develop and implement a digital transformation plan and digital strategy and base their strategic decisions on data and analytics. Lastly, all of the above will result in improved business performance in terms of growth in sales, net profit, market share, penetration rate, speed to the market, customer satisfaction, and operational efficiency.

Limitations and future research

There are some limitations in this study since the study was conducted on South-African and Dutch SMEs during a specific time, which can threaten the generalisability of the study. This, however, creates a future research opportunity to conduct research in other emerging and developed economies. Secondly, the survey instrument is a newly developed instrument based on an extensive literature review, which offers future researchers an opportunity to validate the model on another sample and analyse the results using structural equation modelling (SEM). Future research studies can include multiple moderators that could positively impact the relationship of BMI through digital transformation on business performance, such as business culture renewal and organisational structure.

Conclusion

The purpose of this study was to analyse the relationship between business model innovation through digital transformation and business performance by incorporating strategic renewal as a moderator that facilitates the relationship between BMI through digital transformation and business performance. The study was conducted on SMEs from South Africa and the Netherlands, yielding 426 responses. The study employed an exploratory factor analysis, followed by regression analysis and MANANO tests to determine any significant difference between the two countries. The results indicated that BMI through digital transformation positively impacts business performance and strategic renewal, acting as a moderator, which positively increases the relationship's impact. Also, no significant differences

were identified between the two countries, which offers a future research opportunity to explore the reasons behind the result. This study contributes theoretically to the knowledge of the role of BMI and digital transformation on business performance and what SME business owners and managers can do to achieve this.

Keywords

HR professional bodies, passive avoidant leadership, transformational leadership, transactional leadership

Abstract

There is an urgent need for integrating leadership and HR research. Previous studies on whether there are demographic differences pertaining to how South African HR professionals perceive their leadership styles are limited. A quantitative research method within a positivistic research paradigm was used to conduct research. HR professionals who were members of two HR professional bodies participated in the study by completing an existing leadership questionnaire. Purposive sampling was used. The response rate to the 205 questionnaires received back from the initial 520 questionnaires distributed was 39.42 per cent. Data were analysed by using an ANOVA, t-test and correlation analysis. There were no significant differences and relationships in how the respondents perceived leadership (transformational and passive avoidant) except for transformational leadership, the difference was between the 51-plus years old age group and the 18 to 30 age group. The present survey shows that age is an important demographic factor in transformational leadership perception. These differences must be managed in order to ensure that there is an alignment in how operational and strategic HRM functions are planned and executed.

1. Introduction

Human resource (HR) leaders had a difficult job during and at the apparent apex of the Covid-19 pandemic, they also experience stumbling blocks currently to adapt to a constant change in the introduction of technology in a digitised workplace. The COVID-19 pandemic has fast-tracked digitalisation trends while heightening the importance of employee resilience and well-being in adapting to the widespread job and technological disruption (Trenerry, Chng, Wang, Suhaila, Lim, Lu & Oh, 2021:1). More than 50 per cent of HR leaders struggled in 2019 to ensure that employees possess the skills necessary for a digitised workplace and Covid-19 has led to numerous HR challenges (Bingam, 2020). An HR leader must be able to step up in a time of crisis and think and act creatively (Nahavandi, 2016:6). An important highlighted aspect of leadership is the ability to influence others to come together around a common vision and to bring about change to secure a desirable future (Daft, 2014:6). Leaders around the world face challenges that span all areas of business (Hameed & Sharma, 2020:2379). Boninelli and Meyer (2011:446) assert that HR must always successfully deal with changes in the workplace; this being the ultimate test of leadership effectiveness. Haider, Yanru, and Yunxin (2016:39) are of the opinion that leaders in both public and private sectors must be charismatic, inspirational, good communicators, and visionaries. Leaders are central to organisational achievement, and they must be effective (Araujo-Cabrera, Suarez-Acosta & Aguiar-Quintana, 2016:201-215). The repositioning of HR may help to redefine the role of HR leaders, leadership styles, and incorporate strong technical and strategic skills (Kaluarachchi, 2014:128). According to Govender (2019:53), the overall success of HR is the identification of competency gaps and the building of relevant competency capabilities for registered HR professional bodies.

There is an urgent need for integrating leadership and HR research (Zhao, Liu, Zhu & Liu, 2020). More research on HR leadership is needed to be truly effective in this 'new normal' (Bingam, 2020).

Studies on leadership and human resource management (HRM) both focus on understanding how people in organisations can be managed in an effective manner (Leroy, Segers, van Dierendock & den Hartog, 2018), who state further that, notwithstanding this shared goal, these two fields of research still remain independent.

2. Problem Investigated

Organisational demographic characteristics refer to the diversity of workers and are, for example, gender, age, and educational background (Greenberg, 2004). Previous studies on whether there are demographic differences pertaining to how South African HR professionals perceive their leadership styles have not been found. It is, therefore, not clear how these demographics of HR professionals may differ in terms of leadership. This formed the research gap for the current study. It is beneficial to study the relationships and differences between leadership and demographic characteristics, for example, an age-differentiated approach to leadership is important when considering healthy ageing at work (Koziel, Friedrich, Rudolph & Zacher, 2021). Even though most of the researchers found significant relationships between leadership and demographic factors, others contradict this view (Mushtaq, Qureshi & Javaid, 2019). No consensus has been reached about the relationship between leadership and demographic characteristics (Sürücü, Yeşilada & Maşlakçı, 2018). This study aims to close these research gaps.

3. Research Objectives

The main objective of the study is to determine an HR perspective of leadership by conducting a demographic analysis. The specific objectives are as follows:

- To determine if there is a significant difference in how HR professionals from different age groups perceive leadership.
- To determine if there is a significant difference in how HR professionals from different gender groups perceive leadership.
- To determine if there is a significant relationship between age and leadership.
- To determine if there is a significant relationship between length of employment and leadership.
- To determine if there is a significant relationship between highest qualification and leadership.

4. Hypotheses

The following hypotheses were formulated for the study as explained in section 5.2:

- H₁: There is a significant difference in how HR professionals from different age groups perceive leadership.
- H₂: There is a significant relationship between age and leadership.
- H₃: There is a significant difference in how HR professionals from different gender groups perceive leadership
- H₄ There is a significant relationship between length of employment and leadership.
- H₅ There is a significant relationship between highest qualification and leadership.

5. Literature Review

5.1 Leadership

According to Hogan and Kaiser (2005), the leadership literature can be sorted into troubadour tradition and academic tradition. Hogan and Kaiser (2005) state that the troubadour tradition is by far the larger and more popular literature which consists of the experiences of leaders but there is little supporting evidence and is unreliable. The academic tradition consists of empirical results about leadership. This study aims to add value to the academic tradition literature where seminal authors like Stogdill (1950) state that leadership is all about influencing activities to set and achieve goals. Burns (1978) was renowned for distinguishing two types of leadership, namely transactional and transformational which he deliberated as mutually exclusive. Bass (1985) states that these two

leadership styles are complementary to one another. For the purpose of this study, the focus will be on transformational leadership, transactional leadership and passive avoidant leadership.

Transactional leadership can be defined as the exchange of agreed-upon targets and goals between the management and the employees (Ojokuku, Odetayo, & Sajuyigbe, 2012:202). Transactional leadership focuses on day-to-day operations (Northouse, 2016) and consists of two substyles:

- Contingent reward: The leader focuses on illuminating the task and requirements (Antonakis, Avolio & Sivasubramaniam, 2003) as well as offering meaningful rewards when tasks are completed (Andrews, Richard, Robinson, Celano & Hallaron, 2012).
- Management-by-exception (active): Active leaders try to avoid a serious problem in advance, and set clear rules and alerts based on regular checks (Judge & Piccolo, 2004).

Transformational leadership focuses on harmonising relationships between the leaders and subordinates. A transformational leader motivates followers to perform and realise their full potential by providing direction (Huber, 2010). Belias and Koustelios (2014:187) emphasise that transformational leaders look beyond their self-interest, and commit their followers to greatness by inspiring them. Birasnav (2014:205) states that top management should exhibit transformational leadership while implementing strategies in the organisation. Cossin and Caballero (2013:5) mention that transformational leaders can make a success of a weak business plan and create a positive situation by encouraging employees to be creative in problem-solving situations. Transformational leadership consist of five sub-styles:

- Idealised influence (attributed): The leader who possesses charisma is perceived to have confidence (Antonakis *et al.*, 2003).
- Idealised influence (behaviour): The leader believes in him or herself all actions are according to personalise values and purposes.
- Inspirational motivation: The leader empowers and motivates followers, is optimistic, and demonstrates faith in achieving goals and visions (Avolio & Bass, 2004).
- Intellectual stimulation: The leader obtains ideas from their subordinates, engages with their followers, and guides them to find new processes (Kirkbride, 2006).
- Individual consideration: The leader has knowledge of his or her followers, takes into consideration that the followers have strengths, reserves and needs, and accentuates their irreplaceability (Avolio & Bass, 2004).

In contrast to the above two leadership styles, passive avoidant leadership is reflected by high levels of avoidance, employees being left alone to accomplish their tasks, indecisiveness, and indifference (McColl-Kennedy & Anderson, 2005:115). Passive avoidant leaders do not exhibit proactive leadership and they delay reacting to urgent matters (Grill, Nielsen, Grytnes, Pousette & Törner, 2019). This leadership style tends to avoid interaction with their followers and maintain great social distances (Hinkin & Schriesheim, 2008:501). Leaders practising this leadership style provide inadequate guidance and, thus, often bring about ineffective supervisor-subordinate relationships (Antonakis & House, 2014:746). Goodnight (2011:822) alludes to the fact that the passive avoidant leadership style is more effective in organisations with qualified employees who have the autonomy to perform the duties on their own. According to Alloubani (2016), passive avoidant leadership consists of two substyles:

- Management-by-exception (passive): The leader acts passively and acts only when the problem has already transpired.
- Laissez-faire: The leader does not lead and avoids responsibility.

5.2 Previous studies on demographic variables and leadership

Previous studies on whether there are demographic differences pertaining to how South African HR professionals perceive their leadership styles could not be found. This section consists of relevant studies conducted in any environment and country.

5.2.1 Previous studies on age and leadership

Wegge, Schmidt, Piecha, Ellwart, Jungmann, and Liebermann (2012) state that researchers have defined three sub-dimensions of age differentiated leadership: leadership focused on younger employees (e.g., giving younger employees the support that they need), leadership focused on older employees (e.g., involving older employees in the discussion of upcoming changes at work), and an approach to leadership that balances the needs of both younger and older employees (e.g., promoting a positive 'togetherness' between younger and older employees). According to the study by Larsson and Björklund (2021), the younger group of leaders (29 years old or younger), rated themselves more negatively than the mid-aged (30 to 50 years), and older (51 years or older) leaders. Badura, Grijalva, Newman, Taiyi Yan, and Jeon (2018) state that a gender gap is expected to have declined over time but that a contemporary gender difference remains in leadership emergence. In the study of Larsson and Björklund (2021), young male leaders scored higher in transactional leadership. Sürücü et al. (2018) found that age was significantly related to transactional and transformational leadership. From this information the following hypotheses were derived:

- H₁: There is a significant difference in how HR professionals from different age groups perceive leadership.
- H₂: There is a significant relationship between age and leadership.

5.2.2 Previous studies on gender and leadership

According to Badura et al. (2018), differences in how gender groups perceive leadership leads to a gender gap. Sürücü et al. (2018) found that gender is significantly related to transactional and transformational leadership. Werdhani et al. (2018) found that there was a positive and significant correlation between transformational leadership and gender. From this information, the following hypothesis was derived.

- H₃: There is a significant difference in how HR professionals from different gender groups perceive leadership.

5.2.3 Previous studies on length and leadership

Koziel, Friedrich, Rudolph, and Zacher (2021) found that there is relationship between length of employment and leadership. In the study of Werdhani, Sulistomo, Herqutanto, Wirawan, Rahajeng, Sutomo, and Mansyur (2018), there was a positive and significant correlation between transformational leadership and length of employment. Sürücü, et al. (2018) found that length of employment was significantly related to transactional and transformational leadership. From this information, the following hypothesis was derived.

- H₄ There is a significant relationship between length of employment and leadership.

5.2.4 Previous studies on highest qualification and leadership

Sürücü et al. (2018) found that there was no relation between transactional leadership and transformational leadership and education level. Limited studies were available on this variable and its relationship with leadership. From this information, the following hypothesis was derived.

- H₅ There is a significant relationship between highest qualification and leadership.

6. Research Methodology

6.1 Research Design

This study was conducted within a positivistic paradigm, using a cross-sectional research design and a quantitative research approach.

6.2 Sample

The South African Board for People Practices (SABPP) aims to professionalise the HR function (SABPP, 2022) and the Institute of People Management provides knowledge and tools for strategic and operational people management and development (IPM, 2022). The population of this study consisted of human resources professionals registered with the IPM, with a membership pool of 2013 and the SABPP with a membership pool of 6 906. The professional bodies sent the questionnaire link to all their members and 205 questionnaires were received back. This sample size is accepted according to the sample guidance of Bartlett, Kotrlik and Higgins (2001).

6.3 Measuring Instrument

The Multifactor Leadership Questionnaire (MLQ), as employed by Avolio and Bass (2004), was used in its original form to measure leadership consisting of transformational, transactional, and passive avoidant leadership factors.

6.4 Reliability and Validity

According to Nunnally (1978), a Cronbach's alpha of 0.7 and higher represents good or high internal consistency and reliability. The alpha coefficient of the leadership factor had an acceptable Cronbach alpha score of 0.845, where all the individual items contribute well to the total reliability. A factor analysis was not conducted, because the leadership is an existing questionnaire and the factors (transformational, transactional, and passive avoidant leadership) therefore have already been identified. To ensure content validity, 14 HR experts (8 experts were from academia and 6 experts were from industry) examined the questionnaires to see if any improvements were needed but no improvements were suggested.

6.5 Data Collection

The Faculty Committee for Research Ethics, with Ref #: FCRE2017/FR/08/006-MS (2), granted approval for this study. The researcher had to ensure that the data collection process followed the prescribed procedure. Permission was obtained from the SABPP and the IPM for the distribution of the research questionnaire to its members. The survey itself was created in Survey Monkey in an online format and the link was sent to the SABPP and IPM members to complete the research questionnaire.

6.6 Data Analysis

ANOVA and a t-test were used to determine the demographic differences in leadership. When ANOVA and a t-test were conducted to test for statistically significant differences between demographic characteristics and leadership, significant differences were identified when the p-value stabilised at < 0.05 . The p-value allows the assessment of whether or not the groups differ significantly from one another. If this probability is lower than the conventional 5% ($p < 0.05$), the difference is statistically significant (unlikely to have arisen by chance). Smaller p-values ($p < 0.01$) are sometimes called highly significant because they indicate that the observed difference would happen less than once in a hundred times if there was really no true difference. In conclusion, a significance value below 0.05 is an indication of significant differences between the variables and a significance value over 0.05 is an indication of no significant differences between variables.

A correlation analysis was conducted to determine the relationship between leadership and the demographic variables. The Spearman Rho between leadership and the demographic variables was conducted. Seminal author Cohen (1988) suggests that a small relationship is represented by an r ranging from 0.10 to 0.29, a medium correlation is identified by an r ranging from 0.30 to 0.49, and a large and significant relationship is identified by an r ranging from 0.50 to 1.0. An R -value of 1 indicates a perfect positive correlation, while -1 indicates a perfect negative correlation, 0.5 indicates

a moderate positive correlation, -0.5 indicates a moderate negative correlation, and 0 shows no correlation. The larger the absolute value of the coefficient, the stronger the relationship between the variables. The table below illustrates correlations between the variables. Since any correlation that is greater than 0.5 is large, according to Cohen (1988), this value will be considered a practically large correlation.

7. Results and Findings

First, the profile of the respondents is briefly discussed and thereafter the ANOVA, t-test, and correlation analyses.

The age distribution of 15.8% were in the 18 to 30 age category, 27.7% were in the 31 to 40, 37.7% were in the 41 to 50, and 22.8% of the respondents were 51 years and above. The highest number of responses were in the 41 to 50 age category. Regarding the length of employment, the respondents with between six and ten years and eleven- and twenty years' work experience; each equally accounting for 25.4% (52) of the total respondents. With reference to the qualifications, the results provided show the highest on the list for the level of qualifications at 29.8%, 61 respondents had a bachelor's degree/BTech. Interestingly, more males than females participated in this study which indicates that the significant number of females in the HR profession is expanding. On the employment status, the results display that 86.8% (178) of the respondents were permanently employed. Lastly, most of the respondents resided in Gauteng. This illustrates that HR professionals seek new opportunities in Gauteng, which impacts negatively on the skilled professionals in other provinces.

Table 1 presents the ANOVA for age.

Table 1: ANOVA - significant discrepancy for different age groups

ANOVA						
		Sum of Squares	df	Mean Square	F	Sig.
Transformational leadership	Between Groups	1.734	3	0.578	3.800	0.011
	Within Groups	29.954	197	0.152		
	Total	31.687	200			
Transactional leadership	Between Groups	1.615	3	0.538	2.318	0.077
	Within Groups	44.609	192	0.232		
	Total	46.225	195			
Passive avoidant leadership	Between Groups	1.568	3	0.523	1.097	0.352
	Within Groups	90.550	190	0.477		
	Total	92.118	193			
	Total	147.490	196			

Source: Own compilation

From the results in table 5.137, it is clear that age differed significantly in transformational leadership indicated that $p = 0.011 (< 0.05)$, which was a statistically significant difference of $F(3.800)$. There were no significant differences between age and transactional leadership, and between age and passive avoidant leadership. The nature of these differences was explored by means of post hoc tests, reported in Table 2.

Table 2: Post Hoc tests - multiple comparisons of age groups (n=205)

Scheffe's test							
Dependent Variable			Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval

Source: Own compilation

For transformational leadership, the difference was between the 51-plus age group and the 18 to 30 age group. For transactional leadership and passive avoidant leadership, there were no significant differences in the perceptions from different age groups.

The table below illustrates the gender results. The t-test is used to assess the equality of means for a variable calculated for two or more groups.

Table 3: Levene's Test for equality of variances for leadership

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Transformational	Equal variances assumed	1.166	0.281	-0.311	201	0.756	-0.01739	0.05586	-0.12753	0.09276
	Equal variances not assumed			-0.312	198.475	0.755	-0.01739	0.05574	-0.12730	0.09253
Transactional	Equal variances assumed	1.895	0.170	-0.774	196	0.440	-0.05557	0.07182	-0.19721	0.08607
	Equal variances not assumed			-0.776	193.346	0.439	-0.05557	0.07159	-0.19677	0.08563
Passive avoidant leadership	Equal variances assumed	0.243	0.623	-1.185	194	0.238	-0.11774	0.09940	-0.31378	0.07829
	Equal variances not assumed			-1.186	192.118	0.237	-0.11774	0.09927	-0.31355	0.07807

Source: Own compilation

There are two parts for testing a hypothesis using 'independent sample' t-tests. The first part is Levene's Test for Equality of Variance and the second part is the t-test for Equality of means. One of the assumptions of the t-test is that the variances of the 2 groups are equal. This assumption is met in the case of all the scales. The study has shown that the t-test was not significant for leadership ($p > 0.05$). Therefore, it is concluded that there are no significant differences between gender and leadership.

The relationship between age and leadership is presented in table 4.

Table 4: The relationship between age and leadership

Correlations			
			Age
Spearman's rho	Age	Correlation Coefficient	1.000
		Sig. (2-tailed)	
	Transformational	Correlation Coefficient	0.188
		Sig. (2-tailed)	0.007
	Transactional	Correlation Coefficient	0.197
		Sig. (2-tailed)	0.006
	Passive avoidant leadership	Correlation Coefficient	0.061
		Sig. (2-tailed)	0.397

Source: Own compilation

The results in table 4 reveal that there was no significant relationship between age and leadership.

In table 5 the relationship between highest qualification, length of employment and leadership is presented.

Table 5: The relationship between length of employment and highest qualification and leadership

			Highest qualification	Length of employment
	Transformational	Correlation Coefficient	0.201	0.160
		Sig. (2-tailed)	0.004	0.023
	Transactional	Correlation Coefficient	0.125	0.097
		Sig. (2-tailed)	0.080	0.172
	Passive avoidant leadership	Correlation Coefficient	0.022	0.080
		Sig. (2-tailed)	0.762	0.268

Source: Own compilation

Table 5 reflects the correlation levels between the highest qualification and leadership. It was clear that there was not a significant relationship. Highest qualification can, therefore, not be seen as a variable that relates to leadership. Table 6 also shows the relationship between length of employment and leadership. There was not a significant relationship. Length of service can, therefore, not be seen as a variable that relates to leadership.

In table 6, a summary of the hypotheses outcomes (accept/reject) is presented.

Table 6: Summary of the hypotheses outcomes

Hypotheses	Accept/Reject
H ₁ : There is a significant difference in how HR professionals from different age groups perceive leadership.	Accept (only for transformational leadership)
H ₂ : There is a significant relationship between age and leadership.	Reject
H ₃ : There is a significant difference in how HR professionals from different gender groups perceive leadership.	Reject
H ₄ : There is a significant relationship between length of employment and leadership.	Reject
H ₅ : There is a significant relationship between highest qualification and leadership.	Reject

For transformational leadership, the difference was between the 51-plus age group and the 18 to 30 age group. Larsson and Björklund (2021) also found significant differences between age and leadership in their study.

There was not a significant difference in how HR professionals from different gender groups in South Africa perceive leadership. This finding contradicts the findings of Sürücü *et al.* (2018), Badura *et al.* (2018) and Larsson and Björklund (2021) who found differences in how young male leaders perceived leadership. That said, these studies were not conducted in South Africa, and neither were cited in the rest of this section.

There was not a significant relationship between age and leadership in this study. This finding contradicts the findings of Werdhani *et al.* (2018) and Sürücü *et al.* (2018) who found that age was significantly related to leadership.

There was not a significant relationship between length of employment and leadership in this study. This finding contradicts the finding of Koziel *et al.* (2021), Werdhani *et al.* (2018) and Sürücü, *et al.* (2018) who found that length of employment was significantly related to leadership.

In this study, there was not a significant relationship between highest qualification and leadership. Sürücü *et al.* (2018) also found that there was no relationship between transactional leadership and transformational leadership and education level.

This conclusion means that there were no significant relationships between the demographic groups and leadership as well as no significant differences. Only HR professionals older than 51 and between the ages of 18-30 perceived transformational leadership differently but they did not perceive

transactional leadership and passive avoidant leadership in a different manner. Age is therefore an important characteristic when it comes to the transformational leadership of HR professionals. On preparing the workplaces for digital transformation on multi-level factors, analysis has highlighted the importance of demographic factors in the perception of leaderships needs to be viewed in the context of the individual, group, and organisational levels. Social norms and peer and management support may influence group outcomes such as adaptability, empowerment and participation, team effectiveness and resilience. At the individual level, factors such as age, gender, education, experience and skill levels, job type, job tasks and personality are all probable factors to play a role in digital transformation outcomes. Factors such as work-related well-being, and stress, task performance, productivity, organisational commitment and turnover, job satisfaction all plays and significant role. At the organisational level, leadership, organisational culture and climate are likely to influence digital transformation outcomes, yet may be moderated by factors such as human resource management, support for training, and organisational setting.

A limitation of this study is that it was cross-sectional in nature and cannot be generalised to all South African HR professionals and other professional HR bodies in the world.

There were no significant differences and relationships in how the respondents perceived leadership (transformational and passive avoidant) except for transformational leadership, the difference was between the 51-plus years old age group and the 18 to 30 age group. These differences must be managed in order to ensure that there is an alignment in how operational and strategic HRM functions are planned and executed. It is recommended that the SABPP and IPM create an awareness of the importance of HR leadership in the workplace. Interventions and think tanks be implemented by the SABPP and IPM to obtain more information about how older and younger HR professionals perceive transformational leadership. Such interventions can also be implemented in organisations to improve HR leadership. It is also recommended that HR professionals acquire the necessary leadership skills to propel transformation in order to always successfully deal with changes in the workplace.

Future research can be conducted by using a qualitative research method to obtain rich data on why older and younger South African HR professionals perceive transformational leadership in different manners.

8. Managerial Implications

To summarise what the results mean in terms of actions, top management must be aware that HR professionals older than 51 and between 18 and 30 years of age may perceive transformational leadership in a different way. Transformational leadership is crucial in terms of managing change and is, thus, important to be aware of the differences between younger and older HR professionals. Older HR professionals may see charisma, their belief in themselves, their values and purposes, empowerment, achieving goals and visions, engagement, and knowledge of their followers as well as their irreplaceability differently than younger HR professionals. These differences must be managed in order to ensure that there is alignment in how operational and strategic HRM functions are planned and executed.

Human resource (HR) leaders struggled previously to ensure that employees possess the skills necessary for a digitised workplace and it has led to numerous HR challenges. HR leaders must in times of change and crisis management, think and act creatively and possess the ability to influence people to get a common vision to secure a desirable future. For managers to be effective leaders, they need to be charismatic, good communicators, inspirational and visionaries. In order to obtain a competitive advantage for the business, HR professionals should be leaders with a vision, inspire and engage regularly with management.

9. Conclusion

The present survey shows that age is an important demographic factor in transformational leadership perception. There were no significant differences and relationships in how the respondents perceived leadership (transformational and passive avoidant) except for transformational leadership. These

differences must be managed in order to ensure that there is an alignment in how operational and strategic HRM functions are planned and executed. Older HR professionals and younger HR professionals must be aware of the fact that they perceive transformational leadership in different ways. The future of HR lies in HR leaders who offer operational value, respond to demanding organisational challenges, and link human capital decisions with business strategy.

Talent management,
Transformational
leadership, Work
engagement

Abstract

It is imperative to be aware of the influence that transformational leaders may or may not have on talent management and work engagement of artisans, as a scarce skill, within the South African automotive industry. This article focuses on determining if transformational leadership influences both talent management and work engagement of artisans in this industry. A survey research design and a quantitative research approach were utilised. This study was descriptive and cross-sectional. Structural equation modelling was used to analyse the data. The results show that transformational leadership influences talent management but not work engagement of artisans within the South African automotive industry. This study adds to the literature by highlighting the influence of transformational leadership on talent management but also the fact that this leadership style does not influence the work engagement of the craftspeople in this particular industry. Strategies, policies, and procedures must be developed and implemented to retain South African automotive industry artisans.

1 Introduction

Within the South African economy, the South African automotive industry is one of the most substantial segments (Sharma & Naude, 2021). According to Teti (2016), the South African artisan profession needs to expand and transform. Wildschut and Ralphs (2016) believe that there is a scarcity of artisans in South Africa. In order to be ready for the fourth industrial revolution, the reskilling of artisans within the South African automotive industry is essential (Hufkie, 2021). The retention of skilled and engaged employees requires an empowering and positive leadership style (Mey, Poisat & Stindt, 2021). For organisational practice, it is important to understand that employees may experience fluctuating levels of engagement when performing their work. Research has shown that engaged workers are more inclined to help their colleagues (Bakker & Albert, 2018). However, it is also important to know the general levels of engagement and whether these levels can be influenced by human resources practices (Bakker & Albrecht, 2018) such as talent management. Talent management and work engagement will not be possible without such a proper and positive leadership style (Shikweni, Schurink & Van Wyk, 2019). Within the South African automotive industry, a transformation leadership style is essential to develop strategies to increase the work engagement of artisans and manage their talent.

The theoretical contribution of this study lies in the fact that new knowledge about transformational leadership and its influence on talent management, as well as its non-influence on work engagement within the South African automotive industry, has been developed. This study practically contributes to the adoption of a transformational leadership style to influence talent management among artisans in the automotive industry. New avenues need to be found to improve the work engagement of these artisans, as transformational leadership is found not to influence work engagement.

2 Problem Investigated

Being an artisan or craftsman is scarce in South Africa and the retention of these employees is of utmost importance. Transformational leadership, talent management, and work engagement are seen as factors that can assist with the retention of artisans. As seen in the above section, studies were conducted to determine if transformational leadership influences talent management and work engagement but it is not clear if this will be the case within the South African automotive industry. It is unclear if transformational leadership influences both talent management and work engagement in the South African automotive industry, and this is a problem this study seeks to address. The question therefore arises: Does transformational leadership influence both talent management and work engagement? This study aims to assist with answering this research question and closing this research gap.

3 Research Objectives

The research objective of the study is to determine if transformational leadership influences talent management and work engagement.

4 Hypotheses

The following hypotheses were formulated for the study:

- H₁: Hypothesis 1: Transformational leadership influences talent management
- H₂: Hypothesis 2: Transformational leadership influences work engagement

5 Literature Review

The organisational behaviour theory refers to the study of human behaviour in a business environment. Organisational behaviour is a multi-disciplinary field that aims to investigate human behaviour in organisational settings and is concerned with studying individual, group, and organisational processes, while also incorporating concepts and processes within society (Mahek, 2019). Robbins (cited in Mahek, 2019) describes organisational behaviour as the field of a study aiming to obtain knowledge regarding the impact that groups, individuals, and structures have on behaviour within organisations in order to apply this knowledge towards improving the effectiveness of the organisation. The study of organisational behaviour is applied to HRM functions and its related subjects help us understand how people in organisational environments think, feel and act (Shanaz, Dlvn & Vala, 2020). The organisational behaviour theory is a branch of academic study that aims to investigate how and why people act in certain ways within different types of professional groups.

Pfeffer (2007) mentions three aspects of the organisational behaviour theory:

- As social beings, people prefer to interact with one another and are affected by others' opinions and actions.
- People are concerned about equality, fairness and justice.
- Organisations are embedded in a social context and are influenced by other organisations.

The three constructs (transformational leadership, talent management and work engagement) of this study fall within the organisational behaviour theory. The organisational behaviour theory was therefore used as a theoretical framework and underpinning theory for this study. Next, transformational leadership, talent management and work engagement and previous studies about the influence of transformational leadership on talent management and work engagement are discussed.

5.1 Transformational Leadership

Leadership is the capacity to influence others through inspiration not manipulation (Munroe, 2014). The impact of leadership on employees' behaviour and organisational operations and outputs is the focus of management theorists (Samimi, Cortes, Anderson & Herrmannet, 2021). Although the concept of leadership has been contested over the past decade, empirical evidence shows that transformational leadership characterises an effective form of leadership at the organisational, sectorial and national levels (Gyensare, Otoo, Asare & Twumas, 2016). Charisma and vision are associated with transformational leadership (Gellis, 2001).

The creation of a vision and the formation of guidelines to achieve goals can inspire others to achieve their goals (Antonopoulou, Halkiopoulos, Barlou & Beligiannis, 2021). Transformational leadership is a style of leadership that inspires followers to transcend their self-interests by changing their morale, ideas, interests and values, and motivates them to perform better by pursuing collective goals (Bass, Avolio, Jung & Berson, 2003). Transformational leadership aims to transform the goals and values of followers and motivate them to perform beyond their expectations by inspiring their confidence in their capabilities (Bass & Riggio, 2006). A transformational leader should engage followers in a relationship in which both parties motivate each other to higher performance and moral purpose (Lajoie, Boudrias, Rousseau & Brunelle, 2016). Transformational leadership behaviour directly influences employee performance. Nikezić, Purić, and Purić (2012:288) add that transformational leaders challenge prevailing beliefs, values, goals, and patterns, and then establish alternatives that promote the commitment of subordinates. Avolio, Waldman and Yammarino (1991) mention the dimensions of transformational leadership:

- Idealised influence: social and moral actions as well as the eagerness to execute the organisation's strategy.
- Inspirational motivation: being able to share an appealing and value-adding vision.
- Intellectual stimulation: permitting others to obtain knowledge.
- Individualised consideration: give others a sense of ownership in the organisation's goals.

5.2 Talent Management

Silzer and Dowel (2010) state that talent management is all about strategies to implement recruitment, development, management, and the retention of talent to achieve organisational goals. The attraction, development and retention of technical and managerial talent are essential for top management (Alic, 2016). While this challenge is not a new one for senior leaders, it has become more critical than ever, due to the technology, business model, and consumer-preference disruptions affecting the automotive industry (Doucette, Hensley, Kaas & Rittstieg, 2020). There must be a relative degree of growth in talent (Alic, 2016; Abdollahbeig, 2017). Talent is about developing employees so that they can execute their duties in an innovative manner (Rodrigues & Rebelo, 2019). Kafetzopoulos and Gotzamani (2022) summarise talent management as (includes recruitment and selection activities), developing (includes training and career development activities) and retaining (includes satisfaction and compensation activities).

Top management has to make deliberate and organised efforts to optimally attract, develop and retain competent and committed employees who bear significant influence on the overall sustainable performance of the organization (Thunnissen, 2016). Talent management is of strategic importance for human resource management, particularly as a euphemism for "people" as resources that are simultaneously unique, valuable, rare and inimitable (Lewis & Heckman, 2006). There are three talent management perspectives according to Lewis and Heckman (2006):

- The practices and activities of the human resource department.
- A primary focus on the concept of talent pools by concentrating on the internal workforce.
- A focus on high-performing talent and generic talent.

Doucette *et al.* (2020) found that the HR strategy must be linked to talent and the workforce must be up-skilled and reskilled in order to ensure productivity.

5.3 Work Engagement

Over the past two decades, the number of studies on work engagement has increased rapidly. One reason why work engagement is such a popular concept is that it is a very good predictor of employee, team, and organisational outcomes (Bakker & Albrecht, 2018). Schaufeli (2012) points out that the concept of work engagement, first emerged in the nineties. Work engagement is usually referred to as a positive mental state – being connected to work. An indicator of good mental health is employees' work engagement (Schaufeli, Taris & Van Rhenen, 2008). Schaufeli and Bakker (2010:11) state that

“work engagement refers to a positive, affective-motivational state of high energy combined with high levels of dedication and a strong focus on work”. Daily engagement refers to daily levels of vigour, dedication, and absorption that may fluctuate as a function of daily demands, resources, and proactive behaviours (Bakker & Albrecht, 2018). Dedication, vigour and absorption should be visible in workers whilst working (Schaufeli, Salanova, Gonz ales-Rom a & Bakker, 2002). Vigour and dedication are the main dimensions of work engagement (Schaufeli, 2013). Vigour is about the mental energy and the discretionary effort of workers (Schaufeli *et al.*, 2002; Sonnentag, 2017). Dedicated workers are adding value to the organisation (Sonnentag, 2017). Absorption necessitates involvement in doing job-related tasks in the workplace (Schaufeli, Martinez, Pinto, Salanova & Bakker, 2002). Bursts of energy and enthusiasm are part of being engaged in one’s work (Bakker & Albrecht, 2018).

Bakker, Demerouti and Sanz-Vergel (2014) state that various research articles on conditions in the workplace play a role in the level of engagement. Research over the past decade has revealed that work engagement may fluctuate within persons – across time and situations (Bakker & Albrecht, 2018). Although Schaufeli and Bakker (2003) have argued that an overall score of work engagement may be equally useful in empirical research, in order to fully understand how organisational identification affects engagement, it is important to understand its relationships with the three specific dimensions of engagement (Karanika-Murray, Duncan, Pontes & Griffiths, 2015).

This study aims to give insights into the interplay between transformational leadership, talent management and work engagement by examining the influence of transformational leadership on both talent management and work engagement.

5.4 Previous Studies about the Influence of Transformational Leadership on Talent Management and Work Engagement

Studies about the influence of transformational leadership on talent management are limited, but there are several studies about the influence of transformational leadership and work engagement. The relationship between talent management and leadership in any organisation is considered a positive relationship (Irtaimah, Al-Azzam & Khaddam, 2016). Sadeli (2012) found that transformational leadership influences talent management, and Schinzel (2022) found that there is a link between talent management and responsible leadership. The findings of Gautam and Enslin (2019) indicate that transformational leadership moderately predicted work engagement more than transactional leadership.

An increasing number of studies suggest that transformational leadership influences work engagement (Breevaart, Bakker, Hetland, Demerouti, Olsen & Espevik, 2013; Tims, Bakker & Xanthopoulou, 2011; Tuckey, Bakker & Dollard, 2012). Transformational leadership influences engagement in the hospitality industry in Sri Lanka (Thisera & Sewwandi, 2018) which is consistent with earlier studies by Ree and Wiig (2019), Breevaart, Bakker, Hetland, Demerouti, Olsen and Espevik (2013), Datche and Mukulu (2015), as well as Tims, Bakker and Xanthopoulou (2011) where transformational leadership influences work engagement.

6 Research Methodology

A survey research design within the positivistic research paradigm and a quantitative research method were employed. This study was descriptive and cross-sectional.

6.1 Sampling

Artisans from 152 automotive organisations participated in this study. All the brands from the nine South African provinces were part of this study. The population consisted of 1 045 artisans that were employed within the South African automotive industry. Purposive sampling was used to select the artisans that were compelled to attend training at three different training venues in South Africa. A total of 609 respondents completed the questionnaires. More male respondents (96.72%) than female respondents (3.28%) participated in the study. The majority of the respondents were African with 43.64%, followed by their white counterparts with 31.74%, mixed races represented 15.87% and the remaining 8.76% represented Indian participants. There were 34 (5.6%) respondents in the age group

of 31-40 years, 13 (2.1%) respondents were in the age group 41-50 years old and only 2 (0.3%) respondents were older than 51 years. The majority of the respondents (56.83%) possess a grade 12 certificate and 17.7% an N4-N6 (National) qualification. The data showed that 77.80% of the respondents who completed the questionnaire had tenure of service between 1 and 5 years, 14.50% less than 1 year, 5.9% between 6 and 10 years of service, 1% between 11 and 20 years of service, 0.3% between 21 and 30 years of service and 0.50% had more than 31 years of service. Lastly, there were 78.9% vehicle petrol mechanics 78.9% compared to vehicle diesel mechanics who were 18.5%. Vehicle spray painter was only 1% and the other individual fields of artisan work were less than 1% each.

6.2 Measuring Instrument

A 5-point Likert scale was used as follows: 1 – Completely disagree; 2 – Partially disagree; 3 – Uncertain; 4 – Partially agree; 5 – Completely agree.

The results presented in Table 1 showed that the Cronbach's alpha values for all the variables are between the cut-off point of 0.5 and 0.7. The Dillon-Goldstein's rho for all the variables was above 0.7 which indicates homogeneity of the factor. The results suggest that all the variables are reliable regarding internal consistency. The quality of a measurement model was examined by testing the convergent validity, which shows the degree to which the indicators under the constructs are related. Convergent validity shows the amount of variance the indicators have in common: high factor loading and average variance extracted (AVE). According to Hair, Sarstedt, Hopkins and Kuppelwieser (2014:106) "AVE loadings above 0.5 are indicators of convergent validity". The results displayed in Table 1 indicate that the AVE loadings were above 0.5, except for continuance commitment with 0.3. The final model factor loadings are also reported in Table 1.

Table 1: Internal consistency of the questionnaire

Variable		Number of items	Cronbach's alpha	Composite reliability	Average variances extracted
Talent management 1: Performance planning and motivational processes	TM1	16	0.954	0.958	0.588
Talent management 2: Career development	TM2	4	0.751	0.848	0.571
Transformational leadership	TL	21	0.977	0.978	0.678
Work engagement 1: Vigour	WE1	5	0.903	0.903	0.648
Work engagement 2: Dedication	WE2	5	0.851	0.851	0.588

6.3 Data Collection

The questionnaires were distributed to the artisans who attended the aforementioned training sessions. To ensure confidentiality and anonymity, sealed boxes were used for the deposit of the completed questionnaires and informed consent letters. Different boxes were used for the informed consent forms.

6.4 Data Analysis

For data analysis, the Stata version 15 statistical analysis software was used. The demographic statistics were presented in frequencies and percentages. "The structural equation modelling (SEM), using the partial least squares path modelling approach (PLS-PM), was performed (Hair, Sarstedt, Hopkins & Kuppelwieser, 2014). Salkind (2016) highlighted structural equation modelling (SEM) as an umbrella term for techniques such as regression, factor analysis and path analysis. Bootstrapping was used to estimate the parameters and associated standard errors in the direct and indirect effect in the statistical analysis of the SEM through the non-parametric method.

7 Results and Findings

To determine if talent management predicted transformational leadership and work engagement, the direct relationship estimation of parameters and associated standard errors were reported in Table 2.

In this analysis, the identification of a loading close to 1 indicates a strong relationship, with the percentage (perc.) 0.975 equal to a 95% confidence interval. Further loadings with a zero involved in the reading of the interval [-0.068:0.154] became insignificant. Furthermore, bootstrapping was used to estimate the parameters and associated standard errors.

Table 2: Direct relationship estimation of parameters and associated standard errors

Variable			Original loading	Mean Boot	Std Error	Perc.025	Perc.975
TL	>	TM1	0.724	0.726	0.0261	0.674	0.774
TL	>	TM2	0.587	0.586	0.029	0.530	0.640
TL	>	WE1	0.022	0.024	0.048	-0.079	0.102
TL	>	WE2	0.051	0.054	0.058	-0.058	0.164

Table 2 indicates the different paths resulting from the statistical results. It was clear that transformational leadership predicted talent management (performance planning and motivational processes) (0.724). Transformational leadership was not a predictor of vigour as part of work engagement (0.022) and dedication as part of work engagement (0.051).

Structural Equation Model Assessment

The structural model was used to determine the model's explanatory power to test the developed hypothesis about the relationships among the factors. The model's explanatory power was assessed through the coefficient of determination (R^2), redundancy index and goodness of fit index.

The R^2 (R square) Determination Coefficients

R^2 indicates the amount of variance in the endogenous latent variable explained by its independent latent variables. Hair Jr, Sarstedt, Hopkins and Kuppelwieser (2014), considered R^2 values of 0.75, 0.50, and 0.25 for the dependent variables as substantial, moderate, and weak, respectively. However, Sánchez Hernández, Carvalho, Costa and Gallarde Vázquez (2015) considered R^2 values of $>.60$ as high, between 0.30 and 0.60 as moderate and below 0.30 as low.

Table 3: The R^2 (R square) determination coefficients

Variable	R^2 value loading
TL	0
TM1	0.524312
TM2	0.344336
WE1	0.364606
WE2	0.19382

The R^2 values, as shown in Table 3 are low. The R^2 for the inner model is low for attitude, behavioural intention to use and individual uses. The R^2 for TL is 0, this means that TM explain 52% and TM2 explain 34% of the variation in TL. According to Sánchez Hernández *et al.* (2015), the variation in TL is explained to a moderate degree. WE1 and WE2 factors are 0.364 and 0.193 respectively; this means that the factors WE1 and WE2 explain 36.4% and 19.3% of the variance in TL. These loadings are weak according to Hair *et al.* (2014).

The Redundancy Indexes

Redundancy measures the percentage of the variance of indicators in an endogenous block that is predicted from the independent latent variables (TM1, TM2, TL, WE1 and WE2) associated with the endogenous latent variables (LV). Another definition of redundancy is the amount of variance in an endogenous construct explained by its independent latent variables. In other words, it reflects the ability of a set of independent latent variables to explain variation in the dependent latent variable (Suzukawa & Taneichi, 2002).

High redundancy means high the ability to predict. In particular, the researcher may be interested in

how well the independent latent variables predict values of the indicators' endogenous construct. Analogous to the communality index, one can calculate the mean redundancy, that is, the average of the redundancy indices of the endogenous blocks (Table 4).

Table 4: The redundancy indexes

Latent Variable	Mean Redundancy
TL	0
TM1	0.308221
TM2	0.196466
WE1	0.23637
WE2	0.113829

The redundancy values for the endogenous latent variables are very low, which shows that the latent independent variables explain an infinitely small amount of the variance in the endogenous latent variables.

The Goodness of Fit (GoF)

The goodness of fit (GoF) can be used as a global criterion that helps to assess model performance. From this point of view, a GoF value of 0.78 could be interpreted as if the prediction power of the model is 78%. The naive rule of thumb is the higher, the better. Acceptable 'good' values within the PLS-PM community are GoF >0.7. The GoF index of 0.4742828 for the whole model is well below the suggested cut-off of 0.70 but can be accepted because no comparisons have been done yet to other variables.

The outcomes of the hypotheses, as related to artisans in the South African automotive industry, were as follows:

- Hypothesis 1: Transformational leadership influences talent management – Accepted.
- Hypothesis 2: Transformational leadership influences work engagement – Rejected.

In this study, leadership predicted talent management (performance planning and motivational processes). Transformational leadership also predicted career development as part of talent management. Sayyam, Adil and Hamayun (2020) found that transformational leadership was a moderator between talent management and employee innovative work behaviour, but not a predictor. Irtaimah et al. (2016) found that the relationship between talent management and leadership is positive.

Transformational leadership was not a predictor of vigour as part of work engagement and dedication as part of work engagement. This finding deviates from the findings of Thisera and Sewwandi (2018), Breevaart et al. (2013), Datche and Mukulu (2015), as well as Tims, Bakker and Xanthopoulou (2011) who, in their studies, found that transformational leadership influences engagement.

This conclusion means that transformational leadership's influence on talent management is an essential dimension for management and human resources (HR) of the South African automotive industry as well as adding value to the body of knowledge within the organisational behaviour theory. In order to properly deal with talent management, it is important to note that when it comes to influencing this process in a positive manner, a transformational leadership style will be appropriate and value-adding. Leadership behaviours associated with the transformational leadership style were noted in the study to be relevant in retaining talented employees. Transformational leaders bring talent to life. A transformational leadership style however does not influence the work engagement of artisans in this automotive industry.

A limitation of this study is that it was cross-sectional in nature and cannot be generalised to all the artisans in the South African automotive industry.

It is recommended to develop and implement strategies, policies, and procedures to retain artisans in the South African automotive industry. Transformational leadership styles among managers need to be developed to impact talent management among artisans in the automotive industry. New avenues need to be found to improve the work engagement of these artisans as transformational leadership does not influence work engagement in this environment.

For future research, this study can be duplicated in other countries' automotive industries in order to compare the findings. A study can be conducted to determine if talent management perhaps moderates the work engagement and transformational leadership among artisans in order to further investigate the relationship between these three variables. A qualitative study can be executed to acquire a wide variety of views on leadership, talent management and work engagement of the artisans in the South African automotive industry.

8 Managerial Implications

Technology is dramatically changing how people use cars. To stay competitive, automakers must embrace new methods of finding, hiring, and managing highly-skilled, digitally talented people. To improve the managerial impact and to apply the research results, it is important for managers within the South African automotive industry to improve their transformational leadership style to positively influence the talent management of artisans. This leadership style will not, as seen in the results, necessarily impact the work engagement of artisans. Leaders often spend their time recruiting top talent. But transformational leaders recognise that talent hardly compares to perseverance. Transformational leaders should have a heightened level of engagement and desire to impact employees positively. They, therefore, have a higher degree of involvement in the success of the other person. Breevaart *et al.* (2014) accentuate the fact that if transformational leadership influences engagement, it impacts greatly on how to better manage engagement in the workplace.

9 Conclusion

The purpose of this study is to determine if transformational leadership influences both talent management and work engagement of artisans in the South African automotive industry. It was found that transformational leadership influenced talent management, but not work engagement. It is therefore of utmost importance for managers to ensure that talent management is in place in the automotive South African industry. Strategies, policies and procedures must be developed and implemented to retain South African automotive industry artisans.

MARKETING MANAGEMENT

Predictors towards Actual Use of M-Commerce Apps – An Emerging African Market Perspective

Karen van Niekerk¹, Prof. Mornay Roberts-Lombard^{2,*}, Dr Isolde Lubbe³

¹⁻³ Department of Marketing Management, University of Johannesburg, Johannesburg, South Africa

Keywords

m-commerce applications; athleisure apparel; actual use; facilitating conditions; habit; behavioural intention

Abstract

The fashion industry's growth is reflective of a global movement towards a more active lifestyle and the advent of "athleisure" apparel, namely exercising and general wear clothing. Although m-commerce application purchasing has increased, this is not evident for athleisure apparel in South Africa. Adopting the unified theory of acceptance and use of technology 2 (UTUAT 2) of Venkatesh, Thong and Xu (2012), using actual use as five unique binary outcomes, the model provided insight into consumers' acceptance and use of m-commerce apps to purchase athleisure apparel. Data were collected from 250 South African millennials subjected to an exploratory factor analysis and *t*-tests, indicating that behavioural intention is most likely to influence acceptance and use.

1. Introduction

The global fashion industry contributes 2% of the world's gross domestic product and employs more than 57.8 million people. The industry has grown at a consistent rate of 5.5% per annum over the last 10 years and is currently valued at over US\$3 trillion (FashionUnited, 2022). This growth has been attributed primarily to athletic wear, which generated around US\$353.5 billion during 2020 and is forecasted to continue growing to reach approximately US\$455.46 billion by 2027 (Smith, 2022). This growth is reflective of a global movement towards a more active lifestyle and the advent of "athleisure", a term used to describe clothing that can be used for both exercising and general wear (Amed, Berg, Brantberg & Hedrich, 2017; Trefis Team, 2016). Similarly, the athletic wear retail category in South Africa has grown by 36% over the past five years, and the major trend said to be fuelling this growth has been identified as athleisure (Euromonitor International, 2017a). However, these performance figures are primarily concentrated at physical retail outlets and not online, commonly referred to as e-commerce.

According to Amed, Andersson, Berg, Drageset, Hedrich and Kappelmark (2018), the global fashion industry finds itself in a pivotal developmental phase, where digital adoption among consumers is increasing rapidly and online sales of apparel and footwear are predicted to follow suit. Argyros (2017) stated that to ensure the continued existence and success of the retail industry, retailers need to implement new technologies in their approaches. South African consumers are becoming more technologically savvy and expect their retailer of choice to offer them multiple channels through which they can engage and make purchases. Consequently, a digital retailing channel, such as e-commerce or m-commerce, complements an existing physical presence and offers the retailer another means through which to drive sales and meet steep growth targets (Quinn, Biondi & Penmetcha, 2014).

Described as a business model that permits an organisation or individual to do business via an electronic medium, such as the Internet (Bloomenthal, 2019a), e-commerce has had a marked influence on the global retail industry. E-commerce retail sales worldwide grew by a phenomenal 72.5% from 2014 to 2017, amounting to US\$2.3 trillion in 2017; and 53.5% from 2017 to 2019, amounting to US\$3.53 trillion. This figure is predicted to grow by another 85.3% by 2022, amounting

² E-mail address: mornayrl@uj.ac.za

³ E-mail address: isoldel@uj.ac.za

to US\$6.54 trillion (Statista, 2019a). One of the main drivers of this growth are international emerging markets, including India, Indonesia, and South Africa (Quinn et al., 2014; Statista, 2019b). According to Saleh (2017), at 15.6%, the United Kingdom (UK) has the highest percentage of e-commerce sales globally in relation to total retail sales. The UK is followed by China at 13.8%, Norway at 11.5%, Finland at 10.8%, and South Korea at 10.5%. Manson (2016) stated that emerging markets are reportedly sitting at an average of 5%–6%. However, this is not the case in South Africa.

In South Africa, e-commerce sales currently account for 1.4% of total retail sales (World Wide Worx, 2018). That being said, TechCentral (2017) forecasted exponential growth over the next decade. M-commerce, a form of e-commerce by means of a wireless handheld device, such as a smartphone (Bloomenthal, 2019b; Persson & Berndtsson, 2015), is forecasted to grow 200% faster than e-commerce (Cox, 2016). M-commerce is marked as the single biggest driver of online expenditure growth in South Africa (Smith, 2017).

Most South Africans access the Internet via their mobile phones (Space Station, 2017) and prefer to utilise apps to shop (“What’s driving online shopping in SA?”, 2015). However, of those who do shop via their mobile phones, the category of clothing and accessories does not feature prominently (Erken, 2017; Goldstuck, 2014). With athleisure being a major trend impacting global and local growth in the fashion industry (Amed et al., 2017; Euromonitor International, 2017b), it is imperative for South African fashion retailers selling athleisure apparel to understand the reasons for this low purchasing behaviour. This study provides insights into this phenomenon by determining the constructs that influence consumers’ acceptance and use of m-commerce apps to purchase athleisure apparel in South Africa.

2. Theoretical Framework

The unified theory of acceptance and use of technology 2 (UTAUT2) provides the theoretical foundation of this study. Miladinovic and Xiang (2016) stated that the UTAUT2 outperforms all other technology acceptance theories and models. According to Rondan-Cataluña, Arenas-Gaitán and Ramírez-Correa (2015), consumers’ acceptance and use of new technologies have been actively researched since the 1980s. Various different technology acceptance theories and models have been developed over the years aimed at finding and categorising constructs that influence consumers’ behavioural intention and actual use of technology (Agudo-Peregrina, Hernández-García & Pascual-Miguel, 2014). One such a theory, the UTAUT2, was developed by Venkatesh, Thong and Xu (2012:158) and attempts to ascertain the various constructs that influence consumers’ acceptance and use of new technologies, such as online or mobile shops, and forms the basis of the research model for this study.

Rondan-Cataluña et al. (2015) proved that the UTAUT2 has 26% better explanatory power from a consumer use point of view, compared to other technology acceptance theories and models. Marriott and Williams (2016) stated that the UTAUT2 has proven successful in explaining behavioural intention in the fields of mobile payments, mobile Internet, and mobile banking research. This view was supported by Slade, Williams and Dwivedi (2013), who stated that the UTAUT2 explains up to 52% of the variance on actual use.

The UTAUT2 identifies specific key constructs, namely performance expectancy, effort expectancy, social influence, facilitating conditions, hedonic motivation, price value, and habit. The model then indicates how these constructs affect consumers’ behavioural intention to use a specific technology as well as their actual use (Miladinovic & Xiang, 2016; Venkatesh et al., 2012). Many studies have investigated the constructs that influence consumers’ behavioural intention to use new technologies (Chaouali, Yahia & Souiden, 2016; Miladinovic & Xiang, 2016; Shaw & Sergueeva, 2019), but few have investigated actual use in an emerging economy like South Africa. Actual use refers to an individual using, in the case of this study, m-commerce apps when purchasing athleisure apparel in South Africa (Davis, 1986). Therefore, this study focuses on the UTAUT2 constructs that influence actual use in particular – namely facilitating conditions, habit, and behavioural intention.

Venkatesh, Morris, Davis and Davis (2003) and Venkatesh et al. (2012) are the two main studies referenced in compilation of the scales for facilitating conditions, habit, and behavioural intention. The actual use construct was compiled by combining five items from different studies. Other studies referenced in the compilation of the various scales used only one item to measure actual use (Martins, Oliveira & Popovič, 2014; Venkatesh et al., 2003, 2012), but the researchers decided to extend the construct to include five items. This was intended to extract richer insights from consumers who had used m-commerce apps to purchase athleisure apparel.

3. Theoretical Model Development

3.1. The interrelationship between facilitating conditions and actual use

Facilitating conditions are defined as a consumer's perception of the resources and support available when performing a specific behaviour (Venkatesh et al., 2012:159). In the context of m-commerce, facilitating conditions refer to the online customer support available to the consumer (e.g., frequently asked questions on the company's website, an e-mail address and/or contact number) along with a working Internet connection enabling the consumer to browse and purchase items, as well as working knowledge of the technology (Madan & Yadav, 2018; Miladinovic & Xiang, 2016). Consequently, the facilitating conditions construct is important to this study as it measures m-commerce consumers' perceptions of the support on offer when using a mobile shopping app.

The construct of facilitating conditions from the UTAUT2 and its influence on actual use has been researched in the Internet and mobile banking and mobile shopping industries (Alalwan, Dwivedi, Rana & Algharabat, 2018; Tarhini, El-Masri, Ali & Serrano, 2016; Yang, 2010). Alalwan et al. (2018) found similar results to Venkatesh et al. (2003, 2012), maintaining that there is a statistically significant relationship between facilitating conditions and actual use of Internet banking. According to these researchers, this can be ascribed to the nature of the facilities required to conduct Internet banking, such as a working Internet or Wi-Fi connection and access to a secure website or app. This is similar to some of the facilities needed to adopt mobile shopping (Miladinovic & Xiang, 2016). Yang (2010) agreed, stating that facilitating conditions are critical in consumers' adoption of m-commerce. Moreover, Tarhini et al. (2016) indicated that facilitating conditions are a significant determinant of consumers' actual use of Internet banking. They state that it is imperative for banks to invest more in infrastructural development and customer service enhancement to ensure the required service and/or training is delivered to the customers, as this significantly influences whether or not they will use Internet banking. The aforementioned studies in the Internet and mobile banking and mobile shopping sectors indicate that facilitating conditions are a strong predictor of actual use.

Based on these findings, the following hypothesis can be formulated for this study:

- H₁: Facilitating conditions have a positive influence on consumers' actual use of m-commerce apps to purchase athleisure apparel.

This hypothesis is further refined as follows:

- H_{1A}: Facilitating conditions have an influence on when last consumers used a mobile shopping app to purchase athleisure apparel.
- H_{1B}: Facilitating conditions have an influence on the amount of athleisure apparel items purchased.
- H_{1C}: Facilitating conditions have an influence on the amount of time spent shopping for athleisure apparel via mobile shopping apps per week.
- H_{1D}: Facilitating conditions have an influence on the number of mobile shopping apps visited in a given month.
- H_{1E}: Facilitating conditions have an influence on the approximate rand value of athleisure apparel purchases.

3.2. The interrelationship between habit and actual use

Habit refers to consumers' automatic execution of specific behaviours due to prior learning (Alalwan et al., 2018; Chopdar, Korfiatis, Sivakumar & Lytras, 2018; Venkatesh et al., 2012). Habit in the

context of this study refers to the extent to which a consumer will make automatic use of m-commerce apps (Miladinovic & Xiang, 2016). Lipsman (2015) stated that smartphone use is habitual today, occurring on an almost unconscious level. Research has also proven that the continued usage of apps leads to the formulation of new habits (Chou, Chiu, Ho & Lee, 2013). Venkatesh et al. (2012) indicated that this construct has a significant impact on actual use. Alalwan et al. (2018), in their Jordanian study on Internet banking acceptance and use, found that even though behavioural intention is the most important determinant of actual use, habit has the second strongest influence on consumers' actual use of Internet banking. Gupta, Dogra and George (2018) concurred, affirming that habit is a strong predictor of actual use.

Based on these findings, the following hypothesis can be formulated for this study:

- H₂: Habit has a positive influence on consumers' actual use of m-commerce apps to purchase athleisure apparel.

This hypothesis is further refined as follows:

- H_{2A}: Habit has an influence on when last consumers used a mobile shopping app to purchase athleisure apparel.
- H_{2B}: Habit has an influence on the amount of athleisure apparel items purchased.
- H_{2C}: Habit has an influence on the amount of time spent shopping for athleisure apparel via mobile shopping apps per week.
- H_{2D}: Habit has an influence on the number of mobile shopping apps visited in a given month.
- H_{2E}: Habit has an influence on the approximate rand value of athleisure apparel purchases.

3.3. The interrelationship between behavioural intention and actual use

Phong, Khoi and Le (2018) described behavioural intention as individuals' personal evaluation of their ability to perform an online transaction via a mobile device through a wireless connection. The influence of behavioural intention on actual use has been widely researched in technology acceptance literature and has been cited as the most powerful determinant of actual use (Alalwan et al., 2018:129). Alalwan et al.'s (2018) Jordanian study and Tarhini et al.'s (2016) Lebanese study, both on Internet banking acceptance and use, found behavioural intention to have a significant influence on actual use. Persson and Berndtsson's (2015) Swedish study on smartphone shopping found a statistically significant relationship between behavioural intention and actual use. Furthermore, Vasileiadis (2014) found a statistically significant relationship between behavioural intention and actual use, indicating that behavioural intention is a strong predictor of actual use. Williams, Rana and Dwivedi (2015) explored the relationship between the behavioural intention and actual use constructs of the UTAUT2 and discovered that, of 102 studies, behavioural intention had a predictive weighting of 0.82 on actual use (a score of 1 being indicative of the relationship between constructs being significant) (Williams et al., 2015). Based on these findings, the following hypothesis can be formulated for the study:

- H₃: Behavioural intention has a positive influence on consumers' actual use of m-commerce apps to purchase athleisure apparel.

This hypothesis is further refined as follows:

- H_{3A}: Behavioural intention has an influence on when last consumers used a mobile shopping app to purchase athleisure apparel.
- H_{3B}: Behavioural intention has an influence on the amount of athleisure apparel items purchased.
- H_{3C}: Behavioural intention has an influence on the amount of time spent shopping for athleisure apparel via mobile shopping apps per week.
- H_{3D}: Behavioural intention has an influence on the number of mobile shopping apps visited in a given month.
- H_{3E}: Behavioural intention has an influence on the approximate rand value of athleisure apparel purchases.

Figure 1 depicts the proposed theoretical model for this study, illustrating the different constructs of the study as well as the hypothesised relationships between these constructs.

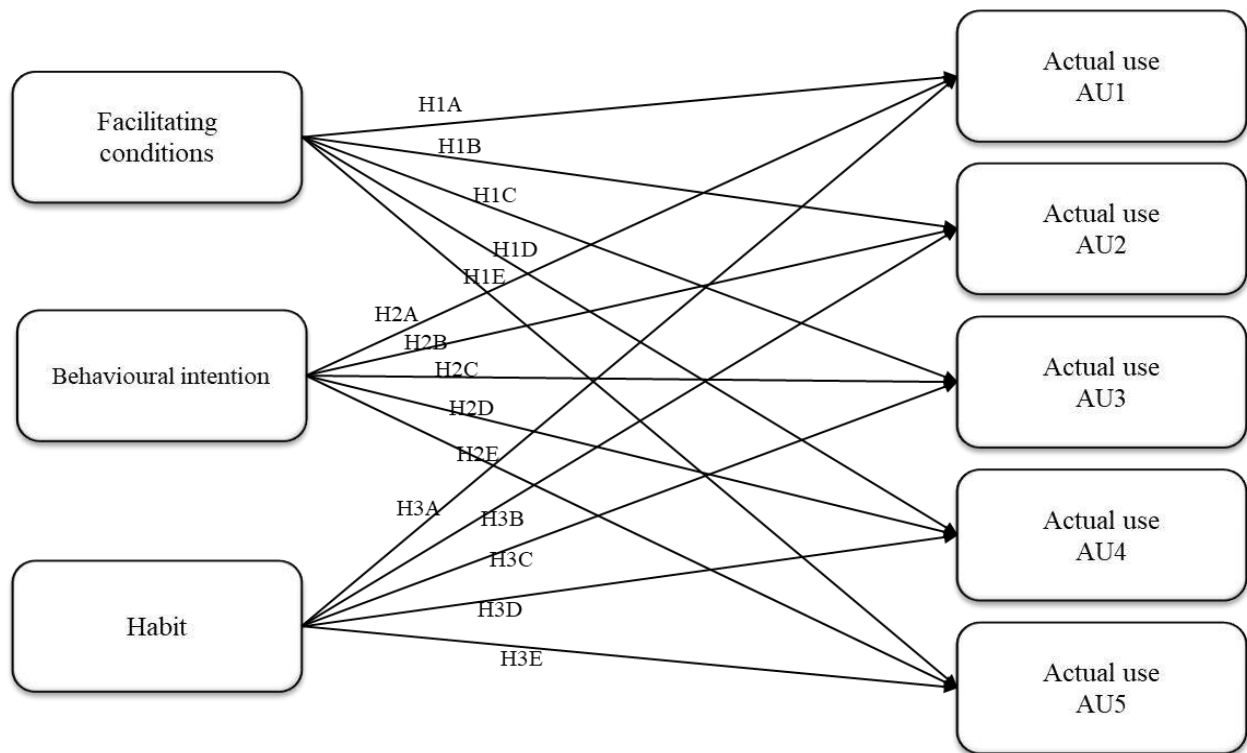

Figure 1: Proposed Theoretical Model
Source: Researcher’s own construct

4. Methodology

The study is quantitative and descripto-exploratory in nature, and flows from Karen van Niekerk’s master’s dissertation titled “Factors that influence the adoption of mCommerce applications for purchasing athletic fashion apparel”. The co-authors on this paper were the supervisors of the study. The study’s target population consisted of South African consumers who had used an m-commerce app over the last 12 months. Consumers who actually made a purchase were included in the study. According to Effective Measure (2017:2), 66% of consumers purchase online or via their mobile phones at most once every three months. An IT News Africa article (“Online shopping trends in 2017”, 2017) reported that 67% of South African shoppers who shop online or via mobile phone purchase less than 10 products a year. Therefore, 12 months was selected as an optimal period for a sufficient sample to be drawn, as the frequency of m-commerce purchases is low in South Africa. The sampling method in this study was a combination of two-part quota and convenience sampling. The quotas were created to ensure that the data represented South Africa’s population (refer to Table 1). In addition to quota sampling, convenience sampling was used as it allows the research sample to be drawn at the researcher’s convenience and permits a large number of respondents to be interviewed within a shorter time frame (Hair, Celsi, Ortinau & Bush, 2013; Zikmund & Babin, 2010).

Table 1: Quotas and Questionnaires to be Fielded

<i>Ethnicity</i>	<i>Percentage of the population</i>	<i>Number of questionnaires to be fielded (equal male and female)</i>		
		Male	Female	Total
<i>Black</i>	80.8%	101	101	202
<i>Coloured</i>	8.8%	11	11	22
<i>Indian/Asian</i>	2.5%	3	3	6
<i>White</i>	8.0%	10	10	20
<i>Total</i>	100%	125	125	250

Source: Statistics South Africa (2017)

The data collection instrument selected for this study was a questionnaire. To ensure sufficient respondents were reached, a hybrid method comprising self-completed and interviewer-administered questionnaires was used. Self-completed questionnaires were answered by the respondents and were distributed via e-mail (Benzo, Mohsen & Fourali, 2018; Saunders, Lewis & Thornhill, 2016). E-mail was used to send the questionnaire to consumers in South Africa. The respondents accessed the questionnaire by clicking on a link provided in the e-mail. In addition, interviewer-administered questionnaires were leveraged to improve the response rate. Interviewer-administered questionnaires were done in person via mall intercept, which is when respondents are approached while shopping in a mall (Malhotra, 2007). Fieldworkers from the private research company, Osmoz Consulting, were contracted to assist with these questionnaires. The research company was orientated towards the aim of the study as well as the questionnaire and its content before the pilot study was conducted to test the validity and reliability of the questionnaire.

The questionnaire comprised distinct sections, including screening questions to determine whether the respondent had used an m-commerce app to purchase athleisure apparel. Section A covered the demographic information of respondents, while Sections B and C asked questions about the constructs, including facilitation conditions, behavioural intention, habit (Venkatesh et al., 2003, 2012), and actual use. The scale to measure actual use was compiled by combining five items from different studies with the intention of extracting richer insights from consumers who had used m-commerce apps to purchase athleisure apparel. This construct was built using items from Chopdar et al. (2018) and Kloppe and McKinney (2004). The scales consisted of 4 to 13 items, depending on the construct, and previously validated five-point Likert scales (ranging from 1 = “strongly disagree” to 5 = “strongly agree”) were used to measure each of the statements for Sections B and C. Table 2 portrays the scales and their statements pertaining to this paper.

Table 2: Constructs and Items

Facilitating conditions	
FC1	I have the resources necessary to use mobile shopping apps to purchase athleisure apparel.
FC2	I have the knowledge necessary to use mobile shopping apps to purchase athleisure apparel.
FC3	Mobile shopping apps are compatible with other technologies I use when purchasing athleisure apparel.
Habit	
HT1	The use of mobile shopping apps to browse and/or purchase athleisure apparel has become a habit for me.
HT2	I am addicted to using mobile shopping apps to browse and/or purchase athleisure apparel.
HT3	I must use mobile shopping apps to browse and/or purchase athleisure apparel.
HT4	Using mobile shopping apps to browse and/or purchase athleisure apparel has become natural to me.
Behavioural intention	
BI1	I intend to use mobile shopping apps to purchase athleisure apparel in the future.
BI2	I will use mobile shopping apps to purchase athleisure apparel where feasible.
BI3	I plan to use mobile shopping apps to purchase athleisure apparel in the future.
BI4	I predict I will use mobile shopping apps to purchase athleisure apparel in the future.
BI5	I will use mobile shopping apps to purchase athleisure apparel in my daily life.
AU1: When last did you use a mobile shopping app to purchase athleisure apparel?	
1	Last week
2	Last month
3	Within the last three months
4	Within the last six months
5	Within the last year
AU2: How many athleisure apparel items did you purchase during this time?	
1	1 item
2	2–3 items
3	4–5 items
4	6 or more items
AU3: In general, how much time do you spend shopping for athleisure apparel via mobile shopping apps per week?	
1	0–5 minutes
2	6–15 minutes
3	16–60 minutes
4	Over 60 minutes
AU4: On average, how many different mobile shopping apps do you visit in a given month?	
1	1–2
2	3–4
3	5–6
4	7 or more
AU5: What was the approximate rand value of your most recent purchase of athleisure apparel?	
1	R250 or less
2	R250–R500
3	R500–R800
4	R800–R1 000
5	R1 000 or more

Data analysis was conducted to examine the 250 valid responses using the IBM Statistical Package for the Social Sciences programme, version 24. This programme applied various statistical procedures, including descriptive statistical analyses and exploratory factor analysis (EFA) and *t*-test analyses, to determine the outcome variables and test the proposed hypotheses. This assisted in the development and delivery of accurate statistical data that contributes towards the existing research field by offering improved knowledge on mobile shopping via apps in emerging markets, such as South Africa.

5. Empirical Findings

5.1. Demographic profile of respondents

An equal number of males and females answered the questionnaire. The majority of respondents were black (81%), followed by white (12%), Asian (3%), and coloured (3%); who spoke English (22%),

Zulu (21%), Sotho (17%), Tswana (9%), and the other remaining seven official languages of South Africa (30%). Respondents represented various levels of education, with most having a university degree (31%), grade 12 schooling (27%), a postgraduate degree (23%), and a national diploma or certificate (12%). Most respondents were aged 18–24 (57%) and 25–29 (21%), followed by 30–35 (12%) and 35 years and older (10%). When respondents were asked if they had used an app on their smartphones to browse and/or buy athleisure apparel, 26% indicated they use an app to buy and 74% that they use an app to browse and buy.

5.2. Reliability and validity

To ensure validity of the questionnaire, a pilot study was done. Only content or face validity was assessed during the pilot test. Content or face validity refers to a subjective judgement that considers the extent to which a specific measure seems to be related to a particular construct. It is the subjective assessment surrounding the presentation of, in this instance, the questionnaire from a relevance, consistency, and clarity point of view (Malhotra, Birks & Wills, 2012; Taherdoost, 2016). Content or face validity is assessed prior to data being collected to ensure the questionnaire covers all areas of the intended research (Hair et al., 2013). During the pilot test, a small sample of 22 respondents was included. All respondents in the pilot test indicated that they use m-commerce apps to purchase athleisure apparel online. The results of the pilot test showed that all Cronbach's alpha values for the constructs in the study were greater than 0.7 (refer to Table 3). Moreover, the respondents indicated clarity of reading of the items and no changes were made to the original items used.

Table 3: Pilot Test Results: Reliability Statistics

Construct	Number of items	Cronbach's alpha	Cronbach's alpha based on standardised items
Facilitating conditions	4	0.865	0.882
Behavioural intention	5	0.908	0.914
Actual use	5	0.772	0.777

To ensure statistical validity, the factor loadings of scale items must be more than 0.5. The average variance extracted for each construct should also exceed 0.5 (Hair et al., 2013:167; Nam, Lee & Lee, 2019; Sun, Lee & Law, 2019). Table 4 depicts the factor loadings for each of the scale items relating to the constructs used in the study. As is evident, all factor loadings were over the 0.5 mark, indicating that statistical validity was met. Moreover, there were no cross-loadings of items.

Table 4: Factor Loadings for Each Scale Item

Construct/Items	Factor loadings
FC1: I have the resources necessary to use mobile shopping apps to browse and/or purchase athleisure apparel.	0.743
FC2: I have the knowledge necessary to use mobile shopping apps to browse and/or purchase athleisure apparel.	0.756
FC3: Mobile shopping apps are compatible with other technologies I use when browsing and/or purchasing athleisure apparel	0.730
HM1: Using mobile shopping apps to browse and/or purchase athleisure apparel is fun.	0.888
HM2: Using mobile shopping apps to browse and/or purchase athleisure apparel is enjoyable.	0.933
HM3: Using mobile shopping apps to browse and/or purchase athleisure apparel is very entertaining.	0.872
HM4: Using mobile shopping apps to browse and/or purchase athleisure apparel is very pleasurable.	0.861
BI1: I intend to use mobile shopping apps to purchase athleisure apparel in the future.	0.862
BI2: I will use mobile shopping apps to purchase athleisure apparel where feasible.	0.832
BI3: I plan to use mobile shopping apps to purchase athleisure apparel in the future.	0.899
BI4: I predict I will use mobile shopping apps to purchase athleisure apparel in the	0.866

future.	
BI5: I will use mobile shopping apps to purchase athleisure apparel in my daily life.	0.604

Table 5 summarises the Cronbach's alpha values for each construct. As per Hair et al. (2013:166), any value lower than 0.7 indicates low and unsatisfactory internal consistency. As is evident, the Cronbach's alpha values for facilitating conditions and habit were above 0.7, but for actual use it was 0.377, indicating low and unsatisfactory internal consistency. This indicates that it is not possible to work with this construct as a latent construct made up of five items, as the various items do not constitute a single construct.

Table 5: Cronbach's Alpha for Each Construct

Construct	Scale items	Cronbach's alpha
Facilitating conditions (FC)	FC1, FC2, FC3	0.787
Habit (HT)	HT1, HT2, HT3, HT4	0.868
Actual use (AU)	AU1, AU2, AU3, AU4, AU5	0.377

5.3. Exploratory Factor Analysis

The analysis of the proposed model includes factor analysis with a view on factor extraction, factor rotation, and interpretation. Thereafter, EFA was conducted on the data. The different items in Table 6 were originally part of the actual use construct, which was the dependent variable to be used in the study. Each of the five items in the study were recoded into two categories and factor rotation was done. Varimax rotation was utilised with Kaiser normalisation, an orthogonal rotation solution. Orthogonal rotation results in uncorrelated factor solutions (Pallant, 2016). As can be seen in Table 6 after varimax rotation, item AU1 explained 18.841% of the variance as opposed to 31.833%, and item AU2 explained 7.368% of the variance as opposed to 22.512%. Table 6 depicts the rotated factor loadings. Majority of the items had factor loadings below the recommended level of 0.4 (Chan & Idris, 2017; Kootstra, 2004).

Table 6: Rotated Factor Matrix for the Five Dependent Variables (Five Items of Original Actual Use Construct)

Construct/Scale Items	Factor	
	1	2
AU1: When last did you use a mobile shopping app to purchase athleisure apparel? (Choose only one)	-0.028	0.476
AU2: How many athleisure apparel items did you purchase during this time? (Choose only one)	0.752	-0.031
AU3: In general, how much time do you spend shopping for athleisure apparel via mobile shopping apps per week? (Choose only one)	0.324	0.206
AU4: On average, how many different mobile shopping apps do you visit in a given month? (Choose only one)	0.125	0.303
AU5: What was the approximate rand value of your most recent purchase of athleisure apparel? (Choose only one)	0.505	0.086

Considering the findings in Table 6, it is noted that it is not possible to work with the originally proposed actual use construct as a latent construct comprising five items in the study, as the various items do not fit well with each other and cannot be combined to measure a single construct. Therefore, it was decided to represent the actual use construct as five unique binary categorical outcomes. This implies that the dependent variables in the study (as proposed by Figure 1) were created by combining five items from different studies. AU1 was sourced from Chopdar et al. (2018) and asked when last respondents used a mobile shopping app to purchase athleisure apparel. AU2 was developed by the researcher and aimed to understand how many items were bought. AU3 and AU4 were adapted from Klopping and McKinney (2004) and asked respondents how much time they spent shopping for athleisure apparel via mobile shopping apps per week as well as how many different mobile shopping apps they visited in a given month. The final item, AU5, was developed by the researcher to understand the value of athleisure apparel purchases. The five proposed outcome variables were

linked to the constructs of facilitating conditions, habit, perceived risk, and behavioural intention (see Figure 1). Table 7 details the frequencies for the five dependent variables in the proposed model.

Table 7: Actual Use Constructs – Frequencies

AU1: When last did you use a mobile shopping app to purchase athleisure apparel? (Choose only one)		
	Frequency	Valid %
Over a month ago	118	47.2%
Within last month	132	52.8%
Total	250	100%
AU2: How many athleisure apparel items did you purchase during this time? (Choose only one)		
	Frequency	Valid %
1 item	89	35.6%
More than 1 item	161	64.4%
Total	250	100%
AU3: In general, how much time do you spend shopping for athleisure apparel via mobile shopping apps per week? (Choose only one)		
	Frequency	Valid %
Up to 15 minutes	124	49.6%
More than 15 minutes	126	50.4%
Total	250	100%
AU4: On average, how many different mobile shopping apps do you visit in a given month? (Choose only one)		
	Frequency	Valid %
1–2 apps	118	47.2%
3 or more apps	132	52.8%
Total	250	100%
AU5: What was the approximate rand value of your most recent purchase of athleisure apparel? (Choose only one)		
	Frequency	Valid %
Up to R500	100	40%
R501 or more	150	60%
Total	250	100%

5.4. T-test analysis

For the purpose of this study, actual use was represented as five unique binary categorical outcomes. Therefore, the proposed model in this study was analysed using a *t*-test analysis to establish the significance of the proposed relationships. The results of the *t*-test for each of the five constructs are as follows. For construct AU1 (i.e., “When last did you use a mobile shopping app to purchase athleisure apparel?”), the *p*-values for habit and behavioural intention were 0.000 and 0.012 respectively, both below 0.05, indicating that these constructs exerted an influence on the last time consumers used their mobile shopping apps to purchase athleisure apparel. For construct AU2 (i.e., “How many athleisure apparel items did you purchase during this time?”), the *p*-value for behavioural intention was 0.003, also below 0.05, indicating an influence on the number of athleisure apparel items consumers purchased. For construct AU3 (i.e., “In general, how much time do you spend shopping for athleisure apparel via mobile shopping apps per week?”), the *p*-value for facilitating conditions was 0.004, less than 0.05, indicating that this construct exerted an influence on the amount of time consumers spent shopping for athleisure apparel items. For construct AU4 (i.e., “On average, how many different mobile shopping apps do you visit in a given month?”), the *p*-values for habit and behavioural intention were 0.003 and 0.031 respectively. Both were below 0.05, indicating that these constructs exerted an influence on the number of mobile shopping apps consumers used to purchase athleisure apparel. Lastly, for construct AU5 (i.e., “What was the approximate rand value of your most recent purchase of athleisure apparel?”), the *p*-value for behavioural intention was 0.019. This was also below 0.05, indicating that behavioural intention influenced the rand value consumers spend when shopping for athleisure apparel items.

5.5. The influence of facilitating conditions on actual use as a binary categorical outcome construct

Hypothesis H_{1C} is accepted, with H_{1A}, H_{1B}, H_{1D}, and H_{1E} being rejected. Facilitating conditions were found to have a borderline significant influence on the amount of time spent shopping for athleisure apparel via mobile shopping apps per week. It can be inferred that, if consumers have a working Internet connection to access and use the mobile shopping app, as well as access to online customer support, more time will be spent shopping for athleisure apparel via mobile shopping apps per week. This finding is supported by Chawla and Joshi (2019) and Liang, Lee and Workman (2022), who stated that in a retailing and financial services context facilitating conditions influence consumers' online behaviour.

5.6. The influence of habit on actual use as a binary categorical outcome construct

Hypotheses H_{2A} and H_{2D} are accepted, while H_{2B}, H_{2C} and H_{2E} are rejected. The data revealed that habit has a significant influence on when last consumers used a mobile shopping app to purchase athleisure apparel. It can be inferred that habitual m-commerce app use influences usage recency. Moreover, habit shows a borderline significant influence on the number of mobile shopping apps visited in a given month. Consequently, habitual m-commerce app use influences the number of m-commerce apps used per month. Thusi and Maduku (2020) concurred, stating that habit has a direct and pertinent influence on individual usage of mobile apps in a retail banking context.

5.7. The influence of behavioural intention on actual use as a binary categorical outcome construct

Hypotheses H_{3A}, H_{3B}, H_{3D}, and H_{3E} are accepted, but H_{3C} is rejected. The data revealed that behavioural intention has a significant influence on the last time consumers used a mobile shopping app to purchase athleisure apparel. In addition, behavioural intention was found to influence the amount of athleisure apparel items purchased, indicating that the more intent consumers have to purchase athleisure apparel via m-commerce apps, the greater the number of items they will purchase. Results further indicated that behavioural intention influenced the amount of mobile shopping apps visited in a given month. And finally, behavioural intention was shown to significantly influence the approximate rand value of athleisure apparel purchases, indicating that the greater the consumer's intent to purchase, the greater the amount spent. This finding is supported by Warganegara and Hendijani (2022), who found that behavioural intention positively and significantly influences consumers' actual use in an online grocery retailing context.

Table 8 provides insight into the findings with respect to the hypotheses formulated for the study. Seven hypotheses can be supported. Based on these findings, nomological validity is also evident.

Table 8: Hypothesis Testing

Hypothesis	Variable	Variable	Sig.	Finding
H _{1A}	Facilitating conditions	Actual use 1	0.078	Rejected
H _{1B}	Facilitating conditions	Actual use 2	0.093	Rejected
H _{1C}	Facilitating conditions	Actual use 3	0.004	Accepted
H _{1D}	Facilitating conditions	Actual use 4	0.983	Rejected
H _{1E}	Facilitating conditions	Actual use 5	0.757	Rejected
H _{2A}	Habit	Actual use 1	0.000	Accepted
H _{2B}	Habit	Actual use 2	0.422	Rejected
H _{2C}	Habit	Actual use 3	0.673	Rejected
H _{2D}	Habit	Actual use 4	0.003	Accepted
H _{2E}	Habit	Actual use 5	0.285	Rejected
H _{3A}	Behavioural intention	Actual use 1	0.012	Accepted
H _{3B}	Behavioural intention	Actual use 2	0.003	Accepted
H _{3C}	Behavioural intention	Actual use 3	0.134	Rejected
H _{3D}	Behavioural intention	Actual use 4	0.031	Accepted
H _{3E}	Behavioural intention	Actual use 5	0.019	Accepted

6. Discussion

From an academic contribution perspective, similar studies in emerging African economies like South Africa have not yet been conducted, thus this study adds to the existing body of knowledge. The separation of the actual use construct into five constructs represents a further contribution to academic literature for the application of the UTAUT2 in emerging African economies, such as South Africa. Based on the low, unsatisfactory internal consistency achieved for this construct (Cronbach's alpha = 0.377; refer to Table 5), it was not possible to work with this construct as a latent construct made up of five items. This was because the various items did not constitute a single construct. Consequently, the study was adjusted to represent the actual use construct as five unique binary categorical outcomes. Both habit and behavioural intention were shown to exert an influence on when consumers last used a mobile shopping app to purchase athleisure apparel (AU1). Behavioural intention was shown to have an influence on the amount of athleisure apparel items purchased (AU2). Facilitating conditions were found to influence the amount of time spent shopping for athleisure apparel via mobile shopping apps per week (AU3). Both habit and behavioural intention were shown to influence the number of mobile shopping apps visited in a given month (AU4). Finally, behavioural intention was shown to exert an influence on the approximate rand value of athleisure apparel purchases (AU5). From an industry contribution perspective, the findings of this study make a significant contribution to mobile shopping literature in South Africa. There is limited research in the field of m-commerce in emerging African economies like South Africa (Magan, 2016). The data gathered from this study shed light on m-commerce and provide South African business owners with a more in-depth understanding of the factors that drive consumers to purchase athleisure apparel.

7. Managerial Implications

The results from this research can assist m-commerce app owners and developers in adjusting their strategies for success. The constructs and the relevant managerial recommendations are discussed in the subsections that follow.

7.1. Facilitating conditions

This study found a positive relationship between facilitating conditions and the amount of time spent shopping for athleisure apparel via mobile shopping apps per week. Hence, elements, such as an available Internet connection to access and use the mobile shopping app as well as the availability of online customer support, will lead to increased time being spent shopping via mobile shopping apps per week (Miladinovic & Xiang, 2016). To exploit this phenomenon, m-commerce app owners can implement zero-rate data usage for their apps, ensuring consumers do not incur any data costs while

using the apps (Yang, 2010). Another element of facilitating conditions that has been reported as significant is the speed in app response time. Slow response times have been shown to have a severe negative impact on customer experience. Designing a small, compressed app with a fast response time will allow users to browse the app quickly and efficiently, creating a positive customer experience. Lastly, chatbot technology is able to provide customers with automated, personalised service anywhere, at any time, and at a much lower price than employing a team of customer service representatives. M-commerce app owners can leverage chatbot technology to assist customers with their service enquiries.

7.2. Habit

The results of this study provide evidence of a positive relationship between habit and when consumers last used a mobile shopping app as well as the number of mobile shopping apps visited in a given month. Consumers are more likely to frequently use m-commerce apps or various other apps if they have already formed habitual behaviour of shopping via their mobile phones (Alalwan et al., 2018). Developers could reference the design thinking applied in top-downloaded and most-used apps to ensure the app feels familiar and intuitive to users. This will ensure the design of an easy-to-use, intuitive app whose usage will become routine and habitual far more quickly (Miladinovic & Xiang, 2016). Additionally, habitual behaviour can be encouraged through the creation of a rewards programme, where frequent app users are incentivised for continued usage. Increased app usage frequency leads to the creation of habit, which bolsters behavioural intention (Miladinovic & Xiang, 2016). M-commerce app owners and developers can also segment the user base into groups and send tailored offers, personalised discounts, and new product announcements. Users can be alerted to these offers, discounts, and rewards by means of push notifications via the app, which will encourage repeat use.

7.3. Behavioural intention

The results of this study confirm a positive relationship between behavioural intention and when consumers last used a mobile shopping app as well as the number of mobile shopping apps visited in a given month, the amount of athleisure apparel items purchased, the number of mobile shopping apps visited in a given month, and the approximate rand value of these purchases. A number of recommendations can be provided to assist managers operating in this space to exploit this finding to their full advantage. M-commerce app owners or developers could design their shopping apps to leverage smartphone capabilities to the fullest, thereby increasing utility for the consumer. In addition, it is imperative that m-commerce app owners or developers design apps with the smartphone screen size in mind. Given the small screen size, the app experience should be carefully thought out and designed, allowing for simple browsing and navigation by one hand and one thumb only (Hew, Lee, Ooi & Wei, 2015; Persson & Berndtsson, 2015; Yang, 2010). Moreover, consumers' behavioural intention can be reduced if a particular app is prone to errors or technological breakdowns (Chaouali et al., 2016). It is vital that m-commerce app owners and developers guarantee their apps are built with stability in mind and are able to handle large volumes of customers at the same time to ensure the app is available at all times (IBM, 2020). M-commerce app owners and developers should regularly release new and improved functionalities on the app, enticing existing customers to make repeat use of it and encouraging new customers to download it (Chopdar et al., 2018). An example of this includes improving convenience by allowing quicker payment (Chaouali et al., 2016). M-commerce app owners and developers may also incorporate customer reviews into apps, allowing customers to rate their overall experience and provide suggestions for improvement. Reviews have increased in popularity and trustworthiness over the last few years, and have been shown to exert significant influence over consumers' purchasing decisions (Li, Xie & Zhang, 2020; Oliveira, Thomas, Baptista & Campos, 2016; Xu, 2020; Yang, 2010).

8. Conclusion

This study successfully utilised the UTAUT2 of Venkatesh et al. (2012) as the foundation model to determine the constructs that influence consumers' actual use of m-commerce apps to purchase athleisure apparel in South Africa. The findings from the research model augment the existing body of knowledge in mobile shopping, shedding light on mobile shopping via apps in emerging markets like

South Africa. The insights gained from this study provide South African business owners with a more in-depth understanding of the factors that drive consumers to purchase athleisure apparel. Nevertheless, the study has certain limitations that can be addressed in future research. The majority of the sample (76.6%) was below the age of 30, an age group classified as millennials and the research findings are limited to this cohort in South Africa. In addition, the entire sample was drawn from the province of Gauteng, specifically the cities of Johannesburg and Tshwane. Even though Gauteng is home to the largest percentage of online shoppers in South Africa (43%), the Western Cape and KwaZulu-Natal could also be included as the next two largest provinces (Effective Measure, 2017). Future research could extend age and location to target the more general South African, thereby providing more accurate generalised data for the broader South African population (Chopdar et al., 2018; Yang, 2010). Many studies applying the UTAUT2 have only focused on consumers' behavioural intention, not actual use (Chaouali et al., 2016; Gupta et al., 2018; Hew et al., 2015; Madan & Yadav, 2016; Miladinovic & Xiang, 2016; Shaw & Sergueeva, 2019; Verkijika, 2018). This study examines consumers' actual use of m-commerce apps to purchase athleisure apparel. Future research could extend the model even further by investigating continued usage to better understand loyalty and return behaviour (Chong, 2013). Finally, since this study was cross-sectional in nature, a longitudinal study could provide additional insights for researchers and industry, as it would evaluate the changes in consumers' behaviour over time (Bashir & Madhavaiah, 2015; Chaouali et al., 2016; Chopdar et al., 2018; Farivar, Turel & Yuan, 2017; Hew et al., 2015; Verkijika, 2018).

The Leverage of Marketing Communication Opportunities by Using Facebook in Faculties at a Selected Comprehensive University

Tamara Francis¹, Prof. Mornay Roberts-Lombard^{2,*}, Geoff Goldman³

¹⁻³ Department of Marketing Management, University of Johannesburg, Johannesburg, South Africa

Keywords

Facebook; university; higher education institutions; faculties; risks; challenges

Abstract

The purpose of the study was to identify how to leverage marketing communication opportunities by using Facebook in faculties at a selected comprehensive university in South Africa. The study applied the Morse and Field approach and the sample included all faculty marketing managers of the selected comprehensive university. It was established that there is a lack of uniformity among all Facebook pages of the eight faculties at the selected comprehensive university. It is recommended that faculty staff attend a compulsory social media rules and regulations information session at the selected university, which will educate them regarding Facebook etiquette within a personal and professional capacity.

1. Introduction

Social media has become one of the main channels of communication and is slowly replacing traditional communication techniques. It can be described as a platform for people to share thoughts, ideas, and content online, as well as to build and maintain relationships (Enke & Borchers, 2021). Jordan and Weller (2018) and Mishra (2020) stated that there are numerous social media platforms that support various types of interactions. For instance, Facebook has pages that people “like”, Twitter involves followers and tweets, and YouTube allows individuals to upload and share videos.

Over the last decade, social networking has remarkably transformed the higher learning landscape. This new pathway of communication will continue to shape the higher education marketplace in the next 10 years (Chugh & Ruhi, 2018). As students increasingly use computers, tablets, smartphones, and other mobile devices in their day-to-day lives, their expectations of how universities and lecturers should communicate and engage with them have changed (Beauchamp & Nolin, 2012; Dismore, Turner & Huang, 2019; Scull, Phillips, Sharma & Garnier, 2020). According to Head, Wihbey, Metaxas, MacMillan and Cohen (2018), prospective students today gather required information by chatting with current students about their experiences at university. Furthermore, faculty administrators and marketers are always exploring new avenues to engage current and prospective university students through Facebook and other social networks (Raza, Qaza, Shah, Qureshi, Qaiser & Ali, 2020; Shields & Peruta, 2019).

Potential and existing students in the South African higher education environment spend a lot of time on Facebook. As a result, it would be beneficial for higher learning institutions to utilise Facebook for marketing and communication purposes. This is especially relevant as university students are devoted users of various social platforms, such as Facebook and Twitter. Universities have to face the challenges associated with serving a new type of university student – one who has grown up with and is proficient at technology and social media (Beauchamp & Nolin, 2012; Dismore et al., 2019). Consequently, it becomes increasingly important for universities to determine how faculties within a higher education institution in South Africa, such as the selected comprehensive university, utilise this social media platform as a marketing communication tool, especially when considering that this

² E-mail address: mornayrl@uj.ac.za

³ E-mail address: ggoldman@uj.ac.za

platform should be incorporated into all faculty marketing strategies. This study:

- Explores the different risks incurred by faculties at the selected comprehensive university when hosting a faculty Facebook page;
- Explains the challenges of managing faculty Facebook pages at the selected comprehensive university; and
- Identifies the support required by faculties of the selected comprehensive university for Facebook efforts.

To the authors' best knowledge, no similar study has explored how faculties within a comprehensive university or universities in South Africa use Facebook as a marketing and communication tool. Facebook is an ideal platform for marketers at the selected comprehensive university to utilise as a marketing communication tool for the institution. In this context, the main aim of this paper is to understand how different faculties at the selected comprehensive university use Facebook as a marketing and communication tool. This paper contributes to the body of knowledge on Facebook usage within universities and can assist higher education institutions to better understand how to use Facebook as a marketing and communication tool. This paper starts with an orientation towards the literature review that grounds the study, followed by the study's methodological process, findings, theoretical and practical contributions, and recommendations.

2. Theoretical Framework

Social media is a major evolution in online marketing communication. If organisations proactively engage, connect, and share information online, this platform of digital communication has the potential to create long-term customers (Assaf, Noormohamed & Saouli, 2012).

2.1. A perspective on the selected comprehensive university

According to Why Joburg (2011), this study's selected comprehensive university – one of the largest residential universities in South Africa – came into existence when three previously independent institutions of higher learning merged in 2005, namely the Rand Afrikaans University, the Technikon Witwatersrand, and the Soweto Campus of Vista University. The selected comprehensive university has eight faculties and offers a range of undergraduate and postgraduate programmes. In 2019, the university had approximately 53 000 students enrolled in the institution and 2 942 permanent staff members (University of Johannesburg, 2019).

2.2. Social media and the millennial generation

Millennials are digital natives, as they are the first generation to experience most of their lives online, particularly through social networks (Akkucuk & Turan, 2015; Charrier, 2016; Munsch, 2021). Bentley, Chu, Nistor, Pehlivan and Yalcin (2021) and Fulton and Kibby (2017) stated that millennials are more engaged, visual, and vocal, and are not passive readers of content, but will interact by posting, blogging, and pinning content. Moreover, this generation frequently uses social media and enjoys sharing activities of their daily lives on these social platforms (Jacobsen & Barnes, 2017; Kijek, Angowski & Skrzypek, 2020). Vasquez and Wadlinger (2016) asserted that 85% of millennials have indicated that they research new products and services via search engines, websites, and social media, with Facebook being the primary choice for a social channel, followed by YouTube.

2.3. Facebook as a social media tool

Mark Zuckerberg founded Facebook in 2004. It was originally named "thefacebook.com" and was intended to be a closed online social network for Harvard University staff and students. Access to Facebook was extended to universities and companies, such as Apple and Microsoft, and has developed globally into one of the most used social media platforms (Karapanos, Teixeira & Gouveia, 2016; Phillips, 2007). According to Latka (2014), 30 million businesses globally are active Facebook users with fan pages, 1.5 million businesses spend money on advertising on Facebook, and 829 million people use Facebook daily, which is an increase from 802 million users in 2013. World Wide

Worx (2015) reported that 93% of the major South African brands use Facebook, 79% use Twitter, and 46% use YouTube for marketing communication activities.

Facebook launched various new features in November 2007, including the possibility of creating Facebook “pages”, which allowed universities and schools to create a presence for their various institutions and recruit fans (page likes) on the social networking site (Joly, 2008; Pinzaru & Mitan, 2013; Sarapin & Morris, 2015). As per Meta for Business (2013), one of the new features for Facebook is mobile applications. These new features can assist businesses with acquiring new users and driving awareness, and may benefit the businesses by increasing engagement on the mobile app. There are also different ways in which Facebook groups can be appropriated – for example, Facebook could be a relationship-building tool or a problem-solving tool. For a group to utilise Facebook as a problem-solving tool, members of the various groups should be willing to interact and help others within the group. Moreover, these platforms could assist in nurturing relationships between students and educators (Lee, Hosanagar & Nair, 2018; Zulkifli, Abd Halim, Yahaya & Van der Meijden, 2021). Numerous scholars (e.g., Moghavvemi, Sharabati, Paramanathan & Rahin, 2017; Zaremohzabieh, Samah, Omar, Bolong & Kamarudin, 2014) affirm that university students are among the most vigorous users of Facebook. The platform is changing the future of communication and how students use this platform, which is something that universities should pay attention to (Raza et al., 2020; Shiau, Dwivedi & Lai, 2018).

2.4. The selected comprehensive university’s usage of social media focusing on Facebook

According to Kitchin (2016), the selected comprehensive university currently uses a few main social media platforms, namely LinkedIn, Twitter, Instagram, and Facebook, with the latter being one of the strongest and most significant platforms used. When interviewed on 28 September 2019, Radikariki (2019) shared that the selected comprehensive university was advancing swiftly with the utilisation of Facebook, compared to competitors in South Africa. The reason being that the institution is aware of and understands the significance of the efficient usage of social media, and takes every opportunity to enhance its efforts in this regard. Gugulethu (2019), also interviewed on 28 September 2019, stated that the university was advancing by identifying and keeping up with social media trends globally and nationally. The selected comprehensive university also employs staff and equips staff with the skills required to have a successful social media presence. Moreover, the university ensures that it has an account for all the popular platforms, which allows the institution to engage with students and other stakeholders on various platforms. The benefits for the university are that it is ahead of its competitors in this regard, students (customers) and all relevant stakeholders can communicate with or receive information from the institution on numerous platforms, and information is accessible and easy to find (Radikariki, 2019).

3. Problem Statement and Research Questions

It is evident from the literature review that social media platforms, such as Facebook, have become a fundamental aspect for marketing communication at the selected comprehensive university, as this is the platform that the university presently uses to engage with different role players. However, these social media platforms provide risks and challenges to marketers, as not all faculties within the selected comprehensive university use them effectively. If used appropriately and effectively, the social media platforms could provide opportunities for growth and new adaptive marketing strategies within the various faculties of the university. Therefore, the following two research questions need to be asked:

- What are the risks and challenges encountered by the various faculties that use Facebook within the selected comprehensive university?
- How can Facebook be used to leverage marketing communication opportunities in faculties at the selected comprehensive university?

An understanding of these two questions will assist with the successful application of this social media platform. In addition, it will contribute to providing guidelines on how Facebook could be incorporated efficaciously into the respective marketing strategies of the different faculties at the selected comprehensive university.

4. Research Methodology

4.1. Research design

This study applied a qualitative research methodology, since the aspects investigated were exploratory and interpretive in nature. The study flows from the master's dissertation of Tamara Keshnee Morgan (married surname is Francis), titled "The utilisation of Facebook as a marketing communication tool within university faculties". The co-authors on this paper were the supervisors of the study. As the research study's topic required the researchers to use a small sample and be concerned with the context in which events are taking place, an inductive approach was used. This approach focuses on obtaining a better feel for what is going on to comprehend the problem more clearly (Saunders, Lewis & Thornhill, 2012). Qualitative data analysis is an inductive process (Creswell, 1994). In this study, the text used for coding was the participants' feedback. The research study utilised an exploratory research design, since it is textual, visual or oral, and not characterised by numbers (Zikmund & Babin, 2013). The study followed a qualitative approach, as the researchers wanted to understand the context of how faculties within a selected university use Facebook as a marketing communication tool. Moreover, a qualitative approach was selected as the study investigates the nature of faculty managers' experiences with the phenomenon and the researchers wanted to obtain a deeper understanding of this phenomenon.

4.2. Target group and sample design

The study's population was the marketing coordinators who manage the Facebook pages of the selected university. The population members had to adhere to specific specifications to participate – that is, they had to be marketing coordinators who manage their faculty Facebook pages. From an ethical perspective, the participants in the study were unknown to the researchers. Furthermore, the marketing coordinators of the different faculties at the selected university provided their written consent to participate in the study. A census approach was used to survey the sample frame, given that the marketing coordinator population is small and each of these employees could be contacted with ease at a low cost. A census is defined as a research method that includes data from each member of the defined population (Hair, Page & Brunsveld, 2019). The researchers conducted in-depth interviews with the different marketing coordinators of the eight faculties at the selected university. Table 1 reflects the sampling plan of the study.

Table 1: Sampling Plan

Design elements	Application to the study
Target population	Marketing coordinators who manage the Facebook pages of the selected university
Sampling frame	Marketing coordinators who specifically manage the faculty Facebook pages within the selected university
Sampling method	A census was conducted
Sampling element	Marketing coordinators of the faculties of the selected university
Sample size	Eight respondents

Fusch and Ness (2015) asserted that data saturation is reached when there is enough information to duplicate the study, when the ability to obtain new information has been attained, and when further coding is no longer feasible. The researchers conducted the interviews and analysed the data. Although data saturation was reached before all eight interviews were finished, the researchers decided to continue and complete eight interviews to determine if new themes emerged.

4.3. Research analysis

This study used an explorative design, utilising the Morse and Field (1996) approach to analyse the qualitative data, as other researchers have applied this approach in the disciplines of management and marketing academic work before (Maritz, 2012). The four steps of the Morse and Field (1996) approach – namely to comprehend, synthesise, theorise, and recontextualise – were applied to this study. De Vos, Strydom, Fouché and Delpont (2011) stated that data analysis in qualitative research is not followed in a linear approach, but rather in a spiral image. The four Morse and Field (1996) processes for analysing qualitative data are explained in detail next.

4.3.1. Comprehend

Qualitative researchers endeavour to make sense of the data. As soon as researchers comprehend what is going on, they are able to better understand the phenomena. Once saturation has been reached, comprehension is completed (De Vos, 1998; Morse & Field, 1996).

4.3.2. Synthesise

The process of synthesising is when the data are sifted through and the pieces are inductively put together. At this point, the researchers are able to get a sense of what is common with regard to the phenomena. At the end of this process, researchers can make statements about the study's participants and phenomena being examined (De Vos, 1998; Morse & Field, 1996). One interpretation group with three subgroups were identified in this study, as illustrated by Table 2.

Table 2: Interpretation Group

Interpretation group	Interpretation subgroup (a)	Interpretation subgroup (b)	Interpretation subgroup (c)
Leverage marketing communication opportunities	Risks	Challenges	Support

4.3.3. Theorise

This step involves arranging the data in a systematic way. The researchers selected various models so that the data could fit into a body of knowledge. This takes place until the best solution for the data is found and alternate explanations are constructed (De Vos, 1998; Morse & Field, 1996).

4.3.4. Recontextualise

During the last step, recontextualise, the theory from step three is transformed to be used in other literature, settings, and populations. Therefore, it is said that the theory is recontextualised into other settings (De Vos, 1998; Morse & Field, 1996). Each interview was recorded using a digital voice recorder and field notes were taken. Hereby, the data are saved in electronic and paper-based formats. Table 3 illustrates the linkage between the interpretation group, the research method, the research questions used, and the relevant research objective(s).

Table 3: Linkage between Interpretation Group, Research Questions, and Objective(s)

<p>Research method: Interviews</p> <p>Research questions:</p> <ul style="list-style-type: none"> • What are the risks and challenges encountered by the various faculties that use Facebook within the selected comprehensive university? • How can Facebook be used to leverage marketing communication opportunities in faculties at the selected comprehensive university? <p>Research objectives:</p> <ul style="list-style-type: none"> • To identify how to leverage marketing communication opportunities by using Facebook in faculties at the university. • To provide guidelines on how to effectively use Facebook as a marketing communication tool for faculties within the selected comprehensive university. 			

According to Lincoln and Guba (1985), the qualitative researcher should employ strategies to ensure that the qualitative data are good quality using the following four criteria:

- *Credibility*: This was established during the interviewing process, transcribing, coding, and analysing of the data. A pilot study was also conducted on three of the selected participants, as members of the population. This enabled the researchers to test the interview before conducting the formal interviews on the selected participants. Conducting a pilot test amongst the selected respondents ensured the trustworthiness of the research study.
- *Dependability*: The findings from this study can be applied to other research subjects in similar contexts and will produce similar results.
- *Transferability*: This refers to how the research findings can be projected to the population. Transferability is particularly important to this study, as social media usage is steadily growing in South Africa and marketers of other educational institutions could use this study as a baseline of how Facebook is used as a marketing and communication tool by a higher education institution.
- *Conformability*: A digital voice recorder was used so that there would be sound evidence of how conclusions and recommendations were made.

5. Results and Discussion

The results obtained from the respondents during the interviews were analysed and formulated to reflect the main categories/themes that emerged. All participants were eager in their responses and gave strong feedback.

5.1. Interpretation group – Leverage marketing communication opportunities

5.1.1. Interpretation subgroup (a) – Risks

Theme 1: Risks incurred by faculties when hosting Facebook pages

Interpretation subgroup (a) looks at the risks involved for each faculty having its own Facebook page. The respondents identified the following risks:

- “Staff or students sharing their personal opinions on the faculty page, which may seem like it’s the opinion of the faculty and not the individual that posted the information” (Respondent 1).
- “No control over who posts information on the pages, there isn’t any way to verify the authenticity of user accounts” (Respondent 5).
- “Angry students will use the page as a platform to share their opinions, which may be negative for the faculty and university brand/image” (Respondent 2).

- “Hacking into the faculty Facebook accounts and sharing negative information” (Respondent 8).
- “Facebook followers tagging the page in content that is not suitable for the university” (Respondent 4).
- “Lack of brand consistency across the various pages. The university seems disjointed” (Respondent 6).
- “There is no uniformity among faculty pages” (Respondent 3).

The researchers asked the respondents if they know what to do if someone posted negative information on their page. Only one of the eight respondents replied positively, merely because of having attended a Facebook training session at a previous place of employment. The other respondents stated that they were unsure of what to do. The quotes in Table 4 highlight the responses from respondents when asked what they thought the risks were of the faculty having a Facebook page.

Table 4: Quotes Concerning Risks of the Faculty Having a Facebook Page

Quotes from respondents when asked what they thought the risks were of the faculty having a Facebook page
“I think that we have had an informal session, not formal sessions and really how to handle the situation, so luckily I haven't been confronted [with] something really serious” (Respondent 1).
“It's quite tough and would need someone with online reputation management” (Respondent 5).
“I think that I am equipped to handle it, just take it as someone walking through that door” (Respondent 7).

Respondent 7 stated that dealing with negative information on the faculty Facebook page would be the same as dealing with someone who walked through the door. This statement reveals the lack of knowledge that Facebook page managers have with regard to responding to negative information. When someone walks through the door, people can assess the situation from the individual's tone of voice and body language. In addition, they are able to discuss the issue at length with the specific individual within the confinement of the office. Dealing with an online situation does not allow a person to assess the situation. In fact, by the time the information is read, it has already been made public and is on the Facebook timeline. Consequently, handling an online query is very different from handling a query with someone standing in your office.

According to Respondent 5, managing a situation where someone posted negative information on the Facebook page would require the skills of an online reputation manager. Conversely, Respondent 8 stated that they would not respond, but instead would send the query through to the social media office of the selected comprehensive university. This statement again underlines the lack of skills of the Facebook page managers, as ignoring the negative information on the Facebook page and waiting for the university to respond allows the information to be shared and disseminated to more people, causing a greater risk concerning the circumstances.

5.1.2. Interpretation subgroup (b) – Challenges

Theme 2: Challenges of managing faculty Facebook pages

This section of the in-depth interview discussed what challenges the respondents encountered with managing the various faculty Facebook pages. Some of the challenges identified by the respondents included:

- Inability to pay to advertise on Facebook;
- Inability to answer non-marketing-related administrative queries that come through on the page;
- Difficulty getting audiences to engage with content on the Facebook pages;
- Working in isolation of other faculties as well as the main university page of the selected comprehensive university;
- Lack of content to post;
- Getting more likes on the page.; and
- Lack of knowledge regarding the university's strategic plan for social media.

The quotations highlighted in Table 5 indicate the challenges respondents felt they face when using Facebook for their faculties.

Table 5: Quotes Concerning Challenges of the Faculty when Using Facebook

Quotes from respondents when asked what they thought faculty’s challenges were when using a Facebook page
“I think the challenge is doing advertising via Facebook, so how do we pay for this because working with the main system of the selected comprehensive university is difficult, how do I get this payment through so I can’t really do Facebook; it’s just a schlep” (Respondent 1).
“Fully engaging with our audiences” (Respondent 2).
“Challenges I think is that we work in isolation when it comes to Facebook” (Respondent 3).
“I think that one potential challenge would be the lack of content of post” (Respondent 4).

Respondent 1 indicated that one of the challenges is that the university procurement system does not allow for the payments of online advertising platforms, such as Facebook. Contrastingly, Respondent 2 said that the faculty’s main challenge is that they are powerless and can do nothing with regard to fans engaging with their audiences. Their audiences do not comment, share or respond to the information shared on the faculty Facebook page. However, Respondent 4 was of the opinion that the challenge is not getting audiences to engage with posts, but rather being able to find suitable and sufficient content to post. Lastly, Respondent 3 found that the challenge is that each faculty within the university works in isolation. There are eight faculties, each posting its own Facebook content, at its own frequency, with no link to any other page of the selected comprehensive university. This highlights the lack of collegiality among the faculties at the university.

5.1.3. Interpretation subgroup (c) – Support provided

Theme 3: Support required by faculties for Facebook efforts

In the interviews, the respondents were asked how they thought the selected comprehensive university could better support faculties’ Facebook efforts. The main themes from this discussion are highlighted in a word cloud in Figure 1 and included:

- Procurement – The selected comprehensive university should modify its procurement processes to allow for the payment of online platforms like Facebook.
- Shares – The selected comprehensive university should share faculty information on its main Facebook page.
- Uniformity – There should be policies within the university that ensure uniformity among faculty Facebook pages.
- Artwork – Corporate artwork should be provided to faculties by the university, which could be used on the faculty Facebook pages and posts.
- Training – All Facebook page managers should be sent on training.

Figure 1: Main Themes
Source: Researchers' own construct

The general consensus among the respondents was that the university could better support faculties by providing formal training on how to manage their Facebook pages. Topics for the training could cover aspects like how to advertise on Facebook, what to do should negative information be posted on the Facebook page, general information concerning Facebook usage, and how to manage the university page. Respondents further stated that the university could provide funds to faculties for advertising on Facebook and that the university should simplify the payment processes related to paying for online advertising. Another point raised was that the selected comprehensive university should share the university social media strategy with all the faculties, so that faculty marketers can align faculty Facebook activities to the overall social media strategy of the selected comprehensive university. All departments, faculties, and entities of the university should be working towards the same strategic goals. The marketing and communication strategy of the selected comprehensive university should filter into the faculty strategy to ensure that all goals of the institution are aligned. This is difficult to accomplish if the institution does not share the university social media strategy with the faculties. The following quote from Respondent 8 highlights the fact that the faculties have no access to the social media strategy of the selected comprehensive university: “By giving us their social media strategy so that we can base ours on theirs and then we are all more or less doing the same”.

5.1.4. Summary of findings from interpretation subgroups 1(a), 1(b), and 1(c) (themes 1–3)

To summarise the findings, there are many risks involved with faculties having their own Facebook pages. These include the lack of uniformity among all the Facebook pages of the eight faculties at the selected comprehensive university, people posting content that may not be suitable on the pages, and students using these pages as a platform to vent their anger. Two of the main challenges that the marketers face are they are unable to pay for advertising on Facebook and have to respond to administrative queries. This section also discussed the support that the university could provide to assist faculties with their Facebook marketing efforts. A summary of the findings of the results is presented in Table 6.

Table 6: Summary of Interpretation Subgroups (a), (b), and (c) with Themes Identified

Theme 1: Risks incurred by faculties when hosting Facebook pages			
Theme 2: Challenges of managing faculty Facebook pages			
Theme 3: Support required by faculties for Facebook efforts

Leverage marketing communication opportunities	Risks incurred by faculties when hosting Facebook pages	Challenges of managing faculty Facebook pages	Support required by faculties for Facebook efforts
Main findings	<p>There are many risks involved in each faculty within the selected comprehensive university managing its own Facebook page, including:</p> <ul style="list-style-type: none"> • “Staff or students sharing their personal opinions on the faculty page, which may seem like it’s the opinion of the faculty and not the individual that posted the information” (Respondent 1). • “No control over who posts information on the pages, there isn’t any way to verify the authenticity of user accounts” (Respondent 6). • “Angry students will use the page as a platform to share their opinions, which may be negative for the faculty and university brand/image” (Respondent 5). • “Hacking into the faculty Facebook accounts and sharing negative information” (Respondent 4). • “Facebook followers tagging the page in content that is not suitable for the university” (Respondent 8). • “Lack of brand consistency across the various pages. The university seems disjointed” (Respondent 2). • “There is no uniformity among faculty pages” (Respondent 1). <p>Facebook page managers face various challenges, identified as:</p> <ul style="list-style-type: none"> • Inability to pay to advertise on Facebook; • Inability to answer non-marketing-related administrative queries that come through on the page; • Difficulty getting audiences to engage with content on the Facebook pages; • Working in isolation of other faculties as well as the main university page; • Lack of content to post; • Getting more likes on the page; and • Lack of knowledge regarding the university’s strategic plan for social media. <p>Facebook page managers could be supported by the selected comprehensive university as follows:</p> <ul style="list-style-type: none"> • Procurement – The selected comprehensive university should modify its procurement processes to allow for payment of online platforms like Facebook. • Shares – The selected comprehensive university should share faculty information on its main university Facebook page. • Uniformity – There should be policies within the university that ensure uniformity among faculty Facebook pages. • Artwork – Corporate artwork should be provided by the university to faculties. • Training – All Facebook page managers should be sent on training. 		

6. Importance of the Research Study

Marketing is vital in any organisation. For universities to survive and succeed in this environment, marketing should be a key aspect in their strategies. The marketing environment has changed with the inclusion of social media. Such a change has not eluded the higher education sector and it is important for the sector to come on board as new generations require a new form of communication (Farinloye, Wayne, Mogaji & Watat, 2020). Higher education institutions are making greater use of social media

and digital media platforms, such as YouTube, Facebook, Twitter, and podcasts, to market their programmes, as they realise the value of these platforms.

The findings of the study established that prospective students in South Africa can also obtain information about the university they are interested in by contacting current university students and discussing their living, learning, and engaging experiences. Traditionally, word of mouth plays a strong role in higher education marketing, but new ways need to be considered to engage prospective students by using social media as a communication medium. Social media offers universities globally valuable instruments to better communicate with the various target groups. The main advantage of using social media is the possibility to obtain feedback and actively engage with the consumer. Furthermore, research has established that 91% of public universities in South Africa are on social media platforms, but do not have social media policies in place, with 61% not having any documentation drafted to manage social media within the institution (Struwig & Van den Bergh, 2016). Considering this, universities in South Africa need to become proactive and introduce systems to manage the potential risks of social media.

7. Managerial Implications

Various recommendations are provided to the selected university when using Facebook as a communication tool. For one, all faculty staff should attend a compulsory social media rules and regulations information session at the selected comprehensive university, which will educate staff on Facebook etiquette within a personal and professional capacity. Such training will also assist in mitigating the risk of staff sharing inappropriate content on Facebook within their professional and personal capacity. Moreover, the university could start a one-on-one training session – for example, staff can book a session (group or individual) on any Friday of the month between 08:00 and 12:00 – as an “educate yourself” campaign regarding the use of Facebook. Moreover, if faculty marketers are unsure of the validity of user accounts, information received from that account should be authenticated or deleted. An additional recommendation is that faculty marketers be sent on training that teaches them how to deal with angry students venting on their faculty pages. This training should also include topics like reputation management, how to calm an angry person on a digital platform, and procedures to follow when faced with a potential reputational risk.

It is recommended that faculty marketers frequently check their Facebook pages and the content being posted on the pages to avoid any unsuitable information being shared on these pages. To assist them, Facebook has a page manager app that can be installed on all mobile devices and linked to the faculty Facebook pages. The Facebook page manager app will send a notification as soon as someone likes, shares, or makes a comment on the page. In the event of negative information being shared on the page, the faculty Facebook page manager should respond in a calm and apologetic tone, making every effort to understand where the anger and frustration come from, thereafter making an effort to rectify the situation. If the content on the post is derogatory and unsuitable, the information should be deleted and a message sent to the person sharing the information. The message should clearly state that the faculty does not support the comments made, resulting in the content being deleted. If all of the above fail, the university social media team should be consulted to advise on the way forward.

Each faculty at the selected comprehensive university should have a dedicated administrative staff member available to assist faculty marketers in responding to the administrative queries received on Facebook. This administrative staff member will have access to the faculty Facebook page and respond to all administrative queries received on the page. Alternatively, the Facebook page manager can send all the queries to the administrator. These e-mails could be red-flagged and have the subject line of “Facebook”, so that the administrator knows that these e-mails should be responded to timeously for the faculties to maintain a 100% response rate on Facebook.

Lastly, the eight faculties at the selected comprehensive university should start paying for advertising on Facebook. This will create awareness for the faculty Facebook pages at the selected comprehensive university. In addition, paid advertising on Facebook will increase the number of faculty page fans, because the advert will direct traffic to faculty Facebook pages.

8. Conclusions and Limitations

The purpose of the study was to identify how to leverage marketing communication opportunities by using Facebook in faculties at a selected comprehensive university in South Africa. Considering the results, it can be argued that the main advantage of using social media is the possibility to obtain feedback and actively engage with the consumer. Furthermore, research has established that majority of public universities in South Africa are currently on social media platforms, but do not have social media policies in place, with almost two thirds not having any documentation drafted to manage social media within the institution. Consequently, universities in South Africa need to become proactive and introduce systems to manage the potential risks of social media. A limitation of the study is that it only included the faculty marketing coordinators of one university in South Africa. Although the results of this study are relevant, they should not be generalised on a national level.

Keywords

Small independent retailers; Online marketing; Internet; Social media; Digital marketing

Abstract

Background: The impact of online marketing strategies on the performance of small independent retailers forms a bridge between small independent retailers and consumers. Small independent retailers in South Africa face a challenge of building online relationships with their customers, which in turn has an impact on the performance of the business. Hence, the lack of online marketing activities causes failure to small independent retailers.

Objectives: The research seeks to establish whether online marketing strategies outcomes have an impact on the performance of small independent retailers. Internet, social media and digital marketing as part of online marketing were researched.

Method: The study employed a descriptive research methodology that involved a quantitative research design. The non-probability sampling method of convenience sampling was conducted using a convenience sample of three hundred small independent retailers in three townships in Soweto, namely, Meadowlands, Dobsonville and Protea North.

Results: The outcomes of the study established that of all the online marketing strategies only digital marketing was a significant determinant of small independent retailer's performance. A regression analysis assessed the impact of marketing communication strategies on the performance of small independent retailers. The results stipulated that online marketing strategies (digital marketing) influences the performance of small independent retailers, however, internet and social media do not predict performance.

Conclusion: In conclusion, the results of the conducted research established that online marketing strategies have an impact on the performance of small independent retailers.

1. Introduction

1.1. Problem Statement

The impact of online marketing strategies on the performance of small independent retailers is the focus of this article as they form a bridge between small independent retailers and consumers. Online marketing refers to instruments that are used to promote the products and services by means of the internet (Amondii, Senaji & Thuo, 2019). Marketing can be done by means of online marketing to enable them to communicate their products and services in the same way that many large businesses

² E-mail address: makhikm@unisa.ac.za

³ E-mail address: vscheml@unisa.ac.za

do (Rugova & Prenaj, 2016). Ghandour (2015) notes that small independent retailers are determined to invest in online marketing as a mean of doing business and have started to realise the function of online marketing (Ainin, Parveen, Moghavvemi, Jaafar & Mohd Shuib, 2015). The awareness of online marketing topics has increased amongst researchers in the internet technology field (Musa, Rahim, Azmi, Shibghatullah & Othman, 2016). Small independent retailers that implement online marketing would create advantages of raising outcomes, enhancing brand awareness and upgrading brand reputation (Musa *et al.*, 2016). Navrátilová and Milichovský (2015) discuss that online marketing allows small independent retailers to reach all customers through tablets, cell phones, laptops and improve all online marketing communication strategies on social media and websites where many campaigns can go viral. Online marketing has numerous media such as social media, websites, social networks, blogs and other channels people can interact online with whomever they need without any restrictions in terms of quality or quantity (Rugova & Prenaj, 2016).

Small independent retailers in South Africa face numerous challenges, such as lack of access to markets and the inability to build online relationships with their customers (Banking Association of South Africa, 2013). Esposito (2013) state that this limitation in online marketing strategies utilised by small independent retailers is due to a lack of marketing skills such as not having knowledge on how to advertise their products online. This statement is supported by Amondii *et al.* (2019) who highlight that South African small business failure is caused by lack of online marketing activities and skills. Existing studies on independent retailers have focused on the challenges impacting on the performance of small independent retailers in Soweto (Makhitha, 2016); examined the unique market offering of formal independent retail and wholesale small businesses in Soweto (Badenhorst-Weiss & Cilliers, 2014). The purpose of this study is to investigate the impact of online marketing strategies on the performance of small independent retailers in Soweto, South Africa. The topic of this study is of emergent importance to the country at large, as the small independent retailers play an important role to determine the future of South Africa's economic growth and development. Additionally, this study aims to show the small independent retailers to the topic of online marketing strategy if they have not yet been exposed to it, as this study aims to contribute to the knowledge regarding online marketing strategy within the small independent retail industry. In what follows in this article, the literature and hypothesis development based on relevant literature is presented before the methods and results of the survey conducted in Soweto.

1.2. Methodology

The quantitative approach using the survey method was used (Maree, 2014). In this study, the descriptive research design employed a cross-sectional design. The non-probability sampling method of convenience sampling was conducted using a convenience sample of 300 small independent retailers. The targeted respondents were conveniently selected in Soweto: 100 in Meadowlands, 100 in Dobsonville and 100 in Protea North. As a result, 300 questionnaires were distributed and 300 were usable, which represents a 100 percent response rate. Three field workers who were trained on how to collect the data were used to help with collecting data using a self-administered questionnaire.

The research variables used (internet, social media and digital marketing) were obtained from existing validated measures. Questionnaire items were adapted to suit the setting of the study from the studies of Soke (2014); Gaweseb (2015); Kallier (2016); Gabrielli and Balboni (2010); and Mokgoatlheng's (2013). Measurement were based on five-point Likert scale ranging from 'strongly disagree' (1) to 'strongly agree' (5), and a Likert scale ranging from 'never' (1) to 'always' (5), and nominal questions with a 'yes or no' answer. After the data was collected, the information from the questionnaires was firstly reviewed, then captured into a Microsoft Excel file, cleaned and transformed into useful and relevant information (Wiid & Diggines, 2015). Then the statistician imported the data into the statistical software package called SPSS version 25. Descriptive and regression statistics were used to determine the outcomes of online marketing strategies that have an impact on the performance of small independent retailers.

1.3. Hypotheses

The following hypotheses were formulated for the study:

- H₁: Internet has a positive influence on the performance of small independent retailers
- H₂: Social media has a positive influence on the performance of small independent retailers
- H₃: Digital marketing has a positive influence on the performance of small independent retailers

1.3.1. Hypotheses development

This section will develop the hypotheses of this article, namely internet, social media and digital marketing. For the purpose of this article, online marketing refers to internet, social media and digital marketing.

1.3.1.1. Internet and small independent retailers performance

The internet is seen as the leading advertising component of any business in today's world (Rugova & Prenaj, 2016). The internet is an important method to reach a larger number of customers, and is considered important to customers (Chu, Kamal & Kim, 2013). In contemporary businesses the internet and especially social media has a great influence, as it can be utilised to connect people around the world (Rugova & Prenaj, 2016). Musa *et al.* (2016) noted that the internet had contributed 41.7% towards the national economy per annum, with the possibility of rising in the following 3 years. The advance of the internet have contributed to online marketing (Riasi & Pourmiri, 2015). The successful implementation of the internet is seen as an essential issue that can warrant long-term growth of small independent retailers (Mason, 2015) as small independent retailers use the internet to communicate with their customers (Aggarwal, 2018).

Shakur, Hassan and Suk (2004) mention that internet shows a significant relationship with regard to small independent retailers, that is small independent retailers have the knowledge of using the internet. A study conducted by Marimuthu, Omar, Ramayah and Mohamad (2012) indicates that the internet is likely to positively impact the performance of small independent retailers. On the other hand, Boateng (2011) states that there is a lack of evidence to support that the impact of internet improves the performance of small independent retailers.

Based on the reviewed literature, the following hypothesis is established:

H¹: Internet has a positive influence on the performance of small independent retailers.

1.3.1.2. Social media and small independent retailers performance

Social media is an online application system programme or media that assists with sharing information online (Seo & Park, 2018). Social media consist of applications such as Facebook, Twitter, MySpace groups, Instagram and YouTube, which are unique media programmes that users use to communicate with each other (Mangold & Faulds, 2009). Musa *et al.* (2016) state that social media is a common platform accepted by small independent retailers in communicating and marketing activities. The benefit of social media to small independent retailers is to create more business coverage, improve the search engine rankings for the business and to increase traffic (Stelzer, 2011).

The speed of adopting social media within the small independent retailers is increasing rapidly over time (Wamba & Carter, 2016; Wang *et al.*, 2016). In Schivinski and Dabrowski's (2016) study, the impact of a marketing communication strategy such as social media towards product awareness had a positive influence on changing the customer's attitude towards the products. Inin *et al.* (2015) add that social media has a positive impact on small independent retailer's performance in improving customer relations. In spite of this Hassan, Nadzim & Shiratuddin (2015) indicated that the use of social media in small independent retailers is found to be low, and Sajid (2016) contends that less than 20% utilising social media. In addition, a survey conducted by Stelzer (2011) on small independent retailers showed that 38% of the employees of small independent retailers utilise social media for marketing purpose, and 23% of self-employed participants within the small independent retailers utilise social media for marketing purposes. This denotes that few small independent retailers utilise social media. According to Lovejoy and Saxton (2012), the impact of social media within small independent retailers has not yet reach its peak. There is inadequate evidence to prove that the impact

of social media on small independent retailers is significant (Donner & Escobari, 2010; Boateng, 2011).

As a result, the proposed hypothesis is:

H²: Social media has a positive influence on the performance of small independent retailers.

1.3.1.3. Digital marketing and small independent retailers performance

Digital marketing refers to the marketing of goods that use digital technology such as the internet mainly, and consists of email marketing, mobile advertising, search engine marketing, display of advertising (web banner), and any other form of digital means (Thomas & Thomas, 2018). A few small independent retailers use digital marketing to market their products and services. Most of them are now starting to use digital (Eriksson, Hultman & Naldi, 2008; Taiminen & Karjaluoto, 2015). Meaning that digital marketing helps the business to performance well (Jobber & Ellis-Chadwick, 2013). Digital marketing is based on the inward bound of marketing approach, which is usually called customer centric approach (Todor, 2016).

Brodie, Winklhofer, Coviello and Johanston (2007) assess the outcomes of digital marketing within small independent retailer's performance, and the researchers found that an increased usage of digital marketing had positive association with small independent retailer's performance. Omondi (2017); and Deraz and Gebrekidan (2019) support that digital marketing has a significant influence on small independent retailers and leads to better business performance. On the contrary, Kallier (2016) argue that there is low usage of digital marketing by small independent retailers. Taiminen and Karjaluoto (2015) agree that small independent retailers have not widely adopted digital marketing for marketing purpose. Donner and Escobari (2010) study found insufficient evidence to prove that digital marketing has an impact on the performance of small independent retailers.

The third proposed hypothesis is:

H³: Digital marketing has a positive influence on the performance of small independent retailers.

2. Literature Review

2.1 Online marketing strategies and small independent retailers performance

Online marketing refers to internet, social media and digital marketing. Poon and Albaum (2019) mention that online marketing is also known as internet marketing. Todor (2016) add that digital marketing is also known as online marketing, internet marketing or web marketing. Online marketing indicates to marketing through the Internet using e-mail marketing, Websites, promotions, blogs, online advertising and online video (Priskila, 2019).

Online marketing strategies within small independent retailers appear to be more instinctive and informal than in larger businesses (Bocconcelli, Cioppi, Fortezza, Francioni, Pagano *et al.*, 2018). Blankson and Omar (2002) discuss that online marketing strategies in this sector are not planned marketing practices as there is a lack of understanding of basic marketing principles. However, according to Dumitriu *et al.* (2019), small independent retailers are learning that they should utilise online marketing strategies that suits the rapid changing business setting.

The emphasis on customers has been enlarged by the arrival of online marketing because online marketing has radically changed the way businesses interact with their customers (Wierenga, 2008). Until recently, online marketing has been the primarily focus on improving website quality, developing price-based competition and building an online customer base (Verma, Sharma & Sheth, 2016) as online marketing is vital for today's marketing communication strategy (Corkum, Liu, Palma, Bauman, Dinniwel *et al.*, 2018; Chaffey & Ellis-Chadwick, 2019; Wu, Wen, Dou and Chen, 2015). Online marketing promotes products and services by using weblog promotion and social systems (Sajid, 2016). Online marketing can explain all the different prices that may appeal to customers and can allow businesses to combine certain types of information in one intricate message (Todor, 2016; Riasi & Pourmiri, 2015).

Online marketing allows small independent retailers to market, reach and influence customers efficiently by allowing collaborations between small independent retailers and providing customers the right freely express their opinions regarding the product or service (Todor, 2016; Corkum *et al.*, 2018). Some of these online marketing strategies lay a compact emphasis on customers' creativity to produce innovative ideas, such as customers that are encouraged to produce their own creative endings for advertisements. The noise from online marketing communication strategies make it more and more difficult for marketing messages to be noticed because the visual images are now mutual on social media and can attract customers attention in the online environment (Leung, 2019).

2.2 Importance of small independent retailers performance

There seems to be no common acknowledged definition for small independent retailers according to Scheffler (2018). However, Kruger (2012) described small independent retail as a separate and independent business that is managed by a single owner. Makhitha (2016) indicates that small independent retailers fall into a number of categories of Small, Medium and Micro Enterprises (SMMEs) as defined by the Department of Trade and Industry (DTI). Small independent retailers are known as intermediaries that sells goods and services for consumption purpose (Ombongi & Long, 2018). The National Small Business Act (1996) in South Africa explains small independent retailers by the number of employees, annual turnover and gross assets (Mohlameane & Ruxwana, 2013).

With regards to small independent retailer's performance, online marketing strategies improves trust between employees, which normally leads to excellent work performance (Charoensukmongkol, 2014). The online marketing strategies has a positive impact on performance of an organisation which is caused by the impact of brand knowledge or product/brand awareness (Kotler & Keller, 2012). Wang, Pauleen & Zhang, (2016) add that online marketing strategies enhance the small independent retailer's performance. Online marketing strategies have a positive impact on small independent retailers' success (Van Aardt, Van Aardt, Bezuidenhout & Mumba, 2008). Small independent retailers that focus on online marketing strategies usually become more successful when compared to those who do not focus on online marketing strategies (O'Dwyer & Gilmore, 2018).

3. Results and Findings

3.1 Demographic statistics

The results of the study show that 58% (n=171) of the respondents were males. With regards to age of the respondents, the largest proportion of the respondents was between the ages of 31 and 40 years (45%), followed by respondents between 41 and 50 years of age (28%); and between 21 and 30 years of age (22%). While the rest of the respondents were relatively equally distributed among the other age groups. Most (43%, n=127) of the small independent retailers in Soweto generate sales revenue per year range from R0 to R50 000. Those with revenue between R50 001 and R100 000 comprised 41% (n=123) of the respondents, and those with revenue between R100 001 and R400 000 comprise 12% (n=35) of the respondents. This was followed by 3% (n=10) of the small independent retailers with revenue between R400 001 and R900 000, 1% (n=2) with revenue between R900 001 and R1 500 000, while 0.3% (n=1) of the respondent indicated that they had revenue between R1 500 001 and R10 000 000. This denotes that there is not even 1% of small independent retailers that generate revenue above R10 000 000 per annum. This is expected on the basis that Soweto is an emerging township that falls in a third world country. The majority of small independent retailers had internet access (57%, n=170), and 43% (n=126) did not have access to the internet. In Wolf's (2011) study, it was confirmed that it seems most small independent retailers have access to internet, but most still experience challenges to use the internet. Respondents revealed that they access to the internet through the internet café (9%, n=15), business cell phones (86%, n=144), public hotspots (5%, n=8), and those who access internet by other means presented 1% (n=1) of the respondents.

3.2 Descriptive statistics

The results of this analysis are presented in Table 1.

Table 1: Descriptive statistics of constructs

Construct	Mean (Likert scale)	Std. Deviation
Internet	2.70	0.968
Social media	2.91	1.092
Digital marketing	2.42	1.274

Table 1 display on the mean scores and standard deviation of the three constructs, namely: internet, social media and digital marketing. The results highlight that small independent retailers weighs the importance on internet and social media with a moderate mean scores, and seem to pay less attention to digital marketing, as can be seen by the low mean scores on this construct.

3.3 Reliability analysis

Cronbach's alpha coefficient is used to measure the reliability of an instrument (Pietersen & Maree, 2014) to determine the internal consistency of internet, social media and digital marketing. Malhotra (2010) state that the Cronbach α of 0.70 is considered to be satisfactory. Reliability analysis (Cronbach alpha) was computed to determine the internal consistency of internet, social media and digital marketing. As a result, the overall Cronbach α for the composite scale was 0.851. The reliability analysis on each of the 3 items obtained a Cronbach's alpha item-total loadings ranged between 0.921 and 0.927, meaning that the instruments loaded well on their respective constructs. The reliability of the scales is satisfactory and consistent with other studies (Swanson, 2004).

3.4 Factor analysis

Exploratory factor analysis (EFA) is a multivariate analysis technique that is used to differentiate variables in a group of observed variables (Lamb, Wolfinbarger, Money, Samouel & Page, 2015). A loading of less than 0.5 is allowed depending on the sample size (Hair, Black, Babin & Anderson, 2010). Items with factor loadings those of less than 0.40 were omitted in this study. For the purpose of the study, three factors were indicated (internet, social media and digital marketing), with the purpose of investigating the impact of online marketing strategies on the performance of small independent retailers.

In order to extract these factors, the statistician suppressed the small coefficients absolute value below 0.50, which is a different approach that took time because it encompassed more iterations.

Table 2: Item loading per factor

Pattern Matrix^a			
Source of information (variables)	Factor		
	Internet	Social media	Digital marketing
<i>'We use the internet to research our competitors'</i>	0.812		
<i>'We have enough knowledge about the use of the internet to market our business'</i>	0.764		
<i>'The internet is useful for our business'</i>	0.716		
<i>'We use the internet to sell products'</i>	0.655		
<i>'We use the internet to research our customers'</i>	0.653		
<i>'Our business uses the internet to advertise products'</i>	0.591		
<i>'We have enough knowledge about social media and its role in marketing our business'</i>	0.515		
<i>'We offer information about our business on our social media'</i>		0.850	
<i>'We provide feedback about the products to our customers on social media'</i>		0.810	
<i>'Social media enables customers to share opinions about the products'</i>		0.766	
<i>'We WhatsApp our customers as a means of direct marketing'</i>		0.532	
<i>'We monitor our social media home page'</i>		0.505	
<i>'Using SMSs as part of direct marketing is good for our business'</i>			0.630
<i>'We use email to communicate with suppliers'</i>			0.583
<i>'We use Twitter for business purposes'</i>			0.581
<i>'We use YouTube for business purposes'</i>			0.578
<i>'We use LinkedIn for business purposes'</i>			0.560
<i>'We email our customers as a way of direct marketing'</i>			0.558
<i>'We unsolicitedly contact our customers over the telephone'</i>			0.549
Cronbach's alpha	0.925	0.927	0.921
Eigen value	28.05	3.34	1.92
Mean	2.42	2.70	2.91
SD	1.274	0.968	1.092
Extraction Method: Principal Axis Factoring.			
Rotation Method: Oblimin with Kaiser Normalisation.			
a. Rotation converged in 24 iterations.			

Table 2 shows the factor loadings for three factors, namely, internet, social media and digital media. A value near 1 indicates an item that loads highly on a specific factor. A loading of ≥ 0.50 can be considered as significant.

The construct 'internet' is Factor 1, and a reliability analysis conducted for Factor 1 achieved a strong Cronbach's alpha of .927, which is above the generally expected minimum of .7, with a mean score of 2.70, standard deviation of 0.968, and 3.34 eigenvalue. The small independent retailers moderately utilise internet which confirms the findings of Aggarwal (2018).

Factor 2 was named 'social media' because more items reflected the general utilisation of social media by small independent retailers. A reliability analysis achieved a strong Cronbach's alpha of .921, which is above the generally expected minimum of .7. A reliability analysis achieved a mean score of 2.91, standard deviation of 1.092, and 1.92 eigenvalue. Hassan *et al.* (2015) mention that the use of social media within small independent retailers was low.

Factor 3 was named 'digital marketing' and this factor reflected how small independent retailers use digital marketing to communicate with their clients. A reliability analysis conducted on this factor

achieved a strong Cronbach's alpha of .925, which is above the generally expected minimum of 0.7, with a mean score of 2.42, standard deviation of 1.274 and 28.05 eigenvalue. In Aggarwal's (2018) study, it was realised that that small independent retailers utilise the internet. However, small independent retailers that are making use of internet to communicate with their customers are faced with challenges such as running out of data, and without data they will not be able to connect to the internet (Mohlameane & Ruxwana, 2013).

3.5 The impact of online marketing strategies on the performance of small independent retailers

Regression analysis is a technique to investigate the functional relationships between variables (Chatterjee & Hadi, 2015). In order to test the hypotheses, regression analysis was employed. Multiple regression was achieved by modelling performance as a dependent variable and the composite of internet, social media and digital marketing as an independent variable. Table 3 summarises the regression analysis results performed to measure whether online marketing strategies acted as a significant predictor of performance. The results showed that the regression model is significant ($p = 0.000$; $F = 9.101$; $r^2 = 0.086$; $\Delta r^2 = 0.076$; and $r = 0.293$). This is found on the model summary on Table 3 ($0.086 \times 100 = 8.6$ (small) implying that the independent variable explains 7% of the variance of the dependent variable (performance).

Table 3: Regression coefficients

Regression												
Model variables	Unstandardised Coefficients		Standardised Coefficients	t	Sig.	Collinearity Statistics		Sig.	F	R ²	Adj. R ²	R
	B	Std. Error	Beta (β).			Tolerance	VIF					
(Constant)	4.045	0.307		13.197	0.000							
Internet	-0.147	0.081	-0.158	-1.812	0.071	0.294	3.398					
Social media	0.107	0.057	-0.150	-1.873	0.062	0.415	2.409	0.000	9.101	0.086	0.076	0.293
Digital marketing	0.188	0.081	-0.241	-2.333	0.020	0.491	2.037					
a. Dependent Variable: Performance												
Notes: N = 290; *** p ≤ .001; ** p ≤ .01; * p ≤ .05, r ≤ .30 (small), r ≥ .30 ≤ .49 (medium), r ≥ .50 (large).												
Note: The statistically significant p-values is highlighted in bold in the table												

The results of regression in Table 3 suggest that the effect of internet is not a significant predictor of performance (p -value >0.05 , $r = -0.158$), hence H^1 is not supported. The analysis further suggests that social media (p -value >0.05 , $r = -0.150$) on performance is not significant. The results do not provide statistical support for H^2 . As the p -value (<0.05) of digital marketing coefficients is significant, this is interpreted that digital marketing is the significant predictor of performance with a small negative relationship ($r = -0.241$). This results provide statistical support for H^3 , which is indicated in table 4. The above findings maintain that online marketing strategies influence performance ($p = 0.000$) within the small independent retailers in Soweto, South Africa. This is supported by a number of scholars, such as Shakur *et al.* (2004); Marimuthu *et al.* (2012); Boateng (2011); Inin *et al.* (2015); and Deraz and Gebrekidan (2019), which assent with the findings that state that the online marketing strategy has a strong positive impact on the performance of small independent retailers. Thus, in conclusion, the results of the current paper revealed that online marketing strategies (digital marketing) have an impact on the performance of small independent retailers. Nonetheless, internet and social media do not predict performance.

Table 4: Hypotheses summary

H ¹	Internet has a positive influence on the performance of small independent retailers	H ¹ is not supported
H ²	Social media has a positive influence on the performance of small independent retailers	H ² is not supported
H ³	Digital marketing has a positive influence on the performance of small independent retailers	H ³ is supported

4. Conclusion

The research seeks to establish whether online marketing strategies outcomes have an impact on the performance of small independent retailers. The conducted research concludes that online marketing strategies have an impact on the performance of small independent retailers. A regression analysis assessed the impact of marketing communication strategies on the performance of small independent retailers. It can be concluded that online marketing strategies (digital marketing) influence the performance of small independent retailers. Additionally, internet and social media do not predict performance. The impact of online marketing strategies on the performance of small independent retailers was achieved by using performance as dependent variables, and online marketing strategies as an independent variable. Meaning that the performance of small independent retailers depends on online marketing strategies. The study shows promise for investigating the impact of online marketing strategies on the performance of small independent retailers, and all the research objectives were achieved. This article has laid the groundwork for future studies in the marketing of small independent retailers by contributing to the literature that provides a more comprehensive view of online marketing strategies and its contributing factors within the small independent retailers contexts.

5. Implications and recommendations

In Ainin *et al.* (2015) study, their research confirms that online marketing strategies have a positive influence on the small independent retailers. The study recommends that small independent retailers should continue to manage relationships with their customers by using digital marketing. In the case of this study, only digital marketing is a vital determinant of small independent retailer's performance. The study recommends that small independent retailers continue utilising digital marketing, as digital marketing is used as a type of electronic media to promote products and communicate with customers. The current study further suggests that small independent retailers share and communicate information with their customers that will, in turn, increase their performance. The results of this study have implications for academics in that most studies in online marketing strategies highlight digital marketing as direct predictors, therefore performance acts positively as an outcome. Small independent retailers need to pay attention to how they use the internet and social media, all of which are also elemental ingredients in the business success. Lastly, small independent retailers need to learn to utilise online marketing strategies that suits the rapid changing business setting.

6. Limitations of the study

The existing literature, specifically small independent retailers, was limited, therefore literature used in the study was based on small and medium-sized enterprises. The study focused only on the impact of online marketing strategies on the performance of small independent retailers in Soweto, not any other areas financial management, business planning, and choosing the right location. Therefore, the fact that a convenient sampling method was employed limits the generalisability of the results. The sample was limited to small independent retailers who were predominantly owners, managers and sales assistants, therefore further research can focus on medium-sized enterprises based in other sectors.

Acknowledgments

This paper benefited from the help of a number of people. Thanks to myself (Mr Vincent Funani Makhubela), Professor Khathutshelo Mercy Makhitha, Professor Louise van Scheers, and my family for discussions about the mechanisms investigated in this paper. My thanks to all other parties as well.

Qualitative Analysis On The Impact Of Digital Disruption On The Competitiveness Amongst South African Advertising Agencies

Alistair Mokoena^{1,*}, J.J. Prinsloo²

^{1,2} Business School, North West University, Potchefstroom, South Africa

Keywords

Digital, advertising, disruption, competition, agile, consulting, data.

Abstract

The advertising ecosystem has been digitally disrupted, exposing weaknesses in the business model that South African advertising agencies have relied on for decades. As a result, many advertising agencies are losing business to new dynamic and nimble competitors who have emerged in the digital age. The primary objective of the study is to explore the impact of digital disruption on competition in the advertising industry and recommend ways in which advertising agencies can respond to competition.

The research methodology used was qualitative with non-probability, judgement sampling. Semi-structured interviews were administered to fifteen practitioners from marketing, advertising, media, production, and regulatory bodies.

The main findings indicated that digital technology has lowered the barriers to entry and as a result there is increased competition in the advertising industry. Increased competition in the advertising industry is driven by the insourcing of creative services by marketers as well as the entry of consulting firms, technology companies and technology savvy start-ups.

This study helps academics and practitioners understand the nature of competition in the advertising industry and equips advertising agencies with ways to respond to increased competition.

1. Introduction

Digital disruption has changed the face of competition in the advertising industry, for example, clients are investing in-house studios, consulting firms are acquiring creative agencies and agencies are starting to in-source production services (Toefy, 2018). In keeping with the in-sourcing trend by marketers, Sheiner and Earon (2019) observe that “marketers now start the planning phase of their strategy based on their own Big Data analysis.” Unless traditional agencies develop new competencies, new propositions and hire digitally savvy talent, they are doomed to fail in today’s economy (Anon. 2, 2017). Chesbrough (2010), Schlegelmilch *et al.* (2003) and Osterwalder and Pigneur (cited by Pedersen *et al.*, 2018:269) warn that “failing to be innovative implies that competitors may enter the scene with new offerings that make prevailing business models redundant.” The current reality, according to Patel (2017), is that advertising agencies have failed to adapt their business models to meet the needs of today’s “hyper-connected consumer.”

Marketers are challenging advertising agencies to display digital skills. In Anon. 2 (2017), a survey by eMarketer revealed that 74% of senior marketers list marketing data and analytics capabilities as some of the key criteria in selecting an advertising agency. Kannenberg (2018) and Toefy (2018) advise that technology has become a competitive edge to agencies and cautions that unless agencies are willing to

¹ E-mail address: alistairmokoena@gmail.com

partner with ad tech companies to enhance their use and understanding of technology, they will not succeed in the digital age. Hull (2017) agrees that in the digital age, organisations need “technologists, consultants, storytellers, copywriters, creative people, entrepreneurs and data scientists to make sense of it all.”

According to Lee (2017), advertising executives like Jason Gonsalves, Mel Exon and Jon Sharpe concur that the advertising industry’s business model needs to be transformed. Toefy (2018) argues that a new ‘agency’ which breaks traditional boundaries is an answer to the need for better creative solutions. This new model considers more closely its various stakeholders such as publishers, brands, audiences and consumers as well as assess what their needs really are in an always-on environment for multi-national, regional and local clients and for millennial-driven digital brands.”

1.1. Problem Statement

Advertising agencies are facing pressure from new competitors to make their structures more efficient. According to Levin *et al.* (2018) “the advertising industry has reached maturity with low barriers to entry to new entrants.” Custers (2017) is of the opinion that “traditional agencies are being disrupted by their leaner, digitally enabled counterparts.” Kannenberg (2018) concurs that agencies need flatter and leaner structures because clients are no longer prepared to tolerate oversized agency teams. The problem that this study seeks to resolve is the existential crisis that traditional advertising agencies in South Africa face, which is brought about by more digitally savvy competitors. Do traditional advertising agencies embrace digital transformation or lose out to new digital, agile, technology-driven competitors?

1.2. Methodology

Qualitative research was conducted. It took the form of fifteen semi-structured (saturation + 1) open ended interviews with junior, middle and senior management practitioners from the regulatory bodies and the marketing, advertising, media, production industries. The participants were all chosen because of their experience in marketing, advertising and in the functioning of client-agency relationships. Non-probability, judgement sampling was used to select these participants. The sample frame that was used to select participants consisted of a list of advertising agencies and advertisers obtained from the Financial Ad Focus 2017 magazine, IAB (Interactive Advertising Bureau) Digital Agencies), MASA website (Marketing Association of South Africa) as well as from the ACA website (Association for Communication and Advertising). Saturation or redundancy was reached after analysing six participant transcripts.

A qualitative pilot study was conducted with two participants. One was a senior advertising practitioner and the other was an advertising executive. One-on-one in-depth interviews were held with these participants. Each interview lasted forty-five (45) minutes. Feedback from these interviews was used to refine the questions in the discussion guide, for example, some of the questions were dropped from the final discussion guide in order to avoid repetition. Some questions were reworded in order to make them clearer.

In the main study, each participant received a consent form via email explaining the reasons for the qualitative study, informing them of their right to refuse to participate, and assuring them of confidentiality. Once signed consent forms were received from the **selected** participants, the researcher emailed the Discussion Guide to them. The researcher contacted the participants to schedule interviews. Five participants opted to email their written responses to the researcher prior to their face-to-face interviews, whilst the other ten of the participants elected to do face-to-face semi-structured interviews. All interviews were conducted by the researcher, and they took place between 26 April 2018 and 11 May 2018. Each interview lasted between 45 and 60 minutes. Some of the interviews were conducted in the researcher’s office while others took place in the participants office. Once permission had been obtained from the participant a voice recorder was used to record the interview. Transcripts of the interviews were sent to a professional transcriber who used the Phillips

Speech Exec Pro software to do the transcription. The written transcripts were sent to a professional analyst for analysis.

The software package Nvivo 12 was used during the data analysis and reduction.

2. Literature Review

The introduction of digital marketing has raised questions about the suitability and effectiveness of the advertising industry's current business model. According to Mangani (2003:295) the growth of the internet has altered the advertising industry's business model. Some commentators feel that advertising agencies are no longer valued partners to marketers because they have lost relevance (Satell, 2014; Hagel, 2016; & Hausman, 2015). The advertising agencies' business model has failed to keep pace with the changing needs of marketers (Manson, 2009). Perkin (2017) warns that advertising agencies' approach to client engagement and remuneration needs to change. Satell (2014), Patel (2017) and Hausman (2015) argue that advertising agencies need to revise their business model to redefine how they deliver and create value in the digital age. Kannenberg (2018) states that "when UK-based market intelligence firm, Creativebrief, questioned 50 agency CEOs and 50 brand CMOs about the changing role of agencies, they found that 68% of agency respondents and 72% of brands believe that agency structures, processes and pace of delivery are not developing at the same rate as the brands' needs."

One of the challenges faced by the advertising industry, according to Kerr *et al.* (2015:392), is that most agencies strategies and tactics are still relying on models and theories from the 1970's and 1980's. The approach that advertising agencies have been applying to traditional advertising development has had to evolve as a result of the shift to digital marketing (Saputra & Motik 2013:749).

According to Long (2018), Michael Buckley, Managing Director of Accenture Interactive, opined that marketing has become about experience, and not just advertising campaigns. Long (2018) argues that digital transformation equips organisations with the capability required to deliver end to end customer experiences and to play a part at every stage in the customer decision journey. This approach enables you to affect "call centres, the frontline staff, retail and commerce."

Paul Howes, head of KPMG's Customer, Brand and Marketing Advisory Business explains that clients approach them for help with digital transformation on brand, customer and marketing. According to Long (2018) "we formed a view that you can't successfully help businesses transform without helping them to transform their customer experience, and you can't transform their customer experience without transforming their brand, and you can't transform their brand without transforming their marketing, and I suppose that is why we are following through in the supply chain."

Berman *et al.* (cited by Troung & McColl, 2010:710) concurs that many of today's mainstream advertisers do not fully grasp the opportunities presented by digital transformation. Kannenberg (2018) advises that "while many of today's traditional agencies have started to expand their digital focus and tech proficiency, their progress hasn't been enough to close the extensive gap between their capabilities and those of the more-savvy digital shops. Creativity skyrockets unbound by the limits of existing technology. True innovation starts with the systems." Graham (2018c) explains that "VML absorbed sibling WPP agency Rockfish, a digital innovation shop with e-commerce expertise that generated \$70 million in revenue in 2016, according to the Ad Age Datacenter. VML told Ad Age earlier this year it planned to put more of an emphasis on artificial intelligence, virtual reality and augmented reality in 2018."

Traditionally, competition for Advertising agencies has come mainly from other advertising agencies. Before the digital age advertising agencies did not have to worry about competing with clients' in-house advertising agencies media agencies, technology start-ups, publishers and management

consultants. According to Levin et al. (2018) “the advertising industry has reached maturity with low barriers to entry for new entrants.” Finn (2020b) points out competition is also coming from unconventional competitors like Cognitive, a business that started in Information Technology before evolving into an integrated marketing agency.

Michael Porter’s Five Forces Model was used as a lens through which to analyse the impact of digital disruption on the state of competition in the advertising industry. According to Satell (2014), an analysis of the advertising industry through Michael Porter’s Five Force Model proves that the industry is facing an existential crisis. Michael Porter’s Five Forces Model is a marketing strategy tool used by organisations to analyse the level of competition in an industry as well as its sustainability and attractiveness. The level of competition in an industry has an impact on industry profitability and attractiveness to potential entrants (Kotler & Keller, 2009:334 & Hough *et al.*, 2008:53).

Many advertising executives and marketers agree that advertising agencies today are facing uncertain times, largely due to digital transformation as well as a tough economic climate. Maggs (2016:5) spoke to Daniel Padiachy, head of marketing at McDonalds, who argued that the lines between traditional advertising agencies, media agencies and digital agencies are being blurred and that the future lies in collaboration. Padiachy is advocating for a move from “a multi-agency approach where we would traditionally get silo-like thinking” (Maggs, 2016:5) to a more collaborative approach. Graham Warsop, founder of The Jupiter Drawing Room, agrees that a better model is one that brings together specialist skills in a collaborative fashion (Maggs, 2016:5). Gau Narayanan, managing director of Net#work BBDO argues that agencies need to focus on “strategic integration, collaboration and operational delivery” (Maggs, 2016:7).

FIGURE 1 (Kotler & Keller, 2009:335) is a representation of Michael Porter’s Five Forces Model. These five forces include potential entrants (threat of mobility), industry competitors (segment rivalry), the threat of substitutes, the bargaining power of suppliers (supplier power) and the bargaining power of buyers (clients).

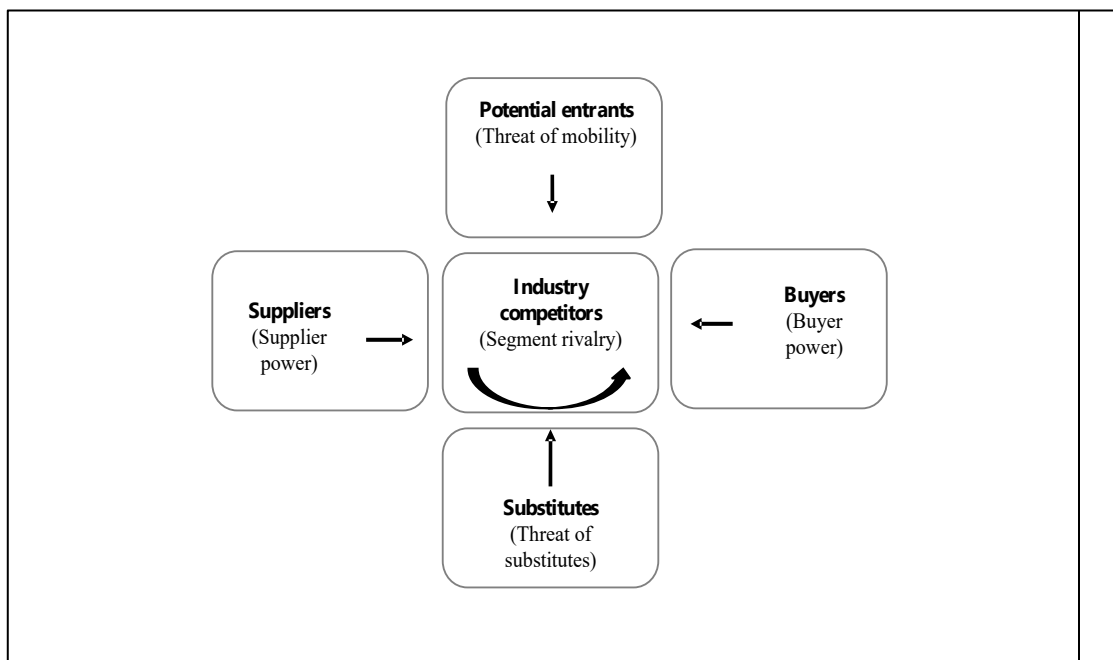

Figure 1: Five Forces Determining Segment Structural Attractiveness (Kotler & Keller, 2009:335)

Competitive rivalry

There is a high level of competition for market share in the South African advertising industry and this makes it less attractive to potential entrants (Maggs, 2015:5). Intense competitor rivalry often leads to price wars and margin erosion (Kotler & Keller, 2009:334). It also leads to “loss of market share and customer traction” (Maggs, 2015:5). Sometimes competition is driven by the acquisition of smaller specialised firms by their larger competitors to gain a competitive edge (Hough *et al.*, 2008:63). According to Kannenberg (2019), the ever-changing requirements of digital marketing demand a diverse set of capabilities which in some cases will come from different agencies. This means advertising agencies need to be open to partnering with agencies they would otherwise consider as competitors.

The threat of new entrants

There is a surge in the number of “small entrepreneurial hotshops” who are competing with the larger advertising agencies (Fels, 2016). Beasley (2016) summarises the threat of new entrants succinctly by stating that “as fees have been cut, workloads have increased, and measurement has become more complex, legacy agencies are getting cut out of the freelancers and boutique agencies.” Lucas and Goh (cited by Loebbecke & Picot, 2015:3) state that innovative start-ups disrupt prevailing business models by “exploiting digital distribution channels, creating and serving new customer demand, establishing new forms of customer engagement and relationships, or any combination of the three.”

The threat of substitution

Pathak (2018c) argues that digital agencies are under attack from the entry of management consultants in the advertising landscape and from in-sourcing by clients. This is attributed to the suggestion that most digital agencies are tactical in nature and lack a deep understanding of business dynamics. According to Whittler (2017) and (Patel (2017), advertising agencies face competition from large management consultancies who, in addition to offering creative services, also offer business and strategic consulting services which advertising agencies do not offer.

Management consultants are hiring talent from advertising agencies “as they seek to help clients to transform their organisations into customer-centric digital businesses” (Long, 2018). Gianatasio (2018) makes the point that management consultants have differentiated their offering from that of advertising agencies by merging marketing with technology. According to Pathak (2018c) consultancies are commodifying agency services by offering to provide design and user experience solutions for free whilst charging for strategy.

