External environmental factors become considerable business disruptors and are presented as challenges for social entrepreneurial organisations. The challenges experienced during the Covid-19 period were a significant theme in the dataset. Organisations ultimately took action to curb the negative impact, determined to meet the dual organisational objectives. The findings concentrated on organisations' responsiveness to the disruptions caused or exacerbated by the pandemic.

The data also contained highlights of how each organisation responded to the disruptions and challenges experienced in the first few months of the Covid-19 period. Moreover, the challenges each social enterprise face outlined their responsiveness or 'response-ability', emphasising their unique actions in response to the encountered circumstances.

Research objective one: to explore what challenges social entrepreneurial organisations encountered during the Covid-19 pandemic.

The themes and sub-themes in Table 3 presents the challenges five social entrepreneurial organisations encountered during the Covid-19 pandemic, addressing research objective one.

Table 3: Challenges social entrepreneurial organisations encountered during the pandemic

Theme 1:	Sub-themes:
Social entrepreneurial organisations confronted with challenges in a less than enabling local environment during the Covid-19 pandemic.	<ul style="list-style-type: none"> • Lack of government support • Access to funding became problematic • Difficult to service beneficiaries' needs during the lockdown period

Source: Own compilation

One of the main setbacks for social entrepreneurial organisations is the stated lack of government support. South Africa is slow in finalising the Social Economy and Solidarity Policy (Patel, 2021), initiated in 2017 and supported by the South African Department of Economic Development, the

International Labour Organisation (ILO), and the British Counsel. The policy development process was in the consultative green paper stage for a while and then moved to the white paper stage in 2021. In the absence of a policy, it will take time to initiate a legal framework and taxation regulations to create an enabling environment for social entrepreneurial organisations. The social entrepreneurial leaders in the cases included in this study expressed discontentment regarding some of these matters (Steinman & van Rooij, 2012). The fact that there is no officially recognised legal entity for social enterprises creates an unfavourable environment in which these organisations must operate. Two social entrepreneurs from different case studies emphasised, *“This is the complexity of South Africa, ... but ultimately there needs to be a legal entity because it's very difficult for us”* (BK01), and the founder of Organisation A mentioned, *“... we need a social entrepreneurial vehicle ... a legal entity”* (AK01).

Generally, government funding for socially orientated organisations, such as non-profit and charity organisations, has decreased over the years (Moboya, 2017). Specifically, during the pandemic, government offices did not operate at optimal capacity, negatively impacting the non-profit sector. The finance manager at Organisation E, EE01, raised a concern about the *“loss of income ... for this financial year and we signed an agreement but the memorandum came in about 8 [eight] months late, so since March till end of August 2020 there was no funding”*. Furthermore, during the pandemic's extended lockdown period, the government provided small businesses with a Debt Relief Fund (Parliamentary Monitoring Group, 2021). Unfortunately, although social entrepreneurial organisations were instrumental in providing services to underserved communities during the pandemic, they were excluded from the benefits of the relief fund, one of the pitfalls of the government's response (Khambule, 2020).

Access to funding is problematic for a social entrepreneurial organisation. The traditional banks and financial institutions will not fund a social entrepreneurial organisation in South Africa, which was emphatically highlighted by BK01, *“... no bank in this country understands [social entrepreneurial organisations], or will fund our transaction. No bank in this country”*. The participant expressed disappointment in not being able to attract capital investment in the current business environment. As further explained by the social entrepreneur at Organisation B, this organisation has a hybrid business model structure. However, even in this case, the organisation is unable to attract international funding due to the restrictive corporate laws in the country. As BK01 further elaborated, *“... there [is] funds called impact [funds]... the funds will only be paid to [a] social enterprise ...”*.

The extended lockdown periods during the pandemic created constraints with a direct and negative impact on beneficiaries and communities in underserved communities. Most businesses and organisations were not allowed to operate, with the exception of businesses providing essential services. At Organisation B, social entrepreneur BK01 stated that, *“Covid-19 had an impact because we are not allowed to operate like everybody else”*. Also, Organisation C was in the middle of an “organisational restructure”, as highlighted by founder CK01. The purpose was to facilitate the implementation of new programmes that would make the organisation more sustainable; this was during the same period when the Covid-19 pandemic unexpectedly arrived. CK01 sadly reported, *“Covid-19 came along so we have[not] been able to finish any of the programs that we had in mind, i.e. entrepreneurial development and a loan scheme”*. The lengthy nature of the pandemic and unexpected challenges had a detrimental impact on Organisation C, which eventually closed down in 2021. The challenge for most social entrepreneurial organisations is that funding is directly linked to the implementation of programmes and the provision of services for beneficiaries.

Moreover, social distancing regulations infringed on the delivery of organisational programmes and meeting beneficiary needs. An employee at Organisation A highlighted that *“... obviously, it [lockdown] interrupted learning”, which negatively impacted training at the CKCs, the schools and children wanting to use the internet for school assignments* (AE02). Another example was offered by the founder (CK01) from Organisation C, who agreed programmes were put on hold during the hard lockdown, which negatively impacted beneficiaries. One of the employees (CE01) stressed that, *“Yes ... [it did] impact the children ... because it seems like they do not understand [what] Covid [is]”*.

An employee from Organisation D (DE01) reported Covid-19 affected them significantly since it put a stop to all programmes, *“we couldn’t progress on many programmes like YOLO to educate them [youth] and it prevented the staff from visit[ing] our Correctional Centre-Child-Stop”*. The limitations imposed on programme implementation made it severely challenging to meet beneficiary needs. During the pandemic, beneficiaries’ needs extended beyond the programmes, and beneficiaries had basic needs for medical care and food.

Research objective two: to identify how social entrepreneurial organisations responded to the challenges with the aim of retaining the dual mission.

The themes and sub-themes in Table 4 reflect the adaptive approaches social entrepreneurial organisations utilised in responding to disruptive environmental challenges during the Covid-19 pandemic, addressing research objective two.

Table 4: Responses by social entrepreneurial organisations during the pandemic

Theme 2:	Sub-themes:
Employing adaptive approaches to address disruptive environmental challenges.	<ul style="list-style-type: none"> • Adopting creative methods to improve organisational strategies and processes • Diversifying service offering • Intentional networking

Source: Own compilation

In response to the challenges social entrepreneurial organisations faced during the pandemic, each organisation adopted creative methods to improve organisational strategies and processes. Organisation A created easier access to introductory information technology (IT) training courses and *“offered Covid-19 special, the free [training] course”* (AE01) during the lockdown period. As stated by one of the programme managers, *“so Covid-19 has taught us that ... sometimes you don’t need a laptop, you can work on your mobile phone because most of our fellow South Africans have a mobile phone”* (AE02). Organisation A applied a social franchise model, which generally requires a geographic presence. However, during the pandemic, Organisation A adopted a hybrid approach to deliver its programmes and training. The organisation transitioned from only using the computer centres to using online platforms and devices such as using mobile phones to conduct training, as well as social media platforms to reach various local and business communities, which broadened the reach of beneficiaries. Organisation A also recognised that in making a move to more online interventions and training, additional beneficiary support was required. AK01, the founder of the organisation, mentioned proudly, *“that Organisation A [is] developing our virtual platform ... [1] it will be used to connect all our community partners ... [2] is then that we can use the virtual hubs to open to ... beneficiaries and also [3] maybe ... trying to motivate and get it [website] zero-rate because we are an educational space”*. The success of adopting more digital methodologies to reach beneficiaries was evident in the increased number of individuals who completed the training programmes.

In comparison, Organisation B had a different beneficiary profile reaching out to people with disabilities (PWDs). The mothers (or guardians) of PWDs also received business skills training. Due to the economic downturn, Organisation B provided the female micro-business owners (the mothers) with enough bales of clothing to sell during this period, without requiring up-front payment. BK01 mentioned that in lockdown Level 4, the micro-businesses were allowed to sell clothes in the local township, *“and they killed it”* [meaning they did exceptionally well]. In addition, the organisation mobilised efforts to raise donations to put together food parcels to *“care for the beneficiaries”* (BK02) physical and basic needs. Furthermore, the organisation creatively made use of idle time and partnered with schools so learners could get involved. As mentioned by BK01, *“lock down they can make the toys at home ... we give them their kits ... and little videos how to make it”*.

Moreover, from an organisational process perspective, the managing directors used the lockdown period to create three innovative solutions to improve internal operational processes. The organisation created software to automate the internal recycling operational process – BK01 stated, *“we built the first wireless internet of things, post-consumer processing system”*. In addition, Organisation B

digitised the life skills training by creating “*how-to-do [video] clips*” (BK02) for job-specific tasks and PWDs, which allowed more PWDs to be reached than in a normal face-to-face training setting. Finally, Organisation B also found an innovative way to mobilise its business by forming a partnership to design “*a 3-phase power solar power trailer*”. A mobile solar power unit can be used to recycle anywhere, with the opportunity to create jobs for PWDs in local communities. The innovative approach applied by Organisation B improved the internal process of clothes recycling and created an opportunity to enhance its outreach strategy to PWDs at a local community level.

Organisation C, which operated as a hybrid entrepreneurial organisation, was dissolved due to various negative external environmental factors. Various challenges, including Covid-19, made it impossible for Organisation C to continue. The founder (CK01) sadly indicated that “*Organisation C came to a natural close*”. In collaboration and from a strategic perspective, the decision was made to hand the outreach programme with beneficiaries (children from the area) to a well-established non-profit company (NPC) near Zandspruit. CS02, a pastor in the area, indicated “*CE01 is now going to establish this [ECD] school in your area [Zandspruit]*”. The NPC agreed to adopt Organisation C’s programme, which would include an early childhood development school for children in Zandspruit. The funder for the children’s outreach programme also agreed to transfer the funding to the new organisation so the good work could continue. Although the organisation was closing, the founders of the organisation acted strategically to successfully save the project and take care of the beneficiaries’ needs, demonstrating a commitment to the primary mission.

Networking fostered ways to maximise available resources during the pandemic. The rural environment has its own unique challenges, such as high levels of unemployment, poverty, lack of municipal services and slow economic growth. To overcome the challenges of a resource-poor environment, Organisation D leveraged new partnerships through collaborative efforts with partner organisations (government agencies, private businesses and other non-profit organisations) to maximise community impact. The founder (DK01) mentioned that they “*invited so many stakeholders such as Lifeline, Right to Care, UFS, some schools ... there are some aspects we can say yes, on this matter yes we’ve been successful*”. Furthermore, in Organisation E, the founder mentioned, “*...it was a new partnership that opened up*”. Thus, while Organisation E no longer had use of the building they previously utilised, a unique opportunity was offered by the local primary school to use its school grounds for after-school care. Furthermore, it was favourable that most of the beneficiaries were from the same school, which reduced logistical costs. The bakery project was also to be re-established at the school, which became a win-win situation for both Organisation E and the school. During the lockdown, many of the local residents lost their employment, but through collaborative efforts with other non-profit organisations, food parcels were provided for the Heidedaal local community. In addition, the organisation secured vegetables from a university vegetable garden during the quiet lockdown period. During this time, there was an increase in collaborative efforts to ease the negative impact of the pandemic.

Moreover, the organisations had to be flexible and open to new ways of ensuring the survival of the organisation. Due to a lack of funding during the pandemic, Organisation D and E decided to diversify and accepted the opportunity to be a service provider to a local university in the Free State province. This university asked Organisation D and E to provide Covid-19 monitoring services to the university’s QwaQwa and Bloemfontein campuses, which generated much-needed income and created jobs for the local residents during the lockdown period. One of the beneficiaries working as a Covid-19 monitor (EB01) stated, “*Covid-19 opened a door that was shut, and that’s how I have a job today, so Covid-19 had a good influence on Organisation E*”. Embracing the opportunity and finding creative ways to fund and sustain the organisation during the economic downturn was a necessary strategic decision made by the organisational leaders.

The diversity of creative approaches and the dexterity used by the social entrepreneurial organisations to mitigate the disruptions caused by external environmental factors, including the negative impact of Covid-19, became apparent throughout the dataset. The investigation determined organisational leaders actively took the lead in managing the disruptions caused by the pandemic. In most instances,

the ability to respond to Covid-19 challenges stirred creativity, innovation and a keen responsiveness to initiate suitable solutions.

7 Managerial Implications

A common element in the social entrepreneurial organisations included in the study was their determination to meet the dual mission, despite external environmental factors. Macro-environmental factors affecting the social entrepreneurial organisations included the downward spiral of the economy, which led to job losses and increased socio-economic challenges, shrinking funding and available grants, as well as the lack of a social economy policy and a legal framework for social entrepreneurial organisations (Gonzalez & Dentchev, 2021). More recently, one of the substantial macro-disruptors was the Covid-19 pandemic (Odeku, 2021), presenting the four turbulent VUCA elements as pointed out by Bundtzen and Hinrichs (2021).

Furthermore, the author reflects on the association between the VUCA elements of organisational agility and organisational leadership adaptability in the five social enterprise case studies. The section focuses on their responsiveness during the environmental turmoil created by the Covid-19 pandemic. As elaborated, organisational agility is associated with elements such as volatility, uncertainty, complexity, and ambiguity (Bundtzen & Hinrichs, 2021). In a cross-sectional exploration of the cases, the VUCA elements were evident in each of the five case studies. First, the volatility or unpredictability of a health crisis such as the Covid-19 pandemic had a significant negative impact on all the social enterprise cases included in the study. The findings indicate that the unexpected arrival of the pandemic caused a setback for each of the social entrepreneurial organisations. The level of environmental disruption created through national lockdowns and social distancing brought all organisational activities to an unanticipated halt. Second, the unexpected closure of all businesses, including social entrepreneurial organisations during this period, created uncertainty for the future sustainability of the organisations in terms of funding (Moboya, 2017). Constraints were also realised in meeting beneficiary needs. Third, the complexity of the situation required organisational leaders to manage the challenges that manifested at an organisational level. The findings indicate that it was the organisational leaders who took action to deal with the challenges through creative and innovative initiatives, assisting in curbing the negative societal impact. Fourthly, the ambiguity experienced in the ever-changing disruptive nature of the pandemic (SAcoronavirus, 2020). Moreover, at an organisational level, the ambiguity related to the extended timeframe of the pandemic and the uncertainty it created.

According to Nafei (2016), three organisational factors should be considered to determine organisations' levels of agility, namely sensing agility, decision-making agility, and acting agility. First, sensing agility means leadership within the organisation should have the ability to scrutinise and monitor changes and trends within the business environment. Unarguably, the pandemic's arrival was unpredictable, and leaders globally and across most sectors did not have a sense of the extent of its impact at an organisational level. Therefore, there was a lack of planning or preparation to mitigate the effects of the pandemic on the social entrepreneur organisations'.

Second, leaders with decision-making agility have an opportunity to collect relevant information, identify opportunities and threats, and be decisive about planning the next steps to prevent disruptions impacting organisational activities. In this instance, the pandemic created socio-economic turbulence, and the information provided in itself was uncertain and unpredictable, which made decision-making complex. However, those leaders who decided to make changes based on the available information and had the drive to find ways to fulfil the organisational mission achieved some progress. A few examples were: Organisations A and B decided to utilise available technology to reach beneficiaries virtually; all five organisations leveraged the available networks to strengthen collaborative efforts to bring services to beneficiaries; and Organisation D and E decided to diversify their service offering to create an opportunity for income generation (Barraket, 2020; Argyrou, 2017). Organisation C had to close because it was no longer sustainable. However, a strategic decision was made first to find an entity to adopt the organisation's projects and social mission to uplift orphans and disadvantaged children from the Zandspruit community.

Thirdly, acting agility entails coordinating organisational tasks and maximising resources to enhance business processes. It tests an organisation's ability to respond appropriately to dynamic events. For example, Organisation A continued using the social franchise business model, but used technology and digital approaches to enhance the training and support offered. Organisation B utilised the dormant lockdown period to enhance internal organisational processes by creating three different types of innovations in a novel manner, creating opportunities for organisational development and growth (Akkaya & Tabak, 2020). Organisations D and E strengthened collaborative efforts for various stakeholders and community organisations to work together and create mutually beneficial partnerships (Bertotti, Harden, Renton & Sheridan, 2012; Jug, 2020). Moreover, in winding up Organisation C, the last available resources were used to ensure beneficiaries were not abandoned. Moreover, as an observation in all five cases, acting agility occurred reactively and not proactively, and it appears the pandemic forced social entrepreneurial organisations to push beyond the 'comfort-zone' of their daily operations. From a managerial perspective, it is evidently imperative for organisational leadership to be more forward-thinking so agility becomes part of the organisational approach.

Furthermore, from a social entrepreneurial perspective, there was a direct and negative impact relating to the Covid-19 pandemic. The pandemic resulted in extended mandatory lockdown periods, socio-economic volatility, and a standstill in many private and public industries. The ripple effect on social entrepreneurial organisations was that it negatively impacted donor funding and grants from the private and government sector. Governments across the globe instead allocated significant resources to flatten the curve and control the fast-spreading virus (Science Newsletter, 2020). The Covid-19 social distancing protocol also made servicing the beneficiaries significantly more complex, and at the same time illustrated the urgency and difficulty of reaching beneficiaries to assist them with basic needs. Subsequently, from a managerial perspective, social entrepreneurial leaders were challenged in dealing with ambiguities from one day to the next, balancing the need to meet the social mission, while keeping the organisation sustained during the precarious Covid-19 lockdowns.

Undeniably, dealing with a dynamic disruptor (like a pandemic) in combination with challenging local environmental factors requires a decisive organisational leader. In a social entrepreneurial organisation, the social entrepreneur is the organisational leader and driver of the organisation's mission (Jackson, Nicoll & Roy, 2018). The constant pressure experienced by social entrepreneurial organisations to maintain the dual mission during turbulent times requires decisive and adaptive leadership (Hiefertz, Grashow & Linsky, 2009).

Although organisational agility requires a prompt response to disruptive environmental situations, a connection exists to an organisational adaptive leadership approach. To develop organisations capable of responding appropriately to environmental disruption requires dynamic leadership that adopts principles of adaptability. Leaders who are rigid and inflexible in organisational systems, processes, and activities suppress adaptive and creative methods by limiting new ideas and change (Battilana & Casciaro, 2012; Harvard Business School, 2003). Adaptive leaders are responsive to change by first assessing the situation, followed by directing and managing organisational resources to implement feasible solutions. In the five case studies included in this investigation, two of the organisations embraced change at a strategic and innovative level. They implemented creative ways of achieving the dual mission. Two of the organisations diversified the type of service they rendered to create financial stability for the organisation, which is a critical aspect of balancing the dual mission. Mobilising available resources and networking became a primary way of taking care of beneficiaries basic needs during this tumultuous time, which created an increase in social capital.

Adaptive leadership demands proactively planning for changing conditions, which was lacking in most of the five social enterprise case studies. There was an exception: one of the organisations in the Free State indicated they have strict financial controls and have a reserve fund available for any emergencies. This fund carried the organisation through the full lockdown period. The other organisations experienced financial strain due to the shortage of funding during the pandemic.

Furthermore, only two of the five organisations started utilising available digital technology; regrettably, this was a reactive means of surviving the disruptive environment. An adaptive leader is able to navigate a changing environment, but more importantly, collectively include the organisational team and make lasting changes to organisational processes and adjust to the changing environment. The team's involvement in making changes was evident in the organisation that promoted digital literacy. This team investigated and implemented the new training strategies and assisted with the design of the virtual hub. In the organisation that focused on clothing recycling, the two founding members developed the innovations now being applied in the enhanced processes, with the overall organisation benefiting.

The following recommendations are offered: (1) the finalisation of the South African social economy policy, which is currently in the white paper phase; (2) access to funding from both government and the private sector, but with more efficient systems in place to enhance organisations' agility; (3) procurement and supply chains should include social entrepreneurial organisations; (4) training institutions should include training courses on creative problem-solving and innovative leadership to promote agility and adaptive practices; and finally (5), social entrepreneurial practitioners should collaborate more with third-sector organisations to strengthen current networks the local ecosystem.

A key limitation in this study was the restrictions created by the Covid-19 pandemic, lockdown measures and social distancing. The researcher, in most instances, had to use virtual online communication tools, preventing an opportunity to connect with the study participant or pick up on body language. Furthermore, the organisations in other provinces that declined to participate in the study limited the geographic representation of the sampled case studies. Moreover, the South African setting means findings are only presented from a developing country's perspective; however, this presents an opportunity for a comparative study with other developing countries. Future research could also observe which management practices are applied to deal with turbulent business environments.

8 Conclusion

Despite the Covid-19 pandemic, the social entrepreneurial organisations sampled for the study demonstrated that decisive leadership, flexibility and organisational agility are essential while working through external environmental disruptions. However, it is also evident that social entrepreneurial organisations have a reactive leadership approach and need to practice proactive planning to deal with potential environmental disruptions. In the South African context, the absence of a social economy policy and the lack of a conducive business environment makes it increasingly difficult for social entrepreneurial organisations to thrive.

This paper contributes to the South African literature considering Covid-19's impact at a social entrepreneurial organisational level. Uniquely, the paper focused on the duality of the social entrepreneurial organisation's mission in relation to organisational responsiveness. Finally, as aptly stated by one of the participants, "*Covid-19 has taught us ...*" (AE02). Therefore, in learning to navigate the external disruptive environment, social entrepreneurial organisations need adaptive leadership and organisational agility management practices to survive environmental uncertainties while maintaining the dual mission to run a successful social enterprise.

Retail Supply Chain Design Resilience in South Africa during the COVID-19 Pandemic

Dr Nkechi Neboh^{1,*}, Dr Patmond Mbhele²

^{1,2} Supply Chain Management, University of KwaZulu-Natal, Westville Campus, Durban, South Africa

Keywords

Fast Moving Consumer Goods; pandemic; product availability; retail supply chain; supply chain resilience

Abstract

The world is facing heightened pressure from environmental issues as well as uncertainty in businesses such as the Fast-moving Consumer Goods (FMCG) industry. The emergence of the coronavirus pandemic disrupted the retail supply chains, its customers' movements were restricted, society and health crises intensified, and all these tested the resilience capability of the FMCG industry. The purpose of this article is to establish the retail supply chain design capability to develop operational resilience from the effect of the coronavirus pandemic in South Africa. A quantitative, non-probability sampling was adopted with a sample size of 300 respondents, selected from the five giant retail stores in South Africa. The main findings indicate that environmental changes, (a dimension of supply chain design) contribute most to the increase in the variance of resilience. The takeout in this study is that businesses need to guard their shores by building resilience. For instance, re-innovating of their business model will assist retailers to address impending or persistent crises. Secondly, resilience will allow FMCGs to retain their competitive positioning as retailers implement strategic plans and policy measures for the benefit of the business.

1. Introduction

The concept of resilience is a critical emerging research area in the supply chain literature that has become imperative in assisting to weather disruptions without affecting business operations. Supply chain resilience is described as the adaptive capacity to prepare and respond to disruptions, recover cost-effectively, and advance to a better state than before the disruption. The South African retail market faces numerous threats to its business; hence the purpose of this study was to establish the capability of the retail supply chain to become resilient from the effect of the coronavirus pandemic. The rapid acceleration of the virus in terms of spread has challenged retail businesses more than envisaged. This sector is vulnerable as it is less prepared for uncertainty and complexity in its environment, even as the impact of this pandemic may be profound. The impact of COVID-19 on retailing comes in a varied package; from lower consumer spending that decimates its profitability through to lockdown measures that hampered its operations to the increase in the unemployment rate as some businesses close operations completely. Coronavirus has immersed retail businesses into a vulnerable position thereby raising the bar for serious discussion on collaboration and trust in the FMCG industry. Despite the provision of retailing to consumers, persistent inequalities in disposable income exist, as access is limited to the purchasing power of the rich against the poor consumers. Collaboration amongst the retailers would help improve rapid access to goods and the development of local farmers' capacity so that the dependence on international and long supply chain agreements is lowered. Moreover, trust is a significant requirement for an effective resilience response.

Coronavirus has taught retailers that agility and speed will be the new premise for differentiation as it allows effective responses to crises. At the scourge of the pandemic on retail, many expectations were

² E-mail address: Mbhelet@ukzn.ac.za

defied, hence yielding multiple responses such as behavioural changes and tactical plans in managing the business.

The need for retail to adjust its resilience capabilities has advanced current supply chains through mediums such as rethinking 'agile' retailing whereby customers become the core focus of the business as well as the full use of digital communication. Digital communication has enabled retailers to engage with their customers as well as the use of social media as a marketing platform. Also, the trading competitiveness of the retail business and supply chains are improved. Furthermore, the shift to local farmers, manufacturers, and local stores has strategically contributed to economic development, employment, increase in demand for locally produced goods, and community growth. The need for retail to adjust their resilience capabilities has seen the improvement of technology used to meet order fulfillment through leveraging a robust order management system that can connect its supply chain.

However, South African retail business capability to design the supply chain for resilience in the context of COVID-19 is yet to be addressed. This is important as the retail industry is continuously tested by the macro business environment, thereby affecting its supply chain. We seek to address this research objective:

- To establish how retail businesses in South Africa are resilient during the COVID-19 pandemic with supply chain design.

Focusing on the five retail stores in South Africa with the employment of almost 2.8 million people, the FMCG industry supports the economy and needs to be investigated, as this kind of study will advocate for its growth and competitiveness.

Technological advancement in retail means that several businesses are globally linked via various means, as consumers use new behavioural patterns such as online retailing, to demand products and services (MacCarthy, Blome, Olhager, Srai & Zhao, 2016) even in times of pandemic or disruptions. From a consumer perspective, sharing of information permits a first-hand notice of occurrences at a lower end of a supply chain. According to Grewal, Roggeveen & Nordfalt (2017), the custodians of information, for instance, the retailers, become empowered using technology, which hastens the services offered to customers, reduces cost, and increases sales. Using technologies at an operational level is widespread (Efendioglu, 2015) though retailers' motive is always with optimising their in-store experiences offering (Willems, Smolders, Brengman, Luyten & Schoning, 2017). The economic influence dimension of supply chain design for resilience stimulates retailing through better policies to govern businesses. From an economic perspective, a transport network ensures continuous product delivery to end consumers. This prompts stakeholders to speedily overhaul upgrade and maintain the roads, as it can be a criterion to build supply chain resilience.

The subsequent part of this paper is presented as follows: a review of literature, the research design methodology, results and discussion of findings, and the conclusions of the study.

2. Literature Review

2.1 Supply chain Design

According to Melnyk Narasimhan & Decampos (2014) supply chain design is known to maximise the supply chain management (SCM) benefits. It has been noted that supply chain design contexts and scopes were still new. Furthermore, many efforts have not been made to design an entire supply chain (Nel & Badenhorst-Weiss, 2010). Therefore, it is necessary to design for resilience at the supply chain level (Sabouhi, Pishvae & Jabalameli, 2018). Ghomi-Avili, Jalali Naini, Tavakkoli-Moghaddam & Jabbarzadeh (2017) supported the need for supply chain design as its objective is to reduce production, transportation, location, and purchasing costs. Badenhorst-Weiss & Nel (2011) investigated the conceptual framework needed to analyse supply chain designs and echoed that it is a complex,

demanding, and challenging process. Niemann (2018) buttressed this point by stating that supply chain design is an important technique in building supply chain resilience.

2.1.1 Dimensions of Supply Chain Design

Melynk *et al.* (2014) suggested that supply chain design is seen as a process outcome and defined by dimensions such as technology advancement, economic influence, transport network, and environmental changes. This article will further discuss the supply chain design dimensions below:

Technological Advancement

Consumers' quality of life is improved by Technology (Pantano & Timmermans, 2014). As consumers adopt new patterns of behaviour in the demand for products and services, technology advancement in retail means that many people are connected through diverse means across the globe. The influence of technology on the supply chain creates a high turnaround clock speed (MacCarthy *et al.*, 2016) and shares valuable information with all supply chain partners (Hassan & Nasereddin, 2018). It also empowers retailers to advance service delivery to customers, increase sales, advance management operations and reduce costs (Grewal, 2017). The growing competitiveness of the African retail landscape embraces fresh and untapped business ventures with more agile responses to consumers faster and in a cost-effective with widespread on an operational level (Kalidas, Magwetsu & Rajagopaul, 2020). In making efforts to offer and deliver a consistent and seamless service experience to customers, retailers ensure that exploring opportunities for technology change becomes imperative in decision making. Technology improves communication between what can be offered by the retailers and what is desired by the consumers (Wesson, 2018) from the underlying effects of Covid-19 disruptions. In the context of this study, COVID-19 has shaken the boundaries of retail and highlighted a whole lot of things that technology can do in such disruption occurrences. In managing these crises, retail businesses continue their operations due to the dependence on technology despite the restrictions in place such as movement of the people and social distancing. Hence, the focus for retailers should be on providing relevant values for consumers using functional and integrative supply chain technology (Suriyantphupha & Bourlakis, 2019) a suitable business model evolution (Climent & Haftor, 2021), likelihood for retailers to optimise their in-store experience offering (Briedis, Kronschnabi, Rodriguez & Ungerma, 2020). The greater benefit to the retailers in adopting technology has the potential to overhaul the distribution structure of retail through augmenting delivery frequencies and the possibility of profiling customers based on patterns of demand can be achieved (Vallandingham, Yu, Sharma, Strandhagen & Strandhagen, 2018). There has been a rapid shift to using digital technology for various retail business transactions especially for interacting with loyal customers. This creates value for the consumers through a physical experience as demands for products and services can still be fulfilled. However, COVID-19 has further brought to light that the understanding of barriers to accessibility of technology (OECD, 2020), and the presence of the digital divide continue to worsen inequalities in South Africa as a nation. Though some retailers had struggled due to the coronavirus impact, others have taken the technology-adopted opportunity due to the sudden increase in demand for products.

Economic Influence of supply chain design on resilience

For the economic influence of supply chain design on resilience, the International Monetary Fund (IMF) 2020 estimated that the sub-Saharan African economy will shrink by 3 percent even though the oil-producing countries suffered a bad plunge in crude prices. Likewise, business confidence is at its lowest, with many investors pulling out of businesses in different countries (IDC report, 2020). With rising unemployment rates and low household disposable incomes, businesses such as retail are constrained to increasingly provide services with limited revenue in circulation. The current pandemic in the world has shaken the African continent such that there was reduced demand for African exports, especially in countries that trade significantly with the global value chains (Gondwe, 2020). Other issues exist that draw the continent backward in terms of growth opportunities and resilience structures such as load-shedding, policy rate hikes, and weakening of currencies that affect the retail businesses. Economic shift heavily impacts the retail industry (United Nations Conference on Trade and Development (UNCTAD), 2020) as it creates a ripple effect on the cost of goods, increases

consumer spending, and even increases the unemployment rate as many employees may be laid off from their work.

Due to COVID-19, retailers are affected by issues such as low consumer demand for products and transportation (Bishi, Grossman & Startz, 2021). However, if the COVID-19 impact moves the world into a deep recession, Africa's Gross Domestic Product (GDP) will drop -by 1.4% and will further drop its total exports by -16.7% with the ensuing revenue losses of up to -5.2% (Gondwe, 2020).

Transport Network

Transportation, water supply, electricity, and communications systems are amongst the basic commodities needed to support daily living. These amenities have become prone to disruptions due to their complexity, and transport systems are amongst the most affected structure when a such disaster occurs (Zhou, Wang & Yang, 2018), which can be man-made or natural. Earthquakes and hurricanes are noted to cause disruptions to transport systems such as Hurricane Sandy in 2012, cyclone Idai and Kenneth in Zimbabwe and other African countries (European Commission, 2019) and these can increase inefficiencies and pollution (Ganin, Kitsak, Marchese, Keisler, Seager & Linkov, 2017). A transport network always needs to be functional, as it is the only means to provide access to any disruption-affected areas to aid emergency response and recovery activities (Zhuo *et al.*, 2018). From an economic perspective, a transport network ensures the continual delivery of products to end consumers and adds to the GDP growth of any economy. From the welfare perspective, a transport network allows access through varied routes to a place of interest such as evacuations and distribution of relief materials to the most indigent in society. When it comes to the relationship between the transport network and resilience, it is the ability to be operable and maintain functionality despite disruptions. Transport networks may also bring about flexibility to a supply chain as multiple modes of transportation such as rail, road, and sea can be combined to get the product to its destination. With a limited transport network that conveys goods to its different destinations in Africa, it will be difficult for retailers to coordinate activities. In the context of South Africa, it means that if the retail business needs to readjust and reroute its transport network to be able to safely deliver goods to stores for consumers despite disruptions, then that plan should be upheld. However, from the COVID-19 perspective, a report from the World Bank Group forecasted the transport sector has completely been toppled by COVID-19 (World Bank Group, 2020). Coronavirus has disrupted African markets and entrepreneurs have come to the reality to invest in local businesses as a matter of priority (Russon, 2020).

Environmental Changes

The growing pressure on businesses is on the greening of products and using renewable materials, and insight that promotes sustainability. The world is going through climate change, and this extends to the retail business environment hence, as the environment changes, so do the design of a supply chain, to build resilience. From a wider perspective and due to the complexity and changes in its environment, the disruptions faced by the retail industry are overwhelming. Ranging from natural disasters such as flooding and drought situations and man-made disasters such as shrinkage allowing the industry to struggle. Retailers can be a driver of environmentally sustainable consumption for consumers as goods are procured from their stores. As the retail environment is exposed to shocks, disruptions, and uncertainties, businesses are required to reduce their carbon footprint through reusing, reducing, and recycling materials such as plastics, which are being discouraged from using, since it is a non-degradable materials. Retail businesses need to understand their environment in terms of the presence of threats and opportunities, then provide insights to building resilience against unforeseen events. In other words, sustainability can be an essential factor in influencing resilience (Ahern, 2012; Pablo, Metzeri, Katharina, Roberto, Franz, Mariana, Debora & Andrea, 2016) as both concepts are attributes or criteria for a decision-making process (Ardebili & Padoano, 2020). The advent of coronavirus in the retail supply chain created lots of rippling effects from food production, movement of the finished products to points of destination, and the impact of environmental change on the supply chain (Alam and Khatun, 2021).). However, in the context of COVID-19, sustainability is the key to survivability in the retail business industry. Maintaining the availability of products through the global supply chain despite the lockdown restrictions in South Africa is essential to life sustenance.

2.2 Resilience

A retail economy is assumed to be formed on the backbone of its supply chain and transport networks. A true supply chain resilience is not just concerned about mitigation and avoidance but about growth and competitive advantage (Harrington, 2014) and the ability to manage risks and to manage damages better than its competitors (Briano, Caballini, Giribone & Revetria, 2010). With the dramatic increase in supply chain disruption impact, firms are beginning to be concerned about supply chain resilience due to emerging system risks that disrupt supply chains geographically and widely (Wright, 2013). However, resilience creation and maintenance are procedures and not a once-off incident (Petit, Croxton & Fiskel, 2013; Scholten, Sharkey & Fynes, 2014). It can consequently be argued that supply chain resilience is undeniably a good phenomenon that every supply chain should aim to achieve since literature has proven its viability in achieving sustained competitive advantage. The integration and coherence amongst supply chain partners prompt the need to be continually resilient, especially in the retail industry which is characterised by its complexity. Hence, resilience is a desirable trait to possess especially in dealing with disruptions.

2.2.1 Supply Chain Resilience

Christopher and Peck (2004) provided a concise description of supply chain resilience during a research study carried out at Cranfield University. Resilience is seen as a system's ability to return to its original state and move to a novel and more desirable state after being disrupted. Resilience is more than the recovery ability (Barroso, Machado and Machado, 2011); it is also the ability to be better placed than competitors in the management of risks. To handle uncertain risks effectively, a resilient supply chain should be built. Supply chain resilience (SCRES) is described as a situation when one encounters an unexpected disruption, the system of the supply chain is restored to a better stable state through the micro constant development of enterprises' self-organising ability. Also, 62 percent of organisations cited that it is a priority to increase supply chain resilience post-COVID-19 (Supply chain digital, 2020). Although, this outbreak is not the industry's first crisis, however, the impact breaks many global supply chains (Araz, Choi, Olson and Salman, 2020; Ivanov, 2020). When it comes to resilience in supply chains, recent research focuses on supplier diversity, visibility, and transparency; this would allow a switch of supply sources, especially in cases where a crisis affects a region (Schmidt, 2020; Alicke Azcue and Barriball Open, 2020). The next section discusses the research methods employed in the study.

3. Research Methodology

This study used a cross-sectional survey research design and a quantitative research approach (Creswell & Hirose, 2019) to investigate the Retail Supply Chain Design for Resilience in South Africa during the COVID-19 Pandemic period. The cross-sectional survey design suited the objective as it examines the supply chain design resilience of the retail in South Africa during the COVID-19 period. The sample was drawn from the five retail giant retail stores. The data were quantitatively gathered with the use of a questionnaire emailed to some identified retail store managers, owners, and supervisors, in line with the lockdown restrictions in South Africa. The sampling technique adopted in this survey included non-probability sampling, preferably purposive sampling, and snowballing techniques. Purposive sampling is a non-probability sampling method (Saunders & Townsend, 2018) that aided in selecting respondents. The justification for using this sampling method is because the respondents are in strategic positions in the retail business and have the valid information sought and are experienced on the job. The respondents were identified electronically through emails and other social media platforms. Additionally, snowball sampling was employed in this study as the population of employees that work from their homes is unknown, and is geographically spread out (Jalca, Lopez, Sotelo, & Raymundo, 2019). The online survey link to complete the questionnaire was provided to respondents with the encouragement to forward the survey link to their managerial colleagues who were on a work shift at the time of the investigation. After 6 weeks, a follow-up and gentle reminders were sent to respondents to complete the electronic survey, a total of 300 responses were retrieved online. The questionnaire was categorised into four structured sections: Section A included the distinctive demographic, personal, and company profile with other general information. Sections B, C, and D included a series of statements on the phenomenon of study. The responses were constructed on

a five-point Likert scale ranging from strongly agree to strongly disagree. Respondents specified the extent of agreement or disagreement. Figure 5 signified “strongly agree” and 1 symbolised “strongly disagree”. The scale items were adapted from Christopher and Peck (2004). The questionnaire was designed using a Google form to improve access to the respondents using the various online platforms such as smartphones, tablets, and other personal computers or devices. The online survey tool was chosen to improve accessibility to as many respondents as possible in the selected African countries during lockdown restrictions. No disclosed identity of the respondents was collected, and the survey began with an informed consent form that emphasises voluntary participation. Also, respondents were informed that their participation would be anonymous and confidential.

4. Data Analysis

The data were analysed using both descriptive and inferential statistical tools. Descriptively, the data were summarised for easy description using descriptive statistics (mean scores) via Statistical Package for Social Sciences (SPSS) version 26.

Table 1: Sample Table

Gender	Male	46	Total: 300
	Female	254	
Work Years	Over 15 Yrs.	75	Total: 300
	5 – 10 Yrs.	80	
	1 – 5 Yrs.	145	
Position	Supervisors	138	Total: 300
	Store Owners	94	
	Managers	68	

Source: Own compilation

The sample characteristics showed that 300 respondents were employed in the retail business, with 254 females and 46 males enlisted. Some of the respondents have been in the industry for over 15 years (75 employees), 5 -10 years (80 employees) and most employees (145) have been in the industry for (1 – 5) years. The number of respondents that were supervisors is 138 in total, 94 were store owners and 68 were managers in the retail business.

Table 2: Descriptive Statistics on Supply Chain Design Dimensions and Supply Chain Resilience

Test Items	Mean	Standard Deviation	Minimum	Maximum
Transport Network	4.75	0.443	2	5
Technology Advancement	4.42	0.682	2	5
Environmental Changes	4.24	0.746	2	5
Economic Influence	4.20	0.753	2	5
Supply Chain Resilience	4.47	0.681	1	5

Source: Compiled by Researcher from SPSS Analysed Results

Descriptive statistics revealed that the technology advancement scored the mean (M)=4.42 and standard deviation (StD) of 0.682, economic influence had M= 4.20 and StD of 0.753, transport network had a score of M = 4.75 with StD of 0.443, and environmental changes had a mean score of M = 4.24 and StD of 0.746, and the independent variable for this study, supply chain resilience scored an M= 4.47 and StD of 0.681. The descriptive statistics signified the role and strength of transport network M = 4.75, technology advancement M = 4.42, and environmental changes M = 4.24 to supply chain resilience. However, economic influence contributed more to supply chain resilience with a standard deviation of 0.746.

Table 3: Reliability and validity Test

Reliability Statistics	
Cronbach's Alpha	N of Items
.663	5

Source: SPSS Analysed Result

The reliability test was based on testing whether the questions from a 5-point Likert scale are reliable. Cronbach Alpha was used to test the reliability of the instrument indicating how closely related a set of items are as a group. According to Hair *et al.* (2016), a reliability score level of 0.7 to 0.8 is good. The data analysis Cronbach Alpha score was 0.663 which indicates that the instrument of measurement is good. Also, the instrument was validated as all measured constructs were populated accordingly.

Table 4: Pearson Correlation Coefficient Between Supply Chain Resilience and Supply Chain Design Dimensions

Supply chain Design variables		Supply Chain Resilience
Technology Advancement	Pearson Correlation Sig (2-tailed)	0.269 0.000
Economic Influence	Pearson Correlation Sig (2-tailed)	0.157 0.006
Environmental Changes	Pearson Correlation Sig (2-tailed)	0.273 0.000
Transport Network	Pearson Correlation Sig (2-tailed)	0.232 0.000

Source: SPSS Analysed Result

It is clear on the Pearson correlation that none of the independent variables can ignite any multicollinearity amongst variables. It is inferred that all independent variables such as technology advancement, economic influence, transport network, and environmental changes are not influencing the power of predictability.

Table 5: Statistics Analysis on ANOVA, Coefficients, Diagnostics, and Residuals on Supply Chain Design and Supply Chain Resilience Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate	Durbin-Watson							
1	.387	.150	.138	.632	1.533							
a. Predictors: (Constant), Transport Network, Technology Advancement, Environmental Changes, Economic Influence												
b. Dependent Variable: Supply Chain Resilience

Source: SPSS Analysed Result

Multivariate analysis such as multiple regression assisted in determining the actual variables that are included in the model and have contributed to predicting the dependent variables, the researcher looked at the Beta values. For this analysis, the variables that are significant include (technology advancement = 0.000, environmental changes = 0.002 and transport network = 0.000). The variable with the largest beta coefficient relates to environmental changes with a value of 0.232. This shows that the variable (environmental changes) makes the strongest individual influence in amplifying the variance in the dependent variable (supply chain resilience). In examining the extent of multicollinearity, the Durbin-Watson value is used, which should lie between 1.5 and 2.5 (Pallant, 2011:156). For this analysis, the value of Durbin-Watson is 1.533. There are no issues of multicollinearity that are evident in this analysis, all the tolerance values must not be below 0.10, and all the values in this study are greater than 0.10 (Pallant, 2011:156; Daoud, 2017). For the VIF values, it must not be above 0.10, and the results indicate that all the VIF values were above 0.10. the R Square tells the extent or degree of variance in the dependent variable (Supply Chain Resilience) that is explained by the model (comprising the independent variables). The value is 0.150 expressed in percentage, meaning that the model explains 15 percent of the variance in supply chain resilience. For this study, the R square value is 0.150, $F = 12.993$, with 4 degrees of freedom at a significance level, $p < 0.05$ using the standard multiple regression method. In retailing, the macro environment is consistently exerting pressures on the industry which is already complex. The variables of technology advancement, transport network, and environmental changes have been deduced to influence supply chain resilience hence caution is suggested to the retailers especially during decision making to consider these variables to build resilience. However, in Africa, poverty, unemployment, and economic situations have plunged its citizens to a point of desperation whereby retailers face the brunt of events such as the pandemic. For instance, in South Africa, riots and protests have gripped the nation to a standstill despite the ravaging effects of the coronavirus pandemic and lockdown restrictions. The citizens have taken to the street by rampaging, looting, and burning malls, stores, and small-medium businesses and left the nation on its knees to recover operations. The extent of damage to the retail industries is incredible and may take years to salvage the wasted opportunities. Humans are insatiable hence government needs to rise to the occasion to provide accessibility to businesses to ensure operational continuity.

5. Results and Discussion

It is interesting to note that environmental changes were evidenced to contribute more to supply chain resilience. As with the current pandemic in the global world, known to be contagious and exist in the environment, businesses need to guard their shores by building a resilient supply chain to ensure continuity. Furthermore, technology advancement and transport networks are also contributory to the variance in supply chain resilience and should not be neglected. Its importance to retail especially in these precarious times is undeniable. For instance, the alarming rate of COVID-19 cases in Africa did not deter the unrest in South Africa where the transport network was distorted, creating ripple costs for businesses as drivers of vehicles reroute their movement to safety. Moreover, the Pearson correlation result indicated no collinearity amongst the variables of interest.

The multivariate analysis deduced that the R square value was 15%. The Beta values indicated that environmental changes contributed mostly to the variance in the dependent variable (Supply Chain Resilience). In designing a supply chain, the customer demands, the effect of the environment on the chain, and the internal objectives of the stakeholders must be considered. The business model of the FMCG industry needs to always consider the expected demands of its consumers and efficiently deliver on its promises and in this case, products must always be made available. Enabling efficient product delivery is dependent on advancement in technology that permits seamless operation, harmonisation of relationships with the combined efforts of the supply chain partners. In addition, a range of information on retail and customers can be integrated into a database hub and can be assessed by every retailer to enhance the visibility of sales data, product movements, and status in the supply chain. Better planning on where a business should be located enhances its viability to trade and gain profit, as customers prefer convenience and shopping experience. It then follows that the nature of a retail supply chain demands a unified body of partners that uniquely decides on investing in resources such as technology, to be able to compete in the marketplace. For instance, Africa needs to connect its

infrastructural network so that there can be transferable means to move products across the continent. Resources such as transport can utilise a faster turnaround time in the delivery of products and goods to their destination. This belief can be enhanced when supply chains are interlinked, with an implication that the partners try as much as possible to share accurate information from the downstream to the upstream. Accurate information sharing assists in reducing distorted forecasts or wrong customer demand information to the suppliers. COVID-19 has dealt a blow on the African continent such that the disparity between the rich and poor deepens. Although the implementation of the African Continental Free Trade Area (AfCFTA) can reinforce the supply chains of the different regions, reduce the susceptibility to external disruptions, advance the transition to digital platforms and build resilience against future unforeseen disasters, the long-term effects of the pandemic could increase prices of food as inflation rises. This is because food supply chains are threatened by the virus as most consumers start panic buying and hoarding products in anticipation of shortages, hence triggering price increases and these activities may induce social unrest. According to OECD (2020), Africa is faced with a dual challenge in their public health and economic crisis as the risks increase with the healthcare system, livelihoods, and slow growth in the regions in years to come. It is anticipated that the current pandemic can wipe out years of developmental gains. The report further highlighted that government bond yields spiraled in Egypt, Nigeria, and South Africa hence it is now difficult for the African countries to borrow. COVID-19 exposed the living well-being of the citizens in terms of economic deprivation and social lives. Retail businesses need to be resilient in these tough times to ensure food security for the population.

6. Conclusion

This study statistically found that transport networks, technology advancement, economic influence, and environmental change are the most influential factors that impact supply chain resilience variance. It is therefore important that even though the target of businesses is to survive, supply chain partners must ensure that these variables are strategically placed for the retail supply chain. Tough times call for tougher strategies to ensure continuity. Retail businesses need to advance their technology and diversify their relationship with other African countries to enhance their industrial performance. The agenda of AfCFTA can assist to coordinate the regional cohesiveness of supply chains to ensure food supply and security for consumers. There is huge potential for growth in Africa, but its transport network demands a regional change to its links to increase its distribution and related services. An efficient transport infrastructure could help in disabling barriers and exploit complementarities across countries, resulting in regional integration. Transport and logistics infrastructure is of importance to Africa as it has the largest number of landlocked countries globally. South Africa has a heightened need to strategically invest more in the transport network to improve resilience by drawing from international experiences.

Furthermore, the need to invest and integrate technology cannot be overstated as the 4th industrial revolution is already happening. Technology can improve the visibility, sharing of information, collaboration, and many other efforts towards pursuing resiliency in businesses. Retailers need to understand that technology has reshaped consumer expectations, which are now unique and higher than before. Retailers must acquire and align processes that can streamline customer demands to the business objectives. Proper actions taken before disruption times, help to reduce cost and mobilise resources associated. In this age of technology proliferation, the power of trade is now shifting towards the consumers, therefore, retailers need to be transparent in their business and try as much as possible to integrate consumer needs when making decisions and constantly engage with them through consumer promotional mix, best wishes messages and develop other incentives or reward for their loyal customers. Supply chain retail partners should constantly reevaluate their supply chain in terms of risk propensities, increase mitigating/contingency plans and effectively change and adapt better operational moves to build resilience. Today's consumers are increasingly becoming aware of the environmental changes in their lives and demand environmentally friendly products, packaging, and even shopping bags to minimise waste. Retailers are forced to reduce their carbon footprint by being environmentally responsible in the way goods are sourced, produced, packaged, and sold. This can be achieved through optimised operations enacted holistically in an integrated retail supply chain network.

Furthermore, as pandemics such as COVID-19 may reoccur, retail businesses may need to diversify their channel of sales, from traditional brick and mortar to online retail experience. There must also be a closer look at their liquidity profile to assess the change in working capital dynamics. These strategies can be a form of pandemic planning considerations to provide continuity for the business and have reliable supply chains. These can be supply chains that can be moved closer to the point of need so that future productions cannot be halted. Therefore, retailers that adapt to change will be better positioned to sustain and win over challenges and become stronger in achieving more customer-oriented businesses. This can be achieved through understanding the stakeholder's operation to optimise business communication channels and reduce the time of response towards fulfilling customers' demands.

7. Practical and managerial Implications

The practical implication of this study informs that the findings may be incorporated into retail supply chain strategies, to improve the awareness of disruptions in the retail business environment and build resilience to hedge against it, especially in the post-COVID-19 era. Hence, adapting resilience to retail business operations possibly suggest an optimal readiness in Africa to improve productivity and relationship amongst stakeholders. There is also a great need for retail supply chain managers to support redesigning of their business model for effective resilience in South Africa. This paper highlights the strong influence of the coronavirus crisis on the supply chain design of FMCGs in South Africa and how retailers can navigate their business operations, build resilience and ensure continuity. Retailers are at the frontline and always confronted by COVID-19 impact as the world consumers depend on their products (necessities of life) for livelihood and survival. However, the persistence of the pandemic coupled with lockdown restrictions, have caused most people to avoid visiting stores as was traditionally the case. Thereby, affecting sales and profitability of the retailers, as certain products are not sold due to non-viewing. The practical implication is that the COVID-19 pandemic has reduced the product flow from all the members of the supply chain down to the consumers, because of the restrictions on movement from one place to another. This implies that the negative impact of COVID-19 has created ripple effects in society. To be better, retailers and managers can support and augment recovery from the current pandemic by harnessing innovative capabilities for visibility and enabling a more resilient feat in the future. The reality is that the pandemic does not seem to abate soon, hence retailers and managers must create a new work world such as online retailing, and reinvent and chart optimal strategic moves for their future business operations.

8. Limitations and Future Studies

A cross-sectional survey was conducted in this study; however, it is suggested that future studies deal with longitudinal techniques and well in a different context, aside from retail. The obvious evidence of limitation is that the study is on selected retail stores in South Africa. This limitation links back to the study objectives in terms of South African retail performance towards supply chain resilience within the context of COVID-19. This heeds a call for leaders to advocate for better data structures and governance for the benefit of business growth and readiness for unanticipated events. The preparation will reinforce retail businesses to mobilise mechanisms and respond to a crisis such as COVID-19. As African economies evolve amid the pandemic, so has the retail business survival mode activated to handle food insecurity and shock from the crisis. The perspective of stakeholders in terms of their experience during the COVID-19 pandemic in the retail industry such as suppliers and wholesalers can be investigated in the future, as this study dealt directly with only retailers. The acceleration for open information sharing must be supported for future use in retail, as timely data access that can inform innovations and interventions are employed.

This study would have included the consumers as participants to examine their perspective on COVID-19 and their resilience ability towards survival during tough times. This would have given a clearer picture of the entire actors in the retail supply chain, fashioned out the means or resources, and cushioned the effect of the pandemic for the business continuity. The findings of this study have presented an informed empirical analysis that the managers of the fast-moving consumer goods

industry can adopt in readiness or response to disruptions such as COVID-19. This can be done by building a tighter relationship with trade partners and as well rethink their business models by restructuring their supply chains. Managers can do this by sourcing supply chain specialists that are experienced in remodeling and redesigning a business to effect the necessary change. This action needs access to the right technologies that can comply with different standards such as end-to-end visibility of the supply chain. Therefore, a decision on the tradeoff between the benefits to be achieved by the retail business and the cost of restructuring the supply chain should be made. The reason why managers should do these, concerns the competitive edge over other competitors, that the retail business will achieve. Managers can also implement disruption management plans to handle and minimise the effect on the retail business. The authors suggest that retailers and managers leverage technology to enhance competitiveness and market position. In addition, understanding the market dynamics and conditions amid any crisis will assist the retailers to prioritise business opportunities, carving their niche offering, and investing in resources appropriately.

This study adds to the value of the body of knowledge as it is one of those studies that investigates supply chain design for retail resilience in South Africa. The study also contributes globally to the scarce literature on supply chain design for resilience in the FMCG industry. Therefore, it is recommended that retailers need continually improve their technology for business growth. The current technology age indicates that the trading power is fluctuating towards the consumers, hence transparency in business, as well as their integration, will be important for decision making in the retailing industry. The retail supply chain partners know that the business environment is ever-changing and therefore must quickly adopt optimal objectives that can differentiate and position their business well in the market.

Organisational culture,
E-commerce

Abstract

The business environment today presents only one certainty: the future is unknown and will offer up unknown disruptions. The COVID-19 pandemic presented the business world with a unique set of complex and uncertain disruptions. Organisational adaptability was critical to ensure survival and success: resilience, agility and flexibility all contribute to an ability to adapt.

The purpose of this research was to identify the critical success factors of South African retail firms during the COVID-19 pandemic, that demonstrated significant adaptive capacity to allow for effective transitions to e-commerce. The focus was on three organisational dimensions: strategy, culture, and structure, and how they could be leveraged to build adaptive capacity.

This exploratory qualitative research collected data through in-depth interviews with a purposive sample of four consultants and five retailers. A thematic analysis was conducted to extract the themes giving the lived experiences of participants.

It was found that a lack of strategic direction and myopic responses led to missed opportunities; further, a culture that was not open to change and tended to be risk averse following the shock of the COVID-19 pandemic compounded the slow response to invest in e-commerce. The organisational structural shift to separate e-commerce teams and flatter structures has been after the fact and is deemed to have facilitated the initial roll-out of e-commerce.

This research developed an adaptability framework that provides consultants with practical recommendations to determine the level of adaptive capacity required, at different uncertainty and volatility levels.

1. Introduction

The business environment today presents only one certainty - the future is unknown and will offer up unknown disruption. The COVID-19 pandemic presented the business world with a unique set of complex and uncertain disruptions. The harsh lockdown measures implemented by the South African government restricted many industries, forcing them to adapt or suffer the consequences. COVID-19 was a 'black swan' event (an unforeseen event of large magnitude) that caught most people and organisations by surprise. Schwab and Malleret (2020) however highlight that characterising the pandemic as a 'black swan' event is a mistake, and they refer it to as a 'white swan' (an event of catastrophic proportions predicted with certainty to occur at some time) despite many of the consequences of COVID-19 being unexpected. Whatever the case, with supply chain disruptions, reduced consumer spending and strict lockdowns, there emerged clear winners in the competitive South African retail arena, who were able to adapt and therefore exploit available opportunities.

Today the business environment is far more unstable, for example the VUCA acronym (volatility, uncertainty, complexity, ambiguity) was popularised in business culture around 2007 (Saleh & Watson, 2017), and the rate of change in this environment is increasing (Papulova & Gazova as cited in Minciu et al., 2020). In times of high uncertainty, organisations that can be both resilient and agile have a higher probability of above average returns (McCann et al., 2009). Reeves and Deimler (2011) suggest that the traditional strategy approach, which is based around stable patterns, is no longer effective and that adaptability is the new competitive advantage. Pfeffer (2007) describes conventional strategy practices as too rigid and predictable and promotes a more fluid, iterative and dynamic process. The emergence of adaptability as an overarching theme is further validated by recent research from McKinsey that points to adaptability as the critical success factor in times of rapid change (Brassey et al., 2021).

With only 2% of total sales in South Africa being conducted online (Daniel, 2020) before the pandemic, putting the South African e-commerce market far behind “the global average of 16%” (Daniel, 2020, para. 6), those who were poised to tap into this space have reaped the rewards. E-commerce has been a response to the pandemic and a marker of adaptability in organisations. As highlighted by Braithwaite (2020), retailers that have offered groceries and essential goods online were able to capitalise on strict lockdowns. Understanding the internal attributes of these organisations, in relation to strategy, culture and structure will enable future organisations to future proof their businesses and effectively pivot out of catastrophic world events and business cycles.

1.1. Problem Statement

As stated by Zucker and Rowel (2021), “while we hope to avoid future pandemics, one thing is clear – we cannot avoid ever increasing complexity.” (para. 1). They argue that the past two years (2020-2021) present us with valuable learnings for continued effective leadership of successful businesses defined by their ability to “...continually learn, evolve and navigate...”. The authors put forward the idea that as complexity increases, businesses are increasingly required to get comfortable with the unknown. Previously a lack of knowledge was perceived to present too much risk; however, now a business’ success is defined by its ability to keep learning rather than know it all. Finding the perfect solution is no longer held as the ideal, instead those able to absorb mistakes and make progress in a constantly changing and moving environment are better positioned to succeed (Garvin et al., 2008). This research sought to determine responses to the COVID-19 pandemic in order to extract learning, in terms of the endogenous or internal factors inherent to retailers that have resulted in survival and/or success during this time. These endogenous factors fall under three key areas: strategy, culture, and structure, as they were found to be of critical importance in building dynamic capabilities and adaptive capacity (Håkonsson et al., 2013). This research used the transition or expansion into e-commerce by retailers, during the pandemic in South Africa, to study adaptability.

1.2. Research Objectives

Consequently, the aim of this study was to determine the endogenous factors, inherent to retail firms, that determine their ability to adapt to e-commerce in times of high uncertainty and volatility. The research objectives were:

- to identify the characteristics of the internal strategy employed by retailers for successful transition to e-commerce,
- to ascertain the dimensions of organisational culture for successful transition to e-commerce by retail firms,
- to determine the organisational structural characteristics of retail firms who have successfully transitioned to e-commerce.

2. Literature Review

The literature review begins by examining the nuances of the South African retail sector and how it was impacted by COVID -19, followed by a definition of adaptability as it is used in this research, as there is some disagreement amongst scholars on its broad definition. Thereafter each of the three key

dimensions described in the introduction are expanded on: strategy, culture, structure and their role in enabling organisations to adapt.

2.1 The Impact of COVID-19 on the South African retail sector

Retailers in South Africa received limited government assistance due to COVID-19 (Robertson et al., 2022), which meant that small to medium enterprises (SMEs) in retail were particularly vulnerable to the strict and lengthy lockdowns, some of the harshest in the world (Greyling et al., 2021), as well as reduced consumer spending. Retailers that profited from the unique opportunity presented in South Africa, both in terms of a nascent e-commerce market and limited physical mobility due to lockdowns, were able to internally leverage digital capabilities to adapt to the new market environment (Abe & Mugobo, 2021; Robertson et al., 2022), with online revenue of food and grocery retailers increasing by more than 50% in 2020 (Dakora & Rambe, 2022).

2.2 Adaptability in a business context

Agility as defined by Holbeche (2015) as the “the search for speed and adaptability” (p. 48) is an important component of adaptability. Nauck et al. (2021) assert that the majority of companies operate based on the assumption that “smooth business conditions” (p. 2) will remain on-going. A new approach is required though, not only spurred on by the COVID-19 pandemic shock, but the access to information at our finger tips through the digital revolution demands agile and faster decision making (Nauck et al., 2021). In summary “decision-makers have more information and more analysis than ever before, but less time to decide” (Schwab & Malleret, 2020, p. 17), and thus need to adapt to making quicker and more effective decisions.

The literature is conflicted on whether adaptability is the result of creating a resilient organisation (Folke et al., 2010; Lee et al., 2013) or whether adaptive organisations are by nature resilient and therefore more competitive (Brassey et al., 2021). As outlined by Brassey et al. (2021), adaptability is set apart from terms such as resilience, agility, flexibility and innovation as it speaks to bouncing forward into an improved state as opposed to simply bouncing back or surviving. This sentiment is further backed by Eshima and Anderson (2017), where the concept of ‘adaptive capability’ is defined as capturing the value of combining existing resources with new ones developed through adaption – effectively how proficient a firm is in “altering its understanding of market expectations” (Eshima & Anderson, 2017, p. 771). This flexibility and willingness to adapt enables firms to align and realign constantly (Holbeche, 2015).

This research views the ability to adapt as the key determiner of success, this ability is defined by three key dimensions: the internal strategy, culture and structure.

2.3 Adaptability as an internal strategy

The theory that closely relates to adaptability in organisations is the dynamic capabilities view (DCV) from the land mark article by Teece et al. (1997), who theorise on why certain firms experience growth in their competitive advantage whilst others experience this advantage eroding over time. They postulate that the competitive advantage of firms stems from internal processes and the effective manipulation of resources. These endogenous factors enable the firm to rapidly adapt and capitalise on new opportunities or offer flexibility when consumer and market forces shift. Teece (2014) explicitly divides capabilities into ordinary or dynamic: *ordinary* capabilities are what is termed ‘best-practice’ and are efficiency orientated, such as the performance of an inventory tracking system, and *dynamic* capabilities are the management of internal resources by top management in order to steer the organisation in the market. More succinctly put “... ordinary capabilities are about doing things right, dynamic capabilities are about doing the right things...” (Teece, 2016, p. 210).

The DCV emerged from the resource based view (RBV), by adding a dynamic component to strategic thinking in which constant innovation and shaping is necessary to stay competitive, versus the RBV model which assumes static market forces (Madhani, 2010; Teece, 2007; Wang & Ahmed, 2007).

It is clear that when the business environment is uncertain and volatile, organisations need to shift their resources into areas that will allow for greater dynamic capability (DC). As per the DC framework (Teece et al., 1997) depicted in Figure 1 below, these are areas that will enhance sensing, seizing, and transforming activities. From a retailer perspective, sensing could be to set up a dedicated team that conducts market research in order to establish shifts in consumer behaviour or new market opportunities/threats, ideally before its competition thus giving it a ‘first mover’ advantage. Seizing would be the capability to act on information provided through sensing, i.e., how quickly can a retailer go to market with a new product or setup a new sales channel. Transforming would be the organisation’s propensity for continuous improvement, challenging the path of least resistance and seeing change as a positive enabler towards operational excellence.

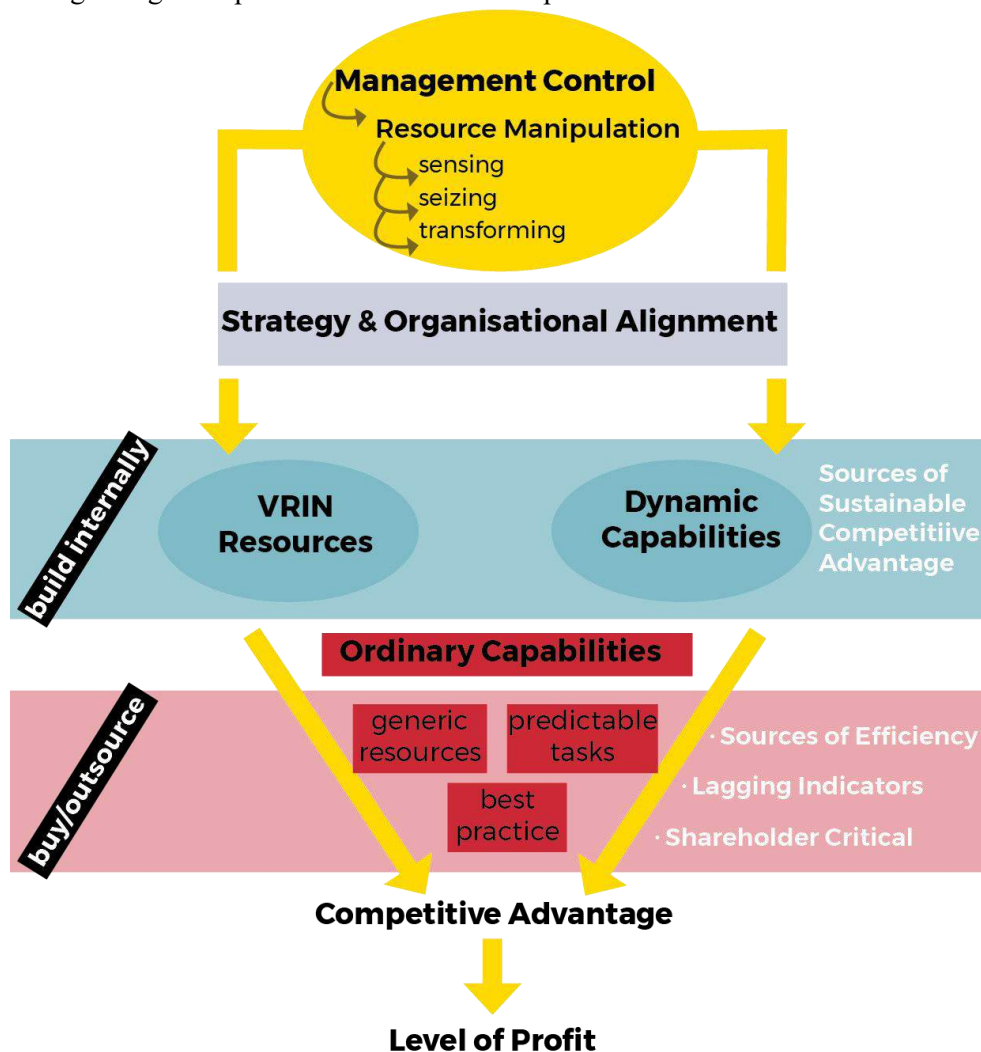

Figure 1: The Dynamic Capability (DC) framework (adapted from: Teece, 2014).

How well an organisation can shift its resources internally, coupled with a good strategy as depicted in Figure 1 (Teece, 2014), thus equates to how adaptable an organisation fundamentally is. In order to ensure the success of such a DCV strategy, two other key areas in the organisation, namely culture and structure, need to be ready to receive it.

2.4 Organisational culture

Culture is a ‘fuzzy’ concept, difficult to pinpoint, “Culture is not primarily ‘inside’ people’s heads, but somewhere ‘between’ the heads of a group of people where symbols and meanings are publicly expressed” (Alvesson, 2002, p. 4). Nonetheless its importance today in seeking competitive advantage is perhaps more important than it has been in the past. As key resources become more accessible to competitors, organisations need to focus internally to cherish and build VRIN (Valuable, Rare,

Imperfectly Imitable, and Non-substitutable) capabilities, thus culture can be a source of sustained competitive advantage (Barlett & Ghoshal, 2002; Pfeffer, 1994).

Schein's model of organisational culture conceptualised in the 80s (Schein, 2004), is perhaps one of the most influential to date and still has wide usage (Birkinshaw & Mark, 2015; Burkus, 2014; Chatman et al., 2014). According to Schein, organisational culture can be interpreted by analysing three different elements: *artefacts*, this is physical matter that can be observed such as employees wearing informal attire or free lunches at the canteen; *espoused beliefs and values*, this is stated and explicit, either through dialogue or in writing, it is the intent and norms of the organisation and its members; *underlying assumptions*, is the implicit behaviour of members, the taken for granted aspects, the underlying assumptions (Schein, 2004). It must be noted that any cultural interpretation using this model is subjective and dependant on individual perceptions (Burkus, 2014).

In order to be adaptive as an organisation a focus on learning, and an environment or culture that fosters learning, is required. As discussed by Garvin et al. (2008) an organisation where the employees "continually create, transfer and acquire knowledge" (p. 1) supports that organisation to adapt to unforeseen changes in the market faster than others, leaving them on top. In essence adaptability is not only your ability to react to volatility, but it is a culture that is fostered, or rather a 'fitness' that is part of the culture to ensure agility in response to anything thrown their way. The warning to businesses is to "avoid the loss of learning, a precursor to rigidity" (Holbeche, 2015, p. 51), which in turn reduces your dynamic capability as an organisation.

Chatman et al. (2014) further defined several cultural norms that promote adaptability in organisations, these being: flexibility, propensity for risk taking, experimentation, future orientated, cannibalising existing products, fast moving, not overly focused on making the numbers, proactive, quick decision making. Similarly, Costanza et al. (2016) developed an adaptive culture scale, based on the existing literature, and rated ninety-five organisations founded prior to 1940, to ascertain the effect of adaptive culture on long-term survival. The culture scale consisted of nine characteristics under two dimensions *action-orientation* and *values about change*: external focus, anticipation, risk-taking, open to change, confidence, development of capabilities, collaborative action planning, executing change, sustaining change. Costanza et al.'s (2016) findings showed that organisations with high *action* scores as well as both high *action* and *values* scores were more resilient.

Coupled with a culture of continuous learning, needs to be a culture for healthy debate and dissent (Bello et al., 2020; Garvin et al., 2008; Sibony et al., 2017). Dissent allows employees at multiple levels in the organisation to challenge the status quo, streamline processes and be innovative. For example Google, Amazon and McKinsey all stipulate in their employee code of conduct that dissent is a necessary obligation (Sibony et al., 2017). These challenges will ultimately lead to continuous change, unlike the traditional view that assumes change as a step wise process (Cummings et al., 2016). An organisation that embraces continuous change, by aligning the internal rate of change with the external environment through building and destroying routines, will deliver better long-term performance as found in the study by Håkansson et al. (2013).

2.5 Organisational structure

Top down or hierarchical structures have been a classic example of organisational architecture in the past, but there has been a growing trend towards flatter structures that allow increased flexibility, innovation and quicker decision making (Kettley, 1995; Vaara et al., 2021). Currently due to COVID-19 other organisational models, such as remote work and hybrid work, are being developed to cope with the hard lockdowns (De Smet et al., 2021).

In the seminal article by Mintzberg (1980), a framework on organisational structure was put forward to understand the internal and outward dynamics of an organisation (Lunenburg, 2012). Mintzberg (1980) suggested that structure can be broken down into four key components: (1) the basic elements of the organisation – the operating core, strategic apex, middle line, technostructure, and support staff; (2) the methods of coordination; (3) the dynamics of processes and systems as factors of

decentralisation; and (4) inherent factors such as age and size. As described by Lunenburg (2012), to analyse a structure it must be understood which element of the organisation plays a major role, this could be middle management or front line workers, the method of coordination such as standardised processes or direct supervision, and lastly an understanding of the involvement of subordinates in the decision making process. Additionally, Mintzberg (1980) posited five pertinent management structures: simple structure, machine bureaucracy, professional bureaucracy, divisional form, and adhocracy. Adhocracy is the most popular new-age structure and stands out as an enabler for creativity and innovation, and is well positioned for an environment that is both complex and dynamic (Mintzberg, 1980), which is seen to be the most conducive for adaptability.

Håkonsson et al. (2013) found that it is not the level of inertia in an organisation that impedes flexibility, it is the rate of inertia that it is the critical factor. Therefore, if an organisation has high levels of inertia or routines, but an equally high rate of routine turnover (change in the routines), it will be more adaptable than organisations with lower levels and rates of inertia. This ‘dynamic fit routine’ as described by Håkonsson et al. (2013) allows for organisations to move away from static states and reactive responses to a dynamic state that is in-line with the external environment. Further, Håkonsson et al. (2013) assert that well designed organisational structures, that have the correct rules in place, enable adaptability.

As dynamic capabilities are essential to organisational adaptability, organisational designs that enhance this capacity will be at an advantage in uncertain and volatile environments. Felin and Powell (2016) conducted a case study of Valve Corporation to determine its design attributes, an organisation that pushes boundaries and has successfully adapted in changing environments,. Valve’s distinguished feature is that employees are free to choose which projects to work on. The organisation is thus polyarchal and relies on a unique set of social proofs to ensure that the correct decisions are made. Sensing is achieved by having a highly decentralised structure with the majority of employees on the periphery testing new ideas; seizing is done though Valve’s social proofs in that three or more members need to agree on a new idea for the organisation to take it on; and transforming happens seamlessly in an organic and fluid way through widespread communication with a transparent strategy, which is constantly being shaped. The proof of their success is in having had higher unaudited revenue per employee than either Facebook or Google (Felin & Powell, 2016).

A further development in designing organisational structures, which is still gaining momentum in the practitioner’s realm, is the role of behavioural psychology in strategic decision making. Sibony et al. (2017) define three organisational processes: large investment decisions, resource allocation, and blue sky processes, which relate to risk taking, agility, and innovation respectively. Their aim is to point out the corporate biases that exist when making these strategic decisions, and offer seven organisational design levers to mitigate these biases: *formality, layering, information, participation, incentives, debate, closure*. These levers can aid in the development of organisational structures that facilitate organisational adaptability to disruptions.

3. Research Methodology

The design of this research follows a similar study on dynamic capabilities by Teece (2014), in which defending the lack of empirical evidence for his theory, he argues that a positivist approach is unfavourable due to the lack of constants and states “management theory is not physics” (p. 335) and suggests that a qualitative study based on “introspection and observation” (p. 335) is more suitable. Thus by adopting an interpretivist research philosophy, this study subjectively questioned adaptability, which required the authors to remain critical and prepared to scrutinise and revise assumptions as data was collected through interviews (Saunders et al., 2009).

The exploratory, qualitative and inductive design of this study was positioned to help the researchers learn from the lived experiences of others (Bryman et al., 2014). The interviews were conducted over a period of 4 weeks (latter 2021) and provided a snapshot of the lived experiences of business practitioners and consultants. This cross-sectional study situates itself within the period of the

COVID-19 pandemic (early 2020 to end of 2021), specifically analysing the business strategies and tactics deployed in the uncertain and volatile business environment at the time.

As suggested by Saunders et al. (2019), when trying to understand the why of a phenomenon versus the what, such as why certain retailers have pulled ahead of the competition during the pandemic, conducting research inductively is more appropriate as the research undertaken aims to generate meaning from the observations and findings obtained. An inductive approach is also recommended when using small samples of qualitative data (Bryman et al., 2014), which was obtained through interviews in this research. Saunders et al. (2009) also suggest that this less structured and inductive approach is suitable to a qualitative study. A qualitative research strategy is flexible and exploratory. Bryman et al. (2014) state, "Qualitative data analysis involves trying to identify inherent patterns rather than imposing preconceived ideas on the data" (p. 43).

The population for this qualitative study included middle to senior managers in the retail sector who were involved in the transition or the build-up of e-commerce in their firms during the pandemic, as well as business consultants with relevant experience through their engagements with retail firms. A non-probability snowball (judgemental) sampling technique was used that led to data saturation after five business practitioners and four business consultants had been interviewed.

Data was collected through semi-structured interviews on MS Teams, averaging 30 minutes. Interviewees were always asked to have their cameras on during interviewing, as this has the potential for visual cues to provide deeper meaning to answers (Holt, 2010). Two interview guides were used for the different samples with open-ended questions, where the responses of the interviewee guided the conversation allowing information to emerge (Saunders et al., 2009). The interviews were recorded and transcribed, the data was coded, the categories were tabulated in Excel, and then high-level themes were identified.

The primary purpose of coding was to condense data, it was therefore by no means exhaustive (Elliott, 2018). Three levels of data funnelling were used in this research and labelled as codes for the primary level, categories for the secondary level, and themes for the highest order level. When new categories emerged that were not part of the literature review, further desk research followed which allowed for further tuning of the interview questions, however due to time constraints a balance had to be struck. Data saturation was achieved when significant themes failed to be extracted from new data. The aim of this study was to have 'depth' in the information provided and not 'breadth'.

The participants' identities and data were kept anonymous and confidential, what is shared was established in discussions prior to commencing the data collection with the interviewees. The nature of the data collected has the potential to compromise the competitive advantage of some firms. Therefore, it was important for the authors to limit the potential risk of a data breach whilst sharing insights that led to the success or failure of some retailers.

Guba and Lincoln (1994) proposed trustworthiness as a primary criterion for assessing a qualitative study, together with authenticity. Trustworthiness consists of four aspects (credibility, transferability, dependability, and confirmability) which align to validity and reliability. Credibility and Transferability align to internal and external validity respectively. Dependability aligns to reliability and Confirmability examines the objectivity of the investigator. Credibility was enhanced by sharing the research report with participants to ensure their perceptions were accurately accounted for, and triangulating data. Transferability in qualitative research is limited due to the small sample sizes, but the rich data gathered will allow future researchers to develop specific frameworks. Dependability has been carried out through close supervision, which to some effect can be seen as auditing of the research methods. Confirmability was achieved by following the protocols on interviewing.

The limitations of the research included the small, non-random and non-representative sample size, implying that the results cannot be generalised to the population, as well as potential bias in the sample selection.

4. Results and Discussion

The five retailers represented different industries and had differing perceptions of the degree of adaptability, from low to high. The discussion below is presented according to themes extracted from the research. These themes were developed through content analysis of the interviews with business practitioners and consultants and then triangulated with desk research to validate their importance and provide useful and practical recommendations.

The results are presented in response to the three Research Objectives:

4.1 Characteristics of the internal strategy employed

The characteristics of the internal strategy employed for successful transition to e-commerce as perceived by the participants were classified into five emergent themes: sensing abilities, sense of urgency to action, internal capabilities, internally performance driven, and clear strategic intent, discussed as follows:

Sensing abilities:

The overall feeling from consultants is that not all retailers were able to sense or anticipate the shift towards e-commerce, with some clearly struggling to accept the new realities of doing business. With practitioners the results are mixed, retailers that have been perceived to have shifted effectively have anticipated market forces through sensing, whereas the laggards in the e-commerce space have not highlighted the need for this capability. Some of the quotes that highlight this theme are given in Table 1:

Table 1. Key quotes regarding sensing capabilities

Interviewee code	Quote
C1	"If people are in a situation where they are able to use online and they don't feel comfortable going out they will do so"
C2	"Retailer 1 and retailer 2 didn't have it as a strategy, but even two years into the pandemic, they still don't seem to have a sense of urgency about delivering it"
P2	"But I think lockdown proved that people will use e-commerce if it's easy"
P3	"When the lockdowns kind of first presented itself at the end of Feb to beginning of March 2020 my business partner and I realized that there was going to be a massive online movement, retail stores were going to close for some period of time."
P4	"I don't think they took it seriously enough up front. There were a lot of naysayers upfront, doubts saying that e-commerce is general merchandise thing. It's never going to take on in grocery. It's 1% or whatever, but everyone's been able to prove that wrong."
P5	"But I think what has happened over the last 18 months has become increasingly important in our minds to focus on e-commerce. It was a growing realisation as to how important omnichannel is for our future."

To the detriment of some organisations, when sensing is not seen as an important day to day task, a tendency to normalise risks or falsely believe that nothing will change, may set in (Schoemaker et al., 2018). Almost every participant has mentioned sensing, either demonstrating their inability to sense in transitioning to e-commerce, or its importance.

Sense of urgency to action

Consultants identified that many of the laggard retailers have been very slow to act and have not seized new opportunities. The results from retailers are mixed, with two vastly different approaches between organisations perceived as 'fast movers' seizing online opportunities as soon as they emerged, and laggards. Some of the quotes that highlight this theme are given in Table 2:

Table 2. Key quotes regarding sense of urgency to action

Interviewee code	Quote
C2	<p>“You know too many companies are sitting and waiting for things to happen. Probably even hoping that this pandemic will go”</p> <p>“I'm seeing companies scrambling around quite a bit especially the ones that are being left behind”</p> <p>“We've been in the pandemic now for almost two years and still some companies are trying to trade out of it as if there was no pandemic or change”</p>
P1	<p>“We geared significantly and so we had a call centre of over 1000 agents in the call centre which gave 65% of the business, phoning customers placing orders. So we went on a shopping spree and we bought. I think we managed to get 600 laptops in sort of seven days”</p>
P3	<p>“Prior to lockdown we decided to leverage the systems and the operations and the website that we had and the customer base that we had to sell them more relevant product which ended up being fresh groceries”</p>
P4	<p>“The leadership team sat up once we saw what was happening with some of our bigger competitors and they tried to implement a basic Shopify platform.”</p> <p>“We lost 2% market share to our competitors”</p>

Once an important threat or opportunity is identified, the organisation needs to seize the moment and act (Felin & Powell, 2016; Schoemaker et al., 2018). In the adaptive scale developed by Costanza et al. (2016), in which two key dimensions were established, values and action, the authors found evidence that organisations with high action scores were significantly more likely to survive long-term when compared to organisations with low action scores. From the interviews, the quotes show that a number of retailers have low perceived adaptability.

Internal capabilities

There were mixed responses in terms of building internal capabilities, “because of the understanding of the business”, versus bringing in expertise from outside, as highlighted in Table 3:

Table 3. Key quotes regarding internal capabilities

Interviewee code	Quote
C3	<p>“Those clients who have an internal development skill end up with a much better product than those clients who rely on external.”</p> <p>“let's build a team that can solve that problem and then use that skill set within the business”</p>
C4	<p>“But it is about strategic partnerships. It is no longer about building and owning it all ourselves, we can get access and route to market using partnerships to be agile and adaptable. So I think strategic partnerships is critical”</p> <p>“From a consulting perspective often we say what is the strategic thing of the ‘secret sauce’ that you want to keep in house and what is a commoditised service that you can go an outsource”</p>
P2	<p>“Bought company 1 and company 2 to strengthen the areas we knew we were weak and then our competitors are doing the same kind of stuff. So it's a bit of a land grab at the moment”</p>
P4	<p>“We will be building capability internally though, so as I'm developing I'm also bringing in new people to help.”</p> <p>“Going forward is just getting the right data science, data engineering skills and capabilities into your company”</p>

At the onset of the pandemic most retailers did not have reliable e-commerce platforms to accommodate the influx of customers, and there were a few complains about websites crashing and the wrong goods being delivered. Teece (2014) suggests that in order to establish sustainable competitive advantage (SCA), dynamic capabilities should be built, whereas ordinary capabilities can be bought, which was shared by some respondents. However, outsourcing is not a band aid solution and needs to be coupled with an intent to learn and grow as well as a ‘secret sauce’ as described by C4 (Pezeshkan et al., 2016).

Internally performance driven

Being overly focused on numbers and internally is an endemic problem with retailers, as well as the external shareholder pressure to hit performance targets based on lagging data. This internal focus versus understanding the challenges of the market are highlighted in Table 4:

Table 4. Key quotes regarding the internal focus

Interviewee code	Quote
C2	“Retailers are a very good example of this. They’re managed by the quarterly results. The disadvantage of that is that the guys are penalized if they're focused too far into the future, and not delivering on those quarterly increases in returns”
P1	“I think where the business lacked was that they were very internal - I'd say internal locus of control where they were very focused internally about if something goes wrong it is something that they've done, not something that's happened externally” “But when it came to what is happening externally so more macro-environment versus a microenvironment, we're very weak.”
P3	“I would say that it was so such an intense, detail-oriented learning process that we at times lost focus on the big picture and the environment that we were actually operating in and the changing needs of that environment”
P5	“Yeah, I think traditionally retailers love the numbers”

Chatman (2014) describe “making your numbers” (p. 794) as a factor that negatively affects adaptability, and similarly Kotrba et al. (2012, as cited in Costanza et al., 2016) suggest that organisations who are too internally focused struggle to adapt. This internal focus can thus attract resources away from sensing capabilities, leading to potential blind spots (Schoemaker et al., 2018; Teece, 2014). This was highlighted by a number of respondents where retailers are too internally focused.

Clear strategic intent

The importance of strategic intent or lack thereof was highlighted by the participants in Table 5:

Table 5. Key quotes regarding strategic intent

Interviewee code	Quote
C2	“The second issue for me and this will sound biased, but I don't think they have a strategy for this. I think that they have been very slow to adapt”
P1	“Definitely the strategic direction is given from a board level and executive level”
P4	“Until we have that clear strategy crafted and signed off you don't know what you're running at, it's always a lot harder, right? So that's my role, to say this is the vision.” “We've had to do a massive strategy overhaul in terms of our digital transformation, so we've been trying to build that narrative internally.”

Teece (2014) stresses the importance of sound strategy in order for dynamic capabilities to be effective. Dynamic capabilities encourage organisational flexibility, however with this flexibility comes a need for direction, which ultimately comes from the strategic objectives of the organisation (Zheng et al., 2010). The requirement for a strong strategic intent was recognised by the participants.

4.2 Dimensions of organisational culture

The respondents were asked questions specific to organisational culture, structured to gain insight into a particular dimension of culture: learning, creativity, mistakes, atmosphere. The data analysis revealed three themes: resistance to change, entrepreneurship culture based on lean start up philosophies, and learning culture coupled with a desire for continuous improvement, discussed as follows:

Resistance to change

Resistance to change at a senior management level is prevalent in retailers, with barriers to change often due to legacy systems and hierarchies that have stifled the voices of employees. This is illustrated in Table 6:

Table 6. Key quotes regarding resistance to change

Interviewee code	Quote
C1	“So where hierarchies are enforced where people are not encouraged to present ideas, that is where they’ve struggled the most.”
C2	“I think one of our difficulties in South Africa, and it does link to this capability issue and adaptability, is that we do tend to hire CEOs that we know are from our industry or out of our industry, but very few of them are really game changers and this adaptability to the future requires us to think differently about it.”
C4	“That is a little bit down to do with legacy and the SAPS systems that have been in place and not being able to be nimble and adapt”
P4	“So I would say this, the culture is a whole lot more conservative. They haven't had a culture of innovation, they are only now implementing it ASAP it's been very much about legacy systems with some data sitting in very disparate places”

Carter and Varney (2018) advocate for placing more importance on the human aspects of change over organisational intricacies. Standardised methods, which become routines in an organisation can be sources of inertia that prevent dynamic responses (Feldman & Pentland, 2003). This resistance to change was identified as a challenge to most retailers.

Entrepreneurship culture based on lean start up philosophies

While some retailers have been dynamic and proactive where others have remained fairly static, the ‘can do’ spirit highlights the entrepreneurial nature of some retailers, as illustrated in Table 7:

Table 7. Key quotes regarding entrepreneurship culture

Interviewee code	Quote
C2	“There's a culture in some of these companies of getting the job done. Let's do it. We know it's a risk. We know we won't be perfect, but let's do it.”
C3	“Their biggest problem again was pre pandemic they weren't flexible”
P1	“It's more a personality trait a sort of entrepreneurial personality. A trait related to owning the situation versus a person being an employee of the business”
P4	“Yeah, there like I say there hasn't been a massive culture of experimentation, so people are very conservative, and I think that's almost got them stuck because no one really wanted to do something in case it failed. You have to be prepared to fail and fail quickly. Learn quickly.”

Anderson et al. (2015, as cited in Eshima & Anderson, 2017) define entrepreneurial orientation as a proactive attitude and a “managerial willingness to pursue opportunities with uncertain outcomes” (p. 770). The lean start-up method encourages organisations to continually test their products through real world experimentation while concurrently building and adjusting (Ladd, 2016). There is a strong

correlation with perceived adaptability and the level of experimentation that took place at the beginning of the pandemic, as evidenced from the responses.

Learning culture coupled with a desire for continuous improvement

Two different cultures were identified, the first culture blocks ideas for improvement which proved to be a major disadvantage in adapting to the pandemic, the second culture encourages new ideas and was described as adaptable. The learning culture and continuous improvement comments are given in Table 8:

Table 8. Key quotes regarding the presence of a learning culture

Interviewee code	Quote
C3	<p>“The culture of the company was one-way, people were told ‘do your job!’ ‘don't bring up any questions!’ ‘don't bring up any improvements!’ When the pandemic hit, they basically went to a complete standstill and had to pay salaries for people who couldn't do any work, ended up having to downsize.”</p> <p>“So the companies that go around the table and says everyone said what they needed to say? Has anyone got any questions left? Please ask. Those are the companies that manage to adapt and survive. The companies that refused to allow ideas beforehand had a lot of dead weight when the pandemic hit”</p>
P3	<p>“We delivered marketing at times that wasn't on the right track and in a lot of ways wasted a lot of digital marketing. It wasn't efficiently deployed as it should have been, but it was a very fast and intense learning curve.”</p>
P4	<p>“We've already lost a lot of people to our competitors and trying to bring young inquisitive minds into your businesses is super critical, so again, that's a big culture shift and a way of working shift.”</p> <p>“Our CEO has realised that bringing some outside in is good in many ways because a lot of our staff are old, a lot of them have only ever worked with us and being the only company that you've worked at you're not exposed to what's happening outside. You get into a very slippery slope where learning isn't driven.”</p>

Empirical research has begun to show that a desire to continuously improve is linked to long-term survival in organisations (Wang & Ahmed, 2007); further, Costanza et al. (2016) include ‘open to change’ and development of capabilities’ as critical factors that enable adaptability. The results of this research reinforced the requirement for a learning culture as necessary for successful adaptation.

4.3 Characteristics of organisational structure

This objective investigated how streamlined process were within the firm, the level of autonomy in e-commerce teams, and how information flowed and decisions were made. This lead to four emergent themes: cross department synergies specifically between business and IT, the importance of fast and sound decision-making, flatter structure smaller agile teams in e-commerce, and information feedback loops from customers and the bottom of the firm, which are discussed as follows:

Cross department synergies, specifically between business units and IT

When business and IT function independently, it is difficult to implement e-commerce effectively. Either a closer relationship between the business units is required, or e-commerce could be a separate team, as highlighted in Table 9:

Table 9. Key quotes regarding cross-departmental synergies

Interviewee code	Quote
C3	“Specifically with regards to e-commerce organisational structures where business and IT are separate have struggled a little bit more.”
C4	“For example one company I worked with has brought in external expertise to head up e-commerce as opposed to it being a function of the IT department. They have set up a separate e-commerce route to market and channel, so it is no longer just an IT job.”
P2	“It's very much a closer relationship between products and business versus business throwing a requirement to IT. That's kind of a shift we're seeing, and that's a bit more how the digital companies are being run”
P4	“I think they didn't necessarily have people with the right skill set or experience that understood the space and they simply looked at it as an IT project, whereas we all know it's a business project, its business strategy and it's very much holistic in terms of the ecosystem that you need to build”
P5	“I took it over in March and we had two businesses running separately and we have now pulled them together and much closer to our core operations and our core stores.” “I think the main reason is because, it means that you are not fighting internal battles”

Destroying silos and streamlining processes is recommended when trying to innovate and build an agile organisation (Rigby et al., 2016; Lee et al., 2013). Collaboration between business units is also one of the nine key factors in the adaptive scale by Costanza et al. (2016) which was used to determine the likelihood of the organisation’s long-term success. As stated by these participants, e-commerce is a business and IT project, the two functions need to be intertwined as retailers build go to market e-commerce strategies.

The importance of fast and sound decision-making

Decision making has been a critical factor for retailers and flatter structures are advocated to speed up this process, as highlighted in the comments in Table 10:

Table 10. Key quotes regarding the importance of fast decision making

Interviewee code	Quote
C2	“The one I'd like to add is obviously a culture linked to the structure of having speed of delivery of key decisions as both a culture and a structure.” “So I would add innovation and collapsing the structure to allow communication, speed of decision-making”
C3	“So organisational structure has a lot to do with decision making and the speed of that decision does come through the number of levels that it has to pass within the organisational structure”
P3	“I made decisions on the spot right there because it was a small and nimble operation”
P5	“Going back to March 2020 because when you are speaking about organizational adaptability it was the most extraordinary time to be in retail; the whole world shutdown, South Africa shut down and there was panic buying.”

The speed of the decision needs to be considered with the potential risk inherent in making the wrong decision. Sibony et al. (2017) offer seven organisational levers to match the level of complexity with the impact of the decision and suggest delayering, less formal process, with less rules when small decisions need to be made fast.

Flatter structure, smaller agile teams in e-commerce

There has been a growing trend across the industry towards a flatter structure, with smaller more autonomous teams as can be seen from the interview quotes in Table 11:

Table 11. Key quotes regarding flatter organisational structure

Interviewee code	Quote
C2	“And they've structured it [e-commerce] as a separate business. It might be internal, but it's a separate business unit. There are separate staff working there” “I think we're seeing a matrix structure rather than hierarchical.”
C3	“I think definitely the more levels there are in an organisation, the slower they are to adapt.”
P2	“So it's changing up, e commerce is definitely flattening it out. So I think we still look like a traditional corporate, but within E-commerce we are flattening out to more product structures with defined ownership but more of a digital company kind of setup.”
P3	“From an organizational structure perspective, we kind of used a very similar model to what we had in our parent company, which is relatively flat. It's not particularly hierarchical”
P4	“I think the biggest barrier is for sure the operating model - there's just so many different levels.”

Multiple information paths and blurry decision channels are two major hindrances of matrix structures (Bartlett & Ghoshal, 2002). In general flatter structures allow for short decision paths and enable quick decision making (Kettley, 1995), with autonomous teams as a symbol of decentralisation, which appears to be the path chosen by retailers.

Information feedback loops from customers and employees

There was a proliferation of communication channels during the pandemic, e.g. WhatsApp groups, that were very effective means of communication from the bottom of the organisation to the top, as illustrated in Table 12:

Table 12. Key quotes regarding information feedback loops

Interviewee code	Quote
P1	“Very autonomously in being able to make decisions because we met weekly. In these weekly ops meetings we were feeding back on a weekly and day-to-day basis, would be definitely feeding from the bottom up” “On a daily basis I was given direction and feedback to the team and we measured everything”
P5	“WhatsApp groups have sprung up far more effectively than any of the corporate tools and teams. They are just so intuitive and natural or easy to set up that they have become a pretty important way to disseminate info quickly to large groups of people.” “Then over time these things grew because where there would have been a culture of calling people before it's just that it's much easier to WhatsApp or send a picture. I think it was very much a ground swell of bottom-up use of WhatsApp groups!”