According to Hull (2017), “consulting firms have the competence to apply the technology to make campaigns more efficient and touchpoints far more personalized.” Management consulting firms and technology companies such as Adobe, Oracle and Epsilon have been acquiring agencies with competencies in digital marketing, design, user experience and mobile (Dan, 2016; Lee, 2017).

These new competitors bring strategic skills, project management skills as well as digital skills in technology and data analysis. Hull (2017) states that when Accenture acquired a digital agency called Karmarama they gained customer experience competency blended with creativity, data and digital skills. Price (2017) concurs that for advertising agencies to future-proof themselves against the threat of consultancies, “they need to think more like consultants and offer a wide array of technical solutions.”

Hull (2017) states that Accenture has added customer experience competency by acquiring Kunstmaan agency and gained a blend of creativity, data and digital when they acquired Karmarama agency. This consolidation is fueled by the fact that marketing is increasingly becoming based on data and technology (Price, 2017). This, in turn, is negatively impacting how advertising agencies operate as well as how they are remunerated (Perkin, 2017), prompting a communications planner, Motshegwa (2017) to question the relevance of advertising agencies in the digital age. Hesz (2017) argues that consulting firms, unlike advertising agencies, realise that advertising needs to have a

positive commercial impact, and not just a cultural impact. Some agencies like Huge and R/GA have responded to this threat by developing consulting and business transformation capability, and this is proving to be successful. (Pathak, 2018c).

Consulting firms are able to apply the technology and make more efficient campaigns and tailor-made touchpoints (Hull, 2017). Johnson (2018) states that in 2017 more than half of agency revenue in the United States was attributed to digital advertising, however the bulk of this went to consulting firms and not advertising agencies. Joseph (2017) provides two reasons for this. Firstly, consultancies focus on the budgets of the CEO, CIO and CFO which happen to be much larger than the CMO's budget. Secondly, marketers allow them to handle conflict business, a courtesy they seldom extend to advertising agencies (Joseph, 2017).

Lee (2017) argues that advertising agencies can use innovation, collaboration, flexible employment practices and their ability to tell emotional stories, to differentiate themselves from management consultancies. According to Lee (2017a), Leo Rayman of Grey Advertising is of the view that unlike management consultants who focus on short-term key performance indicators (KPIs), advertising agencies need to focus on long term brand building. Price (2017) however, counters that for advertising agencies to future-proof themselves against the threat of consultancies, they should act like consultants and their technical solutions should be varied.

Long (2018) informs us that Justin Papps, partner and head of CMO Advisory at PwC, states that there are three elements to PwC's value proposition. They include "strategy (brand and marketing strategy, data analytic strategy and segmentation strategy), structure (an Organisational Design team that designs future-fit teams and departments) and spend (helping clients improve their return on marketing investment).

Lee (2016), Kawaja (2015), Ledbetter (2017), Beasley (2017) and Whitler (2017) all concur that advertising agencies are facing competition for talent from technology companies such as Google, Facebook, Uber, Twitter, Instagram and Tesla, data marketers such as Acxiom, Epsilon, Merkle, Neustar, consulting firms such as Accenture, IBM, McKinsey, PwC and Deloitte and publishers such as AOL, Yahoo, Herbst, Vice and BuzzFeed. Management consulting firms and technology companies such as Adobe, Oracle and Epsilon have been acquiring agencies with competencies in digital marketing, design, user experience and mobile (Dan, 2016; Lee, 2017).

The bargaining power of suppliers

Suppliers to the advertising industry include production companies, recording studios, edit suites, casting agencies, voice banks, cost consultants, pitch and relationship consultants and research companies, amongst others. The bargaining power of suppliers increases when they are organized or concentrated and when there are few substitutes" (Kotler & Keller, 2009:335). According to Hough *et al.* (2008:70) some suppliers use their size and dominant position in the market to unilaterally set and dictate prices to their customers.

The bargaining power of clients

The incidence of clients in-sourcing creative services has had the effect of increasing their bargaining power in relation to advertising agencies (Lee, 2017). One of the marketers with an in-house advertising agency is Crocs (Morrison, 2012). According to Perkin (2017) advertising agencies are facing time and profit margin pressures from clients as well as a commoditization of their services. As Beasley (2016) explains, agencies are being expected to deliver more work for less fees. The power of client procurement departments as well as in-sourcing by clients further threaten agency margins. Pathak (2018c) explains that "the more tactical and repetitive the work, the more the marketer can bring it in-house." Lion (2018) warns that even though procurement drives cost-savings for clients, the voice of the marketing department needs to be louder because marketing creates value.

Clients are demanding more accountability and transparency around agency fees (Feldman, 2017). According to the Agency Scope study conducted in 2016 by Vacchiano and McDowell (2016:18) 54% of the study’s sample stated that the Procurement department is involved in agency fee negotiations. When clients have disproportionately more bargaining power than agencies, the client-agency relationship runs the risk of changing from a partnership to a supplier-client relationship (Whitler, 2017).

3. Results and Findings

To explore the impact of digital disruption on competition in the advertising industry, the following question was asked in the interviews:

- a) What is the role of advertising agencies?
- b) How has advertising agencies evolved over time?

Reduction of the data was based on “word trees” and thematic analysis. The mentioned “word trees, contributed to the overall reduction of the data processes. A Word Tree is a diagram that shows nodes or codes in a hierarchical fashion. In other words, it contains words or phrases that are most frequently used in the study. Figure 14 is a Word Tree on accountability of the marketing function that was developed using insights from the research findings.

Word trees for the following questions:

What is the role of the marketing function?

Has the role of marketing evolved over time? If so, in what way?

The results, contained in TABLE 1 capture the responses to the above research question. Data reduction has been done to reflect identified themes with participant’s responses as confirmation. Table 1 represent categories of data into focussed theme’s.

Table 1: What is the role of advertising agencies and how has it evolved?

Question	
What is the role of advertising agencies and how has it evolved over time?	
Themes	Participant responses
Digital skills	<ul style="list-style-type: none"> • “Agencies who understand customers digital life and journey and how to use those insights to have meaningful conversations with them and sell them products and services relevant to their lives.” • “Talent which is well rounded and versed on digital trends and operations.” • “Clients expect agencies to be digitally ready and they expect agencies to lead the journey.” • “The CMO and the CIO role is now kind of merging and morphing into one, because a lot of digital marketing is technology driven and the evolution of marketing is now one that requires a full understanding of technology and information and communication technology.” • “Suddenly, you’ve got digital managers in every business everywhere, and everybody is trying to do digital strategy.” • “Clients are also wanting all the agencies to be more digital and to work in a disciplined, agnostic way.”

<u>Business minded</u>	<ul style="list-style-type: none"> • “The inner workings of an agency’s success is to have people who understand that their contribution to the company is about business success.” • “Both creativity and effectiveness. I think creativity drives effectiveness and, if the work is to be effective it must be creative. So, I think those things are the two key drivers of success in an [sic] ad agency.” • “And the return on investment. And that’s really the big thing for our clients. They need to know what actually works and what actually doesn’t, and that’s really the impact.”
<u>Creativity and strategic thinking</u>	<ul style="list-style-type: none"> • “And I strongly believe that it’s hinged on great creative ideas and strategic thinking.” • “I think agencies need to understand that it’s not all about the TVC, that you can be extremely creative on digital, but it requires a very different approach to content creation, to creativity. And, now more than ever, creativity is required in strategy, it’s required in media planning, and it’s required in content creation, and the agency of the future needs to embrace this.” • “But, more and more, it has to be about the thinking and the ability to adapt to change.”
<u>Flat structure</u>	<ul style="list-style-type: none"> • “The smaller agencies are actually delivering a lot more in terms of digital. I think that their teams are small, they’re getting a lot of the work out, and I think, because they have a flatter structure, they’re able to offer just a little bit more.” • “Become flatter in order to gain more direct engagement with Clients.”
<u>Nimble and agile</u>	<ul style="list-style-type: none"> • “I think agencies need to be more agile and nimble, it’s definitely a recipe for success for an agency.” • “Transparency, agility, responsiveness.” • “Second thing would be to maintain the agency’s relevance by being able to and nimble enough to adapt, morph around clients’ needs.” • “So flexibility and ability to adapt.” • “As well as looking at how an agency can restructure itself to become more profitable, not only for themselves but profitable for the clients. So, efficiencies in today’s world is [sic] absolutely critical for success.”
<u>Flexible revenue models</u>	<ul style="list-style-type: none"> • “Agencies need more agile revenue models” • “Shared risk/remuneration models, true partnership.”
<u>Consumer-centric</u>	<ul style="list-style-type: none"> • “So, I think the way in which we approach everything that we do has to fundamentally change. I think what we need to be doing is starting with consumers, and not our brands, and working backwards.” • “Agencies need to be able to partner with clients in a way that helps them navigate those changing needs and demands of clients, the end consumer experiences. And that will ultimately deliver relevant solutions.” • “We need to ensure that whatever we do is done that has relevance in their lives. So the media selection in respect of where and how consumers and advertisers meet up show be relevant and appropriate to their lives.”
<u>Speed</u>	<ul style="list-style-type: none"> • “Clients demand quicker, more agile and innovative thinking. Agencies are stuck in the past and find it difficult to keep up with the demands of the clients in today’s world. Agency processes are old, slow and uncompromising.” • “In addition to the large traditional campaigns, clients are also looking for agencies to create tactical and quick turnover content pieces to live online.” • “Speed of execution is critical. Work with greater flexibility and speed.” • “So, there’s this huge pace and need for speed in the market, whether it’s you’re creating product, delivering it into the market, onto shelves, or creating a product and selling it to clients online.”
<u>Collaborative</u>	<ul style="list-style-type: none"> • “True partnerships is the way of the future for client agency relationships. Partnerships

<u>partnerships</u>	<p>with digital platform owners like Facebook and Google, trained and skilled people, agile leadership, open minded support (like finance, operations, creative and production process).”</p> <ul style="list-style-type: none"> • “The ability to partner with other service providers rather than trying to do the work alone is important. Work with other service providers in the form of partnerships and joint ventures.”
<u>Business minded</u>	<ul style="list-style-type: none"> • “I think, from an advertising point of view, we are expected to be a lot more business minded and business focused, as well as strategic, and moving a lot closer to the needs of the marketing department as well as the business.” • “It’s not about an ad agency receiving accolade upon accolade for their creative work. It’s about an ad agency retaining customers and helping the client’s business succeed in order for their business to succeed.” • “The role of advertising itself has moved from advertising into business solutions.”
<u>Consulting skills</u>	<ul style="list-style-type: none"> • “Ad agencies are specialist consultants to business.” • “So, I think that the role of agencies has shifted from one of being a provider of work, an ad, a print ad, radio ad, to more being a strategic partnership.” • “So, for the industry and for us, it’s very tough, and it’s gonna get even more [sic] tougher, and we need proof-ready ourselves for the times when the likes of the Accentures and Deloittes are playing harder.” • “The consultants are getting into digital advertising.” • “Agencies are facing competition from non-traditional agencies / consulting companies in the areas that were previously considered to be the domain of agencies.”

4. Conclusion

Advertising agencies have had to adjust their organisational structures to be better able to deliver on the evolved needs of clients and the end consumer. Advertising agencies have also had to optimise their organizational processes because of digital disruption. Advertising agencies are required to be nimble and agile. Advertising agencies need to adopt flexible remuneration models such as a shared risk model. The implication for advertising agencies is that they need to be more transparent, agile and responsive.

Advertising agencies need to evolve with the new consumer and media landscapes. They can no longer dictate to consumers but should rather let consumers tell them what they need and how to service their needs best. Agencies need to include consumers in the conversation as this will deepen consumer understanding, resulting in insightful creative solutions. Good consumer understanding will help agencies produce creative work that is relevant, impactful and reflective of society.

Agencies need to ensure that they leverage the power of digital media to target the right consumer with the right message at the right time. They also need to analyse various media platforms for effectiveness and impact. This involves the ability to use information and analytics gained through direct contact with consumers to shape the messaging and increase its efficacy.

The need for agencies to evolve their structure and processes has never been greater. Agencies need to replace heavy and expensive operations with flat, agile, nimble, and integrated structures. They need to be more transparent and faster in their responsiveness. They also need to be client centric.

5. Managerial Implications

Marketers are under increasing pressure to demonstrate return on marketing investment. This requires exceptional data analysis skills on the part of advertising agencies, a capability that consulting firms and more digitally focussed advertising agencies are good at. According to Participant 7 *“the advent of the digital age has added an additional complexity of accountability. In the current climate, every impression, click, view and bounce need to be accounted for: data has heralded in the age of ROI and*

accountability for the marketing profession.” Participant 5 add that *“the emergence of data and the impact it has on the reporting of campaign effectiveness means that agencies are far more accountable for the creative produced and the media spent.”* Advertising agencies therefore need to invest in data analysts in order to assist their clients achieve measurability and accountability, or risk losing relevance.

The digitalisation of the broader advertising ecosystem has disrupted the advertising industry by exposing weaknesses in its current operating model. Unless advertising agencies evolve their business model, consulting firms and more digitally savvy agencies will continue to exploit these weaknesses. Participant 15 adds that *“technology has changed the landscape between how brand owners are able to analyse consumer behaviour and trends and how they are able to communicate more directly and in a targeted way to their users.”* Advertising agencies need to ensure that they keep up with these changes in the consumer landscape.

Digital technology has lowered barriers to entry in the advertising industry and as a result, advertising agencies are facing more competition from new nimble, technology savvy agencies, technology companies and consulting firm. Participant 4 argues that *“for the industry and for us, it’s very tough, and it’s going to get even more tougher, and we need to proof-ready ourselves for the times when the likes of the Accentures and Deloittes are playing harder.”* Participant 6 agrees that *“consultants are getting into digital advertising.”* Competition from technology companies and customer experience in digital agencies has heightened the need for advertising agencies to become more adept at creating consumer or customer experiences. Technology is also coming from marketers (clients) who have resorted to in-sourcing creative services.

Marketers are calling on advertising agencies to be more collaborative, nimble, and quicker. Participant 2 opines that *“clients demand quicker, more agile and innovative thinking. Agencies are stuck in the past and find it difficult to keep up with the demands of the clients in today’s world. Agency processes are old, slow and uncompromising.”* The implication for advertising agencies is that they need to be evolve their structure, processes and ways of working in order to be fit for purpose. Participant 10 concurs *“the smaller agencies are actually delivering a lot more in terms of digital. I think that their teams are small, they’re getting a lot of the work out, and I think, because they have a flatter structure, they’re able to offer just a little bit more.”*

Advertising agencies need to evolve their skill set to keep up with competition from new, nimble digital advertising start-ups, technology companies, digital media agencies and consulting firms who have pivoted their services to include digital advertising. Participant 2 states that *“clients expect agencies to be digitally ready and they expect agencies to lead the journey.”*

Must-have skills for advertising agencies to succeed in the digital age include general and specialist skills, consulting skills, advisory skills, and project management skills. Agencies need to be digitally enabled. Participant 14 opines that *“due to the fact that personalisation and the interaction with the consumer is one on one and it’s not mass anymore, it requires that insight to really be driven hard.”*

Advertising agencies are required to possess good marketing technology capability, data analysis capability, strong creative ability, innovation and collaboration with clients, a good understanding of the client’s business and of a fragmented media landscape. Participant 7 argues that *“for the biggest portion of it, it’s measurability. I think it’s, for the first time, you’re able to measure, if not all, most of what you do. And I think that’s because of the measurability and the digital transformation that’s happening within marketing.”* Agencies are also required to have a good consumer understanding. According to Participant 1 the future belongs to *“agencies who understand customers digital life and journey and how to use those insights to have meaningful conversations with them and sell them products and services relevant to their lives.”*

5.1. Recommendations

- Advertising agencies and clients need to embrace Modern Marketing.

Agencies and clients alike need to base their approach to marketing and advertising on the dictates of Modern Marketing, which are that it uses omni-channel strategies to connect brands with consumer; combines brands with customer experience; is enabled by digital transformation; brings together creativity; data and technology and enables advertising agencies to influence various aspects of the customer decision journey.

- Advertising agencies need to deliver interactive, always-on, personalised content.

The proliferation of digital platforms has increased the amount of content that is consumed, thereby making it difficult for marketers to achieve, stand out and make an impact. Digital marketing enables advertising agencies to create content that is personal, bespoke and for the consumption thereof to be interactive.

5.2. Limitations

The study was conducted in South Africa, but there is a need to understand the impact of digital disruption on competition in advertising industries in other markets. There is also a need to understand the impact of digital disruption on other parts of the advertising value chain such as the role of clients' procurement departments.

Keywords

Safety incidents, security incidents, visitor perceptions, zoological garden, urban tourism

Abstract

The National Zoological Garden of South Africa (NZG) serves as an important urban ecotourism attraction in Pretoria. It is ranked as one of the highest rated zoos globally, attracting more than 600 000 visitors annually. It provides numerous social, economic, and environmental benefits and contributes towards the roles of providing education, research, recreation and conservation. Zoological gardens are dependent on the income generated from visitors. Safety and security concerns may influence a visitor's choice of visiting such an attraction, especially if they are located in a central business district, which has a high crime rate. Through structured questionnaires completed by visitors at the NZG, this study aims to explore the current visitor perceptions of safety and security at the NZG. Similar to other literature regarding the NZG, the majority of respondents were satisfied with the current standards of safety and security at the NZG. However, the study found that issues related the general safety and security protocols and procedures, more visible security available throughout the zoo, and improving the zoo infrastructure. This research can help to better understand how visitors perceive the current standards of the safety and security measures and protocols at the NZG and can provide guidelines on how management can address any issues or enhance any measure to improve visitor experiences.

1. Introduction

Tourism has emerged as a major global industry and hence, concerns for tourists' safety has been a major concern for a number of years (De Albuquerque & McElroy, 1999). Tourism experiences are mainly about pursuing tourist satisfaction, however, there are significant risk factors associated with travel and tourism (Fuchs & Pizam, 2011). Tourists often associate trips with challenges of security and safety (Tarlow, 2009) and safety and security concerns in tourism are recognised as a driving force causing changes in the industry in the new millennium (Breda & Costa, 2005). Destinations always have to guarantee a tourist's safety (Ronald & Kenneth, 2003) because the issue of safety and security is a basic need in all areas of human activity, including tourism (UNWTO, 2016).

Safety and security are essential components in all tourist attractions and facilities which may include transportation, attractions, restaurants or hotels (Tan, Chong & Ho, 2017). In tourism literature, the occurrences of safety and security incidents are often mentioned without any clear differentiation, however, safety and security incidents do differ in their essence (Fuchs & Pizam, 2011). Fuchs and Pizam (2011) describe safety incidents as instances where tourists are injured accidentally and without any malice whereas security is described as the protection of a person, place, or reputation from intended harm (Tarlow, 2009).

The high incidents of safety and security incidents threaten the growth of South African tourism (George, 2010). Furthermore, South Africa has received considerable negative media attention as a tourist destination due to several high-profile cases involving crime against tourists (George, 2010). Since tourism is a human activity, it is sensitive and reacts quickly and differently to incidents of

crime (Nkosi, 2010). The violent crime that South Africa experiences is a massive deterrent for tourists and negatively influences the image of the country (Ferreira & Harmse, 2000).

This paper investigates the current visitor perceptions of safety and security at the NZG. The NZG is the largest zoo in the country and the only one with national status (Botha, Kruger & Viljoen, 2021). It is also regarded by World Atlas as one of the best zoos globally, attracting more than 600 000 visitors annually (Sen Nag, 2018). However, according to the South African National Biodiversity Institute (SANBI) (2019), the NZG has recently been affected by low visitation numbers (SANBI, 2019). A contributing factor noted by SANBI (2019) is the location of the NZG, with it being situated in the central business district in Pretoria. Crime Statistics South Africa (CSSA) (2020) reports Gauteng as the highest ranked province, in terms of crime, with Pretoria ranked in the top 10 worst crime districts in the country.

Therefore, this paper asks the following question: What are the current visitor perceptions of safety and security at the NZG? This question is answered by making use of a descriptive quantitative research approach, by means of a survey research design targeted at visitors at the NZG. Evaluating the safety and security aspects will assist the NZG to identify gaps in their current offerings and develop strategies to rectify them, for the benefit of the visitors and the overall survival of the NZG.

2. Literature review

2.1 Tourism and safety

Tourist visitation decisions are based on their unique personalities, attitudes, values and lifestyles and include visiting new places, having new experiences and meeting different people and cultures (Simkova & Holzner, 2014). This is ultimately associated with human psychology, which involves understanding people's motivations for travelling, individual needs and satisfaction (Simkova & Holzner, 2014). Hamarneh and Jerabek (2018) indicate that a tourist's feeling of safety and security is one of their basic needs. The incidents of terrorist attacks, natural disasters, pandemics, wars or high levels of crime at a specific destination can result in potential visitors evaluating whether or not they should reconsider their travel destination or cancel their travelling plans (Hamarneh & Jerabek, 2018). Gisolf (2014) states that many theories have been developed and several models have been designed to explain individual needs in tourism

2.2 Theories of visitor motivation

The first theory of motivation is Abraham Maslow's Hierarchy of Needs. This theory is one of the most familiar theories of individual motivation (Smit, Cronje, Brevis & Vrba, 2011). In this theory, Maslow identified five levels of individual motivation ranked in the following order: physiological needs; safety needs; affiliation (love and belonging) needs; esteem needs; and self-actualisation needs (Smit et al., 2011). This theory of individual motivation was based on two assumptions. The first is that people always need more and the needs of individuals are dependent on what they already have. A satisfied need will no longer be a motivator; however, an unsatisfied need can influence behaviour. The second assumption is that an individual's needs arise from importance (Smit et al., 2011). The needs lower down the hierarchy are regarded as more important and must be satisfied first before individuals can attend to needs higher up on the hierarchy (McLeod, 2018). In this theory of individual motivation, the need for safety and security is the second level that needs to be satisfied after the basic physiological needs have been satisfied. With physiological needs, the need to feel safe and secure requires maintenance throughout one's life (Poston, 2009). This need is more psychological because safety needs may differ depending on the individual and where they are in their life (Poston, 2009).

The second theory, created by Clayton Paul Alderfer, developed Maslow's hierarchy of needs into a theory of his own, called Alderfer's Existence, Relatedness, and Growth (ERG) theory (Yang, Hwang & Chang, 2011). The Alderfer's ERG theory refines Maslow's hierarchy of needs by using three steps or classes of needs: existence, relatedness and growth needs (Yang, Hwang & Chang, 2011). The ERG theory aims to answer the question, "What motivates a person to act?" and assumes that all human activities are motivated by a need (Chang & Yuan, 2008). Yang et al. (2011) describe existence needs as needs which include different forms of safety, physiological and material needs. Furthermore, Chang and Yuan (2008) state that existence needs include things such as: food, water,

air, clothing, safety, physical love and affection. The relatedness needs include senses of security, belonging, and respect (Yang et al., 2011). Chang and Yuan (2008) state that relatedness needs encompass relationships with significant others, this includes being recognised and feeling secure as part of a group or family. The growth needs involve needs for self-esteem and self-actualisation (Yang et al., 2011). These needs urge an individual to render creative or productive effects on themselves and the environment around them (Chang & Yuan, 2008). In this model, safety and security are classified as an existence need in that it is a need for basic material necessity (Digitalis Tankonyvtar, 2011).

The third theory of motivation is the push and pull theory. The examination of visitor motivations through the push and pull theory has been widely accepted in tourism literature (Uysal, Li, & Sirakaya-Turk, 2008). The push and pull theory is often used to explain tourists' or visitors' decisions to visit a particular destination rather than other destinations of a similar nature (Said & Maryono, 2018). According to Slabbert and Viviers (2012:69), push factors in this theory relate to the motivational factors or needs that may arise from a state of disequilibrium with the visitor or tourist. These motivational needs affect visitor behaviour and influence the choice of destination (Said & Maryono, 2018). Pull factors on the other hand, are described by Slabbert and Viviers (2012) as external forces that consists of certain attributes or features of a destination that meet the needs of the visitor or tourist. These features or attributes stem from an individual's belief or perception of a destination (Beerli & Martin, 2004).

Tourist safety and security is often prioritised as an important factor in the push and pull theory as indicated by Shin (2005), who concludes that safety and security at destinations is a predominant thought for tourists. Salimon, Kareem, Mokhtar, Yusoff and Gorondutse (2019), also state that when tourists perceive their intending destinations not to be secure, they tend to develop a negative perception of the destination and refrain from visiting. Ultimately, drawing from this theory and the other theories of motivation that were previously discussed, tourists have a need for safety (push factor) and will seek for places that they perceive will provide it (pull factor).

An individual's safety and security needs have constantly been an essential condition in the tourism industry (Kovari & Zimanyi, 2011). Recent global changes have been significant, with incidents such as terrorism, wars, natural disasters, epidemics and pandemics all having a negative impact on the tourism industry and exposing the vulnerability of tourism's safety and security (Kovari & Zimanyi, 2011). Events like the COVID-19 pandemic have shown to have drastic consequences on the global tourism industry (Fletcher, Büscher, Massarella & Koot, 2020). South Africa's issues of safety and security have also been identified as a high concern in the National Tourism Sector Strategy (South African Department of Tourism, 2017). The high levels of crime pose a threat to many urban attractions in South Africa (Pitte & Boulle, 2010). Other criminal activities such as the illegal dumping, poaching and arson also directly impact negatively on an attraction's biodiversity (Pitte & Boulle, 2010). The perception of these criminal activities negatively impacts the well-being of many South Africans and greatly impacts the tourism sector (Perry & Potgieter, 2013).

Perceptions play a vital role in influencing tourists' decisions on choosing a destination to visit (Perry & Potgieter, 2013). The tourists' perceptions of a destination's image are not solely developed from media tools but are developed from a combination of many personal experiences (Horrihan, 2009). George (2003) states that tourists may develop negative impressions of attractions if they experience feelings of being unsafe or threatened while on holiday. Furthermore, George (2003) argues that these negative impressions are harmful to the destination's tourism industry and can lead to a decline of tourism to an area influencing travellers not to visit a destination due to a high crime rate reputation or influencing travellers to not participate in activities outside their accommodation facility if they feel unsafe at a destination, or by influencing travellers not to return nor recommend a destination where they have felt threatened or unsafe.

Pizam and Mansfeld (2006) state that tourism demand and supply are sensitive to safety and security incidents. According to Fuchs and Pizam (2011), the safety and security incidents negatively affect

the delivery of the tourism 'product' as it causes changes in the visitors' perceptions of risk. Jonas, Mansfeld, Paz and Potasman (2011) argue that the fear of safety and security incidents creates the overall risk perception of an attraction, ultimately affecting a visitor's decision-making and shaping their behaviour.

An individual's perceived risk is based on their perceptions of uncertainty and negative consequences of purchasing a product or service (Dowling & Staelin, 1994), or participating in an activity, or selecting a specific lifestyle (Reisinger & Mavondo, 2005). Sonmez and Graefe (1998) discovered that previous international travel experiences of travellers affected their perceptions of safety-risk and also affected their future travel behaviour. Their study also noted that respondents with international travel experience were more likely to compare their perceptions with reality than those respondents who lacked travel experience. Sonmez and Graefe (1998) concluded that the perceptions of travellers are more harmful to their travel decision-making than the actual safety and risk at a destination. A study by Ramoliki (2013) analysed domestic travellers' responses regarding safety and security of travel within South Africa. Ramoliki (2013) concludes that domestic travellers within South Africa perceive travel as dangerous and were highly concerned about the incidents of theft, robbery, rape, murder, mugging and assault during their travel.

2.3 Safety and security at urban tourist attractions

The NZG provides an important conservation platform for endangered wildlife in the world (Hermann & Du Plessis, 2014). Urban tourism attractions such as zoological gardens, depend greatly on the financial support received from visitors such as entrance fees and sales for their long-term survival (Jordaan & Du Plessis, 2014). Ogunjinmi, Oniya and Oboh (2017) state that the majority of visitors around the world do not visit zoos alone, but in groups with friends, relatives, spouses, or children. Furthermore, Hermann and Du Plessis (2014:1170) conclude that visitors at the NZG are primarily motivated to visit by the need to enhance relationships with family and friends, making the NZG a site for family and friends to meet and get together in their leisure time. According to Mastroianni (2013), safety and security concerns may influence a tourist's choice of visiting a specific destination, particularly when their family is involved in the journey. With the NZG's location being in Pretoria's central business district, which, is ranked as one of the most unsafe precincts in the country (CSSA, 2020). It is important to understand what the visitor perceptions of the NZG's current safety and security standards are and whether their risk perceptions are heightened if they are accompanied by family members or friends.

Mearns and Liebenberg (2018) evaluated the perceptions of public safety and the safety of visitor facilities at the NZG. Their study identified certain issues with safety and security, which were perceived by visitors. Mearns and Liebenberg (2018) found that safety signage was not present at enclosures of certain dangerous wildlife species, as well as a shortage of signage that provides information regarding safety around the zoo. It was also noted that safety outside the NZG was an issue as Mearns and Liebenberg (2018) reported that security was not visible outside the NZG (Kgosana, 2014; Kubheka, 2014). Mearns and Liebenberg (2018) concluded that the three important areas that the NZG needed to address relate to access and availability of parking, safety and security concerns inside and outside of the zoo and the lack of conservation promotion by the NZG. Mearns and Liebenberg (2018) further state that visitors face serious consequences if the abovementioned aspects are not dealt with.

3. Methodology

This study made use of a descriptive quantitative research method in the form of a self-administered questionnaire to gather the information needed to address the research objectives. The questionnaire was designed for the purpose of this study by making use of a comprehensive literature review and using other studies as guidelines. The following studies were also used as guidelines in the development of the questionnaire; Hermann and Du Plessis (2014), Mearns and Liebenberg (2018), Tomas, Crompton and Scott (2003), and Ryan and Saward (2004).

The target population for this study consisted of all visitors to the NZG who are 18 years old and older. When this study was initiated, the visitation figures from the NZG, indicated that the total number of visitors for 2017 was 430 739 people (Allenby, 2018). It was presumed that these numbers were consistent over the research period but may have been negatively affected in 2020 due to the COVID-19 pandemic. A sample refers to a subset of the population (Wagner *et al.*, 2012). Considering a 95% confidence level and 5% margin of error, the sample size calculated for this study was 384 respondents (Survey Monkey, 2018).

Due to the COVID-19 pandemic, the sampling technique used for this study was a hybridised non-probability sampling. The study made use of a non-probability sampling technique due to the inability to use probability sampling (i.e., the low response rate in the probability survey due to potential respondents being hesitant or cautious of contracting COVID-19). The method of non-probability sampling used was the convenience sampling method. This was a necessity due to the uncertainty of the COVID-19 pandemic. Data collection took place during November 2020 to January 2021 and was done physically (267 respondents) and online (38 respondents) resulting in a total sample of 305. To test the reliability of data a Cronbach's alpha coefficient test was conducted and revealed variables each with α scores greater than 0.8.

4. Results and Findings

4.1 Results of Visitor Perceptions of Safety and Security at the NZG

The questionnaire consisted of six sub-categories of safety and security at the NZG namely: pathway safety, vehicle and parking safety, enclosure safety, signage safety, amenities safety, and general safety and security. Respondents were asked to what extent they agreed or disagreed with the statements relating to the sub-categories. The questionnaire also contained an additional comment section for respondents to provide some additional information or voice their opinions.

With regard to the six sub-categories, respondents were asked to what extent they agreed or disagreed with the statements relating to the sub-categories. An exploratory factor analysis was conducted based on the results obtained. Table 1 presents the respondents' responses towards the six sub-categories. The results are presented according to the percentage of respondents that either 1 = strongly disagreed (SD), 2 = disagreed (D), 3 = neither disagreed nor agreed (N), 4 = agreed (A), or 5 = strongly agreed (SA), with the following statements.

Table 1: Descriptive Safety and Security Responses.

VARIABLE	PERCENTAGE OF RESPONSES (%)				
	SD	D	N	A	SA
1. Pathway Safety					
The pathways are well maintained.	5,25	12,79	15,08	40,98	25,90
Pathways are not slippery.	5,90	9,18	13,77	41,97	29,18
There is sufficient signage to enclosures.	0,98	10,49	20	39,02	29,51
There is sufficient signage to emergency exits.	4,59	14,43	19,34	36,07	25,57
There is no debris on pathways.	4,59	13,44	22,30	37,05	22,62
Pathways are wheelchair friendly.	5,90	9,18	13,77	41,97	29,18
Visitors are well protected from hazardous work areas on pathways.	5,25	12,79	15,08	40,98	25,90
2. Vehicle and Parking Safety.					
Parking is sufficient for the number of visitors.	5,90	19,34	19,67	34,43	20,66
Parking is well allocated at the entrance of the zoo.	2,30	13,44	16,72	41,31	26,23
Vehicles are safe in the parking lot.	6,23	14,1	24,59	33,77	21,31
Security personnel can be seen at the parking lot.	2,30	9,84	20,98	41,64	25,25
Security personnel are trustworthy.	2,62	8,2	37,05	35,41	16,72
Sufficient disabled parking is available near the entrance.	2,30	10,16	38,36	30,16	19,02
3. Enclosure Safety					
Signage at enclosures provide information about the animals.	0,98	3,28	16,39	48,52	30,82

Signage at enclosures clearly provide information about visitor zoo behaviour.	2,62	7,87	20,98	43,93	24,59
Off-limit areas at enclosures are clearly indicated.	1,64	5,9	21,97	43,28	27,21
Enclosures are wheelchair accessible.	0,66	5,9	27,54	38,69	27,21
4. Signage-related Safety					
Signage is clear and visible.	1,31	5,9	17,7	43,93	31,15
Signage is well maintained.	1,97	10,82	18,69	40,33	28,2
Warning signs and off limit areas are clear.	1,97	6,23	18,03	43,61	30,16
Signage for toilet facilities is clearly indicated.	1,64	8,2	14,43	45,25	30,49
Assembly points are clearly indicated.	3,28	8,52	23,61	38,36	26,23
Emergency exits are clearly indicated.	3,61	9,84	21,31	40,00	25,25
Signage is safe for visitors.	0,33	4,59	18,03	45,9	31,15
There is sufficient signage in the zoo.	1,64	6,56	20,98	44,59	26,23
5. Amenities Safety					
Toilet facilities are safe to use.	2,30	7,87	22,3	37,38	30,16
Toilet facilities are well maintained.	3,93	10,49	22,62	36,72	26,23
There are disabled toilet facilities available.	0,98	4,59	41,31	31,48	26,56
The rides for children are safe to use.	0,33	4,26	37,38	31,48	21,64
The rides for children are well maintained.	0,98	4,92	38,69	31,15	24,26
The cableway is safe to use.	12,46	8,20	38,69	31,15	24,26
Personnel present ensuring safety at the cableway entrance.	10,82	7,21	39,02	26,89	16,07
Personnel present ensuring safety at the cableway exit.	10,16	7,87	42,30	22,62	14,43
The cableway is well maintained.	12,79	7,87	42,30	22,62	14,43
The golf carts are safe to use.	0,98	2,62	31,15	36,07	29,18
Personnel inform visitors on correct golf cart usage.	0,98	3,61	34,10	35,08	26,23
The golf carts are well maintained.	0,33	4,26	34,43	33,11	27,87
The shops and kiosks are easily accessible.	1,31	1,64	21,31	42,28	32,46
The shops and kiosks are clean and well maintained.	0,33	4,92	21,97	39,34	33,44
6. General Safety and Security					
Information about safety and security measures are provided at the entrance.	13,44	12,13	21,31	31,15	21,97
Contact details in case of emergencies are provided at the entrance.	16,07	12,13	22,95	28,85	20,00
Safety orientation or safety tips are provided at the entrance of the zoo.	17,7	11,48	21,31	27,87	21,64
First aid is readily available at the zoo.	12,79	10,82	30,49	26,56	19,34
Security personnel are visible throughout the zoo.	11,48	10,16	18,69	38,36	21,31
There are no issues with the cell phone reception in case of emergencies.	2,30	6,23	17,70	36,39	37,38
The zoo is not overcrowded.	2,95	5,90	16,39	39,34	35,41

Source: Authors' Own Creation

Each of the key areas presented in Table 1 are discussed individually. The results are as follows:

4.2 Pathway Safety.

Most respondents agreed that the pathways are well maintained for visitors to use (66,88%). Most respondents also agreed that pathways are not slippery, meaning that there was no water or grease on pathways to cause accidents (71,15%) and also that pathways had no debris (68,53%) and visitors were well protected from hazardous work (61,64%). The respondents also agreed that the pathways had sufficient signage to enclosures (59,67%) and sufficient signage to emergency exits (71,15%). Lastly, respondents agreed that the pathways were wheelchair friendly (66,88%).

4.3 Vehicle and Parking Safety.

Many respondents agreed that the parking is sufficient for the number of visitors (55,09%). Most respondents also agreed that the parking is well allocated at the entrance of the zoo (67,54%). More than half of the respondents also agreed that the vehicles are safe in the parking lot (55, 08%). When it comes to the security personnel at the parking lot, 66,89% of respondents agreed that security personnel can be seen at the parking lot. Notably, 52,13% of respondents agreed that security personnel is trustworthy. However, 37,05% of respondents neither agreed nor disagreed on the trustworthiness of the security personnel. Lastly, less than half (49,18%) of respondents agreed that there is sufficient disabled parking available near the entrance of the NZG. The results obtained relating to safety and security of vehicles and parking are in line with the results of the study by Mearns and Liebenberg (2018). Their study indicated that slightly under half of respondents found the parking facilities adequate for the visitors to the NZG.

4.4 Enclosure Safety.

The respondents agreed that the signs at enclosures provide information about the animals (79,34%) and they clearly provide information about visitor zoo behaviour (68,52%). Most respondents also agreed that the off-limit areas at enclosures are clearly indicated (70,49%). The respondents also agreed that the enclosures at the NZG are wheelchair accessible (65,90%). The results obtained relating to safety and security of the enclosures are in line with the results of the study by Mearns and Liebenberg (2018). Their study indicated that respondents found the enclosure facilities adequate for the visitors to the NZG.

4.5 Signage-related Safety.

The respondents agreed that the signage at the NZG is clear and visible (75,09%) and that the signage is well maintained (68,53%). Respondents also agreed that warning signs (73,77%), signage for toilet facilities (75,74%), assembly points (64,59%), and emergency exits (65,25%) were all clearly indicated. Most respondents also agreed that signage is safe for visitors (77,05%) and that there is sufficient signage in the zoo (70,82%). These results contradict the study of Mearns and Liebenberg (2018) which concluded that the signage in the NZG is inadequate, noting that safety signage was not present at enclosures of certain dangerous wildlife species, and that there was a lack of general signage with the information boards needing to be updated.

4.6 Amenities Safety.

The respondents agreed that the toilet facilities at the NZG were safe to use (67,54%) and well maintained (62,95%). More than half of the respondents also agreed that there are sufficient disabled toilet facilities (58,04%). However, a significant number of respondents neither disagreed nor agreed that there are sufficient disabled toilet facilities (41,31%). These results are in line with the results of Mearns and Liebenberg (2018) who found that 51,7% of their respondents agreed that the toilet facilities were clean and safe to use. Slightly over half of the respondents agreed that the rides for children at the NZG are safe (53,12%) and maintained (55,41%). Notably, a significant number of respondents neither disagreed nor agreed on the safety (37,38%) and maintenance (38,69%) of the rides for children at the NZG. Over half of the respondents (55,41%) agreed that the cableway is safety to use. However, a significant number of respondents neither disagreed nor agreed on the safety of the cableway (38,69%). Many respondents also neither disagreed nor agreed on the personnel competency at the entrance (39,02%) and exit (42,3%) of the cableway and the maintenance (42,3%) of the cableway. It should be noted that the cableway had not been functioning during the data collection period. With regards to the golf carts at the NZG, many respondents agreed that the golf carts are safe to use (65,25%) and that personnel inform visitors on correct golf cart usage (61,31%). Notably, 60,98% of respondents agreed that the golf carts were well maintained. However, a significant percentage of respondents had neither disagreed nor agreed on whether the golf carts were well maintained (34,43%). Lastly, when it came to the shops and kiosks, respondents strongly agreed that the shops and kiosks were easily accessible (74,74%) and were clean and well-maintained (72,78%). These results were in line with the study of Mearns and Liebenberg (2018) who noted that the shops and kiosks were of low concern.

4.7 General Safety and Security.

Most of the respondents agreed that the information about safety and security measures (53,12%), contact details in case of emergencies (48,85%), and safety orientation or safety tips (49,51%) are all provided at the entrance of the NZG. Many respondents neither disagreed nor agreed on whether first aid is readily available at the zoo (30,49%). However, 45,90% of respondents agreed that first aid is readily available. The latter is supported by Mearns and Liebenberg (2018) who identified that first aid points were adequately sign-posted. The respondents agreed that security personnel are visible throughout the zoo (59,67%) and had strongly agreed that there are no issues with the cell phone reception in case of emergencies (73,77%). The respondents also agreed that the zoo is not overcrowded (74,75%).

4.8 Results of the Factor Analysis: Identifying interrelationships among variables

An exploratory factor analysis was conducted on the results of safety and security to identify any interrelationships among the different variables. The Orthogonal (Eigenvalue-weighted) Varimax Rotated factor solution indicated that 9 factors were extracted from the 46 Likert scale items. However, the three items that loaded onto Factor 8 loaded higher on Factor 1. This factor was hence discarded. The total variance of this study is 29,7465, after the exclusion of unreliable variables. The Cronbach's alpha for each factor were assessed to establish if internal consistency had been achieved. The results indicate that Cronbach' alpha coefficient for all the factors is above the 0.7 mark except Factor 9. The factor solution was revised by considering a restricted 7 factor solution. Table 2 displays the results for the seven (7) factors that were retained.

Table 2: Factor Analysis Results for Safety and Security.

FACTORS	Mean	Factor Loadings	Variance	Cumulative Variance	Reliability Co-efficient (Cronbach's alpha)
Factor 1: Enclosure and Signage Safety.			6.27546	6.27546	0.9216
Signage at enclosures provide information about the animals.	4,05	0.5799			0.9199
Signage at enclosures clearly provide information about visitor zoo behaviour.	3,80	0.7147			0.9147
Off-limit areas at enclosures are clearly indicated.	3,89	0.7588			0.9129
Enclosures are wheelchair accessible.	3,86	0.6005			0.9164
Signage is clear and visible.	3,98	0.7624			0.9127
Signage is well maintained.	3,82	0.7294			0.9123
Warning signs and off limit areas are clear.	3,94	0.8044			0.9097
Signage for toilet facilities are clearly indicated.	3,95	0.5602			0.9170
Assembly points are clearly indicated.	3,76	0.5597			0.9159
Emergency exits are clearly indicated.	3,73	0.5877			0.9164
Signage is safe for visitors	4,03	0.5808			0.9183
There is sufficient signage in the zoo.	3,87	0.6663			0.9135
Factor 2: Safety and Security Protocols.			4.35153	10.62699	0.9220
Information about safety and security measures are provided at the entrance.	3,36	0.8347			0.8927
Contact details in case of emergencies are provided at the entrance.	3,25	0.8726			0.8826

Safety orientation or safety tips are provided at the entrance of the zoo.	3,24	0.8341			0.8867
First aid is readily available at the zoo.	3,29	0.7372			0.9180
Security personnel are visible throughout the zoo.	3,48	0.6921			0.9354
Factor 3: Vehicle and Parking Safety.			4.17718	14.80417	0.8985
Parking is sufficient for the number of visitors.	3,45	0.6733			0.8860
Parking is well allocated at the entrance of the zoo.	3,76	0.7016			0.8838
Vehicles are safe in the parking lot.	3,50	0.7857			0.8659
Security personnel can be seen at the parking lot.	3,78	0.7311			0.8840
Security personnel are trustworthy.	3,55	0.7662			0.8818
Sufficient disabled parking is available near the entrance.	3,53	0.6868			0.8809
Factor 4: Cableway Safety.			3.97674	18.78091	0.9406
The cableway is safe to use.	3,22	0.8864			0.9221
There are personnel present and ensuring safety at the cableway entrance.	3,30	0.8908			0.9120
There are personnel present and ensuring safety at the cableway exit.	3,26	0.8603			0.9249
The cableway is well maintained.	3,18	0.8417			0.9301
Factor 5: Pathway Safety.			3.90992	22.69083	0.8659
The pathways are well maintained (There are no uneven surfaces).	3,70	0.7248			0.8395
Pathways are not slippery (i.e., no water or grease on pathways).	3,79	0.7207			0.8460
There is sufficient signage to enclosures.	3,86	0.5906			0.8550
There is sufficient signage to emergency exits	3,64	0.6330			0.8473
There is no debris on pathways	3,60	0.6958			0.8544
Pathways are wheelchair friendly.	3,97	0.6898			0.8426
Visitors are well protected from hazardous work areas on pathways.	3,88	0.6755			0.8430
Factor 6: Catering and Visitor Service Safety.			3.72950	26.42033	0.8580
The golf carts are safe to use.	3,90	0.7884			0.8239
Personnel inform visitors on correct golf cart usage.	3,82	0.7146			0.8317
The golf carts are well maintained.	3,84	0.7960			0.8025
The shops and kiosks are easily accessible.	4,04	0.7219			0.8374
The shops and kiosks are clean and well maintained.	4,01	0.5907			0.8454
Factor 7: Sanitation and Recreation Service Safety.			3.32617	29.7465	0.8602
Toilet facilities are safe to use.	3,85	0.7770			0.8255
Toilet facilities are well maintained.	3,71	0.7339			0.8202
There are disabled toilet facilities available.	3,68	0.6142			0.8519
The rides for children are safe to use.	3,80	0.6085			0.8228
The rides for children are well maintained.	3,73	0.5889			0.8325

Source: Author's Own Creation.

The results of 2 display seven key factors. Each of the factors presented above, are described individually.

Factor 1: Enclosure and Signage Safety

Twelve (12) items loaded onto Factor 1. These items all relate to the topic of enclosure and signage safety. The items include: Signage at enclosures provide information about the animals (0.5799); signage at enclosures clearly provide information about visitor zoo behaviour (0.7147); off-limit areas at enclosures are clearly indicated (0.7588); enclosures are wheelchair accessible (0.6005); signage is clear and visible (0.7624); signage is well maintained (0.7294); warning signs and off- limit areas are clear (0.8044); signage for toilet facilities are clearly indicated (0.5602); assembly points are clearly indicated (0.5597); emergency exits are clearly indicated (0.5877); signage is safe for visitors (0.5808); and there is sufficient signage in the zoo (0.6663). The results indicate that the scale has good internal consistency, with an alpha of $\alpha=0.92$.

Factor 2: Safety and Security Protocols

The second factor identified from the factor analysis is related to safety and security protocols at the NZG. Five (5) items loaded on this factor. The items include: Information about safety and security measures are provided at the entrance (0.8347); contact details in case of emergencies are provided at the entrance (0.8726); safety orientation or safety tips are provided at the entrance of the zoo (0.8341); first aid is readily available at the zoo (0.7372); and security personnel are visible throughout the zoo (0.6921). The results also indicate that the scale has good internal consistency, with an alpha of $\alpha=0.92$.

Factor 3: Vehicle and Parking Safety

There were six (6) items that loaded on the third factor. These items all relate to the topic of vehicle and parking safety. The items include: Parking is sufficient for the number of visitors (0.6733); parking is well allocated at the entrance of the zoo (0.7016); vehicles are safe in the parking lot (0.7857); security personnel can be seen at the parking lot (0.7311); security personnel are trustworthy (0.7662); and sufficient disabled parking is available near the entrance (0.6868). The results also indicate that the scale has good internal consistency, with an alpha of $\alpha=0.90$.

Factor 4: Cableway Safety

The fourth factor identified is related to the safety of the cableway. This factor loaded four (4) items. The items include: The cableway is safe to use (0.8864); there are personnel present and ensuring safety at the cableway entrance (0.8908); there are personnel present and ensuring safety at the cableway exit (0.8603); and the cableway is well maintained (0.8417). The results also indicate that the scale has good internal consistency, with an alpha of $\alpha=0.94$.

Factor 5: Pathway Safety

Factor five (5) of the factor analysis is related to the safety of the pathways in the NZG. There were seven (7) items that loaded onto Factor five (5). The items include: The pathways are well maintained (There are no uneven surfaces) (0.7248); the pathways are not slippery (i.e., no water or grease on pathways) (0.7207); there is sufficient signage to enclosures (0.5906); there are sufficient signage to emergency exits (0.6330); there is no debris on pathways (0.6958); the pathways are wheelchair friendly (0.6898); and the visitors are well protected from hazardous work areas on pathways (0.6755). The results also indicate that the scale has good internal consistency, with an alpha of $\alpha=0.87$.

Factor 6: Catering and Visitor Services Safety

There were five (5) items which loaded onto Factor 6. These items are related to the safety of the catering and visitor services. The items include: The golf carts are safe to use (0.7884); personnel inform visitors on correct golf cart usage (0.7146); the golf carts are well maintained (0.7960); the shops and kiosks are easily accessible (0.7219); and the shops and kiosks are clean and well maintained (0.5907). The results also indicate that the scale has good internal consistency, with an alpha of $\alpha=0.86$.

Factor 7: Sanitation and Recreation Service Safety

The final factor identified is related to sanitation and recreation service safety. There were five (5) items that loaded onto this factor. These items include: The toilet facilities are safe to use (0.7770); the toilet facilities are well maintained (0.7339); there are disabled toilet facilities available (0.6142); the rides for children are safe to use (0.6085); and the rides for children are well maintained (0.5889). The results indicate that the scale has good internal consistency, with an alpha of $\alpha=0.86$.

5. Conclusion

The research aimed at identifying the respondents' current perceptions of safety and security at the NZG. The results of the factor analysis indicate that seven key factors were addressed in this study namely, enclosure and signage safety, safety and security protocols, vehicle and parking safety, cableway safety, pathway safety, catering and visitor services safety and sanitation and recreation service safety.

The results of the responses towards vehicle and parking safety indicated that respondents were relatively satisfied with the current standards of the vehicle and parking safety at the NZG. There were some respondents who added additional comments regarding vehicle and parking safety at the end of the questionnaire. Respondents stated that the parking at the NZG is of great concern due to it being insufficient to accommodate visitor numbers and due to the worry of cars being broken into or stolen. Respondents also mentioned that the safety outside the NZG is an issue mentioning incidents of theft and drugs at the entrances and parking areas. This is in accordance with the results of the below average means of the factor analysis for the statements of parking being sufficient for the number of visitors (3.45) and vehicles being safe in the parking lot (3.50). These concerns were also alluded to in the study of Mearns and Liebenberg (2018).

The results of the responses towards enclosure and signage safety indicated that respondents were satisfied with the current standards of the enclosure and signage safety at the NZG. However, some respondents added that there were many features at the enclosures that were broken (cracked windows and rusted cages). The respondents also noted that there were many empty enclosures and these could be hazardous to visitors, especially children. With regard to signage safety, respondents noted that the signage is good and provides useful information in case of emergencies. However, some respondents also noted that the signage in the NZG is not visible, poorly maintained and does not accommodate some official languages.

The results of the responses towards sanitation and recreation service safety indicated that respondents were fairly satisfied with the current standards of sanitation and recreation service safety at the NZG. However, respondents had noted issues with sanitation stating that the toilets were not clean and bathrooms do not have soap or sanitisers. No additional comments were made regarding the recreation services safety.

The overall results of the responses towards cableway safety indicate that respondents were not entirely satisfied with the safety and security of the cableway at the NZG. This could be because the cableway was out of order during the data collection period of this study. Respondents made mention that the cableway had been out of order. This is in line with the results of the below average means of the factor analysis for the following statements: The cableway is safe to use (3.22), there are personnel present and ensuring safety at the cableway entrance (3.30), there are personnel present and ensuring safety at the cableway exit (3.26), and the cableway is well maintained (3.18).

The results of the responses towards pathway safety indicate that respondents were satisfied with the pathway safety at the NZG. However, respondents have stated that the pathways at the NZG were uneven, worn out and badly maintained and this could cause accidents.

The results of the responses towards catering and visitor services safety indicate that respondents were relatively satisfied with the standard of catering and visitor services safety at the NZG. However,

respondents had stated that more golf carts should be made available to accommodate the number visitors, and personnel at the golf carts need to improve their services. Respondents were quite satisfied with the kiosks and shops within the NZG, indicating that they are easily accessible and well maintained.

The results of the responses towards safety and security protocols indicate that respondents were not entirely satisfied with the safety and security protocols at the NZG. However, respondents stated that safety and security protocols need to be addressed for all their guests, with the focus being on the NZG needing to provide information about safety and security measures to visitors at the entrance of the NZG. Visitors are not made aware of any information such as contact details (in case of emergencies) or safety orientation or safety tips, which respondents state should be brought to their attention at the entrance of the zoo. This is in accordance with the results of the means of the factor analysis for the statements of information about safety and security measures are provided at the entrance (3.36), contact details in case of emergencies are provided at the entrance (3.25), and safety orientation or safety tips are provided at the entrance of the zoo (3.24).

The implications of the above-mentioned results indicate that the NZG need to address these issues. Firstly, the NZG need to find ways to enhance the visitor experiences. Visitor experiences can be enhanced through better safety and security protocols like providing easier ways for people to contact emergency services (mobile apps) or through better communication of important safety and security information. Secondly, the NZG should improve signage to meet visitors' educational needs. This can be done by installing new and visible signage with current information, to replace damaged, and outdated ones. The third implication is that the NZG needs more visible security around the zoo and at the entrance. Lastly, the NZG needs to improve their infrastructure. Specific references were made to the old, rusted cages and enclosures, parking facilities, damaged pathways, the cableway and toilets. Addressing these issues can improve visitors' perceptions of safety and security at the NZG.

6. Managerial Implications

This study aimed to identify the visitors' current perceptions of safety and security at the NZG to develop a better understanding of the influence of safety and security on visitor perceptions at an urban attraction located in Pretoria. This was done using a quantitative approach to identify the visitor perceptions of safety and security at the NZG. Prior research by SANBI (2019) and Mearns and Liebenberg (2018) have indicated that the NZG is experiencing safety and security issues and this has contributed to lower visitation rates. The findings of this study revealed that most respondents were relatively satisfied with the current standards of safety and security at the NZG, however, more can be done by the NZG to improve the perceptions of safety and security. Some issues noted by respondents, which need to be addressed were related to the general safety and security procedures, namely, information about safety and security measures not provided at the entrance, contact details (in case of emergencies) are not provided at the entrance, safety orientation or safety tips are not provided at the entrance of the zoo, more visible security available throughout the zoo, and improving the zoo infrastructure. By addressing the concerns identified in this study, the NZG can effectively improve visitors' perceptions of safety and security at the NZG. The use of social media and marketing promotional strategies may be used as channels to communicate the improvement made towards the safety and security of visitors in order to influence public perceptions of the NZG and to attract those visitors that were previously hesitant to return and to attract new visitors.

This study was however, faced with certain limitations that need to be acknowledged. It must be noted that firstly, accessing respondents was a major challenge encountered by the researcher, which resulted in a smaller sample size than expected. Many respondents were hesitant to complete surveys due to fear of contracting the COVID-19 virus as the data were collected during the peak of the 2nd wave of the pandemic. Although precautions were taken (masks, social distancing, and sanitisers), many potential respondents were still cautious of completing the survey. Collecting data during the pandemic also limited the collection time. This was also a limiting factor as collecting data over a longer period may obtain more results and insight on the topic of safety and security because data would be collected from a larger portion of the population rather than a group at a single point in time.

Lastly, since the convenience sampling method was used, the results cannot be generalised to the whole population as visitors are subjective and responses may change depending on the consumer. These limitations do, however, encourage future research in this topic. A gap exists in literature regarding the understanding of the influence of safety and security issues on visitor perceptions of urban attractions such as the NZG, therefore, based on the results of this study, further research is needed to gain additional insight into this subject. This should motivate further research on safety and security and the visitor motivations at the NZG. A study using a methodology that provides a deeper and more detailed understanding, for example, a qualitative methodology employing in-depth interviews at the NZG, should be conducted. The reason is because respondents are restricted when completing a survey. Using interviews may elicit issues that were previously not identified by the researcher. A further recommendation can also be made to conduct this type of research from the supply-side. This can assist in bridging the gap between the NZG and the visitor perceptions.

Keywords

Generic pharmaceuticals;
Patent medication;
Consumer behaviour;
Consumer intent to purchase; Financial risk;
Performance risk; and
Social risk.

Abstract

This study aimed to understand the influence of risk avoidance on the purchasing behaviour of generic pharmaceutical brands. By analysing the influence of risk-avoidance, this study demystifies both the factors that restrain customers from and drive customers towards purchasing generic medications. Primary data were obtained quantitatively through the completion of 202 questionnaires that were distributed online. From the collected data, descriptive and inferential statistics were obtained, which were used to describe and explain the relationships between variables. The results indicate a strong positive and significant relationship between the perception of drug quality (denoted by performance risk), financial risk and consumers' intention to purchase generic medication. The results imply that health authorities should focus on providing timely, adequate, and reliable information on the effectiveness and safety of generic medication to dispel patients' concerns regarding issues pertaining to financial losses and health risks when they use generic medication. By identifying the factors that restrain patients from purchasing generic pharmaceuticals and analysing their influence on the purchase intention of generic drugs, it is hoped that the findings of this study will aid producers of generic pharmaceuticals in addressing patients' perceptions and concerns regarding the purchase of such generic drugs.

1. Introduction

In 2017, South Africa's total healthcare expenditure amounted to 414.5bn ZAR (8.4% of GDP), subsequently rising by an average of 7.5% yearly (Industry Insights 2020). The spending on pharmaceuticals alone accounted for 11.1% of the total amount spent on healthcare, equating to 46bn ZAR (0.9% of GDP). Pharmaceuticals have three sub-divisions: patented/branded prescription medication, generic prescription medication, and over-the-counter medications. Of the total amount spent on healthcare, it was estimated that South Africans spend 88.3% to purchase both branded/patented and generic prescription medications. Expenditure on over-the-counter (OTC) medication makes up the remaining 11.7%. Expenses on patented/branded medications were the largest, totalling 52.8% of all pharmaceutical spending in 2017, followed by generic drug spending at 35.5% (Industry Insights, 2020).

The intersection of an increasing demand for healthcare and the rapidly growing healthcare expenditure, coupled with South Africa's ailing economy, means the steady rising medication costs are unsustainable. In this regard, there are burgeoning calls for patients to purchase more generic medication (Godman et al., 2011; Matlala et al., 2020). The primary benefit of generic medication is the associated reduced cost, which is about 20 to 90 per cent cheaper when compared to the equivalent patented/branded drugs (Hassali and Shafie, 2008). Evidence has shown that the bioequivalence of generic medication is equal to its corresponding patented/branded medication in safety, strength, quality, and performance characteristics (Andrade, 2015)

Maciejewski (2012) make the case that despite the cost-effectiveness of generic medication, consumers seem to be sceptical of its quality. Risk regarding purchasing behaviour is the likelihood of

negative consequences resulting from the purchasing decision taken by the consumer. For example, consumers perceive risk when they do not have adequate information about a product or when they have to make a new purchase decision (i.e. one they have never made before). Maciejewski (2012) further states that consumers' risk experience then evokes a tension state, whereby they fear the loss of money, prestige, time, and health state, amongst others. Consumers then attempt to eliminate this tensioned state via various preventative strategies. Therefore, consumers' perceived risk may have a considerable influence on their purchasing behaviour.

2. Problem Statement

South Africa's latest data shows that 16.4% of the population was covered by a medical scheme (StatsSA, 2019). In the same year in the private sector, approximately R24bn was spent on medicines. Similarly, approximately R12.3bn was spent on drugs in the public sector in the same year (Mamdoo, 2019). 88.3% of this total market spend was for prescription medication (patented/branded and generics), of which generic medications only made up 35.5% of the total market spend (Industry Insights, 2020).

It is argued that by switching to generic medication, savings to a minimum of 20% can be realised (Hassali and Shafie, 2008). Despite this acknowledgement, the transition from patent/branded to generic medication has been agonisingly slow. It is believed that patients' perception of risk regarding generic medications and physicians' hesitancy to prescribe generic medication plays a significant role in this state of affairs (Gauld et al., 2012).

In light of the above, the primary objective for this study was to ascertain the extent to which risk-avoidance influences consumers' behaviour when deciding between generic or originator brand pharmaceuticals.

3. Research Questions

The research questions that guided the study were as follows:

- What risk factors restrain consumers from purchasing generic pharmaceutical prescription medication?
- How does consumer risk influence of purchase intent of generic pharmaceuticals?
- To what extent are consumers involved in the purchase of generic pharmaceutical prescription medication?
- What strategies can be used for effective policy formulation or amendments to ensure consumers can make informed decisions when deciding between original branded and generic medications?

4. Literature Review

Since the 1940s, studies have attempted to determine the guidelines and processes used by consumers when deciding between products that differ in their risk factors (Baratta and Preston, 1948). However, research exploring the specific connection between risk-avoidance and purchasing behaviour is sporadic, even more so in the field of generic pharmaceuticals. Therefore, the three dominant themes that have emanated from the literature are reviewed in this section. The first theme's focal point is the main differences between generic medicines and their patented rivals. The second theme focuses on the influence of risk-avoidance when deciding to purchase generic drugs over patented originals. Lastly, the third theme focuses on the influence of risk-avoidance on consumers' purchasing behaviour.

4.1 Generic pharmaceuticals

The World Health Organisation (WHO, 2008:232) defines a generic medication as "a pharmaceutical product usually intended to be interchangeable with an innovator product that is manufactured without a license from the innovator company and marketed after the expiry date of the patent or other exclusive rights". Thus, a generic medication is identical to patented originator medications regarding

safety, quality, efficacy, dosage form, strength, and route of administration (United States Food and Drug Administration, 2022). On the other hand, patented medications are the originator medications that have been “discovered” and patented by the manufacturer to maximise economic gain for the period in which they are the sole producers of the drug.

4.2 Consumer risk-avoidance

Broman-Fulks et al. (2016) describe risk-taking as the perception of uncertainty surrounding the potential consequences of a purchasing decision. Thus, consumers may be reluctant to sample new products due to the scepticism surrounding the effectiveness of the new product, which is undetermined, especially when compared to established brands (Hofstede et al., 1999). Risk avoidance may further manifest as a selection of definite gains above undetermined gains (Brannon et al., 2012). Understanding consumers’ attitude towards risk is an essential factor in estimating their economic or purchasing behaviour (Dohmen et al., 2011). Therefore, it is fundamental to determine consumers’ perceptions of risk regarding generic pharmaceuticals, as these influence their purchasing behaviour (Abzakh et al., 2013; Maciejewski, 2012).

There are two risk-avoidance types: passive risk-avoidance and active risk-avoidance. Passive risk avoidance is when a consumer avoids risk by choosing an alternative with less perceived risk. In contrast, active risk-avoidance occurs when the consumer intently intervenes via the application of a risk-defusing strategy (Huber et al., 2014).

A risk-defusing strategy is an action taken by the consumer in addition to a pre-existing alternative that is expected to decrease the risk (Huber et al., 2014). For example, a yellow fever vaccination would be a risk-defusing strategy for the alternative of travelling to a country known to carry the risk of yellow fever infection. Therefore, integrating a risk-defusing strategy is a practical way of dealing with a perceived risk. The alternative option is then transformed into a less risky option; therefore, the risk-defusing strategy is a plausible predictor of the consumer’s choice (Huber et al., 2014).

Moreover, if an up-and-coming alternative is presented with an allowable risk-defusing strategy, the alternative will usually be selected (Abdellaoui et al., 2007). Numerous risk-defusing strategies have been identified. These include brand loyalty, product testing, special offers, money-back guarantee, and celebrity endorsements (Yee and Yeung, 2003).

In the generic pharmaceutical industry context, appropriate risk-defusing strategies include quality assurance, decreased price and information regarding product development and origin (Yeung et al., 2010). According to Huber et al. (2014), the difference between active and passive risk-avoidance is that consumers attempt to defuse the risk of an alternative when it has a promising outcome. This implies that applying an appropriate risk-defusing strategy to the marketing efforts of generic drug manufacturers may aid in gaining consumer confidence.

4.3 Purchasing behaviour and generic pharmaceuticals

Generic prescription medications are often viewed as riskier than brand name counterparts (Ganther and Kreling, 2000). As it is illegal to market prescription medication to the public (Pienaar and Visagie, 2019); one may argue that the consumer cannot be highly involved in the purchasing decision process. In addition, prescription drugs’ marketing information and clinical trial results are only allowed to be advertised to healthcare providers (physicians and pharmacists). Therefore, healthcare providers play a significant role in influencing the end-consumer’s decision via information sharing.

Advertising or promotion forms part of the marketing mix with which information is conveyed towards customers, which considerably affects the customer’s images, beliefs, and attitudes towards a particular brand. These beliefs and attitudes, therefore, in turn, affect their purchasing behaviour (Bhola et al., 2013). For example, direct to consumer (DTC) advertising of prescription medication may empower consumers to partake in their healthcare by providing information about available treatment options and safety risks (Ventola, 2011).

Moreover, DTC advertising may encourage over- and inappropriate- use of medications (Stange, 2007). DTC advertising via mass media (television and magazines) of prescription medications is prohibited in South Africa but has been legalised in the United States and New Zealand (Gray et al., 2020; Lee, 2019). The study from Hassali et al. (2009), showed that developed countries' consumers have more readily taken up the use of generic pharmaceuticals as they have increased knowledge and confidence about generic drugs. This was attributed in part to the countries' mass educational efforts. Therefore, the advertising regulatory bodies need to be more prescriptive in their guidelines regarding how the benefits and risks of medications are presented (Parekh and Shrank, 2018) if DTC advertising were to become an option in developing countries such as South Africa.

4.4 Theoretical framework

Several buying behaviour models are used to predict consumer purchasing behaviours (Chen and Antonelli, 2020). One commonly used research model that seeks to predict consumer behaviour is the theory of planned behaviour. The theory of planned behaviour (TPB) was developed by Ajzen (2002) based on the theory of reasoned action (TRA), which was found to have some limitations in dealing with behaviours over which people have incomplete control. Figure 1 depicts the theory in the form of a structural diagram.

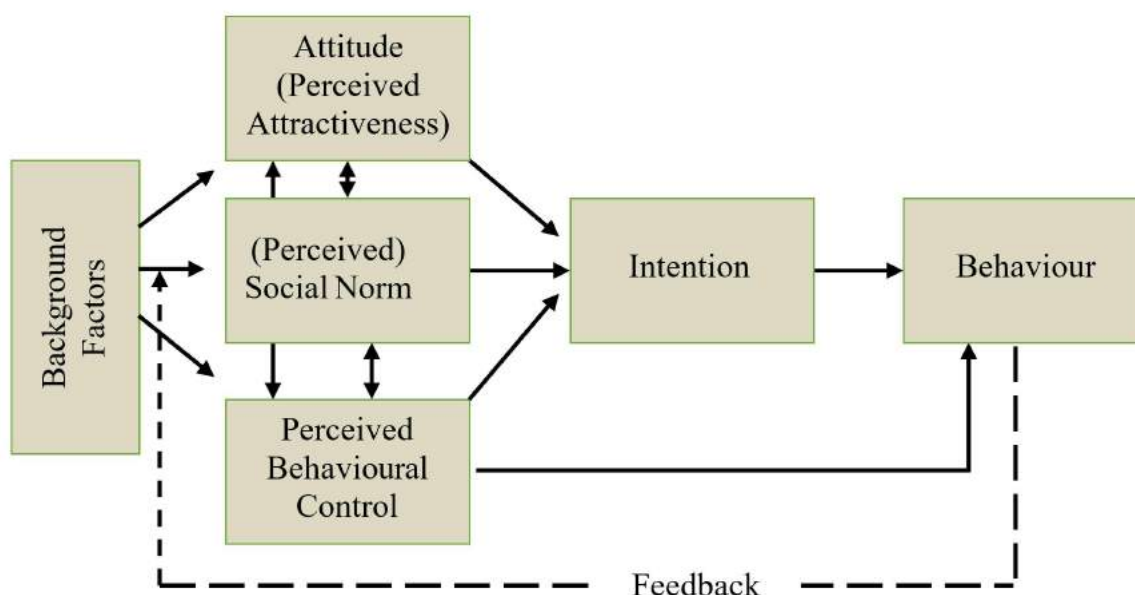

Figure 1: Theory of planned behaviour
Source: Karali (2013:9)

The central assumption of the TPB is that consumers make decisions by weighing different courses of action; that is, calculating the costs and benefits and then choosing the option that provides maximum expected benefits (Karali, 2013).

The model, therefore, belongs to the group of rational choice models. Although the model is familiar and widely used, it has been criticised mainly because human behaviour is highly complex and consists of moral, social, and altruistic behaviour (Abdulkadir et al., 2013). More often, behaviour is entrenched in social and collective decision-making contexts and other contextual factors. Despite the criticism, the TPB is a valuable model for this study. It offers insights into some important factors that can play a role in determining the purchasing behaviour of generic pharmaceuticals.

Karaatli (2015) advocates using the purchasing involvement scale as a helpful construct to better understand and predict purchasing behaviour. According to Laaksonen (1994), consumer involvement may hold important keys to developing marketing plans for products. Purchasing involvement is

described by Mittal (1989:148) as the “extent of interest and concern that a consumer brings to bear on a purchase decision task”. Mittal (1989) developed a purchase-decision involvement scale based on two empirical studies. This study adopts Mittal’s (1989) scale for measuring the respondents’ purchase involvement during the acquisition of medication.

4.5 Conceptual framework

Figure 2 shows that the risks consumers consider in making purchase decisions for generic pharmaceuticals include financial, performance, physical, and social risks. Financial risk refers to the risk of losing money when the product does not perform according to expectations, while performance risk is the risk that the product may not be safe or may result in physical harm (Roselius, 1972; Stone and Grønhaug, 1993). Performance risk is also the risk that a product may fail to perform according to expectations, while social risk refers to the risk that the product may result in others thinking less of the individual or in ego loss (Roselius, 1972; Stone and Grønhaug, 1993). Figure 2 also presents the conceptual framework that brings together the constructs that will be tested in this study.

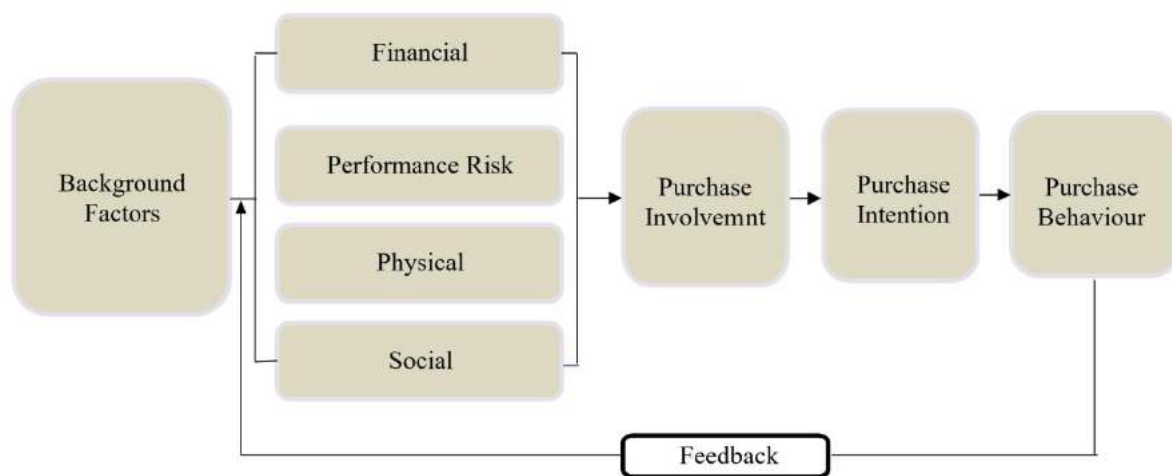

Figure 2: Conceptual Framework
Source: Own compilation

- Financial risk:** Financial risk, which is also referred to as economic risk, is the potential of incurring financial losses as a result of purchasing a product (Abzakh et al., 2013). In other words, financial risk focuses on consumers’ concerns about sustaining a possible financial loss if the generic drug does not perform as expected. Thus, financial risk plays a vital role in consumer decision-making. Reichheld and Schefter (2000) believed that although price is an indicator of financial risk, greater consideration needs to be given to the nexus between price and other service and relational factors. Therefore, to measure financial risk in this study, the extent to which the cost of generic pharmaceuticals and the fear of financial loss due to non-performance influences purchase decisions will be explored.
- Performance risk:** Performance risk is defined as the concern that the product might not perform according to the consumer’s expectations and will therefore not deliver the perceived benefits (Abzakh et al., 2013). Consumers assess service quality positively when their expectations of service are exceeded by their perceptions of the service that has been delivered. Therefore, the perceptions of the quality of generic pharmaceutical medication and its perceived effectiveness in treating chronic illnesses will be used in this study to measure performance risk.
- Physical risk:** Physical risk is defined as the potential of the products or services to have damaging or harmful effects on the health of individuals (Abzakh et al., 2013). To measure

physical risk in this study, factors such as perceptions of safety and the occurrence of side effects will be considered.

- **Social risk:** Social risk refers to the possible damage of status in an individual's social group due to purchasing or using a particular product or service (Abzakh et al. 2013, 43). Such groups include reference groups or peers. To measure social risk in this study, the extent to which family, healthcare practitioners, friends, and pharmacists influence consumers' choice of generic pharmaceuticals.
- **Other factors:** Consumers' knowledge of generic pharmaceuticals was cited by Guttier et al. (2017) as one factor influencing the choice between generic and branded pharmaceuticals. Guttier et al. (2017) also observed specific knowledge regarding price, quality, and packaging characteristics and concluded that there is a higher preference for purchasing generic drugs with a better understanding of generic drugs. To measure consumers' knowledge of generic pharmaceuticals in this study, awareness of the price and quality of generic drugs will be established.

5. Research Method

The study aimed to assess the influence of risk-avoidance on the purchasing behaviour of generic pharmaceutical prescription medication brands. By measuring the influence of risk-avoidance, insights were gained into factors that restrain customers from or drive customers towards purchasing generic prescription medications. This study was conducted in Gauteng. The data was collected from a prominent medical practice database. Selected patients were emailed a link to the questionnaire without any discrimination based on gender or race. Selected patients were over the age of 18. The suggested sample size was 200. The researchers collected 564 questionnaires, 362 of which were incomplete and thus excluded from the results. The results were therefore based on 202 completed questionnaires. The choice of Gauteng province was motivated by the fact that Gauteng was the province that recorded the second-largest expenditure on medications after KwaZulu-Natal. Gauteng had an approximate population size of 13.5 million and approximately 810 000 – 1 215 000 people in Gauteng use prescription medication for chronic illness. (Mamdoo, 2019).

In 2017, 88.3% of the total market spend was for prescription medication, of which generic medicines only made up 35.5% (Industry Insights, 2020) for illnesses that generic medications could treat with the same effectiveness (United States Food and Drug Administration, 2022). With the rising cost of healthcare in Gauteng and other parts of the country and a pressurised healthcare system due to the pandemic, finding avenues to save money is deemed crucial. Therefore, switching from patent/branded to generic medication is perceived as a channel that could help save money and curb unsustainable healthcare costs in South Africa (Erasmus and Kean, 2018).

5.1 Sampling

Purposive sampling was chosen as the most appropriate technique for this study. Purposive sampling enabled the researchers to identify participants who meet specific criteria to participate in the study. A criterion to partake in this study is that participants need to use prescription medications to treat/manage a chronic condition for a minimum of six months, as chronic prescriptions are renewed only once every six months. Additionally, only consumers purchasing medication from private pharmacies were selected, as the selection of medication stocked in public sector pharmacies is determined by the standard treatment guidelines and essential medicines list as set out by the ministerially appointed NEMLC (National Essential Medicines List Committee) (Matlala et al., 2020). This implies that consumers frequenting public sector pharmacies do not determine the choice of medication between generic and original brands; therefore, risk-avoidance will not play a role in their selection process.

This study adopted a quantitative, correlation approach to adequately address the problem statement. Given the objective to ascertain the extent to which risk-avoidance influences consumers' purchasing behaviour when deciding between generic or originator brand pharmaceuticals, determining the correlation between the variables is well-suited. This allowed the researchers to determine to what

degree risk-avoidance influences the purchaser's decision when deciding between generic and branded medications.

5.2 Research instrument

The questionnaire contains constructs to measure risk-taking behaviour and types of experienced risk, purchase intention and factors that influence purchase intention, and knowledge surrounding generic medications. The measure of risk was modified after Betz et al. (2002) conceptualisation of the risk-taking behaviour scale (RTBS). The modified RTBS was thus judged to be a suitable scale to measure a degree of risk-avoidance regarding generic pharmaceuticals, as it can be applied to the health and safety field.

Further questions were adapted from the purchasing involvement scale to investigate respondents' decision-making and purchasing behaviour (Mittal, 1989). Finally, further constructs in the questionnaire were adapted from various studies that sought to determine the attitude and behaviour of consumers towards the purchase and use of generic medicines and the types of perceived risks experienced. The constructs are summarised in Table 1 below.

Table 1: Constructs of the Study

Construct	Source
Purchase involvement	Mittal 1989
Purchase intent	Ajzen 2002
Purchase behaviour	Ajzen 2002
Knowledge of generic pharmaceuticals	Guttier et al. 2017
Social risk/influence of generic pharmaceuticals	Abzakh et al. 2013
Financial risk/Cost of generic pharmaceuticals	Abzakh et al. 2013
Performance risk/Quality of generic pharmaceuticals	Abzakh et al. 2013
Physical risk/Safety of generic pharmaceuticals	Abzakh et al. 2013

Source: Own compilation

5.3 Data collection and analysis

Data for this research was collected via an online questionnaire. After ethical clearance was obtained the link to the questionnaire was shared via email with the target audience. The questionnaire consisted of closed-ended questions from which the data was collected and analysed. In this study, descriptive statistics are utilised, such as central tendency measures and variability in quantitative data analysis. Inferential statistics were then used to determine whether there is a correlation between the dependant variable (use of generic or branded medication) and the independent variables (risk-avoidance, purchasing involvement, physician's influence).

Reliability analysis was conducted by calculating Cronbach alpha coefficients for each of the constructs. Analysis of variance (ANOVA) was done to test for mean differences between the three medication groups. Normal probability plots were inspected for normality and were judged acceptable. Levene's test was used to test for homogeneity of variance, and in cases where it was significant, the Welch test was done. The Welch test results were in all cases similar to the original F- test results, and therefore only the F-test results were reported. For post hoc testing, the Fisher least significant difference (LSD) test was used. A principal components analysis (PCA) biplot was used as a summary graphical representation of the ANOVA results.

5.4 Validity and Reliability

This study's reliability was enhanced via the provision of clear guidelines for completing the questionnaire. Furthermore, the reliability was then checked via consistency reliability estimates as Likert-scale items were involved. Finally, the reliability of this study was strengthened through appropriate meticulous sampling. The validity of this study was enhanced by ensuring that the questionnaire was easy to use with clear instructions. Additionally, the aim of the research was clearly

described before participants were asked to participate. To attain credibility, purposive sampling was used. This ensured that the participants in the sample selection could provide valuable data.

A pilot study aided the researchers in correcting any identified errors in the questionnaire design before fieldwork was conducted. Thus, pre-tests were administered to a sample of 16 participants before fieldwork was started. Nil errors were identified, and the instructions for the questionnaire were found to be precise. The 16 participants were not part of the sample for the final study.

6. Results

This research was conducted with the primary objective of ascertaining the extent to which risk-avoidance influences consumers' behaviour when deciding between generic or originator brand pharmaceuticals. In this section, a detailed discussion of the findings from quantitative data collection and analysis is provided. The target population represented in this survey were selected from the researcher's database of patients who frequent her general practice. All chosen participants reside in Gauteng were above the age of 18 and users of chronic medication for a minimum period of 6 months. This implies that they frequent a private pharmacy at least once a month.

The selected population were emailed the link to the questionnaire with no discrimination on gender or race. Demographic details were not collected to ensure the responses remained anonymous without any identifying data, enabling the researchers to trace results back to a specific respondent. The Cronbach's alpha coefficient was used to measure the internal validity of the survey questionnaire.

The results for each of the variables are presented in Table 2. According to George and Mallery (2003), Cronbach's alpha coefficients greater than 0.70 are considered acceptable, while those below 0.5 are regarded as unacceptable. Table 2 shows that the two variables that had reliability estimated above 70% are purchase involvement and quality of generic medication. However, none of the variables had an unacceptable reliability estimate as they were all above 0.70.

Table 2: Summarised Scales of Cronbach's Alpha

Summed scales	Cronbach's alpha
Purchase involvement	0.73
Knowledge of generics	0.84
Safety of generics	0.79
Quality of generics	0.84
Cost of generics	0.71
Social influence	0.79

6.1 Descriptive statistics

The respondents were asked to indicate the types of medication that they purchase, with three options to select from: generic only, branded medication only, or both generic and branded medication. The results are summarised in Table 3.

Table 3: Types of Medication Purchased

Type of medication	Number of respondents
Generic medication only	10 (5%)
Branded medication only	22 (11%)
Both generic and branded medication	170 (84%)

The results in Table 3 show that only 5% of the respondents purchase generic medication only while 11% purchase branded medication only. Thus, the majority (84%) of respondents purchase both generic and branded medication.

The respondents were further asked to indicate how often they purchase generic medication. As shown in Table 4, 8% of the respondents said they never choose generic medication, while 38% said

they sometimes choose. In addition, 4% were not sure while 39% ticked several times. The remaining 11% of the respondents indicated that they always select generic medication.

From this analysis, the highest number of respondents indicated that they always choose generic medication. Regarding how often they choose branded medication, 4% of the respondents indicated that they choose branded medication, 47% sometimes choose it, and 4% were not sure. In addition, 33% indicated that they choose branded medication several times while 12% always choose branded medication. Thus, the results show that the most significant number of respondents sometimes choose branded medication.

Table 4: Frequency of Purchase of Generic and Branded Medication

	Never	Sometimes	Not sure	Several times	Always
How often do you choose generic medication?	16 (8%)	76 (38%)	9 (4%)	78 (39%)	23 (11%)
How often do you choose branded medication?	9 (4%)	95 (47%)	8 (4%)	66 (33%)	24 (12%)

Furthermore, the respondents were asked to indicate whether they would consider purchasing generic pharmaceuticals the next time they buy medication. The responses are summarised in Table 5. Regarding whether they would consider purchasing generic medication next time, the most significant number of respondents (43%) indicated a yes, followed by 24% who said they would definitely buy and 23% who said they would sometimes buy. Of the remaining 10%, 5% were unsure, and 5% would never consider purchasing generic pharmaceuticals.

Table 5: Will Consider Generic Pharmaceuticals

	Never	Sometimes	Not sure	Yes	Definitely
I will consider purchasing generic pharmaceuticals next time I buy medication	10 (5%)	46 (23%)	10 (5%)	87 (43%)	49 (24%)

As shown in Table 6, the variable purchase involvement had a mean of 3.74, a median of 3.83, and a standard deviation of 0.6504, with minimum and maximum values of 1.7 and 5, respectively. This shows a positive perception of the extent to which purchase involvement plays a role in influencing the purchase of generic medication. The rest of the variables have mean scores above average, implying that most participants agreed with the statements relating to the variables. The knowledge of generic medication variable had the highest mean score. The standard deviation figures for all the variables were less than one, meaning that the individual responses rarely deviated from the mean.

Table 6: Descriptive statistics of study variables

Variable	Mean	Median	Standard Deviation	Minimum	Maximum
Purchase involvement	3.74	3.83	0.6504	1.7	5
Knowledge of generic medication	3.78	3.68	0.6354	2	5
Safety of generic medication	3.67	3.5	0.7593	1	5
Quality of generic medication	3.51	3.75	0.862	1	5
Cost of generic medication	3.58	4.0	0.9763	1	5
Social influence	2.73	2.75	0.7535	1	5

6.2 Inferential statistics

To establish the relationships between the study variables, analysis of variance (ANOVA) and Pearson correlation tests were conducted. ANOVA was conducted (see Table 7) to establish any significant differences between the means of the types of medication.

Table 7: ANOVA Results

Variable	Mean and Standard Deviation – Generic medication only	Mean and Standard Deviation – Branded Medication only	Mean and Standard Deviation – Both generic and branded medication	ANOVA Result
Purchase involvement	3.85 (0.64)	3.98 (0.85)	3.7 (0.62)	F(2, 199) = 4.9450, p=0.15
Knowledge of generic medication	4 (1.07)	3.24 (0.55)	3.83 (0.58)	F(2, 199) = 9.8814, p<0.01
Safety of generic medication	3.95 (0.8)	3.05 (0.95)	3.75 (0.68)	F(2, 199) = 9.7691, p<0.01
Quality of generic medication	3.5 (1.12)	2.68 (0.83)	3.62 (0.79)	F(2, 199) = 12.924, p<0.01
Cost of generic medication	4.05 (1.04)	2.45 (0.97)	3.7 (0.87)	F(2, 199) = 20.436, p<0.01
Social influence	2.75 (1.32)	2.61 (1.13)	2.75 (0.69)	F(2, 199) = .28886, p<0.75

As shown in Table 7, there is no significant difference between the mean for generic medication only, branded medication only, and both generic and branded medicines in respect of the purchase involvement variable ($F(2, 199) = 1.9450, p = 0.15$). This shows that the purchase involvement for the three types of medication is not significantly different. Likewise, for the variable social influence, there is no significant difference between the means for the three types of medication ($F(2, 199) = .28886, p < 0.75$). However, there is a significant difference between the means for the three types of medication for the rest of the variables. This shows that participants' perceptions of each variable significantly differ according to the type of medication. The relationships between the different variables and the purchase of generic medication are shown in the biplot in Figure 3.

Figure 3: Biplot Results

The points in the biplot indicate that the highest preference is for both generic and branded medication, as these points are the ones that are close together. The points for branded medication only and

generic medication only are far away from each other, indicating that there is a small number of consumers who prefer generic medication only and branded medication only. These results are in line with the frequency results, which show that most (84%) participants indicated that they would purchase both generic and branded medication. The vectors in the biplot show that the knowledge of generic medication, the safety of generic medication, quality of generic medication, and cost of generic medication have a similar influence on the intention of consumers to purchase generic medication.

A correlation analysis was conducted to establish the influence of the different consumer risk factors on the purchasing behaviour of generic pharmaceutical brands. The Pearson correlation coefficient of the measured variables was used. The Pearson correlation test measures the strength, direction, and significance of a relationship between variables. The results for the Pearson correlation test are summarised in Table 8.

Table 8: Pearson Correlation Test Result

Variable 1	Variable 2	Pearson correlation coefficient	Pearson p-value
Purchase involvement	Purchase intention of generic medication	-0.21	<0.01
Knowledge of generic medication	Purchase intention of generic medication	0.49	<0.01
Safety of generic medication	Purchase intention of generic medication	0.48	<0.01
Quality of generic medication	Purchase intention of generic medication	0.58	<0.01
Cost of medication	Purchase intention of generic medication	0.56	<0.01
Social influence	Purchase intention of generic medication	-0.03	0.71

The results in Table 8 show the following relationships:

- First, there is a significant weak negative relationship between purchase involvement and purchase intent for generic medication ($r(202) = -0.21, p < 0.01$).
- There is a moderate positive relationship between knowledge of generics and purchase intent for generic medication. The relationship is significant ($r(202) = 0.49, p < 0.01$).
- There is a significant moderate positive relationship between the safety of the generic medication and purchase intention for the generic medication ($r(202) = 0.48, p < 0.01$).
- There is a significant, strong positive relationship between the quality of generic medication and purchase intention for the generic medication ($r(202) = 0.58, p < 0.01$).
- There is a significant strong positive relationship between the cost of generic medication and purchase intention for generic medication ($r(202) = 0.56, p < 0.01$).
- There is a very weak negative relationship between social influence and purchase intention for generic medication. The relationship is not significant ($r(202) = -0.03, p = 0.71$).

7. Discussion of Findings

Despite evidence that consumers can save a minimum of 20% of what they spend on medication by switching from branded to generic pharmaceuticals, the transition from patent/branded to generic medication has been agonisingly slow (Hassali and Shafie, 2008). With the rising healthcare costs in Gauteng and other parts of South Africa and a pressurised healthcare system due to the Covid-19 pandemic, finding avenues to save money is deemed crucial.

In this regard, this study aimed at ascertaining the extent to which risk-avoidance influences consumers' behaviour when deciding between generic or originator brand pharmaceuticals. These

risks include financial, performance, physical and social risks. Thus, by identifying the type(s) of risk experienced by consumers when deciding between the purchase of a generic or patented/branded medication, misconceptions about generic medicines may be identified and adequately addressed.

The study results identify two risk factors that have a strong, positive, and significant influence on the intention of consumers to purchase generic medication: financial risk (cost of generic drugs) and performance risk (quality of generic medication). According to Abzakh (2013), financial risk focuses on consumers' concerns about sustaining a possible financial loss if the generic drug does not perform as expected. In contrast to the findings of this study, Abzakh et al. (2013) found that there was no significant relationship between financial risk and consumer resistance towards generic medication. Concerning performance risk, Abzakh et al. (2013), however, found that there is no significant relationship between performance risk and consumer resistance towards the purchase of generic medication.

Physical risk (safety) significantly and positively influenced the intention to purchase generic medication. When consumers have doubts regarding the standards of generic drugs, they often resist purchasing and consuming them. Abzakh et al. (2013) found a significant positive relationship between physical risk and consumer resistance towards generic medication. Nardi et al. (2015) cited medication safety as an essential factor in purchasing generic medicines.

The results also revealed a moderate positive relationship between knowledge of generic drugs medication and the intention to purchase such medication. This means that the knowledge concerning the medication, efficacy and prices of generic pharmaceuticals are likely to influence the purchasing decisions of such pharmaceuticals. For example, a study conducted by Guttier et al. (2017) found knowledge of generic medication to be a significant predictor of the intention to purchase generic medication. The observations in the aforementioned study included knowledge regarding the packaging's quality, price, or characteristics. The study concluded that those with a better understanding of generic medication had a higher preference to purchase them. Contrary to the findings by Guttier et al. (2017), Keenum et al. (2012) found that although the majority of their study participants possessed adequate knowledge about generic medications, only a minority expressed a preference for generic over branded medications. The authors (Keenum et al., 2012) attributed this to possible prior negative experiences with such medications.

With social risk, the relationship was weak, negative, and insignificant. Thus, social influence is not regarded in this study as a significant predictor of consumers' intention to purchase generic medication. This is consistent with the findings of Abzakh et al. (2013), who found no meaningful relationship between social influence and consumer resistance to purchasing generic medication.

Managerial Implication

The literature on risk-avoidance suggests that despite evidence indicating that by switching from branded to generic medicines, consumers can save a minimum of 20% of what they spend on medication, the transition from patent/branded to generic medication has been agonisingly slow. Therefore, this study identified some risk factors that impact the intention of consumers to purchase generic medications. The situation calls for managerial action to develop strategies for improving the adoption of generic medications among patients and reducing their expenditure on medication (Arcaro et al., 2021). Furthermore, the current negative perceptions surrounding the quality, safety and effectiveness of generic medication need to be dealt with to ensure that patients embrace such medicines with confidence, thereby reducing their expenditure on medication.

There is a need for health authorities to promote generic medications through educational enlightenment programs and campaigns in pharmacies, clinics, hospitals, and mass media such as television and radio programmes. Such educational interventions should encompass all aspects of generic medications, namely bioequivalence, effectiveness, safety, equivalence with branded medication in terms of quality and availability.

In addition, generic pharmaceutical companies should educate doctors and pharmacists on the benefits of their products, paying enormous attention to their safety, effectiveness and associated cost savings. This is primarily because doctors and pharmacists may be instrumental in promoting the adoption and use of generic medications as they have direct contact with patients. They can increase patients' knowledge of generic medications through their positions.

Limitations and Recommendations for Future Research

The major limitation of this study is that it only focused on the research problem from the consumers' point of view. The prominent people behind the prescription of medication are doctors and pharmacists; thus, they play an essential role in the decision-making process. Therefore, their prescription behaviour, level of understanding, and views are crucial to holistically understanding the issue under inquiry. Thus, it is recommended that future studies include physicians and pharmacists. Another limitation of this study is the geographical coverage. The research participants resided in the Gauteng Province only, and the population consisted of people on medication for chronic illnesses and information was obtained from the researchers' database. In this regard, future studies should include more provinces and extend the people to include other patients with different types of diseases.

Conclusion

The study's results indicate a strong positive and significant relationship between performance risk (denoted by quality) and financial risk and consumers' intention to purchase generic medication. For the other variables, such as knowledge of generic medicines, physical risk showed a moderated, positive and significant relationship with consumers' intent to purchase generic drugs. The remaining two variables purchase involvement and social risk – showed a weak, negative, and insignificant relationship with consumers' intention to purchase generic pharmaceuticals. The results imply that health authorities should focus on providing adequate and authentic information on the effectiveness and safety of generic medication to dispel their fears of financial losses and health risks when they use generic medication. Therefore, consumer education on generic medication may be crucial to influence consumers' intentions to purchase generic pharmaceuticals.

Exploring Marketing Communication Alternatives For Ministries In The Reformed Churches

Johan Hatting^{1,*} and J.J. Prinsloo²

^{1,2} Business School, North-West University, Potchefstroom, South Africa

Keywords

Religion, church marketing, marketing segment, differentiation, digitalisation, sister churches, marketing strategy, community.

Abstract

Religious marketing is foreign to the tradition of the reformed churches. This research explored the importance of a marketing strategy, especially with the decline in membership numbers over the last ± 20 years. The marketing industry would call this a loss of market share in a specific market segment.

The problem described above gave rise to the following main research question:

What marketing strategy can be developed to help the reformed sister churches and, more specifically in this research, the Nederduitsch Hervormde Kerk van Afrika (NHKA), recover their market share by effectively and efficiently marketing their ministries?

Since they enjoyed state protection, the three sister churches in South Africa had a growth phase from 1843 until 1992. During this period, the three Afrikaans sister churches had the privilege of having national media exposure. The current situation has changed significantly and Churches that follow a prosperity theology, such as the Christian Revival Church (CRC), have cut into the target market of the reformed churches.

The most prominent themes that emerged from the empirical data were: -

- no marketing strategy for the three Afrikaans sister churches,
- the restrictions that Covid-19 brought mean that the new normal is digitalisation,
- an inside-out communication strategy, and
- the importance of marketing strategy.

1 Introduction

Since 1998, the membership numbers of the three Afrikaans sister churches – *Nederduitsch Hervormde Kerk van Afrika* (NHKA); – *Nederduitsch Gereformeerde Kerk* (NGK) and the– *Gereformeerde Kerke in Suid-Afrika* (GKSA) has been showing a steady decline. The NHKA grew to 170 011 members by 1998, spread over 311 congregations. From 1998 to 2019 (21 years), the NHKA decreased by 89 639 members (Dreyer *et al.*, 2020). The NGK decreased by more than one million members between 2003 and 2019 (Oosthuizen, 2019) and the GKSA by 25 657 members between 1998 and 2018(GKSA, 2018). Some of the declines in the membership numbers of the three Afrikaans sister churches can be attributed to the negative birth rate and emigration trends in the white Afrikaans-speaking communities (Van Staden, 2009).

In contrast with the three Afrikaans sister churches, communities that promote prosperity theology, such as the Christian Revival Church (CRC), founded in 1994, grew from 183 members to more than 70 000 members by 2020 (Boshoff & Boshoff, 2020). In the northern suburbs of Pretoria, 66 home churches and other Christian denominations were established between 2010 and 2018 (Scholtz, 2018).

The three Afrikaans sister churches have fallen into a comfort zone. In business terms, the decrease in members and the rise of other Christian denominations means that the three Afrikaans sisters

Churches have lost market share. The research focused on a marketing strategy that can be implemented to regain market share. The marketing strategy and target market have to keep track of the millennials' and the upcoming Z generation's questions and needs. The research focused on the youth because of the growth potential.

One study has shown that the negative birth rate and emigration trends in the Afrikaans population group could be a reason for the decrease (NHKA (Nederduitsch Hervormde Kerk van Afrika), 2019).

2 Problem Investigated

Marketing is a sensitive issue in the church environment because God's Word is often considered not marketable. However, the message of the Word and the operational part of a church's ministries are, in fact, marketable (McSpadden, 2014:48). The goal is to set up a marketing strategy to gain access and recover a portion of the market share available to the three Afrikaans reformed churches. Michael Porter's five forces evaluate a business organisation's competitive strength and position (Walker & Mullins, 2014:99). According to this model, the three Afrikaans reformed churches have lost market share.

The primary purpose of the NHKA is the *Missio Dei* (missional ministry) and the *passio Dei* (compassion ministry) (Louw, 2016:336-354). As such, the primary message of the Gospel is marketable through churches' ministries and their members as living witnesses. The NHKA's mission statement names (i) community, (ii) celebration, (iii) service and (iv) witnessing as the four pillars of the primary purpose. The mission statement forces the church to self-examine so they can be living witnesses with a global, marketable mission statement (Jordaan, 2007).

The available literature and statistics show that the reformed churches do not market themselves effectively and efficiently to increase their market share. According to Statistics South Africa, the white population of South Africa (the market segment of the reformed churches) has grown by 2% from 2011 to 2020 (Stats SA, 2020). Most members of the NHKA belong to this group. If the national figures indicate growth in the ethnic group's population, we must ask why the membership numbers of the NHKA have been showing a decline?

One of the questions is why people are joining the emerging religious groups rather than the established churches. Are the sister churches losing market share in a small but ever-diversifying market segment?

The problem statement commutes the following: "Despite relative population growth in South Africa, the Afrikaans sister churches continue to experience a downward trend in their membership numbers year on year."

3 Research Objectives

The three Afrikaans sister churches have the same dilemma. They are losing members each year, even though there is population growth. The question is, what can be done to stop the decline? This broad question can be investigated by addressing the following questions below.

The **research question** this study intended to answer was:

What marketing strategy can be developed to help the NHKA recover market share by effectively and efficiently marketing their ministries?

Based on this, the objectives have been formulated as follows:

Primary objective

- This study aims to identify marketing guidelines to help the NHKA effectively and efficiently market its operational ministries.

Secondary objectives

- To gain insight into the current marketing strategy of the NHKA.

- To conduct a literature study of related sciences to understand the current situation and the cultural differences between the age groups in the NHKA.
- To determine the marketing tools that can support the NHKA's objectives so that the church can effectively and efficiently market its operational ministries.
- To propose a marketing guide to the NHKA that can help the church effectively and efficiently market its operational ministries.

4 Literature Review

Over time, all churches worldwide change and develop with the times. The global historical events ultimately played into the establishment of the NHKA in South Africa and the development of the denomination after its birth. This is followed by an evaluation of the recent trends in the denomination to highlight the importance of a fruitful marketing strategy for the NHKA.

The historical development of the reformed churches in South Africa follows significant historical shifts in the early churches over a period. These shifts influenced the culture of the reformed churches and, with that, the current understanding of marketing within the context of the church environment.

4.1 The period 500–1555 AC

In 313 AC, the Edict of Milan established religious tolerance of Christianity under Emperor Constantine of Rome (Dreyer, 2016:2). As a result, the Christian civilisation in Europe developed rapidly from 500 to 1500 AC. This period is also known as the Middle Ages. During this period, Rome lost its power over western Europe to Germanic tribes (Van Wyk, 2019: 203). However, three offices still greatly dictated the developments within the early church (Pont, 1978:77):

- Monks – Benedictus established the monks in Europe, and monasteries gradually became influential.
- The Pope – The Pope fulfilled a spiritual and political leadership role.
- Civil authority (the Emperor). There was a close relationship between the Emperor and the Pope since the Pope crowned the emperor. In effect, the Emperor was subordinate to the Pope

With this, the culture of remorse and indulgence developed, which Luther later wrestled with. The goal of indulgence was for an individual believer to buy their freedom from any sins. The first form of indulgence was ordained in 1035 to finance the building of the Pieters Church (Van Wyk, 2019:60). On 31 October 1517, Martin Luther nailed 95 statements to a church door in Wittenburg. These 95 statements argued against the abuse of indulgence and started the Reformation (Van Wyk, 2017:187-188).

On 10 December 1520, Luther openly burned the papal proclamation condemning him as a heretic and the canonical law books of the Roman Catholic Church. With this action, Luther rejected the pope and the Roman Catholic Church, and he no longer recognised the Roman Catholic Church as a church (Van Wyk, 2019:119). In 1530, Philippus Melancton, an associate of Luther, submitted a confession of faith to Emperor Charles V, who rejected it. In the period leading up to 1555, there was much opposition and violence against the protestants. In 1555, the Reformation was embraced in what is now Germany. Although Luther died in 1546, he witnessed this expansion (Pont, 1978:130-131).

4.2 The period 1555–1652

After Luther, Calvin became the centre of the Reformation. One of Calvin's seminal works is the Catechism of Geneva, which later served as the basis for the Heidelberg Catechism. Calvin saw the church as a community of believers with Jesus Christ as its head. Therefore, the church is not an institution of people but a gift of God to the people. Calvin established the presbyterial order of the church (Dreyer, 2016:115). Since the Holy Spirit is also in the word of God and involved in the sacraments of a congregation, that means the church is *ecclesia complete* (Dreyer, 2016:115). The

structure of the presbyterial order, which is mirrored in the three sister churches today, is ruled by meetings of the office-bearers. These office bearers are referred to as (Dreyer, 2016:95):

- Ministers: They preach and study the Word of God.
- Elders: Those who govern the church and congregation.
- Deacons: They collect tithes and take care of the poor.

These office bearers do not rule alone but as meetings. These include:

- The church council meeting
- Class meeting or circuit meeting
- Synod or general church assembly

Despite many wars between the Roman Catholic Church and the Reformation of the Protestants in the time period 1547 – 1648, Fredrich III (1515–1576) welcomed Calvinists in Germany. Under his governance, the first Heidelberg Catechism was published in February 1563 (Van Wyk, 2017:156). Despite the wars, Protestantism spread to Germany, France, England, Scotland, the Netherlands, and later South Africa, often with much bloodshed.

4.3 Protestantism in South Africa 1652–1806

Jan van Riebeeck, a protestant, brought the reformed tradition to South Africa in 1652. This means that the reformed churches in South Africa grew from the Dutch protestants (Van der Merwe, 2014:113). As the refreshment station grew and a colony was established, the need for spiritual care grew. At first, a comforter for the sick was appointed, which later expanded. Reverend Johannes van Arckel became the first minister in the Cape colony. While the Cape had been in the hands of England (1795 – 1803), the Dutch developed a distinction between the role of the state and the role of the church (Pont, 1978:229-234).

The acceptance of the Church Order written by General JA de Mist in 1804 opened the door to other religious groups and other Christian traditions in the Cape. At this point, the Roman Catholic Church and Islam entered the religious scene (Van der Merwe, 2014:119-121).

4.3.1 The development of the three sister churches in South Africa

In 1816, the General Church Assembly accepted a church law that established independence from the churches in the Netherlands. The title of the church law was “*Algemene Reglement voor het Bestuur der Nederduitsche Hervormde Kerk in Zuid-Afrika*” (Pont, 1978:236). With the acceptance of the new church law in 1842, the name of the church in the Cape colony changed to “*Nederduitsch Gereformeerde Kerk van Zuid-Afrika*.” The term “*Hervormd*” and “*Gereformeerd*” both carry the meaning of “reformed” in English (Strauss, 2019:368).

On 8 November 1843, Ordinance 7 was accepted by the Legislative Council of the Cape with the heading “*The Separation of Church and State Petition*” it became state law, specifically in the Cape colony (Coertzen, 2016:199). Ordinance 7 of 1843 was recognised up to 1996 when the new Constitution of South Africa was accepted (Coertzen, 2016:2).

With the strong influence of England and the fact that church laws and state laws were enmeshed, the anglicisation of the Cape colony was inevitable. This anglicisation meant that the churches in the Cape colony lost some of their connection to the NGK in the Netherlands (Coertzen, 2016:197). Thanks to the Great Trek, the Afrikaners (known as the “trekkers”) preserved their language and culture with its Dutch influence (Pont, 1978:239).

By 1840, two diverging theological trends had developed in the Cape. The first was liberal theology with a strong relationship with the church in the Netherlands. The second theological trend was the English-American Methodism (Pont, 1978: 242). The anglicisation was one of the main reasons why the “trekkers” felt the urge to move inland (South African History Online, 2011).

As early as 1685, with the first mention of a new nation with a new language, this group referred to themselves as Christians. In 1707 Hendrik Bibault referred himself as an "Afrikaner" (Oliver, 2019). Right from the start, the "Afrikaner" was considered a Calvinist (Oliver, 2019). The innate stubbornness of the Afrikaner people has always been and still is a cause of internal conflict and frequent severance. The characteristics of the Afrikaner people include (i) strong-minded individualism, (ii) stubbornness, and (iii) collective persistence. The resulting internal strife is also visible in the history of Afrikaans churches (Oliver, 2019). This strong individualism and persistence of the Afrikaners became visible between 1835 and 1840 when 12 000 to 14 000 Calvinist Afrikaners migrated ("trekked") inland. In 1852 the British Parliament acknowledged the independence of the "trekkers" in the Transvaal, at the time known as the Zuid-Afrikaansche Republiek (ZAR) (Dreyer, 2006:1338). The constitution of the ZAR determined that the *Nederduitsch Hervormde Kerk* carried favour over other churches.

The pre-1994 government gave media exposure and other support to the three sister churches. One example is the practice of broadcasting the worship services of the sister churches on Sunday morning and evening by the South African Broadcasting Corporation (SABC). Coverage included radio and television (Scharnick-Udemans, 2016).

Up to 1991, the South African Broadcasting Corporation (SABC) had five permanent ministers in the religious division who regulated the broadcasting of Christian programmes (Buitendag, 2021).

4.3.2 The three sister churches after 1994

After 1994, a socio-political transformation took place. With the ratification of the Interim Constitution of 1993 and the Constitution of South Africa in 1996, the government protection of the three sister churches ended. The Constitution of 1996 prioritises individual rights over group rights (Barnett, 1998:557). Section 30 of the Bill of Rights protects the culture, religion and language of all South Africans (Scharnick-Udemans, 2016:126).

This ended the special protection of the protestant churches as a so-called "state churches". This opened the field for churches that promote prosperity theology, such as the Christian Revival Church (CRC), one of the fast-growing communities. The community was founded in 1994 by Pastor At Boshoff and has grown from 183 members to more than 70 000 members by 2020 (Boshoff & Boshoff, 2020). During the same period, the NHKA lost 34 545 members.

Table 1 - Loss of members (Dreyer et al., 2020)

	Members gained	Members departure	Nett Total
1999 – 2008	50,233	61,217	(10,984)
2009 – 2018	22,699	46,160	(23,461)
Total	136,293	166,238	(34,545)

With the acceptance of the Constitution in 1996, Ordinance 7 of 1842 was replaced by the Independent Broadcast Commission. The purpose of the Independent Broadcast Commission is to ensure that the government does not interfere with the media (Barnett, 1998:555). Due to a financial crisis, the sale of the radio stations in 1997-1998 paved the way for regional and community radio stations.

In Matthew 28:19, believers receive the mandate to go to all the people and make them disciples "...teaching them to observe everything I commanded..." (Bible, 2018:61). It is an instruction to do missionary work. The term "*mission Dei*" is the theological term for missionary work (Dreyer, 2020:253). According to my understanding as a Christian, it is the command to go and tell people about God. From a world perspective, it is marketing. The protestant churches have never explored or used extensive marketing opportunities like the CRC has been doing since 1992.

Social media and wide digitalisation have further complicated the challenges of the protestant churches in the 21st century. The fast-moving world of technology is a considerable challenge. If we look at the history of the ministries of the three sister churches, decisions have never been made quickly.

How prepared are congregations to use the open digital world? Secondly, to what extent are they ready to use it? Will the remnants of the old regime restrict them? What impact will a digital church have in a post-Covid-19 environment? The pandemic was more disruptive than interruptive, but it also opened the window to new opportunities (Nieuwhof, 2020).

4.4 The current marketing strategy of the *Nederduitsch Hervormde Kerk in Afrika*

The NHKA has no written strategic marketing plan. With the decline in the number of confessing members, the congregations of the sister churches have been struggling to survive over the last 25 years. That is an indication that the three sister churches are in the decline phase of the life cycle of an organisation.

Reverend Barnard explained this problem very well during an informal discussion on the 2nd of March 2022 in the form of an image of speech. He said the three sister churches have flying turkey syndrome (Barnard, 2022). They work hard to get into the air but not high enough to get over the wall, so they fly into the wall time and again. The outcome is that the turkey becomes quicker and faster in its efforts to hit the wall again.

In 2003 Kung made the statement in his book "Credo: The Apostles Creed explained for today": "many people called them religious, but not Christian; many call them Christians but not church members" (Kung, 2003).

4.5 Changes in the marketing strategy of the church over time

The church and the demands of its members have changed over time. It is noticeable that the indulgence system of the early church was commercialised during the Roman Empire to build the St. Peter's Basilica in Rome. (Van Wyk, 2019:61).

With the refreshment station established at the Cape, the Dutch East India Company commercialised it and promoted church planting in the Cape (Van der Merwe, 2014:115). From 1652 until 1994, the protestant reformed churches enjoyed state protection and had the privilege of exclusive public exposure from the national broadcaster (Buitendag, 2021:33-34; Scharnick-Udemans, 2016).

With the acceptance of the Constitution in 1996, the privilege of state protection was lost. It is noticeable that the three sister churches have lost some market share within the market segment to other religious groups.

The challenge for the church is not only to compete with other religious groups but also to keep up with the use of new technology like social media and digital communication.

Due to historical differences and the nature of their composition, the three sisters churches have no written marketing strategy to compete against the other religious groups in the same market segment.

5 Research Methodology

This study examines a particular phenomenon, which means that processes and methods used to obtain knowledge should be trustworthy (Botma *et al.*, 2010:39). As such, the research is exploratory in nature.

A qualitative, non-probability purposive sampling method was selected as the most suitable for the aim of the research. The study results can therefore not be generalised as the findings will be relevant only to the specific context.

The researcher used phenomenology to gather information from the available sources (Bryman & Bell, 2014:184). When using phenomenology, the empirical fieldwork data is about people's experience, behaviour, socialisation, cultural values and everything related to bodily action (Botma *et al.*, 2010: 190). In this study, data were collected in the following ways:

- A literature review.
- Group interviews based on an interview schedule with open-ended questions.
- Analysis of the data collected during the “Kerkspieël” project.

5.1 Research philosophy

The study departs from an interpretive point of view as the views and understanding of insiders and how they interpret reality are inseparable (Botma *et al.*, 2010:42). Interpretivism emphasises the role of people, how they interact with a phenomenon, and the relationship of these interactions with how the phenomenon is investigated (Botma *et al.*, 2010:185, 190).

The researcher can see how the entities (congregations) are a group at different levels within an ontology. Ontological assumptions cannot be separated from the culture, values and beliefs of the church members (Bryman & Bell, 2014:19). Therefore, ontology cannot be separated from epistemological research. Epistemology questions the acceptable standard of knowledge of the discipline.

5.2 Meta-theoretical assumptions

It is not easy to prove what people believe and why. In this study, participants' meta-theoretical assumptions about marketing in a religious environment in a postmodern time will affect the research outcome. The researcher tested participants' beliefs and opinions by conducting interviews via Zoom. The researcher has no control over the philosophy, views, experiences, and background of the participants.

5.3 Theoretical assumptions

Assumptions are those things people adhere to as true but cannot be proven. These assumptions affect the face value of information. Participants' answers may vary due to their interpretation of the open-ended questions during the interview and the assumptions they hold.

5.4 Research design

This research is a qualitative study using a non-probability, purposive sampling technique. The researcher sought to understand why the people in the relevant group what do they do. It was essential to gather divergent data from the purposive sample.

Marketing can be defined as a goal to meet or outperform customer expectations to grasp market share (Fahy & Jobber, 2019:5). Phenomenology entails that the research is focused on a specific group of people and a cultural behaviour (in this case, a church congregation). In turn, the study of religion is influenced by the culture within which the exploration occurs.

Qualitative data were collected through a semi-structured focus group interviews schedule to determine why the reformed churches lost market share.

Due to limited time, the study was cross-sectional.

5.5 Population and sampling

5.5.1 Population

The population for the study included all the members and the management teams of the 289 NHKA congregations in South Africa (Dreyer *et al.*, 2020)

The 289 congregations are distributed over the nine provinces as follows:

Table 2 - Congregation per province

Provinces	Number of congregations per province
Gauteng	102
North West	46
Mpumalanga	43
Northern Cape	10
Western Cape	12
Eastern Cape	8
Free State	24
Limpopo	29
KwaZulu-Natal	15
Total	289

5.5.2 Sample

Church leaders and management teams from selected congregations in South Africa were approached for a Zoom interview using an open-ended interview schedule. The secretary of the NHKA gave consent for the research (see Appendix A). The sample included male and female members from different age groups and fiduciary members (responsible persons).

Each congregation of the NHKA is responsible for managing its operations.

During the fieldwork phase, the Disaster Management Act 57 of 2002, under level 3 of the regulation, determined that religious gatherings are prohibited (Government Gazette, 2020).

This limitation necessitated Zoom interviews. The scope included:

- The time frame to collect the data.
- The financial implications of collecting the data.
- The literature that is accessible.
- The equipment that is used.
- The age of the data.

5.5.3 Sample size

The size of the sample was determined by data saturation plus one. Initially, the ten largest and four student congregations were identified as suitable participants in this study. Eventually, the following congregations were selected and included in the focus group interviews: -

Table 3: Congregations interviewed

Congregations
Middelburg-North
Middelburg
Bloemfontein
Pretoria-Oos
Suidoos-Witbank
Wapadrandt

Due to the Covid-19 pandemic and the distances across the country, semi-structured Zoom interviews were scheduled with each of the identified congregation's management teams.

5.6 Inclusion and exclusion criteria

The research was done in the NHKA as a representative of one of the three sister churches. The resulting marketing strategy will support all three Afrikaans reformed churches in their efforts to regain their lost market share.

The following inclusion criteria were applied:

- Participants had to be members of the NHKA.
- Ministers were included in the sample.
- Members of the management teams were included in the sample.
- Youth members of the NHKA were included in the sample.

5.7 Exclusion criteria

The following persons were excluded from the research:

- Persons who are not members of the NHKA.
- Young people who are not confessing members of the NHKA.

5.8 Risk to the participants

The research held low risks for the participants as the interviews were confidential and participants' views were not shared. An interview guide was used in a zoom meeting with focus group semi-structured interviews. With the development of a marketing strategy, the researcher is interested in the respondent's opinion about a marketing strategy within the ministries' operational side.

5.9 Process of obtaining informed consent

Before the researcher interviews, the researcher sought consent from the secretary of the General Church Assembly. An e-mail was sent to the secretary to explain the purpose and objectives of the research.

The researcher received a consent letter on the 8th of October 2020. The letter authorised the researcher to send out information and the interview schedules to the congregations listed in Table 2. The researcher received access to information on the congregations but not the individual members of the congregations in order to comply with the rules and regulations set out in the POPI Act (Zenda, Vorster & Da Viegga, 2020).

Prof. Cobus Schoeman is the leader of the "Kerkspieël" project. This project holds information on the three sister churches. The report includes data on the NHKA and the NGK and their members. Prof. Schoeman was approached via e-mail and in person on the 19th of October 2020. He agreed that the information could be used for this research, and he shared the ethics clearance issued on the 4th of September 2018 by the University of the Free state in relation to the information. This document is included in Appendix B.

5.10 Data collection

Data were collected through observation and interviews. The Covid-19 pandemic made in-person data collection impossible. As it was limited to religious gatherings and all gatherings such as fundraising, youth gatherings or Bible study groups, the researcher could not do observations. To overcome this limitation, a Zoom interview was set up with the congregation (as identified in Table 4). The interview guide was circulated via e-mail using the databases approved by the General Church Assembly secretary. The database includes the e-mail address and contact numbers of:

- Ministers
- Administrative personnel
- Chairpersons of the Elders, Deacons and Women's Association

The interview schedule included open-ended questions. The collection and analysis of the data are illustrated in Figure 1.

Figure 1 - Steps in conducting a social survey (Bryman & Bell, 2014:169).

5.11 Pilot testing

After a conceptual interview guide was developed, two typical respondents were approached for a pilot test. The pilot test contributed to the trustworthiness of the instrument.

5.12 Trustworthiness

The rigour of the research can be determined in two ways:

- The integrity and accuracy of the data, meaning that different researchers can use it for different projects, or
- The validation of the data through specific procedures. According to Creswell (Botma *et al.*, 2010:230), trustworthiness forms part of validity in qualitative research.

6 Results and Findings

The results of the focus group semi-structured Zoom interviews were divided into two sections. The first four questions established the demographic profile of the participants. The remaining nine questions were open-ended questions to get the opinions of the focus group participants about marketing in their congregation and the holistic church environment.

6.1 Demographics Profile

Figure 2 - Age profile of the interviewed focus group

Figure 3 - Highest qualification

Figure 4 - Correlation between years of confessing membership and role in the congregation

6.2 Open-ended questions and conclusion

6.2.1 Part two: Open-ended questions

The second part of the interview guide contained open-ended questions. The section below presents the thematic analysis.

6.2.1.1 Thematic analysis of interviews

The questions were written down, and comments from each of the three focus groups were listed in table form to enable the researcher to identify themes, subthemes, and categories.

6.2.1.1.1 What is/are your view/s about a marketing strategy in the Nederduitsch Hervormde Kerk van Afrika?

Table 5: Views about a marketing strategy in the NHKA

Focus group 1	Focus group 2	Focus group 3
<p>P1 ".....ek dink nie daar bestaan so iets nie..."</p> <p>P2 " die bree Kerk ... nie n magtige bemarkingsvoertuig nie."</p> <p>P3. "....dit nie bestaan binne-in die Kerk nie....totale afwesigheid."</p> <p>P4. "....in die gemeente is ons in die kinderskoene...."</p> <p>P5. Translated summary for Table 5

Focus group 1	Focus group 2	Focus group 3
<p>Participant 1, 2, 3 & 7 argued that Nederduitsch Hervormde Kerk van Afrika does not have a strategic market plan.</p> <p>Participant 4 mentioned that they (in their congregation) are in starting phase of marketing.</p> <p>Participants 5, 6, 8 & 9 mentioned the importance of a Marketing strategy, but participants 6 & 10 agreed that a mind shift is needed before an operational plan can be implemented as a marketing strategy.</p>	<p>Participants 1 & 3 argued that the time of hard copy communication is something of the past and that we are in the digital marketing era.</p> <p>Participant 2 said that the congregation members are unsure about the road ahead and need guidance.</p> <p>Participant 4 is concerned about the sustainability of the church in the context of a possibility of growth or continued existence.</p>	<p>Participants 1 & 3 argued that they do not do marketing or go out and recruit new members.</p> <p>Participant 2 acknowledges the importance of marketing or introducing the Hervormde Kerk's doings to the outside world.</p>

Table 6: The themes and categories that emerged from Question 1

Theme	Sub-themes	Categories
Lack of a functional marketing plan	Non-existent functional marketing plan	<ul style="list-style-type: none"> • Extinct • Lack • Teach the teacher
Change is needed for the future	Change	<ul style="list-style-type: none"> • Change
Need to develop growth	Growth	<ul style="list-style-type: none"> • Development
Strategic levels	Development of a marketing plan	<ul style="list-style-type: none"> • Mindshift • Operational Marketing

All the focus groups agreed that the NHKA does not have a marketing plan. The **first theme** was – **Lack of a functional marketing plan**. The categories linked to the theme were the extinct and lack of a marketing strategy as indicated by Participants 1 and 7 of Focus Group 1 - P1 "...ek dink nie daar bestaan so iets nie..." and P7. "...dit bestaan regtig nie...". These comments suggest that the members are in anticipation of a marketing strategy. The last category is that members seek guidance to ensure sustainability, as mentioned by Participant 2 of Focus Group 2 - P2. "...meer leiding kry...lidmate....verwag leiding".

The **second theme** was **the need to change for the future**. e witnessed the changing of the church over the centuries. (Corrigan, 2012) proposes that organisations vary due to internal and external factors that successfully present an opportunity to change (Corrigan, 2012). This view from the literature was supported by Participant 1 of Focus Group 2, who mentioned - P1. "*Digitale bemarking sal die pad wees...*"

The **third theme** was the **need to develop growth**. According to Statistics South Africa, the white population has grown over the last ten years (Stats SA, 2021). This is the target market where growth is possible, especially with digital marketing, as specified by Participant 4 of Focus Group 2.- P4. "...volhoubaarheid van die Kerk, in konteks met die uitbreiding en die bestaan..."

The **fourth theme** is the **different strategic levels**. In the operations of a congregation, people's minds have to shift to ensure that the strategic plan is implemented. Participant 10 of Focus Group 1 referred to different strategic levels: P10. "... twee vlakke van bemarkingsplan... Een strategiese plan om die mense 'n kopskuif te maak...." Tweedens "...operasionele plan ...dag tot dag se bemarking.". The first strategic step would be to bring a mind shift in the church. Second, there should be a strategic marketing plan for the church and congregation.

The following results were found in the analysing of the focus group semi-structured interviews:

- The first finding is that the NHKA does not have a marketing strategy but the church values communication. Communication should preferably use any digital communication platform as long as it is short messages.
- The principle of stewardship is essential to get all different age groups involved to take ownership of the implementation of the marketing plan.
- The marketing plan should be aimed at growth, and it cannot go without the necessary changes and mind shifts among the people. Digital marketing and communication and the use of technology, especially in the post-Covid-19 era, have to be part of the marketing plan of a congregation and the church.
- The inside-out approach emphasises the internal strength of a church as a means to succeed with a marketing plan directed at the external environment.
- Two-thirds of the focus group in the empirical research indicated that they would use the same marketing tools for an effective and efficient marketing strategy

The average age of the participants at the time of the interviews was 49. The data gathered by means of the empirical fieldwork indicate that the church has not protected its market share since the changes that occurred from 1994 onwards. It seems that churches are stuck in the mindset they had in the era when they had state protection, as the results show that the NHKA does not have a marketing strategy. All the participants of the focus groups were open to a proposed marketing strategy.

The information received from the empirical process suggests tools for efficient marketing of the congregation's operational ministries. These tools reveal an inside-out communication strategy.

6.3 Final inferences

As indicated, the sister churches are losing members each year, even though the white population of South Africa, which is the target market of the three sister churches, has grown by 2% from 2011 to

2020 (Stats SA, 2020). In contrast with the declining number of members in the three sister churches, churches that follow a prosperity theology keep growing.

The literature study follows the development of the church globally and shows how the Afrikaans churches enjoyed state protection until 1996. This meant that the churches did not necessarily have to do any marketing. After 1994, churches that promote a prosperity theology, such as the Christian Revival Church (CRC), became some of the fastest-growing communities. The Apostles Creed is one of the things the three sister churches have in common, something they may perhaps use to their advantage.

The research method, including the thematic analysis of the data retrieved from the focus group interviews, addressed the study's trustworthiness.

The researcher identified themes from the focus group interviews. These themes revealed an inside-out communication strategy.

7 Managerial Implications

The researcher views this study as relevant, valid, and significant.

7.1 Marketing Strategy

The two key decisions questions in the set-up of a marketing strategy are:

- Which market to target?
- How do we position ourselves in that market?
-

7.1.1 Target market strategy

The target market or niche mark of the NHKA is the white Afrikaans speaking people. The reason for this market is because it's a historical past. However, the Reformed sister Churches' congregations were established in a geographical area that has changed over the last 25 years. In this period, the NHKA changed its Constitution (Kerkorde), which increased the niche market to the Afrikaans speaking and understanding people. The change in effect allows any person to become a member who accepts the culture in which the Church spread the Word of God.

7.1.2 Positioning

The marketing mix refers to the 4 P's (product, place, promotion and price). An additional 3 P's (People Process and Physical evidence) are added to the mix within a service environment (Lamb *et al.*, 2019: 539-540 & 556-557). The challenge is to blend all 7P's as a unity to ensure an effective and efficient result. The strength of the marketing mix within the marketing strategy depends on the intelligent changes and acceptance of the change. The fine-tune within the marketing mix elements can ensure competitive success (Lamb *et al.*, 2019:539).

7.1.3 Product

The challenge for most Churches is to increase Church membership and church attendance. The question of non-Church goers is, "Why should I attend Church?" Unless there is a specific reason (Bagwell, 2007).

Most people are looking for a tangible product, but what product can a Church offer? These days it is not only tangible products but also services and brands are defined as a product.

The product that the NHKA offer is summarised in their mission, namely

- The **celebration** of the good news of the gospel of Jesus Christ.
- to practice the **community** of the believers.
- to provide **service in all forms that the Church offer**; and
- to **testify** to all people about the hope that lives in us.

The other visible product the NHKA provides is developing and accepting a new brand in 2018, as indicated in figure 5 below.

Figure 5: New Brand of the NHKA (Nederduitsch Hervormde Kerk van Afrika, 2017)

With the acceptance of the new brand, the NHKA transformed and freed them from the past. New innovative ways are used to meet the needs of the core business (product) and expectations. The challenge with the new brand is to ensure trust, loyalty, friendliness, and a place to belong. This boiled down to an emotional bond between the member and non-member and the (product) of the Church's core business.

The reduction of the members of the NHKA is visible within figure 6.

Figure 6: NHKA members (Van Staden, 2009).

The same trend is found at the other two Reformed sisters churches. With the decrease in members and youth members, it can be acknowledged that the Reformed sisters church is in a decline stage of the product life cycle. With the acceptance of the new brand in 2018, the Church breathes new life

into the life cycle of the NHKA. The time between decline and growth is also known as chaos when adjustments are made, as indicated in figure 7.

Figure 7: Product Life Cycle (Lamb *et al.*, 2019:343)

New innovative ways are used to meet the needs of the core business (product) and expectations.

7.1.4 Place/distribution

To have a *domicile citandi et executandi* address is essential for legal engagements. This address is where members and Non-members can say it is their place of worship and place of belonging in a community of believers.

Within the digital world, social media is a place to start your Church marketing. The most familiar social media platforms are:

- Facebook.
- Twitter.
- Instagram.
- LinkedIn.
- YouTube.

These platforms are places to distribute information about a congregation ministry. In addition, social media is a place to attract strangers to an assembly.

Another place of attraction is the building attractive and interactive website. The information sharing on the website will determine if a stranger will fit into the culture of a congregation (Naylor, 2021). When a stranger uses google, it is vital to register the website account on *Google My Business* to indicate the nearest Church and the congregation's information (Naylor, 2021).

7.1.5 Marketing communication (Promotion)

Effective communication is a crucial performance indicator when it comes to marketing. Without communication, the whole marketing plan will collapse. Within the **promotion** or **communication** of the services of the NHKA, the marketing plan will have a look into the detail of the following aspect to engage with the target market (Lamb *et al.*, 2019: 400).

7.1.5.1 Advertising

What is the effect of advertising? In 2013 the total amount spent on advertising was =R 45 billion (Lamb *et al.*, 2019: 401). In 2019 the advertising increased and was dominated by television and video advertising. Advertising on the internet is growing at such a pace it is expected to take over television within the next three years (Shand, 2020).

It is expected in 2020 that 15% of global advertisements will be on social media (Shand, 2020). Advertising is part of everybody's life and influence people way of think and spending. One of the more attractive ads which received more attention is humorous ads. Another aspect of advertising is the advertising of a brand. The new brand of the NHKA may influence the attitude of people positive. Therefore, it has to be part of the market plan.

The NHKA is marketed as a unit to gain favourable/positivity towards the broader Church through corporate advertising.

With advocacy advertising, the Church will communicate its views and on controversial issues on social media platforms to communicate that information.

7.1.5.2 Public relations

Bill Gates has said that "If I was down to my last dollar, I would spend it on public relations." (Knikker, 2021).

With public relations, it is crucial to communicate timely and current relevant and exciting information for Church members and strangers or non-Churchgoers.

Through public relations, it is not only about maintaining a positive image, but it also serves as an opportunity to train the public of the Church vision and objectives. The testimony of a public personality connects and attract the youth to a congregation of the Church.

7.1.5.3 Personal selling

The person who does the advocacy advertising has to know the Church to address and communicate burning uses timely. The effectiveness and efficiency of the communication have to be timely bounded. The person who "sells" new complex information to the public on the internet and social media must be informed to do positive marketing.

The personnel responsible for distributing and publishing information must also manage their most significant target market or get information about their target market to establish growth potential. Therefore, this team needs to build and maintain a strong relationship with members and strangers to gain market loss.

The challenge is to recruit and retain new members. The answers (feedback/follow up) of those communications and burning issues is vital to cultivate those in the target market and those who have commented or suggestions. The strategy is to inform people about the Church views according to their vision, mission and objectives.

7.1.5.4 Service promotion

The promotion of service that the Church offers is information or service that has eternal value. It does not necessarily include those charity services of a congregation but also promotes those services that help develop personal strength and psychological growth. These promotions stretch over genders,

personalities, age, profession etc. The venue of these promotions is not bounded at a specific denomination or congregation, with the opportunities of electronic communication, webinars, online short courses, and daily Bible messages.

The information received from SEMRUSH (the analysis of a website's traffic) has indicated only 3200 followers on the website of nhka.org (SEMRUSH, 2021).

The promotion of service is to increase followers on the Church website. To increase the traffic on the website, the following suggestions are: -

- Expansion of keywords on the webpage to attract a larger audience.
- To link up with the webpage of a Gospel radio station to promote the service and the Good News in a way, the NHKA proclamation.
- Promote the Church on Schools & Universities websites with the slogan, for example, "Religion is fun." This promotion aim is to target the youth.
- Create a platform to promote Gospel music and musicians. One example is to publish the top 10 Gospel music of a week.
- The journey of public personality.

7.1.6 Price

Unfortunately, no price can be linked to the services of a church. However, a Church's financial liquidity and sustainability directly link to the tithes that people gave as offerings. The concept of the tithes or offerings is written in the Old Testament of the Bible and more specifically in the books Leviticus 27:30; Numbers 18:26; Deuteronomy 14:24; 2 and Chronicles 31: 5 (Campbell, 2010).

Because the Church is in this world, it must comply with economic and financial challenges and activities. The financing of a congregation ministry is basically from offerings from their members—the concept of economy of scale makes it financially sustainable.

7.1.7 People, Process and Physical Evidence

Within a service environment, the marketing mix elements are expanded with the additional 3 P's, namely People, Process and Physical Evidence. These additional 3 P's are discussed in detail within Product, Place and Promotion.

7.2 Recommendations

The following recommendations flow from the study: -

- Churches should be made more visible using a marketing strategy.
- A new logo/brand will give the church an opportunity to roll out a marketing strategy. The newly developed logo should be promoted by branding buildings, cars etc.
- The church's services in the community should be marketed in a more prominent, effective and efficient way. These services include social development in the community.
- The youth can be involved in marketing the congregation's operational ministries to make it fun during the week.
- The church should consider the provision of VR (virtual rooms) to broadcast worship services to old age homes, hospitals, and other institutions like correctional facilities so that members and non-members can attend worship services virtually.
- The church should use digital marketing to improve the inside-out communication strategy.
- The church should create an opportunity for discussion to interact (blog/social media) with the minister after the worship service.

8 Conclusion

The study has proven the importance of marketing in the three sister churches. This study found that technology offers further potential functionality, as seen during the Covid-19 pandemic, especially to involve youth.

The researcher believes this study makes a unique contribution as it is essential for the church to gain back its market share, especially through digital marketing. In this way, they can reach the youth and involve people who do not belong to any church denomination or who have broken free from the church but acknowledge that they are Christians.

Keywords

Consumer Sustainability;
Greening Practises;
COVID-19

Abstract

This paper sets out to identify the impact of the COVID-19 pandemic on consumer sustainability and greening practices within Nelson Mandela Bay. Substantial research on consumer sustainability, green practices, the environment, and the economy exist but there is limited research on the impact of the COVID-19 pandemic on consumer sustainability and greening practices. The study adopted a quantitative research methodology using descriptive and exploratory research. The survey method was used by means of distributing 275 self-administered structured questionnaires to respondents within the designated population during the third wave of the COVID-19 pandemic. Main findings from the empirical results established that consumers were either neutral or agreed to some of the measures for implementing greening and sustainable practices such as health, waste management, environmental management, transport and traveling and food and clothing practices. Clear guidelines are provided to consumers as to implementing sustainable and greening practices based on lessons learnt during the pandemic.

1. Introduction

The shift in green consumerism and sustainability can be traced back to the early 1960's and 1970's, as people became more aware of the environmental challenges that the world was beginning to face (Du Pisani, 2006). Since then, there has been increased pressure and demands for global initiatives specifically dedicated towards sustainability. As a result, sustainability and green practices are being implemented on a global scale as nations and organisations seek to modify their environmental response toward sustainability (Conrad, 2013:3369). The modification of environmental practices and processes also ensure that consumers are consistently informed of the environmental hazards imposed by organisations as they pursue their bottom line (Smith & Perks, 2010:2).

The promotion of green consumption is considered a significant method of solving environmental issues and the exploitation of natural resources. Thus, green consumption contributes to reducing environmental degradation (Ogiemwonyi, Harun, Othman, Ismail & Ali, 2019:514). Varghese and Viswanathan (2018:87) claim that the most basic way for consumers to help create a cleaner environment is to consume responsibly. Green practices are also defined as the development of procedures for the preservation of energy and other environmental resources (Dutta, Umashankar, Choi & Pasa, 2008:270). Li (2020:586) further asserts that consumer greening practices are based on their green or sustainable consumption and argue that it involves three aspects. Firstly, the consumer is motivated to purchase green production. Secondly, the consumer is encouraged to take measures in circumventing environmental pollution and lastly, it enables the consumer to modify their consumer concepts and promote the natural environment. Consumer's sustainable and green practices include among other, sustainable food practices, sustainable household consumption, transportation and mobility (Akenji & Chen, 2016:7-8).

In March 2020, COVID-19 was declared a pandemic by the World Health Organization and was seen to be the most destructive disease to plague the world in over a century (Cucinotta & Vanelli, 2020:157). Due to the devastating effect the disease had on people, most countries implemented stay-at-home orders which resulted in the closure of many non-essential businesses. This resulted in severe repercussions economically worldwide, seriously impacting global supply chains and thus harming the global economy (Ebrahim, Ahmed, Gozzer, Schlagenauf & Memish, 2020). The impact of the pandemic had a major effect on consumption dynamics, not only were individuals forced to limit their consumption in order to adapt to the changing circumstances, but they were also forced to re-evaluate their overall consumption model – leading to consumers choosing products and services with higher levels of attention regarding environmental responsibility (Esposti, Mortara & Roberti, 2021). Among the physical impacts of COVID-19, negative effects on individual's mental health were also experienced. Studies conducted found that the effects of isolation and quarantine resulted in the increased likelihood of afflictions such as depression, anger, and post-traumatic stress symptoms (Brooks, Webster, Smith, Woodland, Wessely, Greenberg & Rubin, 2020 and Fullana, Hidalgo-Mazzei, Vieta & Radua, 2020). These aspects could have had a possible impact on consumer greening and sustainability practices and buying behaviour.

Behavioural changes in purchasing have previously been observed during times of large-scale events, such as earthquakes, floods, epidemics and pandemics that showed some disruptions in consumer buying behaviour (Fortin & Uncles, 2011). It has also been indicated that when people are faced with stressful situations that threaten their wellbeing, their buying behaviour changes in order to lighten existential pressures (Arndt, Solomon, Kasser & Sheldon, 2004). The COVID-19 pandemic has thus caused consumers to re-evaluate their attitudes towards the environment, society, workplace and buying habits. Against this background, this study aimed to explore how COVID-19 impacted the sustainability and greening practices of consumers in Nelson Mandela Bay.

2. Problem Investigated

In an ideal world, consumers would be able to consume as much as they wanted while having little or no effect on the environment or availability of resources for future consumers. Consumers are increasingly becoming aware of how the creation and use of their preferred products could lead to waste, pollution or disruption of the environment. One of the ways consumers reduce these negative externalities, is by using sustainable and green practices (Young, Hwang, McDonald & Oates, 2010:20). These practices include, but are not limited to, purchasing eco-friendly products, recycling, and upcycling products and reducing the use of plastics and other non-biodegradable products. The environment is burdened by global warming and scarcity of resources (Lorek & Fuchs, 2011:2). It has become evident that humans have the capacity to contribute to various efforts to sustain the environment and contend that consumers have an increasing interest in protecting the environment which encourages companies to achieve greener production (Larsson & Khan, 2011:1). Although the impact of environmental sustainability for organisations and consumers is a widely researched topic, limited research has been conducted regarding this aspect during the pandemic.

Green consumption consists of activities including how consumers retain, use, and dispose their waste, recycling, effective utilisation of energy and other resources, safety and health and the preservation of physical and biological resources (Singh & Gupta, 2012:3). Consequently, several green practices and activities have been developed to aid environmental impacts such as green purchasing, green supply chain management, green manufacturing, green packaging, and reverse logistics (Shaharudin, Akbar, Zainal, Hassam Zainoddin & Nizam, 2018: 243). Consumers could play an integral role in the preservation of the environment through their green purchasing activities. In recent years, more emphasis has been placed on sustainability and increasing concerns for the environment (Giovannoni & Fabietti, 2014:21). However, there are many challenges to achieving a degree of sustainability that ensures future generations meet their needs (Orr, 2002:1457). COVID-19 has emerged as a key challenge for consumer sustainability and greening practices. European Environment Agency (2022) postulates that environmental deprivation often increases the risk of pandemics. COVID-19 has emerged and escalated through the composite interaction between drivers of change, such as ecosystem disturbance, international travel and climate change. The pandemic has also shown that

societies and consumers have immense potential for collective action and change when faced with a perceived emergency.

Although the pandemic has led to a decline in greenhouse gas emissions, the pandemic has also led to excessive consumption, increased technological and energy requirements, and increased solid waste generation (McGain, Muret, Lawson & Sherman, 2021). Latham (2021) contends that the pandemic has also resulted in healthier consumption choices. Although there is abundant literature on consumer greening and sustainability practices, limited research is available of the impact of the pandemic on these practices as the world is still in the midst of the pandemic. The key research question to be addressed in this paper is thus: *What is the influence of the COVID-19 pandemic on consumer sustainability and greening practices within Nelson Mandela Bay?*

3. Research Objectives

3.1. Primary objective

In line with the problem statement, the primary objective of this study is to assess the influence of the COVID-19 pandemic on consumer sustainability and greening practices within Nelson Mandela Bay.

3.2 Secondary objectives

In order to achieve the primary objective, the following secondary objectives have been formulated.

- To conduct a theoretical overview of consumers' sustainability and greening practices during the pandemic.
- To develop an appropriate measuring instrument of the impact of the COVID-19 pandemic on consumer greening practices.
- To empirically assess the level of consumer sustainability and greening practices undertaken by consumers in Nelson Mandela Bay amid the COVID-19 pandemic.
- To provide conclusions and recommendations on how to improve the undertaking of sustainable and greening consumer practices during the pandemic.

4. Literature Review

4.1 Clarification of key concepts

This section of the literature overview seeks to define the key concepts related to the impact of the COVID-19 pandemic on consumer sustainability and greening practices.

4.1.1. Greening practices

Solaja and Adetola (2018:199) define green and sustainable practices as any activities aimed at reducing the impact of human activity on the environment. According to Tan, Johnstone and Yang (2016:2), green and sustainable practices include activities such as recycling, preserving water, decreasing the use of plastic bags and buying environmentally friendly products and services. Consumers have increasingly become aware of the effect their consumption has on the natural environment. This has instilled a need to implement practices that benefit or preserve the environment (Nair & Maram, 2015:5).

4.1.2. Consumer sustainability

According to Hosta and Zabkar (2016:147), consumer sustainability can be defined as the consumers' consciousness regarding the long-term impact of their actions on the condition of the environment. Sharma and Rani (2014:369) argue that sustainable consumption is the consumption of goods and services that do not exhibit harmful impacts on the environment and continues the process of meeting basic human needs for present and future generations.

4.2 Theory of planned behaviour

Specific attitudes and behaviours are required for the consumer to execute sustainable and green choices. The theoretical underpinning of this study is based on the theory of planned behaviour (TPB) which conceptualises the environmental behaviour associated with the psychology of consumer

choices (Dawson & Hancock, 2018:23). Smith (2020:6) also contends that the theory of planned behaviour provides a structure for identifying the determinants of environmental behaviour. Furthermore, Azjen (1991) states that behavioural intentions can be predicted by attitudes towards behaviour, subjective norms and perceived behavioural control (see Figure 1). An individual's attitude is defined as an assessment of the behaviour the individual intends to perform (Kuek, Yap, Chen, Choong, Tan, Kuah & Ng, 2020: 2475). The subjective norm characterises the individual's execution of the action, considering social or community acceptance (Dawson & Hancock, 2018:24). Perceived behavioural control refers to the perceived difficulty of carrying out the task considering an individual's control over it (Kuek et al., 2020:2476).

Figure 1: Theory of planned behaviour
Source: Adapted from Dawson and Hancock (2018: 24)

4.3 Impact of the pandemic on consumerism patterns

The immediate effects on consumer behaviour during the initial phase of the pandemic saw consumers stockpiling, hoarding, and embracing digital technology which included home deliveries (Sheth, 2020). Consumers have been known to engage in hoarding above what is needed due to an emotional reactance response (Kirk & Rifkin, 2020). This was observed in the first phase of the pandemic where consumers were seen to have reacted in a highly emotional and irrational way leading to the emptying of store shelves by hoarding products (panic buying) (Hall, Prayag, Fieger & Dyason, 2020). Following the phase of stockpiling and mass purchasing of products, it was found that consumer preferences morphed into favouring niche products (Huang & Sengupta, 2020). Along with changing preferences, consumers began engaging in the improvisation of do-it-yourself activities in order to manage the shortage of products which included cooking, baking and exercising. This change in mentality reconfigured previous purchasing and consumption habits (Sheth, 2020). Amid the negativity, the pandemic may also have yielded positive outcomes. Robson (2020) alleges that the pandemic may have caused people to respond and act in a more morally enforced way. Sheth (2020) concurs that the promotion and increase in social obligation and humanitarian/philanthropic behaviour is increased when individuals are faced with the fear of natural or human-made disasters. Studies conducted during the outbreak also found that in order to endure the negative effects of stress and anxiety that arose from the uncertainty, people tend to reinforce their communal well-being, and intensify their humanitarian behavioural intentions (Malik, Schat, Raziq, Shahzad & Khan, 2018). Most notably, increased emphasis towards hygiene behaviours, and the shift in consumption patterns as the pandemic evolved (Hassen, Bilali & Allahyari, 2020). Qi, Yu and Ploeger (2020) also reported that consumer attitudes towards organic food rose following the outbreak of the virus. The pandemic has thus brought forth the notion of eternal growth as a solution for sustainability, as fossil fuels are running out and the climate is changing (Giannetti, Fonseca, Almeida, de Oliveira, Valenti & Agostinho, 2021).

4.4 Consumer sustainability and greening practices under COVID-19

This section seeks to provide a detailed discussion on the practices that consumers undertake in their efforts to protect the natural environment, with specific reference to the pandemic, namely waste management, sustainable clothing and food practices, sustainable health practices and green transport

and travel and environmental sustainability. Figure 2 illustrates the theoretical framework developed to determine the impact of the COVID-19 pandemic on consumer greening and sustainability practices.

Figure 2 - Theoretical framework: Impact of COVID-19 on consumer greening and sustainability practicesSource: Own construction

4.4.1 Sustainable health practices

Apart from environmental impacts, health is also substantially impacted by consumer's food choices (Akenji & Chen, 2016:6). Consumption of sustainable health products includes among other, maintaining a sustainable lifestyle, the use of locally produced foods and organic food consumption. Consumers acquire locally produced items that contribute to the minimisation of energy utilisation in the production process, transportation and storage (Sustain, 2007:4). Martinez (2020) concurs that the pandemic has increased consumer affinity for locally produced products. During the pandemic, consumers are more inclined toward smaller, hometown local shops that have local sourcing, ownership, and a more direct impact on the local economy and community. These smaller retail stores do not require customers to be inside the store for long periods of time, which is more desirable regarding social distancing. Customers also may read labels more closely, scrutinize the ingredients of products, and are much more careful about what they put in and on their bodies. The virus has also caused a decline in household expenditure and movements in the spending patterns of consumers (Jribi, Ismail, Doggui & Debbabi, 2020:2). Consumer sustainable food consumption principles include the purchasing of organic products that minimise harmful impacts on the environment and the health of the consumer (Sustain, 2007:4). Consumers trust that organic food products have the ability to boost their immune system and provide ammunition against the COVID-19 virus (Gumber & Rana, 2021:2). A sustainable lifestyle is defined as sequence of consumption employed by consumers in order to promote improved quality of life, minimise natural resource and emissions usage and promotes the needs of future generations (Rakic & Rakic, 2015:893). The COVID-19 pandemic has caused individuals to realise the impact of their consumption choices on the environment and has resulted in the consumer adopting a more sustainable lifestyle (Dey, 2021). Beyond impacting some of the factors that determine consumer spending, the COVID-19 pandemic has also drastically altered how and where consumers choose to spend their hard-earned cash.

4.4.2 Waste management practices

Sarkodie and Owusu (2020) argue that the suppression of the spread of COVID-19 pandemic and limitations on commercial and manufacturing activities and mobility have also significantly affected

waste management in most countries. Household waste management is critical to human development and health outcomes, especially during the COVID-19 pandemic. The intensification of single-use products and panic buying have also increased production and consumption, hence thwarting efforts towards reducing plastic pollution. According to Choshaly (2016:54), the concept of the 3R's forms the basis of green consumption and sustainable development and consists of three activities, namely reduce, reuse, and recycle. *Waste prevention* plays a significant part in the management of waste (Abdul-Rahman, 2014:1). Consumers can implement various steps in their efforts to reduce or prevent waste, including the purchasing of items that are required, and not those that form "wants", purchasing products that are superior in quality, using durable rather than disposable products and avoiding the use of plastic bags by purchasing shopping bags (Abdul-Rahman, 2014:2). *Reusing* transpires after waste prevention is executed (Medina, 2010:7). Reusing is defined as a process that occurs when an object has already satisfied its purpose and is used to perform another activity (Umar, Sehab & Yagnik, 2018:58). Strategies for the reuse of an item includes methods such as employing shopping bags, donating mature objects to charity (Smith, 2020:10), and acquiring beverages in revertible containers (Abdul-Rahman, 2014:3). Recycling involves the regenerating of waste from old materials for reprocessing (Umar et al., 2018:58). Several activities are associated with the process of recycling, including the collection, manufacturing, and refining of materials to enable consumers to acquire newly produced products modified from recycled materials (Smith, 2020:11). The pandemic has thus forced consumers to rethink their household management practices as to contain the spread of the virus. Lockdown measures and the use of sanitizers and face masks impacted on household waste management practices.

4.4.3 Environmental sustainability

Environmental sustainability can be defined as a state of balance and interdependence that enables humans to satisfy their needs while maintaining the volume of the ecosystem to resume its restoration of the services required to satisfy those needs (Morelli, 2011:5). Improved energy efficiency in households refers to adequate attempts to lower energy consumption of households, without compromising the degree of consumer welfare or the state of the environment (Khan et al., 2020:1). The COVID-19 pandemic has resulted in increased waste production from single-use plastic, including personal protective equipment and has impacted waste management activities on a global scale (Silva, Prata & Rocha-Santos, 2020). According to Fielding, Russell, Sprinks and Mankad (2012:1) and Dworak, Berglund, Laaser, Strosser, Rousard, Grandmougin, Kossida and Kyriazopoulou (2007:9), the conservation of water is a fundamental activity undertaken by consumers and households in an attempt to preserve environmental resources and avoid water scarcity. During the pandemic and lockdown most people were forced to stay indoors and work from home thus placing increased pressure on household water and electricity consumption.

4.4.4 Sustainable transportation and travel

Sung and Monschauer (2020) are of the opinion that the COVID-19 crisis has changed people's transport behaviour in many ways, with large reductions in aviation and public transport use and significant growth in cycling usage. One of the biggest impacts has been the reduction in passenger transport demand, due to a combination of government lockdowns and fears of contracting and spreading the virus when using mass or public transport modes. According to Akenji and Chen (2016:8), environmentally sustainable transport is defined as a system that prevents harm to the ecosystem and satisfies human needs for access associated with the utilisation of renewable resources so that consumers can contribute to sustainable systems of travel by adapting their habits to consider the types of transport used, the frequency and distance of travel and the support systems and infrastructure. According to Sung and Monschauer (2020), the pandemic has affected various forms of transport, including public transport and vehicle mobility. Shared transportation is a form of consumption, which refers to passengers sharing transportation (Faulin, Grasman, Juan & Hirsch, 2019:17). International transport activity decreased below fifty percent during the pandemic, while air travel has declined by almost seventy-five percent (Sung & Monschauer, 2020). Sustainable transportation is influenced by COVID-19 through working from home activities that affect air pollution and traffic congestion and the use of electric automobiles (Panday & Bansal, 2014: 305).

4.4.5 Sustainable food and clothing

Consumers play a significant role in the sustainability of food chains through their food choices. According to Brown (2021), food systems affect the environment and influences greenhouse gas emissions, occupies significant amounts of land, and effects biodiversity. Sustainable food consumption is defined as the consumption of food and dietary consumables that satisfy the dietary requirements of humans, the natural environment, and the economy (Ifeanyichukwa & Nwaizugbo, 2020:33). Food consumption plays an integral role in society as it provides the consumer with environmentally sustainable options (Siragusa & Tumino, 2021:1). An individual's clothing choices also form a significant part of their expression (Gwozdz, Nielsen & Muller, 2017:1). Niinimäki (2009:3) reports the definition of green clothing to involve clothing designed for long-term usage, involves locally produced items, and brings about minimal harmful environmental consequences. Consumers exhibit specific sustainable fashion practices, including avoiding fast fashion, purchasing second-hand clothing, collaborative clothing consumption and discarding behaviour (Mukendi, Davies, McDonagh & Glozer, 2020:24). Thus, collaborative consumption involves the lending and sharing of items as a form of environmental and clothing sustainability (Adrami & Stock, 2019:11). Ricchetti and De Palma (2020) allege that the COVID-19 pandemic and the resulting economic shutdowns have created unprecedented challenges for the fashion and clothing industry, among other declining consumer spending and disrupted supply chains. This scenario may fast-track the shift to greener and more sustainable supply chains, which will impact consumer buying behaviour and these industries as a whole.

5. Research Methodology

5.1. Research paradigm

It is noted by Zukauskas, Vveinhardt and Andruikaitiene (2018:123) that three types of research philosophies exist, namely positivism, interpretivism and realism. According to Rahman (2017:106), quantitative research methodology is established by utilising a positivist research philosophy. Daniel (2016:92) contends that interpretivism and realism is related to qualitative research and positivism is associated with a quantitative research methodology. For the purpose of this study a positivistic approach was utilised as it is most appropriate for quantitative data collection. Therefore, the positivist philosophy ensured reliable and consistent data is provided by the respondents of the study.

5.2. Research approach

According to Struwig and Stead (2013:6), several methods could be used for the collection of quantitative data such as exploratory, descriptive, experimental and quasi-experimental research that can be utilised to solve the research problem. For the purposes of this study, a descriptive and exploratory research approach was used to gather data from consumers in Nelson Mandela Bay. The aim was to explore a relatively new topic with limited research in this field of study as well as to describe the perceptions of respondents regarding the impact of the COVID-19 pandemic on consumer sustainability and greening practices in Nelson Mandela Bay.

5.3. Population and sampling

A research population is made up of people, events and records that contain necessary data and information that can be used to answer measurement questions (Cooper & Schindler, 2014). A sample is a subset of the population that can be used to come to a general conclusion of the population based on the findings of the sample group. For the purpose of this study, the population was regarded as all consumers within Nelson Mandela Bay. As there is no database available of all these consumers within the designated population, use was made of non-probability sampling. Use was made of convenience sampling (consumers available and accessible), judgemental sampling (selected based on the opinion of an expert) and snowball sampling (referral by respondents to other possible respondents).

5.4. Data collection

5.4.1. Secondary research

A comprehensive literature review was conducted by collecting data of pre-existing data by another researcher to solve the problem statement (Brynard, Hanekom & Brynard, 2014:38). For the purposes

of this study, secondary data was collected from credible sources, such as internet journals, web documents and textbooks and from international databases such as Emerald and Sabinet.

5.4.2. Primary research

Primary data is defined by Struwig and Stead (2013:82) as the collection of new data which involves collecting data to solve the research problem at hand utilising procedures relevant to the research problem. Primary data was collected by means of a survey using structured self-administered questionnaires. Questionnaires were distributed both by hand to respondents (family, friends and colleagues) and due to pandemic conditions, most questionnaires were distributed online via email to respondents as well as through the Google Forms platform. Where questionnaires were hand-delivered, field workers ensured that COVID-19 protocols were adhered to (e.g. wearing of face masks, social distancing and the use of hand sanitizers). Questionnaires were distributed online mainly by means of referrals as no online database was available. A total of 275 questionnaires were distributed to respondents within the designated population. A total of 202 usable questionnaires were obtained (effective response rate of 73%).

5.5. Questionnaire design

For the purpose of achieving the objectives of this study, a questionnaire was designed to obtain primary data from consumers in Nelson Mandela Bay. The research was undertaken by utilising a self-administered structured questionnaire. The questionnaire used in this study consisted of a cover page and three sections.

To measure the consumers perception towards sustainability, green practices and the COVID-19 pandemic, a five-point Likert-type scale ranging from (1) strongly disagree to (5) strongly agree was used.

- Section A focused on the respondents' general perceptions regarding COVID-19, using a five-point Likert-type ordinal scale (10 statements).
- Section B focused on gathering data about the respondents' perceptions regarding consumer sustainability and greening practices using a five-point Likert-type ordinal scale (20 statements).
- Section C gathered data regarding the demographics of respondents, using a nominal scale (seven statements).

As no previous measuring instruments could be found and it is a relatively new field (COVID-19), the items or variables were mainly self-constructed based on the extensive literature study.

5.6. Data analysis

Data analysis is used as a tool to discover useful information based on the gathered data to make conclusions and formulate recommendations (Struwig & Stead, 2013). The process involves reducing collected data to a manageable size, which then allows the researcher to develop summaries and apply statistical techniques (Cooper & Schindler, 2014:86). During this phase, raw data is converted into useful information. The first phase of the data analysis process was the collection and organising of the data. The quantitative data was transferred to a Microsoft Excel spreadsheet and analysed by means of a computer programme, Statistica. The use of descriptive statistics was utilised in order to analyse the collected data. These statistics included measures of central tendency (e.g. mean, mode, median) and measure of dispersion (e.g. standard deviation) as well as frequency distributions (percentages). Face and content validity were ensured by means of expert judgement of researchers in the field of greening, marketing and statistics, conducting a pilot study among 10 consumers within the designated population and a comprehensive literature study on greening and sustainability practices. Finally, the data was interpreted, and conclusions and recommendations were provided based on these findings.

5.7. Ethical considerations

The research adhered to the requirements set out by the Nelson Mandela University’s Research Ethics Committee (Humans). The research gathered was confidential, anonymous, and voluntary. Ethical clearance from the Department of Business Management was obtained by means of a Form E (ethical clearance form). Participation from respondents was entirely voluntary, respondents remained anonymous and could withdraw from the study at any time.

6. Results and Findings

6.1. Demographical profile of respondents

Table 1 represents the demographical profile of the respondents.

Table 1: Summary of biographical information (Section C)

Characteristic	Category	%
Age	18-25	25
	26-40	33
	41-50	18
	51-60	13
	60+	11
Gender	Female	61
	Male	39
Highest qualification obtained	Grade 11 and lower	2
	Grade 12	22
	National diploma or certificate	19
	Bachelor’s degree	26
	Postgraduate degree/diploma	31
Current employment status	Student	21
	Unemployed	6
	Retired	1
	Employed Full-time	66
	Employed Part-time	6
Frequency of shopping in general	Once a month	18
	Twice a month	16
	Three times a month	22
	Once a week	32
	Every second day	8
	Every day	4

Source: Own compilation

Table 1 shows that 33% of the respondents fall within the 26-40 age group category whilst 25% are within the 18-25 age group. The majority of the respondents are females (61%) whilst 39% were males. In terms of highest qualification obtained, the majority had a national diploma/certificate or bachelor’s degree (45%), whilst 31% had a postgraduate degree/diploma. The majority of the respondents (66%) indicated their current employment status as being full-time employed and 21% were students. To establish the shopping behaviour of respondents in terms of frequency of shopping during the pandemic, 34% indicated that they only shop once or twice a week, 32% indicated that they only visit a retail store once a week and 22% shopped three times a month. Only 4% shopped every

day. It should be noted that the empirical study was conducted during the third wave of the COVID-19 pandemic.

6.2. Frequency distribution results for the type of zero-waste purchases

Table 2 depicts the zero-waste purchases the respondents were most likely to engage with.