Effective communication and access to reliable information has been described as fundamental to organisational adaptability (Bello et al., 2020; Carter & Varney, 2018; Costanza et al., 2016). In order to enable adaptability, communication needs to happen both ways (Carter & Varney, 2018) and Robinson and Schroeder (2014) discuss the merits of idea generation from the bottom, such as in the use of WhatsApp groups.

5. Conclusions

The aim of this study was to determine the endogenous factors, inherent to retail firms, that determine their ability to adapt to e-commerce in times of high uncertainty and volatility. The research focused on three key dimensions to address this aim which are strongly linked together. The way in which people process external information, interact with one another and make decisions based on emotion

is all influenced by the *culture* in the organisation. The processes and routines in an organisation are shaped by the organisational *structure*. Keeping the people and processes aligned to achieve specific objectives is the *strategy* deployed by the organisation. The conclusions to the research objectives are summarised below:

5.1 Objective 1: The characteristics of the internal strategy

Retailers that adapted to new market dynamics, imposed by the pandemic, were able to pre-empt the rise in demand of e-commerce goods, with some clearly benefiting from first mover advantages. This foresight was made possible due to strong sensing capabilities, which is one of three, core capabilities for long-term survival in dynamic environments, according to the dynamic capability view (DCV). The other two capabilities are seizing and transforming. Sensing activities pull resources away from ordinary capabilities such as managing stock or controlling margins and thus have a negative effect on efficiencies, which unfortunately are strong performance indicators for retailers. Retailers that were perceived to be more adaptable than average, made a strategic choice to balance external sensing with internal efficiencies, when compared to laggards in the industry that tended to have myopic attitudes coupled with assumptions that ‘normality’ would return.

The resulting inaction or ‘head in the sand’ approach, of less adaptable retailers, meant lost opportunities and likely loss of revenue as mentioned by an interviewee candidate that lost market share. Not being able to seize opportunities, another capability of the DCV, can be attributed to a lack of strategic direction, leaving the organisation in ‘no man’s land’.

Most retailers are now invested in e-commerce, with different strategies deployed concerning the acquisition of necessary skills in order to role out and scale e-commerce. According to Teece (2014), dynamic capabilities should be built in-house, whilst ordinary capabilities can be outsourced. The source of competitive advantage lies in dynamic capabilities or the ‘secret sauce’ as one of the consultants interviewed put it. Two of the four consultants as well as one of the retailers (P4), alluded to the advantages of building in-house, a strategic choice supported by the literature. How the retail e-commerce space unfolds now will depend on strategic partnerships formed and the inherent dynamic capabilities of retailers.

To summarise, based on the triangulation of desk research, interviews with consultants, and interviews with retailers, the strategic choices of successful retailers were: sensing capabilities to foresee the rise in demand of e-commerce goods at the onset of the pandemic; strategic intent and direction to seize opportunities identified through sensing; building of internal dynamic capabilities in the e-commerce space; and forming strategic partnerships.

5.2 Objective 2: The dimensions of organisational culture

One of the most important characteristics that adaptable retailers have shown to possess, is a culture that is open and embracing of change. Resistance to change is seen as an inhibitor to adaptability and was prolific amongst retailers with low perceived adaptability. This resistance was caused by legacy processes, hierarchical structures that did not give employees a voice, and executive boards that lacked diversity and did not understand the online space. The retailers that had high perceived adaptability, both showed an entrepreneurship culture and learnt through experimentation using a lean startup approach. This was combined with a strong desire to continuously improve and learn.

From Schein’s (2004) organisational culture model, the espoused beliefs and underlying assumptions are not explicitly stated by members of an organisation. This objective had the least number of themes extracted, possibly due to the difficulty by interviewers to narrate these experiences. In summary, organisations that had a culture that promoted innovation and were open to change were seen as the most adaptable.

5.3 Objective 3: The organisational structural characteristics

The retail industry has experienced a trend towards flatter structures with separate e-commerce teams. Retailers with a high perceived adaptability rating, had short communication paths that enabled quick

decisions. At the onset of the pandemic, business and IT operations were separate, which created internal friction and added unnecessary layers. The trend towards a separate e-commerce team has enabled business and IT considerations to be taken simultaneously when making decisions, has increased inter-team collaboration and streamlined the processes. The heads of these separate e-commerce teams are now sitting at very senior levels within the organisation, having direct links to the CEOs, which points to the urgency of not losing market share in this dynamic space. An urgency which as described before was not present.

The machine bureaucracy structure of traditional retailers (Mintzberg, 1980), with a large segment of staff towards the bottom of the pyramid has the potential to leverage off the vast amount of information and ideas held at the front-line level in order to generate continuous improvement. One of the retailers interviewed described how WhatsApp had become a preferred tool for communication across the organisation, whereby taking pictures and posting onto a group was perceived to be a faster and more effective way of communication. Retailers that move away from hierarchal structures and are open and encourage idea generation at the bottom with short and effective communications channels to the top, have strong adaptability potential as the literature review has shown.

6. Managerial Implications

The adaptability framework below has been developed to help consultants when engaging with clients on adaptability assignments, or retailers in improving their adaptability. This framework (Figure 2) shows two distinctive strategic paths that can be followed, that allows enough flexibility to tailor the approach to the organisation's operating environment and the external environment.

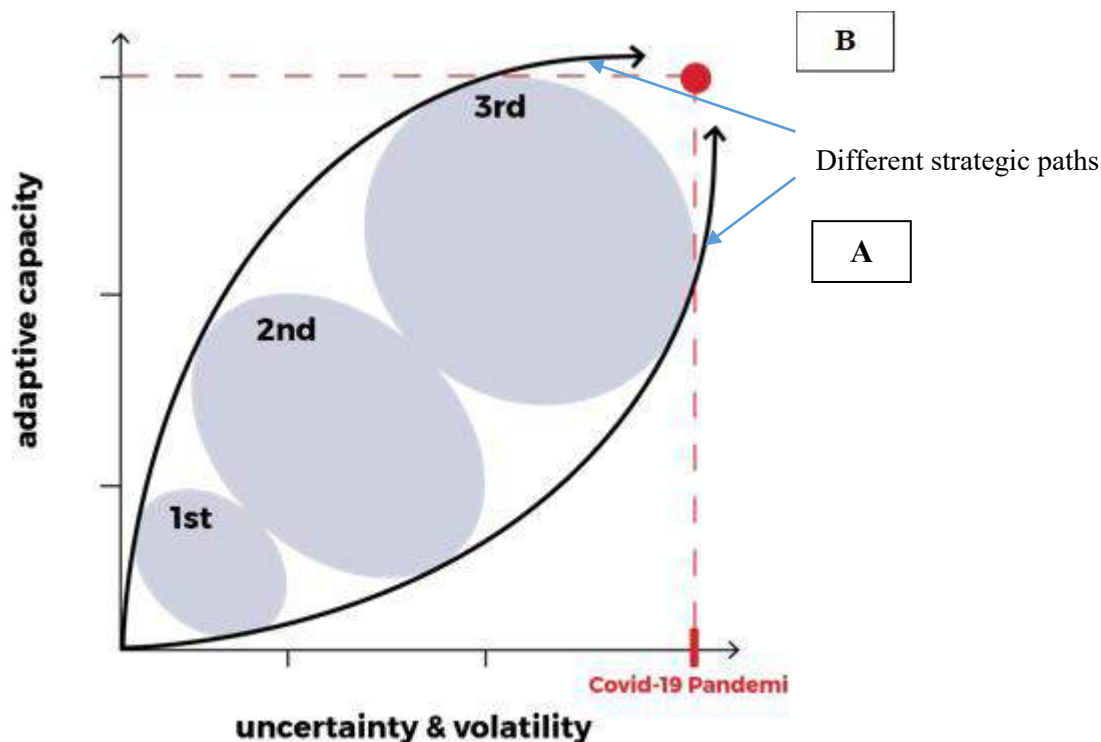

Figure 2: Adaptability framework for retailers (developed for this research)

The level of adaptability necessary is determined by what the operation or environment is, for example an accounting firm would face lower levels of uncertainty and volatility as opposed to a software engineering company. The accounting firm might therefore want to strategically keep its adaptive capacity low, in order not to waste resources unnecessarily, i.e. follow path A. In contrast the software company operating in an ever evolving and competitive industry might make the strategic decision to maximise its adaptive capacity, in order to benefit from possible first mover advantage when exploring new opportunities, path B. In Figure 2, it can be seen that the strategic paths are

tangent to circles 1, 2 and 3. These circles represent the gears that an organisation can choose to be in, so in the figure, 1st gear represent an environment with low uncertainty and volatility which requires low levels of adaptive capacity, again the two extremes are path 1 and path 2 that can be tailored to the organisation's strategy. Gear 3 represents the level of adaptive capacity recommended at very high levels of uncertainty. Each of the three gears have a unique set of recommendations required to achieve that state, these are:

Gear 1: Flat structure, implement short feedback loops of information from the front lines, deploy sensing capabilities.

Gear 2: Set up autonomous teams to seize new opportunities, increase levels of experimentation, increase sensing capabilities, increase learning activities.

Gear 3: Polyarchy structure, idea generation by single employees to prevent decision biases, maximum experimentation, streamline processes, clear and simple strategic objectives, encourage dissent in the organisation.

The analogy that both path A and path B lead to the same point on the graph is important because it highlights a conclusion of this research: in times of extreme uncertainty and volatility no operation is safeguarded, no matter how static its environment is, i.e. accounting firms will need to maximise their adaptive capacity to future-proof their businesses, however this is not the case when gear 2 is recommended following path B.

7. Recommendations for Future Research

This research study was exploratory, which provides several opportunities and directions for research. Researchers could do a quantitative study with a representative sample to verify the findings of this study.

The proposed steps and model proposed in the Recommendations (Figure 2) is a high-level summary and can be enhance by a more in-depth study and by drawing on existing literature on the individual steps.

This study focused on retailers developing e-commerce, and future potential topics for studies could be: 'the role of emotions and unpredictability in decision making for retailers', 'polyarchy organisational structure and their relevance to more traditional sectors such as retail', 'Strategic partnering, outsourcing capabilities or building inhouse capabilities as important decisions for retailers'.

In addition, the study could be replicated in other industries and other emerging markets to determine similarities and differences, e.g. due to cultural issues.

Finally, a longitudinal study after an adaptability intervention could provide insights into the effectiveness of the intervention, and the factors determining the success or otherwise.

The Determinants of Bank Liquidity in South Africa: A COVID-19 Inclusive Perspective

Dr John Mabajane^{1,*}

¹ University of Johannesburg, Johannesburg, South Africa

Keywords

COVID-19, Liquidity risk, South Africa, Banks.

Abstract

This study examines the factors determining liquidity in the South African banking industry, focusing on the COVID-19 pandemic. The study estimates liquidity risk for South Africa banks using the panel data regression method and secondary quarterly panel data spanning 2012: Q1 to 2021: Q4. The results of the study reveal that COVID-19 lockdowns did not significantly affect the liquidity of the South African banks. It shows that South African bank liquidity is determined by bank-internal factors such as bank size, capital adequacy, deposits and loan advances to foreign banks. Like the COVID-19 pandemic, economic factors such as business cycles and employment are not crucial in determining the banks' liquidity.

1. Introduction

An effective business strategy matches a company with its external and internal environment. It should enable a business to survive all forms of internal and external shocks and ensure continuity, growth and profitability (Tikhonov and Zelentsova, 2021). The business landscape is vested with different types of risks that can deter a business from achieving its goals; this makes risk management an essential component of business management (Venkat and Baird, 2016). This study is intended to examine factors that determine liquidity risk in the South African banking industry with a focus on COVID-19.

The rising threat of the COVID-19 pandemic in March 2020 resulted in a series of lockdowns inhibiting economic and financial activity across the globe. The banks were one of the most affected units in the scope of the general economic system as other entities rely on them for operational and financial support (Wu and Olson, 2020). The banks were exposed to extreme levels of instability as their operations and financial stability depend on the proper functioning and financial viability of other units in the economic system (Emenike, 2021). The business and economic activity interruptions during this period affected the banks' capital flows. The banks were forced to provide loan payments concessions to their personal and business clients. Some businesses collapsed while others minimised operations resulting in retrenchments and increased loan payment default rates on already extended loans (Dettling and Lambie-Hanson, 2021).

Liquidity is defined as the ability of an institution to meet its financial obligations and to finance its increase in assets without experiencing undesirable losses (Patora, 2013). Under extreme circumstances, an institutional liquidity crisis can lead to business failure. Hence banks are regulated to ensure that they comply with the prescribed requirements and standards. In South Africa, as in most countries, the central bank is mandated with authority to oversee the banking industry regulatory framework. In return, the national regulatory framework must conform to the standards and requirements of the Bank of International Settlements' operating Basel Accord through the Basel Committee on Banking Supervision (BCBS).

There is a limited amount of research analysing funding liquidity risk on banks in South Africa and there is no research that specifically looks at the effect of the COVID-19 pandemic on banking liquidity in a South African setting. Studies that have examined liquidity in South Africa include the study by Kumbirai and Webb (2010). The study used financial ratios analysis as its tool of analysis

*Corresponding Author

¹ E-mail address: jmabajane@uj.ac.za

and used data from 2005 to 2009. The financial ratio analysis methodology has limitations as its results cannot provide cause and effect relationship information that would otherwise be provided by regression analysis used in the study at hand. The results based on 2005-2009 data that Kumbirai and Webb's (2010) study may not be appropriate because, after the global financial crisis, significant changes were made on the bank liquidity regulatory framework and risk management strategies that banks adopted. Esterhuysen, Vuuren and Styger (2012) also conducted a study intended to analyse the determinants of liquidity creation in the South African banking sector. Like Kumbirai and Webb (2010), the study was conducted using pre and during-financial crisis era data; hence does not reflect the evolution of the bank risk management strategies post-transformation and bears no reflection on the effect of the COVID-19 pandemic on the banks' liquidity.

Although there is evidence of research on determinants of liquidity done on South African banks, most of the studies were conducted during the global financial crisis period. The bank operation is continuously evolving, and the regulatory framework is also changing. The study at hand intends to analyse liquidity risk in South Africa in the era that will capture the transformation of the banks post the global financial crisis and in a period of the COVID-19 pandemic. This study aims to provide an econometric account of the determinants of bank liquidity risk in South Africa post the global financial crisis and an analysis of the effect of the COVID-19 pandemic. Consistent with such studies as Moore (2010), Vodova (2011), and Khoury (2015), this study further intends to use multiple measures of liquidity to address the noted lack of consensus on the appropriate measures of liquidity.

The outline of this paper is as follows: The subsequent section offers information about the South African banking industry and the COVID-19 trajectory. Section 3 provides the literature review, in Section 4 the data is presented, the variables are defined, and the econometric model used is specified. Empirical determinants of banks' liquidity are presented and discussed in Section 5 before the conclusion in section 6.

1.1 The South African Banking Sector and the COVID-19 Trajectory

The South African banking sector hosts 14 locally controlled banks, four foreign-controlled banks, three mutual banks, 28 foreign bank representatives and 13 branches of foreign banks (South African Reserve Bank, 2020). The sector is legislatively well regulated as it subscribes to the Bank of International Settlement (BIS) regulatory framework intended to ensure standards that guarantee the banking system's overall safety, soundness and stability across the globe (Jacobs, Styger and Van Vuuren, 2012). The relatively recent significant disruptions to the banking industry's stability in South Africa and globally were the global financial crisis, followed by the COVID-19 pandemic almost ten years later. In response to the COVID-19 pandemic, South Africa had its first lockdown in March 2020. Working closely with other national entities, the government designed a program ensuring that the lockdowns were applied and implemented in levels ranging from level one with minimal restrictions to the most stringent level five permitting only entities delivering essential services (Stiegler and Bouchard, 2020). The banks were declared as part of the entities providing essential services; however, they had to reduce their workforce operating in their physical structures to a bare minimum (South African Government, 2022).

2. The Determinants of Bank Funding Liquidity: An Empirical Overview

This study recognises the COVID-19 pandemic as one of the factors that could have affected the banks' liquidity in South Africa. The literature presented in Section 1.2 above has indicated that there are other influential factors. These factors include bank-specific factors that emanate from the internal environment of the banks, such as bank size, capital adequacy and bank deposit volumes. Other factors are macroeconomic, these include; market interest rate, economic cycle, inflation and employment (Ahamed, 2021; El Khoury, 2015; Kim, 2018; Patora, 2013). These factors are non-specific, they emanate from the banks' external environment. The COVID-19 pandemic is also classified as a non-bank-specific liquidity determining factor.

One of the studies that examined factors determining liquidity risk was conducted by Khoury (2015). Using Lebanese data from 2005 to 2013, dynamic, fixed and random effect panel regression models,

the study estimates liquidity risk using four equations with four different proxies for funding liquidity. The results of the study reveal a positive association between bank liquidity and bank size, the interbank market, the loan book size, inflation and financial crisis. The study, however, could not establish a significant relationship between bank liquidity and capital, economic growth and the level of unemployment in Lebanon.

Patora (2013) also conducted a study aimed at establishing the determinants of bank liquidity in Central Eastern European (CEE) countries using data from 2004 to 2012 based on a sample of 21 banks from five of the CEE countries. The study uses pooled ordinary least squares as a method of analysis. The results of the study indicate that the liquidity position of the banks in CEE countries is negatively affected by changes in capitalization and market share. The study further shows a positive relationship between bank liquidity and unemployment rate and bank profitability. Like Patora (2013), the study by Trenca, Petria, Mutu and Corovei (2012) also investigated the determinants of bank liquidity using quarterly data from 30 commercial banks operating in Central and Eastern Europe for a period covering 2001 quarter 1 to 2011 quarter 4. The result of the study indicates a negative relationship between lending rates and the banks' liquidity. Consistent with Patora (2013), the results also reveal that capitalization negatively affects bank liquidity.

Using the generalized least squares (GLS) method and data from 2006 to 2013, Gafrej and Abbas (2017) conducted a study investigating the effect of bank-specific factors and the macroeconomic factors on bank liquidity specific for Islamic and conventional banks. The results uncover that liquidity position is very persistent for the Islamic bank as past liquidity position has an influence on the preceding period liquidity position and further establishes a negative association between liquidity and capitalisation. The findings of Gafrej and Abbas (2017) are consistent with those of Patora (2013) whose study also revealed a positive association between liquidity position and profitability and capitalization for conventional banks. Using the panel data regression method on 15 commercial banks and monthly data spanning 2009 to 2012, Chikoko (2013) finds a negative association between funding liquidity, bank size and capital adequacy in Zimbabwean commercial banks.

Umar and Sun (2016) conducted a study analysing the determinants of bank liquidity for BRICS countries for a period from 2002 to 2014 using multiple linear regression. Contrary to the studies of Gafrej and Abbas (2017) and Khoury (2015), which indicated that bank size is one of the significant determinants of liquidity, Umar and Sun (2016) found that bank size bears no significant effect on the liquidity of the BRICS banks as in their three models of liquidity. The study further established that the financial crisis had a negative effect on the liquidity position of BRICS banks.

Using a combination of ordinary least squares (OLS) and Fully-Modified Ordinary Least Squares (FMOLS) regression methods in the Czech banking sector spanning 2003 to 2014, Kašparovská, Laštůvková, and Sřelec (2016) conducted a study primarily intended to establish the effect of exchange rate on bank liquidity. The results indicate that the fluctuations between the Czech Crown (CZK) and the Euro positively affect the banks' liquidity. The study also indicates that the interbank offer rate and inflation negatively affect the banks' liquidity. The results further show that Gross Domestic Product (GDP) does not significantly affect the banks' liquidity position.

Another study on the Czech banking sector was conducted by Vodova (2011) using bank financial data covering the period from 2001 to 2009 and panel regression analysis. The study indicates a positive association between bank liquidity and capital adequacy. The study further establishes that inflation, financial crisis and business cycles have a negative effect on banks' liquidity. A similar study by Vodova (2013) examined the determinants of bank liquidity for Hungary's commercial banks using data from 2001 to 2010 using panel data regression analysis. Consistent with the findings in Czech, the results of the Hungarian study indicate that capital adequacy has a positive relationship with the liquidity of the banks. The study further reveals that interest on loans, monetary interest, and interbank rates are directly related to the banks' liquidity position. The study, however, discovers that the relationship between business cycles and liquidity is ambiguous.

3. Data, Variables, and Specification of the Model

3.1 Data

This study uses quarterly financial data on 28 South African banks and macroeconomic data spanning 2012 quarter 1 to 2021 quarter 4. The period immediately after the end of the global financial crisis was followed by a period of strategic review of the risk models and strategies by the banks and regulators. The study assumes that in 2012, all the necessary adjustments to models and regulations had been completed. The data used in the study is sourced from the South African Reserve Bank (SARB) database.

3.2 Variables

3.2.1 Dependent Variables

The identified inconsistencies and general lack of consensus in the literature on the appropriate liquidity indicator justify the estimation of bank liquidity using multiple measures to ensure the reliability of estimated results. *Total loans/(deposits and short-term loans)*, *Total loans/ total assets*, *Liquid assets/(deposits and short-term funding)* and *Liquid assets/Total assets* are the most used measure of bank liquidity (El Khoury, 2015; Vodová, 2012; Vodová, 2011). This study adopts *Liquid assets/(Deposits and short-term funding)* and *liquid assets/Total assets* as measures of liquidity. The results of the equations based on the other two measures have not been reported in this study because they failed most of the critical specification tests. Below are the definitions of the dependent variables reported in this study:

Liquid assets/Deposits and short-term funding (LIQ1): Liquid assets include all the near-cash assets of the bank; these assets include bills. The higher the calculated value of the ratio, the lesser the liquidity pressure on the bank and the lower the liquidity risk (Khoury, 2015; (Vodova, 2011)

Liquid assets/Total assets (LIQ2): Like in the case of *LIQ1*, Liquid assets include all near-cash assets of the bank. The higher the value calculated the lower the liquidity risk facing a bank (Khoury, 2015; Vodova, 2011).

3.2.2 Independent Variables

Literature has indicated that bank liquidity is determined by the factors that are specific to the banks and factors that emanate from their external environment. Bank-specific factors can be controlled internally and are nonfundamental in nature. The factors that emanate from the external environment of the bank are systematic or fundamental in nature. Although the banks can restructure their balance sheet position and manage their transactional exposures in response to changes in these factors, they lie outside their direct domain of influence. In accounting for these systematic factors, this study focuses on macroeconomic factors. The liquidity determining factors are outlined and discussed, starting with the factors deemed bank-specific.

3.2.2.1 Bank-specific factors

Size (Bank Size): The influence of the bank size on its liquidity and profitability remains conclusive. Examining the relationship between bank size and liquidity also evaluates the most popular “too-big-to-fail” hypothesis. This variable is also used in the studies of Gafrej and Abbes (2017) and Khoury, 2015)

Ln_CAP (Capital Adequacy): If bank customers were rational, they would pursue to place their money with the banks that are well capitalised as these banks would have a cushion to absorb financial risks and have relatively better chances of survival (Trenca *et al*, 2012; Patora, 2013)

Ln_DEP (Change in Deposits held by the banks): One of the traditional business functions of banks is to move money around its customers. Those with surplus funds place them with the banks as deposits and those who are financially deprived take loans. *Ceteris Paribus*, the drying up of the funding sources can expose a bank to a liquidity crisis, and the opposite is also true.

Lnadvfor (Change in Loans and advances to foreign banks): The variable represents advances to foreign banks. The presence of foreign banks in the South African banking sector is primarily a product of financial integration and globalisation. The variable provides information on the impact of the foreign banks and their business participation in the South African banking system with respect to liquidity. The sign and significance of the coefficient of the variable will provide information on whether the presence of foreign banks has enhanced liquidity conditions within the South African banking industry or not.

3.2.2.2 Macroeconomic factors (Systematic factors)

M_Rates (Money Market Interest Rates): *Ceteris Paribus*, Vodová (2011) found that when the short-term interest rates increase, it becomes attractive for the banks to place investable funds into the short-term market, thus improving their liquidity conditions. However, when banks may need funding in the short term, when money market interest rates are high, borrowing in this market becomes costly, creating more liquidity pressure on the banks.

EMP (Employment Growth): The way employment affects the banks' liquidity is two-fold. As more people get employed, the bank's customer base increases. The amount placed as deposits at the banks may also increase as the number of income earners increases. *Altera parte*, as the number of income earners increases, the amount of funds extended as loans may also increase as the general customer's ability to pay increases. The two have a counteracting effect as an increase in deposits enhances liquidity and an increase in loans extended deteriorates liquidity. The direction of influence of employment growth on liquidity is inconclusive.

MS (Money Supply): The amount of money in circulation is controlled by the Reserve Bank of South Africa. An **increased money supply** is associated with increased **liquidity** (Brunnermeier and Pedersen, 2009). This study uses M2 as a measure of Money Supply. The use of M2 as a proxy for money supply can also be found in the studies of Leeper and Gordon (1992) and Omankhanlen, Ilori, Isibor and Okoye (2021).

3.2.2.3 Pandemic factor

COVID-19: Caselli, Grigoli, Lian and Sandri (2020) assert that the lockdowns that were adopted by countries as a response to the COVID-19 pandemic resulted in a decline in economic activity. During the same time, bank transactions, especially withdrawals, could have declined as the bank visits declined with restricted public movement. The loans by companies could have increased as their incomes declined due to a decline in product use while their costs, including salaries, remained fixed in the short run. The decline in withdrawals and increase in loans have a counteracting effect. Flogel and Gartner (2020) assert that the lockdowns that were placed by the countries in response to the pandemic influenced the liquidity demand and the default risk in the banking industry.

In table 1, the notation for the variables used in the study is presented in column 1, the definition or mathematical derivation of the variables is provided in column 2. In column 3 the source of the data used in the study is provided.

Table 1: Description of Variables

Variable	Definition	Source
LIQ 1	Liquid assets/Total Deposits and short-term funding	Reserve Bank of South Africa nested in EasyData (Quantec)
LIQ 2	Liquid Assets/ Total Assets	Reserve Bank of South Africa nested in EasyData (Quantec)
Ln_DEP	Ln of (total deposits)	Reserve Bank of South Africa nested in EasyData (Quantec)
Size	Ln of (Total Assets)	Reserve Bank of South Africa nested in EasyData (Quantec)
lnGDPsa	Ln of GDP	Reserve Bank of South Africa nested in EasyData (Quantec)
Ln_CAP	Ln of (Total Equity/Total Assets), measures capital adequacy	Reserve Bank of South Africa nested in EasyData (Quantec)
COVID-19	A dummy variable, taking a value of 1 during the COVID-19 pandemic period and a 0 otherwise	Reserve Bank of South Africa nested in EasyData (Quantec)
EMP	Employment Growth	Reserve Bank of South Africa nested in EasyData (Quantec)
M_Rates	Money Market Interest Rates	Reserve Bank of South Africa nested in EasyData (Quantec)
MS	Money supply measured by M2	Reserve Bank of South Africa nested in EasyData (Quantec)
Lnadvfor	Loan and Advances to Foreign Banks	Reserve Bank of South Africa nested in EasyData (Quantec)

Table 2 provides a summary of the descriptive statistics of the variables used in this study. The number of observations for most of the variables is 878. Comparatively, *LIQ1* is more volatile than *LIQ2* and the rest of all the other variables. The variable for loans and advances to foreign banks has fewer observations as the business models of some of the banks in the sample do not involve giving loans to foreign banks while other banks are not in the business of giving out loans at all.

Table 2: Descriptive Statistics

Variable	Obs	Mean	Std. dev.	Min	Max
LIQ1	878	1.492196	4.986281	0	35.59401
LIQ2	878	1.372251	5.105084	0	36.58206
Lnadvfor	391	13.28407	2.587387	0	16.29383
Size	878	16.55944	2.177675	12.17459	20.83487
lnGDPsa	858	0.015419	0.040302	-0.18595	0.151854
COVID-19	880	0.190909	0.393241	0	1
Ln_CAP	878	-1.67982	0.640585	-3.37106	0.861799
M_Rates	858	-0.03308	0.45984	-2	0.73
EMP	858	15.25641	3.916216	10	25
Ln_DEP	878	16.64984	2.10629	10.20606	20.82615
MS	840	7.605	2.809462	3.316667	15.16333

3.3 Specification of the model

The study estimates two liquidity estimating equations that incorporates the effect of macroeconomic and bank-specific factors as follows:

$$Y_{it} = \alpha + \beta_0 X_{it} + u_{it} \quad (1)$$

Where Y represents LIQ1 and LIQ2 and Y_{it} denotes liquidity risk for bank i at time t X_{it} denotes the independent variables explaining liquidity risk for bank i at time t and e_{it} is the random error term.

In Table 2, the descriptive characteristics for the explanatory variables and the dependent variables are provided. The descriptive information includes the mean, standard deviation, minimum and maximum. Most variables have 880 observations. The number of observations is, however, not consistent across all the variables. A variable with the least number of observations is the loan growth series, with 687 observations. Some banks are not providing loans; hence, no loan data was captured for those. Other banks are not providing loans to foreign banks at all; hence the noticeable low number of observations for 'Lnadvfor' series. The other inconsistency that can be seen is the discrepancy between the number of observations for the macroeconomic data and the commercial bank-related data. Although the data is from the same database, the commercial bank data seems to be updated more frequently than the macroeconomic data.

4. Empirical Results

In determining banks' liquidity, a series of tests had to be performed collinearity, stationarity and autocorrelation to ensure consistency, reliability and robustness of the estimated equations. The details of the tests conducted, and the results are provided.

4.1 Stationarity test

To determine unit root in the variables used in the estimation of the model, the Fisher type/Dickey-Fuller unit root test is applied on all variables. As Table 3 indicates, the test renders all the variables but inflation, market interest rates and growth as stationary. The COVID-19 variable is also not stationary as it is a dummy variable. All the variables that were found to be stationary in their level form became stationary after the first difference. COVID-19 is the only variable that was included in its natural form without treating stationarity as it is a dummy variable.

Table 3: Unit root test

Variable	Fisher type / Dickey-Fuller Inverse chi-squared (44)	P-Value
LIQ1	80.9677	0.0000
LIQ2	119.4902	0.0000
Lnadvfor	82.6159	0.0000
Ln DEP	82.6159	0.0000
Size	108.4162	0.0000
lnGDPsa	12.2704	0.0000
Ln CAP	109.9807	0.0000
COVID-19	4.4688	1.0000
MS	86.0745	0.0002
M Rates	6.8927	0.0000
EMP	174.5293	0.0000

4.2 Collinearity Test

Table 4 shows correlation coefficients of the variables calculated over the period 2012 quarter 1 to 2021 to quarter 4. The results of the correlation analysis show a weak correlation between most of the independent variables. However, there is positive correlation between lntotaldeposit and the size variable. There are options that could have been adopted to address the problem such as variable elimination, combining the variables or using the ridge regression. The concern of using these

procedures is that the application results in more problems as it leads to loss of vital information that could be lost from the regression models (Hryckiewicz and Kowalewski, 2010). O'Brien (2007) and O'Brien (2017) also assert that collinearity does not affect the results as long as the coefficients of the variables in question are statistically significant.

Table 4: Correlation Matrix

	LIQ1	LIQ2	Lnadvfor	COVID-19	Size	Ln_CAP	Lngdpsa	lnM2	EMP	M_Rates	Ln_DEP
LIQ1	1										
LIQ2	0.9832	1									
Lnadvfor	-0.2681	-0.3044	1								
COVID-19	0.1272	0.1185	-0.0973	1							
Size	-0.6834	-0.7158	0.5357	-0.0661	1						
Ln_CAP	0.7002	0.7	-0.3792	0.0737	-0.7531	1					
Lngdpsa	0.2166	0.2392	-0.0759	0.5325	-0.154	0.3069	1				
lnM2	-0.0175	-0.0356	0.0338	0.2636	0.0442	-0.0925	-0.2272	1			
EMP	0.1146	0.1099	-0.1267	0.6561	-0.0611	0.1156	0.3365	0.4195	1		
M_Rates	-0.0114	0.0092	0.1208	-0.8011	0.0012	0.0902	-0.0504	-0.3871	-0.5839	1	
Ln_DEP	-0.6303	-0.6732	0.5476	-0.0536	0.9958	-0.722	-0.1406	0.044	-0.0525	-0.004	1

4.3 Heteroscedasticity and Serial Correlation

Modified Wald statistic for groupwise heteroscedasticity test is applied in the two equations as well as the Lagrangian-Multiplier test for serial correlation. The two tests indicated the presence of serial correlation and heteroscedasticity in both equations. To address the observed heteroscedasticity, the study estimated the LIQ1 and LIQ2 equations using the *Huber/White estimator*, the procedure produces more robust and reliable results.

Table 5: Autocorrelation Test

WOOLRIDGE TEST	LIQ1	LIQ2
F (1, 9)	5.265	9.319
Prob>F	0.0474	0.0137

Table 6: Groupwise Heteroscedasticity

Wald Test)	LIQ1	LIQ2

5. Empirical Results and Discussions

This study intended to examine the determinants of liquidity risk in South African banks using panel data regression. The estimation technique and model used in the econometric analysis should be consistent with the nature of the study's data. In estimating the intended equations, a decision had to be made whether to adopt the Pooled Ordinary Least Squares (POLS), the Fixed Effects Model (FEM) or the Random Effect Model (REM). The Hausman test was used first to determine an appropriate model between the FEM and the REM. Where the results of the Hausman test would have favored the REM to the FEM, the study would use Breusch-Pagan Lagrange multiplier (LM) to determine whether POLS would be better suited for estimation or the REM. After applying all the necessary tests, both equations were estimated using Random Effect Regression technique as the procedure deemed to be the most appropriate. The noted heteroscedasticity and serial correlation in both equations rendered the use of the more robust Huber/White estimator REM more appropriate.

***, **and * indicate that a variable is significant at 1%,5% and 10% respectively

The derivation of both LIQ1 and LIQ2 variables, which are liquidity measures is different in the two equations presented but the interpretation of the result is the same. For both equations, a positive coefficient indicates a positive relationship between liquidity and a factor under observation.

5.1 The Bank Specific Variables and Banks' Liquidity

The sign of a deposit variable (Ln_DEP) is positive and significant in both equations. The positive and significant result indicates that the liquidity pressure reduces with an increase in deposits received by the banks. The sign for capital adequacy (Ln_CAP) coefficient is also positive and significant in both LIQ1 and LIQ2 equations. The positive and significant coefficient sign indicates that as the banks' capital adequacy improves, the banks' liquidity conditions also improve. This finding is consistent with the results of the study by Vodova (2013) conducted using Hungary data. The size variable is negative and significant in both equations, nullifying the 'too-big-to-fail' hypothesis. This finding is also reported in the study of Zaghoudi and Hakimi (2017). *Appendix 3: Figure 3* shows that on average the trajectory of liquidity risk carried a consistent trend only dropping in 2019, it dropped to the trend it followed between 2014 to 2017 in 2019. *Appendix 2: Figure 2* shows that from 2020 the loans extended by the banking industry increased sharply (loans form a bigger portion of bank assets). The loans are generally considered as illiquid assets. Lopez and Spiegel (2020) report that in the US, during the COVID-19 pandemic period, the banks increased the amount of loans extended as firms and business in general struggled to meet their operational costs obligations. The lnadvfor variable coefficient is negative and significant in both equations. The results indicate that lending to banks that are classified as foreign banks creates liquidity pressure on the banks. This finding partially indicates that global financial integration has not brought liquidity solutions in reducing the liquidity pressure in the South African banking system.

5.2 The Economic Variable and Banks' Liquidity

The lnGDPsa variable proxies the business cycle. The results in both equations indicate that business cycles are not a significant factor in determining bank liquidity. This suggests that changes do not influence South African bank liquidity conditions in economic conditions. The coefficient of money market interest rate (M_Rates) is negative and significant in both equations. Among others, this indicates that the banks are not increasing their investments into liquid money market instruments in response to increasing market rate, they are placing more funds into credit extension in pursue of higher returns that however come at the expense of their liquidity. The variable for money supply (MS) is positive and significant in equation 1. This finding suggests that when money supply increases, the banks get some relief from the liquidity pressure. Intuitively when money supply increases, market rates drop. This finding is consistent with the results reported on the relationship between market rates and bank liquidity. In both equations, the insignificance of the business cycle indicator (LnGDPsa) variable indicates that the banks liquidity is not determined by changes in the economic conditions in the country. The employment growth (EMP) variable is theoretically linked to the business cycles, just as is the case with the relationship between business cycles and banks' liquidity, the coefficient of the employment variable is insignificant in both equations. Vodova (2013) also reports an insignificant relationship between liquidity and business cycle.

5.3 COVID-19 and Banks' Liquidity

The coefficient of the COVID-19 variable is positive but insignificant in both equations. The insignificance of the variable implies that the COVID-19 pandemic crisis did not negatively affect the banks' liquidity. Amongst others, the COVID-19 pandemic would have affected the bank's liquidity through the lockdowns that resulted in economic inactivity and retrenchments. The results of this study show that South African banks' liquidity does not respond to economic cycles and unemployment. *Appendix 2: Graph 2* shows that the amount of deposits held by the banks continued to increase during the COVID-19 pandemic. Consistent with Li, Strahan and Zhang (2020) assertion, *Appendix 1: Graph 1* shows that the loans extended by the banks during the pandemic period increased while deposits increased. *Appendix 3: Graph 3* indicates that in 2019 bank liquidity declined sharply, and the loans extended by the banks also increased sharply around the same period; this confirms that the increase in loan extension by the banks during the COVID-19 pandemic period

compromised bank liquidity. The increase in bank deposits during the COVID-19 period has played a significant role in protecting the banks from the possible extreme effects of the liquidity crisis.

6. Conclusions

This study examined the determinants of liquidity risk in South African banks with a partial focus on the COVID-19 pandemic. The study has shown that the South African banking sector liquidity is not affected by changes in economic growth and employment. These two factors are linked to the COVID-19 pandemic as the lockdowns were adopted as a responding strategy to the COVID-19 pandemic. The lockdowns resulted in economic inactivity due to movement restrictions, business collapses and retrenchments. The regression results have confirmed that the pandemic did not significantly affect the banks' liquidity. Although there are no more lockdowns in respect of the pandemics globally and locally, the results indicate that in any case of a pandemic or a situation close to a lockdown that can result in economic inactivity, the banks will not have a knock on their liquidity position. This study's results have indicated that bank liquidity declined during the COVID-19 pandemic period. The decline can be mainly attributed to business decisions and strategic matters, as the study has shown that bank-specific factors are more dominant in determining bank liquidity. The study provides evidence that during the COVID-19 pandemic period, the number of loans extended by the banks increased, thus compromising the banks' general liquidity status.

The study has nullified the 'too-big-to-fail' hypothesis in the case of the South African banking industry setting, as banks considered to be 'big' because of their asset book size have shown a relatively higher liquidity risk exposure than smaller banks. This result suggests that *ceteris paribus*, it is safer for customers to bank with relatively smaller-sized banks. The results have also shown that adhering and complying with the statutory regulatory liquidity requirements by ensuring capital adequacy significantly contributes to solving banks' liquidity problems in South Africa.

Management Experiences during COVID-19 altering Human Dynamics to Effectively Optimise Operational Performance

Keywords

COVID-19 pandemic;
emotions;
loneliness;
Middle Management;
social isolation and
distancing;
values.

Abstract

The authors postulate that with the reformed rules of working such as social isolation and distancing during COVID-19, employees experienced altered human dynamics which could have managerial implications and impact the future of work. This begs the question: How did managers adapt to the altered human dynamics experienced during COVID-19 rule?

A quantitative research approach was followed obtaining data from a small purposive sample of 20 middle managers in an essential services food production organisation during Covid-19. Data were collected using a self-administered hard copy 4-point Likert-scale questionnaire, comprising three constructs derived from literature i.e., loneliness, values, and emotions. Data were analysed using statistics applicable to small samples.

The results and findings clearly indicate the importance and conduct of management in turbulent times by providing psychological safety (to ensure optimal learning and change); the repair of social connections in the workplace (to mitigate loneliness); support enabling shared values (to ensure a unified effort and purpose); and pleasure in what they do (to mitigate emotions of anger, aggression and fear). Managerial implications and recommendations are addressed in how to deal with altered human dynamics during a crisis. Limitations and future research conclude the paper.

1. Introduction

The COVID global pandemic which was announced in March 2020 raged rampant and widely ignited feelings of fear, anxiety, and uncertainty in societies and workplaces. COVID-19 could be considered the perfect black swan (Taleb, 2008) – infrequent, impactful, and unexplainable. When it comes to black swan events, the future cannot be predicted based on past events, nor can anyone consider events unlikely to occur because the events are outliers (Taleb, 2008). Alternatively, COVID-19 could also be considered a white-swan event: something that would eventually take place with a great deal of certainty (Schwab & Malleret, 2020), given the many highly populated places and networks of human travel and trade.

Irrespective of COVID-19 being a black or white swan event, it remains unprecedented in terms of its effect on economic and organisational activity. Any such events call for a new paradigm of quick changes, flexible resources, focus on action, teams build around end-to-end accountability and leadership which enables action (Taleb, 2008; Schwab & Malleret, 2020).

The impact of COVID-19 was also felt on all levels of an organisation – macro (strategic), meso (team) and micro (individual) level. To survive as organisation, dynamic (creative and unpredictable)

*Corresponding Author

² E-mail address: yvonne.duplessis@nwu.ac.za

and static organisations (reliable and risk averse) were forced to re-configure their total business model - strategy, people, technology, processes, structure, value creation and value protection. Taleb (2008) spoke of the extended disorder family: uncertainty, variability, imperfect and incomplete knowledge, chaos, volatility, disorder, time, the unknown, randomness, stressors, error, dispersion of outcomes, chance, entropy, turmoil and unknowledge. In many organisations, the entire extended disorder family became part and parcel of organisational life during the global pandemic. Synergy of teams and normal functioning becomes difficult and even impossible given the widespread uncertainty. On an individual level, Schwabb and Malleret (2020) conclude that social distancing resulted in distrust, worsened by prolonged angst. The result being that people are driven apart. The authors of this paper postulate that with the altered ways of working, promulgated by social isolation and social distancing during COVID-19, the individual level or employees (including managers) experienced altered human dynamics which could have prolonged managerial implications and impact the future of work.

The purpose of this paper is to investigate the altered human dynamics during the COVID pandemic and the impact thereof on middle managers as employees (individual level) to ensure effective production.

1.1. Problem Statement

The forced lockdown and stringent control measures, e.g., changed working ways, forced social distancing, decreased social contact, increase in survival mode and increased feelings of loneliness and/or lack of social, mental, and/or emotional support, were a reality in workplaces for more than two years. Whilst the intention of lockdown, controls and closures was to prevent the spread of the virus within institutions and prevent carriage to especially vulnerable individuals, these stringent measures have had widespread socio-economic implications (Nicola, Alsafi, Sohrabi, Kerwan, Al-Jabir, Iosifidis, Agha, & Agha, 2020).

The problem being investigated in this paper relates to the uncertainty of how COVID-19 affected the human dynamics of managers and employees on an individual level. The context being an essential food service organisation in South Africa, where production had to be continued under strict COVID-rule. This means managers and employees had to comply with health and safety regulations to avoid becoming infected yet had to get to work when little or no transport was available during lockdown, work in close proximity in the operating plant without socialising and endure daily tests. It was especially the middle managers and operational employees who were more affected as they had no prior experience of managing and working under these pandemic conditions and had to seek solutions under stressful conditions to stay operational. The problem statement informs the research questions to be answered.

1.2. Research questions

The research questions being:

- a) What are the altered human dynamics experienced by middle managers in an operational food production plant during the Covid pandemic?
- b) How did middle managers adapt to the altered human dynamics to effectively optimise operational performance?

Much literature exists on human dynamics during crisis, however, to conceptualise the key theoretical constructs that specifically relate to situations of social isolation and social distancing an extant literature review was conducted.

2. Literature Review

The literature review will include the core constructs of human dynamics that support the discourse pertaining to social isolation and social distancing due to COVID-19 and its implications on employees in essential services organisations. The conceptual theoretical framework shown in Figure 1 below indicates the selected constructs and theories used in the study, which will be discussed.

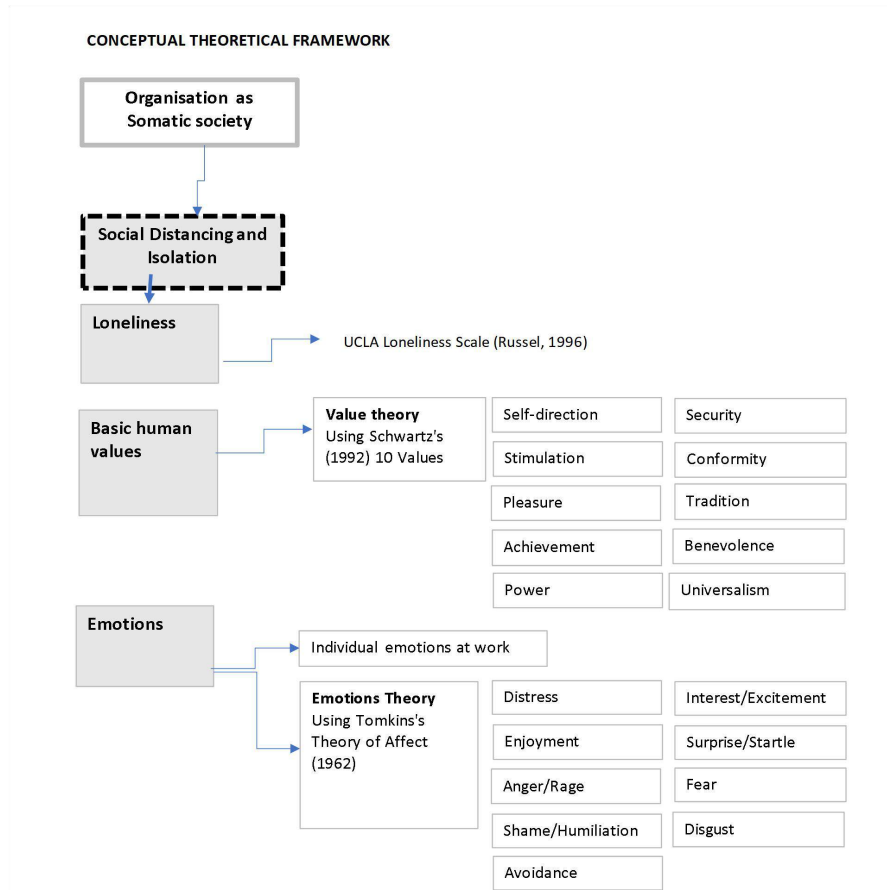

Figure 1: Conceptual Theoretical Framework (Authors' own)

2.1. Organisations – a somatic society

As humans, we have always inhabited a somatic society and these societies and organisations are living organisms, living bodies of work and knowledge, “structured around regulating bodies” (Turner, 1992, pp. 12 – 13). Within the regulating body of the organisation, we find norms, policies, procedures, governance and health and safety measures. Yet, in Africa, South Africa, and even world-wide regulating bodies are crumbling under accusations of fraud, corruption, incompetency, political agendas, and COVID-19 regulations. Within any living body there is a set of identity values and ordering factors of social practices and intuitive representations which finds its basis in widely shared moral intuition (Bianchi, 2008).

COVID-19 took the world by surprise: Governments radically forced guidelines that, in days, shut down business indefinitely and people were compelled to abide by the new norms. While hygiene measures remained like previous pandemics, the social distancing norms were particularly disruptive, resulting in a unique experience (Sikali, 2020). It seems important to investigate the impact COVID-19 regulations has/had on individuals and organisations.

2.2. Social distancing and social isolation – a metaphor for exclusion?

2.2.1. Social distancing

Earlier researchers noted that resistance to diversity and its manifestation primarily changed from overt and obvious manifestations to more subtle and more complex forms (Dovidio & Gaerner, 2000; Hebl, Foster, Mannix & Dovidio, 2002). Hebl, Madera and King (2008) points out (prior to COVID-19) different ways in which diversity resistance is manifested in interpersonal exclusion, avoidance and social distancing. The authors continue that interpersonal discrimination can be manifested in exclusion, avoidance, and social distancing through informal social networks in the workplace. The absence of such networks leads to feelings of isolation (Kanter, 1977) and lack of identification in the

workplace (Tsui and O'Reilly, 1989). Ibarra (1995) suggests that minority employees and in particular, minority managers have fewer intimate network relationships.

Social distancing means creating a safe distance of at least two meters between yourself and others; popularised by COVID-19 as a critical measure to prevent viral spreading. However, according to Pandi-Perumal, Vaccarino, Chattu, Zaki, BaHammam and Manzar (2021) the term is misleading as it implies that individuals should stop socialising.

To organisations and society, social distancing presents the dangers of increasing social rejection, growing impersonality and individualism, and the loss of a sense of community. It negatively affects learning and growth, and prevents people from effectively socialising, which is a fundamental human need (Sikali, 2020).

Baumeister and Leary (1995) asserted that positive social contact is essential for psychological and physiological health. The authors suggest human beings have a pervasive drive to form and maintain a minimum quantity of lasting, positive, and significant interpersonal relationships. Orben, Tomova, and Blakemore (2020) proposed social interactions to be a basic human need, analogous to other fundamental needs such as food consumption or sleep. Feeling insufficiently connected to others is associated with profound and lasting negative consequences on physical and mental health. Lieberman (2013) argued that social connection is the most essential need for human survival. Hagerty and Williams (2020) created three "biotypes" namely rumination, anhedonia [the inability to experience pleasure] and threat dysregulation brain styles; emphasizing the profound threat that COVID-19 poses to what makes us human, namely social connections.

Maintaining social bonds and socialising in a safe context is very important during times of crisis. The authors question whether terminology of physical distancing is not perhaps more appropriate given the longer-term reality of COVID-19.

2.2.2. Social Isolation

Social isolation is defined by the level and frequency of one's social interactions and describes an objective state of an individual's social environments and interactional patterns (Hwang, Rabheru, Peisah, Reichman & Ideda, 2020). The COVID-19 pandemic placed many locations under "stay at home" or "work from home" orders, resulting in a form of social isolation that is unprecedented in the modern world (Clair, Gordon & Kroon, 2021). The authors found that research explored the subjective experience of social isolation. However, the novel experience of mass physical distancing (popularised as social distancing) because of the COVID-19 pandemic suggests that social isolation is becoming a significant factor in the public health crisis.

Various authors concluded that the experience of social isolation relates to a reduction in life satisfaction (e.g., Xia and Li, 2018; Mellor, Stokes, Firth, Hayashi & Cummins, 2008; Hawton et al., 2011), and was found to be a significant mediator in life satisfaction and wellbeing across the adult lifespan during a global health crisis. In addition, individuals reporting higher levels of social isolation experience less satisfaction with the conditions in their home (Clair et al., 2021). Social isolation has traditionally been examined in older populations (e.g., Smith & Lim, 2020) and relates to numerous negative physical and mental outcomes (e.g., Bhatti & Haq, 2017; Xia & Li, 2018). Recent research found younger adults in their 20s reported more social isolation than individuals aged 50 and older during physical distancing (Clair et al., 2021). These findings support those of Nyqvist, Victor, Forsman and Cattani (2016) who found that young adults reported greater loneliness than older adults. Clair et al. (2021) found individuals who reported higher social isolation indicated less connection to their community and broader dissatisfaction across social and life domains. Also, that social isolation led to increased distrust; individuals who need the most support may be the most suspicious of the effectiveness of institutions providing support. Perceived social isolation was associated with negative coping rather than positive coping.

2.2.2.1. Loneliness

Loneliness refers to a subjective feeling of being alone (Hwang et al., 2020). Although loneliness and social isolation are not equal, both can exert a detrimental effect on health through shared and different pathways (Hwang et al., 2020). Loneliness relates to adverse impacts such as reduced sleeping time and increased awake time (Cacioppo et al., 2002; Fässberg et al., 2012), increased depression, impaired functional status, vision deficits and decreased quality of life (Lee et al., 2019). Loneliness is associated with suicide attempts and completed suicide among older adults (Fässberg et al., 2012) as well as with incident dementia (Kuiper et al., 2015).

It is important to note that prior to the COVID-19 pandemic, loneliness and social isolation were prevalent across Europe, the USA and China (10–40%) (Leigh-Hunt et al., 2017; Xia and Li, 2018) where it was described as a “behavioral epidemic” (Jeste, Lee & Cacioppo, 2020). This situation has only worsened with the restrictions imposed to contain viral spread (Lampraki et al., 2022).

To alleviate loneliness, authors (Hwang et al., 2020) suggests maintaining social connections with technology, structuring every day, and maintaining physical and mental activities. However, relaxation techniques, conscious breathing and mediation can manage cognition, emotion, and mood during loneliness.

This means that times of crisis affect social isolation, psychological safety and loneliness of people in general, which can have a detrimental impact on human’s value systems which in turn drive their behaviours. It has been known that values are crucial in explaining social and personal organisation and change (Durkheim, 1964; Weber, 1958). Values indicate what is important to us. Thereagainst, if values that individuals hold dear are not observed, psychological safety will decrease with resultant increased feelings of isolation.

2.2.2.2. Basic Human Values

Values derive from various sources, most of which are not recognized by the individual. Institutional structures (Hechter, 1993) and individual experiences (Feather, 1975; Hechter, 1993) embed values and provide a strategy for dealing with new choices (Kahle, 1996). Socialisation and culture are two constructs believed to impact on values. Values originate during needs, which are survival related manifestations of physiological conditions (Super, 1995). Values are cognitive representations of needs that have been transformed to take social sanctions into account and remain relatively stable motivational characteristics of individuals (Rokeach, 1973).

Social life is impossible without values; the functioning of social systems could not continue to achieve group goals, individuals could not get what they want and need from other individuals, internally they could not establish order and unified purpose (Kluckhohn, 1954). All human groups develop values (Williams, 1979) as a representation of what is important to us in a social setting. Common values ensure that societal members understand each other. At a societal level, values guide the fulfilment of individual’s biological and social needs (Schwartz, 1992). Societal values are stable as each value is surrounded by a cumulative net of meanings and interpretations (White, 1993). Cultural change will occur due to shifts in ecological conditions (Hofstede, 1980), but in turn also shape their environment (Hofstede, 1980; Inglehart, 1990). Bonetto et al. (2021) studied the possible evolution of Schwartz’s theory of Basic Human Values during the COVID-19 and found that values are malleable because of social isolation.

2.2.2.2.1. Schwartz’s Theory of Basic Values

The value theory defines ten broad values according to the motivation underlying each. These values are universal and circular in structure, reflecting the motivations each value expresses and captures the conflicts and compatibility among the ten values (Schwarz, 1992). These values are important coping mechanisms as they represent individuals needs as biological organisms, requisites of coordinated social interaction, and survival needs (Schwartz, 2012).

Schwartz (1992) adopted a conception of values that specifies six main features that are also implicit in the writings of many authors before and after his 1992 publication (e.g., Allport, 1961; Feather, 1995; Kluckhohn, 1951; Morris, 1956; Rokeach, 1973) and are features of all values:

- Values are beliefs linked to affect and when activated, become infused with feeling.
- Values refer to desirable goals that motivate action.
- Values transcend specific actions and situations. This distinguishes values from norms and attitudes which usually refer to specific actions, objects or situations.
- Values serve as standards or criteria.
- Values are ordered by importance relative to one another and
- The relative importance of multiple values guides action.

Table 1 below indicates Schwartz’s ten values with the defining goal and a brief description (Schwartz, 1992). These values are also indicated in Figure 1 above - the Conceptual Theoretical Framework.

Table 1: Schwartz’s ten values (1992)

Value	Defining goal	Description
Self-direction (self-respect, intelligent, privacy)	Independent thought and action (choosing, creating, exploring)	Need for control and mastery (e.g., Bandura, 1977) and interactional requirements for autonomy and independence (e.g., Kohn & Schooler, 1983)
Stimulation (a varied life, excitement, daring)	Excitement, novelty and challenge in life	Need for variety and stimulation to maintain an optimal, positive level of activation (e.g., Berlyne, 1960)
Hedonism (pleasure, enjoying life, self-indulgent)	Pleasure or sensuous gratification for oneself	Need for pleasure and satisfying them (e.g., Freud, 1933)
Achievement (ambitious, successful, capable, influential)	Personal success through demonstrating competence according to social standards	Achievement values emphasize competence in terms of prevailing cultural standards, thereby obtaining social approval; thus, active demonstration of successful performance in concrete interaction
Power (authority, wealth, social power)	Social status and prestige, control or dominance over people and resources	Power and achievement values focus on social esteem; thus, the attainment or preservation of a dominant position within the more general social system.
Security (safety, harmony, stability of society, of relationships, and of self)	Basic individual and group requirement (e.g., Maslow, 1965)	The goal of security for self or those with whom one identifies (social order, family security, national security, clean, reciprocation of favours)
Conformity (obedient, self-discipline, politeness, honoring parents and elders)	Restraint of actions, inclinations, and impulses likely to upset or harm others and violate social expectations or norms	Individuals inhibit inclinations that might disrupt and undermine smooth interaction and group functioning
Tradition (respect for tradition, humble, devout, accepting my portion in life)	Respect, commitment, and acceptance of the customs and ideas of one’s culture or religion	These symbolize the group’s solidarity, express its unique worth and contribute to its survival (Parsons, 1951) and share the goal of subordinating the self to socially imposed expectations by demanding responsiveness to immutable expectations from the past

Benevolence (support, well-wishing)	Preserving and enhancing the welfare of those with whom one is in frequent personal contact (in-group)	Basic requirement of smooth group functioning (Kluckhohn, 1951) and from the need for affiliation (Maslow, 1965). Most critical are relations within family and other primary groups.
Universalism (inner harmony, a spiritual life)	Understanding, appreciation, tolerance and protection of welfare of all people and nature	Contrasting with in-group focus of benevolence. This need is only recognized upon encounters of others beyond the extended primary group and awareness of scarcity of natural resources.

The theory continues to postulate that values form a continuum of related motivation are circular in structure. This also emphasizes adjacent values; the closer any two values in either direction around the circle, the more similar their underlying motivations. The more distant, the more antagonistic their motivations. However, the entire set of ten values relates to any other variable in an integrated manner (Schwarz, 2012). The authors found that the values of benevolence, universalism and self-direction appear at the top of the hierarchy and power, tradition and stimulation values appear at the bottom. Schwartz (2012) draws the order of values as follows (see Figure 3 below): SELF-ENHANCEMENT (Power -> Achievement) -> OPENNESS TO CHANGE (Hedonism -> Stimulation -> Self-Direction) -> SELF-TRANSCENDENCE (Universalism -> Benevolence) -> CONSERVATION (Tradition -> Conformity -> Security) -> SELF-ENHANCEMENT (Power -> Achievement). Note that the circular motion starts again with SELF-ENHANCEMENT (Power -> Achievement).

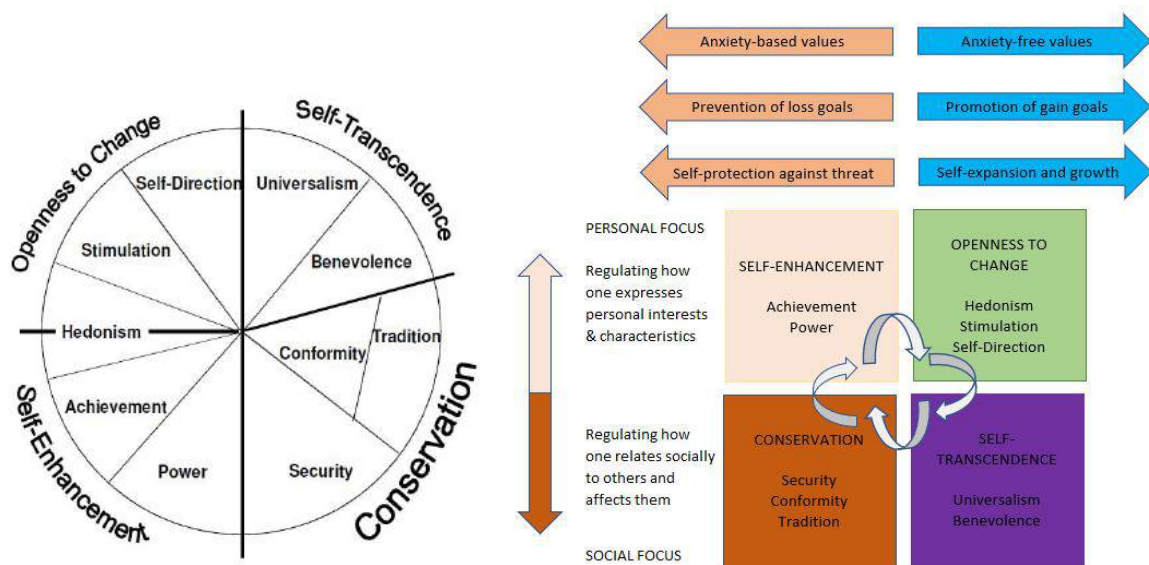

Figure 2: Theoretical model of relations among ten motivational types of value on left and relations among ten motivational types of value on right (Schwartz, 2012)

2.2.2.3. Emotions

Until recently, emotions in the workplace were altogether ignored, or regarded as an irrational annoyance (Fisher, 2019). Emotions had no place within rational organisations. Fortunately, this view changed during the 1980s, when researchers realised emotions are pervasive in the workplace; organisations are populated by people and people have emotions. However, organisations have applied normative expectations and established boundaries for the acceptable expression of emotion among employees (Gopinath, 2011).

Organisations are achievement driven settings. Goal pursuit and identity matter. This makes emotions inevitable (Fisher, 2008; Pekrun & Frese, 1992). Organisations are also social settings with real relationships that matter, again emotions will be experienced (Fisher, 2019). Various combinations of

emotional experience may facilitate or inhibit performance, relationships, creativity, productivity and reliability (Parke & Seo, 2017).

There are many examples indicating the asymmetrical effects of positive and negative emotions (e.g., Lindebaum & Jordan, 2014; Van Knippenberg & van Kleef, 2016). Recent researchers found the emotion most prevalent at work and expressed by managers is anger (28%). Further, that anger produces aggression and fear, creating organisational stress factors. The authors also found that 25% of respondents answered that emotions cannot be expressed at work (Akhvlediani, Mushkudiani & Nikabadze, 2020). Organisations are increasingly urged to intentionally manage their emotional culture to maximise desired outcomes (e.g., Barsade & O’Neill, 2016). Emotions impact on individual behaviour and interpersonal relationships.

2.2.2.3.1. Tomkins Theory of Affects (Emotional response)

Tomkins (1962) describes affect as the innate, biological response to the increasing, decreasing or persistent intensity of neural firing which results in a particular feeling, facial and/or body display and skin changes. Affects feel rewarding, punishing or neutral and makes things urgent. Awareness of an affect is a feeling. A feeling plus memory (of a prior similar feeling) is an emotion. Out of awareness, people develop rules (called scripts) to get more positive and less negative affect. The patter of scripts that a person uses to modulate affect make up his/her personality.

Further, each affect has a unique trigger, a level and pattern of intensity of neural stimulation over time. Stimulus may be inside or outside the body. Tomkins (1962) proposed that innate affects are triggered, not by the specific content of experience as Freud suggested, but by the increasing, decreasing or level intensity of neural firing.

According to this theory, each human is motivated to maximize positive affect while minimizing negative affect. Anything that helps the above is good and anything that interferes with the above is bad for us (Tomkins, 1962). These innate affects are described in Table 2 and indicated in Figure 1 above - Conceptual Theoretical Framework.

Table 2: Innate affects (Tomkins, 1962) before much learning has kicked in.

Affect	Description
Distress-Anguish: The cry for help	Crying is the first human response and is a cry of distress in response to the excessive, inescapable level of stimulation the baby is exposed to upon being born. “Too much!” Help is needed. Distress is triggered by a persistent, too high level of neural firing.
Interest-Excitement: The pull toward mastery	The purpose of this affect is to make learning rewarding. Interest is often neglected, but the interrelationships between the affect of interest and the functions of thought and memory are extensive. Interest is triggered by a gradual, manageable increase in neural firing.
Enjoyment-Joy: The social bond	The innate affect is triggered by a decreasing stimulus and is contagious. This mutually rewarding system of shared joy makes humans want to be social. People will seek to help and be helped by other humans who smile at us. Innate joy is triggered by a decrease in neural firing.
Surprise-Startle: The reset button	The purpose is to get you to stop what you are doing and pay attention to something new. It is triggered by a sudden, brief stimulus.
Anger-Rage: The demand to fix it	Anger is caused by overload. It is triggered by persistent high-density neural firing. If distress indicates “too much”, anger signals “WAY too much”. Managing anger and the violence associated with it are crucial for civilization. Systems of wealth, religion and laws are all collective responses to anger.

Fear-Terror: The signal to flee or freeze (Inherently punishing)	Fear is designed for emergency life and death situations, and it recruits an intense biological response to guarantee our attention goes entirely towards survival. It is highly punishing and intended to be briefly experienced. Fear is triggered by an intense, rapid increase in neural firing.
Shame-Humiliation: The self-protection signal (Inherently punishing)	The shame trigger is the incomplete interruption of excitement or joy. This is less about broadcasting a feeling and more about hiding. The purpose of shame is to be sufficiently negative to bring attention to whatever might have caused the positive affect to be impeded with the purpose of learning how to avoid the loss of positive in that moment or in the future. Once triggered, it further impedes positive affect. Shame can operate when the individual is alone, but often unacknowledged in relationships throughout life.
Disgust: The need to expel (Inherently punishing)	Disgust starts about hunger and is soon applied to people and non-food things. There are many aspects humans figuratively ingest (people, sights, thoughts, noises) that when found to be toxic, needs to be expelled.
Dissmell: The avoidance signal (Inherently punishing)	Dissmell is an impulse to pull/push away from items that should not be invested. Tomkins created this word to capture the biological response of repulsion, as if they smell foul. Dissmell + Anger = Contempt.

The constructs and elements from the theoretical base and theories in the abovementioned literature review have been used to draw the Conceptual Theoretical Framework shown in Figure 1 above and to explain the results and discuss the findings.

3. Methodology

The research methodology is guided by the research problem and questions mentioned above. A positivist philosophy was followed to investigate how existing theories of human dynamics applicable to social isolation and distancing i.e., Loneliness, Values and Emotions correlate with each other if applied in the COVID -19 context. Much literature is available on human dynamics during crisis situations, but not yet sufficient to answer to the research questions. This study followed a quantitative approach with a correlational research design. Correlational research describes what exists currently and examines differences of characteristics or correlates two or more variables. In this type of research, there is no manipulation of variables (Creswell, 2011).

3.1. Population and sample

The organisation under study uses Patterson Classic levels to grade positions. According to this grading system C1 – C5 category, described as middle managers were included in the study. The population comprised 37 of whom 20 voluntary responded to the questionnaire. This is a very small sample for a quantitative study, however the respondents were all experienced middle managers based at its operational plant during COVID-19.

3.2. Data collection

The authors developed a 35-item questionnaire using a four-point Likert scale. Respondents were asked during COVID-19 lockdown to voluntarily self-complete the questionnaire in hard copy, indicating how often each of the statements in the questionnaire is descriptive of them in their work situation. Respondents had to indicate whether they often, sometimes, rarely, or never experienced feelings related to each question. Questions relating to loneliness, values and emotions. The UCLA loneliness scale (Russell, 1996) was used as it is highly reliable, both in terms of internal consistency (coefficient a ranging from .89 to .94) and test-retest reliability over a 1-year period ($r = .73$). Questions pertaining to values and emotions were derived from literature and added to the questionnaire. The 35-item questionnaire intended to measure middle managers as respondent's

subjective feelings of loneliness as well as feelings of social isolation during the COVID-19 lockdown period.

Given the organisational setting, the questions on values related to self-direction, stimulation, pleasure, achievement and security. Emotion/affect questions related to distress, interest, enjoyment, surprise, anger, fear and shame. Pleasure, joy and enjoyment were combined as an enjoyment value-emotion. Similarly, fear and anxiety were grouped together with safety and security as a survival value-emotion.

3.3. Data analysis

An excel spreadsheet was designed for 20 questionnaire responses. Responses were checked for completeness. Codes were used to ensure the anonymous capturing of the data. Data were captured into the excel spreadsheet from where statistical analysis could be done. Firstly, data were cleaned ensuring quality data. Respondents could choose four responses namely, often, sometimes, rarely and never. Control answers were checked to ensure that they fell in the same range or that there was at worst, one scale difference, e.g., if sometimes were chosen, the control answer could be often or rarely, but not never. Data from all 20 respondents were usable. Mean values were determined, as well as Pearson correlations coefficients and Fischer's Exact Test to determine significant association (or not) between variables. Fisher exact test is a nonparametric test for categorical data but can be used in situations in which the chi-square test cannot, such as with small sample sizes (Winters, Winters & Amedee, 2010), such as in this study.

4. Results and Findings

4.1. Respondents and Job Grading

Table 3 indicates the number of respondents with their job grading category.

Table 3: Respondents and job grading category

Respondents	Grading category
1, 2, 3, 4, 5, 6, 7, 8, 9,10,11	C 3 - 5
12, 13, 14, 15, 16, 17, 18, 19, 20	C 1 - 2

4.2. Coding system

Table 4 indicates the data coding used to identify data under the three constructs of Loneliness, Basic Values and Emotions.

Table 4: Data Coding system

Code	Description	Questions	Control questions
LO	Loneliness	2,4,6,7,8,9,12	5,11,14
	Basis values		
SD	Self-Direction	15,26	
ST	Stimulation	16	21
AC	Achievement	17	27
SS	Safety/Security	18,28,34	1,13
	Emotions		
DS	Distress	19,29	
PJ	Pleasure/Joy	20,31	3
IN	Interest	22,30	10
SU	Surprise	23,32	
AN	Anger	24,33	
HU	Humiliation	25,35	

4.3. Statistical Analysis and Results

Results will be shown with brief interpretations and will be discussed in the findings section.

Table 5: Mean values

Variable	Mean	Std. Error	[95% Interval]	Conf.	
LONELINESS	1.81	.114	1.57 2.05		
Self-direction	0.73	.099	0.52 0.93		VALUES
Stimulation	1.55	.153	1.22 1.87		
Achievement	1.65	.131	1.38 1.92		
Safety/Security	1.75	.128	1.48 2.02		
Distress	1.5	.126	1.24 1.76		EMOTIONS
Pleasure	1.83	.116	1.58 2.07		
Interest	1.7	.111	1.47 1.93		
Surprise	1.55	.114	1.31 1.79		
Anger	1.5	.115	1.25 1.74		
Humiliation	1.3	.105	1.08 1.52		

The results in table 6 clearly shows that loneliness was experienced by managers and what pushed them to pursue under difficult circumstances were the values of achievement and stimulation at work provided that safety and security could be upheld. The emotion felt pleasure can be linked to achievement and finding a way to stimulate positive emotions of surprise.

Table 6, next page, shows the estimated Pearson correlations coefficients between the variables. The results in Table 6 indicate that:

- Self-direction shows a *strong positive correlated* with stimulation and interest
- Stimulation shows a *weak positive correlated* with interest
- Achievement *correlates* with surprise and humiliation. It is positively correlated with surprise but negatively correlated with humiliation.
- Achievement shows a *weak negative correlated* with anger
- Distress shows a *positive correlated* with interest
- Pleasure shows a *weak negative correlated* with anger

These results are in line with how values and emotions influence each other in general. If managers give direction during stressful situations emotions can be more positive by leading to achievement. This will be discussed in the findings section

Table 6: Pearson Correlations

Variable	Loneliness	Values				Emotions						
		Self-direction	Stimulation	Achievement	Safety/ Security	Distress	Pleasure	Interest	Surprise	Anger	Humiliation	
Loneliness	1											
Values	-0.179	1										
Self-direction	0.450 20											
Stimulation	-0.010 0.966 20	0.664*** 0.001 20	1									
Achievement	-0.373 0.105 20	0.252 0.285 20	0.066 0.783 20	1								
Safety/ Security	0.066 0.783 20	0.023 0.924 20	0.285 0.223 20	0.286 0.222 20	1							
Emotions	0.287	0.171	-0.123	0.356	0.134	1						
Distress	0.220 20	0.471 20	0.605 20	0.123 20	0.574 20							
Pleasure	-0.123 0.605 20	-0.043 0.858 20	-0.328 0.158 20	0.356 0.123 20	-0.089 0.709 20	0.167 0.483 20	1					
Interest	0.212 0.369 20	0.601*** 0.005 20	0.414* 0.070 20	0.154 0.518 20	-0.066 0.783 20	0.533** 0.015 20	0.123 0.605 20	1				
Surprise	-0.212 0.369 20	-0.179 0.450 20	-0.212 0.369 20	0.504** 0.023 20	0.285 0.223 20	-0.287 0.220 20	0.082 0.731 20	-0.192 0.418 20	1			
Anger	0.302 0.196 20	-0.315 0.177 20	0.101 0.673 20	-0.436* 0.054 20	0.218 0.355 20	0.000 1.000 20	-0.408* 0.074 20	-0.101 0.673 20	0.101 0.673 20	1		
Humiliation	0.373 0.105 20	0.206 0.384 20	0.373 0.105 20	-0.524** 0.018 20	0.191 0.421 20	-0.134 0.574 20	-0.356 0.123 20	0.066 0.783 20	-0.285 0.223 20	0.218 0.355 20	1	

Note: 1. * means that the association between the variables is significant at the 10% level ** means that the association between the variables is significant at the 5% level

*** means that the association between the variables is significant at the 1% level.

Note: 2. The 1st figure indicates the Pearson correlation coefficients, the 2nd figure the probabilities and the 3rd figure the number of observations

4.4. Fisher's test

Fisher's Exact Test was used in this study to determine whether there is a significant association between two categorical variables or not. It is typically used as an alternative to the Chi-Square Test of Independence when one or more of the cell counts in a 2×2 table is less than 5. The following results in Table 7 were obtained.

Table 7: Fisher's test results

Raw Variable1	Column Variable2	Fisher's exact	Prob.	Significant/ Not significant	
Loneliness	Values				
	Self-direction	0.642	0.370		
	Stimulation	1.000	0.658		
	Achievement	0.157	0.119		
	Safety/Security	1.000	0.574		
	Emotions				
	Distress	0.362	0.205		
	Pleasure	0.670	0.465		
	Interest	0.406	0.311		
	Surprise	0.406	0.311		
Anger	0.370	0.185			
Humiliation	0.157	0.119			
Value Self-direction	Value				
	Stimulation	0.005***	0.004	Highly Significant	
	Achievement	0.354	0.277		
	Safety/Security	1.000	0.664		
	Emotion				
	Distress	0.642	0.392		
	Pleasure	1.000	0.608		
	Interest	0.017**	0.012	Significant	
	Surprise	0.642	0.370		
	Anger	0.350	0.175		
Humiliation	0.613	0.336			
Stimulation	Achievement	1.000	0.574		
	Safety/Security	0.336	0.217		
	Distress	0.670	0.465		
	Pleasure	0.197	0.157		
	Interest	0.092*	0.080	Weakly significant	
	Surprise	0.406	0.311		
	Anger	1.000	0.500		
	Humiliation	0.157	0.119		
	Achievement	Safety/Security	0.303	0.225	
		Distress	0.161	0.137	
Pleasure		0.161	0.137		
Interest		0.642	0.426		
Surprise		0.050**	0.038	Significant	
Anger		0.141*	0.070	Weakly significant	
Humiliation	0.037**	0.037	Significant		
Safety/Security	Distress	0.642	0.455		
	Pleasure	1.000	0.545		
	Interest	1.000	0.574		
	Surprise	0.336	0.217		
	Anger	0.628	0.314		
	Humiliation	0.613	0.387		
Distress	Pleasure	0.648	0.388		
	Interest	0.028**	0.025	Significant	
	Surprise	0.362	0.205		
	Anger	1.000	0.675		
Humiliation	0.642	0.455			

Pleasure	Interest	0.670	0.465	
	Surprise	1.000	0.535	
	Anger	0.170*	0.085	Weakly significant
	Humiliation	0.161	0.137	
Interest	Surprise	0.653	0.342	
	Anger	1.000	0.500	
	Humiliation	1.000	0.574	
Surprise	Anger	1.000	0.500	
	Humiliation	0.336	0.217	
Anger	Humiliation	0.628	0.314	

Note: * means that the association between the variables is significant at the 10% level
 ** means that the association between the variables is significant at the 5% level
 *** means that the association between the variables is significant at the 1% level

The following associations were identified applying the Fisher's test:

- Self-direction and stimulation (highly significant association)
- Self-direction and interest (significant)
- Stimulation and interest (weak)
- Achievement and Surprise (significant)
- Achievement and Anger (weak)
- Achievement and Humiliation (Significant)
- Distress and interest(significant)
- Pleasure and anger (weak)

4.5. Discussion of Results and Findings

The authors expected loneliness to be more important as it was viewed as a major construct of social isolation in the literature. Waytz et al., (2015) found people at the bottom of the organisation reported greater loneliness. This could relate to the data as the selected group consisted of mid-level managers who continued to work on-site throughout all the COVID-19 lockdown levels. Waytz et al., (2015) also suggested loneliness to be affected by powerlessness. Again, it seems that the ability by mid-level employees to self-direct, mitigates powerlessness and in turn loneliness. Contrary to earlier beliefs stating that emotions in the workplace is irrational and has no place (Fischer, 2019), the results indicated that emotions in the workplace matters deeply, that emotions are experienced and that emotions may inhibit performance, relationships and productivity.

The results indicated the motion or lack thereof because of experienced emotions. Therefore, the authors refer to e-motion as the energy (e) which allows people into motion (or not). E-motion is then affected by the somatic society or organisation within which people find themselves, by distance or feelings of isolation and by values that are important to them (Bonetto et al., 2021).

The e-motions of self-direction, stimulation, interest, achievement, surprise, humiliation, anger, distress and pleasure stood out in the results. These e-motions include values as an e-motion. This will be discussed in the following section.

4.5.1. Values as an e-motion

E-motion ~ Values: Values explain what people hold important. If our social connections are troubled or non-existing, our social bonds and our feeling accepted by others suffer. Common values ensure that people understand each other. If our social connections suffer, so do our common understanding of each other. Self-direction and pleasure/joy were the two values with the highest correlation to loneliness. These values are described under openness to change (Schwartz, 2012) which aims towards anxiety-free values, the promotion of gain goals, self-expansion and growth.

E-motion ~ Self-Direction: This e-motion relates to the ability to explore new ways of working and making independent decisions and feeling that my opinion counts. Self-direction mitigates feelings of loneliness, even if only as a perception of being in control of my work situation. Positive self-

direction creates openness to change, which in turn creates the ability to learn, master and engage in new ways of working.

E-motion ~ Stimulation: Through stimulation employees are engaged in thought, problem identification and creative solutions. Stimulation allows the utilisation of personal skills, making an employee feel useful, valuable and excited about the task at hand.

E-motion ~ Interest: This e-motion relates to feelings of excitement, pleasure and enthusiasm towards new tasks. When people can work with something that interests them, work seems easy, time flies and people often experience enjoyment.

E-motion ~ Achievement: Achievement is tied to one's ability to achieve set goals. This e-motion is directly tied to an outcome. Humiliation, anger and distress could be classed as negative achievement emotions, tied into the failure to achieve goals or even just the anticipation that one will fail to achieve them.

4.5.2. Basic human emotion as e- motion

E-motion ~ Surprise: Surprise is a basic human e-motion (Eckman, 2003; Tomkins, 1962) indicated surprise as a brief, yet basic human emotion following something unexpected. The moment after the startle response will determine whether the emotions that follow will be positive, negative or neutral.

E-motion ~ Humiliation: This e-motion relates to being shamed and/or humiliated at work, causing the person to make him/herself smaller and even invisible. If employees purposefully hide, it seems fair to assume that productivity, communication, and interactions will suffer. This confirms Argyris (1982 in Edmonson, 1999), who stated that people tend to act in a way that inhibit learning when they face potential threat.

E-motion ~ Anger: Anger is an intense e-motional state which involves strong responses to a perceived provocation, hurt or threat. Anger is often displayed through non-cooperation but often relates to something the employee deeply cares about.

E-motion ~ Distress: Distress could be experienced physically, emotionally and/or mentally (Selye, 1974) and is a highly unpleasant emotional reaction (Tomkins, 1962).

E-motion ~ Pleasure: Pleasure is a positive emotion. Schwarz (2012) termed it hedonism and placed this emotion on the cusp between openness to change and self-enhancement. This indicates that pleasure creates a space for expansion, growth, anxiety-free values and the promotion of gain-goals.

4.5.3. Integrating the Theory of Values (Tomkins, 1962) with the Theory of Emotion (Schwartz, 2012)

The most prevalent e-motions mentioned in point 4.4.2. were grouped together according to the theories of Tomkins (1962) and integrated with Schwartz's (2012) values. This is displayed in Table 8 below. The researchers suggest that loneliness is an affect or e-motion, signaling isolation due to a lack of physical, interest, value and/or emotional connections, thus resulting in stagnation or a lack of movement. However, self-direction and/or interest are powerful mitigators of loneliness.

Table 8: Prevalent e-motions

Affect/E-motion	Signal	Focus	Survival pattern: *F/F/F/F
Self-Direction	Mastery	Openness to Change	None
Stimulation	Mastery	Openness to Change	None
Interest	Learning	Openness to Change	None
Achievement	Power	Self enhancement	*Fight (F)
Surprise	Pay attention	Stop, and do something else	*Freeze (F)
Humiliation	Self-protection	Hide yourself	*Freeze (F), Fawn (F)
Anger	Fix it	Persistent overload	*Fight
Distress	Help	Excessive stimulation	*Flight
Pleasure	Social bond	Openness to Change & Self enhancement	None

Further, the focus column was added to table 9 to indicate the primary purpose for the e-motion. The survival pattern column was used to relate these e-motions back to fight, flight, freeze and/or fawn survival responses. It then becomes clear that distress, anger, humiliation, achievement and possibly surprise are primary e-motions to ensure safety. A re-visualization of the value theory of Tomkins (1962), Schwartz (2012) and Maslow (1943), resulted in Figure 3 below.

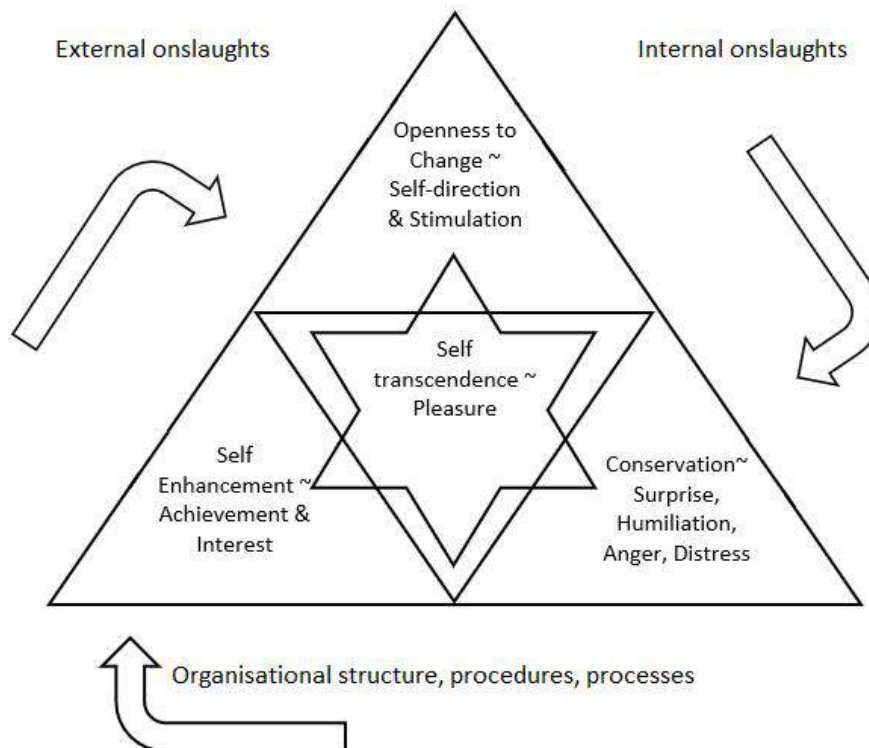

Figure 3: Triangle of emotions (Authors' own)

Figure 3 indicates pleasure at the center. When employees experience pleasure, openness to change, learning and self-enhancement is possible, diminishing conservation e-motions. Pleasure seems to be the doorway to improved balance. An employee experiencing conservation e-motions, are not experiencing pleasure and will therefore find it difficult to engage with interest, achievement, self-direction and stimulation. Similarly, when experiencing self-enhancement e-motions, pleasure opens the doorway to change. Similarly, if e-motions such as anger, surprise, humiliation and/or distress can be utilised towards positive problem solving, reduced isolation and increased psychological safety will follow. This will result in improved effectiveness and efficiency. The pleasure triangle -see

Figure 3, was therefore overlaid with a star shape, to indicate the multitude of possibilities as emotion pleasure is the pivotal piece.

This study indicated that self-direction and pleasure were the two values that suffered most because of loneliness. This implies that values of self-enhancement and self-transcendence cannot be attained, and social focus remains secondary to personal focus. This becomes a double bind; a person's loneliness prohibits his/her ability to explore social connections. Reminding ourselves that loneliness and social isolation was already described as a behavioral epidemic (Jeste, Lee & Cacioppo, 2020), confirms a severe threat to our being human (Hagerty & Williams, 2020).

Further, given our inability to move circularly towards self-enhancement and self-transcendence, conservation becomes unreachable too. Security, the stability of society, relationships and of self becomes impossible. Conformity becomes impossible, resulting in disruption and undermining of smooth interaction and group functioning. Even the display of basic good manners, politeness and self-discipline becomes unattainable. Organisational norms, expectations and demands will most likely no longer be respected, and group goals will in all likelihood become subordinate to the self.

The findings show that managers/employees are increasingly functioning in survival modes. They seem to experience increased feelings of loneliness and/or lack of social, mental, and/or emotional support. Teamwork and the synergy experienced by highly functioning teams are lacking. Teams are not only struggling, but they also hardly exist due to isolation.

Emotions that were commonly experienced during daily routines and interactions, such as anger, humiliation and distress are bound to result in irrational behaviour. A lack of physical closeness (through 'knowing a colleague is there to support me') could be exacerbated by a lack of emotional and/or mental support. Increased distress results in feeling disconnected from one's peers and place of work. If not addressed adequately alienation and loneliness seems inevitable. "Social distancing" could have been termed "physical distancing", with the resultant communication, safe interaction and continued teamwork. Mass social distancing has been forced upon people with control measures and punishment. If not acknowledged, these altered working ways, continued models of work-from-home and social distancing, decreased social contact, increased feelings of anger and distress will likely increase feelings of disconnect and loneliness. All of which are severing workplaces and affects the future of work and community.

5. Conclusion

This first part of the conclusion will be on answering the research questions posed

- a) What are the altered human dynamics experienced by middle managers in an operational food production plant during the Covid pandemic? This question was answered in the results and findings section on Loneliness, Values and E-motions. This paper researched three constructs relating to altered human dynamics as impacted by social distancing and isolation, namely: loneliness, values, and emotions. The authors postulated that social distancing leads to social isolation. Loneliness in the workplace is therefore assumed to be an outcome of social isolation. However, it rather seems that a lack of self-direction is a predictor of isolation and/or loneliness. When an employee feels disconnected, unsupported, insufficiently connected with others and organisational belongingness, then isolation (as a reduction in life satisfaction) will be experienced.
- b) How did middle managers adapt to the altered human dynamics to effectively optimise operational performance? Humans need to belong. When external influences and/or powers seem out of control, the individual needs to take back personal control. Where this is possible, through self-direction, stimulation and interest, (psychological) safety can be achieved because of the pleasure experienced. Where self-direction is not possible, feelings of isolation will increase.

Where employees are permitted to express negative emotions (such as anger, distress, surprise) towards problem solving, isolation can be averted. Fear of expression will likely result in increased feelings of isolation and loneliness.

This study shows how human dynamics are altered during social isolation and distancing with definitive managerial implications in the workplace. The results and findings clearly indicate the importance and conduct of management in turbulent times by providing psychological safety (to ensure optimal learning and change); the repair of social connections in the workplace (to mitigate loneliness); support enabling shared values (to ensure a unified effort and purpose); and pleasure in what they do (to mitigate emotions of anger, aggression and fear). Managerial implications are discussed in the next section to offer practical solutions to re-establish (psychological) safety, social connection, shared values, and improved teamwork to ensure our basic human needs are met while at work.

6. Managerial Implications

It seems important to firstly recognise that workplaces have changed dramatically as a result of the COVID pandemic. Workplaces are no longer rational domains - uncertainty, variability, imperfect and incomplete knowledge, chaos, volatility, disorder, time, the unknown, randomness, stressors, error, dispersion of outcomes, chance, entropy, turmoil and unknowledge are daily occurrences and woven into the modern organisation. The frequency of which disturbs and will continue to disturb the organisational intent.

These changes create the need for managers to operate from within a new paradigm. Key drivers in this new paradigm seems to be flexibility, adaptability, focus on attention, quick changes, teams build around end-to-end accountability and leadership which enables action. As Taleb (2008) rightly concludes: The fragile is easily destroyed and liable to break, while the static finds it difficult to change and/or move. Fragile does not like volatility while agile organisations are able to move quickly and seems, on the surface, not to be perturbed by volatility. This could be described as flexibility or adaptability. However, managers should note that above the surface flexibility and adaptability, volatility could hide below the surface. Sadly, current the key drivers include anger, surprise, humiliation and distress; all of which are fragile and liable to break while finding it increasingly difficult to change and/or move.

One way of moving into such a new paradigm is for organisational leaders and managers to maintain stability, structure and routine in areas that can be controlled. In times of workplace change and amid crisis (e.g., COVID-19), few elements can be under total control. However, support in the form of open communication, conveying the rationale for control vs flexibility and the empowerment of workplace decisions are critical in enhancing psychological safety. Through fair and just application, the foundation of structure, processes and procedures can be a solid springboard (figure 5) for change and self-enhancement and interest.

Ironically, psychological safety is required for optimal learning (Hökkä, et al., 2020). If employees do not feel safe (as our data confirmed), they are unable to learn their way around a new paradigm. Humans are all born with an innate sense of survival, triggers which focus our attention and motivates us to act (Tomkins, 1962). If anger, surprise, humiliation, and distress are primary triggers, organisational learning will be constrained.

Creating a safe workplace must be a priority on every manager's agenda. Without safe workplaces, learning, changing and being productive becomes very difficult. Safe workplaces can be built through teamwork, shared beliefs and values, shared support and ensuring safety when interpersonal risks are taken and to allow employees to make mistakes to learn and discover new and improved ways of working.

The findings suggest important values to cultivate as "new normal" are self-expansion, personal orientation, inner directedness, and competence. If these values are cultivated through altered

workways, employees could experience pleasure at work, which in turn will enhance psychological safety, participation, productivity, and teamwork.

Within the culture of each organisational body, managers should ask themselves how they can assist the repair of social connections in the workplace. Creating structure and routine where possible, supporting strong teamwork, allowing the re-creation of identity in the workplace, re-creating psychologically and physically safe settings for socialising and re-establishing of social bonds and rebuilding loyalty and participation are possible solutions. It seems imperative that above and beyond profit, organisations must create, cultivate, and establish cultures rooted in trust and respect, importance of people and shared values.

It seems that a re-evaluation of emotional display in the organisation is called for. The management of emotions requires effort. If the display of emotions is acceptable or if acceptable outlets for emotions are available, then more energy will be available to be productive as opposed to suppressing emotions. It could be questioned whether low uncertainty avoidance could lead to a struggle as a result of too much non-structuredness, resulting in further emotional turmoil.

If emotions continue to be suppressed, anger is inevitable. If anger is not expressed, aggression and fear will follow. If harnessed correctly, anger can be utilised through a high energy display. If not, anger will become counterproductive, and even toxic.

Many organisations did not survive. Workplaces are of the few institutions that continue to live and will hopefully thrive again – these societies must become more aware and sensitive to fundamental human needs. Organisations will have to rethink the social agenda – feeling sufficiently connected to colleagues, positive mental and emotional contact.

The organisational body does not and cannot live in isolation, as a head cannot function without a heart. The organisational body that has been ripped apart through social distancing must be repaired, sewed together through debriefing, increased physical, emotional and mental closeness and support. Forums to tell the stories, shares the heartache and rebuild emotional bonds could provide one avenue towards repair. Formal debriefing another.

Kluckhohn (1954) states that social life is impossible without values; the functioning of social systems could not continue to achieve group goals, individuals could not get what they want and need from other individuals, nor could they internally establish a measure of order and unified purpose. If our values are not acknowledged, life becomes difficult and even impossible. Organisational culture impact values, as does survival needs. Common values can bridge the divide between survival and cultural needs. Our data indicated that moral and competence values have reduced, possibly because of Covid-19. Further, that personal values increased, possibly due to increased self-centeredness because of survival needs, while social values decreased. Managers therefore need to re-establish shared values, linked to goals and required actions. These values should transcend personal situations and serve as standards or criteria.

Within organisations people must ensure that humans openly share that which is important to them (their values), then the process of re-establishing can begin to socially bond in a safe context. Optimal learning, productivity and efficiency can then follow from a place of pleasure and safety. Sustainable productivity and efficiency will follow when employees know that they operate from a place of pleasure and safety.

7. Limitations and Future Research

The authors acknowledge the small sample size. However, the sample constituted relevant positional categories at the organisation under study.

Future research could expand the depth of the data through in-depth interviews and/or focus group sessions across all job levels and categories. A qualitative study on the outcomes of this study can add

much value and richness of experiences on the topic. More advanced quantitative research can be done with more respondent to validate the data instrument used.

Future research could investigate psychological safety which came out as a finding but was not specifically researched in this study.

Acknowledgments

Thank you to Professor P Serumaga-Zake for his inputs and contribution towards the statistical correctness of the data.

Sustainability Of The Student Housing Market During and Post The Covid-19 Pandemic – A Case Of South Africa

Dr M Nhlabathi^{1,*}

¹ Marketing Management, University of Johannesburg, Johannesburg, South Africa

Keywords

student accommodation, student housing, Covid-19, South African, sustainability.