Table 2: Zero waste purchasing of respondents

Type of shopping item	Category	Percentage
Fruit	No	53
	Yes	47
Vegetables	No	58
	Yes	42
Meat	No	67
	Yes	33
Cheese	No	92
	Yes	8
Grains	No	92
	Yes	8
Beauty Products	No	83
	Yes	17
Cleaning Products	No	89
	Yes	11
Stationary	No	96
	Yes	4
Packaging	No	84
	Yes	16

Source: Own compilation

Table 2 depicts the zero waste products the respondents most frequently engaged with. According to Good (2015), zero waste shopping is concerned with the elimination of all unnecessary waste during an individual's shopping experience. Based on the empirical results it appears that consumers engaged in zero waste shopping, mostly in terms of buying fruit (47%), vegetables (42%) and meat (33%). Although consumers engaged in zero waste shopping, many retail outlets did not allow the use of reusable containers and the items were pre-packed in plastic containers (Wiefek, Steinhorst & Beyerl, 2021). The purchase of products that are sourced locally and purchasing only what is needed in order to prevent unnecessary waste use during a pandemic were also advocated by Chang (2021) and Guarany (2018).

6.3 Frequency distribution results for waste hierarchy activities and practices

Table 3 depicts the respondents' participation in waste hierarchy activities and practices.

Table 3: Waste hierarchy practices of respondents during the pandemic

Waste hierarchy activity	Category	Percentage
Reduce	No	44
	Yes	56
Reuse	No	49

	Yes	51
Recycle	No	61
	Yes	39
None	Yes	25

Source: Own compilation

Table 3 illustrates that 56% of the respondents practice activities that reduce waste and 51% of respondents reuse waste. It was noted that only 39% participate in recycling activities, whilst 25% of the respondents indicated that they did not participate in any of these three waste management practices. This is supported by Reddy (2010) and Makgae (2011) who stated that waste minimisation involves a number of processes, mechanisms and stakeholders in the production, marketing, packaging, selling and consumption of goods that produce waste at all stages of the consumption cycle and all role players should ensure that waste can be reduced through effective waste minimisation. Sarkodie and Owusu (2020) allege that efficient waste management during the COVID-19 pandemic is paramount and failure to effectively manage waste generated by households could escalate the spread of COVID-19 via secondary transmissions.

6.4 Descriptive statistics relating to the general perceptions regarding the COVID-19 pandemic (Section A)

Table 4 illustrates descriptive statistics relating to the general perceptions regarding the COVID-19 pandemic, indicating the mean, standard deviation and frequency distribution results for the 12 statements. A five-point Likert type ordinal scale was used. For purposes of analysis and discussion of the frequency distributions, point one and two are used for disagreeing, point three (neutral) and point four and five for agreeing with the statements. The scales were based on an extensive literature review and included aspects, among other, such as:

- The COVID-19 pandemic has influenced and changed lives on a global scale since its emergence.
- The perceived risks posed by COVID-19 is considerable and severe for many consumers and households.
- Ignorance and non-compliance regarding health and safety protocols are the main contributors for spreading the virus.
- The COVID-19 lockdown has forced people to increase technology use.

Full disclosure of all items is not possible due to intellectual property rights of the measuring instrument by the authors and confined length of the paper. Some aspects are however further covered and dealt with in the recommendation and implication sections of this paper.

Table 4: Results of general perceptions regarding the COVID-19 pandemic

Statement	Mean	Standard Deviation	% Agree	% Neutral	% Disagree
A1	4.44	0.99	92	3	5
A2	3.99	1.17	82	7	11
A3	3.69	1.09	84	8	8
A4	4.43	1.02	93	2	5
A5	4.21	1.19	88	4	8
A6	3.74	0.93	71	23	6
A7	2.87	1.09	26	24	50
A8	3.52	1.13	41	30	29
A9	4.26	0.79	76	12	12

Statement	Mean	Standard Deviation	% Agree	% Neutral	% Disagree
A10	4.70	0.74	98	1	1
A11	4.13	0.97	78	16	6
A12	4.81	0.83	95	3	2
Overall	4.17	0.99			

Source: Own compilation

Table 4 clearly shows that the overall mean score of 4.17 indicates that mean values cluster around point four, showing that respondents tend to agree with the general perceptions regarding the COVID-19 pandemic (Section A). The highest mean score was obtained for A12 (4.81) indicating that respondents agree strongly that the COVID-19 lockdown has forced people to increase the use of technology (e.g., online shopping). The lowest mean scores indicating some form of neutrality (2.87 and 3.52) were obtained for A7 (effectiveness of interventions by the government were being adequately performed) and A8 (there is social discrimination and stigma in some communities regarding people infected with the virus) respectively. The overall standard deviation score of 0.99 indicates that there was not too much variability among the mean scores. The highest individual standard deviation score, however, was obtained by A5 (1.19), indicating some variability that ignorance and non-compliance regarding health and safety protocols are the main contributors for spreading the virus. The following sections will analyse descriptive statistics and frequency distribution results relating to the general perceptions of the impact of COVID-19 on consumer greening and sustainability practices (Section B).

6.5. Results regarding the impact of COVID-19 on consumer green practices (Section B)

The statements in Section B of the questionnaire relate to the impact of COVID-19 on consumer greening practices such as health, food and clothing, transport and travelling and waste management. Some of these items are highlighted in the discussion below as well as in the recommendation and implication section.

6.5.1. Descriptive statistics and frequency distribution results regarding the impact on health practices

Statements B1-B3 in Table 5 represent the respondents' general perceptions regarding sustainable health practices undertaken during the pandemic.

Table 5: Results of general perceptions regarding sustainable health practices

Statement	Mean	Standard Deviation	% Agree	% Neutral	% Disagree
B1	4.17	0.76	78	18	4
B2	3.60	0.80	58	30	12
B3	3.29	0.87	48	32	20
Overall	3.68	0.81			

Source: Own compilation.

The overall mean score of 3.68 for the statements regarding the impact of COVID-19 on consumers' sustainable health practices indicates that the data falls within the "agree range". The highest mean score was obtained by B1 (4.17) showing that respondents agree that maintaining a sustainable lifestyle due to health and wellness concerns is paramount during the pandemic. The overall standard deviation score (0.81) implies no significant variation around the mean score of these statements. Twenty percent of the respondents disagreed with statement B3 that they are switching to increased consumption of organic foods because of health concerns. These findings are supported by PWC (2021) and Cordina, Levin, Ramish and Seshan (2021) stating that changes in consumer behaviour,

many of which were accelerated by the COVID-19 pandemic, are fuelling a redesign of the health system and potentially affecting the way that consumers approach healthcare.

6.5.2. Descriptive statistics and frequency distribution results regarding the impact on waste management practices

Table 6 depicts the descriptive statistics relating to the general perceptions regarding household waste management practices.

Table 6: Results of general perceptions regarding waste management practices

Statement	Mean	Standard Deviation	% Agree	% Neutral	% Disagree
B4	3.58	0.83	64	22	14
B5	3.86	0.79	73	19	8
B6	3.42	0.87	62	16	22
B7	3.21	0.99	49	24	27
Overall	3.52	0.87			

Source: Own compilation.

Statements B4-B7 relate to the consumers general perceptions regarding the impact of COVID-19 on waste management practices. The overall mean score of 3.52 indicates that the responses tend to cluster around neutral. The highest mean score was for B5 (3.86) indicating that respondents tend to agree that they dispose of all hazardous waste (chemical, medical, and other harmful waste) in the manner prescribed. The overall standard deviation score of 0.87 indicates that there was not much variability around the mean scores. Twenty-seven percent of the respondents disagreed with statement B7 that they are making a habit of taking recyclable goods to recycling facilities. These findings are supported by Roe, Bender and Qi (2020:401) and Pappalardo, Cerroni, Nayga and Yang (2020), alleging that perhaps no phenomenon has so quickly and radically altered household production parameters, daily food patterns and waste management as the onset of the COVID-19 pandemic.

6.5.3. Descriptive statistics and frequency distribution results regarding the impact on environmental sustainability

Table 7 illustrates the results of the descriptive statistics and frequency distribution results relating to the general perceptions regarding environmentally sustainable practices.

Table 7: Results of general perceptions regarding environmental sustainability practices

Statement	Mean	Standard Deviation	% Agree	% Neutral	% Disagree
B8	3.29	0.99	58	23	19
B9	3.84	0.87	75	11	14
B10	3.36	0.78	46	27	27
B11	4.02	0.90	80	16	4
Overall	3.62	0.89			

Source: Own compilation.

Statements B8-B11 relate to the consumers general perceptions regarding their participation in environmentally sustainable practices during the pandemic. The overall mean of the data set (3.62) indicates that the data lies within the “neutral” range of the five-point Likert scale. The highest mean score was obtained by B11 (4.02), indicating that the majority of respondents tend to agree that they are attempting to conserve more water at home (e.g., showering, making food, cleaning, etc.), despite that fact that more handwashing and other water related hygiene practices takes place during the

pandemic. Twenty seven percent of the respondents disagreed with statement B10 that they are engaging more in the purchase of home energy-efficient appliances and other energy-saving products during the pandemic. The standard deviation score of 0.89 implies that there is not much variability around the mean scores. These results are in line with Holbrook (2021) and MasterCard.com (2021) stating that the pandemic has elevated consumers' focus on sustainability and believe it's more important to reduce their own carbon footprint.

6.5.4. Descriptive statistics and frequency distribution results regarding the impact on sustainable transport and travel

Table 8 shows the descriptive statistics and frequency distribution results relating to the general perceptions regarding the sustainable transport and travel practices undertaken by the respondents during the pandemic.

Table 8: Results of general perceptions regarding sustainable transport and travel practices

Statement	Mean	Standard Deviation	% Agree	% Neutral	% Disagree
B12	2.99	0.79	85	9	6
B13	4.21	0.95	46	29	25
B14	2.76	0.99	34	17	49
Overall	3.32	0.91			

Source: Own compilation

Statements B12-B14 relate to the consumers general perceptions regarding sustainable transport and travel practices during the pandemic. The overall mean score of 3.32 indicates the values cluster around the neutral range. The highest mean score was obtained by B13 (4.21) showing that respondents agreed that they have changed their air travelling habits, especially for leisure purposes. The overall standard deviation score of 0.91 indicates that there not much deviation around the mean scores. Almost half of the respondents (49%) indicated that they disagreed with statement B14 that they are making use of shared travelling as to reduce traffic congestion and costs. The novel coronavirus pandemic (COVID-19) has adversely affected domestic and international tourism and travelling habits. These findings are supported by Abdullah, Dias, Muley and Shahin (2020) and Chen, Duan, Ali, Duan and Ryu (2021) and state that trip purpose, mode choice, distance travelled, and frequency of trips for primary travelling were significantly different before and during the pandemic. People placed a higher priority on the pandemic related concerns while choosing a mode during the pandemic as compared to their general concerns.

6.5.5. Descriptive statistics and frequency distribution results regarding the impact on sustainable food and clothing

Statements B15-B20 in Table 9 relate to the consumers general perceptions regarding sustainable food and clothing practices.

Table 9: Results of general perceptions regarding sustainable food and clothing practices

Statement	Mean	Standard Deviation	% Agree	% Neutral	% Disagree
B15	2.99	0.89	29	37	34
B16	4.21	0.63	85	13	2
B17	3.36	0.75	46	33	21
B18	3.88	0.89	73	14	13
B19	3.89	0.83	68	21	11
B20	3.84	0.85	67	18	15

Statement	Mean	Standard Deviation	% Agree	% Neutral	% Disagree
Overall	3.68	0.81			

Source: Own compilation

The overall mean score of 3.68 indicates that majority of the respondents tend to agree with most of these statements. The highest mean score was obtained by B16 (4.21) indicating that respondents are of the opinion that new digital technologies and retailing platforms have been fueling online shopping during the pandemic. Neutral perceptions were obtained by B15 (preferring to purchase clothes from sustainable brands) and B17 (ensuring access to high quality, reliable information about the environmental characteristics of products purchased). The overall standard deviation score of 0.81 shows that there was not much variability around the mean scores of these variables. These findings are supported by Picchioni, Po, and Forsythe (2021) and the UN Environment Programme (2020) alleging that the COVID-19 pandemic has brought many challenges to the fashion/clothing industry but also created an opportunity to step back and consider their impact on the planet and environment. Environmental concerns have also become integral to the sustainable food systems agenda.

7. Recommendations and managerial implications

Based on the findings and conclusions of this study, the recommendations and guidelines are outlined below. These are also linked to the statements in Section A and B of the measuring instrument.

7.1 General perceptions regarding the COVID-19 pandemic

Based on the respondents' general perceptions regarding the COVID-19 pandemic, consumers should:

- Recognise that the outbreak of COVID-19 has been a major interrupting event, challenging how consumers engage in shopping behaviour.
- Realise that an essential determinant of the spread of the virus is a series of small-scale individual consumer decisions.
- Recognise that COVID-19 has a rapid spread with a high transmission rate leading to substantial deaths world-wide.
- Be aware that people with low immunity, elder people and those with comorbidities are more at risk.
- View ignorance and non-compliance regarding health and safety protocols as the main contributors for spreading the virus.
- Support government interventions to manage the spread of the virus.
- Recognise that the pandemic has influenced and changed lives on a global scale since its emergence.
- Be provided educational programs about COVID-19 as this could increase awareness and improve infection control and prevention.

7.2. General perceptions regarding the impact of COVID-19 on consumer sustainable and greening practices

Table 10 outlines some general recommendations regarding sustainable and greening practices of consumers during the pandemic.

Table 10: General guidelines regarding consumer sustainable and greening practices

Regarding sustainable health practices, consumers should be	
1	Looking to maintain a sustainable lifestyle due to health and wellness concerns.
2	More health conscious and looking to buy more locally grown food items.
3	Switching to increased consumption of organic foods because of health concerns.

Regarding waste management practices, consumers should be...	
4	Aware of their actions on the environment and engaged in various household waste management initiatives.
5	Disposing of all hazardous waste (chemical, medical, and other harmful waste) in the manner prescribed.
6	Purchasing items in bulk or as refills in order to reduce packaging waste.
7	Making a habit of taking recyclable goods to recycling facilities.
Regarding environmentally sustainable practices, consumers should be ...	
8	Adopting green and eco-friendly practices in their household to improve environmental sustainability.
9	Reducing their consumption of single-use plastic to help save the environment.
10	Engaging more in the purchase of home energy-efficient appliances and products.
11	Attempting to conserve more water at home (e.g. showering, making food, cleaning, etc.).
Regarding sustainable transport and travel practices, consumers should be ...	
12	Understanding that working remotely from home has decreased air pollution as there is less public and private vehicle travelling.
13	Changing their air travelling habits, especially for leisure purposes.
14	Making use of shared travelling as to reduce traffic congestion and costs.
Regarding sustainable food and clothing practices, consumers should be ...	
15	Preferring to purchase clothes from sustainable brands.
16	Understanding that new digital technologies and retailing platforms have been fueling online shopping.
17	Ensuring access to high quality, reliable information about the environmental characteristics of products purchased.
18	Shifting toward at-home cooking and make use of meal delivery services.
19	Of the opinion that home-cooked meals have lower environmental impacts than processed foods.
20	Re-evaluating their eating-out habits and visiting restaurants.

Source: Own compilation

8. Conclusion

The COVID-19 pandemic has had unexpected global ramifications for the market environment, consumers and on social life in general (Končar, Grubor, Marić, Vučenović, & Vukmirović, 2020: 4). According to Jian, Yu, Yang and Zeng (2020:1), consumers adapted their values and behavioural patterns in order to cope with the anxiety induced by the pandemic. As a result, various product sustainability indicators were created for customers such as financial or economic, environmental and social performance. However, it is still unknown which characteristics consumers value more during green purchasing (e.g. reduced or zero carbon footprint, use of less resources, recyclability, eco-friendly packaging etc.) (Shao & Ůnal, 2019). The objective of greening is to help preserve the environment while also creating non-productive value (e.g. less defective equipment or less delays or interruptions) (Świtek & Sawinska, 2017:275).

The main conclusions to be drawn from the study in terms of the impact of COVID-19 on consumer greening and sustainability practices were:

- *Sustainable health practices*

Sustainable health practices are regarded as practices that promote a sustainable lifestyle and includes the purchase of organic foods and locally produced goods. According to Dey (2021), the COVID-19 pandemic had a productive outcome on sustainable lifestyles, as a consequence of the incontrovertible shifts in consumer purchasing patterns, which include organic and natural products, and excludes excessive purchasing of luxury products. Organic products are those products that consumers purchase to restrict harmful consequences on the environment. Locally produced products minimize energy utilization in the production process as less travelling and transportation are involved thus reducing carbon dioxide emissions that likely contribute to global warming. Overall, it appears that respondents tended to adopt sustainable health practices during a pandemic. However, the majority of the respondents were neutral or disagreed that they have switched to increased consumption of organic foods because of increased health concerns.

- *Waste management practices*

Choshaly (2016:54) and Umar, Sehab and Yagnik (2018:58) established that waste management practices consist of principles such as reduce, reuse and recycle activities. In a study conducted by the United Nations Environmental Programme (2020:9), it was reported that the COVID-19 pandemic has introduced several challenges in the management of waste, including increases in the volume of plastic waste, resulting from lockdown restrictions and activities, increases in littering and restrictions in recycling. It is further reported by Sarkodie and Owusa (2021:7952) that the national lockdown has caused a radical increase in the production of waste due to household waste activities involving protective personal equipment. Overall, it appears that respondents are neutral towards these waste management practices, especially of making a habit of taking recyclable goods to recycling facilities.

- *Environmental sustainability*

Environmental sustainability involves a process that authorises humans to consider their basic needs while maintaining the state of the environment, including eco-friendly practices, reducing plastic waste, the consumption of energy-efficient appliances and the conservation of water (Morelli, 2011:15). The COVID-19 pandemic has affected household energy consumption due to work-from-home policies and the national lockdown as consumers and employees were forced to stay at home and use their own energy and water resources. Bomey (2020) also contends that an increase in single-use plastic waste and medical waste has occurred during the pandemic. Excess of medical waste, need for proper personal protection equipment, surge in online food delivery and shopping, and the ban on reusable bags have led to increased plastic pollution during COVID-19 pandemic. Overall, it appears that respondents agreed with the statements regarding environmental sustainability during the pandemic, especially attempting to conserve more water at home when showering, making food and cleaning while being forced to be at home during the lockdown or working from home.

- *Sustainable transport and travel*

During the pandemic, work-from-home policies, shared transportation and declined levels of air travel resulted in decreased greenhouse gas emissions. Sung and Monschaur (2020) and Vetter (2020) contend that the lack of vehicle mobility and public transport were substantially affected by the national lockdowns. Most of the respondents appeared to be neutral in their responses regarding sustainable transport and travel practices during the pandemic. However, they felt strongly and agreed that they have changed their air travelling habits, especially for leisure purposes as it was restricted during the lockdowns. Working remotely from home has also decreased air pollution as there is less public and private vehicle travelling.

- *Sustainable food and clothing*

Consumer's food choices are significant determinants of the state of the environment. Ifeanyi-chukwa and Nwazingo (2020:33) defined sustainable food choices as the consumption of food and dietary products that satisfy dietary needs of humans and the environment. Sustainable eating thus involves foods that provide a balanced diet for the body but also facilitate the conservation of the environment.

At-home cooking meals have lessened negative impacts on the environment. Green clothing includes the consumption of clothing choices that exhibit long-term usage, is locally produced and environmentally sustainable. Environmentally aware consumers undertake sustainable clothing practices by participating in activities that avoid fast fashion, collaborative clothing and discarding measures (Mukendi et al., 2020:24). Overall, it appears that respondents agreed with sustainable food and clothing practices during a pandemic. Strong sentiments were expressed that new digital technologies and retailing platforms have been fuelling online shopping during the pandemic. Neutral perceptions were obtained regarding preferring to purchase clothes from sustainable brands. The pandemic has thus impacted on the eating habits of consumers (e.g. preference for locally produced products, online convenience shopping, eating out at restaurants and home-cooked meals) and the type of clothing that was worn (e.g. less formal office wear).

The following extract seems appropriate to conclude this paper with:

“Consumption has lately been under the microscope facing pressure from all stakeholders as principles of sustainability have gained more popularity ... major shifts in buying and consumption habits. This was shaken up by the COVID-19 outbreak that forced consumers to rethink every aspect of their lives... people’s lives dominated by the pandemic by uncertainty, especially when referring to their financial situation... insecurities caused by COVID-19 will determine consumers’ reassessment of their values, together with embracing new consumption habits. Among the most important shifts, were more prudent purchase decisions, rising interest for discounted prices, increased likelihood of buying local and enhanced preference in buy fresh products instead of processed or semi-processed ones” (Orîndaru, Popescu, Căescu, Botezatu, Florescu, & Runceanu-Albu, 2021).

Keywords

customer loyalty programmes;
customer loyalty;
business performance

Abstract

Customer loyalty programmes are often used by businesses to assist in increasing customer loyalty levels. Despite the existent research on customer loyalty, there is limited research on South African retailers' loyalty programmes and how it can contribute to these businesses' performance. The primary objective of this study is to determine what customers seek from customer loyalty programmes in order to become loyal customers, and how this ultimately influences business performance. The purpose is to identify the antecedents of customer loyalty programmes, to determine how these antecedents influence customer loyalty and to test the relationship between customer loyalty and business performance. This study uniquely conducts the research from retail employees' views. A hypothetical model was constructed based on a comprehensive literature study. The empirical investigation gathered responses through a structure questionnaire and the statistical analyses revealed five significant antecedents of customer loyalty programmes, namely customer satisfaction, communication, commitment, switching cost and trusting image. In addition, the study's results support the significant, positive relationship between retailers' customer loyalty and business performance. The study presents practical strategies as recommendations to South African retailers regarding their customer loyalty programmes, with the aim towards increased customer loyalty and improved business performance.

1. Introduction

Businesses provide customers with need satisfying products and services in exchange for some form of payment from the customer. In addition, businesses aim to improve their business performance on a continuous basis (Krutz & Berson 2019:2-3). In order to improve business performance, businesses can focus on increasing sales by means of retaining current customers and by increasing their customer base (Soltani, Zareie, Milani & Naimpour 2018:237). Therefore, it is important for businesses to retain and expand their customer base through the focus of creating customer loyalty. According to the Market Research Report (2022), the market size of the global loyalty management market was US\$4.54 billion (approximately R72.31 billion) in 2021. The global loyalty management market is, however, expected to grow by 23.5% over the period 2022 (US\$5.57 billion; R88.71 billion) to 2029 (US\$24.44 billion; R389.24 billion) (Market Research Report 2022). The report also noted that 45% of United States of America (USA) consumers changed their brand preferences during Covid-19. The State of Loyalty in 2021 report (2021) highlighted that more than 75% of the consumers in the USA changed their shopping behaviour, including changing brands, since the outbreak of Covid-19. This brand preference change therefore provides an opportunity for businesses towards gaining new customers as well as creating and increasing customer loyalty.

Previous research found that the adoption of customer loyalty programmes is increasing (Thompson & Tuzovic 2020:215). Considering the loyalty market in South Africa, it is reported that in 2019 72% of the economically active South Africans used loyalty programmes, slightly lower than the 75% in

² E-mail address: Chantal.rootman@mandela.ac.za

2018 (The 2019/2020 South Africa Loyalty Landscape 2021). The main reason cited for the decline was the tough economic conditions resulting in customers spending less and therefore using the loyalty programmes less. According to the 2021 Truth & BrandMapp Loyalty Whitepaper (2021), the loyalty programme usage increased during 2021 to 74%. The reasons posed for this increase is that more males are using loyalty programmes and at a higher rate than females while working from home during lockdown. However, a number of reasons are provided for consumers not belonging to any loyalty programmes, such as: not being interested in loyalty programmes, loyalty programmes being too difficult to understand, not spending enough to earn rewards and the difficulty to redeem points or rewards, too much personal information being requested and preferring not to carry loyalty cards (Truth & BrandMapp Loyalty Whitepaper 2021).

The above shows changes in customer loyalty over the years, and reveals that research was mainly done from customers' viewpoints. Indeed, research (Wang, Singh, Li, Mishra, Ambrose & Biernert 2017:122) provides evidence that the intensity displayed by, and the authenticity of a business' employees, positively influence customers' behaviour towards the business. Employees will only display positive intensity and be genuinely authentic if they value the business. Furthermore, a retail sector study by Smith, Sparks, Hart and Tzokas (2004:202) recommends further research regarding employee dimensions towards the increase of customer loyalty. It is therefore important to determine employees' perceptions of the customer loyalty programmes offered by their businesses.

2. Problem Investigated

Retailers are important for South Africa's economic growth as retailers contribute approximately 20% to the South African GDP (Botha 2022). During the first 4 months of 2022, the retail sales in South Africa increased by 2.9% (Trading Economics 2022), although the trading levels are still below those recorded pre-Covid (Botha 2022). As stated by Botha (2022), with high unemployment rates it will also be challenging for retailers to achieve pre-Covid sales. With the increased cost of traveling to retailers, consumers are taking advantage of discounts, coupons and members' only rewards (Shouse 2022). In addition, Shouse (2022) highlights that 43% of customers of chain stores select a specific retailer as a result of the loyalty programmes offered while more than 70% of the customers visit the retailers where they are loyalty programme members. Retailers should therefore make extensive use of their loyalty programmes to retain customers and to increase their customer base. Furthermore, as employees engage with customers on behalf of a business (Wang et al. 2017), employees may have insight into what customers may perceive as important when offering customer loyalty programmes.

Based on the preceding discussion, and since it is evident why customers often do not want to belong to a loyalty programme, the question that can be asked is, what will entice customers to belong to a retailer's loyalty programme? Since employees engage with customers, employees can shed light on what is important for customers to include in a customer loyalty programme. Previous research on customer loyalty (Singh, Singh & Vij 2017; Singh, Nayyar & Das 2019; Singh, Slack, Sharma, Mudalier, Narayan, Kaur & Sharma 2021; Wang, et al. 2017; Willys 2018) gathered customers' views. The focus of this study, however, is on the perceptions of employees. Therefore, the question guiding this study is:

Which factors from the employee's perspective will entice customers to use a customer loyalty programme and become loyal customers, to ultimately improve business performance of South African retailers?

3. Research Objectives

The primary objective of this study was to determine from an employee's perspective what customers seek from customer loyalty programmes to become loyal customers, and how this will ultimately influence business performance. Therefore, it is important to identify the antecedents of customer loyalty programmes, to determine how these antecedents influence customer loyalty and to test the relationship between customer loyalty and business performance in the South African retail context. The main research question can thus be formulated as:

What are the antecedents of customer loyalty programmes that influence customer loyalty and ultimately business performance in the South African retail context from an employee perspective?

4. Literature Review and Hypotheses

Since this study is concerned with retailers' business performance and how these businesses' loyalty programmes can assist in ensuring loyal customers to ultimately improve business performance, the following sub-sections elaborate on these concepts.

4.1. Business Performance

Various definitions of business performance exist as the definition is dependent on the purpose of business performance. Business performance metrics can take on a number of forms, such as sales and profitability (Belli, O'Rourke, Carrillat, Pupovac, Melnyk & Napolova 2022:150). Furthermore, Choo and Lee (2018:127) emphasise that business performance can be measured from both a financial and non-financial perspective. Financial performance is an indication of the financial health of the business (Rashid, Nurunnabi, Rahman & Masud 2020:6). For the purpose of this study, business performance is measured using financial (such as sales growth, cost reduction and productivity) and non-financial metrics (such as employee turnover rate and growth in number of employees).

A study by Singh et al. (2019) highlights that literature identified customer loyalty as a key driver for business performance, while Belli et al. (2021:148) state that a loyal customer base is regarded as a valuable asset to a business. Rashid et al. (2020:1) are in agreement by stating that profitability (a measure of business performance) is important for businesses, with customer loyalty being a major contributor to profitability. In addition, the study found that customer loyalty significantly influences business performance (Singh et al. 2019) as economic success is based on the ability of a business to create long-term relationships with customers making repeat purchases (Famarzi & Bhattacharya 2021:313).

4.2. Customer Loyalty

Customer loyalty is described as the consistent repeat purchase of products and services favouring a specific business that is based on the customer's previous experiences and future expectations (Kim, Steinhoff & Palmieter 2021:74; Kwiatak, Morgan & Thanasi-Boçe 2020:1647; Mokhtar & Shamsudin 2020). When considering customer loyalty, it is important to realise that customer loyalty relates to communication with existing customers, customer loyalty programmes; and it is relevant to consider how customer loyalty can be used to improve business performance (Arslan 2020:18). In addition, offering incentives attracts customers by creating customer attention that can lead to customer loyalty (Mokhtar & Shamsudin 2020). As stated by Gu, Luan, Song and Shang (2021:629), businesses that invested in providing rewards to customers reaped the benefit of an increase in profits. Although customer loyalty is a multidimensional construct comprising of attitudes, intentions and behaviours, this study only considers behavioural customer loyalty (Belli et al. 2022:149). Behavioural loyalty is the behavioural patterns of consumers when purchasing the selected product or service on a consistent basis, or alternatively, it refers to changes in the actual or intended behaviour of the consumers towards the loyalty programme provider (Belli et al. 2022:150, 152).

One of the tools that businesses can use to create or enhance customer loyalty significantly is through the use of customer loyalty programmes (Belli et al. 2022:149; He, Tain & Wang 2019:807; Kwiatak et al. 2020:1646). Therefore, it is important to consider the possible antecedents of customer loyalty programmes which can be linked to or regarded as the antecedents of customer loyalty, although there is no consensus on the antecedents of customer loyalty (Singh et al. 2019).

4.3. Possible antecedents of Customer Loyalty Programmes

A customer loyalty programme is described as a rewards programme offered by a business to customers who frequently make purchases from the business over time (Gu, Luan, Song & Shang 2021:623; He, Tian & Wang 2019:807). Therefore, the purpose of a customer loyalty programme is to increase sales and also to create a relationship between the business and existing customers (Arslan 2020:17). In addition, customer loyalty programmes offer customers additional value over and above the actual value spent (Kwiatak et al. 2020:1645) as its members receive more in return than what

they paid for, for example through special discounts. Furthermore, a study by Chaudhuri, Voorhees and Beck (2019:653) found that customer loyalty programmes have a direct influence on sales and profits, that is business performance from a financial perspective.

The antecedents of customer loyalty programmes, as confirmed by Singh et al. (2019), are customer satisfaction (Ilyas, Munir, Tamsah, Mustafa & Yusriadi 2021; Singh et al. 2017:238; Xhema, Metin & Groumps 2018:288), communication (He et al. 2019:810; Xhema et al. 2018:288), commitment (Singh et al. 2017:238), switching costs (Xhema et al. 2018:288), trust (Singh et al. 2017:238; Singh et al. 2021:1754; Xhema et al. 2018:288), and image (Dam & Dam 2021; Singh et al. 2017:238; Singh et al. 2021:1754; Xhema et al. 2018:288). Since customer loyalty programmes are designed to create customer loyalty, these antecedents of customer loyalty programmes can be regarded as the antecedents of customer loyalty.

Customer satisfaction can be described as the measurement used to determine the happiness of customers with the products and services offered by a business (Mokhtar & Shamsudin 2020). Numerous studies found a significant positive relationship between customer satisfaction and customer loyalty in Vietnamese supermarkets (Dam & Dam 2021:591) and commercial banks (Nguyen, Pham, Tran & Pham 2020: 402), a car repair shop (Ilyas et al. 2021:12) and e-commerce retailer (Rizan, Febrillia, Wibowo & Pratiwi 2020:288) in Indonesia, retail banking in Ghana (Omorieg, Addae, Coffie, Ampomg & Ofori 2019:798), fast-food restaurants in Macedonia (Saneva & Chortoseva 2020:127), amongst mobile phone operators in Madagascar (Willys 2018:1031), and amongst communication service users in the Kurdistan region of Iraq (Demir, Budur & Heshmati 2021:68). Both the studies of Sing et al. (2017:239) and Karunaratna and Kumara (2018:59) propose that customer satisfaction significantly and positively influence customer loyalty. However, the study by Khairawati (2020:20) found no relationship between customer satisfaction and customer loyalty within a shopping retailer in Indonesia. Therefore, the following hypothesis is formulated:

H¹: There is a significant relationship between *Customer satisfaction* and *Customer loyalty*.

It is important for businesses to communicate accurate and timely information to their customers, including customer loyalty programme benefits, promotions and regulations (He et al. 2019:810). A study within the Nigerian banking industry found that marketing communication influences customer loyalty positively and significantly (Zephaniah, Ogba & Izogo 2020:6). Furthermore, the use of social media to communicate with customers also has a positive and significant influence on customer loyalty (Mohammed & Al-Swidi 2019:386). Lee and Salciuviene (2018:585) highlight that customer loyalty depends on the communication channel(s) businesses select. In addition, the study by Rashid et al. (2020:17) found that inadequate communication decreases customer loyalty. Based on the evidence, the following hypothesis is postulated:

H²: There is a significant relationship between *Communication* and *Customer loyalty*.

Commitment is defined as the economic, emotional and or psychological connections customers have with a specific business (Singh et al. 2017: 239; Thompson & Tuzovic 2020:210). A study amongst university students from five countries showed that commitment has a positive and significant relationship to customer loyalty (Thompson & Tuzovic 2020:215). In addition, Koo, Yu and Han (2019:6) found that commitment exerts a significant and positive influence on customer loyalty. A study by Singh et al. (2017:239) also proposes that there is a positive and significant relation between commitment and customer loyalty. Arslan (2020:14) states that disloyal customers are not committed to a business and therefore repurchase of products and services will not occur. Therefore, the following hypothesis is proposed:

H³: There is a significant relationship between *Commitment* and *Customer loyalty*.

Switching costs, that can be monetary or non-monetary, refer to the costs a customer will incur (or give up) when changing from one business to another (Demir et al. 2021:59; Singh et al. 2017:242;

Xhema et al. 2018:288). A study by Koo et al. (2019:6) revealed switching costs to be significantly and positively associated with customer loyalty and the same result is reported by Nguyen et al. (2020:402) amongst commercial banks in Vietnam. Arslan (2020:14) regarded replacement cost as an important factor influencing customer loyalty. The study by Xhema et al. (2018:290) shows that switching costs have a positive and significant influence on customer loyalty. The results of the study amongst mobile phone operators in Madagascar found partial support for the influence of switching costs on customer loyalty, with switching costs measured as procedural cost, financial cost and relational cost (Willys 2018:1027,1031). Karunaratna and Kumara (2018:59) postulated that a positive and significant relationship exists between switching costs and customer loyalty. A study by Demir et al. (2021:68), however, found that switching costs do not influence customer loyalty. Based in the previous discussion, the following hypothesis is postulated:

H⁴: There is a significant relationship between *Switching cost* and *Customer loyalty*.

Trust can be described as the perceived creditability of a business (Thompson & Tuzovic 2020:209). Mohktar and Shamsudin (2020) state that trust is important to achieve customer loyalty while Singh et al. (2017:241) as well as Karunaratna and Kumara (2018:59) postulate that trust positively and significantly influences customer loyalty. In addition, Arslan (2020:14) regards trust as one of the most important factors for customer loyalty. A study by Singh et al. (2021:1763) conducted amongst fast-food restaurants, and a study amongst university students (Thompson & Tuzovic 2020:215), found that trust has a significant positive influence on customer loyalty. Furthermore, a study within the retail banking industry in Ghana (Omoregie et al. 2019:798) found that trust positively influences customer loyalty. A study amongst communication service users in Iraq, however, found that trust does not influence customer loyalty (Demir et al. 2021:68). Therefore, the following hypothesis is put forward:

H⁵: There is a significant relationship between *Trust* and *Customer loyalty*.

As stated by Singh et al. (2017:241) and Demir et al. (2021:58), image is defined as the overall picture that customers have of a business and the actions of a business. Singh et al. (2017:241) as well as Karunaratna and Kumara (2018:59) postulated that there is a positive and significant relation between image and customer loyalty. Previous research found that image has a significant positive influence on customer loyalty within supermarkets in Vietnam (Dam & Dam 2021:591), fast-food restaurants in the Small Island Developing States (Singh et al. 2021:1763), a retail business in Kosovo (Xhema et al. 2018:290) and amongst communication service users in the Kurdistan region of Iraq (Demir et al. 2021:68). However, a study by Omoregie et al. (2019:798) within the Ghanaian retail banking industry found no significant influence of image on customer loyalty. The following hypothesis is formulated based on previous research:

H⁶: There is a significant relationship between *Image* and *Customer loyalty*.

Previous research has found that the use of customer loyalty programmes leads to customer loyalty (Curatman, Suroso & Suliunto 2021:9; Nettet, Bergem, Nervik, Sørli, & Helgesen 2021:7) and to customer retention (Duleepa & Fazila 2021:46; Elgarhy 2022:1). In addition, there are numerous studies providing empirically and anecdotal evidence of a relationship between customer loyalty and business performance (Omoregie et al. 2019:798). Arslan (2020:15) states that customer loyalty is an important factor that assists in improving profitability, a measure of business performance. A study amongst hotels in six countries in Western Europe found that customer loyalty significantly and positively influences business performance (Sampaio, Mogolón & Rodrigues 2019:137). In addition, Vierra, Agnihotri and Almeida (2022:208) found that customer loyalty is used by retailers to improve revenues by focusing on promoting different products with specific rewards for those products. A study amongst Islamic banks in Bangladesh found that customer loyalty has a positive influence on financial business performance (Rashid et al. 2020:17). Another study amongst a banking and life insurance business in five major cities in India showed that a significant and positive relationship

exists between customer loyalty and business performance. Based on previous research, the following hypothesis is postulated:

H⁷: There is a significant relationship between *Customer loyalty* and *Business performance*.

5. Hypothetical Model

Based on the literature review and the evidence from previous research, seven hypotheses were formulated, as specified in the above section. Figure 1 presents the proposed relationships as depicted in the hypothetical model of the study.

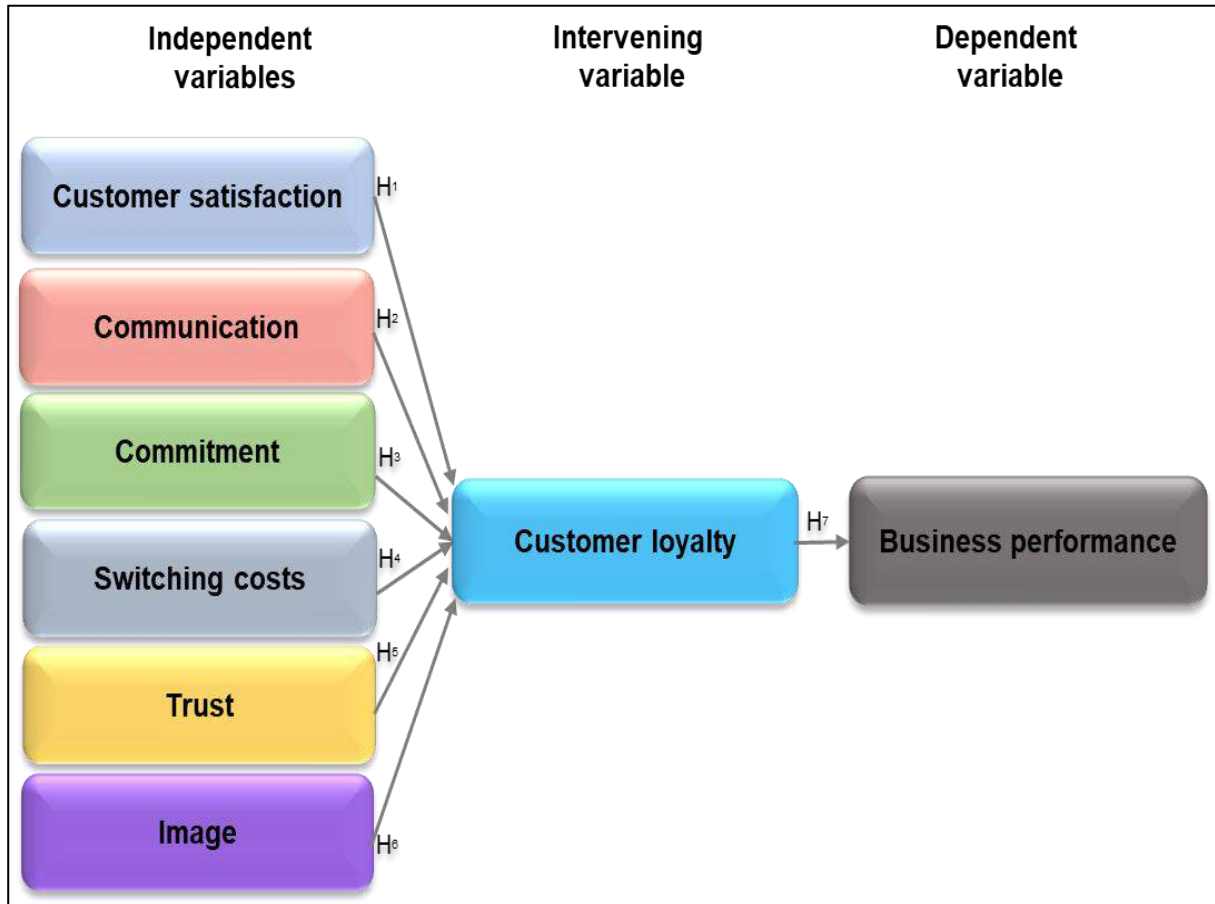

Figure 1: Hypothetical Model of Customer loyalty and Business performance in the South African retail sector

6. Research Methodology

The following sub-sections discuss the study’s research design, participants, measuring instrument and the statistical analysis conducted.

6.1. Research Design

The research design of the study is discussed by means of using the research onion as described by Saunders, Lewis and Thornhill (2019), from the outer layer to the core. Considering the primary objective of this study, the positivistic research paradigm is the most suitable (Maree, Creswell, Ebersohn, Eloff, Ferreira, Ivankova, Jansen, Niewenhuis, Pietersen & Plano Clark 2016). Using this paradigm, the study can identify the antecedents of customer loyalty and the influence of customer loyalty on business performance, based on South African retailers’ perceptions and within their contexts. The best theory development approach for this study is the deductive approach (Saunders et al. 2019:145) as existing literature on customer loyalty was used to identify and test variables linked to customer loyalty. A mono method quantitative methodological choice was most appropriate as the study’s hypotheses could be evaluated to establish relationships between the selected variables (Creswell 2014; Greener & Martelli 2020). To fit the rest of the methodology, a survey strategy was

employed as the perceptions of retail managers were gathered (Saunders et al. 2019:193). Due to the study aiming to gather current customer loyalty and business performance perceptions in the retail context, a cross sectional time horizon was applicable (Saunders et al. 2019:212).

6.2. Research Participants and Measuring Instrument

The empirical investigation of this study allowed primary data to be collected. The study population consisted of retail employees in Gqeberha, South Africa. No list of potential respondents was available, therefore, non-probability sampling techniques, namely convenience and snowball sampling, were used (Struwig & Stead 2013). Trained fieldworkers distributed the questionnaire to potential respondents where the respondents had to be an employee of a business offering a customer loyalty programme. The minimum sample size of 200 was calculated by 8 variables x 5 items per variable x 5 respondents per item (Bartlett, Kotlik & Higgins 2001), and the estimated response rate was 70%. The actual sample size was calculated by dividing the minimum sample size of 200 multiplied by 100 by the estimated response rate of 70 (Saunders, Lewis & Thornhill 2009). Therefore, the study's actual sample size was calculated as 286.

A structured English questionnaire was developed as the measuring instrument and consisted of two sections. Section A consisted of 63 items and used an ordinal scale by means of a five-point Likert-type scale ranging from strongly disagree (1) to strongly agree (5). The section included statements to measure respondents' perceptions of variables in the study's hypothetical model. Using a nominal scale, Section B collected data pertaining to the biographical and demographic information (for example gender and age) of the respondents.

All ethical considerations such as confidentiality, anonymity, voluntary participation and withdrawal from the study were considered while conducting this study. A cover letter explaining the purpose and process of the study accompanied the questionnaire. In addition, a pilot study (to test content validity) was conducted among 20 potential respondents before the main study took place.

6.3. Statistical Analysis

The study's data analysis process comprised of various steps including data cleaning by using both the Microsoft Excel and Statistica software packages. Descriptive statistics were calculated to summarise the sample of respondents. Next, the validity of the measuring instrument was tested. Construct validity was tested and established by conducting an Exploratory Factor Analysis (EFA). Items with factor loadings of at least 0.5 were considered as valid (Osborne 2015). Following this, the Cronbach's alpha was calculated for each factor using the items as determined by the EFA, in order to determine the reliability of the measuring instrument (Creswell 2014). Cronbach's alpha coefficients larger or equal to 0.7 were regarded as reliable (Shukla 2014; Ursachi, Horodnic & Zait 2015; Taber 2017). Based on the factor structure resulting from the EFA, descriptive statistics relating to the variables (including the means and standard deviations of variable responses) were also calculated in the third part of the analysis (MacDonald & Headlam 2014). In terms of further inferential statistics, Pearson's product moment correlations were computed to identify correlations between the variables (Lind, Marchal & Wathen 2012; Yoo, Mayberry, Bae, Singh, Qinghua & Lillard Jr 2014:9-10). The correlations were considered as follows: weak strength if correlations were between 0.1 and 0.3, moderate strength if correlations were between 0.3 and 0.5 and strong strength if correlations were between 0.5 and 1.0. The final part of the data analysis consisted of conducting a multiple regression analysis, which examined the relationships between the independent variables, intervening variable and the dependent variable, after which the hypothesised relationships were then either rejected or accepted (Saunders et al. 2019:621).

7. Empirical Results

The results of the study's empirical investigation are detailed through the sample description, validity and reliability results, descriptive statistics as well as inferential statistics on the relationships between variables. Finally, the decisions regarding the hypotheses' acceptance are provided.

7.1. Sample Description

A total of 265 completed questionnaires were received. After data cleaning, 234 of the completed questionnaires could be used for further analysis, therefore a response rate of 83.57% was obtained (234 usable of the 280 questionnaires distributed). The sample comprised of slightly more females (56.84%) than males (42.74%) with only one respondent not willing to indicate their gender. The population distribution of the sample respondents was mainly Black (40.60%), Coloured (32.05%) and White (20.51%). Nearly 6% of the respondents did not indicate their population group while approximately 1% of the sample was categorised as Asian. Most of the respondents were in the age groups 20 to 29 (43.16%) and 20 to 39 (32.05%), followed by respondents in the age groups 40 to 49 (17.52%) and 50 to 59 (7.27%).

More than half of the respondents have a total working experience of less than 10 years (57.26%), followed by respondents with a total working experience of between 11 and 20 years (28.63%). The remainder of the respondents have between 21 and 30 years (9.83%) and 31 to 40 years (3.42%) total working experience. Two respondents did not indicate their total working experience. The respondents' working experience at their current employment is mainly less than 10 years (76.50%) with a small group of respondents being employed at their current employer for between 11 and 20 years (14.10%). A few respondents have been with their current employer for between 21 and 30 (0.86%) and between 31 and 40 (1.28%) years. Seventeen respondents did not answer the question regarding working experience at current employment.

The most prominent job titles of the respondents are manager (38.89%), sales consultant (22.22%), cashier (10.68%) and supervisor (5.13%). Various other job titles are also listed such as beauty advisor, healthcare advisor and waiter (less than 4% of respondents). The most represented loyalty programmes are for the retailers Spar, PnP and Woolworths (37.61%), health shops such as Clicks and Dischem (28.63%) and clothing retailers such as Edgars, Ackermans, Mr Price, PEP, TFG, Cotton-On Group and Truworths (18.38%). The loyalty programme of a few restaurants (5.98%), banks (4.70%), entertainment facilities (2.99) and coffee shops (1.71%) are also included in the sample.

7.2. Validity and Reliability Results

Regarding validity, the EFA loadings revealed six distinct factors. In addition, the Cronbach's alpha results confirmed that the study's measuring instrument can be regarded as reliable. Table 1 reflects both the EFA and Cronbach's alpha results.

Table 1 reflects both the EFA and Cronbach's alpha results.

Table 1: EFA Validity and Cronbach's Alpha Reliability Results

Source: Own compilation

Table 1 indicates that seven factors emerged from the EFAs. Six of these factors emerged as expected. Two originally expected variables' items loaded together and as such a new, merged factor, realised. One additional factor that resulted from the EFA was deleted from further analyses since less than the minimum required three items loaded onto this factor.

The table indicates that three items expected to measure 'Customer satisfaction' loaded together. In addition, two items developed to measure 'Trust' also loaded onto this factor. These two items' loading here was justified as it considered whether retailers' loyalty programmes "never disappoints" customers, thus these items related to customers' satisfaction with the programmes. The respondents perceived this factor as a single construct, Customer satisfaction, since the items were all related to customer satisfaction.

Table 1 shows that factor two was dominated with items developed to measure 'Communication'. Seven items relating to communication loaded onto this factor. In addition, one item originally developed to measure 'Customer satisfaction' also loaded onto this factor. The reason for this loading can be motivated since the item identified whether customers receive loyalty programme information. It is clear that the item relates to communication. The loading of these eight items together infers that respondents viewed these items as measures of communication.

Furthermore, Table 1 reveals that three items concerning 'commitment' loaded together. One other item first developed to measure 'customer satisfaction' also loaded onto the same factor. This item

measured customers' "happiness to be members" of the considered loyalty programme. This shows that the items fitted with the 'commitment' items. Therefore, this factor was titled Commitment.

Table 1 shows that 10 items, developed to measure 'switching cost' (5), 'commitment' (2), 'customer image' (2) and 'customer satisfaction' (1) loaded on the same factor. Since the factor was dominated with items relating to Switching cost, this factor was labelled as such. Fittingly, the other 5 items' loading here could also be explained. The items considered the loyalty programme's timeous information, resolution of queries, offers and rewards as well as whether customers regard the programme as the best or better than others. Therefore, all the items also related to whether customers will consider a switch to a competitor retailer or whether they regard a switch as being too costly. Evident from Table 1, items originally developed to measure 'Trust' and 'Customer image' separately loaded onto a single factor. The respondents perceived this factor as a single construct and therefore the factor was labelled Trusting image to reflect the combined aspects of customers trusting their retailer's loyalty programme and their image thereof.

The items that loaded onto the study's five factors all had factor loadings above the identified 0.5 cut-off value (see Table 1). This confirms the construct validity of the study's measures. Considering the EFA results, the study's hypotheses were revised. Hypotheses H⁵ and H⁶ merged to form H^{5b} since the new factor, namely Trusting image, emerged: H^{5b} – There is a significant relationship between Trusting image and Customer loyalty. All other hypotheses remained the same.

As mentioned, the internal consistency of each of the factors was also assessed by calculating Cronbach's alpha. The results presented in Table 1 indicate Cronbach's alpha values between 0.728 and 0.902 for all of the study's factors, which indicates a satisfactory level of reliability and internal consistency of the measuring instrument (Shukla 2014; Ursachi et al. 2015).

7.3. Descriptive Variable Statistics and Inferential Statistics on the Relationships between Variables

Table 2 summarises the descriptive statistics for the study variables as well as the Pearson's product moment correlations.

Table 2: Descriptive statistics and Pearson correlations

Variables	Mean	Standard deviation	CS	COM	COM T	SC	TI	CL	BP
CS	4.146	0.560	1.000						
COM	4.267	0.646	0.531	1.000					
COMT	4.157	0.537	0.602	0.455	1.000				
SC	3.784	0.624	0.538	0.465	0.692	1.000			
TI	4.193	0.501	0.696	0.502	0.747	0.748	1.000		
CL	4.132	0.542	0.696	0.566	0.766	0.769	0.840	1.000	
BP	4.075	0.613	0.390	0.336	0.460	0.483	0.503	0.530	1.000

Source: Own compilation

Given that the study's measuring instrument used a 5-point Likert-type scale, it is clear from Table 2 that the respondents were mostly in agreement with the statements relating to the factors because all factors had means above 4, excluding Switching cost (mean = 3.784). Respondents were neutral towards agreeing with the Switching cost items. In particular, with regards to the Customer loyalty (mean = 4.132) and Business performance (mean = 4.075) means, it is evident that respondents regard their businesses' customers as loyal to the loyalty programmes and believe that their business performance improved over the last two years. The highest mean of 4.267 for Communication revealed that respondents view their business's communication about its loyalty programme to be of a high standard. The standard deviations, all below 1, shows that respondents responses varied only slightly.

The Pearson correlations in Table 2 show no weak correlations between variables. All variables have positive – moderated or strong – associations with each of the other variables. All correlations were moderate or strong. The lowest correlation, although still of moderate strength, was found between Communication and Business performance ($r = 0.336$). The strongest link was between Trusting image and Customer loyalty ($r = 0.840$). Two other strong correlations are between Switching cost and Customer loyalty as well and Commitment and Customer loyalty with correlations of 0.769 and 0.766 respectively.

To confirm the correlation results, multiple regression analyses were performed to identify statistically significant relationships between the factors, in order to ultimately test the study's hypotheses (see Tables 3 and 4).

Table 3: Regression analysis – The influence of selected antecedents on customer loyalty

REGRESSION SUMMARY FOR INTERVENING VARIABLE: CUSTOMER LOYALTY						
$R^2 = 79.70\%$						
Parameter	Beta b*	Std. Error	B	Std. Error	T-value	P-value
Customer satisfaction	0.137	0.044	0.132	0.043	3.110	0.002*
Communication	0.111	0.037	0.093	0.031	3.039	0.003*
Commitment	0.196	0.048	0.198	0.048	4.096	0.000**
Switching cost	0.233	0.048	0.202	0.041	4.890	0.000**
Trusting image	0.369	0.057	0.399	0.061	6.519	0.000**

Source: Own compilation

The first multiple regression analysis identified five statistically significant relationships, between Customer loyalty and each of the independent variables. Based on the highest T-value (6.519), Table 3 shows that, with regard to South African retailers' loyalty programmes, Trusting image has the strongest positive relationship with Customer loyalty. This supports the initial Pearson correlation results and implies that if customers trust a retailer's loyalty programme and have a positive image of it, the customer will be loyal to the programme and retailer. The R^2 indicates that nearly 80% of the variability in Customer loyalty is explained by the independent variables.

Table 4: Regression analysis – The influence of customer loyalty on business performance

REGRESSION SUMMARY FOR DEPENDENT VARIABLE: BUSINESS PERFORMANCE						
$R^2 = 28.16\%$						
Parameter	Beta b*	Std. Error	B	Std. Error	T-value	P-value
Customer loyalty	0.530	0.056	0.600	0.063	9.526	0.000

Source: Own compilation

Supported by the literature, the second multiple regression analysis showed that Customer loyalty applicable to South African retailers' loyalty programmes significantly and positively influence the retailers' Business performance. In other words, if retailers increase their customer loyalty levels, their businesses' business performance, including its sales, productivity, profitability, etc., will improve.

7.4. Decisions regarding the Hypotheses

Based on the multiple regression results, the hypotheses were evaluated (see Table 5).

Table 5: Decisions regarding the reformulated hypotheses based on the multiple regression results

Hypothesis number	Hypothesis	Decision
H ¹	There is a significant relationship between <i>Customer satisfaction</i> and <i>Customer loyalty</i> in the South African retail sector.	Accepted
H ²	There is a significant relationship between <i>Communication</i> and <i>Customer loyalty</i> in the South African retail sector.	Accepted
H ³	There is a significant relationship between <i>Commitment</i> and <i>Customer loyalty</i> in the South African retail sector.	Accepted
H ⁴	There is a significant relationship between <i>Switching cost</i> and <i>Customer loyalty</i> in the South African retail sector.	Accepted
H ^{5b}	There is a significant relationship between <i>Trusting image</i> and <i>Customer loyalty</i> in the South African retail sector.	Accepted
H ⁷	There is a significant relationship between <i>Customer loyalty</i> and <i>Business performance</i> in the South African retail sector.	Accepted

Source: Own compilation

A summary of the study's results and the decisions relating to the hypotheses are presented in Figure 2.

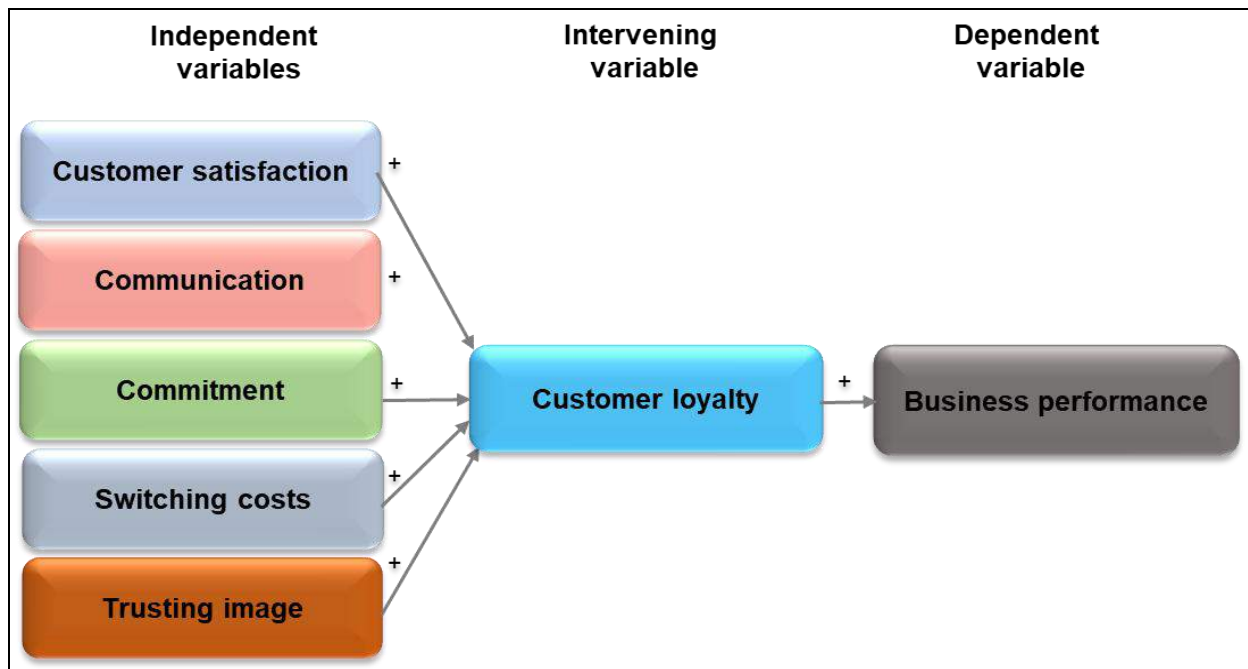

Figure 2: Statistical relationship results pertaining to the Customer loyalty and Business performance in the South African retail sector

8. Managerial Implications

It is clear from Figure 2, based on the statistically significant relationships, that all the selected antecedents of loyalty (as identified from literature and with two variables merging) positively influence Customer loyalty in the South African retail sector. In addition, Customer loyalty through loyalty programmes positively influence the Business performance of retailers.

The study interestingly showed that Switching cost had the lowest mean (currently customers might be willing to switch). It had, however, the second strongest, significant positive influence on customer loyalty. In other words, it is important to ensure customers are not willing to switch (keep switching cost high), as this will increase loyalty. Despite this, currently switching costs are not high in the South African retail sector. This reveals that switching cost is an aspect that retailers can actively use, and strategise around, to increase customer loyalty towards programmes.

Overall, the empirical investigation's results correspond with many previous studies' results in other contexts. Regarding the antecedents of customer loyalty, Karunaratna and Kumara (2018:59) as well as Sing et al. (2017:239) support the result concerning customer satisfaction; Mohammed and Al-Swidi (2019:386) as well as Zephaniah et al. (2020:6) support the result of communication; Koo et al. (2019:6) as well as Thompson and Tuzovic (2020:215) support the result of commitment. In addition, Nguyen et al. (2020:402) as well as Xhema et al. (2018:290) coincide with the result of switching cost; and finally, Arslan (2020:14) as well as Karunaratna and Kumara (2018:59) support the result of trust and image (thus trusting image). Furthermore, the study's result that showed the relationship between customer loyalty and business performance was similarly revealed in studies by Rashid et al. (2020:17) as well as Vierra et al. (2022:208).

It is clear that an increased focus on customer satisfaction, communication, commitment, switching costs and trusting image of customer loyalty programmes would lead to increased customer loyalty levels and the improved business performance of South African retailers. Based on the results and as per the items tested via this study's measuring instrument, the following practical strategies are recommended to South African retailers, to increase customer loyalty through their loyalty programmes and ultimately to improve business performance:

- Proactively determine customers' loyalty programme expectations to adequately design loyalty programme features to meet customers' needs;
- Regularly communicate accurate, updated and understandable loyalty programme information;
- Offer personalised deals and rewards;
- Ensure that customers feel a bond to the specific retailer due to its loyalty programme;
- Encourage and incentivise customers to recommend the specific loyalty programme;
- Make it difficult and time-consuming to switch to a competitor's loyalty programme;
- Outperform competitors' loyalty programmes in terms of benefits and service levels so that customers do not desire to switch;
- Have a well-managed, fair loyalty programme where customer information is confidentially treated;
- Use the loyalty programme (by offering specific or special rewards) to encourage larger, higher-valued and more frequent purchases, for example for bulk purchases.

9. Conclusion

The study gathered perceptions of retail managers in South Africa. In future research, a comparative study could be conducted among retail customers, using the same valid and reliable measuring instrument. In addition, deeper insights could be gained through a qualitative study by means of semi-structured interviews.

Overall, this study contributes to the field of customer loyalty programmes, as implemented by South African retailers. The study is unique in presenting the views of employees, those responsible to "market" their retailers' loyalty programmes among customer and potential customers. It emphasises the antecedents to focus on to increase customer loyalty through loyalty programmes and ultimately improve retailers' business performance.

Apparel sites

Abstract

The purpose of this study was to investigate the influence of Artificial Intelligence on repurchase intention on apparel sites among South African consumers. Using the Technology Readiness Acceptance model, six main constructs were investigated including optimism, innovativeness, insecurity, perceived usefulness, perceived ease of use, use intention and repurchase intention. Using a quantitative, descriptive research design, 123 usable questionnaires were obtained and analysed using Structural equation modelling. Findings indicate that the effects of optimism on perceived ease of use and perceived usefulness were positive and significant. Innovativeness had a positive and significant influence on perceived ease of use yet a negatively and statistically non-significant influenced on perceived usefulness, insecurity had a non-significant on both on perceived ease of use and perceived usefulness. Findings also indicated positive significant relationships between perceived ease of use, perceived usefulness, use intention and purchase intention. It is recommended that online apparel retailers therefore enhance current AI technologies on their sites to increase overall repurchase intention to remain competitive in a highly competitive e-commerce industry.

1. Introduction

One of the technological advancements presented by the Fourth Industrial Revolution is artificial intelligence (AI), which is defined as the simulation of human intelligence processes exhibited by machines (Helm, Swiergosz, Haeberle, Karnuta, Schaffer, Krebs, Spitzer & Ramkumar, 2020). According to Visvikis, Cheze Le Rest, Jaouen and Hatt (2019), part of AI includes machine learning, which uses computational algorithms to learn and analyse a set of data to enable machines to make autonomous decisions and recommendations. Soni (2020) affirmed that AI provides benefits to many industries, including e-commerce. Some of these benefits include improved customer relationship management, achieving sales goals, enhanced customer experience, better customer service, automated processes, forecasting sales, and improved customer satisfaction (Kian, 2021; Thiebaut, 2019).

The e-commerce industry has experienced exponential growth in the last two years due to the coronavirus pandemic. Tyrväinen and Karjaluo (2022) and Verani, Clodfelter, Menon, Chevinsky, Victory and Hakim (2020) posited that hard lockdown measures imposed by many countries forced retailers to shift their operations online to comply with social distancing regulations. Globally, retail e-commerce sales are currently valued at US\$5.542 billion and are expected to grow to US\$7.391 billion in 2025 (Statista, 2022). In Africa, e-commerce revenue grew by US\$6 million from 2019 to 2020, and is expected to reach US\$46.1 million by 2025 (Statistab, 2021). Even once the pandemic is over, many retailers will continue to operate online due to the shifts in consumer behaviour.

A study by Accenture (2020) determined the changes in consumer behaviour as a result of the pandemic. Some of the long-term shopping trends identified in the global market include an increased focus on health, a rise in conscious consumption, and a growing love for local products. Another study by Deloitte (2021) found that South African consumers are more comfortable shopping online and will continue shopping online post pandemic. Except for the periods where COVID-19 infections peaked, South Africans' online shopping intentions across categories remained constant, which contrasts with global trends where online purchase intentions fluctuated significantly based on infection numbers. The report identified clothing and footwear (apparel) as part of the top three categories for which consumers intended to continue purchasing online (Deloitte, 2021). A survey by Statista (2021a) supports this notion, as "fashion" was deemed one of the top four largest revenue-generating e-commerce categories in South Africa. Although electronics is currently the top revenue-generating e-commerce category and has the highest site user penetration, the user penetration rate for apparel sites is expected to surpass electronics in 2024. This can be attributed to the implementation of AI technologies on apparel sites, which is this study's area of interest (Idrees, Vignali & Gill, 2020).

AI has advanced how online apparel sites target customers and improve the overall shopping experience. Some of the ways in which apparel sites have integrated AI include:

- Intelligent searches that use website search engines to track browsing history and perform automated, customised searches. This strategy assists in retargeting potential customers based on their previous purchases (Banerjee, Mohapatra & Saha, 2021). For example, a consumer may have searched for "jeans" on an apparel site, left the site, then logged back in and found a number of "jeans" recommended on their profile.
- Personalised information capabilities use AI to exploit mass data and detect consumer purchase behaviours to personalise information. Consumers then spend less time on searching for information and rather receive direct personalised information, customised to their needs (Guha, Grewal, Kopalle, Haenlein, Schneider, Jung, Moustafa, Hegde & Hawkins, 2021). For instance, after searching for "jeans" on an apparel site, customers might receive numerous emails or pop-up ads with jeans-related promotions.
- Chatbots are used to simulate human conversation and interaction through voice commands or text messages and can be embedded through any major messaging application (Landim, Pereira, Vieira, Costa, Moura, Wanick & Bazaki, 2022). For example, a chat box or pop-up message may appear on the apparel site asking customers "How can I help you?".

Regardless of the benefits presented by AI for apparel sites and the opportunities for online apparel shopping in South Africa, there are some concerns regarding South African consumers' readiness to use apparel sites with AI technologies embedded and whether consumers who purchase from apparel sites using AI will repurchase (Wiese & Humbani, 2020). These concerns are elaborated in the problem statement.

1.1. Problem Statement

The pandemic forced many consumers to re-evaluate their spending as they had less disposable income to purchase non-essential items, such as apparel, due to job losses or salary cuts (Beckdach, Brown, Halbardier, Henstorf & Murphy, 2020). Alberola, Arslan, Cheng and Moessner (2021) stated that some consumers opted for more affordable brands through brand switching, while others stopped purchasing apparel altogether. With fashion and apparel being one of South Africa's top retailing categories (Statista, 2021a), the pandemic led many apparel retailers to lose existing customers, subsequently experiencing a decline in sales and profit (Dewalska-Opitek & Bilińska-Reformat, 2021). However, one of the greatest opportunities that the pandemic offered to apparel retailers was the rapid increase in e-commerce and online shopping (Agava, Selvam & Pete, 2021; Fourie, 2021; Halan, 2021).

Despite the increase in e-commerce activity, Mdluli and Dunga (2022) claimed that majority of the South African population lives below the poverty line or comprises low-income earners, and access to the Internet is not deemed a necessity. Thus, Odunitan-Wayas, Okop, Dover, Alaba, Micklesfield,

Puoane, Levitt, Battersby, Meltzer and Lambert (2021) asserted that consumers from these income groups prioritise their spending on groceries and transport. Lembani, Gunter, Breines and Dalu (2020) added that one of the most prominent socio-economic issues that South Africa faces is access to good-quality Internet infrastructure and data to enable consumers to use the Internet. The high costs, poor infrastructure, cable theft, and rolling blackouts inhibit many consumers' access to the Internet (Bergere, 2020; Koirala & Acharya, 2022; Lavery, Abadi, Bauer, Brambilla, Cheng, Cox, Dudley, Ellis, Fontaine, Kelly, Marquardt, Matlhane, Ndagano, Petruccione, Slavík, Romanato, Rosales-Guzmán, Roux, Roux, Wang & Forbes, 2018).

The digital divide between rich and poor is broadening, as most South African consumers struggle to access and use the Internet (Lavery et al., 2018; Lembani et al., 2020). Resultantly, a large portion of the South African population does not have access to information online and cannot use the Internet to perform many activities that are now being automated, including shopping online (Halan, 2021; Koirala & Acharya, 2022). According to Lembani et al. (2020) and Mdluli and Dunga, (2022), since the broader South African population lacks experience using the Internet, these individuals are not as digitally literate as their middle-high income-earner counterparts, who use the Internet regularly and are more digitally savvy. Subsequently, many South African consumers are sceptical to shop or perform transactions online (Thusi & Maduku, 2020). Moreover, Park and Zhang (2022) and Vlačić, Corbo, Silva and Dabić (2021) argued that new technologies, such as AI, that provide customised solutions and track purchase behaviour increase scepticism among consumers, which hinders their readiness and intention to shop online. Since most apparel retailers have shifted their operations online and integrated aspects of AI on their sites, the digital divide, level of digital literacy, and scepticism regarding online shopping could prove problematic to consumers' readiness and intention to repurchase from apparel sites embedding AI technologies (Gao, Ren, Yang, Zhang & Li, 2022; Lavery et al., 2018).

Consequently, This study therefore aims to investigate the influence of AI on apparel sites on consumers' repurchase intention using TRAM, which combines aspects from the technology readiness index (TRI) and the technology acceptance model (TAM), including technology readiness, perceived usefulness, perceived ease of use, use intention, and repurchase intention (Chen & Lin, 2018; Simiyu & Kohsuwan, 2019). The findings from this study will assist online apparel retailers to determine if South African consumers are ready to use AI to inform their purchase decisions and repurchase intention online.

1.2. Research aim and research objectives

The main aim for this study is to investigate the influence of AI on apparel sites on consumers' repurchase intention using TRAM.

The secondary research objectives proposed for this study include:

SO1: To determine the influence of optimism towards using AI on perceived usefulness of AI on online apparel sites.

SO2: To investigate the effect of innovativeness of using AI on perceived usefulness of AI on online apparel sites.

SO3: To ascertain the influence of insecurity towards using AI on perceived usefulness of AI on online apparel sites.

SO4: To determine the effect of perceived usefulness of AI on use intention of online apparel sites.

SO5: To investigate the influence of ease of use of AI on use intention of online apparel sites.

SO6: To ascertain the effect of ease of use of AI on perceived usefulness of AI on online apparel sites.

SO7: To determine the influence of use intention of AI on apparel sites on repurchase intention from apparel sites.

1.3. Methodology

This study employed a positivist research paradigm and adopted a quantitative, descriptive research approach. The sample was selected based on non-probability, purposive sampling and considered any

South African consumer: (1) who purchased from an online apparel retailer in the past six months, and (2) engaged with any form of AI on the online apparel retailer's site, including but not limited to, Siri, facial recognition, delivering personalised messages, offering chatbot interaction, and/or intelligent searches. The data were collected from the sample using an online questionnaire administered via Google Forms to maintain social distancing. Due to the low response rate associated with online questionnaires, a snowball sampling technique was also employed, which asked the respondents to send the questionnaire link to at least five other people they believed met the purposive sampling screening criteria. Kirchherr and Charles (2018) argue that some of the limitations associated with snowball sampling include the fact that the sample might not be representative of the population, however this did not pose an issue for the current study as it was not the intention or purpose of the study to generalise the findings to the broader population. Noy (2008) adds that some respondents do not want to provide the names and details of potential respondents, however this study employed an online questionnaire via Google Forms which maintained anonymity and confidentiality of all respondents.

The questionnaire was divided into three main sections. Section A required demographic information, Section B asked respondents to provide information regarding their last online apparel purchase, and Section C comprised Likert-scale type items anchored on a scale of 1 to 5, where 1 = "strongly disagree" and 5 = "strongly agree". These items were adopted from Chen, Liu and Lin (2013), Masrom, (2007), Porter and Donthu (2006), and Shin and Lee (2014). Section C included four subsections measuring statements pertaining to: (i) technology readiness with three subconstructs, including optimism and insecurity (each comprising four to five statements); (ii) perceived usefulness (comprising six statements); (iii) perceived ease of use (comprising eight statements); and (iv) continuance intention (comprising six statements). A cover page, explanatory statement, and consent form were included in the online questionnaire and potential respondents were provided with the background to the study, informed about their rights, and assured of their anonymity.

In total, 123 usable questionnaires were obtained and data were coded, cleaned, and analysed using SPSS version 27. Structural equation modelling (SEM) analysis was conducted using SmartPLS 3 to investigate the hypotheses and model fit. Refer to the results and findings sections for the tests performed and the results thereof.

1.4. Hypotheses

Using the TRAM, the following hypotheses were formulated for the study:

- H_{1a}: Optimism has a positive, significant impact on perceived usefulness of AI on online apparel sites.
- H_{1b}: Optimism has a positive, significant impact on ease of use of AI on online apparel sites.
- H_{2a}: Innovativeness has a positive, significant impact on perceived usefulness of AI on online apparel sites.
- H_{2b}: Innovativeness has a positive, significant impact on ease of use of AI on online apparel sites.
- H_{3a}: Insecurity has a non-significant impact on perceived usefulness of AI on online apparel sites.
- H_{3b}: Insecurity has a non-significant impact on ease of use of AI on online apparel sites.
- H₄: Perceived usefulness of AI has a positive, significant impact on use intention on apparel sites.
- H₅: Ease of use of AI has a positive, significant impact on use intention on apparel sites.
- H₆: Ease of use of AI has a positive, significant impact on perceived usefulness of AI on apparel sites.
- H₇: Use intention of AI has a positive, significant impact on repurchase intention on apparel sites.

2. Literature Review

The literature review provides an analysis of existing literature underpinning the study, including the TRI and TAM. Each model is discussed in conjunction with the associated constructs proposed in the conceptual model in Figure 1.

2.1. Technology Readiness Index

Technology readiness (TR) refers to an individual's traits that increase the adoption of new technologies to accomplish a goal (Chen & Lin, 2018). To measure an individual's TR, a TR index was established (Pangriya & Singh, 2021; Simiyu & Kohsuwan, 2019), which comprised various personality subdivisions including optimism, innovativeness, and insecurity. Together, these subdivisions determine an individual's propensity to use new technologies (Tavera-Mesías, van Klyton & Collazos, 2022).

2.1.1. Optimism

Optimism refers to the positive attitude associated with using technology and the results and benefits it offers (Cruz-Cárdenas, Guadalupe-Lanas, Ramos-Galarza & Palacio-Fierro, 2021). Optimism increases the perception of usefulness, control, ease of use, and trust in the technology (Park & Zhang, 2022). Pangriya and Singh (2021) explained that optimism generates curiosity about a new technology and creates the perception among users that they have the ability to use the technology and deal with uncertainty. Gao et al. (2022) asserted that this enhances enjoyment with the AI technology and increases the willingness to help others use it. Resultantly, consumers experience the AI technology to be more fun and thus interact with the technology more frequently. In addition, Flavián, Pérez-Rueda, Belanche and Casaló (2022) discovered that optimism is positively associated with improved ease of use and perceived usefulness. The more individuals prefer to use the new technology, the more likely they are to perceive the technology as useful and easy to use (Yang, Yan, Wang & Xue, 2022). Qasem (2021) conducted a study on "try-on" technology in the context of e-fashion retailing and found positive and significant relationships between optimism and perceived ease of use, and optimism and perceived usefulness. Based on this discussion, the following hypotheses are proposed for this study:

- H_{1a}: Optimism has a positive, significant impact on perceived usefulness of AI on online apparel sites.
- H_{1b}: Optimism has a positive, significant impact on ease of use of AI on online apparel sites.

2.1.2. Innovativeness

Innovativeness refers to the inherent interest to try new technologies (Park & Zhang, 2022). Individuals who express innovativeness are pioneers and want to be the first to use new technologies (Cruz-Cárdenas et al., 2021). According to Flavián et al. (2022), highly innovative individuals tend to be open-minded, demonstrate increased willingness to use technologies, and have a positive and favourable impression towards using the technology. Studies by Kim and Chiu (2019) and Rahim, Humaidi, Aziz and Zain (2022) that combined the TR index with TAM found that innovativeness positively influences perceived ease of use and perceived usefulness. Other research discovered that innovativeness related to AI technologies specifically enhanced the perceived ease of use and perceived usefulness (Pillai, Sivathanu & Dwivedi, 2020). Concerning the context of this research, a study on AI and fashion shopping found that consumers with a high degree of innovativeness tend to have a higher level of playfulness, perceived ease of use, and perceived usefulness towards augmented reality in fashion shopping (Hur & Lee, 2021). With this in mind, it can be hypothesised that:

- H_{2a}: Innovativeness has a positive, significant impact on perceived usefulness of AI on online apparel sites.
- H_{2b}: Innovativeness has a positive, significant impact on ease of use of AI on online apparel sites.

2.1.3. Insecurity

Park and Zhang (2022) described insecurity as a sense of distrust in a technology, based on doubts about its ability to achieve the intended goals accurately or reliably. In some cases, insecurity also concerns the technology having harmful consequences (Cruz-Cárdenas et al., 2021). In relation to AI technologies, Flavián et al. (2022) affirmed that the distrust stems from a lack of understanding about the technology, which leads to diminished confidence in using the technology and thus scepticism about it being able to meet an individual's needs. Individuals with high levels of technology insecurity may be averse to using the technology and some might even refuse to adopt it (Kim & Chiu, 2019). In the South African market, Lavery et al. (2018) and Lembani et al. (2020) suggested that consumers are assumed to be technology-averse due to the digital divide, which negatively influences digital literacy, thus perceived insecurity associated with using AI technologies might not influence perceived ease of use and perceived usefulness like optimism and innovativeness. Studies that have integrated TR with TAM found that insecurity negatively influences perceived ease of use and perceived usefulness regarding AI customer service on online shopping sites (Zhao, Zhang, Liu, Zhu & Gao, 2021). As per Rahim et al. (2022), insecurity has no significant influence on perceived ease of use and perceived usefulness. Therefore, it can be hypothesised that:

- H_{3a}: Insecurity has a non-significant impact on perceived usefulness of AI on online apparel sites.
- H_{3b}: Insecurity has a non-significant impact on ease of use of AI on online apparel sites.

Pangriya and Singh (2021) asserted that the TR subdivisions and the TAM were used to develop the TRAM. In relation to TRAM, Simiyu and Kohsuwan (2019) argued that TR is an antecedent of perceived usefulness and perceived ease of use in the TAM. According to Chen and Lin (2018), to adopt new technologies, individuals evaluate technologies cognitively, using the TR subdivisions to determine the perceived usefulness and perceived ease of use. The individuals' cognitive evaluations then determine their intention to use the technology and their actual use of the technology.

2.2. Technology Acceptance Model

The TAM was developed by Davis in 1989 and aims to predict behavioural attitudes towards a technology (Francom, Schwan & Nuatomue, 2021). The TAM includes the factor of "acceptance" as a behavioural intention and is a preliminary stage of adoption (Marquez, Cianfrone & Kellison, 2020). The TAM is widely used in many studies related to the acceptance of technologies, including AI-related studies by Mohr and Köhl (2021), Sadriwala and Sadriwala (2022), and Sohn and Kwon (2020). Consequently, TAM was selected for the current study. Francom et al. (2021) and Marquez et al. (2020) contended that the original TAM proposed that users' adoption of computer systems – in this case, AI technologies – depended on their behavioural intentions, which was dependent on their attitude towards the technology, and attitude was influenced by two constructs – namely perceived usefulness and perceived ease of use.

2.2.1. Perceived Usefulness

As per Sadriwala and Sadriwala (2022), perceived usefulness is the degree to which a user believes that using a particular technology will enhance the performance of a task. Choe, Kim and Hwang (2021) and Song, Ruan and Jeon (2021) purported that if users perceive that the perceived usefulness of technologies is capable of enhancing their performance of a task without the hindrance of usage difficulties, their attitude towards using the technology is positively influenced. Therefore, positive attitudes towards these technologies increase the likelihood that users intend to use and adopt the technologies (Chi, 2018; Hussein, Mohamed & Kais, 2021). Due to the multitude of studies that have proved that perceived usefulness positively and significantly influences attitude, it can be assumed that perceived usefulness has a direct, positive influence on use intention (Arora, Singh & Gupta, 2022; Rahi & Abd Ghani, 2021). With specific reference to perceived usefulness and AI, research (e.g., Meske & Bunde, 2022; Pillai & Sivathanu, 2020; Yang & Lee, 2019) has found that perceived usefulness positively influences use intention. One study that reviewed an AI technology called True Fit® on online fashion sites found that perceived usefulness of using True Fit® positively influenced the intention to use the technology (Pookulangara, Parr, Kinley & Josiam, 2021). Another study that

investigated the influence of hyper-personalisation on digital clienteling for online fashion retailers found that perceived usefulness of hyper-personalisation and digital clienteling has a strong and positive relationship with behavioural intention (Jain, Rakesh, Nabi & Chaturvedi, 2018). As a result, it can be hypothesised that:

- H₄: Perceived usefulness of AI has a positive, significant impact on use intention on apparel sites.

2.2.2. Perceived Ease of Use

Perceived ease of use is defined as the extent to which using the technology is free of effort (Mohr & Köhl, 2021). Other scholars have referred to perceived ease of use as the user-friendliness of a system or technology (Yalcin & Kutlu, 2019; Karim, Haque, Ulfy, Hossain & Anis, 2020). Easy-to-use systems or technologies lead to the acceptance or adoption of the technology (Francom et al., 2021; Mohr & Köhl, 2021). Similar to perceived usefulness, perceived ease of use regarding the utilisation of technologies positively influences attitude towards using a technology (Sadriwala & Sadriwala, 2022). Choe et al. (2021) and Hussein et al. (2021) found that a positive attitude resulting from perceived ease of use is linked to greater intention to use the technologies. Other research found a direct relationship between perceived ease of use and intention to use technologies (Al Amin, 2022; Hatamifar, Ghaderi & Nikjoo, 2021; Tao & Xu, 2020). With reference to the perceived ease of use of AI and the intention to use AI, Ho, Yeh and Lin (2022); Pillai and Sivathanu (2020); and Sohn and Kwon (2020) discovered a positive and significant relationship between the two constructs. Concerning AI and apparel sites, Tao and Xu (2020) found that consumers' intention to use online fashion subscription services was determined by their perceived ease of use. Another study by Jiang, Gu, Feng, Wei and Tsai (2022) investigated the influence of a virtual shoe-try-on function in mobile online shopping and discovered that perceived ease of use is an important predictor of users' continuance intentions to use the virtual shoe-try-on function. Consequently, the following hypothesis is proposed:

- H₅: Ease of use of AI has a positive, significant impact on use intention on apparel sites.

In many studies, perceived usefulness and perceived ease of use are explored as determinants of use intention, but there is an interplay between the two constructs (Hussein et al., 2021; Jain et al., 2018; Kashive, Powale & Kashive, 2021). Even though some users may perceive higher degrees of usefulness (perceived usefulness) regarding a specific technology, as it effectively enhances the performance of a task, the same users might not perceive the technology to be easy to use (perceived ease of use) (Dhingra & Mudgal, 2019). In relation to this study, it can be assumed that AI might not be perceived as easy to use by consumers in emerging markets who have limited digital literacy skills and are sceptical of shopping online (Lavery et al., 2018; Thusi & Maduku, 2020). Nevertheless, existing studies on AI and TAM argue that perceived ease of use of AI influences perceived usefulness of AI, which affects use intention (Jiang et al., 2022; Mohr & Köhl, 2021; Pookulangara et al., 2021). Hence, it is hypothesised that:

- H₆: Ease of use of AI has a positive, significant impact on perceived usefulness of AI on apparel sites.

2.3. Intention

The outcome of the TRAM is to determine whether users intend to use the technology in future. Regarding this study, the conceptual model proposes two types of intention: use intention and repurchase intention.

2.3.1. Use Intention

The intention to use technology in future is supported by the information systems continuance theory (ISCT), which argues that users will continue utilising technologies if their expectations have been met and/or exceeded (Ding, 2019). In this case, technologies refer to AI. Zheng, Wang, Doll, Deng

and Williams (2018) purported that the ISCT includes perceived usefulness and maintains that if users perceive increased levels of usefulness, they are more likely to experience positive disconfirmation, while lower levels of perceived usefulness lead to negative disconfirmation. Franque, Oliveira, Tam and Santini (2021) affirmed that positive disconfirmation leads to greater intention to use the technology. As mentioned in sections 2.2.1 and 2.2.2, perceived usefulness and perceived ease of use are determinants of use intention as per TRAM (e.g., Chen & Lin, 2018; Simiyu & Kohsuwan, 2019) and were proposed as hypotheses 4 and 5 to be investigated in this study. A lot of information systems research stops at this point or includes an investigation on actual use of the technology, but the marketing scope of this study justifies the need to extend the TRAM beyond intention to use the technology and to determine whether consumers have an intention to repurchase from AI apparel sites.

2.3.2. Repurchase Intention

Repurchase intention is defined as the propensity that a customer will continue to purchase a product from the same online seller (Trivedi & Yadav, 2018). For many online apparel stores, the intention to repurchase was negatively affected by the pandemic as consumers became more price-sensitive and some switched to more affordable clothing options (Alberola et al., 2021; Dewalska-Opitek & Bilińska-Reformat, 2021). The boom in online shopping led to a highly competitive arena for many online apparel retailers. To maintain their competitive advantage, some online apparel retailers enhanced their sites through AI (Pookulangara et al., 2021; Tao & Xu, 2020). Despite the efforts by online apparel retailers to integrate AI on their sites to retain consumers, this strategy might only appeal to a small portion of South African consumers, as the greater population cannot access and use the Internet due to high data costs, poor infrastructure, rolling blackouts, and increased scepticism associated with online shopping (Bergere, 2020; Koirala & Acharya, 2022; Lavery et al., 2018; Mdluli & Dunga, 2022). However, in theory (Apergis, 2019; Ofori & Appiah-Nimo, 2019), consumers who already shop online are assumed to be more digitally savvy and digitally literate, and thus more accepting of new or more advanced technologies, such as AI. Based on their perceived usefulness and perceived ease of use, consumers will have a greater intention to use AI technologies. This was proven in the apparel industry by Jain et al. (2018), Jiang et al. (2022), Pookulangara et al. (2021), and Tao and Xu (2020), who conducted studies on AI technologies, including a virtual shoe-try-on function, hyper-personalisation on digital clienteling, online fashion subscription services, and True Fit® on mobile apparel sites respectively. Other marketing-related research has explored the influence of perceived usefulness and perceived ease of use of AI technologies on purchase intention in the fashion industry (e.g., Isidore & Arun, 2021; Soares, Camacho & Elmashhara, 2022; Yin & Qiu, 2021). However, increased brand switching and price-sensitivity as a result of the pandemic has led to challenges among online apparel retailers concerning the retention of customers (Alberola et al., 2021; Dewalska-Opitek & Bilińska-Reformat, 2021). Consequently, the outcome proposed for this study relates to repurchase intention and research regarding the influence of use intention on repurchase intention in emerging markets is scant. Since most studies prove a positive relationship between use intention and purchase intention (Isidore & Arun, 2021; Nguyen, Nguyen, Nguyen, Phan, Bui & Moon, 2019), it can be assumed that use intention also positively influences repurchase intention. Thus, it can be hypothesised that:

- H₇: Use intention of AI has a positive, significant impact on repurchase intention on apparel sites.

3. Results and Findings

Using IBM SPSS version 27, the data were coded and cleaned, resulting in 123 usable questionnaires. Thereafter, the data were checked for normality using skewness and kurtosis, which should fall within the parameters of -2 to +2 and -7 to +7 respectively (Pallant, 2016). The data fell within these parameters, indicating that it was normally distributed and that parametric tests could be conducted, including descriptive analysis (means and standard deviations), exploratory and confirmatory factor analysis (CFA; as the study combined four different questionnaires that had been previously validated, but not as a combined study), and SEM.

3.1. Descriptive Statistics

The demographic results for the descriptive statistics indicate that 43.9% of respondents hold a diploma/degree as their highest level of education, while majority of respondents (52.8%) were students. Of the study's respondents, 47.2% were aged 18–25. In terms of online shopping behaviour, 27.6% purchase online at least once every three months, while 23.6% of respondents only purchase once a month. Most of the respondents (38.2%) indicated that they use other forms of online stores to purchase clothes, while 29.3% of respondents purchase their clothes at Superbalist. Furthermore, when asked which apparel item they purchased most often, 26.8% of respondents answered shoes.

Central tendency measures were then analysed to determine the extent to which respondents agreed or disagreed with the statements. The mean point of the five-point Likert scale is 2.5 (5/2), with any mean scores below 2.5 indicating that most respondents either strongly disagree or disagree with the statements. Mean scores of 2.5–3.4 suggest that most respondents tend to neither agree nor disagree with the statements. All the mean scores equal to or above 3.5 suggest that most respondents agree or strongly agree with the statements measuring the constructs. Based on the analysis, it was found that most respondents agreed with statements on optimism ($M = 3.58$), perceived usefulness ($M = 3.82$), perceived ease of use ($M = 3.53$), use intention ($M = 3.62$), and repurchase intention ($M = 3.68$), whereas respondents felt neutral about innovativeness ($M = 3.08$) and insecurity ($M = 2.92$).

Standard deviations were also provided which explain the spread of the data from the mean (Pallant, 2016). The highest standard deviations were calculated for repurchase intention ($SD = 0.920$), insecurity ($SD = 0.911$), innovativeness ($SD = 0.836$), perceived ease of use ($SD = 0.824$), use intention ($SD = 0.824$) and perceived usefulness ($SD = 0.781$). This indicates that responses deviated significantly from the mean implying that there were large variations in the responses provided to these statements. Optimism had the lowest standard deviation ($SD = 0.677$). The next section describes the process followed for SEM analysis and whether the data met the criteria for these tests.

3.2. Structural Equation Modelling

CFA is the first step of SEM that determines the validity of the measurements in the model. To perform the factor analysis, two criteria have to be met. The first criterion is to ensure there are sufficient data points available. Pallant (2016) affirmed that 7–10 subjects per item should be available. This criterion was met, as there were 10 subjects for each factor. The second criterion to be met is that of the Kaiser-Meyer-Olkin (KMO) value, which should be 0.6 or above, as per Pallant (2016). Moreover, the Bartlett's test of sphericity should be significant. The data met this criterion, as the KMO value was 0.914 and Bartlett's test of sphericity was significant ($p \leq 0.000$), indicating that the data met all the criteria for sampling adequacy. According to Fabrigar, Wegener, MacCallum and Strahan (1999:277), normally distributed data use the maximum likelihood method as the most suitable extraction method for factor analysis, as it highlights significance testing and the goodness-of-fit indices. This validity assessment includes reliability, convergent, and discriminant validity, which are discussed in the following subsections.

3.2.1. Reliability

Reliability refers to the extent to which the measurement of a phenomenon provides stable and consistent results (Taherdoost, 2016). To assess scale reliability in SEM, the Cronbach's alpha and composite reliability (CR) are used (Field, 2013). The required cut-off value of the Cronbach's alpha and CR is 0.7, although 0.6 is sometimes permissible (Malhotra, Nunan & Birks, 2017). Results in Table 1 show that the Cronbach's alpha ranges from 0.776 to 0.957, indicating an overall acceptable internal consistency of all seven latent variables considered in the model. Therefore, all constructs involved in this study are considered reliable.

3.2.2. Convergent Validity

Convergent validity is the extent to which a set of items only measures one latent variable in the same direction (Hosany, Prayag, Deesilatham, Caušević & Odeh, 2015). The results support the convergent validity because all the factor loadings are above or equal to 0.5. In addition, the average variance

extracted (AVE) estimates are above 0.5. The results from the reliability and convergent reliability tests are presented in Table 1.

Table 1: Reliability and Convergent Reliability Results

Constructs	Items	Corrected item-total correlation	Cronbach's alpha	CR	AVE
Innovativeness	I1	0.807	0.822	0.875	0.585
	I2	0.777			
	I3	0.619			
	I4	0.803			
	I5	0.800			
Insecurity	IN1	0.720	0.776	0.866	0.684
	IN2	0.869			
	IN3	0.883			
Optimism	O1	0.670	0.788	0.855	0.542
	O2	0.752			
	O3	0.784			
	O4	0.704			
	O5	0.766			
Perceived ease of use	PEU1	0.831	0.951	0.959	0.746
	PEU2	0.851			
	PEU3	0.925			
	PEU4	0.888			
	PEU5	0.845			
	PEU6	0.841			
	PEU7	0.824			
	PEU8	0.898			
Perceived usefulness	PU1	0.833	0.934	0.948	0.755
	PU2	0.793			
	PU3	0.909			
	PU4	0.887			
	PU5	0.891			
	PU6	0.893			
Repurchase intention	RI1	0.796	0.957	0.964	0.769
	RI2	0.884			
	RI3	0.932			
	RI4	0.913			
	RI5	0.887			
	RI6	0.934			
	RI7	0.765			
	RI8	0.889			
Use intention	CI1	0.894	0.925	0.941	0.730
	CI2	0.908			
	CI3	0.913			

Constructs	Items	Corrected item-total correlation	Cronbach's alpha	CR	AVE
	CI4	0.878			
	CI5	0.775			
	CI6	0.741			

The statistical evidence of discriminant validity is presented and discussed next using Fornell and Larcker (1981).

3.2.3. Discriminant Validity

Discriminant validity measures the extent to which a latent variable or construct discriminates from other latent variables (Taherdoost, 2016). According to Fornell and Larcker (1981), the square root of the AVE is expected to be higher than the inter-construct correlation coefficients. Discriminant validity was assessed by comparing correlations between all pairs of constructs with the square root of the AVE of each construct (Malhotra et al., 2017). Correlations greater than the square root of AVE indicate poor discriminant validity between the constructs involved. The results in Table 2 suggest that there is no discriminant validity concern.

Table 2. Fornell and Larcker's (1981) Matrix to Assess the Discriminant Validity

	Innovativeness	Insecurity	Optimism	Perceived ease of use	Perceived usefulness	Repurchase intention	Use intention
Innovativeness	0.765						
Insecurity	0.280	0.827					
Optimism	0.624	0.308	0.736				
Perceived ease of use	0.570	0.115	0.496	0.864			
Perceived usefulness	0.519	0.213	0.708	0.591	0.869		
Repurchase intention	0.284	0.049	0.405	0.471	0.387	0.877	
Use intention	0.390	0.165	0.595	0.637	0.633	0.563	0.854

3.2.4. Structural Equation Model

The model was developed and tested to appraise the significance of the constructs. For hypothesis testing, PLS generated results with the computed version of the variables. A graphical representation of the structural model can be seen in Figure 1. According to the results, the empirical model explains 36.4% (R^2) of the perceived ease of use variance. Furthermore, 57.7% (R^2) of the variance is explained by perceived usefulness, and 50.7% of the variance is accounted for by use intention. Finally, 31.7% of the variance is accounted for by repurchase intention.

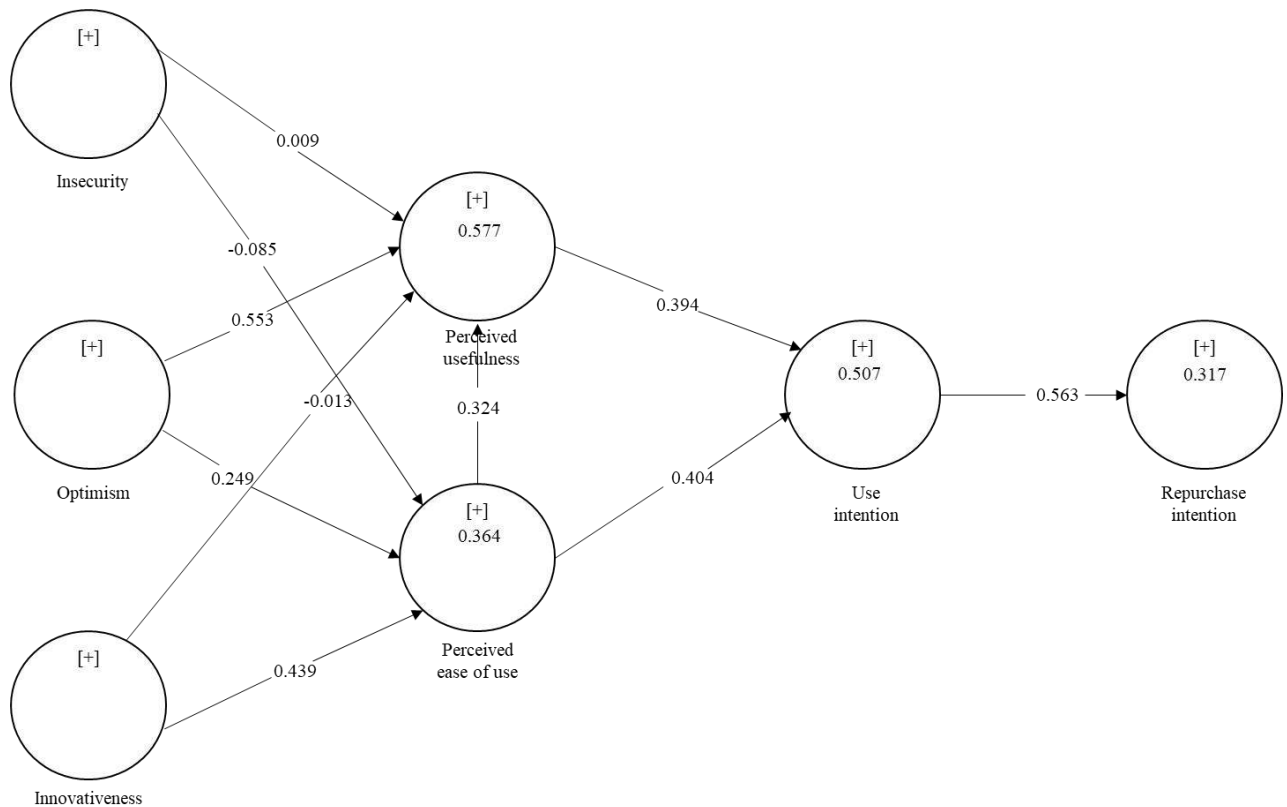

Figure 1: Structural Equation Model

3.2.5. Hypothesis testing

Table 3 establishes the independent variable's predictive effects on dependent variables. The beta values indicate the direction and strength of the relationships, while the p -values (sig.) estimate the significance of the predictive effect (Pallant, 2016). The significance of the relationship is supported if the p -value is below 0.05. An $f^2 \geq 0.02$ is a small effect, an $f^2 \geq 0.15$ is a medium effect, and an $f^2 \geq 0.35$ is considered a large effect size.

Table 3: Standardised Regression Weights and Hypotheses Conclusions

	Beta value	f^2	P Value	Conclusion
Optimism -> Perceived Ease of Use	0.249	0.057	0.027	Optimism has a positive ($\beta=0.249$) significant ($P < 0.05$) effect on Perceived Ease of Use. Therefore, H1_b is accepted.
Optimism -> Perceived usefulness	0.553	0.404	0.000	Optimism has a positive ($\beta=0.553$), significant ($P < 0.05$) effect influence on Perceived usefulness. Therefore, H1_a is accepted.
Innovativeness -> Perceived Ease of Use	0.439	0.182	0.000	Innovativeness has a positive ($\beta=0.439$), significant ($P < 0.05$) effect on Perceived Ease of Use. Therefore, H2_b is accepted.
Innovativeness -> Perceived usefulness	-0.013	0.000	0.895	Innovativeness has a negative ($\beta=-0.013$) and a statistically non-significant ($P > 0.05$) influence on Perceived usefulness. Therefore, H2_a is rejected.
Insecurity -> Perceived Ease of	-0.085	0.010	0.282	Insecurity has a non-significant

Use				(P>0.05) influence on Perceived Ease of Use. Therefore, H3_b is accepted.
Insecurity -> Perceived usefulness	0.009	0.000	0.890	Insecurity has a non-significant (P>0.05) influence on Perceived Ease of Use. Therefore, H3_a is accepted.
Perceived usefulness -> Use Intention	0.394	0.205	0.000	Perceived usefulness has a positive ($\beta=0.394$), significant (P<0.05) influence on Use Intention. Therefore, H₄ is accepted.
Perceived Ease of Use -> Use Intention	0.404	0.215	0.000	Perceived Ease of Use has a positive ($\beta=0.404$), significant (P < 0.05) effect on Use Intention. Therefore, H₅ is accepted.
Perceived Ease of Use -> Perceived usefulness	0.324	0.158	0.001	Perceived Ease of Use has a positive ($\beta=0.324$), significant (P < 0.05) effect on Perceived usefulness. Therefore, H₆ is accepted.
Use Intention -> Repurchase Intention	0.563	0.464	0.000	Use Intention has a positive ($\beta=0.563$), significant (P < 0.05) effect on Repurchase Intention. Therefore, H₇ is accepted.

Based on the findings in Table 3, optimism and innovativeness have a significant and positive influence on perceived ease of use, which aligns with the findings of Flavián et al. (2022), Qasem (2021), and Rahim et al. (2022). Optimism was also found to have a positive, significant influence on perceived usefulness, which was supported by Yang et al. (2022). However, unlike the findings of Hur and Lee (2021) and Pillai et al. (2020), this study found that innovativeness has a negative and a statistically non-significant influence on perceived usefulness. As evidenced by Rahim et al. (2022), insecurity was found to have a non-significant influence on perceived ease of use and perceived usefulness. Moreover, perceived ease of use was found to have a positive and significant effect on perceived usefulness (Hussein et al., 2021; Jain et al., 2018; Kashive et al., 2021). Perceived ease of use and perceived usefulness were proven to positively and significantly influence use intention, which was supported by Jain et al. (2018), Jiang et al. (2022), Pillai and Sivathanu (2020), and Pookulangara et al. (2021). As evidenced by Alberola et al. (2021), Dewalska-Opitek and Bilińska-Reformat (2021), and Nguyen et al. (2019), this study proved that use intention has a positive and significant influence on repurchase intention.

4. Managerial Implications and Limitations

The findings from this study can be employed by online apparel retailers to improve existing retention strategies, remain competitive, and employ AI technologies to keep up with technological trends. Despite the implications of the digital divide, including limited access to data and varying digital literacy rates (Mdluli & Dunga, 2022), this study's findings indicate that South African respondents are optimistic about AI technologies on apparel sites. Consequently, apparel retailers should continue using existing AI technologies, such as Siri, facial recognition, delivering personalised messages, offering chatbot interaction, and/or intelligent searches. Since optimism positively influences both perceived ease of use and perceived usefulness, and innovativeness influences perceived ease of use, apparel retailers might want to consider adding more AI-related technologies to their sites. AI technologies that South African online apparel retailers can consider include: (1) integrating machine learning and human user input regarding personal style, fit, body shape, and event attire appropriateness to suggest various personalised looks similar to the mobile application Affinity; (2) a wardrobe management application that asks users for their email address and permission to access

email receipts of fashion purchases to suggest outfits using consumers' current styles, which is employed by Finery; and (3) using deep learning algorithms to access customers' search information to develop a search engine that helps consumers keep track of global fashion trends, such as the offering by Hook (Jesus, 2019; Marr, 2021). By integrating AI technologies like the above-mentioned onto apparel sites, online apparel retailers increase the likelihood that consumers use the sites, which leads to greater intention to purchase.

This study does come with inherent limitations that can be overcome by future studies. The first limitation is the non-probability sampling techniques employed in this study which prohibited the results from being generalised to the broader population. Future studies could employ probability sampling techniques in order to generalise the results to the broader South African population. Secondly, this study was limited to the apparel industry which was ranked in the top five e-commerce categories in South Africa, however future studies can investigate the influence of AI among the other e-commerce categories such as electronics and media or furniture and appliances. Lastly, this study was descriptive in nature however to add to the depth of understanding of AI on use and repurchase intention, future studies can employ exploratory research through the use of qualitative methods to obtain accurate and detailed insights on consumer behaviour.

5. Conclusion

This study aimed to investigate whether South African consumers are ready to use AI on apparel sites and whether this readiness influences their repurchase intentions of apparel items online. Using the TRAM, it was discovered that consumers are ready to use AI when shopping for apparel online, which also drives their repurchase intentions. In general, consumers were optimistic about the perceived usefulness and ease of use of AI on apparel sites and although they perceived innovativeness of AI to influence perceived ease of use, they did not feel the same about innovativeness and perceived usefulness of AI on apparel sites. Furthermore, it can be concluded that consumers were sceptical of AI due to the insecurity related to perceived ease of use, but insecurity did not influence their perceived usefulness and perceived ease of use regarding AI technologies on apparel sites. In general, perceived ease of use and perceived usefulness influenced whether consumers continued using AI on apparel sites and their intention to use AI positively impacted their intention to repurchase from the apparel site.

Abstract

The paper assesses the servicescape that resonates well with public hospital patients in Nelson Mandela Bay. This research is conducted in light of the fact that most South Africans cannot afford private healthcare services, whilst the National Health Insurance fund has not yet been finalised; as a result, many have to make use of public hospitals. It is the duty of government to provide healthcare services to its population, for the benefit of the country, so as to have a healthy and active population. A population that is able to maintain good health is able to make a meaningful contribution to the economic development of the country. A structured research approach, employing a quantitative research design and convenience sampling, was followed for this study of public hospital patients. The study determined key factors of the public hospital servicescape in Nelson Mandela Bay to be: social encounters, augmented waiting time, patient satisfaction and patient revisit intention.

1. Introduction

Whilst healthcare in general is not the focus of this study, a large portion of healthcare funding is spent on financing public hospitals. The health sector in South Africa is one of the top three sectors with the highest budget allocations. In the 2020/21 budget, Learning and Culture was allocated a budget of R396.4 billion, while Social Development was allocated R309.5 billion, and Health was allocated R229.7 billion (National Treasury, 2020:1). Since the advent of democracy in 1994, South Africa embarked on instituting several health policies with the intention of addressing service delivery gaps brought about by the apartheid government; among those policies is the government's approach to primary healthcare (Rispe, 2016:17; White, Levin & Rispe, 2020:12). The primary aim of the government's efforts regarding healthcare is to improve the health of the general population of the country (Rispe, 2016:17; Otokiti, 2019:426; Tang & Li, 2021:1).

This paper focusses on servicescape, which other researchers consider to be an overarching term that encompasses the dimensions such of tangibility, reliability, responsiveness, assurance and empathy (Dharma, Adawiyah & Sutrisna, 2019:875). Amin, Wahid and Ismail (2016:59) as well as Türker, Gökkaya and Acar (2019:256) clarify that servicescape includes both the exterior and interior attributes of the structure. Exterior attributes are those related to a building's exterior, as well as its parking and landscape. While interior attributes refer to design, equipment and decoration. Ng, Lai, Ismail, Tong and Yuen (2017:734) observe that past research work on servicescape focused on profit organisations, hence, their study was directed to public hospitals which are considered non-profit organisation.

Innovation and embracing of technology are requirements for the appeasement of users of public services, that is, services such as hospitals and schools (Chen, Reichard, Yuan & Li, 2020:1-2). Although safety has been underplayed in the existent research, it is a crucial element of servicescape (Siguaw, Mai & Wagner, 2019:1-2). One would expect that unsafe hospitals would not necessarily chase patients away, however, healthcare workers feel unsafe working in such an environment. In this respect, safety within the hospital environment would be improved when linked to innovation and

technology. This view is supported by Hunter-Jones, Line, Zhang, Malthouse, Witell and Hollis (2019:3) who note that diagnostics, surgical processes and technology advancements resonate well with healthcare professionals who respond to the call of duty.

Researchers have highlighted those elements, within the healthcare environment, that make a positive contribution to the hospitality environment. Among these are the quality of the physical environment and a service-oriented culture, both of which are believed to be appreciated and valued by the recipients of the relevant service (Mody, Suess & Dogru, 2019:2).

Several factors, as discussed below, have influenced the need to undertake the current research. The decentralisation of healthcare services (at the national, provincial and local government levels) has led to conflicting views of people, with some believing that it offers local organisations the opportunity to negotiate with the central government in order to redistribute resources. Others, however, believe that this has worsened the situation for less privileged communities due to the low standard of healthcare services rendered to them (Maphumulo & Bhengu, 2019:6). Passchier (2017:836) has reported that the National Health Insurance (NHI) fund, as proposed by the South African Government through the 2015 White Paper, is intended to address issues of universal access, mandatory preparation of healthcare, comprehensive services, financial risk protection, single fund, strategic purchaser and single payer. As of early-2021, matters concerning NHI funding have not been finalised, which meaning that the discrepancies in the healthcare system still exist.

In South Africa, the basic services necessary for the development of the country, and the well-being of all who live in it, are publicly available. These services include health, housing, road networks, electricity, water supply and sanitation (Kaur, 2018:1; Meyer, 2014:11). Furthermore, Malakoane, Heunis, Chikobvu, Kigozi and Kruger (2020:7) note a decline in the quality of healthcare in certain regions of South Africa due to the decentralisation of healthcare. The service quality of public hospitals has been problematic for many years, due to poor management and certain hospital cultures (Fusheini, Eyes & Goudge, 2017:69).

Developing countries, such as South Africa, have many citizens who rely on the public hospital service since the cost thereof is minimal, if there is any cost at all (Passchier, 2017:836). Public services, including healthcare services, are made available to the population in order to improve public life; hence, the removal of the discriminatory practices that were instituted under the previous political dispensation (Maphumulo & Bhengu, 2019:5). The government has acknowledged a number of challenges within the sector, specifically those related to finances, strategic management, poor internal performance and governance issues at public hospitals, as well as the need for improved quality of services within the public healthcare system. Moreover, amongst public hospital users, the public healthcare system is considered to be under-resourced and dissatisfactory (Fusheini *et al.*, 2017:69). These recommendations, by the government itself, highlight that there is a need for progress in public hospital services.

The focus of this paper is on the servicescape of public hospitals in Nelson Mandela Bay, with the intention of improving the impression these institutions leave on their patients. This is done with a view to avoid overcrowding of certain facilities, while others remain underutilised.

2. Problem Investigated

Previous research shows dissatisfaction amongst those citizens who make use of the public healthcare system in South Africa, particularly in terms of overall service quality as a result of uncaring behaviours displayed by health workers within the public sector (Maseko & Harris, 2018:23). However, these studies were focused on the overall service quality of public hospitals in South Africa, while not much attention has been given to in-depth research on the servicescape of the public hospital system.

Based on previous studies on servicescapes in different settings, it is apparent that no research has been conducted on the servicescape of public hospitals within Nelson Mandela Bay. This study

examines those factors that influence the servicescape of public hospitals, as well as the impact of the servicescape on client satisfaction and intention to revisit.

While there have been a few studies conducted on servicescape itself, and its role in some businesses, none have focused on public hospitals in the Eastern Cape province of South Africa. Various researchers from different parts of the world have, over the years, researched servicescape; for example, Bitner's (1992:59) research focused on perspectives regarding servicescape, and dimensions that influence perceived servicescape. Rosenbaum and Massiah (2011:473) have combined their research with the work of Bitner (1992) in order to form an expanded view on servicescape.

The importance of service quality was initially investigated by Parasuraman, Zeithaml and Berry (1985), as cited by Amin *et al*, (2016:59). Further to this, Jayasanka and Wickramasuriya (2019:1781) then explained that service quality dimensions were classified into five elements: reliability, responsiveness, assurance, empathy and tangibles. A recent study on servicescape has been conducted in India, by DCunha, Suresh and Kumar (2019:1), to "assess the construct validity of the proposed servicescape model and to assess the perception of patients regarding the servicescape".

The scale of the population that is dependent on public hospitals for medical care and treatment creates a reasonable concern for the measurement and improvement of the servicescape of health sector institutions in Nelson Mandela Bay. It was noted, by Maphumulo and Bhengu (2019:4), that the current public healthcare system in South Africa is under-resourced.

There is a perceptible dissatisfaction experienced by patients in South Africa, which may pertain to the servicescape, service quality and waiting periods for services in public hospitals. Thus, this study focuses on ascertaining the problematic dimensions that impede patient satisfaction in public hospitals within Nelson Mandela Bay. Furthermore, the study aims to identify attributes of a public hospital servicescape that are present in other relatable service firms, such as private hospitals, which may potentially enhance the service quality and servicescape of public hospitals. In order to discern whether alterations or additions to the servicescape would plausibly increase patient satisfaction, it is necessary to scrutinise the influence of a public hospital's servicescape on satisfaction within the healthcare system.

Avan, Uyar, Zorlu and Özmen (2019:313) note that, like humans, the servicescape has a personality, of which the design communicates a certain message. They highlight that the servicescape has a significant influence on clients' perceptions and expectations of service quality.

The following questions arose when reviewing the problem statement:

- Which factors augment the servicescape of a public hospital?
- What efforts are public hospital management making to enhance patient waiting time?

3. Research Objectives and Hypotheses

The objective of this study is to investigate the impression that public hospital patients have of the servicescape at Nelson Mandela Bay.

The following hypotheses were formulated:

- Hypothesis H¹: There is a relationship between physical dimensions and the public hospital servicescape.
- Hypothesis H²: There is a relationship between social dimensions and the public hospital servicescape.
- Hypothesis H³: There is a relationship between socially-symbolic dimensions and the public hospital servicescape.
- Hypothesis H⁴: There is a relationship between service quality and the public hospital servicescape.
- Hypothesis H⁵: There is a relationship between waiting time and the public hospital servicescape.

- Hypothesis H⁶: There is a relationship between the public hospital servicescape and client satisfaction.
- Hypothesis H⁷: There is a relationship between the public hospital servicescape and revisit intention.

Figure 1, below, outlines the hypothetical model tested in this paper.

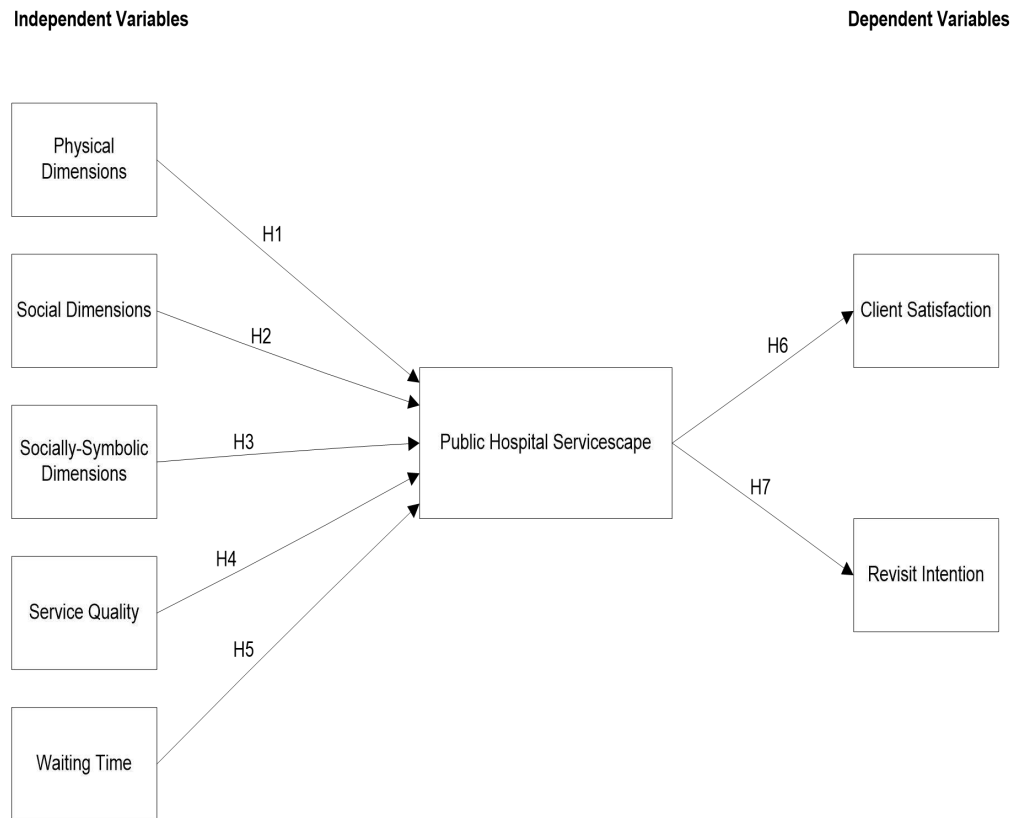

Figure 1: Hypothetical model of the study

4. Literature Overview

The contents of the literature review are influenced by the objectives of the study.

4.1 Servicescape

Dad, Davies and Rehman (2016:30) as well as Hamzah, Abd Rashid, Mansor and Shobri (2020:96) state that the idea of servicescape was first introduced by Kotler (1973), who focused on store atmosphere, and who argued that the store environment has an influence on the store's ability to make a profit from its shoppers. However, Agnihotri and Chaturvedi (2018:116) note that, in 1981, Booms and Bitner extended the concept of servicescape and characterised it as "all of the objective physical factors that can be controlled by the firm to enhance (or constrain) employee and customer actions". Therefore, the concept of servicescape is found in various settings, which include restaurants and hospitals (Min, Hyun, Kim & Lee, 2017:78-79).

4.2 Physical dimension

The physical dimension is categorised or divided into ambient conditions, spatial layout and functionality, as well as signs, symbols and artifacts (Ong & Yap, 2017:130-131). According to Siguaw, Mai and Wagner (2019), the ambient conditions of the servicescape are defined as those background conditions that exist below the level of immediate awareness; this includes, among others, environmental stimuli or atmospherics (such as air temperature, air quality and noise) linked to human sensations (Rosenbaum & Massiah, 2011:474). Spatial layout and functionality are attributed to the manner in which equipment, furniture, furnishing arrangements, sizes, shapes and spatial relationships

promote a conducive environment and allow for the acceptable standard of functionality (Lyu, Hu, Hung & Mao, 2017:2558). Signs, symbols and artifacts refer to displays on the internal and external of a building in order to communicate information (Lee, Wang & Cai, 2015:98). The physical environment plays an important role in the functioning of a hospital; therefore, it is important for any hospital to have the latest amenities, modern equipment and sufficient seating for patients (Al-Azzam, 2020:13).

4.3 Social dimension

A hospital plays a key role in minimising negativity by integrating social and environmental dimensions in its main business of healthcare (Nascimento, Araujo & Alves, 2016:29; Daú, Scavarda, Scavarda & Portugal, 2019:10). Marimuthu and Paulose (2016:558) as well as Andersson, Svensson, Molina-Castillo, Otero-Neira, Lindgren, Karlsson and Laurell (2022:2) note that the social dimension is an element of sustainability; therefore, hospitals embrace sustainability due to social responsibility and social responsiveness, as a result of the shortage of natural resources and the rising cost of healthcare. Social responsibility encompasses the adoption of ethical standards and the formulation of anti-discrimination policies (Liu, Shi, Pong & Chen, 2016:2; Li, Benamraoui, Shah & Mathew, 2021:3). Social factors related to healthcare include, among others, taking a decision to use or not use a healthcare service, as well as incompatibility interaction between hospital users and health professionals (Rojas, 2015:128-132; Hooper, Mitchell, Marshall, Cheatham, Austin, Sanders, Krishnamurthi & Grafton, 2019:1).

4.4 Socially-symbolic dimensions

The socially symbolic dimension can be split into three elements: ethnic signs and symbols; ethnic objects; and artifacts (Pham, Pham, Hossain & Li, 2020:2). Symbolic dimensions at healthcare facilities influence consumer perceptions and satisfaction (Cadirci & Akmaz, 2017:93). They have the potential to either influence consumers positively or negatively, leading to a particular consumer behaviour (Dad, *et al.* 2016:34; Sandberg, Hurmerinta, Leino & Menzfeld, 2022:19). A logo and architectural design, such as style of décor, can also influence patients in a certain way (Ong & Yap, 2017:131).

4.5 Service quality

Service quality can affect a company's long-term sustainability and growth prospects (Hizam & Ahmed, 2019:387). It is associated with meeting customer expectations, customer loyalty, buying behaviour and repurchase intention (Rashid & Rokade, 2019:50). Customers measure service with respect to service quality, and the satisfaction derived therefrom (Sathish, Indradevi & Gangineni, 2018:356). Service quality includes, amongst others, the accuracy of the medical diagnoses and procedures (Kalaja, Myshketa & Scalera, 2016:558), no waiting list or delays in treatment, and the existence of a hygienic environment (Fatima, Malik & Shabbir, 2017:1196).

4.6 Waiting time

Patient waiting time refers to the amount of time a patient spends in the outpatient department while waiting to receive a service; this is the difference between departure time and entry time (Pandit, Varma & Amruta, 2016:86). A long waiting time results in a range of issues such as impaired access to care, abnormal hospital work patterns, and patient unhappiness (Xie & Or, 2017:1). A long waiting time may frustrate patients, as they prefer to be attended to within a short space of time, otherwise they seek services elsewhere if a better alternative is available (Sun, Lin, Zhao, Zhang, Xu, Chen, Hu, Stuntz, Li & Liu, 2017:2). Although waiting time can be uncomfortable when patients are unoccupied, when the situation is not explained to them, and when they feel uncertain as to when they will be attended to; however, if they are kept occupied, by giving them health education items to read, they would not feel the passing of time (Mokgoko, 2013:86; Xie & Or, 2017:2).

4.7 Client satisfaction

Lee, Wang, Lu, Hsieh, Chien, Tsai and Dong (2016:2) as well as Khoa, Nguyen and Nguyen (2020:22) note the work that Kutner and Cripps (1997) have done on client satisfaction. Their research revealed that clients are valuable, and that each client has a different set of needs, likes, buying patterns and

price consciousness. Client satisfaction is linked to the quality of the product or service rendered; moreover, quality is related to a client's expectations of a particular product or service, when benchmarked against other available products or services (Suchánek & Králová, 2019:1238). The theory of "expectation inconformity" states that clients become satisfied when the goods provided to them (i.e. the clients) exceed their expectations; this also applies to service quality (Kumar & Gopinath, 2019:609). This implies that, when patients are taken good care of – from reception, to the doctor's consultation room, to the hospital pharmacy – they will be satisfied with the services offered them, and they are more likely to be willing to revisit the hospital.

4.8 Revisit intention

Pidada and Wandebori (2016:532) as well as Wandebori and Pidada (2017:208) define revisit intention as the client's intention to maintain their relationship with the service provider, as well as the remarkable client experience that has led to their satisfaction. Chan (2018:4) has established that a client has three stages of perception regarding the services they receive: pre-visit, during the visit and post-visit. The client's revisit intention is based on their past experience, trust of the service, and perceived quality of the service received (Sia, Lai, Noor, Ismail, Tong & Yuen, 2018:1316-1317).

5. Research Design and Methodology

5.1 Research paradigm

This study employed the quantitative research method. The study was conducted in order to test the relationships between the dependent and independent variables of preconceived models that were resourced and reformatted into a model for this specific study; thus, the study can be distinguished as a positivistic study.

5.2 Population and sampling

The population for this study consists of patients, past and present, who sought healthcare services from public hospitals in Nelson Mandela Bay. This study required the use of convenience and simple random sampling. The probability sampling method selected for use in this study was convenience sampling, as it was the most advantageous method for interviewing a large number of respondents in a relatively short period of time. The sampling method could also be described as simple random sampling, since the researcher approached any person at random from the clinic and out-patient department. Two hundred-and-fifty (250) questionnaires were distributed and two hundred and twenty-eight (228) questionnaires were usable; this indicates a response rate of 91.2%. The majority of the respondents were females, who constituted just over half of the group of respondents (55%); thus, the male respondents made up 45% of the total respondent group. This is somewhat indicative of a nearly equal gender mix of the out-patients of public hospitals. In terms of the age categories of the respondents, 63% study participants were between 21 and 50 years old. This indicates that the majority of the respondents were younger than 50 years of age. The relatively large volume of respondents could be owing to their price sensitivity regarding their healthcare experience. Similarly, the respondents older than the age of 50 (37%) may make use of public healthcare services owing to their inability to pay for private healthcare. The seniors may also be price sensitive in relation to their healthcare needs, owing to their lack of income, possibly from inefficient retirement funding or unemployment. Interestingly, a majority of the respondents do not live off of their personal income (62%). Therefore, a noteworthy number of respondents either survived off of the household income, pension, government grants, family support, or a disability grant. This implies that a minority of respondents survived through the use of their independent personal incomes (38%). Forty-nine percent (49%) of the respondents are frequent visitors to public hospitals. This result is expected owing to the data being collected from a sample of patients visiting the out-patient department of the selected hospitals. This means that the majority of visitors are likely to make recurring visits in order to collect their periodic medicinal subscriptions.

5.3 Questionnaire design

The instruments with previously tested results, and self-developed measuring instruments, were used to measure the variables included in the model depicted in Figure 1. A questionnaire comprising of 74 items was designed for this study. All questionnaire items were linked to a five-point Likert-type scale

with the following designations: 1 = strongly disagree, 2 = disagree, 3 = somewhat disagree, 4 = undecided, 5 = somewhat agree, 6 = agree, 7 = strongly agree. The categorisation of items, per variable, was apportioned as follows:

- Physical dimension: 12,
- Social dimension: 11,
- Socially-symbolic dimension: 4,
- Service quality: 6,
- Waiting time: 12,
- Servicescape: 7,
- Client satisfaction: 8,
- Revisit intention: 6, and
- Demographic profile of respondents: 8.

5.4 Data analysis

The questionnaire was pre-coded with grouped questions, and sorted in Microsoft Excel. The STATISTICA (version 11) computer program was used to conduct various sets of data analyses for reliability, validity, descriptive statistics, and multiple regression. Descriptive statistics was used to describe and summarise the demographic profile of the study participants.

6. Empirical Results

6.1 Validity and reliability of the measuring instrument

Construct validity was determined by means of factor analysis, so as to establish the degree to which a construct is not associated with other constructs on a theoretical basis.

The findings of the exploratory factor analysis (EFA) are depicted in Table 1, below. Values greater than ± 0.50 are generally considered necessary for practical significance, although factor loadings of ± 0.30 to ± 0.40 are considered to be minimally acceptable (Hair, Black, Babin & Anderson, 2014:116; Quoquab, Mohammad & Sukari, 2019:803). Thus, factor loadings of a minimum of 0.33 are considered acceptable in some studies. However, a more trustworthy minimum score of 0.5 was used for the purpose of this study (Hair *et al.*, 2014:116; Kothari, 2004:239). For this study, 3 items loading per factor is considered significant.

Table 1: Factor loadings matrix on a 5-point Likert scale

Variables	Items retained	Minimum loadings	Maximum loadings
Social Encounters (SE)	19	0.782	0.506
Waiting Time Awareness (WTA)	5	0.714	0.589
Augmented Waiting Time (AWT)	4	0.736	0.534
Ambient Conditions (AC)	4	0.770	0.537
Servicescape (S)	6	0.738	0.524
Client Satisfaction (CS)	5	0.709	0.546
Revisit Intention (RI)	3	0.820	0.662

Source: Calculated from survey results

Table 2, below, provides the construct labels of the purified model, and it identifies items that were used to define the construct. The following independent variables were identified: social encounters (SE), waiting time awareness (WTA), augmented waiting time (AWT), ambient conditions (AC). The intervening variable was: Servicescape (S). Furthermore, the two dependent variables were: client satisfaction (CS) and revisit intention (RI).

Table 2: Empirical factor structure for Cronbach's Alpha values of the latent values

LATENT VARIABLES	INDIVIDUAL ITEMS	A
Social Encounters (SE)	PD8, PD12, SQ1, SQ2, SQ3, SQ4, SQ5, SQ6, SD1, SD2, SD3, SD5, SD6, SD9, SD10, SD11, SSD2, SSD3, SSD4	0.94
Waiting Time Awareness (WTA)	WT4, WT6, WT7, WT8, WT10	0.74
Augmented Waiting Time (AWT)	WT1, WT2, WT5, SD4	0.67
Ambient Conditions (AC)	PD2, PD7, SD7, SD8	0.63
Client Satisfaction (CS)	CS3, CS4, CS5, RI3, S7	0.89
Servicescape (S)	CS7, CS8, S1, S2, S3, S4	0.81
Revisit Intention (RI)	RI2, RI4, RI5	0.77

Source: Calculated from survey results

Table 2 reveals that three of the twelve items expected to measure the ‘physical dimension’ (PD8, PD10 and PD12), all six of the items expected to measure ‘service quality’ (SQ1, SQ2, SQ3, SQ4, SQ5, SQ6), and eight of the eleven items expected to measure the ‘social dimension’ (SD1, SD2, SD3, SD5, SD6, SD9, SD10, SD11), as well as three of the items expected to measure the ‘socially-symbolic dimension’ (SSD2, SSD3 and SSD4) loaded on factor one (1). This indicates that respondents view these items as measures of a single construct: ‘social encounters’.

Table 2 further shows that five of the twelve items that were expected to measure ‘waiting time’ (WT4, WT6, WT7, WT8 and WT10) loaded onto factor two (2). Furthermore, factor three (3) loadings consisted of three of the twelve items expected to measure ‘waiting time’ (WT1, WT2, WT5) and one of the eleven items expected to measure the ‘social dimension’ (SD4). The resulting items that were loaded on factor two (2) and factor three (3), as indicated in Table 2, illustrate that respondents did not perceive ‘waiting time’ as a single construct, but as a two-pronged construct. This means that respondents viewed ‘waiting time’ as consisting of the dimensions related to ‘waiting time awareness’ and ‘augmented waiting time’, which were loaded onto factor two (2) and factor three (3), respectively.

Table 2 indicates that two of the twelve items expected to measure the ‘physical dimension’ (4) (PD2, PD7) as well as two of the eleven items expected to measure ‘social dimension’ loaded onto Factor four (4) (SD7, SD8). This means that respondents view these items as a single construct termed ‘ambient conditions’.

Table 2 also shows that two items (PD1 and PD9) expected to measure ‘physical dimension’ loaded onto factor five (5); these were deleted as they were not sufficient to load to a significant extent, as the cut-off line in this study is a minimum of three items loading per factor, which was considered significant. All items that loaded on factor five (5) were deleted due to a lack of sufficient discriminant validity.

One item (PD10) cross-loaded, and was therefore not considered for further analysis. Ten items (PD3, PD4, PD5, PD6, PD11, SSD1, WT3, WT9, WT11 and WT12) that were expected to measure ‘physical dimension’, ‘socially-symbolic dimension’ and ‘waiting time’ did not load to a significant extent ($P < 0.05$); this led to the deletion of these items, and they were not used in the subsequent analysis. Table 2 further shows that the respondents did not perceive of ‘waiting time’ as a single construct. This signifies that the respondents perceived of ‘waiting time’ as a two-dimensional variable, that is, as related to ‘waiting time awareness’ and ‘augmented waiting time’. Moreover, Table 2 indicates that the study respondents perceive of social encounters, ambient conditions, waiting time awareness and augmented waiting time as influential to the public hospital servicescape.

In this study, statistical analysis was performed to evaluate whether all the items in a test are measuring the same thing by means of a reliability procedure; Viladrich, Angulo-Brunet and Doval

(2017:758) refer to this process as an internal consistency procedure. Cronbach's Alpha is deemed a sufficient measure of reliability; it was, therefore, used as a measure for internal consistency in this study. Table 2 depicts the Cronbach's Alpha values of the variables. The study considered Cronbach's Alpha scores of ≥ 0.6 as acceptable. This represents a sufficient standard in accordance with the objectives of this study (Narang, 2008:181). Taber (2018:1288) cautions that a high alpha value, such as 0.7, which is often promoted in other studies, does not always translate to good results; therefore, a minimum value of 0.6 is adopted for the purpose of this study. Table 3 indicates Cronbach's Alpha values between 0.6 and 0.9. This means that all instruments have a fair degree of reliability greater than 0.50 (De Leng, Stegers-Jager, Husband, Dowell, Born & Themmen, 2017:247; Kothari, 2004:239). In this study, the acceptance of a value >0.6 is consistent with most literature on Cronbach's Alpha values (Taber, 2017:9). Having removed items, and re-coupled items into new variables as a consequence of the EFA, the hypotheses tested in this study had to be reformulated.

The hypotheses subjected to empirical verification are as follows:

H¹ is modified into H^{1.1} and H^{1.2}

Hypothesis H^{1.1}: There is a relationship between social encounters and the public hospital servicescape.

Hypothesis H^{1.2}: There is a relationship between ambient conditions and the public hospital servicescape.

H⁵ is modified into H^{5.1} and H^{5.2}

Hypothesis H^{5.1}: There is a relationship between awareness of waiting time and the public hospital servicescape.

Hypothesis H^{5.2}: There is a relationship between augmented waiting time and the public hospital servicescape.

Hypothesis H⁶: There is a relationship between the public hospital servicescape and client satisfaction.

Hypothesis H⁷: There is a relationship between the public hospital servicescape and revisit intention.

6.2 Regression analyses

Regression analysis was used to test the hypothesised relationships between the independent and dependent variables in this study.

Table 3: The influence of independent variables on the public hospital servicescape

Regression summary for dependent variable: Servicescape						
	b*	Std.Err.	B	Std.Err.	t(222)	p-value
Intercept			0.725707	0.281784	2.57540	0.010659
SE	0.602731	0.052453	0.666793	0.058028	11.49088	0.000000
AC	0.042240	0.051613	0.040096	0.048994	0.81840	0.414005
A-WT	-0.029473	0.051780	-0.029438	0.051719	-0.56919	0.569802
Aug-WT	0.147135	0.052236	0.138303	0.049100	2.81673	0.005287
R	R²		F		Std Error of estimate P	
66%	0.43		42.03		0.62	

Table 3, above, indicates the R² of 0.43 which explains the 43% variability in the model concerning the 'servicescape' variable. Table 3 also shows that 'social encounters'(SE) in a public hospital are positively related to 'servicescape' (b = 0.667, p < 0.000).

Table 3 further shows that ‘ambient conditions’(AC) ($b = 0.040$, $p < 0.000$) and ‘waiting time awareness’(A-WT) ($b = -0.029$, $p < 0.000$) do not exert a significant influence on ‘servicescape’. Table 3 also shows that the ‘augmented waiting time’(Aug-WT) of a public hospital is positively related to revisit intention ($b = 0.138$, $p < 0.000$).

Table 4: The influence of the public hospital servicescape on client satisfaction

Regression analysis: Client satisfaction						
	b*	Std.Err.	B	Std.Err.	t(226)	p-value
Intercept			1.199462	0.168680	7.11088	0.0000
Client Satisfaction	0.643712	0.050905	0.635064	0.050221	12.64538	0.0000
R	R²		F		Std Error of estimate P	
64%	0.41436462		159.91		0.62069	

Table 4, above, shows that the ‘servicescape’ is positively related to ‘client Satisfaction’ ($b = 0.635$, $p < 0.000$). The R^2 of 0.414 explains the 41% variability in the model concerning the variable ‘client satisfaction’.

Table 5: The influence of the servicescape on revisit intention

Regression analysis: Servicescape						
	b*	Std.Err.	B	Std.Err.	t(226)	p-value
Intercept			1.886556	0.232325	8.120342	0.0000
Revisit	0.440748	0.059710	0.510581	0.069170	7.381538	0.0000
R	R²		F		Std Error of estimate P	
44%	0.19425885		54.487		0.84339	

Table 5, above, indicates that the ‘servicescape’ is positively related to ‘revisit intention’(Revisit) ($b = 0.511$, $p < 0.000$). The R^2 of 0.194 explains the 19.425% variability in the model concerning the variable ‘servicescape’.

7. Managerial Implications

7.1 Servicescape and social encounters

It is essential for public hospital management to provide a good setting in which to explore both the layout and functionality of the servicescape, as well as the aesthetic appeal thereof. The ways in which seats, aisles, hallways, walkways, food service lines, restrooms, entrances and exits are designed and arranged influence patient comfort. Moreover, the external environment, architectural design, facility upkeep and cleanliness, decorative banners and signs, as well as the appearance of personnel all influence the ambience of the place.

Services are mostly intangible; in this respect, clients can never be absolutely certain that they will receive the same standard of service every time.

According to the literature, the social dimension includes all interactions within a hospital’s premises. This includes interactions with or between doctors, nurses, medical staff, security guards and other patients. The social encounter between the establishment and client is important as it is a major part of the provision of services; this notion is supported by various researchers. DCunha *et al.* (2019:5) suggest that healthcare administrators should ensure that the service environment is conducive to the needs of patients. Public hospital management seek to recruit staff in order to fill specific roles and provide them with uniforms consistent with the health servicescape in which they work. Service personnel are required to conform to the mandated dress code and grooming standards of the hospital

in which they work; furthermore, it is the responsibility of hospital management to ensure that all members of staff, whether they are in direct contact with patients or not, are fully trained in patient care and the rendering of hospitality services.

Service providers, such as public hospitals, particularly those in which patients spend significant periods of time, should recognize that spatial layouts which make people feel constricted or confined will have a direct effect on patients' perceptions of quality and, indirectly, on their desire to return. This implies that service or retail facilities that are specifically designed to add some level of stimulation to the client's service experience or relaxation and comfort (such as waiting rooms, restrooms, restaurants, coffee bars, sports bars) should take care that ample space is provided to facilitate exploration and stimulation within the servicescape.

This study found that feelings of crowding adversely influence patients' perceptions of the public hospital servicescape. Public hospital management should reduce overcrowding within the health servicescape by ensuring that one's ability to explore and encounter stimulating experiences in the environment (such as hospital waiting rooms, retail outlets, restaurants, gift shops, coffee bars, reading materials, pharmacy, and the other interesting areas) and one's comfort levels during one's stay, are promoted. Individuals who encounter an open facility with ample space to move about are expected to view the servicescape as more exciting and attractive, whereas a congested facility with insufficient space to allow for freedom of movement will be viewed as unstimulating, and it will negatively impact their health.

7.2 Augmented waiting time

The patients feel that waiting is more manageable when there is some form of entertainment or distraction available to them whilst waiting for the medical attention they require.

Patient waiting time can be improved by having staff supervise the queuing system in waiting rooms. Management can provide numbers in a chronological order to patients, which can assist staff in the smooth running of the queue. Waiting time can be augmented through the provision of reading materials, to occupy patients, which will reduce patient perceptions of waiting time. Furthermore, the provision of retail outlets in public hospitals has proven to be another influential factor in respect of waiting time augmentation. Stocking waiting rooms with current and interesting reading materials, such as weekly or monthly magazines and daily newspapers, is ideal to keeping patients occupied while they wait for the services they seek. Management should identify retailers that can provide attractive restaurants that could provide patients with a variety of meals within the hospital premises. This is important to augment the servicescape of the public hospital and to occupy patient waiting time. Restaurants and retail outlets could also generate additional hospital income, which can be used to fund servicescape enhancement. Furthermore, providing gift shops within easy reach of patient waiting rooms can successfully enhance waiting time.

This finding is supported by Mokgoko (2013:70) as well as Han, Kang and Kwon (2018:11) who suggest that the way to make waiting time more tolerable is by making it more fun. They suggest the inclusion of games, such as puzzles; the inclusion of colouring materials and reading materials; as well as live entertainment.

7.3 Patient satisfaction and revisit intention

Public hospital management needs to maintain the professionalism of staff while creating a pleasant and conducive atmosphere in which to promote the health of their patients. Management need to maintain and embrace the responsiveness and degree of knowledge of the doctors and staff in public hospitals. Patients need to be assured of the support and dependability of medical staff when assisting patients; this might stimulate them to consider revisiting public hospitals.

The study indicated that the efforts made by public hospitals, when aiming to improve patient satisfaction through the alteration and improvement of servicescape dimensions, must include all aforementioned dimensions in the servicescape definition. The findings of Dharma *et al.* (2019:876)

have been reaffirmed, in that, client centricity is key to creating satisfied clients; this means that clients should be given top priority. Therefore, public hospital staff members who are mindful of their influence on patient satisfaction are likely to enhance patient perceptions of the servicescape, thus, increasing patient satisfaction and revisit intention. Social encounters with employees scored relatively high in terms of importance in the creation of patient satisfaction since the health and well-being of patients is vastly dependent on the flawless performance of hospital staff. Improving patient perceptions of service quality through enhancing the social dimension of a servicescape could possibly be achieved by increasing the degree of personal attention, and sympathy, provided by staff. Furthermore, efforts to ensure a social comfort level is established between patients, such as increasing the availability of space, establishing sufficient seating arrangements and formal queuing methods, will plausibly and indirectly increase patient satisfaction in a hospital environment. These methods will indirectly increase patient satisfaction, assuming that comfortable patients create a more satisfactory social experience for other patients. Efforts to improve employee satisfaction will indirectly improve patient satisfaction (Soleimani, 2018:11) since employees will then create a better social dimension of the servicescape for patients, therefore, augmenting their satisfaction.

When the service is provided in a satisfactory manner, consumers are likely to return to the establishment in future. It is further plausible, when looking at the results of the study, that the servicescape can be enhanced by ensuring hospital cleanliness, decoration, lighting, and climate control. Furthermore, ambient conditions can be managed by reducing noise, over-crowdedness and unpleasant odours experienced, as these problems influence patient perceptions of, and concomitant revisit intentions, the public hospital servicescape.

Being subjected to pleasant décor and navigating a hospital that has clear and informative signs and symbols make one's hospital stay easier. Furthermore, the hospital must be clean, neat and fully functional in order for consumers to perceive of the service quality as good enough for them to consider revisiting.

Furthermore, public hospital management could provide waiting areas and restrooms with leisure appeal, or they could have some mode of electronic information and entertainment (e.g. televisions, menu or sign boards, graphics, coffee bars, soup kitchens with occasional free coupons, etc.) that can be used to make one's stay in the health facility more bearable and satisfying; this could lead to patients revisiting these public hospitals.

8. Conclusions and Recommendations

The research results lead one to conclude that, when management undergoes efforts to enhance the servicescape of a public hospital, consideration must be directed towards various aspects of a servicescape and that no dimension (social encounter, ambient conditions, waiting time awareness and augmented waiting time) of the servicescape should be considered in isolation. This will likely enhance the probability that the augmentation of the public hospital servicescape will improve patient satisfaction and revisit intention. It is further suggested that managerial efforts to enhance the servicescape be pursued only once managers are cognizant of the servicescape elements and service quality elements relevant to, and most influential for, the public hospital client base. Thus, the elements of the servicescape that influence patient satisfaction, either positively or negatively, can be manipulated correctly in order to enhance patient service quality perception.

The following empirical results were identified:

- It appears that there is a statistically significant relationship between *Social encounters and the public hospital servicescape* ($H^{1.1}$ accepted).
- It appears that there is no statistically significant relationship between *Ambient conditions and the public hospital servicescape* ($H^{1.2}$ rejected).
- It appears that there is no statistically significant relationship between *Awareness of waiting time and the public hospital servicescape* ($H^{5.1}$ rejected).

- It appears that there is a statistically significant relationship between *Augmented waiting time and the public hospital servicescape* (H^{5.2} accepted).
- It appears that there is a statistically significant relationship between the *Public hospital servicescape and client satisfaction* (H⁶ accepted).
- It appears that there is a statistically significant relationship between the *Public hospital servicescape and revisit intention* (H⁷ accepted).

Table 6, below, highlights some recommendations concerning social encounters, augmented waiting time, client satisfaction and revisit intention.

Table 6: Recommendations regarding public hospital patients' impressions of the servicescape at Nelson Mandela Bay

No.	Recommendations on social encounters
1	Security guards should improve their service by ensuring that patients feel welcomed and safe. Furthermore, they should render the service promptly in public hospitals.
2	Some medical staff, and technology in use, in public hospitals should be made reliable by offering the necessary training or services to improve performance.
3	Medical staff should be trained to provide acceptable answers to patients' questions, in a manner that is understandable to the patient.
4	Medical staff should be trained to be calm, even when working in stressful situations.
5	Waiting areas should be improved, and made comfortable for patients.
6	Posters and media equipment should be checked regularly so as to ensure that they are still serving their intended purpose.
7	Lighting should be improved to ensure a conducive environment.
8	Symbols and artefacts within the public hospital environment should consider the diversity of cultures in South Africa.
No.	Recommendations on augmented waiting time
9	Staff at hospital or on-site restaurants and gift shops should improve their services by becoming friendly and helpful to patients.
10	The availability of retail outlets and restaurants would make waiting bearable.
11	Waiting rooms should be supplied with relevant and updated reading material.
No.	Recommendations on client satisfaction
12	If all medical staff can improve their service, patients would quite possibly return to the public hospital without any doubts.
13	If the atmosphere of the public hospitals are always kept clean, odourless and pleasant, then patients would gladly recommend public hospitals to their friends and families.
No.	Recommendations on revisit intention
14	The government should always make medication available – free of charge – to those who visit public hospitals, as this is what motivates some patients to continue visiting public hospitals despite the challenges experience there.
15	The government should provide alternative hospitals in the area, because a lack of such provision makes some patients reluctant to revisit a public hospital with which they are not happy.

East London.

Abstract

Fresh Produce Markets (FPMs) in South Africa generate a combined R15 billion per annum, by distributing over 3 million tons of fresh produce. FPMs support the United Nations Sustainable Development goal 2, which relates to food security and Zero Hunger by 2030. The main contributors to the success of FPMs are positive customer experiences, which promote customer loyalty. The objective of this study was to evaluate the customer experience at the East London Fresh Produce Market (ELFPM) in South Africa. The study followed a positivistic research approach and was quantitative in nature. A literature review on customer experience was conducted and a hypothesised conceptual model was developed and statistically evaluated, including exploratory factor analysis. The study made use of convenience sampling and data were collected using a standardised questionnaire, disseminated in hard copies and via e-mail. A total of 210 customers participated in this study. The results indicate that the independent factors of Brand Experience, Service Experience and Post-purchase/Consumption Experience all have a positive effect on the overall customer experience at the ELFPM. Furthermore, the statistical assessment suggested new factors of Product Quality and Range(s), Brand Experience(s), Empathy(s), Communication(s) and Facilities(s), which have a positive effect on customer experience at the ELFPM. The contribution of the study is practical managerial recommendations for the ELFPM.

1. Introduction

Customer experience (CX), a key marketing concept (Becker & Jaakkola, 2020), is an inclusive process that customers undergo consisting of their cognitive and emotional responses to both direct and indirect interaction with an organisation at a distinct time through various touchpoints on the customer journey (Varnali, 2018). The concept of CX reflects the behaviour of consumers based on how they perceive a specific organisation, which impacts on the organisation's bottom line (Klaus, 2020). CX serves as a strategic distinguishing factor that if improved, enhances the organisation's competitiveness in the market. Organisations have been placing CX at the centre of their business model by establishing customer touchpoints along their purchase journey (Maechler et al., 2016). Baxendale et al. (2015) identified six touchpoint types, namely brand advertising, retailer advertising, in-store communications, word-of-mouth, peer observation (seeing other customers) and traditional earned media. These touchpoints aid CX and include advertising, customer service, staff interaction and post purchase support.

Positive CX is directly related to customer satisfaction and loyalty, hence it is critical for organisations to improve CX to attract and retain customers (Mascarenhas et al., 2006). Organisations must understand the customer's perception of touchpoints during the pre-purchase, purchase and after-purchase stages. Organisations must continuously examine touchpoints along their customers' purchase journey.

South African Fresh Produce Markets (FPMs) started out as meeting places between producers and consumers, where they could trade under the control of a government body. They were centrally located in towns and cities, enabling easy access. Their role is to provide facilities and assist commercial and small holder farmers to market their products, specifically fresh produce (Chikazunga et al., 2008). Historically, FPMs are supposed to play a role in food security, which is an important future goal for the United Nations Sustainable Development, Zero Hunger by 2030 (United Nations, nd).

FPMs were initially concerned that the hypermarkets and supermarkets in all parts of the country would reduce their competitiveness, which would ultimately see the collapse of FPMs (Richards & Patterson, 2003). Supermarkets are conveniently located and have a robust supply chain system that allows them to set non-competitive prices for their fresh produce. On the other hand, the supply chain of South African FPMs is characterised by uncertainty due to the lack of modern infrastructure and infrequency of transactions. This alienates the FPMs seeing consumers preferring reliable supermarkets, however some consumers are more interested in buying locally produced food (The Conversation, 2021). National FPMs are traditionally the largest distributors of fresh produce. Studying and improving national FPMs will benefit government, emerging farmers, informal traders and local communities. CX is one measure that could help the FPMs attract and retain customers to recover their lost market share.

2. Problem Investigated

Klaus (2020) postulates that CX studies offer the business world a deeper understanding of what influences customers' behaviour and the consequent effects it has on the organisations' performance. The research on the concept has enabled managers to improve and adapt touch points along the purchasing journey to fulfil customers' desires (Havíř, 2019). The problem statement of this research is that the factors influencing CX at the East London FPM have not been determined. Based on this significant value in studying CX, this study aims to determine the CX at the East London FPM in South Africa.

3. Research Objectives

The main research objective of the study was to evaluate the CX of customers at the East London FPM. The sub-research objectives of this study were as follows:

- Conduct an EFA to validate the factors (Figure 1) identified by Klaus and Maklan (2011) for the East London FPM;
- Conduct an EFA to determine additional factors that specifically influence customer experience (CX) at the East London FPM; and
- Propose two models, based on the two analyses conducted above, to improve CX at the East London FPM.

4. Hypotheses

The following hypotheses (H₁ to H₃) were developed based on previous studies by Klaus and Maklan (2011) and illustrated in Figure 1:

H₁: Brand Experience positively influences CX

H₂: Service Experience positively influences CX

H₃: Post-purchase/Consumption Experience positively influences CX

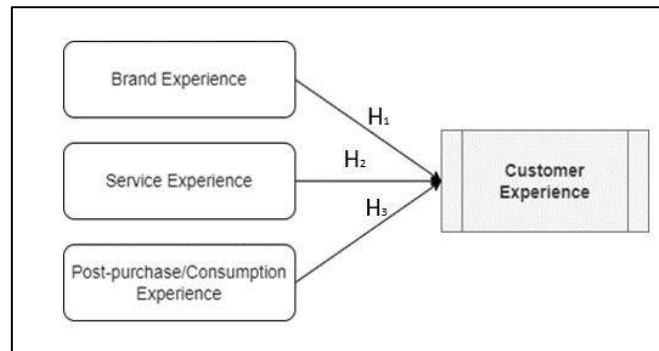

Figure 1: Hypothesised Model

5. Literature Review

CX is the measurement of interactions between service providers and a customer over a long period. The concept of CX was made popular by Holbrook and Hirschman (1982) and improved upon by Meyer and Schwager (2007). They refer to CX as the internal and subjective reaction of customers to direct or indirect interaction with an organisation. CX is about putting customer needs at the centre of what an organisation needs to do, ensuring that all touchpoints along the purchase journey are positive (Maechler et al., 2016). Touchpoints are where a customer interacts with the organisation's brand. This could be through employees, brand slogans and products and it occurs across multiple channels. Positive CX comes from providing excellence at every stage of the customer's journey (Bashir et al., 2015).

5.1. Fresh Produce Markets (FPMs)

The distribution of food in South Africa occurs through formal and informal channels (Chikazunga et al., 2008). Formal channels are dominated by a group of retailers and wholesalers, who use supermarkets for distribution, however the largest food distribution channel in South Africa remains the informal sector (NAMC, 2018). Owing to urbanisation, townships are highly populated and thereby create a high demand for food and the establishment of informal traders. The national FPMs were established with the objective of ensuring food security for local communities (Rathogwa et al., 2005). FPMs are owned and managed by local authorities, whilst regulated by national government. FPMs are an important determinant of food availability and access because markets are integrated price discovery platforms where price is determined by supply and demand (Baiyegunhi et al., 2018).

FPMs are faced with increasing competition by supermarkets and by retailers in the form of direct contracting suppliers in response to consumer demand for better quality (Louw et al., 2016). Supermarkets reduced the market share of markets and informal traders, as supermarkets are sourcing produce directly from farmers (Chikazunga et al., 2008). Supermarkets have established themselves in rural and township communities, taking business away from informal traders and markets. This may disturb government's objective of ensuring food security because unlike FPMs, retail prices tend to be fixed and not quickly moved by supply and demand (Richards & Patterson, 2003).

Wolf et al. (2005) stated that markets are a source of income for farmers. Farmers use markets as price setting mechanisms to determine the price of their produce (Louw et al., 2006). Prices at FPMs vary daily, based on quality and demand (Louw et al., 2006). Customers perceive the price variation to be an indication of which product is fresh, high quality and good value for money (Wolf et al., 2005). Supermarkets have certain conditions for farmers who supply them with fresh produce. These include quality, continuity of supply, packaging and storage, delivery and good production prices. They normally average pricing between the low and high prices (Cordes, nd). Proponents of supermarkets may argue price volatility is a disadvantage for farmers as it disturbs price forecasting.

Baiyegunhi et al. (2018) observed that price regulates the farmers' production and that price volatility benefits farmers, who can provide consistent supply throughout the year as prices even out over time (Rathogwa et al., 2005). Louw et al. (2006) noted that customers were unhappy with distances to get

to markets, shorter hours of operation and variation of food availability due to seasons. Markets must be accessible to buyers and sellers and barriers that prohibit participation of these stakeholders must be addressed (Rathogwa et al., 2005). One of the noted barriers is lack of information. Information on daily prices, demand and supply provides customers with better bargaining power.

Markets service a variety of customers, which include wholesalers, retailers, hawkers, processors, institutional buyers and consumers. Informal traders are regarded as an important category of customers because in South Africa, most consumers buy their goods from informal traders. According to Stats SA's latest Quarterly Labour Force Survey (Q4:2019 QLFS), approximately three million people, or 18% of employed people in South Africa, work in the informal sector. Of those, at least 14% appear to operate within the informal food trade sector (Melzer & Whitehead, 2020). Initially, informal traders were being displaced by the expansion of supermarkets (Chikazunga et al., 2008). This displacement could lead to a disruption in the fresh produce supply chain and would disadvantage low income communities and emerging farmers. FPMs remain the cheapest form of distribution for emerging farmers and informal traders.

The emergence of supermarkets in rural and township communities provides evidence that the existence of FPMs is threatened. FPMs need to reinvent themselves to ensure that they service their customers well to remain competitive. Therefore, it is important to study national FPMs because they are one of the largest distribution channels of fresh produce in South Africa and they play a big role in food security (Baiyegunhi et al., 2018). Studying and improving national FPMs will benefit government, emerging farmers, informal traders and local communities.

The focus on value-in-use, which arises from combining products and services results in CX blurring ordinary distinctions between products and services (Klaus & Maklan, 2011). CX comes from elements that service providers can control (e.g. service interface, atmosphere, assortment, price) and those outside their control (e.g. influence of other customers, smart phones that customers choose) (McColl-Kennedy et al., 2015). Favourable CX positively influences marketing outcomes such as customer loyalty, customer satisfaction and word-of-mouth behaviour (Kranzbuhler et al., 2018; Mascarenhas et al., 2006).

5.2. Customer Experience

The first recognition of CX was in 1982 when Holbrook and Hirschman introduced it in their discussion of consumption experience and hedonic consumption (Rather, 2018). Schmitt's (1999) seminal study proposed that experiences occur when customers encounter things, which provide relational, emotional, sensory, behavioural and cognitive values. Historically, organisations achieved differentiation through products, services and data collected on customers, but now CX is the new focus (Havíř, 2019). CX is founded on the notion that customers need satisfying experiences more than products. It is important to understand human behaviour by recognising the emotional aspects that are involved in purchase making decisions (Lemon & Verhoef, 2016).

Experience is different from goods and services, which means customer purchases include a series of memorable events. Klaus and Maklan (2013) highlight that understanding CX is important for market research because experience has replaced quality and become a new competitive battleground for marketing. Many managers have failed to define the scope, objectives and impact of CX for their business (Klaus, 2020). Becker and Jakkola (2020) advocate that CX research has focused on responses either to managerial stimuli or consumption processes.

Verhoef et al. (2009) trace the origins of CX as resulting from encounters involving a customer and the organisation or its product. Rather (2018) agrees that CX is a reaction that comes from encounters involving both the customer and the organisation. CX is influenced through perceptions from various direct and indirect interactions (Klaus, 2018). It is generated through a lengthy interactive process across multiple channels, generated through emotional and functional clues (Klaus & Maklan, 2013).

Verhoef et al. (2009) highlight CX as the customers' internal and subjective reaction towards the organisation. Interactions can be direct or indirect. Direct interactions occur when a customer purchases or uses a product or services. Indirect interactions occur through recommendations, reviews, criticisms, advertising and news reports. Other forms of interactions are customer care quality, brand packaging, advertising and service features, convenience of use and product reliability (Lemon & Verhoef, 2016).

Havíř (2019) introduces CX as encompassing the whole customer lifecycle of an organisation for an individual customer. It is one of the differentiation tools used by organisations to surpass competitors, secure a market position and create value. CX is the next evolutionary customer orientated approach following customer satisfaction and customer relationship management (Havíř, 2019). Rather (2018) compares CX to experiential marketing because it also requires customers to use their sensing, feeling and thinking abilities when relating to an organisation and its brands. Similarities between these processes are that they both involve cognitive evaluations and affective elements. Rather (2018) further adds that CX can be determined by price, promotions, assortment, social environment and atmosphere.

Understanding CX and the purchasing journey of each customer is important for organisations (Lemon & Verhoef, 2016). The interaction, through various touchpoints between customers and the organisation, makes CX social in nature. Organisations are now compelled to integrate many business functions and external stakeholders in creating and delivering a positive experience. Customer behaviour is complex and managers must prioritise the creation of a strong CX, to the extent of even appointing CX personnel.

Marketing theories identify three themes, the consumer buying behaviour, the process outcomes and customer centricity (Sharma, 2014). The first theme supports the discussion that CX is generated from the customer purchasing process. The second theme highlights the link between CX and behavioural outcomes. The third theme shows the management of CX with stakeholders inside and outside the organisation. According to Lemon and Verhoef (2016), CX stages can be conceptualised into prepurchase, purchase and post purchase. Prepurchase relates to customer interactions with the brand before purchasing, while purchase covers interactions with the brand during purchase and post purchase captures interactions after the purchase.

5.3. Measurement of Customer Experience

Paying attention to CX creates positive experiences and memories for customers and it improves customer satisfaction and loyalty. A loyal customer is defined as one who repurchases from the same service provider, recommends and keeps a positive attitude towards that service provider (Rather, 2018). Customer loyalty is closely linked to customer satisfaction and customer satisfaction has a ripple effect on future customer satisfaction and CX (Verhoef et al., 2009; Diebner et al., 2021). Measures of CX come from a combination of products and services and focus on providing value-in-use for customers (Klaus & Maklan, 2011). Lemon and Verhoef (2016) highlight that CX measurement plays an important role, making insights actionable for the organisations.

5.4. Brand Experience

Brakus et al. (2009) define brand experience as a multidimensional construct, triggered by consumer's exposures to brand related stimuli that can be traced back to their long-term memory. Ha and Perks (2005) explain that this exposure improves the customer's knowledge and familiarity with the brand and this experience has more impact than product features and benefits. Shamim and Butt (2013) describe brand experience as subjective, internal and behavioural responses evoked by brand related stimuli that are part of a brand's design, identity, packaging, communications and environments. Ong et al. (2018) explain that these internal responses are reflected through sensations, feelings and cognitions. These internal responses differentiate brand experience from brand evaluation, involvement, attachment, customer delight and brand personality (Brakus et al., 2009). Understanding the way consumers experience brands influences how organisations develop marketing strategies (Brakus et al., 2009).

Lemon and Verhoef (2016) refer to brand experience as the first touch point. It includes brand owned media like advertising, websites, loyalty programmes and any brand-controlled element of the marketing mix such as packaging, service and price. Klaus (2018) highlights that a positive brand experience increases the likelihood of repurchase and this could be as a result of its ability to generate brand credibility (Shamim & Butt, 2013).

Brand experience occurs whenever there is a direct or indirect interaction with the brand and can be expected or unexpected (Brakus et al., 2009). Klaus (2020) explains that CX is the cause and the brand is the effect, therefore, organisations must focus on managing CX more than brand perception. Brand developments that do not create value only increase customer expectations and can impact CX negatively or positively (Ciuchita et al., 2019).

5.5. Service Experience

Service experience occurs when a consumer interacts with an organisation's physical environment, its personnel and its policies or practices (Brakus et al., 2009). Service experience transcends service contact points and processes into customer relationships (Jüttner et al., 2013). Service experience is associated with service quality (Klaus, 2018) and it measures how atmospheric variables and personnel affect the experience delivered during a service (Brakus et al., 2009). Providing positive service experience brings economic value for organisations and managers must carefully manage customer touch points (Verhoef et al., 2009). The customer perception of CX is concerned with how the service is delivered instead of what service is delivered (Klaus, 2018). Klaus (2018) notes that a positive experience in this stage leads to customer loyalty.

5.6. Post-Purchase/Consumption Experience

Post-purchase experience starts after the purchase is done and ends with consumption, return or exchange of the product (Kumar & Anjaly, 2017). Post-purchase experience also referred to as consumption experience, is a multi-dimensional stage that includes hedonic dimensions such as feelings, fantasies and fun (Brakus et al., 2009). Post-purchase or consumption experience influences whether the customer will make the next purchase (Klaus, 2018; Kumar & Anjaly, 2017). Organisations can use post-purchase experience effectively through engaging customers in value creation by collecting customer feedback and recommendations and also participating in social networks (Haviř, 2019). Retailers are social environments and their social nature impacts CX (Verhoef et al., 2009).

Marketing outcomes and how organisations perform are determined by understanding the customer's view (Klaus, 2018). According to Klaus (2018), if post-purchase experience is positive, it leads to customer recommendations. Post-purchase experience significantly affects assurance about the product or brand (Kumar & Anjaly, 2017).

5.7. Academic Theory

Vargo and Lusch (2007) suggest that CX is influenced by Service Dominant Logic, which is organisation centric and managerially orientated. Wagas et al. (2021) propose that CX is based in Consumer Culture Theory where customer experiences are defined from the perspective of the consumers. In other words, how do they define and modify the meaning of their experiences. In the past, organisations created the meaning of experiences, which were passed onto consumers. The current focus of CX on customer centricity has moved to how consumers develop and interpret that experience. These theories emphasise the importance of evaluating CX.

6. Research Methodology

6.1. Research Design

The study followed a positivistic research paradigm, which is deductive in nature. A cross-sectional study using a quantitative survey was conducted using a questionnaire, which assessed the relationships between the three independent factors (IFs): Brand Experience (BX), Service Experience

(SE) and Post-purchase/Consumption Experience (PX) and the dependent factor (DF): Customer Experience (CX).

6.2. Sample and Data Collection

The target population of this study were all customers of the East London FPM in South Africa. At the time of the study, the East London FPM had over 9,000 customers on their database. A convenience sampling method was used. A standardised and validated questionnaire was obtained from Professor Philip Klaus from the International University of Monaco, a researcher and expert in CX (Klaus & Maklan, 2011; Klaus, 2018, 2020). The questionnaire was distributed online and by printed delivery-and-collection methods. The questionnaire was captured in the university survey tool, QuestionPro. The questionnaire consisted of a biographical section and closed-ended items to measure the DF and three IFs. The 6-point Likert scale was used, namely: “Strongly Disagree” (1), “Disagree” (2), “Neutral” (3), “Agree” (4), “Strongly Agree” (5) and “I Don’t Know” (6).

The questionnaire was sent via an email to the 9,000 customers registered on the East London FPM database through the Sales Manager’s Office and physically at markets, during trading hours. The questionnaire included a cover page explaining the purpose of the study, consent and anonymity. All data from the hard-copy questionnaires were captured on QuestionPro. Thereafter, data from QuestionPro were exported to Excel, which was followed by a process of coding. Incomplete records were discarded and a total of 210 customers fully completed the questionnaire. Thereafter, the statistical package, Statistica was used by the university statistician to conduct the statistical analysis. Full ethics clearance was obtained from the University Research Ethics Committee.

7. Results and Findings

7.1. Demographic profile of the sample

Table 1 provides the biographical information of the respondents (n=210). Most of the respondents (51%, n = 108) were households, followed by informal traders (27%, n = 57) and one respondent was a wholesaler. For data analysis purposes, the categories: informal trader, wholesaler, retailer, food outlet, NGO/Government and other were combined into ‘non-households’.

Table 1: Biographical information of participants (n=210)

Customer Category	Informal Trader	Wholesaler	Retailer	Household	Food Outlet	NGO/ Government	Other
	57 (27%)	1 (0.5%)	11 (5.5%)	108 (51%)	10 (5%)	4 (2%)	19 (9%)
Highest Qualification: Households	Less than Matric	Matric	Certificate/ Diploma	Degree/ Postgraduate Degree			
	27 (13%)	21 (10%)	30 (14%)	30 (14%)			
Highest Qualification: Non-Households	Less than Matric	Matric	Certificate/ Diploma	Degree/ Postgraduate Degree			
	22 (10%)	35 (17%)	24 (11%)	21 (10%)			
Gender by Age Category	18-29	30-39	40-49	50+			
Male	11 (5%)	23 (11%)	33 (16%)	18 (9%)			
Female	20 (10%)	42 (20%)	41 (19%)	22 (10%)			
Gender	Male	Female					
	85 (41%)	125 (59%)					

The results indicated that there was almost an even split between households and non-households. Households accounted for (51%, n = 108) of customers and non-households accounted for (49%, n = 102) of customers. This was in line with most South African communities because there are more households than businesses (Sinyolo et al., 2017). Half of the respondents (50%, n = 105) possessed a post-matric qualification and the least respondents (23%, n = 49) had less than matric. The results further showed that households had more post-matric qualifications (28%, n = 60) than non-households (21%, n = 45). Non-households had more matric qualifications (17%, n = 35) than

households (10%, n = 21). These results indicated that households were more qualified than non-households.

Furthermore, most customers were between the ages of 30 to 49 (66%, n = 139). The age of customers explained that mostly mature age groups shopped at the Fresh Produce Market. This could be because of the style of trading that is unique and different to supermarkets, which might not be familiar to younger age groups. In order to purchase at a FPM, you have to register as a buyer and apply for a quick coded buying card, which requires producing ID or a driver’s license (BCMM, 2022).

7.2. Exploratory Factor Analysis for Factors and Reliability

The Exploratory Factor Analysis (EFA) was conducted to analyse the item loadings of the factors. Initially, four factors were identified from literature and the questionnaire provided by Klaus and Maklan (2011), namely Brand Experience, Service Experience, Post-purchase/Consumption Experience and Customer Experience (Figure 1). A series of EFAs, one for each of the four factors in Figure 1 were conducted. The results of these analyses confirmed that the data fit the postulated model well. However, to explore the possibility that the observed data may reveal further factors related to customer experience, a series of EFAs were conducted for subsets of questionnaire items that appeared to be related to additional factors not included in the conceptual model (Figure 1). The results of this analysis revealed six factors instead of the four in the conceptual model. The four new factors were identified, namely Communication, Empathy, Facilities and Product Quality and Range. This resulted in a new revised model with six IF factors: Brand Experience, Customer Experience, Communication, Empathy, Facilities and Product Quality and Range (Figure 2).

The results reported in this section included EFA using the 4 original factors identified in previous studies by Klaus and Maklan (2011), and the additional IFs identified by the EFA in this study. Different items loaded onto the DF when the additional IFs were included in the EFA (Table 2). In Table 2, the items that loaded per factor after the EFA, together with the Eigenvalues and percentage of variance are explained. Factor loadings greater than or equal to 0.385 were deemed significant at the $\alpha = 0.05$ level for the sample size n = 210 in accordance with the recommendations by Hair et al. (2006). The Cronbach Alpha coefficient was used to measure the reliability of the measuring instrument, which were all above 0.7 ($\alpha \geq 0.7$). The factors in this study (Table 2) met the conditions of Zikmund et al. (2010), Collis and Hussey (2014) and Nunally (1978) for excellent reliability ($\alpha \geq 0.7$).

Table 2: Factors and items included after EFA

	Factors and Items	Factor loadings	Cronbach alpha	Eigenvalue	Variance (%)
Initial Factors	IF1: Brand Experience		0.90	4.425	63.2%
	My Fresh Produce Market’s offerings have the best quality.	0.875			
	The people who work at my Fresh Produce Market represent their brand well.	0.832			
	I am confident in my Fresh Produce Market’s expertise.	0.831			
	My Fresh Produce Market’s offerings are superior.	0.821			
	My Fresh Produce Market offers a variety of products that suit my needs	0.751			
	My Fresh Produce Market gives independent advice (on which product/service will best suit my needs).	0.738			
	The Fresh Produce Market has a good reputation.	0.702			
	IF2: Service Provider Experience		0.90	5.943	49.5%
	Dealing with my Fresh Produce Market is easy.	0.799			
	The people I am dealing with (at my Fresh Produce Market) have good people skills.	0.780			
	My Fresh Produce Market’s personnel relate to my wishes and concerns.	0.773			
	My Fresh Produce Market demonstrates flexibility in dealing with me.	0.763			

Additional Factors after the EFA	My Fresh Produce Market delivers a good customer service.	0.751			
	My Fresh Produce Market advises me throughout my shopping experience.	0.718			
	My Fresh Produce Market keeps me informed.	0.703			
	My Fresh Produce Market's online facilities are designed to be as efficient as possible (for me).	0.689			
	My Fresh Produce Market uses social media to keep me informed.	0.670			
	My Fresh Produce Market's facilities are better designed to fulfil my needs than their competitors	0.619			
	I have built a personal relationship with the people at my Fresh Produce Market.	0.586			
	My Fresh Produce Market's offline facilities are designed to be as efficient as possible (for me).	0.542			
	IF3: Post-purchase/Consumption Experience		0.89	4.303	61.5%
	My Fresh Produce Market knows exactly what I want.	0.850			
	My Fresh Produce Market keeps me up to date.	0.831			
	Being a client at/customer of my Fresh Produce Market gives me social approval.	0.825			
	I stay with my Fresh Produce Market because they know me.	0.784			
	My Fresh Produce Market will look after me for a long time.	0.783			
	My Fresh Produce Market deal(t) well with me when things go(went) wrong.	0.762			
	I am happy with my Fresh Produce Market as my service provider.	0.632			
	DF: Customer Experience		0.91	3.674	73.5%
	My Fresh Produce Market is the best	0.915			
	My Fresh Produce Market is a great brand.	0.908			
	My Fresh Produce Market provides a great customer experience.	0.865			
	There are other shops, but I would rather stay with mine; it makes it much easier.	0.835			
	I intend to shop here for a long time.	0.754			
	IF4: Brand Experience(s)		0.87	3.302	66%
	My Fresh Produce Market is a great brand.	0.878			
	The people who work at my Fresh Produce Market represent their brand well.	0.876			
	I am confident in my Fresh Produce Market's expertise.	0.812

My Fresh Produce Market's offerings have the best quality.	0.922			
My Fresh Produce Market's offerings are superior.	0.901			
My Fresh Produce Market offers a variety of products that suit my needs	0.801			

7.3 Frequency Distribution of Factors

The measurement items have been grouped to indicate the measure of central tendency and the scores for the factors that were categorised in accordance with the 6-point Likert scale (Table 3). In this study, the Likert scales were combined for “Strongly Disagree” with “Disagree” to form “Negative”, “Agree” with “Strongly Agree” to form “Positive” as well as “Neutral” with “I Don’t Know” to form “Neutral”. Thus, after combining the scales, the categories were as follows: Negative (1.00 to 2.59), Neutral (2.60 to 3.40) and Positive (3.41 to 5.00). The mean, standard deviation and highest score per factor is indicated in red (Italics) in Table 3.

Table 3: Frequency Distributions of Factors (n = 210)

Factors		Mean	S.D.	Negative 1.00 to 2.59		Neutral 2.60 to 3.40		Positive 3.41 to 5.00	
Initial factors	IF: Brand Experience	3.95	0.66	13	6%	18	9%	179	85%
	IF2: Service Experience	3.48	0.67	18	9%	70	33%	122	58%
	IF3: Post Purchase/ Consumption Experience	3.61	0.72	24	12%	45	21%	141	67%
	DF: Customer Experience	3.93	0.72	9	4%	29	14%	172	82%
Factors after EFA	IF4: Brand Experience(s)	3.85	0.72	13	6%	30	14%	167	80%
	IF5: Communication (s)	3.40	0.74	28	13%	67	32%	115	55%
	IF6: Empathy(s)	3.64	0.69	23	11%	37	18%	150	71%
	IF7: Facilities(s)	3.18	0.83	30	14%	116	55%	64	31%
	IG8: Product Quality and Range(s)	4.02	0.71	7	3%	34	16%	169	81%
	DF: Customer Experience(s)	3.94	0.66	9	4%	24	12%	177	84%

The responses to the items within the Product Quality and Range(s) factor possessed the highest mean value $\mu = 4,02$ when compared to the responses for Facilities(s), which had a mean value $\mu = 3,18$ (S.D. =0.83). None of the factors obtained a negative mean score (Table 3). Communication(s) obtained a mean of 3.40, falling within the neutral range and thus revealing ambivalence between the respondents and a potential area of improvement. The standard deviation for the factors was relatively small, in the range of 0.66 and 0.85, implying that the responses did not vary greatly between the respondents.

As illustrated in Table 3, almost all the factors received the highest portion of positive responses. Five of the factors obtained very positive scores of at least 80%, namely: Brand Experience (85%, $n = 179$), Customer Experience (82%, $n = 172$), Brand Experience(s) (80%, $n = 167$), Product Quality and Range(s) (81%, $n = 169$) and Customer Experience(s) (84%, $n = 177$). Two factors received positive responses above 65%, namely: Empathy(s) (71%, $n = 150$) and Post Purchase/Consumption Experience (67%, $n = 141$). The factors, Service Experience and Communication(s) received moderate positive response at 58% ($n = 122$) and 55% ($n = 115$) respectively. Facilities(s) received a moderate neutral response of 55% ($n = 116$).

7.4. Inferential Statistics of the Factors

Inferential statistics were conducted to make (1) generalisations about the population, (2) for comparison, testing and prediction and (3) to make conclusions about the population.

7.4.1 Pearson Correlations

In order to determine the relationship between the set of factors, a Pearson's Product Moment Correlation analysis was performed (Table 4). The analysis shows that Customer Experience of East London Fresh Produce Market customers was positively correlated ($|r| > .300$) with all the IFs, which indicated statistical and practical significance. Table 4 indicates the correlations between the initial 4 factors (Figure 1) and the six new factors identified by the series of EFAs. Furthermore, all the independent factors had positive correlations with each other ranging from medium (+0.40 to +0.69) to high (+0.70 to +0.89) positive correlations.

CX is about putting customer needs at the centre of what an organisation needs to do, ensuring that all touchpoints along the purchase journey are positive (Maechler et al., 2016). The correlations suggest that the IFs are positively perceived by the customers of the East London FPM. However, to determine whether the IFs are related to the DFs, a chi-square test was performed followed by a Cramer's V to determine the strength of the association.

Table 4: Pearson product-moment correlations between the DF, Customer Experience and the IFs

Independent Factors (IF)	Correlation r with Customer Experience (DF) old factors	Correlation r with Customer Experience(s) (DF) new factors
IF1: Brand Experience	.805	
IF2: Service Provider Experience	.834	
IF3: Post Purchase/ Consumption Experience	.701	
IF4: Brand Experience		.867
IF5: Communication		.758
IF6: Empathy		.751
IF7: Facilities		.591
IF8: Product Quality & Range		.800
<i>IF = independent factor; DF = dependent factor</i>		

7.4.2 Chi² Tests - Customer Experience related to the other Factors

The university statistician performed a chi-square (χ^2) to establish independence, which compares two variables in a contingency table to see if they were related. Thus, determining whether no relationships exists between the IFs and the DFs at a statistical significance level of 0.05 (where $p < 0.05$). Furthermore, the Cramer's V was calculated, which measures the strength of association. Table 5 shows that most of the IFs have a strong (large) association with the DFs except for Facilities(s), which has a medium association.

Table 5: Results for the Chi² Tests - Customer Experience and Customer Experience(s) related to the IFs

Independent Factors		Customer Experience/ Customer Experience(s)		
		(χ^2) (d.f = 4; n = 210)	p-value	Cramer's V and practical significance
Initial IFs	IF1: Brand Experience	156.94	$p < .0005$	0.61 Large
	IF2: Service Provider Experience	171.92	$p < .0005$	0.64 Large
	IF3: Post Purchase/Consumption Experience	114.54	$p < .0005$	0.52 Large
Additional IFs factors after EFA	IF4: Brand Experience	193.79	$p < .0005$	0.68 Large
	IF5: Communication	82.24	$p < .0005$	0.44 Large
	IF6: Empathy	108.42	$p < .0005$	0.51 Large
	IF7: Facilities	46.56	$p < .0005$	0.33 Medium
	IF8: Product Quality & Range	145.49	$p < .0005$	0.59 Large

Source: Own compilation

7.5. Hypothesised Model

The statistical analysis demonstrated that the three initial independent factors of Brand Experience, Service Experience and Post-purchase/Consumption Experience each exhibit a significant positive effect on Customer Experience. In addition, the Pearson Moment correlations as illustrated in Table 4 indicated that these factors are all positively correlated ($r > .300$) to Customer Experience. The chi-square test (χ^2) indicated that the three initial IFs were related and the subsequent test for association strength (Cramer's V) indicated a large practical difference (Table 5).

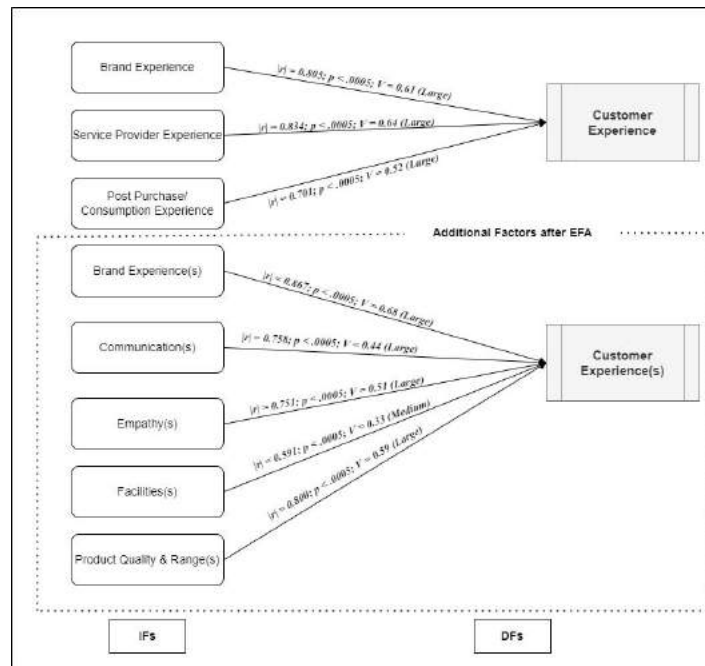

Figure 2: Final hypothesised model of independent factors influencing Customer Experience
Source: Own compilation

The statistical analysis further demonstrated that the five new independent factors of Brand Experience(s), Communication(s), Empathy(s), Facilities(s) and Product Quality and Range(s), each exhibit a significant positive effect on Customer Experience(s). Furthermore, the chi-square (χ^2) test showed statistically significant relationships and Cramers V indicated strong associations between the IFs and DFs. Figure 2 presents the final hypothesised model based on the results from the Pearson's Moment Correlations and chi-square (χ^2) Tests.

8. Managerial Implications

The purpose of these recommendations is to assist and improve managerial decision-making related to CX in the East London FPM. Satisfying customers and building loyalty is an important component for any marketing strategy. As such, generating positive CX and ensuring that all touchpoints are customer focused, is likely to enhance future business growth and increase profitability. According to Meyer and Schwager (2007), products or services alone are no longer sufficient to ensure customer loyalty and customer satisfaction.

According to Havř (2017), organisations find it difficult to assume the role of the customer when analysing CX. This failure results in limitations for organisations to fully understand and appreciate the emotional, social and cognitive responses that co-create meaningful customer experiences. Additionally, the introduction of the digital age and the multitude of touchpoints available, have resulted in increased interaction with customers (Cao & Li, 2015). This poses a challenge for CX management.

Efforts must be made to provide positive experiences for customers by managing all cues that individuals encounter in the purchasing process. Therefore, the East London FPM must look beyond products or services to improve its business. Below are the recommendations that can be used by decision-makers, managers and leaders within the East London FPM.

Brand Experience - The results of the study indicated that customers were positive about the brand experience provided by the East London FPM. Therefore, managers, leaders and decision makers operating within the East London FPM should develop strategies to maintain or improve the existing positive reputation. Strategies include the recruitment of best talent; staff development through

training programmes, mentorships and industry exposure and touchpoints through follow up calls and emails, customer service points and entrance/exit controls. Additionally, organisations should also maintain variety of products and quality offerings and this would require efforts to better understand future consumer requirements.

Service Experience - This study indicated that customers were satisfied with service experience provided by the East London FPM, which was supported by the statistical analysis. Verhoef et al. (2009) assert that service experience is a customer's subjective response to or interpretation of any direct or indirect encounter with a service. According to Jaakkola et al. (2015), service experience includes service provider representatives who experience the service and other people in the social experience network. Therefore, service experience occurs in a multi-stakeholder ecosystem.

Management should design and implement training sessions to develop personnel for improved service experiences. Individuals who deal directly with customers should understand the meaning of creating positive service experience. Building relationships with customers should be prioritised. This would result in a better understanding of customers and their expectations.

Post-purchase/Consumption Experience - The results in this study suggested that most customers are satisfied with the post-purchase experience provided by the East London FPM. However, there are opportunities for improvement to ensure customer retention as noticed by the frequency distributions of responses. Therefore, managers, leaders and decision makers should find ways to maintain and improve the existing positive perception of the post-purchase/consumption experience. Customers of the FPM are likely to return if the FPM ensures that the consumption experience includes the management of after-sales queries, complaints and feedback.

Communication - The results of the study indicated that most customers were positive about communication provided by the East London FPM. Strategies to improve the existing communication should be focused on as the frequency of responses showed ambivalent ($n = 67$; 32%) responses as well. For example, markets should consider marketing teams, which comprise of talented individual(s) to manage marketing activities. The team would communicate with customers, control the suggestion box, launch surveys and handle social media accounts; and develop communication channels to speed up communication.

Empathy - Empathy showcased strong positive correlation ($r = 0.751$) with CX. The Oxford dictionary defines empathy as *the ability to understand and share the feelings of another*. The results of the study indicated that customers were positive about empathy provided by the East London FPM. Thus, managers, leaders and decision makers operating within the East London FPM should develop strategies to improve customer empathy. Strategies can include helpdesks to handle queries and complaints and the training of frontline personnel to aid in client care to achieve retention.

Facilities - Facilities showcased medium positive correlation ($r = 0.591$) with Customer Experience. Notably, FPMs have a traditional style that is different to supermarkets or any other similar business. This may suit the current customers but to attract more customers, an upgrade of facilities may be required. The upgrade can be an improvement to accommodate current business processes or a complete change, which will improve the shopping environment of the FPM. Infrastructure backlogs on markets should be addressed and a detailed needs assessment undertaken. The suitability of the current location as well as the structure of FPMs should also be reviewed (NAMC, 2018).

Product Quality and Range - The results of the study indicated that customers were positive about product quality and range provided by the East London FPM. Therefore, it is advised that the FPM should regularly assess demand to establish products that are in demand to ensure that a wide variety is always provided to customers. The literature suggested that customers become frustrated with the variation in products due to seasons. Therefore, managers should source products throughout the year to maintain availability. Managers should further ensure that all products are of good quality. This can

be done through appointing a quality controller to provide grading and quality inspections as products should be classified according to quality and grade.

Against this background, the FPM should create and implement efforts to maintain and improve its CX, such as technology adoption to improve customer experience. The experience with the brand should remain pleasant and memorable as customers demand positive experiences rather than just a transactional relationship. To gain advantage against competitors, the FPM must deliver a delightful CX, centred on the needs of the customer.

9. Conclusions, Limitations and Future research

FPMs are one of the largest distribution channels of fresh produce in South Africa and they play an important role in food security (Baiyegunhi et al., 2018). FPMs are confronted with increasing competition from supermarkets and other retailing outlets, specifically when these competitors purchase directly from suppliers (Louw et al., 2016). Most consumers are loyal to their preferred organisations and managers should consider ways to improve the perception of reciprocated loyalty. In other words, customers should be certain that organisations consider their intentions and needs. Many channels are available through which organisations can interact with customers and it is most important that these channels are synergised to offer a seamless experience throughout the purchase journey. Carefully considering every stage of the purchasing journey and ensuring that every stage provides superior services, ensures that customers are enjoying a pleasurable CX (Lemon & Verhoef, 2016). Brand Experience, Service Experience and Post-purchase/Consumption Experience collectively contribute to ensuring a holistic approach to value creation.

This study has contributed to the research on CX by adding the additional factors of Brand Experience, Communication, Empathy, Facilities and Product Quality and Range, which were found to be statistically and practically significant with the dependent factor customer experience. The support of the factors to CX presents insights as to how experiences can influence consumer behaviour and loyalty while supporting the Consumer Culture Theory in that CX is interpreted by the consumer. Therefore, management must be cognisant of the expectations of customers in terms of the factors they deem important for their experience at the East London FPM.

The limitations of this cross-sectional study were that it was only conducted at the East London FPM and due to time and resource constraints, had limited responses from East London consumers. This means that the findings may not be representative of all FPMs in South Africa, thus it is advised to repeat the study in other FPMs in South Africa to validate the findings. It is also recommended that a similar study be conducted if the FPM decides to offer an online trading facility.

The final hypothesised model (Figure 2) requires additional research to establish its validity and usability as an effective means to establish and monitor CX both locally and internationally. Such a replication will overcome possible sampling bias and future research should repeat the survey with a larger sample size while controlling certain demographic variables to determine statistical and practical significant differences.

The Influence Of Employer Branding and Social Media Presence On Employee Attraction Among Young Adults: A South African Retail Sector Perspective

Ms Mariette Frazer^{1,*}, Ms Boitumelo Precious Mathe², Ms Dimpho Zama Zwane³, Ms Olwenkosi Simathatha Khafu⁴, Mr Uzair Ebrahim⁵

Keywords

Employer branding; retail sector; young adults

Abstract

Employer branding aims to create an appealing work environment for potential employees. The retail sector is the second largest employment sector in the South African economy. The sector continues to report large skills shortages, which need to be considered against the backdrop of South Africa's escalating unemployment rate, which was at 34.5 per cent in the first quarter of 2022. Uncertainty over the employer attributes that attract talent into the sector, and negative perceptions of the retail sector, contribute to the skills shortage and threaten its sustainability. This study aims to determine the influence of employer branding and social media presence on the employer's ability to attract and recruit young adults into the FMCG retail sector of South Africa. The study targeted a sample of 378 young adults mainly from Gauteng: using a seven-point Likert-scale, an online questionnaire required respondents to indicate their level of agreement or disagreement relating to the five attributes of corporate attraction (employer innovation, development, social environment, economic benefit, and application value) of retail organisations. The results suggest that social environment, innovativeness, and application value attract young adults to retail employers, and that employers should not focus only on social media to communicate with potential young adult employees.

1. Introduction

Attracting the best talent in the market is likely to position an organisation ahead of the competition and increase its ability to reach its goals and objectives (Santos *et al.*, 2019). Employer branding builds the perception of the organisation with the objective of creating an attractive work environment among the current and potential workforce with the intent to attract and retain talent (Rai, 2019). In today's highly connected world, the organisation's online and social media presence is a strategic part of creating and sharing organisational branding messages relating to the work environment (Tajvidi and Karami, 2017). An organisation can set itself apart from competitors by using skilled employees as their competitive advantage, thus bringing about the notion of employees being part of the competitive strategy, therefore, contributing to financial performance (Mouton and Bussin, 2019).

One-third of the South African population is between 18 and 34 years old (Stats SA, 2019). These young adults form the largest part of the current and the future workforce. This highlights the importance of employers understanding the preferences of this cohort to attract top talent. Individuals born in the same period share similar values and expectations and behave similarly (Cismaru and Iunius, 2019). Young adults demand greater personalisation in their job; therefore, for businesses to be able to attract and retain young workers, they must adopt a different mindset when approaching this generation. In attracting the younger generation, employers must adapt to the rapid evolution of

*Corresponding Author

¹ E-mail address: mfrazer@uj.ac.za

the external environment; so, they need to create programmes that develop their younger employees to attract and retain employees (Deloitte, 2021). This generation wants to ensure that their time at work contributes equally to the employer's success and to their interests outside of work. Thus, they want a flexible schedule (Ryan, 2017).

South Africa continues to report high unemployment rates. Unemployment was at 34.5 per cent in the first quarter of 2022 (Stats SA, 2022) – an increase from 32.6 per cent in the last quarter of 2020 – with young adults accounting for 63.3 per cent of the unemployed (Stats SA, 2021a). These levels of unemployment are the highest since records began to be kept in 2008, while an increasing number of young adults are trying entering the labour market. High levels of unemployment are not only found among uneducated South Africans. Nonyana and Njuho (2018) report unemployment levels among young graduates to be as high as 40.3 per cent. In contrast, the retail sector of South Africa – the second-largest sector in terms of the provision of employment (Buthelezi, 2020) – continues to report high levels of skill' shortages. Thus, the sustainability of the retail sector is at risk due to the skills shortage, mainly because of technological developments, such as big data, artificial intelligence, and omnichannel retailing (Ferreira *et al.*, 2020; Mahmoud *et al.*, 2020; Frazer and Stiehler, 2014).

There are many misperceptions about the retail sector, one of which is that its workers do not require a lot of formal training and that it consists of basic jobs only (Malgas *et al.*, 2017). Further, according to Heidig *et al.* (2017), the negative factors that are most closely associated with the South African retail sector include long working hours, low skill levels, few opportunities for growth, and lower levels of remuneration. With all these factors being associated with the retail sector, attracting highly skilled employees becomes difficult; and this is where employer branding comes into play. For young adults, technology plays a vital role in the communication of corporate brands (Kirchmayer and Fratričová, 2020). In the South African setting, retail organisations need to adapt their employer branding and attractiveness to gain some level of interest from young adults if they wish to fill their skills shortage and remain effective and competitive.

Given the importance of employee branding and the need for skills in the South African retail sector, the main objective of this study is the following:

To determine the influence of employer branding and social media presence on the employer's ability to attract and recruit young adults into the retail sector of South Africa.

The contribution of the study is twofold. First, this paper is an empirical investigation in a South African context in which the influence of employer attributes on the intention of young adults to apply for employment - in the retail sector – with the moderating effect of the employer's social media presence – is explored. Second, the study adds uniquely to the academic and managerial understanding of the influence of corporate reputation and social media presence on young adult graduates' intention to apply for employment at a Fast Moving Consumer Goods (FMCG) retailer in the sector.

The organisation of this paper is as follows: the problem investigated in the study is described, followed by the research objectives. The literature review is then presented, which consists of a brief discussion of the need for employer branding in the retail sector, corporate reputation, social media presence, and young adults, and concludes with a discussion of the conceptual model that guides the hypothesis of this paper. In the research methodology section, the methodological choices of the study are described. Finally, the results and findings are presented, followed by the managerial implications and the conclusions.

2. Problem investigated

Research on the influence of employer branding and social media presence on young adults' intentions to apply for employment in the retail sector is limited (Bilińska-Reformat and Stańczyk, 2018; Santiago, 2019) and in particular is not focused on young adults in South Africa. Uncertainty remains about the influence of the corporate attributes and social media presence of an organisation

on the intentions of young adults to apply for employment at a FMCG retailer in the sector. A study by Hadi and Ahmed (2018) focused on the contribution of employer branding towards making an organisation more attractive to employees, but it was limited to educational institutions. This study aims to provide insights into the retail sector, as retailers need to appeal to the younger generation to attract talented graduates into the sector in order to combat the current skills shortages. Recent studies have not explored employer branding in depth to identify which areas of employer branding hold the most value for potential employees (Gilani and Cunningham, 2017). Gaining a better understanding of which attributes young adults consider important and of the role that a social media presence plays relating to the corporate reputation of potential retail employers, is important for the sector's sustainability. Retail organisations may thus be able to appeal more effectively to young adult graduates if they have a better understanding of the important attributes of corporate reputation and the role of social media presence in future employees' intention to apply for employment.

3. Research objectives

This study's main research objective is to determine the influence of employer branding and social media presence on the retail employer's ability to attract and recruit young adults into the retail sector of South Africa.

In order to achieve that aim, the study has the following sub objectives:

- To determine the influence of each of the retail employer branding attributes on the attractiveness of employers in the South African retail sector.
- To investigate whether the employer's social media presence moderates the relationship between young adults' perceptions of the employer's corporate reputation and young adults' intention to apply to work at a FMCG retail organisation within the South African retail sector.

4. Literature review

4.1. Need for employer branding in the South African retail sector

The retail sector consists of organisations in the economy that focus their business activities on the resale of new and used goods to individual consumers or households (Statistics South Africa, 2021b). The retail sector is one of the most important contributors to South Africa's GDP, employing more than 21 per cent of the total workforce (W&RSETA, 2021). The retail sector covers a broad range of organisations, which main business activities consist of the sale, and resale of goods to end consumers. Fast Moving Consumer Goods Retailers (FMCG) also classified as General dealers represent 42, 5 % of the South African retail sector sales (Stats SA, 2021^b). The top 5 retailers in South Africa according to Deloitte for 2022 are mainly FMCG retailers and include; Shoprite Holdings Ltd, Steinhoff International Holdings N.V., The SPAR Group Limited, Pick n Pay Stores Limited and Woolworths Holdings Limited (Deloitte, 2022). Furthermore, the previous study that guided this research also indicated that soon-to-be graduates as future employers (Frazer et al., 2021) preferred several FMCG retailers.

Given that, in the South African context, the retail sector is viewed as undesirable (Heidig, *et al.*, 2018), employee perceptions must be improved. Overcoming the belief that there are no growth opportunities in the South African retail sector calls for effective employer branding, because these perceptions need to be changed if the sector is to attract the highly skilled employees it needs (Malgas *et al.*, 2017). Employer branding also contributes to the strategic success of an organisation by increasing its competitiveness in the employment market. Organisations can enhance their sustainable competitive advantage with the accurate management of human capital, thus making them more sustainable.

4.2. Resource-based Theory

Resource-based theory suggests organisations with rare, valuable resources will have a better competitive advantage and better long-term sustainability, these resources may include physical assets, intellectual property and employees (Gibson *et al.*, 2021). Therefore, attracting better employees supports the resource-based theory (Backhaus and Tikoo, 2004) that sustainable competitive advantage is obtained when resources are rare, valuable and inimitable. Overcoming the challenges faced by retail organisations in attracting and retaining highly qualified and motivated employees around the world, but particularly in South Africa is a key part of ensuring the future sustainability of

the sector. As a result, knowledgeable employees – a critical source of competitive advantage in the retail sector – are scarce (Arenkov *et al.*, 2019). The premise is that organisations should aim to attract the best possible employees so that the human capital adds value and enables the organisation to use its resources better (Dabirian *et al.*, 2019).

Employer branding is described as a method used by employers to attract potential employees by communicating the benefits of a workplace and the unique features of the work environment to them (Ghosh and Kulshrestha, 2016). Therefore, employer branding aims to make the organisation more desirable to work for, by highlighting the unique offerings of the organisation through employment and growth opportunities (Eger *et al.*, 2019). Employer branding includes both internal and external branding efforts and aligns the external brand image with internal employee convictions. Thus, external employer branding extends beyond marketing the organisation's value proposition and corporate brands in order to attract potential employees.

4.3. Corporate reputation

Corporate reputation can be described as stakeholders' overall perception of an organisation and is largely based on its past actions as well as the expectations that people have for its future actions (Pires and Trez, 2018). Corporate reputation is important, as it contributes directly to the credibility of the organisation and to the level of trust that stakeholders have in it (Studiowide, 2016). A good corporate reputation will enhance the ability of the organisation not only to retain its current employees but also to attract the best possible employees because it will have values that align with those of the best prospective candidates (Gözükara and Hatipoğlu, 2016; Schaer, 2020).

As this study focused on corporate reputation in the context of attracting talent, the dimensions that build a corporate reputation among potential employees need to be considered. The dimensions of employer attractiveness, as measured using the EmpAt scale, are employer innovation, development, social environment, economic benefit and application value (Berthon *et al.*, 2005). 'Employer innovation' relates to the interest value of the product and service that the organisation produce or sells. The 'development' attribute considers the perceived opportunity to build skills and grow in the organisation. The working environment and corporate culture constitute the social environment and the economic and potential compensation benefits the organisation offers. The last attribute concerns employees' ability to apply their skills and to transfer them to others in the organisation. However, the retail sector as an employer is perceived negatively because the work environment is characterised by store-based activities that require little education and long hours, which offer low pay, include repetitive and boring tasks, and offer little opportunity for advancement (Heidig *et al.*, 2017).

The most notable attributes that build a corporate reputation are high levels of performance and effective communication (Cutting Edge PR Insights, 2020). Good corporate reputation, therefore, is a product of both external and internal branding communication; internal branding is aimed at current employees, and emphasises organisational values and goals to strengthen corporate reputation internally (Barros-Arrieta and García-Cali, 2021). Job seekers frequently consider current employees' views when they are planning to apply for employment, and they might also consider those employees' views of the company's corporate reputation and working conditions (Ahmad Azmy, 2018). As the popularity of social media has grown, many organisations have been using social media to engage and enhance their corporate reputation (Becker and Lee, 2019).

4.4. Social media presence

Organisations' use of social media expands beyond its customers to include current and potential employees and includes a wide range of goals and objectives. Social media have been effective in creating a positive brand image among both external and internal stakeholders (Szwajca, 2017). Social networks are therefore an effective tool for organisations to engage with current and prospective employees (Rana and Kapoor, 2016). The term 'social media' covers a range of software-based digital technologies that will allow users to send and receive digital content or information through some kind of online social network. The most common social media applications are Facebook, Instagram, LinkedIn, Twitter, Pinterest, WhatsApp and YouTube, they are powered by user-generated content

and are important in contexts of marketing and corporate brand perceptions (Kapoor *et al.*, 2018). By their very nature, social media have the ability to spread information quickly (Szwajca, 2017). In 2020, more than 50 million organisations had a Facebook business account (Olanrewaju *et al.*, 2020).

Furthermore, many organisations use their accounts on social media to advertise employment opportunities and many report a positive influence on their reputation (Grzesiuk and Wawer, 2018). Social media, therefore, have evolved to be a strong career-hunting platform. Facebook is at the forefront, with 67 per cent of people looking for work on social media using it (Jobvite, 2018). The social media presence of an employer may be key to attracting the younger generation of the retail workforce. Over the past decade, social media have grown in popularity and come to serve as a significant source of information. Their use in the recruiting process appears to have grown tremendously (Koch *et al.*, 2018). The younger generation has embraced social media: in South Africa, 57.4 per cent of social media users are aged from 18 to 34 years (Statista, 2021).

4.4. Young adults

Young adults (18- to 34-year-olds) are the fastest-growing population group in Africa (Maskaeva and Msafiri, 2021), and fall mainly into two generational cohorts: millennials and Generation Z (Gen Z). Generational theory groups individuals together into age cohorts on the premise that they have shared histories and similar experiences that shape their behaviour and world view (Jauregui *et al.*, 2020). The millennial generation was born between 1980 and the late 1990s, and is notable for characteristics such as being adaptive, especially in the use of technology and not being averse to change (Indeed Editorial Team, 2021). Gen Z individuals were born between the years 1996 and 2012, and are described as independent and are regarding hard work to attain what they would like to achieve (Schwieger and Ladwig, 2018). A significant and important characteristic of the Gen Z age group is its digital footprint. Gen Z people use digital avenues to educate themselves on a range of topics (Vițelar, 2019). Given both millennials' and Gen Z's reliance on digital information, employer brands should be present on social media such as YouTube, Instagram, Facebook, Snapchat, Twitter, and LinkedIn, as these are the applications that young adults use the most (Beall, 2016).

The retail sector in South Africa traditionally absorbs many of the population's young adults, as the sector offer opportunities that require minimal experience and education (W&RSETA, 2021; Lannoy *et al.*, 2018). However, the sustainability of the retail sector is at risk because it continues to report a large skills shortage, mainly driven by technological changes such as big data, artificial intelligence and omnichannel retailing (Ferreira *et al.*, 2020; Mahmoud *et al.*, 2020; Frazer and Stiehler, 2014). To address the challenge, Goh and Lee (2018) proposed sourcing the needed skills among future entrants from the next generational cohorts.

5. Conceptual model

The proposed conceptual module is grounded in a previous research study on the use of social media and employer attractiveness in the context of employer branding (Sivertzen *et al.*, 2013). The study used the EmpAt scale, developed by Berthon *et al.* (2005) to measure employer attractiveness. The conceptual model hypothesises that corporate reputation is influenced by five attributes – employer innovations, development, economic benefit, application value, and social environment – that will influence potential employees' perceptions of the organisation's corporate reputation, while its social media presence moderates the relationship between corporate reputation and potential employees' intention to apply for employment.

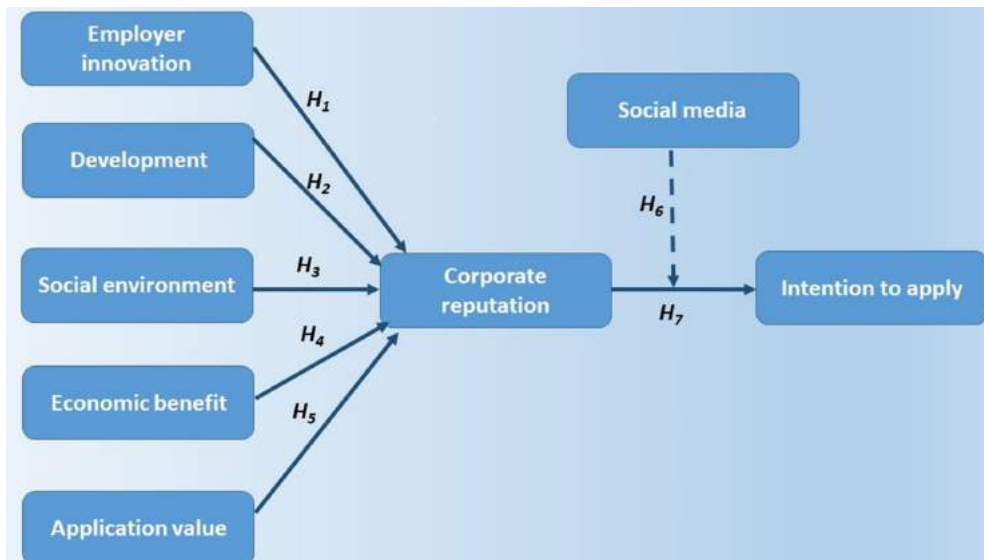

Figure 1: Hypothesised model

6. Hypotheses formulation

The following hypotheses were formulated for the study:

6.1 Employer innovation

Corporate reputation is essential to organisations, as it contributes positively to hiring and retaining employees, thus leading them to be productive and allowing workplace innovation to take place (Jeffrey *et al.*, 2019). A positive corporate reputation actively increases an organisation's internal capital in order to generate value and indirectly increases its innovative capability, which in turn influences its results (Ou and Hsu, 2013). Innovative work behaviour (IWB), which is important for capitalising on corporate innovation, is promoted and valued in high-performing organisations and as a result, innovation in human resource management (HRM) and organisational conduct has also become a focal point (Černe *et al.*, 2017). As a result, the following hypothesis is proposed:

H1: Employer innovation significantly and positively influences corporate reputation.

6.2 Development

Employers investing in their employees' development to increase their skills will attract prospective employees to the organisation. A business that is perceived as having a supportive work culture and that provides opportunities for growth and development will attract potential employees (Naz *et al.*, 2020). Both employees and employers benefit from development programmes, as greater employee efficiency is achieved by developing staff (Jehanzeb, 2020). Given this information, this study proposes the following hypothesis:

H2: Employee development significantly and positively influences corporate reputation.

6.3 Social environment

The social environment of the workplace is seen as one of the important components affecting the corporate reputation of the organisation. In turn, it has been linked to enhancing the attractiveness of the organisation (Styvén *et al.*, 2022). The social environment also encompasses structures in the organisation that might or might not exist, and the relevant organisational culture, which will be used by potential employees to gain an understanding of the working conditions that they might expect (Glassdoor Blog, 2021). By having good relations with its employees, an organisation can increase its attractiveness: current employees will serve as its ambassadors because their needs and wants are always taken into consideration (Wepener, 2015). Given this information, this study proposes the following hypothesis:

H3: The social environment of the organisation significantly and positive influences corporate reputation.

6.4 Economic benefits

The employee compensation and benefits provided by the organisation have a significant influence on the number of job seekers who apply for positions. (Puri, 2018). When applying for a job, job seekers search for an appealing overall compensation package, an above-average salary, and job security in the organisation. Talent is therefore drawn to employers who are perceived to offer better benefits, compensation and conditions. Ahmad *et al.* (2020) confirmed that organisations with better corporate brand perceptions benefitted from improved employer attractiveness, and attracted better talent. As a result, it is hypothesised that:

H4: Economic benefits significantly and positive influence corporate reputation.

6.5 Application value

Application value is concerned with job seekers' perception of whether the prospective employer provides the opportunity to apply what they have learned and to teach others their skills as a favourable attribute when searching for an employer (Ronda *et al.*, 2018). Therefore, application value also covers the relevance of the work in relation to the applicants' skills and knowledge (Kumari *et al.*, 2020), which would typically be acquired through education and previous work experience. Therefore, job seekers hold a more positive view of employers who offer opportunities to apply their skills. It is thus hypothesised that:

H5: Application value significantly and positively influences corporate reputation.

6.6 Social media

Organisations have been using social media for more than a decade to engage with customers and stakeholders about their corporate reputation and brand (Szwajca, 2017). Social media are perceived to be effective tools for organisations to engage with current and prospective employees (Rana and Kapoor, 2016) and many organisations use their accounts on social media to advertise employment opportunities (Grzesiuk and Wawer, 2018). It is expected that social media will play a mediating role between the corporate reputation and the intention of prospective employees to apply for employment. Thus, the following hypothesis is proposed:

H6: The social media presence of the retail organisation will moderate the relationship between its corporate reputation and potential employees' intention to apply for employment.

6.7 Corporate reputation

Corporate reputation influences the attractiveness of an employer and the intention of applicants to apply; therefore, a positive reputation benefits an organisation in both real and intangible ways (Santiago, 2019; Ahmad Azmy, 2018). A good corporate reputation also fosters favourable attitudes and increased loyalty and support from stakeholders, and it helps to recruit employees, because people value affiliations with highly reputable organisations (Gözükara and Hatipoğlu, 2016; Roberts and Dowling, 2002). According to Verčič and Čorić (2018), job seekers are more likely to accept employment from an organisation that has a good corporate reputation. Considering the role of corporate reputation among potential employees, the study proposes the following hypothesis:

H7: Corporate reputation significantly and positively influences the intention to apply for a job with the FMCG retail employer.

7. Research methodology

The study used a quantitative design and an online survey (an internet-based questionnaire) was used to collect data from the target population (Saunders *et al.*, 2019).

7.1 Population and sampling

The target population was millennials and Gen Z young adults with some post-school education in retail, marketing, or related fields, mainly in Gauteng, as this is the main economic hub in South Africa. To achieve accurate and reliable results, the study acquired a sample size of 378 responses. Convenience sampling method (non-probability) was used because the study was focused on individuals from a specific generational cohort who had some post-school education and were accessible to the research team (Etikan, 2016; Taherdoost, 2016).

7.2 Data collection and analysis

The data were collected among respondents who consented to participate, by providing them with a link to the questionnaire through email or social media platforms such as LinkedIn, Instagram, and WhatsApp. Respondents needed to indicate whether they intended to look for employment after completing their current qualifications. Once the respondents had completed the demographic information, the next part of the questionnaire asked them to respond to 25 items that measured employer attractiveness using the EmpAt scale developed by Berthon *et al.* (2005). Using a seven-point Likert scale, respondents indicated their level of agreement or disagreement with the five attributes of corporate attraction (employer innovation, development, social environment, economic benefit, and application value). The final section gathered information about the respondents' intention to apply for employment with selected FMCG retailers and about the retailers' social media presence. For this section, FMCG retailers were used as the majority of retailers in South Africa are from this sub-classification and results from the previous study, (Frazer, *et al.* 2021) indicated that potential graduates prefer the FMCG retailers as their most desirable potential employers. The respondents had to select a retailer from a drop-down list of top FMCG retailers and indicate their intentions to apply for employment and their perception of the retailer's social media presence. A total of 378 responses were included in the final analysis, which used the Statistical Package for Social Sciences (SPSS) version 27.

7.3 Ethical considerations

To ensure that the study complied with ethical guidelines, the questionnaire included a cover page explaining the objectives of the research, that participation was voluntary and that anonymity and confidentiality would be ensured, and asking respondents to give their informed consent to being part of the study. Before implementing the study, the researchers applied for ethical clearance from the University of Johannesburg's College of Business and Economics Ethics Committee. The committee granted ethical clearance for this research study under the ethical clearance code 2021SCiS026.

8. Results

8.1 Descriptive analysis

Table 1 describes the demographic characteristics of the sample. The majority of the respondents were female (63.5%) and aged between 18 and 33 years (94.7%) at the time of the survey. In addition, a large number of the respondents were either undergraduate (59%) or graduate students (34.7%) specialising in marketing (37.3%) or retail (24.1%).

Table 1: Descriptives (n = 378)

Demographic characteristic	Frequency	Percentage
Gender		
Female	240	63.5
Male	135	35.7
Prefer not to say	3	0.8
Age group		
18-33	358	94.7
34 and older	20	5.3
Educational status		

Student	223	59.0
Graduate	131	34.7
Dropout (discontinued/ incomplete studies)	24	6.3
Level of education		
Higher Certificate	17	4.5
National Diploma	95	25.1
Bachelor's degree	139	36.8
Honours degree	90	23.8
Other	37	9.8
Field of study		
Marketing	141	37.3
Retail	91	24.1
Other	146	38.6

8.2 Reliability, mean scores, and validity

The reliability of the scale items used in the analysis of the hypotheses was determined by calculating the internal consistency reliability scores, or Cronbach's alphas. Table 2 below shows the scores obtained and the mean and standard deviation for each of the items.

Table 2: Reliability, mean scores and validity

Construct	Items	Coefficient alpha	Mean	Standard deviation
Employer innovation	The organisation produces innovative products and services	0.859	0.69	1.361
	Innovative employer – novel work practices/ forward thinking.		5.75	1.351
	The organisation produces high-quality products and services		5.88	1.298
Development	Feeling more self-confident as a result of working for an organisation	0.861	5.95	1.357
	Feeling good about yourself as a result of working for an organisation		5.10	1.498
	Gaining career-enhancing experience		5.57	1.457
	A springboard for future employment		5.13	1.490
Social environment	Good relationship with colleagues	0.877	5.13	1.535
	Supportive and encouraging colleagues		5.17	1.552
	The employees have a good relationship with their superiors		4.82	1.521
	Happy work environment			
Economic benefits	An attractive overall compensation package	0.880	5.63	1.342
	An above-average salary		4.40	1.769
	Job security within the organisation		4.23	1.784
Application value	Good promotion opportunities within the organisation	0.905	5.00	1.485
	Hands-on inter-departmental experience		5.13	1.434
	Opportunity to teach others what you have learnt		5.18	1.423

Construct	Items	Coefficient alpha	Mean	Standard deviation
	Opportunity to apply what was learned at a tertiary institution			
	The organisation both values and makes use of your creativity.			
Corporate reputation	Company with a good reputation (Hearing good things about the firm)	0.873	5.97	1.275
	I prefer a well-known employer		5.39	1.589
	The organisation is seen as valuing the customer		5.99	1.287
	My employer should be highly recommended by others		5.73	1.335
	My employer should be highly regarded in the retail industry		5.61	1.495
Intention to apply	I would accept a job from this FMCG retailer	0.920	1.67	1.104
	This retailer would be my first choice of employer		1.76	1.176
	I would attend if I were to be invited for an interview with this company		1.59	1.029
	I would put in a substantial amount of effort if I worked for this retailer		1.70	1.084
	If a friend were looking for employment, I would recommend this retailer		1.60	0.999
Social media presence	I have seen the most social media activity in terms of posts that relate to jobs available at this retailer	0.712	2.36	1.07
	The posts that have been made by this retailer provided the most information about the job		2.55	1.223
	This retailer's social media page grabbed my attention		1.95	1.205

Saunders *et al.* (2019) recommend a Cronbach's alpha coefficient above 0.7; all of the reported scale items were above the threshold, thus confirming their internal consistency and reliability.

8.3 Regression analysis

Regression analyses were used to investigate the relationship between the dependent variable (corporate reputation) and the independent variables (the attributes of employer attractiveness). A level of 95 per cent confidence was used, in that a p-value greater than 0.05 would not validate the hypothesis, thus leading to the alternative hypothesis being accepted (Wiid and Diggins, 2015). The results of the regression analyses and hypothesis testing are summarised in Table 3.

The results of the first regression analysis show that there was a statistically significant and positive relationship between the independent variables employer innovation, social environment, and application value and the dependent variable corporate reputation ($p < 0.05$). This provided statistical support for hypotheses 1, 3, and 5. The results of the regression analysis further show that social environment, with a standardised beta coefficient of 0.170, had the highest influence on corporate reputation. The R^2 (Reasonable R Square) indicates that 55.5 per cent of the variability in corporate

reputation could be explained by employer innovation, social environment, and application value. This is within the range of 0.67 and 0.75 for social sciences model fit.

The second regression analysis focused on the relationship between corporate reputation (the independent variable) and intention to apply for employment (a dependent variable). However, with a p-value of 0.173, the hypothesis was rejected.

Table 3: Regression and hypothesis testing

	Construct	Standardised coefficients beta (β)	T	Sig.	Decision
H₁-H₅	Employer innovation	0.127	2.491	0.013	Accept
	Development	0.109	1.905	0.058	Reject
	Social environment	0.170	3.196	0.002	Accept
	Economic	0.047	.881	0.379	Reject
	Application	0.393	6.272	0.000	Accept
H₇	Corporate reputation	-0.009	-0.173	0.863	Reject

8.4 Moderation analysis

The Hayes process Marco (Hayes, 2018) was used to test H₆, the moderating role of social media on the relationship between corporate reputation and intention to apply for employment. Interaction effect beta values and significance values (p-values) were used to verify the significance of the hypotheses at the five per cent level. Table 4 clearly shows that social media did not influence corporate reputation and the intention to apply and so the hypothesis was rejected.

Table 4: Moderation analysis of social media presence

	Construct	Standardised coefficients beta (β)	T	Sig.	Decision
H₆	Corporate reputation x Social media (interaction effect)	0.0121	0.6585	0.5106	Reject

9. Discussion

The study investigated the influence of employer branding attributes and social media presence on young adults' intention to apply for employment with selected South African FMCG retailers. Most of the respondents were female and were either students or graduates specialising in retail or marketing. The results revealed that employer innovation, social environment, and application value had a significantly positive influence on corporate reputation among young adults. The findings for employer innovation are supported by other studies (Jeffrey *et al.*, 2019; Ou and Hsu, 2013), suggesting that organisations that were perceived to be innovative employers would enjoy better perceptions of corporate reputation among potential employees. The finding shows that perceptions about the social environment of an organisation had the strongest relationship with corporate reputation, and thus were in line with Styvén *et al.* (2022) and Berthon *et al.* (2005). Therefore, the retail employer's workplace environment (its social environment) had a positive influence on corporate reputation perceptions among young adults. In addition, the study found that the ability of young adults to apply what was learned in their prior studies (application value) significantly and positively affected their perceptions of prospective employers' corporate reputation.

The analysis of the results relating to the remaining two attributes of employer attractiveness, employee development and economic benefits, showed no positive relationship. This finding differs from that of other studies that found that employee development programmes and economic benefits would increase corporate reputation, and in turn attract better talent (Jehanzeb, 2020). The outcome of this study might differ because of the retail sector's existing reputation of providing lower economic benefits, requiring lower levels of skills, and not offering great levels of career development.

A study by Grzesuik and Wawer (2018) found that, when social media platforms are used to communicate job opportunities, the organisation's reputation benefits. The finding of the present study was that, in the South African retail sector, social media presence did not moderate the relationship between the corporate reputation of retailers and the intention of young adults to apply for employment at selected FMCG retailers. Furthermore, corporate reputation did not influence the respondents' intentions to apply to a specific retailer, contrary to research by Santiago (2019) and Ahmad Azmy (2018) that had indicated that corporate reputation played a key role in job seekers' choice of employer.

10. Managerial implications

The aim of this study was to determine the influence of employer branding and social media presence on an employer's ability to attract and recruit young adults into the retail sector of South Africa. The continued skills shortage in the retail sector and its inability to attract skilled labour among young adults initiated this enquiry. The attractiveness of employers in the sector contributes to its overall attractiveness and its popularity among job seekers, and it is vital for the sector's sustainability that it attract the right talent. Gaining a better understanding of the attributes that attract young adults to employers is the starting point to overturning negative perceptions of the retail sector and of retail employers. The assumption that young adults are interested in skills development and economic benefits was supported by the findings of this study. Retail employers should thus focus on creating positive communication about the work environment, with a specific focus on their organisations' innovativeness and opportunities for the application of the skills and knowledge that young adults have learned in their post-school education.

Social media, even though popular among young adults, should not be the sole communication channel of the benefits offered by employers in the retail sector. A variety of communication media should be used to improve perceptions about employment in the retail sector. Personal experiences will have the most significant influence on perceptions; young adults hearing from employees in the retail sector would contribute to creating a better understanding of its opportunities and working environment. Furthermore, as the retail sector is one of the few that open their doors daily to customers and thus to potential employees, its stores (the sector's frontline) become a key branding tool for corporate reputation. The in-store experience needs to extend beyond the customer and reach potential employees; an innovative in-store experience, for example, would build positive perceptions of employer innovativeness. When it comes to the social environment, whether retail employees enjoy the work environment and feel connected with their fellow employees is easy to detect by observing their in-store interactions with other retail staff. No social media campaign can replace positive experiences with retailers and with those currently employed in the sector. The results of this study have indicated that social environment has the strongest relationship with the intention to apply for employment with a retailer; and yet retailers often fail to create a warm and welcoming in-store environment, leading to negative perceptions among potential employees.

Finally, connecting the skills learned by young adults in their post-school education with the skills requirements of retail job opportunities would enhance perceptions of application value. Young adults need to be able to see clearly that those working in the retail sector need the skills they have learned, and how those skills will contribute to the success of a retailer and of the sector as a whole. The perception about the low level of skills needed in the sector can be improved by upskilling current retail employees and specific areas such as technology, customer service, and information literacy. In addition, young adults should be exposed, while they are completing their post-school education, to

the different levels and functions of retailers – not only theoretically, but also practically through work-integrated learning and internships. Understanding the bigger picture of retailing and the retail sector would provide young adults with a better view of the potential career opportunities and of the skills needed in the retail sector.

11. Conclusion

Employer branding aims to create an attractive perception of the retail employer and, in turn, of the broader sector among potential employees. The South African retail sector continues to report skills shortages in key areas in an economy in which the number of unemployed young adults is growing. Closing this gap is fundamentally important for the sustainability of the retail sector and of the broader economy, as this sector is the second-largest employer in South Africa. Effective corporate branding in the retail sector will increase the attractiveness of retail employers among young adults and this study has provided retail employers with insights into the attributes of employer branding that young adults perceive as attractive. From a resource theory perspective, attracting and retaining skilled, committed employees will give retail organisations a sustainable competitive advantage. It has also considered the influence of retail employers' social media presence on young adults' intention to apply for employment, and has found that the relationship was lacking. The study has found, further, that young adult employees are not attracted by skills development opportunities or economic benefits; instead, a positive work environment carries the most weight among potential employees. Therefore, the study recommends that retail employers increase their attractiveness by communicating via different channels and focus on employer innovations, their social environment, and their application value. In addition, positive in-store experiences with skilled employees and innovative technology would benefit the overall retail sector's attractiveness among job seekers.

Future research could explore and measure the effectiveness of specific interventions by employers and educational institutions to improve the attractiveness of the retail sector and so better prepare young adults for employment in that sector. Also, as more Gen Z individuals reach adulthood, the target population could be divided into two separate generational cohorts – Gen Z and millennials – to compare the differences between them in their preferences for the attributes of employer attractiveness and the use of social media. In future, the attractiveness of sub-categories of retail organisations of the sector could be compared – for example, of FMCG retailer employers compared with fashion retailer employers. Last, the study could be duplicated in different countries to compare the differences between South African retail sector employer attractiveness and that in other countries. It is also suggested that comparative studies be done in different countries or in different industries in South Africa.

Internet security;
Privacy concerns;
Trust; E-commerce;
Online shopping

Abstract

E-retailers use the latest technologies in the modern e-commerce retail world. They need to resolve the major obstacles of security and privacy to become the best online shopping websites. This article analyses the relations between trust and these obstacles as main antecedents, namely perceived security and privacy. The study also measures trust as a determinant of customer loyalty in online shopping. An online survey collected data from 285 online shoppers that were processed in AMOS version 28. The results of structural equation modeling reveal a positive impact of perceived privacy on perceived security. The results show a strong positive impact of perceived security and privacy on online trust, which, in turn, impacts on consumers' loyalty to online shopping websites. This study contributes to the existing body of literature by validating the antecedents of trust in the modern e-commerce retail world. Online shopping websites that can resolve these obstacles will generate trust and, in turn, build customer loyalty. Theoretical and management implications for establishing trust in the modern e-commerce retail world are validated in this study.

1. Introduction

Technology developments in modern e-commerce retail make online shopping a common method of shopping for consumers. The transformed shopping methods are attributed to the acceptance, transmission, and penetration of information and communications technology (ICT) in both emerged and emerging economies (Tandon et al., 2021). However, customers often fear purchasing products on websites due to cybercrime. The extensive media coverage and frequently publicised reports about major Internet disruptions, fraud, scams, and related news reports increase the public's concern and sensitivity toward the privacy and security of e-commerce (McKnight et al., 2002). Today, the Internet is viewed by many consumers as an unsafe medium on which to disclose their private information, such as credit card or debit card numbers, etc. due to the chances of inappropriate use of this information by unauthorised sales merchants or others (Daroch et al., 2021; Padmavathy et al., 2019). It is widely accepted that while the number of online shoppers has been increasing, consumers' concerns about their security and privacy when using a debit or credit card for online payment remain unresolved (Tandon et al., 2021). Today, security and privacy continue to persist as key obstacles to the growth of business-to-consumer (B2C) e-commerce and the acceptance of online shopping (Faraoni et al., 2018).

In South Africa, online retail reached 66% total growth in 2020, which accounts for R30.2 billion of the total growth of online retail (Goldstuck, 2021). To advance this growth, e-retailers need to understand the key problems that continue to exist as obstacles to B2C e-commerce growth and acceptance of online shopping, such as security and privacy. This study sought to measure the influence of these factors on online customer trust as a determinant of their loyalty to e-retailers in modern e-commerce retail in South Africa. If Internet users feel it is unsafe to enter private information on their technology devices, it hinders e-commerce growth (Shaw & Sergueeva, 2019). A

lack of seller-consumer communication and the possible risk of violation of privacy are huge sales obstacles, as they can delay the decision of a consumer to complete an online shopping transaction (Faraoni et al., 2018).

Research indicates perceived security as a core reason why numerous potential consumers avoid online shopping due to the risks of sharing private information (e.g., debit and credit card numbers) on websites (Belanger et al., 2002; Padmavathy et al., 2019). This shows the strong influence of security as a powerful obstacle that inhibits the growing potential of online shopping (Fortes & Rita, 2016). Other scholars (Hossain, 2019; Tandon et al., 2021) show that shoppers in emerging markets prefer to make cash payments instead of using credit or debit cards. This study examined whether trust could be established from consumers' perceptions of security and privacy when using credit or debit cards in modern e-commerce retail in South Africa as an evolving market.

As security and privacy concerns are leading obstacles for customers to use the Internet, they avoid sharing personal information, including debit or credit card information with e-retailers they do not trust (Belanger et al., 2002). It is essential for e-retailers to establish trust in the mind of customers first, which requires improvements in security and privacy strategies (Daroch et al., 2021). Recently, many academics have paid much attention to security and privacy issues, especially in online retailing (Bobalca et al., 2021; Faraoni et al., 2018; Rita et al., 2019).

Studies on the considerations of security and privacy, and their consequential impact on online customer trust and loyalty in e-retailers, have been conducted mainly in developed countries by Aldweeri et al. (2019), Flavián and Guinalú (2006), and Xiao et al. (2016). This paper adopted the Stimulus-Organism-Response (S-O-R) theory proposed by Mehrabian and Russell (1974) to examine whether consumer-perceived privacy and security have a strong impact on trust shown to websites, and if online trust influences customer loyalty. Firstly, this paper contributes a description of the key antecedents of trust, namely perceived security and privacy, as obstacles that hinder the success of modern e-commerce retail. It validates the direct impact of the distinctive nature and roles of security and privacy, as opposed to their dualistic view, and confirms their interactions. Secondly, the study validates the direct impact of trust on customer loyalty in the modern e-commerce retail world. A robust analysis of the research instrument properties was validated (the scale items in Appendix 1), and hypotheses were tested using AMOS version 28. Theoretical contributions, managerial implications, and future research directions conclude the discussion in this paper.

2. Problem investigated

With the proliferation of technology in retail, it is challenging for customers to determine whether a website is secure, and if it is not, their private data (including credit and debit card numbers) could be exposed to maximum risks. The lack of trust in online shopping makes it hard for e-retailers in the modern e-commerce retail world to develop customer loyalty and generate profit. Over the past century, data security breaches have acquired an extraordinary likelihood to negatively influence the customers' confidence, business reputation and profits, and overall economic development (Dlamini et al., 2009). To date, the growing number of data security breaches continue to affect consumers' trust and hinder e-commerce growth. If trust involves a consumer's expectations regarding the seller's integrity and reliability, safety, competence, and benevolence (McKnight et al., 2002), it raises questions about the seller's competence in managing data security breaches by third parties' and/or fourth parties' interactions in online relations (Bandara et al., 2020). Ferrell (2017, p. 162) asks the question: "How can customers generate trust when the problem is often external and uncontrollable?" He insists on e-commerce transactions' third parties' and fourth parties' impact on security and privacy as important areas for new research opportunities.

This study acknowledges and assesses the above-mentioned questions. This will help e-retailers to improve the perceived security and privacy of online shopping, which establishes trust, and in turn increases loyal customers in the modern e-commerce retail world. Understanding the strategy to build trust and overcome obstacles of perceived security and privacy will help e-retailers (e.g., Amazon) to meet their customers' expectations in terms of security and support (Brusch et al., 2019).

3. Research objectives

This paper applies the S-O-R (stimulus-organism-response) framework (Mehrabian & Russell, 1974), with the aim to examine the impact of stimuli from the key obstacles of e-commerce growth (e.g., perceived security and privacy) on organismic factors of online trust, which determine the response of customer loyalty in the modern e-commerce retail world in South Africa.

4. Hypotheses

Numerous scholars have examined the antecedents of online trust. Bandara et al. (2020) report that trust relationships are the second most widely studied subject in the scope of e-commerce. In South Africa, e-commerce might still be small, but it is a huge budget industry valued at \$2.3 billion annually, with an estimated 17.1 million people (or 31% of the entire country's population) purchasing products and services online, and each shopper spends an estimated amount of \$136 (R1 800) per year (Digital Statistics in South Africa, 2017). For that reason, the total of online retail growth in South Africa was 50% higher in 2020 compared to the R20 billion total forecast made three years ago (Goldstuck, 2021). Despite this growth, many customers interacting with e-retailers' websites lack trust in the protection of the confidentiality of their private data (Oliveira et al., 2017). Trust in online shopping is a key element for e-retailers to develop true customer relationships, especially by protecting the confidentiality of users' information, and a commitment to offering the best service and product consistently (Al-dweeri et al., 2019).

Customers' intentions to use the services of online retailers could be influenced by perceived credibility concerning privacy and security (Kassim & Abdullah, 2008). The literature shows that the trust relationship in the online setting between the consumer and online service provider is generated by perceived security and privacy safety (Faraoni et al., 2018; Torlak et al., 2020). Vos et al. (2014) suggest that a basic strategy of electronic marketers to build the trust of consumers in online exchanges is to improve the security and privacy policies displayed on their websites. As an important component of online exchange and the development of lasting online relationships, trust is a key success factor for e-commerce (Bandara et al., 2020). A lack of trust in the technical and institutional environment, such as disclosing private information to online shopping websites and completing purchases, disrupts e-commerce adoption (McKnight et al., 2002). The growing concerns of consumers about these factors oblige e-retailers to search for and implement privacy safety procedures to increase the perception of the trustworthiness of their websites and to inspire customers to complete online transactions (Kim et al., 2008). Belanger et al. (2002) show that consumer decision making to share personal information depends on a perceived level of trust in the e-retailer irrespective of whether the e-tailer is an online store or blends an offline store with an online store. Baruh et al. (2017) indicate that higher privacy concerns generate weaker intentions of users to disclose private information and higher intentions of adopting privacy safety measures. For behavioural action, customers with stronger privacy concerns use online services less. It shows that customers with greater privacy concerns are unlikely to disclose private data in online shopping and require strong privacy-protection measures (Schomakers et al., 2020).

Due to the nature of trust in e-commerce customer relationships (McKnight & Chervany, 2002), this paper proposes that improving perceived security and privacy could contribute positively to generating trust and developing long-term customer loyalty in the modern e-commerce retail world. To test whether this association will prevail, the study tested the following hypotheses:

- H₁: Perceived security on the Internet positively affects customer trust in e-commerce.
- H₂: Perceived privacy on the Internet positively affects customer perceived security in e-commerce.
- H₃: Perceived privacy on the Internet positively affects customer trust in e-commerce.
- H₄: Trust on the Internet positively affects customer loyalty to e-commerce.

5. Theoretical development of conceptual model

5.1 Stimulus-organism-response (S-O-R) theory

The S-O-R theory proposed by Mehrabian and Russell (1974) posits that the different environments present stimuli (S) in formations that could alter the personality of an individual or organismic (O) conditions, which could, in turn, result in a behavioural response (R). This model has been broadly adopted in consumer behaviour studies. For online shopping websites, a group of factors such as interface, security, privacy, etc. are important stimuli of a beneficial shopping environment that could increase the psychological processes that stimulate the purchase. As such, these stimuli arouse logical explanations of information related to the purchase (Sreeram et al., 2018). In a recent study that employed the S-O-R theory, Gong et al. (2022) investigated how perceived Internet risk, self-efficacy, privacy stress, and trust affected consumers' continuous purchase intention in China. Brand trust significantly influenced continuous purchase intention, but privacy stress did not. Moreover, brand trust was found to be a significant mediator, but privacy stress was not. The S-O-R theory has been applied in studies on online shopping behaviour (Peng & Kim, 2014; Sreeram et al., 2018). Furthermore, the S-O-R theory was applied in a study that explored how to achieve sustainable development of mobile payment through customer satisfaction, which indicated that utilitarian value, hedonic value, and salesperson selling behaviours positively affect customers' satisfaction, which in turn positively affects mobile payment usage intention (Chen et al., 2019). Despite the literature that illustrates many studies that extend the S-O-R theory in the field of marketing, its application in establishing trust in online shopping in the modern e-commerce retail world setting is not validated.

This study attempts to apply the S-O-R theory in the context of online shopping in the modern e-commerce retail world. The S-O-R theory assumes that the external environment (stimuli) probably affects a person's internal states (organism), such as cognition and emotion (Ye et al., 2021). This study thus considers perceived security and privacy as external stimuli (S), trust as an internal organism (O), and customer loyalty as a response (R). In a study that extends Mehrabian and Russell's (1974) S-O-R theory, Kim and Lennon (2013) examined the four dimensions of website quality, namely website design, security/privacy, fulfilment/reliability, and customer service. Security/privacy significantly and positively influenced emotion and significantly and negatively affected perceived risk. In the literature, the customer's trust in the website is conceptualised as the organism's cognitive and affective conditions (Sohaib & Kang, 2014). Li et al. (2022) tested the effect that perceived privacy breach by pharmaceutical e-retailers has on customer boycott intention – mainly the mediating role of emotional violation, including the influence of customer cumulative trust. Wu and Li (2018) developed an integrated model to explore the influence that six marketing mix elements (stimuli) have on consumer loyalty (response). Customer loyalty is the response to the website's stimuli and organism in an online shopping environment (see Figure 1).

6. Literature review

6.1 Analysis of the concept of trust

When management's efforts promote extensive communications about security and privacy through interactive marketing channels and personalised messages based on comprehensive customer insights, this could increase trust, which contributes to the development of a highly faithful market in the long term. For B2C online shopping to elevate its momentum, e-retailers need to understand the factors that improve growth, and the concept of trust is at the heart of this (Belanger et al., 2002). Relationship marketing theorists Morgan and Hunt (1994) explain that trust is the confidence in the reliability and integrity of relational exchange partners. Trust represents a belief between exchange partners who will not exhibit opportunistic behaviour in the long term (Torlak et al., 2020). Many scholars have dedicated a greater focus on the significant role of trust in online shopping (Bilgihan, 2016; Faraoni et al., 2018; Bhat et al., 2021). It is known that trust positively relates to customers' attitudes and purchasing intentions (Fortes & Rita, 2016), as trust extends the focus from its current exchange to predict future situations and customers' willingness to continue the relationship (Doney & Cannon, 1997). Trust may therefore be defined as “the perception of credibility and benevolence of a target of trust” (Doney & Cannon, 1997, p. 36).

Although trust may develop in many ways, strategies and tactics of establishing trust encompass cultural faceted expressions (e.g., societal values, norms, standards, etc.) that guide a person's beliefs and behaviours (Teo & Liu, 2005). Trust beliefs exist when the trustor perceives the trustee to hold features of benefit to the trustor. Four of these beliefs are integrity (honesty and keeping promises), benevolence (care and motives to fulfil the trustor's interests), competence (capability to meet the trustor's needs), and predictability (consistent behaviour) of a particular e-service vendor (McKnight & Chervany, 2002; McKnight et al., 2002). Customers are reluctant to stay with an online service provider if they lack confidence in its competence and honesty (Gummerus et al., 2004). More than ever, confidence in an online context influences consumers' willingness to be vulnerable to the e-retailer, in the belief that it will deliver on its promises and not abuse that vulnerability to its advantage, but will act honourably (Al-dweeri et al., 2019; Anaya-Sánchez et al., 2020).

In the electronic market, trust involves the customers' faith and confidence that the online experience will meet their expectations (Ahmad et al., 2017). It shows that trust helps people to establish "faith" in an interaction because online trust represents security regarding the entity of trust; for example, a customer can proceed with an online transaction regardless of the uncertainties and risks involved in the situation (McKnight et al., 2002). Roca et al. (2009) state that as online consumers feel vulnerable, trust is a main factor in online services transactions. More specifically, among people, trust in the online environment is a key factor in the customer-brand relationship (Anaya-Sánchez et al., 2020). The marketing literature views trust as an essential factor in successful business transactions and the growth of lasting business relationships (Moorman et al., 1993).

As different types of trust exist (e.g., disposition to trust, institution-based trust, trusting beliefs, and trusting intentions) (McKnight & Chervany, 2002; McKnight et al., 2002), this study measured trust not only in the e-commerce retailer, but also in the website where the online transaction is made. Xiao et al. (2016) found significant relationships between the three different dimensions of trust (interpersonal, institution, and disposition trust) and their significant impact on customer loyalty. Trust is vital to e-commerce success and its role has been visible across market structures, business processes, and relationships over the past decades (Ribadu & Ab. Rahman, 2019). However, this important role battles to convert into higher sales records through online shopping as many consumers are reluctant to complete transactions because of a lack of trust (Bilgihan, 2016; Fortes & Rita, 2016). For example, disclosing credit or debit card numbers to an electronic channel with no physical store increases customers' risk perception (Anderson & Srinivasan, 2003). Generating trust is thus cited frequently as the main strategy to encourage consumers to purchase from online shops (Lee & Turban, 2001).

6.2 The impact of perceived security and privacy on online consumers' trust

This research examined a theoretical framework using the S-O-R theory that connects perceived security and privacy, trust, and customer loyalty to online shopping in the modern e-commerce retail world. With this in mind, the study sought to propose and validate security and privacy as two important stimuli most related to the organism of online trust, which leads to responses of customer loyalty. It analysed the strength of their relations and their resultant impact on customer trust as a key determinant of online customer loyalty.

Studies across the literature describe the measures of the impact of security, privacy, and trust in an e-commerce setting. To date, some researchers have assessed customers' privacy concerns in the e-commerce context (Anic et al., 2019; Bandara et al., 2020; Fortes & Rita, 2016), while others have assessed customers' perception of the security of e-commerce transactions (Brusch et al., 2019; Xiao et al., 2016). Perceived security and privacy have since dominated debates in the literature, as measured in various contexts such as online healthcare services (Gummerus et al., 2004), public sector management, private companies' websites (Flavián & Guinalíu, 2006), online trading systems (Roca et al., 2009), open-access academic repositories (Formanek & Zaborsky, 2017), grocery retailers (Faraoni et al., 2018), mobile banking services (Shareef et al., 2018), social media (Gogus & Saygin, 2019), and now the Internet of Things (IoT) (Bayer et al., 2021).

Great debates over the privacy of personal information often include the topic of security, often referred to as information security (Gogus & Saygin, 2019). Overlapping dimensions such as anonymity, secrecy, confidentiality, and ethics often become part of this discussion (Smith et al., 2011). While it appears fair given the particularities of privacy and security as the two factors that must be understood as separate attributes, Flavián and Guinaliú (2006, p. 605) argue that it has nevertheless become apparent that consumers, companies, and policymakers perceive a close relationship between the two concepts, in which, together, these factors are named “perceived security in the handling of private data (SHPD)”, which shows the perception of consumers of the practices involving personal data-protection measures facilitated by the website and the safety of the Internet system where these practices are facilitated.

Due to the similarities, studies often report on and use privacy and security interchangeably (e.g., Faraoni et al., 2018; Rita et al., 2019; Schlosser et al., 2006; Torlak et al., 2020). Wolfenbarger and Gilly (2003) proposed and tested the eTailQ scale founded on validated service quality scales, for example, SERVQUAL and e-SERVQUAL, including SITEQUAL and WebQualTM. The results indicate privacy/security as a key factor in website interface measurement. Studies in e-commerce measure and report on the impact of security/privacy on trust in e-commerce (Faraoni et al., 2018; Kim & Lennon, 2013; Torlak et al., 2020), as well as the influence of privacy/security on key trusting beliefs (i.e., benevolence and integrity beliefs) (Schlosser et al., 2006). When merging a lack of integrity, security, and privacy into a single factor, Oliveira et al. (2017) report this factor to be statistically significant in explaining competence and integrity but not benevolence toward an e-retailer. Table 1 lists studies that have assessed the distinct versus dualistic views of security and privacy on online trust and customer loyalty.

Table 1: The distinct and dualistic measures of security and privacy of business-to-consumer (B2C) trust and customer loyalty

This study aimed to investigate perceived security and privacy as the distinct obstacles to the growth of online shopping in the modern e-commerce retail world. While a standard procedure for measuring both security and privacy as a single construct has been adopted in e-commerce research studies (see Table 1), such dualistic methods are criticised by Belanger et al. (2002), who examined security and privacy as distinct predictors of e-commerce trust. They show that security measures are valued more by consumers than privacy statements presented on the website. Ganguly et al. (2009) found website security as the most contributing factor in the formation of online trust, followed by privacy, information design, and website communication. Roca et al. (2009) found a positive influence of perceived security on online trust in the online trading context, while the impact of privacy concerns on customer trust is not supported. It shows that the security of a website for conducting financial transactions is a major concern for customers who want to perform e-commerce transactions (Chang & Chen, 2009; Hartono et al., 2014). Perceived security is one of the biggest concerns for online customers worldwide (Maditinos & Theodoridis, 2010), and it is a key dimension of gaining potential online customers and retaining current customers (Park & Kim 2003). The security of e-commerce payments continues to dominate the debates in the literature, showing perceived security as a significant element that influences online purchase behaviour (Daroch et al., 2021), mobile banking adoption (Shareef et al., 2018), consumer attitudes to social networks (Shin, 2010), trust in e-commerce (Belanger et al., 2002), online purchase intentions (Schlosser et al., 2006), and e-commerce switching costs (Chang & Chen, 2009).

6.2.1 Security

Perceived security refers to the perception that technical guarantees involving legal requirements and good practices related to privacy will be met (Casalo et al., 2007). Security implies the protection of the entire online transaction process and information exchanged when customers purchase from an online shop (Padmavathy et al., 2019). Online retailers must assure their customers of their security (Tandon et al., 2021). Shin (2010) explored social network services behaviour and found that the perception of security has the strongest impact on customer attitude, followed by privacy. The results confirm the reciprocal interactions between perceived security and privacy. The impact of privacy concerns on the perception of security was thus much higher than the opposite impact, which indicates that privacy is a distinct factor of security. A significant impact of customers' perception of security on trust in the adoption of mobile banking is shown by Shareef et al. (2018). Empirical evidence shows that online security does not positively impact customer satisfaction (Bobalca et al., 2021; Bruschi et al., 2019); instead, it shows a direct positive significant impact of security on customer trust (Belanger et al., 2002; Roca et al., 2009; Xiao et al., 2016). It shows that when security-related mechanisms offer protective measures for preserving personal information, the website reinforces consumers' confidence that it can be trusted (Bart et al., 2005).

6.2.2 Privacy

Perceived privacy refers to the perception that legal requirements and good practices exist to manage personal data (Casalo et al., 2007). Given that privacy involves customers' willingness to share personal information on a website to allow the completion of a purchase transaction (Faraoni et al., 2018; Shaw & Sergueeva, 2019), the importance of this issue is shown by Barrera and Carrión (2014), who found that online privacy is an issue of great concern for Internet users who wish to make online purchases. Perceived Privacy Protection (PPP) as "a consumer's perception of the likelihood that the Internet vendor will try to protect consumer's confidential information collected during electronic transactions from unauthorized use or disclosure" (Kim et al., 2008, p. 550). In this study perceived privacy denotes a consumer's perception regarding the protection of personally identifiable information on the Internet. Ensuring privacy in disclosing personal information when shopping on a website therefore enhances online trust (Bart et al., 2005). While evidence exists in the context of online retailing that shows a positive impact of privacy on online satisfaction (Ahmad et al., 2017), previous studies show that consumer's perceived privacy protection positively affects their trust in e-commerce (Kim et al., 2008; Shin, 2010), which shows that customers' perceived privacy is a key antecedent of trust in the online vendor (Al-dweeri et al., 2019).

6.3 The relationship between perceived security and privacy and online trust and consumer loyalty

Despite living during the so-called Information Age, when "information security and privacy are very important issues" (Formanek & Zaborsky, 2017, p. 46), to a large extent it seems that online shoppers act on instinct without evaluating potential risks related to privacy and security interruptions, or they realise these concerns but are constrained in their actions by many external factors, including low transparency, user-unfriendly interface design, or consumer hostility to privacy policies, together with vulnerability to use a website (Barth & De Jong, 2017). To date, customers' fears that online service providers could disclose their private data to others and the perception of poor security remain distinct obstacles to the growth of online shopping in the modern e-commerce retail world. The perceived fear of poor security has been measured by many studies (Hartono et al., 2014; Kassim & Abdullah, 2008; Roca et al., 2009) as a key factor that influences the use of online shopping websites, whereby this fear of a potential data leak may cause consumers to discontinue the completion of purchase transactions on a B2C e-commerce channel.

Together with prior experience in information systems, trust can "significantly influence consumer's intention to share private information" (Ebberts et al., 2021, p. 413). Recent studies continue to measure security and privacy concerns as the main obstacles to online trust (Bandara et al., 2020; Schomakers et al., 2020). The e-commerce research scope has centred on online security and privacy issues, including equivalent solutions for improved authentication and encryption, including code signature and on-device security to improve trust in e-commerce. These measures of security and privacy have a positive impact on trust in online shopping, as they reduce the perception of risk in sharing private information (Brusch et al., 2019). Security and privacy are therefore viewed in this paper as antecedents of trust, which determines customer loyalty, thereby contributing to online shopping growth in the modern e-commerce retail world. To increase South Africa's total growth of online retail from 66% or R30.2 billion gained in 2020 (Goldstuck, 2021), e-retailers need to understand the key issues that continue to exist as obstacles to B2C e-commerce development and acceptance of online shopping, such as security, privacy, and trust. The objective of this research is to propose and assess a theoretical framework that measures the impact of these variables on trust, which in turn develops customer loyalty in the online shopping context of the modern e-commerce retail world. Based on the S-O-R theory, Figure 1 shows a theoretical framework of perceived security, privacy concerns, trust, and customer loyalty toward e-commerce websites in South Africa.

The difficulties of the above-mentioned factors have received greater emphasis in recent e-commerce research (Al-dweeri et al., 2019; Xiao et al., 2016). Scholars who recently measured the interactions between online trust and customer loyalty found a significant and positive influence of online trust on customers' loyalty (Bhat et al., 2021; Faraoni et al., 2018; Zhang et al., 2020). Because customers are strongly dependent on the website for information search and purchases, and can develop loyalty,

trust is highly essential in the online setting. It becomes important to examine this view in emerging economies such as South Africa. In the marketing literature, Oliver (1999, p. 34) defines loyalty as “a deeply held commitment to repeat purchase or patronise preferred product or service consistently in the future, thereby leading to a repetitive same-brand or same brand-set purchasing, despite situational impacts and marketing efforts having the potential to cause switching behavior”. Oliver (1999) measured loyalty as separated into two facets, namely attitudinal and behavioural loyalty. Marketing literature refers to a consumer’s deeply held commitment to a brand as attitudinal loyalty (Chaudhuri & Holbrook, 2001), whereas loyalty that accounts for repeat purchase behaviour is the outcome of repeat customer satisfaction, which, in turn, manifests in a lower commitment level since consumers repeat buying the same brand, not based on a strong attitude or a deep commitment, but because the time and effort to search for an alternative are not worth it (Donio’ et al., 2006). The power of the relationship between consumers’ attitude and repeat patronage behaviour is referred to as loyalty (Dick & Basu, 1994). Al-dweeri et al. (2019) show that trust significantly positively impacts both behavioural loyalty and attitudinal loyalty in an e-commerce context; loyalty occurs when a favourable attitude a consumer has towards a website manifests in repeat purchase behaviour on that website (Anderson & Srinivasan, 2003).

7. Research methodology

7.1 Sampling

The sample used for this study included South African consumers who purchase products and services from online shopping websites. The choice of sample selection matches the literature (e.g., Rita et al., 2019; Tandon et al., 2021; Torlak et al., 2020). The sample represents the population of e-commerce study for two-fold aims: firstly, these online customers hold good knowledge of online services and are familiar with website applications in the modern e-commerce retail world; and secondly, many online customers feel comfortable using ICT, as well as e-commerce transactions. A structured web-based questionnaire was developed, guided by the study’s background evaluation and problem audit, and the literature review. Two scholarly experts in the field of Information Systems research evaluated the questionnaire. Thereafter, the revised questionnaire was distributed to 50 customers for survey pilot testing and exploring the most recent online shopping experience. The final version of the questionnaire measured the respondents’ demographic variables in Section A, while Section B contained 16 scale items to be tested in the measurement model. All the scale items were validated in the literature. Four items of security (Corbitt et al., 2003), three items of privacy (Barrera & Carrión, 2014), five items of trust (Doney & Cannon, 1997), and four items of loyalty (Kassim & Abdullah, 2008) were revised to achieve the objectives of this study. A five-point Likert scale, which varied from 1 = strongly disagree to 5 = strongly agree, captured responses to validated statements in the questionnaire. The standard estimates and t-values of the scale items are shown in Appendix 1.

7.2 Data collection

A total of 300 structured questionnaires were administered to customers in an online survey. The survey link was shared on social media platforms targeting online shoppers, and e-mails were sent to potential respondents. The participants were not reimbursed for taking part in this survey. A total of 285 questionnaires were completed and the data were tabulated in the Statistical Package for the Social Sciences (SPSS) version 28 for descriptive statistical analysis, and later, AMOS version 28. The response rate was 95.5%.

8. Results and findings

Table 2 lists a summary of the sample’s demographic variables. Table 2 also shows that the survey included more female (61.4%) than male (38.6%) respondents. Of the respondents, 28.8% had more than three years’ online shopping experience, and 37.9% purchased from Takealot.com, and 29.1% indicated monthly spending ranging from R5 000 to R6 000. Interestingly, 46% of the respondents frequently purchased clothing. These results show that customers have average experience in online shopping and hence were eligible participants in this survey.

Table 2: Sample table

Variable	Category	Frequency	Percentage (%)
Gender	Male	110	38.6
	Female	175	61.4
Age	18-24 years	181	63.5
	25-29 years	57	20.0
	30-34 years	21	7.4
	35-49 years	20	7.0
	50-54 years	6	2.1
Monthly spending	Less than R1 000	49	17.2
	R1 000 to R2 000	77	27.0
	R2 000 to R3 000	43	15.1
	R3 000 to R4 000	15	5.3
	R4 000 to R5 000	18	6.3
	R5 000 to R6 000	83	29.1

8.1 Testing the measurement model

A confirmatory factor analysis (CFA) of the scale items in the questionnaire was entered into AMOS version 28 using maximum likelihood estimates to diagnose the factor reliability and the convergent and discriminant validity of the measurement properties. Most standardised factor loadings were above 0.7 (Hair et al., 1998), which indicated construct validity. Appendix 1 shows factor loadings below 0.7 on PRIV2 (0.59), TRS 2 (0.60), and LOY 4 (0.64). However, these factor loadings were retained, as the coefficient value of 0.6 is occasionally accepted (Hair et al., 1998), which shows construct validity.

All the constructs had a Cronbach's alpha above 0.7, which indicated the internal consistency reliability of the factors (Hair et al., 1998), as shown in Appendix 1. Table 3 shows that the measurement model had factors with values of composite reliability (CR) above 0.7, which confirmed each factor's adequate convergence consistency (Fornell & Larcker, 1981). In addition, the average variance extracted (AVE) values of these factors were 0.5 or higher (Fornell & Larcker, 1981). The square root of the AVE (the average variance shared among the variable and its items) matched with the values of inter-construct correlation (the variance shared among the variable and other variables) to evaluate if the latent construct describes its variables well higher than it explains other measured constructs. The square root of AVEs was higher than the factor correlations, and as a rule of thumb, this confirms discriminant validity. This diagnosis shows the values of the CR, AVEs, and the square root of AVEs that meet the model assessment criteria, which signifies internal consistency reliability and discriminant validity of the data in the measurement model.

Table 3: Composite reliability (CR) and discriminant validity

Constructs	CR	AVE	SEC	TRS	LOY	PRIV
SEC	0.893	0.677	0.823			
TRS	0.884	0.607	0.531	0.779		
LOY	0.848	0.585	0.427	0.750	0.765	
PRIV	0.752	0.506	0.421	0.358	0.360	0.712

Note 1: CR, AVE, and bold values indicate the square root of AVE ($\sqrt{\text{AVE}}$)

The results of the goodness-of-fit indices of the CFA, whereby the factors intercorrelate freely without restrictions, show adequate fit indices (Bentler, 1990). The measurement model had data with a good fit ($\chi^2(98) = 173.648$ $p < 0.01$; $\chi^2/df = 1.77$; GFI = 0.93; CFI = 0.96; RMSEA = 0.05; RMSR = 0.03; TLI (NNFI) = 0.96). The next step was to analyse the structural model using AMOS version 28.

8.2 Testing the structural model: Direct effects

The hypothesised relationships were tested using AMOS version 28. The results of the structural model are reported in Figure 1 and Table 4. The findings of the structural model show goodness of fit and significant data ($\chi^2(100) = 176.779$; $p < 0.01$; $\chi^2/df = 1.768$; GFI = 0.93; CFI = 0.96; RMSEA¹ = 0.05; RMSR = 0.03; TLI (NNFI) = 0.96). The overall model explains 18% variance in security, 31% in trust, and 57% in consumer loyalty in online shopping websites. Hypotheses 1, 2, 3, and 4 were therefore supported.

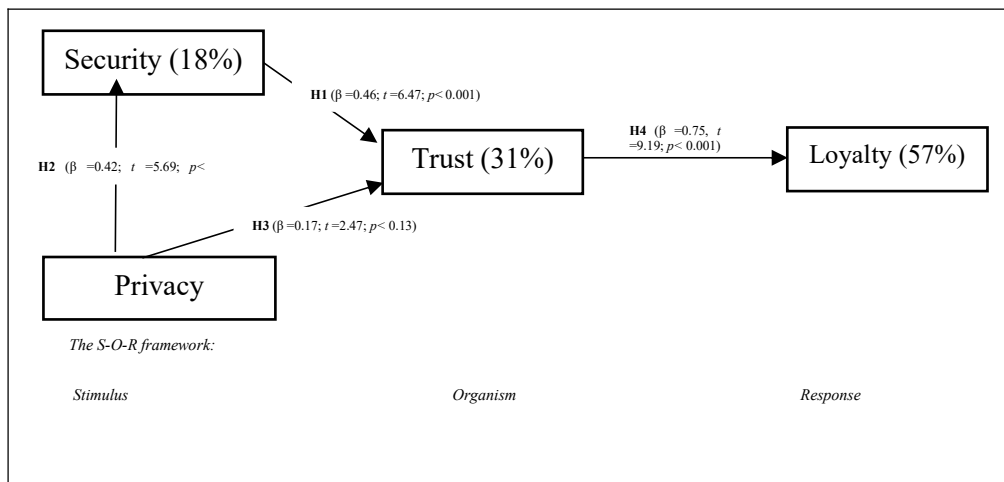

Figure 1: Sample figure

The results in Table 4 confirm the strong positive influence of perceived security ($\beta = 0.46$, t-value = 6.47) on consumer trust. The results show the positive impact of perceived privacy ($\beta = 0.42$, t-value = 5.69) on perceived security, followed by the positive impact on trust ($\beta = 0.17$, t-value = 2.47). Lastly, the results strongly support the significant positive effect of trust on customer loyalty ($\beta = 0.75$, t-value = 9.190).

Table 4: The results of the hypothesised relationships

Hypothesis	Dep.	Ind.	Std. estimate	t-value	p-value	Result
H ₁	TRS	SEC	0.460	6.477	0.001	Accepted
H ₂	SEC	PRIV	0.421	5.652	0.001	Accepted
H ₃	TRS	PRIV	0.176	2.475	0.013	Accepted
H ₄	LOY	TRS	0.754	9.190	0.001	Accepted

Note 2: $p < 0.001$ ***; $p < 0.01$ **; $p < 0.05$ *

9. Discussion of results

The study investigated and quantified measures of perceived security and privacy as the main obstacles to trust and the development of customer loyalty in online shopping in the modern e-commerce retail world in South Africa. Of 61.4% female and 38.6% male respondents, 28.8% had

more than three years' experience in online shopping. Of the respondents, 46% frequently purchased clothing, 37.9% purchased from Takealot.com, and 27.0% spent R1 000 to R2 000 monthly on online shopping. These results support the view by Goldstuck (2021) that the apparel sector is South Africa's fastest-growing e-commerce market with the highest revenue of businesses in 2019. To answer the research questions this study examine, firstly, empirical evidence from this study supports the hypothesis showing the strong direct positive impact of security on online consumer trust. This result supports other studies in the literature (Belanger et al., 2002; Ganguly et al., 2009; Xiao et al., 2016) that improving perceived online security influences customers' trust in their decision to purchase from websites, which contributes to the growth of B2C e-commerce. It confirms that when security-related mechanisms offer protection measures that safeguard the individual's information, the website will enhance consumers' confidence that it can be trusted (Bart et al., 2005). It can be mentioned that the statistical findings lean towards perceived security as a positive strong predictor of customer trust in online shopping in the modern e-commerce retail market.

Secondly, the results show a direct positive impact of perceived privacy on perceived security in modern e-commerce retail in South Africa. This remark is consistent with research on social networking by Shin (2010), who reports that the effect of privacy on security is supported, which implies that privacy has a mediating effect on the relationship between security and trust in online social networks. This confirms that privacy is separate from security. These results contradict evidence of a negative relationship between online privacy concerns and consumers' attitudes to online shopping (Anic et al., 2019). Due to their awareness and experience in online shopping, customers perhaps perceive the websites as safe to protect the privacy of their confidential information, which contributes positively to their perception of the security of the website for online shopping; thus inspiring them to share their private data and finalise online shopping transactions.

Thirdly, the results show a direct positive influence of perceived privacy on online customer trust. This result supports the view that if privacy is assured in sharing personal information on a website, online trust is enhanced (Bart et al., 2005). This sentiment is shared in the e-commerce literature which shows that a positive effect of customers' perceived privacy is a key antecedent of trust in the online vendor (Al-dweeri et al., 2019; Kim et al., 2008; Shin, 2010). It confirms that customers have a perception of privacy and the protection of their private information, which contribute positively to their levels of trust in the website for online shopping. They tend to share their private data and finalise online shopping transactions due to high levels of trust in e-retailers in the modern e-commerce retail world. A well-known website can potentially have a more positive reputation based on word of mouth and ratings from offline and online communities (Casalo et al., 2007).

Lastly, the estimate of the interaction between trust and customer loyalty shows a significant positive impact that trust has on customer loyalty in online shopping. This outcome supports recent studies that indicate a positive effect of trust on customers' loyalty in online shopping (Bhat et al., 2021; Faraoni et al., 2018; Zhang et al., 2020). With this result, it can be concluded that e-retailers with the capabilities to establish trust in online shopping will develop strong long-term customer loyalty in the modern e-commerce retail world. In general, management's efforts to extensively improve perceived security and privacy through interactive communication, marketing channels, and personalised messages based on comprehensive customer insights could build trust, which will contribute to the development of a highly faithful market in the long term. These results present contributions to the literature and managerial plans for e-commerce.

10. Theoretical contributions

To date, existing e-commerce literature has shown the essential role of customer trust in contributing to B2C e-commerce success (Bhat et al., 2021; Tandon et al., 2021; Zhang et al., 2020). E-commerce trust is more strongly influenced by perceived security than perceived privacy. This observation contributes to the meta-analysis by Kim and Peterson (2017), which showed that trust in online markets is highly related to various antecedents that exist when customers interact with the e-retailer's website (e.g., security perception, system quality evaluation, etc.). This study contributes to related literature that continues to show the strong association between perceived security and privacy as

critical factors in establishing customer trust in online services (Faraoni et al., 2018; Rita et al., 2019; Xiao et al., 2016). This study contributes an important view to the S-O-R theory that a complete guarantee of security and private data safety are stimulus that enhances consumers' organism of confidence to enter personal information into an e-retailer's website in the modern e-commerce retail world.

This study extends literature that shows a relationship between privacy and security in an online shopping setting, similar to Shin (2010), who revealed this observation in the context of social network services. This study's findings contribute to the view that security is a strong direct positive element of consumer trust relative to perceived privacy. This supports the work by Belanger et al. (2002) which showed that online security mechanisms are regarded as more crucial than privacy. This view contributes knowledge on the impact of perceived security on online trust as stronger than the influence of privacy on trust. This paper contributes to the consideration of the traditional e-commerce view that online security strongly influences customer trust in online shopping in an emerging market. On this note, Belanger et al. (2002) emphasise that the concept of security is understood better by users in general compared to privacy since security is a pure, solid concept. These authors reveal security measures as highly relevant compared to websites that display privacy statements. Pavlou and Chellappa (2001) report the effect of privacy as weaker than the strong impact of perceived security on online customer trust. It shows that privacy concerns follow the strong impact of perceived security on trust, as opposed to electronic trading systems, whereby Roca et al. (2009) report that perceived privacy is not a significant determinant factor of users' trust in a system. It can therefore be concluded that security is a major factor that influences customer trust in the modern e-commerce retail world. A possible reason is that online shoppers may be knowledgeable about the security protocols and technology features that protect privacy, such as cryptography, encryption, and socket layer keys introduced in online shopping in the modern e-commerce retail world, unlike those features that cannot be easily recognised in an online trading system. Due to the complete guarantee, these security features instil total privacy, and these users have low privacy concerns. This paper contributes to previous research regarding the important role that trust plays in the development and success of B2C e-commerce (Pavlou & Chellappa, 2001; Shankar et al., 2002). This study validates recent e-commerce literature that indicates a higher level of trust as a relevant factor for lasting customer loyalty, mainly in online shopping settings (Al-dweeri et al., 2019; Bhat et al., 2021; Faraoni et al., 2018). This contributes to the S-O-R theory on how overcoming key obstacles of stimulus of security and privacy can generate organism of trust, which results in responses of customer loyalty to online shopping websites in modern e-commerce retail in South Africa. In addition, the results that security perception strongly affects trust in B2C e-commerce have practical implications for website marketing activities as well.

11. Managerial contributions

Trust advances the capabilities to improve consumer intention. For example, by increasing consumer trust, e-retailers could enhance prospective customers' willingness to purchase on the Internet (Corbitt et al., 2003). It shows the vital role of e-commerce trust, as suggested by Teo and Liu (2005), that knowing its antecedents and consequences has been a prime consideration of online marketers for various reasons. Firstly, since managers need to know the absolute prominence of dimensions that affect trust, the antecedents of trust in B2C e-commerce are helpful. Understanding multiple factors could help in redirecting necessary resources and measures to establish online trust. Secondly, by knowing the maximum consequences of trust, managers will realise the important role of trust and its resultant influence on online shopping behaviour. This outlines the explanatory power of S-O-R theory in e-commerce market setting.

In e-commerce, online marketers display security and privacy seals on their websites as a key strategy to increase trust in online exchanges (Vos et al., 2014). Customers can trust any website depending on its privacy policy; retailers can therefore provide customers with a transparent security policy, privacy policy, and a secure transaction server so that customers will not feel anxious to make online payments (Daroch et al., 2021). Among the cognitive-based trust antecedents, Kim et al. (2008) report that privacy and security are two forces that strongly affect customer trust and perception of risk.

Since this study shows a strong positive significant impact of perceived security followed by perceived privacy on customer trust, it confirms security as a key factor to consider in modern e-commerce retail. Cybersecurity and new technologies (e.g., digital signatures, cryptography, encryption, and certificates) used to protect users' private data from the potential risk of fraudsters, hackers, or "phishing", positively impact customers' purchase intention, as previous research confirms (e.g., Kim et al., 2008; Roca et al., 2009; Vos et al., 2014). According to Formanek and Zaborsky (2017, p. 46), "effective security requires layers of security built into devices and the infrastructure that manages them, including authentication, code signing, and on-device security... Analytics, auditing, and alerting are also key to understanding the nature of threats emerging in this area. Finally, strong SSL/TLS encryption technology plays a crucial role in authentication and data protection". These tools will boost the success of online shopping in the modern e-commerce retail world.

A significant effect of perceived privacy on perceived security offers a unique contribution to the successful management of online shopping in the modern e-commerce retail world relative to social network services, as shown in a study by Shin (2010). It is important to appreciate that online retailers can succeed in securing the storage of personal data but could also make incorrect decisions regarding its subsequent use, which increases information privacy concerns. This suggests that "security is a means for privacy, but not a means to an end in safeguarding against incorrect subsequent use, minimise[s] perceived risk of sharing, and reassuring Internet users" (Smith et al., 2011, p. 996).

Nowadays, preserving privacy is important to avoid the leakage of customers' private information and identity theft (Dlamini et al., 2009). This study can help policymakers on online shopping to take the necessary steps to improve critical infrastructure and cyber resilience to preserve the customer's privacy and establish a regulatory body with the cyber-skills needed to guard personal information. Consumers hesitate to share personal information with online companies due to feeling that it could be used incorrectly or shared with unauthorised organisations (Roca et al., 2009). Firms can build trust and resolve privacy fears by strengthening security and regulation, detecting cybercrime, and explicitly communicating a clear privacy policy, as efforts related to cyber risk governance. Furthermore, the best online shopping websites facilitate different roles of online security such as application security, data loss prevention, forensics, security architecture, threat intelligence, vulnerability management, and incident response. These efforts provide advantages as most online shopping websites display a privacy policy and assure customers about transaction security but often fail to describe in detail how online transactions and private data will be secured (Park & Kim, 2003). As customers can trust a website based on its privacy policy, e-retailers can improve policies that guarantee security, privacy, and supply chain of security transactions or server to minimise customers' fears of conducting online payments in the modern e-commerce retail world (Daroch et al., 2021). Consumers primarily look for visible privacy and security statements that describe in clear terms how the website collects data, its data-sharing policies, and its security features, such as encryption and protected passwords (Belanger et al., 2002). The best companies release past performance outcomes, offer references from previous and current users, issue third-party certificates, and enable users to easily locate, read, and comply with the privacy and security policies, which strongly improve online trust (Shankar et al., 2002). Proper security, the trustworthiness of information, and privacy should be emphasised in all advertisements and websites. Shaw and Sergueeva (2019) report that companies could target early adopter segments as these individuals are more innovative, which could be the next wave of adopters, whom others will see as ambassadors upon being satisfied with the security and privacy safety offered.

12. Conclusions

This study provided an online marketing profile of customers who purchase products and services from online shops in South Africa. Online shopping participation is higher among females than males, especially in the segment aged between 18 and 24 years old. These consumers spend an estimated R1 000 to R2 000 monthly on online shopping and mostly prefer to purchase apparel from the Takealot.com website. Most participants had experienced online shopping for less than one year on their favourite websites.

Despite previous studies showing that customer trust in B2C e-commerce is affected by perceived security and privacy, this paper adhered to the necessary requirement to pay them greater attention in e-commerce research than ever before due to their impact on modern e-commerce retail developments. As times change, threats also change. Researchers mostly view security and privacy as two obstacles to B2C e-commerce achieving success. The study emphasises a key strategy of building customer trust in online shopping by enhancing security and privacy perceptions. This paper adopted the S-O-R theory and contributes a validated framework of online shopping, which explains how perceived security followed by perceived privacy significantly and positively impact online customer trust. The paper presents a formal procedure to increase trust as a determining factor of customer loyalty in the modern e-commerce retail world. This study argues that website marketers must strive to build e-commerce trust as a prerequisite for developing customer loyalty in online shopping. This paper contributes a method for website marketers to grow competencies by effectively and efficiently improving customers' perceptions of the security and privacy of their website to position their online stores as safe in securing and facilitating online transactions. This procedure is intended to develop customer loyalty through establishing and nurturing online customer trust.

This paper offers insights into the direct effects of perceived privacy on perceived security. This relationship is hardly examined in the literature, and their effects on trust as a predictor of customer loyalty have not yet received great emphasis in previous studies in the South African context. Also, examining the relationships between customer trust and e-loyalty in the emerging African market contributes to understanding the literature adopting the S-O-R theory on B2C e-commerce within an academic scope. Trusted websites are important for branding since consumers shop on and remain loyal to a few websites they can trust (Bilgihan, 2016). Despite previous studies exploring brand trust (Chaudhuri & Holbrook, 2001; Delgado-Ballester & Manuera-Aleman, 2001), the role of trust in the online shopping context of an emerging market such as South Africa has received little attention. Khan and Rahman (2016) and Frasquet et al. (2017) found that e-brand trust significantly and positively influences e-brand loyalty. This paper offers empirical evidence that substantiates the importance of building customer loyalty through establishing trust. It highlights the importance of a website to improve security that can protect customers' private information. Trust will nurture customer perception that the information provided to a website will not be stolen and used by unauthorised parties, which embraces marketing efforts in ensuring that customers develop trust in a website that secures their private information and prevents information from leaking to unauthorised third parties.

Website designers who improve the security and privacy perceptions of the website as a point of contact will build customer trust. This paper validates the conceptualisation of online transaction security and privacy as separate measures that impact customers' trust when shopping online (Belanger et al., 2002). The study validates trust as a generator of positive consumer behaviour in e-shopping. Offering customer service in an online environment accompanied by trust is a necessity to increase customer loyalty (Ahmad et al., 2017).

13. Limitations of the study and direction for future research

To provide meaningful implications for both the emerging African and South African markets and the global market regarding e-services, the study confirmed trust and its predictors, namely perceived security and privacy, as significant features in enhancing the development of B2C e-commerce, thereby contributing insights to the S-O-R theory. Customers' perceptions regarding these factors contribute positively to establishing trust, which increases customer loyalty and thus enhancing the growth of modern e-commerce retail. However, the study had some limitations. With the increasing number of online shoppers, the sample size of this study can be increased. As marketers continue to collect personal information, it remains the main source of Internet users' privacy concerns (Malhotra et al., 2004), which equally requires continuous research. Recently, research has turned to examine trust in online shopping advancements related to the IoT; e.g., enabled actuators and sensor devices, devices assimilating natural interaction through gesture or voice, and artificial intelligence algorithms that automate customer processes. Experimental research that reveals how machine learning models

recognise consumers' purchase intentions early can be conducted in emerging markets. Lastly, control variables such as respondents' online experience and e-shopping spending could be included in research for solid future solid into the modern e-commerce retail world.

Customer loyalty;
Mobile market; Pre-paid market

Abstract

Rooted in customer relationship marketing theory, this study investigates customer loyalty in the highly competitive prepaid mobile market in South Africa. Specifically, several antecedents of customer loyalty – perceived value, perceived trust, perceived corporate image, perceived customer expectations, and perceived customer care service – were identified from the literature, and the influence of each on customer loyalty was tested. Data was collected from 411 mobile prepaid users using self-administered questionnaires, and analysed using SPSS and AMOS. The findings indicated that perceived service trust, perceived value, and perceived corporate image expectations significantly and positively influenced customer loyalty, while perceived customer care service was the only non-significant antecedent, and perceived value had a negative relationship with customer loyalty. The results could aid marketers working in the prepaid mobile sector with insight into the most important loyalty antecedents on which they should focus and which they should manage in order to secure loyalty in this very competitive market. Mobile service providers need to place a stronger focus on their customer care strategies to strengthen loyalty through the development of a client-focused service approach that is characterised by customer-centric engagement, the professional management of service failure, and a speedy reactive approach to customer queries. Also, through continuous training and development, employees could be enabled to deliver on the customer care expectations of mobile customers more successfully.

1. Introduction

Customer loyalty is a concept that has been widely studied in the telecommunications industry by many researchers, and has become a key consideration for network operators (Tariq & Mat, 2018; Yang & Liu, 2018; Izogo, 2015). Loyalty is defined as “a deeply held commitment to rebuy or patronise a preferred service or product consistently in future” (Izogo, 2015). Service providers across different service industries have realised the importance of customer loyalty as a key determinant of their long-term success and of securing a competitive advantage (Yang & Lui, 2018), given that the challenge of recruiting new customers has proved to be more difficult and expensive than retaining existing customers (Nasir & Mushtaq, 2014). However, limited research is available on customer loyalty in the South African mobile prepaid sector.

The South African mobile industry is characterised by an oligopolistic structure, which implies that the market is dominated by several large-scale operators, each offering products that do not differ much from those of the others. The industry also presents a significant barrier to entry, thus limiting the easy entrance of new competitors (Maisyarah, 2018). This structure in turn creates a highly competitive market in which to operate. The four dominant mobile network operators are Vodacom,

² E-mail address: mornayrl@uj.ac.za

³ E-mail address: bstiehler@uj.ac.za

MTN, Cell C, and Telkom; they are followed by a number of virtual operators that have also entered the market (BMI Research, 2018).

These four operators typically offer two services – prepaid (contract-free services) and postpaid (contract services). The prepaid model currently dominates the mobile market in South Africa, with prepaid subscribers accounting for about 87 per cent of the total mobile base of about 97.1 million mobile subscribers, and the remainder being postpaid customers (McKane, 2021). Prepaid customers significantly drive the volume of mobile usage (Mati & Shambare, 2016). The nature of the market structure means that the prepaid services offered by the dominant operators are similar, with little distinction between what these operators offer (Coakley *et al.*, 2017; Mati & Shambare, 2016). Consumers therefore find themselves switching between operators with ease, or even using multiple providers at the same time (Deloitte, 2017; Morgan & Govender, 2017). Operators are therefore faced with the challenge of exploring different ways to secure customer loyalty, of which building relationships with their customers has been identified as a vital solution in the services sector (Khan *et al.*, 2022; Tariq & Mat, 2018).

A review of the literature suggests that, in particular, trust, perceived value, corporate image, perceived service quality, customer expectations, and customer care service have been found to be the most common determinants of customer loyalty in the mobile industry (Diaz, 2017; Morgan & Govender, 2017; Pumim *et al.*, 2017; Adebisi *et al.*, 2016; Ismail & Yunan, 2016). Responding to this identified gap in the research specifically into the mobile *prepaid* segment, this paper investigates these identified antecedents of customer loyalty in the prepaid market in particular.

This paper begins with the problem being investigated, followed by the research objectives and hypotheses, and then a literature review. This is followed by a discussion of the methodology and the presentation of the key results. The paper concludes with managerial implications that flow from the results, and identifies areas for future research.

2. Problem investigated

The market structure of the mobile industry in South Africa is that of an oligopoly, making this market highly competitive. This competitive landscape is further characterised by a large customer base specifically of prepaid customers. Interestingly, while this is the largest of the consumer bases in this industry, it is a market segment that has enjoyed limited research attention. The nature of the mobile market structure in South Africa means that mobile operators struggle to differentiate their businesses, and specifically their product offerings. A possible solution therefore lies an emphasis on building customer relationships, rather than purely a product focus in a competitive industry such as the mobile industry in South Africa. The theory of relationship marketing argues that building strong relationships with customers can secure and enhance long-term customer loyalty (Khan *et al.*, 2022). This study, therefore, is grounded in relationship marketing theory; it identifies the antecedents of customer loyalty, and tests each of these antecedents and their influence on customer loyalty, specifically in the prepaid consumer market. The specific objectives of the study are outlined in the next section.

3. Research objectives

The primary objective of this study was to investigate the influence of the identified antecedents of customer loyalty on customer loyalty among a prepaid consumer segment.

The secondary objectives were:

- To determine whether a significant and positive relationship exists between perceived trust and customer loyalty
- To determine whether a significant and positive relationship exists between perceived service quality and customer loyalty
- To determine whether a significant and positive relationship exists between perceived value and customer loyalty

- To determine whether a significant and positive relationship exists between corporate image and customer loyalty
- To determine whether a significant and positive relationship exists between customer expectations and customer loyalty
- To determine whether a significant and positive relationship exists between customer care service and customer loyalty

4. Literature review

The literature review provides the background and context of the South African mobile market, followed by the theory grounding the study, and concluding with a discussion of the specific identified antecedents of customer loyalty in the mobile market.

4.1 Understanding the South African mobile market

The number of mobile subscribers in South Africa has been climbing steadily in the past 20 years. In 2000 there were around 8.3 million subscribers, while this number stood at 95.96 million at the end of 2020 (O’Dea, 2021). The market is dominated by four cellular service providers. Vodacom has 42 per cent of the market share, followed by MTN, which has 31 per cent market share, Telkom with 15 per cent, and Cell C with 12 per cent (Msomi, 2022). Prepaid subscribers are by far the most numerous, in particular for cellular voice services; by the end of 2021 they made up 84 per cent of total mobile cellular voice subscriptions (Statista, 2022). Vodacom had 31.8 million prepaid subscribers, MTN had 25.3 million, Telkom had 12.3 million, and Cell C had 8.35 million (McKane, 2021).

Prepaid customers are known for being disloyal. This behaviour is driven by numerous trends, such as operators offering products that show very limited differentiation (Altan, 2019), and the low financial and procedural switching costs associated with moving between providers (Kalebaila *et al.*, 2017). A number of prepaid customers even own multiple SIM cards and switch between operators, depending on the different costs at different times of the day or specials that are running (Deloitte, 2017). The fact that the market is dominated by only a few players, together with the points just made, means that this market is highly competitive. The number of these subscribers suggests, however, that there is good potential revenue to be made. The problem, therefore, is to identify ways in which to secure customer loyalty among this prepaid segment. A customer relationship marketing approach has been found to be effective in building strong relationships with customers; and this can in turn secure customer commitment and loyalty (Khan *et al.*, 2022). Thus this study is therefore rooted in the theory of customer relationship marketing.

4.2 The importance of securing loyalty in building long-term relationships with customers

In the marketing literature, loyalty has been extensively validated as an important requirement for building long-term relationships in a business-to-consumer (B2C) environment (Tabish, 2018) – especially since the establishment and professional management of loyalty can enable businesses to strengthen their existing market share and to secure a competitive edge in a highly cutthroat business environment (Khundyz, 2018). Amin *et al.* (2017) concur, stating that building long-term relationships with existing customers has proven to be more cost-effective than recruiting new customers. Tabish (2018) states that the overall profitability of a business can be increased through the successful management of customer loyalty, since customers will purchase products and services more regularly and will become less sensitive to price in the long term. Scholars such as Kaur and Soch (2018) agree, and state that the current customers of a business contribute positively to the share of visits and of wallet for the business, thereby directly contributing to the overall long-term profitability of the business. Furthermore, customers who are loyal to a brand have a positive attitude and a strong psychological commitment to it. Such customers are in a better position to withstand offers from competitors, and have a lower propensity to switch (Cui *et al.*, 2021; Le, 2021). Interestingly, scholars such as Putit and Abdullah (2019) established in a study conducted in the mobile industry in Malaysia that a customer can be cultivated from being purely a prospect, to becoming a partner through the application of a relationship marketing strategy that secures long-term rewards to customers for their ongoing loyalty to the business.

4.3 A perspective on relationship marketing theory as a grounding for the study

Roberts-Lombard *et al.* (2017) argue that the focus of relationship marketing (RM) is on the creation of value, and should be sustained through improved relationships. Improved relationships, in turn, can only be secured if benefits are established for both parties (the organisation and the customer), and all parties are then satisfied. Gummesson (2017) supports this argument, explaining that RM is rooted in creating professional win-win relationships in which value is created and exchanged. Other benefits and outcomes associated with RM include the dimensions of trust and commitment; and it is argued that these two dimensions are key to maintaining customer relations (Morgan & Hunt, 1994). Trust is further argued to create confidence benefits in the relationship, which can reduce customer anxiety and enhance the organisation's knowledge of customers' service expectations (Yen *et al.*, 2015). According to Salem (2021), RM has recently become crucial in securing the success of companies, and can help companies to sustain themselves in the long term. Importantly, RM is also argued to help establish a connection with customers, as well as sound long-term relationships; and these strong relationships can lead to customer retention and loyalty (Khan, Salamzadeh, Iqbal & Yang, 2022; Salem, 2021). Building retention and loyalty, in turn, helps an organisation to build its purchasing power, as high levels of loyalty are associated with repeat patronage (Khan *et al.*, 2022). Thus it is argued that it is important to understand the concept of loyalty and its respective antecedents better.

4.4 The proposed theoretical model reflecting on the relationships between customer loyalty and its antecedents

4.4.1 Trust

Trust is described as a feeling that exists when a party to a relationship has confidence in another party's integrity and reliability (Wang *et al.*, 2015). Trust is also argued to be a key factor in building long-term relationships (Morgan & Hunt, 1994). Increased trust between the customer and the service provider is imperative to secure relationship success: where trust exists, the relationship is likely to be highly valued, and both parties (customer and organisation) will want to commit themselves to the relationship in the long term (Ngoma & Ntale, 2019). Trust is therefore an important element for fostering long-term relationships, and plays a role in determining the success of businesses – in particular, in the service industry, as it is characterised by uncertainty, high degrees of risk, and vulnerability (Pumim *et al.*, 2017). These characteristics are especially relevant to the mobile sector. Trust, therefore, is argued to influence the future loyalty intention of customers; and so the following is hypothesised:

H1: Perceived trust has a positive and significant influence on customer loyalty in the mobile prepaid segment.

4.4.2 Service quality

Service quality is defined as “a form of attitude which can be measured by assessing consumers' quality perceptions of service firms' efforts in fulfilling the service quality gaps” (Quoquab *et al.*, 2016). Service quality is also a differentiator that can help operators in the mobile industry to gain a competitive edge and to maintain loyal customers (Quoquab *et al.*, 2016). It is further argued that customers who are delighted with the quality of the service received, might become truly loyal, resulting in increased profitability (Dey *et al.*, 2017). Service quality is suggested, therefore, to influence the future loyalty intention of customers; thus the following is hypothesised:

H2: Perceived service quality has a positive and significant influence on customer loyalty in the mobile prepaid market.

4.4.3 Perceived value

Perceived value is defined as “the assessment of the difference in perception between actual service performed and customers' expectations” (Zeithaml, 1988). The willingness of a customer to keep their existing relationship with a service provider is arguably greatly influenced by the service provider's ability to provide greater value to the customer (Morgan & Govender, 2017). Perceived value is also argued to be one of the key reasons that consumers choose and remain with a service provider in the

mobile prepaid market (Pumim *et al.*, 2017). Arguably, when superior value is provided, the customer's willingness to engage in repeat purchases is increased and the intention to switch decreased (Hernandez-Ortega *et al.*, 2017). Perceived value is therefore argued to have an influence on the future loyalty intention of customers. Thus the following hypothesis is proposed:

H3: Perceived value has a positive and significant influence on customer loyalty in the mobile prepaid market.

4.4.4 Perceived corporate image

Perceived corporate image is defined as “the perceptions on an organization that reflect the associations of consumers’ memory” (Keller, 1993). Customers who form a favourable attitude to a service provider’s reputation might become resistant to competitive offers, and so remain loyal to a specific service provider (Giovanis *et al.*, 2016). Positive service experiences also enhance customers’ perception of corporate image, and this might increase their repurchase intentions, and ultimately lead to loyalty (Pumim *et al.*, 2017). Kaur and Soch (2018) also suggest that a service provider retains and gains more satisfied customers from a good reputation and, in the long run, loyalty is enhanced and profitability is increased. Perceived corporate image is therefore argued to influence the future loyalty intention of customers, and so the following is hypothesised:

H4: Perceived corporate image has a positive and significant influence on customer satisfaction in the mobile prepaid market.

4.4.5 Customer expectations

Customer expectations are defined as “beliefs about service delivery that serve as standards against which the quality of a service is judged” (Zeithaml *et al.*, 2009). Building customer loyalty entails offering services that satisfy customers’ demands or expectations, with the intention of establishing permanent relationships and delivering additional value (Ramlall, 2018). When the needs and expectations of customers are fulfilled, organisations can benefit from increased market share and profitability because of customer loyalty (Yee *et al.*, 2015). Perceived customer expectations are therefore argued to have an influence on the future loyalty intention of customers, and so the following hypothesis is proposed:

H5: Perceived customer expectations have a positive and significant influence on customer satisfaction in the mobile prepaid market.

4.4.6 Customer care service

Customer care service is a process that takes place between a customer and an organisation that encompasses a range of activities, such as customer support systems that guide a customer through the entire service delivery value chain before, during, and after a purchase (Adebiyi *et al.*, 2016). Customer care is argued to be an important ingredient in retaining customers, as it affects both attitudinal and behavioural loyalty (Srivastava & Kaul, 2016). Service quality in return is perceived in instances where interactions take place between customers and service providers, and this can lead to customer loyalty (Karami *et al.*, 2016). Therefore, perceived customer care service is argued to influence the future loyalty intention of customers, and so the following hypothesis is proposed:

H6: Perceived customer care service has a positive and significant influence on customer loyalty in the mobile prepaid market.

Figure 1 outlines the proposed model for the study, indicating the antecedents of customer loyalty identified above.

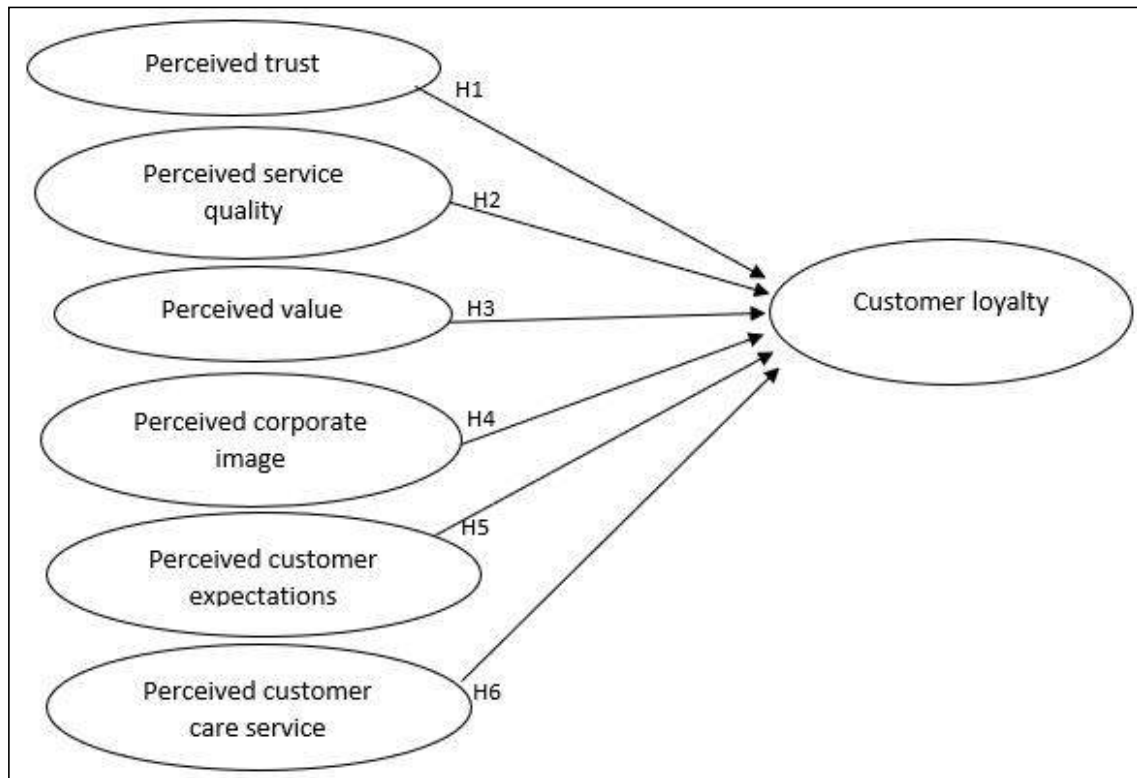

Figure 1: Antecedents of customer loyalty

5. Research methodology

5.1 The research context and the sampling process applied

The study was quantitative and descriptive-interpretive (Elliott & Timulak, 2021) in nature. The sample consisted of South African mobile prepaid service users aged 18 to 35 who lived in Gauteng, and who used Vodacom, MTN, or Cell C as their network operator. Telkom was excluded as a network operator, as their market share was below 10% at the time of questionnaire development - end of 2019 (Asokoinsight, 2021). The targeted age group constitutes about 66 per cent percent of mobile internet users in South Africa (ICASA, 2021; Statista, 2021), and is one of the largest markets to which service providers sell their products (Deloitte, 2017). A sample size of 400 respondents was targeted, but a total of 411 useable responses was received. The final sample comprised 220 male respondents (53.5%) and 189 female respondents (46%). The respondents were mostly educated, having at least a school-leaving certificate (51.1%); the majority were Black (60.1%) and spoke English (41%).

5.2 Data collection

The data was collected over a six-week period using a self-administered survey. Fieldworkers from a research company were trained and tasked to distribute the hard copy survey to qualifying respondents within the specified quotas across Gauteng; Google Forms was also used to distribute the survey via email to friends, connections and colleagues that fit the quotas required. A non-probability quota sampling technique was therefore applied, as the researchers could not obtain a list of network users.

5.3 Measures and items

The measurement scales were adapted from previous studies, but were modified to fit the context of the mobile prepaid market. To increase the reliability of the measurement scales, a combination of items from different scales, based on the literature review, was used to measure the same construct. A five-point Likert scale was applied across all of the variables, where 5 was 'strongly agree' and 1 was 'strongly disagree'. The items measuring the key constructs in this study, and the previous studies

from which they were obtained, are shown in Table 1.

Table 1: Measurement of constructs

Construct	Scale items	Source
Perceived trust (PT)	It is my opinion that my cell phone network service provider is always honest with me	Van Vuuren, Roberts-Lombard & Van Tonder (2011)
	I believe that my cell phone network service provider treats me with the necessary respect	
	I feel that my cell phone network service provider understands my needs	
Perceived service quality (PSQ)	My cell phone network service provider delivers its services at the time it promises to do so	Nyadzayo & Khajehzadeh (2016)
	My cell phone network service provider keeps me informed about when and how services will be performed	
	My cell phone network service provider focuses on solving customer complaints	
	The employees of my cell phone network service provider understand my specific needs.	
	The employees of my cell phone network service provider are well dressed and always appear neat	
Perceived value (PV)	My cell phone network service provider offers me value for money	Calvo-Porrall & Levy-Mangin (2015)
	I consider the rates of my cell phone network service provider as reasonable	
	Doing business with my cell phone network service provider is a right decision when price and other costs are considered	Nyadzayo & Khajehzadeh (2016)
	Doing business with my cell phone network service provider is a right decision when the overall quality of service delivery is considered	
	Compared to the quality of cellular service reception that I get, I pay a reasonable price	
Perceived corporate image (PCI)	My cell phone network service provider is a reliable company	Giovanis <i>et al.</i> (2016)
	My cell phone network service provider offers excellent services to customers	
	My cell phone network service provider is truthful to its customers	
Perceived customer expectations (PCE)	My cellular service provider meets my requirements on overall service expectations	Dutta (2017)
	Overall, I am satisfied with the services of my cellular service provider	
	My cellular service provider exceeds my service requirements	
Perceived customer care service (PCS)	The employees of my cellular service provider are always willing to help	Tang & Shen (2018)
	My cellular service provider responds to requests promptly	
	The employees of my cellular service provider are polite	
	When I have problems, my cellular service provider is sympathetic	
	I feel safe in my interactions with the Service Provider.	
Perceived customer loyalty (PCL)	I will continue to use my cellular service provider	Chuah <i>et al.</i> (2017)
	I will recommend my cellular service provider to others	
	Even if my friends recommended another service provider, my preference for my cellular service provider would not change	
	My cellular service provider is my first choice	Nyadzayo & Khajehzadeh (2016)
	I consider myself to be highly loyal to my cellular service provider	

5.4 Data analysis strategy

The data was analysed using the latest version of Statistical Package for Social Scientists (SPSS 28) and AMOS. The research validity analysis was carried out by determining the Cronbach's α coefficient, and a correlation analysis measured the relationship among the suggested variables. To assess model fit, the commonly used model fit indices in CFA were used: the chi-square degrees of freedom ratio (CMIN/df), the goodness-of-fit index (GFI), the Tucker-Lewis index (TLI), the comparative fit index (CFI), and the root mean square error of approximation (RMSEA) (Hair, Black, Babin & Anderson, 2019).

6. Results and Findings

6.1 Assessment of normality

The assessment of normality was done, and the results were confirmed by using the Kolmogorov-Smirnov and Shapiro-Wilks tests, as the data for the sample did not achieve normality ($p < 0.05$). However, normal distribution was inferred using the central limit theorem because of the large sample size.

6.2 Confirmatory factor analysis (CFA)

The six-factor measurement model revealed that the model fitted the data, but a number of factors had extremely high correlations, as shown in Table 2. An exploratory factor analysis (EFA) was used to investigate the factor loadings, resulting in the model merging some factors, with a new measurement model being formed. A four-factor model was evident with new identified factors, and included perceived service trust (perceived service quality and perceived trust – PST), perceived value (PV), perceived corporate image expectations (perceived corporate image and perceived customer expectations – PCIE), and perceived customer care service (PCCS).

Table 2: Correlation matrix

	PSQ	PV	PCI	PCE	PCCS	CL
PT	0,998	0,776	0,848	0,853	0,797	0,803
PSQ		0,824	0,926	0,900	0,904	0,843
PV			0,742	0,789	0,719	0,668
PCI				0,942	0,925	0,886
PCE					0,873	0,873
PCCS						0,852

A confirmatory factor analysis was then performed to assess the new model with only four variables, using AMOS. First the model fit of the measurement model was assessed, with a normed chi-square (χ^2/df) of 1.782, a normed fit index (NFI) of 0.935, a Tucker-Lewis index (TLI) of 0.963, a comparative fit index (CFI) of 0.97 and a root mean square error of approximation (RMSEA) of 0.044. The model fit statistics are presented in Table 3.

Table 3: Measurement model – goodness-of-fit assessment

Category of model of goodness-of-fit	Selected indices	Acceptable fit	Model fit outcomes
Absolute fit index	Chi-square (χ^2)/ CMIN	A value of $\chi^2 < 3.0$ indicates good fit (Hair <i>et al.</i> , 2019:636; Awang, 2015)	1.782
	Df		84
	p-value		0.000
	RMSEA		0.044
		RMSEA < 0.06 good (Cangur & Ercan, 2015:157)	

	CFI	Value of ≥ 0.90 indicates good fit (Hair <i>et al.</i> , 2019:640)	0,97
Incremental fit index	NFI	Value of > 0.80 (Forza & Filippini, 1998:14) or ≥ 0.90 indicates good fit (Hair <i>et al.</i> , 2019:640; Hooper <i>et al.</i> , 2008:55)	0.935
	NNFI (TLI)	Value of ≥ 0.90 indicates good fit (Cangur & Ercan, 2015:158)	0,963

Table 4 provides insight into the factor loadings, and the variance is explained of the items used to measure the *four newly formulated constructs* of the study (see earlier in this section). The factor loadings and AVEs for all of the constructs measured had a value of greater than 0.50, indicating that the criterion for convergent validity for the research instrument was met. Regarding reliability, the composite reliability and Cronbach's α values for the constructs exceeded the recommended value of 0.70; thus the scales used were reliable and had internal consistency (Wiid & Diggins, 2015).

Table 4: Convergent validity and reliability scores

Construct and items		Factor loadings	Cronbach's α value	CR value	AVE
PST	PT1	0.756	0.829	0.896	0.664
	PT2	0.773			
	PT3	0.779			
	PSQ1	0.867			
	PSQ2	0.842			
	PSQ3	0.753			
	PSQ4	0.845			
PV	PV1	0.762	0.874	0.832	0.501
	PV2	0.686			
	PV3	0.719			
	PV4	0.725			
	PV5	0.640			
PCIE	PCI1	0.849	0.879	0.902	0.695
	PCI2	0.883			
	PCI3	0.793			
	PCE1	0.888			
	PCE2	0.773			
	PCE3	0.810			
PCCS	PCCS1	0.758	0.848	0.809	0.570
	PCCS2	0.789			
	PCCS3	0.787			
	PCCS4	0.738			
	PCCS5	0.699			
PCL	CL1	0.730	0.901	0.901	0.503
		0.719			
	CL2	0.694			
	CL3	0.714			
	CL4	0.748			

Table 5 outlines the results that show that discriminant validity was achieved for the four newly formulated constructs and for perceived customer loyalty (PCL). The constructs met the discriminant validity criterion, as most of the square roots of the AVEs were greater than the inter-construct correlations (Fornell & Larcker, 1981). In addition, the measurement model did not display any scale items that cross-loaded significantly with other constructs, indicating discriminant validity. It could thus be concluded that the model demonstrated sufficient reliability and construct validity. Considering these results, the researchers could continue to assess the structural model.

Table 5: Discriminant (divergent) validity scores (SQRT values in bold)

Research constructs	PST	PV	PCIE	PCCS	CS	CL
Perceived service trust (PST)	0.815					
Perceived value (PV)	0.729	0.727				
Perceived corporate image expectations (PCIE)	0.810	0.699	0.833			
Perceived customer care service (PCCS)	0.719	0.612	0.783	0.754		
Perceived Customer loyalty (PCL)	0.748	0.614	0.809	0.736	0.782	0.721

6.3 Assessment of the structural model

The goodness-of-fit measures were first assessed for the structural model, and the model fit indices revealed that it fitted the data sufficiently. It was found that the normed chi-square (χ^2/df) was 1.997, the normed fit index (NFI) was 0.914, the Tucker-Lewis index (TLI) was 0.948, the comparative fit index (CFI) was 0.957 and the root mean square error of approximation (RMSEA) was 0.048, as presented in Table 6. Subsequently, the structural paths for the study were inspected.

Table 6: Structural model: goodness-of-fit assessment

Category of model of goodness-of-fit	Selected indices	Acceptable fit	Model fit outcomes
Absolute fit index	Chi-square (χ^2)/CMIN	A value of $\chi^2 < 3.0$ indicates good fit (Awang, 2015:57)	1,997
	Df		160
	p-value		0.000
	RMSEA	RMSEA < 0.06 good fit (Cangur & Ercan, 2015:157)	0.048
Incremental fit index	CFI	Value of ≥ 0.90 indicates good fit (Cangur & Ercan, 2015:159)	0,957
	NFI	Value of > 0.80 (Forza & Filippini, 1998:14) or ≥ 0.90 indicates good fit (Hair <i>et al.</i> , 2019:640; Hooper <i>et al.</i> , 2008:55)	0.914
	NNFI (TLI)	Value of ≥ 0.90 indicates good fit (Hair <i>et al.</i> , 2019:640)	0,948

Table 7 provides insight into the hypotheses that were formulated for the study. The results in Table 7 display only four hypotheses, as opposed to the original six, owing to the formulation of the new variables as a result of the EFA and CFA analysis (see section 6.2). The results indicated that perceived service trust, perceived value, and perceived corporate image expectations significantly and positively influenced customer loyalty, with perceived corporate image expectations having the highest significance for customer loyalty. Customer care service did not have a significant impact on

customer loyalty, while perceived value (even though significant) showed a negative relationship with customer loyalty.

Table 7: Structural model estimates for the proposed model

Structural paths	Hypothesis	Parameter estimate (β)	T-statistic (t)	P-value	Rejected / supported
Perceived service trust ---> Customer loyalty (CL)	H ₁	.213	2.082	.037	Supported
Perceived value (PV) ---> Customer loyalty (CL)	H ₂	-.287	-3.055	.002	Supported
Perceived corporate image expectations (PCIE) ---> Customer loyalty (CL)	H ₃	.614	2.340	.019	Supported
Perceived customer care service (PCCS) ---> Customer loyalty (CL)	H ₄	.050	.377	.706	Rejected

Discussion of findings

The high incidence of multi-collinearity between the variables of service quality and trust (merged into perceived service trust) and between corporate expectations and corporate image (merged into perceived corporate image expectations) resulted in the development of two new variables. Perceived service trust, perceived value, and perceived corporate image expectations significantly and positively influenced customer loyalty, with perceived corporate image expectations having the greatest impact on customer loyalty (its path coefficient value was 0.614), whereas the coefficient of perceived service trust was 0.213 and that for perceived value was -0.287. These findings are supported by previous findings in the literature (Adebiyi *et al.*, 2016; Nyadzayo & Khajehzadeh, 2016; Firend & Masoumeh, 2014). The high significance of perceived corporate image expectations could be a result of the identified samples' age group, often known as the millennial segment. Millennials are said to be focused on brands that provide more to them than merely a functional offer (GfK, 2017), and prefer brands that are authentic and allow for emotional bonds to be created (Rodrigues & Rodrigues, 2019; GfK, 2017). This might imply the high relevance of perceived corporate image expectations.

Interestingly, perceived value showed a negative coefficient, indicating that the perceived value of prepaid mobile cellular network providers and customer loyalty are inversely related. This contradicts previous findings (Pumim *et al.*, 2017; Chuah *et al.*, 2014; Firend & Masoumeh, 2014). The inverse relationship with perceived value was an interesting one. Two factors might underlie this relationship: the market is characterised as offering little product differentiation, owing to its oligopolistic structure (Maisyarah, 2018); and it has been suggested that the market is characterised by low switching costs, and that consumers often own SIM cards from multiple service providers (Deloitte, 2017). These findings highlight the challenge of creating perceived value and, arguably, the need to improve this aspect, because previous findings suggest its clear potential for contributing to loyalty (Pumim *et al.*, 2017; Chuah *et al.*, 2014; Firend & Masoumeh, 2014) – even though these arguments do not shed more light on why this is an inverse relationship. The relationship between perceived value and loyalty was however a significant one, suggesting that this variable did have an influence, and should therefore be explored in greater depth to understand its role and contribution in this specific market context and market segment.

Also contrary to previous findings, perceived customer care service did not significantly and positively influence the loyalty of mobile users in this context (Amoako *et al.*, 2016; Srivastava & Kaul, 2016; Kim *et al.*, 2015; Wang, 2015). A major social media sentiment study by BrandsEye and Deloitte in 2020 that analysed two million social media posts found that the highest negative sentiment towards mobile service providers was service delivery levels (BusinessTech, 2021). This suggests that the overall market perception of service quality in this industry is very low, and that this variable has little significance for consumers in this industry. This might explain why this variable did not play a significant role in promoting loyalty.

7. Theoretical implications and managerial recommendations

7.1 Theoretical implications

The theoretical contribution of this paper is threefold. First, the study makes a contextual contribution by testing the antecedents of customer loyalty in an under-researched market segment – that of prepaid mobile customers. Second, rooted in relationship marketing theory, the study contributes a newly established and statistically verified model that has been developed to measure customer loyalty, while also strengthening the argument for the importance of relational aspects in securing loyalty. Third, the study reports those factors that were significant in driving customer loyalty in this market segment, but also reveals one non-significant and one significant relationship, as well as an inverse relationship that should be further researched.

7.2 Managerial recommendations

The managerial recommendations include a strong focus on perceived corporate image, as this variable proved to be the most significant in determining customer loyalty. Especially in light of the chosen sample for the study (millennials), this represents an important current and future market segment for this industry. Previous findings have proposed that millennials need a deeper connection with brands, and are not necessarily strongly focused on the functional component. This might be why this variable played such a significant role in influencing loyalty, and so managers are encouraged to apply a greater focus on this aspect. Using social media platforms (which are popular in this market segment) and posting content that relates to the brand's purpose, meaning, corporate initiatives, and societal contribution might help to achieve this objective. Similarly, a greater focus should be placed on managers' commitment to enhance perceived service trust. This could be achieved mainly through consistency in customer service offerings and by applying a relationship-building orientation. To achieve this, managers should roll out a renewed customer service training approach with a strong emphasis on fostering trust.

Considering that perceived customer care service did not make a significant contribution, even though previous studies found it to be important, it is suggested that managers once again invest in their staffs' customer service approach and training. This should not only remind service employees of the importance of fostering trust (as mentioned earlier), but also focus on equipping employees with the skills to show customer understanding, empathy, and genuine customer care. Tone of voice, active listening and listening with care, the use of words – these are all components that could be applied to establish customer rapport.

Perceived value expectations should also be a key focus; even though this showed an inverse relationship, it was still a significant contributor to loyalty. The industry is characterised by providing minimal product differentiation. A renewed focus on developing value-for-money offerings and differentiated products and service levels is therefore imperative. To achieve this, managers are encouraged to invest aggressively in market research and to consider establishing innovation units. Not only could this develop greater differentiated offers, but it would also help to promote this important technological sector.

8. Conclusion and limitations

The study successfully explored customer loyalty in the highly competitive prepaid mobile market in South Africa. It established the important role played by perceived service trust, perceived value, and perceived corporate image expectations in securing the loyalty of customers. It also determined the need to develop strategies that would successfully address the future customer care service expectations of mobile pre-paid customers in South Africa. However, this study is not without its limitations. The lack of a list of mobile customer clients led the researchers to opt for a non-probability sampling method. The results of the study should therefore be interpreted against this background, appreciating that these results do not represent the entire South African population, and should be reported and communicated as such. The sector also has smaller network service providers that were deliberately excluded in favour of a focus on the three dominant market players (as per their

2019 market share percentages). The age range of the sample – although a substantial and important segment in this industry – represents only the millennial cohort.

Future studies should explore the instance of multi-collinearity experienced for the variables of service quality and service trust, as well as for corporate image and customer expectations. The researchers encourage future studies that use these same variables to determine whether similar results would be obtained, and to report on their insights. Researchers might also want to test and explore the two newly formed variables developed as a result of multi-collinearity in order to verify, through repeat research, whether these could be added to the literature. The inverse relationship between perceived value and loyalty should also be explored through repeat research, to determine if similar results are obtained. In addition, the limited product differentiation that is experienced in this market suggests that perceived value should be further explored and unpacked specifically in the prepaid market context. The proposed methods to enhance customer care service should also be explored, as this is identified as a weakness in this industry that needs to be improved. Finally, future research is also encouraged to explore the importance of corporate image expectation and of millennials' expectations of corporate brands.

Keywords

E-commerce, Online retailing, SMMEs, SMMRs.

Abstract

E-commerce, and specifically online retailing, is a rapidly growing industry globally, showing double digit growth annually. Whilst South Africa is following the global growth trajectory, only a small percentage of retailing takes place online when compared to the total retail spend. The COVID-19 pandemic provided a catalyst to the growth of e-commerce, with e-commerce being a big reason that many companies survived the worst of the pandemic related restrictions. Despite the international trends and unexpected catalysts, many Small, Medium and Micro Retailers (SMMRs) have not adopted e-commerce. This aim of this study was to determine the challenges that SMMRs face in adopting e-commerce.

An exploratory qualitative approach was adopted to determine the key issues. Research data was collected via semi-structured interviews with a purposive sample of seventeen SMMRs. The data was content analysed to determine the key challenges.

The study revealed several areas of alignment between prior research and this study, including the typical challenges of marketing, management support, strategic intent, and technology issues. Additional challenges identified included the cost of e-commerce, product and service type complexities, pricing and margin structure challenges, and the role of social media in e-commerce.

The findings were used to make recommendations to SMMRs on their e-commerce route to market development and strategy. The report includes a high-level model to help SMMRs with their e-commerce optimisation.

1. Introduction

E-commerce may be simply defined as the buying and selling of commodities and services using the internet. It incorporates all technologies and activities related to trading online such as internet marketing, payment processing, supply chain management and data collect and analysis (Shahriari et al., 2015). E-commerce is an established, rapidly growing, and important route to market for retailers in South Africa. Despite its importance, many South African Small, Medium and Micro Enterprises (SMMEs) have not embraced or adopted this market channel and are not trading online. Online sales

make up only 2.8% of the total retail spend in South Africa (Daniel, 2021) and e-commerce was a R30 billion industry in 2020 (USITA, 2021).

Many Small, Medium and Micro Enterprises (SMMRs) operate under the traditional retail model which is reliant on having merchandise displayed in a retail store and on walk-in customers to purchase these goods. Their reach is limited to the community in which they are located and to the customers that enter their stores. While they may appear in online searches through owned or paid media, the lack of an e-store reduces their chances of trading with customers outside of their community. This in turn reduces their chances of growing their market share despite the existence of the technology for them to do so.

The importance and implementation of e-commerce has been highlighted and catalysed by the COVID-19 pandemic with many companies being forced to fast track their development into this space (Goldstuck, 2021). Larger and more agile companies have been able to move quickly to incorporate e-commerce into their service offerings, with Takealot, the largest online retailer in South Africa, boasting a 41% revenue growth in 2020 (Daniel, 2021). SMMRs may not have been able to respond as quickly and have thus been put at a disadvantage, with potential severe knock-on effects on the competitiveness and sustainability of these businesses (Dua et al., 2020).

1.1. Problem Statement

E-commerce and thus, omnichannel adoption, is essential for retailers and manufacturers. Modern consumers insist on convenience and the ability to shop and interact with retailers irrespective of the time of day, type of device, or channel (Plytix, 2020). From Plytix's (2020) data, omnichannel shoppers, when compared to single channel shoppers, spend 35% more in store and 10% more online. However, the online retail market tends to be dominated by large organisations. Takealot, combined with Superbalist, is substantially larger than other e-commerce online platforms (Businesstech, 2021). Takealot, the largest online retailer in South Africa posted a turnover exceeding R3.3 billion in 2020 (Daniel, 2021). Takealot and UberEats, together with a few other online retailers are currently subjects of a market inquiry by the South African Competition Commission (Businesstech, 2021). If this trend of market domination by larger companies with dominant e-commerce capability continues and if SMMRs do not try to compete or innovate, it may lead to constantly reducing revenues or to the end of many of these businesses. However, little is known of the challenges facing SMMRs in implementing e-commerce initiatives.

1.2. Research Objectives

Consequently, the aim of this study is to determine the challenges Small, Medium and Micro Retailers (SMMRs) in South Africa face in implementing e-commerce market channels, and investigating how these businesses may be assisted in competing in the online marketplace. The objectives were:

- to identify the perceived benefits of e-commerce,
- to determine the inhibitors to developing e-commerce routes to market, and
- to determine the potential enablers of e-commerce.

F-Literature Review

Global retail e-commerce sales are predicted to continue increasing to beyond \$6.5 trillion by 2023 (Plytix, 2020) and to \$16.2 trillion by 2027 at a projected compounded annual growth rate of 22.9% from 2020 to 2027 (Meticulous, 2021). The number of online shoppers has increased from 1.3 billion in 2014 to approximately 2.1 billion in 2021 (Coppola, 2021). The rise in internet and smartphones users, easy marketing through social media, evolving omni-channel business models, and new payment methods, together with e-commerce automation drive the growth of e-commerce, whilst online fraud and cybersecurity breaches have had an opposing effect (Meticulous, 2021). The Fulfilment Lab (2021) projects that the United States in-store sales are expected to be exceeded by eCommerce sales by 2024.

The South African retail industry was worth approximately R1 trillion in 2020 which is less than it was in 2019 (Tighe, 2021). South African online sales exceeded R30 billion (\$1.8 million) in 2020, which is a 66% increase from 2019 (USITA, 2021) and more than twice the R14 billion reached in 2018 (Goldstuck, 2021). Expansion in pre-COVID times was organic and followed a natural evolution pattern driven by consumer habits and the strategies of retailers, but the pandemic precipitated an e-commerce demand explosion (Goldstuck, 2021). Mastercard's 2021 data found that 68% of their survey respondents have increased their online shopping since the start of the pandemic. 71% of those respondents planned to continue shopping online post-pandemic (Morel, 2021).

2.1 Perceived benefits of E-commerce

In-person shopping and online shopping are no longer separate or competing models but are rather merging into one omni-channel offering (McAdams, 2021). With growing technology, consumers expect seamless convenient and connected retail experiences that blend into their everyday lives (Clack, 2020). Entrepreneurs thus need to develop their e-commerce capability to survive market competition (Ishtiaq, 2020). The following are the benefits to businesses:

- **Operating hours:** Unlike a physical store, online stores are accessible to consumers at any time of the day or night. They are available without the cost of onsite staff at overtime rates and without any of the other challenges associated with twenty-four-hour operations (Joseph, 2019).
- **Cost effective:** Setting up a e-store is cheaper than setting up a physical shop or a second branch. Besides avoiding property rental and other costs associated with a physical building, cost savings come from cheaper marketing and lower permanent staff requirements due to automation and outsourced skills (Ishtiaq, 2020).
- **Global reach:** Whilst a company may not necessarily strive to have a global reach, global reach is enabled by e-commerce and companies may reach and interact with consumers in any part of the world if they choose to do so (Joseph, 2019).
- **Scalable:** E-commerce is easily scalable through expanding serviced geographies, an updated and optimized site, or new features and services to match market trends and customer demand (Ishtiaq, 2020).
- **Faster response to market demands:** Amazon (2021) believes that every interaction is faster on E-commerce marketplaces and that customer demands are easier to respond to. Market trends are easy to react to and sellers can launch promotions and make deals available efficiently and quickly.
- **Marketing:** An e-commerce site with the right strategies can generate sales by effective target marketing and converting visitors to leads. These leads ultimately become paying Customers, especially with more customers turning to the internet for information (Membrillo, 2021).
- **Enterprise extension and technology integration:** The Internet is a relatively low cost means to extend a company's enterprise beyond its own organization. Enterprise resource planning (ERP), supply chain management (SCM) and customer relationship management (CRM) are tools that can easily be deployed and integrated efficiently over the Internet, enabling efficiency across multiple disciplines (Joseph, 2019).
- **Disintermediation:** E-commerce is effective in reducing the number of levels between customers and suppliers, thereby improving efficiency whilst reducing costs (Joseph, 2019) along the supply chain and ultimately to the customer.
- **Improved customer service:** E-commerce facilitates easy to use feedback mechanisms on products and service via ratings, comments and returns. This data is a key input to improving both service and product quality (Urjalab, 2020).
- **Technology-based customer interface:** The e-commerce technology suit allows for 'screen-to-face' customer interaction via electronic devices. This increases the options that customers have available to interact with a business. Such options include email, contact forms, rating systems and chat bots. In many cases these electronic options are more cost effective over time and can reduce the customer issue resolution time and hence increase sales through better customer satisfaction (Joseph 2019).
- **Customer-controlled interaction:** The customer controls the interaction with the retailer and is free to make use of self-service functionality and decide when to shop or log a query. Conversely, a

physical shopping experience puts some control back in the hands of the retailer, especially where the quality and influence of staff may impact the overall shopping experience positively or negatively (Membrillo, 2021).

- Customised shopping experience: Virtual stores have functionality and data that may be used to customise a shopper's online experience. Data such as previous purchases, product ratings, past search behaviour, location and many other elements, form part of a data set that is, once analysed, used to decide how, when and what to present to a specific customer (Membrillo, 2021).
- Knowledge of customer behaviour: E-commerce facilitates, with other technology partners, the collection of an unprecedented amount of high-quality data on a customer. Such data includes customer behaviours on websites visited like, length of stay, page views, wish lists and shopping carts, purchases, value of purchases, repeat purchases and visit-to-purchase percentages (Membrillo, 2021).
- Localisation: The process of preparing content that is technically and contextually appropriate to a specific regions' language, currency, units of measure and other unique factors including slang and culture. Cross-border retailers that are not considering localisation are potentially missing out on a growing market (Plytix, 2020). Localised e-commerce may be considered a benefit and competitive advantage for local retailers in their home country.

Many of these benefits would be available to SMMRs who adopt e-commerce route to market to build their businesses.

2.2 Inhibitors to developing E-commerce routes to market

Wymer and Regan (2005) classified factors that influence e-commerce adoption decisions into four factor groups. These factor groups of Environmental, Knowledge, Organisational and Technology were used as a framework to classify the inhibiting factors identified in this study.

- Environmental inhibiting factors:
 - Regulatory challenges: AL-TIT (2020) concluded that legal barriers were an inhibiting factor for the adoption of e-commerce. Local laws and regulations for international e-commerce is a challenging factor for the overall e-commerce market (Meticulous, 2021).
 - Competitive pressure: Competitive Pressure is an external force that triggers organisational change to keep up with competitors (Spacey, 2020). However, many companies have still not adopted the e-commerce route to market, despite the external pressure to do so (Marotta, 2021).
 - Market viability: Whilst the e-commerce sector is growing rapidly, not all market sectors shop online. Despite the efforts of government to grow e-commerce during the COVID-19 pandemic, persistent digital and economic divides prevented full participation (OECD, 2020).
 - Availability of partners and vendors: Van Huy et al (2012) identified two inhibitors of e-commerce adoption: the complexity of innovative solutions and the perceived risks of e-commerce. The choice of methods by which a company can adopt an e-commerce solution in 2021 has grown substantially with a variety of service providers using different commercial models (DeMatas, 2021). However, the readiness of suppliers to integrate with new technology solutions is still a critical inhibiting factor (Karrer, 2017).
- Knowledge inhibiting factors:
 - Experience: A lack of prior experience with new technology implementations and the lack of understanding of available e-commerce solutions is a significant inhibitor of e-commerce adoption (Wymer and Regan, 2005). Online retailing requires a different skill set from a traditional retail store (Bick and Leigh, 2014).
 - Innovativeness: AL-TIT (2020) concluded that both Innovativeness and Perceived Ease of Use were important barriers to e-commerce if senior leadership did not have the willingness to change or felt that e-commerce adoption was difficult. However, necessity triggered by COVID-19 may have overridden the influence of Innovativeness and PEOU in recent times (Dludla, 2020).