Abstract

The coronavirus (Covid-19) has destabilised numerous sectors globally since it was discovered in Wuhan City, in China. The real estate sector, particularly the student housing market, was also affected as teaching and learning was either paused or moved to online platforms. This led to student housing facilities being vacant, as student studied from their homes. This study used five independent constructs (housing facilities, health protocols, socialization & additional benefits) to determine their impact on student's behavioural intention to return to or stay in student housing.

The study made use of an online survey to gather 310 usable responses from students in South Africa. A 5-point Likert measurement scale was used. Multiple regression analysis was then conducted to test the study hypotheses.

Findings showed that housing facilities and health protocols had positive and significant influence on behavioural intention, while the socializing and additional benefits constructs showed otherwise. Explanation on the differences was provided in the discussion section.

The study investigated the impact of Covid-19 on student intention to return to student housing, thus influencing the performance of the student housing market. The results showed that students would be willing to return to or stay in student housing if safety and health precautions were observed amidst the Covid-19 pandemic.

1. Introduction

The Coronavirus (Covid-19) is an acute respiratory syndrome, initially discovered in Wuhan City, China in 2019 and has since spread globally (Lenzen et al, 2020; Mhlanga & Moloji, 2020). Consequently, numerous challenges emerged, affecting the lives of people and economies globally (Ihm, Zhang et al, 2021). Among these challenges were strict lockdowns which saw people being constrained in their homes with limited mobility.

In South Africa, 26 March 2020 marked the official declaration of the Covid-19 as a state of disaster, resulting in President Ramaphosa announcing an initial national lockdown of twenty-one days (Motal & Menon, 2020). The lockdown destabilised multiple industries or sectors, including higher education and training (i.e., universities in this case), resulting in teaching and learning being paused at some institutions and moved to online platforms at others (Mhlanga & Moloji, 2020).

For university students, residential housing is an integral part of their learning experience, providing them with a temporary comfortable living environment, privacy, proximity to campus, access to university facilities, and so on (Razak et al, 2017; Amole, 2011; Nurdini & Harun 2011). The Covid-19 lockdown compelled students to move out of such housing environments and go back to their homes. This also mandated the teaching and learning to be completely online, for multiple institutions such as University of Johannesburg (UJ), University of the Witwatersrand (Wits), University of Cape Town (UCT), etc (Conrad et al, 2021). As students moved out of student housing, property owners

*Corresponding Author

¹ E-mail address: mthobisin@uj.ac.za

were affected through loss of income, among other things, as some students refused to pay rent for accommodation they did not occupy (Hubble & Bolton, 2021).

As part of providing good learning experience to students, universities are expected to provide students with accommodation, which is considered an essential facility for a healthy learning environment (Ibrahim et al, 2018). From the health perspective, students deserve to be protected against the Covid-19, which is considered a health risk to students (and everyone exposed to it), while living at the student housing facilities (Ibrahim et al., 2018). Among the common health precautions available to student housing to provide against the Covid-19 is continuous sanitization stations, encouraging the use of face masks, observing the social distancing, and avoiding larger groups where possible and necessary (Cubo, 2020). The performance of student housing depends on multiple factors such as student enrolment growth, growth in younger demographic groups (18–24-year-olds), new supply of student housing units, property leasing and marketing strategies, monthly rental, sociability, amenities, size of institution and proximity (Gunn, 2017; Razak et al., 2017).

Extant literature has examined student behavioural intention in relation to student housing amid the Covid-19 pandemic in Europe where findings showed that student intention leaned towards continued stay at their homes during their studies (Barada et al, 2020). Saving from rental and transport expenses were the main reasons influencing students' behavioural intention (Barada et al., 2020). Such studies highlight negative attitude by students towards returning to student housing. There is hardly any, or not at all, evidence of any similar studies can be found in the context of South Africa, which highlights the relevance and significance of the current study for both academic literature and managerial implications.

Extant literature on the living conditions of some students has highlighted the importance of student housing in providing students with better living conditions during their student life (Jain et al, 2020). This is even more so due to the impact of the Covid-19 on the labour market where some people lost their jobs and were relegated to poverty (Jain et al., 2020).

1.1 Research objectives

While extant literature has discussed the impact of Covid-19 on the student housing sector globally, few have investigated the topic from a South African perspective (Lenzen et al, 2020; Cubo, 2020). Among the affected sectors is higher education and training which was relegated into online teaching and learning mode, thus forcing students to study from home (Mhlanga & Moloji, 2020).

While literature on the European student housing market found that students intended to continue studying from home (Mhlanga & Moloji 2020), it remains to be investigated how students in South Africa feel about the matter. The core of the investigation would be the factors affecting students' behavioural intention, amidst the Covid-19 pandemic.

1.1.1 Primary Objectives

This study intends to investigate factors which influence students' intention to return to student housing, during and post the Covid-19 lockdowns.

1.1.2 Secondary Objectives

- To investigate the impact of bedroom facilities on student intention to return to student accommodation during and post Covid-19 lockdown
- To investigate the impact of leisure and study facilities on student intention to return to student accommodation during and post Covid-19 lockdown
- To investigate the impact of health protocols on student intention to return to student accommodation during and post Covid-19 lockdown
- To investigate the impact of socialization on student intention to return to student accommodation during and post Covid-19 lockdown

1.2 Research Questions

- What is the impact of bedroom facilities on student intention to return to student accommodation during and post Covid-19 lockdown?
- What is the impact of leisure and study facilities on student intention to return to student accommodation during and post Covid-19 lockdown?
- What is the impact of health protocols on student intention to return to student accommodation during and post Covid-19 lockdown?
- What is the impact of socialization on student intention to return to student accommodation during and post Covid-19 lockdown?

2. Literature Review

2.1 Background on student accommodation

The concept of student housing dates to 988 A.D. where housing units were provided to students by Arabic universities to serve basic needs of the students such as sleeping, studying and storage of personal items (Popov (2018). Evolution in the sector saw the emergence of housing unit which included bathrooms and kitchen amenities, in England around the year 1441 (Popov, 2018). The importance of student housing across Europe was highlighted in a 2009 interim report (study) as a basic need, contributing towards economic growth, while also offering students an opportunity to choose their tertiary institution without being limited by lack of housing (PUCA & TKK Centre for Urban and Regional Studies, 2009).

Students living in private dwelling (own lodging, sublet, private flat, etc.) in Finland (85%), The Netherlands (83%) and Germany (64%) showed higher satisfaction levels compared to living with parents or relatives and student halls (PUCA & TKK Centre for Urban and Regional Studies, 2009). In Spain, student preferences were almost even between living with facility or relative (87%) and own lodging (86%). In France, the parents or relatives' figure was higher (77%) than the private dwelling (63%). Generally, the 5 top European countries with the highest satisfaction levels of student in student housing were Spain (85%), The Netherlands (77%), Finland (73%), Estonia (68%) and Italy (68%).

In south Africa, the student housing sector has received increasing interest from scholars in the marketing discipline since the early 1990's, fuelled by the increasing enrolment rates and demand exceeding the supply of student housing (Visser & Kisting, 2019). Visser & Kisting (2019) coined the term 'studentification' to describe the movement of university students to residential areas and its impact on cultural, economic, physical, and social change. Globally, there has been a drastic increase in university and college applications where institutions have not been able to cater for all students in terms of on-campus accommodation (Visser & Kisting, 2019).

Extant literature on student housing market in South Africa has shown similar trends to Europe, the United States of America and Australia (Gopal & Van Niekerk, 2019). Similarly, South Africa has seen an increasing demand for student housing compared to current supply (Gopal & Van Niekerk, 2019). Due to recent increases in student enrolment into tertiary institutions, the student housing backlog has increased to 216 000 in 2016 and projected at 400 000 by 2030, according to the Department of Higher Education and Training (DHET) 2016 report (Nhlabathi, 2021; Verhoef, 2020). Tertiary institutions have thus resorted to partnerships with private property organisations to address the challenges (Wilkinson & Jonsson, 2021; Visser & Kisting, 2019). In 2015, student protests over poor living conditions and backlog in student accommodation across South Africa highlighted the importance such facilities towards the performance of students (Nhlabathi, 2021; RDM News Wire, 2015, 21 October; Amole, 2009).

2.2 Covid-19 and student accommodation

The coronavirus disease (Covid-19) has affected countries, industries, and individuals in various sectors since its discovery in 2019 (Zurlo et al, 2020). The Covid-19 lockdown announced in South Africa since the end of March 2020 forced business offering non-essential goods and services (e.g.,

salons, restaurants, bottle stores, etc.), including tertiary institutions, had to mute operations temporarily, thus migrating their teaching and learning from contact to online platforms (Mhlanga & Moloji, 2020; Zurlo et al., 2020; Recio & Colella, 2020). Students experienced various challenges while studying from their homes, including poor concentration, anxiety, financial uncertainty, depression, and stress (Laher et al, 2021). Some universities globally (e.g., University of Glasgow and the University of Manchester) offered refunds to students who vacated their student housing due to the pandemic (Hubble & Bolton, 2021).

Section 2.3. to 2.5 will discuss factors or proposed constructs that affect the students' intention to return to their student accommodation.

2.3 Housing facilities (bedroom and leisure & study room) and behavioural intention

Students' university experience can be positively influenced by the quality of their dwelling conditions (Gopal & Van Niekerk (2019). Students who are happy with their dwelling conditions in a student residence and those who are not happy with their dwelling outside a student accommodation will likely intend to continue and start staying in a student accommodation, respectively (Nhlabathi, 2021). Factors such as location, transportation between campus and the residence, leisure room facilities, safety, and security influence students' choice of their dwelling (Ike et al, 2016). Although the strict Covid-19 lockdowns forced students out of their dwelling (Cairns, 2021), factors such as access to a good living and studying environment, privacy, bigger rooms, comfortable beds, a study desk, wi-fi connection, clean running water, etc., will likely increase student intention to return to or live in a student dwelling when the restrictions become relaxed (Razak et al., 2017). It can also be said that students who have negative perceptions and experience with student accommodation regarding leisure room facilities will be unlikely to intend going back to stay in a student accommodation (Nhlabathi, 2021).

Consequently, students will be satisfied with, and prefer staying in a residence which they believe is well-managed, safe, affordable, and generally concerned with improving their well-being, thus increasing their intention to stay in such a dwelling (Haris et al., 2017).

The above arguments lead to the following hypotheses:

- **H1: Housing** facilities (Bedroom) will positively affect the student's intention to return to student accommodation.
- **H2: Housing** facilities (Leisure and Study Rooms) will positively affect the student's intention to return to student accommodation.

2.4 Health Protocols and behavioural intention

As advised by the World Health Organisation (WHO, 2022) and Department of Higher Education and Training (DHET, 2022), students and all concerned stakeholders (contractors, academic and support staff, visitors, etc.) can protect themselves and others from the Covid-19 by observing seven precautions:

- Getting vaccinated
- Maintaining a distance of at least 1 metre apart
- Proper ventilation
- Wearing of masks
- Regular cleaning of hands with safe water and soap
- Covering coughs and sneezes with a bent elbow
- Staying at home when sick
- Consistent supply and usage of hand sanitisers and disinfectants

If students have positive attitude, beliefs and confident towards the precautions taken by the institutions on the student housing facilities to curb the spread of the Covid-19, their behavioural intention will improve, according to the TPB (Amaro et al, 2019). Students who believe in taking

necessary precautions and feel comfortable are more likely to intent to return to or choose staying in student housing (Ajzen, 1991).

- **H3:** Health protocols will positively affect the student’s intention to return to student accommodation.

2.5 Student socialization and friendships

Extant literature shows that student university experience is not only based on academic performance, but also an opportunity to make new and maintain friendships with other fellow students (socialization) (Ibrahim et al., 2018). This allows the students to experience the new university environment with their peers, especially for students leaving their familiar environments (e.g., home, local school, hometown, etc) for the first time (Robinson et al, 2020). Having a peer to share some personal social issues such as their home living conditions, among others, enhances the behavioural intention to live on campus (Xulu-Gama, 2019). The TPB argues that students with a positive attitude towards socialization, believe that their close allies would condone their socialization and believe that they are able to make friends and socialise while staying at student housing, will more likely intend to live in a student housing (Haris et al., 2017).

- **H4** Socialization will **positively** influence a student’s intention to return to student housing.

2.6 Research model

Figure 1 shows the proposed research model used to show the influence of housing facilities, health protocols, socialization and additional benefits have an influence on student intention to return to their student housing during and beyond the Covid-19 pandemic. This will also try to predict the future performance of the student housing market, based on the student behavioural intentions.

Figure 1: Conceptual model

3. Methods

3.1 Measurement

The process followed in developing the final version of the research instrument are: adapting an existing multi-item measurement scale to measure constructs, using a 5-point Likert scale ranging from 1 ‘strongly disagree’ to 5 ‘strongly agree’. The constructs which made up the measurement instrument were adapted from Amaro, Andreu & Huang (2019) and Nhlabathi (2021). The instrument was reviewed by two senior academics in the marketing field. Subsequently, the instrument was piloted among a sample of 30 respondents who were included through a convenience sampling. The

sample comprised 310 students registered in tertiary institution in South Africa, aged between 18-65 years, who stayed in student housing. Minor corrections were made on the instrument based on the feedback from the pilot study, after which the final data was collected, as suggested by Malhotra (2020).

3.2 Data gathering

A self-administered online survey was used to collect data for the study. The survey was a better option to save time and eliminate any potential errors associated with personal methods (Nayak, 2019). This was also a better option to limit physical contact between fieldworkers and respondents due to the Covid-19 social distancing requirements (Conrad et al., 2021). The data gathered was then exported and analysed on SPSS. A total of three hundred and ten (n=310) valid responses were collected for analysis.

3.3 Data analysis and results

A multiple regression analysis of the data collected was conducted using the Statistical Package for Social Sciences (SPSS) version 28 to determine the influence of the predictor variables (housing facilities – bedroom, housing facilities – leisure and study room, health protocols, socialization) on the outcome variable (behavioural intention). This type of analysis was necessary as there were multiple predictor variables being tested against the outcome variable (Valaskova et al, 2018).

The data analysis approach for this study was regression analysis. When using this method, Cronbach’s alpha values ranges from 0 to 1, with any values above 0.6 being desirable, while some values as low as 0.5 can be acceptable (Malhotra et al., 2020; Cheek, 1986). In instances where the Cronbach’s alpha values are below the ideal 0.6, the mean inter-item correlation becomes the preferred measure for the items, with the acceptable correlation values between 0.2 and 0.4 (Briggs & Cheek, 1986). The extraction and rotation methods were also used for the EFA.

3.3.1 Descriptive statistics

Table 1: The demographic profile of the respondents

Demographic Characteristics	Frequency	Valid Percent
Gender	Male	38%
	Female	54%
	Prefer not to say/Other	8%
Age Group	18-23	55%
	24-29	41%
	30-35	4%
	36-50	0.3%
Employment Status	Student	84%
	Unemployed	4%
	Employed Full-time	4%
	Employed Part-time	7%
	Self-employed	2%

Table 1 shows that descriptive statistics of the demographic formation of the three hundred and ten (n=310) respondents. Of all the respondents, over half were female (54.3%), followed by male (38%) while the remainder (8%) preferred not to disclose the gender identification. In terms of age splits, those who fell within the 18-23 years old category made up 55%, followed by 24-29 (41.3%) while 36+ had the least number (0.3%). In terms of employment status, 84% were students, followed by part-time workers (7%), full-time workers and unemployed had 4% each, while self-employed had 2%.

3.3.2 Reliability testing results

Malhotra (2020) discussed the importance of testing the reliability of scale used in the measurement instrument (i.e., the questionnaire) to ascertain consistency on the outcome from repeated use of the scale. To confirm the scale reliability, the Cronbach's alpha coefficient values are used (Nhlabathi, 2021; Malhotra et al., 2017). Extant literature has shown that Cronbach's alpha values above 0.8 are considered as good; those between 0.6-0.8 as acceptable and those below 0.6 as unacceptable (Wild & Diggines, 2009). Four of the Cronbach's alpha values shown in Table 2 are above the 0.8 threshold, suggesting a good reliability of the measurement scale for the constructs. The remainder of the constructs (Bedroom facilities) had an acceptable Cronbach's alpha value of 0.721. For this study, the Cronbach's alpha values ranged from 0.721 to 0.917, thus confirming construct reliability at varying degrees (Malhotra et al., 2020; Sujati & Gunarhadi, 2020).

Table 2: Cronbach Alpha coefficient of reliability

Constructs	Number of items	Cronbach's alpha
Housing Facilities (Bedroom)	6	0.721
Housing Facilities (Leisure & Study Room)	8	0.840
Socialization	7	0.880
Health Protocols	7	0.872
Behavioural Intention	6	0.917

3.3.3 Multiple Regression (Model testing)

Regression analysis refers to a flexible technique used in the analysis of associative relationships between one or more independent variables (factors) and a dependent variable (outcome) (Malhotra, 2020). Bivariate (linear) and multiple regression are the two forms of this analysis (Malhotra, et al., 2017). The former (bivariate) looks at the relationship between one independent and one dependent variables, while the latter (multiple regression) looks at multiple predictor variables leading to an outcome (Malhotra, 2020). For this study, the multiple regression technique was utilised as the conceptual model has four independent variables predicting one outcome variable.

When conducting a multiple regression analysis, the threshold for the p value is 0.05, where constructs with values above the threshold lead to the rejection of the hypothesised relationship (Malhotra, 2020). Table 3 shows multiple regression analysis results which can be summarised as follows: housing facilities (bedroom) ($\beta = 0.024$), housing facilities (leisure and study room) ($\beta = 0.249$), health protocols ($\beta = -0.163$) and socialization ($\beta = 0.050$). The results show that all constructs except, health protocols, have positive influence on the intention to return or stay in a student accommodation.

Based on the above analysis, the Housing Facilities (Bedroom Facilities) construct showed positive but insignificant influence on intention to return to or stay at a student housing ($\beta = 0.024$; $p \geq 0.05$), thus rejecting H1. The Housing Facilities (Leisure and Study Facilities) construct was positive and significant ($\beta = 0.249$; $p \leq 0.05$), thus confirming H2. Health Protocols ($\beta = -0.163$; $p = 0.012$) showed a significant influence but in an opposite direction, suggesting that for every 1-unit increase in the predictor variable, there will be an equal but opposite move, thus confirming H3 based on the significance value. Socialization also showed a moderately positive but insignificant influence towards students' intention to return or stay at a student housing ($\beta = 0.05$; $p \geq 0.05$), thus rejecting H4.

Table 3: Multiple Regression Analysis

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	2.537	.475		5.338	<,001
	Health Prot	-.238	.094	-.163	-2.535	.012
	Bed Fac	.039	.096	.024	.407	.684
	Leisure StuFac	.358	.097	.249	3.698	<,001
	Socialisation	.065	.083	.050	.786	.433

a. Dependent Variable: Behavioural Int

*p<0.05; **p<0.01; ***p<0.001, ^{ns} Not significant (p>0.05)

Hypotheses	Test Results
H1: Housing facilities (Bedroom) will positively affect the student’s intention to return to student accommodation.	Not supported
H2: Housing facilities (Leisure and Study Rooms) will positively affect the student’s intention to return to student accommodation.	Supported
H3: Health protocols will positively affect the student’s intention to return to student accommodation.	Supported
H4: Socialization will positively influence a student’s intention to return to student housing.	Not Supported

4. Discussion, Implications, Limitations and Recommendations

4.1 Discussion and implications of the study

This study sought to investigate the impact of the COVID-19 pandemic on the performance of the student housing market in South Africa. Section 4 discussed the methods used for data gathering and analysis, while also presenting the results of the analyses.

Based on the results, the housing facilities (bedroom) construct showed positive but insignificant influence on students’ behavioural intention towards returning or staying at a student housing during or post the Covid-19 pandemic. These findings were supported by a Haris et al. (2017) study which found a positive relationship between housing facilities (bed, study desk, electricity, running water) and students’ behaviour intention. Haris et al. (2017) study was based on the theory of reasoned action (TRA). (Simpeh & Adisa, 2021; Razak et al., 2017).

Findings on health protocols indicated that this construct is important in determining student intention to return to student accommodation, based on its significance level value (p<0.05). Thus, students would be willing to stay in student housing provided that such facilities follow the mandated covid-19 protocols, as advised by WHO (2022) and DHET (2022), as discussed in section 2.4. The respondents indicated that they intended staying at student housing provided that all necessary protocols are observed.

Findings on socialization disputed findings from extant literature which stated that socialisation was important in student decision between staying in a student housing or not (Robinson et al, 2020; Xulu-Gama, 2019; Ibrahim et al., 2018). For the current study, socialisation showed some positive but insignificant influence on the student’s intention to stay in student housing. This suggests that as much as socialization is important to students during their academic tenure at university, their perceived academic performance does not depend on socialization with fellow students, as previously argued in extant literature (Robinson et al, 2020; Xulu-Gama, 2019; Ibrahim et al., 2018). Thus, this attribute is not important when deciding on finding a place to stay for students. Since the survey was conducted during the covid-19 pandemic, it could be that students do not want to mix and socialise with their peers due to fear of contracting covid-19.

The findings on the housing facilities (leisure and study rooms) suggested that students value the presence and accessibility of study and leisure rooms provided by their student housing. This could be

because the Covid-19 pandemic constrained students in their homes, which may have not had the desired leisure and study spaces for students (Razak et al., 2017).

4.2 Implications for theory and managers

The implications of this study dwell around the importance of understanding the various aspects of the covid-19 pandemic in relation to the student housing market. From the findings, student housing factors such as housing facilities (leisure and study room facilities) and socialization showed positive influence on student intended behaviour. This is also important because the context of the study was the Covid-19 pandemic, expanding the use of these factors in a relatively new environment.

For student housing owners, managers and tertiary institutions, it is important who need to promote these two factors, while also working on strategies to address student uncertainties brought by Covid-19. This could be done by reassuring students that the accommodation is still safe and suitable for their well-being, physically, mentally, socially, health wise, and so on. The Covid-19 protocols should also be adhered to as closely as possible (WHO, 2022; DHET, 2022).

4.3 Limitations and recommendations for further studies

As the study was done during the Covid-19 pandemic, there were limitations on the data collection methods available, hence the use of the online self-administered survey method. The study was also limited to respondents with access to the internet and any device with access to the internet. Sampling was done through convenience method, thus including only those respondents who volunteered to participate in the study. Another limitation was that the study was limited to students within the Gauteng province as that was part of the screening questions.

Future studies can build on the limitations of the current study by looking at students from other provinces, using different methods for data collection, investigating other factors which influence students' behavioural intention towards student housing. A comparative study could also help understand the relevance of health protocols and housing facilities (bedroom facilities) factors prior and post Covid-19 to determine the impact of the pandemic on student preferences and choices prior, during and post the pandemic. Further comparative studies can be conducted between students who stayed in university-owned and non-university owned student housing.

5. Conclusion

This study investigated factors that will influence the sustainability of the student housing market in South Africa based on the impact of the Covid-19 global pandemic. The approach was to look at factors that affect student intention to return to such student housing, which ultimately will influence the performance of the sector. Four factors (bedroom facilities, leisure & study facilities, health protocols and socialisation) were investigated, resulting in four hypotheses. Two constructs (Health protocols and Leisure & Study Room facilities) showed positive but varying influence while the other two (Bedroom Facilities and Socialization) shown no significance in influencing student intention towards returning or staying at a student accommodation.

Abstract

Purpose: This paper reflects on the perspectives of the facilitators of the Enterprising Women Programme at the North-West University, South Africa when pivoting its female entrepreneurship development programme from a face-to-face to digital modality during the Covid-19 pandemic. The challenges and lessons learnt when offering the programme in its revised modality, whilst continuing to offer deep value and completing the programme successfully, are considered.

Methodology: Engelström's Third Generation Activity System and the five principles of activity theory were applied to analyse the facilitators' experiences and present the findings.

Findings: The researchers (EWP facilitators) reflected on the transition from face-to-face to online by (i) critically looking at each of the two systems (face-to-face and digitised modalities), and (ii) analysing their reflections using the five principles of activity theory (Engelström, 2001). Whilst numerous challenges were experienced, the enablers were sufficient to complete the programme.

Implications: The analysis identified lessons learnt, which not only provides valuable insight into enhancing the digital modality of the Enterprising Women Programme but could also be utilised by other facilitators when designing online learning programmes. The analysis offers valuable insight into the unique South African context of female entrepreneurs.

Originality: The study contributes to the body of knowledge by providing insights into the challenges and enablers when designing digitised learning programmes and is specifically enlightening in the context of South Africa.

1. Introduction

South Africa faces unique economic challenges as a result of its high unemployment rate and low economic growth, with the national unemployment rate pegged at 24.69% in 2010 and 28.18% in 2019 (StatisticsSA, 2020, p. 8). Entrepreneurship has become a topic of interest for role players campaigning for increased and sustained economic development and growth, particularly in developing countries where poverty and high unemployment rates are rife, but also in developed economies where entrepreneurship is considered to be a driver for accelerated economic growth (Ambrish, 2014, p. 226; Phillips et al., 2014, p. 86). As such, entrepreneurship and entrepreneurial

education have become a particular topic of interest in the last ten years, particularly as a mechanism for alleviating unemployment (Bullough et al., 2015, p. 250).

To contribute toward the economic growth and employability in South Africa, the North-West University (NWU) established an enterprise development centre - The Bridging Business and Education Hub of Innovative Ventures and Expertise, known as the bhive Enterprise Development Centre (bhive EDC) — in 2011 at its Vanderbijlpark Campus, with financial support from the Netherlands Organisation for Internationalisation in Education (NUFFIC) via the Netherlands Initiative for Capacity Development in Higher Education (NICHE). The bhive EDC has made it its mission to develop entrepreneurial propensity and capacity amongst its three focus areas, namely students, females and the local community within the NWU's catchment areas, with a specific niche focus on start-up and early-stage female entrepreneurs.

Consequently, the Enterprising Women Programme (EWP) was initiated in 2013 to provide business support services to women who want to start their businesses. The EWP is a six-month programme, geared toward providing business support services to women who wish to establish a business. Participants are taken through an in-depth programme to explore ideas, develop a business model and put the wheels in motion to initiate the business. Programme participants become part of a peer network of women embarking on an entrepreneurial journey, where they can share experiences and learn from one another and other successful female entrepreneurs by being exposed to structured learning through workshops and group-centred learning. Given the success of its pilot round, the EWP was accredited as an NWU Short Learning Programme (SLP) in 2014, with the programme hosted across the NWU's catchment areas surrounding its three campuses in Vanderbijlpark, Mahikeng and Potchefstroom.

Over the years, interactions with the participating female entrepreneurs revealed that they face distinct challenges, including inequality in terms of how they are viewed and treated when running their businesses. In addition, they have a specific need for, amongst other things, entrepreneurial training and financial support. This correlates with scholars' findings that female entrepreneurs experience unique hindrances, limitations and struggles (Meyer & Landsberg, 2015, p. 3868), especially with establishing and sustaining a business (Botha et al., 2007, pp. 163-164). South Africa's history of racial- and gender inequality, coupled with the unequal distribution of resources between different groups, as well as the difference in the female to male entrepreneurial ratio, resulted in women — specifically women of colour — having virtually no or very few opportunities to start their businesses (Chinomona & Maziriri, 2015, p. 837; Herrington et al., 2017, pp. 13,90). Furthermore, the Global Entrepreneurship Monitor (GEM) Report demonstrates that female entrepreneurs have a greater need for assistance in developing self-confidence and self-esteem than their male counterparts, whilst it has also been found that the backlog in entrepreneurship development in South Africa could be attributed to insufficient entrepreneurial education (Botha et al., 2007, pp. 163-164; Herrington et al., 2017, pp. 13,90).

As a means to address these challenges, the EWP was structured as a face-to-face modality, incorporating workshops with group- and individual work, with practical application through assignments to validate the market, explore financial feasibility and develop a business model, ready for implementation. Successful participants are awarded an SLP Certificate by the NWU and may be invited to join the bhive EDC's incubation programme to embark on the next business building phase of operationalising the business and developing it to its full commercial potential.

Given that the programme was offered in a largely face-to-face modality, with some web-enhanced functionality through emails and WhatsApp, the advent of the Covid-19 pandemic brought about programme delivery challenges, which required a revised delivery modality. Subsequently, a new delivery model, which incorporates a strong digitised component, was launched in June 2020 to support female small business owners and aspirant entrepreneurs who need support in navigating the current challenging economic conditions.

This paper leverages the Activity Systems Theory as an analytical tool to pinpoint the challenges and lessons learnt in pivoting from a face-to-face to digitised modality, whilst aiming to continue to offer deep value and complete the EWP successfully.

2. Literature Review and theoretical background

2.1. Activity systems theory

The Activity Systems Theory is rooted in the work of Lev Vygotsky’s First Generation Activity Theory, who worked in developmental psychology and was the founder of the Soviet cultural-historical school of psychology, Leont’ev’s Second Generation Activity Theory, which expanded the work of Vygotsky to include human activity systems, and Engelström Third Generation Activity Theory, who adapted Leont’ev’s activity theory by including an activity system analysis (Cole et al., 2006; Higgins, 2003; Kaptelinin, 2006).

Vygotsky believed that humans develop by interacting with others within their environments and then within themselves (Kaptelinin, 2006). He had two fundamental philosophies: “*man is not only the product of his environment, but he is also an active agent in creating the environment and the main social experience determines the structure of human conscious activity*” (Luria, 1979). Vygotsky’s psychological approach included three fundamental aspects, namely cultural, historical and instrumental psychology. The instrumental aspect of his approach refers to the method in which people (in this case, EWP participants) respond and adapt to the stimuli (in this case, face-to-face or online interactive workshops) within their environments, and how their ideas expand as they learn more about entrepreneurship. Cultural aspects refer to the structured way in which society (in this case, the NWU’s bhive EDC) organises tasks to attain objectives (herein, the successful completion of the EWP). The historical aspects link with the cultural aspects and include the instruments (herein the tools utilised in face-to-face and online workshops), which are used by men (in this case, EWP facilitators) to master their environment (Cole et al., 2006; Luria, 1979).

Leont’ev’s Second Generation Activity Theory added the dimension of a human activity system. He argued that the activity of human beings should be goal-directed, adaptable and manifest interaction between the subjects (EWP participants) with its objects (the successful completion of the EWP). Leont’ev believes psychological studies must consist of three connected aspects, namely placing the subjects (EWP participants) in the objective reality and altering this reality in the structure of subjectivity (the transition from face-to-face to online facilitation). The analysis must focus on “conscious and unconscious mental phenomena, and the relationship between mind and activity” (Kaptelinin, 2006).

Engelström adapted Leont’ev’s activity theory by including the activity system analysis, which can accommodate more than one activity system to find solutions to specific research questions (Yamagata-Lynch & Haudenschild, 2009). This model includes the social aspects within the system to explain and comprehend the relationship amongst the elements relating to the study, particularly in research relating to education (Robertson, 2008). Figure 1 illustrates Engelström’s Third Generation Activity Theory, with activity systems, which was used as an analytical tool to pinpoint the challenges and lessons learnt in pivoting from a face-to-face to digitised modality, whilst aiming to continue to offer deep value and completing the EWP successfully.

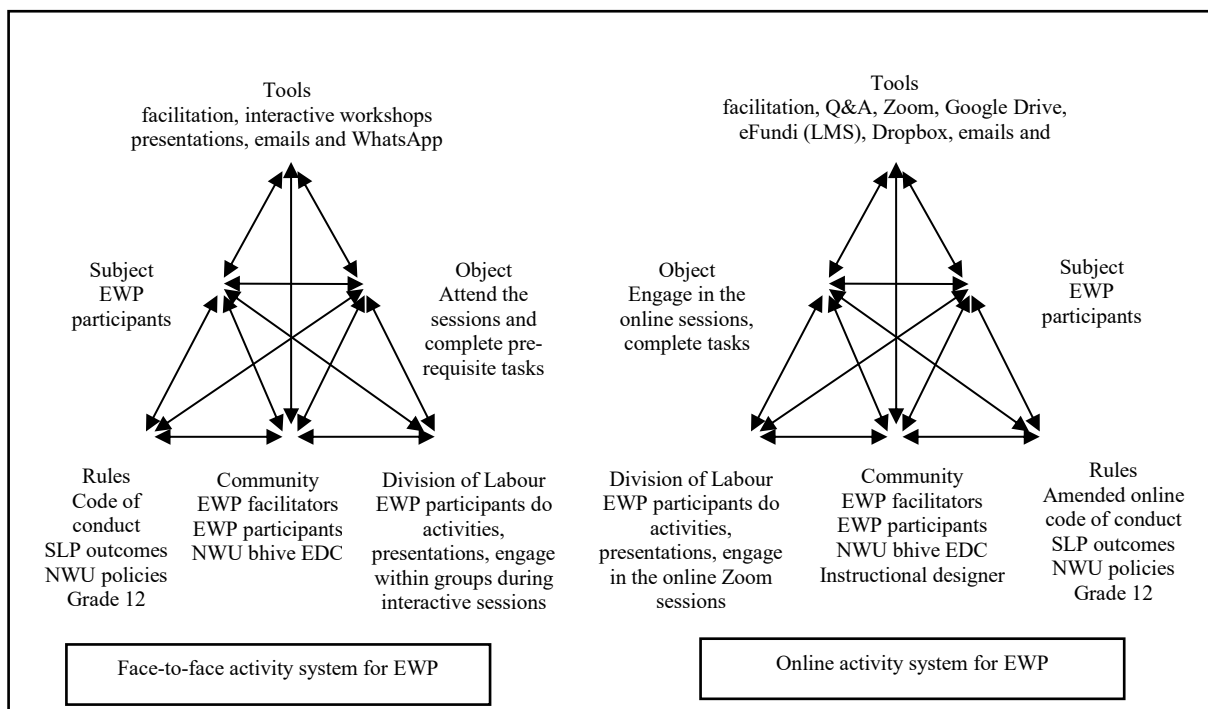

Figure 1: Third Generation Activity Theory (Engelström, 2001)

The third-generation system can constitute a minimum of two interacting activity systems (as demonstrated in Figure 1, refer to figure 2 for elements in the activity system to better comprehend Figure 1). This model includes a common object-orientated activity that moves through the activity systems, whereby each activity system has its outcomes and aims but is connected with the object-orientation of the activity (Engelström, 2001). The relationship amongst the elements in the activity system relates to a community (herein, the NWU's bhive EDC, EWP facilitators and EWP participants) of knowledge-sharing, which operates widely across elements of the education system (Russell, 1997). The activity theory lens is the activity system, constituted of people (EWP participants and facilitators) with a common goal (completing the EWP) using tools (face-to-face or online tools) to achieve outcomes (a sustainable EWP for the NWU's bhive EDC) (Engelström, 1987; Kain & Wardle, 2011). Two activity systems are explored in this paper, namely (a) a face-to-face activity system, and (b) an online activity system (as demonstrated in Figure 2).

An activity system focusses fundamentally on the subjects and the objects, and how these function within the activity. Participants (subjects) must complete the activities within the EWP so that they may start or continue with a sustainable business model (Russell, 1997). These female participants develop their knowledge and skills, including the progression of the business idea to the commencement and management of the business. The objects, which can be either physical- or abstract elements, stimulate and drive the activity. Within the context of this study, the object was subdivided into the objectives and the outcomes of the EWP. The subject for the face-to-face and online activity system remains the same, namely the EWP participants. Figure 2 demonstrates the face-to-face and online activity system for the EWP:

progressive development, where the subjects' activity (how the EWP participants engage and participate) leads to attaining the objects within each of the two systems. The more these EWP participants engage face-to-face or online, the more they will be able to complete the activities (Kaptelinin, 2006).

At the base of the triangle (as per Figure 2), rules, community and division of labour constitute the socio-historical aspects of the mediated action (Engelström, 2001). The rules are the set-conditions, which stipulate how the individual has to perform (Hashim & Jones, 2007). In this context, the rules

refer to the SLP outcomes, code of conduct (amended for online engagement), and NWU’s regulatory framework, which guides the subject to attain the object. The community encompasses EWP participants, EWP facilitators, NWU’s bhive EDC and an instructional designer for the digitised system. Each role player within the community has to complete certain tasks to ensure that EWP participants complete the programme within the six months and that the bhive EDC delivers a sustainable EWP, irrespective of its mode of delivery (face-to-face or online).

3. Research Methodology

To address the research question — What were the challenges and lessons learnt in pivoting from a face-to-face to a digitised modality, whilst continuing to offer deep value and complete the EWP successfully? — a qualitative reflective process (Merriam, 2009) was undertaken to ascertain what the challenges, enablers and lessons learnt were, when transitioning from the face-to-face to the digitised modality.

4. Results and Findings

Following the conclusion of a part face-to-face selection process (before the lockdown in South Africa) and a subsequent online selection process, the digitised EWP was initiated in June 2020 with 38 participants. In addition to 14 workshops, three question and answer sessions were offered via Zoom, with each session hosted by two facilitators. Throughout the 2020-round of the programme, the researchers (EWP facilitators) reflected (using focus groups and the review of the existing process) on the transition from face-to-face to online by (i) critically looking at each of the two systems, and (ii) analysing their reflections using the five principles of activity theory (Engelström, 2001). To ensure trustworthiness of the qualitative data an independent peer reviewer assisted with the data analyses. Table 1 illustrates the pivoting from face-to-face to digitised modality activity systems, according to the elements of an activity system.

As depicted, although the elements of the activity system remained largely constant upon pivoting from the face-to-face mode to the digitised modality, some additional tools and activities were deployed to deliver on the programme outcomes and objectives, in addition to which an increase in labour for the programme facilitators can be observed.

4.1. Discussion: five principles of activity system

The following section discusses the reflections of the EWP facilitators, according to the five principles of activity theory.

The *first principle* is that each object-directed activity system (face-to-face or digital) functions in a network with other activity systems, but still individually functions as a unit of analysis. The goal-directed activities (primary unit of analysis) of the EWP participants and facilitators and their actions in the activity system are self-directed, but a secondary unit of analysis is perceived against the background of the complete activity system (Engelström & Sannino, 2010). As seen in Table 1, each of the role players in the community had to perform certain tasks to ensure that there was a smooth transition from face-to-face to a digital modality. The NWU’s bhive EDC provided the support and funding to ensure that the current cohort of EWP participants will be able to complete the SLP, whilst the facilitators transitioned the programme from face-to-face to a digitised modality, the instructional designers created digital platforms and support was provided to EWP participants to engage online and complete their assignments.

The *second principle* is that an activity system consists of a community (EWP participants, EWP facilitators, NWU bhive EDC and an instructional designer for the digitised mode of delivery) with various viewpoints, practices and interests. Each member of the community has their unique history of where they come from and what role they play within the activity. The division of labour in the activity allows for each member of the community to contribute to the activity, which “forms multiple layers and strands of history fixed in its tools and rules” (Leendertz, 2013). Many of the EWP participants did not have consistent access to the internet, nor did they have advanced digital skills. With the transition to a digitised modality, all participants and the facilitators needed to have adequate internet access, as well as the digital skills to function in the digitised environment. Table 2 summarises the actions of each of the role players within the community.

Table 2: Actions of the community within the EWP digitised activity system

bhive EDC Actions	Instructional Designer Actions	EWP Facilitator Actions	EWP Participant Actions
Ensured sufficient funding for the digitised programme.	Selected appropriate platforms and designed the digitised learning interface (eFundi, Google Drive, Zoom).	Converted EWP to a fully digitised modality and created additional learning resources for EWP participants.	Attended online workshops and question and answer sessions. Viewed videos before workshops.
Invested in an instructional designer to ensure that the	Monitored participants’ interactions, participation and the usability of tools.	Presentation of workshops and facilitation of question	Completed, uploaded and presented assignments to Evaluation Panel.

appropriate digital platforms were selected to best support EWP participants.		and answer sessions and secured NWU academics to present certain workshops.	
Invested in additional facilitators to assist with question and answer sessions and to support technology management.	Provided feedback to the facilitators.	Uploaded handouts, videos and other information on Google Drive and eFundi and provided support to participants via email and WhatsApp.	Peer support, networking and sharing of information via WhatsApp.

Historicity is the *third principle* in activity theory, as an activity system is shaped and altered. The EWP should be evaluated continuously to ensure that limitations, either within the EWP or bhive EDC, are addressed and new additions are incorporated timeously, whether in the programme, policies or the mode of delivery. Shortcomings within the bhive EDC and the EWP upon pivoting to the digitised modality largely centred around the mode of delivery and the corresponding lack of an appropriate online platform (which was overcome by using a combination of eFundi and other mechanisms, such as Zoom and Google Drive) as well as unfamiliarity with some of these digital platforms (which was addressed by soliciting support from the instructional designer and undertaking training, both formalised and through self-exploration).

The *fourth principle* is the fundamental role of contradictions (the challenges within the bhive EDC) accumulated over a long period within and between activity systems. Certain contradictions (challenges) create conflict and instabilities within the activity but also groundbreaking endeavours (enablers) to change the activity. Contradictions in the activity systems have two purposes, namely to identify discrepancies or shortcomings (challenges) and acknowledge the value of the intervention (transition from face-to-face to online) and improvement (to ensure the sustainability of the EWP). (Barab et al., 2004). Typical challenges experienced with the face-to-face modality included transportation difficulties for participants', whilst they also had to juggle the conflicting demands of work, family and demands posed by the EWP. Historically, a key challenge for the bhive EDC and programme facilitators was time and budget constraints, as facilitators were required to regularly travel between the three NWU campuses to host the face-to-face workshops for each of the respective rounds of the programme (two in Vanderbijlpark, one in Mahikeng and one in Potchefstroom). In addition, offering more than one annual round of the programme in different locations often resulted in scheduling conflicts, which required an innovative and adaptive approach to manage this particular challenge.

Naturally, the digitised modality posed its own, unique set of enablers and challenges, as depicted in Table 3.

Table 3: Enablers and challenges of the digitised modality

PIVOTING FROM FACE-TO-FACE TO ONLINE: A REFLECTIVE ANALYSIS		
bhive EDC	EWP Facilitators	EWP Participants
ENABLERS		
Institutional support and funding allocation	Resource and knowledge capacity to offer EWP	Desire and commitment to complete EWP
Commitment to catalyse and support female entrepreneurship	Open-mindedness to continuously review and make programme adjustments, as necessitated	Strong motivation to learn and willingness to engage, accept guidance and collaborate
Enabling culture	Access to technology tools and consistent bandwidth	Computer and English language literacy
Adequate NWU role players to facilitate	Deep industry knowledge	Access to technology tools and

PIVOTING FROM FACE-TO-FACE TO ONLINE: A REFLECTIVE ANALYSIS		
bhive EDC	EWP Facilitators	EWP Participants
workshops, sit on evaluation panels and offer support		bandwidth
CHALLENGES		
NWU budget limitations	Technology platform restrictions, such as the inability to stream videos via Zoom, as well as eFundi space restrictions	Discomfort with technology platforms, such as Zoom and eFundi
Inadequate understanding of the real importance of entrepreneurship by other, non-economic and management science faculties	Workshop management - limited interaction during online sessions makes it difficult to gauge participants' understanding and focus for the full duration of sessions	Varying and fluctuating bandwidth access and power outages
Commitment by some NWU academics to play a role in the programme, but inadequate numbers and consistency	Fully interactive in-session group work is limited by the online delivery mechanism	Varying intellectual capacity and grasp of content, which necessitates individual support, in some instances
	Leaner controls, as more resources need to be managed and closer participant monitoring is required	Limited interaction as a result of the online platform makes it difficult to identify problems timeously, to request in-workshop assistance
	Online platform- and time capacity limitations to assist participants individually	Personal challenges and conflicting work-home-programme demands
	Intense input is required to manage participants' technology challenges	
	Increased administration coupled with a digitised delivery model	

Expansive transformation is the *fifth principle* of activity theory, which articulates that the community within the activity start to question and move from the traditional way of engaging. In the context of this study, the EWP community were required to work together to transition the programme from the face-to-face to digitised modality and to ensure that the EWP is completed, whilst the community adopt the potential of the new activity (Engelström, 2001). An expansive transformation took place, with NWU making an instructional designer available to assist with the design of the online platform and to offer the requisite training (both to facilitators and participants), whilst EWP facilitators collaborated closely to co-host sessions and support one another, offer additional technology support and demonstrating leniency to participants, with EWP participants assisting each other to access and upload documentation.

5. Managerial Implications

A diverse group of stakeholders such as public and private universities, private suppliers of entrepreneurial education programmes, business incubators and consultants should take note of the implications of this study.

A large percentage of the EWP participants have very limited computer and technology skills. Having a group of participants with computer and technology skills ranging from very basic to advanced leads to frustration for all participants as some battle to keep up and others are frustrated with the slow pace of the participants with low computer skills. This may be a more general trend that impacts other entrepreneurial education programmes, specifically for start-up entrepreneurs. Stakeholders should consider establishing the programme applicants' computer and technology skills levels as part of the application process. Knowing the computer and technology skills level gives stakeholders the option to group applicants with similar skills levels together and to include basic computer skills and basic Microsoft office skills in their entrepreneurial education programmes.

6. Limitations of the study

This study focussed on the EWP and its role-players only. The findings of the study cannot be applied to all entrepreneurial education programmes.

7. Conclusion: Lessons Learnt

Key lessons learnt with the implementation of the digitised modality included the realisation that, to a large degree, programme participants are “Digital Ancients”, not necessarily “Digital Natives”, which requires greater flexibility to navigate South Africa’s unique technology context. In addition, programme facilitators recognised that a definitive boundary is required between programme management and participants in terms of technology access and problem resolution, to alleviate the demands of offering a programme of deep value, whilst also having to resolve participants’ technology challenges and stumbling blocks. Ultimately, greater process automation would need to be pursued, to fully leverage the digitised programme’s potential of increasing its footprint across South Africa and, in time, the African continent.

COVID-19; Socio-economic; Systematic; Cyclical, Lockdown;

Abstract

The impact of COVID-19 is multidimensional and significantly affects the socio-economic dimensions of the world community. A largely related literature reveals that living community-wide results in immediate risk to people's social relationships, as well as economic decline. Besides, the relationship between the various socio-economic aspects associated with COVID-19 is not clear. Therefore, this paper is aimed to systematically review the socio-economic aspects of COVID-19 by integrating and synthesizing the existing works to build a unified framework. Besides, the study uncovers a specific relationship of a comprehensive and dynamic socio-economic factors. Moreover, it's attempted to pinpoint the specific areas of investigation in the subject matter for future studies. From the review, a cyclical model that reveals and integrates the varieties of social and economic factors was developed. It revealed that the strict lockdown measures has contributed for reducing the spread of virus, while it extremely affects the socioeconomic dimensions. Further, the factors such as economic unemployment, household's income, financial markets, and psychological distress has been identified and discussed. Finally, the future research investigation should also give consideration to the forgotten aspects such as technological and politico-legal issues to build an integrated framework of COVID-19.

1. Introduction

The COVID-19 pandemic is receiving intensive interest at all levels: political, economic, social, scientific, and in health care (Matias et al., 2020). Besides medical and technological challenges, societal, economic, psychological, and philosophical difficulties should be addressed in order to better approach the global crises (Rudnick, 2020). That is, the impact of this pandemic is not limited to the health crisis, but also with societal and economic crisis. There are a lot of socioeconomic crises that affects the human behavior (You et al., 2020). This is related with key important indices such as age, sex, ethnicity, education, socio-economic status, and geographic location is particularly pertinent (Yaya et al., 2020). For instance, the socio-economic status (SES) indicated by income, education or occupation plays an important role in health outcomes (Yaya et al., 2020). Besides, the socio-cultural activities are restricted and the economy of countries has extremely impacted in the sectors such as tourism, trade, and transportation (Zeren & Hizarci, 2020). Moreover, the financial consequences related with unemployment and recession may reduce the satisfactions from the businesses and economies of countries (Sibley et al., 2020).

The current Coronavirus pandemic disaster has led to escalating emotional, mental health, and economic issues with significant consequences, and this presents a serious challenge to reopening and recovery initiatives (Zhong et al., 2020). Related to the lockdown policy, it will have an impact on the economic side (Samuel et al., 2020). Besides, the social implication has also a paramount importance. The intensity of the impact of the pandemic, the lockdown policies, and the behavioral response of agents beyond the regulations, have greatly impacted the economic production (Aspri et al., 2020). By the leading interest in prioritizing other definite forms of expenditure, it goes without a doubt that the pandemic has radically altered traditional modes of consumption in different forms (Davola, 2020).

The wide application of promoting healthy way of living practices to the community can break the chain of distribution and also reduce social and economic costs more quickly (Faisal & Nirmala, 2020). The outbreak also disrupts the functioning of global supply chains and the world economy, which is experiencing a contraction in production (Zhang et al., 2020). Further, limited and restricted transport as well as global financial markets are also experiencing a significant downturn (Islam & Fatema, 2020). Many people have been laid off temporarily or permanently during the pandemic due to an insufficient workload. Unemployment is then associated with disrupted mental well-being and with other personal as well as societal disruptions such as poverty, crime, and more (Rudnick, 2020). Considering the expected length of the phenomenon, and its impact on the economy and employment, the management of consumers' economic exposure and of unpaid debt is therefore meant to emerge as a major consequence (Davola, 2020). Social distancing will also lead to depression and anxiety and considered as not appropriate in this situation. It further impacts social stability and psychological impacts (Qian & Jiang, 2020).

This study shows the socio-economic multifactor implications of COVID-19 for policy makers. The paper also explores the areas which are integrated with socio-economic aspects and under researched including the unemployment, legal, and household income and uncovers their relevance. Therefore, the contribution of this study is twofold; practical contribution and theoretical contribution. Practitioners and policy makers understand the specific areas affected by COVID-19 pandemic and take counter action to overcome and minimize the negative affect on business, economy, and the society. It also pinpoint, the focus areas that the governments should look to respond through a coordinated strategy to reduce the consequences of the epidemic on the economy and society. Theoretically, no review paper is identified in the socio-economic implication of COVID-19. This indicates, it's necessitated to conduct a review since there are no sufficient publications in each specific subject matters. Therefore, this study contribute to the researchers understand the different socio-economic areas highly affected by the pandemic. It also guides and provides clue for future researchers who want to conduct research in the subject matter by allowing them view the comprehensive analysis in the subject matter.

In general, the literatures shows that COVID-19 is highly affecting the social and economic aspects. Therefore, there is a necessity to systematically review the various works that relates COVID-19 from the perspectives of the social and economy.

2. Problem Investigated

The lockdown and restrictions have high impacts on the economic conditions since countries are placing restriction on productions (Bellomarini, Benedetti, Gentili, Laurendi, & Apr, 2020). As a result, the world economies are in a recession with a widespread of COVID-19 pandemic that hit the economic activities (Petric, 2020). There are many facts that indicated the down turn of economies. For instance, "the IMF warned that contraction and recovery of the world economy would be worse than anticipated. It also estimated a global GDP shrink of 3% this year" (Islam & Fatema, 2020). Moreover, the pandemic leads to continuing loss of trillions of dollars due to the shutdown of businesses (Samuel et al., 2020). On the other hand, the weakened world economy requires quick government response to save huge economic recession in addition to saving lives. To overcome this challenges, governments are making decisions on the extent and the length of imposing restrictions, social distancing, shutting down of schools and industries (Anderson et al., 2020). However, it is vital for governments to balance between the effect of the epidemic, and the economic effect of the regulatory measures (Aspri et al., 2020). In general, there is a necessity to assess the economic effect of COVID-19 by a policy maker (Caraka et al., 2020).

A large related literature reveals that living through community-wide results in immediate risk to people's mental and physical health and social relationships (Sibley et al., 2020). There is dissatisfaction among people because of the lockdown, evidenced by the increasing number of protests, which indicates the presence of high desire to come back to work (Samuel et al., 2020). COVID-19 has highlighted inadequacies which were always present in our social and welfare services,

such as the inadequate provision of medical care, food and benefit systems, and the lack of protections for homeless people, for squatters and for renters (Milligan, 2020). It is a serious condition that will cost hundreds of thousands of lives, and affect the psychology of people. Greater attitudes about the severity of COVID-19 were associated with more social distancing, disinfecting, and news monitoring, but also more hoarding (Oosterhoff, 2000). Therefore, all people behave very responsible during the COVID-19 pandemic, but radical social isolation of all population is not may be the best solution (Petric, 2020). This is because, the virus impacted the social and psychological well-being of the global community.

Consequently, Covid-19 have an impact on the various aspects of economy and social issues. However, the relationship between the various aspects associated with socio-economic implications of COVID-19 is not clear. Therefore, this study shows the socio-economic multifactor implications of COVID-19 for policy makers. The paper also explores the areas which are integrated with socio-economic aspects and under-researched including the unemployment, legal, and household income and uncovers their relevance. In general, no review paper is identified in the socio-economic implication of COVID-19 and this review is among the first paper in reviewing the subject matter.

3. Research Objectives

Given the absence of review paper in the socio-economic implications of COVID-19, this study systematically reviews the socio-economic multifactor implications of COVID-19. The paper also explores the areas which are integrated with socio-economic aspects and under-researched including the unemployment, household income and uncovers their relevance.

4. Research Methodology

We conducted a systematic mini-review of the literatures on multi-dimensional implications of COVID-19. This systematic mini-review used to recognize, evaluate, and synthesize the available literature since its comprehensive, explicit and reproducible approach. In defining the review scope, an expert from different fields of studies including health, environmental science, business, economics, and social psychology has been communicated and discusses the relevance of the review. Because of the multi-dimensional impacts of COVID-19, a thematic analysis was undertaken by identifying themes on the subject matter based on the suggestions provided by experts in different disciplines and the reviewer's experience. Then, these themes are used as a framework for analysis. The themes were identified different aspects under economic and social issues. In addition, we have included peer-reviewed articles, working papers, and special notes since it's a recent phenomenon and the number of articles published on the subject matter were not sufficient for review. On the other hand, pre-peer review articles and all other documents has been excluded in order to reduce the bias.

In order to avoid duplication of papers, in the first place, we have checked the availability of systematic review study in the subject of socio-economic implications of COVID-19. Then, the suitability of peer-reviewed scholarly works was assessed and found that it's relevant to provide a comprehensive scholarly work on this critical and timely issue. Therefore, the analysis was organized from the various implications of socio-economic aspects. Initially, we searched texts in Google scholar since the study is multidimensional, and downloaded all articles, discussion and working papers, and special notes from retrievals to June 2020. However, many articles that have no quality and published by predator journals were identified in the search and excluded from the review paper. Based on the identified themes, the results obtained from google scholar were summarized in table 1.

Table 1: The selection criteria, process and eligibility of journal articles

No	Dimensions	Total retrieved	Based on quality	Title & abstract based relevance	Full text relevance	Excluding other documents except peer reviewed articles
1	Economic factors	69	31	22	16	13
2	Societal factors	116	43	28	15	9
3	Total	185	74	50	31	22

After searched and downloaded articles from Google scholars based on exclusion criteria's, some works are excluded from the review based on the overall quality of journals and articles, title, abstract, and full text. The stages followed in the search strategies include, first, the term COVID19 is searched in combination with the above terms. Moreover, we have searched without spaces between the words in the quotation marks in order to identify both words together. Accordingly, 185 articles were identified in the first search by defining the publication year as 2020. Next, articles that are not peer-reviewed were removed. This is followed by reviewing the identified papers based on their title and abstracts depends on its relevance to the scope of the study. In this case, the title, abstract, or full-text review which is not related to the study topic is eliminated. Finally, working papers, discussion papers, special series notes, and short communications were excluded. Moreover, the search strategy and selection process are summarized in table 1 above.

Table 1 indicates that COVID-19 has various implications on issues of business-economics and social aspects. After the scholars from these disciplines were communicated, data were extracted by two independent reviewers. We have identified and removed the duplicated articles manually. Moreover, we have documented the literature findings and evaluation of results to ensure the study quality. Then, the synthesis was made to obtain necessary findings in relation to the various socioeconomic aspects related with COVID-19 and to build a comprehensive big picture by focusing on the relevant and necessary ideas. For analysis, a qualitative research method is used to analyze and discuss the theoretical aspects related to the socio-economic implications of COVID-19. From this, we compared and contrast the logic and arguments of many scholars to provide conclusions based on the synthesized arguments.

5. Literature Review

The current Coronavirus pandemic disaster has led to escalating emotional, mental health, and economic issues with significant consequences, and this presents a serious challenge to reopening and recovery initiatives (Zhong et al., 2020). Related to the lockdown policy, it will have an impact on the economic side (Samuel et al., 2020). Besides, the social implication has also a paramount importance. The intensity of the impact of the pandemic, the lockdown policies, and the behavioral response of agents beyond the regulations, have greatly impacted the economic production (Aspri et al., 2020). By the leading interest in prioritizing other definite forms of expenditure, it goes without a doubt that the pandemic has radically altered traditional modes of consumption in different forms (Davola, 2020).

The wide application of promoting healthy way of living practices to the community can break the chain of distribution and also reduce social and economic costs more quickly (Faisal & Nirmala, 2020). The outbreak also disrupts the functioning of global supply chains and the world economy, which is experiencing a contraction in production (Zhang et al., 2020). Further, limited and restricted transport as well as global financial markets are also experiencing a significant downturn (Islam & Fatema, 2020). Many people have been laid off temporarily or permanently during the pandemic due to an insufficient workload. Unemployment is then associated with disrupted mental well-being and with other personal as well as societal disruptions such as poverty, crime, and more (Rudnick, 2020). Considering the expected length of the phenomenon, and its impact on the economy and employment, the management of consumers' economic exposure and of unpaid debt is therefore meant to emerge as a major consequence (Davola, 2020). Social distancing will also lead to

depression and anxiety and considered as not appropriate in this situation. It further impacts social stability and psychological impacts (Qian & Jiang, 2020).

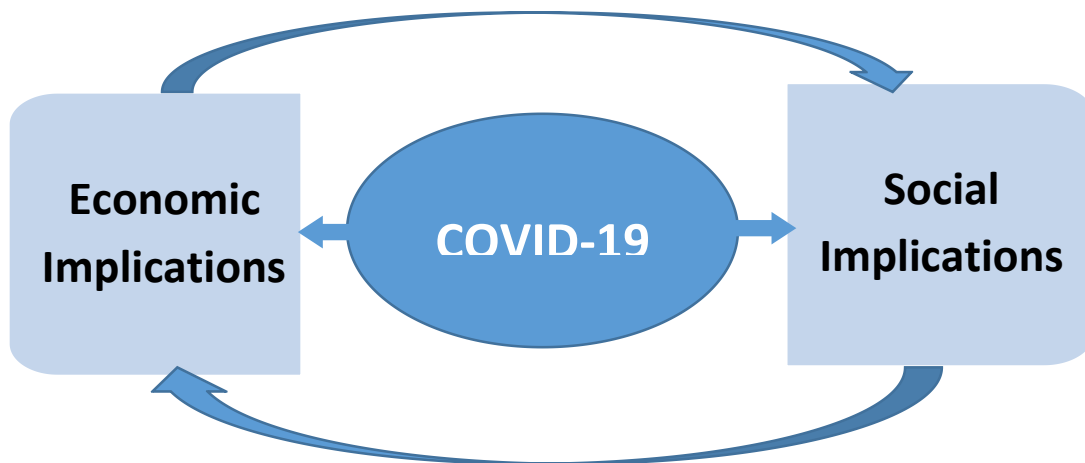

Figure 1: Conceptual Framework

6. Results and Findings

The following section provides the major findings from the existing literature and is used to build dimensions and show the antecedents and consequences of the variable “entrepreneurial orientation for environmental sustainability” (EOfES).

6.1. Results of the retrieved articles

The extent of COVID-19 effects are different among different sectors (eg, service sector is highly affected), firm sizes (small firms were more affected), social groups (disadvantages and minorities are more affected) and etc. Regarding the demographic factors, Acemoglu et al. (2020) considers structural differences in infections for distinct age groups that affect lockdown policies and economic costs (Çakmaklı et al., 2020). In general, the various economic areas affected by the outbreak of COVID-19 includes; Global disaster (Gupta, 2020), tourism industry (Oruonye & Ahmed, 2020), supply chain disruptions (Oruonye & Ahmed, 2020; Tang, Gaoshan, & Ahonsi, 2020) food insecurity (Cosgrove, 2020), shortage of raw materials (Tang et al., 2020), drop in productivity and efficiency (Raja, Lennes, & Biddinger, 2020). These economic difficulties lead to loss of employment which further affects food security. This directly leads to the social crisis.

The papers identified have related to many socio-economic factors including social behavior and attitudes (Ling & Ho, 2020, Sibley et al., 2020, Salman et al., 2020), psychological distress (Zhang et al., 2020, Sibley et al., 2020, Oliveira & Rossi, 2020, Rudnick, 2020), addictive disorders (Marsden, et al., 2020), disadvantages and minorities (Algarin et al., 2020, Opara et al., 2020, Yaya et al., 2020, Ginsburgh et al., 2020), infection level (Tomar & Gupta, 2020, Cássaro & Pires, 2020, Qian & Jiang, 2020, Aluga, 2020), demand and supply (Matias et al., 2020), societal well-being (Sibley et al., 2020), economic disruption (Austermann et al., 2020), business sectors (Oruonye & Ahmed, 2020, Islam & Fatema, 2020, Mihailov, 2020, Caraka et al., 2020), supply chain (Faisal & Nirmala, 2020, Mandel & Veetil, 2020), economic costs (Mandel & Veetil, 2020), financial markets (Abubakar, 2020, Zeren & Hizarci, 2020), and economic uncertainties (Eichenbaum, Rebelo, & Trabandt, 2020, Baker et al., 2020).

In general, the socio-economic impacts of COVID-19 were indicated in figure 1.

Table 2: Summary of objective and findings of the studies

Authors	Objectives	Findings
Ling & Ho, 2020	To analyze and explain the effects of COVID-19 on social behavioral reactions.	Most individuals prevailing over societal collective interest amid the pandemic have been prevalently observed. They also incentivize others to act selfishly, if no restrictions are imposed.
Zhang et al., 2020	To identify the characteristics of psychological distress across populations affected by the COVID-19 pandemic.	The study revealed differential levels of psychological distress in patients who experienced COVID-19 infection, individuals under quarantine, and the general public.
Marsden, et al., 2020	To assess the ways of mitigating and learning from the impact of COVID-19 infection on addictive disorders	Emotions are likely to place us at increased risk of a range of unhealthy behaviors. Some drug and alcohol services will innovate—providing novel ways of delivering harm reduction.
Tomar & Gupta, 2020	Proposing data-driven estimation methods like long shortterm memory (LSTM) & curve fitting for prediction and effect of preventive measures like social isolation & lockdown on the spread.	The prediction of various parameters obtained by the proposed method is accurate within a certain range and will be a beneficial tool for administrators and health officials. By these preventive measures, spread of the virus can be reduced significantly.
Cássaro & Pires, 2020	Presenting a simple model to follow the evolution of the COVID-19 pandemic in different countries.	It is almost impossible to predict based on the initial CV-19 cases how the pandemic will evolve. This approach can serve as a valuable tool for investigating how protective measures are changing the evolution of the pandemic.
Matias et al., 2020	To review the science of human needs and to make preliminary recommendations concerning necessary selfcare focusing on exercise.	In the vast majority of cases, individuals in social isolation have no access to mental healthcare. An in-built system of homeostasis can help rebalance activity, thought & feeling.
Sibley et al., 2020	This article presents a comprehensive analysis institutional trust, attitudes toward the nation and government, physical and psychological health, and subjective well-being.	People in the lockdown group reported higher trust in science, politicians, and police, higher levels of patriotism, and higher rates of mental distress compared to people in the pre lockdown group. Results were confirmed in within-subjects analyses.
Yaya et al.,2020	Examines how racism, segregation and inequality, now emerge as a monumental COVID-19 challenge.	COVID-19 has exposed the strong association between race, ethnicity, culture, socioeconomic status and health outcomes.
Oliveira & Rossi, 2020	In this review, we hope, through comparative behavioral analysis, to avoid, mitigate and alleviate social stress in humans.	By minimizing stress, the most rudimentary emotions, similar between humans and mice, but concient-rationalized in the human and promote the improvement of the human being's elevated quality of life, even in social isolation/quarantine.
Qian & Jiang, 2020	The aim of this article is to discuss the social distancing measures for COVID-19.	After a series of social distancing measures, there are 309 cities with zero cases and 34 cities with confirmed cases in China as of April 13, 2020.
Rudnick, 2020	Presents social, psychological and philosophical reflections regarding the current pandemic and beyond.	Highly exposed individuals and particularly vulnerable populations (eg. health care providers, socially disadvantaged etc, are addressed as requiring special attention.
Chakraborty & Maity, 2020	Describes the impact of COVID-19 on society and global environment, and the possible ways in which the disease can be controlled has also been discussed therein.	Almost all the nations are struggling to slow down the transmission of the disease by testing & treating patients, quarantining suspected persons through contact tracing, restricting large gatherings, maintaining complete or partial lock down etc.

Aluga, 2020	Highlighting the preparedness, response, transmissibility of Covid-19 and proposes intuitions to manage COVID-19	The confirmed cases will continue to increase exponentially if no drastic measures is taken.
Oruonye & Ahmed, 2020	This study has examined the potential impact of covid-19 pandemic on tourism development in Nigeria.	Covid-19 is already worsening the unemployment situations, resulting in loss of substantial revenue to the government, increasing incidence of poverty among others.
Islam & Fatema, 2020	Examines the potential macroeconomic effects of Covid19 on the tourism sector of Europe, US, and China as well as provides policy suggestions in light of previous works.	The global tourism sector is geocentric and the tourism sector of EU countries is interdependent. The study also finds strong domestic tourism in the USA and China whereas domestic tourism in EU countries is not that strong.
Austermann et al., 2020	Analyzes selected Asian & European countries along the degree of strictness when shutting down economic & social life.	Governments across Asia, Europe, and indeed worldwide almost show a concerted action when it comes to the timing of taking measures against the common global threat of the virus.
Faisal & Nirmala, 2020	This paper tries to map the economic impacts that are generally experienced by countries in the world affected by the pandemic.	A simple policy that can be easily implemented by everyone, requires awareness and compliance for all elements of society so that all can implement it which is useful to break the chain of distribution of COVID-19, to help the world economy recover.
Caraka et al., 2020	Assesses the effect of large scale restrictions on the economic growth during COVID-19 pandemic in Indonesia.	There are significant differences of retail, grocery and pharmacy, and residential mobility before and during the COVID-19 pandemic. During the pandemic there are severe economic losses, industry, companies, and real disruptions.
You et al., 2020	The purpose of this paper was to assess the distribution of COVID-19 morbidity rate in association with social and economic factors and discuss the implications for urban development that help to control infectious diseases.	Increasing population density, construction land area proportion, value-added of tertiary industry per unit of land area, total retail sales of consumer goods per unit of land area, public green space density, aged population density were associated with an increased COVID-19 morbidity rate.
Abubakar, 2020	This paper identifies the adverse effect of corona virus to businesses across the globe.	The values of the stock market fall to negative, while that of gold and oil tumbled significantly. Transportations & travel companies, businesses in the hospitality industry, & industrial production companies experience significant drop in patronage.
Zeren & Hizarci, 2020	Aimed to reveal the possible effects of Covid -19 Coronavirus epidemic on stock markets.	All stock markets examined with total death act together in the long run. It is considered as one of the optimal option for investors to avoid investments in stock markets, turn to investment in gold markets.
Eichenbaum et al., 2020	We extend the canonical epidemiology model to study the interaction between economic decisions & epidemics.	The competitive equilibrium is not socially optimal. The best simple containment policy increases the severity of the recession & saves half a million lives in U.S.

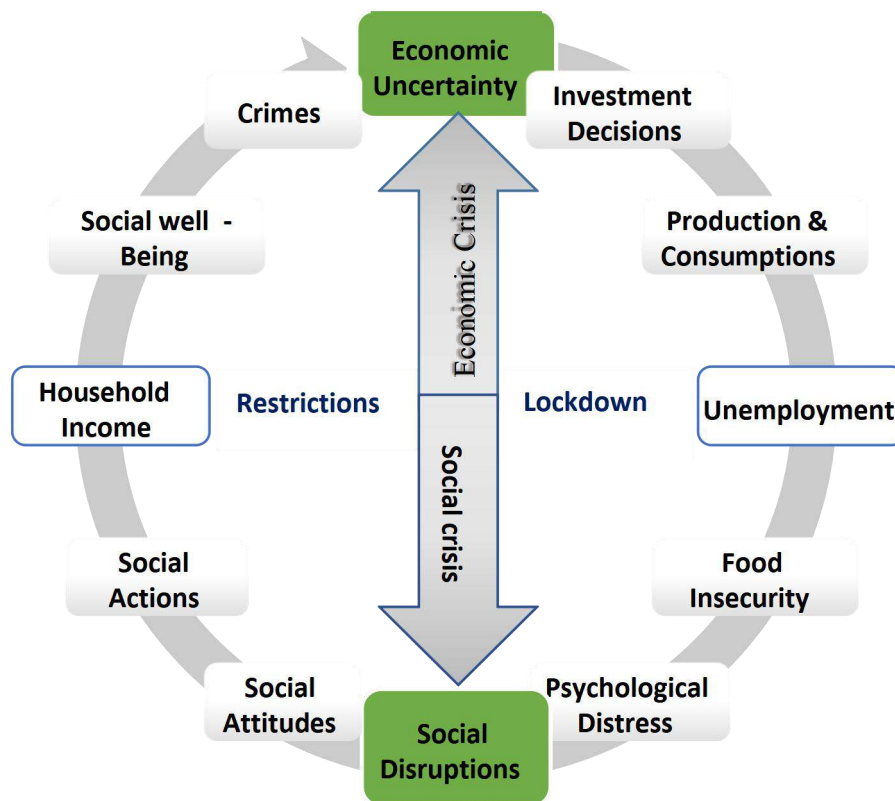

Figure 1: Socio-economic implication of COVID-19

6.2. Trends in Economic Crises

COVID-19 is bringing economic crisis from the lock down that hinders economic activities, and loss of income from shut down of business operation. This may also be associated with low production and less income from tourism and related industries. Besides, there are high costs associated with the outbreak of COVID-19. This may be because of less availability of raw material, which may lead to shutting down of many businesses and trades. Particularly, small firms are more vulnerable since they have less capacity to survive in this tough economic situation. It's also known that the level of uncertainty from the pandemic is higher, because of social isolation and physical distancing. The presence of high economic uncertainty has negative implications on the investment decision by investors. It also has implications on differentiating the economic sectors which are suitable/not suitable for investment in this pandemic time. In this regard, investing in the stock market is considered as unsuitable alternative with the increasing of COVID19 case and death rates (Zeren & Hizarci, 2020), since the pandemic is badly affects the financial markets and the stock market. That is because, investment decisions are highly responsive for the pandemic (Caraka et al., 2020). Therefore investment decision is the decision that requires critical investigation in this period of pandemic.

Investing only in the selected areas of investment and the overall economic uncertainty leads to the imbalance between production and consumption and/or demand and supply. In terms of sectors, the concentration of shocks in some sectors, makes the demand and expenditure reduced (Çakmaklı et al., 2020), particularly related to tertiary goods. Boone, Haugh, Pain, and Salins (2020) stated that the pandemic has impacted in three channels such as demand shock, supply shock, and uncertainty that leads to less consumption. On the other hand, the level of consumption is dependent on the amount of infected people. With the occurrence of COVID-19, many businesses have used shifts and gives time offs for workers, which reduces the production. Moreover, Faisal & Nirmala, (2020) revealed that due to increased demand during severe effect, there will be a need for sufficient supply. That is, the panic among consumers and producers can change the current pattern of consumptions.

6.3. Trends in Social Crisis

The overall economic crisis and psychological distress among societies creates high social disruptions. Socially, the effects are associated with quarantining, large gathering restrictions, and lock down (Chakraborty & Maity, 2020) that hinders social advancement. Such pandemic effects are believed to have influenced human behavior (such as issues of panic buying and noncompliance with government orders and law) (Ling & Ho, 2020). Moreover, the social disruption has contributed to changing social attitudes and behaviors. The society perceived the lockdown as a personal restriction and brings social disruptions. They also perceive that social distancing leads to depression and anxiety, and therefore, it's not suitable (Qian & Jiang, 2020).

The negative attitude among the societies highly changed the social actions. That is, there is a high anxiety that the lockdown increased stresses and alcohol consumption, which will raise the violence (Sibley et al., 2020). In this regard, the increase in violence is related with several factors including “economic stress, disaster-related instability, increased exposure to exploitative relationships, and reduced options for support” (Wang et al., 2020). Accordingly, with the increment of loss of life, social disorders will happen. Also, the closure of educational institutions may lead to long term societal difficulties, while in the short term, domestic violence which may require political and legal decisions may rise.

6.4. Integration of Economic and social crisis during COVID-19

In balancing the supply with demand, many industries are reducing their workers that brings unemployment. The high rate of unemployment has high implications on the overall economic and social crisis of countries. The high rate of unemployment leads to food insecurity, which further has implications on the psychological distress. Besides, financial impacts, the pandemic has implications on the psychological aspects. For instance, Rudnick, (2020) related unemployment with disturbed psychological well-being, poverty, crime, and the like. Therefore, the lockdown causes psychological and societal problems, more on the most vulnerable peoples including children and elders, minorities, and women (Marčinko et al., 2020). Further, the vulnerability to psychological distress associated with various factors, including gender, social support, specific experiences with COVID-19 infection, length of isolation, and amount of exposure to the media (Zhang et al., 2020). This crisis and disruptions requires tough governmental and policy decisions. Though the tough policy decision severely affected the social activities.

Restrictions on societal actions, unemployment, and overall social disruptions has contributed for the reduction of household's income. Particularly, this pandemic affects highly the socio-economic disadvantaged (Ginsburgh et al., 2020) including, ethnic minorities (Yaya et al., 2020), those from lower socioeconomic strata and retired people (Faisal & Nirmala, 2020; Rudnick, 2020). Besides, places exhibiting the greatest inequalities and disparities in income as well as significant concentrations of marginalized, stigmatized, and disempowered populations, regardless of their geographic location, are also disproportionately at risk (Santiago & Smith, 2020). The reduction in the household income also have worsen the social stability and further social advancement. The loss of income that happened because of social restrictions, unemployment may increase the amount of crimes. The unemployed have more affected because of less income. Therefore, the reduction of household's income from the crisis has negative implications on societal wellbeing. That is, the disorganization and limits can interrupt the societal well-being. The overall damage on social well-being leads individuals to involve in various crimes. For instance, Rudnick, (2020) stated that there are peoples that used the pandemic as an opportunity to disorganize the society, particularly those they consider as socially undesirable. In return, the increasing number of crimes leads to uncertainty (Both economic and societal). Therefore, the socio-economic implications of COVID-19 is cyclical and difficult to locate the starting and ending points.

7. Managerial Implications

At this critical time, while saving lives is of course the utmost priority, governments must balance their responses to mitigate the negative consequences for businesses, economy, and the society since a major depression may also cost further lives (Austermann et al., 2020). Hence, the governments

should try to look for the socio-economic impacts of COVID-19, in order to respond through a coordinated strategy to reduce the consequences of the epidemic. Besides, to improve the health system and build the strong facilities and infrastructures which may support to respond effectively, it's crucial to protect both the economic and societal well-being. Therefore, it's recommended that the governments and policy makers consider these multidimensional frameworks simultaneously rather than considering a single aspect in order to effectively respond to the COVID-19 outbreak. Particularly, they have to work on how safely work and come back to the operations. The governments should also give considerations for the highly affected groups by the crisis including, the small firms (eg. providing credit access), and disadvantages and minorities (eg. Providing free access to health and other services).

8. Conclusion

COVID-19 brings various challenges including; economic difficulty and social crisis. Therefore, the socio-economic implication is one of the highest area that has been affected by the pandemic. This may bring many social and economic crises. The occurrence of COVID-19 brings severe disruptions in the business organizations, which further leads to unemployment, reduced income, labor market disruptions, and increasing in distress. More specifically, the sequential socioeconomic influence is integrated and difficult to locate its starting point. Then, we have seen the sequential impacts as a circle, which influences each other. The pandemic leads to the presence of high economic uncertainty. This economic uncertainty may have different implication on different economic sectors. For instance, the tourism sector is highly impacted because of the restriction on the transport and peoples movement. According to Faisal & Nirmala, (2020), there are other service sectors which are highly impacted such as beauty salon and food shopping in restaurants. The economic uncertainty has also different impact on the different sizes of firms. That is, SMEs are more impacted and requires emergency fund, relaxation of installment payments, and cutting interest rates compared to the larger firms.

9. Limitations and Future Research Implications

This study is not out of limitations. First, in this study we made a systematic review with secondary data sources in order to undertake comprehensive analysis. That evidence seems to be largely understood to mean research-based evidence, and not necessarily experiential, implementation based evidence from the field (Raja et al., 2020). Therefore, the future researchers should focus on obtaining original data's and conduct experimental researches. Second, the study of socioeconomic aspects of COVID-19 is wider in scope. However, it's necessitated to conduct a review since there are no sufficient publications in each specific subject matters. For future researchers, we recommend to conduct their study on specific subjects such as unemployment, household incomes, and financial deregulations.

Third, the political and legal decisions are required in every aspects of the socio-economic effects of COVID-19. In the search we made, we are unable to get relevant study that related the COVID19 outbreak with the legal and political aspects. Therefore, the political and legal aspects should be studied and integrated with the socio-economic implications of COVID-19. The major areas that requires flexible decision includes domestic violence, informal settlements (Cosgrove, 2020), irregular migrants (Nanthini, 2020), institutions and regulations (Auener et al., 2020). Consequently, future researchers should critically give consideration to these factors in association with the implications of COVID-19.

Fourth, the technological perspectives have also paramount importance in the socio-economic, health system, and overall environment, even if it's under researched. For instance, the dramatic experience of the global Covid-19 pandemic has highlighted the great difficulty of effectively monitoring patients with existing information systems (Hueber, 2020). Timely and integrated data are not only key in the fight against COVID-19, while digital technologies are useful also for prevention and surveillance measures [27]. Accordingly, the various areas to be considered and requires further clarification in the future research should include; health block chain (Hueber, 2020), Digital applications (Auener et al., 2020), Future nano-technologies and active filters (Gaddi & Capello, 2020). All this specific issue

should be considered and studied in association with socio-economic implications of COVID-19 in the future research.

ENTREPRENEURSHIP

Determining the Influence of Start-Up Capital Source on SMMEs Annual Turnover In The South African Informal Sector

Prof Petronella Jonck¹, Mrs. Lilian Nwosu²

¹ GIFT, North-West University, Mafikeng, South Africa

² Department of Accounting, North-West University, Mafikeng, South Africa

Keywords

Start-up capital; fiscal turnover; informal sector SMME's, bootstrapping, borrowed start-up capital

Abstract

Start-up capital has been shown to influence SMME turnover and by extension growth and development. The purpose of the research reported on was to investigate the impact of start-up capital source on the fiscal turnover of SMMEs' in the South African informal sector notably borrowed and own start-up capital. The motivation for the study could be found in the pivotal role of the informal sector in economic growth which has recently gained momentum and the availability of external sources of start-up capital which is an important indicator of entrepreneurship in addition to economic growth in a country. Secondary quantitative data from the National Survey of Employers and Self-Employed (SESE) downloaded from Statistics South Africa was used, yielding a final sample of 1658 respondents. By means of multiple regression analysis the research established that 3.1 percent of annual turnover could be attributed to own start-up capital, while 1.7 percent could be attributed to borrowed start-up capital. The most important finding relates to the direction of the correlations. Hence, when own start-up capital increases turnover decreased, whereas when borrowed start-up capital increased there was a concomitant increase in SMME turnover. Evidence generated could be utilised when debating expanding the informal sector.

1. Introduction

Small, Medium and Macro Enterprises (SMMEs) are regarded as the pillar of economic development as afore stated play a vital role in employment creation and poverty reduction (Chiromo & Nani, 2019; Ha, Nguyen & Dang, 2022). Despite the pivotal importance of SMMEs, they are confronted with many challenges, especially in the current post-COVID-19 circumstances which has negatively impacted the growth of the global economy (Ha *et al.*, 2022). Access to finance is one on the main critical challenges limiting the start-up, creation, survival, growth and development of SMMEs in most emerging economies (World Bank, 2019). The Organisation for Economic Co-operation and Development (OECD, 2019) substantiate the mentioned assertion and elaborate those challenges in accessing finance have significant negative impact on SMMEs start-up and innovative ventures. Ha *et al.* (2022) affirm that lack of start-up capital, lack of external debt, credit constraints, and equity are the core determinant influencing the performance *inter alia* turnover of SMMEs.

In the South Africa context, SMMEs include formally registered and informal businesses ranging from medium-size enterprises to informal micro enterprises (Small Enterprise Development Agency [SEDA], 2016). SMMEs in the South African informal sector are inclined to have more characteristics indicative of survivalist organisations compared to those in the formal sector. However, afore mentioned informal sector SMME's employ about 56 percent of the workforce and contribute approximately 45 to 50 percent to gross domestic product (Bhorat, Asmal, Lilenstein & Van Der Zee, 2018). In the developing country context, South Africa is comparatively unique as SMMEs in the informal sector are confronted by the challenge of raising start-up capital (Bhorat *et al.*, 2018; Ha *et al.*, 2022). As such, Beck and Cull (2014) noted that the usage of bank loans in Sub-Saharan Africa is lower than in other developing regions of the world irrespective of size of the venture. Wellalage and Fernandez (2019) argue that inadequate start-up capital sources and relatively high level of business law enforcement in South Africa are hindering the growth of informal sector activities. As such,

informal sector SMMEs have less start-up capital and not likely to fund core operations compared to the formal sector (Brixiová & Kangoye, 2016). Lekhanya (2015) cautions that the South African government should focus on creating diverse start-up capital sources for SMMEs especially those operating in the informal sector. Ha *et al.* (2022) assert that SMMEs start-ups in general are struggling to raise enough capital ascribed to limited access to credit facilities, low credit ratings and limited access to primary markets to sell shares and borrow funds. Rafiki (2019) found that the amount of start-up capital and borrowed start-up capital have significant influence on SMME's annual turnover.

Various studies (see for example, Bhorat *et al.*, 2018; Ha *et al.*, 2022, OECD, 2019, World Bank, 2019) both nationally and internationally have been conducted to investigate the impact of source of capital on SMMEs growth. Albeit the majority of studies underscore SMMEs in the formal sector with a paucity of research investigating the impact of start-up capital origin on the fiscal turnover of SMME's in the South African informal sector despite the important role thereof. Jonck and Nwosu (2022) reflecting on previous research (see for example, Essop & Yo, 2010; Fourie, 2018) emphasise the important role of the informal sector subsuming three-quarters of approximately 1.2 million home-based employees in informal employment as well as providing circa 850 000 paid employment opportunities, which represent almost twice the direct employment in the mining sector. In light of the afore stated, the research reported on attempts to address the lacuna in the body of knowledge based on the contention that source of start-up capital statistically significantly influences turn-over and thus SMMEs growth and development in the informal sector. The relevance of the study is underpinned by the contribution thereof to knowledge relating to informal sector SMMEs performance against the vital role thereof in financial growth (Jonck & Nwosu, 2022).

2. Problem Investigated

SMMEs are deemed instruments to address a plethora of socio-economics challenges since afore stated act as catalyst for economic activities (Muriithi, 2017). Ha *et al.* (2022) opine that determining the influence of start-up capital source on SMMEs fiscal turnover in the informal sector is critical for the survival and growth thereof. Inadequate start-up capital source has been cited as one of the main constrain affecting the turnover, performance, and growth of SMMEs in the informal sector (Ndiaye, Razak, Nagayev & Ng, 2018; The World Bank, 2019). The European Commission (2014) concur that inadequate start-up capital source is a common constrain for most SMMEs, especially among under-represented and disadvantage groups ascribed to a lack of own financial resources and collateral assets. According to Asian Development Bank (2014), access to start-up capital is a long-term barrier to SMMEs growth in several nations. Moreover, Beck and Cull (2014) noted that availability of external sources of start-up capital is positively associated with the number of start-up ventures, which in the economy is an important indicator of entrepreneurship and innovation as well as economic growth. It is extrapolated that approximately 30.0% of start-up SMMEs fail after a few years ascribed to inadequate start-up capital and inability to generate sufficient turnover (Lee & Kim, 2019; Solomon, Bryant, May & Perry, 2013). As such, source of start-up capital is an important determinant that drive SMMEs turnover in terms of the economic growth theory as well as the classical and neo-classical theoretical paradigms (Ha *et al.*, 2022).

3. Research Objective

The primary objective of the research reported on subsume investigating the impact of the origin of start-up capital on the fiscal turnover of SMMEs' in the South African informal sector notably borrowed and own start-up capital.

4. Hypotheses

The following hypotheses were formulated for the study:

- H₁: The variance in SMME's annual turnover can statistically significantly be attributed to own start-up capital.
- H₂: The variance in SMME's annual turnover can statistically significantly be attributed to borrowed start-up capital.

5. Literature Review

Despite similarities in the functioning of SMMEs in the development of various economies internationally, there appears to be no universal definition of SMMEs (Berisha & Pula, 2015). As such, the definition of SMMEs is based on criteria, *inter alia*, turnover, sales, level of capitalisation and number of employees, which differs in accordance with country or region (Chiromo & Nani, 2019; Muriithi 2017). The South African definition of SMMEs includes both registered and informal businesses. SEDA (2016) noted that SMMEs can range on a continuum from medium-sized enterprises, for example established household organisations with a workforce comprising of over 100 employees to informal micro-enterprises. The National Small Business Act, Act 102 of 1996 define micro-enterprises as business entities operated by owners with a maximum of five employees and a turnover of less than R150 000 per annum, while very small enterprises are informal businesses that have access to technology employing less than ten paid employees (Republic of South Africa, 1996). The focus of the research reported on is on SMMEs in the informal sector. SMMEs in the informal sector play a core role in most economies across the globe, especially in third world and emerging countries (Ndiaye *et al.*, 2018). The World Bank estimated that SMMEs in the formal sector represent approximately 90.0% of commerce and contribute about 40.0% of gross domestic product as well as up to 60.0% of employment in emerging and developing countries (The World Bank, 2019). Ndiaye *et al.* (2018) further contend that these figures will be much higher if SMMEs in the informal sector were to be included. However, access to start-up capital is a key limitation to SMMEs growth. Due to the impact of the COVID-19 pandemic, SMMEs in the informal sector are finding it difficult to raise capital to continue operations hampering growth and development (Ha *et al.*, 2022). Size of the SMME has also been identified as a constraint with specific reference to financing of start-up capital (see for example, Beck & Cull, 2014; The World Bank, 2019).

Start-up capital is referred to as the financial resources required by a venture to generate new business activity (Carlson, 2020). Raising start-up capital is a vital step in initiating a SMME. Managerial economist uses the term capital to describe the cash and investment utilised in day-to-day operations (Mankiw, 2021). The source of start-up capital can be from the owner of the enterprise, or it can be borrowed from different lenders such as banks, households and other lending institutions (Amadeo, 2020; Ha *et al.*, 2022). Carlson (2020) opined that some of the start-up capital sources available for SMMEs include personal investment, borrowing from significant other such as parents, family or friends, venture capital, government grants and subsidies as well as bank loans. Hwang, Desai and Baird (2019) found that source of start-up capital can be either external or internal. External sources of start-up capital include, for example from the private sector (i.e., banks or investment companies), from the public sector (i.e. government grants or subsidies) or from non-formal organisations. Internal start-up capital also known as bootstrapping, is when the entrepreneur uses own funds to launch a start-up (Carlson, 2020). This source of start-up capital might have a significant influence on SMME turnover. Watson and Wilson (2002) conducted a study among SMEs in the United Kingdom and found that own start-up capital or bootstrapping were the main desired source of capital, followed by loans. Rand *et al.* (2015) in their study found that turnover revenue is the largest source of capital for SMMEs in Vietnam. Haynes and Brown (2009) argued that although external funding is crucial, own start-up capital is essential for small business start-up ventures. As new SMMEs can use own start-up capital more efficiently to improve turnover (Rafiki, 2019; Zarrouk *et al.*, 2020). Mateev and Anastasov (2010) concurred that the turnover growth of SMMEs to a larger extent depends on internal capital or own start-up capital.

However, borrowed start-up capital such as bank loans are the most commonly used source of finance for small and medium-size enterprises. SMMEs seeking start-up capital can source finance through a variety of credit facilities such as a business loan (Carlson, 2020). Beck and Cull (2014) noted that the use of bank loans in Sub-Saharan Africa is lower in comparison to other developing regions in the world. The Asian Development Bank (2014) contend that SMMEs in most emerging economies often have limited access to either borrowed and or own start-up capital. SMMEs inability to obtain start-up capital through external funding can have a significant impact on SMME turnover (Ha *et al.*, 2022). Howbeit mixed research results are reported with reference to the impact of borrowed start-up capital. For example, debt financing or credit constrains is one of the major barriers to the growth of SMMEs

as it requires repayment of principal capital and interest thereby reducing possible cash flow. In a study among SMMEs in the Italian manufacturing industry, Becchetti and Trovato (2002) found that external source of capital has a negative impact on SMMEs turnover. Mateev and Anastasov (2010) argue that external capital (borrowed start-up capital) is needed for SMMEs to buy assets to increase production capacity. Based on data obtained from Swedish small- and micro- enterprises, Heshmati (2001) reported that loan obligation positively affects turnover growth.

6. Research Methodology

Secondary data analysis was employed in the research reported based on an open-source data set downloaded from the Statistics South Africa portal. Johnston (2014) expound that secondary data analysis primarily refers to the analysis of a data set that was collected by a reputable stakeholder for an alternate primary purpose. Furthermore, afore mentioned is a systematic methodology grounded in procedural and evaluative phases encompassing hypothesis development, identification and evaluation of the nominated data set. Retrieving secondary data from a trustworthy electronic platform, for example Statistics South Africa necessitate studying the data set particulars (i.e., Meta data) such as the measuring instrument, statistical release, current output and access conditions explicitly a case by variable data matrix under the ambit of a quantitative research methodology indicative of an evaluation procedure. Hence, the principal research design employed subsume a quantitative approach. Quantitative research can be demarcated as a process of analysing numerical data that allow for statistical extrapolations (Apuke, 2017). The mentioned quantitative data analysis denoted findings from the Survey of Employers and the Self-Employed (SESE), conducted by Statistics South Africa in the third quarter of 2017 embargoed until March 2019.

The SESE is a domestic household-based survey administered to provide inclusive evidence-based findings with reference to small and medium-sized entities (SME's) in the South African informal sector underscoring financial management of SME's not registered for Value Added Tax (Statistics South Africa, 2019). The SESE was piloted in 2001 and carried out longitudinally since with a three-year time period amid iterations. Specifically, the afore stated measuring instrument comprised 83 items covering nine aspects related to SMME's, inter alia business, operations, general, costs, expenditure, capital, transport, business registration and financial inclusion. A biographical section was included to gather information from respondents related to gender, age, educational level, location to mention a few (Statistics South Africa, 2019).

Respondents' demographic information was utilised to provide a profile of the sample. The final SESE sample contains a total number of 1658 (n = 1658) respondents covering nine provinces within South African. Per se, 22.0% (n = 364) of the sample originated from Limpopo, followed by 19.4% (n = 322) from Gauteng, 14.1% (n = 233) from Mpumalanga, 13.6% representing 225 respondents from KwaZulu-Natal, 11.6% (n = 192) from the Eastern Cape, 7.1% (n = 117) from the Free State, 6.3% (n = 105) from the North-West Province, 4.9% (n = 82) from the Western Cape and 1.1%, representing 18 respondents, from the Northern Cape. The sample was approximately equally distributed with reference to gender categorization. Namely 50.5% of the sample (n = 844) indicated their gender categorisation as male, whereas 49.1%, representing 814 respondents, identified as female. Bearing in mind, the age distribution, 27.6% (n = 457) of the sample were between the ages of 40 and 49 years, followed by respondents between the age of 30 and 39 years (n = 426; 25.7%), respondents between 50 and 59 years (n = 386; 23.3%), and respondents between 20 and 29 years (n = 229; 13.8%). Respondents 60 years and older represented 9.5% of the sample (n = 159), while respondents younger than 20 years of age represented only 0.1% of the sample, thus 2 respondents. Considering population group, most of the sample (n = 1 541, 92.9%), selected African and/or Black as racial categorisation. The remnant of the sample included 3.1% (n = 52) white respondents, 2.7% (n = 44) coloured and 1.3% (n = 21) Indian and/or Asian respondents. With reference to respondents' marital status, 38.5% (n = 638) of the sampled identified as married, whereas 34.8% (n = 577) specified they have never been married. Subsequently, 12.8% (n = 213) of the sample were co-habiting, with 10.0% (n = 165) identifying as either a widow or widower. Finally, 65 respondents, representing 3.9% of the sample, were either divorced or separated. Reporting on educational qualification, due consideration should be given to the fact that the data set was recoded to include the following categories, namely secondary

formal schooling (n = 1 507; 90.9%), technical qualification (n = 13; 0.8%), diploma or degree (n = 91; 5.5%), honours degree (n = 20; 1.2%), postgraduate qualification (n = 8; 0.5%) and 19 respondents representing 1.1% of the sample classified as unable to be categorised in the given categories.