- Organisational inhibiting factors:
 - Senior management support: Apart from financial support, non-financial support from senior management is critical to the adoption of digital transformation, and active participation in projects (Karimi and Zhiping, 2015). Digital projects without support from executive management is a common reason for project failure (Andriole, 2021; Imran et al., 2021).
 - Logistics efficiency: Logistics capability is the backbone of e-commerce (Bhattacharjya et al., 2016). Delivery infrastructure problems and concern for reliability of delivery after the purchase of high value goods was identified by Bick and Leigh (2014) as an e-commerce inhibitor.
- Technology inhibiting factors:
 - Technology costs: AL-TIT (2020) identified connectivity cost and technology costs as an inhibiting factor of e-commerce. The high costs of successfully integrating business processes are an underlying reason for low e-commerce adoption, which remains below 2% of retailers in Africa (Mkansi, 2021).
 - Trust in technology: Trust and confidence in web and internet technologies, including payment security is an adoption inhibitor, if companies are not able to meet these technical requirements (Wymer and Regan, 2005).
 - Product information management: Product Information Management (PIM) is a growing and necessary discipline to assist organizations in managing and distributing their product data efficiently and effectively. Those who are unable to execute PIM effectively are at a disadvantage in adopting e-commerce (Plytix, 2020).

The above inhibiting factors may represent significant challenges to SMMRs, who are typically stretched to meet current operational challenges without introducing an e-commerce route to market.

2.3 Potential enablers of developing an E-commerce route to market

To address the challenges of developing an e-commerce route to market, the following non-technological and technological enablers are proposed:

- Non-technological enablers:
 - E-commerce strategy: Ndayizigamiye et al (2019) concluded that having an e-commerce strategy is a significant enabler to e-commerce adoption by South African SMMEs. Conversely, the lack of an E-commerce strategy is identified as a barrier to implementation by other researchers (Wymer and Regan, 2005) and (Karimi and Zhiping, 2015).
 - Compatibility: Any contemplated IT project must be aligned to the needs, goals, and cultural values of the organization. Compatible projects are well accepted by all concerned and the chances of success are increased (Meirmanova, 2020; Altameem and Almakki, 2017).
- Technological enablers:
 - Basic technology: Retailers must have the basics in place before embarking on any e-commerce strategy, including internet access, e-mail and a website. Computerised databases of customers, suppliers and an inventory of products and services were also defined as essential precursors (Ndayizigamiye et al., 2019).
 - Enterprise integration: The establishment of organisational processes by linking software, hardware, data, and other resources, using technology (Hughes, 2021). Enterprise integration in e-commerce facilitates the management of huge volumes of data from different applications and systems, which would be almost impossible to manage, let alone analyse, manually (Altameem and Almakki, 2017).
 - Security: For an e-commerce market channel to survive, all transactions must be private and secure (Alqahtani et al., 2012). IT Security refers to all mechanisms used to defend digital assets from disruption, theft and exploitation by unauthorized individuals commonly known as threat actors. Threats can be malicious or accidental from external or internal parties (Bacon, 2021).

- Innovation adoption and IT agility: According to Odhiambo (2013), the adoption of e-commerce is majorly influenced by customer pressure and their perception of innovation. Companies therefore have the additional pressure of sifting through technology that is inward facing and those that are customer facing. At the same time companies need to be able to decipher fads from value adding innovation (Bones et al., 2018).
- Service providers and associated software: Besides the one-stop shop service provide described by Luo (2018), SAAS (Software as a Service) is a growing trend where companies provide enabling technology and support it for a service fee that is either payable monthly or based on customer usage and transactions (Supriyono, 2019). Other enabling companies sell the rights to their enabling software that is easy to implement and operate (Howe-Patterson and Schuiling, 2020).

There are a number of internal and external enablers of developing an e-commerce route to market which SMMRs could follow, particularly to turn the challenges into opportunities.

3. Research Methodology

With reference to the relatively sparse prior research in the field of SMMR e-commerce initiatives and challenges, this study employed an exploratory, qualitative approach, with both deductive and inductive analysis in a cross-sectional design. The available literature informed the construction of the interview guide which also included open-ended questions, and the transcripts were analysed both deductively and inductively, seeking pre-identified and new concepts. The analytical process described by Saldana (2021) was utilised for the analysis, whereby the transcripts were coded individually, then codes were aggregated into logical clusters called categories. The categories were then consolidated into themes which constituted the findings of the study. The computer software NVivo was utilised to follow the process just described.

The population for this study included all those that belong to the retail community, particularly store owners of SMMRs; the non-probability sample was initially selected purposively from the researcher's network and by snowballing thereafter. The sample size was 17 respondents, who were retailers that represented various industries including Clothing and Apparel, Health and Beauty, Food and Beverage, Industrial and General Hardware, Pet Care, and General Merchandise.

Guba and Lincoln (1994) proposed trustworthiness as a primary criterion for evaluating the rigour of a qualitative study. Trustworthiness consists of four aspects as follows: transferability is equivalent to external validity, credibility to internal validity, dependability to reliability and confirmability to objectivity. Transferability was addressed through detailed transcript analysis to provide rich descriptive narratives; credibility was applied through peer debriefing among the authors and through member-checking with the participants; dependability and confirmability took into account the systematic design and operationalisation of the study and the collecting of auditable recordings and transcripts, The interpretation of the feedback from participants was discussed with respondents at the end of each interview to check for accurate translation of feedback and minimise researcher bias (Bell, Bryman and Harley, 2019).

The limitations of the research include the small, non-random and non-representative sample size, implying that the results cannot be generalised to the population. However, a quantitative assessment of the various barriers to enumerate their relative importance can be conducted at a later stage.

4. Results and Discussion

The seventeen participants were retailers representing various industries, mainly micro enterprises with a turnover less than R10m, and eleven already had a general website that informed customers about their business, with ten already having developed some sort of e-commerce presence. All respondents believed that they needed to retail their products online in addition to their current physical stores.

The analytical process begins with codes from interview transcripts which are grouped into categories, then themes. For reasons of brevity, the results are presented with the themes as the main subheadings, and each theme is backed up with direct quotes from the transcripts and the categories are not specifically named.

The results are presented in response to the three Research Objectives:

4.1 Perceived benefits of E-commerce

The benefits of e-commerce as perceived by the participants related mainly to Marketing, Sales, Business Continuity and Omnichannel Benefits:

Marketing:

“Online is where anyone can see my products, even in America!” was the first reaction one participant had when asked about the benefits of e-commerce. Another said, *“Marketing – e-commerce makes us look more professional.”*

Most participants felt that the marketing benefits were significant when adopting e-commerce. They believed that being online was a necessity to stay abreast with current business practices, market demands and competitors’ actions. As one participant enthusiastically put it, *“Today e-commerce is almost like compulsory.”* Participants felt that E-commerce enabled them to improve their brand exposure and facilitated appearances on search engines. *“People get to know who we are and how special our products are.”* The marketing benefits correlate directly with Membrillo (2021) and Ishtiaq’s (2020) findings.

Sales

Whilst increased sales were listed as a key benefit, unexpectedly, an increase in sales was not cited as the primary reason for most of the respondents to adopt e-commerce. Many commented that it was more important to ensure that they were seen, by customers, to be keeping up with the trend and that they could compete for sales in the e-commerce channel. *“E-commerce allowed us to create stickiness with our customers by interacting with them online, and that improved sales.”* commented one participant. Expansion of sales territory locally and, for some, internationally was an important factor raised by many participants.

Business continuity

“COVID has shown everybody that you don’t need to meet anyone in person – that is the oldest way to do business.” Traditional retailers saw rapid stagnation of sales during the COVID-19 pandemic (Daniel, 2021). Many respondents cited e-commerce as a major factor when it came to its business continuity benefits. *“We had no choice!”*. Those that had already implemented some form of e-commerce were grateful that they had, whilst those that had not, felt that it would have made the peak lockdown levels easier to deal with.

Omnichannel benefits

Participants saw the additional exposure via e-commerce as means to attract new customers to their walk-in stores whilst at the same time, adding the element of convenience to their established customer base. Several participants also suggested that the ability to list thousands of unique items on an e-commerce platform improved their ability to market, and sell, a full range of products to customers. One participant translated the impact into terms of margins by noting that, *“Faster selling lines typically attract lower gross margins whilst the more specialised items typically carry healthier gross margins.”*

4.2 Inhibitors of E-commerce adoption

Lack of strategic intent

While the benefits of e-commerce were recognised by participants, most participants did not see it as part of their primary strategy. Customer convenience, keeping up with modern trends and COVID-19 seemed to be the main reasons for businesses investing in e-commerce. One owner was adamant, *“Our customers like to browse. We are very much a face-to-face business with long standing*

customers. *We went online only to support our customers when they couldn't come in. They are back now.*"

Many felt that they had survived thus far on what they have been doing and had the pandemic not happened, they would have continued along their path. They felt that optimising existing channels and the exploration of other channels, like increasing bulk through subsidiaries, were more important. *"I would rather sell 50 units once, than 1 unit 50 times. That's why I focus on growing my B2B channel instead."* explained one interviewee. Innovativeness is described as a company's willingness to adopt new technology (Wymer and Regan, 2005). In the opinion of most participants, the adoption or acceleration of adoption was a forced necessity. Dlodla (2020) agrees and reported that necessity triggered by COVID-19 may have overridden the influence of Innovativeness.

Lack of knowledge

Unanimously, all participants noted that a lack of knowledge and in-depth understanding of e-commerce was a significant inhibitor to not only getting started but also to operating in the e-commerce environment. Where and how to start was the biggest concern for those that had not yet adopted e-commerce and for those that had previously attempted it, a lack of sufficient knowledge and the wrong partners quickly resulted in failed attempts. The retailers that had already established an e-commerce platform before the interview also reflected on a lack of knowledge being a hinderance when they began. Some of the many responses from participants were, *"I need someone who can make it simple for me."*, *"I don't know where to start."*, *"The only thing I do online is study stitching techniques."*

A lack of in-house expertise further exacerbated the situation since internal resources were, due to a lack of knowledge, not able to monitor and manage the quality of the output from external providers. Participants also felt that in many cases, external service providers did not understand the intricacies of their businesses well enough. This lack of business knowledge and context hindered the quality of the e-commerce output. Explaining his conundrum, one participant said *"Older staff understand our business – younger staff understand IT."*

Financial resources

Funding, especially for the smaller businesses in the sample set was cited as a major barrier for adoption. *"Our business case failed because of all the hidden costs."* Most participants commented that e-commerce was more complex than they initially anticipated. Options to implement e-commerce vary from custom-built sites to Software as a Service options like Shopify. There are many activities that go together with an online store, such as social media marketing and there are also hidden costs such as product and site maintenance. The lack of knowledge around these aspects has led to many of the participants spending more money on e-commerce implementation efforts than they had originally envisaged.

When compared with physical stores and infrastructure costs to achieve increased sales, Joseph (2019) found e-commerce to be cheaper. However, the costs incurred by participants seemed to be driven by experimentation and bad experiences, due to a lack of knowledge and being unable to find the right partners.

Pricing and margin structures

"I lose money every time I sell on Takealot. They have a fee for everything!" Several of the smaller businesses in the sample set were not originally set up with the prospect of e-commerce or complex distribution channels in mind. Their pricing and margin structures became a major inhibiting factor as their businesses needed to consider e-commerce. The targeted margins and associated pricing did not consider the costs associated with e-commerce platform creation, maintenance, and management. These structures did not cater for the additional marketing, transport, and packaging requirements either.

Internal human resources

“...but also, we don't have the drive or the manpower to start. All our money is invested in stock and store costs so we can't afford more staff.” Notwithstanding the initial effort of implementation, participants cited the onerous tasks of ongoing maintenance and the need for resources to manage such tasks as a major inhibitor. Some examples of the tasks referred to, are the creation and management of product images in the correct format and size, the maintenance of pricing files and availability of stock. Some went as far as saying that they believed that the entire e-commerce operation would need to be separated from their physical store. This was mainly driven by perceived challenges of integrating current systems with the e-commerce systems.

Product and service type complexities

Most of the participants raised their product or service type complexities as major challenges. Service type complexities were related to value added services that go along with the purchase of a commodity. Examples of these were alterations to clothing, adjustments on custom made shoes and bags, calibration of devices, and fitting and assembly of equipment. These value-added services are generally conducted in person and not conducive to the online environment. Most retailers in this situation felt that they would need to remove these commodities and associated services from their online offering.

Simply put by one participant, “*Of course I can sell a suit online, but the customer has to come into the store for a fitting and alteration – what's the point?*”

The product type complexities mainly affected the legislative and logistics aspects related to the e-commerce value chain. Examples of the logistics challenges included the high rate of return on footwear and clothing, the transport of perishables and fresh produce, maintenance of the cold chain, transportation of cheap but heavy products like water and the transport of large spare parts that are bulky, heavy and of various shapes. Whilst these challenges exist outside of the e-commerce value chain, it was the challenges in the context of the last mile delivery to customer that was of primary concern. Bhattacharjya et al (2016) found that retailers who did not have sufficient logistics capability may be inhibited in adopting e-commerce. However, no literature was found to completely exclude the possibility of e-commerce adoption because of poor logistics capability.

Options as an inhibitor

A few of the comments from participants when discussing e-commerce and ancillary options were captured in Figure 1.

Figure 1. Options as an Inhibitor Word Cart – Comments from Participants.

Based on the comments in Figure 1, it is apparent that navigating through the various options for e-commerce adoption was a daunting task for many participants. The main concern with options is that there were too many to choose from multiplied by the number of commercial structures. Participants found this overwhelming especially at the beginning of their enquiries and, because most were new to e-commerce.

Many participants felt that at the beginning, the benefits of social media and e-commerce were difficult to measure in terms of their return on investment. This made it difficult to allocate more funds to a project that did not yield good returns early. One participant said, “*it’s a lot less tangible than placing a product on the shelf, watching people interact with the product, and then buying it. All the store costs are known and easier to understand*”. Hidden costs were a major concern for those that used hosted sites, online marketing, and Software as a Service (SaaS) options. In some cases, a lack of understanding of the costs lead to major errors in their business cases. One participant quipped, “*we learnt very quickly that footsteps were free, but clicks were not*”.

4.3 Enablers of E-commerce adoption

Momentum through forced adoption

Participants unanimously agreed that the COVID-19 pandemic had a major influence on their e-commerce channels. The pandemic and associated restrictions forced companies to quickly adopt e-commerce if they did not have an established channel. In instances where they did have an existing channel, they were forced to enhance what they had. Many of the respondents said that they did not have time to carefully consider all options or costs. One participant said, “*We chose the first option that sounded reasonable because every day spent on decision making was another day without sales*”.

Social media

“*We do a lot of social media. Posting, posting, posting, everyday...*” was by far the most succinct articulation of the role of social media as an enabler. Social media has been a useful enabler for the

smaller businesses in the sample set. While not a full value chain e-commerce offering, it was seen by participants as a very important first step and precursor to a full-service e-commerce offering.

This basic value chain involved listing and marketing, albeit with no targeting, on social media. Once a customer was interested, the closing of the sale moved to mobile phone or email and payment was then concluded. Payment was often done via eft or cash on delivery. *“Selling on social media”* was a commonly used misnomer amongst the micro-retailers in the study. Interestingly, one participant had deliberately stayed off Facebook because they did not want to expose their different pricing strategies in different regions. *“My Durban customers are used to paying my price, but I have to make it cheaper for the Joburg customers to try it out.”*

Payment options on Social Media

Another potential enabler raised by the micro business was the creation of payment options on social media. At this stage payment is still handled offline and, whilst there are a few missing pieces, payment is the biggest missing piece of a full value chain e-commerce offering on social media. Many of the micro-retailer participants deal with people in poorer communities who do not use traditional banking methods for payment. Cash and lay buying are still very popular amongst this customer group and the participants felt that a solution to social media payment would enable better e-commerce adoption and market penetration.

5. Conclusions

Despite the scepticism of the South African businesses interviewed, all indications are that e-commerce will continue to grow steadily (Goldstuck, 2021). South Africa has a low adoption base at 2.8% (Daniel, 2021) and this is positive for early adopters. The conclusions to the research objectives are summarised below, against the prior research of each:

Since the contribution of the study can be suggested by comparing the literature review contents with the study findings to establish the extent and nature of gaps and overlaps, the tables in the following section indicate a brief statement of the literature review contents in the left-hand column and a brief synopsis of the study findings in the right along with a comment regarding the nature of the differences between the two.

5.1 Objective 1: Perceptions of benefits of E-commerce

The conclusions for the findings of this objective versus the Literature review are summarised in Table 1 below:

Table 1. Summary of Perceived Benefits of E-commerce versus Literature

Extent of Alignment	Notes and Possible Explanations
Good Alignment	
Marketing, sales, business continuity, omni channels.	Literature was more comprehensive and detailed than interview feedback.
Partial Alignment	
Market demands, customer service, customer experience, benefits of a scalable business.	Participant views were less in-depth and focussed on less complex aspects of these topics, indicating signs of a less mature e-commerce market. Micro retailers were less concerned with customer experience and more concerned with just getting online to begin with.
Opposing Views	
Cost of e-commerce.	The literature view that e-commerce was cost effective was not shared by interviewees. Participants viewed e-commerce as an add-on cost instead of an indirect cost saver. Retailers felt that e-commerce had become cheaper over the years but was still not easily affordable. This was probably also linked to the pricing and margin structure challenges raised by participants when discussing inhibitors.

The main difference in perceptions of the benefits is whether e-commerce is cost effective. The investment in traditional retail infrastructure is viewed as a sunk cost, whereas investment in e-commerce is perceived to be a major additional investment difficult to measure in terms of return.

5.2 Objective 2: Inhibitors of E-commerce development

The conclusions for the findings of this objective versus the Literature review are summarised in Table 2 below:

Table 2. Summary of Perceived Inhibitors of E-commerce Development versus Literature

Extent of Alignment	Notes and Possible Explanations
Good Alignment	
Strategic intent, management support, knowledge, trust, financial and human resources, legislation and regulation, competitive pressure, and information management, logistics.	Literature was more comprehensive and detailed than interview feedback.
Present in Data but not in Literature	
Product and service type complexities. Service type complexities were value added services like alterations to clothing, adjustments on custom made shoes and bags, calibration of devices, and fitting and assembly of equipment.	A major inhibitor according to participants. These value-added services are generally conducted in person and not conducive to the online environment. Participants felt that they needed to remove these commodities and associated services from their online offering. Most literature seemed to focus on commodities that were easier to retail online.
Pricing and margin structure challenges	The stagnating effect on small businesses trying to adopt e-commerce was significant. Most literature reviewed for this study focussed on SMMEs in general but none on micro enterprises only. Micro businesses in the sample set did not start up with e-commerce in mind and hence pricing structures and margins did not cater for e-commerce adoption.

While there was fair consistency in the results with prior studies, the main additional inhibitors involved providing services online, and in the pricing challenges online versus traditional retailing.

5.3 Objective 3: Enablers of E-commerce development

The conclusions for the findings of this objective versus the Literature review are summarised in Table 3 below:

Table 3. Summary of Perceived Enablers of E-commerce Development versus Literature

Extent of Alignment	Notes and Possible Explanations – Summarised
Good Alignment	
Momentum Through Forced Adoption (COVID-19)	Whilst the Pandemic had a devastating effect on most economies, the literature and data were very aligned on the role it played in fast tracking e-commerce adoption.
Availability of e-commerce technical options and service providers	Participants viewed this as an enabler and inhibitor. Most thoughts on its inhibiting nature emanated from a lack of knowledge and expertise. <i>“It’s the fear of the unknown that makes it overwhelming”</i> said one participant.
Present in Literature but not in Data Gathered	
Security, enterprise integration and enablement innovation.	These are more technically advanced enablers. E-commerce immaturity played a role in participants not knowing about or using such technology yet.
Present in Data but not in Literature	
Social media and associated payment options.	The positive impact of social media and the potential of associated payment options on small businesses was widely raised by participants, Social media was not well researched during the literature review as it was not seen as a core function of online retailing, however its impact as a gateway to a full e-commerce service offering was underestimated in this study.

While the Covid-19 pandemic was certainly an instigator towards developing e-commerce for SMMRs, the initiative is still seen as overwhelming, requiring some assistance from experts. Social media was highlighted as an enabler to assist the transition.

6. Managerial Implications

SMMRs need to move beyond the thinking that e-commerce was something they were forced to do because of COVID-19 and rather place e-commerce high up on the company strategy agenda.

If SMMRs want to elevate their e-commerce route to market offering, the following steps are recommended, based on the findings of this study, as illustrated in Figure 2:

Recommendations to Elevate E-commerce Route to Market Offering

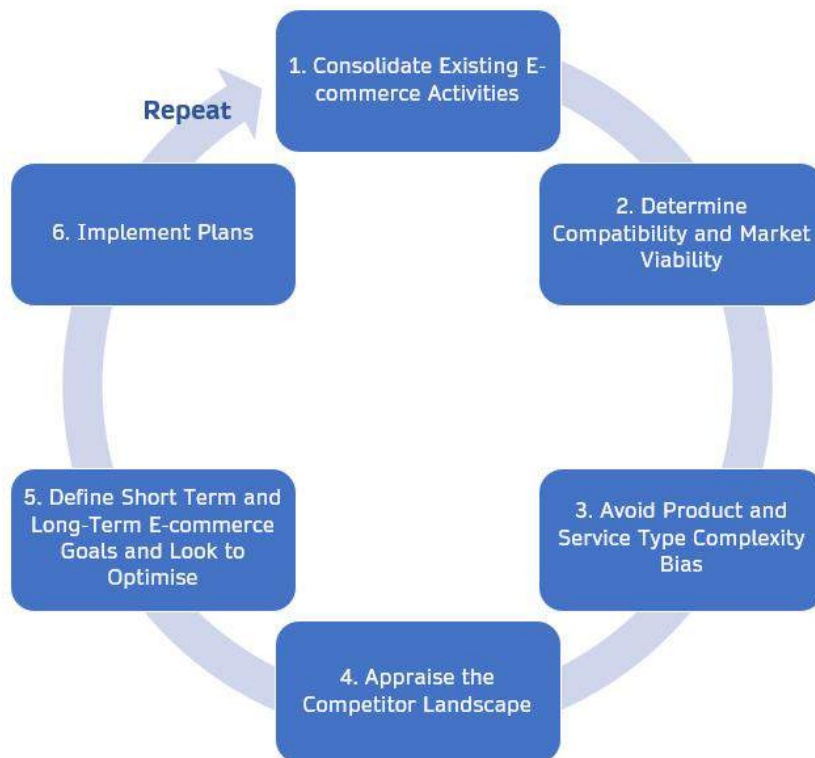

Figure 2: Framework to Elevate E-commerce Route to Market Offering

1. Consolidate Existing E-commerce Activities

A good first step would be to review what is already in place. The company should understand what they have, what is working, what is not, what is incomplete and what is it costing. A full assessment of the total as-is situation should be conducted, including that of service providers, commercial models and e-commerce platforms and tools. Current benefits, enablers and inhibitors should also be considered.

2. Determine Compatibility and Market Viability

Before any further steps are taken, compatibility and market viability should be determined. Compatibility is considered a criterion for assessing the completeness of e-commerce initiatives and it is an important enabler for e-commerce implementation success (Altameem and Almakki, 2017). The company should review the needs, goals, and cultural values of the organization and ascertain if they align to an e-commerce strategy.

Market viability is a measure of the potential of a business to thrive in a specific market (Estay, 2021). The company should assess the market that it plans to serve and ascertain if there is a need for e-commerce. If a need is identified, the specific needs and challenges of that market should be considered.

3. Avoid Product and Service Type Complexity Bias

The specific product and service type complexities of a business must be seriously considered. However, participants of this study seemed too dismissive of the possibility of e-commerce being useful in their environments and did not consider the potential benefits carefully enough. Quotes such as “*our business is unique*”, “*we are not an online business*”, “*we are too specialised*” were too commonplace during the interviews.

4. Appraise the Competitor Landscape

Understanding what direct and indirect competition exists and assessing their actions, strengths and weaknesses is a critical input to developing a strong e-commerce offering. Participants of this study did not understand their competitor landscape well and as a result, were not able to articulate how they might outsmart them.

5. Define Short Term and Long-Term E-commerce Goals and Look to Optimise

Once the company has a clearer understanding of their e-commerce environment, it is important to set short-term and long-term e-commerce goals, using the newly conducted analysis as a key input. A full technology assessment should then be conducted with these goals in mind. The technology assessment should include input from the previous as-is assessment and a review of new and established platforms.

The South African market has the advantage of being e-commerce followers in many regards and companies should not miss this opportunity to learn from international trends and more mature markets. The role of social media must also be seriously considered. It must be noted that not all possible solutions must be implemented, but they should be considered in the context of the set down goals.

6. Implement Plans

Once the options to optimise have been assessed, an appropriate implementation plan should be defined, including time, cost, and quality aspects. Knowledge, access to professional services providers and software options were all identified in this study as factors that significantly influenced e-commerce adoption. It is therefore recommended that companies supplement their internal knowledge by engaging with e-commerce implementation professionals to assist them with their e-commerce adoption and transformation activities. The defined plans should be implemented, and the cycle repeated after a period determined by the company.

7. Recommendations for Future Research

This research study was exploratory, which provides several opportunities and directions for research. First, researchers could do a quantitative study with a representative sample to verify the findings of this study.

Second, a study that splits micro and start-up businesses from medium-sized businesses may yield different results. The views of the smaller businesses seemed more focused on getting started and finding their feet, while the bigger businesses had already started exploring aspects of optimisation, although not to the level of more mature markets.

The development of e-commerce in lower income societies and the role of social media as a precursor to the full e-commerce value chain is an important topic of research for South Africa.

The proposed steps and model proposed in the Recommendations (Figure 2) is a high-level summary and can be enhanced by a more in-depth study and by drawing on existing literature on the individual steps.

Finally, a longitudinal study after an intervention to develop an e-commerce initiative in a SMMR could provide insights into the effectiveness of the intervention, as to whether the inhibiting issues had been addressed.

Age as Moderator in Technological Acceptance of Airbnb Purchase Intentions

Keywords

Airbnb; shared economy; Age as moderator; Technology acceptance; Purchase intentions

Abstract

Despite Airbnb's incredible popularity, few studies have examined user attitude towards technology acceptance and the role age plays as a moderating variable in impacting user purchase intentions in the context of Airbnb. This study was conducted by applying Technological Acceptance Model (TAM), to which the Theory of Reasoned Action (TRA) is applied. This research, with age as a moderator, in the context of Airbnb is a first of its kind. These results will assist marketers in understanding potential profits forgone in relation to certain age demographics in the shared economy and the factors at the margin that determine their participation. Data was collected from a target population of consumers across South Africa and the data was analysed using the theoretical framework. The study finds that the value of connectedness increases as consumers age and is positively significant in influencing the technological acceptance and purchase decisions of older generational groups, especially in the context of applications such as Airbnb. E-commerce technology that holds some form of social benefit for its users want to be accepted by the older generations, the value of its ability to connect with loved ones needs to be explicitly communicated.

1. Introduction

The hospitality industry has been heavily disrupted in recent years due to the establishment of the shared economy and the birth of Airbnb (Oskam and Boswijk, 2016). Airbnb is a peer-to-peer accommodation service where users can either participate as guests or hosts. Airbnb has seen a meteoric rise in user participation since its inception due to the unique experiences and added value it offers (Guttentag, 2013). A combination of convenience, competitive pricing, authentic experience, social interaction and ease of use are all factors that have influenced the consumer decision making process and resultant purchase intentions. It is important to understand the factors that influence the purchase decisions of this relatively novel concept as well as investigating moderating variables that may not have previously been considered. This could allow for optimization of user experience by Airbnb to increase user participation across user demographics that may have been previously overlooked. It has been proposed that the extent to which a user accepts technology plays a significant role in their resultant participation in Airbnb and the shared economy.

1.1 Problem Investigated

Previous studies have used the Technology Acceptance Model (TAM) theoretical framework, which illustrates the extent to which an individual accepts a certain technology. The TAM model uses two factors as key indicators of the likelihood and extent of technology acceptance (Wang and Jeong, 2018). These factors are perceived usefulness (PU) and perceived ease of use (PEOU) of the technology in question. Previous studies have found that in the sharing economy, not necessarily all e-commerce platforms, perceived usefulness is more significant as a determining factor in whether or not a user adopts the specified technology. Perceived usefulness is defined as "the degree to which a person believes that using a particular system would enhance his/her job performance" (What is Perceived Usefulness (PU) | IGI Global, 2021). In the context of TAM analysis in Airbnb and the

*Corresponding Author

¹ E-mail address: deon.nel@uct.ac.za

shared economy, “job performance” would be reframed as “personal situation”, i.e., the degree to which a person believes that using Airbnb would enhance his/her personal situation. The relationship between perceived usefulness and technology acceptance has been found to be positive.

Past studies have highlighted several factors within the end-to-end user experience of Airbnb that significantly influence purchase decisions and future participation of Airbnb users. The level of trust, both towards technology and hosts, that a user has impacts their purchase decisions and potential future participation (Corbitt, Thanasankit and Yi, 2003). The authenticity of the experience offered, be it in the form of the host being “local” and contributing to the authenticity of the experience or the authenticity of the accommodation itself (Kim and Kim, 2020). The convenience and practicality of Airbnb listings allow Airbnb to appeal to a wide range of user desires, both from a location and amenities standpoint, thus adding to the perceived value of the Airbnb experience (Guttentag et al., 2017). The social aspect Airbnb offers through host-guest interaction, which overlaps with the authenticity factor, has also proven to be a significant factor in influencing user purchase intentions.

There is extensive research into the factors within the end-to-end user experience of Airbnb that impact future user participation. On the technology acceptance side, studies have delved into the impact of technology acceptance on user participation in Airbnb due to the high level of technological interaction required. These past TAM theoretical framework results have shown that perceived usefulness is more significant in the Airbnb context than perceived ease of use. The incorporation of age as a moderator variable has only been implemented into the TAM model on an e-commerce level which offers different use benefits to Airbnb. There is thus a gap in the research towards age as a moderator variable in the TAM theoretical framework and the resultant user purchase decisions (Davis, 1989). This defines the problem statement as: *“How does user age influence their level of technology acceptance, in the Airbnb context, and their resultant purchase intentions and participation?”*

2. Research Objectives

The primary objective of this study is determine whether age has a significant impact on the level of technological acceptance of a user

The secondary objectives of this study are to:

- determine whether older generations are more likely to participate in Airbnb than other e-commerce platforms
- investigate whether the interaction between age and perceived usefulness of Airbnb has a positive impact on Airbnb technology acceptance and resultant purchase decisions
- investigate the impact of the interaction between age and perceived ease of use on Airbnb technology acceptance and resultant purchase decisions

3. Hypotheses

The following hypotheses were formulated for the study:

- H₀: Age is not correlated to perceived usefulness in the context of Airbnb
- H₁: Age will be positively related to perceived usefulness in the context of Airbnb
- H₀: Age is not correlated to perceived ease of use
- H₂: Age will be negatively related to perceived ease of use
- H₀: Age is not correlated to overall user attitude towards acceptance and use of Airbnb technology
- H₃: Age will be positively related to overall user attitude towards acceptance and use of Airbnb technology
- H₀: Age is not correlated to overall user attitude towards acceptance and use of Airbnb technology
- H₄: Age will be positively related to overall user attitude towards acceptance and use of Airbnb technology

4. Literature Review

In assessing the factors that influence purchase decisions and resultant participation in Airbnb, a broad view of the factors influencing consumer participation in the shared economy will be taken below. Beginning with literature covering technological acceptance and the role it plays in the initial steps in participation in the shared economy and Airbnb. The scope of the study will then become focused on the actual variables within the Airbnb experience itself that play a significant role in influencing user purchase decisions and subsequent participation in Airbnb. The role of trust will be analysed and how it is influenced by identity verification and pricing determinants within Airbnb. Further literature will be examined discussing factors, unique to the Airbnb end-to-end experience significant in impacting consumer decision making, specifically; authenticity; practicality and convenience; host-guest interaction; user response to targeted advertising; and finally, factors influencing participation in Airbnb from the hosting perspective.

4.1 Technology Acceptance

Technology is advancing at a fast pace, for some it has always been around, but for others it only came about in the second half of their lives or even later in some cases. As a result, we see differences in the level of acceptance individuals have of technology and the resultant role it plays in their everyday lives. To enter the shared economy through Airbnb means engagement with technology, there are no two ways about it. Suffice to say, it is imperative to accept technology before any other factors can play a role determining continued engagement with and participation in Airbnb and the shared economy.

Past research has shown that in the sharing economy, there is a positive relationship between the extent to which an individual has adopted technology and their purchase decisions (Wang and Jeong, 2018; Davis, 1989). The technology Acceptance Model (TAM) is one of the most widely recognized theoretical models to evaluate the extent to which users have adopted emerging technologies and online platforms. Theory of Reasoned Action (TRA) is applied by TAM in order to establish the correlation between the two key constructs, perceived ease of use (PEOU) and perceived usefulness (PU), and the corresponding user intentions, attitudes and adoption behaviour. The powerful theoretical framework that TAM operates on allows it to perform accurately across several different settings, samples and applications, from e-commerce to internet adoption. It is thus a quality tool when it comes to exploring user adoption and resultant brand loyalty. Thus, the concept of technology acceptance includes opinions about and attitudes towards technology, as well as a behavioural component (Hauk, Hüffmeier and Krumm, 2018). In the shared economy and Airbnb space, perceived usefulness has shown greater significance than perceived ease of use on user's adoption of the technologies involved and their resultant attitude towards the brand (Wang and Jeong, 2018). It is for this reason that we will be expanding on the foundation of TAM's theoretical framework by including the age of the user as a moderator variable. We can thus compare the impact of user age on technology acceptance and the resultant likelihood of participation in the shared economy through Airbnb. Another interesting discussion, which may be beyond the scope of this research paper, is the degree to which the country of residence of the user has adopted technology i.e., third world versus first world, and the impact that has on the technological acceptance of users in different age groups. A hypothesis would be that there is a positive relationship between the technological acceptance of the country as a whole and the corresponding likelihood of a resident from said country to participate in the shared economy and Airbnb. There would be an argument for the idea that first world generations, especially Generation X and earlier, would have higher technological acceptance levels than their third world counterparts

4.1.1. Age and Technology Acceptance

Technological advances have been exponential over the last few decades. A 60-year-old living in South Africa today would have been alive for 33 years before having ever been exposed to a cell phone, as they were only released in South Africa in 1994 (Linda, 2021). But how have such technological advances affected the psyche of different generations and how does the level of acceptance of said technology vary, depending on the generation that users fall into? TAM, the theoretical framework as mentioned previously, has already been applied in several different studies,

which looked for correlations between age and technology acceptance. The results have been mixed, some research finding a negative correlation, some no correlation and others finding a positive correlation, between a user's age and the degree to which they accept technology (Hauk, Hüffmeier and Krumm, 2018). It has been established that the response of users to the two key factors of TAM, perceived ease of use (PEOU) and Perceived usefulness (PU), is affected by age (Hauk, Hüffmeier and Krumm, 2018). The results from these TAM studies have shown some results that may be pertinent to the research question this study is to answer.

4.1.2. Perceived Usefulness and Age

Socioemotional Selectivity Theory (SST) states that the older people get, the more the gravity of the finitude of life weighs upon them, and thus affects their behaviour and the priority they give to certain activities (Carstensen, Isaacowitz and Charles, 1999). The Perceived Usefulness of a technology primarily depends on whether or not the user feels they need the technology as part of their lives (Hauk, Hüffmeier and Krumm, 2018). As SST has established, the older an individual gets, the more selective they are with their time and which activities they include. We can thus begin to see the inverse relationship between the age of an individual and the likelihood of technology adoption. Younger adults prioritise growth-related activities, such as acquiring knowledge and the betterment of their personal careers and life goals. As people age, their values shift away from growth and acquiring knowledge towards meaning and social needs (such as close social relationships, family, and emotionally satisfying activities) (Hauk, Hüffmeier and Krumm, 2018). We can now see the conundrum that the older generation faces when weighing up participation in Airbnb. The Airbnb app's technological features such as functionality, communication and payment methods, review systems and profile management all require the individual to put in time in order to understand. The older the individual, the longer it takes to learn foreign concepts such as this due to fluid cognitive decline, exacerbating the time shortage situation they face when deciding on whether or not to engage with the technology (Manard, Carabin, Jaspar and Collette, 2014). On the other hand, however, the use of Airbnb would enhance their ability to supplement their shift in desires towards meaning and interpersonal social connection and fulfilment with loved ones. Being able to search for accommodation at the touch of a button and be situated a stone's throw away from the people who mean the most to them would carry considerable weight too when establishing the perceived usefulness of Airbnb. We can therefore see that the opportunities of Airbnb may outweigh the costs of time spent learning to use and accept the technology. Not many studies have investigated the influence of age on PU in the Airbnb context, where human connection with loved ones is a by-product of using the technology.

4.1.3. Perceived Ease of Use and Age

As touched on previously, the use of the Airbnb technologies requires some degree of learning and understanding which requires the engagement of the individual's fluid cognitive abilities (Rogers, Hertzog and Fisk, 2000). This becomes increasingly more challenging as individuals age, fluid cognitive abilities such as memory capacity, effective working memory and the ability to do multiple, simultaneous tasks declines (Salthouse, 1990). The actual physical side of engaging with the application also becomes more challenging with age. Visual acuity declines and hearing threshold and acuity also begins to decline. These physical impairments make the navigation of the technology a challenge, as app/site buttons may be small and difficult to identify or hit and the identification of important aural queues or notifications may go unnoticed (Pichora-Fuller and Souza, 2003) (Owsley, 2011). This can be exacerbated further by decline in tactile acuity that is associated with the ageing process (Tremblay, Wong, Sanderson and Coté, 2003). As a result of these hurdles, both physical and cognitive, older generations develop a lack of efficacy toward shared economy platforms that inevitably pushes them away from the services (Del Chiappa, Pung, Atzeni and Sini, 2021).

4.2 Trust

Since the establishment of the worldwide web and the birth of e-commerce, there has been evidence of a positive relationship between the amount of trust consumers have towards e-commerce and the resultant decision to participate in an e-commerce transaction. Trust levels towards a particular e-commerce good /service provider are affected by things such as site quality, trust in technology and

the user's overall web experience (Corbitt, Thanasankit and Yi, 2003). These behaviours are mirrored to some degree, in the shared economy. There are, however, differences between e-commerce and sharing economy consumption, such as Airbnb. Because Airbnb is a polyamorous relationship between the user and the different factors of the Airbnb service, trust can be affected by the different stages of the transaction. The actual website or application used to search for the accommodation, the host of the accommodation or the accommodation itself. The user's engagement with these aspects of the overall user experience plays a role in establishing trust between the user and Airbnb or the shared economy as a wholistic marketplace. This resultant establishment of trust, or lack thereof, has been shown to play a role in the likelihood of future use/participation in Airbnb and the shared economy. A trustworthy environment established by Airbnb, through features such as a transparent pricing scheme, developing a secure and robust end to end transaction process and ensuring consistency and reliability in performance, have all shown to positively affect user participation. These traits can indeed help the case of Airbnb and the shared economy in general when it comes to establishing a trustworthy environment for consumers and ultimately maximising the probability for user returns (Wang and Jeong, 2018). Consumer behaviour is complex and there is not, however, a one size fits all feature addition that will increase user trust. The individualism of people and their relevant psychographic features affect the level of trust they have towards the shared economic system, even before they have begun searching for accommodation. Affective Events Theory (AET) says that users are motivated to carry out certain behaviours based on the amount of trust they have in individual hosts within the sharing economy. The encouragement of meaningful interactions between the hosts and the guests is part of the ethos of Airbnb and is based on the idea that doing so will build trust. Trust is imperative in order to build sustainable business relationships, especially in the online sphere (Kim and Kim, 2020). The two-way review system between hosts and guests, which Airbnb employs, plays a large role in developing trust in the app with future users. The evidence of past engagements and their corresponding reviews allow new users to make informed decisions based on the publicly available reviews on the host. Because these reviews are made by people very similar to themselves, it further develops user trust in the app and the decision-making process. This illustrates, once again, why trust is such a large determinant of a user's decision to take part in a transaction within Airbnb (Kim and Kim, 2020).

4.2.1 Identity verification

It is human nature to be somewhat superficial when it comes to making a judgement on someone purely based on their looks due to associated stereotypes and media. It is essential, especially during the evolution of mankind, to be able to discern between friend and foe so that relationships consisting of the sharing of resources can be possible (Darwin, 1873). This is the case in relation to Airbnb as it is a peer-to-peer platform where there is direct communication and transactions with hosts. In this marketplace, provided by a third party, intangible experienced goods are offered which are generally created and consumed simultaneously. Therefore, the calibre of the experience of a listing cannot be backed up until after the consumer has used the service. Thus, Airbnb has much more personal information required on the platform that can be viewed freely by consumers compared to the likes of conventional peer-to-peer marketplaces like Amazon. Therefore, profiles of hosts require personal images that act as identity verification and thus initiates a personal relationship between the host and consumer (Fagerström et al., 2017). Through rigorous research in the impacts of facial expressions in evolutionary times, within the interactive context, it can be seen that there is a strong awaking reaction to menacing impetuous like scary facial expressions which activate the fight or flight system within the brain that is crucial for survival (Tipples, 2008). This similar feeling can also be experienced even when looking at someone's picture online. Therefore, this will negatively affect a buyer's decision to interact with such a host. This also may prevent them from interacting entirely within that specific marketplace and thus their purchasing decision to rent will likely no longer exist. A profile that consists of positive connotations, however, such as showing happy expressions through a smile will likely have a positive perceived reflection of the host on the consumer, making them more likely to want to cooperate and purchase a listing. Proven by research, in a game of trust, players trusted partners who displayed a smile more than those who did not smile (Scharlemann et al., 2001). This is due to human nature whereby people are more trusting of familiar individuals and this familiarity is perceived through positive facial expression.

4.2.2 Pricing determinants

Similarly stated before, Airbnb heavily relies on their trustworthy environment to create a consumer-brand relationship whereby the price is not constrained by determinants such as star rating, demand and special events or holidays. Based on a sample of Airbnb listings in Stockholm, Sweden, research found that the perceived trustworthiness of the host, as inferred from the host's photo, is a better indicator of price and demand than review scores. Whereas, comparing this to what has been found in hotel performance data, it is proven from the online reviews that a 1% increase in the review ratings effectuated a 1.42% increase in proceeds for each room available (Gibbs et al., 2017). Furthermore, it has been found, from the host's perspective, that typically they undervalue their rooms to receive more customer requests so that they can pick and choose who they want to stay. This proves that, in contrast to set margins like in the hotel industry, hosts are driven by emotional decisions rather than monetary values. It can also be said that generally there are two main types of hosts who go about setting their prices differently. The first type is the professional host who focuses on financial performance from having numerous listings of two or more properties and the second type of host are those who only partake in one single listing. The professional type achieves 16.9% greater daily revenue on listings and 15.5% occupancy rates over the non-professional hosts (Gibbs et al., 2017). However, the differing performance levels from the separate types of hosts does not explain the factors that affect the pricing of listings. On the other hand, in the exploration of individual price differences, it has been found that racial discrimination is prevalent on Airbnb and affects pricing of individuals (Teubner, Hawlitschek & Dann, 2017). Researchers have found that Afro-American hosts have had to impose lower charges in comparison to white hosts by more than 12% (Teubner, Hawlitschek & Dann, 2017). It can also be seen in the consumers' point of view that booking requests made by those with typical white names are 16% more likely to be credited a listing compared to someone with a typical Afro-American name in the situation where a profile picture is not present (Edelman et al., 2017). Furthermore, through other related studies on the existence of racial discrimination on Airbnb, it has been found Asian and Hispanic hosts also impose lower charges compared to white hosts on the platform (Kakar et al., 2016).

4.2.3 Airbnb User Experience

The end-to-end user experience of Airbnb consists of a number of unique significant factors that influence consumer purchase decisions (Guttentag, Smith, Potwarka and Havitz, 2017). This combination of factors has allowed Airbnb to separate itself from competitors in the hospitality market. Some of these factors discussed are entirely unique to Airbnb and some have been adapted from their original forms present in traditional hospitality services. As a result, these factors and their resultant influence on future user participation and purchase decisions shall now be further explored.

4.2.3.1 Authenticity of the Experience

“Authenticity is a multifaceted construct that contains various ontological assumptions, perspectives, and typologies” (Wang and Mattila 2015, p. 348). In a world where technology can often make tasks or operations seem sterile and regimented, Airbnb has broken out to create an experience, driven by e-commerce functionality, based around authenticity and unique experiences combined with genuine, person to person transactions. Research has shown that a high proportion of users use Airbnb in search of such authentic experiences (Kim and Kim, 2020). Authenticity covers a range of consumer demographic desires. An authentic home environment, carefully arranged by a caring host, for the wary business traveller, looking for a “home away from home” to rest their head (Guttentag, Smith, Potwarka and Havitz, 2017). A couple, travelling the world, looking for an authentic experience and to “live like the locals” (Wang and Jeong, 2018). The peer-to-peer framework that Airbnb provides allows these authentic experiences to be had. As a result, Airbnb has been able to separate itself from traditional lodging and accommodation services through the authenticity and uniqueness it provides, both through interactions with the hosts and the resultant accommodation they provide. The level of perceived authenticity of the experience has been shown to have a positive influence on the repurchase decisions of the user (Kim and Kim, 2020).

4.3 Host-Guest Interaction

Airbnb, as previously discussed combines e-commerce operations and person-to-person transactions. This human interaction, between guest and host, plays a very important role in determining the value the user associates with Airbnb as a platform. Past studies have shown that the interaction between guest participation and host facilitation affects the perceived value of the transaction in the eyes of the guest and thus impacts their future purchase decisions (Jiang, Balaji and Jha, 2019). Value facilitation is the process whereby the host creates value for the client through providing information, assistance and recommendations (Grönroos and Gummerus, 2014). This value facilitation definition, however, focuses primarily on the “concierge” role of the host. This value facilitation also taps into the earlier mentioned factor that is authentic experience. The fact that a host may be an authentic local adds further to the perceived value of the experience for the guest and positively influences their future purchase intentions (Mody and Hanks, 2019). In some extreme situations, there is also evidence to suggest that some people use Airbnb as a source of company in order to aid loneliness. In recent public debate and media, it has been argued that there is a “loneliness epidemic” in Western Societies (Suanet and van Tilburg, 2019). Recent studies have shown that Airbnb is used as a source of remedy for loneliness, from both the point of view of the host and the guest/user. An argument has been created of loneliness as a driver of peer-to-peer transactions that could even be harnessed by Airbnb in order to optimise the pairing process of guests and hosts experiencing similar emotions and personal hardships (Suanet and van Tilburg, 2019). This will thus allow for more genuine connections between hosts and guests and thus establish increased perceived value and long-term brand loyalty, from both parties, towards participating in Airbnb. This further emphasizes the importance of host-guest interaction as a determinant of participation in Airbnb.

4.4 Practicality and convenience

The Airbnb peer-to-peer framework has proved attractive to many modern-day travellers given its rapid growth since its formation in 2008. A large majority of the attraction stems from the practicality that Airbnb offers to travellers (Guttentag, Smith, Potwarka and Havitz, 2017). A study carried out in 2015 revealed that consumers were drawn to multiple key characteristics Airbnb had to offer that conventional accommodation couldn't, these being: social interaction, the novelty of the idea, home comfort, authentic local experience, the ethos of the shared economy domain and relatively low costs (Guttentag, Smith, Potwarka and Havitz, 2017). Of the key characteristics mentioned, low-cost accommodation and home benefits were the most strongly agreed on practical elements of Airbnb that benefited travellers in some form (Guttentag, Smith, Potwarka and Havitz, 2017). These benefits ranged from having more money available to spend on local activities and experiences to having access to household amenities and conveniences offered within the local suburbs. (Guttentag, Smith, Potwarka and Havitz, 2017). The factor of convenience and proximity of accommodation to areas of interest would play a role in the perceived use of Airbnb for older generations. It would remove the need for extensive commuting from the city centre and/or more urban areas where traditional hotels and accommodations are generally more densely situated. This would lessen both the cost of the trip (no rental car or taxi) as well as the stress associated with it, both of which the older generation would want to minimize. In contrast, a study was carried out to evaluate the geographical clustering of Airbnb's when compared to location convenience. The study focused primarily on cities (New York, LA and Chicago) where the most desirable places to visit were in fact in the city centre. In a comparative analysis across the three cities being investigated, it was found that there was a positive relationship between the proportion of youth population and employment and the resultant number of Airbnb's supplied in the area. This further illustrates that the level of Airbnb adoption and implementation has a significant interaction with age. (Zhang and Chen, 2019).

4.5 Targeted Advertising

Airbnb is unashamedly different from ordinary hotel chains which include the likes of Tsogo Sun, The Marriott Hotels Group and Hilton Worldwide, yet is arguably one of the largest hotel chains in the world despite not owning a single hotel (Liu and Mattila, 2017). Given the peer-to-peer framework and contemporary internet-based business model, focus on the role of digital advertising in creating an attraction to the brands distinguishing features is important to the success of Airbnb (Guttentag, 2013). Research by Liu and Mattila found that the two main distinguishing factors of

Airbnb, that create an appeal to the consumer, were the ideas of “feeling at home” and having an “atypical place to stay” (Liu and Mattila, 2017). The aim of the research was to understand whether these two appeals were equally effective in attracting consumers when used in conjunction with click-through intention advertising, with consumer power being the moderating variable (Liu and Mattila, 2017). Looking at the two appeal factors in relation to power, results showed that powerless individuals had a higher click-through intention rate when there was a feeling of belongingness, otherwise referred to as the appeal to feeling at home, advertised (Liu and Mattila, 2017). These results are supported by Botsman and Rogers who discuss a shift in society over recent years (Botsman and Rogers, 2014:41). The discussion revolves around the idea that current generations have moved to seeking cliques, both on and offline, with which they can participate in peer-to-peer shared economy activities (Botsman and Rogers, 2014:41). On the other hand, powerful individuals had a higher click-through intention rating when there was a sense of uniqueness to the experience, otherwise referred to as the appeal to an “atypical place to stay” (Liu and Mattila, 2017). This correlation between uniqueness and power is evident in a 2017 hedonic pricing model study of Airbnb (Gibbs et al., 2017). The study found that amenities that offered and uncommon accommodation characteristics were directly proportional to an increase in price per night (Gibbs et al., 2017). As a result, the more unique a room, the more appealing it is to powerful individuals who have the means to purchase the service (Gibbs et al., 2017). It is important to note that power in this sense is associated with the attributes of each individual in terms of social status, income, age and health (Liu and Mattila, 2017).

4.6 Participation factors in the hosting context

The competitive advantage of Airbnb is the ease of access for consumers and the ease of employment for potential hosts wanting to share their home with travellers. Airbnb hosts do not require any hospitality or tourism management training due to the minimalistic, somewhat informal ideology behind the experience regarding the peer-to-peer framework (Fischer, Pahus and Bager, 2019). Despite any hosts’ inability to compete with the experience and quality of large multinational hotel corporations, Airbnb continues to flourish in the accommodation industry, largely due to an amalgamation of basic cultural institutions and exponential growth in the technological industry (Fischer, Pahus and Bager, 2019). But what causes individuals to become hosts? To participate in Airbnb as a host, an element of trust is needed between the host and the Airbnb platform. Evidence has illustrated that a host's trust in Airbnb is positively related to four antecedents, namely: social, technical, economical and privacy assurance. It has been found that the technical quality of the platform and the perceived effectiveness of privacy policy both play a strong role in inducing trust. In addition, the social benefits of using the platform and the economic gains that come about as a result of participation in the platform also influences hosts’ behavioural intentions (Wang, Asaad and Filieri, 2019). A recent study looking into the motivations behind Airbnb hosting discovered a multitude of diverse factors that lead to Airbnb hosting (Fischer, Pahus and Bager, 2019). These factors are grouped into four motivating factors that provide an overview as to the motivations behind Airbnb hosting (Fischer, Pahus and Bager, 2019). The “four P’s of Airbnb host motivation” are Pains, People, Psychology and Profit (Fischer, Pahus and Bager, 2019). The Pains factor pertains to the burdens of becoming an Airbnb host in the sense that the host loses a portion of their private space and will inevitably be subject to stress from reviews and consumer expectations. The remaining three factors all speak to the benefits of becoming an Airbnb host with regards to the freedom and flexibility of the job, the financial and independence aspect of the job and the potential to create a network of friends and acquaintances via the intimacy of sharing one’s personal space (Fischer, Pahus and Bager, 2019). In conjunction with this, Airbnb hosts were seen to have motivations similar to that of the consumer, as discussed above, in that becoming a host inevitably combats the fear of being lonely (Fischer, Pahus and Bager, 2019). External influence can also have an impact on an individual's decision to participate in Airbnb as a host. Further studies have shown that Airbnb as a platform uses social idealization and dramatizing the concept of sharing in the Airbnb context as a moral value to encourage hosting (Saturnino and Sousa, 2019). These same social idealization techniques encourage potential hosts to engage in Airbnb in order to better themselves holistically by becoming self-entrepreneurs. It is thus evident that often the decisions to participate as hosts is not always

“uncoerced” albeit it relatively subliminally via smart marketing techniques implemented by Airbnb (Saturnino and Sousa, 2019).

The proposed analytical Model for the study – Technological Acceptance Model (TAM):

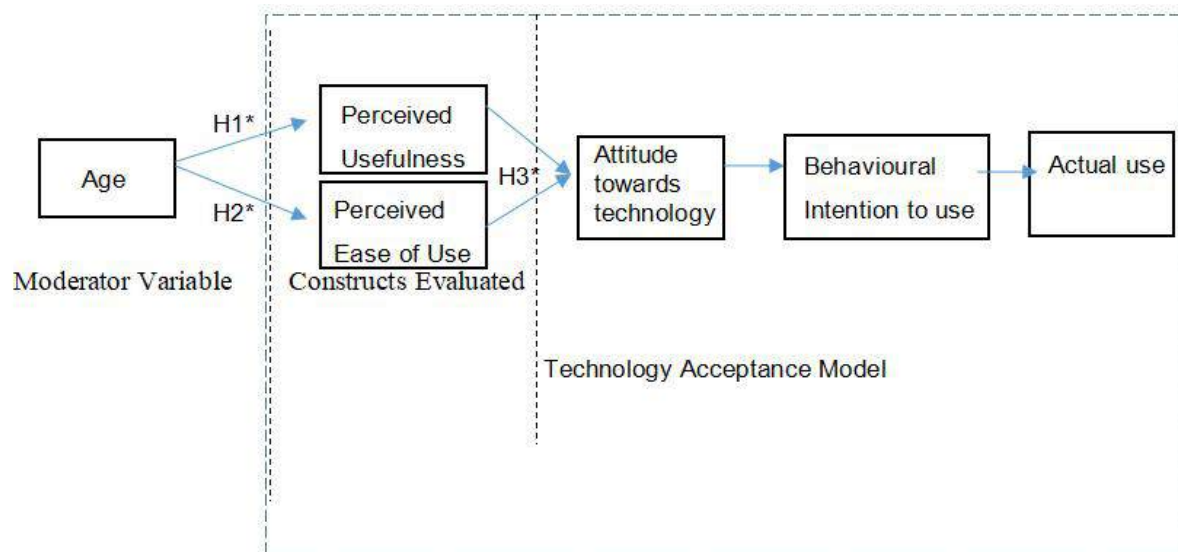

Figure 1 Proposed Analytical Model – Technological Acceptance model; adapted from Davis et.al 1989, including Age as a moderator Variable

5. Research Methodology

This section of the report will discuss the detail of the research methodology implemented in the study. The methodology will begin with the research design and method, followed by sampling, measurement instruments used, data collection and finally the ethical considerations of the study.

5.1 Research Design & Method

The research design was a mono-method, quantitative design of a conclusive nature. This design has been selected as the information needed is clearly defined and the research process is formal and structured with the data being analysed in a quantitative manner. Conclusive research can further be divided into descriptive or causal research. The aim of this study is to establish the impact age has on an individual’s acceptance and adoption of the Airbnb application. Age will act as a moderator variable in the presence of the two constructs, perceived ease of use and perceived use, and as a result this research is of a causal nature. The analytical model that will be used to carry out the research will be the Technology Acceptance Model (TAM). The two primary constructs in TAM that predict technology acceptance are, the beforementioned, perceived usefulness and perceived ease of use (Davis, 1989). TAM is easily modified in order to include moderator variables to analyse their resultant impact on perceived usefulness and perceived ease of use and thus resultant Technology acceptance (Hauk, Hüffmeier and Krumm, 2018; Roy, 2017; Setiyono, Shihab & Azzahro, 2019; Wang and Jeong, 2018). This makes TAM an ideal model in order to investigate the impact of age as a moderator variable on an individual’s adoption and use of the Airbnb application/service.

Past systematic TAM application standards will be drawn upon, modified and “extended” according to the research question this study aims to answer. This extension of TAM analysis by incorporating age as a moderator variable will be guided by similar TAM analysis extensions made by other past studies. The studies selected as references are those investigating the impact of moderator variables on the acceptance of technologies in the m-commerce realm or those that apply age as a moderator variable in technological acceptance (Hauk, Hüffmeier and Krumm, 2018; Roy, 2017; Setiyono, Shihab & Azzahro, 2019; Wang and Jeong, 2018). These are studies were referenced closely because of their relevance to our research question and construct of our hypotheses (the impact of age on technology acceptance and resultant participation in the context of Airbnb). Referencing the standard for TAM analysis, as illustrated through past studies, this study will implement single cross-sectional data collection methods through online, electronic surveys which are subdivided into “perceived ease

of use” and “perceived usefulness” with age as a moderator variable. The decision for use of electronic surveys is the scalability to match sample sizes of past studies, the removal of interviewer influence on responses/anonymity of respondents and time limitations that may be exacerbated by the current social distancing measures in place across South Africa. Theory of reasoned action (TRA) will be then applied to the responses in order to establish the correlation between the two key constructs, perceived usefulness and perceived ease of use, and the resultant user intentions, attitudes and adoption behaviour relating to Airbnb (Hauk, Hüffmeier and Krumm, 2018; Roy, 2017; Setiyono, Shihab & Azzahro, 2019; Wang and Jeong, 2018). As mentioned previously, age of respondents will be incorporated into the analysis as a moderator variable and its impact on technology acceptance will then be cross-sectionally applied and evaluated.

5.1.1 Sampling Design

This section will explain the following aspects of the study: the target population, sampling frame, sampling technique, sample size and finally the intended implementation of the sampling design.

5.1.2 The target population

The target population for this study will be persons over the age of 18 in South Africa who have access to the internet. This range in age of the population is desirable as it will give the necessary scope to the study required to investigate age as a moderator variable in user participation in Airbnb. We selected South Africa as the target population region as our online survey distribution method allows for countrywide distribution, which will make meeting the required sample size easier (Hauk, Hüffmeier and Krumm, 2018; Roy, 2017; Setiyono, Shihab & Azzahro, 2019; Wang and Jeong, 2018).

5.1.3 The sampling technique and sample size

The sampling technique that this study will implement is a traditional approach without replacement as it is undesirable to have a respondent participate twice. Due to the nature of this study, variables being investigated, and resource and time limitations the use of a sampling frame will not be implemented. As a result, the research carried out will be in the form of non-probability, judgemental sampling.

The sample size will be between 200 and 300 respondents, to align with sample sizes of past studies (Hauk, Hüffmeier and Krumm, 2018; Roy, 2017; Setiyono, Shihab & Azzahro, 2019; Wang and Jeong, 2018). The sampling technique will aim to split the respondents between the top end of Generation Z (18-25 years), Generation Y (25-40 years), Generation X (41-56 years) and Baby Boomers (57-75 years). This generational distribution of responses mean that the study will consist of approximately 60-70 responders from each generation.

5.2 Measurement and Scaling

This section will explain the following elements that of the study: The measurement instrument, the scaling procedure and the measurement aids used to expose respondents to the functionality of the Airbnb technology.

5.2.1 Measurement instrument

This study will make use of a questionnaire, supplemented with a link to explore the Airbnb website to familiarize all respondents with the technology’s functionality. The questionnaire layout follows sub-divided into sections of perceived ease of use and perceived usefulness, which has been established as the standard layout in past studies (Hauk, Hüffmeier and Krumm, 2018; Roy, 2017; Setiyono, Shihab & Azzahro, 2019; Wang and Jeong, 2018). There will be 12 questions overall which aligns with past studies (Hauk, Hüffmeier and Krumm, 2018; Roy, 2017; Setiyono, Shihab & Azzahro, 2019; Wang and Jeong, 2018). Questions 1 to 6 will relate to usefulness and question 7 – 12 will relate to ease of use. The respondents will have to give the generation they fall into first (age), which will be incorporated into the response analysis as the moderator variable. As mentioned, prior, the questions will follow a positively correlated, five-point Likert Scale with end points of [1] “Strongly Disagree” and [5] “Strongly Agree”, so that the responses are consistent in the indication of the latent constructs in question (Perceived usefulness or Perceived Ease of Use). Responses of [1] will be

indicative of a very negative mindset towards Airbnb technology and [5] will be indicative of very positive. A high internal consistency of the questions is imperative in order to provide accurate results for the data analysis that will follow the data collection process.

5.2.2 Measurement scaling

All questions follow a positively correlated, five-point Likert Scale with end points of [1] “Strongly Disagree” and [5] “Strongly Agree”, so that the responses are consistent in the indication of the latent constructs in question (Perceived usefulness or Perceived Ease of Use). This scaling technique is consistent with past studies (Hauk, Hüffmeier and Krumm, 2018; Roy, 2017; Setiyono, Shihab & Azzahro, 2019; Wang and Jeong, 2018). Responses of [1] are indicative of a very negative mindset towards Airbnb technology and [5] are indicative of very positive. A high internal consistency of the questions is imperative in order to provide accurate results for the data analysis that will follow the data collection process.

5.2.3 Measurement aids

A non-biased description of what Airbnb is with a link to the Airbnb website will be provided to the respondent along with the questionnaire that they need to complete. A scenario will be created for them that will prompt the exploration of the Airbnb website. The hypothetical scenario created will read as follows:

“Is there a place you’d like to visit, or a person far away that you would like to see? Follow the link below and explore Airbnb.” <https://www.airbnb.co.za/>

The phrasing of the prompt thus places a personal touch on the questionnaire and makes the respondent more invested in the overall process. It will allow them to navigate the platform with purpose and thus give them the greatest possible opportunity to establish whether or not they perceive it as being useful and easy to use.

5.3 Data Collection

This section explains the following elements of the study: pre-testing of the data measurement instrument and the data capture method.

5.3.1 Pre-testing

Pre-testing of the data measurement instrument was conducted prior to releasing the final revision to the sample population. Pre-testing took place in the form of distribution of the questionnaire to 12 respondents from the 4 respective target generations. The pre-testing was conducted with each of the 12 respondents for the sole purpose of gauging respondent attitude towards the measurement instrument and the functionality of the questionnaire – a quality control of sorts in order to ensure that the necessary responses were captured and that the process followed by the respondent was intuitive and simple, so as to allow for responses that were as accurate as possible. Pre-testing results were used optimization purposes only and, therefore, and were excluded from the primary online survey test results. No adjustments were made to the questions after the pre-testing phase, our questionnaire questions and layout considerations revealed that the questionnaire was simple to follow and none of the respondents had any difficulties when progressing through the questionnaire.

5.3.2 Data Source

Data collection was carried out using the online survey method. The questionnaire was designed on google forms, where the results were also stored and captured. The link to the questionnaire was distributed primarily through email and WhatsApp to individuals that the researchers knew personally, through convenience sampling. Preceding the questionnaire was a cover page indicating that participation indicates consent. The cover page presented respondents with a scenario that prompted the exploration of the Airbnb website before they progressed to answering the survey questions. This was an important step in ensuring respondents were familiar with the technology and thus provided accurate responses. The data collection process took place over a-week period starting July 2021 and ended 2021. The total number of responses captured over the period was 275 responses – 62 Baby

Boomers, 56 Generation X, 93 Generation Y and 64 Generation Z. The goal sample size of between 200 and 300 respondents, to align with past literature, was thus met.

5.4 Statistical Analysis

The statistical analysis process began with the data export from google docs and into an excel format. The data was then transferred to SPSS in testing the hypotheses laid out in terms of the theoretical framework and TAM analysis.

Testing for normality of the data using the Kolmogorov-Smirnov test was appropriate since the sample size was greater than 50. We then continued by conducting a Cronbach’s Alpha test to test the internal consistency of the questions and their resultant ability to measure the underlying latent variables, Perceived Usefulness and Perceived Ease of Use. No directional changes were required.

A factor analysis test was performed to confirm the validity of our questions and whether they do in fact load onto the same, intended latent factor. We then progressed to the relevant hypothesis, H1, H2 and H3, that the study sought out to investigate.

For testing H1 and H2 we conducted bivariate correlations, using the Spearman’s Rho, non-parametric test for bivariate correlation, appropriate for determine the relationship between two scale variables which are not normal in distribution. This required recoding of the nominal variable, Generational Group, into numeric format so that it could be analysed as a scale variable.

And finally, for H3, linear regression with the addition of age as a moderator variable through the addition of an interaction term between age and Perceived Usefulness and Perceived Ease of Use respectively. 3 Regression models were run, one for Perceived Usefulness with interaction, one for Perceived Ease of Use with Interaction, and the final model that included both latent independent variables and their respective interaction terms with the moderator variable, age. This was the appropriate test based on the practices of past literature. We then evaluated the regression results and the impact age as a moderator had on the future use of respondents.

6. Results

6.1 Sample Profile

A total of 279 surveys were conducted, 4 of which were only received after data export and as a result the final sample was comprised of 275 respondents across the four generational groups evaluated.

6.2 Descriptive Statistics

The data captured from respondents was comprised the following variables: two nominal variables, that of generational group and decision for future use and two sets of 7 question scale variables pertaining to the two underlying latent constructs measured by the questionnaire, those pertaining to Perceived Usefulness and Perceived Ease of Use respectively.

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Baby Boomers (57 – 75 Years)	62	22.5	22.5	22.5
	Gen X (41 – 56 Years)	56	20.4	20.4	42.9
	Gen Y (26 – 40 Years)	93	33.8	33.8	76.7
	Gen Z (18–25 Years)	64	23.3	23.3	100.0
	Total	275	100.0	100.0	

Figure 1: Summary of generational representation across sample

From Figure 1 it is evident that for the “Generational group” nominal variable the reported valid percentage across generational groups in terms of respondents was Baby Boomers (22.5%), Generation X (20.4%), Generation Y (33.8%) and Generation Z (23.3%), which thus cumulatively made up the entire sample captured. This is illustrative of a diverse sample which was able to capture a significant percentage of each generational group, thus allowing for fair representation when it comes to the interpretation and analysis of the relevant inferential statistics.

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
SumPU	275	2.14	5.00	4.3148	.52882
SumPEOU	275	2.14	5.00	4.2530	.57394
Valid N (listwise)	275				

Figure 2: Descriptive statistics for summated Scale variables, Perceived Usefulness and Perceived Ease of Use.

The scale variables present were questions aimed at measuring Perceived Usefulness and Perceived Ease of Use respectively. The questions (scale variables) relating to Perceived Usefulness reported a mean of 4.3148 and a standard deviation 0.52882. The questions relating to Perceived Ease of Use reported a mean of 4.2530 and a standard deviation of 0.57394. It is evident across both sets of questions that the mean is high and relatively close to 5, indicating that most respondents responded positively to the Airbnb Application. The relatively small standard deviations indicate that there was a general agreement across respondents with respect to the Perceived Usefulness and Perceived Ease of Use of the Airbnb application.

FU

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	No	15	5.5	5.5	5.5
	Yes	260	94.5	94.5	100.0
	Total	275	100.0	100.0	

Figure 3: Future Use response frequency across all respondents

With respect to the final decision on future use of the Airbnb application, represented in figure 3 above, a binary categorical variable of “yes” and “no” responses, 94.5% of respondents answered “Yes” they would use Airbnb in the future and thus 5.5% answered “No”. This indicates that a high proportion of respondents do intend to use Airbnb in future.

6.3 Test for Association

For the purpose of being as comprehensive in our analysis as possible, we ran a chi-square test of association between age and future use using the crosstabulation function. The reason for this is our later hypothesis tests will involve age as a moderator variable in terms of its impact on the two constructs hypothesized to impact future use. Thus, we wanted to evaluate the relationship between age and future use without interaction with underlying constructs in order to evaluate whether or not there is a correlation present.

FUNumeric * GenerationalNominal Crosstabulation

		GenerationalNominal					
		Gen Z (18-25 Years)	Gen Y (26-40 Years)	Gen X (41-56 Years)	Baby Boomers (57-75 Years)	Total	
FUNumeric	No	Count	2	1	5	7	15
		% within FUNumeric	13.3%	6.7%	33.3%	46.7%	100.0%
		% of Total	0.7%	0.4%	1.8%	2.5%	5.5%
Yes		Count	62	92	51	55	260
		% within FUNumeric	23.8%	35.4%	19.6%	21.2%	100.0%
		% of Total	22.5%	33.5%	18.5%	20.0%	94.5%
Total		Count	64	93	56	62	275
		% within FUNumeric	23.3%	33.8%	20.4%	22.5%	100.0%
		% of Total	23.3%	33.8%	20.4%	22.5%	100.0%

Figure 4: Crosstabulation output between Generational Group and Future Use responses

With respect to the crosstabulation output evaluation in figure 4 above, we immediately see some very interesting results with respect to the relationship between age and % contribution to “No” responses in terms of future use. Baby Boomers, the oldest generation, accounts for 46.7% of “No” responses within future use, and Generation X, the second oldest generational group accounts for 33.3% of the “No” responses within Future Use. This is illustrated by the values circled in red and means that the oldest two generations account for 83% of the total “No” responses to whether they would use Airbnb in future. This aligns with the idea illustrated in past literature that older generations are less likely to accept technology (Hauk, Hüffmeier and Krumm, 2018).

Following up these insights found in the crosstabulation we evaluated the Chi-Square output for the test for association between Generational Group (Age) and Future Use of the Application. The corresponding hypotheses are as follows:

H0: There is no association between Generational Group (Age) and Future Use of the Airbnb Application

H1: There is significant evidence to suggest that there is an association between Generational Group (Age) and Future Use of the application

	Value	df	Asymptotic Significance (2-sided)
Pearson Chi-Square	9.537 ^a	3	.023
Likelihood Ratio	10.160	3	.017
Linear-by-Linear Association	6.897	1	.009
N of Valid Cases	275		

Figure 5: Chi-Square output for the test for association between generational group and future use

In reference to figure 5 above, due to the large Pearson Chi-Square test statistic value of 9.537a and correspondingly small p-value of 0.023, we reject H0 at the 5% and conclude that there is significant evidence to suggest an association between age and future use. This once again strengthens the findings of past literature findings as earlier discussed.

Directional Measures

			Value	Asymptotic Standard Error ^a	Approximate T ^b	Approximate Significance
Nominal by Nominal	Lambda	Symmetric	.030	.014	2.139	.032
		FU Dependent	.000	.000	. ^c	. ^c
		G Dependent	.033	.015	2.139	.032
	Goodman and Kruskal tau	FU Dependent	.035	.020		.023 ^d
		G Dependent	.012	.006		.017 ^d

Figure 6: Directional measure of the chi-square association between Generational Group and Future Use.

With respect to direction, Figure 6 illustrates that the Generational group dependent lambda value is 0.033 and significant at the 5% level due to its approximate significance of 0.032. Thus, the relationship is thus positively significant albeit it almost negligibly positive, due to the very small value of 0.032.

		Value	Approximate Significance
Nominal by Nominal	Phi	.186	.023
	Cramer's V	.186	.023
	Contingency Coefficient	.183	.023
N of Valid Cases		275	

Figure 7: Strength of the relationship between Generational Group and Future Use Association represented by Contingency Coefficient

The strength of the relationship will be evaluated by looking at the contingency coefficient represented in figure 7 because it is a 1x1 matrix. The contingency coefficient is significant at the 5% level due to its approximate significance of 0.023 and the strength of the relationship is relatively weak at 0.183, and thus a lot closer to 0 than it is to 1, as 1 would be indicative of an extremely strong association.

6.4 Normality

When testing for normality, we applied the Kolmogorov-Smirnov test for normality as the sample size was $N > 50$. Due to the fact that the questions were conducted on a Likert scale and a high response is indicative of an intuitive, useful application, the responses it was expected that the responses would not be normally distributed. The hypotheses for the test for normality for all variables would be as follows:

H0: The responses are normally distributed

H1: The responses are not normally distributed

Tests of Normality

	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
PU-1	.387	275	.000	.678	275	.000
PU-2	.292	275	.000	.750	275	.000
PU-3	.290	275	.000	.743	275	.000
PU-4	.341	275	.000	.704	275	.000
PU-5	.254	275	.000	.786	275	.000
PU-6	.250	275	.000	.795	275	.000
PU-7	.216	275	.000	.851	275	.000
PEOU-1	.290	275	.000	.767	275	.000
PEOU-2	.269	275	.000	.773	275	.000
PEOU-3	.240	275	.000	.800	275	.000
PEOU-4	.233	275	.000	.829	275	.000
PEOU-5	.239	275	.000	.811	275	.000
PEOU-6	.322	275	.000	.751	275	.000
PEOU-7	.286	275	.000	.751	275	.000

a. Lilliefors Significance Correction

Figure 8: Kolmogorov-Smirnov test for normality for scale variables intended to measure underlying constructs, Perceived Usefulness and Perceived Ease of Use.

All of the questions came back as highly significant, with p-values of 0.000 across all questions when applying the Kolmogorov-Smirnov test, as seen in figure 8 above. As a result, for all scale variables, corresponding to Perceived Usefulness and Perceived Ease of Use, we can reject H0 at the 1% and conclude that none of the variables are normally distributed, and thus non-parametric testing will need to be considered when evaluating the most suitable statistical test when the above scale variables are involved.

	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
FUNumeric	.540	275	.000	.237	275	.000

a. Lilliefors Significance Correction

Figure 9: Future Use Test for Normality Output

Normality Tests were then conducted for future use responses, and due to the fact that future use is hypothesized as being closely related to Perceived Usefulness and Perceived Ease of Use, we were not expecting a normal distribution for this categorical variable either. A Kolmogorov-Smirnov test was once again conducted and a corresponding highly significant p-value of 0.000 was returned, illustrated in figure 9 above, as a result we reject H0 at the 1% for the hypothesis test for normality and conclude that there is significant evidence to suggest that the responses with respect to future use are not normally distributed. This was as we expected. Once again, non-parametric test will need to be considered as a result when specific statistical tests are conducted.

	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
GenerationNumeric	.223	275	.000	.859	275	.000

a. Lilliefors Significance Correction

Figure 10: Generational Group Test for Normality Output

Finally, a Kolmogorov-Smirnov test for normality was run for the generational group nominal variable and the output is in figure 10 above. This too received a highly significant p-value of 0.000

and as a result we rejected H0 at the 1% level and concluded that Generational Groups were also not normally distributed in the sample. Non-parametric test will need to be considered, when including this variable in certain statistical tests.

6.5 Reliability

The structure and formulation of the questions pertaining to the underlying variables being evaluated in the study were based on past literature. The fact that these questions were created by our research team opens the door for the possibility of potential lack of internal consistency across questions in measuring the same underlying construct. In order to ensure that internal consistency was present across questions we conducted an Item Reliability test using the Cronbach's Alpha test for internal consistency, which included alpha-if-deleted values.

Reliability Statistics				
	Cronbach's Alpha	N of Items		
	.827	7		

Item-Total Statistics				
	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
PU-1	25.63	10.905	.637	.799
PU-2	25.83	10.802	.577	.805
PU-3	25.85	10.324	.572	.804
PU-4	25.75	10.648	.509	.814
PU-5	25.93	10.842	.499	.816
PU-6	25.99	9.701	.663	.788
PU-7	26.24	9.276	.606	.802

Figure 11: Item reliability analysis Cronbach's Alpha-if-deleted output for Perceived Usefulness Questions

For the questions pertaining to Perceived Usefulness, we received a Cronbach's Alpha value of 0.827 seen in figure 11 above, which is well above the rule of thumb of 0.7 as the minimum value for the presence of internal consistency. When evaluating the alpha-of-deleted values across all seven questions in figure 11, none resulted in an alpha value greater than 0.827, thus illustrating that all of the questions contributed to the consistent measurement of the same underlying construct. Thus, no questions needed to be removed.

Reliability Statistics				
	Cronbach's Alpha	N of Items		
	.843	7		

Item-Total Statistics				
	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted
PEOU-1	25.46	11.811	.657	.813
PEOU-2	25.48	11.995	.661	.813
PEOU-3	25.56	12.240	.625	.818
PEOU-4	25.69	12.061	.548	.831
PEOU-5	25.58	12.654	.542	.830
PEOU-6	25.38	12.135	.667	.812
PEOU-7	25.47	12.279	.513	.836

Figure 12: Item reliability analysis Cronbach's Alpha-if-deleted output for Perceived Ease of Use Questions

We then carried out the same test for those questions pertaining to the underlying Perceived Ease of Use construct and the results are represented in Figure 12 above. These questions also received a high Cronbach’s alfa value of 0.843, none of the if-deleted alfa values across the seven questions resulted in a higher alfa-value and as a result no questions had to be removed.

6.6 Validity

Although there was internal consistency present across questions and high levels and thus item reliability across both underlying constructs, we decided to run a Factor Analysis in order to evaluate the validity of the questions and whether or not they potentially measured an additional construct that was not accounted for in the study.

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings			Rotation Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	5.986	42.755	42.755	5.986	42.755	42.755	2.873	20.522	20.522
2	1.298	9.269	52.024	1.298	9.269	52.024	2.843	20.304	40.826
3	1.104	7.884	59.908	1.104	7.884	59.908	2.672	19.082	59.908
4	.841	6.006	65.914						
5	.745	5.321	71.235						

Figure 13: Total Variance Explained Output from Factor Analysis function on SPSS

The total variance explained established if there was potentially a third component that the respective scale questions were measuring. We applied the Kaiser’s criterion rule to determine the number of components that significantly contribute to variation in responses across the scale variables (questions). Based on the Kaiser’s criterion, when evaluating the Total Variance Explained output, figure 13 above, we established that there were 3 Principal components with eigenvalues greater than 1. The % of variance explained by the respective PC’s was PC1 (20.522%), PC2 (20.304%) and PC3 (19.082%) thus together accounting for 59.908% of the total variation. This thus indicated that there was a third significant underlying orthogonal (independent) factor that the questions were measuring.

The Principal Component scores with varimax rotation for ease of interpretation. This analysis was done across the two sets of seven questions which were designed to be indicative of Perceived Usefulness and Ease of Use respectively. This was done to evaluate which loaded onto which component.

	Component		
	1	2	3
PU-1	.666	.430	.058
PU-2	.630	.473	-.027
PU-3	.720	.178	.115
PU-4	.448	.338	.276
PU-5	.346	.631	.093
PU-6	.702	.081	.413
PU-7	.688	.034	.438
PEOU-1	.120	.727	.381
PEOU-2	.138	.801	.324
PEOU-3	.252	.694	.305
PEOU-4	.101	.209	.733
PEOU-5	.231	.232	.613
PEOU-6	.229	.340	.672
PEOU-7	.117	.135	.706

Extraction Method: Principal Component Analysis.
Rotation Method: Varimax with Kaiser Normalization.^a

Figure 14: Varimax Rotated Principal Component Output across 14 questions intended to measure Perceived Usefulness and Perceived Ease of Use

Referring to Figure 14 above, Perceived Usefulness questions, PU-1, PU-2, PU-3, Pu-4, PU-6 and PU-7 all loaded most heavily onto PC 1. PU-4, however loaded most heavily onto Principal Component 2. PEOU-1, PEOU-2 and PEOU-3 all loaded heavily onto PC2 as well, indicating an overlap between the underlying component that both they and PU-4 measure.

PEOU-4, PEOU-5, PEOU-6 and PEOU-7 all load heavily on PC3.

The difference in loadings onto Principal components across questions internally as well as across question sets illustrates that the questions may not be measuring the underlying constructs Perceived Usefulness and Perceived Ease of Use respectively as accurately as we had hoped. Should the tests be run again, it would be wise to re-evaluate the phrasing of the questions and establish reasons for overlap between questions designed to measure different underlying constructs. Principle components do not explicitly disclose which construct the PC measures so some level of insight and interpretation will need to be conducted.

6.7 Inferential Statistics

Finally, we progressed to the testing of our three previously stipulated hypotheses:

H1: Age will be positively related to Perceived Usefulness in the context of Airbnb

H2: Age will be negatively related to Perceived Ease of Use

H3: Age will be positively related to overall user attitude towards acceptance and use of Airbnb technology

For testing H1 and H2 we conducted bivariate correlations, using the Spearman's Rho, non-parametric test for bivariate correlation, appropriate for determine the relationship between two scale variables which are not normal in distribution, as previously established. This required recoding of the nominal variable, Generational Group, into numeric format so that it could be analysed as a scale variable. The summation of the Perceived Usefulness and Perceived Ease of Use questions respectively was necessary in order to conduct the correlation between the overall responses equating to the two constructs and age, respectively.

		GenerationN umeric	SumPU
Spearman's rho	GenerationNumeric	Correlation Coefficient	1.000
		Sig. (2-tailed)	.072
		N	275
SumPU		Correlation Coefficient	-.109
		Sig. (2-tailed)	.072
		N	275

Figure 15: Bivariate Correlation Output for correlation between generational group and Perceived Usefulness

H01: There is no relationship between Perceived Usefulness and age.

When analysing the Nonparametric correlation Spearman's Rho output, as shown in Figure 15 above, of the relationship between age and Perceived Usefulness, we found a non-significant negative relationship of -0.109 between perceived usefulness and age, as a result of the corresponding p-value of 0.072 being greater than 0.05. As a result, we fail to reject H01 at the 5% level and conclude that there is not significant evidence to suggest a relationship between age and Perceived Usefulness. In terms of our hypothesis H1, based on the negative relationship established, we actually see that the relationship, albeit it slightly more than the required p-value to result in significance, does in fact illustrate a negative relationship between age and perceived usefulness, which is contradictory to our hypothesis from a directional standpoint.

		GenerationN umeric	SumPEOU
Spearman's rho	GenerationNumeric	Correlation Coefficient	1.000
		Sig. (2-tailed)	.035
		N	275
	SumPEOU	Correlation Coefficient	-.127*
		Sig. (2-tailed)	.035
		N	275

Figure 16: Bivariate Correlation Output for correlation between generational group and Perceived Ease of Use

H02: There is no relationship between age and perceived ease of use.

When analysing the nonparametric correlation Spearman's Rho output in figure of the relationship between age and perceived ease of use, we found a significant, negative relationship of -0.127 between age and perceived ease of use at the 5% level as a result of the corresponding p-value of 0.035. As a result, we reject H02 at the 5% level and conclude that there is significant evidence to suggest a negative relationship exists between age and perceived ease of use. This thus illustrates that hypothesized H2 was indeed correct.

And the final null hypothesis corresponding to our proposed H3:

H03: The interaction between generational group and perceived usefulness and perceived ease of use respectively will have no impact on future use of Airbnb.

Based on past literature and the theoretical framework of the Technology Acceptance Model, it was established that the testing of age as a moderator variable and its resultant interaction with perceived usefulness and perceived ease of use would have an overall positive effect on future use in the case of Airbnb. We thus ran multiple linear regression with Future Use being the dependent variable (converted to numerical so that SPSS could interpret it as a scale variable). Independent variables were Generational Group, summated Perceived Usefulness, summated Perceived Ease of Use and two interaction terms, that of Generational Group*Summated Perceived Usefulness and Generational Group*Summated Perceived ease of use.

Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.489 ^a	.239	.225	.200

a. Predictors: (Constant), GenPEOUInteraction, SumPU, SumPEOU, GenerationNumeric, GenPUInteraction

ANOVA^a

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	3.396	5	.679	16.938	.000 ^b
	Residual	10.786	269	.040		
	Total	14.182	274			

a. Dependent Variable: FUNumeric

b. Predictors: (Constant), GenPEOUInteraction, SumPU, SumPEOU, GenerationNumeric, GenPUInteraction

Figure 17: Model Fit and ANOVA Output for illustrating the significance of the full regression model

In reference to the ANOVA output in Figure 17, the overall model was highly significant at the one percent level and was indicated by the incredibly small p-value of 0.000. The strength of the model, however, is very weak, as represented by the adjusted R-Square value, indicating that the model only accounts 22.5% of the variation in Future Use. This is a cause for concern and may be due to the fact that there are additional underlying factors that may influence future use that the study has not considered.

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	2.777	.274		10.148	.000		
	SumPU	-.151	.088	-.352	-1.718	.087	.067	14.843
	SumPEOU	-.026	.079	-.066	-.331	.741	.071	14.003
	GenerationNumeric	-.565	.097	-2.681	-5.846	.000	.013	74.383
	GenPUInteraction	.121	.031	2.505	3.853	.000	.007	149.467
	GenPEOUInteraction	.005	.028	.096	.169	.866	.009	112.640

a. Dependent Variable: FUNumeric

Figure 18: Regression output for multiple regression to evaluate impact of age as a moderator on its interaction with perceived usefulness and perceived ease of use in impacting the dependent variable, Future Use.

The VIF values of the model indicating Multicollinearity are not a cause for concern as the addition of the interaction terms as well will create heightened multicollinearity. It has already been established that generational group (age) is significantly correlated with variable PEOU as seen in Figure 16, and only just non-significantly correlated with PU in figure 15.

Coefficients^a

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	Collinearity Statistics	
		B	Std. Error	Beta			Tolerance	VIF
1	(Constant)	1.282	.111		11.545	.000		
	SumPU	.165	.032	.383	5.076	.000	.561	1.782
	SumPEOU	-.011	.030	-.028	-.366	.715	.561	1.782

a. Dependent Variable: FUNumeric

Figure 19: Regression Output and corresponding VIF values for PU and PEOU variables when moderator variable generational group (age) and the corresponding interaction terms have been removed.

To illustrate how the addition of the interaction of the moderator variable and the corresponding interaction terms raised the VIF value, we ran linear regression without it, and they are represented in Figure 19 above. It is evident that there is no real multicollinearity present between PU and PEOU when the moderator and corresponding interaction terms are removed.

Thus, moving past the issue of multicollinearity and evaluating the influence of age as a moderator through its interaction with the two key constructs respectively, perceived usefulness and perceived ease of use and its resultant impact on future use, only the interaction of generational group with Perceived Usefulness came back as being significantly positive with a large t-statistic of 3.853 and correspondingly minute p-value of 0.000 with a corresponding positive beta coefficient of 2.505. The interaction between Perceived Ease of Use and Generational group returned a small t-statistic of 0.169 and a non-significant p-value of 0.866 with a very small positive beta-coefficient of 0.096. As a result, with respect to the H3, we reject H0 at the 1% level and conclude that there is significant evidence to suggest that the interaction between generational group (age) and Perceived usefulness has a significant, positive impact on future use.

Our results for H3 were aligned with what we hypothesized. It was established in past literature that as people age, their values shift away from growth and acquiring knowledge towards meaning and social needs and connection with loved ones (Hauk, Hüffmeier and Krumm, 2018). The fact that Airbnb allows individuals to connect with loved ones who may live far away or are difficult to visit may be the reason why we see age acting as a moderator and changing the relationship between age and future use, through its impact on the perceived usefulness of the application. The greatest issue with the results, however, is that of the weak adjusted R-squared value of only 22.5% and the fact that the research had clearly not considered all underlying factors that may influence Future Use of the Airbnb application. This idea is backed up by “extended TAM” models being developed and implemented in recent years in order to account for additional latent constructs Davis, the creator of the foundation TAM model did not include (Davis, 1989; Jayasingh & Eze, 2010). Research and insight into potential additional factors may help explain Future Use and thus technology acceptance more accurately in future studies.

7. Managerial Implications

Firstly, in determining whether age had a significant impact on the level of technological acceptance of a user, a chi-square test of association between age and future use was conducted to evaluate the correlation purely between the two nominal variables in isolation. The results proved that age had a significant, slightly positive, yet weak association with the intention of Future Use of respondents. With respect to the question from the questionnaire about the intent to use Airbnb in the future, using the cross-tabulation output evaluation, there was a significant relationship between the age and the future use with the generational groups Baby Boomers, the oldest, and Generation X, the second oldest, who made up the total of 83% of the “No” answer responses with the shares being 46.7% and 33.3% respectively. Therefore, this further depicts how age had a significant impact on the level of technological acceptance of a user, that being a lower level of acceptance. Further backing up our primary objective, the high statistical value of 9.537 and small p-value of 0.023 from the Pearson Chi-Square test meant that we rejected the H₀ at the 5% significance level and concluded that there was strong evidence to suggest an association between age and future use intent.

The results from the analyses pertaining to our secondary objective, evaluating whether the interaction between age and Perceived Usefulness has a positive impact on Airbnb Technology acceptance and resultant purchase decisions, further supports our primary objective. We conducted bivariate nonparametric correlations on the relationship between age and perceived usefulness and found that there was not significant evidence to suggest a relationship between age and Perceived Usefulness. When we later conducted the multiple linear regression to evaluate the impact of age as a moderator, however our results with respect to Perceived usefulness changed drastically when interacting with age. The interaction between generational group and perceived usefulness returned a large t-statistic and highly significant p-value, as well as a large positive beta coefficient relative to that of other independent variables. This thus aligned answered our aforementioned secondary objective about the positive impact of the interaction between generational group and perceived usefulness on future use of the Airbnb application which resulted in us rejecting H₀₃. This result also backed up our primary objective as it illustrated that age does in fact have a significant impact on future use of Airbnb and the resultant technological acceptance of the user.

Therefore, from these results and the fact that 83% of all respondents who answered “No” to the question of future use were part of the two oldest generations, we can deduce that Airbnb is an application that is primarily used by younger generations, but that there the Perceived Usefulness of the app in the minds of the older generation can have a significant positive effect on their purchase intent and response to the question of future use.

Our results for H3 were incredibly interesting and in fact aligned with what we hypothesized. It was established in past literature that as people age, their values shift away from growth and acquiring knowledge towards meaning and social needs and connection with loved ones (Hauk, Hüffmeier and Krumm, 2018). The fact that Airbnb allows individuals to connect with loved ones who may live far away or are difficult to visit may be the reason why we see age acting as a moderator and changing

the relationship between age and future use, through its impact on the perceived usefulness of the application. This answers the second of our secondary objectives, the question of whether older generations are more likely to participate in Airbnb over other ecommerce platforms. Because of this shift in the mindset of the older generations towards prioritising meaningful, human connection, Airbnb is likely to experience greater technological acceptance from older users than other e-commerce platforms that are not centred around meaningful connections with loved ones.

Thus, we can assume that the true population of the older generation would personally benefit from using Airbnb as it aligns with their priorities due to their life stage and there is evidence of increasing likelihood of future use if they exhibit a greater perceived usefulness when evaluating the value of the app.

Lastly, with respect to the third secondary objective, we reached the conclusion that the impact of the interaction between age and perceived ease of use on Airbnb technology acceptance and resultant purchase decisions was negative. We found this through the nonparametric correlation Spearman's Rho output whereby there was a significant negative relationship between age and perceived ease of use at the 5% level of significance and thus rejected H_02 which tells us that the older generations are less likely able to navigate the site well and thus are less likely to purchase on the platform. The presence of perceived usefulness, however, as seen in the multiple regression model which involved interaction with generational group, illustrated that Perceived Ease of Uses loses its significance when it is considered in conjunction with Perceived Usefulness whilst being moderated by the users age and its resultant impact on future use. It is evident that in the context of Airbnb, that Perceived Usefulness “overrides” the significant Perceived Ease of Use and it is not significant in impacting the user’s likelihood of future use. Thus, younger generations are more likely to purchase on the platform due to their technological capabilities and the application being accommodating.

Overall, with all the objectives and results taken into consideration, we can say that user age significantly influences their level of technology acceptance, but that there is evidence of Perceived Usefulness having a significant positive impact on the respondent’s future use when interacting with age. Simply put, as users get older, the weight of the perceived usefulness of Airbnb in the eyes of the user becomes a greater determining factor in their use of the application and resultant future use. There is thus evidence that the marginal benefit of the usefulness of the app through the ability to see and connect with loved ones is greater than the marginal cost of the difficulty or challenges that come with learning how to use a new technology.

8. Limitations

A potential limitation of the study pertains to the method of data retrieval. Respondents were required to browse the Airbnb website prior to answering the survey questions. This can be seen as a potential limitation for 2 reasons. Firstly, because browsing the Airbnb website will only give non-prior consumers a mediocre understanding of the Airbnb platform. As a result, consumer’s technological acceptance of the Airbnb platform could have been skewed toward high acceptance as the browsing process did not require users to go through the booking process.

Secondly, respondents may have bypassed the browsing process as there was no way to ensure the instructions were adhered to before answering the survey. Therefore, resulting in a less accurate representation of their perception and acceptance of the platform.

The use of Likert scale type questions in assessing the two key-constructs was another limitation to the research. The Likert scales allowed for an understanding of the consumer’s broad perception of the Airbnb platform, be it negative or positive. However, it did not allow for deeper understanding of the true consumer opinions of the Airbnb platform due to their one-dimensional nature and limited scale numbering. There is potential for the option to share comment and criticism in order to get actual feedback on issues at the granular levels, rather than blanket ratings of general questions.

Another limitation identified was present in the validity testing of the data. There was evidence of the presence of a third, significant underlying latent variable (PC3) in the principal component VARIMAX output of the factor analysis. This indicated the questions intended to measure Perceived Ease of Use and Perceived Usefulness had in fact been measuring an additional underlying latent component. This may have been able to explain some of the variation in purchase intent expressed through respondent's future use response. The presence of the latent variable limits the research as it indicates that the questions relating to Perceived Ease of Use and Perceived Usefulness may not have measured the two key-constructs as accurately as they should. This is a potential reason for one of the greatest issues with the results of the regression model evaluating the moderating effect of generational group. The weak adjusted R-squared value of only 22.5% indicates that there was still 77.5% of variation in future use decision that the model and its corresponding variables did not account for. This illustrates that the research has clearly not considered all underlying factors that may influence Future Use of the Airbnb application. This idea is backed up by "extended TAM" models being developed and implemented in recent years in order to account for additional latent constructs Davis, the creator of the foundation TAM model did not include (Davis, 1989; Jayasingh & Eze, 2010). Research and insight into potential additional factors may help explain Future Use and thus technology acceptance more accurately in future studies.

9. Conclusion

Literature has indicated that age as a moderator variable in TAM analysis, its impact on Perceived Usefulness and Perceived Ease of Use and the resultant purchase decisions of users in the Airbnb context has not been investigated explicitly. Studies have also indicated that perceived usefulness is the most significant factor in determining user participation in Airbnb. Due to the complete disruption of the hospitality industry caused by the creation of Airbnb, we realise the impact that investigating demographic variables that may have been overlooked by marketers could have on further cementing Airbnb's position as a superpower of the hospitality industry. After identifying this as an opportunity for future research, the study investigated age, represented in terms of generational group, as a moderator variable that could potentially impact user participation in Airbnb. The next phase was the data gathering process whereby Airbnb users across various generational groups in South Africa were interviewed. A TAM analysis was then applied to the results of perceived usefulness and perceived ease of use of Airbnb while incorporating age as a moderator variable.

The Role of Social Factors and Materialism on Attitudes Towards Counterfeit Luxury Goods

Dr Nicole Cunningham¹

Keywords

Social factors;
materialism; attitude;
counterfeit luxury
goods

Abstract

Often luxury product purchases are motivated by the need to achieve social acceptance and communicate status. However, given the cost, many consumers turn to counterfeits to meet the social pressure. This makes a consumer's social environment important to understand as the majority of consumers cannot afford the authentic luxury goods and turn to counterfeits instead. Given the importance of the social environment, this study focused on the impact social factors (normative susceptibility, informative susceptibility, collectivism) have on the attitude towards counterfeit luxury goods. In addition, the study measured how materialism moderated these relationships. 517 completed questionnaires were retained for analyses, which included multiple regression and moderation analyses. The results of the study found that normative susceptibility and collectivism have an impact on the attitude towards counterfeit luxury goods while informative susceptibility did not have an impact on attitude. Furthermore, materialism moderated the relationship between normative susceptibility and attitude, demonstrating how the need to impress the social group through possessions encourages positive attitudes towards counterfeit luxury goods. The study's findings provide insights into how consumer's attitudes could be deterred towards the purchase of counterfeit luxury goods.

1. Introduction

Consumers are increasingly searching for social acceptance from their social groups and buy products that will provide the acceptance they desire (Jhamb, Aggarwal, Mittal & Pual, 2019). The luxury goods product category has seen an increase in demand on a global scale due to the social status that luxury goods provide (Statista, 2020). However, although luxury goods provide the social status that consumers long for, these goods are often unattainable by most consumers. This has resulted in the growth of the counterfeit luxury market (Wang, Lin & Choi, 2020). Although it is challenging to quantify the size of the market, it is reported to mimic the size of the authentic market – estimated to be approximately over \$3 trillion (Fontana, Girod & Kralik, 2019). The demand for counterfeit luxury goods is visible through the ease of access to these items (Li, Ghaffari, Su, 2020; Kaufmann, Petrovici, Filho & Ayres, 2016; Koay, 2018).

Within an emerging market context, specifically South Africa, consumers are typically classified as consumers who are concerned with their status and purchase products that communicate the status they wish to attain (Mahamba & Mashaba, 2018). As a way in which consumers in emerging markets communicate their status, consumers have increased their purchase of counterfeit luxury goods (Chand & Fei, 2021). This has become more prevalent in emerging markets due to the demand for luxury goods but as the majority of consumers in emerging markets cannot afford authentic luxury goods, they purchase counterfeit luxury goods in an attempt to attain the status they desire (Chand & Fei, 2021; Eisend Hartmann & Apaolaza, 2017; Saiipl, 2020).

Counterfeit luxury item/s are generally much cheaper than authentic items. They are purchased as they fulfil the consumer's functional need (e.g. status) at a fraction of the cost (Phau & Teah, 2009). However, counterfeits can destabilise industries and therefore threaten the global economy (Elsantil &

¹E-mail address: ncunningham@uj.ac.za

Hamza, 2021; Wiedmann, Hennigs & Klarmann, 2017). To understand why consumers are attracted to counterfeit luxury items (other than price), it is important to understand their attitudes towards purchasing counterfeit luxury items. This is due to attitudes being a key consideration when consumers make purchasing decisions (Phau, Sequeria & Dix, 2009). By understanding attitudes, luxury brands will be in a better position to implement marketing strategies that dissuade consumers from purchasing counterfeit luxury items (Bhatia, 2017; Li, et al., 2020).

In order to understand how consumer's attitudes towards counterfeit luxury goods are formed, measuring the impact that social factors like normative susceptibility, informative susceptibility and collectivism have on attitude. This is due to a consumer's behaviour being guided by their need to conform to their social group (Khan, Faziili & Bashir, 2021). Normative susceptibility is focused on the consumer being influenced by the positive impression that they would like to make (Malla & Yukongdi, 2020) while informative susceptibility refers to the consumer being influenced by the expert opinions of others (Hidayat, Hema & Diwasasri, 2013). Collectivism focuses on an individual's desire to comply with their social group's expectations in order to secure acceptance (Tiessen, 1997). Therefore, normative and informative susceptibility as well as collectivism reflect both the consumer's need to comply with their social group's expectations (Ting, Goh & Isa, 2016). As the purchase of counterfeit luxury is driven by the need to be accepted, measuring social factors that take the external environment (e.g. social groups) into consideration will lead to a better understanding of how social groups influence attitudes. However, as consumers use counterfeit luxury goods to attain social status, the consumer's level of materialism is also important to understand. Materialism refers to "set of centrally held beliefs about the importance of possessions in one's life" (Richins & Dawson, 1992, p. 55). These beliefs have the ability to impact the purchase of possessions that consumers believe provide status (Park, Burns & Rabolt, 2007) such as counterfeit luxury goods. Due to this study's context, focusing on the impact of a consumer's materialistic views on their social factors and attitudes will reveal the role that materialism plays towards the attitudes toward counterfeit luxury goods.

Therefore, this study will determine the impact that social factors (e.g. normative susceptibility, informative susceptibility and collectivism) have on the attitudes towards counterfeit luxury goods and the role that one's level of materialism plays. The study will contribute from a theoretical perspective as majority of the research conducted on counterfeit luxury has been conducted in developed market contexts and focus on price as the motivation to purchasing counterfeit luxury (e.g. Bhatia, 2017; Hidayat & Diwasasri, 2013; Wang et al., 2020; Hussain, Kofinas & Win, 2017) and with the growth of counterfeit purchases in emerging markets like South Africa, understanding attitudes within a different context, where they may differ, is imperative. In addition, the study offers luxury retailers the opportunity to understand the consumer's attitudes towards counterfeit luxury items which may offer the opportunity to understand attitudes towards counterfeit luxury goods further and formulate marketing strategies that attract consumers to purchasing authentic luxury goods.

2. Problem Investigated

The demand for counterfeit luxury goods is simultaneous to the demand of authentic luxury goods (Li et al., 2020; Thaichon & Quach, 2016). The demand is especially prevalent in emerging markets, like South Africa, where consumers are concerned with their perceived status amongst their social group and aspire to purchase luxury goods to attain the desired level of status (Mahamba & Mashaba, 2018). However, given the expense associated with authentic luxury goods, consumers have turned to counterfeit luxury goods as an alternative (Chand & Fei, 2021). This, therefore, explains the demand for counterfeit luxury goods. This poses a threat to authentic luxury brands and the global economy as a whole as the production of counterfeits can lead to job losses, unpaid taxes, negative brand reputation and brand equity (Phau, Sequeria & Dix, 2009).

In order to deter consumers from purchasing counterfeits, determining their attitude towards counterfeit luxury goods is required. This is due to attitudes being a key driver to a consumer's behaviour and often result in a positive or negative outcome (Ting et al., 2016). Given the status-related motivation towards purchasing luxury, examining social factors' role in forming the attitude

towards counterfeit luxury would provide further insights. This is due to consumers wanting to conform to their social groups expectations (Larsen & Buss, 2005). From a counterfeit luxury context, the social factors that are the most prevalent in research include normative susceptibility, informative susceptibility and collectivism (Teah, Phau & Huang, 2015; Ting et al., 2016). In addition to social factors, including personality, which represents the internal influence, has also proven to be useful in counterfeit luxury research (Harun, Beldram, Suki & Hussein, 2012) where authors have found that the consumer's level of materialism has played a role in counterfeit luxury purchase (e.g. Kim & Karpova, 2010; Furnham & Valgeirsson, 2007; Phau et al., 2009). Ting *et al.* (2016) further motivates that consumers who are regarded as materialistic will purchase counterfeit luxury goods if they are not in a position to afford the authentic versions. This is owing to the fact that materialistic consumers are concerned with their position in society and rely on products to attain social acceptance (Phau et al., 2009).

Therefore, this study aims to determine how social factors (normative susceptibility, informative susceptibility and collectivism) impact the attitude towards counterfeit luxury goods and materialism's moderating effect. This will provide luxury brands the understanding of how consumer's attitudes towards counterfeits are influenced by social factors – other than price which has been a focus in other studies. This understanding will allow luxury brands to implement marketing strategies that deter consumers from purchasing counterfeits. From a theoretical perspective, the study will offer an understanding of emerging market consumer's attitudes towards counterfeit luxury goods and will demonstrate the effect that the level of materialism plays on the social factors and attitudes.

3. Research Objectives

The primary research objective is: to determine how social factors (normative susceptibility, informative susceptibility and collectivism) impact the attitude towards counterfeit luxury goods and the moderating effect of materialism.

In order to attain the primary objective, the following secondary objectives have been formulated:

- To determine the impact that normative susceptibility has on the attitude towards counterfeit luxury goods;
- To determine the impact that informative susceptibility has on the attitude towards counterfeit luxury goods;
- To determine the impact that collectivism has on the attitude towards counterfeit luxury goods; and
- To determine the effect that materialism has on the relationships between normative susceptibility, informative susceptibility, collectivism and the attitude towards counterfeit luxury goods.

4. Literature Review

This section presents a brief overview of the counterfeit luxury goods industry. This is followed by a discussion of the theories supporting the study and a discussion of the constructs and the proposed relationships, as shown in Figure 1.

4.1. Counterfeit luxury industry

The counterfeit industry has noticeably increased in demand over the past decade (Saeed & Paracha, 2019) and is evident in the ease of access to counterfeit items (Amaral, 2021). Counterfeit goods refer to “any unlawful product that violates intellectual property rights” (Babamiri, Moghadam, Saeidnia, & Zemestani, 2020) which are typically regarded as lower quality allowing for the lower price that consumers are attracted to (Jiang, Miao, Jalees & Zaman, 2019). In the luxury goods context, consumers are willing participants of purchasing counterfeits because they are well aware that what they are purchasing is not authentic and often poorer quality (Khan et al., 2021). As mentioned, globally the counterfeit industry has increased significantly over the past decade (Elsantil & Hamza, 2021:2). According to Fontana *et al.* (2019), the estimated figure of all counterfeit goods is over \$4.5

trillion, with counterfeit luxury goods accounting for 60-70% of this figure. This is an estimated figure due to the nature of counterfeit goods.

Manufacturers of the counterfeit luxury goods aim to replicate the authentic luxury brands and ensure that they resemble the authentic item as far as possible (Wang, Stoner & John, 2017). Eisend, Hartmann and Apaolaza (2017) add that luxury brands are a focus to these manufacturers because of the high price of authentic luxury goods. However, given the prices associated with authentic luxury goods, consumers turn to counterfeits to enhance their perceived status (Phau & Teah, 2009). The growth in the counterfeit luxury goods market is evident in emerging markets (Chand & Fei, 2021), like South Africa where lower levels of income purchase authentic luxury goods improbable. Therefore, as Eisend *et al.* (2017) suggests, these consumers turn to counterfeit luxury to attain their social acceptance and confirm their status amongst their social group.

4.2. Theory of Stimulus Organism Response (SOR) and Theory of Planned Behaviour (TPB)

The SOR proposes that a response is guided by a stimulus and organism (Moon, Javid, Kiran & Awan, 2018). Essentially, the stimulus refers to the mental and cognitive state of the organism which is affected by factors in the external environment and leads to a certain response (e.g. attitude in the case of this study). Within this study's context, the SOR is reflected in social factors' role on the attitudes towards counterfeit luxury goods. The SOR is commonly used in consumer behaviour research (Chopdar & Balakrishnan, 2020), however, the inclusion of attitude in this study is guided by the TPB. As proposed by Ajzen and Fishbein (1975), the TPB suggests that one's attitude, subjective norms and perceived behavioural control influence behavioural intention. Of the three proposed relationships, attitude is consistently found to have the greatest impact on behavioural intention (e.g. Quoquab, Pahlevan, Mohammad & Thurasamy, 2017:83; Das & Sabbir, 2019:224). Therefore, the inclusion of attitude as the response is guided by the impact that attitude can ultimately have on behaviour.

4.3. Attitude

Understanding the consumer's frame of mind towards a product, by understanding their attitude, is vital to understanding the likelihood of the product being purchased or not (Babamiri et al., 2020). This is due to the fact that a consumer's attitude is a key driver to decision-making (De Houwer, Gawronski & Barnes-Holmes, 2013). Therefore, if brands secure a favourable attitude, the consumer's likelihood of purchasing is far greater. This makes studies focusing on attitude valuable for marketers (Babamiri et al., 2020). Within a counterfeit luxury context, attitudes are driven by consumers' social pressures (Khan et al., 2021).

4.4. Social factors

Social factors refer to the effect that others have on an individual's behaviour (Phau & Teah, 2009) and are important when measuring attitudes because a consumer's attitude is often formed based on what their social group's regard as acceptable (Haslam, McMohan, Cruwys & Haslam, 2018). Consumers are susceptible to what their social group expects of them and will purchase products that allow for social acceptance (Ting et al., 2016). This is due to consumers using products to enhance their social image and status amongst their social group (Khan et al., 2021). Normative susceptibility, informative susceptibility and collectivism are the three factors used in this study. These factors are explained in more detail in the sub-sections that follow.

4.4.1. Normative susceptibility

Normative susceptibility is one of the three social factors included in this study and focuses on the consumer's need to make a purchase decision based on the expectation that the decision will provide a positive impression of themselves (Malla & Yukongdi, 2020). Generally, one's normative susceptibility is driven by the behaviour in their social group, making them susceptible to the behaviours within the group (Adiprima, Indraswari & Kasri, 2020). Therefore, consumers who demonstrate high levels of normative susceptibility would purchase products based on what other individuals expect them to purchase. Within a luxury context, consumers purchase luxury goods to impress their social group and in an effort to enhance their status amongst their social group (Kim & Karpova, 2010). This, in turn, would impact whether or not the consumer's attitude towards the product would be positive or negative (Kasuma, Noor, Abdurahman, Sawangchai & Jemari, 2020).

4.4.2. Informative susceptibility

The second social factor included in this study relates to information susceptibility. This refers to when consumers will base their decisions based on the opinions of others (Hidayat et al., 2013). These could include family members, the consumer's peers or reference groups (Phau & Teah, 2009). This becomes more prevalent when consumers are not very knowledgeable about a certain product category (Ting et al., 2016) – for example, within this study's context, the consumer may be more susceptible to information if they are not aware of the types of counterfeit luxury goods or where to purchase the most "authentic" types. As the purchase of counterfeits is regarded as a conscious decision (Moon et al., 2018), consumers will turn to the opinion of others to guide their decisions and ultimately form attitudes (Kasuma et al., 2020:236).

4.4.3. Collectivism

Collectivism is the third and final social factor included in this study. Collectivism relates to the consumer's desire to comply with their social group as opposed to differentiating themselves from their social group's norms (Tiesen, 1997). Within a collectivistic society, as many emerging markets are (Martinez & Jaeger, 2016), consumers regard social acceptance as very important and strive to achieve this acceptance by complying with social group norms (Kim & Yoon, 2021). Within the context of this study, consumers may turn to purchasing luxury as a way in which to conform to their social group's status expectations and may therefore form positive attitudes about purchasing counterfeits in order to achieve acceptance.

4.5. Materialism

Personality factors and attitude are closely related (Awang, Rahman, Ghazali, Ishak, Rahman & Sapiai, 2020). A consumer's personality includes personality traits that can influence their interactions and adapt to certain environments (Larsen & Buss, 2005). Within a marketing context, a consumer's personality has the ability to influence their purchasing and decision-making process. Kotler and Fox (1995) add that one's personality is a key driver to the formulation of an attitude due to the role that personalities play in deeming what is acceptable or not.

Although social factors influence attitude, a consumer's level of materialism is important to consider. Materialism focuses on the consumer's reliance on possessions, often used to communicate a certain message to a social group (Park et al., 2007). As luxury purchases are often driven by the need to communicate status (Jhamb et al., 2019), the consumer's reliance on their possessions (e.g. materialism) is implied. Although some authors (e.g. Belk, 1995; Richins & Dawson, 1992) report that materialism reflects negative attributes like greed, more contemporary research has focused on the positive behaviour that being materialistic offer – such as the desire to work harder and dedication in order to purchase the possessions desired (Karabati & Cemalcilar, 2010). Therefore, including materialism in this study relates to the context of the study and the role that being materialistic may have on the social factors towards attitude.

5. Hypotheses

The following hypotheses were formulated for the study:

- H₁: Normative susceptibility has a significant impact on the attitude towards counterfeit luxury goods
- H₂: Informative susceptibility has a significant impact on the attitude towards counterfeit luxury goods
- H₃: Collectivism has a significant impact on the attitude towards counterfeit luxury goods
- H₄: Materialism moderates the relationship between normative susceptibility and the attitude towards counterfeit luxury goods
- H₅: Materialism moderates the relationship between informative susceptibility and the attitude towards counterfeit luxury goods
- H₆: Materialism moderates the relationship between collectivism and the attitude towards counterfeit luxury goods

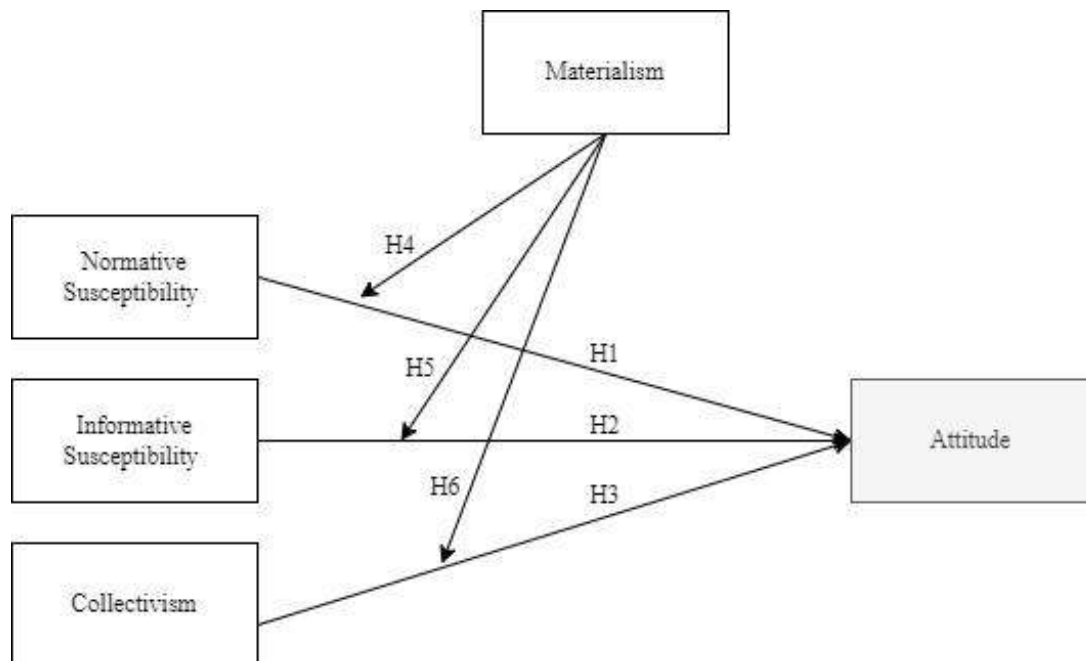

Figure 1: Conceptual model developed for the study

6. Research Methodology

This study was descriptive in nature as descriptive studies are used to determine patterns and trends (Burns, Veeck & Bush, 2017). In addition, the study followed a quantitative approach through a research survey. Self-administered research surveys were also used given the sensitivity of the topic – the purchase of counterfeits being illegal – and respondents being more likely to be honest without the potential influence of the researcher (Wiid & Diggins, 2017). Given the conceptual model developed for the study (as shown in Figure 1), the descriptive research design and quantitative approach was deemed the most appropriate.

The self-administered research survey was administered online through Google Forms and consisted of three sections: the preamble explaining the purpose of the study, the ethical considerations and obtaining the respondent's content to participate; the second section measured the respondents demographic profile and the third section measured the constructs presented in the conceptual model (normative susceptibility, informative susceptibility, collectivism, attitude and materialism). The constructs were adopted from previous study conducted by Teah *et al.* (2015) and were measured using a 5-point Likert-type scale.

This study's target population included consumers between the ages of 18 – 65 and who had either purchased or intended to purchase counterfeit luxury goods within the past six months. In order to reach the target population, non-probability, convenience sampling and snowball sampling was

deemed appropriate. Convenience sampling relates to the respondents being selected based on their accessibility whereas snowball sampling encourages respondents to indicate other potential respondents (Saunders, Lewis & Thornhill, 2016). Once the questionnaire was shared on Google Forms, 517 responses were retained for analysis.

Data was analysed using SPSS, version 28. Both descriptive and inferential statistics were used to analyse the data. The descriptive statistics included the frequencies (demographic variables) and descriptive statistics (constructs). In addition, the construct and their corresponding items were tested for reliability and validity by evaluating the Cronbach's Alpha coefficient values (α) and a Confirmatory Factor Analysis (CFA). Once the descriptive analyses were concluded, inferential statistics, specifically multiple regression (measuring the linear relationship between social factors and attitude) was conducted followed by moderation analyses to determine the effect that materialism has on the relationships between the social factors and attitude.

7. Results and Findings

This section presents the descriptive and inferential statistics conducted for this study.

7.1. Descriptive statistics

This section presents a description of the reliability and validity analyses; the demographic profile of the respondents and the descriptive statistics for each construct and their corresponding items.

7.1.1. Reliability and Validity

The constructs in this study had Cronbach Alpha coefficient values (α) of: 0.921 (normative susceptibility); 0.809 (informative susceptibility); 0.832 (collectivism); 0.707 (attitude) and 0.909 (materialism). Based on these values being above the 0.7 required, the constructs were regarded as reliable as Toklu and Baran (2017) suggest that values 0.7 and greater are considered valid and reliable. When conducting a CFA, Pallant (2016) suggests that the KMO value be above 0.6 and the Bartlett's test of sphericity be significant. The data revealed a KMO value of 0.922 and Bartlett's test of sphericity was significant ($p = 0.000$), verifying that the data was suitable for the factor analysis. The CFA resulted in a five-factor solution. Only Eigenvalues of above 1 were extracted and coefficients less than 0.3 were excluded. The five factors explained 65.2% of the variance. Thus, using the CFA, validity was confirmed.

7.1.2. Demographic profile

As shown in Table 1, of the 517 respondents, majority were females (54.4%) classified as Generation Y (42%) who have an undergraduate qualification (55.8%) and are employed on a full-time basis (64.4%).

Table 1: Demographic profile

Demographic variable	Category	Frequency	Percent
Age	Baby Boomers (1955 – 1964)	25	4.8%
	Generation X (1965 – 1980)	70	13.5%
	Generation Y (1981 – 1996)	217	42.0%
	Generation Z (1997 – 2012)	205	39.7%
Highest level of education	Matric	133	25.6%
	Undergraduate qualification	290	55.8%
	Postgraduation qualification	96	18.5%
Gender	Male	229	45.6%
	Female	273	54.4%
Employment status	Full-time employed	334	64.4%
	Part-time employed	52	10.0%
	Home executive	9	1.7%
	Retired	8	1.5%
	Self-employed	58	11.2%
	Unemployed	58	11.2%

7.1.3. Descriptive statistics: constructs and corresponding items

Table 2 reveals the descriptive statistics for the constructs included in this study. With regards to normative susceptibility, the overall mean was 2.789 (SD = 1.196) indicating that respondents disagreed with the statements relating to this construct. The lowest scoring item was “If other people can see me using a product, I often purchase the brand they expect me to buy” (mean = 2.66; SD = 1.475) and highest scoring item was “I like to know what brands and products make good impressions on others” (mean = 3.09; SD = 1.475). In terms of informative susceptibility, the overall mean was 3.378 (SD = 1.025) suggesting that respondents were neutral in their response to the items representing this construct. The lowest scoring item was “To make sure I buy the right product or brand, I often observe what others are buying and using” (mean = 3.10; SD = 1.424) and the highest scoring item was “If I have little experience with a product, I often ask my friends about the product” (mean = 3.67; SD = 1.202). The last social factor, collectivism, presented an overall mean of 3.160 (SD = 1.043) which indicated that as with informative susceptibility, respondents were neutral in their response to the items representing this construct. The lowest scoring item was “Being accepted as a member of a group is more important to me than being autonomous and independent from others” (mean = 2.81; SD = 1.410) and the highest scoring item was “Being loyal to a group is more important than individual gain” (mean = 3.54; SD = 1.323).

The attitude construct reported an overall mean of 3.163 (SD = 1.425) which indicated that respondents were neutral in their level of agreement towards this construct. The lowest scoring item was “Counterfeits of luxury brands are as reliable as the original version” (mean = 2.89; SD = 1.419) and highest scoring item was “Buying counterfeits of luxury brands damages interests and rights of legitimate/original manufacturer” (mean = 3.45; SD = 1.452). Lastly, the materialism construct reported an overall mean of 3.481 (SD = 1.031) which also indicated that respondents were neutral in their level of agreement towards this construct. The lowest scoring item was “The things I own say a lot about how well I’m doing in life” (mean = 2.93; SD = 1.441) and the highest scoring item was “I’d be happier if I could afford to buy more things” (mean = 3.94; SD = 1.180).

Table 2: Descriptive statistics for the constructs included in the study

Construct	Mean	Std. Deviation
Normative susceptibility		
I rarely purchase the latest fashion styles until I am sure my friends will approve of them	2.81	1.422
It is important that others like the products and brands I buy	2.80	1.148
When buying products, I generally purchase those brands that I think	2.71	1.439

Construct	Mean	Std. Deviation
others will approve of		
If other people can see me using a product, I often purchase the brand they expect me to buy	2.66	1.475
I like to know what brands and products make good impressions on others	3.09	1.475
I achieve a sense of belonging by purchasing the same products and brands that others purchase	2.69	1.496
I often identify with other people by purchasing the same products and brands they purchase	2.76	1.447
Overall score	2.789	1.196
Informative susceptibility		
To make sure I buy the right product or brand, I often observe what others are buying and using	3.10	1.424
If I have little experience with a product, I often ask my friends about the product	3.67	1.202
I often consult other people to help choose the best alternative available from a product class	3.45	1.269
I frequently gather information from friends or family about a product before I buy	3.28	1.239
Overall score	3.378	1.025
Collectivism		
Individual rewards are not as important as overall group welfare	2.92	1.338
Group success is more important than individual success	3.08	1.427
Being accepted as a member of a group is more important to me than being autonomous and independent from others	2.81	1.410
It is more important to encourage loyalty to the group rather than individual initiatives	3.45	1.240
Being loyal to a group is more important than individual gain	3.54	1.323
Overall score	3.160	1.043
Attitude		
Counterfeits of luxury brands provide similar functions to the original version	3.12	1.322
Counterfeits of luxury brands are as reliable as the original version	2.89	1.419
Buying counterfeits of luxury brands infringes intellectual property	3.36	1.443
Buying counterfeits of luxury brands damages interests and rights of legitimate/original manufacturer	3.45	1.452
Buying counterfeits of luxury brands will hurt the luxury goods industry	3.24	1.458
Purchasing counterfeits of luxury brands is illegal	2.92	1.460
Overall score	3.163	1.425
Materialism		
I admire people who own expensive homes, cars and clothes	3.19	1.367
The things I own say a lot about how well I'm doing in life	2.93	1.441
I like to own things that impress people	3.07	1.501
Products make my life comfortable	3.85	1.166
Buying things gives me a lot of pleasure	3.81	1.207
I like a lot of luxury in my life	3.47	1.433
My life would be better if I owned certain things I don't have	3.58	1.436
I'd be happier if I could afford to buy more things	3.94	1.180
It sometimes bothers me that I can't afford to buy all the things I'd like	3.50	1.434
Overall score	3.481	1.031

7.2. Results of the hypotheses developed for the study

H₁, H₂ and H₃ focused on the relationship between the social factors (normative susceptibility, informative susceptibility and collectivism) and attitude. The three hypotheses were tested using multiple regression analysis which revealed an R-squared value of 0.377 explaining 37.7% of the variance and the model was found to be significant ($p = 0.001$). H₁ tested the relationship between normative susceptibility and the attitude towards counterfeit luxury goods and the results revealed a significant relationship ($p = 0.001$; $\beta = 0.307$) which resulted in H₁ being accepted. H₂ tested the relationship between informative susceptibility and attitude towards counterfeit luxury goods, the results revealed an insignificant relationship ($p = 0.834$; $\beta = 0.011$) which resulted in H₂ being rejected. Lastly, H₃ tested the relationship between collectivism and the attitude towards counterfeit luxury goods and the results revealed a significant relationship ($p = 0.001$; $\beta = 0.141$) which resulted in H₃ being accepted.

H₄, H₅ and H₆ focused on the effect of materialism on the relationship between normative susceptibility, informative susceptibility, collectivism and attitude. The three hypotheses were tested using moderation analyses in SPSS. H₄ tested the moderating effect of materialism on the relationship between normative susceptibility and the attitude towards counterfeit luxury goods. The results revealed that materialism moderates the relationship ($p = 0.047$) and H₄ is accepted. H₅ tested the moderating effect of materialism on the relationship between informative susceptibility and the attitude towards counterfeit luxury goods. The results revealed that materialism does not moderate the relationship ($p = 0.154$) and H₅ is rejected. Lastly, H₆ tested the moderating effect of materialism on the relationship between collectivism and the attitude towards counterfeit luxury goods. The results revealed that materialism does not moderate the relationship ($p = 0.679$) and as a result, H₆ is rejected. The results of the study are shown in Figure 2.

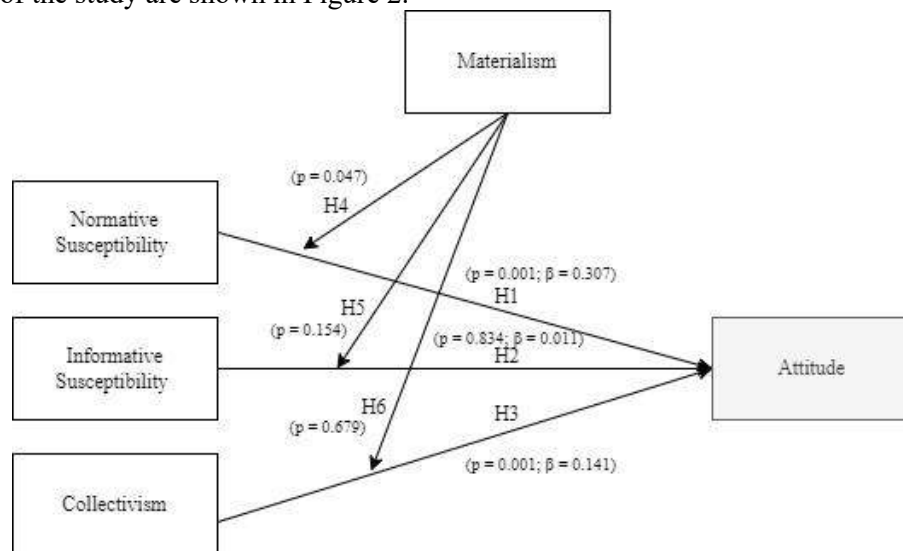

Figure 2: Conceptual model indicating the results

8. Managerial Implications

The results obtained in this study reveal that certain social factors have a significant impact on the attitudes consumer's form towards counterfeit luxury goods. The study revealed that normative susceptibility and collectivism significantly impact attitude towards counterfeit luxury goods, demonstrating that consumers are concerned with the impression they make on their social group and their acceptance within the group (Phau & Teah, 2009). Therefore, consumers may form positive attitudes towards luxury goods if they believe as though it would provide them the status they desire but turn to counterfeits due to their affordability. As social acceptance is important, authentic luxury brands should develop marketing strategies that firstly, encourage consumers and their social groups to purchase authentic luxury goods by emphasising the negative consequences of purchasing counterfeit (e.g. embarrassment). This would ensure that consumers are deterred from purchasing counterfeit luxury goods, as they are aware of the negative consequences that they may face if their

social group becomes aware of the purchase (Ting et al., 2016). Secondly, marketers of luxury brands should consider introducing an “affordable luxury” line within their product offering. Although these may be smaller pieces (e.g. a scarf, belt, wallet), it would still offer the consumer the opportunity to purchase the authentic brand and therefore uphold the brand’s image (Ting *et al.*, 2016). This is motivated by the fact that consumers generally purchase counterfeit luxury goods due to their affordability (Chand & Fei, 2021).

The study revealed that informative susceptibility does not significantly impact the attitude towards counterfeit luxury goods. This could be explained by counterfeit purchases being illegal and consumers being reluctant to approach experts or friends and family for their opinions (Ting et al., 2016). This finding could also support the recommendation mentioned above, as consumers may be reluctant to risk their social group knowing that they have purchased a counterfeit luxury item. Therefore, luxury brands should continuously remind consumers of the potential negative consequences of purchasing counterfeits – focusing on the possible rejection received from a consumer’s social group. Kasuma et al., (2020:238) adds that authentic luxury brands should be engaged in educating consumers about the advantages of purchasing authentic versions and the disadvantages associated with purchasing counterfeits.

Lastly, the study showed that materialism moderated the relationship between normative susceptibility and attitude but not the relationships between informative susceptibility, collectivism and attitude. This offers luxury brands the opportunity to leverage off consumers who are materialistic and seek social acceptance. The more materialistic consumers are, the greater their susceptibility to form positive attitudes towards counterfeit luxury brands, as they want to infer a positive impression on their social group and attain acceptance. This suggests that materialistic consumers would be more likely to purchase counterfeit luxury goods after forming positive attitudes (Phau et al., 2009).

This study focused on the attitudes that consumers have towards counterfeit luxury goods, luxury brands can in summary:

- Focus on the potential social acceptance when purchasing authentic luxury goods, in comparison to the potential negative consequences when purchasing counterfeits (e.g. social rejection, embarrassment);
- Consider offering an “affordable” range within the product line to allow for the luxury brand to remain accessible to consumer’s who might want to purchase the authentic product but are unable to purchase the more expensive items sold by the luxury brand; and
- Ensure that the marketing messages used by luxury brands promote the purchase of authentic luxury goods by focusing on social groups within the marketing messages.

9. Conclusion

This study found that a consumer’s need to obtain acceptance from their social group (normative susceptibility) had an impact on the consumer’s attitude towards counterfeit luxury goods. This demonstrates the social motivation behind counterfeit luxury purchases as consumers want to purchase authentic items but are restricted by their high costs (Chand & Fei, 2021). By understanding the social motivation, through the susceptibility of the group’s norms and the need to conform with the social group, luxury brands can develop marketing strategies that deter consumers from purchasing counterfeits due to the potential negative consequences that they might face within their social group. This is supported by the study demonstrating that consumers do not approach those they consider experts (e.g. friends and family) as they are perhaps aware of the social risk of purchasing counterfeit luxury goods. Thus, if authentic luxury brands ensure that their marketing messages relate social acceptance through the purchase of authentic items, it may result in consumers being deterred from purchasing counterfeit luxury goods. This should be an ongoing strategy seeing the potential negative outcomes that counterfeits have on the luxury goods industry – e.g. job losses; negative brand reputation and potential loss of brand equity (Phau et al., 2009).

Green vehicles,
Behavioural intention,
Hedonic Value,
Customer Value

Abstract

This research study aimed to investigate the intention to adopt green vehicles using the antecedents of the theory of planned behaviour and types of value (a predictive model). This research study used a structured questionnaire with 299 respondents in Gauteng, South Africa. A multiple regression analysis was used to test the proposed hypotheses. The findings examined the insignificant relationship between perceived behavioural control and behavioural intentions. The results of this study indicate that the proposed conceptual model provides a well-grounded explanation of consumers' behavioural intention toward purchasing green vehicles. The results also emphasise that consumers respond more favourably to the addition of hedonic value as an extended construct in the TPB model, and thus their intention – and its adoption – to purchase a green vehicle. Owing to the Covid-19 pandemic, an online convenience sampling was used to adhere to social distancing rules and limit contact between the researchers and participants. This limited the possibility of distributing the questionnaires in public areas in Gauteng and resulted in a limited sample from which to collect data, only individuals with access to the internet. However, this study encourages the purchase of green vehicles if governments initiate and implement policies for the adoption of green vehicles. This study also provides environmentally friendly vehicle manufacturers and marketers with strategies that promote and encourage the adoption of green vehicles. Currently, limited research investigates consumers' behavioural intentions to adopt green vehicles.

1. Introduction

Research has shown the correlation between the increase in combustion- or fossil-fuelled vehicles and climate change (Shalender & Shama, 2021). Climate change has been identified as an issue that threatens society, and different sectors have come up with solutions to combat this phenomenon. The automotive industry has been no different through its introduction of green vehicles and has agreed with the notion of green vehicles being a solution to climate-change-related problems by replacing conventional vehicles (Perujo, Thiel & Nemry, 2011). European Environment Agency (2021) supports this statement, stating that green vehicles are more efficient than conventional vehicles, as their energy is used in the battery used to drive the car and wastes less energy when driving in cities. Statistics also show an increase in the uptake of green vehicles. According to Kopestinsky (2021), green vehicles make up about three per cent of global car sales; green vehicles are expected to reach 10 per cent of global passenger car sales by 2025 and to increase to 28 per cent by 2030 and 58 per cent by 2040. Moreover, there are predictions that the availability of green vehicles globally could rise to 145 million by 2030 (IEA, 2021).

Green vehicles – green products marketed through green marketing by different organisations – have seen steady growth in sales because environmentally conscious customers want to buy green brands (Papista, Chrysochou, Krystallis & Dimitriadis, 2018:101). However, this increase is still slow, as adoption faces different barriers; the growth is generally not enough to offset the impact of conventional vehicles' degradation on the environment (Hamilton & Terblanche-Smith, 2018:2). The lack of speedy adoption by customers has been highlighted as one of the reasons for the availability of green vehicles (Hur, Kim & Park, 2013:146). A 2008 survey showed that 69 per cent of US customers

had little or no knowledge about green vehicles (Wang, Yu, Yang, Miao & Ye, 2017), thus making it hard for people to adopt green vehicles.

2. Problem Investigated

Studies investigating green vehicle adoption have been limited (Rezvani, Jasson & Bodin, 2015; Patella, Grazieschi, Gatta, Marcucci & Carrese, 2020). Nonetheless, some studies have investigated green vehicles adoption, drivers of the adoption of electric vehicles (Kim & Heo, 2019), promotion of alternative fuel vehicles using fiscal policies (Li & Xing, 2018), the use of analytics in aiding the buy more green vehicles (Reich, Winkler, Klampfl & Olson, 2015) and lastly, While Guan Zhang, Liu, Tan and Wu (2016) studied how new energy-saving vehicle buyers behave. As shown above, along with some of the key studies on green vehicles, this study intends to fill the gap by studying the role of hedonic and customer values, attitudes, subjective norms, and behavioural intention in adopting green vehicles. This is demonstrated by the lack of study regarding the role of values in the purchase of green vehicles.

Several studies have researched the different barriers – technological, social, economic and political – to the adoption of green vehicles (Adhikari, Ghimire, Kim, Aryal & Khadka, 2020). However, Jain, Rose and Johnson (2021) highlighted that psycho-social factors play a critical role in the adoption of new technologies such as green vehicles. A few studies have used psycho-social factors to understand green vehicle adoption (Jain, Rose & Johnson, 2021), thus identifying a research gap that this study intends to close.

This study seeks to assess the adoption of green vehicles by extending the TPB developed by Ajzen (1985) by customer value and hedonic value constructs as determinants of green vehicle adoption. Therefore, the extension of the empirically tested TPB model is intended to provide theoretical contributions and assist managers in determining the factors that affect the adoption of green vehicles. This study also aims to determine the role that customer value, hedonic value, and the determinants of behavioural intention highlighted in the TPB have in influencing the adoption of green vehicles.

3. Research Objectives

- To explain how customer and hedonic values and other TPB determinants influence behavioural intention.
- To investigate the types of values that influence customer intentions to purchase green vehicle brands,
- To understand the extent to which subjective norms, attitudes and PBC influences behavioural intention towards green vehicles.

4. Theoretical/conceptual background, conceptual model, and formulation of hypotheses

Theoretical framework

The underlying theoretical model for this study is the theory of planned behaviour (TPB) (Ajzen, 1985). In this study, to understand fully the motives that define a customer's behaviour, we use the TPB to understand the drivers that lead a customer's behaviour to adopt green vehicles. TPB was developed by Ajzen (1985) as an extension of the theory of reasoned action by adding perceived behavioural control as a variable in the model (Chen & Deng, 2016:1748). TPB, according to Shalender and Sharma (2021:667), has been used to investigate the intentions of customers to act in a specific way, as well as their buying behaviour with environmentally friendly products. Behavioural intention is motivated by attitude, social or subjective norms, and perceived behavioural control, which are all interconnected (Dilotsotlhe & Inseng, 2020). TPB has proven to be an excellent theory to ground robust arguments about green purchase intentions (Papista & Krystallis, 2013; Shalender & Sharma, 2021; Sniehotta, Presseau & Araújo Soares, 2014; Dilotsotlhe & Inseng, 2020; Yadav & Pathak, 2017). This theory is mainly used in environment-focused studies, as environmentally responsible human behaviour is revealed by people's attitudes, subjective norms and values about green brands. That said, a customer value model will be used as an extension of TPB, as our constructs are linked to individuals' values and how values influence the intention to perform a

specific behaviour. The customer value model developed by Sheth, Newman and Gross (1991) will be used in the study, especially the value dimension of 'hedonic value', to understand the broad relationship a customer has with a brand, as this value is considered to be a high-order construct.

Attitudes

Attitudes have been empirically tested in many studies. According to Chen and Deng (2016:2), attitudes are an individual's negative or positive assessment of a particular behaviour. Hamilton and Terblanche-Smith (2018) state that attitudes play a critical role in the performance of the behaviour, but they emphasise positive attitudes. Attitudes can come in the form of environmental attitudes, such as the assessment that conventional vehicles are not suitable for the environment while green vehicles are good for the environment. In his seminal model, Ajzen (1991) states that the TPB describes a person's behavioural intention and is influenced by attitudes (Bouarar & Mouloudj, 2021:644). Many studies have sought to understand the relationship between the attitude to green products and the intention to purchase green products (Mkhize, 2021; Mkhize & Ellis, 2018). Chen and Deng (2016:2) found that environmental attitudes positively impact ecological behaviour. Similarly, Jayaraman, Yun, Seo and Joo (2015:306) found a positive relationship between attitudes and the intention to buy green vehicles.

Therefore, this study posits that:

H1: A positive and significant relationship exists between attitudes to purchasing green vehicles and behavioural intentions.

Perceived behavioural control and behavioural intentions

Perceived behavioural control (PBC) is a construct that addresses factors that hinder or motivate action by the customer's ability to perform a task efficiently (Mohiuddin, Mamun, Syed, Masud & Su, 2018:5). The ease with which a specific behaviour is carried out is relatively associated with the likelihood that the customer will demonstrate purchase intentions (Shalender & Sharma, 2021:669; Ajzen, 1991:183). Yadav and Pathak (2017:155) state that behavioural intentions to purchase a green brand are associated with the characteristics of TPB constructs. Therefore, the higher the level of PBC as TPB constructs, the greater the likelihood of a customer purchasing a green brand. This study thus proposes that:

H2: PBC has a positive and significant relationship with the individual's behavioural intention to purchase a green vehicle.

Hedonic value

Hedonic value relates to the product offering's ability to evoke customers' emotions and feelings through different stimuli. This value might derive from customers' comfort and experience with the product (Banyte, 2012). Green products might elicit feelings of doing good, and customers might gain pleasure from the looks, attributes and features of the environmental offerings (Papista et al., 2018). According to Papista and Krystallis (2013), this value is created from customers' pleasure in their consumption experiences. Therefore, this study posits that:

H3: Hedonic value has a positive and significant influence on behavioural intention.

Subjective norms

Subjective norms are the belief that a more significant person or a mass of individuals will accept and keep up certain behaviours (Al-Swidi, Huque, Mohammed, Hafeez & Shariff, 2014). Subjective norms are the social views that pressure the individual to carry out or not carry out a behaviour (Chen & Deng, 2016), elaborating on the aspect of an individual's to perform specific actions. People are influenced by the collective to which they are exposed, showing how particular actions become standard due to that exposure. 'Behavioural intention' can be defined as a sign of one's willingness to act out a given behaviour (Yadav and Pathak, 2017). Customer value is the added benefit that the individual receives from using a given product. Customer value recognises that various factors encourage or discourage customers from adopting green brands (Papista et al., 2018). Behavioural intention is a product of three elements: attitude to the behaviour, perceived behavioural control, and subjective norms are interconnected (Dilotsotlhe & Inseng, 2020). The TPB reveals one's behavioural

intention to engage or not engage in a particular behaviour, and that intention is a critical factor in causing that action (Dilotsotlhe & Inseng, 2020). This indicates that specific customer actions do not always originate with the customer, but another individual might influence them to carry out certain purchases.

As a result, the prediction that can be formed for this construct is that:

H4: Subjective norms have a positive and significant relationship with behavioural intentions towards purchasing green vehicles.

Customer value

According to Papista et al. (2018:102), customer value is a product or service evaluation based on what the customer receives or gets. Customers who care about the environment buy green products to protect it (Barcu & Seda, 2013). The literature shows that customers who value the environment have the behavioural intention to purchase green brands (Papista & Krystallis, 2013; Hamilton & Terblanche-Smith, 2018).

Perceived value is critical today, as more businesses can increase customers' buying intention through a product's value (Steenkamp, 2006). Doszhanov and Ahmad (2015:4) argue that 'green perceived value' is vital for customers to make green choices. In contrast, 'green buying intention' is a significant part of green-buying customers' behaviour because it shows the intention to purchase a product that has value for the customer (Liao, Wu and Pham, 2020:4). Therefore, this study posits that:

H5: Customer value has a positive and significant relationship with customers' buying intentions to use green vehicles.

5. Literature Review

The value of the green market worldwide is currently about USD 4 trillion – a rise from 2009, when it was roughly USD 200 billion (Mkhize & Ellis, 2020:3). The world has become more aware of products that are environmentally friendly and that offer significant benefits to the environment. The emergence of green vehicles has changed the automobile industry contributing to decreasing pollution. This section attempts to build on earlier research by assessing the literature that focuses on green customer behaviour and green consumers.

5.1 Green customer behaviour

Understanding green customer behaviour is crucial for both businesses and the environment. Green customer behaviour is defined as a behaviour that an individual regards as an environmental consideration when buying or consuming a product that will cause less harm to the environment (Lakra, Bedi & Gupta, 2014:5). It refers to customers' concerns about society and not just the individual's needs and wants. Bakhtvar and Piri (2021) found that green customer behaviour contains three assertive themes; assurance/reliability, customer indecision, and similarity. To some customers, green brands may be seen as deceiving. However, customers' behaviour regarding green brands also raises the concern that some companies misinform their customers and are not truthful about the implications of environmental products (Bakhtvar & Piri, 2021).

Green customer behaviour is classified into two categories: the first aims to avoid the depletion of energy resources (curtailing practices), and the second involves environmental buying decisions (green buyer behaviour such as green vehicles) (Migheli, 2021). For instance, Jansson, Marell and Nordlund (2010:359) state that curtailing practices are done daily and tend to impact the environment substantially. They add that eco-friendly buying encourages individual customers to invest more in efficient restructuring to decrease the impact on nature.

Green customers tend to evaluate products using a close inspection. They will look for terms such as 'durable', 'eco-friendly', 'reusable', 'biodegradable', and 'compostable' (Jeevan, 2014:12). A study of customer preferences examined the characteristics of the ecological concern of different customers (Kirmani & Khan, 2016:161). When an individual has a positive attitude to perform a behaviour, they

are more likely to achieve specific behaviour (Hamilton & Terblanche-Smith, 2018:2). A previous study of green purchasing proposed that customers' pro-environmental optimism, natural responsiveness, and green acquired behaviour are determined by social customs, forgotten beliefs, attitudes, and an understanding of the environment (Khare, 2015:311).

Furthermore, a study has applied attitude models in explaining the effect of norms, the impact of social domination, and green behavioural control (Khare, 2015:311). According to Joshi and Rahman (2015:131), the attitude behaviour factor model helps researchers to acknowledge human actions better, in which – according to the model – customer green behaviour is not determined by attitudes only but also by contextual elements. Tu and Yang (2019:5) argue that the theory of reasoned action and the theory of planned behaviour of individuals are determined by the customer's behavioural intention, which influences an individual's attitude and subjective norms.

Green customer behaviour is driven by a customer's knowledge, especially about environmental challenges (Noor, Kasim, Mat & Mat, 2012:59). Customers who are more knowledgeable about environmental challenges are more likely to buy green brands (Darnall, Pointing & Brust, 2012:288). A study conducted in India by Narula and Desore (2016:12) showed that consumption value influences green consumer behaviour toward green brands. In addition, Jeevan (2014:13) argues that green consumer behaviour is driven by individuals with sincere intentions and sufficient knowledge to practise a green lifestyle. These characteristics of green customer behaviour could be translated into individuals adopting green vehicles.

Last, green customer behaviour is led by green customers who are growing in number as customers choose green lifestyles.

6. Research Methodology

This study used a descriptive research method to answer the questions of who, what, where, when, why and how in a given situation (Zikmund, Babin, Carr & Griffin, 2013). Its primary objective is to describe a particular subject matter, which can be salespeople, customers, market areas, or organisations (Malhotra, 2015:87). This study aimed to describe the intention to adopt green vehicles using the antecedents of TPB and types of value. In this study, data was collected from a large target population.

A cross-sectional, self-administered questionnaire was distributed to each respondent via an online electronic channel – Google Forms. This data collection technique allows for a greater variety of respondents (different age brackets and race groups), thus increasing the overall validity and reliability of the collected data (Burn & Bush, 2010:319). For further validation of the survey, the cross-sectional self-administered survey was tested using a sample of 30 respondents who were not included in the final results. Completing the data collection and coding process initiated the data analysis using Statistical Package for Social Sciences (SPSS) version 27 to develop the measurement and structural models. SPSS allowed for descriptive statistics, a range of regression modelling, factor analysis, one-way ANOVA, and equation modelling to develop potential variable associations. This helped to develop accurate statistical data that was instrumental in understanding the role of attitudes, perceived customer effectiveness, subjective norms, and types of value in influencing green vehicle adoption. The results present the views of the 299 respondents.

7. Results and Findings

Table 3: Cronbach's alpha

Construct	Number of items	Cronbach's alpha
Behavioural intention	4	0.935
Customer value	3	0.864
Hedonic value	3	0.917
Subjective norms	3	0.921
Perceived customer behaviour	2	0.667
Attitude	3	0.875

Zach (2021) states that Cronbach's alpha values ranging from 0.6 upwards are satisfactory when computing the internal reliability of an item. However, a score below 0.6 would be poor and, in some instances, unacceptable. All the scores in this study were above 0.6.

Multiple regression analysis

A multiple regression analysis was carried out to assess whether there was a significant relationship between the dependent and independent variables, and then to interpret what was found. The ANOVA table analysis examined the effect of one or more components by comparing mismatched samples (Mishra, Singh, Pandey, Mishra & Pandey, 2019). The p value of the ANOVA analysis in Tables 1 and 2 was 0,000, which was regarded as acceptable, as it was below the threshold of 0.05.

This section covers the multiple regression analysis that tested the study's hypotheses. The findings are presented below in Table 4.

Table 4: Multiple linear regression analysis: TPB without the extended model constructs

Dependent	Behavioural intention					
Independent	Attitude, perceived behavioural control, and subjective norms					
	Unstandardised		Standardised			
	Beta	Std. error	Beta	t	Sig	VIF
Constant	-.322	.227		-1.418	.157	
Attitudes	.840	.047	.742	17.744	.000	
PBC	.072	.043	.058	1.681	.094	
Subjective norms	.134	.038	.133	3.557	.000	
Equation						
R	.858					
R-squared	.738					
F	274.631					

Table 4 shows the study's model fit using only the TPB determinants as the underpinning model. This was done to contrast it with the conceptual model of this study to ascertain whether there was an improvement in the variance with the two additional constructs added to the conceptual model. Table 4 shows the multiple linear regression findings of the tested R-squared, dependent, and independent variables. The R-squared evaluates the effect of the correlation between the model and the dependent variables through a convenience scale of 0–100 per cent (Karch, 2020). The R-squared score was 0.738, or 74 per cent, which proved that the model was reliable and relevant. According to Smith (2021), a low R-squared would mean that the strength of the tested relationship is weak, whereas a high R-squared would mean that the strength of the tested relationship is strong. Analysis showed the

relationship between attitudes (H1), PBC (H2), and subjective norms (H4) on the one hand with behavioural intentions on the other, which were the base constructs of our theory (TPB). The findings showed that attitudes had a positive and significant relationship with behavioural intention, with a level of significance of 0.000 ($p < 0.05$). Perceived behavioural control (PBC) proved to have a weak and insignificant relationship with behavioural intention; the level of significance was 0.94 ($p > 0.05$). H4 (subjective norms) also displayed a positive and significant relationship with behavioural intention, with a level of significance of 0.000 ($p < 0.05$).

Table 5: Multiple linear regression analysis: Attitude, perceived behavioural control, subjective norms, hedonic value, customer value

Dependent	Behavioural intention					
Independent	Attitude, perceived behavioural control, subjective norms, hedonic value, customer value					
	Unstandardised		Standardised			
	Beta	Std. error	Beta	T	Sig	VIF
Constant	-.512	.215		-2.379	.018	
Attitudes	.671	.057	.592	11.780	.000	
PBC	.040	.042	.032	.951	.342	
Subjective norms	.067	.037	.067	1.807	.072	
Hedonic value	.011	.058	.009	.191	.849	
Customer value	.301	.049	.027	6.146	.000	
R	.877					
R-squared	.769					
F	195.041					

With the extension and the inclusion of customer value and hedonic value in the TPB, there was an increase in the R-squared from 0.738 (74 per cent) to 0.769 (77 per cent), which validated the reliability of the proposed model. This meant that customers responded more positively to the addition of customer value and hedonic value as extended constructs in the TPB model to determine their adoption of and intention to purchase a green vehicle (Papista *et al.*, 2018).

After a re-test analysis of the new model, attitudes (H1) showed that there was still a positive and significant relationship with behavioural intention, achieving the highest score among the independent variables of 0.00 ($P < 0.05$). Majchum, Parichatnon and Peng (2016:4) argue that a positive correlation between attitudes and behavioural intentions has been proven in several cultures, and that attitudes play a key role in predicting the intentions of customers to purchase green products. In a study by Mohiuddin *et al.* (2018:18), attitudes proved to be a highly significant construct ($p < 0.05$). This proved and supported a positive and significant relationship, as our study had hypothesised. Perceived behavioural control (H2) still showed no effect on customers' behavioural intention to purchase a green vehicle. This related to the fact of insufficient information and resources such as time, money, and knowledge, and the limited availability of green vehicle models, making it difficult for customers to convert their perceived behaviour into actual behaviour. According to Ajzen (1991:184), PBC may not be a sufficient construct to use when a person has relatively little knowledge, information, or resources to shape their behaviour; hence the rejection of the construct by South Africans in this study who did not have sufficient information about green vehicles. Hedonic value (H3) showed an insignificant relationship with customers' intentions to purchase a green vehicle. This study investigated the effects of hedonic and utilitarian value on creating customer satisfaction, resulting in behavioural intentions. Subjective norms (H4) was insignificant at 0.072 – slightly above 0.05 – suggesting there was possibly a slightly positive relationship. That somewhat insignificance could have been because the influences were not exposed to green vehicles, the functional attributes did not

meet expectations, and there was a lack of credible social influence, as stated by Shalender and Sharma (2021:668) and supported by Yadav and Pathak (2017:115). Customer value (H5) and behavioural intention proved that there was a significant and positive relationship, as the level of significance was less than 0.05, which was the highest. This was because customer value was directly related to positive behavioural intentions: customers used their emotions in making decisions that resulted in ultimate satisfaction.

Therefore, H1, H4, and H5 had a strong and significant relationship with behavioural intention, while H2 and H3 revealed no effect or a low level of significance in influencing behavioural intention. In conclusion, based on Table 5, the tested hypotheses and relationships that could be accepted – because their level of significance was below 0.05 ($p < 0.05$) – were H1 and H5.

Table 6: Hypotheses accepted or rejected

Hypothesis	Accepted/Rejected
H1 Attitudes and behavioural intentions	Accepted
H2 PBC and behavioural intentions	Rejected
H3 Hedonic value and behavioural intentions	Rejected
H4 Subjective norms and behavioural intentions	Rejected
H5 Customer value and behavioural intentions	Accepted

8. Discussion & Managerial Implications

A multiple regression analysis was conducted, and the results showed how attitudes, perceived behavioural control, hedonic value, subjective norms, and customer value contributed to influencing customers' behavioural intention to purchase a green vehicle. The results of the analysis are discussed below.

The testing of the relationships showed that customers had a positive attitude towards the behavioural intention to purchase a green vehicle in South Africa. Thus hypothesis H1 was positive and could be supported. Zhang et al. (2019) state that attitude is a significant and necessary construct in predicting customers' behavioural intention to buy green vehicles. This is in line with the studies of Mamun, Masud, Fazal and Muniady (2019) and of Sajeewanie, Yajid, Khatibi, Azam and Tham (2019), who also discovered that customers' attitudes towards environmentally friendly vehicles were positive because they were environmentally conscious, showing thereby a strong commitment to buying a green vehicle. Customers' attitudes can continue to develop over time when given the chance to participate in this behaviour (Massoules, 2019).

Based on our primary research, several respondents clearly indicated that green vehicles are the future. Marketers might need to develop more strategies to encourage green vehicle adoption that shapes customers' attitudes. This also confirmed the study's hypothesis that customers feel that buying a green vehicle is a good choice, and that a green vehicle purchase will result in environmental sustainability and help to reduce environmental degradation.

The analysis also showed that perceived behavioural control has an insignificant relationship with behavioural intention. This, however, contradicted the study by Sharlender and Sharma (2021), which showed that customers in India had a positive intention to buy green vehicles, as they felt that it would be easy for them to buy and maintain such vehicles. This meant that our study's respondents felt that green vehicles were expensive and difficult to use, and that they had limited access to and knowledge about those vehicles. Car dealership managers and the government will have to introduce efficient measures to entice people to buy green vehicles and offer them incentives in the form of tax rebates when purchasing a green vehicle in South Africa.

The results also proved that hedonic value does not significantly contribute to customers' intentions to buy green vehicles. The results of this study were consistent with those of Hanzaee and Rezaeyeh (2018), who also found that the hedonic value that is derived from buying a green vehicle did not necessarily influence respondents' behaviour in intending to purchase a green vehicle. Subjective norm, when tested, was shown to have an insignificant relationship with customers' behavioural intentions to purchase a green vehicle. These results differed from those of Hamilton and Terblanche-Smith (2018), who proved that subjective norms have a major influence on customers' behavioural intention to purchase a green vehicle. Nonetheless, the respondents in our study experienced little social influence to purchase a green vehicle, as most people still did not know about green vehicles and had little exposure to them, and some did not have anyone within their circle who owned a green vehicle; hence the rejection of the hypothesis. This finding was also made by Yadav and Pathak (2017), thus supporting the rejection of this hypothesis. The results revealed that social influence works in certain product categories but is not effective with energy-saving or green vehicles.

Customer values, after being measured, showed a significant relationship with the respondents' behavioural intentions to buy a green vehicle. The respondents felt that a green vehicle would bring about change in the environment, that a green vehicle was worth buying, and that it would contribute significantly to the satisfaction of their needs. Papista et al. (2018) also found that a strong acceptance of customer value contributed to customers' intentions to behave positively in buying a green vehicle.

This research intended significantly contributes to both managerial practice and the academic literature. So the next section covers the envisaged theoretical and managerial contributions of this research.

8.1 Theoretical significance

This research sought to contribute to the literature by validating that study's conceptual model was underpinned by the well-researched TPB model and types of value. There was a conceptual validation, with the $R^2=0.769$ indicating a very high R^2 . In addition, this study sought to validate the model with high-end green consumption products –namely, green vehicles. Furthermore, while value significantly contributes to customers' behavioural intentions, a limited number of studies have sought to understand its role in high-end green consumption products such as green vehicles. Therefore, by applying the proposed conceptual model, this research aimed to understand the part of the customer and hedonic value in customers' behavioural intention towards green vehicle brands.

The conceptual model is a key driver that contributes significantly to knowledge. It is better understood what influences individuals to purchase or adopt green vehicles. This will give marketers clear insight into how to go about encouraging individuals to adopt green vehicles.

8.2 Managerial/practical significance

The managerial implications of this study were drawn from the results after analysing the primary data obtained from the respondents. This study aimed to prove significant and positive relationships of the independent variables with the dependent variable; however, positive relationships were established between attitudes and customer values about to behavioural intentions, and negative relationships were established between perceived behavioural intention, subjective norms, and hedonic value's influence on behavioural intention. The managerial implications of these positive or negative relationships are discussed below, along with recommended strategies to assist decision-makers to work out their implications.

The positive and negative relationships established after the multiple regression analysis test will assist marketers, government, green vehicle manufacturers, and car dealerships to formulate feasible strategies to attract, encourage, and motivate South African customers more effectively to buy green vehicles. Customer value is a key element in formulating good marketing, and it is what matters most to the customer; thus it will allow marketers to focus on delivering it. Also, looking at the insignificant relationship of perceived behavioural control, hedonic value, and subjective norms,

marketers should consider customer value and attitudes to the adoption of green vehicles and lead customers to believe that their choice is consistent with their behavioural intention.

Green vehicle manufacturers, car dealerships, and the Department of Trade, Industry and Competition should ensure that more new models are produced, technological advances are introduced, and various makes of green vehicle are made available. Marketers also need to capitalise on approaches that use customer value and attitudes, as these constructs had the most positive relationship with behavioural intentions. This can be done through genuine testimonies or good word-of-mouth. To encourage the purchase of green vehicles, governments could initiate and implement policies for green vehicle adoption. Better awareness and understanding of customers' preferences for green vehicles could make it easy for these policies to be effective and well-organised. Furthermore, Zhang et al. (2019) state that more attempts should be made to improve customers' environmental concerns. This could be done by introducing relevant eco-friendly security policies and procedures, encouraging more intense media support for environmentally friendly awareness, and improving the public's consideration of green safety policies and guidelines. This would give representatives, businesspeople, and dealers greater insight into how to win the attention of customers concerning environmental protection and to stimulate their intention to buy green vehicles (Zhang et al., 2019). Through the media, efforts could be made to promote green vehicles by emphasising their convenience, usefulness, and functionality along with their benefits for the environment; this would help customers to understand how green vehicles operate, and influence their perceptions of green vehicles because positive attitudes towards green vehicles stimulate purchase intentions.

Campaigns could also be used to show how a number of customers have adapted to green vehicles. If green vehicles were easily accessible, purchase intention would increase. Through more campaign strategies, car dealerships could make it easy for customers to access green vehicles by using displays, promotional messages, advanced technologies, and discounts, and by setting up strong slogans to influence purchases.

The number of green vehicles has increased in different countries in recent decades, showing that they undoubtedly have a huge impact on conserving the environment. Therefore, the South African government and policy-makers should develop more green adoption policies, introduce tax rebates for customers who buy green vehicles, and introduce policies that require car dealerships to have green vehicles as at least 50 per cent of their stock. Also, the Department of Education could bring about change by introducing initiatives that educate people about green vehicles and about how buying a green vehicle could improve the environment.

9. Limitations, and recommendations for future research

Even though this study provided marketing managers and environmentally friendly vehicle companies with important insights, it had limitations that are highlighted below, followed by recommendations for future research.

Owing to the Covid-19 pandemic, convenience sampling was used by distributing and sending questionnaires to respondents online. This limited the possibility of physically distributing the questionnaires in public areas in Gauteng, and so hindered the ability to go to malls and residential areas to collect data from the sample group. Also, locating individuals who drive eco-friendly hybrid vehicles was difficult because they were not easily accessible. Thus we had to use social media to reach our desired target group. Furthermore, the majority, if not all, of the respondents completed the questionnaire on their mobile devices. That presented a problem, as it meant that the researchers were unable to explain the questionnaire in depth to give respondents a greater understanding of it. This resulted in many respondents not clearly understanding specific questions and what required them.

Despite convenience sampling being used to gather the research information, a recommendation would be to use quota sampling to represent the population more accurately. In addition, in future research, it is suggested that an environment be chosen where the researcher could engage in person with respondents to assist them with any questions about the questionnaire.

10. Conclusion

This study discussed the impact of the determinants (attitudes, subjective norms, customer value, hedonic value, and perceived behavioural control) on green vehicle purchase (behavioural) intention. The proposed model provided a reasonably good explanation of green vehicle behaviour intention, as the combined factors indicated 76.9 per cent of the variance in behavioural intention when purchasing green vehicles. While purchasers are becoming better informed about the environment and are reviewing this information in their choices about green products, previous research shows how little we reflect on customers' motives when deciding to purchase green brands and related green products (Darnall & Vazquez-Brust, 2012). This study provided more information on the role and impact of attitudes, perceived behavioural control, subjective norms, and types of value on green vehicle adoption. The implications of its findings for strategies to be used by environmentally friendly vehicle companies and marketing managers have been explored in this study.

Abstract

Automobile demand has clearly increased as reflected in the rising customer base in South Africa and within Gauteng households. Due to the growing demand for automobiles amongst Gauteng households, the study seeks to examine the influence of promotional tools: advertising, personal selling, sales promotion, public relations and direct marketing on consumer behaviour (buying a hatchback automobile) //and to ascertain the relevance of traditional tools in today's world, which is characterised by digital marketing. A quantitative research approach was used. Primary data were gathered from 320 hatchback automobile purchasers using structured questionnaires, comprising closed-ended questions, being self-administered, and administered via an online-based survey. The results of the study indicated that advertising, personal selling, public relations and direct marketing have a positive and significant influence on consumer behaviour unlike the notion that these marketing strategies belong in the past. Sales promotion has a positive but non-significant effect on consumer behaviour. The study adds value to academic discussions concerning the validity and continuation of the essence of discussion on the value of marketing promotional tools. The study can assist marketing managers of hatchback automobiles to determine which promotional tools to implement to improve sales. This study can be extended by executing further studies in different sectors/industries to determine its generality.

1. Introduction

Promotion is regarded as one of the most powerful elements in the marketing mix, and it implies communicating with and persuading the target market that it is a necessity for them to buy the entity's products (Al Badi, 2018). Munir (2018) advocates that promotion tools are crucial techniques to effectively communicate to potential customers how the product or service can benefit the customer. In today's competitive world, it is not sufficient for an organisation to have only good products sold at a good price (Khanfar, 2016). To generate sales and profits, the benefits of a product must be communicated to consumers (Khanfar, 2016:94). Abdullah (2016) notes that marketing is considered as an important force in the competitive effort between businesses, which leads businesses to be able to stay in the market. Marketing opens up new horizons through activities used to identify the needs and desires of consumers and gain their support (Abdullah, 2016). Gunasekharan, Basha and Lakshmanna (2015) state that for the prospective customer of today, companies need to make a great deal of effort to sell their products and promote their existence.

Tushar (2014) contends that different studies examine the effectiveness of promotional tools that aim to change the consumer's behaviour. Regardless, there is uncertainty as to which combination of tools

*Corresponding Author

² E-mail address: maphetomoloi03@gmail.com

can most effectively persuade the customers to alter their behaviour and perception (Tushar, 2014). The present study seeks to discover the influence of promotional tools, namely: advertising, sales promotion, public relations, personal selling and direct marketing on consumer behaviour. The study is essential to determine the most influential promotional tool that persuades consumer behaviour of buying a hatchback automobile. Furthermore, it is essential to know how the automobile industries use these promotional tools and the consequent effect on consumer behaviour. Every promotional tool has its own distinct characteristics and effectiveness to influence the customers' viewpoint about various goods (Munir, 2018).

1.1. Problem Statement

Promotional tools are a term used to depict the set of tools that an organisation can use to communicate the value of its products and services to its consumers (Alexandrescu & Milandru, 2018). The challenge is to choose the optimal combination of tools to suit a specific industry at a certain time and then use it accurately to accomplish a result (Karunanithy, Sivesan & Lanka, 2013). Although previous researchers have explored the impact of promotional tools on consumer purchasing behaviour, their studies lacked exposure to the significance and efficacy of an individual promotional tool (Nour, Almahirah, Mohammed-Said & Freihat, 2014). Makgopa (2016) further points out that a variety of studies have examined the causal relationship between advertising, sales and brand images (public relations) in various industries other than the automobile industry.

Further, due to the advances of digital marketing, some scholars believe that promotional tools used for marketing belong to the past and are no longer suitable in today's world because of advances in digital technologies. Ntsike (2016) states that there is still no evidence as to whether or not traditional methods of advertising will become outdated. There seems to be a scarcity of knowledge on the effectiveness of the promotional tools influencing customers' behaviour when buying a hatchback automobile. The problem statement of this study is structured as follows: To determine and identify which promotional tools (advertising, personal selling, sales promotion, public relations and direct marketing) influences consumer behaviour buying a hatchback automobile. Therefore, it is important to discover whether promotional tools are essential in influencing consumer's behaviour when buying hatchback automobiles.

1.2. Methodology

1.2.1 Population and sampling

The targeted population chosen for this study was hatchback automobile buyers who reside in Gauteng province, South Africa. Gauteng was chosen as a geographical area because the province is the economic hub of South Africa as well the most urbanised and densely populated province with a diverse population, thus representing South Africa and can be said to be a true representation of the South African population. The respondents selected were hatchback buyers, with the sampling process aimed at being able to examine the influence of promotional tools on consumer behaviour buying a hatchback automobile. A total sample size of 320 participants was considered suitable for the research study. According to Musasa (2014), a sample size of more than 300 is significant enough to generate true conclusions for the greater population in circumstances where nearly all respondents are qualified for the intention of the study.

1.2.2 Pilot survey

A pre-testing pilot survey was administered to a sample of 30 hatchback automobile respondents to point out questions that may not be favourable and also to show any challenges in questionnaire design. The purpose of conducting the pilot survey was to ensure the effectiveness of the study. A pilot study is a method that helps in testing and refining one or more aspects of a final study, it provides an opportunity to practice the effectiveness of the research instruments (Starkey, 2017). Participants were requested to give their opinions and comments on the clarity of the instructions, the wording of the questions, the layout of the questionnaire and the time taken to complete them. The results of the pilot survey indicated that questions were accurate, realistic and easy to understand. The reliability and validity of the report score was good. Pre-testing or piloting the questionnaire ensures that mistakes are eliminated in the questionnaire (Moseki, 2020).

1.2.3 Data collection method

The primary data were collected using a self-administered questionnaire survey instrument. Surveys are convenient, inexpensive and an interactive method (Zikmund & Babin, 2013). Data collectors assisted in obtaining data from 320 respondents using structured questionnaires through online database collection. A total of 568 self-administered online-based questionnaires were distributed to the targeted respondents. Only 325 participants met the requirements of the two screening questions. After cleaning the data, a total of 320 responses were used for analysis, with only one questionnaire voided, representing 99.68 percent. Karimi (2013) states that a questionnaire is often an instrument for a survey, as it is appropriate for descriptive and analytical review.

1.2.4 Data collection instrument

The instrument used consists of a five-point Likert scale ranging from: 1= strongly disagree to 5= strongly agree. Qhogwana (2016) remarks that a Likert scale is a reviewed rating scale, which is made up of statements that stipulate either an agreeable or a disagreeable response towards the objects investigated. The questionnaire for this study comprised three sections. Section A probed respondents' demographic factors such as age and gender. Section B measured the factors advertising, personal selling, sales promotion, public relations and direct marketing. Section C was focused on the dependent factor – consumer behaviour, and specifically on the choice of buying a hatchback automobile in Gauteng, South Africa.

1.2.5 Data analysis

Statistical analyses were used since the data was quantitative; data were captured into a software package and analysed using IBM Statistical Package for Social Sciences (SPSS) version 26. Pearson's correlation coefficient was determined to establish the connections between the variables and the statistical importance of these relationships. Rashid (2015) points out that when implementing the Pearson's correlation test in SPSS, it is important to make use of the correlations that have a statistically important correlation for the analysis. A correlation coefficient allows a person to quantify the quality of the magnitude alliance between numeral variables (Zaid, 2015).

1.2.6 Reliability

Table 1 exhibits that the results for the Cronbach alpha coefficient for all the variables measured are all above 0.7. Malhotra, Nunan and Birks (2017) note that the cut-off value of the Cronbach's alpha is 0.7 even though 0.6 is sometimes permitted.

Table 1. Reliability test

<i>Constructs</i>	<i>Items</i>	<i>Corrected Item-Total Correlation</i>	<i>Cronbach's Alpha</i>	<i>Number of Items</i>
<i>Advertising</i>	ADS1	0,565	0,760	4
	ADS2	0,588		
	ADS3	0,511		
	ADS4	0,562		
<i>Personal Selling</i>	PERS1	0,570	0,816	5
	PERS2	0,629		
	PERS3	0,654		
	PERS4	0,607		
	PERS5	0,570		
<i>Sales Promotion</i>	SP1	0,608	0,819	5
	SP2	0,671		
	SP3	0,560		
	SP4	0,588		
	SP5	0,625		
<i>Public Relations</i>	PR1	0,462	0,781	5
	PR2	0,590		
	PR3	0,530		
	PR4	0,619		
	PR5	0,577		
<i>Direct Marketing</i>	DM1	0,625	0,791	4
	DM2	0,671		
	DM3	0,619		
	DM4	0,497		
<i>Consumer Behaviour</i>	CBB1	0,628	0,848	6
	CBB2	0,645		
	CBB3	0,651		
	CBB4	0,596		
	CBB5	0,656		
	CBB6	0,599		

1.2.7 Validity

Validity refers to whether the measuring instrument measures the behaviour or quality it is intended to measure and how well the measuring instrument executes its function (Surucu & Maslakci, 2020). Further defines validity as acquiring data that is suitable for the intended use of the measuring instruments (Surucu & Maslakci, 2020). Statistical conclusion validity was used to determine whether the research measured what it was supposed to measure. Statistical conclusion validity refers to inferences about whether it is suitable to presume covariation given a specified alpha level and the acquired variances (Drost, 2011). Different methods were taken to warrant the validity of the study. Validity was measured by piloting study of 30 hatchback automobile buyers prior the main investigation to allow for making any adjustment where required. Survey questions were organised on the basis of the literature review and frame of reference to warrant the validity of the study. The reliability and validity of the report score were good. The respondents' positive responses based on the questionnaire design format and questions indicated that the design and questions were clear and concise.

1.3. Hypotheses

The following hypotheses were formulated for the study:

- H₁: Hypothesis 1: Traditional advertising has a positive influence on consumer behaviour buying a hatchback automobile.

- H₂: Hypothesis 2: Personal selling has a positive influence on consumer behaviour buying a hatchback automobile.
- H₃: Hypothesis 3: Sales promotion has a positive influence on consumer behaviour buying a hatchback automobile.
- H₄: Hypothesis 4: Public relations has a positive influence on consumer behaviour buying a hatchback automobile.
- H₅: Hypothesis 5: Direct marketing has a positive influence on consumer behaviour buying a hatchback automobile.

2. Literature Review

2.1 Promotional tools

Automobile industry especially entry level hatchback segment is increasing at a high pace and there is tough competition between brands (Satheesh, Manjula &, 2012). Advertisements are used as a strong medium by marketers to communicate important product information to customers and persuade them to make a purchase (Satheesh, Manjula &, 2012). The primary instruments used to compel customers to buy products or services are referred to as the promotional tools (Agrawal, 2012). Hadita and Adiguna (2019) define promotional tools as a set of elements and methods for exchanging information about the organisation and its offerings, to achieve the essential objectives of the business. Munir (2018) further defines promotional tools as an entire set of different elements, which an organisation uses to communicate its diverse products, services and brands to its target market. Imtiaz, Maqsood, Mehmood and Idrees (2017) substantiate that promotional tools are techniques used by an organisation or manufacturer to interest consumers in purchasing multiple services or products. The use of promotional tools by automobile industries is to enhance within the target market awareness of products and services which simultaneously increase automobile sales, which in turn provides profit for the organisations (Zolkifly, Yusof & Baharom, 2017). These promotional tools are grouped into five major elements: advertising, personal selling, sales promotion, public relations and direct marketing (Onyejiaku, Ghasi, & Okwor, 2018).

2.2 Advertising

Advertising is a mass-marketing communication tool that is fashioned to communicate knowledge and persuade a great number of consumers (Camilleri, 2018). However, this medium needs some type of media or podium to convey the message (Camilleri, 2018). The purpose of advertising is to impart knowledge of a new product, report the attributes and features of the product, advice on product usage, differentiate the product from rival's products, create or improve a product's image and to direct consumers to the point-of-purchase, among other things (Camilleri, 2018).

Weber and Shweiger (2017) define advertising as any composition of paid strategic communication by an identified sponsor that intends to notify and/or convince audiences about an advertising article such as a product, service, a thought, a business or brand. Traditionally this is communicated by means of purchased time or space in mass media platforms (Weber & Shweiger, 2017). Abdullah (2016) notes that advertising is said to be the prime technique in generating product awareness in the mind of a potential consumer who is making a purchasing decision. Advertising serves diverse purposes, the major ones being to inform, persuade, remind and generate the addition of usefulness in consumers' senses (Todorova, 2015). Makgopa (2016) argues that even though advertising plays a part in building product awareness and influences future sales, the effect is not always positive. The result, in the long-run, may be negative (Makgopa, 2016). Dorshi and Parmar's (2016) study reveals that the purchasing of automobiles is mainly influenced by advertisements and secondly, by recommendations from family and friends. An effective advertisement causes a desire in listeners, audiences or readers minds; it also provides information on how to satisfy a desire and how to make the potential consumer feel good about the product (Jan, Hague, Abdullah, Anis, Shakib, & E-Alam, 2019). Therefore, from the discussion above, the first hypothesis is formulated as:

H₁: Traditional advertising has a positive influence on consumer behaviour buying a hatchback automobile.

2.3 Personal selling

Personal selling has long been recognised as the oldest and most likely the most significant component of a promotional mix (Anyadighibe, Awara & Esu, 2014). Supriyanto and Ariyanti (2018) state that personal selling is the interpersonal element of marketing communications, which occurs when the sales force communicates with consumers about prospects to build relationships. Nour, Almahirah, Mohammed-Said & Freihat (2014) define personal selling as spoken communication and face-to-face conversation with one or more potential consumers to create a need for a product or service, reply to inquiries, or respond to requests. Masimane (2017) notes that personal selling is a beneficial vehicle used for communicating with present and prospective buyers. Suttle (2018) states one of the drawbacks of personal selling is that one cannot quickly approach or respond to as many customers; as a result, it will take longer to build consciousness of the products and brand, particularly if one uses personal selling exclusively. According to Yousif (2016), profitable organisations are those that are knowledgeable about customer behaviour and are able to select marketing techniques that get through to target customers by means of the personal selling process. Therefore, the second hypothesis is formulated as:

H₂: Personal selling has a positive influence on consumer behaviour buying a hatchback automobile.

2.4 Sales promotion

Ramesh and Rao (2018) report sales promotion as a marketing and non-marketing force put into practise at a particular period of time to encourage a test of the product, increase customer demand, or to prove the availability of a product. Eleboda (2017) defines sales promotion as 'special offers', which naturally intend to increase demand during the specified period of time set. Nakarmi (2018) states that sales promotion is one of the methods used to interest consumers in purchasing more of the business products and services and defines sales promotion as marketing activities as being specific to a period, area or consumer group, which encourage a direct reaction from customers or marketing intermediaries, through the offer of additional benefits. Sales promotion increases the sales of a business, and it gives an instant boost to an organisation to achieve their anticipated sales and revenue (Zafar, Niazi & Zafar, 2018). Sales promotion is also known as a survival element as it results in competition with rivals to ensure sustainability in the market (Zafar, Niazi & Zafar, 2018). In a study conducted by Adithya (2013) on customer perception and automobile owners' behaviour, it was established that, in terms of hatchback automobiles, brand name was relevant the time for selecting any brand name product and 50 percent of the respondents were price sensitive. As a result, automobile industries used a number of sales promotion strategies and rewards as part of their marketing mix to promote a product and thus increase sales (Pongsamakthai, 2007). Therefore, the third hypothesis is formulated as:

H₃: Sales promotion has a positive influence on consumer behaviour buying a hatchback automobile.

2.5 Public relations

The area of public relations is a very important function in marketing in terms of communication with potential customers. It incorporates trademarks such as articles, blogs, case studies, print media, podcasts, that assist the promotion of an organisation's services and products that aims to create a good reputation for the business and its brands (Gasparyan, 2018). The word 'public' is used in public relations to depict the specific individuals and/or groups with whom a business builds a relationship with (Tam & Kim, 2019). According to Thurlow, Seigny and Dottori (2018), public relations is part of societal dynamics, a perception that suggests organisations are required to respond to societal expectations. Iroha (2019) defines public relations as the art and social science of examining developments, anticipating their consequence, assisting and advising institution leaders and performing a strategic system of action for the benefit of both the business and the public collectively. Ngwainmbi (2016) notes there are challenges in developing public relations, mainly because the general public does not have explicit knowledge of public relations as a practice. As a result, the American Psychological Association and other scholars have considered public relations as a mere concerted set of messages aimed at influencing the conditions or behaviour of large numbers of people, as a result tarnishing the profession (Ngwainmbi, 2016). Anani-Bossman (2019) reports that for the Institute of Public Relations (IPR), public relations are about reputation; the consequence of

what you do, what you speak and what others publish about you. Reputation management is based on the belief that an ethical reputation improves credibility, which converts to various benefits including increased sales and earnings, price premiums, improved community relations, high stock price, among others (Anani-Bossman, 2019). Therefore, the fourth hypothesis is formulated as:

H₄: Public relations has a positive influence on consumer behaviour buying a hatchback automobile.

2.6 Direct marketing

Direct marketing is a direct communication technique used by businesses to target their consumers to attain an instant reaction (Gituma, 2017). Through direct marketing, businesses communicate directly with the aimed consumers to create a response and/or a deal (Ukaj, 2016). Khan (2012) defines direct marketing as the umbrella concept for every media platform that operates in the business place where goods and services are bought and sold, to get a lead, to build traffic, to increase financial resources and to sell a product or service. Direct marketing supplies the business with an opportunity to promote the products and services directly to the customers who most require them (Auto erp, 2018). A good direct marketing campaign will help the business build relationships with new clients, test the appeal of the product or service, notify which marketing approaches reach the target market, provide customers with forceful content they can communicate or share with other potential customers, leading to growing sales (Auto erp, 2018). Therefore, the fifth hypothesis is formulated as:

H₅: Direct marketing has a positive influence on consumer behaviour buying a hatchback automobile.

2.7 Consumer buying behaviour

Consumer behaviour is defined as an activity that customers exhibit when looking for, purchasing, making use, assessing and eliminating goods that they believe will satisfy their needs (Raithel, 2018). Kumar (2019) opines that consumer behaviour is a study of the use and disposal of goods and moreover, the study of how they are obtained. Shrestha (2016) further defines consumer behaviour as a set of procedures when a group of people make choices on usage of products and services during buying to meet their desires and satisfy their needs. Consumer behaviour focuses on how consumers make choices about how to spend their available resources (money, time and effort) on consumption-related products, therefore what they buy, why they buy it, when they buy it, where they buy it, how often they use it and how they get rid of it (Samarhan, 2016).

Sama (2018) notes that a consumer is an individual who purchases or has the ability to purchase goods and services offered for sale by businesses to satisfy personal or collective needs, wants and desires. Consumer behaviour suggests the study of consumer's needs, thoughts and motivation processes used in choosing one brand over the other and the patterns of purchasing different goods and services (Auf, Meddour, Saoula & Majid, 2018). Nonetheless, Dhanabalan, Subha, Shanti and Sathish (2018) state that it is not easy to predict consumers' detailed thoughts as each consumer is a unique product of genes, environment, and experience. Stankevich (2017) reiterates that awareness of how and why consumers behave in a particular way while making their buying decision, helps businesses improve their marketing strategies and be more successful in the market.

2.8 Research Framework

In concluding the literature review, a conceptual model is proposed, which comprises promotional tools (advertising, personal selling, sales promotion, public relations and direct marketing) that influence consumer buying behaviour as the independent variables and consumer behaviour as the dependent variable. Figure 1 represents the conceptual model tested in this study.

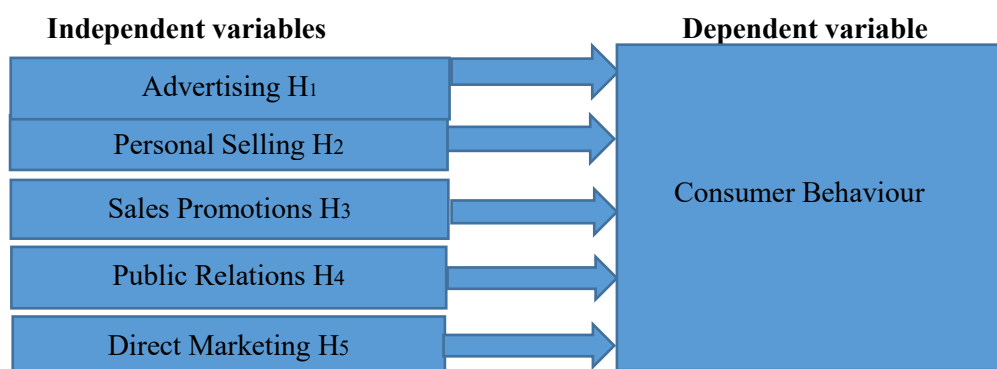

Figure 1. Conceptual model of the study

3. Results and Findings

3.1 Demographic variables

Table 2 depicts that there were more female respondents, representing 53.3 percent, than male respondents, representing 46.7 percent of gender distribution.

Table 2. Gender distribution

	<i>Frequency</i>	<i>Percentage</i>
<i>Male</i>	149	46,7
<i>Female</i>	170	53,3
<i>Total</i>	319	100
<i>Voided (gender not specified)</i>	1	

Table 3 depicts the age group of respondents that have purchased a hatchback automobile. About 61.4 percent of the respondents were between the ages of 18 and 29, and 27,3 percent were between the age of 30 and 39 years, while less were between the ages of 40 and 49 years (9,1%) and 50 and 59 years (1,9%); and 60 and 65 years(0,3%). These results indicate that hatchback automobiles were more appealing to the younger generation, especially to the 18-29 age group.

Table 3. Age distribution

	<i>Frequency</i>	<i>Percentage</i>
18-29	196	61,4
30-39	87	27,3
40-49	29	9,1
50-59	6	1,9
60-65	1	0,3
<i>Total</i>	319	100,0

3.2 Analysis inferential statistics

Correlation and regression analysis are the most frequently used techniques for investigating the relationship between two quantitative variables (Zaid, 2015). ANOVA is a statistical test used to analyse the difference between the means of more than two groups (Bevans, 2020). Regression analysis is a statistical method for estimating the relationship among constructs, and depicts reason and result relations (Uyanik & Guler, 2013).

(a) Correlation analysis

Prior to running the regression analysis, a correlation test was conducted. The results in Table 4 indicate significant relationships between all constructs. There is a significant correlation between advertising and consumer buying behaviour ($r = 0,702^{**}$; $p < 0.001$); between personal selling and sales promotion ($r = 0,701^{**}$; $p < 0.001$).

Table 4. Correlation matrix

	<i>Advertising</i>	<i>Personal Selling</i>	<i>Sales Promotion</i>	<i>Public Relations</i>	<i>Direct Marketing</i>
<i>Personal Selling</i>	.696**				
<i>Sales Promotion</i>	.672**	.701**			
<i>Public Relations</i>	.638**	.672**	.654**		
<i>Direct Marketing</i>	.502**	.399**	.523**	.466**	
<i>Consumer Behaviour</i>	.702**	.650**	.622**	.639**	.485**

The values with *** indicate a significant relationship between the constructs at 95 or 99 confidence intervals. Since all constructs are related, they are appropriate for regression analysis (Pallant, 2010).

(b) Multiple-linear regression analysis

Regression analysis reveal the strength of an independent variable as predictor of the dependent variable and is the basis for either accepting or rejecting a hypothesis.

Multiple linear regression is an extension of simple regression analysis permitting a dependent variable by multiple independent variables. As a result, the level of a dependent variable is explained by more than one independent variable (Babin & Zikmund, 2016). The test was conducted to assess the impact of the independent variables (promotional tools) on the dependent (consumer behaviour) variable.

The outcomes in Table 5 and Table 6 reveal that the model predicting consumer behaviour is statistically significant ($F = 88,881$; $p < 0.001$). The $R^2 = 0,586$ suggests that the independent variables (advertising, personal selling, sales promotion, public relations and direct marketing) explain up to 58.6 percent of the variance of consumer buying choice.

Table 5. Model summary

<i>Model</i>	<i>R</i>	<i>R Square</i>	<i>Adjusted R Square</i>	<i>Std. Error of the Estimate</i>
<i>1</i>	.765 ^a	0,586	0,579	0,53168

a. Predictors: (Constant), Direct Marketing, Personal Selling, Public Relations, Advertising, Sales Promotion

The ANOVA table (Table 6) shows that the regression equation describes a statistically significant part of the variability in the dependent variable due to variability in the independent variables.

Table 6. ANOVA

<i>Model</i>		<i>Sum of Squares</i>	<i>df</i>	<i>Mean Square</i>	<i>F</i>	<i>P value</i>
<i>1</i>	Regression	125,624	5	25,125	88,881	.000 ^b
	Residual	88,761	314	0,283		
	Total	214,386	319			

a. Dependent Variable: Consumer Buying Choice
b. Predictors: (Constant), Direct Marketing, Personal Selling, Public Relations, Advertising, Sales Promotion

3.3 Presentation of results in relation hypotheses

Table 7 presents the predictive results of the promotional tools (advertising, personal selling, sales promotion, public relations and direct marketing) in terms of buying hatchback automobiles. The outcomes show that advertising has a positive and significant effect on consumer buying choice ($\beta =$

0,345; $p < 0,001$; $t = 6,075$). The outcomes also imply that personal selling has a positive and significant effect on consumer buying choice ($\beta = 0,178$; $p < 0,001$; $t = 3,019$). Sales promotion does not have a significant effect on consumer behaviour ($\beta = 0,080$; $p > 0,001$; $t = 1,367$). The outcomes further reveal that public relations ($\beta = 0,198$; $p < 0,001$; $t = 3,646$) and direct marketing ($\beta = 0,107$; $p < 0,001$; $t = 0,016$) have a positive and significant effect on consumer behaviour. Finally, these outcomes suggest that consumer behaviour is driven by direct marketing, personal selling, public relations and advertising.

Table 7. Coefficients

<i>Coefficients^a</i>					
<i>Model 1</i>		Standardised Coefficients	T value	P value	Conclusions
		Beta			
	(Constant)		2,584	0,010	
	Advertising	0,345	6,075	0,000	Advertising has a positive ($\beta = 0.345$) and significant effect on consumer behaviour as its p value (0.000) is lower than 0.05. Therefore, hypothesis H₁ is accepted.
	Personal selling	0,178	3,019	0,003	Personal selling has a positive ($\beta = 0.178$) and significant effect on consumer behaviour as its P value (0.003) is lower than 0.05. Therefore, hypothesis H₂ is accepted.
	Sales promotion	0,080	1,367	0,172	Sales promotion has a positive ($\beta = 0.080$) but non-significant effect on consumer behaviour as its P value (0.172) is higher than 0.05. Therefore, hypothesis H₃ is not accepted.
	Public relations	0,198	3,646	0,000	The construct Public relations has a positive ($\beta = 0.198$) and significant effect on consumer behaviour as its P value (0.000) is lower than 0.05. Therefore, hypothesis H₄ is

					accepted.
	Direct marketing	0,107	2,411	0,016	Direct marketing has a positive ($\beta= 0.107$) and significant impact on consumer behaviour as its P value (0.016) is lower than 0.05. Therefore, hypothesis H_5 is accepted.
a. Dependent Variable: Consumer Behaviour					

4. Conclusion

Promotional tools are the general framework for promotion, intending to present the organisation, its products and services, to increase awareness of potential customers and to raise sales to acquire higher profits.

The results of this study shows promotional tools positively influence consumer behaviour of buying a hatchback automobile. The study examined the influence of promotional tools (advertising, personal selling, sales promotions, public relations and direct marketing) on consumer behaviour of buying a hatchback automobile in Gauteng province, South Africa. This research has proved that promotional tools stimulate interest in consumers and that they encourage a buying decision. In this regard, it can be concluded about how each promotional tool influences customer buying behaviour below.

The research findings were compared with the research finding of other research studies. The study concludes that advertising has a positive and significant effect on consumer behaviour of buying a hatchback automobile with a value of $P=0.000$, personal selling has a positive and significant effect on consumer behaviour buying a hatchback automobile with a value of $P=0.003$, public relations has a positive and significant effect on consumer behaviour buying a hatchback automobile with a value of $P=0.000$ and direct marketing has a positive and significant effect on consumer behaviour buying a hatchback automobile as its value was $P=0.016$. Sale promotion has a positive but non-significant effect on consumer behaviour buying a hatchback automobile with a value of $P=0.172$.

5. Limitations and future recommendations of the research study

This study contributes well to theory and practice. Nonetheless, it has some limitations. Due to financial constraints the geographic location of the study was focused on Gauteng province, South Africa.

The methodology involved a quantitative approach and a closed-ended questionnaire. Future research should aim for a mixed-method approach with a combination of closed and open-ended questions to gain an in-depth understanding of the influence of promotional tools on consumer behaviour buying related to a hatchback automobile. More importantly, the use of qualitative in-depth interviews will enable the researcher to understand why consumers are not influenced by sales promotions but are influenced by other promotional tools. Future recommended identify and represent more participants and include the other eight provinces of South Africa as this study focused only on Gauteng province. The researcher recommends that further analysis be performed with a larger sample size to ascertain whether sales promotion has a positive influence on consumer buying decision.

6. Managerial Implications

The results also reveal that, although, technological advances exist in digital marketing, traditional promotional marketing tools still play a role and marketers should pay particular attention to advertising to attract the younger target market. The research shows that hatchback automobile manufacturers should design promotional tools and marketing strategies specifically aimed at the target market aged 18 and 39 years.

7. Acknowledgments

I would like to thank Professor Phineas Mbango for the support, guidance and encouragement in this academic journey.

Competing interest: The authors proclaim that they have no financial or personal relationships that may have improperly influenced them in writing this article.

Author's contributions: Both authors contributed evenly to the final version of this study.

A Framework to Examine the Outcomes of University Brand Personality

Aaron Koopman^{1,*}, Helen Duh², Neo Ligaraba³

¹⁻³Marketing division, School of Business Sciences, University of the Witwatersrand, Johannesburg, South Africa

Keywords

Branding; University brand personality; Higher education

Abstract

This study was motivated by the changing higher education landscape in South Africa, where an increase in the supply of higher education has resulted in intense competition between various brands. These changes have warranted the need for university managers to unlock their potential using branding and communication strategies. This includes the development of a unique brand personality. The following study proposes a conceptual model to holistically measure the relationship between Rauschnabel *et al.*'s (2016) brand personality dimensions and brand attitude, and its subsequent impact on behavioural and brand related, supportive, and emotional outcomes of university brand personality through the moderating role of self-brand connection. Prior to the development of this framework, the researchers engaged in an extensive review of secondary sources in peer-reviewed, accredited journal articles and relevant books. The proposed framework can be empirically tested by marketers and university management to measure the full power of university brand personality. Furthermore, the model can be tested in different markets using various higher education brands and student demographic groups.

1. Introduction

The South African higher education environment has been described as turbulent and unstable with institutions needing to overcome several challenges if they are to survive and grow (CGHE, 2018; Pederzini, 2016; Wiese *et al.*, 2009). One of these challenges is the increased levels of competition between public and private institutions which has advocated for the use of communication and branding strategies typically used by profit seeking organisations to break through the clutter (Balaji *et al.*, 2016) and build a strong university brand (Rauschnabel *et al.*, 2016).

While branding offers numerous advantages to both consumers and manufacturers (Keller and Swaminathan, 2020), the decision on whether to purchase a product or service is often based on emotions (Khatoun and Rehman, 2021). This places emphasis on universities to develop a strong brand personality, which can enable them to evoke consumer feelings and create an attachment from consumers towards the brand (Rauschnabel *et al.*, 2016). Brand personality as communicated by Su and Tong (2015) who cite (Aaker, 1997, p 347) is described as '*the set of human characteristics associated with a brand*'. The development of a distinct brand personality will allow consumers to identify themselves with a brand and to express their own personality through a brand (Su and Tong, 2015). From a university perspective, consumers are likely to identify with institutions that have a strong brand personality, one that is in congruence with their self-concept (Balaji *et al.*, 2016).

Although there has been numerous studies on university brand personality (see Rauschnabel *et al.*, 2016; Rutter *et al.*, 2017; Watkins and Gonzenbach, 2013), scholars such as Saeed *et al.* (2021)

report on varied benefits/outcomes that can be generated from brand personality. However, universities rarely measure the outcomes of their brand personalities, even though they possess various unique brand personality dimensions that can be useful competitively.

1.1. Problem Statement

Students in South Africa, Africa and globally preferred the University of Cape Town and the University of the Witwatersrand because of their national and global brand image (Taid, 2022). This magnifies the need for branding within the higher education environment and to investigate the unabridged benefits that can be enjoyed from a strong brand personality (Saeed *et al.*, 2021).

Although Rauschnabel *et al.* (2016) has developed a University Brand Personality Scale (UBPS), the scale has yet to be validated in a unique African country like South Africa. In addition, there is also a need to study the outcomes of brand personality considering Rauschnabel *et al.*'s (2016) claims of its importance. From a systematic literature review, Saeed *et al.* (2021) found that behavioural and brand-related outcomes of brand personality have been studied. In addition to validating these outcomes in an African emerging market context, there could be other outcomes, such as emotional and supportive outcomes of brand personality that needs examination.

Drawing upon the attitude-behaviour context (ABC) theory, the study postulates that a positive attitude is required prior to certain behaviours or outcomes being realised. However, there is rarely a guarantee that a positive attitude will lead to a behaviour, hence the existence of an attitude-behaviour gap which needs to be closed (Dhir *et al.*, 2021) and the use of self-brand connection as a moderating variable to close the gap.

In order for the above-mentioned research problem to be addressed, the study aims to provide a conceptual model that measures the behavioural and brand related, supportive, and emotional outcomes of university brand personality through the mediating effect of brand attitude and the moderating effect of self-brand connection by integrating various models. These models include Aaker's (1997) brand personality and Rauschnabel *et al.*'s (2016) scales and dimensions, the anthropomorphism theory, the consumer brand relationship theory, the self-expression model, the self-congruity theory, and the attitude-behaviour-context theory. The integrated framework can be empirically tested to determine the powers or outcomes of university brand personality.

1.2. Methodology

The conceptualisation of the proposed framework was derived from various branding, consumer behaviour and psychology theories which have been discussed below. Prior to developing this framework, the researchers engaged in an extensive review of secondary sources in peer-reviewed, accredited journal articles and relevant books. Databases such as Google Scholar, Emerald and Springer were consulted. Key words in the search process included terms such as branding, brand management, university branding, brand attitude, brand personality, brand personality dimensions, outcomes of brand personality, and self-brand connection. This enabled the researchers to acquire relevant literature that assisted in the development of the conceptual model below.

The proposed conceptual model, illustrated in Figure 1, could be empirically tested using structural equation modelling (SEM). Based on the complexity of the model and the amount of constructs used Malhotra *et al.* (2017) suggest the use of a larger sample size. These sentiments are shared by Siddiqui (2013) who find that a sample size of at least 400 is required for models using 10 to 15 constructs in order to perform SEM tests. As this study uses 16 constructs, with a both a mediating and moderating variable, a sample size in excess of 600 is recommended.

The proposed population would be registered full-time and part-time students at the university/universities of interest. In order for generalisations to be made about all universities in a country or region, a greater a number of respondents at different institutions would be required.

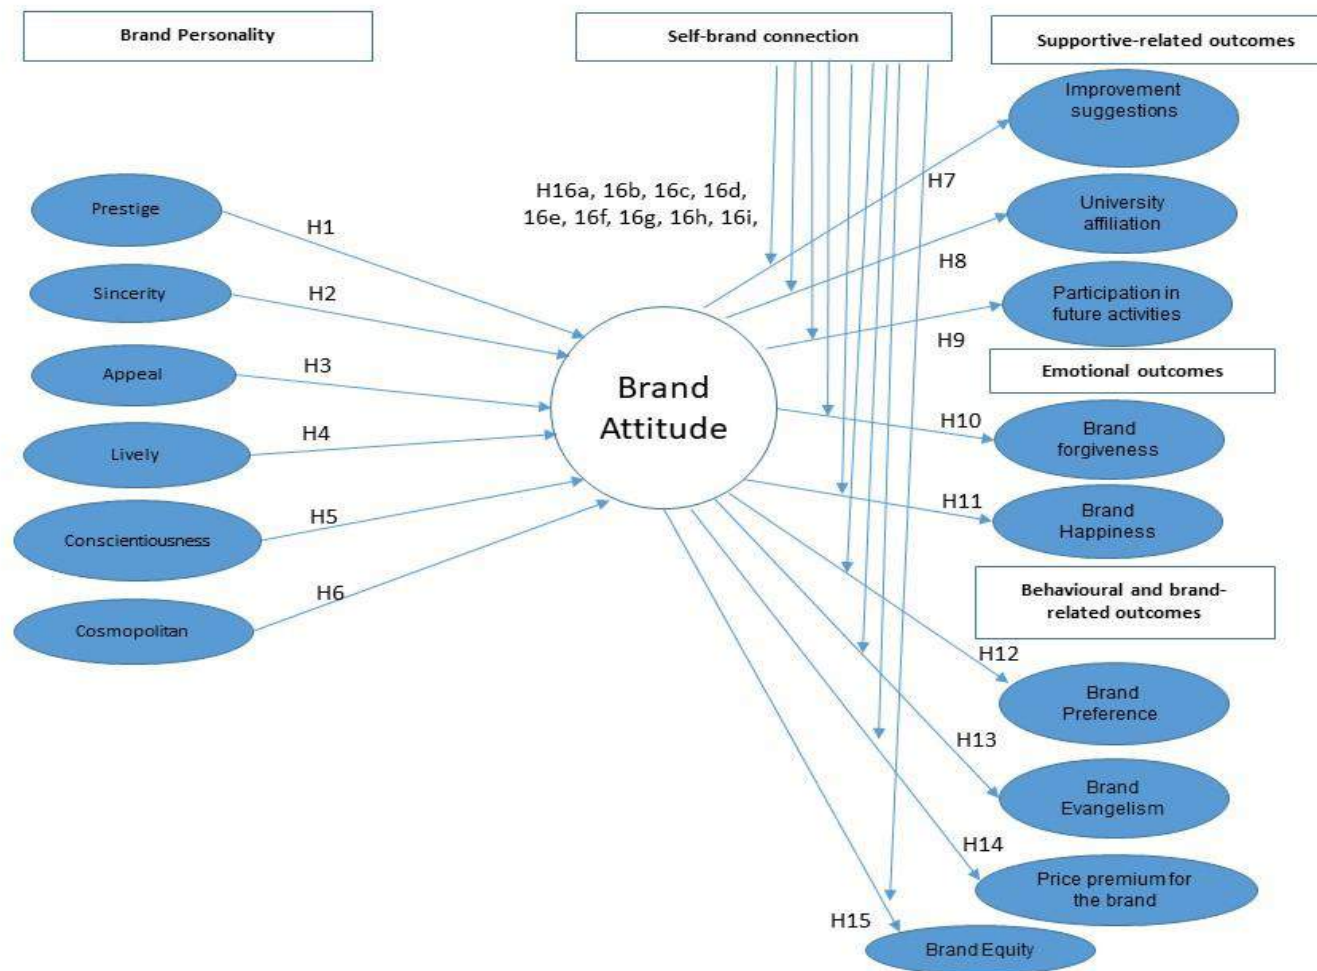

Figure 1: Proposed Conceptual Model

Source: Researchers own development guided by Rauschnabel *et al.* (2016), Balaji *et al.* (2016), Schnebelen and Bruhn (2018), Rup *et al.* (2021), Saeed *et al.* (2021). In addition, the conceptual model is also supported by Aaker's (1997) brand personality dimensions, the anthropomorphism theory, the consumer brand relationship theory, the self-expression model, the self-congruity theory, and attitude-behaviour-context theory.

1.3. Hypotheses

The following hypotheses were based on the proposed conceptual model above:

- H¹: There is a positive relationship between prestige brand personality and brand attitude.
- H²: Sincerity brand personality will positively impact brand attitude.
- H³: Appeal brand personality positively impacts brand attitude.
- H⁴: Lively brand personality positively impacts brand attitude.
- H⁵: There is a positive relationship between conscientiousness brand personality and brand attitude.
- H⁶: Cosmopolitan brand personality is positively related to brand attitude.
- H⁷: There is a positive relationship between brand attitude and improvement suggestions.
- H⁸: Brand attitude positively impacts university affiliation.
- H⁹: Brand attitude positively influences participation in future activities.
- H¹⁰: There is a positive relationship between brand attitude and brand forgiveness.
- H¹¹: Brand attitude positively impacts brand happiness.
- H¹²: There is a positive relationship between brand attitude and brand preference.
- H¹³: Brand attitude positively impacts brand evangelism.
- H¹⁴: Brand attitude positively influences the willingness to pay a premium price for the brand.
- H¹⁵: Brand attitude positively impacts brand equity.
- H^{16a}: Self-brand connection will moderate in the relationship between brand attitude and improvement suggestions.
- H^{16b}: Self-brand connection will moderate in the relationship between brand attitude and university affiliation.
- H^{16c}: Self-brand connection will moderate in the relationship between brand attitude and participation in future activities.
- H^{16d}: The relationship between brand attitude and brand forgiveness is moderated by self-brand connection
- H^{16e}: Self-brand connection will moderate in the relationship between brand attitude and brand happiness.
- H^{16f}: The relationship between brand attitude and brand preference is moderated by self-brand connection.
- H^{16g}: Self-brand connection will moderate the relationship between brand attitude and brand evangelism.
- H^{16h}: Self-brand connection will moderate in the relationship between brand attitude and price premium for the brand.
- H¹⁶ⁱ: Self-brand connection will moderate in the relationship between brand attitude and brand equity.

2. Literature Review

This section discusses the models and theories used to develop the integrated framework for this study. The degree of claims about the benefits of brand personality and how to achieve the various benefits, warrants the need to review and use different underpinning theories in this study to explain the benefits. Some relevant concepts and theories to be reviewed and used in this study includes Aaker's (1997) brand personality and Rauschnabel *et al.*'s (2016) university brand personality scales and dimensions, the anthropomorphism theory, consumer brand relationship theory, the self-expression model, the self-congruity theory, and the attitude-behaviour-context theory. In addition, aspects of various branding models from Balaji *et al.* (2016); Rauschnabel *et al.* (2016); Rup *et al.* (2021); Saeed *et al.* (2021); and Schnebelen and Bruhn (2018) were used to develop the conceptual model.

Rauschnabel *et al.* (2016) Scales and Dimensions

Rauschnabel *et al.*'s (2016) University Brand Personality Scale (UBPS) is based on the work of Aaker (1997). The researchers were motivated to provide a context-specific scale, as there were concerns over Aaker's (1997) scale's ability to transcend cultures and product categories. The result was the development and validation of a six-dimension UBPS comprising of dimensions such as prestige, sincerity, appeal, lively, conscientiousness and cosmopolitan.

Balaji *et al.* (2016) University Supportive Outcomes/behaviours

When there is the liking of the university brand personality and according to the social identity and exchange theories, students give back in terms of engaging in university supportive behaviours (Balaji *et al.*, 2016). Balaji *et al.*'s (2016) model suggests that some of the university supportive outcomes are improvement suggestions, university affiliation and participation in future activities. However, before the university brand personality impacts the supportive outcomes, and following the attitude-behaviour-context (ABC) theory of Dhir *et al.* (2021), a positive attitude is needed as a mediator. The positive attitude is built from identifying with the university brand personality (Balaji *et al.*, 2016). In the context of university brand personality and supportive outcomes, Balaji *et al.* (2016) suggest self-brand connection (SBC) as a moderator that can close the attitude-behaviour gap. Consumers with high levels of self-brand connection identify strongly with the brand and hold positive attitudes towards the brand. These consumers are also more likely to engage in brand supportive behaviours as it allows them to communicate their identification with the university to others (Balaji *et al.*, 2016). These supportive behaviours/ outcomes are illustrated in the model below.

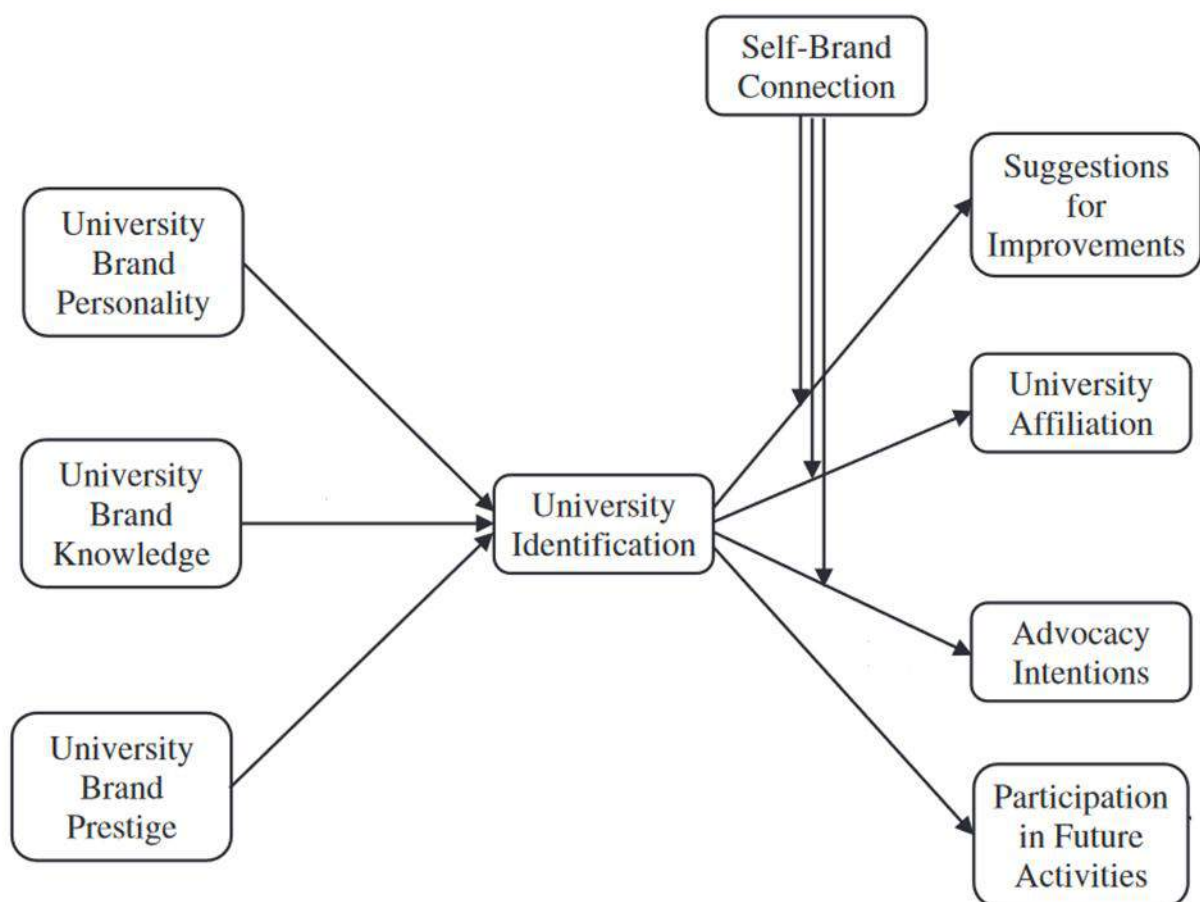

Figure 2: University Supportive Behaviours Model
Balaji *et al.* (2016: 3025)

Schnebelen and Bruhn's (2018) Emotional outcomes

The model developed by Schnebelen and Bruhn (2018) suggests some emotional outcomes such as brand happiness, brand evangelism, positive word-of-mouth and brand forgiveness. As communicated by Rauschnabel *et al.* (2016) university brand personality can create an emotional attachment from consumers towards the brand. This emotional connection can result in favourable returns for brand managers (Khatoun and Rehman, 2021; Schnebelen and Bruhn, 2018; Watkins and Gonzenbach, 2013).

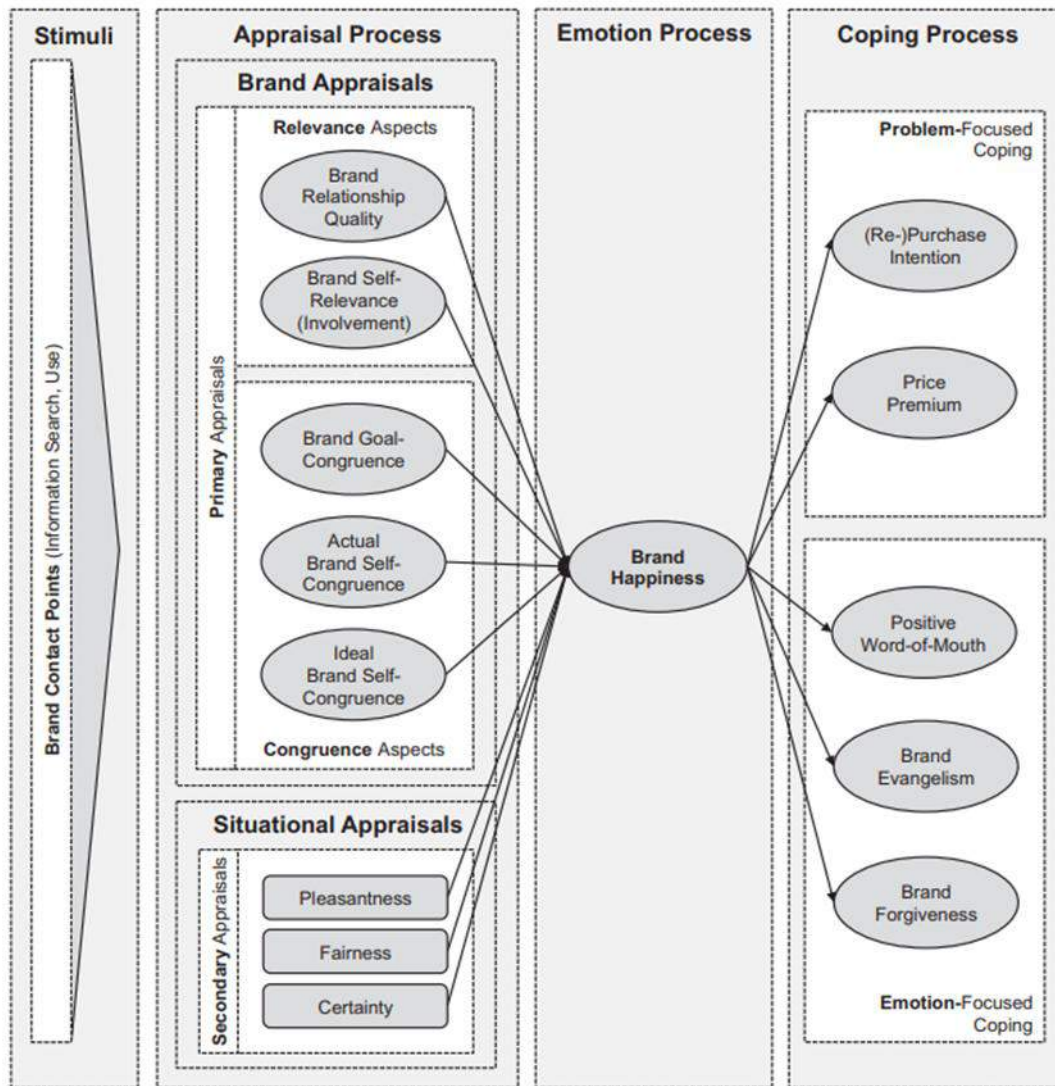

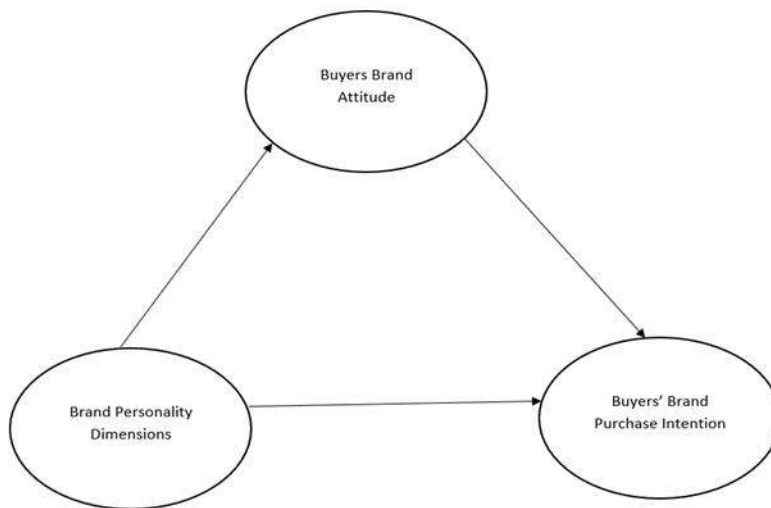

Figure 3: Appraisal Framework Of Brand Happiness (Schnebelen and Bruhn, 2018: 105)

RUP *et al.*'s. (2021) Model depicting the mediating role of brand attitude

Rup *et al.* (2021) suggest that brand attitudes mediate in the relationship between brand personality dimensions and desired behaviours from consumers. The authors allude that prior to certain outcomes being realised, the dimensions of prestige, sincerity, appeal, lively, conscientiousness and cosmopolitan would first impact brand attitude, which thereafter would influence various outcomes.

**Figure 4: Model Depicting The Mediating Role Of Brand Attitude
(Rup *et al.*, 2021: 128)**

Saeed *et al.* (2021) integrative model of antecedents and consequences of brand personality

In a comprehensive literature review on the antecedents, outcomes and theories related to brand personality in general, Saeed *et al.* (2021) summarised and categorised the consequences/outcomes of brand personality into four themes, namely: relational, cognitive, behavioural, and brand related. Out of the four categories of brand personality outcomes that Saeed *et al.* (2021) have identified, they found that relational consequences, such as brand trust and brand loyalty, behavioural consequences such as purchase intention, and brand-related consequences such as brand equity have been studied. Saeed *et al.* (2021) found that studies are lacking on the emotional and supportive outcomes of brand personality. The emotional outcomes are particularly important considering that brand personality is an emotional attribute that emanates from a brand and from which consumers are willing to distinctively respond to their liking of the brand personality (Rauschnabel *et al.*, 2016). Saeed *et al.*'s (2021) framework is indicated below.

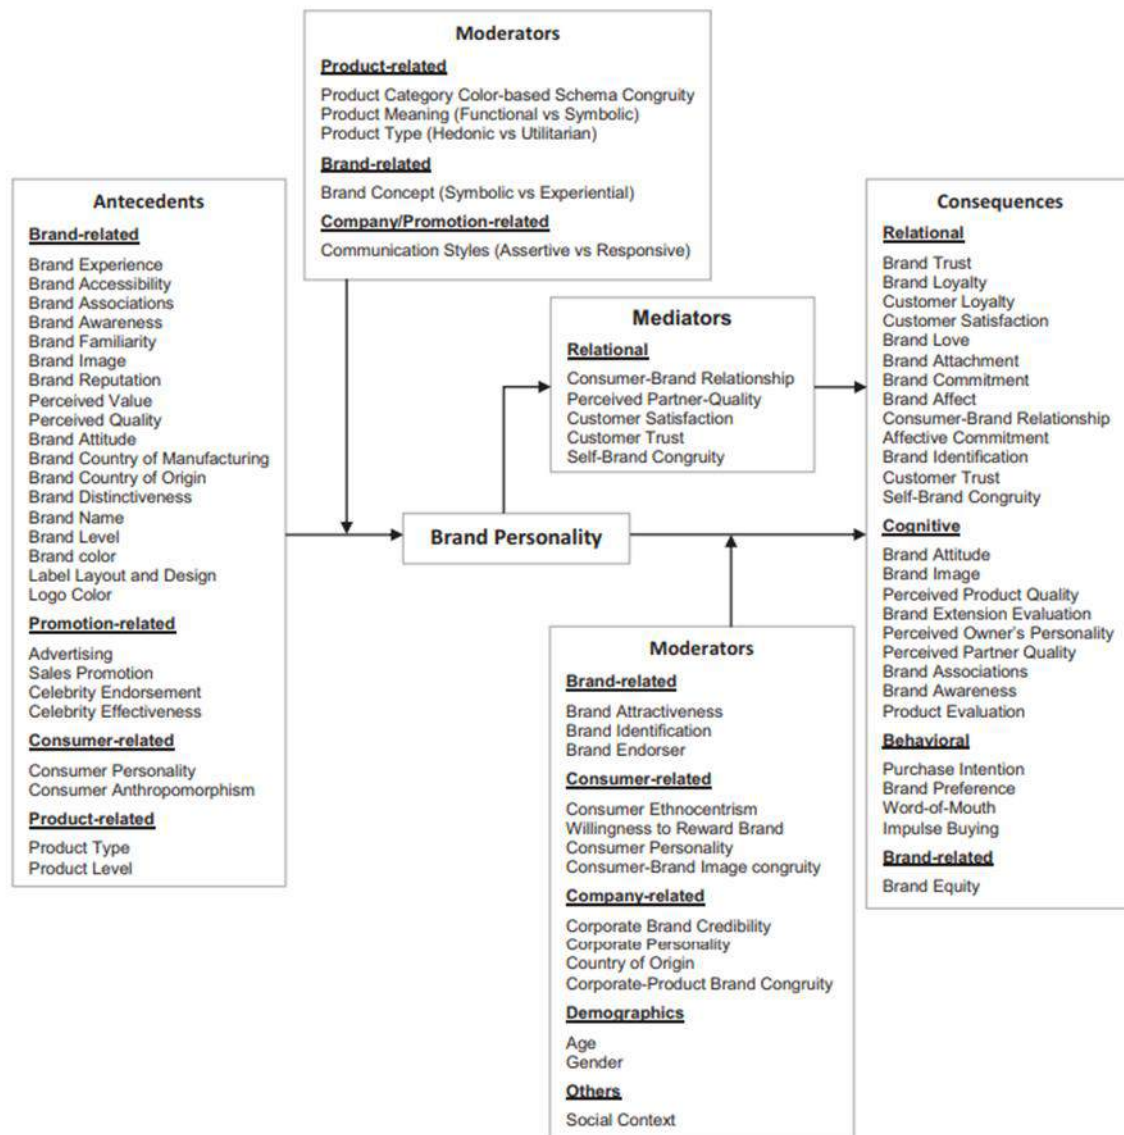

Figure 5: Integrative Model Of Antecedents And Consequences Of Brand Personality

Saeed *et al.* (2021)

Aaker's (1997) Brand Personality Dimensions

Considering the benefits of brand personality to consumers and brand owners, Aaker (1997) developed a scale to measure brand personality. The testing of the scale produces a five-factor model or dimensions namely, sincerity, excitement, competence, sophistication and ruggedness (Loureiro *et al.*, 2014).

Ahmed and Jan (2015) have noted that researchers have employed Aaker's brand personality scale in three directions, firstly the applicability of the scale across countries, secondly is the predictive effects of brand personality and thirdly is the antecedents of brand personality. Although Aaker's (1997) brand personality scale, which highlights various dimensions, has been widely accepted as the scale for measuring brand personality, the scale has certain limitations. Subsequent studies have questioned the scale's ability to be generalised and used across cultures and product categories (Ajeyalemi and Dixon-Ogbechie, 2020; Rauschnabel *et al.*, 2016) as more studies have concentrated on manufacturing sectors rather than service industries (Ahmed *et al.*, 2019). Additionally, Aaker's (1997) seminal paper was developed in the United States of America (USA) and therefore represented its population and culture, which promotes individualism as opposed to collectivism - which is more apparent in African and Asian communities. Moreover, studies have suggested that certain

dimensions such as ruggedness did not appear as part of brand personality, further questioning the use of Aaker's model in different countries (Ahmed *et al.*, 2019). Despite the limitations of this model, the third reason provides sufficient motivation for its adoption in this study.

Anthropomorphism Theory

Based on the intense competition within the industry and as means to capture audience attention and break through the clutter, marketers and advertisers have been encouraged to think innovatively about their marketing and branding strategies. One such way is to humanise a brand – a concept referred to as anthropomorphism (Lee and Oh, 2021). The application of anthropomorphism within marketing communication strategies is validated by Epley *et al.* (2007) who provide evidence to suggest that individuals effortlessly apply anthropomorphic descriptions to non-human agents.

The anthropomorphism theory includes three determinants, namely, elicited agent knowledge, sociality and effectance. The first determinant, elicited agent knowledge, explains the cognitive process of anthropomorphism, highlighting how customers make anthropomorphic judgements towards non-human agents (Lee and Oh, 2021). The sociality dimension focuses on the needs of people to develop connections with others, including the connection with non-human objects. The desire to achieve such relationships with non-human entities is motivated by the fact that customers are more likely to identify and acknowledge human-like traits in a non-human entity. The effectance determinant explains people's motivations to develop effective interactions with their situations by improving the non-human objects predictability while decreasing its uncertainty (Lee and Oh, 2021). Brands that are able to portray human-like characteristics are perceived more positively by consumers (Lee and Oh, 2021). Lee and Oh (2021) further communicate that when there is great uncertainty, and customers are unclear about situations i.e., deciding on which local brand to purchase, they crave anthropomorphism thoughts.

Consumer Brand Relationship Theory

The consumer brand relationship theory explains the relationship between a brand and a consumer. This is found on the assumption that in the minds of consumers, a brand can be humanised to the extent that the brand and the consumers become partners (Loureiro, 2013) The concept of consumer-brand relationship has been a matter of significance among academics in the marketing sphere. Loureiro (2013) states that numerous companies are starting to acquire information in relation to how consumers relate with brands, and the reasons behind why certain brands are preferred over others. The work of Fournier in relation to consumers and brands has been used as a steppingstone in extending, refining and adding new perspectives to the brand relationship theory (Bengtsson, 2003; Crespo *et al.*, 2022).

When analysing both brand personality and brand relationship theory, Avis *et al.* (2012) report that the underlying theories propose that brand personality and brand relationships influence consumer behaviour. Fournier (1998) brand relationship framework suggests that consumer brand relationship quality has a direct impact on whether a consumer will purchase a given brand. Using the consumer-brand relationship theory, Crespo *et al.* (2022) assert that when a good story is told about a brand, consumers build relationships with the brand and these create cognitive, behavioural and emotional responses or outcomes. Thus, it is expected that in the growing competitive higher education industry, the uniquely built brand personality dimensions will improve consumer-brand relationships and create emotional and behavioural outcomes through positive brand attitudes.

The Self-expression Model

The self-expression model is based on the premise that consumers use certain brands as means to reflect or portray their identity. The self-identity can be either the consumer's actual identity or their ideal identity (Aaker, 1996). Aaker (1996) also allude that even though a brand may not exhibit a strong brand personality, consumers may still use their products to express their identity, however stronger brands are known to play key roles in the self-expression process (Aaker, 1996; Phau and Lau, 2000)

The concepts of self-expression which is consistent with the self-congruity theory acknowledges that consumers have a positive attitude towards brands that are self-congruent and exploit these brands as a means to express themselves (Phau and Lau, 2000). The self-expression model can also become an extension of the self to such an extent where it becomes difficult to separate the user from the brand (Phau and Lau, 2000). Consumers often have strong associations with brands that meet their expectations (Tan et al., 2018) and are motivated to maintain relationships with brands that are able to communicate their self-image (Li et al., 2021).

Inasmuch as the terms brand attitude and self-brand connection are similar, and that an earlier study conducted by Ferraro et al. (2013) as communicated by Casidy et al. (2021) illustrate a reciprocal relationship between the two terms where consumers with a strong self-brand connection maintain a favourable view of the brand, Eelen et al. (2017) suggest that self-brand connection, and its favourable outcomes, is dependent on a brand's ability to reflect a consumer's identity. However, Sarkar et al. (2021) opine that this will depend on the moderating effect of brand attitudes.

Self-congruity Theory

Self-congruity is referred to as a match between a product's image and a person's actual self-image (Sirgy, 1985) and is known to positively impact consumer behaviour (Roy and Rabbanee, 2015). Roy and Rabbanee (2015) further suggest that self-congruity is an important concept for marketers to understand as it facilitates positive attitudes towards brands and can affect purchase intention, brand preference and brand loyalty. A consumer's motivation to express or position himself or herself in a certain way can be influential in their purchase of branded products and services. The purchase and consumption of branded products is not only to satisfy physical needs but also psychological needs where self-identity and one's individuality can be conveyed (Roy and Rabbanee, 2015). When the personality of a brand is congruent with consumers identity or values, especially social values, Chieng et al., (2022) found that it leads to brand attachment directly. However, according to Sarkar et al. (2021) and the attitude-behaviour theory, the brand-related outcome may depend on the brand attitudes. Whether these will apply in the university brand personality dimensions, need investigation.

Attitude-behaviour-context Theory

The attitude-behaviour-context (ABC) theory posits that consumers' behaviour is the outcome of the attitude and other contextual factors which include age, gender, culture, and personal interests. The theory also stipulates that a behaviour exhibited by a consumer may be linked to the expected benefits they may derive (Dhir et al., 2021). However, even when benefits are provided, which may be functional, symbolic and social congruency benefits from a brand, Zhang et al. (2018) contend that the behavioural outcomes will only be possible when positive attitudes have been developed. How much the attitude leads to the behaviour and the factors that will close the attitude-behaviour gap are questions that continually need answers. While Rup et al. (2021) suggest that brand attitudes mediate in the relationship between brand personality dimensions and desired behaviours from consumers, Balaji et al. (2016) assert that self-brand connection will act as a moderator before the attitude translates into the behaviour. These relationships can be presented in a conceptual model and a suggestion on how to close the attitude-behaviour gap made and tested.

3. Results and Findings

Sources for various constructs

Constructs	Sources
Prestige	(Rauschnabel et al., 2016)
Sincerity	(Rauschnabel et al., 2016)
Appeal	(Rauschnabel et al., 2016)
Lively	(Rauschnabel et al., 2016)
Conscientiousness	(Rauschnabel et al., 2016)
Cosmopolitan	(Rauschnabel et al., 2016)
Brand Attitude	(Rup et al., 2021)

Self-brand connection	(Balaji <i>et al.</i> , 2016)
Improvement suggestions	(Balaji <i>et al.</i> , 2016)
University affiliation	(Balaji <i>et al.</i> , 2016)
Participation in future activities	(Balaji <i>et al.</i> , 2016)
Brand forgiveness	(Schnebelen and Bruhn, 2018)
Brand happiness	(Schnebelen and Bruhn, 2018)
Brand preference	(Saeed <i>et al.</i> , 2021)
Brand evangelism	(Schnebelen and Bruhn, 2018)
Price premium for the brand	(Schnebelen and Bruhn, 2018)
Brand equity	(Saeed <i>et al.</i> , 2021)

4. Conclusion

This conceptual paper presents a framework that seeks to measure the behavioural and brand related, supportive, and emotional outcomes of university brand personality through the mediating role of brand attitude and the moderating effect of self-brand connection. Previous literature on brand personality commonly refers to the relational consequences, behavioural consequences and brand-related outcomes such as brand equity (Saeed *et al.*, 2021). However, Saeed *et al.* (2021) indicate further powers/ outcomes of university brand personality.

Therefore, the proposed conceptual model can be empirically tested amongst various higher education brands and in different markets and student groups. Doing so will provide marketers and higher education management with knowledge and scientific evidence to validate the implementation of various branding and marketing communication strategies.

5. Managerial Implications

5.1 Practical contribution of the study

The proposed conceptual model offers a notable contribution to future research on university brand personality and can be empirically tested to investigate the behavioural and brand related, supportive, and emotional outcomes of university brand personality. Marketers and university management could use the findings to develop appropriate branding and communication strategies as it will provide them with information on the relevant brand personality dimensions that impact the behavioural and brand-related, emotional, and supportive outcomes of university brand personality. As acknowledged by Su and Tong (2015), there is also great significance in understanding brand personality as it provides a platform for creating and building meaningful relationships with consumers, which ultimately can improve brand equity. Moreover, by investigating the moderating role of self-brand connection, scientific evidence can be obtained to close the attitude-behaviour gap.

5.2 Academic contribution of the study

While the concept of brand personality had existed prior, the seminal work of Aaker (1997) provided a scale to measure brand personality dimensions. Subsequently, this created a springboard for Rauschnabel *et al.* (2016) to develop a measurement theory that relates specifically to university brand personality and identified six university brand personality dimensions. However, Saeed *et al.* (2021) allude that relational consequences, such as brand trust and brand loyalty, behavioural consequences such as purchase intention, and brand-related consequences such as brand equity have been studied. However, it was suggested behavioural and brand-related outcomes need further study. For example, behavioural and brand-related outcomes such as brand evangelism and the willingness to pay a premium price for a brand, require examination in relation to brand personality. Additionally, Saeed *et al.* (2021) found that studies are lacking on the emotional and supportive outcomes of brand personality. The emotional outcomes are particularly important considering that brand personality is an emotional attribute that emanates from a brand and from which consumers are willing to distinctively respond to their liking of the brand personality (Rauschnabel *et al.*, 2016). The overall academic or theoretical contribution of the study is the development of a proposed conceptual model which enriches the model developed by Rauschnabel *et al.* (2016) and can subsequently be used by different higher education brands and among different sample groups.

Recommendations

As a conceptual study, this paper lacks empirical evidence to substantiate the relationships between the various constructs. It is recommended that future researchers test the validity of the proposed framework in various contexts and among different target groups. The empirical evidence obtained will potentially add new points of new discussion to the conversations surrounding university brand personality.

Keywords

E-pharmacy; COVID-19; South Africa; Perceived risk; Hedonic value; Utilitarian value; Satisfaction

Abstract

The success of an innovation like an e-pharmacy rests on its massive acceptance by consumers. However, research on this topic in developing countries like South Africa indicates that most older consumers still prefer to access their medication from physical healthcare stations. Research in this field has not adequately addressed the issue of what contributes to the usefulness of e-pharmacies and consumers' trust therein. This study applied the expectation model to understand the factors influencing e-pharmacies' usefulness perception and trust among 350 older South African consumers who have access to the internet and have used e-pharmacies previously. Structural equation modelling was utilised to validate the research measurement model and test the study's hypotheses. The findings suggest that the integrated proposed model provides a better explanation for e-pharmacies' usefulness. Furthermore, the findings suggest that perceived usefulness is influenced by confirmation and utilitarian value. Moreover, perceived usefulness has a significant influence on older consumers' trust in e-pharmacies.

1. Introduction

The internet has transformed our lives, communication, and buying habits and practices. As access to the internet grows, so does its use in healthcare. It is estimated that approximately 4.5% of all internet searches worldwide are related to healthcare queries or information (Srivastava & Raina, 2021). In addition, today's consumers use the internet for more than just reclaiming healthcare information, including self-diagnosis and obtaining various other healthcare-related services and products. E-pharmacy or online pharmacy refers to the trading of medications through a website and distributing them directly to customers (Srivastava & Raina, 2021). The growth of e-pharmacies in recent years has been fuelled by the easy availability of the internet, increased awareness of digital literacy, the shift from physical doctor-patient interaction to self-diagnosis, a surge in the ageing population experiencing difficulty visiting pharmacies, and an integrated e-commerce supply chain. Furthermore, the COVID-19 pandemic has positively impacted the market growth and transformed the fortunes of e-pharmacy companies owing to increased consumer switch from traditional buying to online purchases of general medications and medical devices, such as oximeters, thermometers, and health supplements. Economic Times (2021) reported that the number of households using e-pharmacy services increased by 2.5 times to 9 million during the pandemic. Moreover, the *Online Pharmacy Market-Global Outlook & Forecast (2020)* report confirmed that there is an exponential growth in the e-pharmacy industry in both developed and developing countries. As such, the global e-pharmacy

market size is expected to reach USD169.3 billion by 2028 and to grow at a compound annual growth rate of over 20% during the 2019–2025 period (Business Wire, 2021). E-pharmacy offers benefits like convenience, time-saving, affordability, and ease in the availability of medicines (Business Wire, 2021).

Despite the benefits of e-pharmacies, evidence shows many consumers – especially those in African countries – still prefer to collect their medication from physical health facilities (Azevedo, 2017). According to Pharma Dynamics (2022:1), in South Africa “internet pharmacies that sell scheduled medication are still by and large considered illegal in our country, despite them having been in operation for nearly 20 years elsewhere in the world”. Nevertheless, only a limited number of studies have investigated the factors influencing the use of e-pharmacies in a developing country context (Anand, Baid, Navin & Ghosh, Arijit., 2021; Chordiya & Garge, 2019; Thalkari, , Karwa, & Gawli., 2018). Furthermore, researchers commonly cite consumer trust as the most significant factor influencing consumers’ use of innovations (Fittler, Vida, Káplár & Botz, 2018; Zhu, Liu, Kapucu and Peng (2020). This is particularly important in the context of e-pharmacies, as understanding the issues explaining consumer trust is critical to promoting the sustained success of this innovation and thus there is enormous room for contributions to this body of research.

Healthcare scholars have identified various studies on the use of health technologies by different demographic groups, especially older people (Berauk, Murugiah, Soh, Sheng, Wong & Ming, 2020; Klimova, 2016). However, limited research has examined the factors contributing to older consumers’ perceived usefulness and trust of e-pharmacies. Considering this gap in present literature, this study aims to identify older consumers’ perceptions of usefulness and trust towards e-pharmacy in a developing country, namely South Africa. Furthermore, prior research (Oghuma, Libaque-Saenz, Wong & Chang, 2016) has identified hedonic and utilitarian values as important drivers of consumer intentions to adopt and/or continue using innovations. Nonetheless, there is limited research examining the extent to which these values influence the usefulness of the innovation. To better understand how the hedonic and utilitarian values that consumers receive from e-pharmacies could explain their perceived usefulness with e-pharmacies, this study integrates hedonic motivation and utilitarian value constructs into the expectation-confirmation model (ECM) to determine how they serve as explanatory variables in e-pharmacy users’ perceptions of risk. Additionally, the conceptualisation and validation of e-pharmacies hedonic and utilitarian values provide new insights into how these factors influence older consumers’ perceived usefulness with e-pharmacies.

2. Literature Review

2.1. Overview of E-Pharmacies

Having recently emerged as a developing industry, e-health refers to the use of electronic health information and services via the internet and mobile technology. These online services enable consumers to obtain various healthcare support and facilities through the use of blogs, online communities, and integrated technology platforms like online healthcare consultation and online pharmacies. Consumers can effectively manage and improve their and their families’ healthcare needs and requirements by using online purchasing platforms (Anad et al., 2021). This shift from traditional to internet-based healthcare services has allowed consumers to better understand the various health conditions that exist and develop a proactive approach to their health (Rains, 2007). Nonetheless, there is an apprehension concerning the use of such services, which influences consumer acceptance and usage patterns. Researchers have argued that online health information lacks credibility and the expertise of those who provide it is questionable (Dutta-Bergman, 2003; Lemire & Wiebe, 2008). Furthermore, consumers have expressed a reluctance to use online health information and services due to concerns about the misuse of personal confidential information (Bansal, Gefen & Zahedi, 2010; Beldad, Jong & Steehouder,2010).

Online pharmacies, also known as e-pharmacies, are made possible by the processes of selling and purchasing pharmaceutical medicines over the internet and delivering them via the e-commerce supply chain. Medicines are classified as prescription medicines that require a doctor’s prescription to be dispensed, or non-prescription medicines (also known as over-the-counter medicines), which do

not need prescriptions. For the past few years, the digital pharmacy has been identified as the next disruptor of healthcare delivery. While hospitals, pharmaceutical companies, non-governmental organisations, other platform providers, and consumers recognise the promise and need for a digital interface, it lacks the motifs needed to accelerate implementation (Frost-Sullivan, 2020). Before COVID-19, more than 67% of people worldwide researched their health problems online, while nearly 59% used consumer health goods to treat acute conditions (Frost-Sullivan, 2020). Patients' use of non-prescription healthcare and health-monitoring technology has created an ecosystem where the journey into the digital sector is transitioning to consumer healthcare. Falling behind on internet skills may have long-term consequences for seniors. For example, more health appointments, services, and products are migrating online, as many of us experienced during the pandemic.

2.2. Benefits of E-Pharmacies

E-pharmacies are beneficial to both healthcare facilities and consumers. With the introduction of e-pharmacies, healthcare institutions have been able to enhance customer services and enjoy operational efficiencies by shifting the focus from dispensing medication to providing services requiring human interaction (Cho et al., 2016). The use of e-pharmacies has enabled some healthcare institutions to offer services timely, reduce queues, and meet their clients' expectations. Moreover, this innovation has enabled healthcare institutions to reduce their expenditure on hiring staff and purchasing office furniture, fittings, and stationery.

E-pharmacies are a technological advancement that can bridge the gap for consumers by providing them with affordable and easy access to medications delivered to their homes at the click of a button, as well as offering appropriate medical remedies (FICCI, 2016). Furthermore, instead of handwriting or calling in prescriptions, doctors and medical practitioners can use e-prescribing to write and send prescriptions electronically to participating pharmacies (Sonawane, Ramesh & Mahajan, 2020). Srivastava and Raina (2020) highlighted e-pharmacies' willingness to reach numerous consumers despite their lack of geographic location. E-prescribing has the potential to improve patient safety, pharmacy workflow, and prescriber-patient contact (Mahesh, Samuel, Bag & BG, 2020). E-pharmacies reduce the number of dealers in the long chain of drug distribution, saving money and time, while still providing lower-cost medication to end users (Moparty & Irene, 2020). Individuals who live far away from a traditional pharmacy as well as the elderly, disabled, and others who are unable to travel to a traditional pharmacy can benefit from the speed and convenience with which medications can be purchased online (Chordiya & Garge 2019).

2.3. Elderly Consumers and Technology Use Behaviour

Technology is believed to improve the elderly's daily lives and maintain their health efficiently. According to a report from the United Nations, the number of people aged 60 and over will increase by 56% between 2015 and 2030, growing from 901 million to 1.4 billion (Dugarova, 2017). This suggests that older consumers are becoming more important to economies. Innovative products, such as e-pharmacies enabling self-service, have been introduced by underscoring the benefits for older consumers. However, older consumers are still hesitant and have lower intentions to adopt compared to younger consumers. Park, Kim & Sen (2020) stated that older consumers are resistant to new technology and do not want to change their lifestyles. Nevertheless, the COVID-19 pandemic has changed older consumers' behaviour towards the use of technology. Research shows that older consumers' technology use accelerated during this period, as many suffered from isolation, loneliness, and being less mobile. As a result, older consumers have been using their devices and the internet as helpful tools. Moreover, research indicates that older consumers with smartphones have increased their usage.

According to the 2020 Euromonitor International report, the most popular weekly online activities embraced by people above 60 are: online browsing (81%), visiting online news sites (72%), visiting and updating social networking sites (60%), and using a banking service on a mobile phone (45%). Other weekly online activities, such as making in-store mobile payments (24%), visiting health-related or medical sites (23%), taking part in online video gaming (21%), online streaming of music (19%), and buying groceries online (13%), are less popular among the elderly. Furthermore, there has been an increase in the use of technology for health-related activities among older consumers, with

70% of the respondents admitting that they have used a remote consultation app, purchased medical supplies online, and been in contact with someone in the health sector – although there are still a somewhat smaller share of seniors doing this, compared to younger generations. Additionally, due to the COVID-19 pandemic, many of these older consumers realised the benefits of the digital world when they were forced to stay in contact with family and friends as well as to do their shopping online. This relatively wealthy age group became more familiar and comfortable with technology and the use of online services.

3. Conceptual Model and Research Hypotheses

Figure 1 demonstrates the relationships between the constructs in this study.

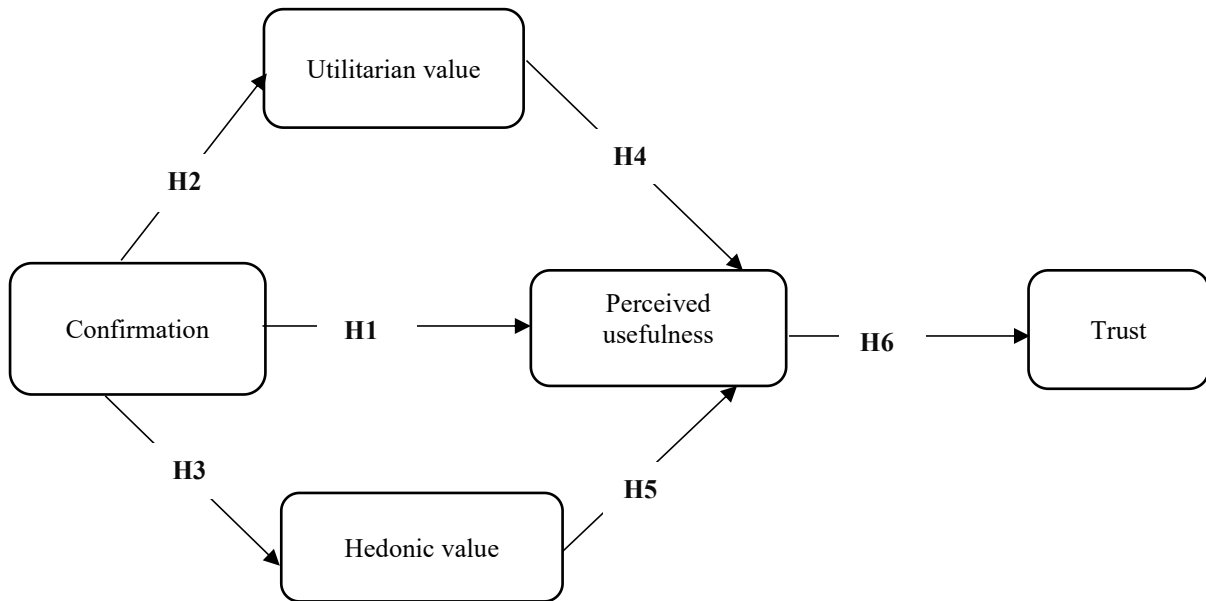

Figure 1: Conceptual Model
(Source: Author's compilation)

3.1. Confirmation

Confirmation refers to the level at which actual usage experience confirms consumers' initial expectations (Mogil & Macleod, 2017). In the e-pharmacy context, confirmation is described as the confirmation of users' initial expectations of e-pharmacy services. Mogil and Macleod (2017) stated that customer expectations serve as a benchmark against which current and future service encounters are measured. According to Brown, Venkatesh and Goyal (2014), users' degree of confirmation has a beneficial impact on their perception of technology's utility. Several studies (Bhattacharjee 2001a; Tam, Santos & Oliveira 2020; Zhou, 2017) underscore the significant role of confirmation on perceived usefulness, hedonic and utilitarian values (Oghuma et al, 2016) in various m-commerce contexts. As a result, this study suggests that:

- H1: Confirmation has a significant, positive influence on older consumers' perceived usefulness of e-pharmacies.
- H2: Confirmation has a significant, positive influence on older consumers' hedonic value.
- H3: Confirmation has a significant, positive influence on older consumers' utilitarian value.

3.2. Utilitarian Value

Utilitarian value is defined as the customers' overall assessment of the usefulness of goods or services based on the expectations of what is offered in exchange for what they pay. In e-pharmacies, utilitarian value is described as the judgement of functional benefits, such as the convenience of purchasing medication online any time and the lower costs associated with online purchases. In an e-pharmacy context, utilitarian value is described as the view of functional benefits, such as time-saving, discounts, the convenience of buying medication online, and product features. In e-commerce

literature, utilitarian value has been identified as an important variable in determining technology usefulness (Kautish & Sharma, 2018; Keszey, 2020). Kautish and Sharma (2018) argued that most consumers choose mobile shopping for utilitarian reasons, such as time-saving, price-saving/discounts, service convenience, and merchandise selection/assortment. Based on this argument, this study proposes that:

- H4: Utilitarian value has significant, positive influence on consumers' perceived usefulness of e-pharmacies.

3.3. Hedonic Value

Hedonic value is defined as a complete assessment (i.e., judgement) of the costs and benefits of experiences, such as entertainment and amusement. In this context, hedonic value is defined as the pleasurable experience of using e-pharmacies. Research shows that consumers usually shop online for fun (Şener, Ateşoğlu & Coşkun, 2018). Entertainment is a hedonic element of e-commerce that is used to retain customers' attention and create a positive view of the brands/products (Picot-Coupey, Krey, Huré & Ackermann, 2021). The relationship between online shopping activities and hedonic value has been analysed in marketing literature (Edem Amenuvor, Owusu-Antwi, Basilisco & Seong-Chan, 2019). Hedonic pleasure increases online shoppers' satisfaction and usefulness of a website or a shopping app, resulting in customers spending more time browsing for other items. Thus, this study suggests that:

- H5: Hedonic value has a significant, positive influence on consumers' perceived usefulness of e-pharmacies.

3.4. Perceived Usefulness

Perceived usefulness is defined as "the extent to which a person believes that a system enhances his or her performance" (Davis, 1989: 320). From an e-pharmacy perspective, if users feel that using an online pharmacy is useful, they will have trust in it. Empirical research supports the positive impact of perceived usefulness on users' trust (Amin, Rezaei, and Abolghasemi, 2014; Chinomona, 2013; Wilson, Ket & Tan, 2021), arguing that when customers believe that a new technology gives them added value, they put trust in it. In a study to examine the role of perceived usefulness towards trust of online consumers in China, Wilson et al. (2021) found that perceived usefulness has a positive influence on users' trust. Hence, this study proposes that:

- H6: Perceived usefulness has a significant, positive influence on users' trust of e-pharmacies.

4. Methods

4.1. Measurement

The study employed an electronic questionnaire. The construct-measurement items were adapted from previous related studies. The measurement items for confirmation, perceived usefulness, and trust were adapted from Bhattacharjee (2001a). All the primary constructs were measured with reflective items adapted from Arnold and Reynolds (2003), Babin, Darden, & Griffin (1994), and Chiu, Fang, Cheng & Yen (2013). To measure this, this study applied a Likert scale ranging from 1 ("strongly disagree") to 7 ("strongly agree").

4.2. Sampling, Data Gathering, and Sample Characteristics

The study's population was defined as South African consumers aged 50 years and older who had previously used an e-pharmacy at least once. Since no sample frame was available, participants were chosen using a non-probability sampling technique known as convenience sampling. The first page of the online questionnaire had a consent form clarifying the aim of the research and the rights of the participants. Thereafter, a screening question asked potential respondents if they were above 50 years old and had used the e-pharmacy before. Those who answered "yes" to the screening question were guided to the rest of the online survey, while those who answered "no" were thanked for their time but denied participation because they did not meet the inclusion criterion. Self-administered online

questionnaires were used to collect the data. Based on the gender distribution of the sample, there were 176 (52.2%) females, 150 (44.5%) males and 10 (3%) who indicated “other”. In total, 69 (20.5%) participants reported having a household income of ZAR5 001–ZAR10 000. Of the sample, 210 (62.3%) participants were African, 34 (10.1%) were coloured, 25 (7.4%) were Indian/Asian, 65 (19.3%) were white, and a further three people (0.9%) selected “other”. In terms of age, 71.5% of the sample were aged 50–60, 21.7% were aged between 61–70, and 1.2% were aged over 70. Eighteen people chose not to disclose their age.

5. Data Analysis and Results

5.1. Validation of Scale

The validity of the reflective measurements and the formative measures was conducted to determine the reliability and validity of the proposed measurement model. The measurements’ validity was evaluated using convergent and discriminant validity. The convergent validity was evaluated using standardised factor loadings, Cronbach’s alpha, composite reliability (CR), and average variance extracted (AVE). The results presented in Table 1 indicate that factor loadings were greater than 0.7. The Cronbach’s alpha for the internal consistency of reliability and the CR estimates all exceeded the 0.7 threshold, and the AVEs for each of the constructs are all greater than 0.5 (Hair, Sarstedt, Ringle, & Gudergan, 2018). As a result, the reflective constructs were proven statistically to be acceptable and reliable.

Table 1: Convergent Validity of the Constructs

Confirmation: CR = 0.8990, AVE = 0.7480, Cronbach’s alpha = 0.8330	
CON1 My experience with using an online pharmacy was better than what I expected.	0.866
CON2 The service level provided by an online pharmacy was better than I expected.	0.891
CON3 Overall, most of my expectations from using the e-pharmacy were confirmed.	0.837
Perceived usefulness: CR = 0.9090, AVE = 0.7700, Cronbach’s alpha = 0.8500	
PU1 E-pharmacies would be useful for my medication collection.	0.887
PU2 E-pharmacies would enable me to collect my medication quickly.	0.839
PU3 E-pharmacies will make things easier for me.	0.904
Trust: CR = 0.8610, AVE = 0.7860, Cronbach’s alpha = 0.7860	
TR1 I have confidence in third parties to protect me against any potential risks (e.g., leaking of personal information) of online pharmacies.	0.782
TR2 I am sure that I cannot be taken advantage of (e.g., leaking of personal information) because of using an online pharmacy.	0.827
TR3 I am confident that the e-pharmacies provide correct medication.	0.853
Hedonic value: CR = 0.8540, AVE = 0.6620, Cronbach’s alpha = 0.7490	
HV1 To me, using an online pharmacy is very pleasant/fun.	0.836
HV2 Online pharmacies are fun and enjoyable	0.807
HV3 I get excited when I received my medication from the online pharmacy	0.797
Utilitarian value: CR = 0.8650, AVE = 0.7870, Cronbach’s alpha = 0.9170	
UV1 Using an online pharmacy saves time.	0.877
UV2 Using an online pharmacy enables quick service.	0.900
UV3 Using an online pharmacy enables me to get my medication more easily	0.885

Discriminant validity was confirmed using the heterotrait-monotrait (HTMT) criteria because the HTMT ratios of correlation realised for the constructs are less than the strict threshold (Henseler, 2018) guidelines. The HTMT construct values were measured against the threshold of 0.85 (correlation value). The results in Table 2 indicate that all construct values are below the 0.85 threshold, thus confirming discriminant validity.

Table 2: Discriminant Validity – HTMT Criteria

		1	2	3	4	5
1	Confirmation					
2	Hedonic value	0.780				
3	Perceived usefulness	0.764	0.728			
4	Trust	0.560	0.797	0.524		
5	Utilitarian value	0.713	0.874	0.828	0.610	

5.2. Structural Model and Hypotheses Testing

5.2.1. Collinearity Diagnostics

The results of the collinearity diagnostics are presented in Table. The variance inflation factor (VIF) values ranged from 1 (hedonic value, utilitarian value, and trust) to 2.247 (perceived usefulness). These estimates are below the critical VIF threshold of 5, suggesting that collinearity does not pose a threat to the structural model analysis.

Table 3: Collinearity Assessment: VIF

	Confirmation	Hedonic value	Perceived usefulness	Trust	Utilitarian value
Confirmation		1	1.819		1
Hedonic value			2.322		
Perceived usefulness				1	
Trust					
Utilitarian value			2.247		

5.2.2. Hypotheses Testing

The analysis of the structural model was also accomplished using the partial least squares structural equation modelling (PLS-SEM) technique via SmartPLS 3. The results of the PLS-SEM of the structural model analysis are presented in Table 4 and Figures 2 and 3.

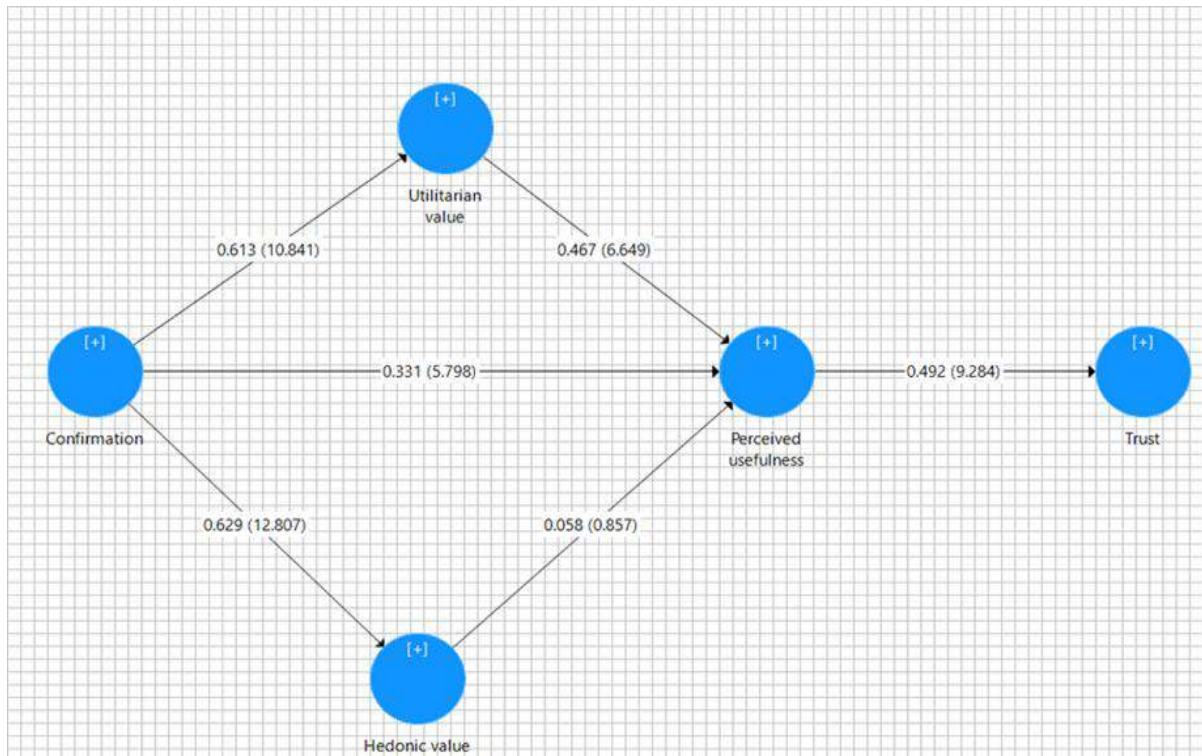

Figure 2: Structural Model with Path Coefficients with p-Values

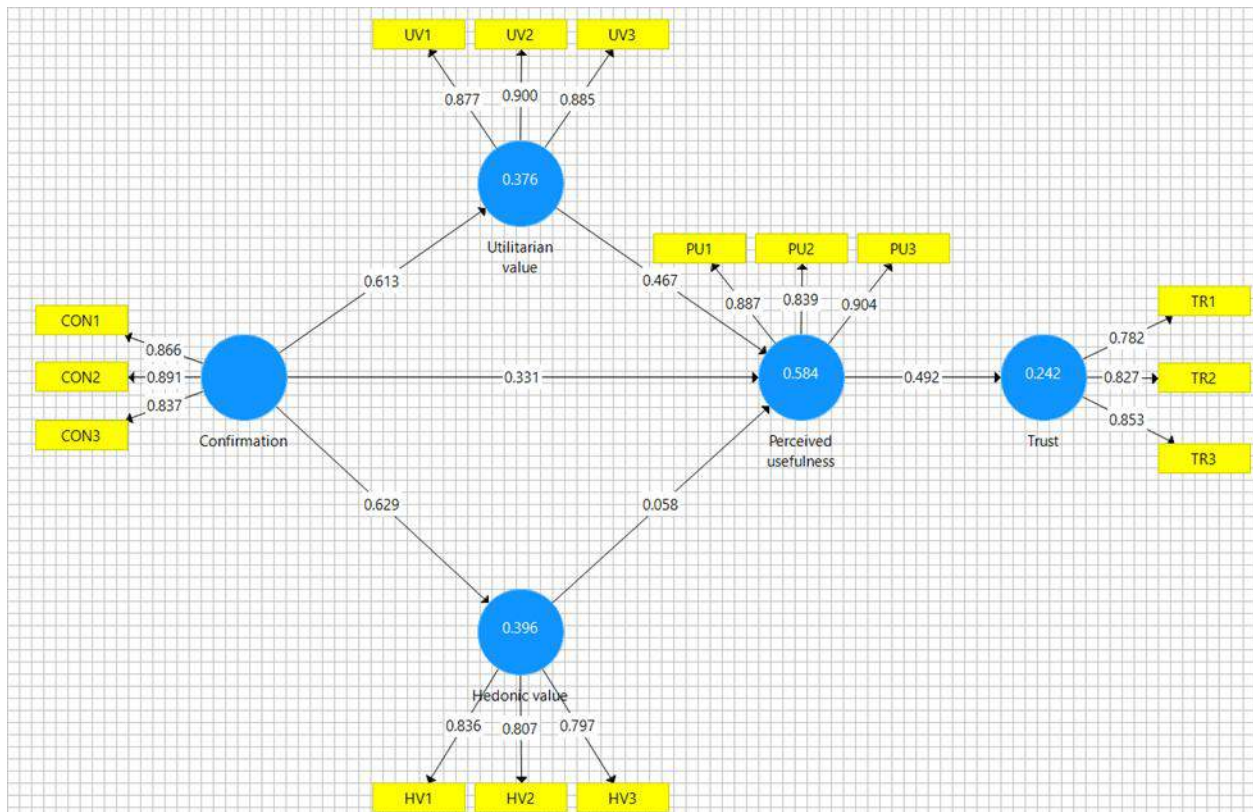

Figure 3: Structural Model Analysis with Path Coefficients and R2 Estimates

Table 4: Summary of the Results of the Hypotheses Testing

	Path coefficient	t statistics (O/STDEV)	p-values
Confirmation -> Perceived usefulness (H1)	0.331	5.766	0.000
Confirmation -> Hedonic value (H2)	0.629	12.561	0.000
Confirmation -> Utilitarian value (H3)	0.613	10.651	0.000
Utilitarian value -> Perceived usefulness (H4)	0.467	6.600	0.000
Hedonic value -> Perceived usefulness (H5)	0.058	0.837	0.403
Perceived usefulness -> Trust (H6)	0.492	9.147	0.000

6. Results Discussion

The results confirm a positive and significant relationship between confirmation and perceived usefulness, providing support for H1 ($\beta = 0.331$, $t = 5.766$, $p < 0.000$). This is consistent with the arguments under the ECM (Bhattacharjee, 2001b) and aligns with the results of previous research (Oghuma et al., 2016; Tam et al., 2020). These findings mean that if e-pharmacy users' expectations are confirmed, they will find e-pharmacies to be useful. The results of this study further indicate that there is a strong and positive relationship between confirmation and hedonic value, providing support for H2 ($\beta = 0.629$, $t = 12.561$, $p < 0.000$). These findings are consistent with researchers (Oghuma et al, 2016), implying that customers' expectations of the hedonic value of using mobile shopping are confirmed. This finding is in line with that of Oghuma et al. (2016), proving that a significant relationship exists between confirmation and perceived enjoyment. Furthermore, the results of this study confirm that confirmation is positively associated with utilitarian value, providing support for H3 ($\beta = 0.613$, $t = 10.651$, $p < 0.000$). These results are in line with extant research (e.g., Oghuma et al., 2016), where a positive relationship between utilitarian value and confirmation has been noted consistently. These findings imply that e-pharmacy users' expectations of time-saving, price-saving/discounts, service convenience, and merchandise selection/assortment are confirmed.

Furthermore, the study's findings indicate that utilitarian value and perceived usefulness are positively associated, thus providing support for H4 ($\beta = 0.467$, $t = 6.600$, $p < 0.000$). These results are consistent with prior research (e.g., Evelina, Kusumawati & Nimran, 2020) and denote that if

consumers find e-pharmacies to be helpful in providing functional benefits for their health needs, they are more likely to perceive them as useful. However, the findings show that the relationship between hedonic value and perceived usefulness is not significant, thus H5 is not supported ($\beta = 0.058$, $t = 0.837$, $p > 0.01$). These findings are inconsistent with the findings of Inani et al. (2020) but align with those of Basilisco and Seong-Chan (2019). This proves that older consumers are not looking for fun/pleasure when using e-pharmacies. Consequently, hedonic features do not make e-pharmacies useful to this customer segment. Lastly, the findings confirm a significant positive relationship between perceived usefulness and trust, which supports H6 ($\beta = 0.492$, $t = 9.147$, $p < 0.000$). These findings are consistent with the results of Wilson et al. (2021) and denote that if consumers feel that e-pharmacies are useful, they tend to trust the innovation.

7. Managerial and Theoretical Implications

This study's empirical findings provide the basis to actively bolster older consumers' perceptions of e-pharmacies' usefulness and promote their trust with e-pharmacies. The analysis from the structural model resulted in two factors that influence e-pharmacies usefulness, namely utilitarian value and confirmation. The conclusion drawn from the findings is that older citizens generally perceive e-pharmacies to be useful if their initial expectations are met. Furthermore, they perceive e-pharmacies as useful because of the utilitarian features associated with the use thereof. Since utilitarian value is so significant, e-pharmacy service providers should prioritise providing basic utilitarian value before focusing on other attributes of the e-pharmacy website. This can be achieved by offering accurate, useful product information and the acquisition of desired products. Consequently, for e-pharmacy service providers to increase the utilitarian appeal, they should invest more resources into developing e-pharmacy sites characterised by rich product information of medication, medical records, online medical consultation, convenience of buying medication any time and anywhere, and availability of various medications for purchase. The study further underscores the significance of usefulness to promote trust of e-pharmacies. This implies that consumers will trust e-pharmacies if they believe that they are helpful and assist them in overcoming their health-related issues. Thus, e-pharmacy retailers have a responsibility to emphasise the benefits and usefulness of e-pharmacies if they aim to gain the trust of older consumers. This can be achieved by advertising e-pharmacies as a useful innovation that is aimed at solving customer problems. E-pharmacy service providers could introduce awareness campaigns where older consumers are informed about e-pharmacies, its benefits, and how it will make their lives easier compared to the traditional health system.

The findings of the study make significant contributions to e-commerce research. First, the proposed integrated research model provides a fairly good explanation of e-pharmacies' usefulness and has a robust predictive power as the factors together explain 58.4% of the variance. This is higher than the variance explained in study of Joo and Choi (2016), which was 20%. Second, as far as is known, this is the first study to explore the usefulness of e-pharmacies from the perspective of an emerging African economy (i.e., South Africa) using an integrated model that combines theoretical factors from literature on ECM, utilitarian value, hedonic value, and trust. Lastly, in the ECM, confirmation is the only variable predicting usefulness. The findings of this study confirm utilitarian value as an additional important explanatory variable of perceived usefulness. The addition of this variable plays a significant role in increasing the predictive power of usefulness ($R^2 = 58.4\%$) over that of the original ECM (i.e., 21%), which only had confirmation as a predictor of usefulness. Therefore, this study significantly adds value to literature by incorporating utilitarian value as a vital variable with the ability to explain usefulness and increase the predictive power of perceived usefulness in the ECM.

8. Limitations and Recommendations for Future Research

While this empirical study makes several contributions to a better understanding of e-pharmacies' perceived usefulness, it has a number of limitations, proposing that there is a need for further research. First, the study only investigates positive predictors of e-pharmacies' usefulness and trust, and ignores the potential barriers that exist. Future studies should investigate the negative factors that might influence the trust and usefulness of this innovation and the trust of consumers. Further research could integrate negative factors, such as the perception of privacy risk, into the model. Second, this study

was conducted among older consumers in South Africa. To better generalise findings, future research could duplicate the study in other countries and in different age groups.

Keywords

podcast marketing,
podcast adoption,
information adoption
model, source
credibility

Abstract

This study investigated the factors that influence the adoption of podcast marketing among consumers in Gauteng Province, South Africa. A conceptual model with theoretical roots in the information adoption model (IAM) was proposed and tested using data acquired from 382 customers who were users of podcast marketing. A partial least squares structural equation modelling technique was used to assess the validity of the measurement model and to test the hypotheses proposed for the research. The results suggested that the extent to which consumers find a podcast to be useful had a significant and positive impact on their adoption of podcast marketing. The source's credibility also had an impact on the adoption of podcast marketing, and the argument's quality also exerted a significant positive influence on the adoption of podcast marketing among consumers. The implications of these findings, both managerial and scholarly, are highlighted in the paper.

1. Introduction

Communication has proved not only to be a fundamental aspect of marketing, but also instrumental in the success of a company (Brunello, 2013; Mkhize & Ellies, 2020). The new communication tools that have emerged through the development of technology are referred to as 'digital communication tools', and include Instagram, Twitter, Facebook, and other online social networks that people use, as well as virtual platforms such as websites and microblogs (Cizmeci & Ercan, 2015; Fraccastoro, Gabrielsson & Pullins, 2021). One of the less-researched platforms that has gained a lot of popularity in the past ten years is podcasts. These are information-based online broadcasts that are made available for live listening or downloading and that recent studies have shown continue to grow in popularity (Samuel-Azran, Laor & Tal, 2019). Podcasts are thus digital media files that consist of audio recordings that are usually compiled and released as a series. Organisations use podcasts to describe their businesses and products or offer any other information that may interest their customers (Gokhale, 2016).

Several investigations have been carried out on podcasting in diverse areas of specialisation. For example, Chang and Cevher (2007) explored the conceptual models of podcast marketing in the advertising sector, while Mou and Lin (2015) investigated the adoption of podcasts from the perspective of the theory of planned behaviour in the field of education. Samuel-Azran *et al.* (2019) researched the socio-demographics of podcasts in the high-technology industry, while Rockhill, Pastore and Johnston (2019) investigated the effectiveness of podcasts in the field of sports management. Such previous studies have illuminated the concept of podcast marketing and made a meaningful contribution to theory development. However, there is limited research on understanding the consumer adoption of podcast marketing, particularly from a developing country perspective. Therefore, the aim of this study is to investigate the factors that lead to the consumer adoption of podcast marketing.

2. Problem Investigated

Podcast marketing is continually attracting interest from a variety of scholars (Chang & Cevher, 2007; Zahay & Fredricks, 2009; Mou & Lin, 2015; Rockhill *et al.*, 2019; Samuel-Azran *et al.*, 2019). An analysis of the literature reveals that, thus far, most studies have focused on the reasons for users to listen to podcasts (Gay, Bemrose-Fetter, Bracey & Cain, 2007), the role of podcast marketing in

specialised advertising (Chang & Cevher, 2007), student learning (Harris & Park, 2008; Rockhill *et al.*, 2019) and behavioural intention (adoption) (Mou & Lin, 2015) in different market areas.

However, scholars have not given much attention to understanding consumers' adoption of podcast marketing in developing countries (Saeed, Yang & Sinnappan, 2010; Bezbaruah & Brahmabhatt, 2022). Indeed, to the present author's knowledge, no such study has been conducted thus far in South Africa. Understanding the drivers of consumers' adoption of podcast marketing is important for promoting the widespread acceptance of the technology. Nonetheless, most studies on podcast marketing have focused on the profile of customers using podcast marketing or on the evolution of content marketing that leads to podcast marketing (Gokhale, 2016; Samuel-Azran *et al.*, 2019). Therefore, this study addressed two gaps: first, it illuminated the factors that influence consumers' adoption of podcast marketing in the context of developing countries, specifically South Africa; and second, this study sought to apply the information adoption model (IAM) in the podcast marketing technology sphere. Previous scholars have used other models (Kang & Gretzel, 2012; Mou & Lin, 2015; Merhi, 2015; Ho, Chou & Fang, 2016) than the IAM.

The following research question was thus formulated to bridge these gaps:

- What are the factors that influence consumers' adoption of podcast marketing?

3. Research Objectives

3.1. Research aim

The aim of this study was to determine the factors that influence consumers' adoption of podcast marketing in South Africa.

3.2. Research objectives

The following objectives were formulated to address the aim of this study:

- To examine the factors influencing South African consumers' adoption of podcast marketing, using the information adoption model (IAM).
- To examine the validity of the IAM in the podcast marketing technology domain.

4. Hypotheses

The following hypotheses were formulated for the study:

- H1: Source credibility is significantly and positively related to podcast marketing adoption.
- H2: Source credibility is significantly and positively related to the usefulness of information.
- H3: Usefulness of information is significantly and positively related to podcast marketing adoption.
- H4: Argument quality is significantly and positively related to podcast marketing adoption.
- H5: Argument quality is significantly and positively related to the usefulness of information.

5. Literature Review

Two sections cover this area: the theoretical background, and a research model and the relationship between the constructs.

5.1. Theoretical Background

The theoretical background of this study was rooted in the information adoption model (IAM) (Sussman & Siegal, 2003). According to this model, the usefulness of information is consequential in determining users' adoption of technology. The model also posits that the usefulness of information mediates between influence outcome (the adoption of technology) and the constructs of argument quality and source credibility. Based on this theory, we proposed a conceptual model (Figure 1) that posits that the source credibility of information and the argument quality will influence the information usefulness of the podcast. The conceptual model further posits that the use of information

will influence the adoption of podcast marketing. Last, the model posits that source credibility and argument quality will influence the adoption of podcast marketing.

5.2. Research Model and Relationship between Constructs

5.2.1. Research Model

Figure 1: Proposed research model

5.2.2. Relationship between Constructs

The relationships between these constructs and the hypotheses (presented in section 4 above) are discussed below.

Source credibility and podcast marketing adoption

‘Source credibility’ refers to the degree to which a source of information is regarded as believable, competent, and trustworthy by those receiving that information (Jamil & Qayyum, 2021). According to Abu-Taieh, AlHadid, Masa’deh, Alkhaldeh, Khwaldeh and Alrowwad (2022), source credibility is one of the most influential factors in information adoption. Numerous studies have consistently shown a significant and positive relationship between source credibility and podcast adoption (Ayeh, Au & Law, 2013; Ayeh, 2015; O’Reilly, MacMillan, Mumuni & Lancendorfer, 2016; Bezbaruah & Brahmabhatt, 2022). A study by Ismagilova, Slade, Rana and Dwivedi (2020) found that the source credibility of electronic word-of-mouth (eWOM) communications significantly influences information adoption. Thus Hypothesis 1 (presented in section 4 above) is proposed.

Source credibility and usefulness

Based on the study of Wu and Wang (2011), source credibility indicates how much the message’s recipient believes in the sender. Furthermore, they suggested that, if the source has credibility, consumers will believe the message. Thus credibility is how much the message reflects reality as evaluated by the consumer. Accordingly, various studies have established a significant and positive relationship between source credibility and usefulness (Ayeh et al, 2013; Kang & Namkung, 2019; Lee, 2021; Srimulyo, 2021). A study by Jamil and Qayyum (2021) among YouTube users (both influencers and consumers) found source credibility to be significantly and positively related to usefulness. Therefore, Hypothesis 2 (presented in section 4 above) is proposed.

Usefulness and podcast marketing adoption

According to Bansah and Agyei (2022), ‘usefulness’ relates to the degree to which a person believes that using a particular system would enhance his or her job performance. Tavitiyaman, Zhang and

Tsang (2022) suggested that usefulness is one of the major motivations of informational technology acceptance. Researchers have consistently demonstrated that the usefulness of information leads to the intention to use and to the adoption of technology (Merhi, 2015; Hussain, Ahmed, Jafar, Rabnawaz & Jianzhou, 2017; Nayanajith, 2021; Bansah & Agyei, 2022). A study by Wei and Ram (2016) of employees in a case study global company found usefulness to be significantly and positively related to podcast marketing adoption. Thus Hypothesis 3 (presented in section 4 above) is proposed.

Argument quality and podcast marketing adoption

‘Argument quality’ refers to the quality or strength of the information received. When the information has strong arguments, recipients of that information will develop a positive attitude towards it (Mendes-Filho & Tan, 2009). Arguments that are supported by data provide an informative basis and reasons for a person to accept them (Kim & Kim, 2019). Xu and Yao (2015) found that argument quality positively influences adoption. Furthermore, researchers have consistently demonstrated that a strong argument quality leads to the adoption of information or technology (Wang, Liu & Fan, 2011; Hussain *et al.*, 2016; Tseng & Wang, 2016; Shankar, Jebarajakirthy & Ashaduzzaman, 2020). A study by Zhang, Li and Fan (2019) of online health communities in China found that argument quality was significantly and positively related to adoption. Thus Hypothesis 4 (presented in section 4 above) is proposed.

Argument quality and usefulness

Aghakhani, Oh and Gregg (2017) posited that argument quality leads to the usefulness of information. Further research has established a significant and positive relationship between argument quality and usefulness (Chang, Yu & Lu, 2015; Cheng & Ho, 2015; Li, 2015; Shen, Zhang & Zhao, 2016). In a study of electronic word-of-mouth (eWOM), Rofianto, Kornelys and Rifkhansyah (2017) found that the higher the quality of information or argumentation is perceived to be, the more useful that information or argument will be to its recipients. Last, Zhu, Chang and Luo (2015) investigated the influence of consumer-to-consumer (C2C) communication on consumers’ purchase decisions in online communities and found argument quality to be significantly and positively related to usefulness evaluation. Therefore, Hypothesis 5 (presented in section 4 above) is proposed.

6. Research Methodology

6.1 Measurement

A self-administered, paper-based questionnaire was the main measurement instrument used in this study. The questionnaire comprised two sections. The first section contained questions on demographic information of the respondents such as age, education level, income, and podcast use. These variables were measured on nominal and interval scales. The second section of the questionnaire consisted of multi-item scales measuring the constructs of interest in the study, using a seven-point Likert scale with anchors ranging from 1 “Strongly Disagree” to 7 “Strongly Agree”. All of the scales were selected and adapted from the study of Bhattacharjee (2001).

Prior to fielding, the questionnaire was pre-tested on a convenient sample of 45 respondents to ascertain the clarity of the instructions and the wording of the questions/statements. The results of the pilot test indicated that the respondents generally understood the questionnaire’s instructions and wording.

Reliability analysis was conducted with the pilot sample to determine the internal consistency of the items in measuring each construct. The results of this analysis showed that Cronbach’s alpha for all of the constructs was above the 0.7 threshold, thus indicating that the measurement items for the constructs were internally reliable. With this positive feedback, the questionnaire was finalised for the data gathering.

6.2. Sampling and data gathering

The population of the study was defined as South African consumers in general. To meet the selection criteria, the potential participants had to be 18 years or older, had to be residents in Gauteng at the time of the survey, and had to have listened to a podcast. A non-probability convenience sampling

technique was used to select the participants. Trained research assistants approached potential participants in their homes and in public parks and workplaces. The research assistants first introduced themselves, and then explained the purpose of the study and the ethical measures implemented to protect anonymity, confidentiality, and the right to withdraw from participation. Participants were also informed about their rights, including their freedom to withdraw from the study without any negative consequences. Willing participants were then given a copy of the questionnaire to complete. Of the questionnaires collected, 382 usable responses were realised.

7. Results and Findings

A partial least squares (PLS) structural equation modelling technique using Smart PLS 3 software was the main data analysis tool used (Ringle, Wende & Becker, 2015). As recommended by Anderson and Gerbing (1988), the measurement model was assessed to determine the validity of the measurement instrument, and then the structural model was analysed to test the hypotheses.

7.1. Measurement model analysis

The validity of the measurement model was assessed to determine its convergent validity and discriminant validity. In assessing the former, the standardised factor loadings, composite reliability, and average variance extracted (AVE) were observed. According to Hair, Hult, Ringle, Sarstedt and Thiele (2017), to achieve convergent validity, the factor loadings should exceed 0.7, the composite reliability should be greater than 0.7, and the AVE should exceed 0.5.

The results of the convergent validity assessment of the scale are presented in Table 1 below. The standardised factor loadings ranged from a minimum of 0.854 to a maximum of 0.970. These values were greater than the 0.7 threshold (Hair *et al.*, 2017). Similarly, the minimum estimated value for the composite reliability was 0.928 – thus above the 0.7 cut-off point. Last, the AVEs ranged from a minimum of 0.764 to a maximum of 0.933, and so were above the recommended threshold of 0.5 (Bagozzi & Yi, 1988). The results thus confirmed the convergent validity of the measurement model.

Table 1: Results of the convergent validity of the measurement model

Constructs	Indicators	Loading	Cronbach's alpha	Composite reliability	Average variance extracted (AVE)
Argument quality	AQ1	0.854	0.897	0.928	0.764
	AQ2	0.881			
	AQ3	0.900			
	AQ4	0.861			
Podcast adoption	Adoption1	0.905	0.899	0.937	0.832
	Adoption2	0.925			
	Adoption3	0.907			
Source credibility	SC1	0.883	0.913	0.938	0.792
	SC2	0.868			
	SC3	0.909			
	SC4	0.899			
Usefulness	PU1	0.964	0.976	0.982	0.933
	PU2	0.962			
	PU3	0.966			
	PU4	0.970			

Following the confirmation of the convergent validity of the measurement model, its discriminant validity was assessed using the heterotrait-monotrait (HTMT) technique. The HTMT criteria suggest that, to obtain discriminant validity, the HTMT ratio of correlations should be less than either the conservative estimate of 0.850 or 0.900 (Henseler, Ringle & Sarstedt, 2015). Based on the results

presented in Table 2, all of the HTMT ratios of correlations obtained for the current study were less than 0.900, thus providing further evidence to support the discriminant validity of the constructs that were used. The results of the discriminant validity analysis are presented in Table 2.

Table 2: Discriminant validity of the measurement model (HTMT technique)

		1	2	3	4
1	Argument quality				
2	Podcast marketing adoption	0.413			
3	Source credibility	0.453	0.394		
4	Usefulness	0.120	0.329	0.252	

Once the convergent and discriminant validity of the measurement model had been confirmed, the structural model was assessed to test the hypotheses.

7.2. Structural model analysis

The structural model was also analysed using Smart PLS 3. A bootstrapping technique using 5,000 resamples was used to determine the significance of the path estimate. The results of the structural model analysis are presented in Figures 2 and 3 and Tables 3 and 4. Prior to testing the structural model, the threat of collinearity between the independent constructs was assessed using the VIF values. The results showed that the VIF values ranged between 1.061 and 1.257. Given that these values were less than the critical threshold of 3, collinearity did not raise any critical issues for the constructs. Next, the R2 of the endogenous constructs and the path coefficients along the respective p-values and t-values for the path significance were assessed. The results of the hypotheses are presented in Table 3 and Figures 2 and 3. The results showed that the respective exogenous constructs explained 5.7% and 24.1% of the variance in usefulness and podcast marketing adoption respectively.

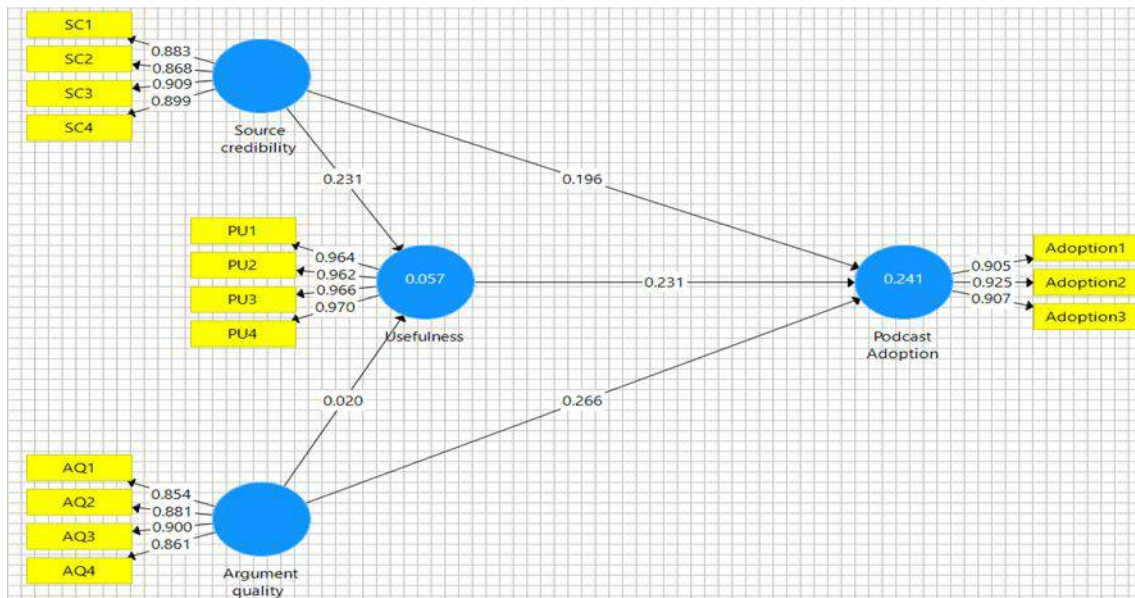

Figure 2: Factor loadings, path coefficients, and R2 values

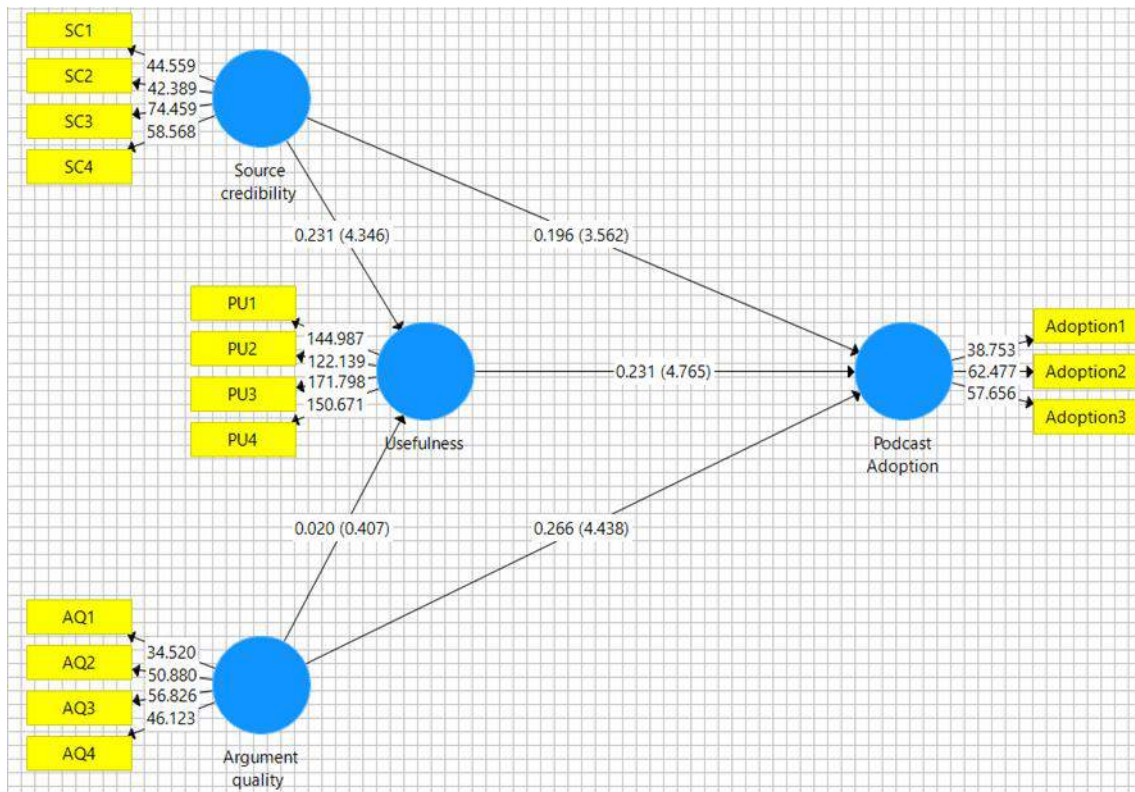

Figure 3: Results of PLS model estimation of bootstrapping for path significance

Table 3: Results of hypotheses testing

	Path coefficient	T-value	Bias corrected confidence 95%		f ²
Source credibility → Podcast marketing adoption	0.196***	3.562	[0.094; 0.310]	Supported	0.040
Source credibility → Usefulness	0.231***	4.346	[0.126; 0.329]	Supported	0.047
Usefulness → Podcast marketing adoption	0.231***	4.765	[0.135; 0.325]	Supported	0.066
Argument quality → Podcast marketing adoption	0.266***	4.438	[0.137; 0.369]	Supported	0.078
Argument quality → Usefulness	0.020 ^{ns}	0.407	[-0.070; 0.117]	Not supported	0.000

***p<0.001, **p<0.01, *p<0.05, ns=non-significant

In respect of the path coefficients, the results showed that source credibility had a significant and positive relationship with podcast marketing adoption ($\beta = 0.196$, $t=3.562$, $p < 0.001$); therefore, Hypothesis 1 was supported. Similarly, the results suggested that source credibility had a significant and positive relationship with usefulness ($\beta = 0.231$, $t=4.346$, $p < 0.001$); thus Hypothesis 2 was supported. With regard to Hypothesis 3, usefulness had a significant and positive relationship with podcast marketing adoption ($\beta = 0.231$, $t=4.765$, $p < 0.001$), therefore supporting Hypothesis 3. Furthermore, the results showed that argument quality had a significant and positive relationship with podcast marketing adoption ($\beta = 0.266$, $t=4.438$, $p < 0.001$); thus Hypothesis 4 was supported. Contrary to previous research, this study found that argument quality had no significant relationship with usefulness ($\beta = 0.020$, $t=0.407$, $p > 0.05$), and so Hypothesis 5 was not supported.

8. Managerial Implications

The aim of the study was to establish the factors that lead to users' adoption of podcast marketing. The findings established that the source credibility of information is positively associated with users' adoption of podcast marketing. This finding is consistent with prior research (O'Reilly *et al.*, 2016; Ismagilova *et al.*, 2020; Abu-Taieh *et al.*, 2022; Bezbaruah & Brahmabhatt, 2022), which found a significant and positive association between source credibility and the adoption of information. The results of this study have thus suggested that the source credibility of information is likely to influence the adoption of podcast marketing. Similarly, the findings have shown that the source credibility of information is positively associated with its usefulness. This finding corroborated those of earlier studies (Wu & Wang, 2011; Kang & Namkung, 2019; Jamil & Qayyum, 2021; Lee, 2021), which found a significant and positive relationship between source credibility and usefulness. This result has suggested, therefore, that podcast marketing that provides credible sources is most likely to be useful to its users.

The findings have also indicated that podcast marketing adoption is positively influenced by the usefulness of the information provided by podcast marketing. This finding has confirmed those of previous studies (Hussain *et al.*, 2017; Nayanajith *et al.*, 2021; Bansah & Agyei, 2022; Tavitiyaman *et al.*, 2022), which found a significant and positive association between usefulness and system adoption. This result of the present study has demonstrated, therefore, that users who find podcast marketing information useful are likely to adopt podcast marketing.

In the same breath, the findings have shown that argument quality positively links with podcast marketing adoption. This finding has validated those of earlier studies (Tseng & Wang, 2016; Kim & Kim, 2019; Zhang *et al.*, 2019; Shankar *et al.*, 2020;), which found a significant and positive relationship between argument quality and adoption. This result has suggested, therefore, that users who perceive the argument to be of high quality are likely to adopt podcast marketing.

Contrary to the proposed hypothesis (H5), the findings have shown that there is no significant positive relationship between argument quality and the usefulness of information. Aghakhani, Oh and Gregg (2017) suggested that argument quality leads to usefulness of information, and several scholars established a significant and positive relationship between argument quality and usefulness (Chang *et al.*, 2015; Li, 2015; Zhu *et al.*, 2016; Rofianto *et al.*, 2017). However, this study has found that argument quality has no significant relationship with usefulness. This means that, even if the quality of the argument is strong, there is no certainty that the users of podcast marketing will find it useful.

The findings of this study have implications for business organisations that are interested in increasing the adoption rate of their podcast marketing. The results of this study, which have demonstrated that usefulness can lead to adoption, emphasise that, even though usefulness is a mediator of adoption, both source credibility and argument quality have a direct, significant, and positive influence on podcast marketing adoption. Therefore, marketers should improve the quality of their arguments and/or information. This means that management should ensure that the information provided through podcast marketing is thoroughly researched. All arguments advanced should be backed by data and sources. Personal opinions should be clearly declared and labelled. In instances when the information or argument lacks sufficient data to back it up, disclaimers should be clearly stipulated. Furthermore, the sources of information should be credible. Marketers can increase source credibility by using vetted sources; they should prioritise sources who are experts in their respective subject matter. This could be achieved by ensuring that the host of the podcast topic is knowledgeable enough to command authority in that specific matter.

The findings of this study have made scholarly contributions in two domains: First, this is one of the first studies to shed light on the factors influencing consumers' adoption of podcast marketing in the context of a developing country, paying special attention to South Africa. Scholars so far have not given much attention to understanding consumers' adoption of podcast marketing in developing countries. Second, previous studies that have applied the IAM have mostly paid attention only to the construct of usefulness being a mediator between source credibility and podcast marketing adoption,

as well as, between argument quality and podcast marketing adoption. In effect, they have investigated podcast marketing adoption as influenced by usefulness. This study has investigated source credibility directly influencing podcast marketing adoption, as well as argument quality directly influencing podcast marketing adoption.

9. Conclusion

This study examined several factors that influence consumers' adoption of podcast marketing. The factors that were analysed were source credibility, argument quality, and usefulness of information. The study was theoretically grounded in the information adoption model (IAM). The findings suggested that usefulness has a positive influence on podcast marketing adoption, and that source credibility has a positive influence on podcast marketing adoption. Last, the study found that argument quality is significantly related to podcast marketing adoption.

The findings of this study contribute to the literature by addressing the deficiency of research on podcast marketing, particularly in emerging markets. The study further provides empirical validation of the IAM in the digital media innovation domain from the perspective of a developing country. Considering that the original IAM was developed and tested on a sample of professionals of a multinational public accounting firm in their North American operations, this validation in a digital media innovation domain in the context of an emerging African country is significant in validating this model beyond its original context.

The study has some limitations that open up opportunities for future research. First, businesses use other digital marketing communication tools such as blogs, wikis, and video chats, while the current study only focused on podcasts. Future research could extend this scope by analysing other digital marketing communication tools. Second, the current study focused only on consumer markets (B2C). Given that there is a significant difference between B2C and business-to-business (B2B) markets, future research could expand to podcast marketing adoption by B2B markets.

Determinants of Consumers' Intention to Continue Using Mobile Food Ordering Apps

Mr. Ryan Lesetja Mathaba¹

¹Department of Marketing Management, University of Johannesburg, Johannesburg, South Africa

Keywords

Perceived usefulness; reliability; attitude; perceived ease-of-use; mobile food ordering apps

Abstract

Although mobile food ordering apps are becoming common platforms that South African restaurants, like others elsewhere, are using to provide services to their customers, it is not clear whether customers intend to continue using the platforms. By integrating reliability – a dimension of service quality – into the technology acceptance model (TAM), the current study assesses the factors influencing customers' intention to continue using mobile food ordering apps. A survey strategy was used to obtain data from 385 customers who had previously used mobile food ordering platforms. The data was analysed using the partial least squares structural equation modelling technique. The study's findings showed that perceived usefulness and reliability influence the attitudes towards using mobile food ordering apps. Moreover, consumers' attitude towards using mobile food ordering apps have a significant impact on their intention to continue using the app. The findings further indicated that reliability significantly moderates the impact of usefulness on attitude. Such a greater perception of reliability strengthens the impact of perceived usefulness on attitude.

1. Introduction

Technological advances such as online food ordering services are rapidly transforming the traditional restaurant industry and people's dining cultures (Cho, Bonn & Li, 2019). The mobile food delivery app is one such technological innovation in the restaurant industry. The app is a platform for ordering food via smart mobile phones (Ray, Dhir, Bala & Kaur, 2019). This food delivery app innovation is fuelled by the increasing number of smartphones and greater internet connectivity, enabling users to access information efficiently and quickly without any limitations of time and space (Lee, Sung & Jeon, 2019; Roh & Park, 2019). In the restaurant industry, mobile food ordering apps are developed to give consumers remote access to multiple restaurants to order their favourite meals (Natarajan, Balasubramanian & Kasilingam, 2018; Ramesh, Prabhu, Sasikumar, Devi, Prasath & Kamala, 2021). Such apps offer online-to-offline mobile services that connect restaurants and customers effortlessly. In addition, customers can easily and conveniently use their smartphones to order food from their preferred restaurants to be delivered to their homes or offices with just a few simple clicks (Cho *et al.*, 2019; Zhao & Bacao, 2020).

It is important to note that mobile food delivery apps are categorised into two types: restaurant-owned apps and multiple-restaurant apps that deliver food from a range of restaurants (Riley, 2020; Yeo, Goh & Rezaei, 2017). In South Africa, well-known restaurants with their own mobile food ordering apps are KFC, Nandos, Debonairs Pizza, and Steers, whereas popular multiple-restaurant apps serve Mr D Food and Uber Eats (Riley, 2020). According to Pigatto, Machado, Dos Santos Negreti and Machado (2017), ordering food through apps provides consumers with several advantages, such as the ability to read reviews and ratings, view menus, choose between different payment options, see the estimated delivery time, and track the delivery in real time.

2. Problem Investigated

Previous studies have acknowledged that consumers have different preferences and tastes when it comes to using mobile food ordering apps (Kang & Namkung, 2019; Cho *et al.*, 2019). In addition, various factors can influence their perception of the service quality that is offered, which in turn could

affect their attitudes towards their intentions to use specific mobile food delivery apps. However, no relevant study has yet examined the determinants of consumers' intention to continue using mobile food ordering apps in the South African context. Nor, has any South African research to date analysed how perceived usefulness, perceived ease-of-use, and reliability affect the user's attitude towards mobile food delivery apps and how users' attitudes affect the intention to continue using mobile food delivery apps. Therefore, gaps remain in the literature on the impact of perceived usefulness, perceived ease-of-use, and reliability on the intention to continue using mobile food ordering apps and how reliability mediates the relationship between perceived usefulness and attitude.

3. Research Objectives

The aim of this study was to examine the determinants of consumers' intention to continue using mobile food ordering apps. In order to achieve that aim, the following objectives were defined:

- To examine the influence of perceived usefulness on attitude towards using food ordering apps
- To examine the influence of perceived ease-of-use on attitude towards using food ordering apps
- To examine the influence of reliability on attitude towards using food ordering apps
- To examine the influence of attitude on intention to continue using mobile food ordering apps
- To examine the moderating role of reliability on the relationship between perceived usefulness and attitude towards using food ordering apps

4. Hypotheses

The following hypotheses were formulated for the study:

H₁: *There is a significant and positive relationship between attitude and intention to continue using.*

H₂: *There is a significant and positive relationship between perceived ease-of-use and attitude.*

H₃: *There is a significant and positive relationship between reliability and perceived usefulness.*

H₄: *There is a significant and positive relationship between reliability and attitude.*

H₅: *There is a significant and positive relationship between perceived usefulness and attitude.*

H₆: *Reliability positively moderates the relationship between perceived usefulness and attitude.*

5. Literature Review

This section comprises the study's theoretical background and the proposed research model, including the relationship between the constructs.

5.1. Theoretical background

The present study was theoretically rooted in the technology acceptance model (TAM) (Davis, 1989), which was integrated with the reliability dimension of service quality. The TAM consists of two key constructs – perceived usefulness and perceived ease-of-use – that serve as predictors of an individual's attitude to adopting and using a technology. The TAM further asserts that a person's attitude towards the technology's use influence their intention, and that this intention results in use behaviour. The TAM has been widely applied in previous studies to predict consumer behaviour regarding the use of different technologies; and the findings of these studies across various contexts and domains have generally provided robust support for the TAM. A study by Koenait, Maziriri and Chuchu (2021) revealed that the perceived usefulness of a mobile banking application stimulated attitudes towards the use of mobile banking applications. However, in the context of online streaming, Camilleri and Falzon (2021) used the TAM in order to “[understand] motivations to use online streaming services”, and discovered that individuals' perceptions of usefulness and ease-of-use significantly influenced their intentions to use such technology. Similarly, Su, Nguyen, Nguyen, Luu and Nguyen-Phuoc (2022) adopted the TAM to examine the factors that affect consumers' loyalty to mobile food delivery apps, and discovered that perceived usefulness and perceived ease-of-use were among the factors that positively influenced customer loyalty towards mobile food delivery apps. These studies have provided validation for the TAM as a valid theoretical basis for the present study.

As indicated earlier, the service quality dimension of reliability was integrated into the TAM to assess the extent to which it enhanced the prediction of perceived usefulness. Reliability is acknowledged as one of key factors in service quality to be used to measure the adoption of new technology (Prasad & Aryasri, 2009; Wengrowicz, Dori & Dori, 2014; Verma, 2020).

5.2. Research Model And Relationship Between Constructs

The next section comprises a detailed discussion of the proposed research model and of the relationships between the constructs in the study.

5.2.1. Research model

Consistent with previous literature, the study proposed a model (Figure 1) that posits that perceived usefulness, reliability, and perceived ease-of-use have significant and positive effects on attitudes, which in turn has a positive effect on the intention to continue using mobile food ordering apps. Furthermore, it was proposed that reliability positively mediates the relationship between perceived ease-of-use and attitude.

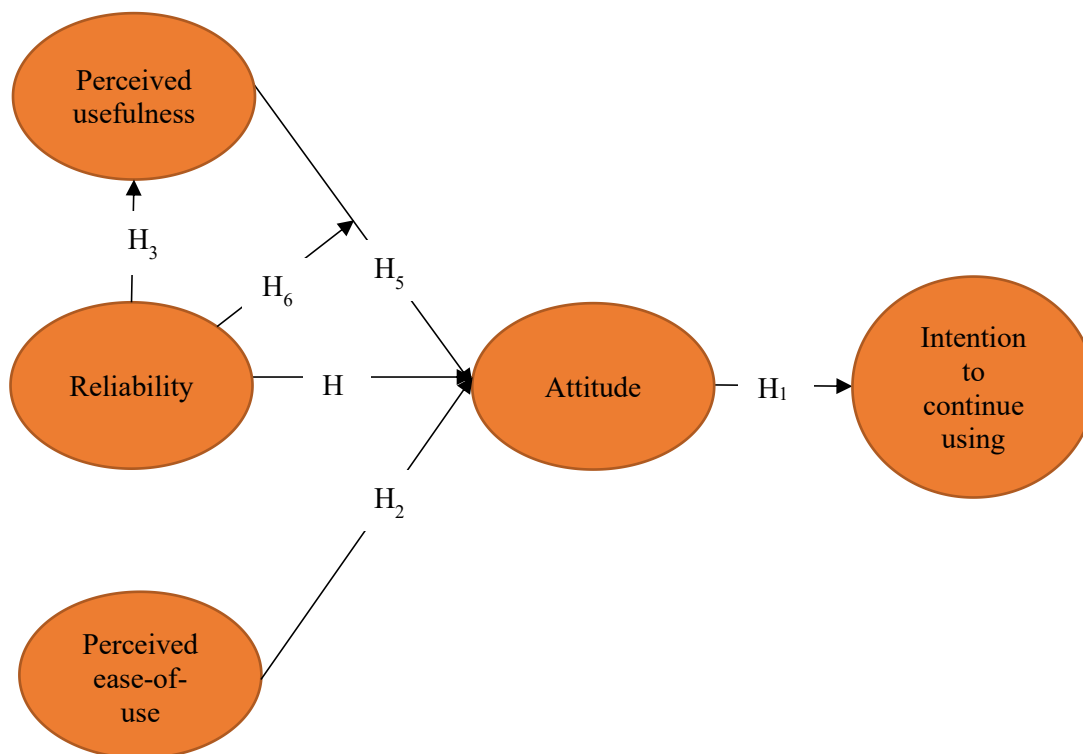

Figure 1: Proposed research model

The relationships between the constructs in the model are discussed in the paragraphs that follow.

5.2.2. Relationships between constructs

Perceived usefulness

Perceived usefulness (PU) is defined as “to the degree to which an individual believes that adopting the technology would improve his or her task performance” (Davis, 1989:320). Lee, Lee and Jeon (2017) explain that perceived usefulness is a factor that significantly affects the use of mobile food ordering apps. For instance, food delivery apps’ usefulness is expected to be convenient for users regardless of their location and the time that they order food (Lee & Jeon, 2016). Perceived usefulness is also found to have a positive relationship with customers’ attitudes when it comes to their intention to use food delivery app services (Yeo *et al.*, 2017). Okumus and Bilgihan (2014) found that perceived usefulness is among the factors that influence consumers’ attitude after examining smartphone users’ intention in ordering food through apps. Similarly, several studies found that perceived usefulness had a significant and positive relationship with attitude (Law, Kwok & Ng, 2016; Yeo, Tan, Teo & Tan, 2021).

Perceived ease-of-use

Davis (1989:320) defined perceived ease-of-use as “the degree to which a person believes that using a particular system would be free of effort”. Perceived ease-of-use was defined by Ozturk, Bilgihan, Nusair and Okumus (2016) as the provision of the appropriate information gathered from using technology such as mobile applications. In the context of the current study, perceived ease-of-use reflected how easy it is for consumers to use food orders apps. Previous studies conducted by Morosan (2011), Salehi-Esfahani and Kang (2019), and Zhang, Seo and Ahn (2019) found that perceived ease-of-use had a strong effect on consumers’ attitudes towards the adoption and use of technology in accessing hospitality and tourism services. Similarly, Ray *et al.* (2019) showed that perceived ease-of-use influenced customers’ intention to continue using food ordering app services.

Reliability

Parasuraman, Zeithaml and Berry (1994) defined reliability as the level of emotions linked with the consumer’s belief that the company would deliver as promised, and that the consumer could trust the company with which they traded. In the context of mobile food ordering apps, reliability depends on the service provider’s ability to deliver the right order at the right time and so satisfy the customer (Azizul, Albattat, Shahrman & Irfan, 2019). A study by Ilham (2018) revealed that consumers develop a positive attitude towards using mobile food ordering apps that consistently provide quality services. Providing accurate, detailed, and reliable information was found to have an impact on consumers’ attitudes towards the use of mobile apps to order food (Lee *et al.*, 2019). Reliability was found to be a significant factor in influencing individuals’ attitude to the adoption of food delivery services during the Covid-19 pandemic (Hong, Choi, Choi & Joung, 2021). Moon and Armstrong (2020) highlighted that customers who perceive technology such as mobile applications to be useful and reliable develop positive attitudes, likely leading to future usage.

Attitude

According to Fishbein and Ajzen (1975), attitude is defined as “an individual’s positive or negative feelings about performing the target behavior”. Attitude was described by Hwang, Lee and Kim (2019) as an important evaluative criterion that an individual develops when using mobile food ordering apps, and that can affect their intention to continue using it (Belanche, Flavián & Pérez-Rueda, 2020). Previous studies have found that customers who perceive mobile food ordering apps to be useful tend to develop more positive attitudes towards using such apps (Cho *et al.*, 2019; Gârdan, Epuran, Paştiiu, Gârdan, Jiroveanu, Tecău and Prihoancă, 2021; Song, Ruan & Jeon, 2021). The results of a study by Troise, O’Driscoll, Tani and Prisco (2021) revealed that consumers’ intention to continue using mobile food ordering services is influenced by their positive attitudes towards mobile apps that exceed their expectations. Similarly, a recent study by Al Amin, Arefin, Alam, Ahammad and Hoque (2021) showed that attitudes had a significant impact on the behavioural intention to continue using mobile food delivery apps during Covid-19. Kang and Namkung (2019) examined customers’ decision-making when purchasing food product through the use of technology, and found a positive relationship between attitude and the behavioural intention to use it.

6. Research Methodology

Measurement

The data was collected using a structured paper-based questionnaire. A multi-item scale, adapted from prior related literature and modified appropriately for this study, was used to measure the constructs. Perceived usefulness, which consisted of five items, and perceived ease-of-use, which consisted of three items, were adapted from Davis (1989). The intention to continue using, with four items, was adapted from Mouakket (2015). Reliability, with three items, was adapted from Stevens, Knutson and Patton (1995). Attitude had four items, and was adapted from Yeo *et al.* (2017). All of the items were measured as reflective items on their corresponding constructs with a five-point Likert scale ranging from 1 ‘strongly disagree’ to 5 ‘strongly agree’.

The measurement instrument (a questionnaire) was tested in a pilot study involving 60 respondents. An online self-administered questionnaire was used: a link created in Google Forum was shared via emails to potential respondents. The main purpose of the pilot study was to assess the appropriateness

of the questionnaire's contents, instructions, and structure. The responses received were positive; so only slight changes, such as correcting spelling errors and rephrasing some words, were made to improve the quality of the final questionnaire to be used to collect data.

Sampling and data collection

In this study, the target population were consumers over the age of 18 years who resided in Gauteng Province, South Africa and who had used mobile food delivery apps in the month prior to the survey. When collecting the data, non-probability convenience and judgmental techniques were used owing to the unavailability of a sampling frame. Participation in the survey was completely voluntary, and participants were informed that they could withdraw from the study at any point without detrimental consequences.

The questionnaire used for the data collection was created using Google Docs. Thereafter, a link to the online questionnaire was generated and embedded in an email inviting the respondents to participate in the study. The first page of the questionnaire had a consent form that stated the conditions of participation, which had to be read by participants before they could take part in the study. Those who completed the online questionnaire were encouraged to share the link with anyone in their network who met the participation criteria. The data was collected over a period of three months (May to July) in 2020. A total of 385 usable responses were obtained.

7. Data Analysis And Results

The data was analysed using the partial least squares structural equation modelling (SEM) technique, employing SmartPLS 3 software. This technique was considered appropriate because the goal of the research was to predict the determinants of consumers' intention to continue using mobile food ordering apps. This was in line with the predictive orientation of PLS-SEM (Hair, Hult, Ringle & Sarstedt, 2017). The measurement model was examined to check its validity, and the structural model was evaluated to validate the significance of the proposed hypotheses.

Measurement model analysis

To examine the validity of the measurement model, its convergent and discriminant validity were established. To examine convergent validity, standardised factor loading, composite reliability, and average variance extracted (AVE) were used. For a measurement model to possess convergent validity, the standardised factors loading should exceed 0.708, the composite reliability estimates should be greater than 0.7, and the AVEs for the constructs should exceed 0.5. The results of the convergent validity test presented in Table 1 show that all of the standardised factor loadings exceeded the 0.708 threshold, with 0.739 (ATT2) being the lowest. Moreover, the composite reliability estimates obtained for the study's constructs far exceeded the 0.7 threshold, with 0.861 – for the construct 'confirmation' – being the lowest. Finally, the AVEs for the constructs also exceeded the 0.5 cut-off point. These results supported the convergent validity of the measurement model.

Table 1: Convergent Validity Of The Measurement Model

		Loading
Attitude: α =0.807; CR= 0.898; AVE= 0.634		
ATT1	I like the idea of using mobile food ordering/delivery apps.	0.809
ATT2	I think that using mobile food ordering/delivery app is a good idea.	0.816
ATT3	I think that using mobile food ordering/delivery apps is pleasant.	0.739
ATT4	I think that using food ordering/delivery apps would be a wise idea	0.818
Perceived ease-of-use: α =0.774; CR= 0.898; AVE= 0.815		
PEU1	Learning how to use the mobile food ordering/delivery service app is easy for me.	0.894
PEU4	Overall, I find it easy to use the mobile food ordering/delivery apps.	0.912
Intention to continue using: α =0.845; CR= 0.907; AVE= 0.764		
INT1	I intend to continue using the mobile food ordering/delivery app in the future.	0.885
INT2	I am willing to continue using the mobile food ordering/delivery apps in the near future.	0.873
INT3	I am likely to continue using mobile food ordering/delivery apps in the near future.	0.864
Reliability: α =0.757; CR= 0.861; AVE= 0.673		
REL1	The features provided by the mobile food ordering/delivery app are dependable.	0.799
REL2	The capabilities provided by the mobile food ordering/delivery app are reliable.	0.800
REL3	The food ordering/delivery app behaves in a highly consistent way.	0.861
Perceived usefulness: α =0.828; CR= 0.886; AVE=0.66		
PU1	Using food ordering/delivery apps enables me to accomplish the task of buying food more quickly.	0.827
PU3	Using food ordering/delivery apps is a more effective way of buying food.	0.792
PU4	I find the food delivery service mobile app to be useful.	0.811
PU5	Overall, I would find using a mobile food ordering/delivery app to be advantageous	0.821

The next step in the analysis of the measurement model was to assess its discriminant validity. The Heterotrait-monotrait (HMTMT) technique (Henseler, Ringle & Sarstedt, 2015) was applied. The HTMT criteria for confirming discriminant validity suggest that, to obtain discriminant validity, the HTMT ratio of correlations should be less than a conservative estimate of either 0.85 or 0.90 (Henseler *et al.*, 2015). According to the results presented in Table 2, all of the HTMT ratios of correlations obtained for this study were less than 0.900, thus providing evidence to support the discriminant validity of the constructs that were used.

Table 2: HTMT ratio of correlations

		1	2	3	4	5
1	Attitude					
2	Ease-of-use	0.660				
3	Intention to continue using	0.858	0.561			
4	Reliability	0.819	0.637	0.659		
5	Usefulness	0.877	0.784	0.661	0.793	

After confirming the convergent and discriminant validity of the measurement model, the relationships between the constructs in the structural model analysis were examined.

Structural model analysis

After confirming the validity of the measurement, the structural model was examined to determine the significance of the proposed hypotheses and to explain the variance in the dependent variable (intention to continue using) using the significant independent variables. As a first step in assessing the structural model, collinearity among the independent constructs in the model was examined using VIF. Hair *et al.* (2017) suggested that collinearity is not a critical issue if the VIF estimates are below

3. The results obtained for the present study showed that the VIF estimates ranged from 1.00 to 2.475. Given that these were below the threshold of 3, it was concluded that collinearity was not a critical threat to the study. Having ruled out the threat of collinearity, the size and significance of the path coefficients and the R2 of the predicted constructs, as well as the effect size (f^2) of the paths, were examined. These results are presented in Figures 2 and 3.

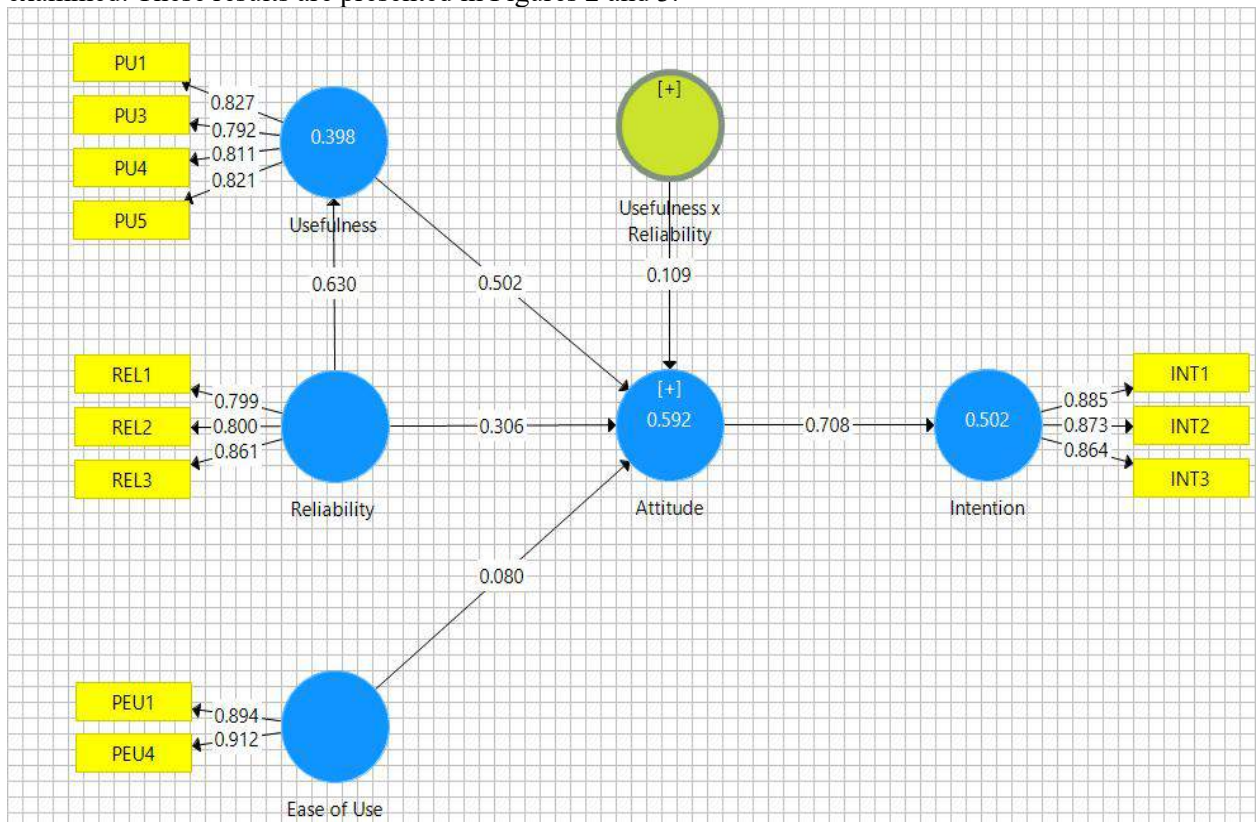

Figure 2: Path estimates with R2 values

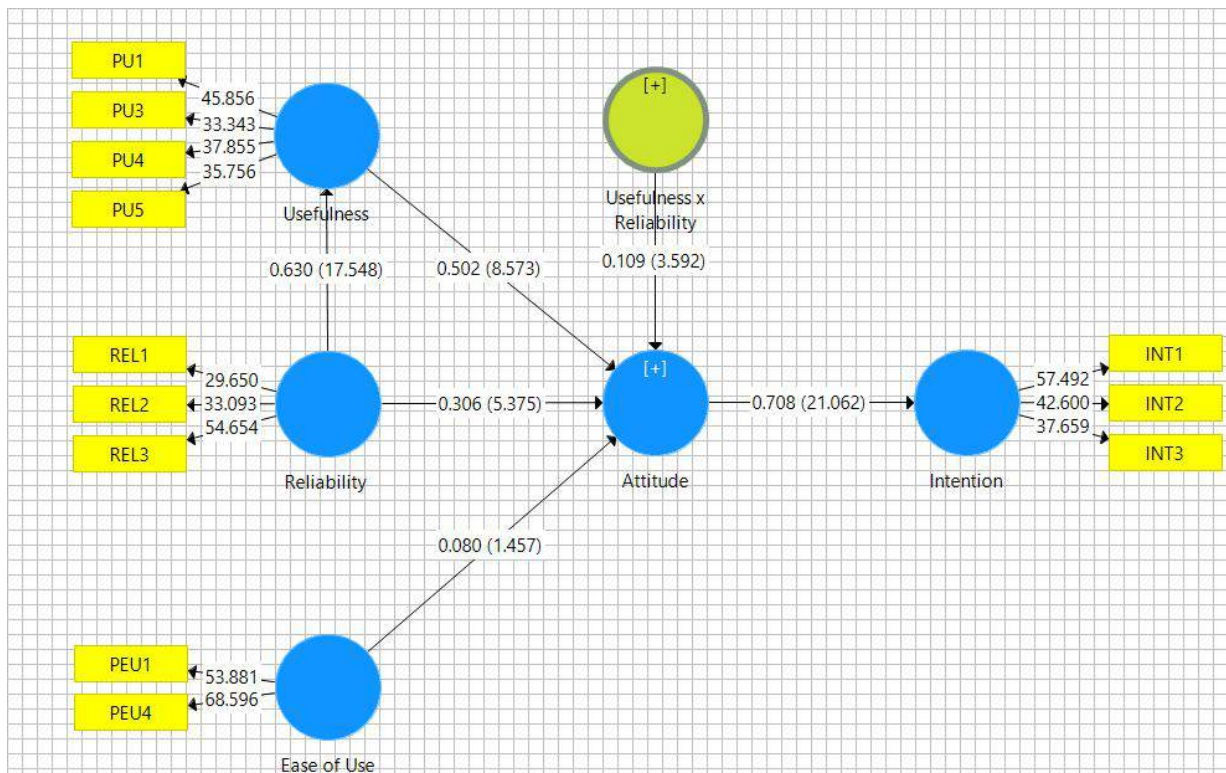

Figure 3: SmartPLS results of path estimates with t-values

Table 3: Path estimates

		Path coeff.	T Statistics	P Values	Result	f2
H1	Attitude -> Intention	0.708	21.062	0.000	Supported	1.008
H2	Ease-of-use -> Attitude	0.080	1.457	0.146	Not supported	0.009
H3	Reliability -> Usefulness	0.630	17.548	0.000	Supported	0.66
H4	Usefulness -> Attitude	0.502	8.573	0.000	Supported	0.285
H5	Reliability -> Attitude	0.306	5.375	0.000	Supported	0.135
H6	Usefulness x Reliability -> Attitude	0.109	3.592	0.000	Supported	0.032

According to the results of the hypothesis testing, attitude had a significant and positive impact on consumers' intention to continue using mobile food ordering apps ($\beta=0.708$; $t=21.062$; $p<0.001$), providing support for H1. The effect size for this relationship was large. The results showed further that consumers' perception of the ease of using food delivery apps was not significantly related to their attitude ($\beta=0.080$, $t=1.457$; $p<0.001$). Therefore, H2 was not supported. However, the results showed that reliability had a significant and positive impact on consumers' perception of the usefulness of food delivery apps ($\beta=0.630$; $t=17.548$; $p<0.001$), thus providing statistical support for H3. The effect size for this significant relationship was large. Similarly, the results showed that perceived usefulness was strongly associated with customers' attitude to using food delivery apps ($\beta=0.522$; $t=8.573$; $p<0.001$); thus H4 was statistically supported. The effective size for the impact of perceived usefulness on attitude was also large. Conversely, the findings showed that consumers' perception of the reliability of food delivery apps was significantly related to their attitude ($\beta=0.306$; $t=5.375$; $p<0.001$), thus providing statistical support for H5. The effective size of the reliability → attitude link, however, was negligible, while consumers' perception of how reliable the food delivery apps are partially mediated ($\beta=0.109$; $t=3.592$; $p<0.001$) the relationship between perceived usefulness and attitude.