Table 1: Demographic profile of the sample

Variable		N	%	Cumulative %
Province	Western Cape	82	4.9	4.9
	Eastern Cape	192	11.6	16.5
	Northern Cape	18	1.1	17.6
	Free State	117	7.1	24.7
	KwaZulu-Natal	225	13.6	38.2
	North-West	105	6.3	44.6
	Gauteng	322	19.4	64.0
	Mpumalanga	233	14.1	78.0
	Limpopo	364	22.0	100.0
Gender	Male	844	50.9	50.9
	Female	814	49.1	100.0
Age	Younger than 20	2	0.1	0.1
	Between 20 and 29	229	13.8	13.9
	Between 30 and 39	426	25.7	39.6
	Between 40 and 49	457	27.6	67.2
	between 50 and 59	386	23.3	90.5
	60 years and older	158	9.5	100.0
Population group	African/Black	1541	92.9	92.9
	Coloured	44	2.7	95.6
	Indian/Asian	21	1.3	96.9
	White	52	3.1	100.0
Marital status	Married	638	38.5	38.5
	Co-habiting	213	12.8	51.3
	Widow/Widower	165	10.0	61.3
	Divorce or separated	65	3.9	65.2

Educational level	Secondary formal schooling	1507	90,9	90,9
	Technical qualification	13	0,8	91,7
	Diploma / degree	91	5,5	97,2
	Honours Degree	20	1,2	98,4
	Postgraduate	8	0,5	98,9
	Other	19	1,1	100,0

Source: Own compilation

Statistics South Africa employed a two-pronged sampling strategy to arrive at the sample expounded on above. More specifically, ascribed to the absence of a standardised sampling frame purposive

sampling was used to classify respondents in accordance with the Quarterly Labour Force Survey (QLFS) administered in the third quarter. Purposive sampling, even though a nonprobability sampling approach, is used when the population is indefinite focusing on respondents with predetermined characteristics best deemed to meaningfully contribute to the research project (Etikan, Musa & Alkassim, 2016). Furthermore, a maximum variation sampling strategy or heterogeneous sampling was used, to select respondents across a comprehensive spectrum underscoring the study topic. Hence, SMME's from various sectors was included in the sample (see Table 2 below for a detailed description), namely trade (51.5%), community and social services (12.2%), construction (12%), finance (7.9%), manufacturing (7.3%), transport (5.8%) and agriculture (1.6%). Trained enumerators in the SESE sector were responsible for data gathering (Statistics South Africa 2019), while data management required cleaning the spreadsheet excluding variables outside the scope of the study. After data cleaning the spreadsheet was imported to the Statistical Package for Social Sciences (SPSS) version 27.

Table 2: SMME sector

Variable - sector	N	%	Cumulative %
Growing of crops	25	1.5	1.5
Farming of animals	11	0.7	2.2
Manufacture of other food products	9	0.5	2.7
Manufacture of beverages	13	0.8	3.5
Manufacture of other textiles	10	0.6	4.1
Manufacture of knitted and crocheted fabrics and articles	5	0.3	4.4
Manufacture of wearing apparel	43	2.6	7.0
Manufacture of footwear	2	0.1	7.1
Manufacture of products of wood	2	0.1	7.2
Manufacture of non-metallic mineral products	10	0.6	7.8
Manufacture of structural metal products	15	0.9	8.7
Manufacture of other fabricated metal products / metalwork	16	1.0	9.7
Manufacture of motor vehicles	1	0.1	9.8
Manufacturing general	6	0.4	10.1
Building of complete constructions or parts thereof	108	6.5	16.6
Building installation	28	1.7	18.3
Building completion	43	2.6	20.9
Wholesale trade in non-agricultural intermediate products	1	0.1	21.0
Specialised retail trade	2	0.1	21.1
Retail trade not in stores	777	46.9	68.0
Repair of personal and household goods	29	1.7	69.7
Maintenance and re-pair of motor vehicles	56	3.4	73.1
Sale	1	0.1	73.2
Hospitality i.e., hotel accommodation	8	0.5	73.6
Restaurants	14	0.8	74.5
Alcohol retail in a Shebeen	6	0.4	74.8
Transport	82	4.9	79.8

Cash loans	2	0.1	79.9
Financial intermediation	1	0.1	80.0
Real estate activities with own or leased property	69	4.2	84.1
Renting of other machinery and equipment	5	0.3	84.4
Renting of personal and household goods	1	0.1	84.5
Software consultancy and supply	6	0.4	84.9
Maintenance and repair of office	1	0.1	84.9
Architectural	5	0.3	85.2
Business activities not elsewhere classified	20	1.2	86.4
Educational activities i.e., day care	7	0.4	86.9
Human health activities	44	2.7	89.5
Social work activities	22	1.3	90.8
Activities of other member-ship organizations	4	0.2	91.1
Motion picture	6	0.4	91.4
Other service activities	116	7.0	98.4
Not specified	26	1.6	100.0

Source: Own compilation

Statistically linear multiple regression modelling was used to test the research hypotheses which stated that:

H₁: The variance in SMME's annual turnover can statistically significantly be attributed to own start-up capital.

H₂: The variance in SMME's annual turnover can statistically significantly be attributed to borrowed start-up capital.

The primary purpose of regression modelling is to predict Y centred on X or to describe Y in accordance with X. In the case of multiple regression modelling Y has a normal distribution expressed as (Alexopoulos, 2010):

$$Y = B_0 + B_1X_1 + \dots + B_pX_p + \sigma(Y), \text{sd}(Y) = \sigma(\text{independent of } X)$$

Where B₀ represent the intercept, while B₁ B_p refers to the regression coefficients and σ the residual standard deviation. Prior to inferential statistical analyses, descriptive analysis was performed to provide a profile of the sample in addition to contextual information relating to start-up capital. Secondary coded data was exploited in the research project, thus no interaction with human and or animal participants occurred. Moreover, the dataset used has been published on a public platform adhering to the POPI Act requirements.

7. Results and Findings

The primary research objective of the research reported on subsume investigating the impact of the origin of start-up capital on the fiscal turnover of SMME's in the South African informal sector. To provide context to the inferential statistical analyses, Table 1 depicts findings from the descriptive analysis.

Table 3: Descriptive statistics

Variable	Level of the variable	N	%	Cumulative %
Finding financial support	Yes	979	59.0	59.0
	No	679	41.0	100.0

Usage of own money as start-up capital	Yes	731	74.7	74.7
	No	248	25.3	100.0
Main source of start-up capital	Wage employment	396	54.2	54.2
	Other business	35	4.8	59.0
	Sale of livestock/crops	11	1.5	60.5
	Sales of other assets	16	2.2	62.7
	Inheritance	24	3.3	66.0
	Pension from work	25	3.4	69.5
	Retirement/severance pay	23	3.2	72.6
	An investment policy that matured	1	0.1	72.7
	Money paid from 'stokvel'	41	5.6	78.4
	Other savings	62	8.5	86.8
	Old age grants	17	2.3	89.2
	Other social grants	79	10.8	100.0
	Amount of own start-up capital	0 to 49 000	694	95.2
50 000 to 99 000		21	2.9	98.1
100 000 to 149 000		5	0.7	98.8
150 000 to 199 000		2	0.3	99.0
200 000 and more		7	1.0	100.0
Origin of borrowed start-up capital	Loans from banks	12	6.2	6.2
	Loans from friends and relatives	150	76.9	83.1
	Loans from credit societies / 'stokvel'	10	5.1	88.2
	Loans from moneylenders	16	8.2	96.4
	Others	7	3.6	100.0
Annual fiscal turnover	R0 - R199 999	1074	97.8	97.8
	R200 000 - R399 999	18	1.6	99.5
	R400 000 - R599 999	2	0.2	99.6
	R600 000 and more	4	0.4	100.0

Source: Own compilation

According to Table 3 above, 59.0% of the sample representing 979 respondents noted that they were able to obtain financial support for the SMME, while 41.0% (n = 679) indicated the alternative. Moreover, 74.7% (n = 731) specified that the start-up capital was provided by the respondents themselves, while 25.3% (n = 248) obtained start-up capital from other sources. The main sources of start-up capital in descending order include previous and or present wage employment (n = 396; 54.2%), social grants (n = 79; 10.8%), other savings (n = 62; 8.5%), money paid out from a 'stokvel' (n = 41; 5.6%), alternative ventures (n = 35; 4.8%), pension from work (n = 25; 3.4%), inheritance (n = 24; 3.3%), retirement or severance pay (n = 23; 3.2%), old age grants (n = 17; 2.3%), sales of other assets (n = 16; 2.2%), sale of livestock or crops (n = 11; 1.5%) and lastly an investment policy that matured (n = 1; 0.1%). Reflecting on the amount of own funding used as start-up capital, respondents indicated that in the majority of cases (n = 694; 95.2%) less than R49 000.00 were invested as start-up capital, followed by 2.9% (n = 21) of the sample who invested between R50 000 and R99 000. Furthermore, 5 respondents (n = 5; 0.7%) invested between R100 000 and R149 000, while 2 respondents (n = 2; 0.3%) invested between R150 000 and R199 000 and lastly 7 respondents representing 1.0% of the sample invested R200 000 and more. When considering the sources of borrowed start-up capital, the majority of the sample i.e., 76.9% (n = 150) engaged in informal lending such as loans from friends and relatives, followed by loans from moneylenders (n = 16; 8.2%), loans from commercial banks (n = 12; 6.2%), loans from credit societies and or 'stokvel' (n = 10; 5.1%) and 3.7% of the sample representing 7 respondents selected other. With reference to annual

fiscal turnover, the majority of the sample (n = 1074; 97.8%) had a turnover of less than R199 999.00, while 1.6% (n = 18) of the SMME's had a turnover of between R200 000 and R399 999.00, 0.2% (n = 2) had a turnover of between R400 000 and R599 999.00 and lastly only 0.4% of the sample representing 4 SMME's had a turnover of R600 000 or more.

Multiple regression analyses were performed to determine the variance in annual fiscal turnover on relation to the origin of start-up capital i.e., own or borrowed start-up funding with results illustrated in Table 4 below.

Table 4: Multiple regression analysis with annual fiscal turnover as dependent variable

Variable	B	t	P	ΔR^2	R ²	F
Own start-up capital	-0.031	-0.785	0.433	-0.001	0.001	0.615
Borrowed start-up capital	0.017	0.426	0.670	-0.001	0.000	0.181

Note: β , Beta; p, statistical significance; ΔR^2 , adjusted r square, R², r square

Source: own compilation

As can be deduced from Table 4, own start-up capital did not statistically significantly predict annual fiscal turnover ($\beta = -0.031$; p = 0.433). More specifically 3.1 percent of the variance in annual fiscal turnover could be attributed to own start-up capital howbeit not statistically significantly. The relationship direction was negative thus as own start-up capital increase there would theoretically be a concomitant decrease in annual fiscal turnover. In the same vein, borrowed start-up capital did not statistically significantly predict annual fiscal turnover ($\beta = 0.017$; p = 0.670). More specifically 1.7 percent of the variance in annual fiscal turnover could be attributed to borrowed start-up capital. The relationship direction was positive thus as borrowed start-up capital increase there would hypothetically be a concomitant increase in annual fiscal turnover.

8. Policy Implications

One of the important areas of policy action involves increasing access to external or borrowed start-up capital for SMMEs, especially those in the informal sectors. As such, the OECD (2019) opine that ensuring SMMEs have access to the right source and amount of start-up capital is essential for SMMEs development and growth. Thus, policy directives should focus on emphasising capital investments specifically aimed at SMME development instead of SMMEs using social grants, “stokvel” money or loans from family and friends which might be less than required to ensure adequate SMME turnover and growth. Moreover, the article has practical and theoretical implications. In practice, this study can serve as a reference source for SMME owners when deciding on the best start-up capital source that will contribute positively towards generating turnover. Theoretically, this paper contributes to the corpus of knowledge on SMMEs start-up capital sources, and fiscal turnover with specific reference to the South African informal sector.

9. Conclusions and recommendations

The primary objective of the research reported on subsumed investigating the impact of the origin or source of start-up capital on the annual fiscal turnover of SMMEs in the South African informal sector underscoring specifically own start-up capital versus borrowed start-up capital. Despite the pivotal role of informal sector SMMEs in the South African context limited empirical evidence could be identified that investigated the topic under discussion. Hence, source of start-up capital could be deemed a novel research area and a possible success factor with specific reference to SMME growth and development. This contention is based on the assertion that availability of external start-up capital is hypothesised to be positively correlated to the amount of start-up ventures and an indicator of entrepreneurship within a country.

To contextualise the findings of the study, 97.8% of the sample represented micro- to small enterprises in the informal sector with less than R199 999 annual turnover. Moreover, 95.2% of the sample indicated that the amount of start-up capital invested ranged between R0 to R49 999. Afore stated confirm research by Brixiová and Kangoye (2016) in that informal sector SMMEs have less

start-up capital and not likely to fund core operations compared to the formal sector. Results presented indicated that 74.7% of the sample used bootstrapping to fund the start-up venture, while 25.3% noted other sources of funding. In terms of specifically borrowed start-up capital, 20.0% of the sample indicated that they sourced external funding in the form of loans to fund the SMME. To delineate further, the main sources of bootstrapping included wage employment (54.2%), social grants (10.8%), savings (8.5%) and “stokvel” money (5.6%). With reference to borrowed start-up capital 76.9% requested a loan from family and or friends. Only 6.2% of the sample applied for a bank loan to fund the SMME. Results presented confirm research findings by Carlson (2020) which identified similar start-up capital sources available for SMMEs include personal investment, borrowing from significant other such as parents, family or friends, government grants and subsidies as well as bank loans. Results of the study also confirm those by Watson and Wilson (2002) who conducted a study among SMEs in the United Kingdom and found that own start-up capital or bootstrapping were the main desired source of capital. The fact that only 6.2% of the sample used a bank loan to fund the SMME verify research by Beck and Cull (2014) which noted that the use of bank loans in Sub-Saharan Africa is lower in comparison to other developing regions in the world.

Results from the multiple regression analysis revealed that 3.1 percent of annual turnover could be attributed to own start-up capital, while 1.7 percent could be attributed to borrowed start-up capital. However, neither own start-up nor borrowed capital sources had a statistically significant effect on annual fiscal turnover of informal sector SMMEs. The most important finding relates to the direction of the correlation. As such, when own start-up capital increases turnover decreased, whereas when borrowed start-up capital increased there was a concomitant increase in SMME turnover. This finding contradicted research by Ha *et al.* (2022) on Vietnamese SMEs which revealed that own start-up capital has a significant impact on the sales (turnover) growth of SMMEs, while borrowed start-up capital had a negative effect on SMEs turnover growth. Notwithstanding, results presented confirm those by Mateev and Anastasov (2010) which argued that external capital (borrowed start-up capital) is needed for SMMEs to buy assets to increase production capacity. Similarly, based on data obtained from Swedish small- and micro- enterprises, Heshmati (2001) reported that loan obligation positively affects turnover growth.

In conclusion, the turnover growth of SMMEs require internal capital (own start-up capital) but to a large extent external capital (i.e., borrowed start-up capital) would increase annual fiscal turnover as it is presumed that borrowed start-up capital would be invested to acquire assets to increase production capacity. Availability of external start-up capital could hypothetically be identified as a success factor in SMMEs growth and development in the South African informal sector. Governments’ role in fostering informal sector SMMEs should be intensified, especially since the financial system and the economic condition in South Africa seems to be a potential stumbling block for SMMEs to access enough financial assistance in the form of own start-up and borrowed capital. The assertion is in accordance with Lekhanya (2015) who cautioned that the South African government should focus on creating diverse start-up capital sources for SMMEs operating in the informal sector.

Acknowledged caveat’s part and parcel of the research reported on should be taken into consideration when interpreting the results. Firstly, secondary data downloaded from a reputable source was utilised and consequently subject to the suppositions made in the statistical release. Secondly, lack of transparency and incomplete data could lead to an unbalanced dataset. Thirdly, the sample size of this study was 1658 (n = 1658) respondents and could potentially be enlarged in future research to increase generalisability. Fourthly, this paper focused on two sources of capital, namely own money as start-up capital and borrowed start-up capital. Future study should include more capital structures in order to increase the accuracy of the regression model.

Abstract

In an entrepreneurial landscape that is fast paced and ever changing, entrepreneurial decision-making and the speed at which decisions are to be made, are of paramount importance. The research reports the results of an exploratory qualitative study of 14 entrepreneurs.

Participants stated that varying leadership styles are required in order to make decisions. Risks involved, level of education, personal values, skills development and lived experiences also play a role in decision-making. A final theme that emerged, was that government is a barrier to entrepreneurial decision-making. It is thus recommended that entrepreneurs need to be aware of their journey and identity as entrepreneur at the stage of decision-making, because it can influence their decision-making ability.

1. Introduction

1.1. Background

Entrepreneurial decision-making is largely guided by rationality, emotion and intuition (McKinsey, 2020). In a business landscape that is ever changing and fast paced, decision-making and the speed at which decisions are to be made, are of paramount importance as it has a direct impact on competitiveness (Ilonen, Heinonen & Stenholm, 2018; McKinsy, 2020). Entrepreneurial decision-making can be described as a multifaceted and complex approach made within an environment of uncertainty and unpredictability. Subsequently, entrepreneurial success and competitiveness relies heavily on their decision-making ability (De Winnaar & Scholtz, 2020).

Studies conducted in the past largely focused on an entrepreneur's decision-making strategy relative to causation and effectuation (Ilonen et al., 2018). Sarasvathy (2001) describes the theory of effectuation as a process in which entrepreneurs make decisions and perform specific actions in order to achieve goals and solve business problems. The theory purports that entrepreneurs make decisions based on a future that is inherently unknown and unpredictable.

According to Jones, Ratten, Klapper and Fayolle (2019), entrepreneurial identity can also change over time, based on context and the socioeconomic environment. Furthermore, entrepreneurial identity can influence an entrepreneur's behaviour and decision-making ability. Entrepreneurial identity is thus fluid in nature and subsequently can affect the decision-making process (Martina, 2019). Factors influencing entrepreneurial decision-making that will eventually lead to competitive and sustainable advantage, still needs investigation. Hence, the intention and purpose of this article is to assess the factors influencing the decision-making process of South African entrepreneurs in creating competitive advantage.

1.2 Problem statement

Building and maintaining sustainable SMME's has a direct impact on economic growth (Olawale, 2014), there is thus an urgent need both locally and internationally to uncover the influences and

*Corresponding Author

drivers that lead to the success (and failures) of SMME's of which decision-making is one. The article aims to better understand the factors that enable or hinder decision-making within South African SMME's. These factors need to be identified, because effective decision-making can become a competitive advantage for fast-paced entrepreneurs.

1.3 Research questions, aims and objectives

The main research question investigated by this paper is: What factors influence entrepreneurial decision-making within SMME's in South Africa that drive competitive advantage? This question was supported by asking in the sub-questions about the influence of leadership styles, the effectuation theory, and competitiveness on decision-making. The objective of the research was thus to identify the factors influencing the decision-making process. The aim is to, once the factors have been identified, make entrepreneurs aware of how they can speed up the decision-making process, because fast and effective decision-making can become a competitive advantage for SMME entrepreneurs.

1.4 Methodology

An exploratory research design within the interpretivist paradigm, according to a qualitative research methodology, was employed to support the primary research question by exploring factors that influence the decision-making process of entrepreneurs within South African SMME's.

Semi-structured interviews were adopted to collect data (Saunders & Lewis, 2012; Wegner, 2018). Data collection was conducted through open ended questions. During the interviews participants were encouraged to give feedback based on their own lived experiences and views. Entrepreneurial decision-making, identity and leadership theories were the pivot during the discussion and insured that the conversations remained within the parameters of the subject.

1.4.1 Population and sample

The research sought to identify a group of individuals within a predefined context with similar characteristics. The population identified, was relevant in that all participants were entrepreneurs with varying years of experience, operating multiple businesses, and all of whom are key decision makers within the requisite businesses. Non-probability sampling was used due to the limited amount of exact data and the informal nature within the SMME sector (Saunders et al. 2012). In order to remove sampling-bias, a selection criterion was adopted, namely entrepreneurs who have managed to successfully opened and run more than one business for more than five years..

The intention of this ensured that a cross sectional analysis seeking to understand the impact of entrepreneurial identity and leadership styles and its influence on decision-making was attained. For purposes of the research the sampling method employed was purposive wherein participants with similar characteristics were selected in order to address the outlined goals of the research project and subsequently answered the research questions.

In order to achieve the number of participants required the researcher employed the snowball sampling method whereby participants were able to recommend other entrepreneurs within the industry and context whom fit the criteria and are able to support in answering the research questions. This process is key in accessing relevant participants whom may provide rich insight into how entrepreneurs make decisions through the different life stages of their entrepreneurial lifecycle relative to the effectuation theory.

The snowball method proved to be very useful as the researcher was able to gather deep and insightful data from participants that were referred to the researcher by participants already interviewed. By means of employing the purposive sampling method alone the researcher would have lost this opportunity. Therefore, the researcher collected data from 14 participants until data saturation was realised.

1.4.2 Analysis approach

In order to substantiate the exploratory nature upon which the research was designed, the research project made use of content analysis in order to analyse the data gathered during the semi-structured interviews. Interviews were recorded and transcribed through software platforms, namely Microsoft teams and Otter.ai. The transcribed data was submitted into the software tool Atlas.ti, to assist with coding and theme identification.

2. Literature Review

Sarasvathy (2001; 2008) describes the theory of effectuation as a process in which entrepreneurs make decisions and perform specific actions in order to achieve goals and solve business problems. The theory implicates, entrepreneurs make decisions based on a future that is inherently unknown and unpredictable. The effectuation theory is common practice for entrepreneurial decision-making. It has been observed that entrepreneurial identity is a fluid construct and naturally changes during the entrepreneurial process and journey (Martina, 2019). Entrepreneurs can adopt simultaneous identities during the decision-making process.

2.1 Small Business Landscape

The Department of Small Business Development defines SMME's through three metrics that cover: the number of total employees, total asset value as well as the total turnover that a business produces. SMME's have been classified into three distinct categories which include small, micro and medium businesses. Countries motivate the development of SMME's with the intention of expanding the economy, creating jobs and reduce unemployment (National Planning Commission, 2011). In contrast with this intention, South Africa finds itself in a precarious position with regards to the survival rate of SMMEs when compared to global statistics. Research shows that around 75% of SMME's within the first few years of business fail (Freidrich, 2016).

2.2 Entrepreneurship as a theory

Entrepreneurs are commonly depicted as key drivers of economic advancement possessing the innate ability to recognise and uncover potential opportunities giving them the aptitude to navigate future uncertainty and change (Ramoglou, 2021). Naumann (2017) states that entrepreneurs possess specific attributes which include the ability to set goals based on specific tasks, to spot opportunities and to take risks. Entrepreneurs have an innate ability to solve problems and identify needs. This stems from lived experiences, level of skill, knowledge base and their entrepreneurial network.

Entrepreneurship is surrounded by three concepts that define the theory. These could be outlined as the level of risk, the degree of uncertainty and the context in which entrepreneurship occurs (Greene, 2020). These components are fundamental within the theories of entrepreneurship. Innovation theory, normally caused by a disruption, initially purported by Schumpeter has a distinct focus within entrepreneurship (Upadhyay & Rawal, 2018). According to Schumpeter inventors develop and discover new models and frameworks however, innovators surround themselves with the discovery of new inventions which aim to improve the context (after a disruption) in which it was invented. Schumpeter's innovation theory acknowledges entrepreneurship and the direct link it has with both business and new inventions, resulting in continuous entrepreneurial business development (Mehmood, Haitham, Alshurideh, Al-Gasaymeh & Ahmed, 2019).

McClelland base his theory on the entrepreneur's needs for achievement, power and affirmation and the subsequent factors that drive it (Warren, 2020). Within this context internal factors such as value and motivation that advance the exploitation of opportunity and conditions relative to trade are paramount and consequently of utmost importance when considered in conjunction with innovative characteristics associated with entrepreneurship. It can therefore be argued that this theory focuses on an entrepreneur's innate desire and need of achievement (Aparna, 2020). McClelland indicated that entrepreneurs with a higher need for achievement value reward as more than just monetary incentive (Aparna, 2020).

2.3 Effectuation

At the beginning of the 21st century the approach called effectuation got associated more regularly with entrepreneurship (Sarasvathy, 2001). This theory purported an alternate dimension and approach within the field of entrepreneurial decision-making which went against the status quo and norms of the theory of causation. This theory sought to outline how entrepreneurs made use of a set of heuristics within environments of uncertainty. The notion furthermore purported entrepreneurs create opportunities for themselves as opposed to searching for them. This paradigm shift of the entrepreneurial process outlines principles that guide decision-making through the use of effectual logic (Sarasvathy, 2001; 2008). According to Fisher (2012), effectuation is a practical theoretical construct within which entrepreneurial decision-making actions are outlined. Perry, Chandler and Markova (2012), critiqued that the theory of effectuation was yet to be effectively verified and practically tested. Arend, Sarooghi and Burkemper (2015), are also critics of the theory by stating that the theory of effectuation is lacking in originality and it is ambiguous.

The theory of effectuation contends that it is a process in which entrepreneurs make decisions and perform specific actions in order to achieve goals and solve business problems. The theory contends that entrepreneurs make decisions based on a future that is inherently unknown and unpredictable. According to Sarasvathy (2001), entrepreneurs employ effectuation during the pursuit of subsequent entrepreneurial opportunities.

Entrepreneurs outline objectives required in order to advance entrepreneurial opportunities. By so doing they make use of current skills and means (Perry, Chandler & Markova, 2012). Effectuation further states that objectives are not clearly envisioned at inception however, effectuation processes are rigid and inflexible in nature therefore, entrepreneurs are able to exploit environmental contingencies by taking advantage of them and as a subsequent consequence learning throughout the entrepreneurial journey (Perry et al., 2012). Thus, effectuation as purported by Sarasvathy (2001; 2008), epitomizes a paradigmatic shift within the traditional notions of entrepreneurship as a school of thought consisting of different methods of decision-making such as:

2.3.1 Bird in hand

The “Bird in hand” theory is based on a set of principles of which the foremost being that whereby entrepreneurs make decisions and create entrepreneurial opportunities based on their own personal means of who they are, what they know and whom they know. This principle can be expressed as the foundation and core unto which the theory of effectuation is built as it differentiates itself from what effectuation is and subsequently what the theory is not as it clearly outlines and distinguishes itself from other decision-making theories, namely causation (Fisher, 2012).

2.3.2 Affordable loss

The affordable loss principle states that entrepreneurs make decisions with the intention to limit risks through an inherent understanding and acceptance of what they can afford to lose (Sarasvathy, 2008). This notion stands to reason then that an entrepreneur’s decision-making ability is rigid, based on the above premise. This principle focuses on limiting the potential losses that an entrepreneur might face in the pursuit of an entrepreneurial opportunity.

2.3.3 Lemonade

This principle dictates that entrepreneurs have the ability to leverage contingency. Entrepreneurs actively seek out worst case scenarios in order to uncover potential initiatives and opportunities which ultimately facilitate decision-making.

Entrepreneurs have an innate flexibility which allows them to exploit environmental contingencies within uncertainty. Due to the future being inherently unknown, effectual decision-makers employ an adaptability which seeks to capture the opportunity which are direct results of uncertainty (Sarasvathy, 2008; 2009).

2.3.4 Patchwork quilt

The patchwork quilt metric within the construct of effectuation relies on partnerships. Entrepreneurs focus on building networks and partnerships with the intention of mutual synergy and success. Strategically selected partners provide entrepreneurs with an innate ability to remove uncertainty early on and assist in the decision-making process.

2.3.5 Pilot in the plane

The fifth construct is that of the pilot in the plane metric. This analogy of a pilot in a plane, outlines how entrepreneurs focus on actions within their control and subsequently through the employment of this metric decisions lead to desired outcomes (Sarasvathy, 2008). Moreover, within environments of uncertainty and unpredictability effectual entrepreneurs seek to actively control influences and outcomes thereby plotting out a course that leads to future success through risk mitigation, the management of resources and leveraging partnerships (Sarasvathy, 2008).

Table 1: Effectuation Theory of Sarasvathy summarised

Effectual Principle	Meaning
Bird in hand	<ul style="list-style-type: none"> • Who am I? • What do I know? • Whom do I know? (Means)
Affordable loss	Price that I am willing to pay to give myself the opportunity to achieve my entrepreneurial goal (Focus on Downside)
Crazy quilt	<ul style="list-style-type: none"> • Stitch together the people I need • Obtain their commitment • Multiply my means (Co-creation partnership)
Lemonade	If life gives you lemon, make lemonade (Leverage contingencies)
Pilot in the plane	If you can control it, you need not to predict it (Worldview: Control vs Contingencies)

2.4 Effectual cycle

It is of key importance to outline the effectual cycle in practice. According to Sarasvathy and Dew (2005), the effectual cycle commences with an entrepreneur's means as the starting point and outlines what an entrepreneur knows, who the entrepreneur is, and whom the entrepreneur knows or has access to. The cycle then moves onto the process of defining goals relative to what the entrepreneur is able to do within the effectual decision-making process, within this phase's potential courses of action, and outlining goals of paramount importance.

Sarasvathy (2008) states that these two interactions then lead to a direct engagement with potential partnership, networks and stakeholders. Strategic partnerships and alliances are formed through effectual stakeholder commitment, subsequently leading to a commitment of resources by both parties which translates to mitigation of risks and a reduction of future uncertainty. The subsequent benefit of partnering with stakeholders lead to the development of new means, new goals, new markets and an increase thereof through the expanding cycle of resources (Ghorbel, Hachicha, Boujelbene & Aljuaid, 2021).

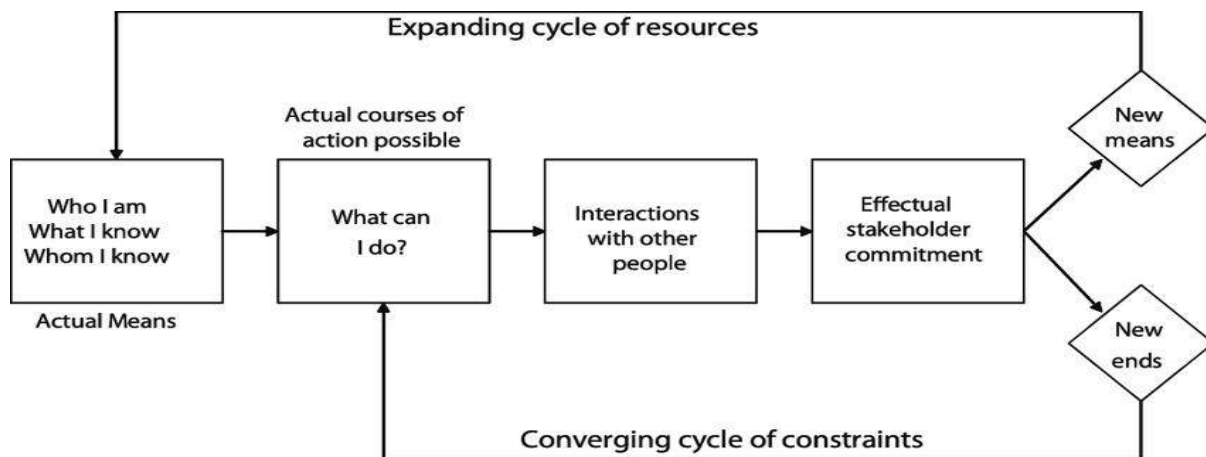

Figure 1: Effectual Process

Source: (Sarasvathy and Dew, 2005:543)

2.5 Decision-making as a construct

Decision-making as a theory surrounds itself with the construct of cognitive processing as well as methodology that exercise thinking in situations where entrepreneurs are faced with identifying, creating or exploiting opportunity (Grichnik, Baier & Faschingbauer, 2016). Decision-making follows the process of recognising the current state, evaluating options at hand, selecting potential actions based on the decision-makers need and reassessing options based on the consequence (Beach and Lipchitz, 2017).

2.5.1 Rational choice theory

Rational choice theory purports that decision-makers are rational as they pursue maximum efficacy through means of having absolute knowledge when faced with a problem, potential solutions and the outcomes of each. It can then be argued that decision-making theories based on the premise of rational choice theory has both identifiers of a descriptive and prescriptive nature. Wherein it dictates how decision-makers should perform and seeks to understand how decision-makers do perform during situations (Pettigrew, 2014). However, decision-making when observed through a rational lens can be described as prescriptive in nature. Hence, the rational choice theory follows a process of problem identification, creating alternate options, assessing alternate options, selecting an alternate option, implementation of the decision and evaluation of the results. (Lunenburger, 2011).

2.5.2 Bounded rationality

Pettigrew (2014), states that in practise rationality is bounded as the decision-maker's competency is influenced by both the internal and external environment as a result. Decision-makers are proscribed from making decisions which are completely unbiased. Rationality declines as soon as decision-makers are confronted with an elevated degree of ambiguity which resultantly leads to making bounded decision's which are grounded on information gathering relative to the decision. This concept is of paramount importance within the context of entrepreneurial decision-making as the notion purports that entrepreneurs are usually faced with a high level of uncertainty due to dynamic and everchanging environments. However, Sarasvathy (2008; 2009) states that uncertainty is a given and thus the need to predict the future becomes irrelevant if decision-making protagonists can control it.

2.5.3 Cognitive bias

Cognitive bias can be defined as mental heuristics employed within decision-making. Cognitive bias assists decision-making protagonists overcome cognitive limitation however the resultant outcome is less rational as complete decision-making. Emotions are a fundamental tenant of cognitive bias as differing emotions produce divergent cognitions. Arguably, now more than ever research shows that decision-makers rely on rational choices when making decisions however, emotion and cognition still play a significant role in influencing decision-making (Lerner, Li, Valdesolo & Kassam, 2015). Decision makers that are inclined toward cognitive bias tend to have a risk perception which is low leading to decision's that take on higher risk through an increased risk appetite.

2.5.4 Social cognition theory

Social cognition theory is focused on an understanding of the cognition which inherently dictates human behaviour as opposed to trying to understand it. The theory purports that decision-makers have an increased sense of obligation regarding a decision when they are of the view that they are in direct control of the requisite situation. Whereby the central tenant of implicit cognition relies on experience influencing decisions within conscious settings (Wyer and Shrull, 2014).

2.5.5 Naturalistic decision-making

Naturalistic decision-making relies heavily on an intuitive approach wherein decision-makers identified as experts within their requisite fields, make decisions based largely on intuition. Although naturalistic decision-making supports advanced entrepreneurial decision-makers who can match decisions with cognitive capability it also supports novice entrepreneurs as they can learn and adapt new skills throughout the entrepreneurial journey (Zsombok, 2014). Within the context of decision-making, it can be argued that uncertainty and risk are prerequisites and can be found in multiple forms. Furthermore, this can have a negative effect on decision-makers whereby they avoid making decisions due to uncertainty (Klein, 2015). Although literature states that in practise the scenario of not deciding due to uncertainty is not realistic and subsequently not possible consequently, naturalistic decision-makers consider this factor and distinguish between the constructs of uncertainty and risk.

2.5.6 The entrepreneurial mindset

Entrepreneurial mindset theory outlines how a decision-maker has the ability to act within environments and conditions of uncertainty. The central tenant of entrepreneurial mindset purports the notion that entrepreneurial decision-makers have the innate ability to engage in numerous cognitive approaches. This is done through the means of acquired experience and knowledge wherein decision-makers can set goals on cognition and chose the best possible approach within differing environments. Environmental uncertainty is the main reason for this notion. Research also points out that environmental uncertainty can be viewed as an important resource for entrepreneurs (Haynie, Shepherd, Mosakowski & Earley, 2010).

De Winnaar and Scholtz (2020) states that within the construct of the entrepreneurial mindset, is the notion of metacognition. This is defined as a process where strategies are formulated and positioned through a collection of cognitive mechanisms available to the decision-maker. This construct is closely linked to positive decision-making that is adaptable wherein decision-makers within environments of change and uncertainty can make quick decisions drawing from cognitive function.

2.6 Entrepreneurial Identity

There are multiple schools of thought that argued the notion of entrepreneurial identity being context specific. Interpretation thereof is based entirely on an entrepreneur's value system, cultural background, and belief structure within the society in which the entrepreneur operates. This theory also suggests that an entrepreneur's behavior is directly linked to lived experiences. Thus, entrepreneurial identity is both an individual and a collective construct which is formed through lived experiences and social interactions. It can then be stated that an entrepreneur's identity is not innate but relatively dynamic and has the ability to change, based on lived experience and social interaction (Jones et al., 2019). Contrastingly, research also points to the notion that entrepreneurial identity can be influenced and incorporated by culture and creativity (Werthes, Mauer & Brettel, 2018).

For that reason, it is imperative to understand the context in which entrepreneurial identity is produced. The nature of entrepreneurial identity is principally ascribed within the setting wherein it transpires. Consequently, the setting is of paramount importance. Context is associated with the socio-economic environment in which the entrepreneur operates. This includes society, economic and social policy, industry, environment, geographic parameters as well as cultural and acceptable norms (Jones et.al. 2019). Hence, context plays a paramount role and contributes directly to entrepreneurial identity. It provides the social indicators necessary to influence an entrepreneur's identity relative to social belonging and differentiation. Entrepreneurial self-efficacy influences entrepreneurial identity directly and as a result it stands to reason that the dispositional consequence of entrepreneurial identity assists

in the consolidation of succinct expectations and efficacy perceptions which influence entrepreneurial intent (Celuch, Bourdeau & Winkel, 2017).

2.7 Leadership styles

Transactional leadership focuses on achieving goals and outputs through mutually beneficial relationships and interactions. This leadership style puts emphasis on achieving outputs through reward and exception management by both passive and active means. On the other hand, situational or contextual leadership purports the notion that context and environment influence the way in which leaders operate. As a result, the environment and context directly impact a leader's decision-making, behaviour, influence and attitude leading to a change in leadership style dependent on the environment or context in which a leader subsequently leads and makes decisions (Oc, 2018). Within the past decade the concept of contextual leadership research has gained popularity in that multiple scholars have tried to research the construct relative to the environment and circumstances that affects contextual leadership (Oc, 2018).

3. Results and Findings

3.1 Profile of participants

The 14 participants that participated in the research were from multiple industries and provided insight that produced rich data. The largest percentage of participants were found within the information technology industry and the second largest group operating within the trade and services industry. The balance of the participants operates within construction, energy, health care, hospitality, petroleum and mining. One of the key constructs that the study sought to understand were entrepreneurial identity and decision-making. As a result, it was of paramount importance that participants within the study have varying degrees of experience stemming from multiple years' operating as entrepreneurial decision-makers. Thirty six percent of the participants have experience between two to four years, followed by 28% of participants that have entrepreneurial decision-making experience of between 5 and 10 years and lastly 36% of participants with entrepreneurial experience of 15 years and more. All participants had some level of education, with the minimum level being that of a certificate followed by one participant who had a bachelor's degree, 28% of the participants had honours degrees and 50% had master's degrees. This added to the richness of the sample as participants had a high level of academic knowledge and background relative to entrepreneurial decision-making frameworks and models employed within the context of entrepreneurship. Therefore, feedback from these participants relative to frameworks that support or enhance value proposition within entrepreneurial decision-making proved insightful.

3.2 Analysis of data

Three themes were identified and are discussed in the following paragraphs. The findings are presented per identified theme:

3.2.1 Leadership styles and decision-making

The intention of the research was to gain an understanding into leadership styles and decision-making and how effective decision-making could contribute to becoming a competitive advantage for an entrepreneur. Furthermore, it seeks to understand if there is a link between types of leadership styles and entrepreneurial styles, and to what extent does that either enable or hinder entrepreneurial decision-making. From a leadership perspective the research aimed to unpack the extent to which decision-makers are influenced by their leadership styles and to what extent does employing different leadership styles have an influence on decision making.

Participants gave varying views regarding the concept of different leadership styles. Three themes emerged. Relative to decision-making the participants were interviewed in order to understand the type of decision-making styles being employed when making decisions. This then led to probing through the research question the extent to which leadership styles influence entrepreneurial decision-making. Participants outlined what they viewed as the inherent characteristics of decision-making furthermore, it was also outlined that decisions are made relative to the type of leadership styles employed. Themes uncovered from the analysis were found to be focused around leadership styles

that purport collaboration, situational and contextual responses as well as transformational leadership styles and were most commonly employed which subsequently had direct links on the context of collaboration and communication.

Sub-theme 1: Transformational leadership

Participants mentioned the style of leadership they most associate with and employ during the process of decision-making as transformation leadership. Participant 4 mentioned that the transformational leadership style utilizes a collaborative approach, built around the notions of collaboration and transformation as these two constructs should not be viewed as mutually exclusive.

Sub-theme 2: Situational leadership

The second theme that was identified within the data, was that of a situational or contextual leadership style and how adopting it influences decision-making. This style is centered around the environment or context in which decisions are made. When asked about leadership styles relative to decision-making a participant within the information technology sector stated: “So, I really do think that an entrepreneur needs to be able to flex between various leadership styles and know which is the right one for the situation” (Participant 2).

Within the theme of situational leadership, it was mentioned that leaders need to employ particular decision-making styles which overlap with leadership styles within certain contexts. It was furthermore mentioned by all participants who identified with situational leadership styles cited that this particular leadership style is only successful when it is closely related to a collaborative approach through communication.

Sub-theme 3: Collaborative leadership

The third theme identified was collaborative leadership. This style was very closely related to both transformational and situational as participants all mentioned components found within the style of collaboration even though they identified with either transformational or situational styles of leadership. When asked about which styles best describes him, a participant within the information technology industry with more than 15 years of experience and an honour’s degree stated: “Definitely collaborative. And I suppose collaboration leads to transformation. They shouldn’t be mutually exclusive.” (Participant 14).

Another participant, also in the information technology industry, and with also more than 15 years of experience, outlined the importance of connection and communication within collaboration. “I am really interested in connection and collaboration and communication, those are the big things for me, like, I create value, I experience value in the world directly proportional to my ability to connect and communicate effectively with other people” (Participant 11).

Participants thus gave varying views regarding the concept of different leadership styles. The responses showed that transformation leaders need to employ notions of motivation and inspiration as a means to facilitate decision-making. It was further mentioned the transformational leaders must employ a clear vision and come up with new and constructive ways of doing things. Within the theme of situational leadership, it was mentioned that leaders need to employ particular decision-making styles which overlap with leadership styles within certain contexts.

It was furthermore mentioned by all participants who identified with situational leadership styles cited that this particular leadership style is only successful when it is closely related to a collaborative approach through communication. Within the third theme of collaboration as a leadership style the notion was very closely linked to the ability to collaborate by employing effective communication. It was mentioned that in order to effectively create value, communication is key. Additionally, participants outlined that collaboration must be underpinned by a method of consultation and coaching.

3.2.2 Factors influencing decision making within SMME's

A second main theme identified sought to understand the factors within South African SMMEs that affect decision-making. Additionally, participants mentioned barriers or limitations and the extent to which this hindered decision-making. Focus was likewise placed around the characteristics of decision-making and how these characteristics are viewed when it comes to their decision-making function as entrepreneurs.

Moreover, methods, approaches and the business environment within South Africa were probed within the interview to uncover hindrances or enablers as a result thereof. During the process of data analysis three succinct themes emerged through the category grouping. Participants pointed out that risk was a paramount factor of influence within decision-making. They went on to further state that education and skills development played an important role with regards to how entrepreneurs make decisions and the success of it thereof, lastly an important theme that emerged was that of government being a barrier to entrepreneurial decision-making.

Sub-theme 1: Risk as an influence

The first subtheme identified was that of risk. Participants viewed risk from both a financial and non-financial perspective when making decisions. When asked about his view on risk and how they associate risk with the concept of value, a participant within the construction industry stated: "The risk is always higher than the value, because I might lose everything" (Participant 6).

Contrastingly a participant within the information technology sector that has more than 15 years of decision-making experience outlined his view of risk as a positive one. He mentioned that he views risk in an optimistic way by stating that decisions are based on value and therefore outweigh the risk involved. "I think this is actually the definition of an optimist: If you tend to undervalue the risk or over value the upside. By default, I tend to come up with a: 'I'll always believe that there will be a way for, for value to outweigh risk', which is a good reason for me not to bet on spot. I've always defaulted to believing that there is infinite potential for risk and limited potential for value" (Participant 11).

Another participant outlined how her decision-making was influenced by real financial risk and subsequently acted as a barrier and limitation when trying to affect change. Participant 7 stated: "I would say it's definitely again, a financial thing, a cash flow issue. It's very difficult to affect change, and make changes when you haven't got any sort of investment into those changes. The barrier, and the limitations are just the cash flow issues that our particular industry is experiencing at the moment."

Sub-theme 2: Education and skills

Within the sample, one participant had the minimum of a certificate qualification followed by one participant who had a bachelor's degree. However, five participants had an honours degree and seven of the 14 participants had master's degrees. This led to a paramount theme of education and skills being an important factor within decision-making in South African SMMS. All participants viewed skills and education as a key driver for enabling entrepreneurial decision-making. When probed about the effect that education has on decision-making, the participant with a certificate stated: "I actually think that entrepreneurial subjects should be mandatory at schools, because not everyone is born to be a nine to five person. I also believe that if I had a qualification to make better financial and strategic decisions, I would also be able to work on my business not just in my business. And I also be better at delegating and hiring staff to oversee elements of the business."

Another participant within the information technology sector with more than 15 years of experience outlined how, through the development of specific skills, his decision-making ability has improved. Another participant outlined the absolute importance of having entrepreneurial skills as the foundation upon which the decision-maker operates. He stated: "I don't believe that you can be an entrepreneur without being able to think business and innovation! You must spot opportunities and go for it and take a chance" (Participant 5).

Sub-theme 3: Government as a factor

During the interviews participants were asked to give their views on the role that Government plays within the SMME landscape of South Africa. All participants in the survey stated that Government was a barrier and that they received no support or enablement from Government within South Africa, which had a direct impact on decision-making. A participant who operates within the entertainment and advertising industry stated that government offered no support towards enhancing or enabling growth for SMME's and decision-makers.

“So definitely not in my sector, because the entertainment and advertising industry was hit the hardest during the pandemic, and the government offered no support to us. I feel like they should, like Google has. You can do these free courses on Google. And I feel like the government should offer that on the website, like, free courses to become a better entrepreneur, on saving or investing, or in making better financial decisions” (Participant 1).

Another female participant within the information technology sector and with more than 10 years of experience outlined how government processes are a limiting factor within SMMEs. Furthermore, she stated that the small business sector within South Africa plays a fundamental role and as such government support should improve. “I think they could do more in terms of tax relief, especially now during COVID. So, tax, like PAYE. I'm talking about things like skills development levies. We pay our employees their salaries, but we still need to pay government PAYE and all those other things. So, I just feel like we need more support from government. And considering small medium enterprises as the biggest employer in South Africa. I think the government could do way more” (Participant 3).

This was further corroborated by participant who mentioned the importance of the small business sector and its direct link to job creation; however, it was outlined by the participant that government lacks the appetite to support the sector and subsequently entrepreneurial decision-makers within it. “I've been pretty disappointed over the years. I think the start-up and small business sector has a greater opportunity to create employment and shift the needle on our economy more than any other space. And yet government's appetite to support, seems very limited. I assume it is just a function of bureaucracy. So, I think it's a real shame that given the potential that it has, government's appetite for supporting the small business sector has been woefully inadequate” (Participant 11).

An entrepreneur within the trade and services industry outlined that government is a factor within decision-making due to the fact that government does not create open markets for trade within SMME's. “I would say that because government does not create an open market that is free and fair, government play a role in this by mingling and managing the role of SOEs. And in that it's affected how unions and everything else is regulated, which is not fair because that impacts labour laws and the labour laws are, as is, not conducive for small business. The laws are very restrictive with regards to recruiting people, dismissing people or just keeping people engaged. And by doing this, the government has sucked the oxygen out for small businesses to be able to thrive and to innovate, because the cost of labour is one of the big things; then comes the lack of ability to have free and open competition. Only then will small businesses have a fair chance at winning a tender or a piece of work” (Participant 5).

Another participant within the information technology sector and more than 15 years of experience linked the concept of government as a limiting factor to the notion of not understanding the business landscape within which SMMEs is operating and as a result, not having the capacity to control or support it.

3.2.3 Entrepreneurial identity influence decision-making

During the interviews, questions were directed at participants with an intention of understanding entrepreneurial identity and decision-making and how it drives competitiveness within SMMEs.

Within the category groupings methods, approaches and characteristics were probed followed by identity as a construct and its impact on decision-making. Two succinct themes emerged from the

analysis which outlined personal values that enable decision-making as well as how decision-making is a result of lived experience.

Sub-theme 1: Personal values that enable decision-making

The first theme that emerged during the analysis was that of how personal values enable decision-making within SMMEs. When asked about personal values and the influence it has, a participant within the information technology industry stated: “I suppose my personal values are integrity and honesty. So many people who say they have it, don't. My big trait is creativity and just seeking out different ways of doing things. Curiosity, I suppose is definitely a characteristic of mine” (Participant 14).

Another participant linked personal values to that based on religion. She stated that her religious beliefs and views underpin her values which have a direct link and influence on her decision-making capacity: “My personal values are based on Christianity: you don't lie, you don't cheat, you don't steal” (Participant 7). A female participant within the information technology industry outlined that integrity and trust was of paramount importance within the construct of decision-making. She associated her values with that of Christianity as well corroborating the theme as purported by the previous participant.

Sub-theme 2: Decision as a result of lived experience

The second theme that emerged from the analysis of participant interviews was that of entrepreneurial decisions being influenced by their lived experiences. This theme showed how entrepreneurs have subsequently changed the way they make decisions throughout their entrepreneurial journey as a result of a change in identity brought on by lived experiences. When asked about decision-making within his entrepreneurial journey the participant stated that financial status played a huge role in decision-making. “I was making decisions early on, in my entrepreneurial journey, I had very few options. Partly because of my financial status” (Participant 11). He further stated that making decisions from an irrational standpoint usually leads to poor outcomes. “It's hard to think of a worse place to make a decision from than a highly emotional, highly stressed position. I think the other things are ascertaining the motivations for the decisions. If my motivations for making the decisions are initiated, or driven by fear, or envy or any other kind of distract anger, destructive emotion, then the outcomes of that decision are usually going to be pretty poor.”

Another participant outlined how she had to learn through experience the ability to make decisions quickly by taking into account all the necessary factors and in doing so avoiding analysis paralysis. This critical experience has given the participant a competitive advantage. “When it comes to my decision making, I have learned recently to make decisions quickly. I used to be a slow decision maker. I used to ask a thousand questions on what are the risks? How can I mitigate this? Weighing pros and cons - almost get into analysis paralysis. So, when it's coming to my decision making, I've actually learned to make decisions quickly and live with the decisions that I've made, whether they're good or bad. And a lot of my decision-making is based on my moral compass” (Participant 3).

Table 2: A summary of the themes and subthemes influencing entrepreneurial decision-making

Theme Identified	Sub-Theme
Leadership styles influence decision-making	<ul style="list-style-type: none"> • Transformational leadership • Situational leadership • Collaborative leadership
Factors within the SMME influencing decision making	<ul style="list-style-type: none"> • Risk • Education and Skills • Government
Entrepreneurial identity influences decision-making	<ul style="list-style-type: none"> • Personal values • Lived experiences

3.3 Discussion and implications

The first theme that was identified, was transformation leadership as a style that entrepreneurs employ when making decisions relative to the business as well as leading their employees. Anderson and Sun (2017) stated that transformational leadership style employs focus on achievement of goals through means of motivation and progression. Transformational leadership style utilizes a collaborative approach built around the notions of collaboration and transformation as these two constructs should not be viewed as mutually exclusive. Situational or contextual leadership styles were also identified as influencing decision-making. This is supporting Oc, (2018), who stated that, situational or contextual leadership purports the notion that context and environment influence the way in which leaders operate. As a result, the environment and context directly impact a leader's decision-making, behaviour, influence and attitude as a result leading to a change in leadership style dependent on the environment or context in which a leader subsequently leads and makes decisions (Oc, 2018).

Within the past decade numerous reports have focused on decision-making theories and its long-standing links within the field of entrepreneurship-research. Decision-making as a theory surrounds itself with the construct of cognitive processing as well as methodology that exercise thinking in situations where entrepreneurs are faced with identifying, creating or exploiting opportunity (Grichnik, Baier & Faschingbauer, 2016).

Risk from both a financial and non-financial perspective are important when making decisions. Entrepreneurs associated risk with the concept of value associated to the potential risk. One explanation for this can be outlined in the theory of effectuation reported by Sarasvathy (2008). Entrepreneurs need to develop products and services and capture or deliver these products to new markets in a way that reduces the potential for losses and subsequently leads to economies of scale relative to resources and or capital investments, and in doing so, ensuring that risks are both managed and reduced (Sarasvathy, 2008; 2009). Risks must always be benchmarked against the relative loss that could be realized.

Education and skills play a huge role in enabling decision-making within South African SMME's. Through the development of specific skills decision-making ability improves and there are definite benefits to education and skill as an enabler within decision-making. Pettigrew (2014) confirmed that decision-making protagonists are rational as they pursue maximum efficacy through means of having absolute knowledge when faced with a problem, potential solutions and the outcomes of each thereof. Entrepreneurs are of the view that a qualification would help facilitate better decision-making as long as you are able to apply the teachings through a process of experience.

Government is the biggest limitation and barrier to decision-making within South African SMMEs. Entrepreneurs stated that they received no support from Government within South Africa which had a direct impact on decision-making.

Within the context of decision-making, it can be argued that uncertainty can be found in multiple forms. This can have a negative effect on decision makers whereby entrepreneurs avoid making decisions due to uncertainty. Freidrich (2016) states that South Africa finds itself in a precarious position with regards to the survival rate of SMMEs as compared to other countries globally. Research shows that around 75% of SMME's within the first few years of business fail.

This failure can be attributed to various compounding reasons which are of both an internal and an external nature. It is therefore evident that even though SMMS within South Africa are the largest contributor towards GDP, Government still provides no support for entrepreneurial decision-makers and hence finds itself as the biggest barrier when trying to serve its agenda of poverty reduction and decreasing unemployment. Contrastingly however the National Development Plan states South Africa intends on developing SMME's with the intention of expanding the economy, creating jobs and the reduction of unemployment (National Planning Commission, 2011).

Personal values are viewed as a key enabler for entrepreneurial decision-making. Entrepreneurs within the study outlined how they based their personal values to that on religion and how these views underpin their values which have a direct link and influence on their decision-making capacity. It was also stated that integrity and trust was of paramount importance within the construct of decision-making.

Personal values can be linked to Sarasvathy's (2008) bird-in-hand, whereby entrepreneurs make decisions and create entrepreneurial opportunities based on their own personal means of who they are and what they stand for.

Lived experience is also a key driver and an enabler within decision-making. Entrepreneurs have subsequently changed the way they make decisions throughout their entrepreneurial journey as a result of a change in identity brought on by their lived experiences. Entrepreneurs learned through experience the ability to make decisions quickly by considering all the necessary factors and in doing so avoiding analysis paralysis. It can then be stated that an entrepreneur's identity is not innate but relatively dynamic and has the ability to change based on lived experience and social interaction (Jones et al., 2019).

Furthermore, participants delineated how change was a central factor within lived experience that determined and expanded the way in which decisions were made from inception as an entrepreneur to the current state and this all centred around learning how to deal with specific constructs relative to people and technology and subsequently how decisions are made. Sarasvathy (2009) supported this stance by dictating that entrepreneurs are able to establish the means within their disposal through lived experience and introspection which directly relates to entrepreneurial knowledge, social capital and acquired networks.

4. Conclusion

One of the main findings stated that transformational, situational and collaborative leadership styles have a direct influence on entrepreneurial decision-making. When employing these leadership styles entrepreneurial decision-makers were able to effectively navigate the decision-making process within the SMME landscape. Risk is a paramount factor of influence within decision-making. So are education and skills development when it comes to making decisions and being successful in the process. It seems however, as if Government, and its lack of support, is experienced as a barrier to entrepreneurial decision-making. This came as a shock since SMMEs are playing such a huge role in economic growth and job creation, which is considered to be a high priority for Government.

Another identified theme, playing a huge role in the decision-making process, is the personal values as a construct of entrepreneurial identity. Integrity, trust and an ethical way of doing things (influenced in many cases by religious convictions) inspire decision-making. Linked to this theme, is the lived experiences of entrepreneurs as a factor that has a direct impact and influence on decision-making within South African SMMEs.

It seems as if effective decision-making processes can lead to a competitive advantage, because the quicker and more effective one can make a decision, the better your business will benefit.

4.1 Limitations

A key limitation here was that 85% of the participants had a minimum of an honours degree. Of the participants, 50% had a master's degree qualification. This could have skewed the results in that it could have impacted the ability of participants to give views that reflected a general perspective from those that had lower educational qualifications.

A longitudinal study could also have produced different results. The COVID-19 pandemic was also a limitation as it has caused multiple industries to close and have also led to extreme conditions under which decision-makers have had to make decisions over the past two years and hence this dramatic

shift could have impacted the data. This research however explores this important topic and some conclusions were made.

4.2 Suggestions for future research

Future research could look into emerging technology, artificial intelligence and the Internet of Things, and how this can influence entrepreneurial decision-making. A longitudinal investigation on how entrepreneurial identity changes over-time and how it influenced decision-making in different phases of life, can also be of interest. A model to test relationships should be developed and tested.

Is It a Bird? Is It a Plane? Entrepreneurship and Other Things That (Do Not) Fly

Dr Maria Smit^{1,*}, Prof Marius Pretorius²

^{1,2} Department of Business Management, University of Pretoria, Pretoria, South Africa

Keywords

Critical entrepreneurship studies; terminology confusion; entrepreneurship as a development apparatus (EDA); new conceptual framework;

Abstract

The entrepreneurship ideology presents all the concepts included under the conceptual entrepreneurship umbrella as essentially the same activity, and drives the knowledge claim that anything labelled “entrepreneurship” has equal potential to contribute to economic growth and job creation. This paper argues that merely highlighting the heterogenous nature and refining the typologies of everything included in the conceptual entrepreneurship umbrella will not bring the paradigmatic break and new narrative needed to challenge the assumptions inherent in mainstream entrepreneurship theory. It calls for the unbundling of the meta-theoretical conceptualisation of “entrepreneurship”. With the input from 13 experts in the field of entrepreneurship and critical management studies (by means of a Delphi study), it opens this critical dialogue by revisiting the inceptive boundaries of the entrepreneurship domain and demarcating the boundaries for the fidelity entrepreneurship concept. Finally, it proposes a new conceptual framework for enterprise theory, illustrating how changing ideological, value-laden terms such as “entrepreneurship” can bring about the paradigmatic break needed to move entrepreneurship theory past an impasse.

1. Introduction

The word “bird” (scientific class “Aves”) invokes a general image of a feathered, winged, flying animal. However, not all bird species can fly (examples being ostriches and penguins) even if they share many other characteristics with the scientific class “Aves”. Furthermore, not everything that flies can be scientifically classified as “Aves” – think of mosquitos and aeroplanes. Things that fly can be birds, but not everything that flies is a bird. If aeroplanes are included in the scientific class “Aves” because they share some characteristics with birds, logical research questions would include “why don’t planes lay eggs?” or “what interventions can be taken to help planes lay eggs?”. However, aeroplanes are not included in the scientific class “Aves” simply because they have wings and because they can fly.

In the same manner, it has become imperative to distinguish what entrepreneurship is from what entrepreneurship can be (Bögenhold, 2020). The current mainstream conceptualisation labels a number of diverse phenomena as “entrepreneurship”, because these phenomena share some characteristics with or have historically developed from entrepreneurship theory. The entrepreneurship ideology presents all these concepts included under the conceptual entrepreneurship umbrella as essentially the same activity, and drives the knowledge claim that anything labelled “entrepreneurship” has equal potential to contribute to economic growth and job creation (Smit and Pretorius, 2021). Based on this ideology, entrepreneurship has become appropriated as a development apparatus across the Global South. Entrepreneurship as a development apparatus (EDA) is defined as the implementation of entrepreneurship support programmes (such as training, incubation, mentoring and funding) for individuals with little or no entrepreneurial experience, especially in economically marginalised communities, and with little or no other options for employment, based on the

assumption that such interventions will result in high-growth entrepreneurial ventures that create a significant number of meaningful jobs (Smit & Pretorius, 2020).

A number of critical scholars have called for exposing the myths and assumptions inherent in the mainstream entrepreneurship ideology by highlighting the heterogeneous nature of the term “entrepreneurship” (i.e. Calás, Smircich & Bourne, 2009; Poole, 2018; Verduijn & Essers, 2013). Other scholars have attempted to refine the typologies or classification of everything included in the conceptual entrepreneurship umbrella (for a summary see Kuada, 2015). However, this paper argues that merely highlighting the heterogeneous nature and refining the typologies of everything included in the conceptual entrepreneurship umbrella will not bring the paradigmatic break and new narrative needed to expose the myths and assumptions inherent in mainstream entrepreneurship theory. It argues that not everything that “flies” can scientifically be classified as belonging to the scientific class “entrepreneurship” and therefore calls for the rejection of the entire meta-theoretical conceptualisation of “entrepreneurship” and the unbundling of the conceptual umbrella.

This paper opens this critical dialogue by revisiting the inceptive boundaries of the entrepreneurship domain and demarcating the boundaries for the fidelity entrepreneurship concept. Focusing on the product resulting from EDA it highlights how some enterprises cannot be included under the conceptual entrepreneurship umbrella by default and rather have to be “un”trepreneuried. Finally, it proposes a new conceptual framework for enterprise theory (see figure 2), illustrating how changing ideological, value-laden terms such as “entrepreneurship” can bring about the paradigmatic break needed to move entrepreneurship theory past an impasse.

2. Problem Investigated

2.1 The entrepreneurship umbrella

The process of defining entrepreneurship has evolved since the first mention of the term in the 18th century (Nieuwenhuizen, 2019) and the contents of the term “entrepreneurship” has changed significantly over time (Bögenhold, 2020). It has become a multifaceted and polysemous umbrella term under which a broad hodgepodge of research is included (Bögenhold, 2020; Dey, 2020; Shane & Venkataraman, 2000). The umbrella term represents a multifaceted concept that cuts across a number of disciplinary boundaries and entails a complex set of contiguous and overlapping constructs (Katz, 2003; Kaufmann & Dant, 1999). The term includes many different contents, domains, origins and destinations (Baker & Welter, 2020; Bögenhold, 2020).

However, critical scholars argue that the word has come to mean both everything and nothing (da Costa & Silva Saraiva, 2012). There is a general lack of consensus on what entrepreneurship is, and what it is not (Bögenhold, 2020). In the absence of a precise demarcation, the term has evolved to include a variety of different meanings and interpretations simultaneously. Because the boundaries of the field of entrepreneurship are not clearly defined, a weak paradigm for entrepreneurship theory is promoted (Urban, 2010). Phenomena that are loosely related – by having started a venture, for instance – are (erroneously) classified as belonging to the same scientific family by default (see figure 1). The inceptive boundaries of the umbrella term have been expanded to incorporate more or less all of humanity (Poole, 2018). The entrepreneurship discourse has turned everything into entrepreneurship and everyone into an entrepreneur (Örtenblad, 2020).

This confusion surrounding the definition and boundaries of the entrepreneurship umbrella is, however, largely ignored and the scholarly entrepreneurship community has adopted an apparent universal orthodoxy (Bögenhold, 2020; Talmage & Gassert, 2020).

2.2 The umbrella assumption

The overly positive image of entrepreneurship is shrouded in ideological mystification (Jones & Murtola, 2012). The assumed characteristics are extended to all concepts included under the entrepreneurship umbrella and, in this manner, expects the same results from any and all types of practices included in this conceptual entrepreneurship framework (Smit & Pretorius, 2021). Terms included under the umbrella are often conflated, overlapping, used interchangeably and without

precision or consistency (Poole, 2018; Smit & Pretorius, 2021). Using the terminology in this manner supports the knowledge claim that any and all types of entrepreneurial activity are essentially the same. What is more, tools and concepts that are developed for entrepreneurship in a very specific context are unquestioningly and uncritically extended to any phenomenon included under the entrepreneurship umbrella (Kuada, 2015:150; Steyaert, 2007). In this manner entrepreneurship theory becomes extended too far outside of the context for which it was developed (Baker & Welter, 2020; Naudé & Havenga, 2005; Verver, Roessingh & Passenier, 2019). To put it another way: the theory of ornithology is extended to answer questions about aeroplanes.

Flowing from this erroneous classification is the umbrella assumption that everything scientifically classified as “entrepreneurship” will contribute equally to economic growth and job creation. However, data is continuously showing that only a select few of who we classify as “entrepreneurs” “will create the businesses that will take people out of poverty, encourage innovation, create jobs, reduce unemployment, make markets more competitive, and enhance economic growth” (Shane, 2009). In fact, not all enterprises can even be considered entrepreneurial (Kuada, 2015). The reality is that the majority of what is classified as “entrepreneurship” has no prospect to survive past three years, let alone contribute significantly to job creation. The erroneous classification and resulting terminology confusion inherent in the mainstream entrepreneurship discourse is leading to misunderstandings, political hegemony and epistemic violence and the term can no longer be used scientifically in the way that it is currently conceptualised (Bögenhold, 2020; Smit & Pretorius, 2020; Smit & Pretorius, 2021). This paper argues that the umbrella assumption has become inseparable from the ideologically loaded term “entrepreneurship”. However, mainstream research is continuously conceptualising everything included under the entrepreneurship umbrella as homogenous (Calás et al., 2009; Vivarelli, 2013).

Although this terminology confusion is a concern from a Global North perspective (for a summary see Örtenblad, 2020), it becomes even more problematic in a context where entrepreneurship is appropriated as a development apparatus in marginalised communities, believing these “*erga omnes*”, “the-more-the-merrier” EDA interventions to be a guaranteed ticket out of poverty, the silver bullet for economic emancipation, a catalyst for growth and a vehicle for the redress of past injustices (Honig, 2017; Poole, 2018; Urban, 2020). Based on this belief, a significant number of resources are pushed toward supporting an ever-increasing number of start-ups (Vivarelli, 2013). Based on the resource-based view, it is assumed that these increased resource inputs will propel EDA start-ups into success. Governments and development organisations also continuously reinvest in these start-ups when they become distressed (Pretorius, Le Roux, Rosslyn-Smith & Letsholo, 2021).

However, the product of EDA is failing abysmally in creating any empowerment or upward mobility for the marginalised communities it aims to emancipate, and does not contribute significantly to job creation (Honig, 2017; Naudé, 2011; Shane, 2009). In spite of appearing to have little in common with fidelity entrepreneurship, the product resulting from EDA is included in the entrepreneurship umbrella (see figure 1).

3. What Is In a Name?

Language is not merely a collection of a few words that are strung together unintentionally. It is also not neutral, unambiguous and objective. By choosing a specific word over another, or omitting some details in a description while including others, a specific version of the world is intentionally created (Rapley, 2011). Consider for example: in 1990, Nelson Mandela is freed after 27 years in prison. One newspaper headline reads “Freedom fighter finally released after 27 years”. Another headline reads “Terrorist released after only 27 years”. The two headlines not only present two vastly different realities, but they also create two vastly different realities. Language thus serves “as the mediator for constructing reality” (Achtenhagen & Welter, 2007). The way in which language is intentionally used to construct a specific reality has definite consequences (Ziai, 2013).

Scholarly discourses also have definite consequences when the knowledge claims presented in these discourses are used to influence policy. Through naturalising the umbrella assumption,

entrepreneurship has become an ideology discourse that deadens all critical faculties (da Costa & Silva Saraiva, 2012; Verduijn, Dey, Tedmanson & Essers, 2014). The entrepreneurship umbrella and the resulting umbrella assumption create the impression that EDA interventions will produce large numbers of successful, high-growth entrepreneurial ventures that will ensure economic emancipation for the beneficiaries and create a significant number of jobs across the Global South where unemployment and poverty are rife. Merely refining the typologies and renaming categories under the entrepreneurship umbrella will not challenge the core assumption that everything and anything included under this conceptual umbrella is essentially the same heroic activity that will contribute significantly to economic growth, job creation and emancipation of the marginalised. The ideological image evoked by the word “entrepreneur” has become so embedded in mainstream public and scholarly discourse, that a reinvention of the term would be near impossible and, if possible, would take too long. Rather, this paper addresses the terminology confusion and resulting assumptions by rejecting the entire meta-theoretical conceptualisation of entrepreneurship and presenting a new conceptual framework for the theory of enterprises.

4. Research Objectives

This paper aims to highlight the restrictive impact of the current mainstream theoretical conceptualisation of “entrepreneurship” and introduce an alternative conceptual framework for rethinking entrepreneurship theory. It furthermore rejects the taken-for-granted assumption that the product of EDA can be included in the conceptual entrepreneurship framework. It responds by proposing an alternative conceptual frame for “enterprise theory” that separates the product of EDA from the mainstream entrepreneurship domain (figure 2). In proposing this new conceptual framework, this paper aims to do the following:

- Challenge the mainstream entrepreneurship discourse that is resulting in terminology confusion, political hegemony and epistemic violence.
- Initiate and stimulate a critical dialogue in the scholarly discourse relating to EDA, in particular, and the meta-theoretical conceptualisation of the entrepreneurship umbrella, in general.
- Propose realistic expectations for the enterprises resulting from EDA.

The paper will proceed in the following manner: Firstly the inceptive borders of the entrepreneurship umbrella are critically revisited to clearly demarcate the domain of fidelity entrepreneurship. Thereafter a short overview of the development of entrepreneurship theory is given to illustrate how each of the inceptive borders have been extended. Thirdly, the product of EDA is discussed against this demarcated domain of fidelity entrepreneurship, illustrating the characteristics that these enterprises have in common and where they differ. Finally, flowing from this discussion and with the input of 13 experts in the field of entrepreneurship, a reconceptualised umbrella for the theory of enterprise (an umbrella that includes fidelity entrepreneurship and the product of EDA) is proposed.

5. Research Methodology

This paper emphasises the importance of bringing a critical, reflexive, metatheoretical perspective to management study (and specifically entrepreneurship theory study) in South Africa (Goldman, 2016; Ruggunan, 2016; Van der Linde, 2016). It argues that a more-of-the-same, positivist, quantitative enquiry will not bring answers to the research problem highlighted above. It therefore moves away from the mainstream entrepreneurship ontology and associated quantitative methodologies, and is purposefully grounded in a critical entrepreneurship paradigm in an attempt to question and challenge the assumptions embedded in mainstream theorising. It argues that the theory of entrepreneurship cannot be further developed and expanded if it is not reframed epistemologically from a positivist to a critical perspective.

It will incorporate the four components of critical thinking (Brookfield in Almesson and Willmott, 2003):

1. *“Identifying and challenging assumptions behind ordinary ways of perceiving, conceiving, and acting;*
2. *Recognising the influence of history, culture, and social positioning on beliefs and actions;*
3. *Imaging and exploring extraordinary alternatives, ones that may disrupt routines and establish orders;*
4. *Being appropriately sceptical about any knowledge or solution that claims to be the only truth or alternative.”*

When the qualitative Delphi methodology was first used in the 1950s, consensus of opinion was sought based on the “bandwagon effect” or the “halo effect”, referring to the phenomenon where individuals conform to the majority opinion (even if they do not necessarily agree with it) (Greatorex & Dexter, 2000; Mulgrave & Ducanis, 1975). This means that the facilitator of a Delphi study would present the findings from a previous round to persuade the panellists to change their opinion to reflect the majority view. However, over the years variations of the Delphi method have been developed for a variety of situations where expert problem solving is required (Okoli & Pawlowski, 2004) – such as the complexity of the entrepreneurship umbrella.

The Delphi methodology is essentially qualitative (Wardner, 2013), although summarising the expert opinions leads to a degree of quantification (Linstone & Turoff, 1975). It provides a method for obtaining, refining and communicating the informed judgments of knowledgeable people (Ludlow, 1975). The Delphi methodology is commonly described as “a method for structuring a group communication process so that the process is effective in allowing a group of individuals, as a whole, to deal with a complex problem” (Steinert, 2009) by measuring professional opinions rather than objective facts (Schmidt, 1997). The structured group discussion that is facilitated in the Delphi methodology is a way to raise issues for debate by, inter alia, revisiting knowledge claims in the subject of study (Hasson, Keeney & McKenna, 2000; Wardner, 2013). The Delphi methodology also has the ability to act as a tool for new framework development and theory building (Okoli & Pawlowski, 2004). All of the above characteristics makes the Delphi a suitable vehicle to address the research question presented in this paper. Due to the Covid-19 pandemic, travel and physical contact were discouraged at the time of this study. The Delphi methodology presented a practical solution for gathering experts’ opinions on the research problem.

At the onset, the researchers aimed to determine if a panel of experts in the field of entrepreneurship and/or critical management studies can reach consensus on the boundaries of the fidelity entrepreneurship domain, and whether the product of EDA falls inside or outside these identified boundaries. The researchers anticipated that a number of panellists would be from a positivist, uncritical research tradition that does not necessarily agree with the premise that the entrepreneurship umbrella has been extended too wide. The Delphi methodology was thus approached in a way that abled panellists to contribute to the conversation without having to agree with the critical stance toward the conceptual entrepreneurship framework. During the second-round data analysis, it became clear that the terminology confusion inherent in the entrepreneurship discourse also has an impact on the experts’ responses in this study. This resulted in a change of course mid-method, by substituting all generic, value-laden terms (such as “entrepreneurial”) with specific examples in the final round. These challenges and adaptations are discussed in more detail in step 6 below.

The following section explains the approach and method used, based on the steps for Delphi studies developed by Hasson, Keeney and McKenna (2000). Using this checklist provided structure to a practice that has at times been accused of being arbitrary. The expert opinions expressed during this Delphi process guided the process of rethinking the mainstream entrepreneurship framework, presented in the conclusions of this study.

Step 1: The background

The research problem was identified based on extant entrepreneurship literature from both mainstream and critical schools of thought. The research problem underlying the research in this study influenced the application of the Delphi methodology (Mitroff & Murray, 1975).

Step 2: Selecting the expert panel

Delphi studies generally require as few as five to ten panellists from a homogenous group of subject matter experts, such as the carefully selected panel in this study (Loo, 2002). Persons who are affiliated with a tertiary academic institution in South Africa in the field of entrepreneurship and/or critical management studies were purposively selected to form part of the panel. Twenty-one potential expert panellists were approached for participation in the study, with the aim of assembling a panel of 12 experts. This would leave room for panellists potentially withdrawing in rounds 2 or 3 of the study. Thirteen panellists indicated that they were willing to participate by completing the first-round open-ended questions and all of these experts remained part of the process to the end of round 3. Responses were treated anonymously in all three rounds. Two of the panellists indicated that they were practically involved with EDA interventions, while four were knowledgeable in the field of critical entrepreneurship studies.

Step 3: The iterative rounds

Ideally, the iterative rounds in a Delphi study will continue until consensus is reached, or results become repetitive, or when the panellists reach an impasse (Loo, 2002). However, the majority of Delphi studies limit the number of rounds from the onset to ensure maximum response rates from panellists in ongoing rounds (Hasson et al., 2000). Being respectful of the panellists' time, this study clearly communicated to the potential panellists that the study would be limited to three iterative rounds. The first round consisted of a questionnaire with two open-ended questions, while the second and third rounds consisted of structured questionnaires.

Step 4: The questionnaires

The first round consisted of two open-ended questions that ask the panellists' opinions on the role of entrepreneurship and EDA in economic growth and job creation. Round 1, supported by a thorough literature review, then provided a departure point for developing the structured questionnaire for round 2.

The round 2 questionnaire was introduced by a cover letter that set out the background and aim of the study, including the meta-theoretical critique that the boundaries of the entrepreneurship umbrella have been extended too far and that the current framework is being revisited. This round's questionnaire consisted of three sections: the entrepreneurship domain, other enterprises included in the entrepreneurship umbrella and the product of EDA. These three sections comprised two open-ended questions and 31 statements with a 9-point Likert response. The third-round questionnaire excluded the section on other enterprises in the mainstream entrepreneurship domain, but introduced three new questions relating to the panellists' knowledge of critical entrepreneurship studies and their practical involvement with EDA.

Because the questionnaires in rounds 2 and 3 measured abstract opinions rather than absolute judgment, a 9-point Likert scale was used (Wardner, 2013). The questions in rounds 2 and 3 were presented as statements where panellists are requested to give their opinion on each statement, with 1 representing "strongly disagree" and 9 representing "strongly agree". The aim of the iterative rounds of questionnaires was to produce a "funnelling effect" (Loo, 2002) that moves from the more general to the more specific, aiming to establish the scholarly consensus (and in some cases dissensus) on themes relating to the mainstream entrepreneurship umbrella. Each of the structured questionnaires also provided a number of sections for open-ended feedback, although these were optional. The questionnaires were checked by a retired expert in the field of entrepreneurship and a statistician prior to sending them to the panellists.

Step 5: Predefining consensus

The responses in each round were coded as follows: if panellists selected options 1, 2 or 3, they were considered as disagreeing with the statement. If panellists selected options 7, 8 or 9 they were considered as agreeing with the statement (similar to Putnam, Spiegel & Bruininks, 1995). Options 4, 5 and 6 were considered neutral responses and not included in the tallying of responses that agreed or

disagreed with a statement. Consensus in this study was predetermined at 70%. This means that the panel is regarded to have reached consensus on a specific theme of at least 70% (or nine of the 13 panellists) agreed or disagreed with a statement by selecting the top three (7,8 or 9) or bottom three (1,2 or 3) measures on each of the Likert items. Predefining the level of consensus before the onset of the analysis contributes to the reliability and validity of the study (Schmidt, 1997; Williams & Webb, 1994).

Step 6: Issues that guided the data collection – adjusting to a curve ball

The researchers expected a divergence of opinions between panellists who are supportive of and those who are critical of EDA. They were prepared to follow the guidelines for a policy Delphi study that seeks to generate the strongest possible opposing views and thus welcomes dissensus (Steinert, 2009). However, the second-round data analysis revealed a more complex challenge that resulted in a change of course in the final round. The responses in the second round did not reveal two diverging opinions as expected, but rather a “shotgun” pattern with a multitude of responses for a number of the items (see the standard deviation in round 2 in tables 2 and 3 that illustrates this).

The entrepreneurship discourse is known for providing contradictory and inconsistent definitions and interpretation of key concepts (Kaufmann & Dant, 1999). The researchers concluded that the multiple responses in round 2 were not necessarily due to conflicting opinions on the subject, but rather a manifestation of the terminology confusion inherent in the entrepreneurship discourse: all panellists seemed to be giving their opinion based on their own interpretation of the value-laden term “entrepreneurial”. Therefore, in the final round, the terminology confusion was addressed by asking all panellists to give their prototype example of “an entrepreneur” and to insert this name in the statements that followed. For instance, a statement in the second round questionnaire that aimed to determine if innovation is to be considered a boundary of the fidelity entrepreneurship domain read: “Enterprises that are not innovative can be considered *entrepreneurial*”. This statement was changed in the final round to read: “If (insert name of your example of a prototype entrepreneur here) was not innovative they still would have built the business(es) that they have”.

This curve ball led the researchers to expand the research problem to address an additional question: how does the use of generic, value-laden terms (like “entrepreneurial”) influence the expert opinion in the entrepreneurship discourse? This meant placing less emphasis on reaching consensus or highlighting the diverging views on the key concepts that form the boundaries of the entrepreneurship domain in the third round, and rather illustrating how the terminology confusion in the mainstream entrepreneurship umbrella is obscuring the important distinction between what entrepreneurship “is” as opposed to what it “can be”. However, as the results indicate, changing the terms from the value-laden, generic “entrepreneurial” to specific examples led to the panel organically reaching consensus on a number of statements.

Step 7: Presenting the final results

The results from rounds 2 and 3 of the Delphi study are presented in tables 1, 2 and 3 by highlighting the percentage of support for each item, the mean values representing the aggregate rank of each item and the standard deviation to indicate the spread of the group response around the mean (Greatorex & Dexter, 2000; Holey, Feeley, Dixon & Whittaker, 2007; Schmidt, 1997). The size of the sample is considered too small to warrant the use of parametric statistical analysis (Kalaian & Kasim, 2012). The tables show the results for the two rounds side by side to indicate how the consensus, mean and standard deviation shifted when generic terms were substituted with specific examples to counter the terminology confusion inherent in the discourse. In the final section, these findings in relation to the fidelity entrepreneurship boundaries and the product of EDA inform the discussion on the boundaries of the entrepreneurship domain. This discussion additionally highlights how the terminology confusion influences the group opinion. Lastly, these experts’ opinions inform the proposed new conceptual framework for the theory of enterprises.

6. RESULTS FROM THE DELPHI PROCESS

Table 1: The boundaries of the entrepreneurship umbrella

	Theme	Consensus ¹		Mean ²		Standard deviation ³		Mean rank (third round) ⁴
		Round 2	Round 3	Round 2	Round 3	Round 2	Round 3	
1	Innovation	62%	77%	3,62	2,15	2,66	1,72	3
2	Identify opportunity	62%	92%	4,15	2,00	2,88	1,68	1
3	Act on opportunity	54%	85%	4,62	2,00	3,04	1,91	1
4	Independence	54%	70%	3,85	3,08	3,05	1,93	5
5	Grow in terms of turnover	38%	54%	4,69	4,31	2,63	2,93	9
6	Aspire to grow in terms of turnover	85%	77%	2,69	2,62	2,02	2,71	4
7	Grow in terms of jobs	46%	46%	5,31	4,46	2,84	2,70	10
8	Aspire to grow in terms of jobs	31%	54%	4,54	3,92	2,47	2,60	8
9	Financial risk	70%	70%	3,31	3,31	2,14	2,87	7
10	Personal risk	70%	70%	3,00	3,08	2,24	2,84	5

7. Revisiting The Inceptive Boundaries Of The Entrepreneurship Umbrella

7.1 Fidelity entrepreneurship

In the continuous process of making the conceptual entrepreneurship umbrella more inclusive, the inceptive boundaries of the domain of entrepreneurship have often been extended or even abandoned (figure 1). The term “fidelity entrepreneurship”, coined by Pretorius et al. (2021), is used in this study to refer to the entrepreneurship domain as it was demarcated before the inceptive borders of the umbrella were extended. The authors are fully cognisant of the fact that the act of demarcating the field of “entrepreneurship” has been attempted by almost every scholar in the field and that there is currently little agreement on what fidelity entrepreneurship ought to be. They are also cognisant of the fact that “entrepreneurship” has become a very complex concept that carries many different meanings for different people (Gartner, 1990). However, this paper argues that it is this very lack of agreement on clear boundaries of the entrepreneurship domain that has led to the terminology confusion, the

umbrella assumptions and the resulting hegemony and epistemic violence highlighted by critical entrepreneurship scholars. To address this, it has become imperative to clearly demarcate the boundaries of a fidelity entrepreneurship domain, even if those boundaries at first glance appear to present an over-simplification of a complex problem.

Source: own compilation

Figure 1: The fallacious entrepreneurship umbrella

Unbundling and reconceptualising the entrepreneurship umbrella do not imply that phenomena that are “un”trepreneuried deserve any less scholarly interest. Although not the same, the economic and social roles that these phenomena fulfil are not regarded as any less noteworthy than those of fidelity entrepreneurship. However, unbundling and reconceptualising the myriad of concepts included under the entrepreneurship umbrella will create realistic expectations of the role that each of these phenomena can play within a broader enterprise ecosystem. Although the focus of this study is on fidelity entrepreneurship and the product resulting from EDA, specifically, other enterprises included under the entrepreneurship umbrella are also discussed briefly.

This paper proceeds by going back to the conceptual drawing board to underscore the inceptive boundaries of the fidelity entrepreneurship domain. Key concepts are identified from extant literature and confirmed through the Delphi panellists’ personal definitions of “entrepreneurship”. From this process, the boundaries for the fidelity entrepreneurship domain are drawn as: *opportunity, starting a venture, innovation, intention and ability to grow, independence, risk taking and reward beyond survival*. These boundaries of the fidelity entrepreneurship domain are now illuminated by firstly indicating how the concept was included in the inceptive entrepreneurship domain, and then briefly discussing how each boundary was redrawn following developments in the field of entrepreneurship research, in general, but also in the context of EDA, specifically.

7.2 Boundary 1: Opportunity

Kuratko (2007) describes entrepreneurs as “*individuals who recognize opportunities where others see chaos, contradiction, or confusion*”. Entrepreneurship then becomes the act of identifying and exploiting these identified opportunities (Acs, 2006). Recognising and acting upon an opportunity are placed centrally in most attempts at defining the field of fidelity entrepreneurship, such as the oft-cited demarcation by Venkataraman (1997):

“Entrepreneurship as a scholarly field seeks to understand how opportunities to bring into existence ‘future’ goods and services are discovered, created and exploited, by whom, and with what consequences”.

This inceptive boundary was extended with the realisation that not all entrepreneurs are pulled toward entrepreneurship. In this regard, the construct “necessity entrepreneur” was introduced to refer to persons whose motive for being pushed into entrepreneurship is a lack of any options for work other than self-employment (Acs, 2006). It is important to note, however, that necessity entrepreneurs generally have lower economic outcomes, lower survival rates and a lower propensity for employment creation than opportunity entrepreneurs (Shane, 2009; Vivarelli, 2013). Poole argues that the very notion of necessity-motivated entrepreneurs is questionable, because the concept of opportunity has to be central in any realistic model of entrepreneurship (2018).

In the Global South, where unemployment and poverty are rife, the term “necessity entrepreneurship” has been extended even further. The lack of opportunities in the wage sector pushes large numbers of unemployed persons into self-employment activities. These persons are not only unemployed, but often have few skills and limited capital, and starting some kind of enterprise is easier than finding an employer with a job to offer (Banerjee & Duflo, 2007). These enterprises mostly manifest as petty vendors who run their businesses as survival workshops that are unlikely to become profitable once the total labour cost is factored in (Kuada, 2015; Poole, 2018). These “entrepreneurs” are thus not regarded as drivers of economic growth (Naudé, 2011), and Banerjee and Duflo (2007) warn that these “*penniless entrepreneurs*” should not be romanticised. Of all regions, Africa has the highest prevalence of necessity entrepreneurship. In 2016, the rate of early-stage entrepreneurial activity in South Africa that was necessity driven, was 23.6% (Herrington, Kew & Mwanga, 2016).

Based on the above, this paper proposes the following:

P1a: Identifying and acting on a real business opportunity is a boundary condition for the fidelity entrepreneurship domain.

P1b: Necessity-motivated enterprises cannot be considered “entrepreneurial” by default.

In the context of EDA, entrepreneurship support programmes (e.g. training, incubation, mentoring and funding) are implemented for individuals with little or no entrepreneurial experience and no other options for employment. This study argues that being a beneficiary of an EDA initiative *is* the opportunity and that the recognition and exploitation of a real business opportunity are unlikely. This study therefore further proposes the following:

P1c: The product of EDA is unlikely to identify and act upon a real business opportunity.

7.3 Boundary 2: Innovation

Entrepreneurs create innovative insights for discovering and exploiting opportunities (both new and existing) and for solving problems (Botha, 2019). Higher degrees of creativity and innovation have proven a positive predictor of the survival and growth of enterprises (Vivarelli, 2013) and also translate into a greater contribution to economic growth (Naudé, 2011). In fact, Naudé argues that “*the major conceptual approach toward defending the role of the entrepreneur in economic growth has been to see the entrepreneur as a conduit for innovation*”.

However, this border of the fidelity entrepreneurship domain has been extended to include the replication of existing enterprises (Baker & Welter, 2020). These replicative activities are unlikely to result in “*industrial revolutions and the consequent explosions in economic growth*” (Griffiths, Kickul, Bacq & Terjesen, 2012), and replicative entrepreneurship is not considered important for contributing to economic growth (Naudé, 2011).

Again, this boundary was extended even further in the context of EDA. Kuada (2015) describes the replicative self-employment activity of a large number of persons in the Global South:

“Once news goes around that there is good money to be made by providing a particular type of goods or services and without a huge investment, many people will quickly flock into this line of business out of sheer necessity or to fulfil their lifestyle ambitions. They tend to enter businesses that may be said to lie at the low-end market segments – i.e. serving the bottom of the pyramid consumers. Their owners have low levels of expectations and ambitions and are therefore inattentive to opportunities for growth. The potential profitability of these businesses is low and this reduces their organic growth potentials.”

Based on the above, this paper proposes the following:

P2a: Innovation is considered a boundary condition for the fidelity entrepreneurship domain.

P2b: The product of EDA is unlikely to create innovative new products or processes.

7.4 Boundary 3: Risk-taking

There is an inherent personal and financial risk involved for persons embarking on the entrepreneurial process (Nieuwenhuizen, 2019). A number of innovative ideas never make it to the market, and even if they do, there is no guarantee that these ideas will make money (Baumol in Griffiths et al., 2012). Entrepreneurs can to some extent manage this risk by taking control of and being involved in the managing of the business. They can also reduce their financial risk by involving investors (Botha, 2019). Fidelity entrepreneurship remains a practice in which huge losses are risked (Baumol in Griffiths et al., 2012).

As per the definition, most EDA interventions are directed at unemployed persons with little or no other opportunities for employment. Persons starting a business when unemployed have a lower opportunity cost on their time than persons who leave their jobs to start a business (Shane, 2009). EDA programmes also often involve funding opportunities for the start-ups born from these interventions in the form of grant funding. There is thus little or no financial risk involved for the individual when becoming a beneficiary of an EDA programme, and the financial losses incurred by the beneficiary when the business fails can be considered insignificant. Rather, it is argued here that the access to funding for the start-up could be considered a financial reward by these beneficiaries who would otherwise be without an income. This absence of risk involved in participating in an EDA intervention may inform the dissensus from the Delphi panel (table 3).

Based on the above, this paper proposes the following:

P3a: Risk-taking is considered a boundary condition for the fidelity entrepreneurship domain.

P3b: EDA inherently reduces risk-taking by the beneficiary.

7.5 Boundary 4: Starting a venture

Venture creation is considered an integral attribute of fidelity entrepreneurship (Gartner, 1990). Although the questionnaires in rounds 2 and 3 did not explicitly ask the panellists' opinion on the theme of “starting a venture” (see table 1) eight of the 13 Delphi panellists in this study explicitly mentioned “starting a venture” in their personal definitions of entrepreneurship.

This boundary of the fidelity entrepreneurship umbrella has been extended to include activities that do not involve the creation of a new venture. A first extension is the inclusion of the construct of “corporate entrepreneurship” under the conceptual entrepreneurship umbrella. Corporate entrepreneurship refers to entrepreneur-like activities and traits exhibited by individuals in existing firms, even if these skills are not harnessed to start a business (Kaufmann & Dant, 1999). This boundary has also been extended to incorporate potential and nascent entrepreneurs under the entrepreneurship umbrella. Potential entrepreneurs are defined as persons who “*perceive good business opportunities and believe that they have entrepreneurial capabilities*” and nascent entrepreneurs refer to persons who “*intend to pursue a business opportunity within the next three years*” (Botha, 2019).

Examining the data on start-ups in South Africa, it becomes clear that the boundary of “starting a business” cannot be considered without considering the survival and growth of such businesses. South Africa’s business discontinuance rate is higher than the established business ownership rate in the same period, implying that “*there are more businesses being closed, sold or otherwise discontinued than there are businesses being continued*” (Bowmaker Falconer & Herrington, 2020). Even if these start-ups do survive, 22.6% of early-stage “entrepreneurs” do not expect to create any additional jobs in the following five years. From the same group, 46.8% expect to create only between one and five new jobs, and a mere 30.6% expect to create six or more jobs over the next five years (Bowmaker Falconer & Herrington, 2020). Even if these start-up ventures do survive, they are unlikely to develop into high-growth ventures that enhance economic growth and contribute significantly to job creation (Audretsch, 2012; Hartmann, Krabbe & Spicer, 2019), a fact that was confirmed with consensus from the Delphi panel (table 2).

The creation of start-up ventures forms an integral outcome of EDA interventions. Development organisations’ or government’s contribution to “entrepreneurship development” is often measured and reported in terms of the number of new start-ups that have been created as a result of EDA interventions, assuming that these ventures will survive past three years and ultimately result in entrepreneurial ventures that contribute to economic emancipation and job creation. However, EDA is resulting in excess entry and excess failure (Hartmann et al., 2019). As per the definition, EDA interventions are directed toward persons with little or no entrepreneurship experience. These low-skilled beneficiaries of EDA run ventures of low quality and low profit that are doomed to early failure (Vivarelli, 2013). When these ventures do fail, they are abandoned and the founders of the start-up opt to enter the labour market (Plehn-Dujowich, 2010). When opportunities in the labour market are scarce, the founder will be necessitated to start yet another low-quality venture that is again doomed to early failure.

In this regard, the Delphi panellists reached consensus that the product of EDA is unlikely to survive past three years without ongoing mentorship and grant funding (table 2). The mere act of starting a business does not constitute “entrepreneurship”. It is only when this start-up moves inside the other boundaries of the fidelity entrepreneurship domain that it can be labelled “entrepreneurship”. Based on the above, this paper argues that, although a handful of start-ups (including those resulting from EDA) may develop into fidelity entrepreneurial ventures, start-up ventures cannot be included in the entrepreneurship umbrella from the onset and by default. It is proposed that:

- P4a: Starting a venture can only be considered entrepreneurial once such a start-up meets the other boundary conditions for fidelity entrepreneurship.
- P4b: The majority of start-up ventures in South Africa are unlikely to develop into high-growth ventures.

7.6 Boundary 5: Intention and ability to grow the business

It is only through growing businesses that entrepreneurship has the potential to contribute significantly to economic development and job creation (Davidsson, Achtenhagen & Naldi, 2010), yet high growth ventures make up a very small number of ventures included under the conceptual entrepreneurship umbrella (Audretsch, 2012; Shane, 2009). In this section, a distinction is made between growth in terms of turnover and growth in terms of employment. A further distinction is made between the growth of the venture, the intention to grow the venture and the ability to grow the venture.

The boundary of “growing the business” was extended when researchers and observers realised that not all enterprises were predisposed to growth and their intention to grow could not be assumed (Douglas, 2013). Growth intention is defined as the intention to create a venture that will be substantially larger in subsequent time periods (Douglas, 2013). For a number of reasons, enterprises may deliberately refrain from exploiting opportunities to expand their firms (Wiklund, Davidsson & Delmar, 2003). Even if ventures show an intention to grow in terms of sales, it can also not be assumed that they intend to grow in terms of employment (Neneh & Vanzyl, 2014). A case in point is

the newer technology companies that are showing a decrease in employment as more services and functions are outsourced.