In respect of the R2, reliability explained 39.8% of the variance in perceived usefulness and 59.2% of the variance in attitude. Perceived usefulness and confirmation – which are significant predictors of satisfaction – explained 58.8% of the variance in the construct. Last, attitude explained 50.2% of the variance in the intention to continue using the apps. The relatively high R2 values provided validation for the antecedents in predicting their respective outcome variables. To explain further the significant moderating impact of reliability on the relationship between perceived usefulness and attitude, a simple slop analysis (Figure 4) was performed. The results showed that higher reliability reinforced the impact of perceived usefulness on attitude.

Figure 4: Moderating effects of reliability on the relationship between perceived usefulness and attitude

8. Discussions and Managerial Implications

The purpose of this study was to examine the determinants of consumers' intention to continue using mobile food ordering apps. Its findings showed that attitude had a strong impact on consumers' intention to continue using mobile food ordering app services. This finding supported prior results (Kang & Namkung, 2019; Al Amin *et al.*, 2021; Gárdan *et al.*, 2021), which revealed that the user of mobile food ordering apps who had a positive attitude intended to continue using those apps, provided that items were occasionally updated. This implied that the attitude of mobile food app users must be monitored, since it influences their intention to continue using the apps. Therefore, restaurants and developers of food delivery apps should provide occasional promotional strategies, such as festive season or Easter savings or coupons, to frequent users of food delivery apps in order to reinforce their existing positive attitudes towards their intention to continue using the apps. At the same time, similar offers could be made to new and potential users to encourage them to start using those apps.

The findings further revealed that consumers' perception of the ease of using food delivery apps had no positive impact on attitude, contradicting the results of previous studies by Ray *et al.* (2019) and Zhang *et al.* (2019), which found that perceived ease-of-use had a significant impact on consumers' attitudes towards the adoption and use of apps such as those for mobile food ordering. This implies that the users of mobile food ordering apps are now familiar with how they operate, and that there is nothing exciting, new, or complicated to learn about the apps they use. This might be an opportunity for restaurants and app developers to add exciting functions that would make the apps easy to use and to expand the services into new markets, such as rural areas, where the use of mobile food delivery apps is not popular.

The findings indicated that reliability had a statistically substantial and positive impact on both attitude and users' perception of how useful food delivery apps are. This result confirmed the findings of previous studies (Moon & Armstrong, 2020; Hong *et al.*, 2021) that mobile food ordering app service providers who delivered on their promises were perceived to be useful. According to the results, such perceptions positively influence the attitudes of mobile app users who are able to fulfil their need for food. This finding suggested that users of mobile food ordering apps perceived those services to be dependable and hassle-free and as very smart, effortless, and efficient. In addition, Shokouhyar, Shokoohyar and Safari (2020) emphasised that delivering what is ordered the first time gives customers the assurance that they can rely on the service provider, which also positively influences their attitude. It is recommended, therefore, that mobile food delivery apps be regularly maintained to ensure that consistent information is exchanged with their users, who depend on such

apps to order food. Such an approach would have a positive influence on users' attitudes and perception of usefulness.

The findings suggested that perceived usefulness was positively related to attitude, which is in line with the results of other studies (Lee *et al.*, 2017; Yeo *et al.*, 2017). This implies that users of food delivery apps who can easily find various food items from different restaurants perceive such apps to be helpful. It is recommended, therefore, that such apps be designed in such a way that ordering food is informative and helpful, practical, and convenient for users who have little time to cook their own meals (Zanetta, Hakim, Gastaldi, Seabra, Rolim, Nascimento, Medeiros & Da Cunha, 2021). That kind of design would be likely to have a positive impact on the attitudes of mobile food ordering app users. It is also recommended that the functions of mobile food delivery apps be able to recommend items such as combos which take less time to be prepared and delivered quickly to consumers. In a similar study, Wen, Pookulangara and Josiam (2021) suggested that mobile food delivery apps offer the innovative strategy of bundling orders from different restaurants that are reasonably close to one another without any extra cost to users.

The findings also showed that reliability positively moderated the relationship between perceived usefulness and attitude. This result emphasised the importance of reliability in improving the impact of usefulness on attitude. In practical terms, the findings of this study might be valuable to marketers of both restaurants and food delivery apps as they formulate relevant strategies, since factors such as perceived usefulness and reliability influence consumers' attitudes towards using such apps.

9. Conclusion

By integrating reliability into the TAM, the current study examined the factors that influence South African consumers' use of mobile food ordering apps. Data was obtained from 385 users of food delivery apps. The study found that both perceived usefulness and reliability had a positive relationship with attitude. However, perceived ease-of-use was statistically proven not to have any impact on attitude, whereas attitude was found to have a significant impact on the intention to continue using such apps. The study's findings also highlighted the significant moderating impact of reliability on the relationship between perceived usefulness and attitude, such that reliability reinforces the impact of usefulness on attitude. Future research could expand the scope of this study to include other provinces in South Africa, using probability sampling, different data collection methods, and longitudinal designs to obtain the in-depth views of a wider population.

Drivers of Grocery Retail Customers' Engagement With a Loyalty Program and the Grocery Retailer Brand

Ilse Struweg^{1,*}

¹University of Johannesburg, Johannesburg, South Africa

Keywords

Loyalty program engagement; brand engagement; behavioural drivers; grocery retailer

Abstract

Advances in technology and more robust competition have necessitated grocery retailers to adopt various strategies to increase customer engagement and connections. Many grocery retailers try improving customer brand engagement and relationships through loyalty programs. Although grocery retailers in South Africa have done well in attracting new loyalty program members, the challenge is to engage them long-term. This paper uses a quantitative, descriptive design to investigate the drivers of grocery retail customers' engagement with a loyalty program and the grocery retailer brand. Self-administered questionnaires were distributed through social media platforms to respondents who used at least one grocery retailer's loyalty program three months before data collection. IBM SPSS and AMOS were used to analyse data from 299 suitable questionnaires. The findings from the multiple regression analysis showed that six customer behavioural drivers of loyalty programs in a specific hierarchical order all impact loyalty program engagement positively, which in turn enhances grocery customers' engagement with the grocery retailer brand.

1. Introduction

The grocery retail sector has changed significantly due to customer behavioural changes and heightened competition in economically challenging times. Resultantly, many South African grocery retailers have started to rely on loyalty programs to engage customers in long-term relationships. Brink, Heyns, and Kilbourn (2019) support this notion by stating that grocery retailers find it challenging to build and maintain loyalty in the quest for strengthened customer engagement and relationships with increasingly demanding customers. Customer engagement is central to strengthening long-term customer relationships, as put forward by Brodie, Hollebeek, Jurić, and Ilić (2011). Accordingly, based on Vivek, Beatty, and Morgan (2012), this study defines customer engagement as the extent of a customer's connection with and participation in a firm's activities and offerings from both the firm and the customer. Septianto, An, Chiew, Paramita, and Tanudharma (2019) confirm that a way to encourage customer engagement with brands is for firms to invest in loyalty programs. Not only to drive repeat purchases but to induce perceived value and reinforce relationships with the firms (Chaudhuri, Voorhees & Beck, 2019).

Furthermore, loyalty programs offer customers social benefits and financial incentives through their relationship with the company (Bruneau, Swaen, & Zidda, 2018). According to Xie and Chen (2013), the strengths and achievability of loyalty programs have been covered widely in academic literature. In addition, according to Chen, Mandler, and Meyer-Waarden (2021), customer loyalty programs are considered an obvious marketing solution to enhance long-term customer relationships in customer loyalty literature, specifically in the retail sector. However, there appears to be an inadequate understanding of customer engagement with loyalty programs. Bruneau et al. (2018) echo Henderson, Beck, and Palmatier's (2011) findings and confirm that using loyalty cards or redeeming points insufficiently explains loyalty program engagement. Consequently, a clear need arises to explore the

behavioural dimensions that impact grocery retailer customers' loyalty program engagement and, hence, their customer brand engagement.

1.1. Problem Statement

Against this background, four problems appear to ground the paper. First, the average South African belongs to almost nine loyalty programs - including the Smart Shopper card of the grocery retailer, Pick n Pay's as one of the most used (Thukwana, 2021). With customers being part of so many loyalty programs, the question arises of the genuine engagement of grocery store customers with their loyalty programs and their engagement with the grocery stores' brands. Bruneau et al. (2018) note the seeming lack of customers' loyalty program engagement. They call on retailers to use interactive technologies to better engage with loyalty program members and map their customer journeys to optimise customer brand engagement with the grocery retailer.

Secondly, Haramse (2019) argues that even though customers belong to many loyalty programs, they have become more selective about the specific loyalty programs they engage with. An opportunity, therefore, arises to study the behavioural dimensions that drive grocery store customers' loyalty program engagement. Thirdly, despite evidence that loyalty programs are ideal for relationship marketing, Kim, Steinhoff, and Palmatier (2021) call for less fragmented and more comprehensive perspectives of studying loyalty programs. Fourthly, by determining loyalty program engagement and customer brand relationships with grocery stores it could add to Lo, Im, Chen, and Qu's (2017) findings: that through customer brand relationships, loyalty programs can strengthen customer advocacy, increase the share of wallet and purchase frequency, lower expenses to acquire new customers, and lower switching.

1.2. Research aim and objectives

1.2.1. Research aim

To investigate the drivers of grocery retail customers' engagement with a loyalty program and the grocery retailer brand.

1.2.2. Research objectives

- To investigate the demographic profile of respondents participating in the study. This objective is to provide background information relating to the purpose of the study.
- To determine whether a significant and positive relationship exists between the drivers of grocery retail customers' (proactively using a loyalty card, point redemption, altered customer buying behaviour, information sharing, openness to information and active search for information) and loyalty program engagement.
- To determine the hierarchical order of the drivers of grocery retail customers on grocery stores' loyalty program engagement.
- To establish whether a significant and positive relationship exists between grocery retail customers' engagement with a loyalty program and the grocery retailer brand.

2. Literature Review

First, the literature review provides a summary of customer engagement theory and expectancy-value theory as the grounding theories concerning the aim of the study. Second, the focus shifts to describing the key constructs and their relation to customer engagement. This leads to an explanation of the interrelationship between these constructs. Then, the corresponding hypotheses illustrate the proposed linkage between the constructs in this study. This section concludes with the proposed conceptual framework.

2.1 The theoretical underpinning of expectancy-value theory

Being part of a loyalty program provides customers benefits such as cash back, discounts, upgrades to certain products or services or other promotional options. The expectancy-value theory of Fishbein and Ajzen (1975) offers a theoretical basis for understanding the behavioural drivers of loyalty

program grocery retail customers' loyalty program engagement in this study. According to Mai and Liao (2021), expectancy-value theory suggests that motivation is a result, among others, of expectations or beliefs and values which are linked to the relative, subjective appeal of an outcome. More specifically, Gvili and Levy (2018) argue that the expectancy-value theory proposes that individual customers' expected benefit from an action affects their behaviour. The expected use, or what Fishbein and Ajzen (1975) refer to as "the utility", is a result of two aspects, namely the belief that an object (behaviour) has a particular attribute and the consideration of this attribute (Gvili & Levy, 2018). In the expectancy-value theory, the objects' attributes establish the attitude toward the object and consecutively confirm individual customers' intention to act in a specific way, which results in the consequent behaviour (Henning, Hennig-Thurau & Feiereisen, 2012).

Furthermore, Inzlicht, Shenhav, and Olivola (2018) argue that effort is usually expected in customer engagement in attaining some goal. The attractiveness (linked to value) and achievability (linked to expectancy) parts of goals are central to primary theoretical analyses of motivation (Kruglanski, Jasko, Chernikova, Milyavski, Babush, Baldner & Pierro, 2018). Furthermore, Eccles and Wigfield (2002) added to the expectancy-value theory to include the importance of mental processes. They distinguished the two essential parts (attractiveness and achievability) as determining factors of the intensity of the customer's motivation. Therefore, Kruglanski et al. (2018) argue that attractiveness or achievability determines the probability of completing the engagement, specifically regarding engagement tasks.

Therefore, based on the expectancy-value theory, this study proposes that the behavioural drivers of loyalty program customers are antecedents of loyalty program engagement which shape customer brand engagement.

2.2 The theoretical underpinning of customer engagement theory

Earlier research indicates that loyalty programs are fruitful platforms for fostering customer brand engagement (Itani, Kassar & Loureiro, 2019). Similarly, Bijmolt, Krafft, Sese and Viswanathan (2018) illustrate how loyalty programs can encourage customer engagement. Therefore, to examine customer brand engagement by grocery store customers in this study, this study firstly draws on customer engagement theory.

To contextualise customer engagement theory, it is valuable to focus on its development briefly. This theory originates in Morgan and Hunt's (1994) commitment trust theory, which paved the way for relationship marketing theory (Bhattacharjee, Pradhan, & Swani, 2022). The critical premise of relationship marketing theory, according to Grönroos (2019), is the central purpose of firms to establish positive customer relationships to influence customers' preferences and persuade them to buy on a long-term basis promoting productivity, effectiveness, efficiency, and cooperation. Bhattacharjee et al. (2022) claim that firms' objectives advanced from relationship marketing to customer engagement over time. Pradhan, Malhotra and Moharana (2020) argue that "engagement" has gained prominence in the marketing field. Pansari and Kumar (2017) affirm that customer engagement is undoubtedly central to contemporary marketing, having developed from relationship marketing. These scholars proposed customer engagement theory, "the process of engaging a customer follows relationship formation and that the tenets of relationship marketing are subsumed in engagement theory" (Pansari & Kumar, 2017, 300). So, Kim and King (2021) argue that the significance of customer engagement exists in insight into dynamic, interactive customer-brand interactions, such as how customers engage in loyalty programs. The discussion now shifts to the key constructs in this study: loyalty program engagement, behavioural dimensions of loyalty program engagement and customer brand engagement.

2.3 Customer brand engagement

France, Merrilees and Miller (2016) maintain that customer brand engagement literature indicates growth in engagement knowledge between the customer and the brand. One of the typical features of a loyalty program is that it enables data collection about the loyalty program customers (Belli, O'Rourke, Carrillat, Pupovac, Melnyk, & Napolova, 2022), therefore providing an opportunity to gain

knowledge of the link between the loyalty program customer and the retail brand. Customer brand engagement, an adaptation of the customer engagement concept (Hollebeek, 2011), is explained by Dessart, Aldás-Manzano, and Veloutsou (2019) as the level of a customer's behavioural, cognitive, and emotional contributions, in particular, interactions with a brand. Hollebeek, Glyn and Brodie (2014) define customer brand engagement as "a customer's positively valence brand-related cognitive, emotional and behavioural activity during or related to focal consumer or brand interactions". Similarly, according to the seminal work of Brodie et al. (2011), customer brand engagement is a "psychological state" comprising "proactive, interactive customer relationships". Research in customer brand engagement conceptualisations also focuses on engagement as customer behaviour (Van Doorn, Lemon, Mittal, Nass, Pick, Pirner and Verhoef, 2010), whereas Boden (2019) views it as a loyalty-building process.

Both the brand and the customer play an essential part in creating and sustaining customer brand engagement, but this strongly depends on an actionable firm-led platform (France, et al., 2016), such as a loyalty program. Pratomo and Magetsari (2018) proved that a customer's engagement with a brand is not only an interaction process between the customer and a brand but a fundamental enabler to developing customer brand relationships. Before discussing loyalty program engagement as an enabler of customer brand relationships, it is necessary to recognise the concept of loyalty programs.

2.4 Loyalty programs

According to Chen, Mandler and Meyer-Waarden (2021), loyalty programs were introduced in the airline and retail industries in the 20th century. Based on the work of Bombaij and Dekimpe (2020) and Steinhoff and Palmetier (2016), a loyalty program encompasses an integrated approach to personalised marketing activities with marketing communications that offer both tangible and intangible rewards. Loyalty programs help retailers to induce customers' perceived value, encouraging customers to enrol and stay with the loyalty program and enhancing their buying behaviours and relationship with the retailer (Chen, et al., 2021). Loyalty programs are predominantly used in industries that monitor customer behaviour to improve promotions and where loyalty stakes are high (Wu, Sun & Yada, 2020), such as petrol stations, airlines, and supermarkets.

Furthermore, He, Tian and Wang (2019) argue that loyalty programs are also used to support firms in overcoming challenges such as engaging and retaining existing customers. Therefore, Mafa (2019) argues that a firm's communication of its value offering to customers significantly influences customer engagement. Thus, how a firm communicates its value offerings to customers will affect customers' engagement with the firm (Mafa, 2019:23). The effective use of loyalty programs can, according to Corbishley (2017), result in the saving of costs because of higher customer retention. Furthermore, according to Thaver (2019), customers joining loyalty programs are more likely to become brand loyal to the firm. Corbishley (2017) further argue that loyalty programs have developed a platform for retailers to advance customer brand engagement. Similarly, Filipe, Marques, and Salguero (2017) found that customer engagement in loyalty programs enhances long-term customer brand relationships.

However, to assess the effectiveness of loyalty programs, Meyer-Waarden and Benavent (2009) propose that the two-way relationship of the loyalty program should be considered to move beyond the exclusive firm-focused perspective. Therefore, Bruneau et al. (2018) identify the necessity to use loyalty program engagement to address customers' relational responses to determine their active contribution to and presence in this relationship – a gap that this study aims to address.

2.5 Loyalty program engagement

To create a contextualised understanding of loyalty program engagement, it is essential to understand a few perspectives that ground the meaning of engagement for this study. First, engagement, for this study, entails active participation (Vivek, Beatty, & Morgan, 2012) and active interactions (Kumar, Aksoy, Donkers, Wiesel, & Tillmanns, 2010), as well as behavioural manifestations (Bijmolt, et al., 2010). Secondly, the engagement process is a sequence of combined states of engagement, which is a) context-dependent, b) individual, c) can be studied at unique complexities or intensities, and d) at

different points in time (Brodie, et al., 2011). Thirdly, engagement is considered in this study to involve not merely motivation but is rather typified by customers' behaviour, differentiating engagement, involvement, and commitment (Bruneau, et al., 2018). Therefore, as de Villiers (2015) argue, commitment refers to a conscious decision to *be* in a specific relationship, while engagement implies *behaviour to remain* in the relationship. Lastly, customer engagement for this study follows Mollen and Wilson's (2010) argument that customer engagement exceeds involvement but instead entails a dynamic brand relationship.

Research on loyalty program engagement focuses predominantly on a comparison between loyalty program members and non-members to evaluate the effectiveness of the loyalty program, which, according to Bruneau et al. (2018), a) fails to differentiate between engaged and unengaged loyalty program members and b) fails to determine loyalty program members who never engage in the loyalty program. There are, however, some scholars who refer more specifically to loyalty program behaviours. One study focuses on loyalty program members' reward redemption behaviour (Dorotic, Biumolt, & Verhoef 2012). Evanschitzky (2012) explored loyalty program members' card usage as an indicator of loyalty toward the program. Steinhoff and Palamatier's (2016) study focuses on participation in the loyalty program, and the resultant rewards received. Therefore, this study can contribute to loyalty program engagement literature in determining the relationship between several loyalty program behavioural drivers (proactively using a loyalty card, point redemption, altered customer buying behaviour, information sharing, openness to information and active search for information).

Next follows the definitions of the selected loyalty program behavioural drivers for this study:

- *Proactively using a loyalty card*: This refers to proactively using the loyalty program card when a customer makes a purchase (Bruneau, et al., 2018).
- *Point redemption*: This is when loyalty program customers redeem their benefit points for abstract or tangible rewards (Meyer-Waarden, Benavent, & Castéran, 2013; Meyer-Waarden, 2015).
- *Altered customer buying behaviour*: The willingness of the loyalty card customer to adjust buying behaviour, for example, buying more or other products to earn more loyalty points (Bruneau, et al., 2018).
- *Information sharing*: Loyalty program customers share their experiences with others (positive or negative), such as telling friends and relatives about the grocery store and its loyalty program (Bahri-Ammari, 2012).
- *Openness to information*: Loyalty program customers are receptive/open to targeted marketing of a given product, loyalty program or the firm (i.e., grocery store (Santos & Castelo, 2018)).
- *Active search for information*: Loyalty program customers actively investigate information regarding the firm (the grocery store) and its products to create a good purchase decision and increase their product knowledge or keep them informed about the grocery store and its loyalty program (Sangwan & Agarwal, 2019).

3. Conceptual model

The proposed model for this study is based on expectancy-value theory and customer engagement theory and seeks to determine the interrelationships between the loyalty program behavioural drivers (pro-actively using a loyalty card, point redemption, altered customer buying behaviour, information sharing, openness to information and active search for information) and loyalty program engagement, and the relationship between loyalty program engagement and customer brand engagement.

Figure 1 illustrates the proposed conceptual model to uncover the relationships between the proposed constructs in this study.

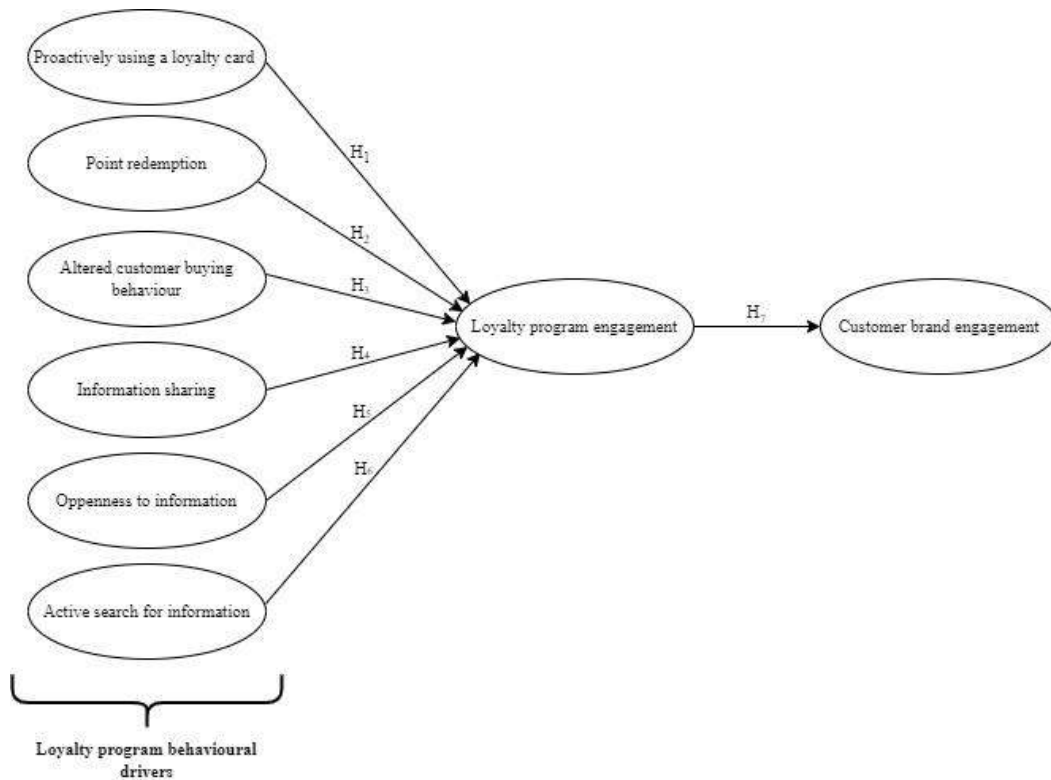

Figure 1: Conceptual model
Source: Own conceptualisation

4. Hypotheses formulation

This section explores the interrelationships between behavioural drivers, loyalty program engagement, and customer brand engagement.

4.1 The impact of loyalty program behavioural drivers on loyalty program engagement

Studies by So, King, and King (2021), Van Doorn et al. (2010), and Bombajj and Dekimpe (2020) confirm that various customer behavioural or firm-related marketing strategies can act as drivers that impact the intensity of customer brand relationships. This section explores the interrelationships of loyalty program behavioural drivers and loyalty program engagement.

4.1.1 The impact of proactively using a loyalty program card and loyalty program engagement

Most loyalty programs are developed to promote increased loyalty program use, where increased customer purchases lead to increased rewards (Liu, 20017). Bazargan, Karray and Zolfaghari (2021) confirm that customer retention, one of the central goals of loyalty programs, is ensured through repeat purchases, specifically, loyalty program cards. According to Meyer-Waarden (2015), loyalty program customers tend to make repeated purchases to ensure maximum value is derived from using the loyalty program card. However, Hupfeld and Speed's (2017) study found a reduction in loyalty program card usage, predominantly based on customers' forgetfulness in bringing their loyalty program cards with them when shopping, as well as some customers who viewed the scanning of the loyalty cards as a tedious process. Even so, Harmse (2019) concluded that the proactive use of loyalty program cards was a valid measure to determine loyalty program engagement. Accordingly, the following hypothesis is put forward:

H₁: Proactively using a loyalty program card has a significant, positive impact on loyalty program engagement by grocery retail customers.

4.1.2 The impact of point redemption on loyalty program engagement

According to Bombaij and Dekimpe (2020), retailers do not only vary in their decisions to implement a loyalty program or not but even more so in how it is implemented. In this regard, Nasir, Lola and Deraman (2019) confirm that most loyalty programs share the practice of customers receiving redeemable points when loyalty program cards are used. Notwithstanding, Bies, Bronnenberg and Gijbrecs (2021) found a general decrease in loyalty point redemption. Also, some studies identified why loyalty points are not redeemed regularly (Nasir, et al., 2019). Consequently, Hollebeek, Das and Shukla (2021) argue that loyalty program points that are not redeemed result in minimal customer engagement. Hence, the following hypothesis is offered:

H₂: Point redemption in loyalty program programs has a significant, positive impact on loyalty program engagement by grocery retail customers.

4.1.3 The impact of altered customer buying behaviour on loyalty program engagement

Rewards in loyalty programs can stimulate customers' buying behaviour (Wu, Sun, & Yada, 2020). Chen et al. (2021) state that loyalty program buying behaviour can be explained through customers' buying frequency, the frequency of their retail visits, and repeat purchase percentage. Retailers can benefit significantly from understanding customers' buying behaviour in loyalty programs and how it can affect further engagement (Minnema, Bijmolt, & Non, 2017). Harmse (2019) confirms that loyalty programs can significantly affect how and when loyalty program members buy. Interestingly, a study by Liu, Ansari and Lee (2020) found that the loyalty status of customers influences their buying behaviour and that delayed rewards increase loyalty program engagement. Thus, the subsequent hypothesis is proposed:

H₃: Altered customer buying behaviour in loyalty programs has a significant, positive impact on loyalty program engagement by grocery retail customers.

4.1.4 The impact of information sharing buying behaviour on loyalty program engagement

According to Bruneau et al. (2018), information sharing regarding loyalty programs refers to customers spreading information about loyalty programs through various traditional or online mediums, contributing to loyalty program engagement. Liu and Jo (2020) found that customers who are genuinely dedicated to a loyalty program could become advocates for the loyalty program and the firm through positive word-of-mouth. Therefore, this could increase loyalty program engagement and ultimately engage with the loyalty program's brand. Furthermore, Dwivedi, Wilkie, Johnson and Weerawardena (2016) argue that some customers were found to create groups to share information regarding specific loyalty programs, reinforcing the socialisation of the brand and promoting loyalty program engagement. Against this background, the following hypothesis is put forward:

H₄: Information sharing about loyalty programs has a significant, positive impact on loyalty program engagement by grocery retail customers.

4.1.5 The impact of openness to information on loyalty program engagement

Customers who actively process loyalty program information from retailers, for example, by reading an email related to the loyalty program, suggest, according to Bruneau et al. (2018), that receptiveness to information also represents loyalty program engagement. Ruthven (2019) explains that openness to information points to an individual's willingness to act rather than provisionally preserving the information. Therefore, Heubner (2018) found that customers in a contemplative state of mind can become progressively more open to information that impacts the practicality of their conclusions and, considerably, more accurate in assessing their viewpoints to attain their objectives, thereby being mindful not to ignore information that can be helpful later. Therefore, the next hypothesis is put forward:

H₅: Openness for information has a significant, positive impact on loyalty program engagement by grocery retail customers.

4.1.6 The impact of active search for information on loyalty program engagement

Customers who are actively searching for information to ensure they are updated regarding information about a loyalty program are considered by Bruneau et al. (2018) to be actively engaged in the loyalty program. Hollebeek et al. (2020) claim that searching for loyalty program information involves, for example, visiting the loyalty program kiosk in the retailer, finding out about a particular promotion for loyalty program members online, or searching for information on a retailer's website to learn more about the loyalty program. Bruneau et al. (2018) also found that customers viewed the search for information about loyalty programs as more effortful and time-consuming. This is why customers engage less frequently in active pursuits for information on loyalty programs. As a result, the following hypothesis is suggested:

H₆: Openness for information has a significant, positive impact on loyalty program engagement by grocery retail customers.

4.2 The impact of loyalty program engagement on grocery retailer brand engagement

Retailers must offer customers shopping experiences that resonate with their value exchange needs, as it assists in driving customer brand engagement (Hollebeek, et al., 2014). Focusing on engaging loyalty programs could be one example of contributing to the customers' value exchange needs, thereby providing opportunities to enhance customers' engagement with the brand. According to Aluri, Price and McIntyre (2019), the central purpose of loyalty programs is increased customer brand engagement. Subsequently, the following hypothesis is suggested:

H₇: Loyalty program engagement has a significant, positive impact on customer brand engagement by grocery retail customers.

5. Methodology

5.1 Research design and method

The nature of the research design for the study was descriptive and quantitative. In the absence of a list of the population, a non-probability convenience sampling method was applied in the study to choose the respondents. A total of 299 grocery retail customers in South Africa completed the research instrument. The proposed sample size was deemed adequate based on Malhotra's (2020) recommendation of a minimum sample range of 200 to 450. Respondents had to be between 18 and 65 years old and have at least one grocery store loyalty program card at a South African grocery retailer that was used in the three months before the collection of data. Data collection was influenced by the South African government's Covid-19 restrictions and regulations at the time, which required using social media platforms (Facebook, WhatsApp and LinkedIn) for data collection purposes. Respondents accessed the self-administered questionnaire through a Google Form link on social media platforms, which ensured anonymity in the responses.

5.2 Research instrument

The self-administered questionnaire included an introduction to the study, the study's objectives, the respondents' rights (including informed consent) and the instructions to complete the questionnaire. The inclusion criteria, as explained above, were also included for confirmation. This paper forms part of a more extensive study on loyalty programs, which included additional constructs such as loyalty, satisfaction, and a green orientation to loyalty programs. The respondents' demographic information was obtained in section A of the questionnaire to align with the study's first objective. A five-point Likert scale, ranging from strongly disagree (1) to strongly agree (5), was used in the remainder of the questionnaire. All the measurement variables selected were proven to be valid and reliable. The items in section B, which focused on loyalty program engagement and the behavioural drivers thereof, as well as customer brand engagement, were measured by the scale of Bruneau et al. (2018). All scales were adjusted to represent the study's context. *Face validity* was attained by using the existing scales from the survey of Bruneau et al. (2018), which were proven to be valid and reliable. A pilot study was also done to confirm that the intended items were measured.

5.3 Data collection and analysis

The data collection stretched over five weeks, while reminders were regularly placed on social media platforms to encourage respondents to complete the questionnaire. In total, 299 respondents completed the survey. The cleaned data were entered into the statistical package IBM SPSS and AMOS version 26.0, which revealed that only 291 of the 299 collected questionnaires could be used due to incompleteness. IBM SPSS was used to analyse the research data and calculate the frequency and descriptive statistics, as well as Cronbach's alphas to measure data reliability and mean values of each construct and construct reliability.

6. Results and findings

6.1 Demographic profile and grocery retailer customer patronage practices

The respondents in the sample were 47.8 per cent male and 52.2 per cent female. Several respondents held an undergraduate degree (44.3 per cent), followed by those who completed matric (32 per cent). When completing the questionnaire, most respondents were full-time students (41.9 per cent), while 36.8 per cent were employed full-time. Most of the respondents were in the 18- to 28-year-old category (72.8 per cent), and the majority indicated their ethnicity to be African (58.8 per cent). Almost half of the sample stated that they purchased from grocery retailers "as needed" (49.5 per cent). Pick n Pay (54 per cent), Woolworths (18.9 per cent), and Checkers (18.6%) were the preferred grocery retailers to shop from where respondents used their loyalty program cards.

6.2 Descriptive statistics

This section presents information regarding the descriptive results of the investigated constructs in the study. Four statements' scores were reversed, namely "I wait for the cashier to ask for my card before presenting it to them", "I forget to take out my loyalty card when I make my purchases at this grocery store", "When I am disappointed by the loyalty program, I talk about it with my close friends and relatives", and "When I receive communication linked to the loyalty program (email, SMS, flyer etc.), I delete it or throw it away immediately".

6.2.1 Grocery store customers' loyalty program behavioural drivers

Table 1: Descriptive statistics for grocery store customers' loyalty program behavioural drivers

Item	Mean	Std. dev.
Proactively using a loyalty card	3.58	1.21
I present my loyalty card to the cashier when they ask for it	4.51	0.85
I wait for the cashier to ask for my card before presenting it to them	2.92	1.35
I present my loyalty card to the cashier, even when they don't ask for it	4.15	1.25
I forget to take out my loyalty card when I make my purchases at this grocery store	2.44	1.28
I spontaneously take out my loyalty card when I'm paying for my purchase	3.90	1.32
Point redemption	3.69	1.36
When I receive a reward to use with my next purchase, I make an effort to return to this store to benefit from it	3.59	1.37
I do what I need to do to redeem my loyalty points and receive my reward	3.96	1.29
When I reach a certain point threshold, I go specifically to this store to get my reward	3.52	1.43
Altered customer buying behaviour	3.54	1.28
I am ready to purchase other products than I have planned to get more advantages offered by the loyalty program	3.49	1.30
I am ready to purchase other brands that I have planned to get more advantages offered by the loyalty program	3.61	1.23
I am ready to buy more products to get more advantages offered by the loyalty program	3.52	1.30
Information sharing	3.50	1.35
When I am disappointed by the loyalty program, I talk about it with my close friends and relatives	3.31	1.48
If I am satisfied with the loyalty program, I recommend it to my close friends and relatives	3.88	1.24
I try to convince my close friends and relatives to become members of this loyalty program	3.33	1.33
Openness to information	3.18	1.27
When I receive communication linked to the loyalty program (email, SMS, flyer etc.), I delete it or throw it away immediately	2.96	1.28
When I receive communication linked to the loyalty program (email, SMS, flyer etc.), I open it immediately	3.11	1.26
When I receive communication linked to the loyalty program (email, SMS, flyer etc.), I take some time to read it	3.47	1.27
Active search for information	3.00	1.35
I look for information about the loyalty program (on the Internet or in-store)	2.94	1.40
I closely follow the accumulation of my loyalty points	3.05	1.31
I keep up with news concerning this loyalty program	2.95	1.33
In the store, I take the new magazines or leaflets with information about the loyalty program	2.89	1.45
I keep informed about the offers of this loyalty program	2.97	1.33
When I receive an offer as a loyalty program member, I am curious, and I look for more information	3.22	1.26

The highest average mean across the grocery store customers' loyalty program behavioural drivers is point redemption (3.69). If point redemption is so prominent for loyalty program members, the consequence from a grocery retailer perspective is that ease of point redemption lowers the possibility of switching behaviour and can create a customer lock-in effect (Alshurideh, Gasaymeh, Ahmed, Alzoubi, & Kurd, 2020), which contributes to the customer brand engagement and consequently drive the grocery retailer's business. The grocery store customers' behavioural driver with the lowest average mean was customers' active search for information (3.0). Although customers' active search for information appears to be the lowest driver of loyalty programs, Hauker and Fjellander (2019) indicate that a lack of actively searching for information about a brand or product might be a consequence of information overload. Their research found that information overload, regardless of

its context, has proven to be influential in three ways, namely a) choice overload, b) the interface design of technological products, and c) a potential source of passive loyalty – indicating customers who stay with a brand without being committed. This implies that grocery store retailers should consider designing loyalty program communication more strategically to relieve loyalty program information overload and to find innovative ways to excite their customers into wanting to know more about the loyalty program, thereby improving loyalty program engagement.

6.2.2 Loyalty program engagement

Table 2: Descriptive statistics for loyalty program engagement

Item	Mean	Std dev.
Loyalty program engagement	3.82	1.52
I would recommend this loyalty program to others	3.90	0.96
I have a strong preference for this loyalty program	3.76	1.03
I like this loyalty program more so than other loyalty programs	3.69	3.13
I intend to interact with this grocery store again during the next two weeks	3.95	0.97

The means related to loyalty program engagement ranged from 3.69 to 3.95, and the standard deviation was between 0.96 and 3.13. The standard deviation of the scale item, “I like this loyalty program more so than other loyalty programs”, indicated a standard deviation of 3.13. Therefore, this item was excluded from the data set. The scale item “I intend to interact with this grocery store again during the next two weeks” stands interestingly in contrast to the demographic question regarding respondents’ frequency of their grocery purchases, where almost half of the respondents indicate they buy merely ‘as needed’ from the grocery store. Then again, as per the definition of customer loyalty program engagement by Bruneau et al. (2018), the concept refers to customers’ behavioural drivers (manifestations) toward a company’s loyalty program *beyond the purchase*.

6.2.3 Customer brand engagement with the grocery retailer

Table 3: Descriptive statistics for customer brand engagement with the grocery retailer

Item	Mean	Std dev.
Customer brand engagement	3.40	1.14
I like to know more about the grocery store brand of this grocery store	3.60	1.03
I pay a lot of attention to anything related to the grocery store brand of this grocery store	3.53	1.15
I keep up to date with things related to the grocery store brand of this grocery store	3.30	1.16
I spend a lot of my discretionary time with this grocery store	3.29	1.24
I am passionate about the grocery store brand that runs this grocery store	3.27	1.12

The means for customer brand engagement with the grocery retailer ranged from 3.27 to 3.60, with the standard deviation ranging between 1.03 and 1.24. Respondents, therefore, revealed that they are engaged with the grocery retailers’ brands and are interested in becoming more engaged to acquire more information about their grocery retailers’ brands. Interestingly, this aligns with the result related to openness to brand information (one of the grocery store customers’ loyalty program behavioural drivers), with a mean of 3.18.

Tables 1 to 3 show that the constructs’ overall mean scores vary between 2.89 and 4.51. These scores are reasonably positive given the Likert scale (one representing “strongly disagree” and five “strongly agree”) that measured all constructs.

6.3 Confirmatory factor analysis

Confirmatory factor analysis commonly estimates the *convergent validity* of the measurement. In this study, convergent validity was established according to Fornell and Larcker’s (1981) and Malhotra, Nunan, and Birks’ (2017) guidelines. As indicated in Table 4, convergent validity was calculated by means of factor loadings and the average variance extracted (AVE), with a threshold of > 0.5

(Tabachnick, Fidell, & Ullman, 2007). Based on this threshold, the following items did not load onto the factors and were removed from the data set: PUC1, PUC5, PR2, CBE1, and CBE4.

Table 4: CFA – Factor loadings, AVE, CR and Cronbach Alpha

Items / Factor	Factor Loadings	AVE	CR	Cronbach's α
Proactively using a loyalty card.				
PUC2	0.790	0.569	0.798	0.679
PUC3	0.784			
PUC4	0.685			
Point redemption				
PR3	0.837	0.656	0.792	0.802
PR1	0.782			
Altered customer buying behaviour				
ABB2	0.812	0.625	0.833	0.830
ABB1	0.796			
ABB3	0.763			
Information search				
IS2	0.707	0.580	0.846	0.848
IS4	0.604			
IS3	0.504			
IS1	0.504			
Openness to information				
OI1	0.873	0.675	0.861	0.893
OI3	0.829			
OI2	0.759			
Loyalty program engagement				
LPE2	0.884	0.658	0.851	0.734
LPE1	0.870			
LPE4	0.661			
Customer brand engagement				
CBE2	0.838	0.560	0.790	0.808
CBE3	0.763			
CBE5	0.629			

The Cronbach Alpha reliability was used to assess the reliability of the factors which emerged from the factor analysis. Bougie and Sekaran (2019) put forward the following thresholds for the Cronbach Alpha values that deems a construct to be sufficiently reliable at 0.7, acceptable under 0.7, but weak below 0.6, and strongly reliable if the value exceeds 0.8.

Table 5 depicts the discriminant validity where the bolded values should exceed the correlation values (Malhotra, 2020). Fornell and Larcker's (1981) thresholds were used to demonstrate *discriminant validity* between the measurement constructs. Accordingly, the bolded values in Table 5 should exceed the reported correlation values.

Table 5: Component Correlation Matrix (Discriminant validity)

	PUC	PR	ABB	IS	OI	LPE	CBE
Proactively using a loyalty card	0.754						
Point redemption	0.328	0.810					
Altered customer buying behaviour	0.434	0.132	0.791				
Information sharing	0.153	0.362	0.426	0.761			
Openness to information	0.128	0.353	0.356	0.401	0.882		
Loyalty program engagement	0.226	0.278	0.391	0.482	0.068	0.811	

Customer brand engagement	0.120	0.245	0.513	0.533	0.340	0.485	0.748
---------------------------	-------	-------	-------	-------	-------	-------	--------------

The results in Tables 4 and 5 point out that the measures for reliability and validity were met and surpassed in this study.

6.4 Regression analysis and results

Multiple regression analyses included the six predictor variables (proactively using a loyalty card, point redemption, altered customer buying behaviour, information sharing, openness to information and active search for information). Hair, Page and Brunsveld (2019) suggest that using the coefficient p-values to select variables to be included in the final model is accepted practice. The initial coefficient p-values of the six predictor values were proactively using a loyalty card (PUC) $p = 0.000$, point redemption (PR) $p = 0.000$, altered customer buying behaviour (ABB) $p = 0.000$, information sharing (IS) $p = 0.000$, openness to information (OI) $p = 0.000$ and active search for information (SFI) $p = 0.000$. Subsequently, with all six predictor variables' p-values < 0.005 , the new model could include all six predictor variables (Malhotra, 2020). Therefore, for the new model, the six-loyalty program behavioural drivers of customers, namely proactively using a loyalty card, point redemption, altered customer buying behaviour, information sharing, openness to information, and active search for information, significantly predict loyalty program engagement. Similarly, the initial coefficient p-value of loyalty program engagement (LPE) $p = 0.000$ significantly predicts customer brand engagement.

The new model's regression results revealed that the model explained 48.5 per cent of the variance, and the model significantly predicts customer brand engagement, $F=169.76$, $p=0.000$. Furthermore, proactively using a loyalty card contributed second most to the new model ($\beta=0.244$; $p=0.000$), and point redemption contributed most of the independent variables to the new model ($\beta=0.608$; $p=0.000$). Similarly, although slightly less, altered customer buying behaviour also impacted the model ($\beta=0.233$; $p=0.000$), and so did information sharing ($\beta=0.212$; $p=0.000$). Openness to information (OI) contributed the least to the new model ($\beta=0.005$; $p=0.000$), while actively searching for information (SFI), although to a lesser extent, also impacted the model ($\beta=0.181$, $p=0.000$). Moreover, loyalty program engagement contributed significantly to the new model ($\beta=0.485$; $p=0.000$). Additionally, multicollinearity was not a concern (proactively using a loyalty card, Tolerance=0.87, VIF=1.04, point redemption, Tolerance=0.67, VIF=1.38, altered customer buying behaviour, Tolerance=0.75, VIF=1.27, information sharing, Tolerance=0.61, VIF=1.64, openness to information, Tolerance=1.00, VIF=1.00 and active search for information (SFI) Tolerance=0.72, VIF=1.39 and loyalty program engagement, Tolerance=1.00, VIF=1.00). Finally, as per Hair et al. (2014) (χ^2/df 1.982, TLI 0.929, CFI 0.943 and RMSEA 0.218), adequate model fit results were obtained. This confirms that the adjusted model supports the data (Malhotra, 2020). Therefore, to illustrate the analysis results, Figure 2 indicates the adjusted conceptual model.

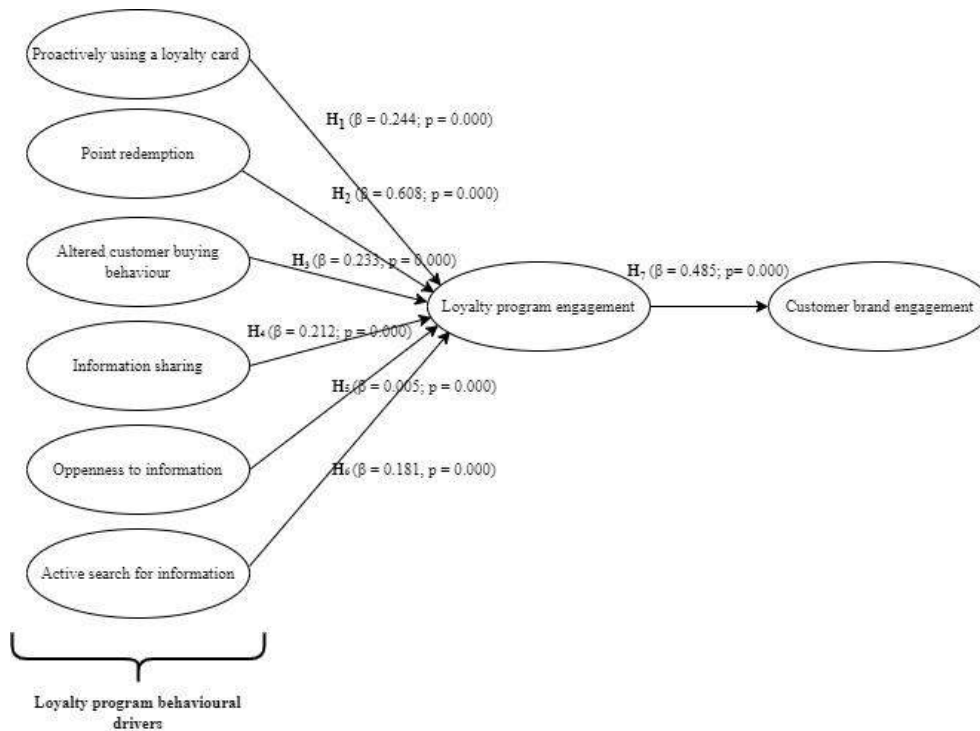

Figure 2: An adjusted conceptual model
Source: Own conceptualisation

Figure 2 indicates that point redemption is the most significant predictor of loyalty program engagement of grocery store retailers ($\beta = 0.608$; $p = 0.000$). This loyalty program behavioural dimension in the adjusted model is followed by Proactively using a loyalty card, having the second-largest influence on loyalty program engagement of customers of grocery store retailers. Loyalty program engagement is a significant predictor of customer brand engagement. Table 6 below points toward the results of the hypotheses testing.

Table 6: Hypotheses testing results

Hypothesis	Hypotheses testing result
H ₁ : Proactively using a loyalty program card has a significant, positive impact on loyalty program engagement by grocery retail customers.	Accepted
H ₂ : Point redemption in loyalty program programs has a significant, positive impact on loyalty program engagement by grocery retail customers.	Accepted
H ₃ : Altered customer buying behaviour in loyalty programs has a significant, positive impact on loyalty program engagement by grocery retail customers.	Accepted
H ₄ : Information sharing about loyalty programs has a significant, positive impact on loyalty program engagement by grocery retail customers.	Accepted
H ₅ : Openness for information has a significant, positive impact on loyalty program engagement by grocery retail customers.	Accepted
H ₆ : Openness for information has a significant, positive impact on loyalty program engagement by grocery retail customers.	Accepted
H ₇ : Loyalty program engagement has a significant, positive impact on customer brand engagement by grocery retail customers.	Accepted

7. Conclusion

This study investigated the drivers of grocery retail customers' engagement with a loyalty program and the grocery retailer brand. This study successfully addresses this aim and is aligned with previous customer brand engagement by applying the conceptualisation of loyalty program engagement as per Bruneau et al. (2018). Similarly, this study addresses loyalty program engagement to comprise various behavioural drivers which influence, specifically in this case, grocery retail customers' loyalty

program engagement. The study also expands the work of Bruneau et al. (2018) to reflect a different hierarchy of behavioural drivers, where the hierarchy is not entirely based on the different effort levels related to each driver. For example, in Bruneau et al.'s (2018) study, openness for information is second last in the hierarchy of effort in engaging with a loyalty program.

In contrast, in this study, it is the least significant behavioural driver of loyalty program engagement. However, the hierarchical order of the remaining behavioural drivers is the same as those suggested in the original study by Bruneau et al. (2018). This study also affirms that, as loyalty program engagement consists of various behaviours, loyalty program engagement has a significant and positive impact on customers' brand engagement with grocery retailers, which ultimately influences customer brand relationships (Brodie, et al., 2011). Furthermore, this study shows that traditional loyalty program measures, such as reading an email about the loyalty program or using the loyalty card (Raïes, Mühlbacher, & Gavard-Perret, 2015), when used in isolation, are not only insufficient to claim loyalty program engagement, but also to suggest customer brand engagement. Therefore, more involved, demanding behavioural drivers should also be included in a loyalty program engagement strategy to enable a deeper level of customer brand engagement in a balanced approach.

8. Managerial Implications

With almost all South African grocery retailers employing loyalty programs over the past few years, it is central for retailers to look beyond mere enrollments in their loyalty programs and shift their focus to loyalty program engagement. Failure to change to personalised contact after enrolment, not letting grocery retail customers know how the program works in simplistic ways and being explicit about the loyalty program's benefits will prevent grocery retailers from building genuine customer brand relationships.

In a big data world, grocery retailers are in a prime position to transform cold data about their customers into engaged relationships. Also, as Berry (2015) has pointed out, many firms still consider a loyalty program member as an engaged customer based on using the loyalty card and point redemption. However, Bruneau et al. (2018) warn against this misguided view of loyalty program usage and state that these limited efforts do not predict customer brand engagement. By monitoring a broader spectrum of customer behavioural drivers of loyalty program engagement, grocery retailers can, through their loyalty programs, induce higher levels of customer brand engagement. Ideally, as is evident from the hierarchical ordering of customers' behavioural drivers of loyalty program engagement, managers could take the bold step to identify engaged grocery retail customers to look at more demanding customer behavioural drivers to motivate customers to alter their grocery buying behaviour. In promoting such behaviours, managers could ensure closer loyalty program engagement, enhancing grocery customers' engagement with the grocery retailer brand.

Investigating Marketing Factors That Influence Customer Loyalty in the Sports Betting Industry

Prof Phineas Mbango^{1,*}, Costen Madoro²

^{1,2} University of South Africa, Pretoria, South Africa

Keywords

Customer loyalty, loyalty programmes, trust, effective complaints handling, customer, sports betting industry

Abstract

This study was motivated by the current lack of empirical evidence to prove the relationship between factors influencing customer loyalty in the sports betting industry. The researcher was interested in investigating customer loyalty factors (bookmaker trust, effective complaints handling, loyalty programmes, effective communication, and customer satisfaction) that might have led to the uneven distribution of the market share among bookmakers in Gauteng.

A quantitative research approach was employed and the convenience sampling method used for this study comprised respondents that were provided on a database by Osmoz Consulting. A total of 385 valid responses from participants aged between 18 to 65 were collected using an online questionnaire and all racial groups were included regardless of their gender. A descriptive and standard multiple regression directed on IBM Statistical Package for Social Sciences (SPSS) was used.

This study found that all the five factors have a significant positive influence on customer loyalty. However, trust and effective complaints handling were the main factors influencing customer loyalty. Bookmakers are encouraged to focus on improving trust and ensuring effective handling of complaints. Management in the sports betting industry should invest more effort in ensuring that complaints are effectively handled, and trust between bookmakers and bettors is greatly improved. This research was done in Gauteng only and this is the main limitation to this study.

1. Introduction

Sports betting in South Africa has grown to become the second most popular mode of gambling after casinos (Sangoco, 2019). Nienaber (2016) says that reasons for the growth of the sports betting industry in South Africa are unknown and therefore cannot be attributed to marketing since the legal environment is not in favour of advertising and/or promotion of any gambling activities. The Gambling Act (2004) effectively renders most of the common traditional marketing factors proved to be effective in other countries legally inapplicable in South Africa.

Nonetheless, betting companies must do their best to build long-term customer loyalty with this industry's already available nomadic customers (Kotler et al., 2017). Customer loyalty is critical in the betting industry, especially since there is limited capacity for product differentiation and very little price elasticity involved (Griffiths et al., 2017; Hing, 2014). Therefore, the need for betting companies to influence customers to consciously decide to be loyal to one bookmaker becomes essential (Ferreira et al., 2016). Consequently, customer loyalty has become the fulcrum of sports betting marketing in South Africa. However, available literature and previous studies on this subject do not relate to the South African context due to legal constraints (Hanss et al., 2015; Griffiths et al., 2017).

Several studies have indicated that customer loyalty is driven by customer satisfaction (which is itself a result of service quality), communication, loyalty programmes, organisational trust (credibility), among many other factors (Toyin and David, 2011; Ferreira et al., 2016; Kotler et al., 2017; Khadka and Maharjan, 2017). Therefore, it has become evident that research must be undertaken to investigate and ascertain whether these same drivers have the same influence on customer loyalty in the betting industry,

¹ E-mail address: mbangp@unisa.ac.za

particularly in South Africa; the extant literature is scant in this regard. The main objective of this study is to investigate marketing factors that influence customer loyalty within the sports betting industry.

Customer Loyalty in the sports betting industry

Wohl (2018) discovered that betting companies mistake gambling problems (addiction) as loyalty, making it difficult to separate loyal customers from problem gamblers. Nevertheless, a study conducted in Italy by Calsova (2016) concluded that only less than 18% of bettors are loyal to one particular bookmaker, with over 70% having unstable or polygamous loyalty to different bookmakers, and about 10% not showing loyalty to any bookmaker. However, the study did not investigate further the factors that drive loyalty in this industry, and this current study sought to close that gap.

2. Literature Review

2.1 Loyalty Programmes and customer loyalty

Loyalty programmes according to Sharp and Sharp (1997), are structured marketing efforts which reward, and therefore encourage loyalty behaviour. These programmes are also referred to as rewards to customers which are meant to encourage them to return to stores where they frequently make repurchases as well as to be loyal (Investopedia 2018). customer loyalty programmes are not easy to develop and manage but if they are properly managed, they play a great role when it comes to driving customer loyalty.

In his definition, Toporek, (2012) reiterated that loyalty programmes use the psychological principles of reciprocity, commitment and loss aversion to increase the likelihood of customer loyalty. However, when it comes to the gambling industry, researchers have been silent concerning loyalty programmes, probably because gambling loyalty programmes are believed to generate harm to vulnerable individuals (Wohl, 2018).

Due to limited product differentiation in the sports betting industry, loyalty programmes give organisations a competitive edge (Dhamdhere, 2019). Loyalty programmes are widely believed to increase customer spending since they give customers a boost in motivation that in turn makes them want to spend more (Krenzin, 2018). Most bookmakers have rewards programmes that encourage players to stick around and stay loyal to them, at least for as long as the loyalty programmes exist (Onlinebettingsites, 2019). Though every rewards programme is unique, the one thing they all share is that the more you bet, the more you get in return.

However, a study by Zakaria, Rahman, Othman, Yunus, Dzulkipli & Osman (2014) shows that in a competitive industry, customers can be loyal to more than one brand since loyalty programmes have become ubiquitous. Interestingly, Calvosa (2016) also wrote that there is a limited number of customers who are exclusively loyal to one betting company, hence, most of them adopt a multi-brand-loyalty behaviour.

Though loyalty programmes have proved to work in many industries as indicated by the above discussion, the same have not been tested in the sports betting industry in South Africa, and this study sort to close this gap.

2.2 Trust and Customer loyalty

Brand trust is defined as the willingness of the average consumer to rely on the ability of the brand to perform its stated function and has been shown to be a key contributor to brand equity and customer loyalty and it has become a subject of much discussion amongst business, academia and the media over the past decade (Sallam and Sefnedi, 2017). Today's consumers have more options than ever when it comes to choosing among a huge mix of hundreds of brands and thousands of products and services and in such a fiercely competitive environment, brand trust has become an important competitive differentiator (Bedgood, 2019). Orzan, Platon, Ștefănescu, and Orzan (2016:145) believe that "underlying loyalty is always trust". Furthermore, brand trust leads to customer loyalty because trust creates exchange relationships that are highly valued, therefore, in this respect, it is important for a bookmaker to focus on building and maintaining trust since it represents the basis for long-term customer relationship.

However, this view on brand trust has not yet been previously studied in the sports betting industry, hence the need for this study.

There is a robust relationship between brand trust and brand loyalty (Chinomona, 2016) Upamannyu, Gulati, Chac and Kaur (2015), also discovered that there is a strong relationship between customer trust and repurchase intention, even though the relationship is much stronger when corporate social responsibility is used as a moderator.

In agreement with the other studies, safestbettingsites.com, (2019) suggests that for bookmakers to be reputable, they should make sure that winnings are paid in time, bonus agreements and any other agreements must be honoured and when it comes to disputes, customers must feel fairly treated. Hence, to gain customers' trust, companies need to ensure that products and/or "services offered match or exceed customer expectations" (Mbango & Phiri, 2015:86)

In their 2018-2021 publication, The British Gambling Commission points out that trust and transparency are still the most prominent concerns in the gambling industry. Machin (2019) believes that being a trusted and regulated bookmaker is critical for customer loyalty in the gambling industry and customers view payments are a cornerstone to trusting a betting company.

This study views trust as a positive relationship between a bookmaker and a customer which is based on the customer's belief that the bookmaker is reliable on its ability to fulfil the promises it makes.

2.3 Service quality and customer loyalty

Service quality analysis makes an impact on the development of the customer loyalty concept therefore service quality can be regarded as one of the most frequently analysed customer loyalty determinants. Spacey (2017) defines service quality simply as a subjective value of service to customers which is driven by needs, expectations and/or perceptions. It is a multi-dimensional construct commonly based on customer judgements about service supplier and customer interactions and service itself and it is seen as the difference between customers' expectations and perceptions of service with the view of building a competitive advantage (Iddrisua, Noonib, Fiankoc, & Mensahd, 2015).

The Gambling Commission of UK (2017) noted that the way a bookmaker handles complaints in the sports betting industry forms the basis of how its service quality is viewed by customers and stakeholders. Therefore, effective complains handling has become the basis for measuring service quality in the sports betting industry. Hsiao, Chen, Choy, & Su, (2016) noted that complaining is one of the options available to customers to express their dissatisfaction. A complaint is when a customer brings a problem to the attention of the company and expects some redress (2015). (SBIF, 2009). More generally, a complaint is an expression of dissatisfaction communicated to an organisation in regard to its products and/or services (Carvajal, Ruzzi, Nogales and Moreno, 2011).

From the above discussion, it has been proved that effective customer complaints handling has an impact on customer loyalty. However, this assertion needed to be thoroughly investigated in light with the sports betting industry in South Africa since there is limited literature in this regard.

2.4 Effective Communication and customer loyalty

Effective communication is the most important part of customer service and the real secret to effective customer communication lies in the ability to gauge customer's expectations and then respond appropriately, especially in this age of digital communication, when organisations may not be able to meet customers face to face (Patel, 2020). Mbango & Mmatli (2019) defines effective communication as the customers' perception of the extent to which an organisation interacts with them in a warm and personal way. It is believed that effective communication tools bring about a sense of satisfaction and friendship (Muhamedi Ariffin, 2017).

Kotler et al (2017) suggest that a company must carefully integrate its many communication channels to deliver a clear, consistent, compelling and even personalised message about the organisation and its brands. All points of contact between the customer and the bookmaker's content about its brand must be identified and more effort should be directed towards delivering a positive consistent message at each contact with the aim of tying together all the bookmaker's messages and images and align them with customer preferences (Linton & Shoenberger, 2019).

2.5 Customer satisfaction and customer loyalty

According to Pratiwi, Hana, & Rosmawati, (2019), customer satisfaction is an emotional state of consumers/subscribers gained after comparing the performance of a product or service that has been purchased with their expectations. Customer satisfaction has also been defined as the level of emotional reactions from service experience, thus, satisfaction is based on direct past experience, (Darmawan, Mardikaningsih, & Hadi, 2017). Mbango, (2018), define customer satisfaction as a feeling of pleasure, fulfilment and desire towards a service rendered and it is also viewed as the level of post-purchase dissonance.

Customers feel satisfied when they have positive feelings towards the concerned service or product and such positive feelings are derived from meeting or exceeding their wants, demands and expectations. Therefore, customer satisfaction, as noted by Ananda & Devesh (2018) and supported by Nobar & Rostamzadeh (2018), is a result of service quality and customer expectations, among other influencing factors; and is a positive driver of customer loyalty (Gong & Yi, 2018).

Available evidence showed that there is a significant relationship between customer satisfaction and customer loyalty (Leninkumar, 2017). Customer loyalty is considered a result of customer satisfaction.

2.6 Problem statement

The growth in the regulated gambling market, both online and brick and mortar shops, is accompanied by a continuous increase in the level of competition globally and South Africa (Calsova, 2016; Gauteng Gambling Board, 2019). This growth has necessitated the need to build long-term loyalty with customers who are always moving from one bookmaker to another. The sports betting industry is very competitive, with over one hundred and twenty bookmakers registered in Gauteng alone, making the customer loyalty phenomenon critical (GGB, 2019). There is limited capacity for product differentiation and very little price elasticity involved in this industry (Griffiths et al., 2017; Hing, 2014). Therefore, the need for bookmakers to influence customers to consciously decide to continue betting with one particular bookmaker becomes essential. Consequently, customer loyalty has become the fulcrum of sports betting marketing in the country, given the gap between the market-share leaders and competitors. However, studies that investigate factors influencing customer loyalty in the sports betting industry in South Africa are scarce (Nienaber, 2016). Therefore, this study aims to investigate these factors in South Africa.

3. Research Objectives

Primary objective

The primary objective of this study was to determine the customer service factors that influence customer loyalty in the sports betting industry in Gauteng, South Africa.

Secondary objectives

In order to achieve the aim of the study, the following secondary objectives were formulated:

- To determine the influence of loyalty programmes on customer loyalty within the sports betting industry.
- To determine the influence of trust (credibility) on customer loyalty in the sports betting industry.
- To determine how service quality, with particular reference to complaints handling, influences customer loyalty within the sports betting industry.
- To determine the influence of effective communication on customer loyalty in the sports betting industry.
- To determine the influence of customer satisfaction on customer loyalty within the sports betting industry.
- To determine the main factors influencing customer loyalty in the sports betting industry.

4. Research methodology

Since this research intended to investigate factors influencing customer loyalty in the sports betting industry, the use of a quantitative approach was more appropriate as compared to qualitative approach because the research relied on hypothesis testing and the researcher needed not to do intelligent guesswork, but to follow clear guidelines and objectives (Lichtman, 2013:4; Wright et al., 2016). Above

all, the main factor that motivated the choice of this approach is it guaranteed respondents anonymity, which is important since most gamblers are not comfortable having their gambling information exposed.

The research was based entirely on the positivism philosophy, which gives rise to quantitative methodology (Mukherji and Albon, 2014).

4.1 Sampling method

Given the unknown number of sports bettors in Gauteng, a less desirable non-probability sampling method known as convenience sampling was applied when collecting data. The researcher drew samples from a database of bettors and an online questionnaire was sent to these respondents via emails resulting in 404 responses being collected.

This was the best option for the research, especially given that the researcher had access to the bettors' database. The bettors willing to participate in the research provided their responses through an online questionnaire.

A total of 404 responses collected for this study from a targeted 1200 bettors. However, only 385 responses that met the desired criteria were considered for further analysis.

5. Data Analysis and interpretation

5.1 Scales/Mapping

The researcher intended to investigate the influence of five constructs on customer loyalty in the sports betting industry in Gauteng: loyalty programmes (LP), effective complaints handling (ECH), trust (Tr), effective communication (EC), and customer satisfaction (CS). Table 4.1 below shows the constructs and the question number on the questionnaire.

Table 1: Study constructs and items used to measure them

Construct (Latent)	# Items (Observed)/Qn. Number
Loyalty Programmes [LP]	8, 9, 10
Effective Complaints Handling [ECH]	11, 12, 13
Trust [TR]	18, 19, 20
Effective Communication [EC]	25, 26, 27
Customer Satisfaction [CS]	33, 34, 35

5.2 Case screening

Data collected from participants were captured, recorded, and screened for errors and missing values before the analysis. The reason for case screening was to proactively check the data for potential errors that could have a negative impact on the analysis. This process involved excluding cases that had missing values for item scale measures during the data collection process. Case screening also involved excluding those cases that did not qualify to be part of the final results and identifying cases where respondents did not engage with the questionnaire.

A total of 404 responses were collected for the study through an online questionnaire administered via emails.

5.3 Gender composition

Table 2 below shows the gender distribution of respondents in this study. Based on the findings of this study, 59.9% of the sports betting customers who participated in this research are male, 33.2% are female, and 6.8% preferred not to disclose their gender.

Table 2: respondents gender distribution

Q5. Please indicate your gender.					
		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Female	127	33.0	33.2	33.2
	Male	229	59.5	59.9	93.2
	Prefer not to say	26	6.8	6.8	100.0
	Total	382	99.2	100.0	
Missing	System	3	0.8		
Total		385	100.0		

5.4 Age

Out of the sampled respondents 40.2% bettors were between the age of 31 and 40 years. The least contribution was from the ages between 18- and 20-years old, who only constituted 1.8%. Bettors between the ages of 41 and 50 made 30%. Below is the age distribution of the respondents whose responses were considered for further analysis in this current study.

Most of the bettors who took part in this study had matric as their highest academic qualification (43.3%). The least contribution came from bettors who had a degree as their highest qualification (99.2%).

5.5 Frequency of bookmakers

Most of the bettors (33.2%) place their bets with more than three bookmakers. About 32.4% place bets with exactly three bookmakers. Only a smaller percentage (5.7%) place bets with only one bookmaker, and 28.7% bet with exactly two bookmakers.

5.6 Favourite online bookmaker

Hollywoodbets is the favourite bookmaker amongst online bettors, with 46.6% of the bettors indicating that they place their online bets with this bookmaker. Supabets Gaming Group is the second favourite, with 24.4%, followed by Betway, with 22.6%. Topbet, which represented other bookmakers, has fewer bettors betting online with them (6.3%).

5.7 Favourite physical bookmaker

Supabets was the popular physical bookmaker among bettors in Gauteng, with 56.8% indicating that they place their physical bets with this bookie. Topbet, which represented other bookmakers, was the second favourite, scoring 31% of the total valid responses. Hollywoodbets and Betway were least preferred by bettors for physical betting.

6. Factors influencing Customer Loyalty in the sports betting Industry

The factors influencing customer loyalty (CL) in the sports betting industry were categorised into five: LP, ECH, trust (Tr), EC and CS.

Questions 8, 9, and 10 were intended to establish the relationship between LP and CL. The questions were designed to suit the CLI method of establishing the level of CL (Section 2.4.5.). Questions 11, 12, and 13 were designed to establish the relationship between ECH and CL. A similar format to the one for LP was also used for this construct and all other constructs under study. While questions 18 to 20 were intended to determine the relationship between trust (Tr) and CL, questions 25 to 27 were intended to establish the relationship between CL and EC. The relationship between CS and CL was measured from questions 33 to 35.

6.1 Corelation.

Table 3: Construct Correlation Matrix

		Correlations ^c					
		LP	ECH	TR	EC	CS	CL
LP	Pearson Correlation	--					
ECH	Pearson Correlation	.108*	--				
	Sig. (2-tailed)	0.034					
TR	Pearson Correlation	-0.089	.278**	--			
	Sig. (2-tailed)	0.082	0.000				
EC	Pearson Correlation	.404**	-.143**	0.035	--		
	Sig. (2-tailed)	0.000	0.005	0.494			
CS	Pearson Correlation	-0.021	.132**	.446**	.150**	--	
	Sig. (2-tailed)	0.686	0.009	0.000	0.003		
CL	Pearson Correlation	.538**	.443**	.550**	.592**	.621**	--
	Sig. (2-tailed)	0.000	0.000	0.000	0.000	0.000	

*. Correlation is significant at the 0.05 level (2-tailed).
 **. Correlation is significant at the 0.01 level (2-tailed).
 c. Listwise N=385

Table 3 above indicates that CL and the marketing factors under study (LP, ECH, trust, EC and CS) are positively correlated. The strength of the relationship is robust at 96.1%, which means that LP, ECH, trust, EC and CS explain up to 96.1% of the variance of CL.

Table 4 below shows the unstandardised factor loadings, which are also interpreted as unstandardised regression coefficients. Also indicated in the same table are standardised factor loadings interpreted as correlations between the item and its factors. All tolerance values are > .70, and this is also good evidence for convergent validity.

Table 4. Regression Coefficients
Coefficients^a

Model		Unstandardized B	Coefficients Std. Error	Standardised Coefficients Beta	t	Sig.	95% Confidence interval for B		Collinearity Statistics	
							Lower Bound	Upper Bound	Tolerance	VIF
1	(Constant)	.076	.060		1.271	.205	-.042	.193		
	LPx	.235	.009	.296	25.776	.000	.216	.252	.781	1.280
	ECHx	.372	.010	.422	38.322	.000	.353	.391	.851	1.175
	TRx	.430	.011	.453	38.339	.000	.408	.408	.738	1.355
	ECx	.160	.008	.234	20.139	.000	.142	.145	.763	1.310
	CSx	.243	.009	.323	28.116	.000	.226	.226	.780	1.282

a. Dependent Variable: CL

The results in Table 5 below show that the model predicting CL is statistically significant. The $R^2 = 0.961$ suggesting that these predictors (LP, trust, CS, EC and ECH) explain up to 96.1% of the variance of CL.

Table 5. Model summary

Model Summary ^b				
Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.980 ^a	.961	.960	.13053

a. Predictors: (Constant), CSx, LPx, ECHx, ECx, TRx

b. Dependent Variable: CL

Table 6 below shows the model fit indices obtained for this research. Some of the common model fit indices from table 6 were then measured against the thresholds proposed by Hair et al (2014). The results prove that the model fits the data and can be adopted to represent the factors influencing CL in the sports betting industry.

Table 6. Model fit indices

CMIN	314.38	
df	89	
P-value	0.000	
CMIN/df	3.532	<0.5
GFI	0.90	>0.9
AGFI	0.87	
NFI	0.87	
TLI	0.88	
CFI	0.90	>0.9
RMSEA	0.081	<0.08
PCLOSE	0.000	
SRMR	0.125	
AIC	376.4	
BIC	498.9	

The researcher confirms that the overall model Chi-Square (X²) at 314.38 with 89 degrees of freedom is correct. The p-value associated with this result is 0.000. This p-value is significant using a type I error rate of .05. The value for Root mean square error of approximation (RMSEA), is 0.081 which indicates a moderate fit index. This value appears quite fine though it is slightly above the .08 guideline for a model with 15 measured variables and a sample size of 385.

In addition, the standardised root mean square residual (SRMR) with a value of .125, way above the conservative cut-off value of .05, also provides the necessary support for model fit. Furthermore, both GFI (goodness of fit Index) and CFI (comparative fit index) values were 0.9 which was not bad at all given that they are equal to the minimum acceptable value. Therefore, the above values show a moderately fit model for the research.

The indicators in this study were caused by more than one factor and the error items were assumed to correlate and this resulted with a multi-dimensional model being considered for this research. Theoretically, when working with latent variables and reflective scores, constructing a CFA is ideal to assess if the data fit the proposed model. Below on figure 4. is a confirmed model for this research showing reflective scores for the factors under study. This model is relatively fit as proved by the statistical explanation above.

Figure 1: Sports Betting Confirmed CL Model

7. CONCLUSIONS AND RECOMMENDATIONS

7.1 Loyalty programmes

LP are structured marketing efforts that reward and encourage loyalty behaviour. These programmes are also referred to as rewards to encourage customers to return to bookmakers who they frequently place bets with. Chen (2019) and Schofield (2019) agree that although LP have several goals, which include to

increase business and sales, the main aim is to strengthen the relationship between the customer and the bookmaker so that customers keep coming back regularly.

Owing to limited product differentiation in the sports betting industry, LP is believed to give bookmakers a competitive edge (Dhamdhare, 2019). Most bookmakers have rewards programmes that encourage players to stick around and stay loyal to them, at least for as long as the LP exists (Onlinebettingsites, 2019). Although every rewards programme is unique, the one thing they all share is that the more you bet, the more you get in return.

Findings on LP indicate that most respondents are impartial about the influence of LP. Though LP has proved to play a significant role in influencing CL in other industries, the influence it has on CL in the sports betting industry is small as denoted by the standardised coefficient of 0.296, which was less than the acceptable cut of 0.300. However, the effect size can extend to medium if rounded off to 1 decimal place.

The findings from this study show that although LP influences customers loyalty, the effect is small in the sports betting industry as compared to other industries. Therefore, from these findings, it is concluded that LP only accounts for up to 29.6% of the changes in CL. Bettors do consider LP when deciding to be loyal to a bookmaker even though the effect is small.

7.2 LP recommendations

In every competitive industry, as proved by Zakaria et al. (2014), customers can be loyal to more than one brand since LPs have become ubiquitous. CL programmes appear less efficacious in achieving CL due to the multi-brand-loyalty in the sports betting industry. The mere focus by bookmakers on increasing the sensitivity to external rewards by bettors may result in a lack of emotional bonds with the bookmaker, which is much needed for CL to exist. While LPs improve customer relationships, they also lead customers to expect extraordinary efforts from companies as an entitlement.

The research findings show that there is a limited number of customers who are exclusively loyal to (place bets with) one betting company; hence, most of them adopt a multi-brand-loyalty behaviour. However, this can be countered by bookmakers thriving to create LPs that are unique and distinguishable such as percentage payback on losing bets. Modern LP must not just award points but must go beyond and appeal to bettors' need for deeper engagement and personalised experiences.

Furthermore, for LPs to be effective, they have to be tied to the brand's core values and then looped around what the bettor is looking for, not what the bookmaker thinks about the bettor's experience. Since this research shows that LPs have a small influence on CL in the sports betting industry in Gauteng, bookmakers can rather use them as a way of buying repeat purchases. However, the number of bettors who chose to remain neutral on loyalty programme statements (questions) prove that bettors have limited information about LP and how bettors can benefit from these programmes. EC on LP can assist bettors in understanding LP that are offered by bookmakers, and it is only then when bettors can understand the LP and their benefits.

8. Trust

Bookmaker trust is the willingness of the average bettor to rely on the ability of the bookmaker to perform its stated function. This study asserts that trust is the most critical, strategic, and enduring intangible asset that a bookmaker can possess. The findings of this research concur with The British Gambling Commission's findings in their 2018–2021 publication, which points out that trust and transparency are still the most prominent concerns in the gambling industry and that bettors view winnings payments as a cornerstone to trusting a bookmaker.

Trust is a key contributor to brand equity and CL. Owing to the competitive environment in which bookmakers in Gauteng are operating, sports bettors now have more options than ever when choosing among hundreds of bookmakers.

This study found that trust has the greatest influence on CL in the sports betting industry.

The current study concurs with the literature on the influence of trust on CL. The findings reveal that most bettors agree that trust influences their decision to be loyal to a bookmaker. Based on these findings, it can then be concluded that bookmaker trust influences the bettors' decision to place their next bets with a bookmaker they trust. Bettors may also recommend that bookmaker to friends and family and try other betting games offered by the same bookmaker they trust. According to the findings of this research, trust contributes up to 45.3% of the variance in CL in the sports betting industry in Gauteng.

8.1 Recommendations on trust

Bookmakers need to focus on building and maintaining trust since it represents the basis for long-term CL. If trust exists between the bettors and the bookmaker, the effort to foster cooperative relationships will be easier. Breakdowns in trust occur when the actions of a bookmaker differ from the promises and values communicated by them to the bettors. A bookmaker needs to deliver what it has promised. The bookmaker should show that it is indeed capable of delivering those promises because failing to build trust undermines CL and can damage a bookmaker's revenue.

Although a traditional bookmaker's trust is still important, trust in the online promise can be a potent force. Online reviews have a direct impact on the bookmaker's reputation. The ability to build bookmaker trust through reviews from trusted sources is simply another good way to gain trust from potential and existing bettors.

Bettors are in it for the money, as shown in the findings above. Therefore, it is for this notion that bookmakers are recommended to ensure that winnings are paid in time and that bettors have many withdrawal options at their disposal. Bonus agreements and any other agreements must be honoured. Regarding disputes, customers must feel fairly treated for a bookmaker to earn trust from bettors. The extent of the bettors' trust to a bookmaker builds true loyalty, which, in turn, will make competitive offers, convenience, and the promise of "something better" matter less because most bettors' connection to the bookmaker will be based on how much they trust the bookmaker.

9. Effective complaints handling

Complaining is one of the options available to customers to express their dissatisfaction. A complaint is when a bettor brings a problem to the bookmaker's attention and expects some redress. More generally, a complaint is an expression of dissatisfaction communicated by bettors to a bookmaker regarding the bookmaker's products and/or services. Therefore, complaints handling is the procedures and actions of bookmakers to address bettors' complaints and recover dissatisfied bettors. Recent studies in the banking sector have proved that ECH improves CL (Carvajal et al., 2011; Salim et al., 2018). Ineffective complaints handling often leads to bettors' defection if the bookmaker does not take steps to provide an efficient solution to the particulars of the grievance. However, if bookmakers effectively handle bettors' complaints in, say, less than 5 minutes, those bettors go on to become loyal customers. It was established that areas of complaints in the sports betting industry are mainly to do with suspended accounts or funds, documents (FICA), unfair games, software/connection faults, bonus complaints/abuse, terms and conditions, gambling limits/losses and cancelled bets, among others (Gibraltar, 2019).

Findings from this research agree with the literature on ECH. It was this study's finding that ECH is the second greatest influencer of CL in the sports betting industry, as shown by the average mean of 4.38 and standard deviation of 0.744.

It is revealed through these findings as indicated on table 4 (regression Coefficient), that ECH accounts for up to 42.2% of the variance in CL.

According to this research, one can conclude that ECH is the second largest influencer of CL (after bookmaker trust) in the sports betting industry in Gauteng. This variable had the highest overall mean compared to the other four factors under study, meaning that most bettors consider ECH as their number one influencer when deciding to be loyal to a bookmaker.

9.1 Recommendations on effective complaints handling

Understanding customers' complaints requires a continuous assessment of negative feedback and criticism from them. It is believed that complainers are the heaviest users of a service/product (Crie and

Ladwein 2002). Therefore, it is recommended that bookmakers pay attention to ECH practices to make the complainants more trustworthy and loyal than before.

To understand bettors' complaints, bookmakers should continuously assess negative feedback and criticism from bettors and not just carry out sophisticated computerised analysis but should also contact dissatisfied bettors directly to ascertain their grouse against the bookmaker. In this era of WhatsApp groups, a bookmaker should monitor conversations amongst bettors in open groups created by the bookmaker. A bookmaker can lead certain conversations in those groups to get feedback from bettors on certain matters.

By setting up complaints/queries desk in every physical shop to cater for physical bettors, bookmakers can reap the benefits of ECH since complaints are related to satisfaction, and when correctly handled often lead to CL. Similar, desks can be set up in selected busy malls as a backup to the call centre support team to cater for online bettors who have limited access to the physical shops.

Bookmakers should ensure that their complaints handling procedure is well articulated and made accessible to bettors. They should encourage complaints from dissatisfied customers - research shows that complaint resolution enhances CL

Below is a suggested complaints model that bookmakers in Gauteng can adopt to ensure that they deal effectively with customer complaints to improve CL. The model suggests the setting up of complaints handling office at the bookmaker's head office to deal with complaints coming from disgruntled bettors. Bettors can bring in their complaints through the complaints handling agents stationed at physical shops and malls around Gauteng. Bettors can also be given an option to directly call, WhatsApp or email the Head Office Complains handling office for quick redress.

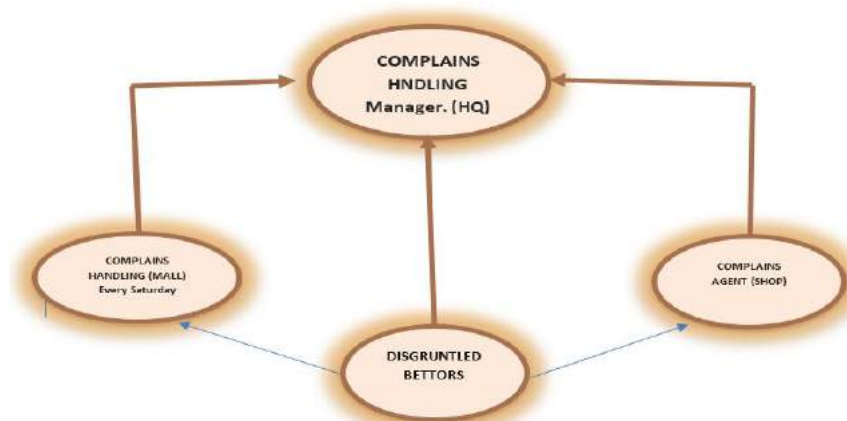

Figure 6.1: Bettors complains handling model. Source: researcher's own creation.

10. Effective Communication

EC is the most important part of customer service, and the real secret to EC lies in the ability to gauge bettor's expectations and then respond appropriately, especially in this age of digital communication, when bookmakers may not be able to meet customers face-to-face (Patel, 2020). Mbango and Mmatli (2019) defines EC as the customers' perception of the extent to which an organisation interacts with them in a warm and personal way.

Though quality service and better odds prove that bookmakers care for their customers, what matters to these customers is how bookmakers demonstrate it through ongoing attentiveness and creativity in the quality of communication (Doucette 2017).

The findings of this research show that even though EC has a statistical significance on CL, its practical influence on CL is small (**beta** value = 0.234 and **p** = 0.000).

The results of this research support the literature on the influence of EC on CL. However, the influence that EC has on CL is very small in the betting industry as compared to other industries. These current

findings show that EC accounts for only 23.4% of the variance in CL in the sports betting industry. Less than 40% of the bettors who participated in this research agreed with all statements on EC. For instance, only a total of 37.1% of the bettors agreed and strongly agreed that they would recommend to their friends and family a bookmaker that has EC channels.

Based on the findings, one can conclude that EC is not seriously considered by both bookmakers and bettors in the sports betting industry.

10.1 Recommendations on EC

A bookmaker must carefully integrate its many communication channels to deliver a clear, consistent, compelling and even personalised message to its bettors. All points of contact between the bettor and the bookmaker's content about its brand must be identified, and more effort should be directed towards delivering a positive, consistent message at each contact to tie together all the bookmaker's messages and images and align them with bettor preferences.

Instead of being their judge of the effectiveness of communication, bookmakers should rely on responses from bettors. Hence, bookmakers need to keep their ear on the ground to get responses on their communication.

Sports betting is inherently time-sensitive, and therefore EC about sporting events should be sent out in time to the right people with speed and accuracy. Putting up fixtures big matches a week before can go a long way as EC.

The use of live engagement tools for real-time support assistance with live assistance tools such as video chats, co-browsing, and live chats should be implemented by bookmakers to ensure EC.

To improve the effectiveness of their communication, bookmakers must aim to reduce waiting time and avoid scripted conversations when offering real-time support. Avoiding jargon when communicating with bettors is essential and ensures that there is no misunderstanding of the message being communicated.

Bookmakers are encouraged to collect bettors' feedback and monitor social conversations both online and offline to understand bettors preferred social channels and actively engage them on those channels. Through this strategy, social media may be used to announce new product releases, bookmaker news, content updates, and events. This will improve the effectiveness of communication, which will eventually lead to CL.

11. Customer satisfaction

CS in the sports betting industry is an emotional state of bettors, based on direct experience gained after comparing the performance of the bookmaker's services with their expectations. Mbango (2018) define CS as a feeling of pleasure, fulfilment, and desire towards a service rendered, and it is also viewed as the level of post-purchase dissonance.

A review of literature showed a significant relationship between CS and CL. Many authors have advocated that CS is one of the determinates of CL, especially in the service industry (Belás and Gabčová, 2016; Coelho and Henseler, 2012). Furthermore, it can be assumed that the relationship between CS and CL is nonlinear. Suggestions pointed out the importance to organisations to increase CS if they want to sustain the level of CL (Fida et al., 2020).

Findings from this study concur with the literature and previous findings on the relationship between CS and CL. Most bettors agree that they will be loyal to a bookmaker that they are satisfied with. This was shown by the overall mean of 3.97 (which was well above the 3.5 minimum value) and a standard deviation of 0.874.

Results from this current study indicate that CS has a medium influence on CL in the sports betting industry (**beta** = 0.323 and **p-value** = 0.000). This shows that CS causes 32.3% of the variance in CL. This is a practically significant change that bookmakers should not take for granted.

11.1 Recommendations on CS

If a bookmaker wants to attract new bettors, it is recommended that its primary focus should be on CS, as this will significantly affect bettor recommendations to friends. Bookmakers are advised to draw knowledge from banks and bear the data cost that bettors incur in betting, in addition to a quick and prompt pay-out facility. Some of the bookmakers in Gauteng now do have a data-free application that bettors can use when placing bets. However, most of these data sites have limited access to some of the betting options.

Bookmakers are also recommended to place their focus on customer experience, especially on newly acquired bettors. Helping the bettors get started can go a long way in satisfying them. Taking a newly signed-up bettor through their first bet can give the bettor much satisfaction that is required to build CL.

Practice credits can also be issued to new bettors so that they can learn how to bet on different games while getting used to the bookmaker's betting system. To improve bettors' experience, bookmakers should ensure that their website's layout is user-friendly to their customers. Complex sites are always avoided by bettors, especially given that majority of them have only matric as their highest academic qualification. It was discovered during this research that Hollywoodbets has the most preferred website layout on sports games, and it might be the reason why they are leading the online market with such a big gap

Bookmakers have to acknowledge that every bettor needs to experience victory at some point. A long losing run can make a bettor leave, especially if the bettor feels that the bookmaker only exists to take their money. With this in mind, the bookmaker should try and increase CS by helping the customers to win some of their bets by offering information such as sports betting tips, statistics, and predictive analysis.

However, so many bookmakers do an excellent job of customer acquisition, and then the customer is ignored while the bookmaker chases more new customers. Even after investing enormous amounts of time and cash to get new customers on board, few bookmakers take the time to evaluate why so many leave them. They are trapped in an eternal cycle of replacing the customers they are losing, hindering true growth brought about by satisfying existing customers. CS should be considered as one of the top priorities by bookmakers if CL in the sports betting industry is to be achieved.

11.2 Main factors influencing CL in the sports betting industry

The study discovered that the main influencing factors on CL in the sports betting industry in Gauteng are trust (mean = 4.22, std. dev. = 0.691, beta(β) value = 0.453 and p-value = 0.000) and ECH (mean = 4.38, std. dev. = 0.744, beta (β) value, 0.422 and p-value = 0.000) as compared to the rest of the factors.

Based on the results above, one can conclude that all the marketing factors in this study (LP, ECH, EC, trust and CS) have a significant effect on CL. According to the bettors who participated in this research, the major influential CL drivers in the sports betting industry are trust and ECH.

The findings of this study point to the importance of bookmaker trust and ECH in the sports betting industry. It is therefore recommended that bookmakers pay more attention on these factors if they are to improve CL. Detailed recommendations on these factors was done above under Conclusions and Recommendations section.

Young People's Perceptions of the Road Safety Aspects in Developing Countries: A South African Perspective

Rose Luke^{1,*} Gert Heyns²

^{1,2} University of Johannesburg, Johannesburg, South Africa

Keywords

Road safety, transport security, developing country, public transport, South Africa

Abstract

Background: South Africa's road crash fatality rate is amongst the highest in the world. Although almost 50 per cent of fatal crashes involve motor cars previous research amongst university students (Luke, 2016) showed that there is a strong perception that private cars are safer than public transport. This perception is fuelled not only by the possibility of being involved in a crash but also by safety from crime in both the vehicle and waiting areas, which is a key consideration in making modal choices in South Africa.

Purpose: To consider the modal shift from private to public transport, it is important to understand reasons for safety concerns amongst various modes, thus highlighting specific areas for intervention. This research seeks to investigate the various safety factors that are taken into consideration in modal choice, as well as the extent to which they manifest across various modes of transport. The purpose of this paper is to investigate young people's perceptions of safety aspects associated with public and private transport options.

Method: To obtain the empirical data for the research, a quantitative research design was employed. A self-administered online questionnaire was used to collect the research data. Research data were gathered from two non-probability sampling surveys conducted in the Johannesburg area in 2019 and 2020, providing responses from 702 and 630 young people respectively.

Results: The study found that, for the more common forms of public transport, safety levels were generally considered to be poor to very poor. Issues that were highlighted include the likelihood of being in an accident, staff training, and safety measures against crime, both inside the vehicles as well as in waiting areas.

Conclusion: The findings consider specific aspects that young people perceive as problematic in public transport service provision, as well as the improvements that could be made to, firstly, attract them to public transport and, secondly, curb intentions toward car ownership. This provides an indication to service providers of priority areas for safety interventions.

1. Background

According to the World Health Organisation (WHO) (2018), South Africa had an estimated fatality rate of 25.9 per 100 000 population in 2016, translating to a rate of approximately 14 507 people. Using 2015 figures, the total cost of road traffic crashes amounted to approximately R142.95 billion, equating to 3.4 per cent of gross domestic product (GDP) (Labuschagne, et al., 2016). Without specific intervention and, given the general annual increase in vehicle registrations of approximately 2 percent (eNatis, 2019; eNatis, 2018), it is likely that this rate continues unabated.

The South African White Paper on National Transport Policy vision for transport in the country is to "Provide safe, reliable, effective, efficient, and fully integrated transport operations and infrastructure

*Corresponding Author

¹ E-mail address: rluke@uj.ac.za

² E-mail address: gjheyns@uj.ac.za

which will best meet the needs of freight and passenger customers at improving levels of service and cost in a fashion which supports government strategies for economic and social development whilst being environmentally and economically sustainable" (Department of Transport, 1996, p. 3). The new Draft Revised White Paper on National Transport Policy (2017, p. 1) extends the vision of providing safe transport to "Furthermore, for the users of transport, the supply should be: ... safe and secure." This extension suggests that there is an acknowledgement in policy that transport in the country requires a focus on safety, but also that personal safety (security) also warrants attention. This is further illustrated by the recognition in this document that "The safety, security, and quality of service of some modes of transport are currently below acceptable levels. The Government is committed to a concentrated and integrated effort to bring them into line with international best practice. Particular attention will be paid to road and rail safety" (Department of Transport, 2017, p. 3).

Despite recognition of safety and security as policy objectives, safety remains critical. According to StatsSA (2018) transport accidents accounted for approximately 12.5 per cent of deaths from non-natural causes. The World Health Organisation (WHO) (2018) estimated South Africa's fatality rate as 25.9 per 100 000 population; an estimated 14 500 people. Based on 2015 figures, the total cost of road traffic crashes amounted to approximately R142.95 billion (approximately €9 billion, as at January 2020), equating to 3.4 per cent of gross domestic product (GDP) (Labuschagne, et al., 2016). Without specific intervention and, given the general annual increase in live vehicle registrations of approximately 2 per cent in the last year (eNatis, 2019; eNatis, 2018), it is likely that the crash rate will continue at similar levels. Although almost 50 per cent of fatal crashes involve motor cars (Road Traffic Management Corporation, 2018), and public transport modes such as minibus taxis and buses account for only 9 per cent and 1 per cent respectively, previous research (Luke, 2016) showed that there is a strong perception that private cars are safer than public transport. This perception is fuelled not only by the possibility of being involved in a crash, but also safety from crime in both the vehicle and waiting areas, which is a key consideration in making modal choices in South Africa.

The latter is not only recognised Draft Revised White Paper on National Transport Policy 2017, as outlined above, but also in provincial and national household travel surveys. In the National Household Travel Survey (StatsSA, 2013), 8.7 per cent of respondents indicated that safety from accidents was their biggest determinant of modal choice. A further 2.4 per cent cited security from crime as their main reason. Although slightly lower, the latest National Household Travel Survey (StatsSA, 2021), shows that 4.5 per cent of respondents indicate safety and security as the main influencing factor of modal choice. When asked about dissatisfaction regarding specific modes, Table 1 refers to the safety and security issues highlighted by the National Household Travel Surveys in 2013 and 2020, respectively.

Table 1: Dissatisfaction with safety and security, by mode

MODE	TAXI		BUS		TRAIN	
	2013	2020	2013	2020	2013	2020
Security on walk to / from mode	38.4	33.3	35.0	31.6	56.6	70.6
Security at rank or station	37.9	29.9	35.6	34.6	32.3	57.7
Security on mode	33.8	22.6	29.3	22.5	47.4	65.3
Safety from accidents	45.8	36.5	27.7	21.8	29.4	39.1

Source: compiled for the purposes of this study from the National Household Travel Survey (StatsSA, 2013; StatsSA, 2021)

Table 1 provides a clear indication that safety and security are major concerns for commuters. Security is an issue in all modes of transport, but of far greater concern to train users. Safety from accidents is of particular concern to minibus taxi users. A later household travel survey for Gauteng, the province where the country's economic hub, Johannesburg, is located, reflects very similar results (Gauteng Province Roads and Transport, 2014; StatsSA, 2021)). Table 2 depicts the safety and security concerns for commuters in Gauteng.

Table 2: Dissatisfaction with safety and security, by mode (within Gauteng, 2020)

MODE	TAXI	BUS	TRAIN
Security on walk to / from mode	37.0	29.1	70.2
Security at rank or station	33.7	33.7	60.5
Security on mode	26.8	18.1	67.6
Safety from accidents	48.9	17.6	39.0

Source: compiled for the purposes of this study from the National Household Travel Survey (StatsSA, 2021)

It is however noted that crime is reported generically for all bus services. In practice, there are very clear differences between various bus services. In Johannesburg, PUTCO historically caters for low-income commuters, who tend to be socio-economically disadvantaged, generally travelling from outlying areas into economic centres, whilst Metrobus caters for low- to middle-income commuters within the city. Rea Vaya is a bus rapid transit system that caters to commuters in both outlying areas as well as city commuters. It is thus expected that the generic term, bus, would not adequately describe the safety and security concerns of commuters on the various forms of bus services in the country.

There is however no newer comprehensive research on safety and security in public transport in South Africa, although crash statistics are reported on regularly. This reporting is the responsibility of the Road Traffic Management Corporation, of which the last comprehensive report is the State of Road Safety Report (Road Traffic Management Corporation, 2017). A recent analysis of the type of vehicle involved in fatal crashes compared to the proportion of the total vehicle population, indicated that heavy passenger motor vehicles (12 or more persons) are responsible for 9.6% of speed infringements, while only representing 2.5% of the vehicle population (Road Traffic Management Corporation, 2021). It is concerning that Toyota Quantum and HiAce vehicles, the most widely used minibus taxi vehicles, are involved in 15.1 per cent of fatal crashes, although they constitute only 7.9 per cent of the total vehicle population (Road Traffic Management Corporation, 2021).

Although crime is reported on more regularly (Crimestats, 2019), it is difficult to determine the levels of crime in public transport, as these are not reported on in specific public transport-related categories, and therefore it is difficult to ascertain attitudes towards crime in specific modes. A recent study by Venter (2020) revealed that security from crime is the most important consideration of respondents when evaluating the first and last mile attributes of public transport trips. According to Vanderschuren, et al. (2019), fear of crime is a barrier to the use of public transport worldwide. Furthermore, females also have a higher risk perception than males, specifically when it comes to the mode of transport, the time of day (e.g. off-peak hours), at facilities (e.g. platform/stop) and while using the mode (e.g. in the train). Safety and security issues on public transport are, however frequently reported on in the popular and trade media, which provides some insight into modal perspectives (Blom, 2018, Chambers, 2018, Safer Spaces, 2018, Lindeque, 2019, Osborne & Brown, 2019, Retief, 2019). Limited numbers of academic texts (Teffo, et al., 2019) and government reports (Western Cape Provincial Government, 2018) provide further insights, however, it is evident that little research exists into the state of safety and security in public transport and the difference between these aspects on various forms of public transport.

People between the ages of 16 and 34 represent approximately 35% of the South African population (StatsSA, 2019). According to this report, 61% of the Gauteng (the most populous province in South Africa) population are under 35 years of age, with young people comprising 38% of the country's total population. As active transport users and the largest single population grouping, as well as being the primary future users of transport, this group's perceptions of current safety and security concerns were considered to be particularly important for analysis.

2. Research method

The purpose of this research is to gauge young people's perception of safety aspects associated with public and private transport options and to investigate the apparent perception that private cars are

safer than public transport. The first source of data was secondary data collected for a previous study on the service quality of public transport in Johannesburg, South Africa (Luke & Heyns, 2019) which was used to assess the service gap that may exist between commuters' expectations of service quality, specifically safety concerns, and the actual service quality offered by selected public transport service providers. A five-point Likert-type scale, anchored by *strongly disagree* (1) and *strongly agree* (5), was used to obtain the respondents' level of agreement with the various expectations and perceptions statements. For the purposes of this analysis, only safety-related data was used. Furthermore, as the research focused on young people's perceptions, all users from the initial respondent group aged 30 years or older, were excluded, resulting in a final sample size of 702 respondents.

To expand on the initial data collection, a second survey was conducted to include commuter modes such as private cars and the Gautrain, a high-speed rail mode used mainly by higher-income commuters. In this research, a two-part, quantitative research approach was used to obtain an informed awareness of the travel behaviour and safety perceptions of young people. In the first part, the research instrument was developed following the literature review of available and pertinent literature. The structured, self-administered online questionnaire consisted of four separate segments. The first section requested demographical information of the respondents (such as gender, age group, student and employment status); the second section requested information regarding the respondents' preferred modal choices and daily travel behaviour; the third section assessed the respondents' service quality perceptions of the various transport services; and the last section of the questionnaire solicited the respondents' views and intentions regarding private transport.

To acquire the research data convenience sampling (also known as availability sampling) was used. Convenience sampling is a non-probability sampling method that relies on the geographical proximity, accessibility, availability, the relative simplicity of collection and the willingness of respondents to take part in the survey (Etikan, Musa & Sunu, 2016; Saunders, Lewis & Thornhill, 2019) to obtain a sample. For these surveys, researchers and research assistants' social networks were used as a starting point, with a snowballing technique used to achieve a sufficiently large sample size. A limitation of convenience sampling is that it has the tendency to be biased (Sedgwick, 2013; Saunders et al., 2019) and implies that any generalised interpretations of the research results should be treated with caution and care (Zikmund, Babin, Carr & Griffen, 2013; Sedgwick, 2014; Saunders et al., 2019). The data collection campaign for part 1 and part 2 resulted in 630 and 702 usable responses, respectively. The profiles of these respondents is shown in Table 3 and Table 4 below. The survey data were analysed using SPSS for Windows version 25.

Table 3: Respondent Profile (Part 1)

		Metrobus	PUTCO	Minibuses	Rea Vaya	Metroraail
Respondents		300	100	204	200	348

Employment status	Full time employed	23%	Not currently working	66%
	Part-time employed	11%		

3. Discussion of results

Using the SERVQUAL model, adapted to the RECSA dimensions to suit the South African environment, respondents were asked to rate 25 items relating to reliability, extent of service, comfort, safety and affordability. For the purposes of this analysis, only the safety aspects are considered. The overall perception of safety is shown in Table 5.

Table 5: Perceptions of safety

<i>MB = Metrobus, P = PUTCO, MBT = Minibus Taxi, RV = Rea Vaya, MR = Metrorail</i>					

The results show that, perceptions of the safety dimension are higher for Metrobus than any other mode of transport. It is expected that Metrobus, which caters to middle-class urban commuters, would be perceived as safer than minibus taxis, which are widely regarded as unsafe. It is also expected that Metrobus would be regarded as safer than PUTCO and Metrorail, as the latter two modes are considered to be mass transit modes for lower-income or captive users over longer commuting distances (generally from townships outlying the city to the CBD). It was however unexpected that Metrobus would be perceived as offering a higher service quality for safety than Rea Vaya. Rea Vaya is a relatively new bus rapid transit system, where equipment is still new, and buses run in dedicated

lanes, implying that safety might be expected to be higher than other modes of transport. To identify specific reasons for these perceptions, Table 7 individually analyses the items which collectively form the perceptions of the safety dimension. With regards to expectations, as shown in Table 6, there are far fewer differences between the modes, indicating that users have a general expectation that the modes of transport should offer a reasonably high level of safety. This is reflected in the medians for the modes, which are either 4 or 5, indicating a high expectation for safety.

With regards to the item, there are adequate safety measures against crime on vehicles, the median for Metrorail is the lowest of all the modes, indicating that crime on this mode is the biggest safety issue, rather than driver training. Metrobus again outperforms the other modes, although the median of 3 suggests that respondents are neutral, rather than positive about crime on this mode. Minibus taxis are perceived as being higher ranked than Metrorail, indicating that, although the general perception of this item is relatively neutral, driver behaviour is a bigger concern than crime on this mode.

<i>MB = Metrobus, P = PUTCO, MBT = Minibus Taxi, RV = Rea Vaya, MR =</i>					

In relation to the probability of an accident, Metrobus has the best perceived safety level, although Rea Vaya is also considered to be relatively safer than most other modes of transport. The finding is that Metrorail, which has a poor safety record, is perceived as being less likely to have an accident than minibus taxis. The latter is generally perceived, as reported in the National Household Travel Surveys (NHTS) and in the popular media, as having a very poor accident record. It is also noted that there is no significant difference between the accident perceptions of minibus taxis and PUTCO, confirming the further perception that PUTCO is not a safe mode of transport.

With regards to driver training and safety measures, Metrobus is again perceived as being better than any of the other modes. The mean ranking for all modes are higher than the mean ranking for minibus taxis, indicating that the perceptions of skilled drivers in this group is very poor, as is also evidenced in the popular media and the NHTS. Although Metrorail is poorly perceived from a safety perspective in general, drivers are perceived to be relatively better trained than the drivers from most other modes, with the exception of Metrobus, indicating that driver training is not the biggest safety concern for this mode. In a related item, there is a low possibility of personal injury due to reckless driving, the results are similar to the driver training, with Metrobus outperforming the other modes and minibus taxis having the lowest overall mean ranking. There are not significant differences between the rest of the modes.

With regards to the item, there are adequate safety measures against crime on vehicles, the median for Metrorail is the lowest of all the modes, indicating that crime on this mode is the biggest safety issue, rather than driver training. Metrobus again outperforms the other modes, although the median of 3

suggests that respondents are neutral, rather than positive about crime on this mode. Minibus taxis are perceived as being higher ranked than Metrorail, indicating that, although the general perception of this item is relatively neutral, driver behaviour is a bigger concern than crime on this mode.

The NHTS (2013) identified safety and security in the waiting areas as a major cause of concern. This could include theft, harassment, attacks, etc. This continues to be a major issue, as indicated in the latest NHTS (2020). This was measured in the final item “there are adequate safety measures against crime in waiting areas”. This is the only item where Metrobus does not outrank all other modes, suggesting that this is the biggest issue facing this mode of transport. It is likely that this can be attributed to the many on-street bus stops, which may not necessarily be under the control of Metrobus, but rather city authorities. It does however suggest that Metrobus could provide facilities to enhance this aspect of safety in their services. Metrorail and PUTCO also perform poorly on this element. PUTCO’s perceived performance, as with Metrobus, is likely attributable to on-street bus stops. Metrorail, on the other hand, is fully responsible for train stations, which are perceived as being particularly unsafe. Rea Vaya, which waiting areas are only accessible by ticket, is ranked lower than minibus taxis, suggesting an area which requires improvement.

Whilst the initial dataset provided valuable insights into the main public transport modes used for commuting, two key modes were omitted. As the survey was focused on the service quality of public transport, perceptions of the highest commuting mode, namely private vehicle transport, were omitted. A further public transport mode, the Gautrain, a high-speed rail option, was also excluded, as it caters to only a small portion of higher-income commuters. To be able to compare these modes to the modes covered by the first survey, a second survey included a general perspective on all modes of transport. In this case, respondents were not mode-specific users, but were rather asked to provide their perceptions of the safety of all transport modes. This allowed for individual level comparison of the modes. The results are shown in Table 7.

The results show that respondents perceive the Gautrain, a new transport mode, as being safe, which is likely due to using new equipment, extensive safety measures on trains and in stations, and high levels of driver training. Of concern is the finding that cars are generally higher ranked for safety than most other forms of public transport. This was reiterated by another question in the survey instrument where, on a 5-point Likert-type scale, respondents' average mean for the question "Using a private car is safer than using public transport" was positive at 3.65, thus providing some indication of the relative perceived lack of safety in public transport. A further concern is that this perception will drive already high car ownership aspirations. The results further reflect that Metrorail, PUTCO and minibus taxi are all rated below the midpoint of 3, thus indicating disagreement with the perception that these modes are safe. Metrobus and Rea Vaya are positively rated, although the proximity to the midpoint suggests that these modes are not as safe as they could be.

4. Managerial implications

Most forms of public transport are not perceived as being safe, suggesting managerial implications for both service providers and city planners. Cars are perceived as being safer than all public transport modes, with the exception of the Gautrain. This implies that commuters will select cars if they can afford them. From a city planning perspective, this is likely to lead to high levels of congestion, which are unsustainable. This suggests that city planners need to focus future transport management efforts on making public transport safer and more "car competitive" in order to achieve a modal shift from cars to public transport. For minibus taxis, the most utilised form of public transport, although crime on the vehicle and in waiting areas are not well rated, the greater concern is reckless driving and the possibility of accidents, suggesting that this industry needs to focus significant resources on driver training initiatives. In addition, taxi associations should ensure that the service is extended beyond the trip into the waiting (especially rank) environment, to ensure the safety of commuters whilst awaiting services. For Metrorail, respondents are less concerned about driver training and accidents, however, crime is an area of major concern. As Metrorail is responsible for its infrastructure, this suggests that the railway service provider urgently needs to provide better security measures on the trains and in stations. Metrobus is generally perceived as being safer on most safety items, however crime in waiting areas was the respondents' major concern. Although this is mostly out of the service provider's control, the results suggest that Metrobus should consider mechanisms to ensure the safety of its commuters while waiting and should also lobby the city to consider better on-street security measures for the general commuting public. The general perceived safety performance of Rea Vaya, the new bus rapid transport system, is lower than expected. It appears that respondents have a concern about driver performance as well as crime in waiting areas. As station access is limited, this suggests that training and security measures need to be enhanced before users place complete trust in the mode. PUTCO is generally rated as poor on most safety aspects. As this mode generally caters to low-cost captive users, the poor performance suggests a lack of concern for the safety of their commuters. As

this is a subsidised service, the results further reflect that the government is not providing sufficient resources for this mode of transport and should be lobbied to focus resources on the captive transport user.

5. Conclusion

Whilst the above management implications propose areas where the various modes need to focus future spending to improve safety levels, the results also suggest that, should these not be addressed, commuters are likely to switch modes, particularly to private vehicle ownership, to improve safety performance. Future research should investigate the thresholds at which mode switching takes place, to determine the safety levels required to retain passengers. The research should also be expanded to other metropolitan areas in the country, to determine whether these perceptions are experienced country-wide, or whether public transport performs better from a safety perspective in different cities. Differences in results would likely reflect cities where more subsidies are provided for public transport, or there are higher levels of safety in public spaces. It would also be worthwhile repeating this study to determine whether perceptions have shifted during the COVID-19 pandemic, and thereafter.

Safety concerns are key considerations when young people make the decision to shift from public to private transport. To slow this concerning trend, it is necessary to provide public transport that meets the safety needs of young commuters. This research has highlighted key areas where each public transport service needs to focus resources and efforts in a bid to maintain or improve current ridership figures.

The Relevance of Entrepreneurial Self-Efficacy, Social Networking and The Institutional Environment on Immigrant Entrepreneurship in South Africa

Prof Boris Urban¹, Mr Mahad Moti²

^{1,2} Entrepreneurship, University of the Witwatersrand, Johannesburg, South Africa

Keywords

Entrepreneurial self-efficacy; Social networks; Negative regulatory environment; Immigrant entrepreneurship; Entrepreneurial performance

Abstract

South Africa has high rates of criminal activity and widespread corruption, which debilitates many entrepreneurs' entrepreneurial activity, performance, and operations. However, many immigrants can overcome these challenges despite these obstacles using their entrepreneurial self-efficacy and social networking capabilities. Entrepreneurial self-efficacy has been found to influence entrepreneurial intention, behaviour, motivation, and performance; furthermore, entrepreneurial self-efficacy is the targeted outcome of entrepreneurial education and training. Research shows that social capital networks enabled the acquisition of capital resources and opportunities, which supports research that indicates that entrepreneurs with networks have a resource acquisition advantage. This study will attempt to determine if an ethnic immigrant minority is able to operationalise their entrepreneurial self-efficacy and social networks to improve the performance of their ventures, despite all the regulatory challenges they face in South Africa. This study will employ a quantitative research method, as it measures the relationship between quantifiable variables. The population of this study is Pakistani immigrant entrepreneurs. Further research showed that immigrant entrepreneurs have capabilities, knowledge, and other experiences, which are useful, based on the resource-based theory, for conducting business internationally. This will be measured in terms of entrepreneurial performance with a specific focus on growth and innovation in this study.

1. Introduction

Despite its history of Apartheid, a new form of racism has emerged in the new and free post-apartheid South Africa, in the form of xenophobic violence (Pillay, 2017). This form of anti-immigrant sentiment has been studied worldwide and scholars have studied immigrant entrepreneurial activity increasingly (Brettell & Nibbs, 2010), due to globalisation.

This negative sentiment towards immigrants is due to locals blaming immigrants for social segregation and high crime rates (Zang, 2000); hence, immigrants are seen as a threat to society, which might explain the violence that immigrants experience (Costello & Hodson, 2011). These findings relate to immigrants in western countries; however, this could correlate with this study which explores a particular ethnic minority, the Pakistani immigrant entrepreneurs. The risks attached to immigrant entrepreneurship could dissuade them from engaging in entrepreneurial activity and understanding how Pakistani immigrant entrepreneurs overcome such challenges is the primary concern of this study.

To conduct such a study, the unique environment of the immigrant entrepreneurs needs to be considered, as it could play a moderating role in entrepreneurial activity. Especially in developing countries such as South Africa, entrepreneurial activity is encouraged, and even more, the focus is placed on determining the characteristics of successful entrepreneurs and their origins (Venter &

¹ E-mail address: boris.urban@wits.ac.za

² E-mail address: motimahad@gmail.com

Urban, 2015). Hence, the environment of South Africa is expected to have a entrepreneurship-promoting climate for immigrant entrepreneurs; but entrepreneurial activity can be promoted or suppressed by the influence of institutions on the economy, and to examine and understand this, the institutional theory needs to be explored (Stenholm, Acs, & Wuebker, 2013; Urban, 2019). Therefore, the context within which Pakistani immigrants operate must be understood, along with the surrounding institutional environment, as these factors could influence their behaviour. Various previous researchers have supported the importance of the institutional theory and are of the view that for economic and entrepreneurial development, there needs to be an existing institutional environment (Baumol & Strom, 2007; Bosma, Content, Sanders, & Stam, 2018; Valliere & Peterson, 2009). The institutional environment in which Pakistani immigrants operate will play a significant role in their behaviour and operations. Hence, the quality and quantity of entrepreneurial activity in a country are dependent on the type of institutional environment in that country (Valliere & Peterson, 2009). The institutional environment might also influence various entrepreneurial activities' behaviour and beliefs (Busenitz, Gomes, & Spencer, 2000).

The entrepreneurial performance will be used to measure the said influences of the institutional environment on Pakistani immigrant entrepreneurs in South Africa. Entrepreneurial performance can be seen in economies where the formal institutions have established themselves and protect the interests of private organisations from government influence and expropriation (Shahid, Imran, & Shehryar, 2018; Urban, 2019). Thus, this type of performance needs to be measured amongst Pakistani immigrant entrepreneurs about the impact the institutional environment has on them to determine if the influence is significant or not.

Immigrant entrepreneurs may be able to overcome the various challenges of the institutional environment, and this may be due to their entrepreneurial self-efficacy and social networks. Entrepreneurial self-efficacy in immigrant entrepreneurship forms part of entrepreneurial competencies (Chrystome, 2010; Morgan, Sui & Baum, 2015), and is broadly defined to include personal characteristics, such as motives, skills, knowledge, and self-efficacy (Bird, 1995), which influence venture management and creation (Dabic et al., 2020). Self-efficacy, or more specifically entrepreneurial self-efficacy, for this study, translates to a person's belief in their ability to perform entrepreneurial or managerial tasks (Newman, Obschonka, Schwarz, Cohen, & Nielsen, 2019). This ability to perform entrepreneurial or managerial tasks is possibly used to overcome institutional environmental challenges.

Social capital, conversely, comprises the relations and contacts that people or individuals have with a range of communities and stakeholders, internally and externally, including the networking performed and the networks created (Hsiao Lee & Chen, 2016). Individuals have utilised social capital to overcome challenges and deal with shortcomings faced and is crucial to an individual's locus of control (Hsiao et al., 2016). Gedajlovic, Honig, Moore, Payne, and Wright (2013) explained that entrepreneurship and entrepreneurs are situated socially, and Corbett (2007) further elaborated that the social environment wherein organisations and individuals interact is where opportunities are explored and exploited. For a host country to develop a stable environment for immigrants, ethnic networks, and safety networks are of the utmost importance for new and existing immigrants who use these networks to grow their businesses.

This study will use entrepreneurial self-efficacy and social capital factors to determine how an ethnic minority of Pakistani immigrant entrepreneurs in South Africa overcome challenges presented by the institutional environment. The focus will be on the negatives of the institutional environment in a developing economy, such as South Africa, and how a minority can overcome them, so that their local counterparts could develop similar skills and networks to overcome challenges.

2. Problem Investigated

South African entrepreneurs are failing, which could have catastrophic consequences for the country and its people in the short term and in the long term. The GEM (Bowmaker-Falconer & Herrington, 2020) reported concerning figures where 4.9 per cent of businesses closed and only 3.7 per cent of

businesses were started, making the discontinuance of business exceed new ownership in 2019. This is despite more South Africans accepting entrepreneurship as a viable career path (Bowmaker-Falconer & Herrington, 2020), while simultaneously having an increased fear of failure. These issues are a major problem for South Africa and affect the foundation of this study. In developing countries such as South Africa, the characteristics of successful entrepreneurs and their origins are important and their origins need to be determined (Venter & Urban, 2015). Due to these limitations and the need for more entrepreneurial knowledge and data, this study seeks to research to add to the body of knowledge for countries, such as South Africa, to overcome the potentially devastating consequences of lack of entrepreneurship, such as high rates of unemployment, increased burden on the government, increased crime rates, stagnant economic growth, and limited innovations.

This study seeks to achieve the above by determining if the institutional environment might be one of the causes of entrepreneurial activity being hampered in South Africa. According to Stenholm, Acs and Wuebker (2013), and Urban (2019), entrepreneurial activity can be promoted or hindered by the impact that institutions in various economies have and to examine and understand this, the institutional theory needs to be used. Various previous researchers have supported the institutional theory's importance and believe that for economic and entrepreneurial development, there needs to be an existing institutional environment (Baumol & Strom, 2017; Bosma et al., 2018; Valliere & Peterson, 2009). This makes research on the South African institutional environment significantly important, and a field of study that could contribute to understanding how a failing state might be the cause of entrepreneurial inhibition.

Immigrant entrepreneurship will be explored to determine the solution to this problem. Immigrant entrepreneurship is important for a South African study, as after Apartheid, South Africa opened up to the world and there was an influx of immigrants, along with which came a host of issues (Gebe, Maharaj & Pillay, 2011; Vargas (2005). Immigrant entrepreneurs' success is hindered in South Africa due to an unsupportive labour market, inaccessible capital, lack of institutional support, and discrimination (Basu & Altinay, 2002). Furthermore, barriers such as language, crime, excessive tax, excessive regulation, excessive compliance costs, and lack of skills also negatively affect the performance of immigrant entrepreneurs in South Africa (Dana & Morris, 2007; Vargas, 2005). These significant challenges for immigrant entrepreneurs are added to the institutional challenges mentioned above, resulting in the immigrants being worse off than their South African counterparts, and yet they seem to be able to survive (Moti, 2019). This makes the study of immigrants in South Africa an important element in determining what allows them to survive when their counterparts in similar conditions are unable to do the same. These findings could help struggling entrepreneurs to survive in the South African economy.

It should be noted that not all elements that contribute to the immigrants' success levels can be included in this research; as such, the focus is placed on two variables that many authors have noted to contribute to success. Krueger, Reilly, and Carsrud (2000) claimed that one of the differences in immigrant entrepreneurs is self-efficacy which leads them to their industry of choice. A meta-analytical study done by Miao, Qian, and Ma (2017) found a relatively strong relationship between performance and the business founder's entrepreneurial self-efficacy. Similarly, McGee and Peterson (2017) found a positive link between the entrepreneurial self-efficacy of business founders and entrepreneurial performance.

Entrepreneurial self-efficacy is the first variable. Its importance for immigrants needs to be understood, as it is possible that due to Apartheid, this quality might be missing in the South African population. Should it prove to be a crucial element in the survival of immigrant entrepreneurs, then it needs to be developed by South Africans, to increase entrepreneurial activity within South Africa.

The second variable in this study is social capital. To develop a stable position in a host country, ethnic networks and safety networks are of the utmost importance for new immigrants and existing immigrants who use them to grow their businesses. The networks are used for various reasons, including contacts, knowledge of procedures and markets, access to potential employees and

customers, and financial resources (Barnard & Pendock, 2013; Kalnins & Chung, 2006). Thus, social networking is a crucial element of immigrant entrepreneurship research and a variable for this study alongside entrepreneurial self-efficacy. The study of these two variables and the proof of their success will change how South African entrepreneurs operate and could become tools for their success, which benefits all stakeholders involved.

There is an approach in research which avoids western economics in favour of other geographical locations (Bruton, Ahlstrom & Obloj, 2008), as western economies cannot be compared to other economies and can create a bias. There is a growing body of knowledge about the hostile nature of developing economies toward businesses, yet its influence about entrepreneurial performance has not been sufficiently studied (Brixiova, Ncube & Bicab, 2014). Developed economies have the necessary resources and facilities to allow research to be conducted on their economies and as such, there is a significant body of knowledge on these economies. The other economies, such as in Africa, are neglected, and scholars try to measure Africa against the developed western economies, without fully understanding the uniqueness of African economies. Furthermore, Welter and Smallbone (2011) said that very limited knowledge is available on how entrepreneurial opportunity recognition and evaluation occurs in the unique African markets in terms of the institutional environment. This is one of the biggest problems in the field of entrepreneurship, which necessitates research in South Africa. By conducting this study, contributions relevant to Africa could be made, allowing for the body of knowledge to grow and prompt more research in South Africa.

3. Research Objectives

Institutional issues are abundant in South Africa, which is not conducive to growth, with immense problems in the regulatory sphere. Human and social capital can enable individuals to overcome these challenges and continue to perform. This study will determine if the said human and social capital in a challenging institutional environment and a problematic regulatory environment can allow individuals to work around these challenges. This will be measured in terms of entrepreneurial performance. The population under observation makes this study unique, which will be immigrant entrepreneurs in the challenging environment of South Africa; and their specific human and social capital that can help them overcome challenges.

To determine the extent to which entrepreneurial self-efficacy and social networking influence the performance of Pakistani immigrant entrepreneurs in South Africa while accounting for the regulatory environment as a moderator in this relationship.

- To examine the influence of entrepreneurial self-efficacy on the performance of Pakistani immigrant entrepreneurs in South Africa.
- To examine the influence of social networking on the performance of Pakistani immigrant entrepreneurs in South Africa.
- To examine the moderating influence of the regulatory environment in the relationship between entrepreneurial self-efficacy, social networking, and the performance of Pakistani immigrant entrepreneurs in South Africa.

4. Hypotheses

Hypothesis 1

From this literature, the following hypotheses were constructed and tested in this study:

Hypothesis 1: Higher levels of entrepreneurial self-efficacy positively influence the performance of family businesses of Pakistani immigrants.

- Hypothesis 1a: Higher self-efficacy in successfully identifying new business opportunities positively influences the performance of family businesses of Pakistani immigrants.
- Hypothesis 1b: Higher self-efficacy in creating new products positively influences the performance of family businesses of Pakistani immigrants.

- Hypothesis 1c: Higher self-efficacy in thinking creatively positively influences the performance of family businesses of Pakistani immigrants.
- Hypothesis 1d: Higher self-efficacy in commercialising an idea or new development positively influences the performance of family businesses of Pakistani immigrants.

Hypothesis 2: Higher levels of social networking positively influence the performance of Pakistani immigrant businesses.

- Hypothesis 2a: Higher levels of political networking positively influence the performance of Pakistani immigrant businesses.
- Hypothesis 2b: Higher levels of financial networking positively influence the performance of Pakistani immigrant businesses.
- Hypothesis 2c: Higher levels of family networking positively influence the performance of Pakistani immigrant businesses.

Hypotheses 3: The relationship between entrepreneurial self-efficacy, social networking, and the performance of businesses of Pakistani immigrant entrepreneurs in South Africa, will be moderated by the regulatory environment.

5. Literature Review

5.1 Immigrant entrepreneurship

The study of immigrant entrepreneurship began in the most popular migration destinations, such as Canada (Dana, 2013), the United Kingdom (Patterson, 1963), and the United States of America (Cochran, 1972). The topic of immigrant entrepreneurship is of interest in various fields, such as economics, sociology, entrepreneurship, anthropology, management, public policy, and psychology (Dana, 2007). Immigrants are those who are born abroad, and immigrant entrepreneurship is the entrepreneurial activities of immigrants (Dabić et al., 2020). Immigrant entrepreneurship is due to globalisation, which has led to an increased migration of people (Nazareno, Zhou, & You, 2019).

Researchers have suggested that immigrant entrepreneurs would be faced with challenges such as a lack of embeddedness in society, language barriers, lack of resources, and a lack of experience that would hinder their efforts to start a business (Constant, Kahanec, & Zimmermann, 2009; Millar & Choi, 2008). Contrarily, other researchers found that immigrant entrepreneurs have a higher entrepreneurial propensity than their local counterparts (Levie, 2007), showing that immigrant entrepreneurs overcome barriers using their self-efficacy and networking.

The research into the field of immigrant entrepreneurship has come with challenges such as limited synchronisation in the studies conducted and the integrated models used, which has resulted in a fragmented understanding of what induces and enhances the immigrant entrepreneurship (Sundararajan & Sundararajan, 2015). This fragmentation of knowledge is caused by studies focusing on a specific immigrant entrepreneurial group (Barrett & Vershinina, 2017); making these studies not generalisable (Dana, 2007). Furthermore, previous researchers failed to cover the distinctiveness of the immigrant entrepreneurship (Bailetti, 2018) and studies that attempted to provide an overview in a structured manner have failed to cover the entrepreneurial path of the immigrant entrepreneurs (Brzozowski, 2017).

According to research done by Morgan, Sui, and Baum (2018), immigrant entrepreneurs cannot accurately perceive risk when internationalising, due to their overconfidence. Furthermore, immigrant entrepreneurs are not more successful than local entrepreneurs, as the risk taken for the returns gained is not beneficial (Sui et al., 2015; Wang & Liu, 2015).

Neville, Orser, Riding and Jung (2014) are of the understanding that the experience, capabilities and knowledge that immigrant entrepreneurs possess provide an advantage when operating internationally. It has also been found that immigrant entrepreneurs have a better entrepreneurial orientation than do local entrepreneurs (Li, Isidor, Dau & Kabst, 2018), better international ties and language skills

(Cerdin, Diné & Brewster, 2014), and as such, can exploit opportunities better than their local counterparts (Morgan et al., 2018). This proves the theory that follows the antecedents of entrepreneurial self-efficacy where prior work experience, education, and training of the immigrant entrepreneurs, allows them to overcome challenges.

The negatives of immigrant entrepreneurs are seen by the anti-immigrant sentiment (Brettell & Nibbs, 2010) that local people have towards them and who often blame them for the social segregation and higher crime rates (Zang, 2000); they are seen as a threat to society (Costello & Hodson, 2011). These findings by the above-mentioned authors give the grim outlook and possible discrimination that immigrants face and the risks attached to immigrant entrepreneurship which would dissuade an immigrant to not engage in entrepreneurial activity, yet many still do, despite the risks.

Clark and Drinkwater (2010) provide an alternative view; their research found that immigrants from some groups, compared to their local counterparts, are more likely to pursue an entrepreneurial activity, creating more wealth and jobs. Despite barriers faced by immigrants such as finance, resources, and language, some immigrants are still able to engage in new venture creation (Aviram, 2009). This shows the more positive outlook that immigrants could bring to society and the economy and the higher entrepreneurial propensity that some immigrants possess. Furthermore, it proves that the immigrant population's entrepreneurial self-efficacy and social networks may be higher than that of their local counterparts.

5.2 Entrepreneurial self-efficacy

There are three types of self-efficacy to consider. The first is described by Bandura and Wood (1989) as the belief that a person has the capabilities to meet demands by driving their cognitive resources, motivation, and course of action. The second is the belief someone has in their competence to perform tasks that lead to various achievements (Chen, Gully, & Eden, 2001). Lastly, the self-efficacy that is the focus of this study is entrepreneurial self-efficacy, which is the belief in one's abilities to perform entrepreneurial tasks (Chen, Greene, & Crick, 1998).

The relevant theory about entrepreneurial self-efficacy is the social cognitive theory. Bandura (2001) explained that an intention is a proactive commitment to bringing about action and that the entrepreneurial process comes into existence due to the individual's entrepreneurial action and motivation. The social cognitive theory enhances human agency at a collective and individual level by enabling behaviour (Bandura, 1997; Newman et al., 2019). It is based on the reciprocal model of cognitive and other personal factors, environmental influences, and behaviour working in conjunction with each other (Bandura, 1986). Vicarious learning, mastery by experience, and gaining further knowledge and judgment from others, lead to a better understanding of the self and the environment (Bandura, 1977; Newman et al., 2019).

Bandura (1997,1986) proposed a social learning perspective framework, which considers four primary factors of developing self-efficacy. They are a) vicarious experience, b) verbal persuasion, c) physiological arousal and d) enactive mastery (Gielnik, Uy, Funken, & Bischoff, 2017). Vicarious experience is about observing the performance of others and it was suggested by Bandura (1977) that watching others succeed can boost one's self-efficacy. However, Bandura (1986) including Bux and van Vurren (2019) noted that vicarious learning in comparison to direct experience is weaker, and the impact thereof can have a lasting effect on one's self-efficacy.

Bandura (1986) explains that enactive mastery which is one's historical performance is one of the biggest influencers of self-efficacy, further, those who have developed the ability to overcome challenges and stay motivated are more likely to have a self-efficacy that is irrepressible (Woods & Bandura, 1989). In his study, Krueger (1993) found that having experience led to an increased desire and feasibility for an entrepreneurial career (Newman et al., 2019).

Bandura's (1997, 1986) third major factor of self-efficacy is physiological arousal, which is that one should consider their physiological state, as having a negative state will lead to a lowered self-efficacy

and vice versa. The last factor is verbal persuasion; though it is not a powerful influencer, it does play a role in creating self-efficacy within a person when feedback is received from others about one's ability to complete a task (Bandura, 1986; Miao et al., 2017).

To understand entrepreneurial action and related beliefs, Bandura's (1986, 1997) agency perspective, from a self-efficacy point of view, is considered the best approach (Frese, 2009). Entrepreneurship requires passion and persistence, as such entrepreneurial self-efficacy is a crucial psychological construct in entrepreneurship research (Miao et al., 2017). Entrepreneurial self-efficacy has been found to influence entrepreneurial intention, behaviour, motivation, and performance; furthermore, entrepreneurial self-efficacy is the targeted outcome of entrepreneurial education and training (Newman et al., 2019). Entrepreneurial self-efficacy has become important for researchers and policymakers (Wilson et al., 2009) due to the increased interest in entrepreneurial acting and thinking for occupational behaviour and career development (Obschonka et al., 2017).

5.3 Social networking

The suppliers, customers, and stakeholders with which a business creates long-term relationships are referred to as business networks (Vecchio, 2003); making networks the basis of social capital; so, crucial to entrepreneurs (Low & MacMillan, 1998). Dabic et al. (2020) deliberate that when considering the success of ethnic minorities, the social network factors need to be assessed specifically to the group in question and should not be generalised. Due to the failings of transitional country governments, entrepreneurs can form weak networks to grow, harmonise activities, and combine resources (Luthans, Stajkovic, & Stajkovic, 2000). Networking allows entrepreneurs to deal with obstacles, acquire critical resources, and increase opportunity capital (Low & MacMillan, 1998; Chan, Yi-Hsuan & Chen, 2016). Davidsson and Honig (2003) maintained that social capital networks enabled the acquisition of capital resources and opportunities, which supports research that indicates that entrepreneurs with networks have a resource acquisition advantage (Aldrich & Zimmer, 1986; Al-Omouh, Simón-Moya, & Sendra-García, 2020). Africa has very limited research done on social capital and the studies done do not cover all the actors of social capital (Urban & Ratsimanetrimanana, 2019; Zoogah, Peng, & Woldu, 2015). This is essentially the reason why social capital is a focus in this research, however there is a challenge with social capital. The studies that were conducted on social capital have presented mixed results in terms of entrepreneurial performance (Alhusban, Alhusban, & AlBetawi, 2019; Doh & Acs, 2010; Urban, 2019), which is what this study will also be testing.

5.4 The regulatory dimension

The performance of entrepreneurs in the emerging markets is usually faced with a multitude of challenges from rapid economic climate change, enforcement of business laws, ownership patterns, sudden institutional changes and movement in government involvement level (Peng et al., 2008; Urban & Hwindingwi, 2016) and these determine the accessibility of capital and resources that entrepreneurs need to start or grow their firms (Busenitz et al., 2000). The institutional gaps are not being filled due to the various regulations that entrepreneurs face in emerging markets (Khanna & Palepu, 2010) and this is further supported by Venter and Urban (2019) who found that the government's involvement in African emerging economies is too much and results in hampering entrepreneurship.

To discuss some of the challenges entrepreneurs face in the South African context, high criminal activity and widespread corruption hampering entrepreneurial activity and performance, causing operational difficulties for entrepreneurs (Herrington et al., 2017; Urban, 2019). South Africa, particularly, is faced with a major challenge of corruption, poor management and outdated laws that impact the legal and judicial system (Urban & Hwindingwi, 2016; World Bank, 2018). The performance of the business is also significantly impacted by the ever-changing labour laws and regulations that are developed between labour unions and big businesses, that do not take into account the smaller business but require these small businesses to adhere to the new regulations without considering that the small business does not operate like a big business and these changes can hinder the growth and performance of the smaller business (Schirmer & Bernstein, 2017). In South Africa,

key market areas are dominated by monopolies with high entry barriers, creating structural problems and a lack of competition (Urban, 2019). The overall challenge with regards to regulations and legislation in South Africa is that there is no coordination and rules are made from ignorance and ideological differences at the expense of entrepreneurial activity; despite the government correcting some legislations in one sector they add other regulations to other sectors (Herrington et al., 2017).

5.5 Entrepreneurial performance

It needs to be explored about the three major constructs of the study, namely its relationship with entrepreneurial self-efficacy, social networks and the institutional environment to understand the theoretical background of entrepreneurial performance. Bandura (1997) suggested that self-efficacy has two dimensions, one is the ability to perform a task, and the other is domain-specific, which is the ability to perform several tasks in a specific domain (Cassar & Friedman, 2009). Literature does not provide information about the relationship between entrepreneurial self-efficacy and organisational performance after start-up (McGee, Peterson, Mueller, & Sequeira, 2009). Studies that attempted to measure this relationship yielded mixed results and are inconclusive (Hmieleski & Baron, 2008). Organisational performance about entrepreneurial self-efficacy can be affected by various factors such as personal characteristics (McGee et al., 2009), environmental dynamics, and dispositioned optimism (Hmieleski & Baron, 2008). These authors provided an overview of the challenges of measuring performance and the importance of defining the measures clearly.

The relationship between social capital and entrepreneurial performance has been justified by Venter and Urban (2015), who found that business support provided by the entrepreneur's networks increased entrepreneurial performance. However, the network structures needed for entrepreneurial performance must be created through the determination of the entrepreneur (Burt, 2000), thus highlighting the importance of social networks created by the Pakistani immigrants in overcoming challenges and increasing entrepreneurial performance.

Lastly, entrepreneurial performance can be seen in economies where the formal institutions have established themselves and protect the interests of private organisations from government influence and expropriation (Shahid, Imran, & Shehryar, 2018; Urban, 2019), making the influence of the regulatory environment an important aspect for the success of any economy and by extension, an important aspect for the entrepreneurial performance of entrepreneurs.

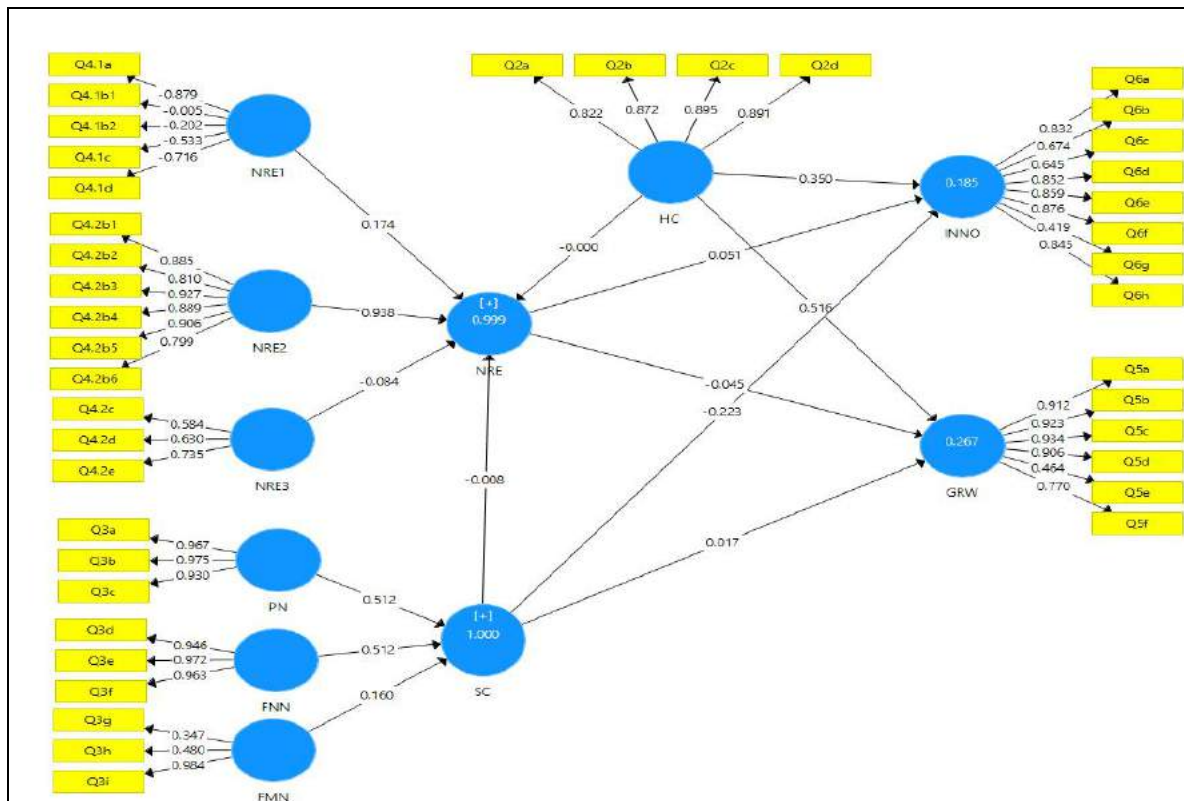

Figure 1: Hypothesised model

6. Research Methodology

This study is a predictor study, testing various independent variables about two dependent variables, with strict control variables in a specific context. The independent variables are entrepreneurial self-efficacy in terms of four task-based variables and social networking in terms of political, financial and family networking and the dependent variables of entrepreneurial performance in terms of growth and innovation. This is further defined as a complex study, which according to Lowry and Gaskin (2014), should use second-generation statistical techniques to measure the theory's credibility and reliability. One such technique is structural equation modelling, which can simultaneously examine multiple manifest and latent variables (Hair, Hult, Ringle, & Sarstedt, 2017). This is an ideal tool for this study, which seeks to measure such variables concurrently. Previous scholars have cited the reliability and credibility of this model and it is seen as a superior tool for analysing behavioural patterns that are causal in nature (Bollen, 1989).

A very specific category of structural equation modelling will be used, so that the model theory of this study can be holistically evaluated to ensure the credibility of this study further. This is called partial least squares structural equation modelling (PLS-SEM) (Lowry & Gaskin, 2014). It is suitable to use this specific model as the study is testing various theoretical models in specific narrowed-down contexts, which is the case of this study wherein the human capital is narrowed down to entrepreneurial self-efficacy and social capital is narrowed down to social networks. PLS-SEM is considered an excellent tool in statistics (Afthanorhan, 2013), as it does not work on any data distribution assumptions, and without creating any identification concerns when dealing with smaller sample sizes, provides effective data modelling (Hair et al., 2017). This is important for a study such as this, where the sample population is a generally inaccessible population due to language barriers and cultural differences, making the study unique and testing theories that will create unique relationships. The population in question is also an ethnic minority, which means that the sample size may also be limited. These factors make the PLS-SEM the perfect tool to be used to maximise the benefits of this study. Furthermore, this model displays higher R-square values and significant t-values, while rejecting null hypotheses of no-effect (Gefen, Straub, & Boudreau, 2000), which is due to maximising the explained variance of the endogenous latent constructs (Afthanorhan, 2013). These

are necessary elements for this study, as the hypotheses are unique in the sense that in the context of the study of corrupt South Africa and an ethnic minority sample population, the model should be able to reject null hypotheses and provide data that can be used and applied in the future.

6.1 Data Analysis of the Empirical Model

To be able to utilise the PLS-SEM model the empirical model will be divided into an outer and inner model, the outer model is the measurement model of the study (Wong, 2013), which measures the causal relationship between manifest and latent variables (Hair et al., 2017). The inner model refers to the structural model (Wong, 2013) and measures the causal relationship in the empirical model between the latent variables (Hair et al., 2017).

6.2 Empirical model descriptive statistics

The collected data was audited and any missing data or anomalies were traced, including results outside the given scales. Observations with missing data of over five per cent were deleted. The reason for the above precaution is in the case of a mistake during data collection, for example, skipping a question, which was not the fault of the participant. This cleaned data will be exported to SPSS for broad statistical analysis, to determine benchmarks and to gain a basic understanding of how the overall population answered (Hair, Ringle, & Sarstedt, 2013). First, the most basic mean, median, and standard deviation were provided for a basic distribution understanding. Thereafter, Kurtosis measures and Skewness measures were used, along with the Kolmogorov-Smirnov test. This further statistical analysis determined how normal the distribution was or to what degree it was away from normality (Hair et al., 2017).

6.3 Common method bias assessments

In a study that is in part a psychological study of individuals' entrepreneurial behaviour, there is a risk of common method bias occurring. Podsakoff, MacKenzie, Lee and Podsakoff (2003) thought that common method bias occurs due to the research context, the research instrument, and rater bias, all of which should significantly impact the study and should be accounted for in the results.

Using the findings of Podsakoff et al. (2003), various common method bias assessments were considered relevant for this study. They include not understanding the question properly and responding randomly, this will be countered, as the research instrument will be administered in-person, allowing the respondents to gain clarity should they not understand any questions. This study has certain questions that deal with corruption and the respondents may be hesitant to give accurate and honest responses, this will be countered by explaining to the respondents that all their responses will be kept confidential and anonymous. When research instruments have shorter scales, they influence rater responses, as such, this study has used a seven-point Likert scale, higher than most studies, to avoid short-term memory responses. Similarly, the seven-point Likert scale will help mitigate common method bias caused by respondents' boredom caused by common scales and deter respondents from trying to provide consistent responses caused by the consistency motif. Furthermore, as these research instruments will be conducted in person, the likelihood of the above occurring is low. In addition, the research instrument will be separated into sections to avoid bias.

However, statistical tools will be used to ensure that no common method bias occurs. First, the Pearson correlation matrix will assess the level of common method bias; 0.9 indicates a significant correlation. Second, confirmatory factor analysis will determine the measurement model's construct validity, indicating if any common method bias exists. The discriminant validity will not be processed for this study because it is not necessary for a formative measurement model, nor will the study test for internal consistency as a formative measurement model is considered error-free and does not correlate highly (Hair et al., 2017; Hair et al., 2013).

6.4 Measurement model assessment

In the PLS-SEM, there are two types of measurement perspectives, formative and reflective. This study will use a formative measurement model as it meets the following criteria: first, the reflective model, according to Hair et al. (2017), the reflective model uses a single-item scale. In the reflective

model, the observed measures test for the manifestations of the underlying latent constructs, and indicator variables, which are interchangeable and highly correlated variables. Contrarily, according to Hair et al. (2017), the formative measurement model uses multi-item scales where the variables are sensitive to change and as such, any omission of any variable significantly impacts the construct, as the indicator variables give meaning to the latent variable construct.

The study is more suited to the formative measurement model as a multi-item scale will be used, the indicator variables cannot be interchanged and the latent constructs combine to make the indicator variable, which represents the elements of the theoretical domain (Hair et al., 2017):

- *Content validity*: An in-depth literature review is needed to ensure that each formative measure is a valid representation of each latent construct (Hair et al., 2017). In this study, Chapter 2 attempts to analyse each latent construct and the related theoretical domain to ensure content validity.
- *Convergent validity*: According to Hair et al. (2017), convergent validity is to ensure that the formative indicators test the primary factors of the formative latent constructs. The redundancy analysis will measure whether there is a high correlation between the endogenous and exogenous variables of the latent variables in question (Hair et al., 2017; Hair et al., 2013). Convergent validity is achieved when the R^2 value is greater than 0.5 and the strength of the path coefficient is greater than 0.7.
- *Multi-collinearity model assessment*: The collinearity of formative indicators will be measured using variance inflation factors and tolerance values of the indicating variables. High collinearity for this model can result in interpretation and methodological issues. Variance inflation factors less than five and tolerance values greater than 0.20 represent low collinearity and mean the formative model can continue. The reflective model would be more appropriate for this study if the variance inflation factors are more than five and tolerance values less than 0.20. Hair et al. (2017) and Hair et al. (2013) advised that should there be an odd few high collinearity issues, these can be merged or eliminated to continue using the selected model.
- *Formative indicator significance and relevance assessment*: An indicator's comparative significance and absolute significance will be assessed to determine the influencing capability of the formative indicator on the latent constructs (Hair et al., 2017; Hair et al., 2013). The comparative significance of the manifest variables (independent variables) and latent variables (dependent variables) will be determined using multiple regression outcomes (Hair et al., 2017). Thereafter, the significance of the formative indicator's outer weights (comparative significance) will be analysed using the Bootstrapping technique. The study will follow a two-tailed Bootstrapping testing approach with a 95 per cent bootstrap confidence interval and a five per cent significance threshold, wherein p-values and t-values will be used (Hair et al., 2017). Since the threshold is five per cent, a higher percentage will be considered significant and form the outer weight, while a lesser percentage would be insignificant and form the outer loading (Hair et al., 2017).
- *Discriminant validity*: The discriminant validity will not be processed for this study; it is not necessary for a formative measurement model, nor will the study test for internal consistency, as a formative measurement model is considered error-free and does not highly correlate (Hair et al., 2017; Hair et al., 2013).

6.5 Structural model assessment

The structural model will be tested to determine if the causal relationship between constructs and the model's ability to reach the targeted constructs can be achieved by the structural concepts of the path model (Hair et al., 2017).

- *Structural model path coefficients significance and relevance assessment*: The path coefficient refers to the relationship between the constructs that are hypothesised and provides the strength of the relationship of the latent constructs to give a clear understanding of the

theorised relationship. The relationship measurement is done on a scale of -1 to +1, where the former represents a weak, insignificant or negative relationship between the latent constructs and the latter represents a strong, significant and/or positive relationship between the constructs (Hair et al., 2017). Dependent on the results or what is hypothesised, a study might want to show negative or positive relationships and should be assessed accordingly. This study hypothesises relationships that expect to yield positive and strong relationships between the constructs.

- *Two-tailed Bootstrapping testing*: Using t-values and p-values, the predictor significance will be determined. Furthermore, the Bootstrapping confidence intervals need to be tested to ensure the stability of the structural model path co-efficient (Hair et al., 2017). The benchmark for this study will be a 1.96 threshold for the critical t-values and for a p-value less than 0.05, a five per cent significance level threshold equivalent will be applied.
- *R² assessment*: To determine the predictive ability of the structural model, the coefficient of determination will be represented as R² (Hair et al., 2017). The coefficient of determination is measured on a scale of zero to one, with one being a perfectly accurate prediction of the model. In this study, a value of 0.5 will result in a moderate level of accuracy in predicting the model and a value of above 0.75 will result in considerable accuracy; the aim is to achieve a high coefficient of determination as this will mean that the predictive power of the model is high. To avoid any bias caused by the exogenous constructs toward the empirical model, the study will also determine the adjusted coefficient of determination (R²_{adj}) (Hair et al., 2017).
- *Effect size f² assessment – exogenous variables*: The coefficient of determination will test the endogenous variables of this study. As the exogenous latent variables also need to be considered, the impact of the exogenous variables on the coefficient of determination will be assessed on a scale where any value above 0.35 will mean a large effect and any value greater than 0.15 will represent a medium effect and will be represented by f² (Hair et al., 2017).
- *Predictive relevance Q² assessment*: The predictive relevance of the structural model will be evaluated by employing the blindfolding statistical technique, wherein a value greater than zero will represent a relevance between the exogenous latent variables and the dependent variable (Hair et al., 2017). The value determined by using the above statistical technique will give the cross-validated redundancy measure and this analysis will be represented by Q² (Hair et al., 2017).
- *Effect size q² assessment*: The q² represents the assessment of the effect size that the exogenous latent variables will have on the Q² value. Any q² value above 0.35 will mean that the exogenous construct has significant predictive relevance to the independent variable and a value greater than 0.15 will mean that the exogenous construct has a moderate predictive relevance to the independent variable (Ellis & Steyn, 2003; Hair et al., 2017).

6.6 Moderation analysis

This study has identified one moderating variable that would influence the causal relationship between the dependent and independent variables. The moderating variable is the regulatory environment in terms of corruption. The study predicts that the moderating variables will affect the dependent variables in achieving the required entrepreneurial performance.

A two-stage PLS-SEM approach of analysis will be conducted to test the moderation model of this study. In the first stage, the interaction terms will be omitted within the moderation model, and the latent variables will be analysed. In the second stage, a similar analysis will be done, but the interaction terms will be included. The interaction terms are achieved by multiplying the moderator variables with exogenous latent variables. The moderating variables' effect size (f²) will also be evaluated, with results greater than 0.025 representing a large moderating effect and results above 0.01 representing medium moderating effects (Hair et al., 2017). The analysis will provide an understanding of the moderating variables' effect on the study's path model.

7. Results and Findings

7.1 Test for Common method bias

Confirmatory factor analysis was conducted including all rating questions into one construct and the total variance explained was 21.4%. This was less than 60%, which indicates that there was no common method bias.

The Construct Reliability and Validity results for the hypothesised model are presented in Table 1. The results show that there were reliability issues with the NRE construct as well as its subconstructs NRE1 ($\alpha = 0.525$), and NRE3 ($\alpha = 0.359$) as well as the FMN construct, which also had a Cronbach's Alpha value less than 0.7. The composite reliability also confirmed issues with the mentioned constructs as the composite reliability scores were less than 0.47. There was no convergent validity for the FMN and NRE constructs as the AVE values were less than the minimum acceptable value of at least 0.5. This indicates that there was a need to prune some items from the model to improve reliability and validity.

Table 1: Construct Reliability and Validity: Hypothesised model

	Cronbach's Alpha	rho_A	Composite Reliability	Average Variance Extracted (AVE)
FMN	0.693	1.973	0.661	0.440
FNN	0.958	0.958	0.973	0.922
GRW	0.905	0.940	0.930	0.698
HC	0.893	0.900	0.926	0.758
INNO	0.898	0.951	0.916	0.585
NRE	0.630	0.906	0.602	0.290
NRE1	0.525	0.652	0.617	0.322
NRE2	0.935	0.938	0.949	0.758
NRE3	0.359	0.340	0.688	0.426
PN	0.955	0.955	0.971	0.917
SC	0.850	0.920	0.888	0.524

The pruned model presented in Table 2 met all the criteria and Cronbach's alpha was all above 0.7 and as such acceptable for the study. The composite reliability was also all above 0.9, making them all acceptable and reliable for the pruned model to match the data.

Table 2: Construct Reliability and Validity: Pruned model

	Cronbach's Alpha	rho_A	Composite Reliability	Average Variance Extracted (AVE)
FNN	0.958	0.958	0.973	0.922
GRW	0.935	0.937	0.952	0.798
HC	0.893	0.900	0.926	0.758
INNO	0.898	0.954	0.915	0.584
NRE	0.934	0.912	0.932	0.735
PN	0.955	0.955	0.971	0.917
SC	0.931	0.932	0.946	0.745

The discriminant validity results for the pruned model showed that there was good discriminant validity the diagonal elements are higher than any other correlation in the same row or column. This indicates that the items within each construct are strongly correlated to each other more than they are correlated to items in other constructs.

Table 3: Discriminant Validity: Fornell-Larcker Criterion

	FNN	GRW	HC	INNO	NRE	PN	SC
FNN	0.960						
GRW	-0.034	0.894					
HC	-0.022	0.518	0.871				
INNO	-0.220	0.708	0.366	0.764			
NRE	0.124	-0.088	0.000	-0.030	0.857		
PN	0.621	0.012	-0.025	-0.218	0.052	0.958	
SC	0.901	-0.012	-0.026	-0.244	0.098	0.900	0.863

7.2 Outer Model

The structure model with moderation included is shown below.

Table 4: Mean, STDEV, T-Values, P-Values

	Original Sample (O)	Sample Mean (M)	Standard Deviation (STDEV)	T Statistics (O/STDEV)	P Values
FNN -> SC	0.558	0.558	0.016	35.093	0.000
HC -> GRW	0.534	0.544	0.081	6.618	0.000
HC -> INNO	0.365	0.375	0.081	4.531	0.000
Moderating Effect 1 -> INNO (i.e., NRE moderates the relationship between HC & Innovation)	0.004	0.020	0.102	0.043	0.965
Moderating Effect 2 -> INNO (i.e., NRE moderates the relationship between SC & Innovation)	-0.059	-0.089	0.093	0.637	0.525
Moderating Effect 3 -> GRW (i.e., NRE moderates the relationship between HC & Growth)	0.092	0.097	0.100	0.920	0.358
Moderating Effect 4 -> GRW (i.e., NRE moderates the relationship between SC & Growth)	-0.097	-0.114	0.077	1.260	0.208
NRE -> GRW	-0.090	-0.048	0.111	0.807	0.420
NRE -> INNO	-0.008	0.032	0.117	0.066	0.947
PN -> SC	0.553	0.553	0.017	33.120	0.000
SC -> GRW	0.002	0.005	0.073	0.031	0.975
SC -> INNO	-0.231	-0.221	0.088	2.624	0.009

Summary of Results

- Entrepreneurial Self-Efficacy (HC) had a positive significant effect on Entrepreneurial Performance as measured through growth (B = 0.534, p-value = 0.000).
- Entrepreneurial Self-Efficacy (HC) had a positive significant effect on Entrepreneurial Performance as measured through innovation (B = 0.365, p-value = 0.000).
- Social Networking (SC) had a positive but insignificant effect on Entrepreneurial Performance as measured through growth (B = 0.002, p-value = 0.975).
- Social Networking (SC) had a negative significant effect on Entrepreneurial Performance as measured through innovation (B = -0.231, p-value = 0.009).

- Moderating Effect 1 results show that NRE does not moderate the relationship between HC & Innovation (p-value = 0.965).
- Moderating Effect 2 results show that NRE does not moderate the relationship between SC & Innovation (p-value = 0.525).
- Moderating Effect 3 shows that NRE does not moderate the relationship between HC & Growth (p-value = 0.358).
- Moderating Effect 4 shows that NRE does not moderate the relationship between SC & Growth (p-value = 0.208).

8. Discussions

The following discussions are on the pruned model and the results derived thereof:

Discussion pertaining to hypothesis 1

In the literature review section, it was determined that self-efficacy was the belief one has in one's ability to perform a task and entrepreneurial self-efficacy was a more focused belief in one's ability to perform entrepreneurial tasks (Chen, Greene, & Crick, 1998). To understand entrepreneurial action and related beliefs, Bandura's (1986, 1997) agency perspective from a self-efficacy point of view is considered the best approach (Frese, 2009). Entrepreneurship requires passion and persistence, as such, entrepreneurial self-efficacy is a crucial psychological construct in entrepreneurship research (Miao et al., 2017). Entrepreneurial self-efficacy has been found to influence entrepreneurial intention, behaviour, motivation, and performance; furthermore, entrepreneurial self-efficacy is the targeted outcome of entrepreneurial education and training (Newman et al., 2019).

This study, therefore, sought to determine if the entrepreneurial self-efficacy of Pakistani immigrant entrepreneurs influenced the entrepreneurial performance of these individuals. The entrepreneurial performance was measured in terms of growth and innovation, as measuring growth and innovation inside a minority group would yield a better understanding of the Pakistani immigrant minority:

- Entrepreneurial Self-Efficacy (HC) had a positive significant effect on Entrepreneurial Performance as measured through growth (B = 0.534, p-value = 0.000).
- Entrepreneurial Self-Efficacy (HC) had a positive significant effect on Entrepreneurial Performance as measured through innovation (B = 0.365, p-value = 0.000).

The entrepreneurial self-efficacy of Pakistani immigrant entrepreneurs had a significant positive effect on entrepreneurial performance as measured through growth and innovation. This shows that the Pakistani immigrant minority does believe in their ability to perform entrepreneurial tasks, which can be one of the reasons that they are thriving in the difficult economic conditions of South Africa. Despite this being the time in which the world economy is dealing with the aftermath of the 2019 covid pandemic, Pakistani immigrant entrepreneurs have not stopped believing in themselves and their abilities. It was important to measure the entrepreneurial performance with growth and innovation, as it gives better insight into their thinking, rather than measuring in terms of revenue, which they would not have disclosed accurately.

Discussion pertaining to hypothesis 2

The business networks of individuals or organisations are made up of the long-term relationships created with stakeholders, customers, and suppliers (Vecchio, 2003), which are crucial and make up the social capital of an organisation or individual (Low & MacMillan, 1998). Failings of the institutional environment force entrepreneurs to create networks, combine resources, and harmonise activities (Luthans et al., 2000). Networking can be further used to overcome obstacles, increase opportunity capital, and acquire resources (Low & MacMillan, 1998). Davidsson and Honig (2003) maintained that social capital networks could be used to acquire opportunities and capital resources. This supports research stating that entrepreneurs using social networks have an advantage over those who do not use social networks (Aldrich & Zimmer, 1986).

Sui, Morgana, and Baum (2015) and Neville, Orser, Riding, and Jung (2014) are of the view that immigrant entrepreneurs have experience, knowledge, and other capabilities, which are exceptionally useful for conducting business internationally, based on the resource-based theory. However, it must also be noted that the research does not systematically prove that immigrant entrepreneurs perform better than other businesses, in the sense that the returns gained on the risk assumed in a foreign market is not worth the effort (Neville et al., 2014; Sui et al., 2015; Wang & Liu, 2015). The study aimed to determine how the social networks of Pakistani immigrant entrepreneurs affected their entrepreneurial performance. The following results show that a positive, yet insignificant effect

- Social Networking (SC) had a positive but insignificant effect on Entrepreneurial Performance as measured through growth ($B = 0.002$, $p\text{-value} = 0.975$).
- Social Networking (SC) had a negative significant effect on Entrepreneurial Performance as measured through innovation ($B = -0.231$, $p\text{-value} = 0.009$).

The results showed that social networks did not play a positive role in the entrepreneurial performance of Pakistani immigrant entrepreneurs, contrary to what was hypothesised. The hypothesis was that there would be a positive significant effect on entrepreneurial performance, as social networks would have helped overcome challenges as seen in the literature review. However, this finding that the social networks are not what the Pakistani immigrant entrepreneurs are using to overcome challenges is an important finding to differentiate them and South Africa from the main western studies. This finding implies that Pakistani immigrant entrepreneurs rely on their own belief in their entrepreneurial self-efficacy for their success.

Discussion pertaining to hypothesis 3

Some challenges entrepreneurs face in South Africa are high criminal activity rates and widespread corruption, which debilitates entrepreneurial activity, performance, and operations (Herrington et al., 2017; Urban, 2019). Corruption is defined as having three facets: first, an organisation or individual uses their authority for personal gain, instead of benefiting the stakeholders or people entrusted with power. Second, an individual or organisation is involved in illegal activity, violating existing rules and regulations and going beyond their legal limits (Bahoo, Alon, & Paltrinieri, 2020). Third, an individual or organisation, be it a private or public person, misuses their power to benefit personally. This can happen in a variety of ways: fraud, bribery, and nepotism, among others.

This study looked at the negative regulatory environment as a moderator between the various variables discussed above. The study found that the negative regulatory environment did not moderate Pakistani immigrant entrepreneurs' human and social capital for innovation and growth. This is contrary to what the literature review had found from research, and sheds light on some of the unique facets of a South African study, despite it being a minority, it appears that the negative regulatory environment does not influence the capital of Pakistani immigrant entrepreneurs. The literature review found that the negative regulatory environment should have an impact, however, it could be that it moderates South African entrepreneurs and not the minorities that come from other countries such as Pakistan.

- Moderating Effect 1 results show that NRE does not moderate the relationship between HC & Innovation ($p\text{-value} = 0.965$).
- Moderating Effect 2 results show that NRE does not moderate the relationship between SC & Innovation ($p\text{-value} = 0.525$).
- Moderating Effect 3 shows that NRE does not moderate the relationship between HC & Growth ($p\text{-value} = 0.358$).
- Moderating Effect 4 shows that NRE does not moderate the relationship between SC & Growth ($p\text{-value} = 0.208$).

9. Managerial Implications

The study attempts to determine the regulatory environment's influences on immigrant entrepreneurs' entrepreneurial performance, which adds value and contributes knowledge to the pre-existing theoretical framework. Entrepreneurial activity can be promoted or obstructed by the impact that institutions from various economies have, and to examine and understand this, the institutional theory is used (Stenholm, Acs, & Wuebker, 2013; Urban, 2019). The study provides a unique relationship to be tested in terms of the negative elements of the regulatory environment that hinder entrepreneurial activity, and the effects of variables being tested in this study on a specific immigrant minority in their efforts to overcome these challenges. Previous research supported the importance of institutional theory and was of the view that for economic and entrepreneurial development, there needs to be an existing institutional environment (Baumol & Strom, 2017; Bosma et al., 2018; Valliere & Peterson, 2009). Hence, the contribution and importance of the study are within the growth achieved by immigrant entrepreneurs when the South African economy is struggling, which can help academics and policymakers determine the facets that need to change to allow for increased productive entrepreneurial activity.

Immigrant entrepreneurship is a growing field of study in entrepreneurship due to globalisation and the ease of immigrating. The environment of immigrant entrepreneurs needs to be considered and in countries such as South Africa, the origins and characteristics of successful entrepreneurs are important and need to be determined (Venter & Urban, 2015). This has resulted in the need for further research on immigrant entrepreneurship, as the traditional models of entrepreneurship have started to unravel. This study will focus on a specific immigrant population to provide a detailed account of the immigrant minority and a unique look at a previously inaccessible population. This will add to the theoretical framework of immigrant entrepreneurship, as around the world, scholars have studied immigrant entrepreneurial activity and found that the negative experiences of immigrant entrepreneurs are because of anti-immigrant sentiment (Brettell & Nibbs, 2010).

Another contribution to be made by this study regards entrepreneurial self-efficacy, which will build on the existing knowledge base by focusing on a particular context and a specific population in South Africa. A meta-analytical study done by Miao et al. (2017) found a relatively strong relationship between performance and the business founder's entrepreneurial self-efficacy. This addition to knowledge is unique, as the majority of research is done in the western countries that are then compared to African countries which are developing economies, and not developed like the western economies. Apart from the contribution to literature, there will also be contributions to the theoretical framework, as the focus is on immigrant entrepreneurship in a corrupt regulatory environment, providing a very specific look into the role that entrepreneurial self-efficacy plays. Furthermore, the contribution to knowledge will be how immigrants used their entrepreneurial self-efficacy to overcome challenges in South Africa, so that their local counterparts may use this knowledge to thrive in South Africa's dire economic conditions.

The commercial impact of this study will be that it will allow established entrepreneurs to use this study to increase their entrepreneurial knowledge and find ways to remain motivated and passionate. Potential and new entrepreneurs will be able to use this study to increase their entrepreneurial self-efficacy, which will keep them motivated and passionate to keep growing or starting new businesses. A further contribution, in line with entrepreneurial self-efficacy, is social networking, which will determine if immigrant entrepreneurs use it to overcome challenges. Gedajlovic et al. (2013) explained that entrepreneurship and entrepreneurs are situated socially, and Corbett (2007) further elaborated that the social environment in which organisations and individuals interact is where opportunities are explored and exploited. Through the theoretical framework, the contribution to literature will be in the form of testing the regulatory environment and unique relationships that allow an immigrant population to thrive in South Africa. Dabic et al. (2020) deliberated that when considering the success of ethnic minorities, the social network factors specific to the group in question need to be assessed and should not be generalised. This knowledge could be used to allow South Africans to understand the importance of social capital and its development towards competitiveness and entrepreneurial growth.

This study will be testing complex theories and relations of people from a specific background to add extensive knowledge and findings that could be utilised by multiple disciplines and studies within the field of entrepreneurship. This creates a unique study, testing unique relationship types that could contribute greatly to various fields, structures and interested parties. The other unique element of the study is that the targeted population and their background of being Pakistani immigrant entrepreneurs adds a whole new level of data that is extremely difficult to access due to language and cultural barriers. Thus, this study will further add knowledge to immigrant entrepreneurship and the abovementioned unique complex relations. The study will contribute to knowledge at various levels, as the data collected in this study will contribute to the following fields in entrepreneurship: entrepreneurial self-efficacy, social networking, institutional environment, family business, immigrant entrepreneurship and entrepreneurial performance.

South Africa has a dedicated department for the benefit of SMMEs in the form of the Department of Small Business Development. This department can use this study to better assist SMMEs and entrepreneurs by using the antecedents of entrepreneurial self-efficacy as tools to increase the entrepreneurial self-efficacy of the entrepreneurs in the various SMMEs. This study will provide a better understanding of how certain immigrant entrepreneurs can be more entrepreneurial and this will enable the creation of more effective and efficient policies for any government and related policy makers that can be implemented in all communities to enhance entrepreneurial propensity.

This study will also contribute by giving potential and existing entrepreneurs the knowledge of how immigrant entrepreneurs can overcome challenges, barriers to entry and unfavourable conditions to be entrepreneurial. The academic contribution of the study is that the findings of this study can be used to add to the curriculum about immigrant entrepreneurship and their related entrepreneurial self-efficacy and social networking in a challenging regulatory environment.

Entrepreneurship has been argued by Schumpeter (1934) to lead to economic growth; however, this is mainly for developed countries, and there is limited empirical research that supports this for developing countries (Koster & Kumar Rai, 2008), such as South Africa. This study aims to contribute to a limited knowledge base and will add to various facets of knowledge of developing countries about entrepreneurial self-efficacy, regulatory environment, social networking, immigrant entrepreneurship, and family entrepreneurship.

South Africa is an emerging economy, and this type of study will contribute toward developing controls suitable for an emerging economy, which is not as widely studied as the more northern developed economies. The impact of the negative elements of a regulatory environment results in the local entrepreneurial environment engaging in more unproductive activities and engaging in corruption. This study will assist policymakers to create controls that will limit such behaviours and level the odds for local entrepreneurs, which will induce more productive entrepreneurial activity.

The study will also benefit other emerging markets with an influx of immigrant entrepreneurs due to globalisation. Too may be impacted by the negative elements of the regulatory environment, which the immigrant entrepreneurs may overcome, while their local counterparts may be struggling to survive. This study may potentially help them create better regulatory controls and ensure that no unproductive entrepreneurial activities occur and all entrepreneurs can rely on a supportive regulatory environment.

Furthermore, this study will be focusing on a very specific minority of Pakistani immigrant entrepreneurs, which makes the contribution to academia unique, as it is an extremely difficult minority from which to gather data due to the various language and cultural barriers. This insight into the Pakistani immigrant community will provide very specific data on an ethnic minority, which is crucial in the more globalised economy of South Africa.

10. Conclusion

The various relationships being measured in this study are supported and their relationships hypothesised using extensive research. The literature focuses on providing an understanding of entrepreneurship in general and provides an in-depth look at some of the factors that provide contextual details of the study, such as unproductive immigrant entrepreneurship paired with local entrepreneurship in the venture creation framework.

This highlights the narrow focus of the study and the type of entrepreneurship under scrutiny. Thereafter, the literature provides an extensive understanding of immigrant entrepreneurship, which is the main population type being studied. This should provide a clear understanding of the unproductive family businesses of immigrant entrepreneurs in South Africa.

Thereafter, the independent variables of human capital and social capital are reviewed and discussed. The human capital variable is narrowed down to the entrepreneurial self-efficacy of individuals, which is discussed extensively; social capital is narrowed down to social networks such as family, personal, and political ties. These variables are supported by research to measure their relationship with entrepreneurial performance.

To provide further context and boundaries in the study, the institutional dimensions are reviewed as moderating variables of the study, and the control variables are covered to give more context to the study.

This study is a cross-sectional primary study focusing on Pakistani immigrant entrepreneurs, wherein the data will be collected by administering the research instrument, with closed-ended questions, in person. The targeted sample population is formal businesses owned by male Pakistani immigrant entrepreneurs. The location of the study will be Gauteng, South Africa and due to the population in question being a minority, the respondents will be selected using convenience and snowball sampling methods to ensure that the necessary number of responses are collected for a successful study. Multiple statistical tests will be done on the data collected to ensure that the maximum knowledge may be derived from the study and PLS-SEM will be used as the statistical framework.

The research found that the entrepreneurial self-efficacy of Pakistani immigrant entrepreneurs contributes to their success and entrepreneurial performance, as measured through growth and innovation. It was also further determined that the social networks of Pakistani immigrant entrepreneurs do not affect their entrepreneurial performance in terms of growth and innovation for Pakistani immigrant entrepreneurs. It was also found that despite the western research which found that the negative regulatory environment could influence and moderate the capital theory of entrepreneurs is disproved for Pakistani immigrant entrepreneurs.

It would appear that the advantage that the Pakistani immigrant entrepreneurs have over their South African counterparts and can survive the harsh South African economic environment is due to their entrepreneurial self-efficacy and not their networks. This may not be the only reason for their survival. Still, rather one of the elements and only further research into other facets of the entrepreneurial field will reveal the other components of success. The belief in themselves and their ability to do entrepreneurial tasks contributes to them remaining passionate and working through the covid pandemic, overcoming challenges of the negative regulatory environment and anything else that becomes an obstacle for them. This is a key trait that should be focused on and should be taught through all possible channels to give individuals the ability to trust themselves to be entrepreneurial and remain steadfast even when faced with failures and obstacles.

OPERATIONS AND SUPPLY CHAIN MANAGEMENT

The “Fit For Study” of the First-Year Intake at a Higher Education Institution

Marius Wait^{1,*}, Ronel Toerien²

^{1,2} University of Johannesburg, Johannesburg, South Africa

Keywords

First year students; fit for study; reasons for study; student financial awareness; inductive content analysis.

Abstract

Determining the fit for study of first-year students may help educators and higher education Institutions develop a better understanding of the first-year student cohort. Students face various choices on entering higher education studies, including institution selection, payment plans, and qualification types. Students enter higher education institutions with a certain frame of reference that guides their choices. The purpose of this study is to investigate the fit for study of first-year students at a comprehensive higher education institution in South Africa. In this qualitative study, twenty-eight questionnaires with ten open-ended questions were gathered via google docs and analysed using inductive content analysis. The study investigated, for instance, first-year students’ reasons for studying, students’ prior knowledge of financial planning and qualifications as well as their general fitness for higher education studies. The findings indicate that the first-year cohort is unprepared and unfit for studies. The majority of first-year students are African first-generation students who know nothing about their chosen qualification prior to registration and use extrinsic motivation, such as careers and salaries, to choose their qualification. In this study, students argued that their first year of study was hard work and a huge adjustment, exacerbated by teaching and learning being presented online due to COVID-19 restrictions. This study contributes to literature by providing a student-centred perspective on fit for study and by enhancing students’ academic learning when lecturers expose, utilise, and understand students’ prior knowledge on higher education matters.

1. Introduction

Students who wish to pursue a higher education (HE) qualification face various choices, such as the brand of higher education institution (HEI), payment options and qualification types (diploma or degree). When preparing educational opportunities for students, HEIs should have a clear picture of students’ motivations, preparedness/fitness for study, expectations, and an understanding of the constraints that might prevent or inhibit a student from studying. Hudig et al. (2020) opined that students go to HEIs with a certain mindset/frame of reference relating to their motives for studying. This frame of reference may consist of multiple motives.

Many of the first-year students in South Africa are African first-generation students and come from economically polarised and socially stratified backgrounds. These various backgrounds have affected the different schooling backgrounds with classification of schools within certain societal and geographical groupings (Mazwayi, 2020; Motsabi et al., 2020). Bunce and Bennet (2021) revealed that there is evidence to suggest that approaches to learning and subsequent academic performance are influenced by student identity. Students’ identification within social categories may impact how they think of themselves as students and the behaviours they are likely to adopt in the context of learning.

Much research has been done on first-year students (Britt, Ammerman, Barrett, Jones, 2017, Harahap, Hurriyati, Gaffar, Wibowo, Amanah, 2017), but it has been argued (Hudig et al., 2020) that research on motives for studying has primarily been dimensional or variable-centred with a quantitative approach. This method of research is outdated, as it tests the relationship of various dimensions, the interplay between these dimensions or validating certain dimensions. Moreover, current research on HE students takes the angle of students as HE consumers (Khan & Hemsley-Brown, 2021). However, students and

² E-mail address: rtoerien@uj.ac.za

their interplay with HEI is complex and they have multiple motives that may interact. Therefore, a qualitative, student-centred perspective on motives for studying can be more fruitful to explain students' fitness for HE studies and first-year study success and well-being. Motsabi et al. (2020) agreed, stating that the unfitness of first-year students contributes to high failure rates at HEIs, attrition problems of first-year students, a lack of understanding from both the HEI and students and thus warranting more exploration.

Considering the background provided above, it is important to investigate how and why students make their educational choices and how fit they are for this journey. Only by understanding first-year students' fit for study can educators make accurate decisions about better preparing them for HEIs. This study is done within the emerging economy of South Africa and aims to investigate the prior knowledge and readiness to study of the first-year intake at a HEI. Consequently, the following areas were probed:

- First-year students' reasons for studying;
- First-year students' knowledge on financial planning and payment of studies;
- First-year students' prior knowledge of and reason for chosen qualification; and
- First-year students' general fitness for HEI studies.

This study contributes on two levels. On a theoretical level, the study provides a student-centred perspective on fit for study, a neglected research domain (Hudig et al., 2020). On a managerial/practical level, this study's finding can support and enhance students' academic learning when lecturers expose, utilise, and understand students' prior knowledge of HEIs (Castillo-Montoya, 2017).

The study's introduction is followed by a literature review that provides context to the study and endeavours to offer insights into first-year students' fitness for HE studies. The investigative nature of the study called for a qualitative research approach explained in the research methodology. Thereafter, the findings are presented and discussed, followed by the managerial implications, limitations, avenues for future research, and conclusion.

2. Literature review

The literature review section starts off by providing context for the study with a brief introduction of the South African educational sector, the research environment of this study. As this study provides opportunity to ascertain the voice of first year students, previous research findings are explored on various student issues, such as reasons for students studying, students' prior knowledge of their financial obligations and chosen qualification, and of first-year students' general fitness for HEI studies. This study argues that students make HE study choices not on informed decisions or talent but rather on social pressures.

2.1 Context of the study

South Africa has 26 HEIs that accommodate just over one million students. These HEIs are divided into:

- Nine universities of technology focused on vocationally orientated education;
- Six comprehensive universities offering a combination of academic and vocational diplomas and degrees; and
- 11 traditional universities offering theoretically orientated university degrees (Universities South Africa, 2021).

The study's selected HEI is a comprehensive university in Gauteng, one of the nine provinces in South Africa. Gauteng is considered the economic hub of South Africa and host six universities. The most of any of the other provinces. Many of the Gauteng universities also occupy high rankings in South Africa (Universities South Africa 2021)

2.2 Reasons why students study

Students further their HE studies for academic performance and achieving learning, but little is known about what fuels such reasons. These educational reasons can be regarded as the push and intrinsic value that energise educational activities, facilitate learning, and channel behaviour towards achieving educational goals (Öqvist & Malmström, 2018). Educational motivation is defined as the doing of study

activities where a student is moved to act for different reasons. This moving to act can be for the fun or challenge, or external expectations or rewards. Educational motivation requires energy, direction, and persistence, which are aspects of activation and intention (Ryan & Deci, 2000), and guides the goals and aspirations of students (Podoyntsyna et al., 2012; Welpel et al., 2012). According to Lauver et al. (2013), there are two basic reasons why students study, namely they are career-driven and HE studies are seen as taking the first step in the direction of a career, and students view HEIs as a time of further growth by interacting with lecturers and other students and gain confidence through encouragement and building relationships. Bunce and Bennett (2021) added that there are two broad types of motivation applicable to student motivation: intrinsic and extrinsic. Students who find a task intrinsically motivating engage in the content as they find it inherently satisfying and interesting. Students who are extrinsically motivated engage in a task because they desire a particular outcome or reward, or expect external recognition. Curtis and Ledgerwood (2018) agreed with Lauver et al. (2013), stating that millennials express a high interest in engaging with the world beyond their homes. Therefore, studies at HEIs offer unique experiences to students by providing lifelong personal and professional benefits, such as personal growth, cultural awareness, employability, new language skills, creativity, communication skills, and social network development. This is especially applicable to those first-year students choosing to stay in residences.

2.3 Students' prior knowledge of the financial obligation of studying

Britt et al. (2017) stated that the elevated cost of HE has received well-deserved attention lately. In South Africa, student-led protests against the high fees of HEIs gained momentum in 2015/2016 and spread across the country. The #FeesMustFall movement sparked heated debates on HEIs' fee structures. The student message was clear – the HE costs were too high and unaffordable for most poor students (Ndelu et al., 2017). This protest action led to student funds paid out by the National Student Financial Aid Scheme (NSFAS). The mission of the NSFAS is:

To transform NSFAS into an efficient and effective provider of financial aid to students from poor and working class families in a sustainable manner that promotes access to, and success in, higher and further education and training, in pursuit of South Africa's national and human resource development goals. (National Government of South Africa, n.d.)

NSFAS has the following criteria for candidates: must be a South African citizen; must have a valid matric (grade 12); must have a valid ID document; must have a proof of acceptance from the institute of higher learning where applying to; must provide proof of income for either parents or guardians, or proof of deceased where applicable; must be capable within the English language; and parents must have a combined annual household income of no more than R350 000 (Alfred, 2022; NSFAS, n.d.). However, in the 2021 academic year, 150 000 applications were rejected and did not receive NSFAS funding (Bhengu, 2021) and there is the issue of the "missing middle class". These are students from households earning above the NSFAS threshold of R350 000 a year, but who are not wealthy enough to fund themselves or to qualify for study loans from banks (Bangani, 2021). Wilson-Strydom (2017) maintained that South African education, in particular the terrain of access to HE, provides a helpful empirical platform for analysis, given the extremes of wealth and poverty in South Africa. Greeff et al. (2021) stated that the #FeesMustFall movement exposed students' financial vulnerabilities. Nevertheless, the protest was in many cases misunderstood by students.

2.4 Students' prior knowledge of their chosen qualification

Kazi and Akhlaq (2017) emphatically stated that unfortunately students' career choices are made with little awareness of the real world. This sentiment is shared by Castillo-Montoya (2017), who asserted that students' prior knowledge comes from their own lived experience. HEI students have prior knowledge of academic subject matters they have learnt from their secondary/high school. Students have "pockets of knowledge" and this is rooted in their view of their own identity and encompasses race, ethnicity, social class, and religion, and reflects larger social, cultural, and historical realities. This is exacerbated by the fact that many current students are first-generation university students and could not be truer within the South African context. Most first-year students are African and the African culture prides itself in providing support in their communities (Motsabi et al., 2020). In African culture, social support is part of the ubuntu philosophy, which emphasises the importance of a group or community (Mangena, 2016). Children grow up within a family constituting parents (mother and father), grandparents, aunts,

neighbours, and older children who share in the parenting. African people believe in the idiom “*umuntu ngumuntu ngabantu*”, which translates to “a person is a person through other persons” (Mangena, 2016). Social support serves as a protective factor for first-year students through social networks, which either provide financial support, information, or other resources help buffer the students from the harshness of poverty and desperation of need. When faced with challenges of academia, students have a network of family, peers, and other community members to depend on. The big problem is that first-generation students come from families where the understanding of academic norms, expectations, and general HE demands are often misunderstood (Motsabi et al., 2020).

In summarizing the literature, it is evident that South African students are rife with choice on HEI to start their studies but the reason for this selection is unclear. Students enter these HEI with a total lack of knowledge on how to pay for HE or how to select a qualification and rely on their own inner social circle as their source of knowledge. This study endeavours to investigate these claims within an emerging context. The rationale for this study is to provide an opportunity to understand first year students and used a qualitative research approach to investigate the fit for study of first year cohort at a HEI in South Africa.

3. Research methodology

3.1 Research paradigm

A research paradigm is inclusive of several components that lay out the study process. An interpretivist paradigm is more suited for this study as Interpretivism is more sensitive towards individual meanings and contribution. And, as Alharahsheh and Pius (2020) stated, Interpretivism considers differences such as cultures, and various social circumstances.

3.2 Study approach

This study is investigative in nature and followed a qualitative research approach. Kamal (2019, p. 1387) stated that qualitative enquiries have been widely applied in the social sciences and educational studies and this approach explores and understands the meaning individuals or groups ascribe to a social or human problem. Qualitative research is concerned with how people describe their experiences in their own words and what meaning they attribute to their experiences based on the objective of the study. In this study, first year student will express their views – from their own frame of reference – on matters of HEI selection. Shava (2019, p. 239) revealed that qualitative research is also better suited when there is limited research information on the topic, as in the case of this study, within an emerging economy. A qualitative approach is better suited as this study aims to provide specific understanding to a phenomenon based on the students’ experiences

3.3 Sampling plan and site selection

Moser and Korstjens (2018, p. 10) stated that a sampling plan is a formal plan that includes a sampling method, a sample size, and the procedure for recruiting the study participants. The sampling plan must describe how many observations, interviews, focus group discussions or cases are needed to ensure that the findings will contribute rich data. This study employed a purposive sampling technique, wherein judgement was used in the selection of the study participants, and all first-year students within a business and economic college were invited to participate. Purposive sampling provides justification to make generalisations from the sample to the population (Sharma, 2017, p. 750). Twenty-eight questionnaires with ten open-ended questions were gathered via google docs, the link was provided on BlackBoard, a student-lecturer learning interface platform. The ten questions were guided by the study’s aim, areas of investigation and the literature that was reviewed. These twenty-eight questionnaires represent three different departments within a business college, namely Marketing, Accounting, and Public Governance. The study was conducted in Gauteng, South Africa.

3.4 Data analysis

This study aimed to describe human experiences and perspectives and used inductive content analysis. This form of data analysis is suitable when the phenomenon under study has received little attention from academicians or when prior knowledge is fragmented. This method’s ultimate goal is to produce abstracts of the raw data that summarise the main categories, concepts, and themes (Kynge, 2020, p. 14). The research used in vivo coding to further honour the participants’ voice (Saldaña, 2018, p. 86). This form of coding is helpful when researchers interact with participants from a particular group, for instance, first-

year students in this study (Manning, 2017). This study followed the sequential framework of Mayring (2014), as outlined below.

Step 1 – Research questions. Formulate a research aim that fits an inductive logic, which means that it must be exploratory or investigative. The aim of this study was to explore the prior knowledge and readiness to study the first-year intake at a HEI. The theoretical background must be described using literature and previous studies. Step 1 was covered in the introduction and literature review sections.

Step 2 – Category definition and level of abstraction. The category definition, which has to be explicit, serves as a selection criterion to determine the relevant material from the texts – online questionnaires. The level of abstraction defines how specific or general categories have to be formulated, which is central to inductive category formation. For the purpose of this study, the areas of investigation were operationalised into the following category definitions: investigate and describe first-year students' reasons for studying; investigate and describe first-year students' knowledge on financial planning and payment of studies; investigate and describe first-year students' prior knowledge of and reason for chosen qualification; and investigate first-year students' general fitness for HEI studies. Step 2 was covered in the introduction, literature review, and participants' feedback in the online questionnaires.

Step 3 – Coding the text. Qualitative data coding decisions should be based on the paradigm and theoretical approach of the study. To tap into the participants' experience, in vivo coding was used to honour their voice and to ground the data analysis from their perspective. Steps 3 to 7 were carried out on the questionnaires, with each step improving on the last.

Step 4 – Revision. A revision in the sense of a pilot loop is necessary when the category system seems to stabilise. A check is done to see whether the category system fits the research question; if it does not, a revision of the category definition is necessary. A check is also done to see whether the degree of generalisation is sufficient. If there are only a few categories, then the level of abstraction is too general; and if there are many, then the level of abstraction is too specific.

Step 5 – Final coding. All the data material had to be worked through with the same rules – that is, category definition and level of abstraction.

Step 6 – A list of categories emerged at the end of this process. They were grouped together to build themes, keeping in line with the research aim.

Step 7 – Intra- or inter-coder check. The text was coded from the beginning to match the categories.

Step 8 – Findings. Initially, the findings were the list of categories. If categories have to be found for several text passages, a frequency analysis of the categories' occurrence could be useful. The categories and the frequencies have to be interpreted in the direction of the research aim. Step 8 revealed the findings of this study, which are presented in the section that follows. The findings will be presented in the same order as the listed areas of exploration.

3.5 Data trustworthiness

Lincoln and Guba's Four Dimensions Criteria (1985) were considered to evaluate trustworthiness through assessing credibility, transferability, conformability, and dependability of the qualitative data. The coded data were checked by peers and subject experts and their feedback was considered. Anney (2014) stated transferability is how the qualitative researcher demonstrates that the research study's findings are applicable to other contexts. In this case, "other contexts" can mean similar situations, similar populations, and similar phenomena. From a qualitative perspective transferability is primarily the responsibility of the one doing the generalizing. The most common related strategy to obtain transferability is the use of thick descriptions, but it is also supported with purposeful sampling to ensure a representative sample and data saturation. Another method to ensure trustworthiness is to do constant comparisons between participants' feedback.

3.6 Ethical clearance

This study was issued with an ethical clearance certificate through the relevant college committee. Participants' informed consent was obtained via a click through button on the google doc and privacy and anonymity was also guaranteed via a click through button.

4. Findings and discussion

First, this study investigated and described first-year students' reasons for studying. One dominant theme that emerged centred around careers. The participants felt that getting a qualification would assist them in getting a career and that people who have qualifications get good jobs and qualifications are seen to build careers. The findings from this exploration focused on getting a job and making money. The participants were aware that studying is the key towards a career and a better life overall, with some explaining why they studied as follows:

- To further my studies and have a degree. (P1)
- It is because majority of people who studied at higher education get good occupations that is what I noticed. (P15)
- To better my life. (P27)

From these findings, it is clear that students are extrinsically motivated to study. They connect their motivation to study to external recognition. According to Shcheglova et al. (2020), students who have a HE qualification have a better chance at a successful career and self-realisation. Van Broekhuizen et al. (2016) opined that students are motivated to improve their family circumstances with qualifications that would enable them to get better jobs to achieve their goals. Furthermore, students want to better their lives and first-generation students are motivated to study at a HEI to break the cycle of poverty. By obtaining a qualification, students can get a job with a good salary that would enable them to improve their social conditions (Motsabi et al., 2020).

Once the reasons why students study were made clear, the participants were probed further to explain what they would have wanted to know before choosing to study at a HEI. The themes that emerged focused on insecurities and unfitness for HE studies. Participants wished they had known beforehand how everything works, referring specifically to how to navigate their studies and their chosen HEI. There is also a general uncertainty on their chosen qualification and participants wanted to know what their future job prospects were. Moreover, I participants stated that they wished they had known beforehand that studying at a HEI is hard work. There are still many unanswered questions.

- I would have wanted to know how things actually work here in terms of choosing modules and all that stuff. (P5)
- I would want to know how to find a job maybe after finishing my studies. (P21)
- I wish I'd known that it was this hard. (P28)

This finding ties in well with Van Broekhuizen et al. (2016), who stated that high schools are not adequately preparing students for HE studies. Contrastingly, Öqvist and Malmström (2018) maintained that although students have many unresolved questions, it is educational motivation that provides persistence and commitment to learning tasks. This educational motivation is an important factor for the entire learning process. Educational motivation is pivotal for students' learning and for academic achievement, such as graduation and career success.

Second, the study wanted to investigate and describe first-year students' knowledge on financial planning and payment of studies. There is a general apathy and participants expressed a lack of knowledge on HEI finances, how to pay for their studies, or how to obtain the necessary information. The participants stated that they had to source the information themselves or that they asked the teacher at the high school for such information:

- My LO [life orientation] teacher from high school is the one that told me about financial planning and payment of studies. (P5)
- Browsing on the Internet and word of mouth. (P2)

South Africa has 26 types of HEI, each with numerous qualifications and costs involved, meaning the information provided by teachers is superficial. This is confirmed with the next finding, when the participants were asked what they would have wanted to know about financial planning and payment of studies before applying to study at a HEI and the resounding theme emerged of “what everything costs”. The participants were shocked regarding what it costs to be a student. According to them, it is expensive to be a student, even with NSFAS funding. The participants were unaware that HEIs’ tuition fees do not reflect the full cost needed to study. There is a lack of financial fitness amongst the first-year students:

- I wish I would've looked into it much earlier and applied for much more [funding] because I was so close to not having finances to pay my studies. (P24)
- I wish I'd known that it would so much money; that there would be such a difference between university fees and high school fees. (P2)

Richards (2019) revealed that students expect a relevant course design, good support services, and a social life, and expect their university to maintain a good reputation. High service quality improves the hassle of paying fees and enhances satisfaction. Service quality encompasses activities and facilities, such as reputation, library services, catering, accommodation, quality of course design, class size, good teaching, recreational facilities, and student workload. Motsabi et al. (2020) stated that it would be unrealistic to expect students to have prior financial knowledge of HE, as many of these first-generation students come from poverty and a social environment that cannot provide the necessary information. These students see HE studies as a means to improve their family situation.

Third, this study endeavoured to investigate and describe first-year students’ prior knowledge of and reason for the chosen qualification. An interesting yet overwhelming response was that the participants knew nothing about their chosen qualification prior to registration. The answers were superficial with a lack of substance:

- I didn't know about it, as it was chosen by default of space constraints in the course I specifically applied for. (P2)
- [The qualification] involved a lot of maths and thinking. (P25)

When the participants were probed more and asked what made them choose their qualification, two themes emerged. The participants indicated that they liked the subject at school and that their matric results guided their study choice. It is noteworthy to indicate that no participant mentioned any form of deliberate chosen career, nor was there any indication of some sort of career guidance, such as psychometric testing:

- I loved business studies in high school, so me furthering it was just perfect. (P8)
- My marks. (P3)

Harahap et al. (2017) stated that students wanting to pursue HE studies face various considerations, such as the choice of HEI and the various qualifications. The collection of information on these choices becomes a real challenge. The authors added that there are several reasons why students choose a qualification, namely the personal situation of the student; student decision-making is also affected by price, promotion, people, and physical evidence; and information from students who are still studying and have passed the qualification (alumni).

Lastly, this study wanted to investigate first-year students’ general fitness for HEI studies. To obtain thick and rich descriptions, several probing questions were used. When asked what could be put in place to better inform high school learners on further study opportunities after high school, the participants felt that HEIs must be proactive and send HEI agents to high schools to talk to school-leavers. Additionally, participants shared that they want to be assured they have selected the right course. They believe that HEI agents will provide more accurate information on courses and on various HEIs. Overall, the study’s respondents longed to acquire the right information, including all aspects of HEIs and career choices. Some even expressed that school-leavers should be given aptitude tests to help career guidance.

- Much more information than the one that is available and also universities could send some agents to high schools to provide information about a certain institution. (P1)
- Giving them aptitude tests and providing them with the qualifications they are applicable for. (P23)

As these participants were already in their first year of studying when surveyed, it can be assumed that some students were aware that they may be in the wrong qualification. They still want assurance from somebody that they have made the right career choice. Students want more information on the various qualifications and where their knowledge and abilities fit in; they want a:

- Guarantee that they will have a bright future if they choose the right course at the right institution. (P12)

This finding is not unique and, as Castillo-Montoya (2017) stated, HE students make qualification choices based on subject matter they have learnt at secondary/high school. This insufficient prior knowledge may not be relevant later. Participants were further probed and asked to elaborate on their first-year experience of HE teaching and learning. They argued that their first year was hard work and a huge adjustment, exacerbated by the fact that everything was online. The online theme was always connected with negativity:

- It was hard for me to cope ... you have to catch up! (P22)
- It's a huge adjustment. (P10)
- It is not that much fun as everything is online and we can't experience full varsity life because of coronavirus. (P2)

The students did not expect all teaching and learning to be online, but they were aware that COVID-19 was the cause for this. According to Shcheglova et al. (2020), first-year students mostly struggle with social and academic integration. The first year of study is a critical period for students, as it is a major transitional period from secondary/high school to a HEI and subsequently to a more adult life. Novice students may experience the registration process and arrival at campus as a culture shock, which becomes replaced by issues of assimilation and absorption of values of the HEI. This leads to first-year students often feeling isolated, separated, or socially and academically alienated from the college (Shcheglova et al., 2020). Matarirano et al. (2021) stated that current students are digital natives and would not encounter many challenges in online learning. Today's students enter HEIs with vast knowledge and experience of computer technologies as they grew up with the technology. Most students have access to and are experienced in using digital technologies as they spend a lot of time on gadgets. Most students can use HEI online tools and platforms, but the successful utilisation of these platforms requires an Internet connection, data, and a laptop, which are resources that are not always available to many students, especially those from remote rural areas.

The participants were asked what hardships they experienced when moving from high school's teaching and learning to HEI's teaching and learning. The participants moved from a face-to-face lecturing method at school to an online lecturing method at the HEI, which was a huge adjustment. This was exacerbated by the fact that there was no social interaction on campus. The respondents lamented that they missed human interaction – for example, the teacher in front of the class and making new friends. Moreover, they found navigating HE and the HEI very complex:

- Everything moved to an online platform where contact classes are not used, so it has been difficult to actually concentrate in class. (P1)
- The transition from high school and varsity was not bad, however I found it complex to make new friends and to adjust my finances. (P4)
- [The] workload and also the style of teaching [were difficult]. (P16)

The factors influencing students' fit for HE studies include academic and social integration, students' commitment to obtaining a university qualification, socio-economic status, and student loans. These factors vary from country to country and depend on the design of the admission system, funding sources, and curriculum structure. (Shcheglova et al., 2020). The importance of teaching quality and social life balance are extremely important to student expectations and satisfaction (Khan & Hemsley-Brown, 2021).

Ménard et al. (2021) stated that stress may be a salient issue for undergraduate students who must juggle a heavy workload, negotiate intense time management commitments, and adapt to new pedagogy. Student hardship and stress related to anxiety, depression, relationship concerns, family issues, academic performance, career worries, (Fusco, Sica, Parola, Sestito 2022), and relationship problems are typical issues for many students seeking psychological services on campus (McIlveen & Patton 2007).

When participants were probed on how they deal with these hardships and other HE teaching and learning stresses, it emerged that they were still coping with these stresses and using numerous methods to cope, such as exercise, sleep, and listening to music:

- I'm still dealing with it. (P1)
- Exercise, sleep and cry out my emotions. Lastly, I call [a support line on campus]. (P2)

In their study, Yzer and Gilasevitch (2019) reported that exercise was students' preferred active to reduce stress. Beliefs about exercise emphasised physical well-being benefits, but not having time for exercise was a stress enhancer. Students believe that asking for help for stress is multifaceted – it is about getting support from others (students and lecturers), the stigma attached to asking for help, and the time constraints wherein this assistance must happen. Furthermore, Ménard et al. (2021) stated that students use a variety of different coping strategies, including social support, self-care, hobbies, and problem-solving. It is also noteworthy to mention that different students experience stress differently (Ménard et al., 2021). There is a difference between students staying in residences compared to those staying at home, as well as between students studying different qualifications. Nevertheless, Galindo-Domínguez and Bezanilla (2021) opined that academic stress among HE students is not a new topic and seems to have an impact regardless of the country, culture or ethnic group. In recent years, HE students have reported higher levels of stress than previous studies that used the same measurement instrument. Moreover, depression and anxiety disorders among HE students is higher compared to the general population.

5. Practical implications

Several managerial/practical suggestions arose in this study. These are outlined below. High schools do not prepare students adequately for HE studies.

Action strategy 1

Greater awareness about HEI and their qualification offerings should be targeted at high school learners. This can be done by ensuring easy and understandable information is provided on institutional websites. This information should include payment plans / options, and specific careers that flow from qualifications.

Action strategy 2

HEI should send agents to visit schools and provide relevant information to learners. Learners should be provided with take-home pamphlets containing information and links to further information. HEI agents visiting schools should form part of the HEI overall awareness and marketing initiatives.

Students do not select qualification based on interest / skills and aptitude.

Action strategy 1

HEIs should use discipline-specific enrolment criteria for qualifications. Students should not be selected merely on their matric results for acceptance. This should alleviate any uncertainty from students on qualification choice and subsequent career opportunities.

Students find it hard to fit in on campus life or to navigate the HEI

Action strategy 1

HEIs should schedule mandatory and extensive first-year orientation. This initiative should include centralised functions like finances and de-centralised functions such as specific qualifications. The qualification orientation must reference career possibilities and the finance orientation must reference what it costs to be a student, and orientation on navigation through the institution. During such orientation, students must be exposed to various departments and centres of the HEI.

Students want to be assured that they have selected the right qualification.

Action strategy 1

HEIs should be flexible in cross-qualification movements, which will allow students to move from one qualification to another if interest is lost in their first choice. This movement, can alleviate the problem of students that find later in their studies, that they have lost interest or have found a better interest in another qualification.

6. Limitations and future studies

This research was conducted in a comprehensive university in the South African province of Gauteng. Further research using samples from other universities and colleges, including other subject domains, such as science, would present a more comprehensive picture of students' motivations and educational expectations. As per Curtis and Ledgerwood (2018), there are varying motivating factors between business and non-business students. It would be very interesting to determine if students studying professional qualifications, such as medicine, dentistry, and microbiology, have greater prior knowledge of their qualifications. Another future study could investigate what role secondary/high schools play in getting students fit for studies. This fitness should include alignment between student interest and qualification choice as well as accurate information on all matter financial. Moreover, a student-centred quantitative study, using a bigger sample could provide more insights.

7. Conclusion

This study investigated first-year students' general fitness for study at a HEI. It surveyed their academic view on this topic and the findings were all corroborated by previous studies. First-year students at a comprehensive HEI studying a commerce qualification are unfit for studies. The students did not base their choice for qualification on any scientific method, such as career guidance, nor any psychological intervention and rather used external motivators like money and recognition within their social circle as motivation for study. This method of choosing a qualification creates uncertainty later, as many students want to be assured that they have made the right choice. The results indicate that first-year students are unaware the financial obligation tied to HE studies and are surprised to discover the overall cost of being a student. First-year students find the transition from high school to HEI extremely stressful and full of uncertainty. It was found that first-year students are stressed, unfit, and finding it difficult to cope in this new HEI environment.

The Influence of Globalisation and the Knowledge Economy on Postgraduate Education: a Policy Perspective

Prof Petronella Jonck^{1,*}

¹GIFT, North-West University, Mafikeng, South Africa

Keywords

Postgraduate completion rate; Globalisation; Knowledge economy; burden of supervision

Abstract

Postgraduate education is considered a principle within the higher education context which depends on effective and efficient supervision of postgraduate students by supervisors. Nevertheless, massification and the necessity to improve educational access are acute anomalies facing postgraduate supervision. The primary objective of the reported research was to explore the influence of globalisation and the knowledge economy on postgraduate education within the South African context. The research was based on a policy analysis following a systems analytical approach as theoretical underpinning. Results indicated that globalisation and the knowledge economy influence postgraduate education on four levels, *inter alia*, micro-, meso-, macro- and supernational levels of complexity. Furthermore, four specific influences to a varying extent are related to quantity or access, transformation, efficiency and quality supervision. Since postgraduate education supervisors are the focal point in the postgraduate education discourse, it is pivotal at the grass root level to comprehend the forces that brought the massification into being and evaluate the way it has been implemented to achieve the stated purpose.

1. Introduction

Postgraduate education is considered critical as it provides higher education institutions with the opportunity to foster innate research capabilities, enhance the academic reputation and is a source of financial gain (Alam, Alam & Rasul, 2013). The previous authors further assert that the success and quality of postgraduate education largely depend on the effective and efficient supervision of postgraduate students (Alam et al., 2013). Frisch and Larson (2000) confirmed that effective supervision of research students is recognised as a pivotal success factor in completing postgraduate studies. Nonetheless, Cekiso, Tshotsho, Masha and Saziwa (2019) opine that the teaching-learning process is inadequately understood despite the keystone role of postgraduate supervision. For example, Lee and Murray (2015) alluded to a postgraduate supervisory framework which consists of five intertwined components, *inter alia*, (i) functional (i.e., project management); (ii) enculturation or epistemological access where students are encouraged to become members of the disciplinary community; (iii) critical thinking (i.e., students are encouraged to question and assimilate research findings); (iv) emancipation (i.e., students are stimulated to question and develop a professional identity; and (v) developing a supervisory relationship where postgraduate students are enthused, inspired and nurtured.

Current debates in postgraduate supervision discourse underscore different approaches (Bitzer & Albertyn, 2011), usage of coaching (Keane, 2016), facilitation and reflective practice (Kuwahara, 2008), technology usage (Rambe & Mkono, 2019), various modalities, for example, distance education (Manyike, 2017), and the influence of supervisory motivational values on postgraduate throughput (Callaghan, 2020). Similarly, Lee and Murray (2015) referred to a large body of work on postgraduate academic writing. Currently, massification in the face of scarce resources and the necessity to improve educational access are acute anomalies facing postgraduate supervision (Albertyn, Machika & Troskie-de Bruin, 2016). Akerlind and McAlpine (2017) contend that international policy directives currently prioritise increasing growth in the number of postgraduate students, notably doctoral candidates, as well as the prompt completion of studies within a three-to-four-year timeframe. . According to Alam et al. (2013), this results in enormous pressure on

supervisors and postgraduate students. Akerlind and McAlpine (2017) further argue that growing international attention on the public investment to expand postgraduate education has given rise to an extensive debate about the purpose thereof. Callaghan (2020), citing Mouton (2016), maintains that postgraduate education, specifically at the doctoral level, has been predisposed by four policy discourses, including the necessity for (i) quantity; (ii) efficiency; (iii) transformation; (iv) and quality. Mouton (2016) further asserts that this policy discourse finds expression in a complex system (i.e., higher education) of recursive causality and emergent properties. As such, a system can be defined as a structured entity comprised of components sufficiently interrelated and interdependent as to form a unit; higher education can influence the system on various levels of complexity by the hierarchy of systems (Jonck, Goujon, Woldegiorgis & Maloiy, 2019). Notwithstanding the complexity of postgraduate supervision and the stumbling blocks faced by South African academic staff, for example, the burden of supervision, postgraduate supervision appears to be comparatively efficient (Callaghan, 2020).

2. Problem Investigated

Lee and McKenzie (2011) asserted that internationally there is increasing pressure on higher education institutions with reference to the quality of postgraduate education underscoring accountability and completion rate. Within the South African context, the National Development Plan (2012) recommended that by 2030 institutions of higher education should produce more than 100 doctoral graduates per million citizenries annually, amounting to 5000 graduates. Botha (2009) opined that higher education institutions (HEIs) nationally are implored to increase epistemological access and postgraduate education output aimed at improving research skills and research-based knowledge. For the most part, the mentioned policy directive is driven by, for example, funding for HEIs in most countries, including South Africa is linked to the completion rate of postgraduate students (De Beer & Mason, 2009). However, the Council for Higher Education (CHE, 2019) vital statistics for the 2017 academic year indicated that 59 152 magister students enrolled with 12 951 graduating, reverting a completion rate of 21.89%. In the same vein, 22 572 doctoral students enrolled, with 3 057 graduating, reflecting a completion rate of 13.54%. The said trend persisted and could be identified in the 2019 data (CHE, 2021), which indicated that 62 157 magister students enrolled with 13 519 qualifications awarded, reverting a completion rate of 21.75%. In comparison, 24 386 doctoral candidates enrolled with 3 445 qualifications awarded with a completion rate of 14.13%. The Council for Higher Education (2021) furthermore reported that in 2019 there were a total of 55 742 academic staff employed at institutions of higher learning, with 14 991 academic staff possessing a doctoral qualification. Thus, 14 991 staff members from senior lecturer onward were responsible for supervising 86 543 postgraduate enrolled students (CHE, 2021). Essop (2020) indicated that the increase in doctoral enrolment was in accordance with the doctoral graduation rate, i.e., an annual average increase of 8.2%. Nevertheless, the disparity between the growth rate of academic staff and the headcount enrolments has given rise to the phenomenon termed the burden of supervision (Essop, 2020). Cekiso and colleagues (2019) confirmed that numerous postgraduate students fail to complete enrolled studies within the stipulated time because of, amongst other inexperienced or overburdened supervisors, inadequate candidate preparation, poor planning and management, methodological difficulties, insufficient financial support, strained student-supervisor relationship and ineffective infrastructure support for postgraduate education. While postgraduate supervision might be extensively researched in the context of effective supervision according to Petersen (2007), the question remains concerning the factors contributing to the increased postgraduate completion rate expectation and/or demand, especially considering the burden of supervision. Against the stated background, the research report aims to explore the influence of globalisation and the knowledge economy on postgraduate education as possible factors driving the increased postgraduate throughput demand.

3. Research Objectives

The primary objective of the reported research was to explore the influence of globalisation and the knowledge economy on postgraduate education within the South African context. The rationale underpinning the research subsume improved understanding at the grass root level with specific

reference to the drivers of postgraduate education ‘massification’ and the implications thereof for postgraduate supervision practice.

4. Policy environment

Jonck (2017: 65), citing numerous authors, stated that ‘*South Africa has set itself the unusual and challenging task of becoming a development state.*’ Thus, the ruling political party entrenched in promulgated legislation a conceptual understanding of South Africa as a developmental state grounded on four specific characteristics, *among other things*, the developmental state’s strategic positioning should be reflective of a people-centred approach, people-driven concentrating on fostering change, sustained development and restructuring of the economy and socio-economic inclusion (African National Congress, 2012). Furthermore, the developmental state ought to provide leadership in defining the shared national agenda and mobilising society to participate in the implementation thereof. Besides, the developmental state, in its organisational capacity, should guarantee that internal structures and systems enable the realisation of the national agenda (Jonck, 2021). To this end, Jonck (2017: 66) alluded to the Medium-Term Strategic Framework (Republic of South Africa, 2014), which articulated those graduates from the post-school system, i.e., HEI graduates ought to have adequate skills and knowledge to meet the current and extrapolated future needs of the economy and larger society. Furthermore, the necessity for socio-economic reform in South Africa and specifically the higher education landscape has been expressed in, among others, significant policy documents, including but not limited to The National Plan for Higher Education (DOE, 2001); A programme for the Transformation of the Higher Education System (White Paper 3) (DOE, 1997); Towards a New Higher Education Landscape: Meeting the Equity, Quality and Social Development Imperatives of South Africa in the 21st Century (CHE, 2000); and the National Development Plan (2012). Specifically, Essop (2020: 7), citing the White Paper of 1999, noted that:

“As our policy documents make clear, it is vital that the mission and location of higher education institutions be re-examined with reference to both the strategic plan for the sector and the educational needs of local communities and the nation at large in the 21st century”.

Expounding on the above, the White Paper on Higher Education (DOE, 1997: 3) asserted that “*to address the development needs of society and provide the labour market, in a knowledge-driven and knowledge-dependent society, with the ever-changing high-level competencies and expertise necessary for the growth and prosperity of a modern economy*” the higher education landscape must be transformed. The White Paper on Higher Education (DOE, 1997: 4) furthermore emphasised that the post-school system contributes towards the creation, sharing and evaluation of knowledge through, for example, research, learning and teaching. Thus, from a policy perspective, the knowledge economy has been identified as a driver of change. Moreover, the Department of Science and Technology (2008: 290) asserted that South Africa must increase the doctoral production rate by factor 5 over a 20-year period to build a knowledge economy positioned between developed and developing countries. Correspondingly, the Academy of Science of South Africa (ASSAF, 2010: 15) opined that there is a broad consensus in the South African science community that not enough high-quality doctoral graduates are being produced concerning the development needs of the country.

While the National Development Plan (2012) express the legislative intent about higher education transformation as follows (NDP, 2012: 296): “*Lifelong learning, continuous professional development, and knowledge production alongside innovation are central to building the capabilities of individuals and society as a whole.*” Furthermore, the NDP (2012: 317) set a target of one in six South Africans must be university graduates, which is the strongest indicator of expanding access to university education. The National Development Plan (NDP, 2012) was promulgated in 2012 by the South African Government as a roadmap toward socio-economic transformation, including in the higher education sector. The NDP (2012: 317) identified higher education as the major driver of information and knowledge systems that contribute to economic development. More specifically, the NDP can be seen as a long-term modus operandi aimed at eradicating poverty and decreasing inequality by 2030 while uniting citizenry, unleashing intrinsic vitality, fostering economic growth and an inclusive economy, developing individual capabilities, and enhancing the capability of the state (Jonck, 2021

citing National Planning Commission, 2012) thus contributing towards the achievement of the national agenda.

5. Literature review

Woldegiorgis, Jonck and Goujon (2015) expound that major economies are knowledge-based in the current epoch of globalisation, embodied by elevated levels of skills, education, lifelong learning, and innovation. While globalisation continuously emphasise the expanding tendencies of interconnectedness and interdependency, mobility of citizenry, ideas and capital gains prominence among nations (Jonck *et al.*, 2019). Jonck (2014), elaborating on research conducted by Goujon, Lutz and Wazir (2011) explained that knowledge and skill endowment, rather than physical capital, determine a country's labour force progress (i.e., economically as well as at a societal level) and hence a country's ability to compete in the world economy. Moreover, globalisation has influenced the higher education sector, giving rise to a concern for quality and relevance beyond national borders ascribed to mobility, graduate employability, transferability of credits, and cross-border comparability of qualifications (Woldegiorgis *et al.*, 2015). Specifically, the international demand for specialised skills and innovative research attributed to globalisation, continuous change in competitive markets, management and services, design and development has forced HEIs to produce more postgraduate students (Alam *et al.*, 2013). The rationale underpinning the increased demand for postgraduate graduates is based on the association between economic prosperity and citation intensity, which is linked to research outputs. Hence, HEIs are advised to emphasise knowledge outputs substantially to compete with developed countries in a globalised knowledge economy (ASSAF, 2010). Regarding the national agenda, the NDP (2012: 324) has identified globalisation as a significant trend driving change within the South African context, notably the education sector.

The NDP (2012: 13) defines globalisation as a promulgated policy directive as: “*rising global trade and increased flows of people, capital, ideas and technologies across border.*” The NDP (2012: 76) further noted that while globalisation provided enormous benefits, including a reduction in poverty and greater social integration, a failure to curb financial, technological and social threats associated with globalisation poses a substantial risk. Similarly, the NDP (2012: 95) made mention of the unintended consequences of globalisation subsuming the increased pressure on the government to re-structure global institutions to novel realities and to promote a more equitable global order. Specifically, in the educational context, the NDP (2012: 324) advised private and public institutions to collaborate to foster educational infrastructure pre-requisite to support a thriving economy since the globalisation of skilled labour and technological markets necessitate educational systems to function across national borders and sectors. Mainly, globalisation requires economic activities founded on new knowledge stimulating economic growth, providing higher wages and more employment opportunities. However, aforesaid depends on novel technology investments, high-technology industries and skills labour which are deemed essential ingredients of a knowledge-based economy (Blankley & Booyens, 2010).

McKenna (2021: 97), expounding on the relationship between skills, the economy and higher education, opine that the knowledge economy can be defined as the idea that the economy advances through knowledge development. The principal to the notion of a knowledge economy is that knowledge and education are deemed productive assets that can be leveraged for a high investment return. Boughey, Van den Heuvel and Wels (2017) noted that the need for South Africa to engage with the globalised knowledge economy has recently been paramount. Intrinsically, the economies of developed countries have increasingly evolved into knowledge-based economies, depending less on traditional resources, for example, capital and labour, for economic development (Blankley & Booyens, 2010). Despite this, Jonck (2014), reflecting on research by Guile (2006: 364), noted that the knowledge economy had been ‘under-theorised’, resulting in policies that reflect a paucity of clarity about the type of knowledge required and how such knowledge should be acquired. Certainly, knowledge economy indicators which indicate a country's status quo plays a pivotal role in policy debate however, a standard set of indicators for the knowledge economy is absent. Suggested international comparable knowledge economy indicators subsume research and development (R&D), innovation and information society (Blankley & Booyens, 2010). Nevertheless, the NDP (2012)

articulation of South Africa's long-term vision supports the notion of a knowledge economy vis-à-vis a resource-intensive economy (Jonck, 2017).

As such, the NDP (2012: 144) opine that sectors and clusters that might avail South Africa with a competitive advantage should be promoted to transition to a knowledge economy and optimal utilisation of information and communication technologies. Pursuantly, the NDP (2012: 157) stive for a “*greater emphasis on innovation, improved productivity, intensified pursuit of a knowledge economy and exploitation of comparative and competitive advantages*” approaching 2030. Moreover, it is envisioned that information and communication technology would underpin the development of a dynamic and connected information society indicative of an inclusive and prosperous knowledge economy (NDP, 2012: 190). Consequently, per the national agenda for South Africa to become a participant in a globalised knowledge economy, the quality and quantity of postgraduate education should significantly improve which necessitate quality inputs (i.e., supervision, infrastructure, and enabling environment, to mention a few) and quality outputs referring to the postgraduate production rate (Boughey *et al.* 2017). Hlengwa (2017) confirm this assertion by indicating that South Africa is obligated to increase the number of doctorandi, enabling the country to develop its knowledge economy.

Against this background, globalisation and the knowledge economy have been identified from promulgated policies and legislation supported by the corpus of knowledge as key drivers that influence postgraduate education. Though, the way and or extent to which the mentioned drivers influence postgraduate education remains a topic that needs to be explored from a policy perspective.

6. Theoretical underpinning

Mouton (2016) elucidated that higher education policy discourse finds expression in a complex higher education system. Hence, complex systems theory has been selected as a theoretical underpinning. Frei (2011) argues that the rationale for utilising complex systems reasoning with reference to educational structures is founded on the supposition that societies are becoming increasingly complex and interrelated especially considering globalisation. For the sake of clarity, a complex system refers to a structure as a complete-part unit where the influence supersedes linearity (viz. causality), and parts are interdependent (Roth, 2017). Hypothetically, the higher education system as an example of a vertical hierarchal system, can theoretically subsume micro-, meso-, macro- and supranational levels of complexity (Jonck *et al.*, 2019). At the micro level of complexity representing the individual, access to higher education facilitates job opportunities as the unemployment rate for higher education graduates is significantly lower compared to secondary education (Gwatirera, 2018). On the meso level of complexity or at a societal level, higher education is an imperative enabler for previously disadvantaged with reference to transforming the disempowered's economic, socio-psychological, political and legal status (Jonck *et al.*, 2019). At a macro level, higher education is a veritable instrument for national development. Hence, higher education is deemed a principal method for imparting skills relevant to the individual's contribution to national development (Erdem & Tugcu, 2012). Lastly, in the context of globalisation and the knowledge economy, reciprocal relationships between countries' higher education systems represent the supranational influence of higher education (Nafukho, Muya & Irby, 2014).

7. Research Methodology

A qualitative descriptive research methodology was implemented to explore the research question viz. the influence of globalisation and the knowledge economy on postgraduate education. Qualitative research can be defined as an approach aimed at understanding the processes and context which outline various phenomena (Wagner, Kawalich & Garner, 2012). Whereas the main objective of a descriptive study is to elaborate on a topic as accurately as possible at a specific point in time (Jonck, Le Roux & Hoffman, 2012). Within a higher education context policy is pivotal as it determines the resources allocated for educational endeavours (Razik & Swanson, 2001), hence a policy document analysis was implemented. Policy document analysis is believed to be a practical tool which can also be adopted as a qualitative research method (Cardno, 2018). The previous author furthermore elaborates by emphasising the importance of policy analysis for higher education subsuming

providing information about the forces that brought it into being, the policy history to comprehend how the policy was constructed as well as evaluate the way it has been implemented to achieve the stated purpose (Cardno, 2018). Influential authors such as Bell and Stevenson (2006) and Busher (2006) gave rise to a contemporary conceptual framework for policy analysis, which includes analysing policy from three perspectives, namely context, text, and consequences. The policy text is the content of the policy document and analyses the identified policy in accordance with the purpose, values and characteristics underpinning the mentioned (Cardno, 2018). The selected research design was operationalised by means of thematic content analysis of the identified data source, i.e., the National Development Plan. Thematic analysis is considered a qualitative descriptive method aimed at identifying, analysing and reporting themes within a data source. In comparison, content analysis embodies a systematic coding and categorisation to explore textual information toward determining trends, patterns, and the structure of narratives (Vaismoradi, Tutunene & Bondas, 2013). Therefore, the purpose of the thematic content analysis was to identify and describe trends related to postgraduate education discourse in the NDP in terms of identified themes, namely globalisation and the knowledge economy utilising a complex systems theory approach to analyse and interpret the data.

Research design implementation was following the corpus of knowledge relating to qualitative content analysis. Considering the delimitation of the topic, confinement of the study to a singular data source, and the specific purpose of the analysis, sampling was not performed (see, for example, Pietersen, 2018). During the data analysis process, subthemes emerged and were presented sequentially per theme in the findings. Findings were integrated with relevant theory and followed overleaf by concluding remarks. A qualitative content analysis of a policy document was employed in the research project; hence no interaction with human participants or animals occurred. Furthermore, the NDP (2012) has been published on a public platform adhering to the POPI Act requirement.

8. Results and Findings

In accordance with the theoretical underpinning, i.e., vertical hierarchal complex systems approach the influence of globalisation, and the knowledge economy was analysed at various levels of complexity, namely micro-, meso-, macro- and supranational levels. Specifically, data analysis was conducted on Chapter 9 of the NDP (2012) which refers to improving education, innovation and training. Take note, that a data excerpt is included for all sub-themes following accepted practice in qualitative research.

8.1 Sub-theme 1: Micro level

Access to higher education is deemed a micro-level influence. Per se, the NDP (2012: 317) noted that *‘in 2030, one in six people [citizens] will be a university graduate. This is one of the strongest indicators of expanding access to university education.’* Furthermore, the NDP (2012: 319) propose the following in terms of access:

‘Increase the participation rate at universities by at least 70 percent by 2030 so that enrolments increase to 1.62 million.’

‘Increase the throughput rate for degree programmes to more than 75 percent’

‘Increase the number of masters and PhD students. [...] By 2030, over 25 percent of university enrolments should be at postgraduate level.’

‘Produce more than 100 doctoral graduates per million per year by 2030.’

‘South Africa needs more than 5 000 doctoral graduates per year.’

The NDP (2012) also notes on a micro level that the qualifications of higher education academic staff should be improved, fostering individual career opportunities and personal development. Thus, *‘South African needs to increase the percentage of PhD qualified staff in the higher education sector from the current 34 percent to over 75 percent by 2030’* (NDP, 2012: 319).

8.2 Sub-theme 2: Meso level

At a societal level, the NDP (2012) noted that previously disadvantaged groups should be promoted within the higher education milieu with specific reference to gender and race. As such, the NDP (2012: 319) indicated that women and black Africans should make out more than 50% of research and academic staff. More specifically, *‘double the number of postgraduates and postgraduate scientist and increase the number of African and women postgraduates, especially PhDs, to improve research and innovation and make university staff more representative.’*

8.3 Sub-theme 3: Macro level

At a macro level, the NDP (2012) identified higher education as a major driver of the knowledge system linked with economic development. Hence, the NDP (2012: 317) opine that *‘higher education is the major driver of information and knowledge systems that contribute to economic development.’* It is, furthermore, argued that HEIs are pivotal to developing South Africa with specific norms and standards identified, including (NDP, 2012: 318): (i) providing high-level skills; (ii) dominant producers of novel knowledge, critiquing information and finding novel applications for existing knowledge; and (iii) providing an opportunity for social mobility. Specifically, regarding finding novel applications the NDP (2012: 297) explained that *‘higher levels of education, skills, research and innovation capacity are required for developing new and utilising existing technologies.’* Also *‘the pool of researchers [postgraduates with doctoral qualifications] needs to expand and their productivity needs to increase significantly. Innovators are going to play a critical role in creating new products and new ways of producing existing products cheaply and more efficiently’* (NDP, 2012: 297). When considering the role of higher education with specific reference to skills, the NDP (2012: 316) expound that HEIs should *‘respond to the skills needs of all sectors of society including business, industry and the government.’* Hence, HEIs should respond to the need for scarce skills with a closer link between the economy and educational planning. For example, the NDP (2012: 315) specified that *‘accelerating economic growth requires science, technology, vocational and technical skills, and they need to be produced quickly.’* Furthermore, the NDP (2012: 317) proposed that by *‘2030, graduates must be in the critical skills categories, such as engineering, actuarial science, medicine, financial management, and chartered accountancy.’*

As such, higher education programmes and initiatives should address national priorities. Fore stated is articulated in the NDP (2012: 318) as *‘universities should define their niches to enhance their ability to contribute to national objectives.’* The NDP (2012) likewise indicated that higher education should have a coherent national agenda promoting innovation and knowledge production. Per se, the NDP (2012: 315) proposes the higher education system should be an *‘expanded, effective, coherent and integrated system.’*

8.4 Sub-theme 4: Supranational level

In terms of the supranational level of influence, the NDP (2012) references labour market research to comprehend the human-capital and skills required for the knowledge economy. Postgraduate education is furthermore necessary to address the global climate crisis. As such, the NDP (2012: 297) noted that: *‘higher levels of education, skills, research and innovation capacity are required for the transition to a low carbon economy and meeting the greenhouse gas emission target.’* Moreover, postgraduate education should also contribute to tackling health challenges considering the COVID-19 pandemic are supranational. The NDP (2012: 297) indicated that *‘higher levels of education, skills, research and innovation capacity are required for tackling health challenges.’* At a supranational level, it is furthermore recommended that HEIs should *‘develop partnerships to play a strong role in regional initiatives’* (NDP, 2012: 316). The supranatural influence of higher education is evident in the assertion that *‘the academic profession requires renewal if South African universities are to expand, compete and drive the knowledge society and economy’* (NDP, 2012: 317).

9. Postgraduate supervisory implications

Ascribed to the fact that postgraduate supervisors are for the most part the focal point in the postgraduate education discourse it is pivotal at grass root level to comprehend the forces that brought

the policy directive into being (i.e., globalisation and the knowledge economy), the policy history to comprehend how the policy was constructed as well as evaluate the way it has been implemented to achieve the stated purpose (Cardno, 2018). Stipulated postgraduate completion rates have significant consequences for individual supervisors supporting the contention by Akerlind and McAlpine (2017) that growing international attention on the public investment to expand postgraduate education has given rise to an extensive debate about the purpose thereof. Understanding the purpose of the ‘massification’ of postgraduate education could assist individual supervisors specifically with the ‘burden of supervision.’

10. Conclusion

The primary objective of the research was to explore the influence of globalisation and the knowledge economy on postgraduate education within the South African context to improve understanding at grass root level with specific reference to the drivers of postgraduate education ‘massification’ and the implications thereof for postgraduate supervision practice. Fore stated was implemented based on a complex systems theoretical approach, and it was deduced that in practice, the influence could be seen on four levels of complexity, including micro-, meso-, macro- and supranational levels of complexity. Furthermore, the results support research by Mouton (2016), which maintained that postgraduate education, specifically at doctoral level, has been predisposed by four policy discourses, including the necessity for (i) quantity; (ii) efficiency; (iii) transformation; (iv) and quality.

Keywords

Artificial Intelligence;
Warehouse
management;
Warehousing; Industry
4.0

Abstract

Background: Artificial Intelligence (AI) has gained prominence in the logistics industry and academic discourse. Various applications of AI play an essential role in propelling transformation in warehousing. However, in the research literature, it is not yet clear which warehousing processes have benefited or improved the most due to AI-driven solutions.

Purpose of the study: This article reports on a semi-systematic literature review (SSLR) on implementing AI-driven solutions in warehousing. We show that different types of AI-driven solutions have impacted warehousing processes in various ways.

Design/Methodology/Approach: the study adopted an SSLR method and employed six steps for conducting the review. The first step involved identifying the review question and developing a search strategy for the second step. The third step involved determining the criteria for inclusion and exclusion concerning the research objectives. The fourth step involved conducting a critical evaluation of studies included in the review, followed by data extraction as the fifth step. The final step involved data analysis.

Results/Findings: The study identified the following five AI-driven solutions implemented in warehousing: AI-powered warehousing robots, unmanned warehouses, intelligent picking operations, automated guided vehicle systems, and facial recognition technologies. Also, the following warehousing processes were affected by AI implementation: receiving, storage, sorting, inventory management, material handling and order picking.

Managerial implication: Insights are provided into how AI-driven solutions are implemented in different warehousing processes. This should help managers in identifying improvement opportunities in warehousing.

1. Introduction and background to the study

The fourth Industrial Revolution (also known as 4IR or Industry 4.0) is increasingly acknowledged by researchers and organisations worldwide as a critical propeller of a technological revolution in logistics (Shi, 2014; Holubčík, Koman & Soviar, 2021). Industry 4.0 presents numerous opportunities for the logistics industry as it enables quick and flexible responses to the changes that are happening using Artificial Intelligence (AI), transparent processes, and continuous supervision (Schelechtendal, Keinert & Kretschmer, 2015). Essentially, Industry 4.0 represents improved automation in different parts of logistics allowing for seamless integration of physical items into a network of information. According to Schelechtendal et al. (2015), there are numerous pillars of Industry 4.0, namely, AI, Big Data, Internet of Things, Autonomous Automation, Machine Learning, Expert Systems, Deep Learning, Data Mining, Genetic Algorithms, Artificial Neural Networks (ANN), Fuzzy Logic and Natural Language Processing (NLP).

AI is a technological innovation that imitates human brainpower using computer-aided robots, language processing, voice recognition technology, and expert systems (Shi, 2014). Conventional computers function by using programming instructions, whereas AI entails technological tools that change a pre-programmed system into a completely unique system that seeks to remove all programming components required to consistently provide new directions to machines (Li, 2013). AI essentially, therefore, entails sophisticated software engineering focused on developing programmes that can function autonomously without human control and direction (Danielsson & Ekströmfound, 2018). AI applications can think independently and self-rely (Amirkolaii, Baboli, Shahzad & Tonadre, 2017; Li, 2019). Therefore, AI is a broad term used to describe computerised methods, which aim to process and store information, create reasoning and self-learning and decision making that enables machines to be smarter and require less human intervention (Hellingrath & Lechtenberg, 2019). AI can also be defined as a mixture of technological processes that concurrently aim to imitate the human mind's reasoning process and create an arrangement of computational processes that aim to provide solutions to previously impossible problems (Shi, 2014). It entails various procedures such as evolutionary programming and artificial neural networks (Dirican, 2015). Generally, AI can be categorised into two distinctive groups: symbolic intelligence, which involves expert systems based on knowledge, and case-based reasoning (Adeniran, 2016).

Exploring AI can be an elaborative task since it has many groups and subsets (Amirkolaii et al., 2017). Some subsets of AI include big data, NLP and machine learning (Amirkolaii et al., 2017). Four essential AI applications exist: reactive machines, limited memory, theory of mind, and self-aware machines (Canhoto & Clear, 2020). Executives from the logistics sector have argued that the field of logistics is going through a substantial revolution (Hellingrath & Lechtenberg, 2019) essentially enabled through Industry 4.0 technologies. Relative to other Industry 4.0 technologies, AI has gained more prominence in the logistics industry and academic discourse (Hellingrath & Lechtenberg, 2019) and globally, the adoption of AI in logistics management is increasing at a fast pace (Canhoto & Clear, 2020). Potential is seen in using AI to provide advanced technological capabilities suitable for improving logistics systems (Li, 2019). A key factor driving the popularity of AI in the logistics sector is its potential to enhance efficiency in logistics activities through automation (Kohtamäki, Parida, Oghazi, Gebauer & Baines, 2019). Dirican (2015) argues that AI also provides higher accuracy in problem-solving. AI is not an emerging field of study in academia (Dirican, 2015); nevertheless, research has only recently shown that AI can be applied in various areas of logistics (Dirican, 2015; Kohtamäki et al., 2019).

Warehousing can be explained as a logistics system element fulfilling an essential role in the integration of critical value-adding supply chain processes, including procuring materials or components, conversion thereof into finished products, and the distribution to customers (Akerkar, 2019). Warehousing plays a significant role in creating customer service through the optimisation of distribution and product availability (Almada-Lobo, 2016) and is considered a (2013), element of contemporary supply chain management (Faber, de Koster & Smidts, 2013). A warehouse performs the critical task of ensuring a continuous and uninterrupted movement of products, strengthening collaboration with other stakeholders in the supply chain, and integrating modes of transport (Bukova, Brumerickova, Cerna & Drozdziel, 2018). An essential task of warehouse management is to ensure the effective movement of items in a warehouse (Lu, McFarlane, Giannikas & Zhang, 2016). It is, therefore, essential to understand every one of the critical functions of a warehouse to minimise failures and losses in the organisation and ultimately satisfy customer requirements (Pyza, Jachimowski, Jacyna-Gołda & Lewczuk, 2017).

Key warehousing processes include receiving, storage, sorting, inventory management, material handling, order picking and shipping of goods. Receiving is the first warehousing process which begins with the notifications of goods' arrival (Kaplan & Haenlein, 2020). The following steps include unloading goods from a vehicle, counting and identifying items, performing quality control and accepting goods into the warehouse (Dirican, 2015). The receipt is given once the goods are accepted into the warehouse. The accepted goods are marked and documented in the information system and prepared for storage (Dirican, 2015). Storage is another warehousing process responsible

for consolidating goods kept in the warehouse to ensure efficient use of space and effective material handling (Pyza et al., 2017). For effective storage, companies may organise goods within a warehouse according to the physical features of goods or to accommodate material handling equipment (Kaplan & Haenlein, 2020).

Sorting is a warehousing process that entails grouping goods according to their features and assigning them a suitable storage location according to those features, along with systematic recordkeeping (Ben-Daya, Hassini, & Bahrour, 2017). Material handling is another crucial warehousing process involving moving, protecting, storing, and controlling materials and finished products using manual, semi-automated, and fully automated equipment and systems that ensure efficiency throughout warehousing (Barata, Rupino Da Cunha & Stal, 2017). Material handling is one of the costly processes since it requires high investment in resources such as equipment, labour, facilities and capital (Kohtamäki et al., 2019). Therefore, the warehouse managers need to ensure that the material handling process adds value to warehousing to justify the costs incurred. Usually, material handling in a warehouse is associated with the movement of goods and storage (Barata et al., 2017).

Another critical process carried out in a warehouse is order-picking. This involves selecting the products ordered by customers from where they are stored (Garcia-Herreros, Agarwal, Wassick & Grossmann, 2016; Pandian, 2019). They define order picking (also known as retrieval) as the process whereby a set item is selected, retrieved from the storage area, and transported to a sorting or consolidation process of order fulfilment (Chen, Wang, Xie & Qi, 2016). These picked orders are then sorted into customer orders. This activity is called accumulation, and it is an essential process, especially when order-picking is done in batches (Wagner & Bode, 2013). In such circumstances, once the picking process is completed, the picked items must be assembled by customer order. Usually, orders need to be packed and stacked on the appropriate unit loads, such as pallets (Garcia-Herreros et al., 2016; Deepak, 2015).

Inventory management is a warehousing process that includes receipt, storage and tracking of inventory in a warehouse facility; staff management; cost and storage space optimisation; all of which has a direct impact on order fulfilment and customer service (Bukova, Brumerickova, Cerna & Drozdziel, 2018). An effective inventory management system is key to efficient warehousing management (Kaplan & Haenlein, 2020) since it allows companies to make an informed decision on what to buy, in what quantities, and when to buy it (Barata *et al.*, 2017). This ensures a balance in demand and supply and no overloading of a warehouse, eliminating unnecessary inventory holding costs and reducing lead-times due to delays in delivery. While it is true that storing any quantity of products in a warehouse will lead to storage costs, inventory and warehousing management systems can help with controlling and reducing these costs (Amirkolaii *et al.*, 2017). This includes calculating the exact amount of stock of items a company must keep (Amirkolaii *et al.*, 2017).

The last process of warehousing is shipping. Shipping is a process that includes determining transport destinations for packed consignments, assigning a delivery truck, and ultimately loading goods to the truck (Kohtamäki et al., 2019).

AI can generate the necessary knowledge and intelligence to ensure effective and efficient management of all warehousing activities (Dubey, Gunasekaran, Childe, Bryde, Giannakis, Foropon & Hazen, 2020). By adopting AI, companies can gain a new understanding of the impact of specific warehousing processes on overall performance (Dubey et al., 2020). This will help managers to plan properly and prioritise resources (Kaplan & Haenlein, 2020; Toorajipour, Sohrabpour, Nazarpour, Oghazi & Fischl, 2020; Kwak, Bae & Cho, 2014). Although AI is not a new concept in academia, the adoption of AI in warehouse management is still in a nascent phase (Kwong, Jiang & Luo, X, 2016). Recent studies on AI have suggested significant opportunities for applying AI technology to resolve problems in warehousing (Küfner, Uhlemann & Ziegler, 2018). However, it is unclear which types of AI implementations have been done successfully in warehousing and which of the technology's key warehousing processes have been supported. This research aims to identify examples of AI implementation in warehousing using a semi-systematic literature review (SSLR) approach.

2. Problem statement and research objectives

Although the implementation of AI has been examined in several studies (Jarrahi, 2018; Kaplan & Haenlein 2020; Nishant, Kennedy & Corbett, 2020; Ransbotham, Kiron, Gerbert & Reeves, 2017; Abdirad & Krishnan, 2020; Sutherland, 2019; Soni, Sharma, Singh & Kapoor, 2020; Gligor, Dumitru & Grif, 2018; Kearney, Chan, Valdes, Solberg & Yom, 2018; Klumpp, 2018; Ransbotham, Kiron, Gerbert & Reeves, 2017; Rekha, Abdulla & Asharaf, 2016) it is still unclear which warehousing processes are most likely to benefit from AI-driven solutions in terms of improving overall performance (Wang, Xiong & Olya, 2020). Existent studies on the implementation of AI in warehousing primarily focused on one or a limited number of applications (refer to Table 1 for relevant studies). No study was found focusing on the spread of AI implementations in warehousing. To address this gap in the research literature, an SSLR on the implementation of AI in warehousing was conducted to bring together key findings from the different studies, which are helpful for practitioners and researchers in the field of logistics and should also provide a starting point for further research.

Table 1: An overview of relevant existing studies

Name (s) and year	Title	Focus areas
Yang, J.X., Li, L.D. & Rasul, M.G. 2021	“Warehouse Management Models Using Artificial Intelligence Technology with Application at Receiving Stage – A Review”	The study focuses on AI applications in warehousing but is limited to a focus on the receiving part of overall warehousing processes.
Xinke Du, 2020	“Research on the Artificial Intelligence Applied in Logistics Warehousing”	This article deals with the applications of AI in warehousing and analyses the limitations of AI adopted in developing a smart warehouse. Although the study provides some applications of AI in warehousing, the study only focused on the material handling and storage parts of warehousing.
Pandian, A.P. 2019	“AI application in smart warehousing environment for automated logistics”	In this study, the implementation of AI is limited to the storage part of the overall warehousing processes.
Wu, Y. & Ge* D, 2019	“Key Technologies of Warehousing Robot for Intelligent logistics”	This research focuses on the application of an Intelligent Warehousing Robot with a specific focus on the Kiva system. The study also discusses the technical composition of intelligent warehousing robots (such as location and navigation, Mechanical structure, Robot

		<p>management system, and AI algorithms). In this study, the implementation of AI is limited to the material handling aspect of warehousing and it does not explore a broad application across various warehousing processes.</p>

Source: Own compilation

This review aims to report on the findings of an SSLR on the implementation of AI-driven solutions in warehousing. This will improve knowledge in this area and help managers identify improvement opportunities for their warehousing processes.

The primary research objective is:

1. To determine how AI-driven solutions are implemented in warehousing

The secondary objectives are:

1. To determine which AI-driven solutions are implemented in warehousing
2. To establish which warehousing processes are affected by the implementation of AI.

3. Research methodology

The SSLR method adopted in this study is used in research studies that do not claim to undertake a systematic review of literature in a given field (Wong, Greenhalgh, Westhorp, Buckingham & Pawson, 2013). Wong et al. (2013) maintain that a systematic literature review is “a comprehensive, protocol-based review and a synthesis of research focusing on a chosen topic or on defined research questions”. In this study, the literature review does not comply with all systematic review guidelines, but only some of them. To be precise, the study met the systematic review guidelines such as design and search terms documentation, using a relevant database, analysing several papers, documentation of the papers included in the review for each search term, and the adoption of clear criteria for inclusion and exclusion. A systematic literature review guideline that was not met is that of ensuring that numerous authors evaluate the papers and conduct a thorough quality assessment of the research and data collection and analysis. Therefore, an SSLR was applied. Additionally, the research questions are broad, and the analysis is qualitative.

This SSLR has adopted a descriptive, narrative review method. A descriptive review aims to examine the nature of the literature concerning a particular research objective, concept, or research area (Xiao & Watson, 2019). It explains the literature when a review is conducted (Xiao & Watson, 2019). A narrative review is the most popular type of descriptive review as it is less costly and time-consuming than other types (Xiao & Watson, 2019).

This SSLR has employed six generic systematic review steps suggested by Paré, Tate, Johnstone and Kitsiou (2016). The first step entails defining the plan for the review, followed by searching the literature as the second step. The third step involves determining inclusion and exclusion criteria based on their relevance to the current study or containing topics relevant to the research objectives (i.e. AI-driven solutions are implemented in warehousing and the warehousing processes affected by the implementation of AI). The fourth step involves conducting a critical evaluation of studies included in the review, followed by data extraction as the fifth step. The final step involves data analysis.

3.1 Step 1: Review Plan

As suggested by Paré et al. (2016), a review plan entails (i) creating a review question, (ii) choosing the review type and method to be used, and (iii) formulating a protocol for the review. The following sections outline these steps:

Review question: this step aims to identify the review question. This study aims to answer the following main review question: How are AI-driven solutions implemented in warehousing? The

secondary objectives are to determine which AI-driven solutions are implemented in warehousing and to establish which warehousing processes are affected by the implementation of AI.

Type and method of review: this review employs a theory-building or developmental type (Templier & Pare, 2015) as it aims to create a typology of technologies implemented in warehousing with AI features and the warehousing processes affected by the implementation of AI.

Review Protocol: A review protocol is a detailed outline of the processes to be adopted when conducting the review, and it aims to improve the trustworthiness of the findings (Moher, Shamseer, Clarke, Ghersi, Liberati, Petticrew & Group, 2015). A review protocol entails developing a research question that will guide the review, directing the data used in the search strategy and inclusion/exclusion criteria (Berger, Denner & Roeglinger, 2018; Ertel, 2018). After developing a focused question and writing the review aim, the next stage is to design the search strategy. Designing a search strategy is one of the fundamental components of the review protocol since it allows the reviewers to locate, choose, analyse and use the information. Creating search terms and keywords is the next stage in writing a review protocol. This could include examining critical research on the topic of interest to determine common words used in the literature to ensure that search terms are focused on the study purpose (Paré et al., 2016; Rowe, 2014). The following steps in the review protocol include developing criteria for inclusion and exclusion, data extraction, and data analysis methods. Review protocols encourage reviewers' consistency and minimising data ambiguity (Moher et al., 2015).

3.2 Step 2: Search strategy

Initially, publications were searched, sorted, acquired, and read (Boell & Cecez-Kecmanovic, 2014). By reading thoroughly, new keywords and concepts emerged and probing proceeded. Lastly, this iterative process started to pinpoint relevance in the existing literature. The preliminary search aimed to consolidate relevant current academic articles to achieve the research objectives. This was done by searching academic peer-reviewed journals, including Association for Information Systems (AIS) journals including Information Systems Research, Journal of Management Information Systems, MIS Quarterly, and Journal of the Association for Information Systems and Information Systems Journal. This ensured that only academic studies were included in the review. To identify key AI-driven solutions and explain how these technologies are implemented in warehousing, the following search terms were used to search titles, abstracts and keywords of academic journals: (“warehousing” or “warehouse management”) and (“Artificial Intelligence” or “Machine Learning” or “Deep Learning” or “AI”). The researchers searched peer-reviewed academic journal articles and conference papers published between 2013 and 2021 to obtain relevant content given the time-sensitive nature of the technology focused on in the study (Boell et al., 2014).

An SSLR was conducted in Science Direct, Research Gate and Google Scholar databases of relevant academic articles published before August 2021. Science Direct is one of the most prominent platforms for obtaining research and hosts more than 12 million items of works from 3500 research journals and 34 000 e-books (Enughwure & Febaide, 2020). Google Scholar and Research Gate are prominent social platforms used by researchers, scholars, scientists, and research students to disseminate, collaborate and exchange research work and knowledge (Enughwure & Febaide, 2020).

3.3 Step 3: Determination of inclusion/exclusion criteria

It is essential to have inclusion/exclusion criteria since these set limits for conducting a review by determining which research papers are likely to form part of the review and which ones are not relevant to the current study (Stern, Jordan & McArthur, 2014). Moreover, having criteria for inclusion/exclusion assists in mitigating any reviewer's personal bias. Inclusion and exclusion criteria also ensure that a study is included based on predetermined, substantiated principles, instead of being only of interest to the reviewer. The reviewer needs to find an equilibrium between having too specific or narrow inclusion criteria that might eliminate relevant studies and having too broad criteria that include irrelevant studies. Hence, it is essential to justify a chosen inclusion criteria based on the review requirement. Table 2 provides the inclusion criteria for this review.

Table 2: Inclusion and exclusion criteria

Criteria	Justification
Studies published between 2013 and 2021 (academic papers published within this period)	There has been rapid development of AI solutions in recent years, followed by numerous studies on the implementation of AI in warehousing (González-Calatayud, Prendes-Espinosa & Roig-Vila, 2021). Studies published before 2013 were excluded to ensure that contemporary practices and philosophical points of view are examined in the review.
Studies examining the implementation of AI-driven solutions in warehousing	The implementation of AI must relate specifically to warehousing and it must be the primary aim of the study. Any studies which focus on AI implementation in other logistics functions other than warehousing were excluded since they are not in line with the research objectives.
Studies examining warehousing processes that are impacted in the AI implementation	The review only included studies that focused on different warehousing processes that are included in the implementation of AI-driven solutions. Studies examining other supply chain activities other than warehousing functions were excluded.
Research studies published in the English language	The SSLR only included research studies published in English and not in other languages due to limited resources to translate and include them.

Source: Own compilation

Journal articles were selected if they were relevant to or contained information regarding: (i) AI-driven solutions, (ii) AI driven-solutions adopted or implemented in warehousing, (iii) the warehousing processes affected by the implementation of AI-driven solutions, or (iv) a mixture of the three. The researchers read all topics and abstracts of journal articles and conference papers to select the relevant papers. Where there were no abstracts, the researcher read the introduction. The review did not include research irrelevant to these four points of the study.

3.4 Step 4: The critical evaluation

The critical evaluation aims to assess the research for rigour and to make sure it is not affected by any methodological issues which might influence the validity and quality of the review findings. Critical evaluation is also necessary to assess whether the authors' findings represent the participants' views and experiences. In this study, the Critical Appraisal Skills Programme qualitative checklist (CASP; CASP International Network, 2013) was used for critical appraisal. The CASP appraisal tool considered three broad issues: are the research findings valid? What are the study findings? How will the findings help locally? A checklist of ten questions to make sense of the qualitative study was used to answer these questions. The checklist questions are as follows:

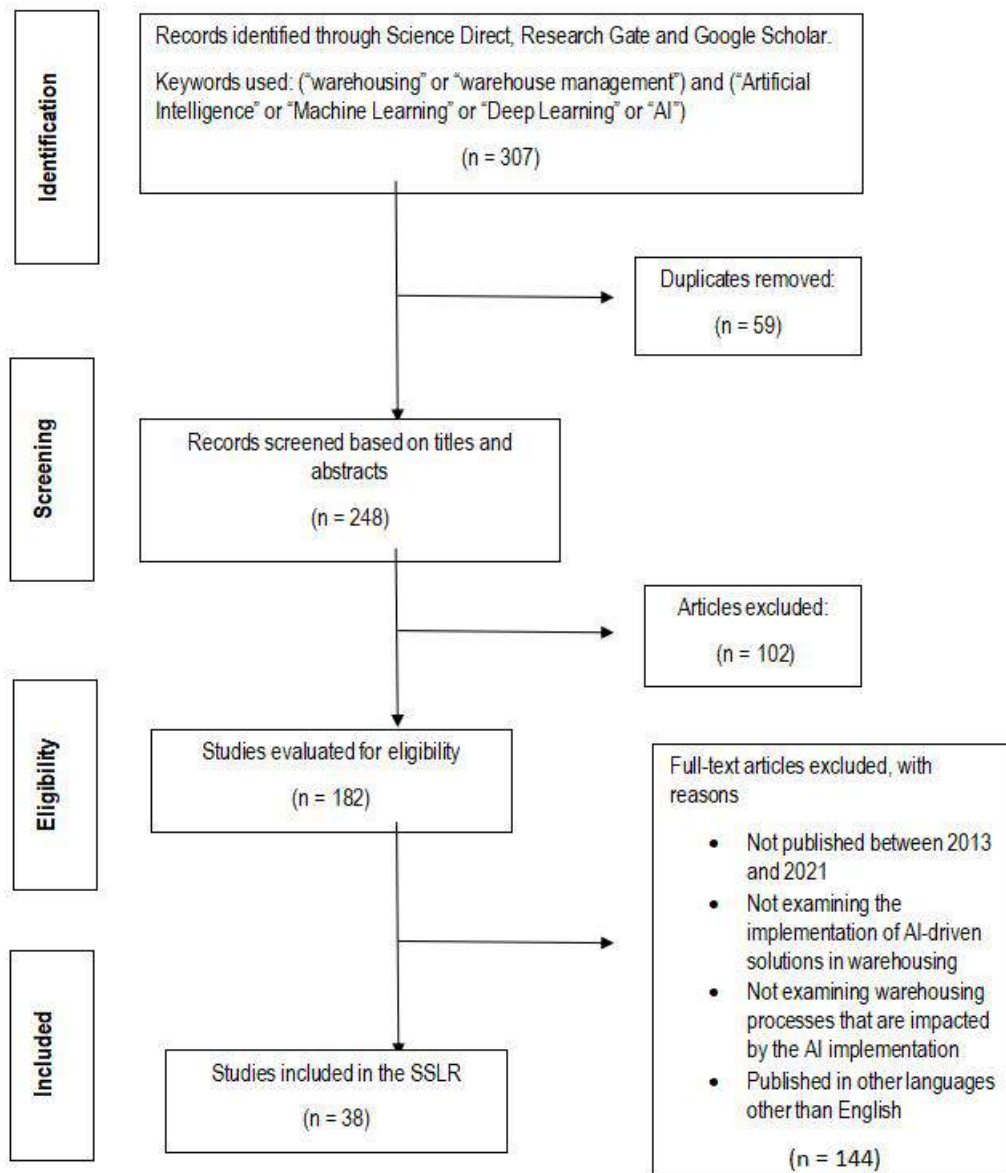

- Were there clear research objectives?
- Was it appropriate to use a qualitative approach for this study?
- Was the researcher justified in using the research design?
- Was it appropriate to use the recruitment strategy to select participants?
- Was the researcher justified in using a data collection strategy to address the research problem?
- Was any consideration taken regarding the relationship between the researcher and participants?
- Has the researcher considered ethical issues?
- Was there sufficient analysis of data?

- Are the research findings adequately stated and discussed?
- Does the research provide any value?

3.5 Step 5: Data extraction

During data extraction, the review protocol must have a clear framework of what kind of data is required before conducting data extractions. After defining the concept of data, the review protocol must provide a framework within which data will be extracted and the number of reviewers will be included. Commonly, data extraction is carried out using an extraction tool developed or designed by the reviewer based on the requirements of the review and to ensure consistency during the extraction of data amongst all reviewers.

Data extraction was carried out by the reviewer using an extraction tool. The tool was piloted on two articles prior to use. The extraction tool was based on the main topic of the implementation of artificial intelligence in warehousing, while recognising related information emerging from reading texts on the following aspects: (i) descriptions and main characteristics of AI-driven solutions, (ii) descriptions of AI in relation to warehousing, and (iii) identification of types of AI-driven solutions implemented in warehousing, and (iv) explanations about how the implementation of AI can be improved in warehousing. The researchers selected a specific bibliographical database using the criteria listed in step three to select journal articles in the fields of AI and warehousing. Thus, the researchers could ensure that they extracted information that applies to the current study. Research that contained unrelated content was discarded. Those publications categorised in the inclusive set were read carefully to ensure they were relevant to the current study.

**Figure 1: The PRISMA flow diagram describing stages of a literature search conducted in this study.
Source: Own compilation**

3.6 Step 6: Analysis and Synthesis

Data analysis involves being familiar with the data (see steps 3 to 5), and before the analysis, it involves grouping it into categories and making summaries. In this study, data analysis was conducted using thematic content analysis, which involved determining patterns within and between the texts (Sekaran & Bougie, 2016). This data analysis technique was appropriate for this research since it enables the analysis of texts collected from different data sources such as textbooks, journal articles, and other textual data. It seeks to examine the content themes evident in the data (Sekaran & Bougie, 2016).

4. Findings and discussion

The previous sections have provided the background to the research, presentation of the problem statement and references to literature. This section discusses findings concerning the primary and secondary main research objectives.

In this study, the data search was conducted using PRISMA (Preferred Reported Items for Systematic Review and Meta-analysis) guidelines from Science Direct, Research Gate, and Google Scholar. The researchers identified 307 articles matching the search terms discussed in Section 3.2. Of 307 articles,

59 duplicates were identified and removed. Thereafter, 248 studies were screened based on titles and abstracts, where 102 articles were excluded. The remaining 182 studies were then assessed for eligibility concerning inclusion criteria (refer to Table 2), where 144 full-text studies were excluded. After reviewing all studies retrieved, 38 studies addressing the research objectives were included in the review. The PRISMA flow diagram showing different stages of the literature search is described in Figure 1.

Figure 2 illustrates the publication timeline of included studies. The publication timeline suggests there was little research conducted on AI in warehousing until 2015, when there was a significant increase of studies on the topic until 2020. This could be explained by the recent significant increase in investment in AI within logistics as alluded to earlier.

Figure 2: Publication timeline of included studies
Source: Own compilation

The researchers read all the articles, identified all their themes, and grouped them concerning their similarities. Across articles meeting primary inclusion criteria, most studies examined different technologies adopted in the logistics industry, different areas of warehousing that have implemented AI, and examples of leading companies implementing AI-driven solutions. A small portion of these studies discussed improvements that can be made to the implementation of AI in warehousing.

4.1 AI-driven solutions implemented in warehousing

In the study sample, five different AI-driven solutions implemented in warehousing were identified from fourteen articles as shown in Table 3.

Table 3: AI-driven solutions implemented in warehousing

AI-driven solutions	Sources
1. AI-powered warehousing robots	Xinke (2020); Jingyu (2019); Duan, Edwards & Dwivedi (2019); Lyutov, Uygun & Hutt (2019); Fatorachian & Kazemi (2020); Davenport (2018); Gligor <i>et al.</i> (2018)
2. Unmanned Warehouse	Xinke (2020), Feng (2019); Jingyu (2019); Li (2019); Tanning (2019); Ying, Qin & Tingting (2019); Gligor <i>et al.</i> (2018)
3. Intelligent picking operations	Feng (2019); Dirican (2015); Canhoto & Clear (2020)
4. AGV (Automated Guided Vehicle)	Xinke (2020); Feng (2019); Gongjian (2018); Barreto, Amaral & Pereira (2017).
5. Facial and Image Recognition Technologies	Fatorachian & Kazemi (2020); Gongjian (2018); Xinke (2020); Li <i>et al.</i> (2018); Zhou (2018); Gligor <i>et al.</i> (2018); Jarrahi (2018)

Source: Own compilation

4.1.1 AI-powered warehousing robots

As illustrated in Table 4, seven studies identified AI-powered robots as a key technology used in warehousing. After using autonomous robots to conduct search and rescue and explore mines, robots have now entered the business market to improve warehouse productivity, speed, and reliability (Fatorachian & Kazemi, 2020). AI-powered warehousing robots have also contributed to creating a self-organised automated warehouse (Davenport, 2018). AI-powered warehousing robots possess the capabilities of both reactive and limited memory machines since they create knowledge by using memory in combination with pre-programmed instructions (Dirican, 2015).

Among the research included in the SSLR is Xinke (2020) study. The latter study reports on AI-powered robots used in the format of reported automated shuttle equipment. Automated shuttle equipment is defined by Jingyu (2019) as “drive-in rack” automated equipment, which includes intelligent robots developed to carry out numerous tasks, including picking, transportation, and interaction with the warehouse management system. Furthermore, this equipment operates in collaboration with radio frequency identification (RFID) barcodes or other technological devices used for intelligent item identification. Jingyu (2019) referred to Amazon’s Kiva Robot as an example of automated shuttle equipment, stating that to move forward, Kiva robots scan the path using the bar codes embedded in the warehouse floor. An article by Lyutov et al. (2019) on managing customer requirements workflow using machine learning discusses the Kiva robotics system, which aims to solve the order fulfilment problem. The Kiva system is an automated warehouse management system that uses autonomous robots to move items around in the warehouse to fulfil customer orders (Lyutov et al., 2019; Duan et al., 2019). The findings presented by Xinke (2020) and Jingyu (2019) are similar to those of Gligor et al. (2018).

4.1.2 Unmanned warehouses

In the study sample, six papers by Ying et al. (2019), Tanning (2019), Xinke (2020), Jingyu (2019), Li (2019) and Feng (2019), discuss unmanned warehouses as a form of AI-driven solutions implemented in warehousing. Unmanned warehouses can be described as autonomous warehousing (Ying, et al., 2019). This extremely automated and intelligent warehouse depends on incorporating smart processes in logistics to replace human employees with intelligent machines (Ying et al., 2019). A study on the intelligent logistics architecture and its Influencing factors by Tanning (2019), refers to unmanned warehouses operated by JD Asia No1, Amazon, and Alibaba as some of the most technologically advanced unmanned warehouses.

Tanning’s research supports Xinke’s argument that unmanned warehouses require some of the most technologically sophisticated equipment, such as intelligent robots and lift-assist devices that communicate with numerous AI technologies. For example, JD Asia No1’s unmanned latter

warehouse has a computerised control centre capable of accurately calculating 68 billion possible routes within 0.2 seconds for over 300 robots (Xinke, 2020). The reaction speed for this intelligent control system is 0.007 seconds (Xinke, 2020). Ying et al. (2019) state that psychologists have conducted experiments on the human reaction time to the same input, and the findings indicate that it is over 0.1 seconds. This means that the speed of reaction of the unmanned intelligent brain is six times that of humans (Ying et al., 2019). Unmanned warehouses function as limited memory machines since they can remember the information learned from observation of past activities (Gligor et al., 2018).

4.1.3 Intelligent picking operations

An article on the artificial intelligence applied in the logistics field (Feng, 2019) identified intelligent picking operations as an AI-driven solution used in warehousing. Intelligent picking operations include wearable wireless picking technology, the newest picking innovation of its kind. Feng (2019) further identified two types of wireless picking technology, namely, voice picking and Augmented Reality (AR) visual picking technology. Feng describes voice picking as converting warehouse management commands into vocal sounds to be communicated to the warehouse workers, who will then have access to the locations of the matching items in accordance with the I commands (Feng, 2019). Upon arrival at the corresponding goods position, the operator will pick up the goods, and the confirmation will be made once the goods have been picked (Feng, 2019). The main visual focus of the operator is on the assigned tasks, and there is no need to operate any device to scan items, hence eradicating any mistakes. Intelligent picking operations involve another type of reactive machine described by Dirican (2015) and Canhoto & Clear (2020) since they cannot be used to perform tasks that require retrieval of memorised information.

Feng (2019) also states that voice picking, and AR-related picking involve warehouse operators wearing AR eyeglasses to find their way to picking locations. The instructions regarding tasks to be carried out are projected on the AR glasses (Feng, 2019). Another study on “application research on automatic technology of intelligent logistics system” by Jiang (2020), supports the argument of Feng (2019) that, by projecting information on the AR glasses, visual picking using AR glasses can provide similar benefits to voice picking as it also allows operators to be hands-free.

4.1.4 AGV (Automated Guided Vehicle)

AGV was discussed in four articles as one of the AI-driven solutions applied in warehousing. A paper by Xinke (2020) states that an AGV can rapidly be implemented in an intelligent warehouse and can be utilised to sort shelves. This is due to an AGV’s ability to use AI-based sensors and cameras to navigate automatically and to park itself at the product location based on the system’s commands, and to then point the operator to the location and the quantity of the specified products using the on-board display terminal. Jiang (2020) states that the conventional picking mode of “Person to Goods (P2G)” is replaced by “Goods to Person (G2P)” which saves significant time, eradicates manual work, and enhances the efficiency of picking operations. Gongjian (2018) argues that further to realising “Goods to person”, there are numerous other innovative uses of AGV in warehouse operation. These include AGV’s ability to mount on the static pallet stretch wrap device, thus, warehouse operators do not have to install the conveyor belt of the pallet, which significantly enhances a factory’s safety and minimises the cost of labour (Barreto et al., 2017). AGVs have the abilities of limited memory machines since they are trained using a large amount of data that they collect and store and then use as a model of reference to resolve problems in the future (Feng 2019).

4.1.5 Facial recognition technologies

Research by Xinke (2020), Gongjian (2018) and Li et al. (2018) discusses facial and image recognition as crucial AI-driven solutions implemented in warehousing to ensure effective warehouse access control. The access control of intelligent warehousing operations uses facial recognition technologies when performing individual identity detection using the basic features of the human face (Li et al., 2018). Coupled with its initial smart card access control, the company can significantly improve security and ensure effective warehouse access control and safety (Gongjian, 2018). One of the most valuable components of facial recognition technology is that facial images are captured using

high-definition cameras providing evidence for investigating any event that undermines access control security (Li et al., 2018; Fatorachian & Kazemi, 2020). Facial recognition technologies are a good example of limited memory machines discussed earlier in the literature by Gligor et al. (2018) and Jarrahi (2018) since they rely on input information or pre-programmed data. For example, different faces of employees must be registered in the memory of the face recognition technology for it to remember them.

5.2 Warehousing processes affected by the implementation of AI

As discussed earlier, several warehouse activities are carried out as part of crucial warehousing processes. This section focuses on the findings emerging from the literature regarding the warehousing processes affected by implementing AI-driven solutions. Several researchers have discussed different warehousing processes that have benefited from implementing AI-driven solutions, as shown in Table 4.

Table 4: Warehousing processes affected by the implementation of AI

Warehousing processes	Sources
1. Receiving stage	Yang, Li & Rasul (2021); Minichino (2015)
2. Storage	Chocholáč, Boháčová, Kučera & Sommerauerová (2017); Deepak (2015); Deshmukh, Santhosh, Mane, Verma & Pai (2015); Strigul, Gatziolis, Liénard & Vogs (2015)
3. Sorting of items	Choy, Ho & Lee (2017); Zhou, Zhang & Zhou (2015); Xu, Ma & Qin (2014); Chen <i>et al.</i> (2016)
4. Inventory control and planning	Addo, Centhala & Shanmugam (2020); Grace & Timothy (2018); Tereza (2016); Bandaru, Aslam, Ng & Deb (2015); Paul, Azeem & Ghosh (2015)
5. Material handling	Zhang, Zhu & Lv (2018); Zhang, Zhang, Qu, Liu & Zhong (2017); Bhuiyan, Wu & Wang (2016); Ko, Jung & Jeon (2013)
6. Order picking	Lu <i>et al.</i> (2016); Chen <i>et al.</i> (2016); Scholz, Henn, Stuhlmann & Wäscher (2016); Bottani, Montanari, Rinaldi & Vignali (2015); Henn & Schmid (2013); Chen, Wang, Qi & Xie (2013);

Source: Own compilation

5.2.1 Receiving stage

From the SSLR, the receiving stage was identified in two articles as one of the warehousing processes affected by the implementation of AI-driven solutions. An article by Yang et al. (2021) focusing on the use of a conceptual artificial neural network model in warehouse receiving management, states that many problems are commonly experienced in the warehouse receiving stage due to delays in information sharing or data errors. These problems typically require the urgent attention of the management team. Therefore, the availability and uninterrupted flow of information at the warehousing phase of receiving is critical for the success of all logistics operations. Yang et al. (2021) further suggest that various ANN models could be studied to develop a theoretical model for implementation in warehousing. Minichino (2015) proposed using an ANN model, called “Artificial Neural Network for Components Identification and Counting model” to identify and count various receiving components of warehouse management.

5.2.2 Storage

Five of the articles reviewed identify storage as one of the warehousing processes affected by the implementation of AI in warehousing. A study on “robotic navigation and inventory management in warehouses” by Deshmukh et al. (2015) acknowledges that warehouse storage operations are becoming increasingly complex, paving the way to automate the storage process to improve efficiency and effectiveness. In another study by Strigul et al. (2015), it is stated that many warehouses use an inefficient way to count inventory, primarily involving manual work performed by

people. However, Deepak (2015) suggests that in the last decade, advanced technologies in warehousing such as barcode scanners, robots, and RFID tags were introduced to track and record goods within a warehouse. Deepak (2015) also indicates that barcode scanners have been limited since they are only effective when the inventory is placed on the conveyor belt or in a vehicle. Chocholáč et al. (2017) report that creating AI-powered solutions such as autonomous drones have led to the automation of the storage process and improved efficiency. Strigul et al.'s. (2015) findings are similar to those of Chocholáč et al. (2017) and state that using automated AI systems based on drone scanning has primarily contributed to improving the overall storage process, including minimising the risk of human injuries, improved accuracy and speed, and reduced downtime and operational costs.

5.2.3 Sorting of items

A study by Xu et al. (2014) has emphasised the significance of the sorting function in warehousing, where AI-driven solutions are adopted mainly to improve its efficiency. Researchers including Choy et al. (2017); Zhang and Wang (2014), and Xu et al. (2014) note that AI-driven technology can be used in the sorting function to identify information and replace manual labour. Technologies such as ANN are used to solve problems related to classification in data processing. This has allowed specific AI applications to categorise various characteristics and properties of items to create one classification (Zhou et al., 2015). As a result, many items with different features could be identified with high accuracy. Chen et al. (2016) and Zhou et al. (2015) indicate that sorting systems in warehouses for tobacco and pharmaceutical products often adopt AI-driven solutions. AI-powered robots reduce the time spent by the workers sorting since they are more accurate and efficient during the sorting process.

5.2.4 Inventory control and planning

Inventory control and planning were identified in five articles as one of the essential warehousing processes involved when implementing AI. According to Paul et al. (2015), the cost of holding just a single inventory unit per year ranges between 15% and 35% of its item value. Therefore, a company's success in a highly competitive market relies on its capability to conduct proper inventory control and planning at lower costs while ensuring constant inventory availability when customers need it (Paul et al., 2015). To achieve this, there is a need to have access to precise, actual data regarding the anticipated demands of customers, size, amount, and type of available inventory (Paul et al., 2015). Articles by Addo et al. (2020); Grace & Timothy (2018); Tereza (2016); Bandaru et al. (2015) all suggest that AI-driven solution techniques such as expert systems are better suited to handling decisions relating to inventory control and planning since they can substitute for the judgment of experienced inventory managers.

5.2.5 Material handling

Four articles in the study sample identified material handling as one of the warehousing processes that were affected by implementing AI-driven solutions. Zhang et al. (2017) stated that the cost of material handling operations is a substantial part of the entire cost of the product. Hence it is essential to optimise the material handling system to reduce costs. To achieve this, a significant number of AGVs can be operated when moving goods in the warehouse (Zhang, 2018). AGVs allow companies to implement a manageable material routing system in the warehouse (Zhang et al., 2017). Bhuiyan et al. (2016) argue that companies such as Amazon, Alibaba and DHL are already using AGVs in their warehouses to improve material handling processes. According to Ko et al. (2013), companies that seek to improve flexibility and productivity in their material handling operations have enhanced the intelligence of their vehicles.

5.2.6 Order picking

Chen et al. (2016) authored one of the six articles that identified order picking as one of the warehousing processes affected by implementing AI-driven solutions. The authors argue that picking orders among warehouse activities is commonly considered more costly because of its very labour-intensive nature and reliance on high financial investment. Henn and Schmid (2013) argue that the process of order picking can be conducted either manually or by adopting automation. It is projected that picking orders manually account for over 55% of the entire warehousing costs (Bottani et al., 2015). Feng (2019) stated that companies use AI technologies such as robots and wireless picking

technologies to solve this problem. Other authors cited that companies use AI-powered robots to reduce costs in picking operations (Chen et al., 2013; Choy et al., 2017). The AI-powered robot's end-of-arm tooling configured into the AI can provide coordinates and angles for AI-powered robots to pick the products without crashing into external structures (Choy et al., 2017). Information is also shared across different robotic systems, which allows them to learn from each other for continuous advancement (Scholz et al., 2016). This is made possible by machine learning which uses algorithms to learn from previous activities and make practical decisions for warehouse picking activities (Chen et al., 2013). The use of robots improves safety and accuracy by allowing human workers to perform safer activities while minimising the occurrence of errors. Machine learning will enable the picking of new products at any time without making changes in robotic programming. Scholars and company executives in the logistics sector regard order picking as an area with high potential for improvement (Chen et al., 2013; Lu et al., 2016).

6. Recommendations

For the reported findings to benefit practitioners in the field of logistics, some recommendations are made concerning the implementation of AI-driven technologies in warehousing. Practitioners should note that various AI solutions are available for implementation in warehousing and could support all the critical warehousing processes. Some technologies deserve special mention. In the review, most researchers cited AI-powered robots as essential in creating an automated warehouse system. Therefore, companies striving toward automated warehousing should consider investing in more robotic technologies to reduce operational costs in different warehousing processes. It was indicated in the review that order picking accounts for over 50% of warehousing costs, which is primarily due to the manual labour involved. By removing manual picking using robotic technology, companies can reduce labour costs and time spent retrieving items. This will allow workers to focus on other more complex warehousing processes such as packaging and shipping. Information is a critical enabler of AI and when implementing AI, it is essential to ensure that inventory information is accurate and regularly updated to make the most of what AI-driven technologies can offer. To that end, warehouse operations should benefit most from the comprehensive adoption of technologies across the spectrum of core processes performed.

7. Conclusion

In this study, an SSLR was conducted by bringing together the main findings from various studies on implementing AI-driven solutions in warehousing. The analysis stage of the review focused on 38 academic journal articles. The majority of which highlight the importance of AI adoption in warehousing. It was found that different types of AI-driven solutions have impacted in similar and different ways on warehousing processes. In this study, five leading AI-driven solutions were identified as having been implemented in warehousing operations, i.e. (i) AI-powered warehousing robots, (ii) Unmanned warehouses, (iii) Intelligent picking operations, (iv) Automated guided vehicle systems, and (v) Facial recognition technologies. Among the five AI-driven solutions, most researchers cited AI-powered robots as essential in creating an automated warehouse system. The unmanned warehouse was the second most cited AI solution in the journal articles in this review and could be linked to the use of robots. Automated shuttle equipment and Intelligent picking operations were cited in fewer publications.

The SSLR also identified that most of the critical warehousing processes are affected by AI implementations, including receiving, storage, sorting, inventory control, material handling and order picking. It is clear from the review that most of the articles cited storage, sorting, inventory control and planning, material handling, and order picking as warehousing processes mostly affected by AI implementation. Fewer articles cited receiving as affected by AI implementation. Also, only ANN models were indicated as potential AI applications in receiving as opposed to other warehousing processes, which indicated multiple AI solutions.

The study recommends that practitioners consider more financial investment in robotics technology to help in reducing operational costs across different warehousing processes. Limitations of the study are that the research relied on secondary data sources, and an empirical study was not conducted.

Accordingly, the researcher did not control how variables emanating from the secondary data sources are described or categorised. Also, there was a limited number of studies that were reviewed. A further study is suggested on the success of implementations and the challenges experienced in implementation since these would be issues that practitioners should be interested in when creating feasibility studies for top management to consider prior to implementation. Also, an experimental research study could be done on other logistics functions to examine the extent of AI implementation. Comparative studies could also be undertaken in similar industries to determine whether similar AI-driven solutions are implemented. Another semi-systematic review could be done to include major databases that were left out in this study.

Keywords

supply chain,
supply chain design,
inventory management,
on time delivery,
regression model

Abstract

The need for uninterrupted pathology services is undeniably paramount to the growing population of South Africa and a well-designed and effective supply chain is a key driver in creating this opportunity. This article aims to investigate how the current supply chain design of a specific pathology laboratory in South Africa affects organisational performance. A regression model was used to analyse and then determine the main factors that influence the effectiveness of the supply chain design. A link to the Survey Monkey website was emailed to the 128 sampled population to access the survey. The results of the study concluded that various factors including resilience capability, risk management capability and strategic supplier management, have a positive influence on the current supply chain of the organisation, while inventory management and on time delivery which was highlighted during the data analysis phase, as being a negative contributor to the overall supply chain performance.

1. Introduction

Supply Chain Design (SCD) shapes the nature of SCs Supply Chain's by understanding your customers' needs and requirements and developing your SC to cater for these needs and requirements (Youssef, 2021). SCD has become a key source of competitive advantage that enables organisations to fine-tune their SCs to match their strategic objectives (Melnyk, Narasimhan & DeCampos, 2014). A purposefully built SC that is aligned with the organisation's strategic goals, necessitates management action and strategic corporate investments into areas that will ensure that organisations SC stands above the rest (Melnyk et al., 2014). This investment should be aimed at procuring, developing, and configuring appropriate resources, processes, and metrics that develop the organisation's SC to meet the organisation's requirements and identify what the SC can and cannot address (Youssef, 2021).

One of the fundamental objectives of a laboratory service is to provide diagnostic results within a relatively quick turn-around-time (NHLS, 2018). To achieve a relatively quick turn-around-time of tests, pathological laboratories need to have a SC design that optimises the infrastructure available and effectively creates downstream value to the end-user by ensuring the ingredients required for conducting these tests are available on demand (Kagaruki & Kilale, 2018). The pathology industry is regulated in how products (medical devices as described within the Act) are distributed and stored following the Medicines and Related Substances Act, 1965 (Act 101 of 1965) and it is also to be noted that reagents, consumables and other products such as chemicals and equipment, collectively inventory, that is required for conducting these tests is often the largest item in the current assets category on a balance sheet within the organisation. The organisation that we will be discussing within this study, is one of the leading pathology laboratories in Africa and provides vital diagnostic and monitoring pathology services in South Africa and 12 other countries in Sub-Saharan Africa (Sinha, 2021). For this study, we will concentrate on the design of the organisations South African supply chain and how effective it is in servicing the requirements of the South African laboratories within the network.

1.1 Background

With a population of 58.8 million people in 2018, South Africa is experiencing significant population expansion (National Health Laboratory Service, 2018). The need for health care and laboratory services has increased as the population has grown. South Africa is dealing with a quadruple burden of disease caused by communicable diseases like HIV/AIDS and tuberculosis, maternal and child mortality, noncommunicable diseases like hypertension and cardiovascular diseases, diabetes, cancer, mental illnesses, and chronic lung diseases like asthma, as well as injury and trauma (WHO, 2018).

The need to provide laboratory services for the management of these communicable and non-communicable diseases is vitally important. When a patient visits a doctor, the doctor will listen to the patient's symptoms and conduct a complete physical examination. After that, the doctor will diagnose the ailment or illness, prescribe the best course of action/therapy, and track the results. Additional testing, such as laboratory investigations, may be required by the doctor in order to diagnose, detect, or rule out disease or illness with more certainty (NPG,2021). The doctor's use of a pathology laboratory is critical to improving diagnostic abilities and, as a result, minimising the length of illness by quickly instituting the most effective medication for the diseases or infections discovered.

A comprehensive pathology laboratory encompasses four main disciplines: clinical chemistry, Haematology, microbiology and Serology, Anatomical Pathology and Cytology. There are many tests performed within these disciplines that require various consumables, reagents, and equipment to generate a result. For these tests to be performed on-demand, the laboratory needs to have speedy access to inventory, indicating the need for a highly efficient and effective supply chain (Kagaruki & Kilale, 2018)

The research organisation has been experiencing twenty percent of orders not being delivered on time. The late or non-delivery of reagent and consumables to the labs affects the organisations ability to provide a quick turn-around-time for results which is an industry wide requirement (NHLS, 2018). In some cases, stock available at the warehouse could not reach the laboratory in time, resulting in test results being delayed, which resulted in the Healthcare professionals (HCPs) requesting other pathology organisations to perform the test and thus the study organisation experienced loss in revenue.

Figure 1 provides a visual representation of the value of inventory stored within the organisation at a specific moment in time. This snapshot of the inventory value was taken on the last day of every month to provide the researcher with information pertaining to the inventory values.

Figure 1: Inventory values within the study organisation

From figure 1 it stands to reason, if the warehouses have the capability of delivering inventory to the labs within 72 hours, the labs must keep stock that will last until their next delivery, however, the inventory value within the labs does indicate significant levels of stockpiling, potentially driven by the fear of running out due to the delayed deliveries from the warehouses. The amount of inventory present within the study organisations network has an immense impact of the profitability of the organisation and could even lead to failure of the organisation if not managed properly (Kungu, 2019). It is therefore of great importance that non-capitalised assets coming in and out of the organisation be managed with the required care, allowing the organisation to reach its optimal profitability, controlling the amount of working capital tied up in inventory, reducing write-offs (Kungu, 2019), all while ensuring the testing requirements are met.

1.2 Problem Statement

In today's globalised economy, organisations face increasing competition and must be able to mobilise all its resources which includes suppliers and available infrastructure, to cut wasteful expenses and inefficiencies in order to provide the best value to the final customer (Haroon, Wasif, Khalid, Khalidi, 2021). SCM as a whole (or a system) must be a key focus area for organisations in maximising value for the supply chain's eventual client, instead of focusing on management for the maximum benefit of one of the parties in the SC (Madhani, 2019). If the SC is viewed as a system of organisations with a single goal (to provide value to the final customer), it stands to reason that a problem in one element of the supply chain will have an impact on the system's or supply chain's overall effectiveness and efficiency. It is therefore important that the organisation's SC is designed with maximum effectiveness and efficiency in mind and the SC possess the capability of servicing the organisations requirements.

Pathology and in particular testing, plays a significant role in the management of the high disease burden present in South Africa and is paramount to increasing the overall health of the population (NHLS, 2018). Pathology contributes significantly to cost-effective patient care and the discipline is critical in the medical care of all patients, not only in the active diagnosis of patients, but also for evaluating the effectiveness of treatment (NPG 2020). One of the fundamental objectives of a Laboratory service is to provide diagnostic results within a relatively quick turn-around-time (TAT) (NHLS, 2018). To achieve a relatively quick turnaround time of tests, pathological laboratories need to have a supply chain design that optimizes the infrastructure available and effectively creates downstream value to the end-user by ensuring the "ingredients" required for conducting these tests are available on demand (Kagaruki & Kilale, 2018). The pathology industry is regulated in how products (medical devices as described within the Act) are distributed and stored following the Medicines and Related Substances Act, 1965 (Act 101 of 1965) and it is also to be noted that reagents, consumables and other products such as chemicals and equipment, collectively inventory, that is required for conducting these tests is often the largest item in the current assets category on a balance sheet within the organisation

This research study will therefore be focused on the following problem statement:

To determine how the current SCD of the case organisation affects organisational performance in a highly competitive environment, paying particular attention to the delivery of inventory into the laboratories.

The study will also aim to answer the following research questions:

- What are the factors influencing the effectiveness of the SCD in the Pathology Laboratories Industry?
- How effective is the SCD of the study organisation in providing downstream value to its customers?
- What recommendations can be provided to improve the SC of the study organisation?

2. Literature Review

2.1 Overview of the South African pathological landscape

In South Africa, pathological laboratories are divided into public and privately-owned laboratories (Khadambl-Morokare, Bhowani & Ayuk, 2021). According to the NHLS, in 2018 there are 53 million tests performed annually by the private laboratory groups and 91 million tests by the public sector. Using the population estimates of Statistics South Africa (STATS SA), the per capita expenditure for the public sector was approximately R153 compared to R702 for the private sector annually based on the assumption that 20% of the population (medical aid population) utilise the private sector (NHLS, 2018). Pathology and laboratory services perform a vital role in the management and diagnosis of patient's illness or disease. At least 60 to 70 percent of clinical decisions and patient diagnoses are dependent on laboratory tests (NHLS, 2018). In order for these public laboratories and the private laboratories to provide cost-effective and efficient laboratory services that meet the health care needs of all the citizens in the country, there is a need for effective development and management of laboratory supply chains (SC) (Khadambl-Morokare, Bhowani & Ayuk, 2021).

Conceptual Framework: Supply Chain Design

The design of the SC is an important component of the overall SC success (Melnyka et al., 2014). The SCD ultimately influences the organisation's investment patterns across its various SCs (Youseff, 2021). Figure 2 depicts a conceptual framework developed from a review of available literature in the field of supply chain design (SCD), supply chain management (SCM) and adopted from a very comprehensive study conducted by (Nel & Badenhorst 2010).

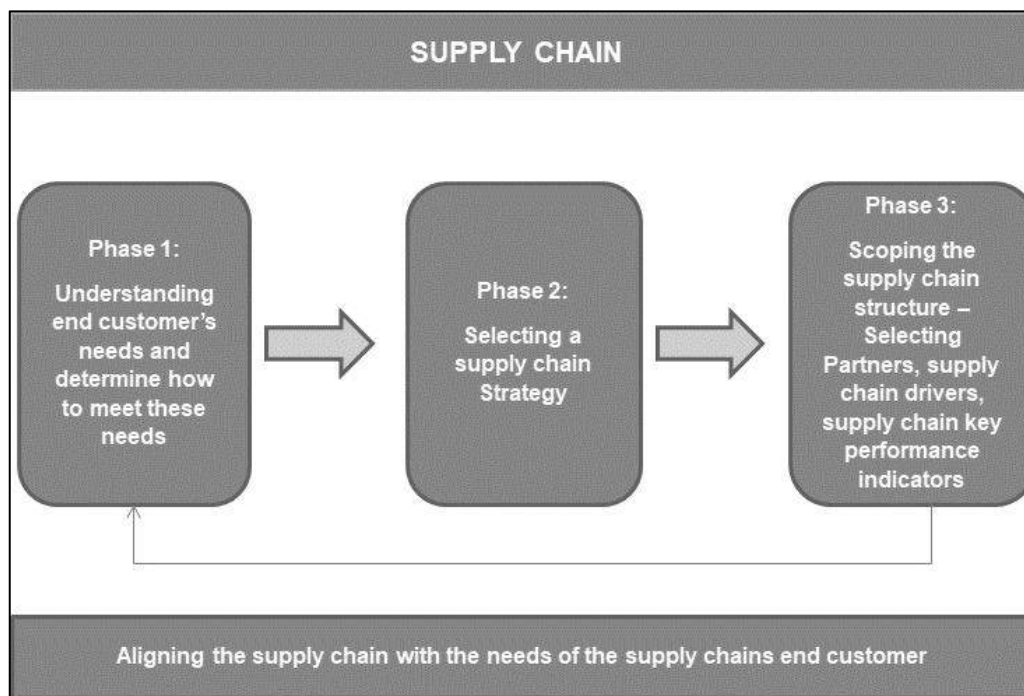

Figure 2: The conceptual framework of Supply Chain Design

Source: Adopted from Nel and Badenhorst (2010)

As illustrated on Figure 2 once the requirements of the end users have been identified, organisations will have to identify how to meet these needs. As a result, the conceptual framework determines if the strategy (as well as the level of market demand predictability and market winners) is in line with end-user expectations and how to achieve them (Melnyka et al., 2014). The conceptual framework also determines whether the SC structure and strategy are in alignment, as well as whether SC partners, drivers, and KPIs are aligned with the chosen strategy (Nel et al., 2010, Melnyka et al., 2014, Youseff, 2021).

2.2 An overview of Supply Chain

A SC can be described as a group of three or more entities (organisations or individuals) that are actively involved in the upstream and downstream flows of products, services, funds, and/or information to (and from) a consumer (Mukhamedjanora, 2019). In this regard, the SC includes manufacturers, suppliers, transporters, warehouses, wholesalers, retailers, other intermediaries, and even customers. SCM refers to the upstream and downstream relationships between suppliers and consumers in order to resolve functional boundaries within and across organisations (Miller, 2017). An organisation's long-term competitiveness depends on its ability to design a SC that responds well to its customer preferences regarding cost, quality, and flexibility.

2.3 Supply Chain in Healthcare

A healthcare SC is an ecosystem made up of a variety of organisations, people, technology, activities, information, and resources that enable the cost-effective distribution of healthcare products, vaccines, and other medicines from the manufacturer to the end-patient (Christos, Vicky & Constantinos, 2014). One of the key goals of the healthcare SC is to ensure that inhabitants of a country, regardless of their geographic location, have access to flexible healthcare delivery systems that can respond to a variety of patient needs (Tseng, Islam, Karia, Fauzi & Afrin, 2019).

2.4 Supply Chain Management in the Healthcare Sector

The SCM of the healthcare sector has gained much importance due to the need to improve delivery of products and patient satisfaction (Durakbasa & Gençyılmaz, 2020). Changes in the healthcare sector have been rapid, resulting in the need to have corresponding changes in the SC. In this regard, many healthcare organisations are now improving the techniques and methods in SCM (Durakbasa & Gençyılmaz, 2020). The performance of the healthcare SC is another major challenge.

Resource-Based View (RBV) can explain a wide range of organisational and SC outcomes. According to Barney (1991), a pioneer in the field of RBV, organisations should look inside to gain a competitive advantage rather than looking at the environment within which it competes. Organisations can achieve competitive advantage by leveraging existing resources and developing these internal capabilities and resources (Jurevicius, 2021).

The study applies RBV to help understand how SCD can be used within an organisation in creating competitive advantage, and importantly, what internal factors influence SCD and SCM within the organisation, that ultimately affect the overall SC performance. For this study, we will define the design and effectiveness of the SC - *as the effective use of the organisational SC infrastructure (resources and capabilities) to create competitive advantage, by ensuring inventory required for testing patients is available on demand at the various laboratories with the study organisations network.*

2.5 Factors influencing Supply Chain Management

SC visibility, technology, organisational alignment, collaboration, human resources, distribution management, and performance management are the seven main characteristics of the healthcare SC (George & Pillai, 2019; Mehmeti, Musabelliu & Xhoxhi, 2016).

2.5.1 Supply Chain Visibility

Supply Chain Visibility (SCV) is made possible by SCM technology, which provides near-real-time data on logistics and SC activities. This data may be used to avoid inventory shortages, alleviate bottlenecks, comply with regulatory requirements, and track products from start to finish (Biel, 2020). SCVs major goal is to improve and intensify the SC by giving accurate real-time data to all stakeholders such as product demand, sales forecasts, inventory available at different warehouses within the network, open orders (Saqib et al., 2019) and in the case of this study, stock on hand in the respective labs where testing takes place.

2.5.2 Organisational alignment

Organisational alignment in a demand-driven organisation and entails a transformation process in which the organisation's vision is centered on an outside-in strategy (Prajogo, Oke & Olhager, 2016). This takes customer value as its start and end point and actual client demand, is translated into strategies and plans, and these strategies include customer segmentation and product classification. To maintain organisational alignment, metrics such as: increasing the quality of services and product availability, and reducing inventory levels while still maintaining sufficient inventory to cater for the organisational requirements, should be linked with SC goals and objectives (Melnyk et al., 2014).

2.5.3 Distribution management

The ability of an organisation to support the storage and movement of items in order to meet consumer demand reliably and efficiently is characterised as distribution management (Mehmeti, Musabelliu & Xhoxhi, 2016; Bvuchete et al., 2020). Warehouse and inventory management, cross-docking, distribution planning and transportation are the top distribution management methods which enhances responsiveness and flexibility which in turn reduces errors and costs (Bvuchete et al., 2020).

2.5.4 Collaboration

Collaboration in SC refers to cooperative planning and execution of SC activities (Buijs, Vis & Carlo, 2014). Customer happiness is impacted by SC collaboration since it affects service levels and ultimately costs (Bvuchete et al., 2020). A well functional collaboration approach allows the partners within the SC to better understand the demands of the SC (Bvuchete et al., 2020).

2.5.5 Technology

Implementing efficient and reliable SCM information systems can help an organisations success and compete in the global marketplace (Al-Odeh, 2016). Technology allows for the seamless capture, analysis, and distribution of real-time demand and inventory data (Bvuchete et al., 2020). The communication of data among SC participants can be facilitated by a quick data exchange platform (Al-Odeh, 2016).

2.5.6 Human resources

Human resources are regarded as a key success factor in the SCM (Elmortada, Mokhlis, Elfezazi & Mokhlis, 2017). Organisations will need to invest time and money to develop their staff's capabilities (Bvuchete et al., 2020). Human beings are also the drivers of innovation; thus, it is crucial to have some mechanisms to capture SC staff's new ideas (APICS, 2017).

2.5.7 Supply Chain stakeholders

The healthcare SC Network is made up of three important players in healthcare SC producers, service providers, and purchasers (Bvuchete et al., 2020). Patients, the government, and insurance companies are all included in the healthcare SC and are regarded as the purchasers of healthcare. The SC processes that is implemented must be determined by these stakeholders (Lambert & Enz, 2017).

2.6 Supply Chain Design

SCD is the process of identifying the organisation's desired strategic outcomes, then planning, implementing, and managing the resources, procedures, and relationships inside the business and across the SC over time to ensure the achievement of those outcomes (Melnyk et al., 2014). For this study, we will define SCD as the effective use of the organisational SC infrastructure to assist in creating competitive advantage by ensuring inventory required for testing patients is available on demand at the various laboratories with the study organisations network.

Organisations have discovered that their SC efficiency determines their market competitiveness (Sjoerdsma & van Weele, 2015), and their ability to manage SC resources and suppliers determines their capacity to deliver the right products at a faster pace and at a lower cost than their competitors (Lii & Kuo, 2016). Even though SCD is primarily aimed at creating and obtaining strategic decisions and outcomes, it is a highly dynamic aspect that greatly impacts all levels of decisions. SCD can also

be described as choosing capabilities along the value chain that can be invested and developed internally (Dominguez, Cannella & Framinan, 2016).

2.7 Factors influencing Supply Chain Design

There are various factors that influence SCD. These factors will be discussed in this section.

2.7.1 Inventory Management

As indicated within this study, laboratory facilities are vital components of health care, assisting in the delivery of high-quality pathology services to patients by providing accurate diagnosis and monitoring of medical outcomes and their effectiveness is hinged on the availability of inventory, equipment and facilities (Kagaruki & Kilale, 2018). It is therefore paramount for proper inventory management for the attainment of this goal (Dominguez et al., 2016). Inventory Management (IM) is a critical component of SCD that provides the healthcare system with some level of protection against service disruptions (Befekadu et al., 2016). In the case of the study organisation, after the inventory is delivered to the warehouse, it must be delivered to the point of service, for example, where the customers can obtain the service from the organisation (labs and bleeding depots). IM uses demand planning techniques such as S&OP meetings and trend analysis to understand how much to order or issue and how to keep appropriate stock to minimise shortages and oversupply during this process (Dominguez et al., 2016). IM will not be able to function effectively, however, if the support from all parties within the SC is not operational (Befekadu et al., 2020). IM needs insight into demand patterns and environmental changes within the labs. IM is therefore a key component in creating a successful laboratory service to patients.

2.7.2 Support from top management

Managers in the higher positions and boards of the organisation influence how the organisation operates and performs as they are responsible for the philosophy of SCM of the organisation (Dominguez et al., 2016). Top management influences strategic planning and purchasing, information technology adopted, logistics, and the developing relationship between facilities. To create a successful SC, top management's abilities are critical. Therefore, when designing the SC, there is a need for top management to use the latest technologies, trends, methods and ideas to ensure that they develop an effective SC that ensures the organisation is profitable and able to compete on a global level. These decisions have an impact on the SC's structure and design (Mehmeti et al., 2016).

2.7.3 Customer demand and focus

Focusing on customers is crucial in designing the SC, and getting this right, will lead to customer satisfaction which drives repeat and even new business for the organisation (George & Pillai, 2019). If the customers are extremely satisfied with the products supplied and the value added to the products, they could even pay higher than market indicated prices to have that product or service – convenience on all levels is key to sustainable positive customer experience (George & Pillai, 2019). It is therefore important for organisations to fully understand the market within, which they operate and most importantly understand what changes within this market will do for the demand of their product or service.

2.7.4 Information technology

Information is an essential driver in the SC and contributes to how the SC works and is vital in any stage in the SC (Dominguez et al., 2016). Technological advancement in the SC has changed how SC operates by providing relevant and accurate data on inventory level, shipment status, required quantities of products, product availability and forecast accuracy. The use of websites and social media platforms has enabled many organisations to understand the changes in the tastes and preferences of the customers which aids forecast accuracy and provides greater market insight. This reduces demand uncertainties and bullwhip effect and reduces safety stock (Mehmeti et al., 2016).

2.7.5 Communication tools

Communication tools work hand in glove with information technology. They are responsible for communication such as intranet and extranets and facilitating data transfer like electronic fund

transfer (EFT) and electronic data interchange (EDI), between partners (Dominguez et al., 2016). EDI is used for disseminating information to customers through catalogues that show product information, whereas EFT is used to transfer funds between partners. Intranets are used to facilitate easy communication within an organisation whereas extranets enable the organisation to communicate with external collaborators (George & Pillai, 2019). Internet forms part of communication tools that allow the organisation to communicate with others through browsers. Even though they are costly to implement, these communication tools help in cost reduction and organisation's effectiveness (Dominguez et al., 2016).

2.7.6 Planning tools

Planning tools are essential in integrating resource planning processes in the organisation to create total value across end-to-end business. There are many planning tools such as Material Requirement Planning (MRP), manufacturing resources planning (MRPII), and Enterprise Resource Planning (ERP) (Burnette et al., 2016). These planning tools forms the spine of many activities across the entire organisation. When designing the SC, there is a need to look at the planning tools for the organisation to ensure that they are in line with the demands of the SC and especially from an inventory management point of view.

2.7.7 The Relationship between SC members

The SC is made up of different trading partners such as wholesalers, distributors and retailers with the same aim of deriving mutual benefits through collaborative advantage (Mofokeng & Chinomaona, 2019). The relationship between partners is crucial for the performance and success of a SC. The quality of the relationship influences the level of risk sharing, supply base reduction, cross-functional teams and information sharing among partners (Mehmeti et al., 2016). The SC is generally complex and this indicates that there is need for some form of professionalism to ensure that mutual benefit can be achieved and the goals of different organisations are achieved. Globally, organisations compete and try to reduce operating costs and improve quality to meet customers' needs as they look for better service, more choices, higher quality, and fast delivery (George & Pillai., 2019).

2.7.8 Lead time

Another critical factor crucial in SCD is lead time. Lead time refers to the time gap that exists between the receipts of orders to delivery. The lesser time, the lesser the bullwhip effect, whereas a long lead time leads to the bullwhip effect (Khosroshahi, Hussein & Marjani, 2016). Long lead time causes shortages in total inventory (Iqbal, 2018) or causes the organisation to carry excess inventory to cater for the longer lead time, whereas shorter lead time contributes to the SCs effectiveness as inventory can be turned over quicker leading to less working capital tied in inventory sitting on shelves (Ross, 2015).

2.7.9 Environmental factors

Environmental factors influence the design of the SC (Youssef, 2021). Environmental factors comprise many factors in the SC which ultimately affect the SCD, such as: unexpected changes of customers, changes in technology, changes caused by competitors and suppliers, changes in customer demand that causes demand uncertainties, and supply uncertainties caused by product quality and availability.

The political environment, particularly complex legislation, and support from the government, the policies, norms and regulations made when an organisation imports raw materials, which, all influences the design of the SC. According to Chen and Paulraj (2014), increased international commerce has an impact on the SC by raising the competitiveness and quality of the manufacturing sector around the world. International trade forces push local providers to improve their quality to meet international standards. However, international trade increases transportation costs, risk of massive exchange rate fluctuations and administrative practices with the import and export of goods (Bashynska et al., 2019).

2.7.10 Supply Chain structure

Lastly, the structure of the SC affects the success of the organisation. In a SC, there are several facilities, different stages, and different information needed for each stage, making the SC complex. In many SCs, there are very few linear relationships, and there exists different SC structures such as dyadic, serial, convergent and divergent (Cannella et al., 2017). The organisation needs to avoid complex channels as this may cause the bullwhip effect (Dominguez et al., 2016).

2.8 The Supply Chain of Pathology Laboratories in South Africa

For pathology laboratories to function effectively, there is a need for uninterrupted availability of products, reagents, supplies, and other consumables (African Society for Laboratory Medicine, 2012). Failure to have a steady supply of essential products causes stock-outs of key reagents and other supplies and compromising service delivery. Pathology laboratories require constant and unlimited access to laboratory commodities ranging from chemicals, reagents to high-throughput equipment. Laboratories need to manage their SC effectively to ensure a readily available supply of critical products to complete testing as the market demands (Kagaruki & Kilale, 2018). The SC of pathology laboratories in South Africa plays a crucial role in providing assurances for managing the current disease burden, prevention, care and treatment (NHLS, 2018). It helps link planning, implementation, and management of essential health care services from providers and suppliers to patients in the country (NHLS, 2018). The theoretical part is good

3. Methodology

In this study, exploratory research was used. It was selected since the concept of SCD is viewed as a relatively new topic. In addition, in South Africa, there is a literature gap as very few studies have addressed the design and effectiveness of SC in the pathology laboratories. Exploratory research design was selected since it is flexible and produces new knowledge. As a result, this research lays the groundwork for future research on how SCD effects overall supply chain performance, paying particular attention to the pathology industry within South Africa.

3.1 Research philosophy

Research philosophy refers to the understanding of how data concerning a given topic will be gathered, analysed and used (Saunders et al., 2016).

3.3.1 Positivism research philosophy

Positivism was selected for this study as it has the ability to gather factual data knowledge and it allows collected results to be generalised over the entire population, which is one of the weaknesses of interpretivism and its subjectivity. Positivism approach was considered for this study as it involves use of high structured methodology that facilitates replication and generalisations.

3.4 Research methodology

Refers to the method or the strategy that is used to establish a structure that guides the research from start up to end (Clur, 2015). In this study due in part mostly to time constraints, quantitative research methodology was utilised as it permitted the researcher to collect and analyse the data in a shorter amount of time.

3.5 Research strategy

Research strategy is a plan of how the researcher will aim to accomplish the ultimate research goal in answering the research questions, hence every research needs to have a research strategy (Bryman & Bell, 2015). In this study, the case study research strategy was used as the study was focused on a single organisation and the research methodology adopted to answer the research questions was quantitative.

3.5.1 Case study research strategy

A case study, according to Saunders et al. (2016), is the observation of an individual unit, such as a child at school or a clique in a community. It's used to answer queries like *how*, *why*, and *what*.

This study used a case study research technique to ensure that analytical generalisations on the design and effectiveness of pathology SCs could be made. It was also selected as it allows for a deeper and more contextual exploration.

3.6 Population and sample framework

The findings of this study were extrapolated to a specific research organisation with around 400 employees. By requesting participation from laboratory managers, procurement staff, laboratory technical staff, quality assurance staff, and support service staff such as those in finance and internal risk within the organisation, who are directly affected by activities of the SC, the study attempted to gather information about SC effectiveness and perceptions of the current SCD. As a result, the goal of this research is to determine the impact of SC activities on the organisation's overall success. Table 1 shows the population for this study.

Table 1: Population and Size

Job Position	Population
Laboratory Managers	200.
Technical Specialists	
Quality Personnel	
Pathologist	
Other staff (Support)	

3.6.1 Sampling strategy and technique

Saunders et al. (2016) indicate that the sample of the population is a specific group of people you wish to collect data from and discusses two main sampling strategies - the probability sampling strategy and the non-probability sampling strategy. The probability sampling strategy was chosen in this study as it uses statistical actions to give every member of the population a chance to be selected. It is primarily used in quantitative research, which is the research methodology used in this study, and is more appropriate where the sample representatives are crucial in making inferences about the entire population (Easterby et al., 2015). In this study, stratified random sampling technique was utilised. It was utilised as it allowed the researcher to have relevant information of the population through use of strata. In this regard, the population was stratified based on the job position.

3.6.2 Sample and size

A sample, according to Bryman & Bell (2015), is a fraction of the population that will represent the total population. To determine the sample size required, a sample calculator was used.

Using a confidence level of 95% and confidence interval of 5% the sample size needed for the study was determined to be 132. The stratified sampling approach divides the population into strata based on some essential characteristics (Saunders et al., 2016). The sample was distributed proportionally within the target population.

3.7 Data collection

Data collection, according to Creswell (2015), is a set of interconnected tasks intended to gather rich data that will be utilised to answer the study's research objectives. In this study, primary research data was collected via probability, stratified random sampling, by the use of an online self-administered questionnaire.

3.7.1 Questionnaire design

The format of the questionnaire and structure has an impact on data collection. A questionnaire must be constructed in such a way that the researcher can obtain useful data from respondents (Zikmund, 2017). For this study, the questions were grouped into different sections. The questions were designed using the Likert scale which measures variables from strong agreement to strong disagreements or vice versa.

The questionnaire was divided into four subsections which allowed the researcher to group questions relating to each objective within this study and permitted the sample population to put into perspective each question when answering.

- **Section A:** This section asked for demographics of the sample population – age, education level and number of years' experience within the pathology industry.
- **Section B:** This section was designed to answer objective number 1. This section focused on the factors that influence the effectiveness of the SCD within the study organisation.
- **Section C:** This section was designed to answer objective number 2. This section focused on factors influences the effectiveness of the design of the current SC within the study organisation.
- **Section D.** This section was designed to answer objective number 3. This section focuses on recommendations on how the SC of within the study organisation can be improved.

3.7.2 Questionnaire distribution

A link to the Survey Monkey website was emailed to the sample population, and they were requested to click on the link to access the online questionnaire.

3.8 Pilot study

Once ethical clearance was confirmed with UNISA SBL, the questionnaires were handed to 8 employees in the procurement department of the study organisation. The pilot study results were analysed using SPSS 25 results showed a Cronbach Alpha of 0.90. This high Cronbach Alpha indicates that the research instrument was quite dependable. To avoid data contamination, the results of the pilot study were not included in the main study.

3.9 Administration of questionnaire

Before the survey was released, each participant received a letter of consent and participation. All responses were collated within the survey monkey platform in the form of spreadsheets, graphs and diagrams. This information was further downloaded and uploaded into SPSS version 25 for further analysis. Data from SPSS was displayed in a variety of ways, including percentages, charts, graphs, and tables. All data regarding the questionnaire was securely stored on the researchers computer and was password protected.

3.9.1 Collection of questionnaires

All responses were collated within the survey monkey platform in the form of spreadsheets, graphs and diagrams. This information was further downloaded and uploaded into SPSS version 25 for further analysis.

3.9.2 Storage of questionnaire data

A copy of the data was downloaded onto the researcher's computer. The data on the computer was kept secure because the computer is password protected and only the researcher has access to it.

3.10 Data analysis

Data from SPSS was displayed in a variety of ways, including percentages, charts, graphs, and tables.

3.10 Validity and Reliability

The Cronbach's alpha test was used to support the outcomes of this study's internal consistency reliability test. With an average of 0.90, the Cronbach's Alpha reliability test revealed very high reliability. The methodology is fine except that some more detail needed on the actual respondents as per job position..

4. Findings

The findings in this paper are also aimed at meeting the study's research questions and objectives, which is the following:

Research questions were:

- What factors influence the effectiveness of the SC Design in the Pathology Laboratories Industry?
- How effective is the SC design of the study organisation in providing downstream value to its customers?
- What recommendations can be given to improve the SC of the study organisation?

To provide reliable and compelling results, the main survey results were evaluated using statistical techniques and software (SPSS). A statistician was engaged to assure authoritative and accurate results. The internal reliability of the research instrument's constructs was determined using the Cronbach alpha coefficient. Table 2 shows the reliability statistics for the study.

Table 2: Reliability statistics

Construct	Cronbach's Alpha	No. of items
Strategic Supplier Partnership	0.541	5
Resilience capability	0.816	4
Customer Relationship	0.948	5
Inventory Control Policy at site/lab level	0.956	7
Ranking Supply Chain factors	0.841	4
Risk management capabilities	0.969	4
Effectiveness of the design of the current supply chain	0.853	7

4.1 Mean Scores: Study Constructs

In this study, the study key variables were measured on a 5-point scale, where: strongly disagree = 1, disagree = 2, undecided = 3, agree = 4, and strongly agree = 5.

t-test

Using the one-sample t-test, the mean Likert scale ratings were compared to the undecided or neutral score of 3, which was the mid-point between disagree and agree, using the t distribution.

$$T = \frac{\bar{X} - \mu}{S/\sqrt{n}}$$

Where \bar{X} is the mean score, μ is the assumed mean value (in this case, it equals to 3), S is the standard deviation of the scores, X's (where i = 1, 2, ...30) and n is the sample size.

The difference was significant and the mean score was larger than 3, the respondents agreed with the assertion. The significance threshold was set at 0.05. For example, in Table 4.6, the estimated mean score for the respondents for question 1 (Section B of the questionnaire: We consider quality as our number one criterion in selecting suppliers) is 4.03 (std. dev.=.766), which is greater than 3 (and t = 59.335, p-value=.000.01). This indicated that the respondents concurred with the assertion.

4.2 Relationships between variables

Table 3 shows the correlations between effectiveness and the factors that influence SC design. In order to measure relationships, the Pearson correlation coefficient was used. The results indicate that all the listed constructs, partnership (strategic supplier partnership), resilience (resilience capability), relationship (customer relationship), inventory (inventory control policy at site/lab level), ranking

(ranking SC factors), and risk (risk management capabilities) are highly correlated positively with effectiveness of the design of the current SC within the study organisation at the 1% level of significance, which effectively indicates that these constructs add positively to the design of the current Supply Chain.

Table 3: Correlation matrix for dependent variables

	Partnership	Resilience	Relationship	Inventory	Ranking	Risk	Effectiveness
Partnership							
Resilience	0.612**						
	0 126	1					
Relationship	0.498**	0.794**					
	0 125	0 126	1				
Inventory	0.616**	0.715**	0.790**				
	0 124	0 125	0 124	1

	0 125	0 126	0 125	0 124	0 124	0 126	1

Note: ** Significant at the 1% level

4.3 Regression analysis

In its most basic form, regression analysis allows market researchers to look at the relationships between one independent and one dependent variable (Sarstedt & Mooi, 2014).

4.3.1 Normality test

One of the assumptions of regression analysis is that the dependent variable is normally distributed, otherwise, the results might be invalid. The dependent variable (effectiveness) in this study was therefore tested for normality. The normal Q-Q plot of competitive advantage indicates that because almost all the dots lie on the straight line, the variable roughly follows the normal distribution.

Figure 3: Normality test

Table 4: Regression model

Model	Sum of Squares	df	Mean Square	F	Prob.
Regression	39.323	5	7.865	67.976	0.000

We include our key suppliers in our planning and goal-setting activities	1	13	13	94	5	3.7	0.738	10.74	0.000	Reject

We consider price as our number one criterion in selecting suppliers	0	46	11	57	12	3.3	1.063	2.933	0.004	Reject
Resilience capability (specifically deliveries from the warehouses)										
Our logistics system is able to adapt to the disruptive situations by quickly reengineering the logistics processes	1	15	9	99	3	3.7	0.74	10.55	0.000	Reject
Our logistics system is able to promptly and adequately respond to logistics disruptions	1	22	6	96	3	3.6	0.825	8.355	0.000	Reject
Our logistics system is able to quickly recover to the previous performance level or to a more desirable level	1	21	9	93	3	3.6	0.819	8.234	0.000	Reject
Our logistics system is able to reduce the extent of negative impacts by quick responses	2	50	11	64	1	3.1	0.992	1.07	0.287	Accept
Customer Relationship – Internal (your procurement department as a supplier)										
We frequently interact with customers to set reliability, responsiveness, and other standards for us	2	19	7	95	5	3.6	0.839	8.635	0.000	Reject
We frequently measure and evaluate our customer satisfaction	2	22	9	90	5	3.6	0.875	7.476	0.000	Reject
We frequently determine future customer expectations	1	22	12	90	2	3.6	0.823	7.544	0.000	Reject
We facilitate our customers' ability to seek assistance from us	1	18	5	98	5	3.7	0.792	9.86	0.000	Reject
You are satisfied with the overall service delivered by your procurement/supply chain department	0	22	5	94	5	3.7	0.813	8.985	0.000	Reject
Inventory Control Policy at site/lab level										
We maintain accurate information regarding the level of inventory in stock	0	67	8	48	5	2.9	1.029	-0.773	0.441	Accept
We have access to critical information about our inventory	8	59	10	46	4	2.8	1.089	-1.711	0.090	Accept
Inventory data is fully integrated across all your management systems and is accurate in real time	1	75	8	43	1	2.8	0.964	-2.934	0.004	Reject
Information generated from our inventory management system is always accurate.	0	78	12	35	2	2.7	0.93	-3.72	0.000	Reject

We have control over the inventory that comes in and leaves our site/lab	2	68	9	42	8	2.9	1.052	-1.518	0.131	Accept
We inform our suppliers in advance of changing needs	1	67	10	42	6	2.9	1.04	-1.285	0.201	Accept
We and our suppliers exchange information that helps establishment of business planning	1	52	11	59	3	3.1	1.004	0.976	0.331	Accept
Ranking Supply Chain factors										
Our strategic partnership with suppliers helps to keep our SC effective	0	13	7	103	4	3.8	0.669	13	0.000	Reject
Our relationship with our Customers plays an important role in our SC effectiveness	0	11	5	103	7	3.8	0.65	14.53	0.000	Reject
The level of information sharing within the SC helps to keep the SC effective	0	14	7	100	6	3.8	0.704	12.36	0.000	Reject
The inventory control system in place helps to keep our SC effective	0	49	5	68	5	3.2	1.017	2.53	0.013	Reject
Risk management capabilities										
Our logistics system is able to remain effective and sustain even when internal/external disruptions occur	4	18	6	96	3	3.6	0.875	7.705	0.000	Reject
Our logistics system is able to avoid or minimise risk occurrence by anticipating and preparing for them	3	17	9	96	3	3.6	0.834	8.377	0.000	Reject
Our logistics system is able to absorb a significant level of negative impacts from recurrent risks	3	18	9	95	2	3.6	0.839	7.932	0.000	Reject
Our logistics system is able to have sufficient time to consider most effective reactions	2	17	10	95	3	3.6	0.805	8.821	0.000	Reject
Effectiveness of the design of the current supply chain within the study organisation										
We always deliver our products in time	1	65	8	45	8	3	1.075	-0.495	0.621	Accept
Our Lab/depot/support services customers are satisfied with our SC Process	2	30	7	81	8	3.5	0.972	5.729	0.000	Reject
We maintain the quality and integrity of products during the SC process	1	3	6	93	25	4.1	0.635	19.21	0.000	Reject

Our SC allows us to be flexible in sourcing alternative products when primary items are on short supply/out of stock	2	24	6	89	6	3.6	0.904	7.163	0.000	Reject
We can supply products even when there is a short notice of change of requirements, i.e. amended requisition, change in testing requirements	2	25	6	92	2	3.5	0.88	6.753	0.000	Reject
Our SC is geared to service the organisations requirements	2	14	5	100	6	3.7	0.779	10.71	0.000	Reject
You are satisfied with our Supply Chain design	1	50	8	65	3	3.2	1.009	1.672	0.097	Accept
Which area would you recommend										
Strategic Partnerships with Suppliers	0	16	12	91	4	3.7	0.741	10.1	0.000	Reject
Relationship with Customers	1	15	7	93	8	3.7	0.785	10.53	0.000	Reject
Level of information Sharing	0	10	8	93	12	3.9	0.689	14	0.000	Reject
The inventory management system	0	15	6	63	40	4	0.928	12.39	0.000	Reject
Concerning SC performance, which area do you think needs more attention?										
Lead-time for stock delivery to Labs/Sites	0	16	13	83	12	3.7	0.808	10.12	0.000	Reject
Back orders/customer order fill rate	0	9	12	54	52	4.2	0.874	15.13	0.000	Reject
Delivery reliability	0	14	13	86	11	3.8	0.769	10.98	0.000	Reject
Customer satisfaction	1	12	11	55	46	4.1	0.957	12.44	0.000	Reject
Concerning supplier selection, which area do you think needs more attention?										
Cost, Quality, Service, Innovativeness	0	16	48	49	9	3.4	0.811	5.69	0.000	Reject

Table 5 shows the results of the mean scores based on the Likert scale and the t-test results for the items that were used to measure the key study variables (or constructs). These constructs were Strategic supplier partnership, Resilience capability, Customer Relationship, Inventory Control Policy, Ranking SC factors, Risk management capabilities and Effectiveness of the design. All those items for which the respondents were undecided were coloured green, and all those items for which they disagreed with are coloured blue. The results in the table indicate that respondents agreed with all the statements of strategic supplier partnership. So what – please in your own word indicate what is the main meaning of these constructs to SC.

5. Discussion

5.1 Research question 1

Research question 1 aimed to identify factors that influence the effectiveness (sentence) of the SCD within the study organisation and it was found that there are many factors, that influence SCD within the organisation such as, Inventory management, Support from top management, IT, Customer Demand, communication tools and planning. Based on the RBV theory according to Esper & Crook (2014), these resources and capabilities are what influences the organisations ability in generating a

competitive advantage over similar organisations operating in a similar environment. Also, in support of the research findings, Hitt et al. (2016) emphasised the importance of resource heterogeneity, allocation, independency, utilisation, and imitability in establishing capabilities and developing resources for the accomplishment of competitive advantage.

5.2 Research question 2

Research question was to evaluate the effectiveness of the design of the current SC within the study organisation. It was concluded that distribution management and SCV is a key area of weakness in the management of the current SC and thus effects the overall SCD negatively. According to Mehmeti et al. (2016) and Bvuchete et al. (2020), distribution management is the ability of an organisation to support the storage and movement of items in order to meet consumer demand reliably and efficiently, and as indicated within this study, the on time in full delivery rate stands at 80%, which effectively means 20% of deliveries do not happen on time. This indicates that the distribution management area needs much work, as they have a direct impact on organisational performance from a revenue generation and customer experience point of view.

It is however doubtful if the organisation warehouses always deliver products in time; and the respondents were undecided on the question of being satisfied with the SC design.

5.3 Research question 3

Research objective three aimed to provide recommendations on how the SC within the study organisation can be improved. Based on the survey participants replies to Section C of the questionnaire which was specifically designed to provide recommendations and the study literature review under chapter 2, the following is to be noted:

- 66.94% (never starting a sentence with a percentage!) of the participants agree that lead-time for stock deliveries must be improved with 9.68% strongly agreeing that this area needs improvement. This trend is similar for questions related to back order fill rates and delivery reliability questions within the questionnaire.
- 50.81% of the participants agree that the inventory management system needs improvement with 32.26% strongly agreeing that the inventory management system needs improvement.

It is therefore recommended that the research organisation improve or modify the current *in-lab* inventory management system and policy to enable accurate inventory management and visibility. The labs should also be able to utilise the min and max (write out) level methodology for accurate ordering points and this must be an ERP driven approach. In creating an environment where this is managed easily, it will ensure all *links* within the SC has the required information to make the best decision possible for ordering and delivery of inventory into the labs. This will also increase the order fill rate by ensuring the right amount of product available at the warehouse at the right time, and will allow the study organisation to remain a competitive force within the pathology industry in South Africa. IM will therefore be an essential component in creating the best turnaround time for patient results. Lastly, this recommendation must be driven by senior management to be make an impact within the organisation, as it will require a vast amount of change management.

6. Managerial Implications

Senior management within the study organisation should evaluate the current use of available IT infrastructure, and seek to improve the overall usage of available tools to improve the performance of the organisation in terms of inventory management and order fulfilment. Staff based in the laboratory must have access to real-time inventory information and this should be as automated as possible. Training and refresher training must be conducted as regularly as possible to ensure staff is using the tools available to make informed decisions. The results of this study shows the importance of SCM and SCD, and within this two spheres how the factors such as inventory management, SCV, and distribution management can have a direct impact on the profitability, and importantly, affect the organisation from a competitive advantage point of view. Furthermore, investment into systems that

provide end to end visibility of the supply chain is key to leveraging current infrastructure to create a competitive advantage and this must be made available to all staff responsible for key activities.

7. Limitations

One of the major limitations of the study was the use of a single organisation and general implications where made, which is not entirely representative of the pathology industry within South Africa.

8. Conclusion

The aim of the study was to answer the question being: ***To determine how the current SC design of the case organisation affects organisational performance in a highly competitive environment, paying particular attention to the delivery of inventory into the laboratories.*** This study's theoretical framework attempted to comprehend SCD in the context of using internal resources and competencies to gain a competitive advantage. The conceptual framework ensured that the research instrument was targeted and geared toward obtaining themes and core findings linked to the study's subject.

This research study was designed to determine how the current supply chain design of the case organisation effects organisational performance in a highly competitive environment, paying particular attention to the delivery of inventory into the laboratories. The study was based on a South African based pathology organisation. The objectives of the study was to identify areas of weakness in the current supply chain design and recommend areas for improvement. The findings and recommendations will assist senior management to focus on key areas within the supply chain and implement corrective action plans and initiatives. These plans will be used to mitigate the hurdles identified in the pursuit of end user satisfaction with the supply chain performance, while also potentially reducing overstocking situations, thereby reducing overall inventory cost. In conclusion, this research study addressed the research issues by recommending solutions to the research problem of determining how the current supply chain design effects organisational performance.