Many enterprises included under the entrepreneurship umbrella may not possess adequate internal resources to grow the business (Lau & Busenitz, 2001). Even if these enterprises indicate a desire to grow (Choto, Tengeh & Iwu, 2014), their ability to do so is questionable. The focus of these enterprises rarely go beyond survival, sales and profit rates, and their potential for growth thus remain limited (Nieuwenhuizen, 2019). Even if they do grow or intend to grow their enterprise, the cultural context shapes the way in which business resources are generated, leveraged and used (Baker & Welter, 2020; Kuada, 2015). Specifically, the importance that African societies place on traditional family structures has to be taken into consideration since it has two definite implications for the growth of enterprises in this context. Firstly, the family structures provide a reliable, flexible and cheap pool of labour. For this reason, ventures often contribute very little to job creation outside of the family network (Banerjee & Duflo, 2007; Kuada, 2015). Secondly, the small businesses in this context are often the only source of income for the extended family. Resources that are generated by the business are thus used to support weaker family members at a rate that “*outpaces their capacity to recoup them for growth*” (Kuada, 2015). In worst cases, the burden of unemployed family networks could even lead to the collapse of these small businesses.

The Delphi panellists did not reach consensus (table 1) that growing an enterprise in terms of turnover or jobs is a boundary of the fidelity entrepreneurship domain, since enterprises may at times deliberately choose not to expand their firms. They did, however, reach consensus that to be considered entrepreneurial, an enterprise should indicate an intention to grow in terms of turnover (table 1). The panel also reached consensus that (provided they survive) the product of EDA is unlikely to grow in terms of turnover year on year (table 3). Furthermore, five of the panellists were of the opinion that the product of EDA is likely to create employment for the owner only, while four panellists were of the opinion that such product is likely to create employment for the owner and their immediate family. Only four panellists were of the opinion that the product of EDA is likely to create employment outside of the owner’s family.

Based on the above, this paper proposes the following:

- P5a: The ability to grow the business when the intention is there is considered a boundary condition for the fidelity entrepreneurship domain.
- P5b: EDA is unlikely to produce ventures that have the intention and/or ability to grow beyond employing immediate family members.

7.7 Boundary 6: Reward beyond mere survival

The term “reward” as used here refers to profit or an increase in the value of the business (Nieuwenhuizen, 2019), not reward in terms of personal satisfaction. This boundary of the fidelity entrepreneurship domain was extended to include endeavours that are not profit seeking, but rather socially driven (Kaufmann & Dant, 1999). The purpose of these social enterprises is not simply to generate revenue or maximise profits, but rather to fulfil a social need through commercial activity. These enterprises thus produce goods and services in response to a lack of facilities and services in a community (Di Domenico, Haugh & Tracey, 2010). Different from non-profit organisations that rely on donations and philanthropy for an income, social enterprises pursue revenue-generation strategies through trading (Di Domenico et al., 2010).

This boundary of the fidelity entrepreneurship domain was also extended further with the introduction of survivalist enterprises. As with necessity-motivated entrepreneurs, survivalists are pushed into self-employment due to the lack of opportunities in the wage sector. However, the income levels of these survivalists generally remain below the minimum poverty line and is just enough for their daily upkeep and survival (Kuada, 2015). Amsden (2010) calls this the act of people hiring themselves at starvation wages. Apart from survival, the income generated by these ventures can be considered too small to be regarded as financial reward. As one of the panellists commented in the third round: “*In*

my experience 'meaningful employment' is survivalist in nature. You need to eat". In this regard, the Delphi panel reached consensus that survivalist enterprises cannot be included under the entrepreneurship umbrella by default (table 2).

Based on the mainstream entrepreneurship ideology, EDA is sold to and desired by marginalised communities in the Global South as a guaranteed ticket out of poverty and a guaranteed road to riches. In reality, however, barely one in four start-ups in South Africa survive past their first three years of existence. Even if they do survive, they are unlikely to develop into enterprises that yield high financial rewards. Failure is likely and success remain elusive (Hartmann et al., 2019). Against this background, this paper argues that the product of EDA is not producing the rewards that it is promising and that the beneficiaries of EDA are better off not pursuing "entrepreneurship" in the first place (Hartmann et al., 2019). In fact, the panellists reached consensus that if beneficiaries of an EDA intervention were to receive an employment offer in the form of a meaningful job, they are likely leave the venture born from EDA to pursue the opportunity (table 3). The beneficiaries likely view an opportunity for full-time employment as more rewarding than the opportunity to start and run a business.

Based on the above, this paper proposes the following:

P6a: For fidelity entrepreneurship to exist, reward has to go beyond mere survival.

P6b: Survivalist enterprises cannot be included under the entrepreneurship umbrella by default.

P6c: EDA beneficiaries prefer an opportunity for full-time employment above the opportunity to start and run a business.

P6d: The product of EDA is unlikely to deliver reward beyond survival.

7.8 Boundary 7: Independence and autonomy

Entrepreneurs are generally individuals who have a high degree of autonomy who believe that they can control and influence the outcome of their own actions (Botha, 2019). Furthermore, the creation of an enterprise requires resources and fidelity entrepreneurship employs a range of tools and strategies (e.g. networking, bootstrapping and bricolage) to garner these resources – even in resource-poor environments (Di Domenico et al., 2010). This boundary was extended by including ventures (such as survivalists) that do not exhibit economic independence (Botha, 2019).

The start-ups resulting from EDA often remain operating in a zone of insolvency, dependent on externally provided resources and are bound by an external locus of control through blame of and dependence on others (Pretorius et al., 2021). EDA is unlikely to contribute to economic growth and job creation (Vivarelli, 2013), and is more likely create ventures that, if they survive, remain dependent on grant funding and business rescue interventions to keep the business afloat (Pretorius et al., 2021). In this regard, the Delphi panellists reached consensus that the product of EDA is likely to remain dependent on mentorship and grant funding for survival (table 3).

Based on the above, this paper proposes the following:

P7a: Independence and autonomy are considered boundary conditions for the fidelity entrepreneurship domain.

P7b: The product of EDA is unlikely to become dependent and autonomous.

7.9 Other enterprise types included under the entrepreneurship umbrella

Although this study focuses on fidelity entrepreneurship and the product of EDA, the researchers utilised the commitment from the expert panellists to explore their opinions on other venture types that are currently included under the entrepreneurship umbrella in the second round questionnaire (see table 2). There was only one question pertaining to each of these enterprises in the round 2 questionnaire. Consensus was reached in the second round and the questions were not repeated in the third round.

Not all small businesses can be considered entrepreneurial ventures, yet the term has become synonymous with entrepreneurship (Griffiths et al., 2012). Although small businesses are related to the field of entrepreneurship in that they require entrepreneurial action for start-up, they rarely appear interested in innovation, growth and reaching certain strategic objectives but rather focus on survival, sales and profit targets (Nieuwenhuizen, 2019). With consensus from the Delphi panellists, this paper proposes the following:

P8a: Small business is a type of enterprise, but it is fallaciously included under the entrepreneurship umbrella.

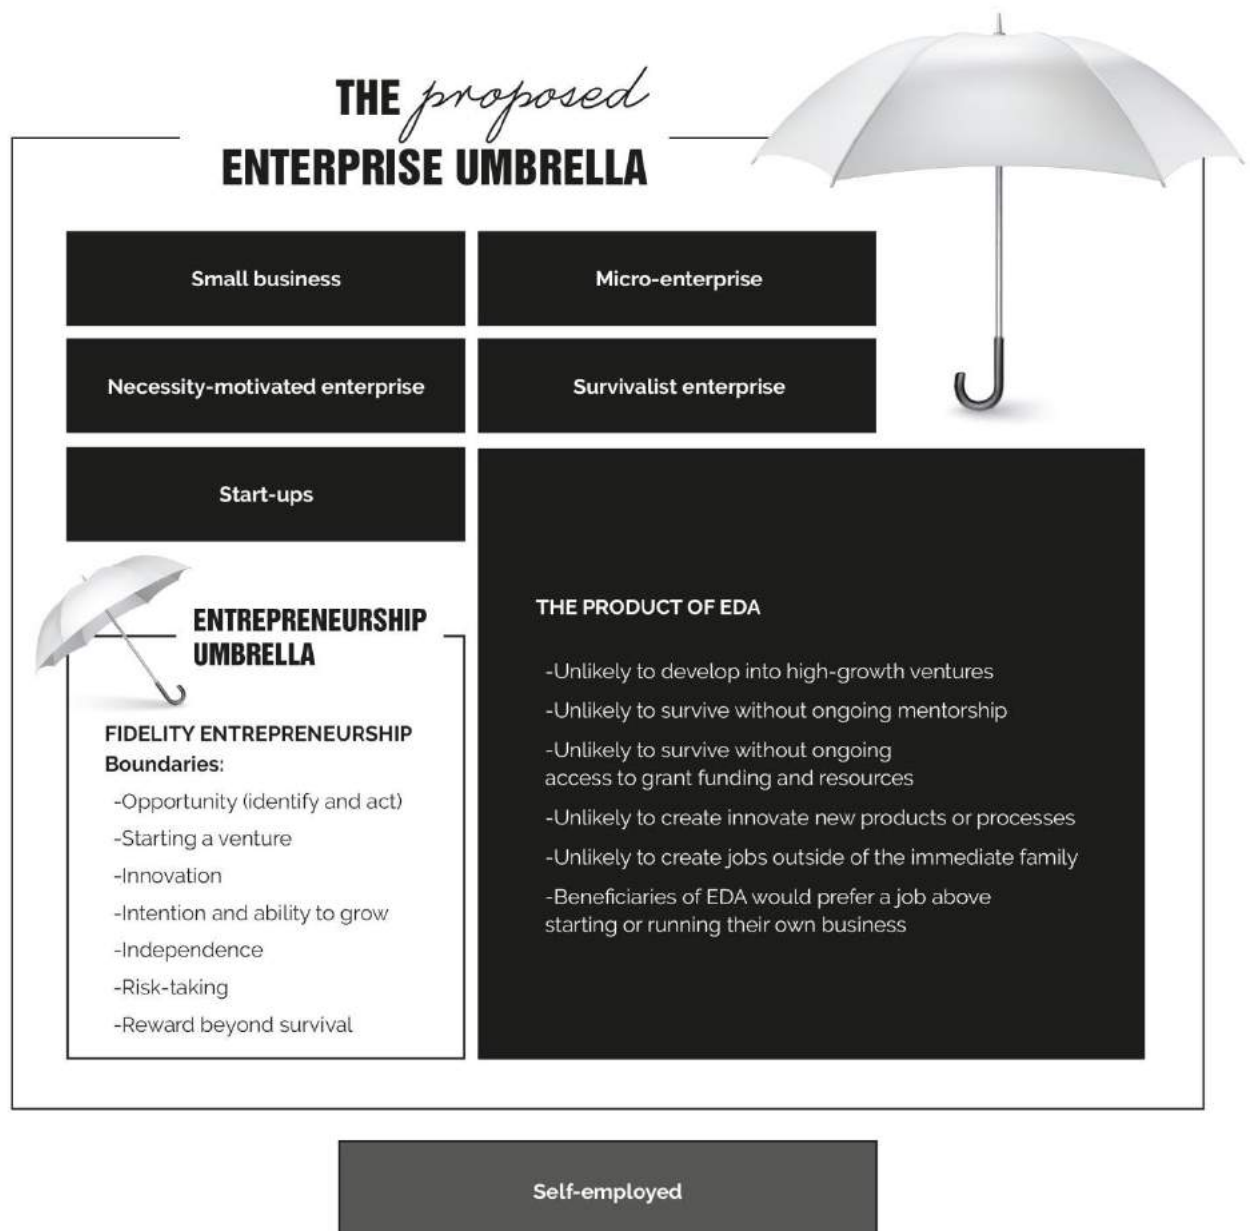

Micro-enterprises are also included under the current conceptual entrepreneurship umbrella. It is defined as an enterprise with less than ten employees, but is often merely self-employing. Bygrave suggests that we fool ourselves when we say that we are researching “entrepreneurship” when we are in fact studying “micro business” (Bygrave, 2007). Again, a handful of these micro-enterprises may potentially develop into entrepreneurial ventures and migrate into the boundaries of the fidelity entrepreneurship domain. However, this study proposes the following:

P8b: Micro-businesses is a type of enterprise, but it is fallaciously included under the entrepreneurship umbrella.

This mainstream conceptualisation of entrepreneurship also ignores a number of important distinctions between the concepts “entrepreneurship” and “self-employment” and largely present them as synonyms (Bögenhold, 2020; Griffiths et al., 2012). Self-employment *can* fall within some of the fidelity entrepreneurship boundaries, but all self-employment cannot be classified as “entrepreneurship” by default (Kuada, 2015). Bögenhold (2020) strongly argues that “*the equation of self-employment with an unclear definition of entrepreneurship should not be taken further*”. In agreement with critical literature and supported by the Delphi panel this paper thus proposes the following:

P8c: Self-employment cannot be included under the fidelity entrepreneurship umbrella or an enterprise umbrella from the onset and by default.

8. A NEW CONCEPTUAL FRAMEWORK FOR THE ENTERPRISE UMBRELLA

Source: own compilation

Figure 2: The proposed enterprise umbrella

When related phenomena are not equalled to fidelity entrepreneurship, but rather roughly linked to entrepreneurship under the enterprise umbrella, it challenges the meta-theoretical assumption that anything and everything previously labelled “entrepreneurship” is essentially the same activity. It also challenges the assumption that all types of enterprises included in the mainstream entrepreneurship umbrella are equally able to contribute to economic growth and job creation. -

This newly proposed enterprise theory umbrella provides a departure point for a critical dialogue in the scholarly discourse relating to EDA, in particular, and the meta-theoretical conceptualisation of the fallacious entrepreneurship umbrella, in general. This newly presented enterprise umbrella challenges the question “why do aeroplanes not lay eggs?” with the answer “because they are not birds”.

9. Limitations And Future Research

As presented in this research, this is an introductory Delphi study that aims to stimulate debate and introduce a new narrative for the entrepreneurship discourse, in general, and the product of EDA, in particular. This study is not without limitations and future research can build on the findings in this study.

Firstly, the panel was limited to 13 specialists. This size of the sample is too small to pursue significance; however, this was not the aim of this study. Secondly, only four of the panellists indicated that they had knowledge in the field of critical entrepreneurship studies. Although the background and aim of the study were clearly set out in the cover letter preceding the second round questionnaire, the questions were phrased in a way that elicited a response from the panellists without them having to agree with the premise that the current conceptual entrepreneurship framework has to be revisited and potentially rejected. Future studies can extend to a broader panel of critical entrepreneurship scholars that explicitly reject the mainstream conceptual entrepreneurship framework. Such a panel may, however, likely span diverse nationalities, which may present other challenges. Thirdly, only two of the panellists indicated that they were practically involved with EDA interventions. Future studies can extend to a panel of EDA practitioners.

Another limitation is the fact that there were no explicit questions on the questionnaires in rounds 2 and 3 that address the theme of “reward” and “starting a business”, and the findings were inferred from open-ended responses and extant literature. Future research can explicitly explore these themes.

During the second-round questionnaire analysis the researchers considered that the study may potentially benefit from additional rounds to drive consensus through the panel conforming to the majority opinion. An online discussion with the beneficiaries (as is sometimes done with a modified Delphi process) was also considered. However, the researchers opted to respect the fact that the panellists had committed to the process based on the assurance that it would be limited to three iterative rounds. The trends observed in these three rounds of this Delphi process suggest that a follow-up study is warranted.

This study focused specifically on the product of EDA. Future research may also demarcate boundaries for other enterprises, indicating how these enterprises may be related to fidelity entrepreneurship, yet cannot be considered synonymous with fidelity entrepreneurship.

10. Summary

This paper underscores the restrictive impact of the current mainstream theoretical conceptualisation of “entrepreneurship” on theory development. The terminology confusion brought about when a number of diverse phenomena are lumped together under the same theoretical umbrella, may be at the heart of the theoretical impasse in mainstream entrepreneurship theory.

This paper addresses this terminology confusion and resulting assumptions underlying mainstream entrepreneurship theory by rejecting the entire meta-theoretical conceptualisation of entrepreneurship. It presents a framework for enterprise theory, an umbrella that includes loosely related phenomena such as, *inter alia*, micro-enterprises, necessity-motivated enterprises, the product of EDA and fidelity entrepreneurship. The boundaries for the fidelity entrepreneurship phenomenon (one of a number of phenomena included under the newly presented enterprise umbrella) are clearly demarcated. Phenomena that fall outside of these boundaries are “un”trepreneuried and presented as phenomena that can be studied from an enterprise theory perspective, but not from an entrepreneurship theory perspective. Doing so does not imply that these “un”trepreneuried phenomena deserve any less scholarly interest. Unbundling and reconceptualising the fallacious entrepreneurship umbrella creates realistic expectations of what the role of each of these phenomena can be within a broader enterprise ecosystem. To open the dialogue, this study also presents realistic expectations for the product of EDA.

This study moves beyond the impasse in the mainstream entrepreneurship paradigm by proposing an alternative umbrella for enterprise theory. This new umbrella stimulates a new narrative about the (in)ability of “entrepreneurship” (and EDA specifically) to contribute to economic growth and job creation.

Keywords

Entrepreneurship; entrepreneurial intention; entrepreneurial self-efficacy; perceived access to finance; South Africa

Abstract

Worldwide entrepreneurship has been recognised as an engine for job creation, economic growth and development. As such, many nations are looking into entrepreneurship to address the rising unemployment. Nevertheless, the level of entrepreneurial activities in South Africa remains relatively low compared to other developing countries. This is worrying since the country is experiencing a high unemployment rate, especially among the youth. This necessitates a need for more studies to explore what drives the youth in South Africa to choose an entrepreneurial career. Thus, this study examined whether the possibility of accessing start-up funding can influence students to start a business. Additionally, the study tested whether ESE moderates the PAF-EI relationship. Data was collected from 500 students at a South African university using a questionnaire. The findings showed that the PAF-EI association was positive and significant. Moreover, the results showed that ESE significantly predicts EI. It was also established that ESE positively moderates the PAF-EI nexus. The study culminates with several practical and policy implications.

1. Introduction

All over the world, entrepreneurship has been identified as a vital strategy for new job creation, local economic development, and economic growth due to the flexibility and innovative capability of entrepreneurs (Wiklund, Wright & Zahra, 2019; Neneh, 2020; Elnadi & Gheith, 2021; Maheshwari & Kha, 2021). An entrepreneurship career provides individuals with financial freedom, flexibility, and economic inclusion (Dzomonda & Fatoki, 2019; Adebusuyi, Uysal et al., 2021). Venturing into entrepreneurship is considered intentional (Ajzen, 1991; Liñán & Chen, 2009; Uysal et al., 2021) since entrepreneurial intentions (EI) form long before a new venture, suggesting a link between entrepreneurship and intention (Liñán & Chen, 2009; Thompson, 2009). Thompson (2009, p. 676) defined EI as “a self-acknowledged conviction by a person that they intend to set up a new business venture and consciously plan to do so at some point in the future.” Based on this definition, it becomes vital to understand the formation of EI because it is the initial stage that influences the entire new venture creation process (Ajzen, 1991; Elnadi & Gheith, 2021; Maheshwari & Kha, 2021). The idea that EI is a crucial determinant for new venture creation is widely supported by existing studies (Ajzen, 1991; Elnadi & Gheith, 2021; Maheshwari & Kha, 2021).

Prior studies have investigated different factors influencing entrepreneurial intention (Urban & Ratsimanetrimanana, 2019; Neneh, 2020; Nguyen, 2020; Al-Ghazali & Afsar, 2021; Elnadi & Gheith, 2021; Uysal et al., 2021; Rusu et al., 2022). Among these various factors, access to finance is considered an essential factor influencing entrepreneurial intentions (Urban & Ratsimanetrimanana, 2019; Nguyen, 2020; Rusu et al., 2022). Drawing from the credit rationing theory (Stiglitz & Weiss,

*Corresponding Author

¹ E-mail address: Nenehbn@ufs.ac.za

1981), perceived access to finance (PAF) describes the difficulty perceived by an individual in accessing finance. Likewise, Rusu et al. (2022) define perceived access to finance as the amount of information an individual has about credit facilities and financial support from different institutions. Start-up capital is a vital resource for all new businesses as it helps the company cover working capital, improve the business's productivity, and finance projects for expansion purposes (Neneh, 2016; Urban & Urban Ratsimanetrimanana, 2019; Rusu et al., 2022). As such, access to finance facilitates the establishment and growth of a new business. While the critical role of access to finance in fostering entrepreneurial intention cannot be overlooked, existing studies suggest that understanding the mechanisms and context through which this association occurs is crucial for making effective decisions regarding promoting entrepreneurship (Nguyen, 2020; Urban & Ratsimanetrimanana, 2019; Rusu et al., 2022). Thus, there has been an increase in studies examining the PAF-EI relationship (Rusu et al., 2022). Even though existing literature sheds light on the association between PAF and EI, some gaps exist, which raise pertinent research questions. One limitation of existing studies is mixed findings regarding the PAF-EI relationship. For instance, while several scholars established that PAF positively predicts EI (Aslam & Hasnu, 2016; Urban & Ratsimanetrimanana, 2019; Rusu et al., 2022), others found no significant direct effect (Mwatsika, 2015; Nguyen, 2020). Also, existing studies further indicate that the PAF-EI relationship does not always hold in some instances (Mwatsika, 2015; Nguyen, 2020). According to Nguyen (2020), perceived access to finance alone may not always predict entrepreneurial intention. Thus, the PAF-EI relationship is contingent on other factors (Nguyen, 2020; Rusu et al., 2022). Once an individual has high PAF, translating such high PAF into entrepreneurial intentions may require favourable boundary conditions. Thus, there is a need to understand the association between PAF and EI clearly. Therefore, we introduced entrepreneurial self-efficacy (ESE) as a boundary condition to provide an alternative explanation on the PAF-EI association. Also, given that the PAF-EI has been validated in other contexts (Urban & Ratsimanetrimanana, 2019; Rusu et al., 2022), it is crucial to test if this will hold in a different context such as South Africa and if this relationship can be moderated by entrepreneurial self-efficacy? Unlike the above contexts, for students from a developing country such as South Africa, characterized by high unemployment, poverty and income inequality, access to finance may be a priority for them to start a business. This study provided clarity on the association between PAF and EI by incorporating the moderating effect of ESE. This study further provided an alternative explanation on the association between PAF and EI by demonstrating that ESE significantly moderates the association between these two constructs.

1.1 Problem Statement

According to the 2021/2022 Global Entrepreneurship Monitoring Report, entrepreneurial activities have increased in the past year in South Africa. However, such entrepreneurial activities are still relatively low compared to other African regions (GEM,2021/2022). This is worrying since the country is also experiencing issues of unemployment where youth between 15-24 years account for 63,9%, 42,1% is accounted for by individuals between the ages of 25-34 years, while the national unemployment rate is 34,5% (Statistics South Africa, 2022). The high unemployment rate among the youth is of great concern as the youth constitute a significant percentage of the South African population (Dzomonda & Fatoki, 2019). Entrepreneurship can be a sustainable solution to the socio-economic challenges facing South Africa because the entrepreneurship career offers financial freedom, a tool for wealth creation, decent jobs, and value addition activities that spur economic growth.

Nevertheless, many youths still prefer full-time employment over an entrepreneurship career as they perceive it as risky in terms of income uncertainty (Dzomonda & Fatoki, 2019). Thus, examining factors that enhance the level of entrepreneurial intention amongst youths is an essential step towards solving this problem. While access to finance facilitates new venture creation and sustainability thereof (Neneh, 2016; Adomako & Danso, 2014), a perceived lack of finance hinders entrepreneurial activities among the youth. Also, there are mixed findings regarding the association between PAF and EI. For instance, while several scholars established that PAF positively predicts EI (Aslam & Hasnu, 2016; Urban & Ratsimanetrimanana, 2019; Rusu et al., 2022), others found no significant direct effect (Mwatsika, 2015; Nguyen, 2020). One of the causes of these mixed findings is that these studies only tested the direct effect of PAF on EI without considering other boundary conditions that can modify

this relationship. We argue that while an individual has high PAF, translating such PAF into EI may require favourable conditions (Nguyen, 2020). One such condition can be ESE. Existing studies report that ESE significantly influences an individual's career choice and development because it affects how people evaluate a particular career based on their skills (Newman et al., 2019; Elnadi & Gheith, 2021; Uysal et al., 2021). Since an entrepreneurial career requires particular skills, ESE may influence individuals to start a business in the future by making them confident in their abilities to thrive in such a domain. Besides supporting evidence regarding the role of ESE in predicting EI, limited studies have endeavoured to explore the moderating effect of ESE on the PAF-EI relationship, which necessitates further research.

1.1.1 Objectives of the study

Thus, this study aimed to examine whether the possibility of accessing start-up funding can influence students to start a business in the future. Additionally, the study tested whether ESE moderates the PAF-EI relationship.

2. Methodology

The current paper was quantitative as it intended to test the constructs in the conceptual model statistically. The quantitative research method enhanced objectivity in the study, thus, improving the rigour of findings. We collected data using a questionnaire in a survey from students at a South African University. The students were from the faculty of Economics and Management Sciences (Business management, Accounting, Economics and Finance, and Public administration and Management). The choice to consider university students is because they are regarded as potential entrepreneurs at a point to make career decisions (Rusu et al., 2022). Since entrepreneurial intentions are formed long before a new venture (Liñán & Chen, 2009; Thompson, 2009), using university students as a sample improves the understanding of this concept and provides rich data to inform policymakers (Liguori et al., 2020). Also, several existing studies related to entrepreneurial intention have been validated using student samples (Neneh, 2020). A sample of 620 university students was conveniently recruited to participate in the survey. Out of these questionnaires distributed, 500 questionnaires were accurate and usable (i.e. 80.65% response rate).

2.2.1 Measures

We measured EI using six items adapted from existing literature (Linan & Chen, 2009). Some sample items included, "My professional goal is to become an entrepreneur." Perceived access to finance was measured using constructs on financial knowledge and skills (sample items include: "If I were to start my own business, I know how to prepare a business plan"; "If I were to start my own business, I know how to use financial information to make business decisions") collateral requirements (sample items include; "If I were to start my own business, I know that lack of credit history will make it difficult for me to borrow money from the banks and financial institutions"; "If I were to start my own business, I know that banks will be reluctant to finance my new business because of the high risk involved") and small business support (sample items include; "If I were to start my own business, I know a lot about Khula and the sources of funding they have available to promote entrepreneurs"; "If I were to start my own business, I know a lot about SEDA and the sources of funding they have available to promote entrepreneurs"). These scales were adopted from prior studies (Mazanai & Fatoki, 2011; Padiaychee, 2016). We measured ESE using four items adapted from existing literature (Zhao, Seibert & Hills, 2005; Neneh, 2020). Some of the sample items include "I can come up with new ideas and products." The statements to measure each construct in the questionnaire were scored on a 5-point Likert scale which ranged from 1 "strongly disagree" to 5 "strongly agree". Data was analysed using descriptive statistics, Pearson correlation and hierarchical regression.

3. Hypotheses

The following hypotheses were formulated for the study:

- H1: PAF will positively predict EI.
- H2: ESE will positively predict EI.

- H3: The association between EI and PAF is moderated by ESE such that individuals who have high ESE will have a high EI.

3.1. Theoretical framework

The current study adopted base theories such as Theory of Planned Behaviour (TPB) (Ajzen, 1991) and the Social Cognitive Theory (SCT) (Bandura, 1982) to understand the processes linked to the EI formation among individuals. The TPB explains that EI predicts actual behaviour (Ajzen, 1991). EI is a function of attitude towards behaviour (ATB), subjective norms (SN) and perceived behavioural control (PBC). ATB describes an individual's evaluation of the behavior regarding enacting a particular behavior in the future (Ajzen, 1991), which implies that entrepreneurial attitudes are formed based on whether the outcomes will be favourable or unfavourable (Ozaralli & Rivenburgh, 2016). On the other hand, SN refers to the effect other people and society have in influencing an individual towards behaviour (Ajzen, 1991). This means the individual will likely enact behaviour that is regarded as acceptable by members of the family or society. In this case, an entrepreneurial society calibrated with norms that highly regard entrepreneurship may influence an individual to develop intentions towards establishing a business in the future. From understanding the concept of SN, existing studies have argued the importance of having role models and a family with an entrepreneurial background to help individuals choose an entrepreneurial career (Bandura, 1982; Ajzen, 1991). According to Ajzen (1991), PBC refers the individual's evaluation of the ability to perform the behaviour. The TPB has been found to be useful in explaining human behaviour, such as starting a new venture, leading to its wide adoption in entrepreneurship research (Pugh & Adkins, 2020; Otache et al., 2022). Many scholars agree that the TPB has been validated across different contexts, making it a vital tool for providing a nuanced understanding of the formation of EI and actual behaviour (Liu & Liu, 2019; Neneh, 2020; Otache et al., 2022). The TPB will help us understand EI formation by exploring its link to PAF and ESE. The conceptual model tested in this study is presented in Figure 1.

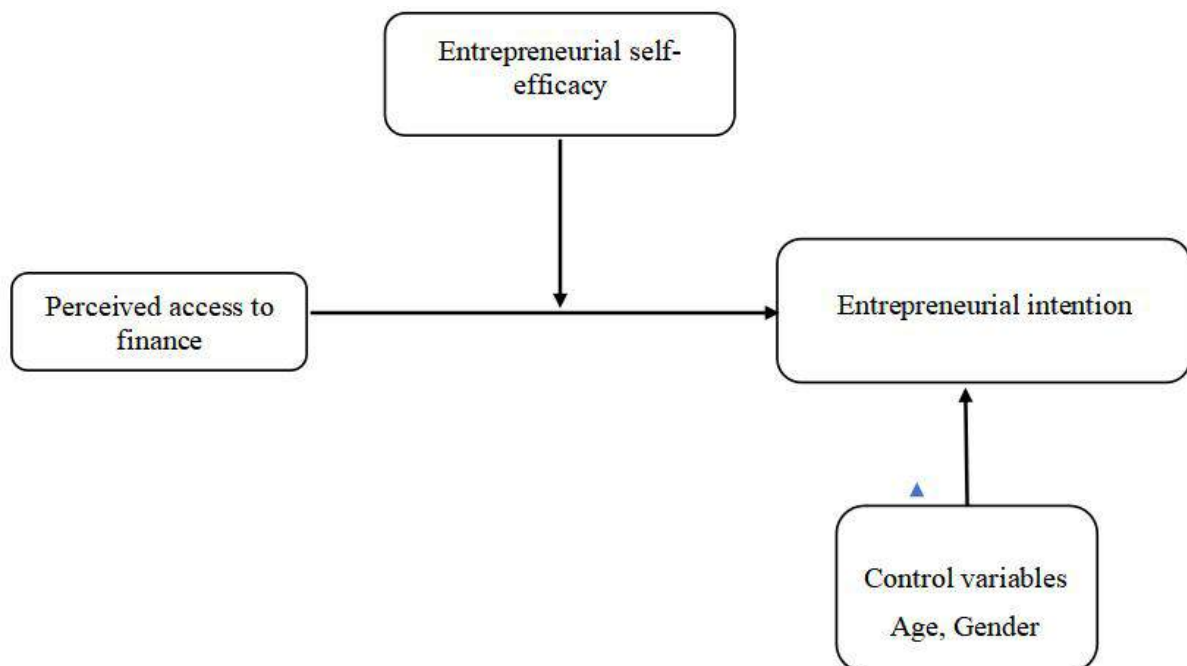

Figure 1: Conceptual model
Source: Authors conceptualisation (2022)

This study also adopted the SCT (Bandura, 1982) to provide a theoretical underpinning of ESE in the conceptual model in Figure 1. Basically, the SCT explains the cognitive processes involved in career choices. The SCT is also used to understand human behaviour, providing an alternative explanation for why individuals end up in certain careers (Bandura, 1982). Bandura (1982) defined self-efficacy as an individual's evaluation of their abilities regarding performing a task. This study adopted ESE as

a variable closely linked to entrepreneurial processes (Newman et al., 2019). “ESE describes a person’s confidence in his or her own entrepreneurial abilities and the belief that one is able to successfully execute the various roles and tasks related to entrepreneurship” (Schmitt et al., 2018, p. 840). ESE is a proximal factor that strongly predicts EI and actual behaviour (Newman et al., 2019; Uysal et al., 2021).

2.Hypothesis development

2.1 Perceived access to finance and entrepreneurial intention

PAF refers to the information possessed by individuals regarding financial resources and funding sources available to them (Rusu et al., 2022). The availability of financial resources is of great importance for any business to function well. The implication is that having high chances of securing funding for the new business can positively influence an individual’s decision to pursue an entrepreneurial career (Svotwa et al., 2022). Every new business must access internal and external finance to grow and survive. To start a business, an individual needs external sources of funding such as; equity financing and debt financing to turn their dream into reality (Nguyen, 2020). Sources of finance include family, friends, banks and government funding. Having sufficient financial resources facilitates the establishment and growth of a new business; however, financial constraints among the youth have been a significant impediment to developing entrepreneurial activities in South Africa (Neneh, 2016; Osano & Languitane, 2016). Urban and Ratsimanetrimanana (2019) assert that having access to finance makes an individual confident to start a business. This is because it assures them that it will be feasible to attract other vital resources such as skilled employees and accessible business premises, which is essential to start a successful business. Likewise, Rusu et al. (2022) argue that having easy access to finance makes individuals confident that they are in charge of their entrepreneurial goals. From a developing country perspective, where several youths come from poor backgrounds, the support that the individual expects to get from the government can also play an essential role in influencing their entrepreneurial intentions (Urban & Ratsimanetrimanana, 2019). Also, most youths in developing countries face problems in accessing finance because they do not have the collateral security required by banks. Thus, the belief that it will be difficult or easy for them to obtain start-up capital from the government will determine whether they will pursue the entrepreneurial career path. Many studies highlighted that perceived access to finance positively predicts entrepreneurial intention (Engelschjøn, 2014; Liñán & Fayolle, 2015; Urban & Ratsimanetrimanana, 2019; Rusu et al., 2022). This study advances the argument that an individual’s knowledge of whether or not they can access finance will determine the development of entrepreneurial intention. Thus, the hypothesis is stated as;

H1: PAF will positively predict EI.

2.2 Entrepreneurial self-efficacy and entrepreneurial intention

Chen et al. (1998, p.295) defined ESE as “an individual’s belief that he/she is capable of successfully performing the various roles and tasks of entrepreneurship.” According to Saadaoui and Affess (2015), ESE describes an individual's confidence regarding their ability and skills to pursue an entrepreneurship career successfully. Similarly, Bandura (2012) explains that ESE transforms individuals by making them confident of what they can achieve with their skills and capabilities, which becomes part of their belief system. This implies that individuals who believe in their entrepreneurial skills will be motivated to establish a business because they have an assurance that they will be able to cope with the demands of an entrepreneurial career (Newman et al., 2019; Uysal et al., 2021). This is further substantiated by the view that ESE enables individuals to select and pursue challenging tasks and remain optimistic about their capabilities as unique resources to attain the entrepreneurial goal (Bandura, 1982; Newman et al., 2019; Uysal et al., 2021). Ideally, ESE enables individuals to identify and act on opportunities even when facing challenges, which is a vital characteristic required to be a successful entrepreneur (Schmitt et al., 2018). Individuals with high ESE can remain optimistic and resilient even when faced with a challenging task. They persevere until completing the task (Newman et al., 2019). Empirical studies show that ESE positively predicts EI as it conditions an individual’s cognitive processes towards attaining a desired goal in the future

(Newman et al., 2019; Elnadi & Gheith, 2021; Uysal et al., 2021). Based on this evidence, the hypothesis is stated as;

H2: ESE will positively predict EI.

2.3 The role of entrepreneurial self-efficacy

Existing studies argue that PAF alone may not always predict entrepreneurial intention (Nguyen, 2020). Thus, the relationship between PAF and EI is contingent on other factors (Nguyen, 2020; Rusu et al., 2022). The argument is that once an individual has high PAF, translating such into strong entrepreneurial intentions may require favourable boundary conditions. ESE is one such favourable condition. ESE affects a person's behaviour, career choice, and the extent to which the individual will persevere toward achieving a goal (Cardon & Kirk, 2015; Newman et al., 2019). In this case, individuals with high ESE are known to be persistent toward a goal even when confronted with uncertainty, while those with low ESE may quit or change their career path.

We argue that there are two reasons why ESE will moderate the PAF-EI relationship. Firstly, entrepreneurship is a risky career polarised with high uncertainty (Schmitt et al., 2018; Neneh, 2020). Thus, even though an individual may have high PAF, translating such PAF into strong EI requires one to have high ESE, a factor which helps individuals to persist in entrepreneurial activities even when facing challenges (Cardon & Kirk, 2015; Schmitt et al., 2018; Neneh, 2020; Uysal et al., 2021). According to Schmitt et al. (2018, p. 841), "entrepreneurs high in entrepreneurial self-efficacy can more effectively regulate their emotions related to the perception of increased uncertainty and tend to be less susceptible to threatening and anxiety-provoking thoughts." If individuals persist in their actions, they have a greater chance of succeeding in that task by learning to solve problems as they arise (Bandura, 1982; Cardon & Kirk, 2015; Newman et al., 2019). Secondly, the entrepreneurship career requires specific skills and for the individual to have confidence in their knowledge and entrepreneurial skills. Additionally, the entrepreneurship career requires an individual who is opportunity oriented. Thus, when a person has high ESE, the argument is that such an individual will be capable of becoming an entrepreneur with minimal or no assistance from others because of their skills (Newman et al., 2019). Additionally, to become an entrepreneur, an individual must have ESE to become more alert and sensitive to opportunities within their environment (Schmitt et al., 2018). Existing empirical studies agree that ESE is an essential construct that strengthens individuals' EI and ability to persist in their entrepreneurial careers (Newman et al., 2019; Adebuseyi et al., 2021; Uysal et al., 2021). Boyd and Vozikis (1994) found that ESE is a significant moderator which strengthens the chances of one becoming an entrepreneur. This view is further substantiated by Schmitt et al. (2018), who singled out the vital role that ESE plays in moderating the association between EI and its antecedents. Consistent with these studies, we argue that EI will be stronger at high levels of PAF and ESE and vice versa. Based on this background, the hypothesis is stated as;

H3: The association between EI and PAF is moderated by ESE such that individuals who have high ESE will have a high EI.

3. Results and Findings

3.1 Demographic information of the participants

The demographic characteristics considered in this study included gender, age, race, level of education qualifications, prior entrepreneurial experience, family background, and EI. It was established that most participants (56.4%) were females, while 43.6% were males. The dominant aged group was 21-25 (58.2%). Black people were the majority (77.6%) followed by white people 15.6%. Also, 24.4% had prior experience, while 55.2% indicated that their family had business history.

Moreover, 83.6% of the respondents preferred to run their own business than to be employed by someone. Of those wishing to run their own business, 60.4% preferred to run their business alone, while 39.6% preferred to run their business with others. The results showed that most respondents chose entrepreneurship over employment because of the independence, flexibility, and high income earning potential associated with the entrepreneurship career.

3.2 Descriptive statistics

Table 1: Descriptive statistics, and Correlation analysis

Constructs	Mean	SD	1	2	3	VIF
1. EI	3.87	1.14	1			5.46
2. PAF	3.48	1.09	0.312**	1		6.55
3. ESE	3.74	0.675	0.426**	0.530**	1	3.95

** Correlation is significant at the 0.01 level (2-tailed)

Table 1 presents the mean, standard deviation and correlations among the constructs. A mean of 3.87 shows a moderate entrepreneurial intention among the participants. The results also show that the participants displayed moderate perceived access to finance (mean, 3.48) and entrepreneurial self-efficacy (3.74). Regarding the correlations, the results show that the variables are correlated. A coefficient of 0.312 indicates that PAF and EI are moderately correlated. Likewise, there is a moderate correlation (0.426) between ESE and EI. Furthermore, the correlation (0.530) between PAF and ESE was moderate. The study also assessed collinearity issues by evaluating the variance inflation factor of the constructs. The findings show that the VIFs were acceptable as the values were less than 10. This means that the model does not suffer from multicollinearity issues.

3.3 Assessment of reliability and validity

Table 2: Assessment of reliability and validity

Constructs	Items	Factor loadings	Cronbach's alpha
Entrepreneurial intention	EI1	0.781	0.939
	EI2	0.829	
	EI3	0.789	
	EI4	0.854	
	EI5	0.874	
Perceived access to finance	PAF1	0.740	0.924
	PAF2	0.890	
	PAF3	0.880	
	PAF4	0.876	
	PAF5	0.856	
	PAF6	0.817	
Entrepreneurial self-efficacy	ESE1	0.704	0.943
	ESE2	0.714	
	ESE3	0.727	
	ESE4	0.742	
	ESE5	0.733	

Table 2 shows an assessment of reliability and validity of the constructs. Since the measures of the constructs were adopted from existing studies, it was crucial to assess issues related to reliability and validity. As indicated in Table 2, all the factors perfectly loaded showing that the items were true measures of each construct, thus exhibiting validity of the measures. The factor loadings ranged from 0.704-0.890 which is acceptable. Regarding reliability of the constructs, the Cronbach's alpha values ranging from 0.924-0.943 shows that the three constructs (EI, PAF and ESE) were all reliable. The Cronbach's alpha values of the constructs were above the threshold 0.7, which is acceptable (Hair et al., 2019).

3.4 Hierarchical Regression

Table 3: Hierarchical Regression Model on the relationship between EI, PAF and ESE

Constructs	Model 1		Model 2		Model 3	
	Beta	T-Value	Beta	T-value	Beta	T-value
Control Variables						
Constant		9.623**		5.705**		5.660**
Gender	0.035	0.816	1.108	0.268	0.045	1.131
Age	0.058	1.095	-0.802	0.423	-0.054	-1.082
Education	0.036	0.694	0.405	0.685	0.035	0.707
Independent Variable						
H1: PAF	0.318	7.360**	0.122	2.533*	0.127	2.646**
Moderating Variable						
H2: ESE			0.364	7.633**	0.375	7.890**
Interaction Effects						
H3: PAF x ESE					0.112	2.762**
Model Parameters						
R ²	0.101		0.196		0.208	
Adjusted R ²	0.094		0.188		0.199	
F-Value (sig.)	13.883		24.047 (0.000)**		20.022 (0.000)**	
R ² -Change	-		0.095		0.012	
F-Change	-		58.226 (0.000)**		7.630 (0.006)**	
Max VIF	1.533		1.536		1.545	

** Sig at 1%, * Sig at 5%, Model 1 is the independent variable (PAF), Model 2 is the Moderating variable (ESE) and Model 3 is the Interaction effect (PAF X ESE)

Table 3 shows the relationship between EI, PAF, and ESE. We also tested the effect of control variables such age, education, and gender on EI. The model was also significant at $p \leq 0.05$, when the F-value is considered. The results showed that PAF positively predicts EI, thus, confirming hypothesis 1. It was also established that ESE significantly predicts ESE, thus, supporting hypothesis 2. The results also showed that ESE positively moderates the association between PAF and EI. This supported hypothesis 3, which stated that the association between EI and PAF is moderated by ESE such that individuals with an ESE will have a high EI.

3.4 Probing the PAF-EI relationship at varying levels of ESE

The PAF-EI relationship was further examined at varying levels of ESE, as graphically presented in Figure 2.

Figure 2: Probing the PAF-EI relationship at varying levels of ESE

Figure 1 graphically shows the interaction terms. The results show that EI increases as PAF increases. However, this association is mainly pronounced only with those with a high ESE. This implies that ESE strengthens the association between PAF and EI. This is likely to result in greater EI for individuals with perceived access to finance and higher levels of ESE.

3.5 Discussion

This study examined the association between PAF and EI. Also, the study tested the moderating effect of ESE on the PAF-EI association. The results showed that PAF positively predicts EI. This implies that individuals will be confident and motivated to start a new venture in the future if they have an assurance that they will access start-up funding either from the bank or the government. Access to finance is essential for all start-ups; thus, perceived access to capital motivates individuals to choose an entrepreneurship career over employment (Neneh, 2016; Osano & Languitane, 2016; Rusu et al., 2022; Sivotwa et al., 2022). To start a business, an individual needs external sources of finance such as equity and debt financing to turn their dream into reality (Nguyen, 2020). Having access to finance makes an individual confident to start a business because it assures them that it will be feasible to attract other vital resources such as skilled employees and accessible business premises, which is essential to start a successful business (Urban & Ratsimanetrimanana, 2019; Rusu et al., 2022). Consistent with other studies conducted in developing countries (Urban & Ratsimanetrimanana, 2019; Rusu et al., 2022), our findings confirm that PAF positively predicts EI among the surveyed participants. Given that several students from developing countries such as South Africa come from poor backgrounds and lack collateral security to secure loans from the bank, the support that the individual can get from their family and friends, as well as the government, will enhance their EI.

It was established that ESE positively predicts EI. This implies that ESE is a crucial determinant for EI. An entrepreneurship career requires individuals who are confident in their abilities to manage the venture and interact with investors. Hence, existing studies argue that ESE is a proximal determinant of EI because it makes individuals confident in their skills and capabilities, which encourages them to create a business (Newman et al., 2019; Neneh, 2020). Individuals who believe in their entrepreneurial abilities and skills will likely pursue an entrepreneurial career (Cardon & Kirk, 2015; Hsu et al., 2017). ESE measures a person's confidence in their capability to enact particular behaviour, thus, influencing their entrepreneurial intentions because entrepreneurship demands specific skills (Doanh & Bernat, 2019; Al-Ghazali & Afsar, 2021). Several studies reported that ESE positively predicts EI (Cardon & Kirk, 2015; Hsu et al. 2017; Neneh, 2020). Including the interaction item (PAF x ESE) in the model, significantly strengthened the PAF-EI association showing that ESE positively

moderates the PAF-EI relationship. By further probing the PAF-EI at varying proportions of ESE, the results showed that EI increases as PAF increases. However, this association was mainly pronounced only for those with high ESE. According to Doanh and Bernat (2019, p. 2449), “a person who has high self-efficacy for a particular task is likely to engage and then persevere in that task than an individual who shows low self-efficacy.” Likewise, Elnadi and Gheith (2021) asserted that individuals with high ESE tend to have high entrepreneurial intentions than those with low ESE. An entrepreneurship career is associated with increased risk and uncertainty (Schmitt et al., 2018; Newman et al., 2019), suggesting that people who are highly confident in their abilities and skills tend to develop coping mechanisms to deal with such situations compared to individuals with low confidence (Elnadi & Gheith, 2021). Other scholars also express that people characterised by high ESE are more likely to be persistent and resilient in pursuing their entrepreneurial goals than those with low ESE (McGee & Peterson, 2019; Memon et al., 2019). Our findings confirm the findings of other existing scholars (Schmitt et al., 2018; Adebuseyi et al., 2021; Uysal et al., 2021), who reported that ESE has a significant moderating effect on EI and its antecedents. Nevertheless, since this study was limited to students at particular South African university, this may weaken the generalisability of the findings.

4. Conclusion

The current study examined the impact of ESE on the association between PAF and EI. The study contributed to the existing literature by demonstrating that ESE is a crucial boundary condition that strengthens the PAF-EI link. The implication is that EI becomes stronger at high levels of PAF and ESE. This finding is valuable for policy making regarding promoting entrepreneurship in South Africa. Our results confirm other studies conducted in different contexts in the existing literature.

Nevertheless, the nature of this study may expose some limitations that future studies can improve. Firstly, this study only included students from one faculty of a South African university. Therefore, findings from this study may not necessarily be generalised across all youths in South Africa. Thus, other researchers can improve the sample's representativeness by increasing the current sample size by recruiting students from other universities in South Africa. Furthermore, our study was limited to the impact of ESE on the PAF-EI association, leaving other possible variables that can influence this link due to the scope of this study. Future studies can explore other factors such as entrepreneurship education, personality characteristics, gender, and culture in this relationship. Another limitation of the current study is that it only explored factors which influence the formation of entrepreneurial intention among students without testing how the entrepreneurial intention will translate into entrepreneurial action. Since existing studies indicate that entrepreneurial intention may not always predict actual behaviour and venture creation, future studies can explore how entrepreneurial intention may translate into entrepreneurial action.

5. Managerial Implications

This study offers theoretical, managerial and policy implications. Theoretically, our study builds on the TPB as a vital framework to understand the PAF- EI relationship and uses the SCT to provide an alternative explanation of the PAF-EI association. This provided a better theoretical perspective on the formation of EI from a career choice theory.

Practically, the current research adds value in several ways. Firstly, our study showed that PAF significantly predicts EI among university students. This indicates that PAF is a crucial determinant of EI, which needs nurturing. Educational programmes need to equip students with practical financial management skills and knowledge. One way of achieving this is to task students to work on and resolve financial issues of existing small businesses of their choice. Students can also be taught how to prepare funding proposals and pitch to potential investors in their industry. Educational programmes must incorporate material to enlighten students on the collateral requirements when applying for start-up funding. The university can also enrich PAF among students by inviting banks to share information about their products related to small business financing. The educational programmes can also contain material that outlines the organisations providing start-up funding for young entrepreneurs. This can be reinforced by inviting representatives from government agencies

mandated to support ventures owned by young people to share information about such initiatives. Secondly, our study showed that ESE positively moderates the PAF-EI relationship such that EI is high when PAF and ESE are favourable and vice versa. This implies that ESE is a crucial construct that can enhance the effectiveness of a strategy to promote entrepreneurship. The first step to nurturing ESE is identifying its antecedents (Newman et al., 2019; Memon et al., 2019; Adebusuyi et al., 2021; Uysal et al., 2021). Since there is evidence that ESE develops from experience and vicarious learning (Adebusuyi et al., 2021; Uysal et al., 2021), the curriculum needs to incorporate practical activities such as business plan presentations, case studies and action-based entrepreneurial activities to boost ESE among students. “These activities, by enhancing the self-confidence of students would create a positive attitude towards realising a start-up idea, as well as strengthening the self-expectations of strong positive outcomes of selecting entrepreneurship as a future career” (Uysal et al., 2021, p.11).

Regarding policy implications, the government needs to intensify its efforts toward customising its funding programmes to suit the needs of university students. Since most students come from poor backgrounds, the government can work with all banks in South Africa to subsidize loans for young people with innovative ideas that have the potential to become high-growth businesses.

Keywords

Entrepreneurship education; EMPRETEC programme; ILO Start and Improve Your Business programme; training skills transfer; business startup; job creation

Abstract

Global reports highlight the link between entrepreneurship education and entrepreneurial activity in an economy. This study's aim was to compare how entrepreneurship training affects skills transfer, new venture formation and job creation in Zimbabwe. The study compared the effectiveness of two well-established programmes: the International Labour Organization's (ILO) Start and Improve Your Business programme (SIYB) and the United Nations' *Emprendedores Tecnologia* (EMPRETEC) entrepreneurship programmes that assist promising entrepreneurs in building innovative and competitive SMEs.

A literature review established criteria of what the programme are required to do and outcomes to expect and research hypotheses were formulated. A cross-sectional research design, using a survey was conducted to collect data from 551 randomly selected respondents who had attended either one of the programmes. Descriptive and inferential statistical tests were conducted.

The study determined that both programmes resulted in business start-up with significant business and entrepreneurship skills transfer. Therefore, policymakers, donors and sponsors should support holistic and integrated programmes reflecting at a minimum the identified skills and competencies with appropriate methodologies. Importantly, developing entrepreneurial characteristics was found as a key component in the more effective EMPRETEC programmes compared to the ILO programmes. This unique insight contributes to training efficacy theory and recent development in the entrepreneurial self-efficacy literature.

1 Introduction

Entrepreneurship is an essential catalyst for increasing gross domestic product (GDP) (Bosma & Kelley 2019:3; Mack, White & Senghor 2019:3) and plays an important role in economic growth and development (Van Vuuren & Alemayehu 2018:2). Within a regional context, economic progress in African countries relies on high rates of total early-stage entrepreneurial activity (TEA), according to Herrington and Coduras (2019:2).

However, the African region underperforms in GDP per capita compared to Asian and Latin American countries with similar TEA activity. It is noted that GDP disproportion can be explained by economic performance also being related to healthy institutional ecosystems. Africa is noted to lag in this regard where issues such as poor infrastructure and energy supply constraints severely hamper business growth and entrepreneurship (Herrington & Coduras 2019:2).

Entrepreneurship may be defined as deliberate business start-up and growth behaviour when entrepreneurs do precisely that: start and grow enterprises (Nieman & Nieuwenhuizen 2014:9-10). The entrepreneurial process involves recognising and exploiting opportunity through planning and securing the resources to start and grow a business venture (Hisrich, Peters & Shepherd 2010:6; Shane

& Venkataraman 2000:219), with innovation strongly reinforcing entrepreneurship (Acs, Szerb, Lafuente & Lloyd 2018:1-2; Schumpeter 1947:150-151). Innovation is when a business producing new products or services (Brundin & Vigren-Kristoferson 2013:455; Love & Roper 2015:44).

In this study's context, entrepreneurship in Zimbabwe has approximately 5.7 million people employed in micro, small and medium businesses, with 2.8 million being youth owners over the age of 18 (Finscope 2012:8). However, the mere 16% contribution of SMEs to GDP for low-income countries like Zimbabwe (Republic of Zimbabwe 2014:9) is in stark contrast with high to medium-income countries' average of 39% to 51%. The Finscope 2021 MSME survey to be launched in 2022 will validate the growing importance of the MSME sector in Zimbabwe. Therefore, SMEs can increase their benefit to Zimbabwe, given their potential to innovate and be flexible with low start-up costs and capacity for rapid development compared to larger enterprises (Karedza et al. 2014:38).

However, Zimbabwean SMEs have been affected by several constraints. Various studies have pointed out that SMEs in Zimbabwe are limited by factors such as; access to and the cost of finance; lack of marketing; poor management skills; poor entrepreneurial skills; and lack of access to infrastructure, land and information and are operating in a difficult regulatory environment (Bomani, Fields & Derera 2015:125; Karedza et al. 2014:39). There is a significant dominance of SMEs in the manufacturing sector, however like other SMES, they face a myriad of challenges that include limited access to finance, inadequate and costly workspaces, lack of proper technologies and machinery and inadequate skills resulting in the high cost of doing business and informalisation (Republic of Zimbabwe, 2020:107).

These aspects are important in the context of entrepreneurial ecosystems essential for providing for the needs of the small business sector, not only in Zimbabwe but globally (Acs et al. 2018:1-2; Hechavarría & Ingram 2018:22). At the time of this research, Zimbabwe – for more than 15 years – had been experiencing an economic downturn and instability, including hyperinflation, unemployment and a de-industrialised and informal economy. The broader institutional ecosystem and economic context in Zimbabwe cannot, therefore, be counted on to provide the level of support desired by SMEs in the country. However, the Zimbabwean government acknowledges SMEs as the engine of economic growth, given their high labour-to-capital ratio (Ledriz-Zeparu 2013:21).

The importance and role of the SMEs sector is acknowledged through, the share of foreign exchange allotments of the SMEs Auction to total allotments grew from 8% in first quarter of 2021 to 19% in the fourth quarter of 2021 (Reserve Bank of Zimbabwe, 2022:112)

In the context of the above-mentioned, limited business and entrepreneurial skills affect the growth of SMEs in Zimbabwe (Bomani et al. 2015:125; Karedza et al. 2014:39). To ensure that the contributions of the SME sector are realised, the government has collaborated with support institutions such as the United Nations' (UN) Emprendedores Tecnologia (EMPRETEC), the International Labour Organization's (ILO) Start and Improve Your Business (SIYB) and the Small Enterprise Development Corporation to help the SME sector (Zindiye, Chiliya & Masocha 2014:662). Entrepreneurship training is recognised as a measure to improve the capabilities of entrepreneurs to start and grow businesses (Balachandra, 2019:72; Neck & Corbett, 2018:10)

Although the government, private sector and non-governmental organisations (NGOs) attempt to build entrepreneurs' business and entrepreneurial skills capacities, the gaps in training and skills are not adequately addressed by service providers or through skills sets that they offer (Republic of Zimbabwe 2008:31). Various government training programmes are implemented, for example, vocations, apprenticeship and entrepreneurship, NGOs, different UN agencies and the private sector offer entrepreneurship training in Zimbabwe. An assessment of the role that different entrepreneurship and education programmes play is therefore required, which this study does by comparing the effectiveness of the two largest entrepreneurship training programmes in the country.

Against this background – specifically, the low contribution of SMEs to GDP in countries like Zimbabwe – the interest of this study is that entrepreneurship training is generally lacking, and available training is not of the required quality and standard, resulting in a skills gap. Therefore, the effectiveness of entrepreneurship training programmes in Zimbabwe in achieving their training objectives, such as business start-up and growth, must be better researched and understood.

For example, a 2002 impact evaluation in Brazil found that the level of entrepreneurship due to EMPRETEC training is more than twice that of the general population (Sanyang & Huang 2009:325). However, earlier studies on the EMPRETEC programme conclude that behavioural changes seem to occur in the short run, with their influence diminishing in the long run. A possible explanation could be because the programme ‘learning effects are tacitly integrated into business practices and become less dominant over time as external factors “smooth” out the learning effects’ (Grossmann 2005:9).

Furthermore, the ILO SIYB programme has trained more than 4,5 million people in 100 countries. The UN’s EMPRETEC programme, the German Technical Cooperation/Creation of Enterprises Formation of Entrepreneurs programme, and business plan competitions and training implemented by Technoserve, among others, have given resources to train people in different regions and countries. However, until quite recently, there has been limited evidence on the causal effects of these programmes (Arraiz, Bhanot & Calero 2019:3). Although some studies have found no relationships between business management training, entrepreneurship training and improved business performance, others have established significant effects of business and entrepreneurship training on profits/sales (Mukata, Ladzani & Visser 2017:87).

In addition, after assessing the SIYB programme against similar programmes, some argued it is ineffective to empower youth with business management skills and microfinancing within diverse business settings and local environment contexts (Ntlaloe 2011:35). However, the SIYB programme in Lesotho addressed the entrepreneurial challenges of starting one’s own business and provided business management, business planning and record-keeping skills. However, the SIYB programme has short classroom-oriented training (Ntlaloe 2011:88-89), and according to Moremong-Nganunu (2009:224), the SIYB is not an effective programme, with limited appropriateness or relevance in developing countries. For example, in Botswana, SIYB does not include key entrepreneurship variables like evaluating opportunities and competitiveness as components of a quality curriculum (Moremong-Nganunu 2009:236).

The current study was conducted to compare the effectiveness of the two largest entrepreneurship training programmes in Zimbabwe developed for start-up and existing businesses. The empirical study was conducted using a quantitative survey of trainees of the ILO’s SIYB and EMPRETEC programmes after they had received the training in Zimbabwe. The ILO programme comprises the Start Your Business (SYB) and Improve Your Business (IYB) training packages for potential and existing entrepreneurs (ILO 2007). The EMPRETEC programme consists of the Entrepreneurship Development Workshop (EDW) and Micro Entrepreneurship Programme (MEP) training packages (EMPRETEC 2012:8).

The overall study first consulted relevant literature and identified five factors for indicating and measuring skills transfer: 1. business skills, 2. entrepreneurial skills, 3. business performance, 4. business planning and presentation, and 5. programme methodology. These factors are relevant in establishing the effectiveness of skills transfer of the two globally implemented entrepreneurship training programmes. This literature further provided the theoretical framework and rationale for the study’s research questions and hypotheses. This paper examined four of the five factors identified, excluding business planning and presentation. The research design is *ex post facto* and cross-sectional, as the respondents were surveyed after receiving their training and the study was not involved with the training programmes during its delivery.

2 Literature Review

Studying entrepreneurship requires a definition of the term. Although various definitions have confounded researchers over many years, entrepreneurship is widely accepted as a legitimate field of study (Morris, Kuratko & Cornwall 2014:16). Researchers have defined entrepreneurship as a process of identifying, evaluating and exploiting opportunities; creating something new; and devoting time and effort, with financial, psychological and social risks and uncertainties, where monetary reward and personal satisfaction is received (Acs et al. 2018:1-2; Moore et al. 2010:5; Nieman & Nieuwenhuizen 2014:9-10; Shane & Venkataraman 2000:218-219; Zimmerer & Scarborough 2011:5).

Chell (2013:22) and Degeorge and Fayolle (2011:253) believe the entrepreneurial process is complex and should consider the skills needed for each phase. Kunene (2009:122), however, argues the importance of the entrepreneurial process as being specific regarding the business, technical and entrepreneurial skills needed to prepare participants to go through the stages as they start their business. Kunene (2009:129) further highlights that the different types of training focus on different phases, from pre-start-up to post-start-up.

On the individual level, an entrepreneur identifies opportunities in a new or existing business, creates value and assumes attendant risks (Moore et al. 2010:5). An entrepreneur creates a business given the risks and uncertainty, gains profits through identified opportunities, exploits them and garners resources (Zimmerer & Scarborough 2011:5). Furthermore, entrepreneurs are distinct from managers, as entrepreneurs focus on the development and growth process, instead of daily management functions such as general management, marketing or finance and functional management competencies (Mahmood, Basharat & Bashir 2012:513; McKenzie & Woodruff 2014:56-57; Sánchez 2011:428). More recent entrepreneurship studies have adopted theories and concepts from psychology, sociology, economics or strategic management, which is a shift in focus from individuals and contexts to the convergence of knowledge from various fields (Sánchez 2011:428).

Generally, there is a consensus that facets of entrepreneurship can be taught (Farashah 2013:870), which catalyses the further development of developing economies (Dzisi & Odoom 2017:440). A part-outcome of entrepreneurial education and training is the entrepreneurial mindset, referring to a thinking propensity and awareness to identify a new opportunity and act on it, which separates entrepreneurs from non-entrepreneurs (Davis et al. 2016:2; Strimel et al. 2019:32). The entrepreneurial mindset has been noted in studies on Africa, where entrepreneurship positively impacts economic growth (Herrington & Coduras 2019:2).

To conclude this sub-section, it is notable that entrepreneurship catalyses economic development and competitiveness (Mack et al. 2019:3). Developing entrepreneurs is therefore important through educating and training them. Government legislation and educational systems can influence the rate of entrepreneurship – and economic activity – because education equips individuals to perceive opportunities and gives them the knowledge to use in developing new ventures (Do Paço & Raposo 2011).

2.1 Entrepreneurship education and training

Entrepreneurship education and training (EET) should be differentiated from business management education (Vosloo, Vosloo & Antonites 2018:295). EET strengthens the intention to go into business and shapes entrepreneurial attitudes, skills and culture (Martínez et al. 2010:15). EET conveys entrepreneurial competencies formally and involves the concepts, entrepreneurship skills and mental awareness that individuals use to start and develop ventures (Isaacs et al. 2007:614). Through EET, personal qualities and attitudes are developed, including formal knowledge and skills, giving individuals competence in entrepreneurship (Ndedi 2013).

Theories on educational training show that non-cognitive skills are also important to increase entrepreneurial behaviour and efficacy (Rideout & Gray 2013:331). Starting a business is, therefore, also based on non-cognitive attributes such as perceptions of desirability, feasibility, attitudes, social norms, self-efficacy and the character to act (Farashah 2013:871). EET has been associated with

increased entrepreneurship knowledge, skills and competencies (Balachandra 2019:72; Gielnik et al. 2016:339). Many studies have evaluated EET programmes and have concluded that they are indeed linked to higher levels of enterprise start-up and growth (Mungule & Van Vuuren 2016; Nabi et al. 2017; Rauch & Hulsink 2015; Rauch & Rijdsdijk 2013; Valerio, Parton & Robb 2014).

EET builds entrepreneurship knowledge and skills at all levels of the educational system (Martínez et al. 2010:16). While general education positively affects general entrepreneurial performance, entrepreneurial training is effective for those starting their own businesses (Sánchez 2013:448). Furthermore, Sánchez (2013:449) proposes that the government and institutions should promote lifelong education, which includes EET at all educational levels, to develop market competencies, skills, abilities and knowledge.

For effective EET, the relationship between the goals, target group, content of modules, methodology or pedagogy and approach to assessing the entrepreneurship programme must be clear (Lekoko, Rankhumise & Ras 2012:12027). According to Kunene (2009:122), the key focus areas of entrepreneurial training are the business, technical and entrepreneurial skills needed to catalyse entrepreneurial activity. SMEs can survive when provided with training programmes that impart relevant and transferable skills. Pretorius, Van Vuuren and Nieman (2005:424) posit that the transfer of knowledge and skills can be incorporated into training programmes. Botha, Nieman and Van Vuuren (2007:163) postulate that changing and enabling the behaviour needed for starting a business is important.

Regarding pedagogy, the experiential or ‘learning-by-doing’ method is more effective than lecture methods for developing entrepreneurial skills and attitudes (Martínez et al. 2010:11). Experiential learning using games or simulations or the creation of a business through practical adult teaching methods, instead of focusing on theory, can improve learning outcomes (Rideout & Gray 2013:332). Experiential learning should therefore form an integral part of the entrepreneurial training process as several important aspects of entrepreneurship cannot be simulated in a classroom (Vosloo et al. 2018:300). A motivated facilitator with practical business start-up experience also requires adequate education and training to perform the multiple roles of trainer, mentor and role model (Azim & Al-Kahtani 2014:134).

2.2 EET outcomes: Entrepreneurial skills, business skills and business start-up and growth

According to Chell (2013:8), skills are implicit through action, reflecting cognitive and affective constructs and context. Skills are not an individual’s fundamental, innate capacities and must be developed using training, practice and experience. Skill acquisition is a process of gaining effective and ready knowledge to develop personal aptitudes and abilities in a specific field (Andah & Akpo 2021:46). Notably, skills are classified as personal, technical, business operation and management (Perks & Struwig 2005:172). Entrepreneurs require a range of technical, business management and entrepreneurial skills.

Martínez et al. (2010:11) postulate entrepreneurship training as developing knowledge and skills in preparation for starting a business and contend that training has a role in supporting and ensuring that small businesses start more successfully. Synonymous with skills are competencies and abilities. According to Mojab, Zaefarian and Azizi (2011:440), entrepreneurial competencies, including ‘motivations, characteristics, knowledge and skills’, are shown by those starting a business.

Skills expected from entrepreneurship training are business skills consisting of functional management skills such as general management, financial, costing systems, human resource and information systems, strategy, planning, marketing, and project and time management. Business management skills are required to grow ventures. For example, increased profitability and business growth are reconcilable with management efficiency and practices defined through general management, marketing management and business planning generally included in entrepreneurship training programmes (McKenzie & Woodruff 2014; Morris et al. 2013).

Furthermore, entrepreneurship training must develop soft and hard skills, with enterprising skills including creativity, innovation, motivation, and identifying role models and opportunities. Entrepreneurial skills must further include the ability to create, identify and exploit opportunities (Igwe et al. 2014:103). Entrepreneurial competencies are what entrepreneurs need to know and do to start and grow a business (Man, Lau & Chan 2002:124). Independent studies have identified opportunity identification, perseverance through difficult situations, determination (the need for achievement) and networking amongst the top entrepreneurship competencies (Kyndt & Baert 2015; Rezaei Zadeh et al. 2017).

Training and education programmes have been shown to affect entrepreneurial self-efficacy (Elliot, Mavriplis & Anis 2020:49), and entrepreneurs feel more confident about business start-up and growth after being influenced by entrepreneurship training interventions. These skills may be developed and improved by training and practice (Mamabolo, Kerrin & Kele 2017:1). Sánchez agrees that entrepreneurial skills can be taught – it is not only a matter of innate personality characteristics and entrepreneurship training can enhance an individual’s skills and creativity to be a successful entrepreneur (Sánchez 2013:448).

2.3 Entrepreneurship training programme design, methodologies, and models

In business management education, EET is designed for outcomes that include creating the mindsets and skills entrepreneurs require (Vosloo et al. 2018:295). To be effective in doing so, Henry, Hill and Leitch (2003:91) indicate that the key features of well-designed EET programmes are:

- The use of a mix of didactic, skill-building and indicative learning approaches;
- The role of the facilitator as a role model, consultant or counsellor;
- Adequate time for individual learning;
- A focus on the needs of participants; and
- Programme objectives that include the domains of learning, knowledge, skill, competence and attitude.

For effective EET, a relationship between the goals, target group, content of the courses or modules, methodology or pedagogy and assessment is required for the entrepreneurship programme (Lekoko, Rankhumise & Ras 2012:12027). Some researchers argue that many entrepreneurship training initiatives do not address the entrepreneurs’ real needs, as some programmes are task-oriented instead of behaviour-oriented and focus on functional skills for business management rather than entrepreneurial skills (Henry et al. 2003:97). These challenges should be considered when EET is designed. According to seminal work by Kirkpatrick (1967) and Kirkpatrick and Kirkpatrick (2009:3), vocational training must meet the participants’ needs to be successful.

Following a semi-systematic literature review, Farashah (2013:870) indicated that the range of EET was established in the literature to be ‘education for, about and in entrepreneurship’. Where education *for* entrepreneurship seeks to stimulate the entrepreneurship process and ways to create a business, education *about* entrepreneurship offers an understanding of entrepreneurship and how it benefits society. Finally, education *in* entrepreneurship aims to make individuals innovative and change agents and provide them with skills and competencies for starting and growing businesses.

Notably, Farashah’s analyses (2013) show a shift from education *for* entrepreneurship to education *in* entrepreneurship. Training in competencies is thus essential for inclusion when developing entrepreneurship training programmes. Moreover, competencies are key to undertaking an actual business, not only training in the knowledge and resources required to start a business (Sánchez 2013:449). Therefore, for EET to be effective, it should focus on practical ‘*in* entrepreneurship’.

Various factors contribute to EET’s effectiveness, including the core components of programme goals and programmatic elements. Goals are independent variables informing the choice and design of the programme elements, which form the relationships between the core components. Components, such as the characteristics of the programme participants, contextual characteristics of the programme’s

environment and funding, are moderators influencing a programme's effectiveness in achieving its goals (Schneider 2017:52). Furthermore, using interactive practical experience and learning-by-doing (experiential learning) components will contribute to overall effective entrepreneurship training (Igwé et al. 2014:106).

One can measure training effectiveness, efficiency and quality through reaction, learning, behaviour, and results (Kirkpatrick 1967; Mukata et al. 2017:85). The delivery methodology can include learning-by-doing, real-life scenarios, case studies and presentations by entrepreneurs or more didactical and conventional procedures whose efficiency can be assessed (Lekoko et al. 2012:12027). Lastly, the trainers, curriculum and programme follow-ups such as mentorship all influence EET effectiveness. Jones and Matlay (2011:701) posit that what makes EET effective 'has less to do with transferable teaching techniques, or standardised curricula and [has] more to do with the unique set of dialogic relations'.

2.4 The EMPRETEC and SIYB entrepreneurship training programmes in Zimbabwe

With various training programmes for SMEs in Zimbabwe, this study researched the two dominant training programmes in the market: the ILO's SYB and SIYB programmes and the EMPRETEC's EDW and MEP programmes. The ILO and EMPRETEC programmes have operated for nearly three decades and are used by government ministries, non-governmental organisations (NGOs), business associations and the private sector.

In the Zimbabwean context, there is very little evaluation of the effectiveness of entrepreneurship programmes. It is argued that when evaluating training courses, it is best to directly relate programme outcomes to objective economic measures (Henry et al. 2003:103), although the evaluation will depend on the level of economic penetration the programmes focus on.

For example, the EMPRETEC EDW package is meant for those starting a business (so business start-up is evaluated and measured) and those with an existing business (so business growth is evaluated and measured). On the other hand, the MEP programme is customised to focus on the micro sector, which may have somewhat different metrics. Similarly, the ILO's SYB is for potential entrepreneurs, while the ILO IYB package is for existing small businesses and provides modular content on business planning, record-keeping, marketing and other operational topics.

It is conceivable then that the different programmes target different levels of economic penetration, such as business planning and start-up versus business growth (Henry et al. 2003:103). Therefore, these aspects must be designed into the evaluation and measurement tools, and it is implied that this study must do the same.

2.5 EMPRETEC's EDW and MEP programme packages footprint, theory, content and aims

EMPRETEC is an integrated capacity-building programme operating in 32 countries with more than 300,000 trained entrepreneurs. EMPRETEC offers a behavioural approach to entrepreneurship, unlike other types of training (Arafeh 2016:5). The EMPRETEC programme is based on a theoretical framework and follows the traits approach, where there is a set of behaviours and traits that characterise high-achieving individuals. The traits approach combines defining the entrepreneur as an economic agent from an individualistic perspective and with self-reliant behaviours (Coutinho 2020:85).

EMPRETEC aims to develop ten personal entrepreneurial characteristics (PEC) competencies, each defined in terms of the behaviours to be tested and developed in practical activities (Guedes Gondim & Mutti 2011:199). The ten PECs that the EMPRETEC programme is based on were developed at Harvard University, from which UNCTAD published an Entrepreneurship Policy Framework and Implementation Guidance. The EMPRETEC EDW package is for entrepreneurs starting a business and those with existing businesses. The EMPRETEC MEP package has been derived from the EDW and was customised for micro-entrepreneurs, start-ups and existing businesses (EMPRETEC 2012).

The MEP and EDW provide content that covers the ten PECs and the development of a business plan, including cash flow forecasts.

Prior studies that have evaluated EMPRETEC programmes have shown modest but positive business start-up levels within three years, with between 9% and 33% of the participants eventually opening a business. Furthermore, employment numbers increased between 5% and 25% among those who already had a business prior to receiving the training, and sales increased between 10% and 80% (Denis 2000:8). Denis (2000) studied the EMPRETEC programmes across five countries and reported that firm survival rates varied between 30% and 85% for businesses already in existence before receiving the EMPRETEC training.

While the outcomes expounded above are favourable to the evaluation of the EMPRETEC programme, it must be noted that few studies of EMPRETEC programmes used experimental research designs (Grossmann 2005:2-8). Experimental research has more strict measures of causality that involve robust testing against control groups, and against contextual factors that differ between countries and regions. Therefore, using experimental research may have been a more robust test of the results in past studies of EMPRETEC.

However, other studies have also reported positive results from EMPRETEC programmes, including Glaub (2011:6), who found increased new business creation, increased survival rates and sales improvement, and Sanyang and Huang (2009:325), who found that those who participated in an EMPRETEC programme in Brazil had twice the level of entrepreneurship than those who did not participate.

2.6 ILO's SYB and SIYB programme packages footprint, theory, content and aims

According to the ILO (2012), the SYB is aimed at potential entrepreneurs who have a business idea and are ready to start a business based on that idea. The SYB focuses on content on starting and running a business, including developing a business plan with cash flow forecasts (ILO 2007). The programme aims are to assist the potential entrepreneur in developing concrete, feasible and bankable business ideas and writing a business plan to start micro or small-scale businesses. The SYB training is described as interactive and organised around the potential entrepreneur's needs, and it uses advanced adult training methods (ILO 2012). In conjunction, the ILO's IYB programme is for entrepreneurs who already have an operational business (for at least six to 12 months) and are interested in improving their business management. The training methods are modular and according to the entrepreneurs' needs, and business counselling is provided through mentoring (ILO 2012).

De Mel, McKenzie and Woodruff (2012:24-25) indicate that business owners' use of the SIYB training practices is modest for those already in business. However, it assisted those thinking of starting a business to do so faster than those in the control group. Their study in Sri Lanka ascertained that training alone brought about some changes in business practices but had no effect on business profits, sales, or capital stock (De Mel et al. 2012:24-25). Moremong-Nganunu's (2009:224) evaluation of the ILO's SIYB in Botswana concluded that the entrepreneurship programme was ineffective in that country. The authors also questioned why key entrepreneurship competencies such as opportunity evaluation and competitiveness are not part of the SIYB (Moremong-Nganunu 2009:236).

However, according to Mukata et al. (2017:86-87), the effectiveness of the SIYB programme increases when training is embedded with follow-up support regarding access to finance, mentors, coaches and technical skills. In addition, SIYB programmes are regarded as effective when through self-assessment, entrepreneurs frequently report business improvement, such as actual business start-up, or for existing businesses, this could be improved quality, sales increase, higher profits and employing more workers (De Mel et al. 2012:24-25).

Van Lieshout, Sievers and Aliyev (2011:16) state that the methods applied to measure the impact of SIYB vary substantially in countries and regions, and the results may therefore differ. This point is

relevant in terms of the economic impact of such programme outcomes (Henry et al. 2003:103) when, for example, job creation is left unmeasured (Van Lieshout et al. 2011:16). The authors' findings show that new business resulting from the SYB created an average of three jobs (Van Lieshout et al. 2011:18).

2.7 Models for entrepreneurship training and education

The elements and content of EET programmes developed in South Africa illustrate the skills, constructs and concepts included in entrepreneurship training models. Van Vuuren and Nieman (1999) developed the Entrepreneurial Performance Education (E/P Education) model presented in a formula

$$E/P = f(aM \times b E/S \times c B/S)$$

where E/P is defined as entrepreneurial performance; M = motivation; E/S = entrepreneurial skills; B/S = business skills, and a, b and c are constant coefficients.

Pretorius (2001) developed the Entrepreneurial Education (E/E) model outlined as

$$E/E = f \{ aF (bA \times [cB/P \times dE/S \times eB/S]) \}$$

where E/E = entrepreneurship education for start-ups; F = facilitator's skills, knowledge and motivation; A = approaches used by facilitator; E/S = entrepreneurial success themes and knowledge; B/S = business skills and knowledge; B/P = business plan usage and a, b, c, d and e are constant co-efficients (Kunene 2009:133).

Pretorius et al (2005) further developed the Education for Improved Entrepreneurial Performance (Ed for E/P) model, which integrated and strengthened the above E/P Education and E/E models (Pretorius et al. 2005:422). Kunene (2009) developed the Training for Entrepreneurship model, which recommends that business, entrepreneurial and supporting skills be integrated into the entrepreneurial process's training and phases. These South African models are highlighted because they contributed to how the study analysed the Zimbabwean programmes.

2.8 Key hypotheses development based on the research questions

Research questions are exploratory and seek to analyse and provide empirical evidence to answer them (Bak 2009:21; Mouton 2011:53). Based on the literature expounded above, the researchers posed research questions related to skills transfer and training programme effectiveness. Subsequently, to answer the research questions, they were tested based on their related hypotheses. The hypotheses were therefore formulated as the basis to test for business skills, entrepreneurial skills, job creation and business start-up, and programme methodology (design and delivery) meeting the participants' needs. The study research questions and hypotheses are outlined in Table 1 below.

Table 1. Research Questions and Hypotheses

Research Questions	Related Hypotheses
1. Are there differences between the ILO and EMPRETEC entrepreneurship training programmes in terms of imparting entrepreneurial skills?	<p>Null hypothesis 1 (H₀₁): There are no statistically significant differences regarding entrepreneurial skills transfer between the four training packages.</p> <p>Alternative hypothesis 1 (H_{A1}): There are statistically significant differences regarding entrepreneurial skills transfer between the four training packages.</p>
2. Are there differences between the ILO and EMPRETEC entrepreneurship training programmes in terms of imparting business skills?	<p>Null hypothesis 2 (H₀₂): There are no statistically significant differences regarding business skills transfer between the four training packages.</p> <p>Alternative hypothesis 2 (H_{A2}): There are statistically significant differences regarding business skills transfer between the four training packages.</p>

Research Questions	Related Hypotheses
3. To what extent do the ILO and EMPRETEC entrepreneurship training programmes results in terms of new business start-up differ?	<p>Null hypothesis 3 (H₀3): There are no statistical differences in the number of new business start-ups between the ILO and EMPRETEC programmes.</p> <p>Alternative hypothesis 3 (H_A3): There are statistical differences in the proportion of new business start-ups between the ILO and EMPRETEC programmes.</p>
4. To what extent do the ILO and EMPRETEC entrepreneurship training programmes differ in terms of creating jobs?	<p>Null hypothesis 4 (H₀4): There is no statistically significant difference in job creation after trainees attended the ILO and EMPRETEC programmes.</p> <p>Alternative hypothesis 4 (H_A4): There is a statistically significant difference in job creation after trainees attended the ILO and EMPRETEC programmes.</p>

3 Methodology

3.1 Research design and sampling methods

The purpose of the study was exploratory and to undertake empirical research, which was conducted in a formal study to test the hypotheses and answer the research questions. The study concepts were initially based on academic books and journal articles on entrepreneurship, business management skills, training and education. This was followed by an empirical quantitative study conducted in the field. The study adopted a cross-sectional, ex post facto, survey research design. Empirical data was collected using a quantitative survey questionnaire from trainees of the ILO and EMPRETEC programmes after they had received training. It was, therefore, not an experimental design where a before-and-after observation was recorded (Cooper & Schindler 2011:468). The study has a statistical scope, and the sample results were analysed using statistical procedures for population generalisation.

The sample consisted of potential and existing entrepreneurs from a population of 800 ILO SYB, ILO IYB and EMPRETEC EDW and EMPRETEC MEP-trained entrepreneurs. The population was derived from databases from 2011-2013 of entrepreneurship training and education programmes in Zimbabwe, specifically, the ILO SIYB and the EMPRETEC EDW and MEP packages for SMEs. The population sampling frame consisted of start-up and existing business owners selected from the major commercial and industrial cities, towns and rural areas in Zimbabwe. A random probability sampling methodology was used.

3.2 Research questionnaire structure

The questionnaire structure was designed to facilitate collecting data that was relevant to the research's key issues to answer the research questions and conduct hypothesis testing. Data was subsequently collected for the following:

- Demographics: gender, age, language and education or EMPRETEC training;
- Technical skills
- Entrepreneurial and business-skills training
- Training knowledge and skills;
- Satisfaction with the ILO or EMPRETEC training received;
- Training duration and if follow-ups were done after training;
- What training assisted trainees regarding business and entrepreneurial skills;
- Business start-up status – before and after receiving training;
- Business description: location, age, registration status, sector, employees, products, services, customers, sales, profits and assets;
- Sources of finance;
- Type of finance institutions applied to for business finance and purpose of intended use; and
- Business performance in respect to internal and external factors contributing to success and barriers to development of SMEs.

3.3 Data analysis

Descriptive statistics were conducted to establish the personal and business demographic profiles of the 551 entrepreneurs. Furthermore, inferential statistics were administered using chi-square tests, Kruskal-Wallis tests, t-tests and analysis of variance (ANOVA) to test hypotheses pertaining to the entrepreneurial and business skills, new business venture and job creation; and participant satisfaction with the ILO and EMPRETEC programmes.

Rotated factor analysis results outlined business skills to include the following variables: business systems, processes, procedures and records; financial management; human resource management; operations; business plan development; strategic plan development; market research; business regulations; mobilising business resources and networking. Entrepreneurial skill variables included hard work, persistence, the need for achievement, independence, self-confidence, problem-solving, decision-making, creativity, opportunity identification and the use of role models.

The Kruskal-Wallis tested the null hypotheses stating that there were no statistical differences between programmes for the dependent variables of business-skills and entrepreneurial-skills transfer. The Kruskal-Wallis has the advantage of testing statistically significant variance between groups when the data per group are not normally distributed. In addition, when statistical significance was found, the multiple comparisons post-hoc test was conducted to understand which programmes were statistically significantly different. To further understand if there was a statistically significant difference in job creation and new business start-up categorical data, the null hypotheses for the means were tested by employing chi-square tests.

4 Findings

The descriptive statistics are presented first in Table 2 to provide the context within which the inferential statistics are interpreted.

Table 2: Descriptive Statistics (N = 551)

Variable	Results
Number of respondents	ILO trained = 240; and EMPRETEC trained = 311
Gender	53.5% female; and 46.5 % male
Age	Majority respondents ages between 16-35 years, with SYB mean age = 29 years; IYB mean age = 28 years; EDW mean age = 28 years; and MEP mean age = 34 years
Education	12% had completed primary school; 11% had attended one to three years of high school; 50% completed General Certificate Education (GCE) Ordinary-level (years of high school); 7% completed GCE Advanced-level; and 20% completed tertiary education (diplomas and first degrees)
Existing operating business	327 operating a business of their own; and 224 not currently owning a business

Source: Own compilation

Table 2 shows the sample's key descriptive statistics. The average age was 28 to 29 years old, with the majority being youth entrepreneurs. Fifty per cent of all respondents achieved their GCE and thereby completed ordinary secondary schooling. Furthermore, 20% of all respondents had gone on to achieve a tertiary qualification – either a diploma or first degree. It is therefore evident that half of the respondents have a good level of education, with a high level of literacy.

The majority (311) received training from the EMPRETEC, while 240 were trained by the ILO SIYB programmes. Gender composition showed slightly more females than males. Only 60% of the entrepreneurs had technical skills training prior to the entrepreneurship programmes, indicating the

participants' necessity-driven nature. At the time of the survey, only 59% of respondents operated a business, and 41% did not.

4.1 Inferential statistics results and discussion

Inferential statistics go beyond mere descriptions of observations and are conducted to estimate population values by extending the findings from the sample to the population. This is a process of inferring and drawing conclusions about the population, as derived from sample findings (Babbie 2010:467). The study conducted inferential statistics to test the research hypotheses and to answer the stated research questions.

4.1.1 Imparting entrepreneurial skills

The first research question considers the differences between the two training programmes in terms of them imparting entrepreneurial skills, represented in the following research hypotheses.

- **Null hypothesis 1 (H₀1):** There are no statistically significant differences regarding entrepreneurial-skills transfer between the four training packages.
- **Alternative hypothesis 1 (H_A1):** There are statistically significant differences regarding entrepreneurial-skills transfer between the four training packages.

To determine any variance between programmes in this regard, the researchers conducted a Kruskal-Wallis test. However, although a Kruskal-Wallis test shows whether a statistical significance difference exists, it does not indicate precisely where the difference is between the four training packages the exists. Therefore, the multiple comparisons post-hoc test was conducted to further understand the differences.

Table 3: Kruskal-Wallis Multiple Comparison Two-tailed Test for Transfer of Entrepreneurial skills of the ILO and EMPRETEC Skills Training Programmes

Dependent variable: Entrepreneurial skills	Multiple comparisons DiffMean (analvars.sta)	p-values (2-tailed);	entrepreneurial skills
	Independent (grouping) variable: Prog. Kruskal-Wallis test: H (3, N = 482) = 25.73205 Kruskal-Wallis test p-value, p = .0000		
	1. ILO SYB R: 228.19	2. ILO IYB R: 227.24	3. EMPRETEC EDW R: 216.20
			4. EMPRETEC MEP R: 293.21
1. ILO SYB		1.000	0.005*
2. ILO IYB	1.000		0.262
3. EMPRETEC EDW	1.000	1.000	0.009*
4. EMPRETEC MEP	0.005*	0.262	0.009*

*Indicates a statistically significant variance at $\alpha = 0.001$, confidence interval: 99%

Source: Own compilation based on the data analysis

Firstly, the Kruskal-Wallis multiple comparisons test finding in Table 3 show that there are statistically significant differences between the entrepreneurial-skills transfer scores of the four training packages, $p < 0.001$. Secondly, the result shows that entrepreneurial-skills knowledge transfer was statistically significantly higher for respondents trained in the EMPRETEC MEP package than those who received ILO SYB and the EMPRETEC EDW training. On this basis, **the null hypothesis H₀1 is not accepted, and the alternative hypothesis H_A1 is.**

4.1.2 Imparting business skills

The second research question considers the differences between the training programmes in imparting business skills, represented in the following research hypotheses.

- **Null hypothesis 2 (H₀2):** There are no statistically significant differences regarding business skills transfer between the four training packages.
- **Alternative hypothesis 2 (H_A2):** There are statistically significant differences regarding business skills transfer between the four training packages.

To determine any variance between programmes regarding business skills, the researchers again conducted a Kruskal- Wallis multiple comparisons test, the findings are illustrated in table 4.

Table 4: Kruskal-Wallis Multiple Comparison Two-tailed Test for Transfer of Business skills Knowledge of the ILO and EMPRETEC Skills Training Programmes

Dependent variable:	Multiple comparisons p-values (two-tailed); Knowledge and skills DiffMean (analvars.sta)			
Business skills	Independent (grouping) variable: Prog. Kruskal-Wallis test: $H(3, N = 482) = 34.73951$; Kruskal-Wallis test p-value $p = .0000$			
	1. ILO SYB R: 230.64	2. ILO IYB R: 220.60	3. EMPRETEC EDW R: 209.40	4. EMPRETEC MEP R: 300.70
1. ILO SYB		1.000	1.000	0.001*
2. ILO IYB	1.000		1.000	0.086
3. EMPRETEC EDW	1.000	1.000		0.001*
4. EMPRETEC MEP	0.001*	0.086	0.001*	

*Indicates a statistically significant variance at $\alpha = 0.001$, confidence interval: 99%

Source: Own compilation based on the data analysis

Again, the Kruskal-Wallis findings in Table 4 show statistically significant differences between business-skills transfer scores of the four training packages, $p < 0.001$ for ILO SYB, EMPRETEC EDW, MEP and $p=0.086$ for ILO IYB. The multiple comparison post-hoc result further shows that business-skills transfer was statistically significantly higher for respondents trained in the EMPRETEC MEP package than those who received ILO SYB and EMPRETEC EDW training.

The findings from Table 3 and Table 4 conclude the superior training results from the EMPRETEC MEP training package compared to the ILO SYB and EMPRETEC EDW training packages. It should be noted that the ILO IYB has a non-significant variance. This study's result – for entrepreneurial and business skills – infers those trainees indicated a higher gain in these specific skills from the EMPRETEC MEP package compared to the other training packages.

This finding is relevant in the context of positive results from EMPRETEC programmes found by Glaub (2011:6), and Sanyang and Huang (2009:325) who found that trainees who had participated in an EMPRETEC programme had twice the level of entrepreneurship in a population like Brazil, compared to those who did not. On this basis, **the null hypothesis H_02 is not accepted, and the alternative hypothesis H_A2 is.**

Why this may be the case is partially explained by the design of the EMPRETEC MEP package. It is a practical beginner's version aimed at micro-enterprises and start-ups but is derived from the EMPRETEC EDW package for SMEs. Both the MEP and EDW provide content on PECs, business plan structure and cash flow projections. Furthermore, the EMPRETEC MEP package content incorporates financial planning and is less detailed on structuring a business plan but more in-depth and detailed on the PECs (EMPRETEC 2012).

In comparison, the ILO SYB covers preliminary aspects of entrepreneurial characteristics but is more detailed on business planning, costing, cash flow planning, starting a business, products and services, and employees. The ILO IYB content encompasses costing, buying, marketing, record-keeping, stock control, business planning and cash flow, and profit and loss projections. (ILO 2012). In comparison to the superior results above found for the EMPRETEC programme; it may be inferred that the ILO's focus on business management and business planning is less effective than focusing on personal entrepreneurial competencies for the EMPRETEC.

The above inference is supported by the nature of the EMPRETEC programme, which has a behavioural approach to entrepreneurship instruction that is considered markedly different from other types of training (Arafah 2016:5). EMPRETEC focuses on role-modelling behaviours and traits of high-achieving individuals and defines the entrepreneur as an individualistic economic agent with self-reliant behaviours (Coutinho 2020:85). The self-reliant entrepreneurial behaviours require

resilience and self-motivation if it is to result in practical activities such as start-ups (Guedes Gondim & Mutti 2011:199).

4.1.3 Result in new business start-up

The study compared the two programmes in relation to new business start-up. This concerns the third research question comparing the number of the ILO and EMPRETEC programmes' new business start-up rates. To evaluate and understand any variance between the two programmes, the researchers calculated the number of respondents between the two programmes who had a start-up after training and those who did not. Then a chi-square test was conducted to determine the statistically significant variance between the two training programmes of start-ups resulting after training. The two hypotheses are stated below, followed by the findings of the chi-square test in Table 5.

- **Null hypothesis 3 (H₀ 3):** There are no statistical differences in the proportion of new business start-ups between the ILO and EMPRETEC programmes.
- **Alternative hypothesis 3 (H_A 3):** There are statistical differences in the proportion of new business start-ups between the ILO and EMPRETEC programmes.

Table 5: Business Start-up Rate and Chi-square Statistic (N = 450), EMPRETEC and ILO

Business Status	EMPRETEC	ILO	Total
Not in business after training	116 (42.03%)	108 (62.07%)	224
Start-up business after training	160 (57.97%)	66 (37.93%)	226
Total	276	174	450
Chi-square statistic	Df	Value	Prob
	1	17.143	<0.001*

*Indicates a statistically significant variance at $\alpha = 0.001$, confidence interval: 99%

Source: Own compilation

Table 5 illustrates that a higher percentage (58%) of the EMPRETEC trainees started a business after training compared to a lower percentage (38%) of ILO trainees. Furthermore, a higher proportion of ILO trainees (62%) were not in business after training compared to the EMPRETEC trainees (42%). Based on the chi-square results, $p < 0.001$, **the null hypothesis H₀3 is not accepted, and the alternative H_A3 is.**

This finding provides evidence that the EMPRETEC training programme was significantly more likely than the ILO programmes in having participants start a business following their training. The study endeavoured to explicate why this is the case. One reason consistent with the prior subsections is that the EMPRETEC training focused more on personal entrepreneurial development than technical or business-skills transfer. Ostensibly trainees of EMPRETEC who felt personally more empowered and motivated were more likely to start a business than those who did not feel this way.

In the context of this study, self-reliant and self-motivated entrepreneurial behaviour links with the theory of planned behaviour (Boyd & Vozikis, 1994:69). Individuals believe that they can increase their inclination to plan and start businesses (Krueger & Brazeal, 1994:94). This is like the case with the EMPRETEC programme that is found to be more focused on entrepreneurial behaviours found to have superior results and outcomes consistent with findings by Newman et al. (2019).

4.1.4 Result in job creation

The fourth research question considers the extent of job creation following the ILO and EMPRETEC programmes. The hypotheses related to the question are:

- **Null hypothesis 4 (H₀₄):** There is no statistically significant difference in job creation after trainees attended the ILO and EMPRETEC programmes.
- **Alternative hypothesis 4 (H_{A4}):** There is a statistically significant difference in job creation after trainees attended the ILO and EMPRETEC programmes.

Table 6 illustrates the results of the T-test for dependent samples conducted to compare the extent of job creation. The researchers wanted to understand if the number of employees of the businesses started after training (N = 225), had increased up to the point that this research was conducted.

Table 6: T-test for Dependent Samples for Job Creation (N = 225)

T-test for dependent samples									
Variable	Marked differences are significant at $p < .05000$								
Include condition: Business = 'Start-up'									
	Mean	Std. Dv.	Diff.	Std. Dv. Diff.	t	Df	p	Confidence -95.00%	Confidence 95.00%
Current employees	3.644	4.387							
Employees at start	2.84	3.654	0.804	2.219	5.436	224	0.001*	0.512	1.096

*Indicates a statistically significant variance at $\alpha = 0.001$, confidence interval: 99%

Source: Own compilation

The mean at the point of business inception (after training) was 2.84, compared to 3.64 at the point of the survey. The result shows a statistically significant ($p = 0.001$) improvement in job creation for businesses that started and survived from when training was conducted in the ILO and EMPRETEC programmes. Then to further understand whether the job creation differed between the new business start-ups following training and businesses already operating at the time of training, the researchers conducted another T-test on the start-up group and the existing business group for the dependent variable *jobs created*. The results are illustrated in Table 7.

Table 7: T-test Comparing Job Creation between Start-ups (N = 225) and Existing businesses (N = 101)

T-tests; Grouping: Business (hypdata.sta)										
Variable	Group 1: Start-up (versus) Group 2: Existing									
	Mean	Mean	t-value	Df	p	Std.Dv.	Std.Dv.	Levene	Df	p
	Start-up	Existing			0.677	Start-up	Existing	F (1, df)	Levene	Levene
Jobs created	0.804	0.702	0.415	324		2.219	1.559	0.543	324	0.461

*Indicates a statistically significant variance at $\alpha = 0.05$, confidence interval: 95%

Source: Own compilation

The analysis was conducted to prove the employment creation effect of the ILO and EMPRETEC training programmes. Of the 551 trained entrepreneurs reached, 59% (N = 225) started a business after training. Table 7 illustrates the results of the T-test conducted to compare the extent of jobs created by start-ups versus existing businesses. A resulting p-value = 0.677, indicating a non-significant variance, was found between the mean job creation of start-ups (0.804) compared to the mean job creation of established businesses (0.702). The actual number of jobs created is similar between the two groups.

This point is relevant regarding the job-creation expectation from new business start-ups versus that of existing businesses. The literature indicates that new small businesses create jobs, which is why TEA is considered vital for economic growth and development. Therefore, job creation is one of the most important contributions of (newly formed) SMEs. However, the research findings yielded a

different result, as illustrated above. Therefore, based on the results, **the null hypothesis H₀₄ is rejected, and the alternative H_{A4} is accepted.** It is therefore inferred that both training programmes were helpful in creating jobs after the respondents were trained, with statistically meaningful increases for new business start-ups and existing businesses.

4.1.5 Result in the participant’s satisfaction of the ILO and EMPRETEC programmes

During the research one of the descriptive statistical analyses conducted was the extent of satisfaction that the training participants had with the ILO and EMPRETEC programmes. This point is relevant because vocational training theory stipulates that training design and delivery must meet the participants’ needs if it is to be successful (Henry et al. 2003:97; Kirkpatrick 1967; Kirkpatrick & Kirkpatrick 2009:3; Lekoko et al. 2012:12027). Ordinal data was collected to establish whether participants were satisfied that the training programmes met their needs. The data was analyzed to produce the training satisfaction rate, of the ILO and EMPRETEC programme, in percentage that are illustrated in table 8.

Table 8: Training satisfaction rate with the EMPRETEC and ILO programmes

Level of satisfaction	ILO SYB	ILO IYB	ILO SYB+IYB	EMPRETEC EDW	EMPRETEC MEP	Total	Percent
Highly dissatisfied	1.33%	0%	0%	0%	0%	2	0.36%
Dissatisfied	0.67%	0%	0%	0%	0.67%	2	0.36%
Satisfied	33.33%	20.67%	14.49%	20.67%	11.36%	117	21.23%
Highly satisfied	64.67%	79.19%	85.51%	79.33%	87.88%	430	78.04%
Total	150	21	69	179	132	551	100.00%

Source: Own compilation

The result indicates that overall, the training participants were highly satisfied with 78% of respondents, and that 21% of respondents were satisfied, with very few participants who recorded a dissatisfaction or highly dissatisfied response to this question. The levels of satisfaction did not differ across the ILO and EMPRETEC training programmes.

Overall, the duration of the programmes was between 3 – 6 days for the EMPRETEC and the ILO is a standard 5-day programme, which the participants attended. The literature consulted supports this finding showing how very high satisfaction rates result in successful programme outcomes, when training meet participants’ needs and expectations (Henry et al. 2003:97; Kirkpatrick 1967; Kirkpatrick & Kirkpatrick 2009:3; Lekoko et al. 2012:12027; Van Vuuren & Botha 2010:607).

5 Conclusions and Recommendations

This research contributes to the field of entrepreneurship, especially entrepreneurship training programmes intended for entrepreneurs in the SME sector. The overall study firstly identified from the relevant literature, five essential factors that entrepreneurship training should encompass: 1. business-skills transfer, 2. entrepreneurial-skills transfer, 3. business performance, 4. business planning and presentation, and 5. programme methodology. These factors were identified as elements in the training models reviewed and are key aspects of effective entrepreneurship training programmes (McKenzie & Woodruff, 2014; Herrington & Coduras, 2019:2; Igwe et al. 2014:103; Van Lieshout et al. 2011:18; Mamabolo et al. 2017:1 De Mel et al. 2012:24-25 Glaub, 2011:6; Kirkpatrick,2009).

The study then focused on four of the above-mentioned factors and conducted empirical research on two global entrepreneurship programmes implemented in Zimbabwe. The study formulated hypotheses and tested for statistically significant differences between the ILO and EMPRETEC programmes regarding entrepreneurial-skills transfer, business-skills transfer, new business start-ups, job creation and participant satisfaction. At the time of the study, no such empirical research – analysing and comparing the performance of the ILO and EMPRETEC programmes – has been

carried out in Zimbabwe or elsewhere. Therefore, the study findings contribute to managerial implications for the ILO and EMPRETEC programmes and ongoing and future implementation. In the macro context of Zimbabwe, both the ILO SYB and EMPRETEC EDW training packages were found to have skills transfer. However, the EMPRETEC trainee sample had a statistically significantly higher proportional gain in entrepreneurial and business-skills transfer, and a higher proportion of business start-ups. In contrast, job creation variance between the two packages was found to be non-significant.

The study infers that the disparity and superior results for the EMPRETEC programmes are because it is highly focused, with more in-depth and detailed development of the personal entrepreneurial competencies. These personal qualities are vital to motivate actual business start-ups and are consistent with prior literature (Isaacs et al. 2007:614; Ndedi 2013). This finding is also important in relation to recent literature that emphasizes the vitality of entrepreneurial self-efficacy (Newman et al. 2019; Gielnik, et al, 2016). Furthermore, this contribution made by the study supports the theory of planned behaviour (Boyd & Vozikis, 1994:69), that when entrepreneurship training programme develop trainees perception and belief that they can plan and start businesses, then they are more likely to do so (Krueger & Brazeal, 1994:94).

In addition, the importance of developing entrepreneurial self-efficacy for entrepreneurs to feel more confident about business start-up and growth after training interventions is acknowledged (Elliot et al. 2020:49). In effect when entrepreneurs' personal competencies are developed and entrepreneurs feel confident about their personal ability, then they generally do better. Entrepreneurial self-efficacy is a factor in deciding to start a business and when specifically targeted by entrepreneurship education and training programmes it will positively influence entrepreneurial intent, behavior, and business startup and growth.

Furthermore, the EMPRETEC packages' content incorporates financial planning but is less detailed in structuring a business plan. In comparison, the ILO programmes are more detailed regarding business planning, costing, cash flow planning, starting a business, products and services and employees; however, they are less effective. This insight is unique in the context of comparing two entrepreneurship training programmes servicing the same target market with the same personal and demographic characteristics.

More insight has been provided to donors, sponsors and governments who support and promote entrepreneurship programmes, including what may be more effective training programmes and what curriculum content should be covered at a minimum. Delivering relevant training content leads to better outcomes and results. This study finds that personal entrepreneurial development is at least as important as entrepreneurial and business skills content.

It is critical to have adaptable and flexible training durations appropriate for different target groups and ensure follow-up is conducted for trainees at their business site or facilitated in small group sessions. This is consistent with training packages, such as those of the ILO, that have better training outcomes when supported by follow-on interventions, such as mentorship or access to finance (Mukata et al. 2017:86-87). This is consistent with Jones and Matlay (2011:701), who argue that effective training 'has... more to do with the unique set of dialogic relations'.

5.1 Recommendations and management implications

Based on the study results, donors, sponsors and training providers are recommended to work with the programmes to integrate business and entrepreneurial skills to achieve the objectives of starting and growing a business. The study findings imply that training practitioners should focus on training packages that develop entrepreneurial characteristics and attitudes, which are equally as important as technical, business and entrepreneurial skills.

Entrepreneurs are recommended to become equipped with technical skills for the line of business they are starting or expanding. Business and entrepreneurial-skills training leads to more success in

business start-ups. The entrepreneurial process's various stages for business start-up and growth requires entrepreneurs to have specific skill sets to successfully move through these stages. It is recommended that the design, content and structure of the training programmes discussed in this paper include, at minimum, entrepreneurial and business skills during initial training. The ILO programme must strengthen the training packages' entrepreneurial-skills and characteristics content to complement the existing content on business skills. The EMPRETEC programme will benefit from strengthened business-skills content in its training packages.

6 Study Limitations and Future Research

The study consisted of empirical research, ex post facto, using a questionnaire survey. It also used models based on the context of South Africa, a more developed and stable economy than Zimbabwe. Further, the Zimbabwean context limited the generalisation of the findings. More analysis is required on the extent of each programme's skills transfer, using larger sample sizes for each training package in the ILO and EMPRETEC training programmes.

Longitudinal studies with an experimental design of respondents in the ILO and EMPRETEC training programmes (including before and after intervention and at various time intervals, such as six months) are recommended to inform more valid impact evaluation studies. In addition, policymakers can put in place national policies encouraging a culture of entrepreneurship, and SME policies can be further improved with entrepreneurship policies.

Integrating entrepreneurship training programmes into the Zimbabwean educational system at the primary, secondary and tertiary levels remain critical. An in-depth analysis of the implications of demographic factors, location, legal status or registration and the entrepreneur's age should be conducted to ascertain how these variables affect the skills transfer results. A comparative research study on women-owned businesses trained in both programmes can contribute to the body of knowledge. Further, a comparative analysis of youth trained in both programmes – in the same country – may also enrich the body of knowledge

Keywords

Entrepreneurship education; Design Thinking; Entrepreneurial; Constructivist; Visionary

Abstract

Entrepreneurship education offers interdisciplinary learning opportunities for entrepreneurial students. On the other hand, design professionals who run their own businesses in the creative industry offer an example of such interdisciplinary thinking in practice. From a theoretical perspective, the relevance of Design Thinking has been identified in business schools and for the management sciences including entrepreneurship. Nevertheless, the application of Design Thinking in business disciplines beyond the method for innovative products or services, is underexplored. This paper explores how designer-entrepreneurs apply their Design Thinking as philosophy to solve Wicked Problems. The research question that this paper aims to answer is: what can entrepreneurial students learn from professional designers? Ten documented cases in Lagos on entrepreneurial designers with an architecture or adjacent design skill set are analysed from the documentary-series: “Made by Design”. The findings reveal that the African creatives in this study offer a visionary constructivist approach to deal with Wicked Problems that may be inferred to a business contexts in order to create opportunities. Implications for entrepreneurship education in terms of Design Thinking as a philosophy are provided accordingly.

1. Introduction

The need for interdisciplinary approaches to teaching entrepreneurship have been promoted particularly when entrepreneurial mindsets are a desired outcome (Fiore, Sansone & Paolucci, 2019; Secundo, Mele, Sansone & Paolucci, 2020). An underpinning theory to promote such an entrepreneurial mindset with special reference to the support of creativity and innovation is Design Thinking (DT) (Dorst, 2015). Several business schools and tertiary institutions therefore include the DT method as a tool to teach entrepreneurial thinking (Groeger & Schweitzer, 2020). The applicability of DT method to promote action (experimentation) and reflection is relevant to developing problem solving skills (Peschl, Deng & Larson, 2021), however, what remains underexplored in the literature is the applicability of DT as a philosophy to solve Wicked Problems. A Wicked Problem can be defined as an ill-structured problem that does not have an exact or precise solution/answer but requires some ideation and prototyping or scenario planning with consideration for each solution as each solution is consequential and may bring about another set of challenges (Sarasvathy, 2021). Wicked problems are therefore complex problems that require creativity to move toward potential solutions. In this regard, grappling with Wicked Problems may require entrepreneurial thinking on a meta-theoretical level and Peschl *et al.* (2021) propose DT as a philosophy that could direct pedagogy on entrepreneurial thinking for the uncertain 21st century with its plethora of open complex problems.

This paper offers a view into the thinking of 10 professional entrepreneurial designers who share their thinking on open-complex problem-solving on some of their favorite and most challenging projects in Nigeria. The objective of this paper is therefore to reflect on what it is the business discipline (or more specifically entrepreneurial students) can learn from these creatives with specific reference to their ability to deal with Wicked Problems on a conceptual level.

This paper commences with a literature review with special emphasis on Design Thinking as a philosophy for constructivist thinking. The research methodology is then discussed followed by the findings. Discussions of the findings are linked back to literature and conclusions and implications for entrepreneurship education are shared towards the end of the paper.

2. Literature Review

In this literature review it is important to note that there is no dispute about the value of the design thinking process or the principles that underpin the method, yet DT in this paper is not offered as method for innovation, but rather, it is unpacked in terms of its applicability as a philosophy towards solving Wicked Problems. The review applies the DT theory to the context of entrepreneurship and where possible to entrepreneurship education.

2.1 Design Thinking as a philosophy for problem solving

DT is a familiar construct in the business discipline and has been applied to the business context particularly as a methodology to yield innovation as well as solve open complex problems (Glen, Suci & Baughn, 2014). Brown (2009) who is one of the first authors on DT in the business context, refers to DT as a human-centered approach to innovation and he highlights the use of the DT methodology to synthesise people's needs and technology in order to promote business success. DT requires empathy to be applied to the context of a problem, creativity in the generation of solutions so that new insight is gained, and rational thinking to analyse the fit of solutions to the context (Micheli, Wilner, Bhatti, Mura & Beverland, 2019). It is also important to note that DT is future focused (what can be) (Linton & Klinton, 2019), and that it is ultimately a philosophy for change (Buchanan, 2019). Therefore, in summary, the human-centeredness, potential for innovation, thinking that incorporates analysis, synthesis and evaluation of alternative solutions for a particular context, but also the potential to yield changed scenarios of what can be beyond what is, could make DT a suitable philosophy for complex problem solving.

In order to further explore the applicability of DT as a philosophy, its applicability towards solving Wicked Problems is offered as entrepreneurial minds need this skill as much as designers do.

2.1.1 .Thinking for and about Wicked Problems

Designers (and in this paper entrepreneurial minded problem solvers) deal with complex problems all the time (Peschl, *et al.*, 2021). These problems are signified by their uncertain solutions and often referred to as Wicked Problems (Buchanan, 1992; Gero & Milovanovic, 2020). In their seminal work, Rittel and Webber (1973) highlight that every Wicked Problem is unique and does not have a set of approved operations that may be incorporated to present several solutions, rather that the solutions of such a problem is explored as good or bad (as opposed to right or wrong). For this reason the Wicked Problem is also seen as an open and complex by later scholars such as Sarasvathy (2021).

Attempting to solve a Wicked Problems can involve the development of products, services, systems or creation of value that result from a design process (abstract or physical) (Teasdale, Steiner & Roy, 2020). The value of the solutions in terms of good or bad or satisfying or not, is measured against what Helkkula, Kowalkowski and Tronvoll (2018) refer to as design-in-quality. Design-in-quality refers to the non-tangible quality factors of commitment, accessibility and uncomplicatedness of the design that need to be considered in each design phase when value, use and experiences are created (Singh, Akbani & Dhir, 2020). The thinking required in an attempt to solve a Wicked Problem is therefore subjective and requires a deeper interpretation of the design/problem's initial boundaries (beyond what seems initially apparent) and utilize thorough cause and effect analysis towards better or good solutions (Buchanan, 1992; Dell'Era, Magistretti, Cautela, Verganti & Zurlo, 2020). One may

argue that from the design perspective (which involves a strong foundation in aesthetics), that a “good” solution following a DT philosophy therefore implies that it is human-centered (serves the people).

With regard to principles of what constitutes “good design” or in a philosophical sense, design for good, when a Wicked Problem is at stake, Buchanan (2019) offers four principles that he argues overlaps when a systematic approach or DT philosophy is followed to solve complex problems. The first of the four principles is designing **for good** which entails affirming a proper place of human beings in the spiritual and natural order of the world. The second that goes hand in hand with this is to design **for the just** which entails that an equitable and ethical relationship among human beings should be acquired in such an instance as a design outcome. Buchanan (2019) goes on to explain that designing **to meet needs** (meeting physical, psychological and social needs) of people may also be a design outcome and finally designing **the useful** in supporting people to accomplish goals or intentions is another possibility. The context of his contribution on these four principles is to illustrate that Systems Thinking and DT share certain overlaps. Nevertheless, the argument can also be made that in terms of DT and desired outcomes of a design thinking process, these four principles might need to be met to be viewed as good in an attempt to “solve” the Wicked Problems in society. Thinking of the Design in-quality factors mentioned by Helkkula, Kowalkowski and Tronvoll (2018) is thus pivotal in achieving “good design” (which may then also comprise just, useful and meeting needs as design goals).

Similarly, for entrepreneurs as visionaries or pioneers (Asiyah, 2020) or agents of change (Schumpeter, 1934) to attempt solving some of the Wicked Problems in society, they too need the skills to understand how new ideas for products, services, systems or value can be created. What this thinking might entail from a DT perspective is discussed shortly.

2.1.2 Constructivist approach towards solving problems

Constructivism can be defined as a philosophy with the central idea which subscribes to individuals that construct knowledge rather than passively taking it in (Morris, 2019). This implies that individuals are actively involved in constructing their knowledge and making sense of their own worlds. The constructivist approach is therefore subjective and the sense making is a process of synthesising new knowledge to existing knowledge that is shaped by the individual’s experiences (Mesgari & Okoli, 2019; Vaghely & Julien, 2010). The relevance and application in DT is thus logical because, those who apply DT construct knowledge as McCurdy, Nickels and Bush (2020) are of opinion that during DT individuals actively engage with possible solutions to complex problems and experimentation is a part of the process. Learning, is therefore implicit in a constructivist approach to solving problems.

Cronje (2021) defines constructivism in the context of learning and highlights that it is subjective and contrasts objectivism. He illustrates in his early work on constructivism as learning philosophy or paradigm that there are dimensions to this paradigm that offers valuable means for operationalisation. The following table provides these dimensions to put constructivism into perspective:

Table 1: Constructivism as learning

Dimension	Description of constructivism aligned to dimension
Reality is:	is modeled by the way in which we personally construct them
Symbols are:	are products of culture that are used to construct reality
Human thought:	is imaginative, develops out of sensory experiences, perception & social interaction
meaning:	is a construction that results from applying mind

Source: Cronje (2006:390)

From the above table one may deduce that if one were to apply the above to the learning of designers, their design process and construct knowledge and form perceptions to create meaning while applying their imagination, senses as well as socially interact. Designers (or in this study entrepreneurial thinkers) create symbols as products of culture “that are used to construct reality” (Cronje, 2006:390).

This implies that creating symbols or constructing symbolic meaning may in fact be deeper than only creating form and function as is typically referred to as goals of design (Michl, 1995), but the notion of context (frame) is very important when constructivism is applied as a paradigm for learning or problem solving.

Bearing in mind the above, the level of expertise of a designer should not be disregarded when a constructivist paradigm is relevant because the very nature of the subjectivity of the learning and the existing experience of the individual makes this dimension important. Dorst and Reymen’s (2004) framework for the expertise was later revised by Lawson and Dorst (2013). This framework has been validated for other fields and illustrates that as levels of expertise grow to master and visionary level, the person starts thinking beyond their own field (context/frame) as well. The applicability of the framework to entrepreneurs may therefore be a helpful tool in entrepreneurship education as well. The levels of expertise from proficient level and beyond are shortly summarised in the table below to illustrate how engagement and context changes the more experienced a designer becomes:

Designer’s levels of expertise originally compiled by Dorst and Reymen (2004:3) and revised by Lawson and Dorst (2013:32)

Table 2: Levels of expertise

Level of expertise	What this level entails
Proficient	“Immediately sees the most important issues and appropriate plan, then reasons out what to do.”
Expert	“Responds to specific situation intuitively; performs the appropriate action, straightaway. There is no problem solving and reasoning that can be distinguished at this level.”
Master	“A new uneasiness creeps in. The master sees the standard ways of working that experienced professionals use not as natural but as contingent. Displays a deeper involvement into the professional field as a whole, dwelling on success and failures. This attitude requires an acute sense of context, and openness to subtle cues. In his/her own work the master will perform more nuanced appropriate actions than the expert.”
Visionary	“The world discloser or ‘visionary’, consciously strives to extend the domain in which he/she works. The world discloser develops new ways things could be, defines the issues, opens new worlds and creates new domains. To do this a world discloser operates more on the margins of a domain, paying attention to other domains as well, and to variances and marginal practices that hold promises for a new vision of the domain.”

Source: Lawson and Dorst (2013:32)

From the above table it is apparent that the subjective thinking is associated with designers who are at the higher levels of expertise. In other words, the more the expertise grows, the more emerged the designers become in their work and in this regard one could argue that their ability to construct their own knowledge and context seems to become more important the more their expertise grows. At visionary level, for example an individual extends domains/contexts that he/she usually works in. Similarly these levels can be related to entrepreneurial expertise.

From the literature review it is thus evident that for solving Wicked Problems, an entrepreneurial thinker who applies a DT philosophy might be a constructivist and that this person’s level of expertise in a field/domain might influence their ability to construct knowledge beyond that particular context/field/domain (or not). What one can learn from the design professionals may guide how one should engage with Wicked Problems as an entrepreneur.

3. Research Methodology

3.1 Research paradigm

An interpretivist research paradigm was applied in this study as an interpretivist paradigm enabled the researcher to gain deep insights based on a specific context. In this regard Alharahsheh and Pius (2020)

are of opinion that an interpretivist paradigm allows the researcher to embrace the individual's experience as a whole instead of only considering certain parts of it. In this study the researcher was interested in the experiences of the entrepreneurial-designers (particularly their problem solving and thinking about it) as they presented it.

3.2 Research Design and Sampling

The research design is a case study research design containing 10 documented cases in Lagos. The cases contained a homogeneous sample of entrepreneurial designers in Lagos (Nigeria). According to Creswell (2012) multiple cases that are homogeneous with a similar context and can be labelled as a collective case study. Ten entrepreneurial designers with architecture or adjacent skills were selected for this paper documented in a Netflix documentary-series²: "Made by Design". The 10 entrepreneurial designers were purposefully selected out of the 13 designers who were screened on the show. It was apparent that the producers of the show selected the designers from Lagos and all of the designers seemed to have played an important inspirational role in the country in terms of creating jobs for others or illustrating how their creative thinking could enhance the country. This rationale for selection of the 13 designers was disclosed in a magazine article about the show and was not in the control of the researcher of this particular study. However, in this study, the designers who had a business venture or own practice or even a partnerships in a firm were selected because it was argued that their entrepreneurial skills beyond their design skills were also important for the entrepreneurial part of this study. Each entrepreneurial-designer was interviewed and the semi-structured interview questions could be deduced from the series because similar questions were posed and written on screen to every designer.

3.3 Research Method

The series documents interviews with 13 designers. Each episode features a qualitative interview with one designer and there are visuals of the work of each designers in every episode. A main theme is then given to each episode capturing the particular designer's unique story. For this paper, only the 10 entrepreneurial designers who applied their design thinking to their own businesses as well as to their designs were selected.

The interviews were edited to become episodes of between 21 and 28 minutes long with questions in all interviews that involved the entrepreneurial-designer's:

- 1) Upbringing, education and professional journey
- 2) Design style and inspiration including mentors
- 3) Design philosophy (probing on how it links to personal life philosophy and problem solving)
- 4) Favorite projects (probing on most challenging projects or projects that were most memorable)
- 5) A typical day in their lives

A website that reported on the series was also found to correlate some of the verbatim quotes from interviews with some of the designers when the designers were asked to give an opinion about the value of the series. These quotes were also incorporated into his paper where it added value (indicted with * in Table 3 and in Table 4).

Using film as a medium for research is not traditionally associated with management sciences, yet it is often used in the Art and Design disciplines. The research method is interviews and the visual material illustrated during interviews was used to confirm what was said (this can be compared to simple observation). The research method and the medium were deemed appropriate for this paper for two main reasons:

- 1) The research topic is interdisciplinary (design and entrepreneurship) with its implications in entrepreneurship education. The medium allowed for interdisciplinary nuances yet drew from methods that are often applied in the management sciences.

² The series was aired from 26 December 2021. This didactic documentary-series was produced by Titi Ogufure.

- 2) A post-pandemic teaching environment calls for hybrid methods of teaching and learning. Using relevant and rich content available in the online public domain for students has proven to be useful over the past two years and enhances student's skills to reflect. This documentary-series was explored as a teaching tool as well as a data set.

3.4 Data analysis and ensuring the trustworthiness of the conclusions

The researcher did not have input into compiling the questions for the interviews and this may be seen as a limitation of the study. The researcher therefore watched the series as a member of public but ended up watching the series three times to evaluate the value of the series for educational purposes and its validity as data for research purposes.

The first time that the series was watched, it was simply for relevance of content and to judge the quality of the cases in relation to the central story line that was already provided by the directors of the show. The second time, the content of interviews with the designers in each programme were analysed (with sub-titles as well) and this is when the 10 cases with entrepreneurial designers were identified. After the second viewing of the series, certain patterns and themes could be identified and literature checks were done to identify the theoretical underpinning of the content that emerged from all the selected episodes. Upon the third viewing, the researcher took more time to do a deeper analysis of each case/episode after a preliminary conceptual framework was identified from the literature to validate and refine this framework.

The data analysis process is qualitative in nature and subjective, however to avoid bias, another researcher from an Arts and Design Faculty was also asked to do a thematic content analysis so that notes could be compared throughout the data analysis process. The peer and literature checks are practices that enhance trustworthiness of data analysis and the conclusions (Henry, 2015). Although each episode was analysed in detail, this paper reports on only two overarching themes relevant in all the selected episodes that may have relevance to entrepreneurial students.

4. Findings and Discussions

The most of the entrepreneurial designers display a strong architecture background or skills adjacent to architecture and another thing that all the designers shared was that they all had international exposure in some part of their training. Most of them had some European exposure and this exposure seems to make them all aware of their own context.

4.1 Theme 1: Applying higher level of expertise to create opportunities

There is an overwhelming sense of expert level of each entrepreneurial-designer that enables them to create new opportunities with new product lines or to solve problems in new domains that extend their primary fields of expertise. The following evidence illustrates that the designers in this study are on master or visionary level. Those on master level show potential to get to visionary level and strive to get there.

Table 3: Levels of Expertise of Entrepreneurial designers (self-compiled)

Episode Business case (Entrepreneurial – designer's name)	Level of expertise of the entrepreneurial- designer (Training)	Specific indicators that illustrate level	Verbatim as evidence to illustrate the level	Opportunities created
Lady carpenter Majeurs Chesterfield (Demi Samande)	Master level (Architecture)	a deeper involvement into the professional field acute sense of context	* <i>"We are finding our voice and stripping away the replicas we created of the West. Africa's growth and authenticity lie in designing with the agency to solve African problems whilst being globally inspiring"</i>	Businesses, guidance to young people on You Tube, manufacturing and training in furniture restoration on an

				international level
Beach house queen CM Designs Atelier (Tosin Oshinowo)	Master level (Architecture)	deeper involvement into the professional field acute sense of context	<p>“I embody my architecture in my lifestyle” “because we are able to control entire process we are able to fully curate the entire experience”</p> <p>“Being a designer, an architect is thinking about the experience. It is not just about creating buildings or rooms.”</p>	New businesses linking to her existing practice and exports furniture. Incorporates fabric that is local in furniture
Conservator Studio-Lani (Lani Adeoye)	Visionary level (Information system design)	<p>Extend the domain in which she works.</p> <p>The world discloser develops new ways things could be, defines the issues, opens new worlds and creates new domains.</p>	<p>“I break the silo’s between art, design and craft...There is a direct relation between design and wellbeing”</p> <p><i>*“I think it’s great to be able to tell our stories and share the diversities of our culture through a contemporary lens. It is important to dispel the myths of a singular language connected to African design”</i></p>	Interior product development and opportunities for artists to collaborate
Mastermind Theo Lawson Architecture (Theo Lawson)	Master – Visionary level (Architecture)	<p>Extend the domain in which he works.</p> <p>deeper involvement into the professional field</p>	My work embodies all the things I like. My realization of my love for history, love for green spaces ”	Incorporates Art in Architecture thus creates opportunities for many artists but also for researchers due to historical content of projects
The Pioneer IO Furniture (Muni Shonibare)	Visionary level	Extend the domain in which she works	“ I am eclectic ”	Design and manufacturing
Radical Architect SO Architects (Seun Oduwole)	Visionary level (Architecture)	<p>Extend the domain in which he works</p> <p>opens new worlds and creates new domains.</p>	<p>“I am intentional, for me it is about responsibility: environmental, social”</p> <p>“When people say ‘you cannot do that, I think, watch me’. That speaks to our philosophy”</p>	Various collaborations with others in construction and technical experts and product developers

Interior Architects (Tola Akerele)	Later interior design)	into professional field		Co-founder of Bogobiri house (hotel) Cookbook published as well
(Art)chitect MOE+ Architecture (Papa Omotayo)	Visionary level (Architecture)	opens new worlds and creates new domains	“Our work is transdisciplinary between art and architecture and everything in-between ” “I keep wanting to lock in words: Aesthetic, design process or design language”	Architect and founder of Whitespace Creative Agency for digital creatives and others to experiment
Boss lady James Cubitt Interiors (Intrapreneurial venture) (Jackie Aki)	Master level (Drafts person)	new uneasiness creeps in	There is Strive for excellence but also for Nigeria (beyond self also for quality production and technical ability of local people)	Own interior value chain up to manufacturing training
Quirky creative CC Interiors (Osara Alile)	Master level (Several design courses as well as interior design)	deeper involvement into professional field	“ I sprinkle happiness everywhere I go .Anyone who goes through this space, how do I want them to feel? ”	Product development for example: Greeting card range and other local interior products

**Quotes from: <https://www.wallpaper.com/design/netflix-made-by-design-african-design-documentary>*

From the above evidence it is apparent that all the entrepreneurial designers are beyond an expert level and that they are able to either create opportunity with new product lines by being deeply involved with their fields, having an acute sense of context or extend their context and start dabbling in other fields as well. This designerly ways of grappling with the Wicked Problems they deal with (all have unclear project briefs to fulfill), also manifest in how they are able to create opportunities for others in the business world. In this regard one sees an ability of these designers to systemically integrate their solutions for problems as Buchanan (1992) refers to as problem placement that encompasses construction, symbolism (making meaning) as well as communication. All of these designers (even those who are still moving towards a visionary level), are able to create opportunities for others and are therefore seen as entrepreneurial.

Theme 2: Philosophy that informs how entrepreneurial designers deal with Wicked Problems

Each entrepreneurial-designer has a certain philosophy that they incorporate in their designs and life decisions. Excerpts of these philosophies gives insight into what these entrepreneurial designers design for.

Table 4: The design philosophy and problems addressed of the entrepreneurial designers

Episode name	Typical Problem addressed (summarized via a vignette)	Philosophy to illustrate the problem addressed	Design for...
Lady carpenter	Furniture restoration and manufacture on level of excellence to the extent that Price Charles is a client. Yet she trains others in her country manufacturing and restoration to enhance local economy. Involved in building youth young entrepreneurs	<i>“As we develop confidence with this resolve, innovation within our authenticity is inevitable. I want my work to be a catalyst in showing Africans what is possible. To demonstrate in every piece of furniture, we make sure that we have the talent in Africa to build Africa”</i>	just and good
Beach house queen	Expert in terms of creating an experience for clients with beach – home designs from the house to the interior. The furniture business is to create uniquely modern and culturally fused products to compliment the spaces and enhance experiences. Local jobs are created as a result.	“Architecture should be celebrated as a lifestyle... It is about creating an experience: what aura do you create? What senses does it involve?” <i>“...it is very important for the younger generation to be inspired by imitation, the fact that young Africans can see fellow Africans doing trailblazing work in the design industry is really the representative shift we need”</i>	good and just
Conservator	Art, craft and architecture are not in silos and are used to compliment each other. The community is pulled into each project: the weaving crafters, metal artists, painters, stool makers, hair braiders all contribute to a vision.	“...to be in harmony with self and others. This idea of duality is also in my work: From corporate to creative, heritage and culture to innovation; constantly thinking of marrying the two creates tension. But in the work I do, I try to merge and find harmony between seemingly different worlds”	good
Mastermind	Mostly designs public spaces and fuses a place’s history with green design. He is the designer of Freedom Park for example that used to be a prison and symbolic of pain, yet turned this into a public space that is enjoyed and celebrated with stories and art.	“Architecture uses folklore and traditional beliefs to tell stories, it is not just brick and mortar”	good and just

The Pioneer	Due to a strong background in industrial design, she sees the connection between textile graphics, arts, crafts in interiors. She believes it is the responsibility of designers to encourage cultural nuances and create opportunity.	“I marry my western exposure and African exposure and reframe that. They all work beautifully together”	good
Radical Architect	Designs buildings that are radically different, yet promotes interaction and conversation. He does what has not been done. Sometimes this entails renovation/restoration other times to build something unconventional. But it is always a conversation piece that reminds others what can be done in Africa by Africans.	“We have the task of shaping the cities...people interact here.” “Every project is an intervention, an opportunity to make something...people can respond to, that inspires, that helps the quality of life, that creates backdrops to memories”	good and just
Curator	Afro-modern design interiors were western and African are fused to create experience. Every area is seen as something that must “work well”. This relates to something beyond function and aesthetics but must enhance experience with something different”	“Art is important and part of our design philosophy. Or philosophy is based on natural beauty. I have an attitude of gratitude and it puts all things into perspective”	good
(Art)chitect	For this architect, it is about engaging the public and thinking about visual identity. He works on public spaces but uses art to communicate and enhances simplicity with various mediums. His work is honest and captures what comes naturally to people using the space. Design becomes a language beyond aesthetic that captures the identity of	“Design is a language, an aesthetic, design is truly trying to represent what you want to represent. We push the envelope a bit...try to do things differently”. “Real inspiration is participation”	good and just

	people.		
Boss lady	She started an intrapreneurial interior venture with her architect partner. She creates better spaces for people. Better in terms of experiences. She has a greater purpose of improving Nigerian production as well.	“I visualize a better version of myself and project what it is I want to have achieved, I hold onto that vision and look up to that”	good
Quirky creative	This interior designer creates experiences for all types of clients and teaches her clients what they actually want. She came back to Nigeria from UK to make a difference and train people in her industry.	“I am the pilot of happiness. Everyone deserves to live in a happy place, regardless of income...” This happiness relates to experiences that need to be created for and by people.	good

Quotes from: <https://www.wallpaper.com/design/netflix-made-by-design-african-design-documentary>

From the above table there is an overwhelming sense of designing for “good” and for “just”. The designers are dealing with Wicked Problems and see their profession as an opportunity to create not only artefacts, product and experiences but beyond their context, they create opportunity and have a sense of responsibility to others to innovate what seems to be inspiration or “what can be”. Even those on a master level of expertise are moving towards visionary level and in this regard perhaps the “Radical Architect” says it best: *“Every project is an intervention, an opportunity to make something...people can respond to, that inspires, that helps the quality of life, that creates backdrops to memories”*

This notion of a social responsibility to others be it during the process of design or business start-up, the end result or the way that the voices of others are incorporated whilst grappling with solutions to Wicked Problems seems to enable powerful solutions that fit Buchanan’s (2019) definitions of what is “designing for good” (affirming a proper place of human beings in the world) and “just” (an equitable and ethical relationship among human beings should be acquired).

5. Conclusion and implications

Aesthetics in design is about stimulating senses, creating symbolic meaning and evoking emotion (Desmet & Hekkert, 2007). These aesthetics link the typical criteria that designers need to consider: form follows function (Michl, 1995). However the entrepreneurial designers in the documentary-series allude to something beyond form and function due to their level of expertise as identified by the model of Lawson and Dorst (2013). It is apparent from the findings that awareness of context is important when complex problems are engaged with. Each of the entrepreneurial designers has a design philosophy that enables them to think and construct solutions for people (beyond only their clients). Thinking outside and beyond the frame can perhaps be equated in entrepreneurship to thinking out of the box which Akyıldız and Çelik (2020) link to creativity. Bearing this in mind, this implies from the findings in this study, that creativity is also linked with a strong sense or awareness of one’s own philosophy and this seems to enable the thinking of problems on a meta-theoretical level (for example: What is good? and/or What is just?). This Form, Function and Frame awareness is a visionary approach toward solving Wicked Problems and may be applied in various fields where entrepreneurs have to be innovative.

Constructivist in this study, also seems to go beyond designing or creating the useful and to satisfy needs only. Instead, constructionist from this visionary perspective is done “for good” and “for the just”. This implies that problems are engaged with in a new way and systemically integrates communities, cultures and, human values. The “design for good and just” is an interdisciplinary notion and may also be related to sustainability development goals. This implies that a deeper understanding of the openness of problems and the mere notion of moving problems forward beyond their immediate context, may eventually enable sustainable solutions in the long term that also involves communities as opposed to individuals.

For entrepreneurship education, the philosophy of DT then may imply that students are challenged to engage with Wicked Problems in terms of designing for good or good design that includes the notions of just, useful and satisfying needs. This philosophical angle that can be introduced to students beyond a method towards innovation and may enhance the awareness of context, self and others within and out of that direct context. Moving beyond one’s own context may also enhance one’s ability to view problems from different perspectives, which offers alternative points of engagement. Such alternative points of engagement has the potential to enhance creativity. This is the advantage if the inter- or transdisciplinary learning and can be offered through project-based teaching. It is acknowledged that visionary constructivism as proposed in this paper is a very high level skill and unrealistic to expect entrepreneurial students to master at undergraduate level, yet the “construction blocks” towards such skills need to be noted and project based learning with interdisciplinary scope for the philosophy of DT need to be incorporated on undergraduate level at least. Perhaps entrepreneurial students similar to the designers of change in this data set, are able to strive to take control and narrate futures that is “for the good” and “for the just”.

The limitations of this paper is that it only offers the philosophical views of designers who have architecture or adjacent skills. Although many of the designers in this study do not limit the application of their skills to architecture, further studies can be done to understand the various thinking styles of other types of entrepreneurial designers (including those in fashion, industrial, and graphic design) in an attempt to profile various design thinking styles. In this way the true value of DT can be shared with educators in business fields beyond yielding innovative products and services only. Furthermore, studies on the value of DT in project based learning aimed to address the sustainability goals of the United Nations can be done to understand the complexity of engaging with the Wicked Problems that affect the future in specific contexts like Africa. The philosophical thinking of future entrepreneurs or intrapreneurs may enable visionary constructivism that is needed to overcome the challenges of the future in a way that considers form, function and frame (context).

To end this paper, the sentiments of an entrepreneurial designer on the show is therefore shared as is also relevant when entrepreneurs become philosophical design thinkers, and use their talent to direct a good narrative beyond what others may perceive as boundaries:

“We...need to celebrate our rich cultural heritage and appreciate the global influence it has, and make a conscious and concerted effort to take charge and direct the narrative.”

An Instrument For Measuring The Relationship Between Corporate Entrepreneurship And The Success Of Automotive Organisations

Prof Stephan van der Merwe^{1,*}, Dr Peter Kungeke²

^{1,2} North-West University Business School, North-West University, Potchefstroom South Africa

Keywords

Automotive, Business Success Model, Corporate Entrepreneurship, Entrepreneurial Orientation, Organisational Antecedents, Organisational Success Factors, Structural Equation Modeling, Sub-Sahara Africa

Abstract

The exploratory study developed an empirical measurement instrument using constructs from organisational antecedents, entrepreneurial orientation, corporate entrepreneurship, and organisational success factors. Organisational antecedents (top management support, autonomy or work discretion, rewards or reinforcement, time availability and organisational boundaries) were used as independent variables, entrepreneurial orientation and corporate entrepreneurship as mediating variables and organisational success factors as dependent variables in the measurement instrument.

The investigation gathered 429 responses from Sub-Sahara Africa, which were vigorously exposed to exploratory factor analysis and confirmatory factor analysis to confirm the construct validity and reliability before conducting structural equation modelling (SEM). SEM was conducted to test the study's hypothesis and produce a framework proposed for this study.

The discoveries of the investigation demonstrated that the measurement instrument was psychometrically firm with acceptable construct validity and reliability. The measurement instrument produced the proposed framework of the study, which produced evidence of the relationship between corporate entrepreneurship and the success of organisations. By and large, findings drawn from the study suggested that top management support, rewards or reinforcement and organisational boundaries were positively related to entrepreneurial orientation, and entrepreneurial orientation was positively related to corporate entrepreneurship. As a result, corporate entrepreneurship activities were also found to be good indicators of the success of organisations. Additionally, new results that were not hypothesised by the study showed that rewards or reinforcement and entrepreneurial orientation were partially directly related to the success factors.

1. Introduction

The contemporary business environment is continuously characterised by turbulent and uncertain environments that are constantly mutating, thereby creating complexities in strategy and operations management (Van Wyk & Adonisi, 2012:65). Several organisations operate in globalised, dynamic and rapidly changing environments branded by aggressive competition, ever-increasing expectations and demands from various stakeholders (Albuhisi & Abdallah, 2018:1360).

Entrepreneurial actions propel organisations to continuously focus on ring-fencing their growth, survival, and global competitiveness (Kuratko, 2011:9). Therefore, such kind of pressure is now demanding organisations to resort to a myriad of strategies to stay in business, such as concentrating on core business, outsourcing, downsizing, restructuring, decentralising and, in general, endeavouring to reinvent themselves (Morris, Kuratko, & Covin, 2011:25; Shimizu, 2012:194).

*Corresponding Author

¹ E-mail address:Stephan.vandermerwe@nwu.ac.za

Turbulent conditions have mainly been the result of an assortment of external and internal variables of the business environment, such as technological changes, global challenges, pandemics, heightened competitive intensity, internal inflexibility, bureaucratic structures, demographics, customer taste and demands (Ireland & Webb, 2009:473; Shimizu, 2012:194; Donthu & Gustafsson, 2020:284). The changes experienced by organisations have consistently caused dramatic changes in how consumers behave and how businesses should act in line with the changes in consumer behaviours (Donthu & Gustafsson, 2020:284). Organisations need to be continuously innovative and think outside the box, which is now becoming a requirement for business.

2. Problem Statement and Objective

Although corporate entrepreneurship has gradually permeated several organisations, there is no measurement instrument or tool for measuring the relationship between corporate entrepreneurship and the success of organisations. The problem identified in this study was that not only automotive organisations, but several organisations face the challenge of not easily grasping the relationship between corporate entrepreneurship and the success of their organisations.

No integrated study has been conducted thus far to better understand the chemistry between corporate entrepreneurship and organisational success factors (Kungeke & Van der Merwe, 2020:17).

Developing an instrument measuring corporate entrepreneurship and business success can help organisations understand the relationship between corporate entrepreneurship and the success of organisations. This could assist business leaders in determining the elements or variables that can suggest which strategy or direction to pursue (Shimizu, 2012:194).

In this respect, there has been no clear-cut research that focused on linking corporate entrepreneurship to organisational success factors such as financial wealth, customer satisfaction, efficient internal business processes and continuous improvement through learning and growth. Furthermore, amplified by the Coronavirus disease of 2019 (COVID-19), it has become necessary for an organisation to have a clear image of the relationship between corporate entrepreneurship and the success of their organisations.

Therefore, the study's primary objective was to develop an instrument that measures the relationship between corporate entrepreneurship and organisational success.

3. Operationalisation of Variables

3.1 Corporate entrepreneurship

According to Kuratko (2017:2), corporate entrepreneurship is a term used to explain entrepreneurial behaviours within small, medium, and large organisations. It is now considered a major strategy of many organisations.

Research on corporate entrepreneurship has also realised the importance of internal organisational dimensions to promote and support innovative environments (Kuratko *et al.*, 2014:37).

Organisations that have embraced corporate entrepreneurship as part of their strategy are now viewed as firms that are dynamic, flexible, and ready to take on new opportunities that appear on the horizon (Kuratko, 2017:3).

3.2 Organisational antecedents

The five organisational antecedents that are important determinants of an environment favourable to entrepreneurial behaviours are top management support, work discretion or autonomy, rewards or reinforcement, time availability and organisational boundaries (Kuratko *et al.*, 2014:37).

3.2.1 Top management support

Top management support (leadership) is fundamental in an organisation's management and operations and is essential in corporate entrepreneurship (Kuratko *et al.*, 2014:39). The objective of top

management support is to organise staff, roles and functions in a fashion that enhances entrepreneurial actions (Bhardwaj & Momaya, 2011:188).

Research has shown that top management support positively correlates with innovative results (Kuratko *et al.*, 2014:39). The more supportive top management is, the more innovative employees will be. Hence, top management support is one of the organisational antecedents instrumental in promoting corporate entrepreneurship, and the following hypothesis (H₁₋₁) was proposed: Top management support is positively related to entrepreneurial orientation.

3.2.2 Work discretion or autonomy

Work discretion or autonomy is a factor that is directly impacted by top management support. According to Kuratko *et al.* (2014:39), work discretion or autonomy is the degree to which employees perceive that the firm tolerates failure, provides decision-making latitude, the freedom from excessive oversight, and delegates authority and responsibility to lower-level managers and employees. The following hypothesis (H₁₋₂) was proposed: Work discretion or autonomy is positively related to entrepreneurial orientation.

3.2.3 Rewards or reinforcement

Rewards or reinforcement is the degree to which employees perceive how the organisation uses methods that reward based on entrepreneurial activities and success (Kuratko *et al.*, 2014:39). The rewards system is a critical success factor for stimulating entrepreneurial behaviours (Bhardwaj & Momaya, 2011:190).

Examples of entrepreneurial incentives are recognition systems and rewards, bonuses, promotions, salary increases, company benefits, equity, and equivalents (Bhardwaj & Momaya, 2011:190). Employees who feel correctly rewarded and have enough resources to do their jobs are highly committed. The following hypothesis (H₁₋₃) was proposed: Rewards or reinforcement are positively related to entrepreneurial orientation.

3.2.4 Time availability

Time availability is the degree to which employee's perception of workload schedule ensures extra time for employees to pursue creativity and innovation (Kuratko *et al.*, 2014:39).

Top management that provides unstructured or free time to employees can encourage corporate innovators to identify opportunities during their unstructured time (Kuratko *et al.*, 2014:39). The unstructured or free time provided to employees is an essential resource for generating entrepreneurial creativities (Kuratko *et al.*, 2014:39).

The unstructured time given to employees can help employees introduce new ideas to the organisation. Hypothesis H₁₋₄ was proposed: Time availability is positively related to entrepreneurial orientation.

3.2.5 Organisation boundaries

According to Kuratko *et al.* (2014:39), organisational boundaries are the degree to which employees perceive their flexible organisational boundaries that are useful in encouraging entrepreneurial actions because they enhance the flow of information between the external and internal environments of the organisation. Furthermore, the flow of information can be extended to divisions within the organisation and between departments to reduce silo structures (Kuratko *et al.*, 2014:39). Organisational boundaries can enhance entrepreneurial activities in an organisation and the hypothesis H₁₋₅ was proposed:

H₁₋₅: Organisational boundaries are positively related to entrepreneurial orientation.

3.3 Entrepreneurial orientation

Entrepreneurial orientation germinated within the field of entrepreneurship and is strongly considered an aspect of corporate entrepreneurship (Covin & Lumpkin, 2011:855; Kungeke & Van der Merwe, 2016:2; Mungule & Van Vuuren, 2016:3).

Entrepreneurial orientation is regarded as principles that influence business approaches and create exploitative behaviours toward business opportunities to gain and sustain competitive advantage and longevity (Kasim & Altinay, 2016:62).

The five dimensions of entrepreneurial orientation are innovativeness, proactiveness, risk-taking, autonomy and competitive aggressiveness. They work together to improve organisational entrepreneurial behaviour (Kungeke & Van der Merwe, 2016:42).

Thus, hypothesis H₂ proposed that entrepreneurial orientation positively relates to corporate entrepreneurship.

3.4 Organisational success factors

The organisational success factor strategy is a way to classify important information that is needed to be monitored closely and applied exceptionally well by organisational leaders for organisations to be successful (Marais *et al.*, 2017:2).

Organisational success factors in this study were derived from the Balanced Scorecard, a modern business performance measurement tool that can continually evaluate the performance of business processes for both quantitative and qualitative results (Dobrovic *et al.*, 2018:41).

The Balanced Scorecard helps not only to understand the financial soundness but also to evaluate non-financial aspects which are essential for achieving maximum competitiveness of an organisation (Dobrovic *et al.*, 2018:41).

The four perspectives of the Balanced Scorecard, i.e., finance, customer, internal business processes, and learning and growth, were used as success factors determinants (Hamdy, 2018:424).

3.4.1 Finance perspective

The finance perspective is one of the most important measures of the Balanced Scorecard, specifically for firms that are in business to make profits (Niven, 2014:7). It measures the economic effect of priorities chosen by the organisation, decisions made, plans executed, and actions taken by managers (Aswani *et al.*, 2016:1587). The financial perspective is one of the success factors derived from the Balanced Scorecard, and hypothesis H₃₋₁ was proposed: Corporate entrepreneurship will have a causal effect on the financial growth of an organisation.

3.4.2 Customer perspective

The customer perspective is an important aspect of the Balanced Scorecard that captures the ability of an organisation to provide quality goods and service, effective service delivery and customer satisfaction (Hamdy, 2018:425). It is measured through the pre-set organisation objective, i.e., lead time to serve a customer, quality of service or product, performance, and costs (Aswani *et al.*, 2016:1587). The customer perspective is concerned with customer value add, which is achieved through creativity, innovation, and high-quality service (Aswani *et al.*, 2016:1587). Customer perspective is a success factor derived from the Balanced Scorecard, and the hypothesis H₃₋₂ was proposed: Corporate entrepreneurship will have a causal effect on customer perceptions of an organisation.

3.4.3 Internal business process

The internal business process perspective reflects the importance of identifying and analysing the important processes correlated to efficiency and productivity within an organisation's short- and long-term strategic plans (Oliveira *et al.*, 2018:2591). According to Hamdy (2018:426), the internal business process affords firms with resources for achieving customer performance expectations. The internal business process perspective focuses on value chain activities to design, sell, and deliver products and services (Niven, 2014:118).

Hypothesis H₃₋₃, was proposed: Corporate entrepreneurship will have a causal effect on the internal business process.

3.4.4 Learning and growth perspective

The learning and growth perspective is the root and supplier of enablers, intangible in nature to the other perspectives of the Balanced Scorecard (Niven, 2014:6). The learning and growth perspective focus on identifying measures that link to the long-term growth of organisations (Aswani *et al.*, 2016:1587). People are key drivers of any organisation’s strategy implementation. The success of any organisation’s strategy relies on the capacity of its human capital in terms of new skills, competency acquisition and morale (Aswani *et al.*, 2016:1587). Hypothesis H₃₋₄ was proposed: Corporate entrepreneurship will have a causal effect on the learning and growth of employees in an organisation.

4. Conceptual Framework

The conceptual frame was developed on organisational antecedents by Kuratko *et al.* (1990) and organisational success factors developed by Kaplan and Norton (Harvard Business Review, 1992). The two aspects are commonly used in the day-to-day running of organisations, but surprisingly enough, there are no systematic and scientific approaches to apply these principles so that they can both improve entrepreneurial activities and the success of organisations.

Fundamentally, this study hypothesised that a good mixture of organisational antecedents could create entrepreneurial orientation, resulting in corporate entrepreneurship. Eventually, corporate entrepreneurship would yield positive financial results, customer satisfaction and retention, improved internal business processes and learning and growth for employees’ skill development and satisfaction as shown in Figure 1 below. The five organisational antecedents have a covariance relationship (Morris *et al.*, 2011:51). They all can create a favourable entrepreneurial environment which can develop an entrepreneurial orientation environment.

Figure 1: Hypothesised model for measuring organisational success factors

5. Research Methodology

5.1 Measurement instrument development

The study measurement instrument was developed in four parts: the organisational antecedents, entrepreneurial orientation, corporate entrepreneurship, and the organisational success factors, as shown in Figure 1 above. Organisational antecedents’ questions were derived from several previous

scholars who used similar questions in the process of refining the research on the corporate entrepreneurship topic, e.g. (Adonisi, 2003; Brizek, 2003; Hornsby *et al.*, 2013; Kuratko *et al.*, 1990; Kuratko *et al.*, 2014; Mungule, 2015 and Van Wyk & Adonisi, 2012). The questionnaire was largely based on the Corporate Entrepreneurship Assessment Instrument (CEAI) (Kuratko *et al.*, 2014).

Entrepreneurial orientation questions were drawn from numerous scholars who used similar questions in the process of identifying the relationship between entrepreneurial orientation and the performance of organisations, e.g. (Kungeke and Van der Merwe, 2016; Lotz and Van der Merwe, 2013a; Lotz, 2009; Covin and Slevin, 1989). Entrepreneurial orientation dimension items were primarily compiled based on the study of Van der Merwe and Malan (2013), adopted from the work of Lumpkin and Dess (2001:442).

Corporate entrepreneurship questions were drawn from the work of Covin and Miles (1999) and Morris *et al.* (2011). The questions were based on one alternative corporate entrepreneurship, strategic entrepreneurship (Morris *et al.*, 2011:97).

Success factors questions were derived from various scholarly works that researched organisational success factors, the Balanced Scorecard, organisational performance, and new questions developed by the researcher for this study (Kungeke & Van der Merwe, 2020:434). Previous work was derived from Matsuno *et al.* (2002); Van der Merwe and Oosthuizen (2011); Kumar *et al.* (2015); Valmohammadi and Servati (2011); Aswani *et al.* (2016); Singh and Arora (2018); Dobrovic *et al.* (2018) and Albuhihi and Abdallah (2018).

5.2 The study population

The study population was drawn from selected automotive organisations from Sub-Saharan Africa. The sampling frame focused on automotive organisations that have been in existence for 15 years or more (Krishnaswami & Statyaprasad, 2010:51; Taylor, 2018:94). The sample was comprised of employees from Toyota Tsusho Africa (TTAF), Subaru Southern Africa, Toyota Malawi, Toyota Kenya, Toyota Zambia, and Toyota Zimbabwe.

A stratified random technique was used to ensure that the sample obtained was representative of the population from which it was drawn (Taylor, 2018:96). The research was cross-sectional, which surveyed all employees from the selected organisation of all ages, races, and levels of employment (Saunders & Lewis, 2012:123). The estimated sample population was 1434 employees from all participating organisations.

5.3 Data collection

Primary data was collected using a questionnaire developed to nest responses that would address the research questions and objectives. The study was focused on investigating automotive organisations in the Sub-Saharan Africa region.

5.4 Questionnaire

The questionnaire was developed using the concept of a 5-point Likert scale (Taylor, 2018:65). According to Taylor (2018:65), the Likert scale is a special response format used for a research questionnaire to capture responses from respondents at the ordinal level of measurement. The results can be analysed using nonparametric, chi-square tests of association, or correlation coefficients. The Likert scale contained five ordinal values; (1) strongly disagree, (2) disagree, (3) neither agree nor disagree, (4) agree and (5) strongly agree (Taylor, 2018:66). The questionnaire had 86 questions (78 questions from Section A, B, C and D, eight questions from Section E) (Kungeke & Van der Merwe, 2020:434).

5.5 Data processing and analysis tools

The statistical package for social sciences (SPSS) was used to analyse descriptive data, and analysis of moment structures (AMOS) was used to conduct SEM analysis (IBM, 2017; IBM, 2019). AMOS

helps to easily use SEM to test hypotheses on complex variable relationships and acquire insights into data (IBM, 2019; Khine *et al.*, 2013:4).

AMOS is an SEM software that helps researchers to support their theories by extending multivariate analysis methods such as regression, correlation and analysis of variance (IBM, 2019; Khine *et al.*, 2013:4).

Using AMOS, researchers can construct attitudinal and behavioural models that reflect complex relationships more accurately than standard multivariate statistical tools (IBM, 2019).

Exploratory factor analysis and confirmatory factor analysis were used to assess the construct validity, and the Cronbach Alpha test was used to determine reliability. Validity is the capability of an instrument to measure what it is supposed to measure for a latent construct (Awang, 2015:55). The main objective of confirmatory factor analysis and exploratory factor analysis was to ensure that the measurement instrument is accurate (Khine *et al.*, 2013:85; Hair *et al.*, 2010:709). While reliability ensures that the observed variables are reliable and contain few errors so that the latent variables can be correctly represented (Khine *et al.*, 2013:6)

5.5.1 Exploratory factor analysis

The key focus areas for this study on exploratory factor analysis were Kaiser-Meyer-Olkin (KMO) and Bartlett's test, communalities tests, total variance explanation, the pattern matrix and reliability tests. The KMO and Bartlett's test is the initial step used to perform a factor analysis because it can evaluate the data for factor analysis with a satisfactory sampling adequacy greater than 0.5 for a satisfactory analysis to proceed, although values greater than 0.6 are preferred (Khine *et al.*, 2013:153). The recommended *p*-value that is considered statistically significant must be less than 0.05 (Khine *et al.*, 2013:13). *P*-values of less than 0.001 show that the correlations' patterns are compact in that factor analysis should produce reliable factors (Lotz & Van der Merwe, 2013b:199).

5.5.2 Confirmatory factor analysis

Confirmatory factor analysis measures causality relations among determining factors for a particular study (Khine *et al.*, 2013:152). Therefore, confirmatory factor analysis is used to determine whether the construct structured by the researcher is consistent, suitable and divulges causality relationships (Khine *et al.*, 2013:152). The investigation was utilised to ascertain whether the hypothesised model provided a good fit to the data by indicating if a relationship existed between the observed variables and the latent variables using the minimum sample discrepancy divided by degrees of freedom (CMIN/DF), CFI, RMSEA and *p*-values (Hancock & Mueller, 2010; Blunch, 2008; Mueller, 1996).

The recommended value of CMIN/DF is assumed to be acceptable even for values of 5.0. The interpretation of the CMIN/DF value size depends on the researcher's viewpoint, where ratios as high as 5.0 represent a good model fit (Awang, 2015:57; Mueller, 1996). CFI values above 0.9 indicate an excellent overall fit (Awang, 2015:57; Mueller, 1996). The RMSEA values smaller than 0.08, reported at an average confidence level of 90%, represent a good model fit, while RMSEA values of 0.10 should not be accepted (Awang, 2015:57; Khine *et al.*, 2013:15; Blunch, 2008).

5.5.3 Reliability

The reliability of a measurement instrument is measured using the Cronbach Alpha coefficients, which test the internal consistency of items of the measurement instrument (Khine *et al.*, 2013:85; Lotz & Van der Merwe, 2013b:203). The internal consistency between items of the measurement instrument and its coefficients varies between 0.0 for no reliability and 1.0 for maximum reliability (Lotz & Van der Merwe, 2013b:203). The acceptable reliability must be higher than 0.7 (Khine *et al.*, 2013:102; Bryman & Bell, 2007:164).

6. Results

6.1 Demographic information

The total number of respondents was 429, giving a response rate of 30%. Of the respondents, 31% were female, while 69% were male. General staff had a 54% response rate, supervisors 16%, junior management 13%, middle management 12% and senior management 5%.

6.2 Construct validity

Construct validity of the measurement instrument was assessed using exploratory factor analysis and confirmatory factor analysis. Organisational antecedents and organisational success factors variables did not load 100% on the pattern matrix in exploratory factor analysis and hence were further subjected to confirmatory factor analysis to test the construct validity.

6.2.1 Entrepreneurial orientation variable analysis

The exploratory factor analysis for the entrepreneurial orientation scale showed satisfactory sampling adequacy of KMO of 0.948, indicating that the data was enough to conduct factor analysis, as shown in Table 1 below. The KMO result of 0.948 confirmed that Bartlett's test was also statistically significant, and that factor analysis was applicable because correlations amongst the items were very high (Khine *et al.*, 2013:157). The *p*-value for the KMO and Bartlett's was statistically significant at $p=0.000$, less than 0.001 (Khine *et al.*, 2013:13).

Table 1: KMO and Bartlett's test for entrepreneurial orientation

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy		0.948
Bartlett's Test of Sphericity	Approx. Chi-Square	7877.919
	df	351
	Sig.	0.000

Amongst all the 27 items in entrepreneurial orientation, the communalities test found only 24 items with satisfactory values ranging between 0.618 and 0.383, greater than 0.3 (Khine *et al.*, 2013:153).

The total variance explained a cumulative percentage of the eigenvalue at 47.375%, slightly less than 50% of the information collected for entrepreneurial orientation, as shown in Table 2 below (Khine *et al.*, 2013:71). Thus, the result was considered satisfactory to explain the factor represented in entrepreneurial orientation.

Table 2: Total variance explained for entrepreneurial orientation

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
	1	12.791	47.375	47.375	12.791	47.375

The pattern matrix for the entrepreneurial orientation latent variable was loaded as expected by the literature. Therefore, it was considered enough evidence of construct validity. The pattern matrix for entrepreneurial orientation loaded the observed variables according to how they were categorised in the measurement instrument. All the factor loadings produced values higher than 0.3, as shown in Table 3 below.

Table 3: Entrepreneurial orientation pattern matrix

Pattern Matrix ^a	
Observed variables	Component
C1. I have enough autonomy in my job without continual supervision to do my work.	0.502
C2. Our organisation allows me to be creative and try different methods to do my job.	0.619
C3. Employees at our organization are allowed to make decisions without going through elaborate justification and approval procedures.	0.631
C4. Employees at our organization are encouraged to manage their own work and have flexibility to resolve problems.	0.650
C5. I seldom have to follow the same work methods or steps while performing my major tasks from day to day.	0.387
C6. Our organization regularly introduces new products/services/processes.	0.709
C7. Our organization places a strong emphasis on new and innovative products/services/processes.	0.755
C8. Our organization has increased the number of products/services/processes offered during the past two years.	0.774
C9. Our organization is continually pursuing new opportunities.	0.750
C10. Over the past few years, changes in our products/services/processes have been quite dramatic.	0.701
C11. In our organization there is a strong relationship between the number of new ideas generated and the number of new ideas successfully implemented.	0.709
C12. Our organization places a strong emphasis on continuous improvement (kaizen) in products/services/processes.	0.535
C13. Our organization has a widely held belief that innovation is an absolute necessity for the organization's future.	0.686
C14. Our leaders seek to maximize value from opportunities without constraint to existing models, structures or resources.	0.760
C15. When confronted with uncertain decisions, our organization typically adopts a bold posture in order to maximize the probability of exploiting opportunities.	0.754
C16. In general, our organization has a strong inclination towards high-risk projects.	0.667
C17. Owing to the environment, our organization believes that bold, wide-ranging acts are necessary to achieve the organization's objectives.	0.629
C18. Employees are often encouraged to take calculated risks concerning new ideas.	0.655
C19. The term 'risk-taker' is considered a positive attribute for the employees and management team in our organization.	0.647
C20. Our organization is very often the first to introduce new services/ learning areas/ sport codes/processes.	0.733
C21. Our organization typically initiates actions that competitors respond to.	0.696
C22. Our organization continuously seeks out new services/learning areas/sport codes/processes.	0.773
C23. Our organization continuously monitors market trends and identifies future needs of customers	0.746
C24. In dealing with competitors our organization typically adopts a very competitive "undo-the-competitor" posture.	0.731
C25. Our organization is very aggressive and intensely competitive.	0.786
C26. Our organization effectively assumes an aggressive posture to combat industry trends that may threaten our survival or competition position.	0.755
C27. Our organization knows when it is in danger of acting overly aggressive (this could lead to erosion of our organization's reputation or to retaliation by competitors).	0.684

6.2.2 Corporate entrepreneurship variable analysis

The exploratory factor analysis for the corporate entrepreneurship scale showed satisfactory sampling adequacy of KMO of 0.884, indicating that the data was enough to conduct factor analysis, as shown in Table 4 below. The KMO result of 0.884 confirmed that Bartlett's test was also statistically significant and that factor analysis was applicable because correlations amongst the items were very high (Khine *et al.*, 2013:157). The *p*-value for the KMO and Bartlett's was statistically significant at *p*=0.000, less than 0.001 (Khine *et al.*, 2013:13).

Table 4: KMO and Bartlett's test for corporate entrepreneurship

KMO and Bartlett's Test		
Kaiser-Meyer-Olkin Measure of Sampling Adequacy.		0.884
Bartlett's Test of Sphericity	Approx. Chi-Square	1991.782
	df	15
	Sig.	0.000

The communalities test for all the six items in the corporate entrepreneurship factor produced satisfactory values that ranged between 0.787 and 0.664, greater than 0.3 (Khine *et al.*, 2013:153).

The total variance explained a cumulative percentage of eigenvalues at 73.886%, which was more than half of the information collected in the corporate entrepreneurship factor, as shown in Table 5 below (Khine *et al.*, 2013:71). The result for the total variance explained for corporate entrepreneurship was satisfactory to proceed with the analysis.

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	4.433	73.886	73.886	4.433	73.886	73.886

The pattern matrix for corporate entrepreneurship latent variable loaded according to the literature. Therefore, it was considered evidence of construct validity to conduct structural equation modelling. The pattern matrix for corporate entrepreneurship loaded the observed variables according to how they were categorised in the measurement instrument. All the factor loadings produced values higher than 0.3, as shown in Table 6 below.

Table 6: Corporate entrepreneurship pattern matrix

Pattern Matrix ^a	
Observed variable	Component
B1. Our organisation regularly and continuously introduces new products, services and enters new markets.	0.815
B2. Our organisation seeks to sustain or improve its competitive standing by altering its internal processes, structures and capabilities.	0.850
B3. Our organization seeks to redefine its relationship with its markets or industry competitors by fundamentally altering how it competes.	0.887
B4. Our organisation proactively creates a new product market arena that others have not recognised or actively sought to exploit.	0.867
B5. Our organisation applies entrepreneurial thinking to the design or redesign of its core business model (s) in order to improve operational efficiencies.	0.868

6.2.3 Organisational antecedents' analysis

Confirmatory factor analysis for organisational antecedents produced a CMIN/DF value of 5.199, CFI of 0.788 and RMSEA of 0.099. The CMIN/DF and RMSEA values were considered acceptable to represent a good model fit, while CFI value was less than 0.9 at 0.788, which was not indicative of an overall good model fit (Awang, 2015:57; Mueller, 1996). However, since the two indices, CMIN/DF and RMSEA were acceptable, an acceptable construct validity was assumed with all items loading statistically significantly. The full results of the organisational antecedents' model fit are shown below in Table 7.

Table 7: Organisational antecedents' model fit summary

Model	NPAR	CMIN	DF	P	CMIN/DF
Default model	91	1632.456	314	.000	5.199
Saturated model	405	.000	0		
Independence model	27	6591.540	378	.000	17.438
Model	NFI Delta1	RFI rho1	IFI Delta2	TLI rho2	CFI
Default model	.752	.702	.790	.745	.788
Saturated model	1.000		1.000		1.000
Independence model	.000	.000	.000	.000	.000
Model	RMSEA	LO 90	HI 90	PCLOSE	
Default model	.099	.094	.104	.000	
Independence model	.196	.192	.200	.000	

All the *p*-values for the organisational antecedents' items loaded were statistically significant on the factors at *p*=0000 less than 0.001 (Khine *et al.*, 2013:13).

6.2.4 Organisational success factor variable analysis

The confirmatory factor analysis for organisational success factors produced a CMIN/DF value of 4.365, CFI of 0.917 and RMSEA of 0.089. All three reported indices for the confirmatory factor analysis were considered acceptable to represent the model fit. CMIN/DF value of 4.365 was within the acceptable estimate of smaller than 5.0, CFI value of 0.917 was greater than 0.9, and RMSEA value of 0.089 was less than 0.10 (Awang, 2015:57; Blunch, 2008; Khine *et al.*, 2013:15; Mueller, 1996). The results indicated that an acceptable construct validity existed, and all items loaded were statistically significant, as shown below in Table 8.

Table 8: Organisational success factors model fit summary

Model	NPAR	CMIN	DF	P	CMIN/DF
Default model	60	563.055	129	.000	4.365
Saturated model	189	.000	0		
Independence model	18	5413.852	171	.000	31.660
Model	NFI Delta1	RFI rho1	IFI Delta2	TLI rho2	CFI
Default model	.896	.862	.918	.890	.917
Saturated model	1.000		1.000		1.000
Independence model	.000	.000	.000	.000	.000
Model	RMSEA	LO 90	HI 90	PCLOSE	
Default model	.089	.081	.096	.000	
Independence model	.268	.262	.274	.000	

All the *p*-values for the organisational success factors items loaded statistically significant on the factors at *p*=0000 less than 0.001 (Khine *et al.*, 2013:13).

6.2.5 Reliability of the measuring instruments

The reliability for entrepreneurial orientations' 27 items was higher than 0.7 (Bryman & Bell, 2007:164; Khine *et al.*, 2013:102; Lotz & Van der Merwe, 2013b:203). The reliability of entrepreneurial orientation was at 0.953, as shown in Table 9 below (Gerrish & Lathlean, 2015:418).

Table 9: Cronbach Alpha for entrepreneurial orientation

Reliability Statistics for Entrepreneurial Orientation				
No.	Latent Variable	Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	No. of Items
1	Entrepreneurial Orientation	0.953	0.954	27

The reliability for corporate entrepreneurship six items was higher than 0.7 (Bryman & Bell, 2007:164; Khine *et al.*, 2013:102; Lotz & Van der Merwe, 2013b:203). The reliability for corporate entrepreneurship was 0.928, as shown in Table 7.10 below (Gerrish & Lathlean, 2015:418).

Table 10: Cronbach Alpha for corporate entrepreneurship

Reliability Statistics for Corporate entrepreneurship				
No.	Latent Variable	Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	No. of Items
1	Corporate Entrepreneurship	0.928	0.929	6

The reliability of the organisation antecedents' values was all acceptably higher than 0.7 (Bryman & Bell, 2007:164; Khine *et al.*, 2013:102; Lotz & Van der Merwe, 2013b:203). Therefore, the reliability of the five subscales of organisational antecedents was all acceptable, ranging from 0.878 to 0.719. Top management support had the highest reliability of 0.878, while organisational boundaries had the lowest value of 0.719, as shown in Table 11 below (Gerrish & Lathlean, 2015:418).

Table 11: Cronbach Alpha for organisational antecedents

Reliability Statistics for Organisation Antecedents				
No.	Latent Variable	Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	No. of Items
1	Top Management Support	0.878	0.879	8
2	Autonomy / Work discretion	0.811	0.815	4
3	Reward / Reinforcement	0.863	0.864	5
4	Time Availability	0.764	0.762	5
5	Organisational Boundaries	0.719	0.724	5

The reliability test for success factors values was higher than 0.7 (Bryman & Bell, 2007:164; Khine *et al.*, 2013:102; Lotz & Van der Merwe, 2013b:203). The reliability of the four subscales of success factors was acceptable, ranging from 0.904 to 0.817. Financial produced the highest reliability value of 0.904, while internal business process produced the lowest value of 0.817, as shown in Table 12 below (Gerrish & Lathlean, 2015:418).

Table 12: Cronbach Alpha for success factors

Reliability Statistics for Success Factors				
No.	Latent Variable	Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	No. of Items
1	Financial	0.904	0.905	4
2	Customer	0.896	0.899	5
3	Internal Business Process	0.817	0.819	5
4	Learning and Growth	0.852	0.858	4

6.2.6 Mean and standard deviation

According to Levine *et al.* (2014:136), the mean is a typical or central value that serves as a balance point in a data set. When the mean is higher than the mid-point, it indicates that the results are more favourable to the viewpoint, and if the mean is lower than the mid-point, it indicates that the results were less favourable to the viewpoint (Levine *et al.*, 2014:136). A mean value higher than 3.0 in this study was considered a favourable response, whereas a mean value lower than 3.0 was considered an unfavourable response.

While standard deviation is the measure of variation and is used to measure the average scatter around the mean (Levine *et al.*, 2014:142). Standard deviation determines how larger values fluctuate around the mean and how smaller values fluctuate below the mean (Levine *et al.*, 2014:142). In this study, smaller values of standard deviation showed that responses had similar views and larger values showed that responses had varied views e.g. standard deviation values less than 1.0 showed that responses had similar views and values greater than 1.0 showed that responses had varied views (Levine *et al.*, 2014:142).

Table 13 below shows a summary of the average mean and a standard deviation of all the latent variables used in the hypothesis. The top management latent variable received an average of 428 responses with a favourable mean value of 3.4 and a favourable standard deviation of 0.97. Autonomy or work discretion latent variable received an average of 427 responses with a favourable mean value of 3.52 and a favourable standard deviation value of 0.932. Rewards or reinforcement latent variable received an average of 426 responses with a favourable mean value of 3.58 and a favourable standard deviation value of 0.894. The time availability latent variable received an average of 426 responses with a favourable mean value of 3.43 and a favourable standard deviation of 0.916. Organisational boundaries latent variable received 424 responses with a favourable mean value of 3.61 and a favourable standard deviation value of 0.903. All organisation antecedent latent variables showed a more favourable mean response, greater than 3.0 and a favourable standard deviation value of less than 1.0.

The entrepreneurial orientation latent variable received 426 responses with a favourable mean value of 3.61 and a favourable standard deviation of 0.841.

The corporate entrepreneurship latent variable received 425 responses with a favourable mean value of 3.78 and a favourable standard deviation value of 0.904.

The financial latent variable received 427 responses with a favourable mean value of 3.86 and a favourable standard deviation of 0.881. The customer latent variable received 426 responses with a favourable mean value of 3.94 and a favourable standard deviation of 0.844. The internal business process received 425 responses with a favourable mean value of 3.89 and a favourable standard deviation of 0.847. The learning and growth latent variable received 425 responses with a favourable mean value of 3.76 and unfavourable standard deviation of 1.003.

All the success factors variables had mean values that were favourable, most of them with a standard deviation value that showed similar views except for the learning and growth latent variable with a standard deviation value greater than 1.0.

In a nutshell, all the mean values of the 11 latent variables were greater than 3.0, and 10 latent variables standard deviation values were below 1.0. The learning and growth latent variable was the only variable with a standard deviation value greater than 1.0, as shown below in Table 13. On the surface, considering the results in Table 13 below, the outcome favours the initial hypothesis, which states that when the internal environment of an organisation is conducive, it facilitates the existence of entrepreneurial orientation, which in turn creates a corporate entrepreneurial environment, which ultimately results in the success of organisations.

Table 13: Summary of average mean and standard deviation

Variable	Average Number of Respondents	Minimum	Maximum	Mean	Std. Deviation
Top management support	428	1	5	3.4	0.97
Autonomy / Work Discretion	427	1	5	3.52	0.932
Rewards / Reinforcement	426	1	5	3.58	0.894
Time Availability	426	1	5	3.43	0.916
Organisational Boundaries	424	1	5	3.61	0.903
Entrepreneurial Orientation	426	1	5	3.61	0.841
Corporate Entrepreneurship	425	1	5	3.78	0.904
Financial	427	1	5	3.86	0.881
Customer	426	1	5	3.94	0.844

6.2.7 SEM Model summary results

The model produced three mediation effects in the relationship, starting from organisational antecedents to the entrepreneurial orientation factor, as shown in Table 14 below. A positive relationship was apparent between the top management support factor, rewards or reinforcement factor, organisational boundaries factor, and entrepreneurial orientation factor. The relationship between autonomy or work discretion factor and time availability and entrepreneurial orientation was weak, resulting in no mediation effect and therefore was deleted from the model. The regression lines for autonomy, time availability, and entrepreneurial orientation produced p-values of 0.219 and 0.513, respectively, greater than 0.05.

The relationship between the two mediating variables, entrepreneurial orientation and corporate entrepreneurship, with the success factors, was strong, indicating a mediation effect. However, the relationship between entrepreneurial orientation to success factors produced a partial mediation effect of 53.58%. The relationship between organisational antecedents and success factors showed complete mediation in top management support factors and organisational boundaries. No unique effect in autonomy or work discretion factor and the time availability factor was produced. The relationship from rewards or reinforcement factor to success factor produced a partial mediation at 29%, as shown in Table 7.14 below.

Table 14: SEM model summary results

SEM Model					
Factors		Estimate	P-value	Relationship	
C_Entrepreneurial_Orient	← Management_Support	0.253	0.001	Mediation	
C_Entrepreneurial_Orient	← Autonomy	0.136	0.219	No mediation	
C_Entrepreneurial_Orient	← Reward	0.197	0.049	Mediation	
C_Entrepreneurial_Orient	← Time_availability	-0.047	0.513	No mediation	
C_Entrepreneurial_Orient	← Organisational_boundaries	0.345	***	Mediation	
B_Corp_Entrepreneur	← C_Entrepreneurial_Orient	0.895	***	Mediation	
Success	← B_Corp_Entrepreneur	0.317	***	Mediation	
Success	← C_Entrepreneurial_Orient	0.246	***	Partial mediation 53.58%	
Success	← Management_Support	0.133	0.111	Complete mediation	
Success	← Autonomy	0.011	0.924	No unique effect	
Success	← Reward	0.258	0.015	Partial mediation 29%	
Success	← Time_availability	0.015	0.845	No unique effect	
Success	← Organisational_boundaries	-0.024	0.759	Complete mediation	

7. Conclusion

The proposed framework developed after conducting SEM analysis produced nine variables out of the initial 11: three independent variables, two mediating variables and four dependent variables. The independent variables were organisational antecedent factors; top management support, rewards or reinforcement and organisational boundaries (Kuratko *et al.*, 2014:37). The mediating variables were entrepreneurial orientation and corporate entrepreneurship (De Jong, Parker, Wennekers & Wu, 2011:4). The dependent variables were success factors; finance, customer, internal business process and learning and growth (Kaplan, 2010:4; Singh & Arora, 2018:874). Additionally, the framework exposed that rewards or reinforcement and entrepreneurial orientation were partially related to the success of organisations.

After a detailed analysis using SEM, the proposed framework was renamed to Business Success Model (BSM). The BSM in Figure 2 below, suggests that a well-balanced combination of top management support, rewards or reinforcement and organisational boundaries can create entrepreneurial orientation which would, in turn, produce corporate entrepreneurship. Corporate entrepreneurship supported by entrepreneurial orientation and rewards or reinforcement can be responsible for producing the success of organisations. Furthermore, rewards or reinforcement and entrepreneurial orientation can produce organisational success.

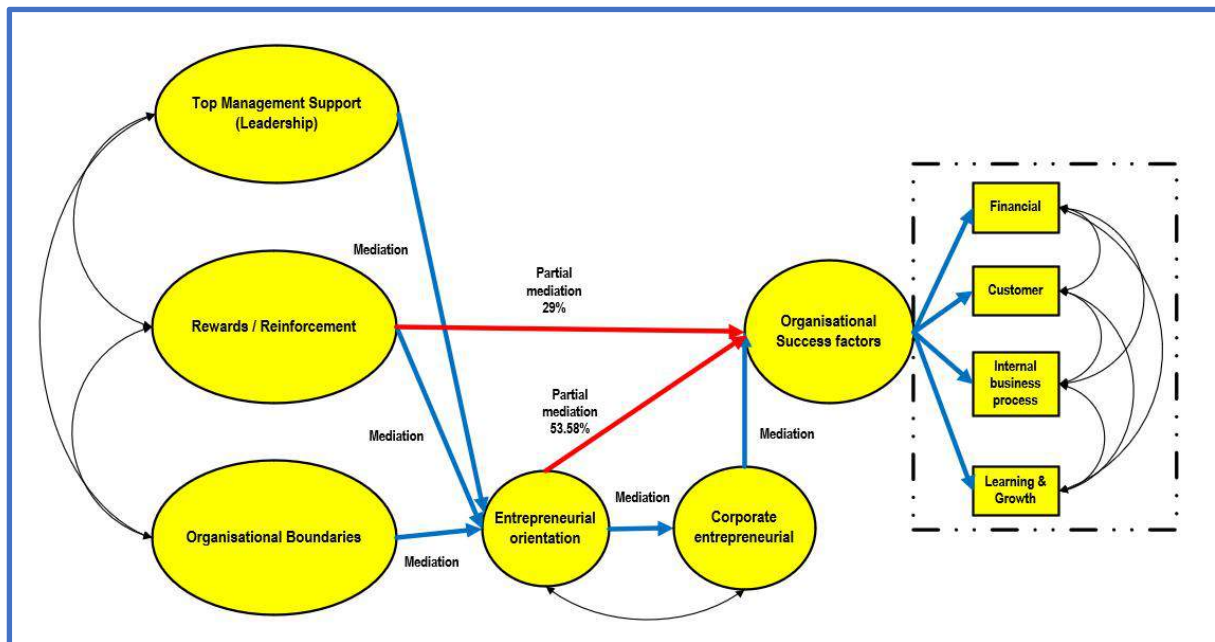

Figure 2: Business Success Model

8. Recommendations And Managerial Implications

The study identifies the key variables required by a business to create organisational success. Top management support, reward or reinforcement and organisational boundaries were identified as key to organisational success. Business leaders are recommended to create a conducive environment to enhance organisational success. Top management is recommended to develop business visions, missions, and strategies to provide direction to employees and provide channels to employees for ideas and suggestions. This can enable top management to tap into the collective expertise and creativity of the entire organisation. Furthermore, top management should reduce red tape in decision-making processes through unbundling layers that slow communication.

Reward or reinforcement stood out to be a key factor for success. Directly by itself, it can impact success. Organisations are recommended to develop reward systems that are clear and fair to

employees. Additionally, reward systems should be linked to projects or innovations, and successful projects should be rewarded fairly.

Organisations should ensure smooth and transparent communication between departments, introduce flexible standard operating procedures, clearly specify employees' job descriptions, and expose employees to internal and external factors that affect the organisation.

Organisations should ensure that employees have complete autonomy in their jobs, promote innovation and continuous improvement, provide room for failure to encourage risk-taking, and promote forward thinking that introduces new business models and strategic renewal. They should use the results to challenge competitors through domain redefinition and organisational rejuvenation.

It is also recommended that market share, budgets and financial targets are tracked annually and comparisons between years are conducted. Customers are habitually surveyed, the voice of the customers is acted upon swiftly, and product quality and customer promised times are met to satisfy and retain customers.

Standard operating procedures should be designed flexibly and always aligned with customers' needs and wants. Internal processes that encourage smooth communication between departments and customer relations employees should also be promoted.

Introduce internal satisfaction surveys for employees. Identify skilled and experienced employees and appoint them to become mentors for junior staff, introduce succession plans and ensure that all employees are trained.

9. Limitation of Study

The investigation identified a few constraints that could be utilised as the initial step for future research on corporate entrepreneurship. The spread of research locations resulted in budget and time constraints. Non-speaking English countries such as Angola, Mozambique and the Democratic Republic of Congo were excluded from the study. The study viewed countries going through varying political, economic, technological, and social challenges without considering these differences. Furthermore, cultural factors were not considered in the measurement instrument.

10. Further Research Suggestions

The study proposed a new framework that evaluated the relationship between corporate entrepreneurship and organisational success. The framework must be rigorously validated through future research to prove its model fitness.

The study conducted was a cross-sectional study. A longitudinal study with an extended geographical demarcation is suggested to further fine-tune the proposed framework to further strengthen the proposed framework.

Sub-Saharan Africa is the untapped region for corporate entrepreneurship studies. The recommendation is that more resources be channelled towards the region to increase the number of research projects to further improve knowledge of corporate entrepreneurship in the region.

Keywords

Keywords: Talent management, Sustainability, Small and medium enterprises (SMEs)

Abstract

Purpose: This paper explores the integration of talent management for sustainability, in small-medium enterprises.

Design/methodology/approach –Using a constructivist perspective, 10 SMEs were studied from South Africa, by interviewing the owners. It is imperative to interpret the above practices from the practitioners' viewpoint, hence qualitative research was deemed relevant for this study. Data was transcribed, coded and thematic analysis carried out.

Findings – The findings show a substantial impact of all the components of talent management (attracting, selecting, developing, and retaining talents) for sustainability. The talent management practice improves SMEs' sustainability in their business.

Practical implications –Talent management should be integrated into SMEs for sustainability.

1. Introduction

Given how challenging the global economic environment is, companies must be strategic and pragmatic in order to remain competitive (Savanevicien & Vilciauskait 2017:245). They achieve this in part by making the most of their highly skilled people resources on a global scale (Carbery, 2015). Regardless of local economic and labor market circumstances, there has been a resurgence of interest in this topic worldwide. Businesses of all sizes now value the value of good personnel management. Many businesses believe that talent management is essential for gaining a competitive advantage in today's climate of hyper-change in small and medium enterprises. The framework for this study is to identify the integration of talent management practices such as attracting talent, developing talent, motivating talent, retaining talent, and system integrating talent practices. In the modern-day, the small-medium enterprise has played a dynamic role in economic turnaround such as the primary source of employment and poverty reduction both in unindustrialised countries and industrialised countries (Abugre, & Anlesinya, 2019:438).

Naidoo, (2021:75) emphasizes that nearly 40% of the population is unemployed. Therefore, the need for SMEs is significant in addressing the unemployment challenges that bring about poverty and inequality. For sustainable wealth creation, it is important to recognise talent management practice that retains the best individuals for the job (Štrukelj, Nikolić, Zlatanović & Sternad, 2020:499). The problem of high unemployment may be reduced if one considers the enormous contribution played by SMEs toward employment creation. The operation of small businesses in South Africa has been evaluated to be 5.6 million, creating 11.6 million overall employment openings (Ramukumba,

³ E-mail address: sdhliwayo@uj.ac.za

⁴ E-mail address: akinlakindeji@gmail.com

2014:23). This implies that a total of six million jobs have been created not taking into account the small business owners themselves (Mira, Choong & Thim, 2019:778).

Talent management is defined as a company's dedication to attracting, employing, retaining, and cultivating the most qualified and extraordinary people available in the labour market. It's a business strategy that firms believe will help them retain their finest and brightest employees. In a competitive market, the stated business strategy, like employee involvement or employee appreciation, will ensure the attraction of top talent. Talent management is a business strategy that aligns the workforce with the organisation's goals and values. It includes aligning the right person with the proper role and tools (Anlesinya, Dartey-Baah, & Amponsah-Tawiah, 2019:150).

Talent management is a management strategy that organisations install to retain their top employees and training/developing them to meet the changing dynamics of the organisation is a much more significant concern (Beaumont, Farnale, & Hartel, 2016:500). However, the sustainability of talent management helps businesses to achieve their desired outcomes. Talent management helps to develop employees' skills according to the company's needs. For an effective talent management process, the following components are crucial which will help in accomplishing corporate goals and values which include attracting, selecting, developing, and retaining talents. Talent management for sustainability helps in assessing an organization's capability to maintain its goals (McDonnell, Collings, Mellahi & Schuler, 2017: 87). Individual competencies that will help the firm deliver strategy are created and maintained through talent management.

The contribution of this study to the context of SMEs, talent management is viewed as a concept suited for all employees but focuses mostly on people with high potential and in pivotal roles in order to attract talents, grow their optimal capabilities, and retain them. The research also contributes to small business leaders/owners' ability to improve the ability to develop effective talent management strategies,

2 Problem Investigated

In South Africa, SMEs have numerous problems in developing and maintaining a solid talent pipeline, many of which result in failure. Businesses must not only adapt to changing demographics and labor choices, but also establish new competencies and reinvigorate their organizations, all while investing in new technology, globalizing operations, and competing against new competitors. To be successful globally, SMEs operating in several markets must do more to attract, select, develop, and retain the finest workers. Many studies and investigations were carried out with possible solutions to improving SMEs (Lopes, 2016:210; Tafti, Tafti, Mahmoudsalehi, Mahmoudsalehi, Amiri, & Amiri, 2017:18). Furthermore, talent management practices stand as a possible solution for SMEs' sustainability. The study at hand, therefore, aims to explore the possible ways through which to integrate and apply talent management practices to address the challenges facing SMEs in South Africa. A new framework for talent management has to begin with clear objectives. One of the objectives is integrating talent management practices for the sustainability of SMEs and secondly the skills and competencies SMEs need in order to be sustainable and lastly, ways of retaining the right talent in SMEs.

3 Research Aims

To explore integrating talent management practices into SMEs to enhance their sustainability

4 Research Questions

- The primary research question is
How can SMEs achieve sustainability through integrative talent management practices?

The secondary research questions are as follows:

- How do SME owners/leaders interpret talent management practices for sustainability?

- How best can SME's attract, develop, and retain talent for increased sustainability of their businesses?

5 Literature Review

This section offers a review of the talent management framework. The review addresses the school of thought within the human resources function. Ozuem, Lancaster, and Sharma (2016:50) highlighted that a lack of critical talent existed in the workplace and therefore emphasized that organisations must use effective talent management practices if they wanted to be successful. Such recommendations led to the emergence and development of numerous talent management strategies to win the 'talent practice'. Mohammed, Baig, and Gururajan (2018:16), state four important areas of talent management practice such as winning value proposition, talent mindset, robust resource strategy, and tactics to build the pool of talent. This helps in building and developing practice for effective talent practice. In the 2000s, some authors (Cui, Khan, & Tarba, 2017:10; Khilji, Tarique, & Schuler, 2015:240; Sparrow & Makram, 2015:260) agreed on the uncertainties of change in SMEs that will integrate talent management practices. Gallardo-Gallardo and Thunnissen (2016:35) listed technological changes, economic challenges, and political instabilities as key influencing business operations. A number of organisations promote talent management. Urbancová and Vnoučková (2015:120) argued that the identification and management of talent should be a critical agenda for co-operating organisations. Thus, many organisations struggle to align their talent management under one consistent strategy. It may be a considerable challenge to make this happen. Sustainability plays a role in SMEs to have a good package and to succeed in their businesses, which is not only for the short-term economy but for long-term and financial value (Rudhumbu & Maphosa (2015:27). However, the only way to connect to sustainability in SMEs is through genuine outcomes, but in larger companies, the implementation of the sustainability report is well supported and developed (Dartey-Baah, & Amponsah-Tawiah, 2019:149). In fact, only a few SMEs accept the talent management practice for sustainability in SMEs.

5.1 A framework for Talent Management

Talent management is defined as the methodically organised, strategic process of getting the right talent onboard and helping them grow to their optimal capabilities while keeping organisational objectives in mind (Waters-Sobkowiak, Kowalski & Smits, 2018:12). The process thus involves identifying talent gaps and vacant positions, sourcing for and onboarding the suitable candidates, growing them within the system and developing needed skills, training for expertise with a future focus, and effectively engaging, retaining, and motivating them to achieve long-term business goals. The definition brings to light the overarching nature of talent management. However, it permeates all aspects pertaining to human resources at work while ensuring that the organization attains its objectives. Thus, the process of getting the right people on board and enabling them to enable the business at large.

Thorough integration of talent management with other business processes necessitates combining business strategy, human resource strategy, and organisational culture, as well as delivering significant results (Meyers, 2016:12). The integration's outcomes can help in resolving short-term talent concerns, providing platforms for delivering talent management processes, and aligning talent management programs with talent goals. The alignment approach featured business and talent strategies for successfully aligning core business practice, strategic deliverables and competencies, and a talent mindset. The performance of talent management may be judged when it is aligned with other procedures in the company strategy. Talent management is the implementation of a set of integrated systems designed to improve labor force efficiency by evolving the processes of attracting, developing, and retaining talented individuals in order to ensure that their essential aptitudes and skills are used to meet the company's current and future needs (Gateau, & Simon, 2016:23). To improve performance effectiveness, (Meyers & van Woerkom, 2017:670) the talent management approach integrates four key success elements. The recruitment and selection of talent to the business, as well as the assessment of competencies and abilities in talent evaluation, are all success aspects that combine with human resource programs, systems, and procedures. Mory, Wirtz, and Göttel (2016:182) revealed that employee motivation and loyalty are important factors in achieving a long-term

competitive advantage within an organisation and that they may help a company achieve its goals. O'Connor and Crowley-Henry (2019:910), state that motivation and engagement are frequently given as a strategy to improve individual performance. In addition, McDonnell, Collings, Mellahi, and Schuler (2017:87), indicate that the majority of the evaluated talent management methods and activities are commonly applied to the concept of talent management. Employee retention, training and development, performance management, remuneration, and senior management participation (Leonard, 2010). In order to effectively lead the firm forward into the new normal, HR professionals must attempt to improve their business knowledge. All HR activities targeted at attracting, developing, motivating, and retaining high-performing individuals are included because talent management is centered on people, it assists the organizations in maximizing their value as an HR tool, which involves many stages.

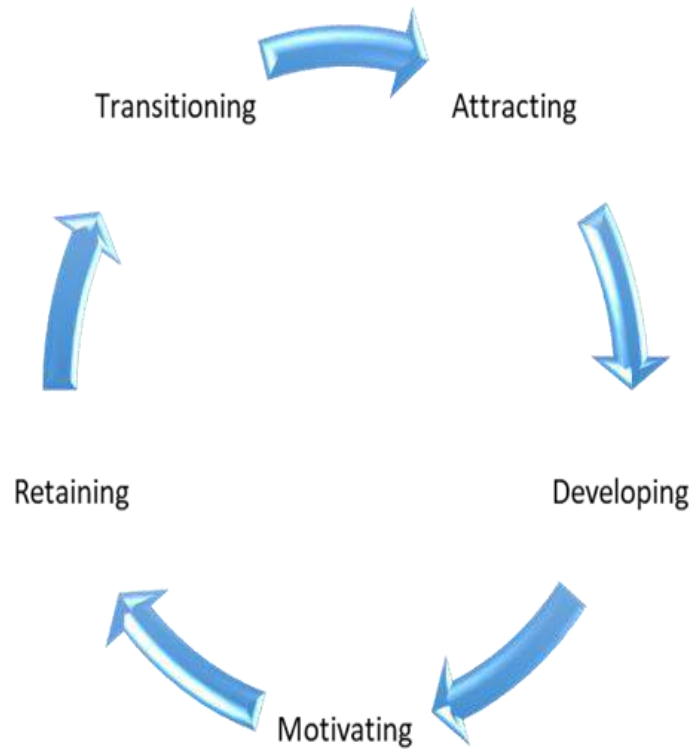

Figure 1: Talent Management Framework

An integrated talent management approach can assist leaders to identify the types of talent available in a global organization, connecting all practices talent to the central strategy, and understanding the types of investments made/can be made to fulfil current and future business objectives.

5.1.1 Attracting Talent

Talent management provides a clear picture for SMEs to approach staff development and management planning. Therefore, businesses are not deliberate in this area; they will fail to develop employee loyalty, which will have a negative impact on the business in the future. It has been suggested that corporations hire based on individual attributes and characteristics that are difficult to teach because specific tasks are more accessible and less expensive to coach when an individual has the necessary talents (Neri & Wilkins, 2019:54).

5.1.2 Developing Talent

The importance of training and development in the implementation of a successful sustainability program cannot be overstated (Tajuddin, Ali, & Kamaruddin, 2015:80). Human resource managers can have an immediate impact on any planned changes in an organization through training initiatives

(D'Annunzio-Green & Teare, 2018:125). Allowing employees to obtain practical experience in adopting new job processes is also crucial in order for them to gain expertise and dedication to long-term efforts (Tajuddin, Ali, & Kamaruddin, 2015:80). Training and development must continue to focus on specific job requirements as well as the development of interpersonal skills in order to be effective (Anlesinya, Dartey-Baah, & Amponsah-Tawiah, 2019:152). Ford (2017:46) agreed that training and development programs should support information directly relevant to an employee's work activity to fill in the gaps in the job description and demonstrate to executives the training programs' return on investment. Furthermore, for an organization to survive and thrive, the primary focus should be on how a brilliant individual may grow to provide long-term value in learning programs that are aligned with company strategy. Job rotation, performance feedback, job expansion, job enrichment, job shadowing, and promotion from within are sustainable development practices. Involve team members in all elements of the personnel selection, training, and development process (Gallardo-Gallardo, Moliner, & Gallo, 2017:335).

5.1.3 Motivating Talent

Makram, Sparrow, and Greasley (2017:260), motivation is a combination of three fundamental factors that make up an individual's stimulus profile: a want to maintain cordial relationships with others, a desire to achieve, and a desire for power. Reward systems encompass more than just monetary rewards. Reward options include schedule flexibility (Jooss, Burbach, & Ruël, 2019:24), profit sharing, benefits and incentives (Cardenas-Navia, & Fitzgerald, 2019:214), and recognition (King, 2016:95), paid time off and vacations, premium parking, and gift cards. Motivational programs require a lot of attention. If performance goals are set excessively high, employees may believe they are impossible to accomplish and will not try to meet them (Hsieh, Chen, & Liu, 2019:113). On the other hand, employees may not take the procedure seriously if the criteria for awarding bonuses are too low (Jooss, Burbach, & Ruël, 2019:25). Incentives and prizes are commonly thought to be the most powerful motivators for aligning organizational goals with employee goals (King, 2017:299).

5.1.4 Retaining Talent

Employees from younger generations are more likely to have a learning goal orientation and are less likely to have a solid connection to their company. Organizational commitment has substantial impact retaining on talent as a mediator between learning orientations and intent to stay. Creating distinctive growth chances for managerial workers is likely to promote organizational engagement, especially among younger generations (McCracken, Currie & Harrison, 2016). "To attract and retain talent in organizations simply is to give leadership development and nurture both learning goal orientation and organizational commitment" (King, 2015:279).

5.1.5 Transitioning Talent

Effective talent management focuses on the organization's collective transformation and progresses through individual personnel development (Chung & D'Annunzio-Green, 2018). This entails making each employee feel like they're a part of something bigger. Retirement benefits, exit interviews, and efficient succession planning may appear unrelated career stages, yet they are all transition instruments that allow the shared journey to occur (Hsieh, Chen, & Liu, 2019:108).

5.2 Talent management and SME sustainability

Concerning the enhancement of performance as a result of talent management activities, it is also believed that businesses that fail to recruit, retain, and use competent, talented, and high performers are more likely to employ relatively unskilled employees. Such staffing levels are likely to negatively influence on an organization's survival, growth, development, and competitiveness (Ali, Egbetokun & Memon, 2018:2). Similarly, Ali et al., (2018:2) argued that poor strategic hiring has a high risk of setting the company back years in competitive advantage. It is easy to conclude that talent management is critical for an organization's survival, growth, and competitiveness based on this concept. This argument supports the notion that human capital is the bedrock of corporate success (Philips, 2014:18). Talent management places great importance on employee performance, which defines their organisational classification. According to the talent management agenda, when people in leadership or management roles perform poorly, the enterprise's overall productivity suffers.

Church, Rotolo, Ginther, and Levine, (2015: 17) also discovered that below-average performers aim low, lowering everyone's performance scale in the organization. Furthermore, below-average performers are more inclined to enlist the help of their underperforming coworkers. Talent management strategies were devised and strategically applied to solve performance difficulties. Furthermore, businesses are more likely to achieve top performance levels when they make an effort to recognize, develop, and utilize the unique abilities of their employees to attain corporate goals (Bratton, 2018). In essence, businesses invest in talent management to increase efficiency, be more inventive, and, in the end, improve customer happiness, all of which contribute to the company's survival, growth, and competitiveness. Given the importance of talent management to the study and the fact that businesses use it for various reasons, the values of talent management as outlined by management scholars were used in the research. This was done to include SMEs in the study based on the importance of talent management.

6 Research Methodology

6.1 Research Design

Qualitative research is used when a researcher has little knowledge of a topic or phenomenon and wants to learn more about it (Cridland, Phillipson, Brennan-Horley & Swaffer, 2016:7). Qualitative research will be acceptable for the research to be undertaken because the researchers have minimal information about the occurrence, the study was done within Interpretivism. The researchers' goals are to use socially constructed meanings to analyze and make sense of talent management for sustainability in small-medium enterprises (SMEs) in South Africa. Qualitative research was chosen as the best method for conducting this study. Qualitative research is a collection of interpretive techniques in which all practices are considered equal, and no single approach is chosen over another (Mayer, 2015:56). "Qualitative research is used to investigate an event in the context of the environment in which it naturally occurs, and it is supported by social meaning from the individuals who were exposed to the occurrence" (Ngulube, 2015:135).

6.2 Sampling, Data collection, and Data analysis methods

6.2.1 Sampling

Purposive sampling techniques were used to select the participants (Creswell & Plano Clark, 2007). In qualitative research, samples are frequently chosen rather than drawn at random. To find participants who wished to and could engage in the current study, a purposive sample was used.

6.2.2 Population

The population for this study was small-medium firms in Johannesburg, South Africa. Small business owners from different parts of Johannesburg were chosen to add to the data's richness.

6.2.3 Sampling Method

Cluster probability sampling was used by the researcher to identify the sampled businesses. This strategy worked well since it enabled us to geographically cover the entire country and perform in-person interviews with the sample. Only participants who are conveniently accessible or available at any given time are chosen for the sample using convenience sampling (Latham, 2008).

6.3.4 Sample Size Determination

The sample size for a phenomenology study might range from 5 to 20 people (Sigvaldadóttir & Taylor, 2016). When selecting the sample size for the study, researchers used the data saturation technique. When the collected data does not lead to new information but rather a replication of what has been gained earlier, the researcher will know they have collected enough data (Sigvaldadóttir & Taylor, 2016). SME owners who own businesses that have been in operation for at least five years and are based in Johannesburg, South Africa, and to be staffed by between 0-50 employees, and must implement talent management policies with their businesses, all these requirements must be in order to be selected for participation in the study. After interviewing ten SME owners, the study was deemed complete, due to data saturation.

6.2.5 Data Collection

The data were gathered using semi-structured face-to-face interviews. Each participant received and signed an informed consent form prior to participating in the interviews. The meetings took place at a mutually agreeable time, date, and venue. The interviews were all held in public venues that were convenient for the participants. The interview settings supported participants' confidentiality and safety. In qualitative research, Van den Broek, Boselie, and Paauwe, (2018:140) defines interviewing as a data-gathering approach for obtaining in-depth thoughts and first-hand information from respondents' viewpoints.

6.2.6 Dimensions of trustworthiness

It is critical to look at how qualitative researchers decide whether the research study's conclusions are credible, transferable, confirmable, and trustworthy because they do not employ methods with set standards for validity and reliability. Being reliable is essential to implementing these four principles. How confident a qualitative researcher is in the study's findings is measured by their credibility (Korstjens & Moser, 2018). This demonstrates how reliable and accurate the study's findings are. To ensure the validity of the research findings, the researcher employed triangulation.

The key to transferability is how a qualitative researcher shows how the study's results can be applied to different contexts (Noble & Smith, 2015). The researcher gave a thorough explanation in order to guarantee transferability. The study report should contain a substantial summary because it is comprehensive and provides a wealth of background and methodology information. The researcher outlined every stage of the research procedure in the report, from data collection to interpretation and conclusion.

Conformability is the extent to which the results of an investigation can be checked or supported by other researchers (Baxter & Eyles, 1997). To validate the data and account for all the research decisions and actions, including how the data was acquired, documented, and evaluated, the researcher carefully assessed the inquiry techniques and findings. To assure confirmability, this was done. The researcher was aware of his background and constantly considered it in order to minimize bias while collecting data. The continuity of outcomes through time is referred to as dependability. Participants in the study were SME owners/founders. To ensure that SMEs have valid data that could be collected, resulting in results that could be believed, the same interview procedure was used throughout the whole study.

6.2.6. Data Analysis Techniques

The data analysis techniques employed in this study include explorative analysis. The study used explorative analysis to summarise all the responses from the participants using manual coding.

6.3 Coding

The data was transcribed and read after the interview to extract the participants' expressions, feelings, and opinions in form of inductive coding. This is a beginning point for demonstrating the format of an interview. Upon establishing the outline, the comparisons are grouped into reactions, such as grouping into different categories of personality traits to establish the subject of individual elements that produce the individual or organizational talent management approach. This sort of code, known as open coding, is suited for this type of circumstance. Themes, coding, and classification. This technique concludes as follows:

Table 1: SME owner sustainable talent management practices

Engaging talent management for sustainability in SMEs (Individual)		
Individual Factors	Needs of Sustainability in SMEs	Factors related to the nature of sustainable talent management
1. Experience 2. Personal commitment	1. Relationship with employees 2. Sustainable growth 3. Sustainable development	1. Sustainable Talent\ 2. Attract, develop, retain and motivate talent 3. Role of talent management

7 Result findings

7.1 Individual Factors

Individual factors disclose the genuine essence of the individual during the interview process, defining their conduct. This illustrates that each participant may decide on talent management methods for their businesses based on their views and feelings. Below are the two most critical keys.

Table 2: Individual factors

First Themes Category	Individual Factors
Talent Management practice related to SMEs in South Africa	1. Experience in talent management 2. Personal commitment

7.2 Experience in Talent Management

The majority of the participants have similar perspectives on in-depth knowledge and expertise with talent management, and their responses to the research questions were "are you familiar with the term Talent management?" And could you give me a brief description of it in your own words?" The first respondent said the following:

Participant 1 comment "I am well aware with that term Talent management," "Yes"

Participant 1 comment about talent management;

"Talent management is to guarantee that organizations have the amount and quality of people in place to achieve their present and future business needs,".

Talent management is a generic perspective on talent that focuses on either high-performing and high-potential people or talent in general, and it can also be a talent pool or flows of employees into a role in an organization."

Participant 2 comments about management: "uhmmmm, a bit. Yeah I am familiar with it".

"In my own words? It's the way I help people out of my business. Ya that's how I can say, how I can define it." "Yes. Oh, ok, talent management facilitates the development and career progression of highly talented and skilled individuals."

Participant 4: "uhhh, Talent management can be it is basically a set of combined activities such as attracting, developing, motivating, engaging and keeping talented or highly competent employees."

Participant 5: "Talent management it ensures organizations to have the quantity and quality of people in place to meet their current and future business priorities".

The finding of this study showed that experience plays a vital role in SME owners because the researcher found that business managers had few experiences before starting their businesses. The response concurs with literature review, business managers need to have experience of running the business.

7.3 Personal Commitment

Personal commitment refers to the participant's thoughts that develop because of being obligated due to their personal beliefs and ways of thinking. In the statement below, participant number one illustrates this.

“.....SMEs can achieve their sustainability through talent management practices, this is one of the best ways is to incorporate talent management to the company mission and vision.” This shows that the participant felt that the only way to have sustainable talent management in their organization is by incorporating talent management into the company mission statement. Participant 3 also shows signs of their personal commitment and beliefs in the statement below when asked if they felt other companies should engage in sustainable talent management.

“Yes. Talent management is said to be the integration of different skills or activities and moreover to me is called is an in-born talent.”

The report for this study states that educational credentials and also to incorporate talent management are required to successfully compete in the organization. Moreover, he pointed out that only one talent management practices are sustainable in the organization by incorporate talent management into the mission statement of the company.

7.4 Factors related to Sustainability in SMEs

The practice of being involved in talent management, which has been identified as a vital aspect in SMEs' sustainability, has also been proven to have a major impact on decision-making. Relationships with employees, and long-term viability. This moniker gave the leadership, sustainable growth, and sustainable development. The following people's responses provide additional proof for these claims. The foundation of SMEs' sustainability factors are depicted in the table below.

Table 7.4: Factors related to the nature of sustainable talent management

Third Themes Category	Issues related to the nature of sustainable talent management
The factors that is related to the nature of sustainable talent management	<ol style="list-style-type: none"> 1. Sustainable talent management 2. Attract, develop, retain, and motive talent 3. The role of talent management practice

Participant 9 was the only participant that expressed his views, on how integrated talent management practice can be sustainable. The participant described the level of sustainable talent management as being another way businesses can bring their ideas and support, establishing and maintaining a comparative advantage talent management practices to be more sustainable. This is shown in the below statement

“Yea, therefore, by systematically managing the employees with their different competencies and integrating this with team dynamics, it is very possible to attain sustainability”. Other participants from 1, 2, 3, 4, 5, 6, 7, and 8 gave the same comment regarding what strategies can be associated more with competitive and sustainable talent management practices in SMEs; Attract, develop, retain, and motive talent.

These are some of their comments:

Participant 1: “hummmmm, the only way the business can move forward is by hiring and selecting skilled and talent candidates for the jobs, so that talent can be developed by offering workshops and seminar”.

Participant 2: “Obviously you see, any corporate business owner’s days is expected to implement talent management practices into their business to ensure that their company has a good brand image this will entice future employees to want to be associated with this company. So that the Company

can also ensure that they train employees so that they can gain new knowledge and advance in their career, and also make the work flexible to ensure creativity from the employee”.

Participant 3: “um, it all starts with hiring the right people or the right job. This is a human resource issue. Finding and selecting the best people who can not only perform but enrich the organization through managing the talent and development”.

Participant 4: “well, that is a right question you ask me, Laugh, the first and most important thing is to cater the generation of employees, that is the generation x and Y’s. They grew up with technology and as a result, the use of social media and other virtual platforms will help attract employees. As for development, it is important to have programs in place that help bridge the gap between the corporate world and university life. Effective retention again is dependent on the newer generation of employees in the talent pool, whose values are different from those of elder generations”.

Participant 6: “Obviously, not only does the program provide new job opportunities, but it also provides career connections offers a host of career development tools such as self-assessments, tools to develop resumes, and articles on various job seeking strategies within the organization. Skilled people will not remain in a job if they see no future in their position. To eliminate the feeling of being in a dead-end job, every position should have an individual development plan”.

Participant 7: “Obviously you see, any corporate business owners is expected to implement talent management practices into their business so that it can ensure their company to have a good brand image, by so during enticing future employees will want to be associated with this company”.

Participant 8: “Yes, organizations will improve by developing the ability of all the employees by attracting, developing, motivating, and retaining talent. By so doing there will be an increase in productivity and creating a positive work environment to be recognized, by rewarding the right behavior candidate for the job”.

Participant 9: “um, it all starts with hiring the right people or the right job. This is a human resource issue. Finding and selecting the best people who can not only perform but enrich the organization through managing the talent and development.”

The outcomes demonstrated that effective leadership was essential to the survival of their businesses. However, executives and owners must balance internal dynamics and link human resources to their plans in order to improve organizational performance. It's crucial to implement the desired leadership style such as participative and transformational approaches, but owners and executives believed that to achieve desired results, like inspiring, empowering, and motivating employees; transforming the workplace encourages pleasant interactions between employees and clients for the success of the company.

7.5 The Role of Talent Management Practice

All participants believed that the role of talent management practice in SMEs can be so important in exploring in today’s business environment. Moreover, in developing into the businesses for tomorrow, business owners should develop the HR capability and use the technical know-how of management skills which is more required. So, large organizations have the mindset of having talent at the top of their agenda to achieve their goal. More likely to have higher productivity, and profitability and increase their market value. Here are the comment from each participant.

Participant 1: “ agreed that the role of talent management practice in SMEs is essential for the success of small business firms, by so doing it will create more value to the business and as well as to the employees”.

Participant 2: “stated Yes, the only way that talent management can be of help in the small business in South Africa is by initiatives and cultivate the strategies where more roles are based on the organizational goal,”

Participant 3: “ addressed that um, talent management practice can contribute in the areas of sales skills, marketing, time management, and basic business skills pays a high return, by responding to skills shortages with short-term fixes which is not sufficient, but instead should be addressed in ways that support strategic plans of the business and contribute to long-term business success”.

Participant 4: “Leadership succession planning in talent management will also be a help to the role of talent management as to the businesses to diversify talent by investing early on the high potential talent employees. Mentoring is also an important best practice because it provides the mentor for the opportunity to look at professional growth and development”.

Participant 5: “Yes, evolving talent management offerings, clearly defining career paths, integrating talent management programs across the organization and measuring talent-related outcome”.

Participant 6: “Yes, the role of talent management it can contribute to the SMEs in South Africa by hiring the skilled talent individual, development and motivating them to the standard of achieving the purpose the goal of the company”.

The study finds that in order to ensure the survival of their companies, business owners place a high value on organizational culture and the characteristics of a learning organization. The roles significantly impacted their firms' plans for sustainable personnel management and competitive advantage. These SMEs' owners have developed cultural values that should help them better adapt their strategies for serving new clients, give them the ability to seize and create new opportunities, improve employee skills, value knowledge and its sources, and foster an environment that is innovative and empowering.

8. Discussion of the Study

The findings demonstrated that small business owners and leaders viewed the phenomenon as a real-world challenge that required them to be committed, driven, creative, and decisive in addition to having a clear understanding of the company's objectives. The owners and executives thought talent management, sustainability leadership, and organizational effectiveness culture/structure, other influences, and the notion of a learning organization all had a significant impact on the viability of their companies in South Africa. The main problems are the absence of talented and experienced workers in a company, the difficult working conditions, the underappreciation of management performance, and the dearth of qualified individuals, which severely limits the ability to provide services.

Despite the fact that many business owners always struggle with talent management, doing so is essential to helping them achieve their objectives. As small business executives and owners searched for and seized business opportunities and contributed to the industry's problem-solving, they fostered an environment that will foster their expansion. How do SMEs owners and leaders interpret talent management techniques for sustainability in South Africa? Was the overarching research question created to direct the current study. How do SMEs owners and leaders interpret talent management techniques for sustainability in South Africa? was the overarching research question created to direct the current study. The results showed that small business owners and leaders saw the phenomena as a practical and demanding experience in which they had to be devoted, motivated, inventive, and resolute as well as having a clear understanding of the business's goals.

9. Recommendations

In view of the findings, the following recommendations are made to improve the sustainability of SMEs in South Africa:

- SMEs founders or owners should put in place and implement mentoring programs, and strategize ways to identify, coach, and prepare potential individuals for the futuristic sustainability of SMEs. SMEs founders must keep an open channel of communication, eliminate the barriers to communication and create efficient, participative, and transparent communication with their employees on futuristic continuity plans.
- SMEs founders should establish training programs by establishing program goals, choosing the right training software, and creating useful, personalized, and engaging past founders learning experiences, and seminars, in order to develop the technical, managerial skills, and competency of the employees to prepare him for future succession.
- SMEs in South Africa must embrace the concept of talent management on a regular basis by revisiting their talent identification processes, talent development initiatives, talent retention programs, talent utilization, and reward management systems.

10. Managerial Implications

The managerial implication of the study, failing to comprehend the identified talent management themes and pillars, can hinder successful implementation. Because talent management is not simply an HR necessity but also a business requirement, senior managers must actively participate in the talent management process by making recruitment, succession planning, leadership development, and key employee retention targets. Managers must also be willing to dedicate significant time to these duties, such as participating in departmental recruitment interviews and assisting other talent management stakeholders.

Many authors asserted that the development of talent management strategies for sustainability is influenced by shareholder pressure, which compels businesses to reform. In reality, however, many managers are not aware of the tactics and procedures that could promote sustainability. To successfully implement sustainability, HR professionals must gain a better understanding of environmental concerns and how they relate to talent management practices in an organization. Employees must learn to change their actions and attitudes through emotional appeals to their ideas, desires, and identities. A number of theories and concepts are connected to the framework of talent management strategies for sustainability in SMEs including hiring, employee engagement, training, development, reward system, and communication

11. Suggestions for Further Studies

This study defined talent management as attracting, developing, selecting, retaining, motivating, and transiting talent, hard-to-fill positions talent development, higher position talent development, talent use, and reward management. As a result of this multi-item talent management composition, it is reasonable to assume that other dimensions and related attributes critical to the talent management agenda in businesses were not determined or incorporated in this people management study. The researchers also believe that additional research is needed to evaluate human resource management systems in SMEs concerning talent management initiatives and practices.

12. Conclusion

Implementing an effective talent management strategy may help ensure that the right people are in the right place at the right time and that the company is prepared for the future. Businesses that employ talent management as a robust approach for long-term growth can look forward to a bright future. Talent management is very critical in the sustainability of SMEs. Furthermore, the study assumes a result without talent SMEs will fail. SMEs founders should be at the forefront in providing the necessary support and stimulus for talent management. They should engage their organization and employees in open discussions about talent management and provide training programs to ensure that their potential employees are equipped with the necessary skills, competencies, and knowledge.

Examining the Influence of Dynamic Capabilities and Personal Entrepreneurial Competencies on Small and Medium Enterprises Cost Efficiency

Prof David Pooe¹, Dr Alfred Masakale², Dr Watson Munyanyi^{3,*}

¹⁻³ Department of Business Management, University of Johannesburg, Johannesburg, South Africa

Keywords

Strategy; decision making; cost efficiency; managerial competencies; small and medium enterprises.

Abstract

Purpose: There is a growing concern regarding the capacity of small and medium enterprises to remain competitive, owing to the inability to manage the cost side. As such, cost efficiency has become a central strategic factor for small and medium enterprises success. The present study aims to provide small and medium-sized enterprises with a guide on using dynamic capabilities to attain operational efficiency.

Design/methodology/approach: This study used Structural Equation Modelling conducted with the use of AMOS 26.0 to establish the direction and strength of the relationship between variables. This technique is a multivariate statistical analysis that integrates two statistical methods: factor analysis and path analysis. Data was collected using a five-point Likert scale questionnaire targeting small and medium enterprises; 254 were self-administered.

Findings: These results imply that South African SMEs must assess their competencies and dynamic capabilities to maximize cost efficiency. The results support other empirical studies, such as the one conducted in which capabilities and competencies differ from the organisations' performance.

Research limitations/implications: Notwithstanding the academic and practical contributions, the study has limitations. The current research was carried out with geographical and sector limitations. As such, there may be a limitation in the generalisability of the results obtained in this study. In addition, the methodology applied in the current study has its limitations. Other methodologies that can be applied are more robust in determining causality.

Practical implications: Generally, this study's findings offer managerial direction for determining superior cost efficiency. This study's conclusions are useful to managers considering cost efficiency as an engaging strategy. Small and medium firms must improve their sense of appreciation of dynamic capabilities, regardless of what resources they possess

Originality/value: The findings provide empirical support for the theory of entrepreneurship, which proposes that entrepreneurial competencies must be developed for SMEs to increase their chances of reaching the model's appropriation stage – entrepreneurial success. The finding also adds value to the SME operational performance literature related to operational strategy dimensions of product quality, operational flexibility, delivery time and cost-efficiency

1. Introduction

Most Sub-Saharan African countries are characterised by unrest, political instability, and deadly pandemics, mainly deterring potential foreign investors (Adenle, Manning & Azadi, 2017). South Africa, like other countries, has had a fair share of instabilities and uncertainties, which have affected the inflow of investors and slowed economic growth (Abdelbary & Benhin, 2019). As stated by Magubane (2002:95) “South Africa was dubbed among the "hottest" emerging markets, and attracted lots of foreign investors post the 1994 political change... [it] is losing its appeal as an attractive destination for FDI”. This has much economic responsibility in the hands of locally funded small and medium enterprises (SMEs). SMEs have been applauded for being a “manifestation of a people-driven economy” and for occupying a strategic position in driving national economies (Ismail, Meutia & Ummi, 2019). Besides playing a pivotal role in economic growth, employment creation, and contributing to the gross domestic product (GDP), SMEs now act as the cause of disruption in many sectors. In South Africa, SMEs have positively impacted citizens' socio-economic welfare, which has been widely covered in existing studies (Hamann et al., 2017; Smit & Watkins, 2012; Urban & Naidoo, 2012). Statistics show that SMEs have contributed seventy to eighty percent to the country’s employment output (Balogun, Nazeem & Agumba, 2016; Mathu & Tlale, 2017; Nieuwenhuizen, 2019). The South African government recognises small businesses' role in addressing this crisis, which is partly the reason for introducing programs such as the New Growth Path (NGP) to mitigate against entrepreneurial ecosystem challenges. However, there is a growing concern over the capacity of SMEs to remain competitive, owing to the inability to manage their costs. In line with the dictates of Porter (1983), for SMEs to attain competitive positions and survive in the current turbulent business environment, there is a need to improve on critical strategies such as cost reduction. As such, cost efficiency has become a central strategic factor for SMEs' success.

2. Problem Investigated

Globally, SMEs are confronted with a unique situation where transformation is unavoidable, even though it requires them to focus on cost efficiency to be more sustainable. This has called for a change in the operational strategies employed by these businesses as traditional ones continue to lose relevance (Msomi, Ngibe & Nyide, 2019). To effectively contribute to national development, SMEs need to survive and thrive in turbulent business environments (Edoun & Fotso, 2019). To effectively navigate these environments, SMEs will need to establish and grow their business capabilities in line with the demands of their sectors. Personal entrepreneurial competencies are at the centre of current research concerning their capacity to help firms attain competitive advantage (Nieuwenhuizen & Oosthuizen, 2017). In addition to entrepreneurial competencies, some studies have also investigated the role of business factors such as absorptive capacity (Escribano, Fosfuri & Tribó, 2009), and adaptive capacity (Nguyen et al., 2014) in enhancing SME performance. Literature suggests that some of the major causes of failure by organisations to attain greater levels of profitability include failure to manage organisational resources. Yet, hardly any empirical studies have investigated the relationship between personal entrepreneurial competencies, organisational dynamic capabilities and SME cost efficiency. Most studies aligned to the current study preferably used the RBV in place of the dynamic capabilities. The present study aims to provide small and medium-sized enterprises with a guide on using dynamic capabilities to attain operational efficiency.

3. Research Objectives

The following empirical objective guided the conduct of this research:

- 3.1. To examine the influence of personal entrepreneurial competencies on SMEs’ cost efficiency.
- 3.2. To assess the extent to which absorptive capacity influences cost efficiency among SMEs.
- 3.3. To evaluate the influence of adaptive capacity on SMEs' cost efficiency.

4. Hypotheses

The following hypotheses were formulated for the study:

- H₀: There is no relationship between personal entrepreneurial competencies and dynamic capabilities, and cost efficiency

- H₁: There is a positive and significant relationship between personal entrepreneurship competency and cost efficiency.
- H₂: There is a positive and significant relationship between absorptive capacity and cost efficiency.
- H₃: There is a positive and significant relationship between adaptive capacity and cost efficiency.

5. Literature Review

5.1. Theoretical Framework

The current study is grounded on the dynamic capabilities theory (DCT) of firm competitiveness, which follows the resource-based view (RBV). The RBV argues that “all assets, capabilities, organisational processes, firm attributes, information, knowledge, etc.” (Barney 1991) establish a firm’s competitive position. Modern-day business contexts call for extensive value creation through the calculated use of intangible resources than tangible ones (Russell, 2017). A dynamic capability relates to that organisational ability to efficiently and effectively exploit its resources and simultaneously explore opportunities, thus making it “ambidextrous” (Sollosy, 2013). As an extension, however, DCT believes that to navigate the changing business environment, a business needs to be able to rearrange its internal resources, strategic capabilities, and competencies, to sustain competitiveness (Teece et al., 1997). Teece et al. (1997: 516) define dynamic capabilities as “the firm’s ability to integrate, build and reconfigure internal and external competencies to address rapidly changing environments”. The focus on adjusting capabilities and competencies differentiates the DCT from RBV (Laaksonen, O., & Peltoniemi, M. (2018).). Central arguments around the DCT are that wealth creation by business enterprise firms operating in environments of rapid technological change rests on the distinctive processes shaped by how it manages its capabilities and competencies (Teece et al., 1997). In conducting its business, an enterprise will acquire knowledge that it has to manage and exploit for its competitive advantage. The current study is thus a stress test on the DCV of competitiveness by examining how strategic capabilities in managing resources will affect cost efficiency among manufacturing SMEs.

5.2. Conceptual Framework

The study's conceptual framework presented in Figure 1 consists of three predictor variables: absorptive capacity, adaptive capacity, and personal entrepreneurial competence, and one outcome variable, cost efficiency. This conceptual model also guided the development of the hypothesis pertinent to this study.

Figure 1: Conceptual Model

5.3. Small Business in the South African Context

In South Africa, the definition of a small business covers the full spectrum of business enterprises to the exclusion of large enterprises and corporations. Although there are several of defining an SME in South Africa, definitions are commonly guided by the number of employees and turnover bands. The National Small Business Act of 1996, as revised in 2003, defines a small business as “a separate distinct entity including cooperative enterprises and non-governmental organisations managed by one owner or more, including branches or subsidiaries if any is predominately carried out in any sector or subsector of the economy mentioned in the schedule of size standards” (National Small Business Act, 1996:2). Nieman and Nieuwenhuizen (2009) believe that small businesses are generally a separate and distinct business that are not of a holdings company and are usually owner-managed. According to the same Act, the quantitative definition states that a business can be classified as an SME based on

the total number of full-time paid employees, total annual turnover, and total gross asset value (excluding fixed assets). The Act further classifies small businesses along the industry sector and its subsectors; size of class such as small, medium, or micro; number of employees; annual turnover; and asset value. The current study focuses on small businesses, specifically those with an independent informal organizational structure.

5.4. Cost Efficiency

The business value propositions will not give a business a competitive edge if they are not done at reasonable costs. Lowering costs ensures that businesses add value and make a profit in the process. Businesses are in the practice of creating, improving, or making things to add value. Adding value is done via the transformation process and has to be done in the most cost-efficient way (Nieuwenhuizen, 2020). Cost efficiency is essential for businesses, as it costs money to deliver quality products or services, and a balance needs to be achieved (Ismail, Meutia & Umami, 2019). Low costs are also a concern for customers, and businesses need to develop their capability to offer services or manufacture products at a low price. Low costs mean that the product can, to some extent, close the gap between customer expectations and, simultaneously, allow a company to make a profit. Cost-effectiveness allows this to happen, as it optimises resources, focusing on lowering costs. An SME, as previously discussed, can adopt cost leadership as a strategy, in addition to the differentiation and focus strategies, to engage the market, as proposed by Tinitis and Fey (2022). Due to SMEs' challenges in the current hypercompetitive environment, companies experience increased demand to control production costs to achieve a competitive advantage (Dunford, Dunford, Barbu & Liu, 2016). Competitive advantage can be achieved by efficiently using resources, whether resource-based or intangible strategic capabilities. Grutter (2010) proposes that businesses focus on low prices as a value-driver strategy. Sarkar (2017) believes that efficiency can be divided into cost- and time-based efficiency. Cost-based efficiency is measured in terms of the costs relating to quality, production changes and manufacturing. In contrast, time-based efficiency relates to delivery speed, manufacturing lead time, and inventory turnover (Sarkar, 2017). The study's focus was on cost efficiency, the ability to produce products or services at the lowest price possible, and investigated how SMEs manage the cost of production, including overhead costs, unit costs, and costs compared to their

5.5. Dynamic Capabilities

As resources alone cannot give a business a competitive advantage, a dynamic approach is needed to be responsive to the challenges of the contemporary business environment. As provided for in the DCT, having a dynamic capability is the ability to build and protect one's competitive advantage in changing business environments (Krzakiewicz & Cyfert, 2017).

5.5.1. Absorptive Capacity

Absorptive capacity defines how organisations adapt to today's ever-changing environment and how they apply previously acquired knowledge to their advantage (Morabito, 2013). Zahra and George (2002:186) define absorptive capacity as a "set of organizational routines and processes" including acquisition (to identify and obtain external knowledge), assimilation (to interpret and understand the information obtained), transformation (to integrate and combine existent knowledge with the newly acquired), and exploitation (the application of new knowledge for commercial ends)". It is a concept closely related to knowledge management and also relates to the ability of a business to respond to the competitive environment, which is crucial for SMEs to perform well and gain a competitive advantage (Gebauer, Worch & Truffer, 2012; Teece, Pisano & Shuen, 1997). According to Teece et al. (1997:552), businesses must avoid the complacency trap and always be responsive and adaptive to the environment to remain competitive. To adapt, dynamic capabilities such as absorptive capacity aid SMEs in adaptation and responsiveness. The study adopted a measurement tool for absorptive capacity from Tavani, Sharifi and Ismail (2014).

5.5.2. Adaptive Capacity

Nowotarski and Paslawski (2015) posited that for an organisation to adapt, it needs to be flexible enough to respond to internal and external dynamic changes. The organisation's adaptive capacity

focuses on how the organisation understands its core competencies and how those directly affect its ability to respond to these challenges (Bateman and Snell, 2013:321). Birkinshaw and Gibson (2004) delineated adaptive capacity as a business's ability to respond to environmental changes and take advantage of the environment's opportunities. Wang and Ahmed (2007) stated that adaptive capacity aligns strategic resources to external challenges. Birkinshaw and Gibson (2004) proposed that adaptability should also be a priority before aligning to the environment for long-term organizational business success. Researchers such as Nguyen, Beeton and Halog (2014) have also reiterated a lack of empirical research on adaptability's role in SME performance, especially in developing countries such as South Africa. Thus, the present study will investigate how adaptive capacity, a dynamic capability, mediates the relationship between personal entrepreneurial competencies and SME operational performance.

5.6. Personal Entrepreneurial Competency

Entrepreneurial competencies differ between entrepreneurs and small business owners (Wagener et al., 2010). Krueger and Brazeal (1994) assert that an opportunity must present itself before there can be entrepreneurship, and the presence of someone with entrepreneurial competencies to take advantage of it is required. Recognising and taking advantage of a chance needs a good development of entrepreneurial competencies. An entrepreneur must be alert to opportunities, as well as resources available to "enable them to recognise gaps" and organise resources to take advantage of them (Zainol & Al Mamun, 2018:6). Several reasons exist that may influence the probability of SME success or failure, including the influence of personal entrepreneurial competencies. Other reasons could include business management-related factors such as environmental factors, cash flow management, and working capital, strategy and succession planning, and knowledge management (Edoun, Mbohwa & Bhila, 2019:2820; Egbu, Hari & Renukappa, 2005:258). These "business factors", namely, dynamic and strategic capabilities, also contribute to business success.

6. Research Methodology

6.1. Research Design

According to Sekaran and Bougie (2016), a research design is a blueprint for the assembly, measurement, and analysis of data based on the study's research question. The research design follows the researcher's formulating of the research question, framed after an extensive literature review. This study followed the quantitative approach using the cross-sectional survey method since it sought to investigate the relationships between different constructs by assessing targeted respondents' views (Creswell, 2013). Likewise, the survey method enables a faster and more convenient once-off collection of data, as well as adequate statistical-oriented analysis of gathered information. It also leads to a better generalization of results across larger scopes of studies (Nardi, 2015). In essence, the research design incorporates all the research elements clearly and straightforwardly. The study will adopt a hypothetico-deductive method as a research method to answer the research question. The hypothetico-deductive approach was developed from an epistemological paradigm. Sekaran and Bougie (2013) state that the hypothetico-deductive approach is a scientific, step-by-step, logical, and rigorous method available to a researcher when trying to find a solution to a problem. The hypothetico-deductive approach was developed from an epistemological paradigm. The epistemological approach of the research will be a deductive, positivist approach.

6.2. Research Sample

The study will focus on SMEs operating in South Africa, and the data will be collected from various available databases, including the Royal Bafokeng Nation Entrepreneurship Development Centre database, the UJ Centre for Entrepreneurship (UJCfE) databases, and the Gauteng Enterprise Propeller (GEP) database. The databases are regularly updated and have a multisector scope, covering retail, manufacturing, construction, tourism, agriculture, and transport. The Royal Bafokeng Nation Entrepreneurship Development Centre in the North West province has a database of 1,631 SMEs covering various businesses from different sectors. The University of Johannesburg's Centre for Entrepreneurship (UJCfE) has 399 SMEs from multiple industries in its database, including entrepreneurs in their programmes funded by the Raymond Ackerman Academy (RAA) and Small Business Enrichment Programme (SBEP). The GEP database has 4,968 SMEs, with 953 being

cooperatives. These databases are maintained by organisations that have an interest in the development of SMEs in South Africa. All the SMEs in the databases constitute a sampling frame, and they are active, can be traced, and the databases are kept current via regular updating. About 1250 indicated their willingness to participate in the study and were each allocated a number ranging from 1 to 1250. The numbers were written on separate pieces of paper in a box in sequential order from 1 to 1250. Afterward, the box was shuffled to ensure the impartiality and randomness of the selection process. Afterward, 700 papers were selected indiscriminately from the box representing the selected SMEs and supplier organizations considered in the study. Data was collected face to face slightly before the 2019 Covid-19 induced lockdowns and restrictions on movement. The returned, fully completed responses for the study came to 280; after data cleaning, the sample size was reduced to 254 participants.

7. Results and Findings

When data analysis was done, it intended to establish the demographic data relating to the research participants. The demographic data were primarily focused on the characteristics of the business entities under scrutiny, from which data relating to research constructs was collected. Information relating to such variables as the business sector, number of years running the currently active business, annual business turnover in sales, and the number of employees was collected and analysed. This information is critical, especially in the research context, as it verified that the intended target population was reached. The results are presented in **Table 1** below.

Table 1: Background and demographic information of sample (N = 254).

Items	Frequency	Percent
Manufacturing	51	20.1
Service	131	51.7
Wholesale/Retailer	25	9.8
Construction	29	11.4
Transport	12	4.7
Other	5	2
Less than 1 year	2	0.8
Between 1 and 2 years	84	33.1
Between 2 and 3 years	83	32.7
Between 4 and 5 years	27	10.7
More than 5 years	57	22.8
R100K–R200K	88	34.7
R201K–R500K	40	15.7
R501K–R999K	53	20.9
R1 million–R5 million	47	18.9
> R5 million	25	9.8

From the results presented in Table 1, it can be observed the majority of the SMEs that participated in the research were in the service sector (51.7%). This was followed by the manufacturing sector, constituting 20.1% of the total participants. Limited participants were obtained from other sectors (2%) and the transport sector, which had 4.7%. Regarding the number of years in business, most participating institutions were between 1 and 2 years of operation. This is in line with the scholarly view that most SMEs do not live beyond two years of operation. The least number of respondents was obtained in the category of less than one year, with 2 participants (0.8%). The income category highly represented was the R100,000 to R200,000 interval, which had 88 participants (34.7%), followed by the R501,000 to R999,000 category with 53 participants (20.9%).

4.1. Measurement Scales' reliability and validity

Prior to the hypothesis testing, confirmatory factor analysis (CFA) was conducted to examine the instrument for construct validity, reliability, and overall model fit. The instrument's reliability was measured regarding the items' Cronbach Alpha and estimated factor loadings (FL). The Composite Reliability (CR), and the Average Variance Entreated (AVE) of each construct were used to measure validity (Forenell & Larker 1981; Anderson & Gerbing 1988). The results of the CFA conducted are presented in Table 2 below.

Table 2: Descriptive statistics and confirmatory factor analysis (N = 105).

Constructs and factors	Mean	S.D.	Factor Loading	CR	AVE
Absorptive Capacity (ABC) (Cronbach's alpha = .792)				0.801	0.501
The general knowledge level of my employees is high	2.10	0.848	.453		
The general educational level of my employees is high	2.42	0.975	.501		
The overall job competence of my employees is high	2.03	0.784	.747		
The knowledge of my employees is adequate to respond to market changes	2.15	0.825	.761		
The knowledge of my employees is adequate when dealing with new technologies	2.26	0.935	.561		
Adaptive Capacity (ADC) (Cronbach's alpha = .740)				0.750	0.502
Our business always is responsive to the changes in the market business encounters	1.83	0.728	.602		
Our business is responsive to the cash flow challenges the market changes	1.89	0.740	.743		
Our business is responsive to the changes in the market by allocating the necessary resources to be responsive to the change	2.03	0.899	.770		
Personal Entrepreneurial Competencies (Cronbach's alpha = .704)				.719	0.591
I am confident that I could deal efficiently with unexpected events in my job	1.66	0.687	.565		
No matter what comes my way, I am usually able to handle it	1.73	0.739	.595		
I consider creativity as one of my stronger points	1.60	0.691	.535		
I am open to new and special ideas	2.05	1.140	.453		
Cost Efficiency (COE) (Cronbach's alpha = .756)				.765	0.557
Our business produces products with low costs	2.17	0.937	.588		
Our business incurs low overhead costs in the production process.	2.24	0.984	.521		
Our cost per unit is relatively lower than that of competitors	2.26	0.977	.851		
Our offer price is as low as or lower than our competitors	2.24	1.027	.699		

In SEM-based studies, the lowest acceptable factor loading is 0.500 (Borroso et al. 2010), of Composite Reliability (CR) of each construct is 0.5 (Hair et al. 2011), and AVE is 0.5 (Urbach & Ahlemann 2011). Regarding Cronbach's alpha, the general rule is that for reliability to be conferred, the alpha values for a construct should be above 0.700. The results show that all the α scores were above the threshold. From the results presented above, all the assessments yielded above benchmark scores. All the factor loadings for the variable items were above 0.5, meaning they all successfully loaded to their respective constructs. The Cronbach alpha values were also above the benchmark and the AVE and CR values. This provided confirmation of the validity and reliability of the instrument obtained.

Table 3: Discriminant validity of the model's constructs on Fornell-Larcker.

Construct	AVE	ABC	ADC	PEC	COE
ABC	0.501	.708			
ADC	0.502	.541	.709		
PEC	0.591	.458	.665	.769	
COE	0.557	.485	.563	.651	.746

NOTE: The elements of the diagonal (bold) are the square root of the variance shared between the constructs and their measures (AVE). The values below the diagonal are the correlations between the constructs.

For discriminant validity to be guaranteed, the square root of the AVE for all items should be greater than the constructs' intercorrelations. As presented in Table 3 the square roots for the AVE were all greater than the inter-construct correlations. As such, reliability and validity were achieved. Confirmatory factor analysis (CFA) was used to further examine the goodness of fit of the model and the model fit the data well ($p < .001$; $\chi^2/df = 2.256$; CFI = .966; IFI = .919; TLI = .941; NFI = .926; RFI = .924; AGFI = .922; and RMSEA = .570). Thus, the CFA assessment indicated the structural models and is suited for hypothesis testing

4.2 Hypothetical test

This study used Structural Equation Modelling (SEM) in AMOS 20.0 to examine the mediating and moderating effects. SEM is a multivariate statistical analysis, and multiple variables in this study can be analysed simultaneously (Tho, 2018). The results of the path analysis are presented in Table 4 below

Table 4: Hypothesis Testing

Hypothesis	Direct Effect	t-Value	p-Value	Decision
ABC→COE	.631	4.562	.000	Supported
ADC→COE	.211	1.158	.000	Supported
PEC→COE	.356	2.168	.000	Supported

The results provided in Table 4 indicate that all three hypotheses were supported at $p < 0.05$. H_1 proposed a positive and significant relationship between personal entrepreneurship competency and cost efficiency. The results show a coefficient of 0.631 and a t-value of 4.562 at a 5% significance level. This shows that the relationship was supported. In the same vein, H_2 stated a positive and significant relationship between absorptive capacity and cost efficiency. The analysis yielded a positive 0.211 coefficient which is in line with the proposition. Lastly, H_3 stated a positive and significant relationship between adaptive capacity and cost efficiency. The results showed a positive and significant 0.356 coefficient, supporting the hypothesis. Absorptive capacity had the most significant impact of the three predictor variables, followed by personal entrepreneurial competencies and adaptive capacity.

8. Managerial Implications

The overall success of any study balances on the ability of its findings to yield practical managerial recommendations. The current study has significant implications for the manager and the entire entrepreneurship discipline. The results also contribute to the literature that supports the importance of dynamic capabilities, especially in mitigating environmental challenges faced by SMEs. The contributions made are both theoretical and practical, as discussed below. This study aimed to assess the relationship between personal entrepreneurial competencies and cost efficiency, grounded on dynamic and strategic capabilities. The results confirmed a statistically significant relationship between personal entrepreneurial competencies and SME operational performance, mediated by absorptive capacity, adaptive capacity and strategic stance. The study contributes to the body of knowledge on operational management, specifically how the proposed operational measures link to SME owners' entrepreneurial competencies. The findings add to the theoretical understanding of the

importance of personal entrepreneurial competencies to SMEs to grow and to which SMEs generally should pay attention. The current study presents meaningful relationships of constructs that precede cost efficiency by investigating the impact of personal entrepreneurial competencies, dynamic and strategic capabilities on operational performance.. Its practical implications have been partly addressed while discussing its hypothesis and objective, although other implications deserve special mention in this section. This study's findings generally offer managerial direction for determining superior operational performance by employing personal entrepreneurial competencies mediated by organisational capabilities. It confirmed the existence of a strong and positive correlation between entrepreneurial competencies and operational performance. SME owners and managers must acknowledge organisational capabilities as an antecedent of superior operational performance. The results contribute to theory in different disciplines, but specifically to the practice of management and entrepreneurship. Owners of SMEs must prioritise personal entrepreneurial competencies, dynamic capabilities, and strategic capabilities as these improve operational performance and will hopefully transform superior performance into competitiveness. These findings demonstrate the emphasis that should be placed on personal entrepreneurial competencies about cost efficiency. When faced with a situation requiring strategic decision-making, firms must not ignore the significance of personal entrepreneurial competencies in selecting the right strategy.

9. Conclusion

The current study was grounded on the personal entrepreneurial competencies, dynamic and strategic capabilities theories, which are linked to SMEs sustaining performance in the environment. Thus, the study contributed to these by investigating and recommending ways SMEs can enhance their operational performance through competencies and capabilities. The findings merit both theories, which are essential for firms to evaluate their resourcefulness, prioritise capabilities development, and adopt strategies to ensure superior performance. Therefore, this study contributes significantly to the underlying variables relating to the entrepreneurial competencies and dynamic capabilities theories that negate the need for resources to compete. Resources traditionally tended to be tangible, and SMEs in the current environment must focus on intangible assets such as competency development and capabilities to sustain themselves in their various industries. Also, as dynamic capabilities theory is an extension of Therefore, this study's conclusions are valid for managers who consider operational performance as an engaging strategy because they are presented with an empirically workable strategy to achieve longevity in performance. Also, members of small and medium firms must improve their sense of appreciation of personal competencies, regardless of what resources they possess. The results back the precepts of personal entrepreneurial competencies, as described in the theoretical grounding.

² DHET-NRF SARChI in Entrepreneurship Education, Department of Business Management, University of Johannesburg, South Africa

Keywords

SMMEs; small business; business incubator; university business incubator; services; South Africa

Abstract

Small, medium and micro enterprises in South Africa experience multiple challenges, largely affecting their business operations and survivability. Business incubators are increasingly being developed to assist these small businesses in overcoming the challenges and offer areas of support so that these small businesses can be established in a nurtured environment to ensure that they will be sustainable and achieve high levels of growth. For business incubators to be successful, they must offer their services according to the needs of the small businesses as a one-size-fits-all approach would be unsuitable. As such, this study aimed to determine at which phase of the business life cycle the owners/managers of small businesses required the support services offered by university business incubators. The data was collected following a quantitative research approach, whereby judgement sampling was utilised to select 125 small businesses within the Vaal Triangle region. The findings indicate that not all small businesses require the same services throughout their development phases and that some services overlap between the phases. Therefore, it is important that business incubators regularly assess the needs of small businesses to ensure that the correct product offering is presented.

1. Introduction

Small, Medium and Micro Enterprises (SMMEs) are well-known drivers of economic development and sustainability as they alleviate poverty through job creation, stimulate innovation and entrepreneurship and increase competitive economic growth, which is essential for fostering and sustaining global economies (Ellitan, 2021:1004; Fatoki, 2018:1). South Africa, a developing economy, is characterised by an increasingly high unemployment rate of 34,5 percent, which is especially affecting the youth cohort in the country as they are unable to find employment opportunities (Stats SA, 2022). Furthermore, the South African economy has elevated levels of poverty, income inequality and a low economic growth rate (Fatoki, 2018:1). At a national level, the government is promoting the establishment and growth of SMMEs as a mechanism that can reduce the high unemployment rate, stimulate economic growth and development, innovation and competition. Ultimately, the government aims to have SMMEs generate 90 percent of employment opportunities by 2030 (Bhorat *et al.*, 2018:2).

According to Mukwarami *et al.* (2020:491), an estimated 2,2 million formal and informal SMMEs are currently operating within South Africa. Astoundingly, more than 70 percent of SMMEs in South Africa fail to survive and continue in their organisational operations within five to seven years of their existence (Bushe, 2019:1; Ladzani *et al.*, 2011:1461). In addition, it has been noted that 40 percent of new businesses fail within the first year of operation, 60 percent fail within the second year, and 90 percent of SMMEs cease to operate within ten years of their existence (Mukwarami *et al.*, 2020:491). Agbenyegah and Mahohoma (2020:65) highlight that small businesses will only be able to actively participate and survive in a competitive market if their level of performance is acceptable and

² E-mail address: natanyam@uj.ac.za

maintained throughout their operations. However, SMMEs in South Africa operate under challenging economic conditions that create an unstable business environment (Fatoki, 2018:2). As such, SMMEs are confronted with multiple issues that ultimately affect their performance and sustainability over the long term (Mlotshwa & Msimango-Galawe, 2020:1).

It is important to understand the challenges SMMEs in developing economies face as developed economies do not experience such high business failure rates (Agbenyegah & Mahohoma, 2020:65). Small businesses are confronted with a hostile legal environment, difficulty reaching international markets, finance and credit, scarcity of organisational skills and access to information, equipment and technology, unsuitable business locations, high levels of crime and inadequate support services (Ladzani, 2012:43; Mlotshwa & Msimango-Galawe, 2020:2; Mukwarami *et al.*, 2020:494). Asah and Louw (2021:2) state that several aspects affect the limitations SMMEs experience relating to finance and credit. These aspects comprise inadequate capital or complications in obtaining credit, inaccurate capital estimations and a lack of knowledge about bookkeeping, high start-up costs, elevated operating expenses, and insufficient profits. Mukwarami *et al.* (2020:494) exclaim that capital is the backbone of a business, and without sufficient access to capital, SMME development and growth will be hindered. However, capital is not only limited to financial support but also intellectual capital, such as business management skills, which is crucial during the start-up phase of small businesses. Van Scheers (2018:168) emphasises that small business owners lack the basic management skills to effectively operate a business, which includes financial, marketing and human resource skills. Furthermore, the managerial skills shortage negatively influences these businesses' success and feasibility, highlighting their need for support services and assistance.

Worldwide, business incubators are recognised as mechanisms that provide support to small businesses so that these businesses can flourish and, in turn, improve the economic development and growth of an economy by increasing employment opportunities (Schutte, 2019:1). In South Africa, business incubators are established to concentrate on improving the success of small businesses, reduce unemployment and generally assist with the challenges encountered by small businesses (Lose, 2021:2). Business incubators offer support to entrepreneurs by providing a nurturing and supportive environment to assist them with the establishment of their businesses (Allie-Edries & Mupela, 2019:72; Leitão *et al.*, 2022:1). According to Hewitt and Janse van Rensburg (2020:1), the goal of business incubation is to offer services to small businesses that will assist them in conquering the challenges that are experienced. Alpenidze and Pauceanu (2019:1) highlight that incubation programmes are specifically tailored towards start-up businesses as it is known that the majority of challenges are encountered during the early stages of the business lifecycle when the business is most vulnerable to failure. However, business incubators are not only developed to support start-up businesses but also support existing SMMEs currently operating in the market (Rens *et al.*, 2021:224; Masutha & Rogerson, 2015:233), irrespective of the development stage in the business lifecycle (Schutte, 2019:3).

It is generally known that an incubation programme consists of three stages. The first stage is the pre-incubation stage. The incubator assists the entrepreneur in developing the business concept and transforming it into a viable business before they become part of the programme. Hereafter, the incubation process follows, and the entrepreneur is offered an array of services that can be utilised to ensure that business success is achieved. The last stage, the aftercare or post-incubation stage, occurs when the business is ready to graduate from the incubator and survive in the competitive market to achieve higher growth levels (Allie-Edries & Mupela, 2019:76; Masutha & Rogerson, 2015:225). Business incubators provide services to small businesses because these businesses struggle to gain access to the services. These services commonly include computer and technology services, accounting and financial services, legal services and office space, amongst other services regarded as being essential to operating a business (Meyer *et al.*, 2016; Alpenidze & Pauceanu, 2019:1). Business incubators offer physical facilities, such as office space, conference rooms, telephone, internet and networking equipment (Allie-Edries & Mupela, 2019:78; Masutha & Rogerson, 2015:225), general business services that includes secretarial services, access to printers and inventory management (Schutte & Barbeau, 2022:4). Moreover, general management and networking services are provided

by business incubators, which includes for example, advice on business plan development, human resource management, advertising and research and development (Masutha & Rogerson, 2015:225; Schutte & Barbeau, 2022:4). Alpenidze and Pauceanu (2019:5) highlight that networking services are essential for businesses as it creates linkages for the successful internal and external operations, such as marketing and legal representation. Business incubators offer financial services, which are of extreme importance for small businesses as the owners most often lack the potential to gain access to funding on their own (Rens *et al.*, 2021:219).

Various business incubators are developed with differentiating purposes and scopes (Allie-Edries & Mupela, 2019:74; Rens *et al.*, 2021:226). Business incubators located within a university, referred to as university business incubators (UBIs), present numerous advantages for entrepreneurs as the university can provide additional linkages to the industry, society and government (Hassan, 2020:2). Foo and Turner (2019:288) state that UBIs aim to transform academic research and innovation into practice, together with enhancing the entrepreneurial activities amongst students and graduates. In addition to the general services offered by business incubators, Hassan (2020:6) highlights that entrepreneurs will have the added services of having access to the university's laboratories and computer systems as well as the advice offered by well-skilled human capital presenting expertise in specific subject fields.

2. Problem Investigated

While the number of established business incubators has recently increased, there is a strong need for them to achieve a level of success. If business incubators fail to be successful, they will not adequately be able to provide the level of services needed to ensure the sustainability and survival of the small businesses incubated (Schutte & Barbeau, 2022:2). Muriithi *et al.* (2018:201) concur, indicating that the success and functioning of business incubators cannot be neglected as there is an approximate 90 percent failure rate amongst incubated businesses. According to Alpenidze and Pauceanu (2019:5), business incubator success can be enhanced if the management of incubators focuses on providing programmes that meet the specific needs of the incubated businesses. Rens *et al.* (2021:232) add that there is a minimal focus given to the vision and objectives of incubated businesses. As a result, the incubators' vision and objectives contradict those of the incubated businesses. As such, Hewitt and Janse van Rensburg (2020:4) highlight that a business incubator should focus on diagnosing the incubated businesses' specific need requirements within the incubation process, where a one-size-fits-all approach is not suitable.

Numerous research has been focused on business incubators internationally and in South Africa (Al-Mubarak & Busler, 2010; Hewitt & Janse van Rensburg, 2020; Leitão *et al.*, 2022; Lose, 2021; Ndabeni, 2008) and UBIs (Flavel & Kalendra, 2008; Foo & Turner, 2019; Lee & Osteryoung, 2004; Todorovic & Suntornpithug, 2008). More specifically, on the incubator best practice (Al-Mubarak *et al.*, 2013; Bergek & Norrman, 2008), incubator services (Abduh *et al.*, 2007; Bruneel *et al.*, 2012; Flavel & Kalendra, 2008), and the critical success factors of incubators (Alpenidze and Pauceanu, 2019; Buys & Mbewana, 2007; Mian, 1997; Verma, 2004). However, minimal research has been focused on determining small business owners/managers' perceived requirements of UBI services over the business life cycle phases.

Considering the above, the objective of this study was to determine which UBI services are required at the various business life cycle phases, namely pre-start-up, start-up, growth and maturity. By determining the precise requirements of small business owners/managers, the management of UBIs can tailor their offerings to ensure that they meet the needs of their incubated businesses, potentially leading to the success and survival of small businesses. Furthermore, this will also provide marketing opportunities for the UBI management as small businesses will be attracted to the offering if it is aligned with their requirements. Thus, contributing to the successful operations of the UBI.

3. Literature Review

Phan *et al.* (2014:788) highlight that a business life cycle describes the developmental phases a business goes through during its years of operations. Petch (2016) adds that in simple terms, every

business transitions and experiences growth and development, which alternatively creates changes in the business's aims, objectives, priorities and strategies. There has been debate on the number of phases a business passes through in its life cycle. According to Krivtsova *et al.* (2020:342), business life cycles are known to have between two and ten phases. The classic business life cycle consists of four phases namely, start-up, growth, maturity and decline (Dempsey, 2018; Krivtsova, 2020:342). However, more commonly, five phases are present in the business life cycle, namely pre-start-up (seed and development; research and development), start-up (launch), growth (establishment), maturity (expansion) and decline (maturity and exit; stability) (Petch, 2016; Pretorius, 2004:294; Timmons & Spinelli, 2009:309). According to Scott and Bruce (1987:45), a business goes through five stages: inception, survival, growth, expansion and maturity, with each phase having its own characteristics. For the purpose of this study, the business life cycle phases will be noted as pre-start-up, start-up, growth, maturity and decline phases.

The pre-start-up phase of the business life cycle is the phase in which the business is considered, and the entrepreneur envisions the idea from a conceptual point of view to obtain funding (Petch, 2016; Pretorius, 2004:294). Timmons and Spinelli (2009:310) state that during this phase, entitled the research and development or nascent phase, the viability of the business idea is examined, and the entrepreneur conducts thorough research to ensure that the idea is feasible. Moreover, the research conducted within this phase is also utilised to determine if any potential challenges might hinder the intended idea from becoming an actual business (Taylor, 2022). Petch (2016) adds that it is important for entrepreneurs to gather as much possible advice and opinions from networks, which may include family, friends, colleagues, business associates or even specialists within the industry, to determine the viability of the business idea. Bridge *et al.* (2003:192) and Petch (2016) indicate that this phase begins when the planning of the business is initiated and is terminated once the business is put into operation. This phase's characteristics are highlighted by recognising the entrepreneurs' business ideas and thoroughly analysing the potential business.

The start-up phase in the business life cycle is one of the most important phases, as this is when the business is put into operation. Phan *et al.* (2014:789) highlight that during this phase, the entrepreneur will primarily be concerned with the marketing and distribution concepts of the business. Bridge *et al.* (2003:200) and Krivtsova *et al.* (2020:342) emphasise that during the start-up phase, the entrepreneur will need to secure capital and finances, support, consumers, suppliers, employees, business premises, information and advice, management skills and infrastructure. Pretorius (2004:294) cautions that entrepreneurs take high risks and experience levels of uncertainty during this phase. Petch (2016) concurs, indicating that this phase is often viewed as the riskiest phase in the business life cycle, and errors made during this phase will impact the business for a long time during its operations.

During the growth phase of the business life cycle, the business is likely to experience an increase in profits (Tendai, 2013:90) and customers (Petch, 2016). Phan *et al.* (2014:789) state that the entrepreneur will consider expanding their business operations by considering the extension of their product and/or service lines, innovation and diversification. The characteristics of the growth phase include an increase in demand, which leads to an increase in sales and larger profit margins (Pretorius, 2004:294; Taylor, 2022). However, this phase is also characterised by an inflow of competition into the market (Petch, 2016; Scott & Bruce, 1987:50).

Once the business has passed through the growth phase, the maturity phase is reached, denoted by stringent competition levels. It is during this phase that the entrepreneurs reconsider their pricing structures and adjust their pricing strategies to match the competition in the market, which often results in a decline in profits (Wang *et al.*, 2013:999). Timmons and Spinelli (2009:310) and Dempsey (2018) state that entrepreneurs aim to achieve stable profitability during this phase. Kuratko and Hodgetts (2007:611) and Krivtsova *et al.* (2020:342) highlight that entrepreneurs are confronted with two options during this phase, the first option is that the entrepreneur can increase the levels of innovation within the business and reach increased levels of profitability, or alternatively, the other option would be that the business will lead to a decline phase, whereby it may cease its operations. Moreover, Dempsey (2018) states that there is potential within this phase for reinvestment to ensure

growth and sustainability, whereby according to Scott and Bruce (1987:51), it may also be that small businesses transition into larger businesses.

The last phase of the business life cycle, the decline phase, is reached once the entrepreneur experiences a substantial decrease in sales that lowers their profit margins. Prevention of this occurrence is challenging as entrepreneurs often miss the onset of this phase and only realise once they are already operating within the phase (Pretorius, 2004:295), or they operate within this phase without knowing (Dempsey, 2018). As such, the decline phase of the business life cycle was not utilised for the purposes of this study.

4. Research Methodology

The target population utilised for this study was defined as any individual that owned or managed a small business in the Vaal Triangle region. This region is situated in the Gauteng and Free State provinces of South Africa and includes the area between the main town of Vanderbijlpark, Vereeniging and Sasolburg. This area was specifically chosen because it has a UBI that services local businesses. To establish the sample frame, businesses within this region were sourced from the Vaal Triangle Info Business Directory (Vaal Triangle Info, 2015). Centred on the number of full-time paid employees, the National Small Business Act (102 of 1996) states that small businesses employ a maximum of 50 employees (South Africa, 1996). Therefore, for the purposes of this study, small businesses are defined as having 50 or fewer full-time employees employed by their business. Based on these criteria, non-probability judgement sampling was used to select 125 small businesses within the Vaal Triangle region.

Based on the literature about UBI services offered, a scale was developed for the structured self-administered questionnaire utilised in this study. The structured self-administered questionnaire included a cover letter requesting participation and indicating the study's purpose, followed by a section assigned to collecting the respondents' demographical and business information required to profile the sample. Two screening questions were included in the demographical and business information section, the first question was to ascertain that the respondent was an owner/manager of a small business, and the other screening question requested the participant to provide the number of employees employed by the business to ensure that the business conformed to the criteria of being a small business. Another section of the questionnaire was included in order to determine the small business owners'/managers' specific UBI service requirements over the phases of their business life cycle. This section included six constructs: physical facilities, general business services, management services, networking and professional services, financial consulting services and university services. The owners/managers of the small businesses were requested to indicate on a scale, ranging from the pre-start-up, start-up, growth and maturity phases, at which phase of their business life cycle they required the services of a UBI. In addition, a 'not applicable' option was included on the scale so that the owners/managers could select the option if they felt that the UBI service was not required at any phase of their business life cycle, or alternatively if they had not reached the specific phase in their business life cycle.

The self-administered structured questionnaire was subjected to ethical clearance. Generally, businesses represent a 'difficult-to-access' population (Berné Manero *et al.*, 2020:121). As such, the researcher followed an unsolicited calling approach to have the questionnaires completed by the owners/managers of the small businesses. The researcher personally visited the small business, explained the study's purpose, and requested participation from the owner/manager. Once the owner/manager of the small business granted permission, the researcher hand-delivered the questionnaire and agreed upon a date for collection, whereby a two-week completion period was granted in most situations. The Statistical Package for Social Sciences (SPSS), version 22, was used to capture and analyse the data.

5. Results and Findings

A response rate of 86 percent was achieved as 108 of the 125 questionnaires were returned and included in the study. Based on the screening questions, the sample only included the

owners/managers of small businesses and businesses that employed 50 or fewer employees. Moreover, 37 percent of the sample was made up of start-up businesses that have been in operation for less than five years, and 63 percent of the sample consisted of established businesses that have been in operation for more than six years. Table 1 represents the demographic information of the sample participants.

Table 1: Sample description

		Frequency (percentage)
Business categories	Auto	21 (19.4)
	Estate agents and property management	21 (19.4)
	Health care and beauty	22 (20.4)
	Hospitality and accommodation	20 (18.5)
	Professional	24 (22.2)
Gender	Male	41 (38)
	Female	67 (62)
Position in organisation	Owner	54 (50)
	Manager	54 (50)
Organisations' age	Younger than 5 years	40 (37)
	Over 6 years old	68 (63)
Number of employees	0 – 19 employees	96 (88.9)
	20 – 50 employees	12 (11.1)

Source: Own compilation

Figure 1 presents the small business owners/managers' results pertaining to their perceived requirements of UBI services during the business life cycle phases. The small business owner/manager was requested to indicate at what phase/s of their business life cycle the UBI service was required for their sustainability. They could select the 'not applicable' option if they did not require the UBI service at any phase during their business life cycle. Moreover, one respondent did not complete the questions about the requirement of UBI services during the business life cycle phases.

Figure 1: Owners/managers' perceived requirements of UBI services during the business life cycle phases
Source: Own compilation

When considering the business life cycle phases, the results indicate that physical facilities (32 responses) and financial consulting services (33 responses) provided by UBIs are mostly required by small businesses during the pre-start-up phase of business development. Bhorat *et al.* (2018:59) found

that access to finances was one of the major constraints influencing the growth of SMMEs in South Africa. Without sufficient access to finance, small business owners/managers will be unable to consider or start their business operations. Moreover, during the pre-start-up phase, the owner/manager will be required to conduct thorough research into the business idea's viability (Timmons & Spinelli, 2009:310). In order to effectively conduct research, the owner/manager will require the physical facilities of internet and networking equipment, access to a computer and even a telephone. In the study conducted by Bhorat *et al.* (2018:58), it was also found that infrastructure was one of the main constraints hindering the growth of SMMEs in South Africa. As such, the owners/managers of small businesses in South Africa will benefit from the UBI services offered during the pre-start-up phase as they would be able to make use of the services that they previously might not have had access to, enabling them to ensure that the foundations of their business idea is flawless before they begin with the actual business operations.

The owners/managers of small businesses perceived physical facilities (26 responses), general business services (25 responses) and management services (26 responses) as being the most important UBI services required for the start-up phase of their businesses. This is in accordance with the characteristics of the start-up phase of the business life cycle that states that the entrepreneur will need to secure capital and finances, support, consumers, suppliers, employees, business premises, information and advice, management skills and infrastructure (Bridge *et al.*, 2003:200). Moreover, in South Africa, it has been identified that small business owners lack managerial skills, such as financial, marketing, and human skills necessary to operate a business (van Scheers, 2018:168; van Scheers & Radipere, 2008:6). Therefore, the owners/managers of small businesses within South Africa would benefit from the general business services and management services offered by UBIs during the start-up phase as they would be able to gain the knowledge and training required to successfully open and operate their small businesses.

Networking and professional services (37 responses) and financial consulting services (32 responses) offered by UBIs were mostly required by the small business owners/managers during their growth phase. The growth phase of the business life cycle is characterised by an increase in sales, leading to an increase in profitability (Pretorius, 2004:294). As such, small business owners/managers might need assistance with managing their finances and securing investments during this stage, which fall within the financial consulting services and professional services offered by UBIs.

For the maturity phase of the business life cycle, the small business owners/managers did not require UBI services as much as was noted with the previous three phases in the business life cycle. Compared to the sample description, a total of 68 small businesses were over the age of six years. However, as Petch (2016) highlighted, businesses will experience life cycle phases at different stages. Some businesses might not progress through all the phases or even follow the phases in the intended order. Therefore, this indicates that the small businesses included in the sample of this study might not have been in the maturity phase of the business life cycle, suggesting that they could not adequately indicate their requirements for the UBI services offered. From the results, the highest responses were received for networking and professional services (17 responses) and management services (16 responses) offered by UBIs. As noted by the literature on the maturity phase of the business life cycle, the owners/managers are confronted with increasing competition and declining profits. They might even need to consider rejuvenating their operations to ensure survivability. As such, the owners/managers would greatly benefit from established networks, professional and management knowledge, and guidance on their operations during this phase of their business development.

The respondents were given the option to select 'not applicable' for any UBI services they did not require over their business life cycle. From the results, 58 respondents indicated that university services offered by UBIs did not apply to their small businesses, followed by 21 responses for management services. An explanation for this could be that the concept of UBIs is new or unknown to the owners/managers of small businesses. As such, they indicated that the university services were not required as they may not be familiar with the services offered.

6. Managerial Implications

This study aimed to determine at which phase of the business life cycle the owners/managers of small businesses required the support services offered by UBIs within South Africa. The findings suggest a difference in the services required amongst the small business's life cycle phases, as perceived by their owners/managers. As such, the UBIs management could incorporate these findings into their UBI programmes as it will be beneficial to the stakeholders and current and potential incubated businesses if the services are offered at the phase that they are most required. Conversely, by altering the UBI programmes to match the needs of the incubated businesses specifically, greater success could potentially be experienced, which largely affects the success of the UBI itself.

For the pre-start-up phase, the findings revealed that physical facilities and financial consulting services were mostly required by the owners/managers of small businesses. The UBIs can strengthen their physical facilities and financial consulting services offered during the pre-start-up phase of small businesses by ensuring that these services are adequately available to the owners/managers. Moreover, the management of UBIs can also tailor the financial consulting services offered in order to meet the needs of the pre-start-up phase, which might include assistance with gaining access to capital or applying for a business loan. At the same time, more advanced financial consulting services, such as providing advice and guidance on investment possibilities, can be incorporated during the growth phase of the business life cycle. UBIs management should also ensure their physical facilities are up to standard so that they can be provided to the owners/managers of small businesses when they most need it. In other words, the UBI's internet and networking equipment and technology must be up to standard so that it does not cause any frustration to the owners/managers when needed.

The findings suggest that the owners/managers of small businesses require physical facilities, general business services and management services at their start-up phase of development. The UBIs management needs to ensure that these services are available when they are most needed. As such, the UBIs can alter their programmes to ensure that the physical facilities and general business services are mostly available during the start-up phases of the business life cycle. Moreover, management services need to be available during the start-up phase of development, so the UBIs management could consider offering training programmes to enhance the management skills and knowledge of the owners/managers, or the UBIs management should ensure that they have the sufficient capacity to offer the management support needed. For example, the UBI can offer a multi-week training programme on effectively developing and writing a business plan. Alternatively, the UBIs programme can have business consultants to assist the owners/managers with developing their business plans.

The results further indicated that the owners/managers mostly required networking, professional, and financial consulting services during the growth phase. As with the recommendation at the pre-start-up phase, the UBIs management needs to secure financial consulting services relevant to the business life cycle phase. For example, the owners/managers would need investment advice during their growth phase as they experience increased profitability. The UBI's management should tailor the services provided to the needs of the owners/managers as they would be dependent on the UBI to ensure that the proper support is available to provide guidance. Moreover, the UBIs management should ensure a strong network is available to the owners/managers during the growth phase. The network should consist of internal connections made with the university's management, staff and stakeholders, as well as external connections to the state, trade and industry sectors.

The findings on the maturity phase suggest that the owners/managers did not necessarily require the UBI service offerings or had not yet reached the maturity phase of their business life cycle. As such, the UBIs management should continue offering the services at this phase, but to a lesser extent than what is being offered at the other business life cycle phases. In this regard, the UBIs management will focus its scarce resources on the phases in the business life cycle where it is mostly required by the owners/managers of small businesses.

In general, the UBIs could also consider tailoring and marketing their offerings following the phases of the business life cycle. As such, potential clients will be attracted to the UBIs offering if their

businesses are at the current phase of development and encountering challenges that can be combatted through incubation and acceleration programmes. This will generate an increase in clientele for the UBI and increase their success rate as the services provided are tailored specifically to their target market's needs. In addition, UBIs should ensure that their clients and potential clients are aware of their services available.

7. Conclusion

SMMEs in South Africa are experiencing multiple challenges, specifically a lack of resources, business and management skills, access to finance, infrastructure, crime, and supply of basic resources, amongst many others. Business incubators are increasingly being developed to assist these small businesses in overcoming the challenges and offer areas of support so that these small businesses can be established in a nurtured environment up to a point where they can survive the competitive market on their own and achieve high levels of growth. SMMEs are recognised for creating employment opportunities and increasing an economy's economic growth and development. With the assistance of business incubators, SMMEs can be sustainable, and the benefits thereof will enhance the South African economy.

It is clear that not all business phases require the same services and that some overlap. The change in external environments and external shocks, such as the recent COVID-19 pandemic, affect SMMEs, and UBIs should regularly assess the needs of these businesses in order to ensure the correct product offering is presented. The services UBIs can offer can be valuable to local SMMEs, especially those in the nascent and early stages. However, many businesses may not be aware of the services or may feel the service offering is not tailored to their needs. The study highlighted important findings about the different business phases and related UBI services. However, it is not without its limitations. The data were presented descriptively. In this case, we felt this was the best way to present the current data as the aim was exploratory in nature, and we wanted to determine what phase of the business life cycle the owners/managers required the UBI services. In addition, the sample was limited to only a specific region in South Africa; however, this was due to the existence of a UBI in the area. Future studies may include determining if any statistically significant differences between the businesses from the various life cycle phases are present regarding the need for UBI services. A qualitative study will also be done by conducting structured interviews with selected small business owners to determine their needs, challenges and success stories concerning UBIs. In addition, the findings can be compared to other regions or areas that are also services by a UBI.

Abstract

Existing economic activity and business practices are contributing to environmental crises especially in developing economies. Despite the growing research interest in entrepreneurial orientation (EO) and environmental sustainability (ES), there is a lack of comprehensive studies that link EO to ES in developing countries. This study explores environmental sustainability in the firm's EO decisions. To meet this aim a systematic literature review of selected articles has been conducted. An integrated framework and dimensions of EO and ES at an individual, firm and national level are presented as findings. This study brings substantial benefits to the development of research on the joint subject of EO and ES by integrating concepts such as entrepreneurship, the environment, and sustainability. Managers in developing countries should incorporate environmental issues into entrepreneurial decision-making. Future researchers should undertake detailed empirical studies on the subject matter of EO and ES since the new construct requires further study for clarification.

1. Introduction

Rapid globalization and industrialization have caused adverse impacts on the environment such as global warming, air pollution, water pollution, and chemical and toxic explosion (Habib et al., 2020). Attempts to address these issues were done through legislation, the promotion of ethical business practices, and currently linking entrepreneurship to the notion of sustainability (Criado-Gomis et al., 2017). The present economic activity has contributed to a serious environmental crisis. Business sustainability is also focused on pursuing economic and social development without damaging the environment (Yusoff et al, 2019). Along with the sustainability, environmental considerations are increasingly contributing to a strategic foundation for decision-making within businesses (Golsefid-Alavi et al., 2021). As, businesses are responsible for many environmental challenges, it can present opportunities for entrepreneurial ventures, towards the development of green entrepreneurship and a business model that takes into consideration profit and environmental protection (Fatoki, 2019).

Recognition of research opportunities about the green entrepreneurial orientation concept can largely contribute to the theoretical development and empirical studies in entrepreneurship and environmental science (Golsefid-Alavi et al., 2021). On the other side, despite the growing interest in environmental entrepreneurship and Entrepreneurial orientation- (EO), not much is known about these concepts (Golsefid-Alavi et al., 2021), particularly on their integration. Accordingly, the scientific nexus of entrepreneurship and the environment disciplines has led to some research work on green entrepreneurship (eg., Fatoki, 2019), sustainable entrepreneurship, sustainable entrepreneurial orientation (SEO) (eg., Kraus et al., 2018), and environmental sustainability orientation (ESO) (eg., Eijdenberg et al., 2018).

Given the above, the contribution of this study includes; first, despite the growing research interest in EO and ES, there is a lack of comprehensive studies that link EO to ES in developing countries. That is, previous theories in environmental economics and institutional economics did not provide a comprehensive theory that links EO to ES (Sher et al., 2019). For instance, the role of government in the uptake of green entrepreneurship in agriculture in developing country contexts has not been analyzed (Sher et al., 2019). Besides, Golsefid-Alavi et al., (2021) conducted a review of the literature on the nexus of entrepreneurship and the environment is presented and found that none of the existing studies had focused on the concept of green entrepreneurial orientation (GEO) and the factors affecting this concept, which makes the study very relevant. Therefore, this study integrates EO and ES at an individual firm and national level.

Second, it is believed that the effective way to reduce the negative impact of economic development on the environment is the mutual responsibility of large and small firms (Nawi et al., 2020). However, small resource-constrained businesses in developing countries need to be more innovative and creative in developing or integrating environmentally sustainable practices without undermining the economic objectives of their business (Roxas et al., 2017). There is also a lack of empirical studies that compares and contrasts the practices of small and larger firms simultaneously. More specifically, even though authors such as Eijdenberg et al., (2018) conducted their studies on small enterprises, the reasons why small businesses become environmentally sustainable remain poorly understood because the vast majority of business research on environmental sustainability to date tends to draw from the experience of large firms from advanced industrialized countries (Roxas et al., 2017). This necessitates a study that considers both small and larger firms simultaneously as well as all types of institutions since the issue of environmental sustainability is a concern for all types of organizations, societies, and governments. This study is unique in integrating these different aspects.

Third, a major portion of such studies has been contributed by researchers who have been strongly biased toward sustainability and the environment rather than entrepreneurship (Golsefid-Alavi et al., 2021). This study brings substantial benefits to the development of research on the joint subject of EO and ES. Particularly, it integrates concepts such as entrepreneurship, the environment, and sustainability. Thus, the study provides inputs for public policy in developing countries.

2. Problem Investigated

A noteworthy hallmark of many large corporations in the 21st century has been the adoption of environmental sustainability policies to demonstrate care for the environment (Amankwah-Amoah, 2019). Developed countries and international organizations tend to place a greater emphasis on the term “green” and market opportunities, while the developing countries are more focused on the term “entrepreneurship” and the market demands (Farinelli et al., 2011; Golsefid-Alavi et al., 2021). However, to improve circumstances, African least developed countries (LDCs) have increasingly become the subject of sustainability research (Eijdenberg et al., 2018). Besides, greater insights into how EO can lead businesses in developing countries to become more environmentally sustainable should be valuable for managers and should inform the design of public policy in developing countries (Roxas et al., 2017).

Relating to this, a few studies have found a negative correlation between a firm’s ecological engagement and its financial performance, while others have found a positive correlation (Eijdenberg et al., 2018). Besides, there is an overwhelming emphasis on the activities of firms in developed countries on entrepreneurial orientation and environmental sustainability since firms in emerging economies often lack legitimacy and operate under different underdeveloped institutional environments (Roxas et al., 2017; Amankwah-Amoah et al., 2019). That is, empirical evidence and the notions of ESOs and sustainability, in general, come mainly from western societies (Eijdenberg et al., 2018). The shift of manufacturing activities from advanced industrialized economies to developing countries becomes a grave concern given the generally poor environmental standards in many developing countries (Roxas et al., 2017).

Besides, the above gaps, there is no sufficient studies that links EO and ES which leads to the absence of comprehensive and integrated theory in the subject matter. A major portion of this studies also focused on the environmental sustainability side and no sufficient consideration is given to the entrepreneurial side. The previous studies have been conducted in either corporate firms or small firms, however, there is lack of studies that compare both firms in a single research. Therefore, this study tends to fill these gaps by investigating the integration of environmental sustainability in the firm's entrepreneurial orientation decisions in developing countries.

3. Research Objectives

The objective of this study is to investigate the integration of environmental sustainability and entrepreneurial orientation decisions by giving emphasis on developing countries. In line with this objective, the specific objectives are; (1) to analyse the trends of the publications in the subject matter, (2) to develop a dimensions for a new construct of entrepreneurial orientation for environmental sustainability, (3) determining the antecedents and outcomes of entrepreneurial orientation for environmental sustainability.

4. Research Methodology

This section provides the approaches used in conducting a systematic literature review on the nexus between EO and ES including the procedures and techniques for obtaining and synthesizing the data.

4.1. Study approaches and design

We have conducted the systematic review based on the criteria of the Preferred Reporting Items for Systematic Reviews and Meta-Analyses (PRISMA) guidelines and a diagram that helps to illustrate the records identified using the search engines. To ensure transparency, rigor, and objectives of the study, we adopted the method suggested by Tranfield, Denyer, and Smart (2003). Following this method, we started by identifying the review questions and setting conceptual boundaries.

4.2. Review scope and search strategy

The review scope was determined by experts and reviewers from different fields such as management and environmental science by discussing the relevance of the review. The review scope was established by identifying themes based on the suggestion from experts and reviewers' experience. Next, we established the conceptual boundaries by determining key terms. The third step was the determination of the review scope, which is established by specifying the inclusion and exclusion criteria. That is, in terms of limiting the articles to be included in the review, only peer-reviewed journal articles were considered. Further, we have focused on the articles that study the relationship between EO and ES.

The stages followed in the search strategies include, first, checking the availability of systematic reviews in the subject matter of the nexus between EO and ES to avoid duplication of papers. Then, the independent experts assessed the suitability of peer-reviewed scholarly works and found it relevant to provide comprehensive scholarly work on this critical issue. This was followed by establishing the keywords and searching on the Google Scholar (GS) in full primarily since the study is multidimensional. Two reviewers who are experts in the field compiled a list of articles and independently screened the title and abstracts identified. The reasons for exclusion and inclusion criteria were documented and provided on the flow chart of study selection based on Preferred Reporting Items for Systematic Reviews. Those articles deemed relevant based on title and abstract proceeded to full-text analysis. If a discrepancy existed between the two independent reviewers/authors, it was resolved by discussing it with the third author. That is, the third independent reviewer appraised the quality and suitability of the selected articles. Later, each stage followed in the selection process was outlined in a PRISMA flow chart. Besides, the process has been evaluated against the 27-item PRISMA checklist.

Based on the conceptualization of the variables, we have identified the keywords such as entrepreneurial orientation and environmental sustainability. The independent reviewers participated in determining the keywords and synonyms words. First, the term EO and ES is searched

independently and next the keywords are associated to create a combined search. The search was conducted using the entries such as “entrepreneurial orientation” OR “entrepreneurial intention” AND “environmental sustainability” OR “green environment” AND “developing country” OR “developing economy”, combining them with the terms ‘green’ and ‘sustainability’. Besides, we performed a secondary search through the references list and citations. References of the articles identified in were examined order not to miss relevant publications.

4.3. Study identification, screening, and selection process

Following the search results, both inclusion and exclusion criteria were used to select the appropriate articles from the database. Based on the inclusion criteria, only peer-reviewed articles written in the English language were considered. Since only a few articles from, before 2010, were found, the review limited itself to articles published after 2010. The review team felt that a 15-year data was sufficient to uncover the early root of studies around entrepreneurial orientation and environmental sustainability. Other sources such as books, book chapters, conference papers, and articles in non-reputable journals were not considered. Later, by excluding conceptual and review articles, we considered only empirical studies. Then, a three-stage screening process was undertaken. These included manually excluding duplicates, manually screening titles and abstracts, and assessing eligibility based on full text. Finally, the full-text articles were evaluated based on the presentation of validated knowledge, quality and rigor, theory robustness, practical implications, appropriateness of methodology, data, and contribution to knowledge as espoused by Phillips et al., (2015).

4.4. Data synthesis and analysis

A synthesis was made to obtain necessary findings related to the EO and ES to build a comprehensive big picture by focusing on the relevant and necessary ideas. We used the narrative synthesis to combine the findings from the selected articles and to thematically establish the relationship. The themes and sub-themes are constantly revised and compared to avoid potential conceptualization conflicts. Besides, a ‘cross-study syntheses was made by comparing and contrasting all the studies based on the key themes (Zahoor & Al-Tabbaa, 2020). Based on the previous studies, a theoretical framework was developed from syntheses of previous models, theories, and dimensions. Four major domains/dimensions were established.

For analysis, a qualitative research method is used to analyse and discuss the theoretical aspects related by comparing and contrasting the logic and arguments of different scholars to provide conclusions based on the synthesized arguments. To do this, we created a summary table in Microsoft Office Excel 2016 and listed out information used for analysis. Some of the information extracted from the selected paper and included in the created excel table are the name of the author, name of journal, area of study, field of study, study unit, approaches of the study, major variables under study, objectives of the study, and key findings. Later, we employed a thematic analysis to provide an overview of the subject matter and determine the established relationship between the themes. The review theme specified the themes of the subject matter based on prior experience. Later, the identified theme was developed into a framework for analysis.

To ensure quality, there are articles dropped because no sufficient background was provided, the methodology was not discussed, and/or analysis lacked details. The quality concern was minimized by including only peer-reviewed articles.

5. Results and Findings

The following section provides the major findings from the existing literature and is used to build dimensions and show the antecedents and consequences of the variable “entrepreneurial orientation for environmental sustainability” (EOfES).

5.1. Descriptive results

The following figures show the descriptive results of the sixteen selected articles. That is, publishing journals, level of analysis, countries of study and field of study.

Figure 1 revealed that among the sixteen selected articles Journal of Cleaner Production and Corporate Social Responsibility and Environmental Management published two articles each. The remaining journals have published one article each.

Figure 2 revealed the unit of analysis in which the study is conducted. The figure shows that fourteen of the studies were conducted at the firm level. This indicates that the subject of EOofES is directly related to the responsibilities of the enterprises since most of the studies are conducted at the firm level. Four other articles were conducted at the industry level, on farmers, informal vendors, and at the country level. Figure 3 revealed a country-wise analysis, which indicates two studies from Pakistan and Malaysia. Finally, figure 4 shows that most of the studies are related to the discipline of Business and Economics followed by Environmental Science.

5.2. EO & ES Dimensionality

Various studies deliberate the concepts and practices of environmental sustainability orientation (ESO) (e.g., Kirkwood and Walton, 2014; Eijdenberg et al., 2018) and sustainable entrepreneurial orientation (SEO) (e.g., Kraus et al., 2018). However, there is a necessity to consider the specific issue of ES in entrepreneurial decisions. Accordingly, EOofES is categorized as a new construct that integrates the ES decision to EO. In this regard, previous research revealed the EO dimensions are importantly applied to the ES.

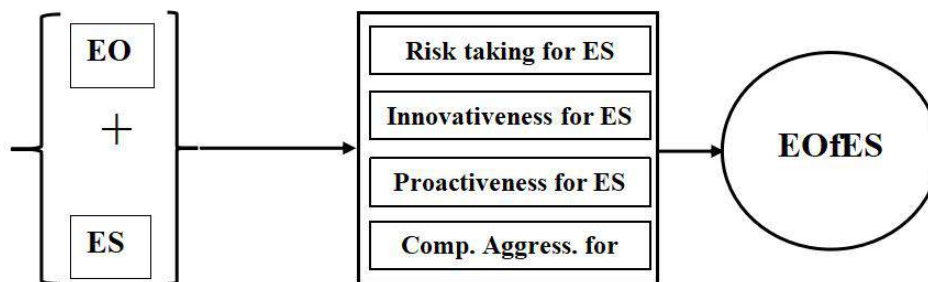

Figure 5: Dimensions of entrepreneurial orientation for environmental sustainability

Entrepreneurship and the natural environment were thought to be incompatible by economists, however, lately, management researchers have found out that the two concepts can play an important role in modern economic development (Fatoki, 2019). This leads to the formation of a new construct EO for environmental sustainability (EOfES). This is because, the association between strategic orientations as intangible and valuable resources that give rise to a firm's economic and environmental sustainability is explained under the premises of Resource Based View (RBV)(Nawi et al., 2020). This is through establishing and linking the strategic and entrepreneurial orientations to sustainable success considering the environment. This concept is not limited to enterprises (eg., Roxas et al., 2017), but also to individuals (eg., Eijdenberg et al., 2018) and governments (eg., Amankwah-Amoah et al., 2019). For instance, Kangogo et al., (2020) incorporate farmer EO as a factor influencing farmer investment decisions on climate change adaptation strategies. This opens further discussion on this new construct of EOfES. That is, organizations (both government and non-government) should link their business decisions to the concerns of the natural environment, while the individuals need to develop a positive attitude toward environmental concerns. This will be done through interlinked decisions integrating the natural resource aspects in the organization's system and activities in line with entrepreneurial pursuits. This includes awareness creation among the individual participants to get a better commitment.

Particularly, the different dimensions of EO such as proactiveness (Roxas et al., 2017), innovativeness, risk-taking, and competitive aggressiveness are directly linked to environmental sustainability. This necessitates the strategic linkage of the EO dimension to ES by creating a positive entrepreneurial mindset towards eco-friendly productions and environmental conservations. This is supported by the ecological modernization theory that considers both entrepreneurship and environmental issues. Also, the natural RBV extended from the RBV considers the issues related to both entrepreneurship and the natural resources. There are several concepts related to entrepreneurship and environments, including SEO, sustainable entrepreneurship, sustainability orientation (SO), and ESO. However, in all the above perspectives sustainability is not limited to the environment, but also includes the social aspects as a part of the triple bottom line. Therefore, integrating the EO to a particular aspect of ES has paramount importance to determine the specific contributions. Accordingly, engagement in entrepreneurial activities needs consideration of environmental problems in particular. That is, the individuals' and firms' strategic decisions should broaden the scope of their goals toward the natural resource preservations.

5.3. Antecedents and outcomes of EO for ES

The construct EOfES strategically links the various variables related to both EO & ES. These include the linkages with variables, such as; stakeholder (Nawi et al., 2020; Roxas et al., 2017), financial (Roxas et al., 2017; Eijdenberg et al., 2018), business plan or strategy (Amankwah-Amoah, 2019; Roxas et al., 2017), entrepreneurial mindset (Criado-Gomis et al., 2017; Eijdenberg et al., 2018), dynamic capabilities, the structural character of environmental issues, industrial activity, economic growth (Criado-Gomis et al., 2017), recycling materials (Eijdenberg et al., 2018), culture, firm performance, awareness creation, public policy, decision making and business operations (Roxas et al., 2017), social responsibility (Fatoki, 2019), business models (Fatoki, 2019), regulations and laws (Amankwah-Amoah et al., 2019), competitive culture (Kraus et al., 2018), triple bottom line (Eijdenberg et al., 2018; Criado-Gomis et al., 2017).

Based on the few studies that have been conducted in the context of developing countries, enterprise owners need to be motivated to have certain ESOs (Eijdenberg et al., 2018). Particularly, the practices of EOfES require firms and individuals to engage in strategy development that integrates the activities of business modeling, financial budgeting, firm operations, organizations' internal structuring, and business decisions that consider the environmental problems through building dynamic capability. This includes reconfiguration of the overall organizational systems and practices in line with environmental protection and conservation. Besides, there is a necessity to build a strong culture, an entrepreneurial mindset, and ethics toward environmental protection through creating awareness of

EOfES. The overall integration of these operations gives firms competitive advantages. Further, it is linked to the stakeholders, public policies, social responsibilities, and economic growth.

The antecedents and outcomes from the new construct of EOofES are taken from the practices of individual environmental entrepreneurs, organizations, the general public, and governments at different levels. At the individual level, possessing and skilfully employing ESOs is one of the routes for subsistence entrepreneurs to better (personal) circumstances (Eijdenberg et al., 2018). This means that individual entrepreneurs should play a substantial role as environmental protectors since individual human beings are the main cause of environmental problems. They have to take part in alerting the general public about environmental concerns and participate in environmental protection activities within their communities. They should be at the forefront of promoting environment-related government policies and legislation.

At the organizational level, studies conducted in developing countries indicate that both government and non-government organizations are engaged in environmental conservation. The modern organization in developing countries should include practices of ES in their entrepreneurship-related strategic decisions. For instance, through the lens of institutional theory, the entrepreneurial orientation is introduced as an important driver of the green management of companies in emerging economies (Golsefid-Alavi et al., 2021). Golsefid-Alavi et al., (2021) revealed that the integration of environmental issues into strategic plans is important since companies with high levels of ESO tend to carry out a wide range of activities to reduce the negative impact of their businesses on the environment. Research on EO literature in a sustainability context found that firm-level entrepreneurial orientation increases the probability that such a firm develops pollution prevention capabilities (Grobeck et al., 2012). Roxas et al., (2017, p??) also added that “the deliberate actions of small businesses who are passionate about the environment have been identified as the main catalysts for embarking on environmental sustainability initiatives”. Given this fact, at the firm level, the integration of environmental aspects to the firm’s entrepreneurial decision and philosophy has paramount importance in the protection of the natural environment. This means competitiveness, as well as profitability, would have been integrated into environmental sustainability through producing environmentally-friendly outputs. There is a need, therefore, to include environmental issues in the company’s purpose, business models, regulations, operations, and other strategic decisions. However, in the developing country context, CSR is heavily influenced by the institutional environment, such as investors, the media, and international regulatory bodies (Eijdenberg et al., 2018). This necessitates the integration of different parties in the protection of the environment in line with the business practices.

Government intervention and support is another crucial element that strengthens the practices of EOofES at all levels. Government support, such as granting subsidies for providing environment-friendly services and immaterial mechanisms such as activating interactions between environmental entrepreneurs and other key players is needed (Golsefid-Alavi et al., (2021). Given the high environmental deterioration, governments are developing policies and procedures that motivate positive conservation of the environment. This includes activities related to supporting environmentally-friendly ecological sustainability-related activities, promoting green economic practices, ensuring social responsibilities, and setting environmental sustainability-related policies. Furthermore, the government and its agencies have to play a crucial role in creating awareness among the society and changing people’s mindset toward the environment.

Previous studies conducted in developing countries indicate that at a certain level of economic growth, an increase in per capita income can lead to reductions in environmental pollution (Iqbal et al., 2020), while others found a positive relationship between green entrepreneurial orientation (GEO) and financial, environmental and social performance (Fatoki, 2019) as well as GEO and market orientation, GSCM, and all the dimensions of the triple bottom line (Habib et al., 2020; Gomis et al., 2017). According to Ahmed et al., (2020) ecological innovation, EO, and entrepreneurial self-efficacy enhance energy efficiency and environmental performance. Similarly, Khalid, et al., (2020) indicates that an environmental strategy, entrepreneurial innovation, and EO are the key contributors to energy

efficiency and environmental performance. Particularly, EO can improve sustainable development (SD) engagement (Ayuso, 2017) and provides better environmental sustainability that will bring superior performance (Roxas et al., 2017). Besides, Onwe,., Ogbo., & Ameh, (2020) and Adomako ., (2020) found a hostile environment motivates firms to adopt EO, which ultimately improves their performance. However, Eijdenberg et al., (2020) revealed that performance was minimally affected by ESOs. Moreover, intrinsic and extrinsic religiosity improves environmental sustainability attitudes (Singh et al., 2021).

From the above arguments related to antecedents of EOfES, one can summarize that the adoption of green entrepreneurial orientation, entrepreneurial innovation, and an environmental strategy will convey improved efficiency and performance in terms of financial, SCM, market, environment, as well as social aspects. On the other side, the environmental problems will be increased with the growth of the economy, increasing per capita income, and the presence of environmental hostility. More specifically, the existence of a turbulent environment such as climate change, natural resource degradation, toxic explosion, and environmental pollution, initiated by individuals and firms to engage in entrepreneurial activities takes these concerns into account. This leads to the emergency of EOfES concept which will be practiced by companies. This new integrated concept has been associated various determining factors and leads to the emergency of many outcomes.

In summary, these factors can be categorized into individual, organizational, societal, and governmental levels. Among the reviewed studies, most are conducted at the organizational level and focused on firms' EO towards the environmentally-friendly activities. The practices here include; ensuring CSR, recycling wastes, promoting environmental innovation capabilities, producing environmentally friendly products, engagement in sustainability orientation, making environmental issue a part of competitive advantage and performance, and reducing environment polluting activities. In this regard, there are determinants of EOfES including; firms capability, firms orientation towards market, customer and innovation, green investment, adoption of clean technology, managerial cognition, GSCM, organizational culture, customers and competitors reactions, and strategic motivations. On the other hand, the possible outcomes are good performance, superior competitive advantage, improved efficiency, product and process innovation, sustainable growth, green supply chain development, and exploited opportunities.

At the individual level, the determinants of EOfES are individual's religiosity, attitudes, and environmental consciousness, while at the government and societal level, there are macro level activities such as environmental awareness creation, environmental friendly product purchase commitment, creating environmental conscious society, developing pro-environmental policies and regulations, which will happen through the joint actions with different stakeholders such as industries, NGOs, the general public, and researchers. Given these inputs the outcomes are, improved environmental performance and social responsibility, improved culture towards the environment, and conserved natural environments.

6. Future Research Implications

Regarding future research, first, there are only a few empirical studies on this topic, identified in developing countries. Therefore, the future researchers should undertake detailed empirical studies on the subject matter of EOfES since the new construct requires further study for clarification. Second, even though the term technology is included in the search along with other topics, we are unable to find the study that integrates EO and ES with technology. Therefore, the future researchers should conduct study on EOfES by integrating with technological aspects. Third, there is also a need to link the EOfES to concepts such as corporate social responsibility, market orientation, innovativeness, and firm's performance. Finally, future researchers could further advance the topic by widely applying content and bibliometric analyses.

7. Conclusion

The EOfES categorized as a new construct that integrates the ES decision and the EO. In this regard, previous researches revealed the EO dimensions are importantly applied to the ES. Individuals' and

firms' strategic decisions should broaden the scope of their goals towards the natural resource preservations. The overall integration of these operations will likely give firms competitive advantages and better performance. Further, the approach has linked to the stakeholders, public policies, social responsibilities, and economic growth. Thus, greater insights into how EO can lead businesses in developing countries to become more environmentally sustainable should be valuable for managers and should inform the design of public policy in developing countries (Roxas et al., 2017). Since environmental issues are of a greater concern, managers should try to incorporate them in their entrepreneurial decision making. Governments in developing countries should also provide incentives for environmentally friendly companies.

Appendix

Author & year	Objectives	Study Variables	Findings
Iqbal et al., 2020	Linking environmental responsive entrepreneurship with sustainable development through empirical evidences from developing country.	Sustainable entrepreneurship and environmental pollution:	At a certain level of economic growth, a 1% increase in per capita income can lead to reductions in environmental pollution by 2.88%, 4.54%, and 2.48%.
Fatoki, 2019	To investigate the impact of green entrepreneurial orientation (GEO) on the sustainable performance (SP) of firms in the context of the hospitality sector.	Environmental performance (EP); Financial performance (FP); Social performance (SP); green entrepreneurial orientation (GEO)	The results indicated a significant positive relationship between green entrepreneurial orientation (GEO) and financial, environmental and social performance.
Ahmed et al., 2020	To analyze the ecological aspects of them by identifying the relationship of ecological innovation, ES and entrepreneurial self-efficacy in affecting a firm's energy efficiency and environmental performance	Ecological Innovation, EO, Entrepreneurial Self-Efficacy, Environmental Performance, & Energy Efficiency	The findings ensure that the ecological innovation, EO, and entrepreneurial self-efficacy are the key contributors to enhance the energy efficiency and environmental performance of SMEs in Malaysia.
Onwe, C., Ogbo, A., & Ameh, A. (2020).	Investigating effect of environmental hostility towards the relationship between EO and the performance of small firms in Nigeria to determine the.	Entrepreneurial orientation, firm performance, & environmental hostility	There is no significant relationship between EO and firm performance, however, a hostile environment motivates firms to adopt EO, and ultimately improve their performance.
Khalid, et al., 2020	Investigating the link between entrepreneurial attributes, strategic capabilities, & environmental nexus in Malaysian manufacturing firms.	Environmental Strategies, Entrepreneurial Innovation, EO, Firm Environmental Performance, and Energy Efficiency	The environmental strategy, entrepreneurial innovation, and EO are the key contributors to enhance the energy efficiency and environmental performance of multinational firms in Malaysia.
Habib et al., 2020	Examining the impact of GEO and market orientation on the implementation of green supply chain management practices and subsequent sustainable firm performance. Further, it identifies the mediating factor between GEO and sustainable firm performance.	GEO, market orientation, green supply chain management, sustainable firm performance	GEO has a significant positive influence on market orientation and GSCM practices, which ultimately positively effects on all the three dimensions (economic, environmental, and social) of sustainable firm performance. Also, GSCM practices partially mediate the relationship between GEO and firm
Sher et al., 2019	The study aimed to investigate barriers in the adoption of green entrepreneurial farming in Pakistan.	Training & development, EO, Market orientation, Customer orientation, Innovation orientation, & Green supporting supplies related barriers.	20 critical barriers are grouped into six major categories and the most dominant barrier among six groupings was training and development-related barriers and the marginal role of government in the provision of such endeavours.
Adomako S, Nguyen NP, (2020)	Drawing on the resource dependency theory, it examines the impact of interfirm collaboration on CSR expenditure. It also examine EO as a moderator of the relationship	Interfirm collaboration, CSR, Expenditure, EO, Market turbulence	Results from our empirical analyses reveal that interfirm collaboration positively impacts CSR expenditure and this relationship is strengthened when entrepreneurial orientation is greater in turbulent environments

Eijdenberg et al., 2020	Investigating the extent to which performance and environmental sustainability orientations (ESOs) are developed, as well as their association, in a typical impoverished community: the informal economy of LDC.	ESO, performance, Age, Gender, level of education	A significant distinction can be made between basic and advanced performance. There is significantly higher levels of awareness of ESO practices that are intangible and are not fully within their control than the personal tangible ESO practices. However, performance was minimally affected by ESOs.
Zahoor, N. & Lew, YK. (forthcoming),	This study examines the influence of strategic orientations and dynamic capability on the sustainable international performance of (SMEs).	EO & alliance orientation (AO) facilitates dynamic capability and, in turn, the sustainable international performance of SMEs	The study finds the significant effects of the interaction between EO & AO on dynamic capability. Dynamic capability mediates the interactive effect of EO & AO on international performance.
Roxas et al., 2017	The main objective of this study is to investigate the effects of EO on ESO and the consequent effects on the performance of small businesses in a developing country context.	EO, ESO, and Performance,	An entrepreneurial strategic orientation enables to develop a more proactive stance toward environmental sustainability practices which lead to superior firm performance.
(Smes, 2021)	The role of the automotive parts industry is crucial in minimizing environmental degradation and promoting sustainable development.	GEO; green innovation; economic performance; environmental performance; social performance	Green innovations have the strongest influence on economic and environmental performances.
Ayuso, 2017)	To shed light on the relationship between entrepreneurial behaviour and commitment to sustainable development (SD)	SD; CSR; EO; internationalisation;	EO is positively associated with SD engagement, particularly regarding the environment, human resources, and community involvement.
Tounés et al., 2020)	To study environmental intention of owner-managers through a multidimensional concept rarely mobilized in the environmental field, namely, EO	environmental intention; entrepreneurial orientation; textile-clothing industry	Textile-clothing industry, which is the source of significant amounts of water and air pollution and is among the priority industries designated by the Tunisian state as part of an environmental improvement program in 2014
Gomis et al., 2017)	Proposes SEO as a multidimensional construct that offers researchers the possibility of empirically testing their theoretical proposals in the sustainable entrepreneurship field	Sustainable entrepreneurship; strategic orientation; SD; dynamic capabilities; multiple orientation; organizational predisposition	SEO's nature is conceived at a firm-based entrepreneurship level and is based on an integrated triple bottom line sustainability

Abstract

Doing business in South Africa is challenging in many ways and recently the deterioration of infrastructure and services provision at the local level have come to influence business location decisions. This paper sets out to build an index that describes the factors that determine the competitive advantages of local economies. This idea is inspired by UNCTAD's Foreign Direct Investment (FDI) Potential Index for countries, but linked to the theories of Geographical Economics and applied at municipal level in South Africa. Principle Component Analysis is used to combine measures of the size and sophistication of the local economy, the local business and government institutions, and the broad macro forces that influence it all. We call the result the *Where to do business (WTDB) index*.

1. Introduction

Economic activity does not take place on the featureless plains of macroeconomic models. It is unevenly distributed across South Africa and the world. Producers and consumers choose to locate in specific places. In South Africa, a big part of the discourse about local economies is currently about the deterioration of infrastructure and public services provision across South Africa. That is an important part, but only a part of the factors that determine the choice where to do business.

1.1. Problem Statement

This paper sets out to build an index of where to do business in South Africa. It builds on insights from the Geographical Economics literature that describes the factors that determine the competitive advantages of places. Local institutions matter as well, and the paper adds a specific focus on the role of local business networks.

1.2. Method

The empirical method for constructing the index is principal component analysis. The *Where to do business index* is calculated at the local municipality level and the data are sourced from HIS Markit's REX database. For all the observations the latest available year is 2021.

1.3. Outline

The structure of the paper is as follows. Section two gives a brief overview of the Geographical Economics literature that provides the basis for the empirical work that follows. Section 3 explores the role of organised business in local level institutions and how Chambers of Commerce can contribute to the competitiveness of a local economy. Section 4 presents a description of the data and factor analysis used to construct the *Where to do business index*. Section 5 concludes.

2. Review of the classic Geographical Economics literature

Geographically, economic activity tends to be unequally distributed and concentrated. Similarly, economic growth rates vary significantly between localities. To examine this, one should distinguish between concentration, specialisation, and agglomeration of economic activity.

Specialisation examines a region or locality's economic structure. As Brakman *et al.* (2001:131) put it, it is the question of whether or not a location's share in the production of cars or apparel is relatively large to the share of other locations in the production of cars or apparel. In contrast, concentration and agglomeration refer to the question of how economic activity as a whole (a specific industry or the whole manufacturing sector) is distributed across space. In this the distinction is a matter of degree. Concentration considers a few well-defined sectors and agglomeration considers the location across space of a much larger part of economic activity, for example the manufacturing sector as a whole (Brakman *et al.*, 2001:129). Thus, explaining the spatial distribution of economic activity, and the determinants of the growth of economic activities across different localities, is about explaining agglomeration.

When the Geographical Economics literature argues that geography matters for agglomeration and growth, it is not only so-called first-nature geography that is important. The analysis goes beyond climate, disease, burden, or distance. Explanations of the ways that economic agglomerations are formed appeal to nature (the unevenness in the distribution of resources), to non-market institutions (such as externalities that give rise to endogenous spatial inhomogeneities), as well as to imperfect competition (Fujita & Thisse, 2002:45).

Porter (1998) linked the ideas of first-nature geography, external economies, distance, and market size with an emphasis on competitiveness leading to growth. He argued that globalisation has changed the importance of the location of production in space. National and international markets for factors are more efficient and competition is less factor intensive. Modern, flexible technologies are often less scale-intensive and are coupled with outsourcing and close relationships with suppliers. There is earlier access to huge foreign markets. This has diminished the importance of factor endowments and the size of local markets. Porter (1998) argued that location now affects competitive advantage through its influence on productivity and productivity growth. This occurs within the context of clusters.

A cluster is a critical mass of producers in a particular location – the result of the process of localisation. Porter (1998) discussed several ways in which location affects the business environment, competition, and growth. These are, to a large extent, the reasons for localisation that Krugman later advanced (1991, 1995, 1998). The first influence is that of the factor conditions of a location. These range from basic inputs such as physical infrastructure, to information. In clusters, the proximity of producers leads to spillovers that improve factor conditions. This improves the flow of information and the success of innovation. This is also true for related and supporting industries. They provide specialised inputs and information, and facilitate complementarities amongst firms. Materials, components, machinery, and services are supplied more efficiently and at lower cost when producers are concentrated in a particular locality. Location plays a role in firm strategy and rivalry. Rivalry that involves imitation and differentiation improves competition and leads to growth. When firms are clustered together, the rivalry is more intense. In the final instance, the demand conditions in a locality may influence the business environment, competition, and growth. Sophisticated and demanding customers at home press firms to improve and differentiate. A cluster may provide such a group of customers.

Thus, Porter (1998) saw the enduring competitive advantages in a global economy as localised. Advantages arise from concentrations that follow from highly specialised skills and knowledge, institutions, rivals and sophisticated customers in a particular region or locality. Proximity allows special access and relationships, better information and other advantages in productivity and productivity growth. Agglomeration is seen as the primary long-run source of economic growth and prosperity.

Empirical studies of the determinants of spatial economic growth may be grouped into three strands (Brakman *et al.*, 2001:128). The first is that of regional and sub-national growth studies that test the determinants of spatial economic growth. This approach is often related to the market-potential approach. The second strand is studies that focus on cities as centres of economic activity. The main questions here relate to city size distribution and optimal city size. The third strand involves the testing of the predictions of the core model of Geographical Economics. From the different tests of the determinants of the spatial variation of per capita income, wages, industry employment or production, a number of commonalities are clear. Firstly, first-nature geography is a significant explanatory variable, working either through endowments or distance. Secondly, externalities are put forward by Geographical Economics model as explanations of agglomeration and they are significant second-nature geography explanatory variables, but the empirical tests are typically for the market access or home-market effect.

Using this literature as a basis this paper sets out to build a measure agglomeration that captures the idea of local competitive advantage. This idea is inspired by UNCTAD's Foreign Direct Investment (FDI) Potential Index for countries (2007), but here it is about the locality's potential as a place to do business.

3. The local role of organised business

As the concept of an index that captures the local business environment is relatively new in South Africa, it is possible to explore terrain over and above the conventional criteria of investment potential, or ease of doing business, considering factors specific to South Africa and its municipalities. This means considering including a possible additional institutional mechanism that could play a relevant role in business decision-making about location. Given the challenges faced at governance level in South Africa, it therefore becomes necessary to examine the extent to which business may have to cope with an extended role in the local economy.

Conceptually, of course, when economists construct economic models – such as seeking to establish criteria for identifying optimal areas for doing business – the natural preference is to want to deal with variables that are easily quantified. As a result, they must often make assumptions that allow them to sidestep the many non-quantifiable aspects of human behaviour and human relationships. The result is that the individuals and institutions that exist are often too simple to give an adequate profile of the circumstances that prevail in the real world, such as for example the value created by the existence of organized entities. The answer must lie in seeing business decision-makers as adaptive organisms that are willing to access whatever data is needed with which they assess alternative courses of action, including location.

The issue of business location is a wide-ranging subject covering small, medium, and large enterprises from all sectors of the economy, basically underpinned by market-driven considerations. It has long been obvious that some business activities – whether from the mining, manufacturing, or service sectors – tend to congregate in particular parts of South Africa. Hence a great deal of attention in economic literature is given to the study of the reasons for the location of economic activity. In the case of sectors like mining or agriculture the location of business activity is often inevitably 'place-bound', or close to an economic 'heartland'. However, in general the obvious orthodox factors driving location in most economies around the world revolve mainly around the cost ratios of transport of raw materials, of workers or of finished goods.

What we do now know generally about business decision-making is that (1) usually a multi-dimensional method is frequently employed by firms to assess investment options, and (2) that outcomes of these options are envisaged with various levels of uncertainty. While most firms may mobilize various technical tools to unpack the investment possibilities there are, as previously suggested, also variables that do not lend themselves to easy modelling. Clearly, it would be advantageous if decision-makers as far as possible could make the future less unpredictable. If they are sufficiently aggressive, they would devote a greater proportion of time and energy to the task of gathering information about the locality and gaining access to data variables about the area.

The confidence with which businesspeople make their decisions must, to some extent, therefore inevitably depend on the broad ‘state of opinion’ they find about the locality and its prospects, or ‘where to do business’. In passing it is interesting to note that, in compiling an article on ‘Ease of Doing Business Index: An Analysis of Investors’ Practical View’, the authors employed a cross-sectional survey design drawn from 47 companies registered with the Lagos Chamber of Commerce and Industry, which it says is the most representative of the organized private sector group in Nigeria (Babatkude et al., 2021). It hints at the existence of an organized business network as being a potential resource, or as a ‘search engine’.

And in the real world, although competitive forces may exist, the interdependence of economic links thus suggests that an ‘industry’ or a ‘sector’ can thus also be seen as a social grouping, that is, a set of firms who are conscious of a common interest – either nationally or locally. This common interest is often reflected in the creation of a trade association or Chamber of Commerce, which will represent the relevant businesses to the relevant authorities and other outside bodies. In some instances, when the number of firms with similar interests gravitate to a locality, the sense of common interest may become strong, even though they are competing. In other words, there is potential through collaboration to enlarge and access external economies of scale through joint or collective access to information.

At a practical level a survey of organized business in the Vaal Triangle of South Africa a few years ago outlined the expectations of several Chambers of how they saw their role in the area and what their priorities were in serving their members. It also provided a useful literature review. The research highlighted the problem issues facing business chambers and their ability to influence the course of events in their area. It also provided a valuable narrative of the strengths and weaknesses of these chambers at the coalface of their representational role in dealing with their respective local authorities (Landsberg et al., 2016)

It should be emphasized, though, that the conceptual framework for collaboration here should, of course, always be focused on conventional advocacy and lobbying by business, not business connections being used for collusive, corrupt, or state capture purposes. In the extensive evidence of state capture and corruption interrogated by the recent Zondo Commission into State Capture in South Africa (Judicial Commission of Inquiry into State Capture, 2022) there have been no instances of legitimate organized business being accused of such activities.

Firms are more likely to behave ethically and act against corruption if they are confident that their competitors also adhere to the same ethical standards. Business associations and Chambers of Commerce can potentially offer a good platform for firms operating in a given sector or location to collectively engage in the fight against corruption and hence level the playing field. They can, inter alia, encourage more transparency and accountability in government decision-making, as well as promote good business integrity.

Orthodox organised business institutions at national, sectoral, or local level should therefore always be so structured and governed to eliminate any scope for dubious behaviour. These remain the basic parameters within which to view the potential role of the organised business network. Does it meet general criteria that add value to business decision-making and help in particular to identify a favourable location in which to do business? And in an environment in which the business mandate may well inevitably extend beyond the immediate balance sheet of the firm or enterprise what mechanism(s) – such as local Chambers of Commerce – may exist to assist in managing such additional obligations?

In focusing on the possibility of a local index of where to do business – the business criteria which would therefore be relevant at higher levels would therefore be largely replicated at lower tiers of government. They would, however, have to be adapted accordingly. In this process the enterprise or firm would need to manage some of the special local challenges when making decisions in a

nonetheless uncertain future environment. The way in which a business will respond to these uncertainties remains of importance in shaping its strategies

Clearly it will be to the advantage of the firm or enterprise if they can diminish them, as this will enhance the chances of making more favourable business and investment decisions in the future. Among the several ways in which uncertainty can be minimized are the use of more elaborate search techniques, including access as suggested to collective information about the locality that is being considered. This may not only help to reduce uncertainty but also assist in protecting the firm against it. The question to be addressed here is whether the existence of local business structure can thus additionally contribute to an assessment of a favourable regional or local investment environment?

It is also true that the uncertain policy environment in South Africa has been particularly important to business confidence and the investment climate in the country. Hardly any current global or local economic assessment about the South African economy have appeared without the inclusion of the words ‘policy uncertainty’ in them. Policy uncertainty in South Africa has been regularly calibrated through the NWU Business School’s Policy Uncertainty Index published quarterly since 2016. Business therefore needs to access all the information needed in their investment and location decisions that will enable them either to minimize the level of policy uncertainty or to identify areas in which it is less acute.

The World Bank Group recently introduced a new concept of investment competitiveness, defined as the ability of countries not only to attract but also retain and integrate private investment into their respective economies. The supporting World Bank study (World Bank Group, 2017) stresses that strengthening investment competitiveness requires establishing a favourable business environment, which includes developing more and better linkages with local, regional, and global economies. Investors attach greater value to mechanisms that help them to expand their businesses than to policies used by governments simply to attract investment in the first place. As many as 68 per cent of multinational corporations now see information on the availability of local suppliers and links to these suppliers as critically important in their location decisions. This creates another opportunity for both well-organised and professionalised local business associations and bilateral national chambers to add value to this process, using their networks.

A narrow approach would also not be in line with the traditional philosophical commitment of Chambers of Commerce to open markets and to uphold the competitive system. Fortunately, empirical research confirms that in a wide range of developed and developing countries most business associations’ activities are in reality market supportive and contribute to economic efficiency. Under certain conditions business associations and chambers can even contribute to economic development without intending to do more than defend their members’ interests, just as trade unions can do.

Briefly, the approach here is to interrogate the following questions:

- argue the question as to what extent an effective ‘organized business network’ of one kind or another can help to shape the environment or location within which business may wish to locate itself?
- identify who is there in a town or city who is committed and can be relied upon to promote that particular business environment or location?
- examine whether good local government-local business relations can assist in contributing to perceptions of an attractive business location?

This is therefore in part an exploratory paper to see whether this collective or collaborative factor can be captured in a new locality index for doing business.

4. Empirical analysis

The construction of a composite indicator of the agglomeration forces that make a specific locality a better place to do business draws on the notion that the competitive advantage of a local economy is a construct that cannot be directly measured, but analysis can identify groups of variables that measure the construct. This idea is inspired by UNCTAD’s Foreign Direct Investment (FDI) Potential Index

for countries (2007) and Zietsman *et al.*'s (2006) Growth Potential Index for towns in the Western Cape.

4.1 Data and factor analysis

For the construction of the Where to do business index per local municipality the data are sourced from HIS Markit's REX database. For all the observations the latest available year is 2021.

The following measures were included in the analysis that follows:

- The municipal level Gross Domestic Product.
- The size of municipality in square kilometres.
- The total population.
- The total number of households.
- The population density.
- The share of exports and imports in local value added.
- The Human Development Index.
- The share of the population with post-matric qualifications.
- A local infrastructure index.
- The share of middleclass households in the municipality.
- The local economic growth rate, average for the period 1996 to 2016.
- The unemployment rate.
- The murder rate.
- A dummy variable indicating whether there is a local chamber of business.
- Local municipal finance data, including the ratio of grants to subsidy income, the share of rates income to total income, the ratio of rates income to grants income, the debt ratio, the debt to revenue ratio.

The choice of these indicators follows Le Roux Booyesen (2003) who used similar measures to construct so-called reconstruction and development indices per province. The focus is on the level of local municipality using the 2016 demarcation and includes the metropolitan municipalities but excludes district councils. The analysis was undertaken using IBM SPSS Statistics 27.

The method for constructing the index is principal component analysis. This approach helps to screen the data, extract the factors, determine the communality, and calculate the factor scores. The factor scores are then used as index values for further analysis.

The first step was to screen the data using a correlation matrix. The analysis requires measures that correlate fairly well with coefficients greater than 0.5 (Field, 2009). The second step in the analysis is to determine whether principal component analysis is appropriate. Table 2 presents the test statistics for KMO and Bartlett's test for sphericity. KMO is a measure of sampling adequacy and represents the ratio of the squared correlation between variables to the squared partial correlation between variables. The statistic ranges between 0 and 1. A value close to 1 indicates that patterns of correlations are relatively compact and principal component analysis should yield distinct and reliable factors (Field, 2009). Here the KMO statistic is .852 and it is possible to continue with the analysis. Additional analysis of the anti-image correlation matrix shows the diagonal elements to be greater than .05 and the off-diagonal elements to be small. Thus, principal component analysis is appropriate for this data.

Table 1: KMO and Bartlett's test

Kaiser-Meyer-Olkin Adequacy.	Measure of Sampling	.852
Bartlett's Test of Sphericity	Approx. Chi-Square	8886.634
	df	231
	Sig.	.000

(Authors' own calculations)

Bartlett's measure tests the null hypothesis that the original correlation matrix is an identity matrix (Field, 2009). The test statistic is significant, which means that one rejects the null hypothesis that the R-matrix is an identity matrix. Thus there are relationships between the variables that can be included in the analysis. Again, the conclusion is that principal component analysis is appropriate.

The extraction of the factors identified four factors with an Eigen value greater than one. The factors explains 76 per cent of the variance of the service delivery.

The communalities represent the amount of variance in each variable that can be explained by the factors that has been retained. Table 2 presents the communalities after extraction. It is clear that the factors explain a large part of the variance in most of the measures save for the chamber dummy, murder rate, area, current ratio, and the full period economic growth rate, but can be retained in the analysis.

Table 2: Communalities

	Initial	Extraction
Chamber dummy	1.000	.392
Total population	1.000	.945
Total nr households	1.000	.959
HDI	1.000	.897
Post matric education	1.000	.749
Population density	1.000	.897
Infrastructure index	1.000	.849
Unemployment rate	1.000	.721
Share of middle-class households	1.000	.810
GVA	1.000	.977
Economic growth rate 1996 - 2018	1.000	.574
GDP	1.000	.977
Export share	1.000	.823
Import share	1.000	.936
Area km2	1.000	.448
Murder rate	1.000	.293
Rates income	1.000	.957
Grants to subsidy income	1.000	.903
Rates to grants income	1.000	.702
Current ratio	1.000	.553
Debt ratio	1.000	.670
Debt to revenue	1.000	.713
Extraction Method: Principal Component Analysis.		

(Authors' own calculations)

Finally, varimax extraction was used to obtain the component matrix to maximise the variance explained by the factors (Field, 2009). Component scores smaller than 0,5 were excluded in the rotated component matrix shown in Table 3.

Table 3: Component matrix

	Component			
	1	2	3	4
GDP	.975			
GVA	.975			
Rates income	.967			
Total nr households	.960			
Total population	.949			

Import share	.932			
Population density	.916			
Grants to subsidy income	.900			
Export share	.867			
Post matric education	.651			
Chamber	.404			
Infrastructure index		.853		
Share of middle-class households		.828		
HDI	.415	.818		
Unemployment rate		-.674		.472
Debt ratio		.541	-.539	
Area km2		.437		
Murder rate		-.401		
Rates to grants ratio			.606	
Debt to revenue ratio		.578	-.603	
Current ratio		-.433	.473	
Economic growth rate 1996-2018				-.674
Extraction Method: Principal Component Analysis.				
a. 4 components extracted.				

(Authors' own calculations)

There are four component groupings of the measures that we classify as follows. Component 1 captures the size of the market, component 2 the sophistication or development of the market, component 3 reflects the financial health of the local government, and component 4 the macroeconomic forces of growth and unemployment.

A number of measures load on two factors and with contrasting signs. A high unemployment rate is negatively related to the other factors that measure the development of the market, so is a high murder rate. High debt ratios and debt-to-revenue ratios are found in more developed markets, but are negatively related to the financial health of the local government. The opposite is the case for the current ratio. Though it is practice to remove measures with double loadings we believe that they do help to explain variation and in directions that concur with expectations.

Factors three and four unfortunately does not provide much useful information for the subsequent building of the index. Factor three will rank municipalities with high rates to grants ratios and current ratios higher and those with higher debt ratios and higher debt to revenue ratios, lower. It does not quite capture the complexity of the challenges facing local government finance. A quick inspection of a ranking of the factor scores shows a high ranking for very small rural municipalities in the Western and Northern Cape and does not say much about doing business there. Other measures of local government financial health and governance will have to be included in further iterations of this work. In the case of factor 4, the negative loading on unemployment dominates the outcome and a ranking shows large rural municipalities with high unemployment rates coming up tops. This also does not add useful information about where to do business.

Based on the analysis above the final step was to calculate factor scores. The factor score is a composite score of the attractiveness of a local municipalities to business in. In this case the regression method was used to calculate the factor scores. These scores are uncorrelated and have a mean of zero. The average of the first two factors scores constitutes the *Where to do business index*. The following sub-section presents preliminary analysis of the index results.

4.2 Results and interpretation

This sub-section presents the index results and simple checks of the index. Figure 2 shows a scatter plot of the aggregate index and the local economic growth rate over the period 1996 to 2018. It is

clear that there is a positive relationship between having a higher WTDB index score and faster average economic growth over the period.

Figure 2: Economic growth and the WTDB index

Figure 3 shows a 2D-dotplot of the aggregate index number split by whether the municipality has a chamber of business or not. It is clear that the majority of municipalities do not have chambers of commerce, but for those that do, the average index score is slightly higher.

Figure 3: WTDB and chambers of commerce

Table 4 shows the ranking of municipalities by the constructed measures of the size of the market, the sophistication of the market, and the provisional index score.

Table4: Index rankings

Size of the market	Sophistication of the market	WTDB
City of Johannesburg	Overstrand	City of Johannesburg
City of Tshwane	uMngeni	City of Cape Town
City of Cape Town	Midvaal	eThekwini
Ekurhuleni	Stellenbosch	City of Tshwane
eThekwini	Mogale City	Ekurhuleni
Nelson Mandela Bay	Saldanha Bay	Overstrand
Polokwane	City of Cape Town	uMngeni
Emfuleni	Cape Agulhas	Nelson Mandela Bay
Mangaung	Knysna	Msunduzi
Madibeng	Drakenstein	Stellenbosch
City of Mbombela	Msunduzi	Midvaal
Msunduzi	eThekwini	Mogale City
Rustenburg	Hessequa	Buffalo City
Bushbuckridge	Buffalo City	Saldanha Bay
Buffalo City	Nelson Mandela Bay	Drakenstein
Emalaheni	Mossel Bay	Mangaung
Greater Tubatse/Fetakgomo	George	Knysna
Thulamela	Steve Tshwete	Cape Agulhas
King Sabata Dalindyebo	Sol Plaatje	Hessequa
Greater Tzaneen	JB Marks	City of uMhlathuze

The results show the dominance of the large metro cities and many of the larger cities and towns in the Western Cape and KwaZulu-Natal. Though many of the names make sense, one should caution that these are preliminary results that still require further investigation.

5. Managerial Implications

The point of departure in this paper is that, over and above the existing macro and micro data available to business in deciding where it may be best to locate and do business, there is a gap that needs to be filled by the creation of a Where to do business index in South Africa. It can be seen as a valuable new tool to evaluate the advantages and disadvantages of various cities and towns, as now calibrated by such an index

An index along these lines which identifies localities most favourable to business and investment activity will therefore add value to decision-making in the following six ways:

Firstly, apart from its business and economic value, there are also a number of overall socioeconomic reasons distinctive to South Africa that enhance the role that such an index can play in the location of business activity in general and investment in particular. It identifies particular areas where local economic development may be facilitated. This then requires a sharper focus on local criteria for business investment. Drawing on available Geographical Economics literature and fresh sources the paper opens up new dimensions for consideration, including those of local business institutions and the existence of a business-friendly environment at local level.

Secondly, the index aims to enhance – but also to compress – the flow of information that is relevant to identifying optimal business locations and hence to guide decision-making accordingly. While all firms could potentially benefit from a Where to do business analytical tool, it is especially useful to SMMEs, whose size is usually inadequate to assist them in their investment analysis. This may also be true of larger firms when the size of the investment is small in relation to the value of the resources which the enterprise has at its disposal. This is all especially relevant when assessing the economic potential of smaller towns and localities.

Thirdly, in the long run the success of a firm or enterprise is related to its return on investment and on its existence within an environment of economic sustainability. To make the best business decisions the firm must therefore reduce level of uncertainty that may surround a particular city, town, or locality. The firm must thus either devote more time and resources to the task of gathering information about the local environment, or it can now access up-to-date and readily available Where to do business data. It is clearly to the decision-maker's advantage if the local future can be made more predictable in this way. It is, of course, uncertainty about a particular locality to which the new index is addressed that is that is relevant here, not uncertainty generally.

Fourthly, it may well be that a decision-maker should continue to collect information about a locality until he or she is of the view that the gathering costs exceed the benefit that can be obtained from its use. However, this is not always a very cost-effective way to go, as no consistent or stable relationship has been found between the cost of searching for data and the value of the knowledge gained. The existence of a readily available and reliable Where to do business index now helps to bridge that gap and reduce the transaction costs of gathering certain pertinent information.

Fifthly, the availability of a Where to do business index therefore improves the accuracy of predictions as to locality. It helps an enterprise to access information which allows more accurate predictions about the profitability of various business proposals that are being considered. This reduces the likelihood that projects will be selected that turn out to be unprofitable or unsustainable and reject opportunities that may have been more lucrative or aligned with local economic developments. The confidence with which decision-makers take decisions must depend reliable sources of information which are credible.

Sixthly, from the point of view of overall governance in South Africa the existence of an updated Where to do business index offers a useful spin-off that could (a) help to act as an 'early warning system' to higher authorities monitoring local government as to changes in the investment attractiveness of various metropolitan centres and towns and (b) inject a useful additional 'competitive' element into the performance of cities and towns in serving their citizens and business. The concept of a Where to do business index in South Africa therefore represents an innovative opportunity to mobilize the local data available in ways that promote good decision-making by business as to its optimal location.

ENVIRONMENTAL MANAGEMENT

Reporting on Water Targets and Measures in the Food Beverage and Tobacco Industry

Dr Martin Botha^{1,*}, Prof Merwe Oberholzer², Prof Sanlie Middelberg³

¹⁻³ North-west University, Potchefstroom, South Africa

Keywords

Water targets and measures; food, beverage and tobacco industry; disclosure; Global Reporting Initiative

Abstract

The food, beverages and tobacco industry depend heavily on water and is therefore directly exposed to water scarcity. To address the water issue, the phrase ‘what gets measured, gets managed’, could be applied. The objective of the paper was to develop an improved water disclosure index by expanding the GRI 303 water and effluents framework. A sample of 49 companies listed on the Australian Security Exchange, the South African JSE Limited and Dow Jones Sustainability Index (DJSI) were selected. A manual content analysis was performed, which included a process of coding qualitative and quantitative data collected from the integrated, sustainability or environmental reports. The study revealed that the constructs’ current quality of disclosure of targets and measures is between 32.65% and 43.88%. Furthermore, companies listed on the DJSI (69.23%) outperformed the South African (41.25%) and Australian firms (16.00%). Our improved water disclosure index contributes by adding four new constructs measuring water quality, water recycled and reused, including a baseline year and water efficiency ratio. This could be used to improve comparability between water users and improve decision-making by stakeholders.

1. Introduction

With water becoming a global concern due to factors such as intensive agricultural production and growing populations (DeMaagd & Roberts, 2021), individuals, countries and small and large companies have become aware of the importance of this scarce resource. The food, beverages and tobacco industry depend heavily on water and is therefore directly exposed to water scarcity (McKinsey and Company, 2009:4). This industry interacts with water in many different ways that can negatively affect the environment and, in turn, communities (Kemp *et al.*, 2010:1553).

Stakeholders are demanding to be better informed about the social and environmental impacts of business, and deteriorating environmental conditions have heightened the expectations of stakeholders around corporate social responsibility (CSR) practices (Boiral, 2013:1036; Dong *et al.*, 2014:59). Water has become one of the dominant environmental issues around the world, resulting in a focus on corporate water disclosures driven by increasing importance of sustainable water use (Hazelton, 2013:270). The world is seeking solutions to water-related issues, increasing the recognition of the potential of water accounting to contribute to the solution by providing relevant water information (Chalmers, Godfrey & Potter, 2012:282). The phrase ‘what gets measured, gets managed’, could be applied.

In this paper, the emphasis is on the disclosure of setting water-related targets (also known as targets and goals) and the measurement thereof. We expanded on the Global Reporting Initiative (GRI) 303 document that deals with “water and effluents”. The document explains that there is a strong relationship between (i) water withdrawal, (ii) water consumption, and the (iii) discharge of water (GRI, 2018:4). We place focus on the quality of water disclosure of companies in the food, beverage and tobacco industries listed on three indices: Firstly, the Australian Security Exchange (ASX), since Australia is the most arid continent (Besada & Werner, 2014:129); Africa is the second-most arid continent and South Africa is classified as one of Africa’s water-stressed countries (Tewari,

*Corresponding Author

¹ E-mail address: Martin.botha@nwu.ac.za

2009:693). Consequently, South African companies listed on the Johannesburg Security Exchange (JSE) were selected; and thirdly, considering that water is a global concern, the listing requirements of the Dow Jones Sustainability Index (DJSI) provided a global perspective and comparison towards best practices in the food, beverage and tobacco industry.

The GRI, which consists of lists of metrics related to sustainability, is arguably currently the most widely reported initiative utilised by companies (D'Andrea, 2017; Fonseca *et al.*, 2012:78-81; GRI, 2013:54-61). Notwithstanding, previous research conducted on the improved GRI G4 guidelines where companies have to specify the standards and methods they apply in their reporting, indicate that researchers are still questioning the usefulness of water data that is aggregated from many sites (Danoucaras *et al.*, 2014:728). By providing consistent information across all sites, Leong *et al.* (2014:98) argued that companies can show that they are not manipulating their reports by cherry-picking the best stories and results across their operations. Another study performed by Fonseca, McAllister, and Fitzpatrick (2012:70) contested the effectiveness of the GRI framework by arguing that GRI-based reports could mislead decision-makers because unsustainable practices, particular at site level, is not reported on. Semmens, Bras, and Guldberg (2013:247) stated that more standardised water reporting guidelines would allow companies to conduct meaningful comparisons of internal activities to benchmark against competitors' operations. Dantas *et al.* (2021) investigated global, international, and national water databases for water withdrawal and consumption, and found significant inconsistencies which encumbers comparison across databases. The authors call for improved water reporting and further investigations to improve water data reporting. Jones *et al.* (2015:118) conducted an exploratory study selecting the world's top 10 food and drinks companies as ranked for social responsibility by Oxfam. The findings revealed considerable variations in the information provided by the food and beverage companies on their approach to water stewardship. Hereupon, they argued that the lack of common and agreed frameworks and standards make it difficult to establish meaningful comparisons between companies.

2. Problem Investigated

There is a need how to measure, manage and report water information. This is driven by the lack of uniform standards and guidelines on reporting practices. Unlike carbon emissions, no collective accepted standard exists for the setting of meaningful and measurable targets for water. Significant targets are those that are closely linked to the context within which a company's direct operations and supply chains are located (CDP, 2017b:10). To address these shortcomings, targets and measures to improve measurability and comparability of the information to assist stakeholders to compare and evaluate the disclosed information, are required. This paper aims to fill this gap by contributing to the debate on how to standardise reporting and disclosure practices with regard to water targets and measures. In this regard, only 56% (418) of the total companies investigated in the latest Carbon Disclosure Project (CDP) global water report have set targets. However, the majority remain short-term goals and do not adequately account for sustainable thresholds of the basin upon which the company relies (CDP, 2017a:13).

3. Research Objectives

The objective of the paper is to develop a water target and measures disclosure index for the food, beverage and tobacco industry. The research comprised three phases. Phase 1 – part of the literature review – developed a water disclosure index by expanding the current GRI 303: water and effluents framework and utilising it as a measuring instrument for the quality of water targets and measures disclosure. In this vein, several studies have used the GRI sustainability guidelines as basis to analyse sustainability reporting practices of companies (Topp-Becker & Ellis, 2017; Weber & Hogberg-Saunders, 2018). Phase 2 empirically tested the index by gathering qualitative and quantitative data from the sampled companies listed in the food, beverage and tobacco industry of the three selected indices. Phase 3 identified additional best disclosure practices from the sampled firms to develop a further improved disclosure index.

We contribute four new sub-constructs as part of an improved water disclosure index, namely water quality, water recycled and reused, baseline year and water efficiency ratio. This new water disclosure

index, which is focused on water targets and measures, could be applied by firms operating in the food, beverage and tobacco industry. This could contribute to the skills needed to disclose integrative and comparable water-related information. The different sub-constructs in the water disclosure index could contribute to future reporting frameworks, and practitioners, policymakers, academics or standard setting bodies could utilise the index as a benchmark to test, refine or adjust the index.

4. Literature Review

4.1. Targets, measuring and reporting

To identify and quantify water impacts are crucial for companies to enhance effective management decisions. Mueller *et al.* (2015:33) stated the significant gaps in datasets and inconsistencies in measurement and reporting of geographical water shortfalls. The need for more complete datasets, containing the following information, was emphasised (Mueller *et al.*, 2015:42):

- Amount of water withdrawal and discharge.
- Amount of freshwater availability and depletion.
- Water quality to be monitored.
- Reuse and recycle information on water.

This argument is corroborated by the CDP's global water report of 2017, where it is argued that companies have to measure and monitor water withdrawals, discharges, quality, consumption and the provision of water, sanitation and hygiene services across their operations (CDP, 2017a:13).

Companies have to set targets to reduce impacts on water availability and quality. Once these targets are set, companies should have to commit to these targets as they are fundamental to determine the status of water resources. The GRI 303 explains that there is a strong relationship between water withdrawal, water consumption and the discharge of water (GRI, 2018:4). Because of this strong relationship, companies are expected to report on all three topic-specific disclosures. As water-related impacts are often localised, the company is encouraged to support any quantitative aggregate-level information with narrative descriptions of any contextual factors that were considered when compiling the information (GRI, 2018:4). To adhere to this need, a more comprehensive overview of the company's water use should be available. This standard includes disclosures on the management approach and topic-specific disclosures. The requirements in terms of the management approach are discussed in GRI 303-1&2, however this paper focuses on topic-specific disclosures, namely sub-construct 1, disclosure GRI 303-3 water withdrawal, 2, disclosure GRI 303-4 water discharge and, 3, disclosure GRI 303-5 water consumption.

In terms of disclosure GRI 303-3, water withdrawal, and GRI 303-4, water discharge, the reporting organisation should report the following information (GRI, 2018:9):

- (a) Total water withdrawal/discharge from all areas in mega litres (ML) and all areas with water stress in ML, and a breakdown of this total by the following sources, if applicable:
 - (i) surface water;
 - (ii) groundwater;
 - (iii) seawater;
 - (iv) produced water; and
 - (v) third-party water.
- (b) A breakdown of total water withdrawal/discharge from each of the sources listed in disclosures GRI 303-3 (a) and GRI 303-3 (b) in ML by the following categories:
 - (i) freshwater ($\leq 1\,000$ mg/L Total Dissolved Solids); and
 - (ii) other water ($>1\,000$ mg/L Total Dissolved Solids).

- (c) Any contextual information necessary to understand how the data have been compiled, such as any standards, methodologies and assumptions used.
- (d) Finally, only relevant to GRI 303-4, priority substances of concern for which discharges are treated, including:
 - (i) how priority substances were defined, and any international standard, authoritative list, or criteria used; and
 - (ii) the approach for setting discharge limits for priority substances.

Disclosure GRI 303-5 which deals with water consumption, states that the reporting organisation should report the following information (GRI, 2018:15):

- (a) Total water consumption from all areas in ML.
- (b) Total water consumption from all areas with water stress in ML.
- (c) Change in water storage in ML, if water storage has been identified as having a significant water-related impact.
- (d) Any contextual information necessary to understand how the data have been compiled, such as any standards, methodologies and assumptions used, including whether the information is calculated, estimated, modelled or sourced from direct measurements, and the approach taken for this, such as the use of any sector-specific factors.

The set targets should be scientifically informed by sustainable thresholds and the social context of a given catchment and should be aligned with other targets. Referring to these targets, the company should be able to account for the local context where the water is withdrawn and discharged. Additionally, the targets should be aligned with public sector efforts, such as the targets of the UN Sustainable Development Goal number 6 on water, or with other targets set by national and local government institutions, trade associations and action groups (GRI, 2018:7).

According to Chalmers, Godfrey and Lynch (2012:1003), the importance of high-quality water-related information to support decision making is of critical importance when addressing water management. The deterioration in water quality is a global concern, which is expected to intensify over the next decades causing serious threats to human health, the environment and also for sustainable development (WWAP, 2018:3). Consequently, water quality is included in our water disclosure index – targets and measure and titled Sub-construct 4.

Results revealed that if firms report water discharge, they also report water withdrawal, water consumption and water recycled under the GRI G3 characteristics (Kleinman *et al.*, 2017:347). In an example of a distillery it was found that they report on both recycling and the reuse of water Diageo (2018:18). Subsequently, water recycled and reused disclosure are included in the water disclosure index: targets and measure and is titled Sub-construct 5. This is based on reporting on water quality that was included in the previous GRI (2013) report (G4 – EN 8) which included the question: “Does the company report the total volume of water recycled and reused by the organisation in cubic metres per year (m³/year) as a percentage of the total water withdrawal reported?”.

4.2. Phase 1: Design of the water targets and measure disclosure index

The aim of the first phase was to design a water targets and measure disclosure index. The previous GRI guidelines, the latest GRI 103 and GRI 303, the CDP, the GRI sector guidance for food and beverage processing, and grounded literature on water reporting identified, were used to develop a water disclosure index. Themes were identified to function as five sub-constructs of water disclosure with regard to water targets and measures. A three-point assessment scale – with a quality description for each element in the water disclosure index – was developed. This was to improve the accuracy towards coding and consequently scoring the reporting of targets and measures of water in the sampled companies. Each sub-construct in the water disclosure index was deliberated at a colloquium of experienced persons, followed by pilot coding, and a subsequent discussion of the results – before

further analyses commenced. Table 1 formed and refined each sub-construct together with the coding instructions.

Table 1: Developed water targets and measures disclosure index

Sub-constructs	Coding		
	0	1	2
<p>1) Total water withdrawal by source (EN 8): The company discloses total water withdrawal from all areas in ML, and a breakdown of this total by the following sources, if applicable: (a) surface water (i.e. collected or harvested rainwater); (b) groundwater; (c) seawater; (d) produced water; (e) third-party water.</p> <p>Total water withdrawal from all areas with water stress in ML, and a breakdown of this total by the following sources, if applicable: (a) surface water; (b) groundwater; (c) seawater; (d) produced water; (e) third-party water, and a breakdown of this total by the withdrawal sources listed in a-d. (When compiling the information specified above, the reporting organisation shall use publicly available and credible tools and methodologies for assessing water stress in an area).</p> <p>A breakdown of total water withdrawal from each of the sources listed in Disclosures 303-3-a and 303-3-b in ML by the following categories: (a) freshwater ($\leq 1,000$ mg/L Total Dissolved Solids); (b) Other water ($> 1,000$ mg/L Total Dissolved Solids). (Other water constitutes any water that has a concentration of total dissolved solids higher than 1,000 mg/L. Other water is therefore all water that does not fall into the freshwater category.)</p> <p>Any contextual information necessary to understand how the data have been compiled, such as any standards, methodologies, and assumptions used.</p>	No disclosure	The company discloses total water withdrawal (quantity) and/or the source but does not quantify the source.	The company discloses total water withdrawal, quantifying each source.
<p>2) Disclosure 303-4 water discharge: The company discloses total water discharge to all areas in ML, and a breakdown of this total by the following types of destination, if applicable: (a) surface water; (b) groundwater; (c) seawater; (d) third-party water, and the volume of this total sent for use to other organisations, if applicable. (An example of third-party water discharge is when an organisation sends water and effluents to other organisations for use. In these instances, the organisation is required to report the volume of this water discharge separately.)</p> <p>Priority substances of concern for which discharges are treated, including: the number of incidents of non-compliance with discharge limits.</p> <p>Any contextual information necessary to understand how the data have been compiled, such as any standards, methodologies, and assumptions used.</p> <p>The number of occasions on which discharge limits were exceeded. Any fines received or to be paid.</p>	No disclosure	The company discloses total water discharge (quantity) and/or the source but does not quantify the source.	The company discloses total water discharge, quantifying each source
<p>3) Disclosure 303-5 water consumption: The company discloses total water consumption from all areas in ML. (If the reporting organisation cannot directly</p>	No disclosure	The company discloses	The company discloses total water

measure water consumption, it may calculate this using the following formula: Water consumption = Total water withdrawal – Total water discharge). Any contextual information necessary to understand how the data have been compiled, such as any standards, methodologies, and assumptions used, including whether the information is calculated, estimated, modelled, or sourced from direct measurements, and the approach taken for this, such as the use of any sector-specific factors.		total water consumption (quantity).	consumption (quantity) with contextual information
4) Disclosure of water quality: The company discloses information on their water quality.	No disclosure	Statement about water quality.	Provide more detail on water quality.
5) Percentage and total volume water recycled and reused: The company discloses total volume of water recycled and reused by the organisation in cubic metres per year (m ³ /year) as a percentage of the total water withdrawal reported under Indicator G4 – EN 8.	No disclosure	The company discloses total water recycled and reused.	The company discloses total water recycled and reused (quantify and percentage of total withdrawal).

Source: own compilation

5. Methodology and Design

From the literature review, a water disclosure index (refer table 1) for targets and measures with the five mentioned sub-constructs was developed and applied as the measuring instrument. Phase 2 empirically tested the index in the selected three indices in the food, beverage and tobacco industry by following a mixed method approach. Firstly, a manual content analysis was performed by reviewing the integrated, sustainability or environmental reports of the sampled companies. Qualitative data through review of narrative reporting, and quantitative data by establishing a disclosure score for each of the sampled companies utilising the water disclosure index (Table 1), was collected. Secondly, a quantitative approach was followed to test the sample companies' current disclosure quality using the disclosure scores. Descriptive statistics were used to calculate the mean disclosure score for each of the sub-constructs included in the framework. A further quantitative analysis included an ANOVA which measures whether there is a significant difference between the mean scores of each index.

Phase 3 searched for additional themes during the qualitative coding of the integrated, sustainability or environmental reports from the sample companies. The aim was to identify additional best disclosure practices from the sample firms to develop a further improved disclosure index. Abductive reasoning was applied after phase 2 and 3 were concluded where the quantitative analysis was integrated with the qualitative analysis to enhance the final improved disclosure index.

Non-probability, purposive sampling was utilised to select firms from the ASX in Australia, the Johannesburg Securities Exchange (JSE) in South Africa and global companies listed on the Dow Jones Sustainability Index (DJSI) in the food, beverage and tobacco industry for the period November 2018 – February 2019. Australia and South Africa are water scarce countries, and a global perspective was added by including firms listed on the DJSI.

The sample included 16 of the 18 companies listed in South Africa – one company was a new listing and did not have any sustainable reports, while the other company is British American Tobacco (BAT), a dual listing on both the JSE and DJSI. BAT was reckoned only under the DJSI in order to compare global best practices. On the ASX index in Australia, 26 companies were detected under the food, beverage and tobacco industry. For purpose of this study, only the 20 largest companies per market capitalisation were selected. Thirteen companies on the DJSI adhere to the listing

requirements of the index and formed part of this study. In total 49 companies (16 + 20 + 13) were included in the sample.

6. Results and Findings

6.1. Phase 2: Empirically testing the water disclosure index

Table 2 reveals the analysis of the results of the five constructs within the water disclosure index based on the disclosure score of each of the sampled companies. The number of companies analysed, the minimum- (0) and maximum (2) disclosure score is illustrated. The developed assessment scale (ordinal scale) provided the ability to measure the quality of disclosure. The mean, standard deviation (SD), and mean percentage is also provided. The Cronbach's alpha for targets and measurement as an overall construct showed a value of 0.875 which suggest very good internal consistency reliability. It is recommended that values of the Cronbach's alpha coefficient should be above 0.7 to be acceptable (DeVellis 2012, 112).

Table 2: Descriptive statistics of disclosure of water targets and measures

Sub-constructs	N	Min	Max	Mean	SD	Mean%
1) Total water withdrawal per source	49	0	2	0.88	41.62	43.88
2) Total water discharged	49	0	2	0.65	42.76	32.65
3) Total water consumption	49	0	2	0.80	44.46	39.80
4) Disclosure on water quality	49	0	2	0.86	40.82	42.86
5) Volume of water recycled and reused	49	0	2	0.65	43.96	32.65

Source: own compilation

Table 2 presents the quality of disclosure of water targets and measures. It is evident that the quality of disclosure for each construct is very low as the mean is lower than 1 which effectively means that it ranges between no disclosure and limited disclosure (refer to table 1). The two constructs with the lowest disclosure scores are construct 2 – total water discharged, and construct 5 – volume of water recycled and reused. While the best performing construct was construct 4 measuring the disclosure on water quality. The mean percentage narrowly ranges between 32.65% and 43.88%.

We found that not all companies use the same metrics for water measurements. It was also detected from the analyses that many firms calculate water withdrawal and discharges in total, however a further breakdown of water withdrawal and discharges per source, was lacking. Some firms did calculate water intensity/efficiency ratios by expressing water consumption in an efficiency ratio as input versus output, rather than water used per kilogram of finished product, or per litre of packaged product. Disclosure on the reuse and recycling of water was one of the least reported on elements. Table 3 exhibits a comparison between the disclosure quality of the sampled companies listed on the three indices.

Table 3: Targets and measures per index/country

Country	N	Mean %	SD
South Africa	16	41.25	33.24
Australia	20	16.00	24.37
Global	13	69.23	25.64
Total/average	49	38.37	34.84

Source: own compilation

Assessing Table 3, it is evident that the companies listed on the DJSI, with a disclosure score of 69.23% outperformed the South African (41.25%) and Australian firms (16.00%). A recorded p-value of 0.000 was calculated that illustrates significant differences among the groups which requires further investigation. Accordingly, the Tukey test in Table 4 separates the three groups.

Table 4: Tukey test for targets and measures

Targets and measures: Tukey B		Subset for alpha = 0.05		
Country	N	1	2	3
Australia	20	16.00%		
South Africa	16		41.25%	
Global	13			69.23%

Source: own compilation

The three subsets in Table 4 implies that the mean of water targets and measures disclosure score for the global companies are statistical significantly ($p < 0.05$) higher than the South African and Australia companies and that the South African companies disclosure mean score is statistical significantly ($p < 0.05$) higher than the Australia companies.

In research conducted by ACCA (2010:20), targets and measures were split between consumption and implementation categories. The Australian companies recorded an average score of 50% under the consumption category and 26% for the implementation criterion. ACCA (2010:24) stated that full quantitative disclosure was absent from most companies, especially in the areas of water discharge and recycling. The 32 companies analysed in ACCA's study achieved higher percentages when compared to the 16% recorded in this study. The difference could be ascribed to various industries analysed in the study of ACCA, suggesting that companies in the food, beverage and tobacco industry in Australia have much room for improvement. The CDP (2017a:13) revealed that 466 of 742 of the world's largest publicly listed companies (63%) had a good grasp of measuring and monitoring water withdrawals, discharges, quality and consumption. The companies listed on the DJSI in this study achieved a higher score of 69.23%. The Tukey test in Table 4 verifies that the firms listed on the DJSI could be viewed as organisations implementing best practices. This signifies that the firms listed on the DJSI are taking the lead in the food, beverage and tobacco industry with regard to water disclosure on targets and measures – which other firms could utilise as examples to improve.

6.2. Phase 3: Best disclosure practices

During the coding process, which required an intensive study of the content of sustainability/environmental reports, examples of some best practices with special reference to the construct of targets and measures, were identified. For example, Distell, a JSE-listed company in the alcoholic beverages industry in South Africa, disclosed the following with regard to water efficiency:

Our resource efficiency targets for 2020 (relate to the usage of water, electricity and fossil fuel-based energy in our production processes) will enable us to actively drive annual improvements in performance to ensure we reach our long-term goals. We achieved our 2018 target and even exceeded our 2020 target to reduce water usage by 15% by increasing water recycling at our Adam Tas and Green Park sites and installing a closed loop cooling system at our Wellington distillery (Distell, 2018a:30).

Nestlé, the world's largest food and beverages company, reported on their water efficiency and stated that they implemented 578 water-saving projects in their factories with expected savings of 5.4 million m³ of water a year, through operational efficiency and technology for reusing water (Nestlé, 2017:80). The ability of Nestlé to quantify water information illustrates their commitment towards water governance. Diageo (2018:18) measured their success relative to the size of an Olympic swimming pool:

A recent programme of investments in our distilleries in Maharashtra state has driven further improvements. We have installed new water-recycling equipment, including ultra-filtration followed by reverse osmosis systems at our Nasik, Aurangabad and Pioneer sites. This has enabled us to reuse up to 500,000 cubic metres of water a year – enough to fill 200 Olympic swimming pools.

In addition to the elements measured above, some companies disclosed water intensity/efficiency ratios, for example British American Tobacco (2017:35) recorded that they use 3.27 m³ of water per million cigarettes equivalent produced, a 33% reduction from a 2007 baseline year. Calculating water usage per litre of packaged product, Distell (2018b:48) reported usage of 3.33 litres compared to 4.94 litres used by Diageo (2018:8). Considering that both companies operate in the alcoholic beverage industry, the expression of water efficiency ratios could provide valuable and comparable information to stakeholders.

Examples of best practices observed when performing the analysis, which could improve the comparability of water reporting, was the disclosure of water intensity/efficiency ratios. The companies disclosing water efficiency ratios are utilising their measurements from total water withdrawal, to calculate an efficiency ratio in terms of water used per kilogram of finished product or per litre of packaged product. To provide further substance to water efficiency, some companies introduced a baseline year. For example, ThaiBev (2018:94) listed on the DJSI divided their water intensity ratios per product line and compared it with a baseline year – in order to advance comparability as follows:

In the beverage business, the water intensity ratio was reduced by 1.37 hectolitres per hectolitre of finished product, or 16.72% compared to 2014 as a baseline year. For the food business, the water intensity ratio was reduced by 0.06 hectolitres per kilogram of finished products, or 22.86% compared to 2017.

Additionally to water efficiency ratios observed, Grupo Nutresa (2017:182) listed on the DJSI stated that they are working on the measurement of their water footprint, which measures the direct and indirect water consumption, as medium- and long-term plans.

Kellogg's (2018:32), an American multinational food manufacturing company, highlights their commitment to water reuse relatively to a baseline year:

Kellogg is committed to implement water reuse projects in at least 25% of our plants by 2020 from a 2015 baseline, with a specific focus on plants located in water-stressed areas. Kellogg has committed to responsibly sourcing our ten priority ingredients as determined by environmental, social, and business risk by 2020 by partnering with suppliers and farmers to measure continuous improvement.

Although the firms listed on the DJSI performed the best with a disclosure score of 69.23%, the overall performance of all 49 firms for the targets and measures construct was 38.37%. Referring back to the literature, Mueller *et al.* (2015:31) stated that quantifying water impacts are key to enable firms to make effective management decisions. However, full quantitative disclosure was nevertheless lacking by many firms within the elements in the targets and measures construct.

Best practices in the analyses highlighted that water reuse projects, reverse osmosis systems and water-recycling equipment resulted in millions of litres water reused and recycled.

6.3. An improved Water Disclosure Index: Targets and Measures

The main objective was to develop an improved water disclosure index to measure the disclosure of water targets and measures. Table 5 presents this index. Four additional sub-constructs were added to the original three water disclosure index developed from literature. The first additional two sub-constructs are water quality, and water recycled and reused, while the last two are disclosure of a baseline year which enables a company to compare its improvement over a period of time, and the disclosure of a water efficiency ratio.

Table 5: Improved water disclosure index for food, beverage and tobacco industry

Water disclosure index	Guidance
<p>1) Total water withdrawal by source Disclose total water withdrawal from all areas in ML and provide a breakdown of this total by the following sources, if applicable: (a) surface water (includes collected or harvested rainwater); (b) groundwater; (c) seawater; (d) produced water; (e) third-party water. Total water withdrawal from all areas with water stress in ML, and a breakdown of this total by the following sources, if applicable: (a) surface water; (b) groundwater; (c) seawater; (d) produced water; (e) third-party water, and a breakdown of this total by the withdrawal sources listed in a-d. (When compiling the information specified above, the reporting organisation shall use publicly available and credible tools and methodologies for assessing water stress in an area). A breakdown of total water withdrawal from each of the sources listed in Disclosures 303-3-a and 303-3-b in ML by the following categories: (a) freshwater ($\leq 1,000$ mg/L Total Dissolved Solids); (b) other water ($> 1,000$ mg/L Total Dissolved Solids). (Other water constitutes any water that has a concentration of total dissolved solids higher than 1,000 mg/L. Other water is therefore all water that does not fall into the freshwater category.) Any contextual information necessary to understand how the data have been compiled, such as any standards, methodologies, and assumptions used.</p>	<p>The company should disclose total water withdrawal, quantifying each source.</p>
<p>2) Water discharge Disclose total water discharge to all areas in ML and provide a breakdown of this total by the following types of destination, if applicable: (a) surface water; (b) groundwater; (c) seawater; (d) third-party water, and the volume of this total sent for use to other organisations, if applicable. (An example of third-party water discharge is when an organisation sends water and effluents to other organisations for use. In these instances, the organisation is required to report the volume of this water discharge separately.) Priority substances of concern for which discharges are treated, including: the number of incidents of non-compliance with discharge limits. Any contextual information necessary to understand how the data have been compiled, such as any standards, methodologies, and assumptions used. The number of occasions on which discharge limits were exceeded. Any fines received or to be paid.</p>	<p>The company should disclose total water discharge, quantifying each source.</p>
<p>3) Water consumption Disclose total water consumption from all areas in ML. (If the reporting organisation cannot directly measure water consumption, it may calculate this using the following formula: $\text{Water consumption} = \text{Total water withdrawal} - \text{Total water discharge}$) Any contextual information necessary to understand how the data have been compiled, such as any standards, methodologies, and assumptions used, including whether the information is calculated, estimated, modelled, or sourced from direct measurements, and the approach taken for this, such as the use of any sector-specific factors.</p>	<p>The company should disclose total water consumption (quantity) with contextual information.</p>
<p>4) Water quality Disclose information on water quality.</p>	<p>Provide detail on water quality which could affect food and beverage products.</p>
<p>5) Percentage and total volume of water recycled and reused</p>	<p>The company should</p>

Disclose total volume of water recycled and reused in m ³ /year as a percentage of the total water withdrawal reported.	disclose total water recycled and reused (quantify and percentage of total withdrawal).
6) Baseline year Set and disclose a baseline year of total water withdrawal, water discharge, and water reused and water efficiency ratios against which comparisons should be disclosed from one year to the next.	Disclosure of different timeframes, and comparisons with a baseline year would assist progression towards more water efficient operations.
7) Water efficiency ratio Calculate water efficiency ratios in terms of input (water consumption in ML) divided by output (kilograms of finished product or litres of packaged product).	Firms should calculate and express their water consumption in an efficiency ratio and compare this to a set baseline year (as discussed above) in order to determine whether progress is made to more water efficient operations. These ratios could be utilised to compare with other firms.

Source: own compilation

7. Recommendations and Conclusion

Building on the GRI 303 framework, we developed a new water disclosure index to measure water targets and measures. We added four new sub-constructs namely water quality, water recycled and reused, baseline year and water efficiency ratio. This is to address shortcomings uncovered in the literature review, such as a lack of comprehensive overview of withdrawal, consumption and discharge and various metrics. The quantitative results revealed that the disclosure of targets and measures in food, beverage and tobacco companies listed on the ASX, JSE and DJSI, are poor. The five sub-constructs reached median percentages of between only 32.65% and 43.88%. The results confirmed major gaps in the measuring and reporting of water data – which could lead to poor information available for decision-making. This low score may be attributable to the fact that there is no collective accepted standard for the setting of meaningful and measurable targets for water. The lack of standards was further revealed as statistical significant disclosure differences between the three indices were found. The ASX companies performed significantly weaker than the JSE companies, where the latter performed significantly weaker than the DJSI companies. This could stem from the cost or complexities involved to gather and to measure water-related data. Absent or outdated systems, as well as the variety of methods applied, could add to the problem of comparability.

On the other hand, our qualitative analysis revealed innovative technologies and appropriate practices in the disclosure of some companies. Many firms disclosed measurable progress on reducing water usage as a result of quantified water information – which illustrated commitment towards water governance. Since it is evident that there is much room for improvement on the disclosure of water targets and measures, especially the ASX and to some lesser extent the JSE companies, we recommend standardising reporting practices with regard to water targets and measures. Therefore companies, especially in the food, beverage and tobacco industry should start to implement the improved disclosure index as a benchmark that can be further refined by for example, practitioners, policymakers, academics or standard setting bodies could utilise the index.

This paper focused on a single construct of water disclosure, the quality of disclosure of water targets and measures. Moreover, only the food, beverage and tobacco industry was investigated on three indices. Future research could include adding more water related constructs to this index by focusing on aspects such as the disclosure of water materiality, -governance, and/or -risks. Furthermore, more countries and industries can be included to enable a cross-country and cross-industry comparison.

We recommend that the same metrics for measurements (mega litres) should be used by all reporting entities. This would bring about standardised water information and improved comparability. Secondly, we recommend that companies disclose water withdrawal and discharges per source – which would provide more specific information to inform decision-making. Thirdly, we recommend that firms calculate water efficiency ratios in terms of water used per kilogram of finished product, or per litre of packaged product. Furthermore, firms should divide their water efficiency ratios per product line i.e. beverages and food. The disclosure of water efficiency ratios would provide valuable and comparable information to stakeholders. Fourthly, it is recommended that firms should concentrate more on the reuse and recycling of water. Fifthly, arising from the preceding recommendations, firms should assign a baseline year towards water withdrawal, discharge, reuse and efficiency figures. This should represent thresholds and baseline conditions as an effective tool to verify and compare whether improvement and set targets have been accomplished.

This paper concludes by arguing that all firms should take cognisance of global water issues and the importance of water and water disclosure in the food, beverage and tobacco industry.

An Analysis of the Quality Management System on Water Management Practices at Ethekewini Municipality

Alexander Bradley Samuels¹

¹ Transport Economics and Logistics Management, Northwest University, North West, South Africa

Keywords

Water supply accessibility, water restrictions, quality management system.

Abstract

One of the primary goals of this research was to look into the accessibility of water supply to consumers in the eThekewini Municipality region. The emphasis is on investigating the difficulties encountered when attempting to access water during erratic rainfall patterns. The purpose of this research is to familiarize KwaZulu-Natal (KZN) residents with the various restrictions and remedies that can help them conserve and use water more effectively and efficiently. This study emphasized the significance, causes, and effects of the limited water supply that affects not only the KZN province but South Africa as a whole.

The study assessed water management practices in KwaZulu-Natal using an exploratory case study method. When determining the critical issues encountered during water supply, a qualitative research approach was used, which added more value. The research was carried out at the eThekewini Municipality Water and Sanitation Department in KwaZulu-Natal. Purposive sampling was used, with a sample size of nine participants. As a data collection tool, semi-structured face-to-face interviews were used. For this qualitative study, NVivo 12 was used as thematic analysis software.

This research study contributed to the creation of knowledge about a new quality management system implementation and how ISO 9001 can be used to ensure effective and efficient quality by implementing new practices that will ensure continuous improvement.

1. Introduction

1.1. Problem Statement

Many households and businesses in South Africa, including the eThekewini Municipality in KwaZulu-Natal, do not have a consistent continuous water supply, resulting in poor water management practices (eThekewini Municipality, 2018). According to Section 27(1)(b) of the Republic of South Africa's Constitution of 1996, "everyone has the right to adequate water." According to Viljoen (2018), water scarcity is becoming an increasing problem that is escalating at an alarming rate as the supply of water to households and industries is restricted due to poor water management practices and ineffective service delivery.

The study aimed to investigate the problem of water scarcity and loss and the impact on water management practices in the eThekewini region because measures to address water scarcity in eThekewini are currently unknown. The researcher investigated the current water management practices in the KwaZulu-Natal region and recommended tailor-made solutions to improve the efficiency and effectiveness of the quality water management system.

1.2. Methodology

• Research Design

Because of the nature of this study, the researcher chose an exploratory case study design. Sekaran (2016) states that a research design is the implementation of structures within a study. Three broad categories of qualitative and quantitative research methodologies exist descriptive, exploratory, and causal research designs.

According to Burns and Grove (2011), an exploratory research design is research conducted to gain new insights, discover innovative ideas, and increase knowledge of a phenomenon. This method allows researchers to enter the field of study and collect data through observation, focus groups, and interviews.

The primary goal of the exploratory research is to identify water supply constraints in the eThekweni region. As a result, the focus of exploratory research should be on the most likely problems, opportunities, or situations, as well as determining the key salient factors or variables that will be contributory factors and relevant to the study (Van Wyk, 2013).

• Research Approach

The primary research approaches are qualitative and quantitative (Creswell, 2014). Qualitative research refers to holistic, subjective methods for analysing, comprehending, and developing a theory (Leedy and Ormrod, 2015). In contrast to numbers, statistics, and measurements, the qualitative approach is associated with language, words, and past experiences (Marshall and Rossman, 2011). This research strategy can be classified as dynamic and developmental (Leedy and Ormrod, 2015). It is made up of narrative data that has been properly identified, gathered, and analysed.

The most appropriate research paradigm for this study was determined to be qualitative research, as it will probe into deeper areas, whereas quantitative research methods may be too superficial (Hair, Celsi, Ortinau, and Bush, 2013). Hair et al. (2013) emphasize the importance of employing specific approaches to conduct in-depth research in specific areas. This is consistent with the findings of this study, which calls for a thorough investigation into the causes and consequences of water scarcity.

• Research Instrument

When conducting an exploratory study, the researcher is more likely to include in-depth or semi-structured interviews in their design. Similarly, the purpose of an exploratory study is to use interviews to assist the researcher in identifying and inferring causal relationships between variables (Ghauri and Gronhang, 2011). As a result, it was critical for the researcher to comprehend the reasons for participant selection, the decisions made, and the participants' opinions and attitudes. (Saunders et al., 2019).

Semi-structured and in-depth interviews give the researcher the opportunity to probe a response by asking the participant to explain, elaborate, or build on their previous response. As the researcher adopted an interpretivist philosophy, the interviewer became concerned with understanding the meaning of his participants and how they ascribed to the various types of phenomena (Saunders et al., 2019).

Face-to-face semi-structured interviews were thus the most appropriate research instrument for this study and were used during data collection, as this study required an exploratory case study approach. To be more specific, this type of study required semi-structured interviews and comprehensive research to provide a deeper understanding of how the Municipality assesses its water management practices in relation to the challenges of water supply and water shortage.

- **Study site**

eThekweni Water and Sanitation is a unit of the eThekweni Municipality that oversees providing water and sanitation services to all Municipality customers. The study site is the location where the research will be carried out. This research was conducted at the eThekweni Municipality Water and Sanitation Department, 3 Prior Road, Durban, KwaZulu-Natal. The study location was chosen because of the implementation of its water management practices and the ease of access to information.

- **Sampling Technique**

This study's sampling strategy will be non-probability based on purposive sampling. Purposive sampling, according to Sekaran and Bougie (2013), is limited to specific types of individuals with specific elements that can provide the desired information for a specific purpose. The sample elements are carefully selected based on participant characteristics. The researcher chose the purposive sampling technique on purpose, and the researcher chose participants based on the importance of the qualities that he or she possesses.

- **Data Quality Control**

Reliability and validity, according to Sekaran et al. (2016), are critical in quantitative studies. However, in qualitative research, Lincoln and Guba's (1985) four dimensions of trustworthiness are considered equivalent to reliability and validity in quantitative research. It is critical to ensure the credibility and trustworthiness of a research study because they assess the study's quality and the possibility of similar future studies.

In general, both reliability and validity contribute to the essential quality research criterion of trustworthiness (Lincoln and Guba, 1985). The trustworthiness of observations or data is referred to as reliability, and the trustworthiness of interpretations of conclusions is referred to as validity. Although qualitative research does not make a clear distinction between observations and interpretations, it is useful for the researcher to distinguish procedural trustworthiness from the criteria used to judge the trustworthiness of interpretations (Stiles, 2013).

As a result, conducting qualitative research becomes difficult because the researcher is unsure whether the research will be credible and trustworthy after it is completed. When conducting this type of research, the researcher considered four dimensions to ensure the credibility of this qualitative research: transferability, confirmability, trustworthiness/credibility, and dependability (Lincoln and Guba, 1985).

- **Data Analysis Technique**

An inductive rather than a deductive approach to data analysis was used (Hair et al., 2015). The study was expected to have close interaction with data from eThekweni Municipality because it was based on a qualitative approach rather than a quantitative approach.

By identifying the correlation between relationships via search engines and query functions, the researcher can test theories, identify specific trends, and cross-examine information. NVivo software can be used to determine observations, and the researcher can create a body of evidence to support his/her research (Braun and Clarke, 2006).

Conventional content analysis, according to Sekaran and Bougie (2016), is divided into coding categories derived directly from data collection. Thematic analysis was used on the data to identify key themes and patterns using NVivo software, and the researcher was able to analyze the data using categories and codes. The themes were identified as a result, and categories and sub-categories were created (Sekaran et al. 2016).

2. Literature Review

A concept was created because the researcher believed that combining elements from various frameworks was important in supporting the goal of improving water practices and enhancing water

quality management practices at eThekweni Municipality. The Service Quality Gap Model can be used to explain the effectiveness and efficiency of the Quality Management System, as well as how service delivery can be used to boost continuous improvement in accordance with ISO 9001. Figure 2.4 explains how to integrate the service gap model into the Quality Management System to ensure continuous improvement.

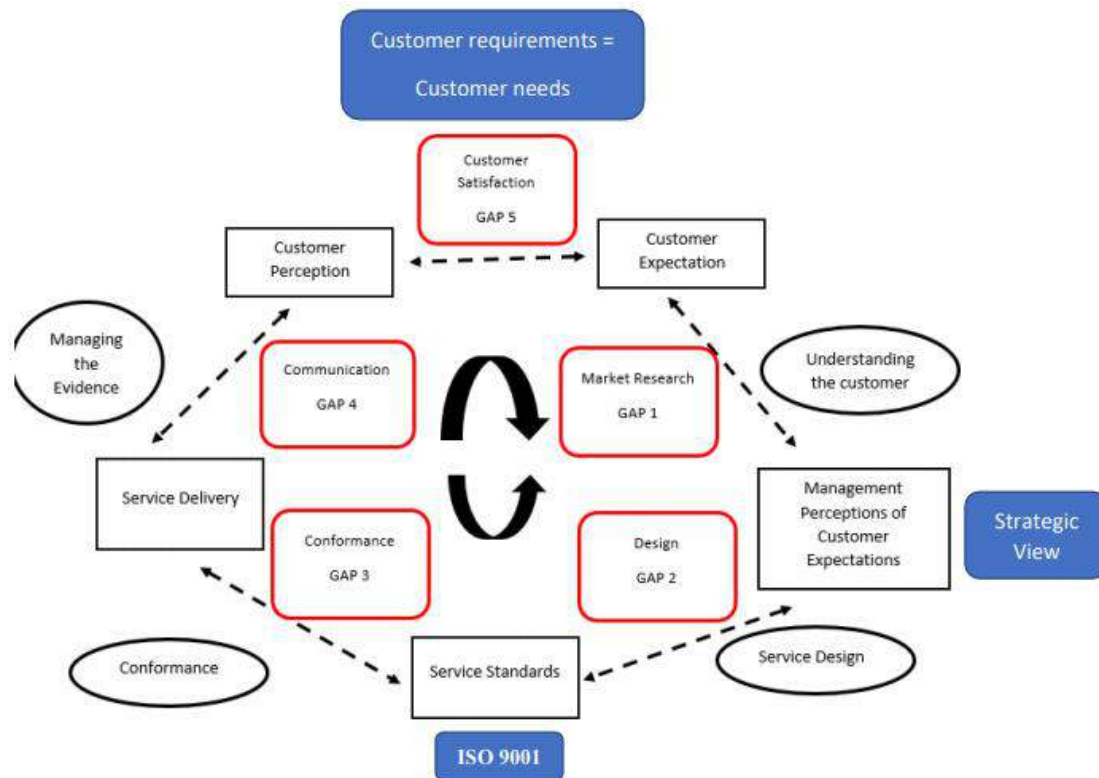

Figure 2.4: Service Quality Gap Model
Source: Author's construction

GAP 5 is defined as the difference between the two factors - customer expectations and perceptions. Customer satisfaction is dependent on closing gaps 1 through 4 associated with service delivery. GAP 1 - Market Research - is the misalignment of customer and management expectations (Buttle, 2004). GAP 1 is caused by management's lack of understanding of how customers must formulate their expectations based on a variety of sources (Klibi, Martel, and Guitouni, 2010). Improving marketing research, fostering better communication between managers and their contact employees, and reducing the number of management levels are all strategies for closing the gap (Bharwana, Bashir, and Mohsin, 2013).

The service design gap is caused by management's inability to formulate and implement service quality target levels capable of meeting customer perceptions and translating these into realistic and achievable workable specifications (Bharwana et al., 2013). GAP 2 is caused by management's lack of commitment to quality specifications or perceptions of the inability to meet customer expectations (Brink and Berndt, 2004). Setting specific, measurable, achievable, and realistic service delivery goals will help to close the gap (Ivanauskiene and Volungenaite, 2014).

The conformance gap occurs when the actual delivery of the service does not meet management's expectations and specifications. GAP 3 occurs due to a variety of factors, including a lack of teamwork, poor employee selection, and insufficient training and development. Communication tools shape customer expectations of the service provider (Berry, Parasuraman, and Zeithaml, 1994). GAP 4 is the mismatch between service delivery and external communications, manifested as a lack of

communication to the appropriate personnel and exaggerated promises that cannot be kept (Bharwana et al., 2013).

The focus of developing countries, in general, is on customer orientation, as the common theme for all efforts in reforming and modernizing public administration. eThekwini Municipality recognizes the importance of involving their customers, such as businesses and consumers, in the design and evaluation of their services. Given that the eThekwini Municipality is the service provider, the Municipality can maintain close contact with its customers and provide them with the services they require.

As a result, as acknowledged in the service quality approach, customer evaluation of eThekwini Municipality's services is primarily linked to aspects such as service setting, frontline employee performance, and other non-human elements of service delivery.

Collecting customer feedback on such determinants benefits the EMWS department because it serves as a guide for improvement and the attainment of higher levels of excellence. Few studies have compared the perspectives of customers and employees on service quality expectations or perceived levels of desired service quality. The researcher plans to contribute to and fill this void. This becomes a strong justifiable and critical role for service delivery for the eThekwini Municipality to capture the perceptions of frontline employees.

This role entails listening to customers, understanding, and interpreting their needs, and performing appropriate tasks in accordance with the quality service standards that have been established (eThekwini, 2019). To avoid many service quality gaps, the eThekwini Municipality must have alignment between their customers' and frontline employees' perceptions.

3. Results and Findings

This objective assesses the current Quality Management System's effectiveness and efficiency. This section also discusses current QMS system practice and how service delivery is evaluated. The researcher hoped to gain insight into the types of criteria used for water acceptability practice and to improve the revenue management system (RMS).

Please describe the current quality management system on water supply at eThekwini Municipality?

The findings revealed that there is no formal quality management system in place, but the EMWS department is using a variety of methods to meet quality standards. The goal of this question was to learn about the current quality management system's effectiveness and efficiency. The researcher identified this as a critical question because there were few concerns about the quality management system and the department needed to improve. ISO 17025, SANS241, water service act (WSA) & DWS, and water lab tests emerged as themes.

Most participants stated that water laboratory tests were used as a practice implementation of ISO 17025 because they assisted in assessing water quality.

Participant six contended that because no quality management system was implemented, there were too many bottlenecks in the system, preventing the system's quality, efficiency, and effectiveness. This prevents eThekwini Municipality from achieving ISO 9001 because it only has a water laboratory to test the water supply from Umgeni Reservoir before supplying water to businesses and households.

Participants five and eight brought up SANS 241 requirements. Both participants agreed that potable water was supplied in accordance with SANS 241, as this was the Water Service Act (WSA) and the EMWS department's requirements.

How does water practice meet the criterion of quality management?

The findings indicate that the ISO 9001 standard must be implemented. This standard will ensure that consumers and businesses have access to high-quality water. The question sought to identify various criterion measures for best water practices. The only recurring theme was the "ISO 9001 standard."

ISO 9001 implementation was deemed necessary by eight participants. Participant four contended that the total quality management system might be lacking due to water scarcity because the ISO 9001 standard had not been implemented, and that rainfall should be assessed. The sixth participant stated that the EMWS department has a standardized criterion that is used to inspect the water specification before it is supplied to KwaZulu- Natal residents. This participant also stated that health and safety standards are generally followed. However, participant nine agreed that implementing the ISO 9001 standard will meet quality standards and improve water supply service delivery. This standard will have a positive impact on eThekweni Municipality, transforming it into a SMART city.

How does the water practice meet the criterion of acceptability?

The findings revealed that a combination of SANS 241 and aggressive awareness programs can help vulnerable consumers. This question was designed to help the researcher understand the acceptability criterion for best water practices. SANS 241 and water supply awareness programs were identified as two themes.

Most participants agreed that the SANS 241 standards could be used as acceptability criteria, while participants 7 and 9 agreed that roadshows and awareness programs could be used as acceptability criteria to raise awareness about the water compliance standard. However, participant four contended that the EMWS department could not be rated in comparison to other countries because this was unacceptable.

How can the current Revenue management system be improved on water loss at eThekweni Municipality?

The findings revealed that there are revenue leakages in the water supply system, which will need to be investigated and resolved using an efficient accounting system and a cutting-edge water supply structure. The goal of this question was to learn how the current revenue management system was used to improve water loss detection and revenue loss prevention. Water leaks, efficient water infrastructure, a 100 percent water detection system, a water metering system, and illegal water connections were among the topics covered.

Most participants suggested that a SMART water metering system was required, while participant six discussed how the implementation of a water metering system would provide a more accurate water reading. However, participants one and eight both agreed that installing water infrastructure in all areas can improve the system's quality and reduce water waste.

A few participants suggested imposing penalties for excessive water usage and disconnecting water supplies via illegal connections. Participants six and eight, on the other hand, stated that the implementation of a water detection method will aid in water retention recovery and the prevention of illegal water connections.

According to Sithole (2019), the EMWS department was looking at how other provinces dealt with the issue of non-revenue water. The eThekweni Municipality currently spends more than R163,6 million per year on non-revenue water, and non-revenue water trends are increasing at a rate of about 2% per year. Despite the numerous challenges, the EMWS department has made positive progress in interventions, including the installation of new pressure-reducing Valves (PRV), the removal of illegal connections, the metering of unmetered properties, and the maintenance of existing PRVs, and the detection of active leaks.

4. Conclusion

Implementing a Quality Management System is a strategic decision that demonstrates the organization's commitment to the development and application of the QMS model. The QMS aims to

continuously improve its effectiveness through evaluation. This type of commitment must be carried out and demonstrated by employees by informing the organization about the importance of meeting customer requirements and satisfaction, complying with legal requirements, establishing quality objectives, and implementing a Quality Policy.

One of the primary goals of the implementation stage is to determine the scope of the QMS for evaluation. The scope must be examined and defined in light of the issues confronting eThekweni Municipality, as well as customer needs and expectations, as well as legal and regulatory compliance obligations. The QMS information scope and justified exclusions must be identified and documented, as this can aid in future Quality Management System adoption decisions. The findings revealed, first and foremost, that the eThekweni Municipality lacked a formal quality management system. As a result, the EMWS department employs a variety of quality-control measures.

Second, to assist sensitive consumers with their concerns, a combination of SANS241 and aggressive awareness programs was proposed. Third, revenue leakages in the water supply system were discovered, which needed to be addressed with an appropriate accounting system and a modern functioning water supply structure. Finally, a smart water metering system was identified as a requirement because it will help with better accuracy readings, identifying water flow interruptions, and illegal connections.

Due to issues with the eThekweni Municipality's water management system, this goal was met. As a result, the eThekweni Municipality Water and Sanitation department must establish, maintain, and constantly improve its water management practices. This includes the various processes required within the department, as these changes must be in accordance with the ISO 9001 standard for effective water distribution management.

Smart Water Metering can be used to record water consumption in today's global water industry. This monitoring and billing information is measured and communicated to the water utility department on a daily basis. Water intervals are measured in the water industry every 30 to 60 minutes; if the intervals are longer than 60 minutes, the water utility will receive insufficient information. Where the Water utility is allowed to use a communication channel, this type of communication channel obtains the water meter reading and indicates the demand for water supply. This channel also determines whether or not the water supply has passed through the smart meter and onto the customer's property.

The smart water metering system will send a command to the meter that will cause it to perform specific tasks such as disconnecting the water supply or limiting the pressure flow. The smart water meter also has an internal display that provides users with real-time feedback on their water consumption and costs. As a result, this system will aid in better revenue management and water management practices within the eThekweni Municipality.

5. Managerial Implications

The purpose of this research is to provide measures for developing a Water Quality Management System and ensuring better water management practices. Water scarcity has become one of South Africa's most pressing issues, and better management is required to ensure that the existing water supply is maintained. eThekweni Municipality is one of the largest municipalities in the KwaZulu-Natal region; however, EMWS management must implement quality strategies to ensure continuous improvement in their existing water management practices through research and development. Other researchers have also provided recommendations and opinions on the previously identified problem areas. Adopting the proposed recommendations could help the EMWS department reduce the percentage of excessive water loss to zero, allowing for more effective and efficient quality management practices.

Acknowledgment

All participants in this study, for taking the time to participate in the research. Your input and contribution have ensured its success.

Environmental Health Concerns of Generation Y Consumers in South Africa

Dr Costa Synodinos^{1,*}, Dr Kirsty-Lee Sharp²

^{1,2} Management Sciences, North-West University, Vanderbijlpark, South Africa

Keywords

attitude; environmental knowledge; health consciousness; Generation Y; South Africa

Abstract

Increased environmental concern has resulted in consumers altering their daily purchasing behaviours. As such, consumers are looking for more sustainable ways to consume, recycle and dispose of the products they use daily. This is becoming increasingly prevalent amongst today's youth, who are spearheading green purchasing behaviour. Compared to older generations, the youth of today are more inclined to concern themselves with the state of the natural environment. The primary objective of this study was to investigate a model depicting the effect which attitude, environmental knowledge and health consciousness play on the purchase intentions and ultimately, the purchase behaviour of Generation Y consumers. The findings indicate that Generation Y consumers have favourable attitudes towards environmental behaviour, consider themselves environmentally knowledgeable, and concerned for personal health. Furthermore, it was found that these factors positively influence both their purchase intent and behaviour of green products over conventional products. Organisations seeking to capture the Generation Y market segment must create an environmentally friendly culture within their business strategies. This may attract a new environmentally conscious consumer that can show great potential to purchase and behave in a pro-environmental manner.

1. Introduction

Owing to the increasing amount of highly complicated environmental issues, the world is witnessing environmental degradation. In addition, there is a debate that the earth's environmental problems are a consequence of mankind's endeavours of continuous global urbanisation (Wang & Dong, 2019:165-166; Jeff, Marla, Jha, Levy & McEntee, 2015:676; Said, Ahmadun, Paim & Masud, 2003:306). The depletion of natural resources, the contamination of water, global warming, carbon dioxide emissions and climate change are a few of the environmental problems the world faces at present due to the relentless industrialisation that has and is still taking place (Mayerl & Best, 2019:27; Taufique & Vaithianathan, 2018:46; Jeff et al., 2015:676). Consequently, this has given rise to increased awareness and concern among consumers regarding the depletion of natural resources, such as food and water, the preservation of the environment for future generations and self-preservation or health consciousness (Singh, Chiliya, Chikandiwa & Chodokufa, 2016:467; Lim, Yong, & Suryadi, 2014:298). This increased environmental concern has resulted in consumers altering their daily purchasing behaviours. As such, consumers are looking for more sustainable ways to consume, recycle and dispose of the products they use on a daily basis (Bhuiyan & Sharma, 2017:352; Trivedi, Patel, & Savalia., 2015:74; Albayrak, Aksoy & Caber, 2013:28). Verma and Chandra (2018:1153) suggest that this is becoming increasingly prevalent amongst today's youth, who are spearheading green purchasing behaviour. Compared to older generations, the youth of today are more inclined to concern themselves with the state of the natural environment, which is important for organisations to take heed of as South Africa's population was estimated at a total of 60 142 978, with an estimated 43 percent of the total population being characterised as Generation Y in 2021 (Statistics South Africa, 2021). Therefore, developing an understanding of the environmental behaviour of the individuals of

*Corresponding Author

the Generation Y cohort is vital for the environment and the environmentalism movement (Taufique & Vaithianathan, 2018:47; Kanchanapibul, Lacka, Wang & Chan, 2014:528).

2. Problem investigated

Owing to the sheer size, potential future income and possibly a higher social standing within a community (Bevan-Dye & Surujlal, 2011; Day & Newburger, 2002), this study focused on the youthful Generation Y cohort. Compared to previous generations, it is evident from the research that the new environmentally concerned consumer appears to be younger, highly educated and increasingly affluent. In addition, these consumers have an increasing inclination to accept innovative ideas, while being prone to be more socially or environmentally conscious (Kanchanapibul et al., 2014:529; Royne, Levy & Martinez, 2011:332). Collectively, young new graduates may be deemed as highly influential individuals amongst their peers. Consequently, this study aims to investigate the environmental health concerns of Generation Y consumers in South Africa, through the validation of a model depicting the effect which attitude toward behaviour, environmental knowledge and health consciousness play on purchase intentions and ultimately, the purchase behaviour of Generation Y consumers.

3. Research objectives

- To determine if a significant and positive relationship exists between attitude towards behaviour and purchase intention is present.
- To determine if a significant and positive relationship exists between environmental knowledge and purchase intentions.
- To determine whether a significant and positive relationship exists between health consciousness and purchase intentions.
- To determine if there is a significant and positive relationship between purchase intention and purchase behaviour of Generation Y consumers in South Africa.
- To determine a model depicting the relational effects attitude towards behaviour, environmental knowledge and health consciousness portray towards purchase intentions and ultimately, purchase behaviour of Generation Y consumers in South Africa.

4. Literature review

The literature review provides a discussion on the theory underpinning this study, namely the theory of planned behaviour, followed by the antecedents of attitude, environmental knowledge and health consciousness and their influence on purchase intentions and subsequent purchase behaviour, concluding with a look at the Generation Y cohort, specifically in the South African context.

4.1 The Theory of Planned Behaviour

The theory of planned behavior is an extension of the theory of reasoned action (Ajzen & Fishbein, 1991; Fishbein & Ajzen, 1975). Brookes (2021) indicates that based on the theory of planned behaviour, perceived behavioural control, combined with behavioural intention, can be used to predict the achievement of certain behaviours.

4.2 Attitude toward behaviour

Indriani, Rahalu and Hadiwidjojo (2019:629) define attitude as an expression of an individual's feelings, which illustrate their likes or dislikes of an object or collection of certain objects. Attitudes may be attributed to psychological processes which one is not able to observe directly, however they may be inferred from what an individual says and does. Perner (2018) adds that consumer attitudes are an amalgamation of beliefs and feelings towards an object and the subsequent behavioural intentions towards the object. Duggal (2019) highlights that attitudes are important drivers of purchase behaviour, motivating consumers to purchase or not to purchase products or services. Therefore, this study proposes the following hypothesis:

H₁: Generation Y consumers attitudes towards behaviour significantly influences their purchase intention.

4.3 Environmental knowledge

As a consumer moves through the various stages of the consumer decision-making process, the amount of knowledge an individual possesses in relation to a particular object or group of objects will influence the outcome of the final purchase made. The same applies for consumers who follow the decision-making process in relation to the purchasing of environmentally friendly products. Zahari and Esa (2016:447) indicate that the more individuals identify with environmental degradation, the higher the likelihood will be that these individuals will consider environmentally friendly products. Consequently, Zsóka, Szerényi, Széchy and Kocsis (2013:27) define environmental knowledge as the combined knowledge an individual possesses regarding the current environmental issues facing the globe. As can be seen in previous research undertaken, environmental knowledge may be viewed as a positive correlating factor with environmental concern (Heo & Muralidharan, 2019:424; Yadav & Pathack, 2016:734; Almossawi, 2014:9; Zsóka et al., 2013:127; Polonsky, Vocino, Grau, Garma & Ferdous, 2012:243), which may in essence transgress into pro-environmental behaviour.

Gray et al. (2019:395) suggest that environmental concern can be linked to educated individuals, where the potential to earn higher disposable income increases the likelihood that these individuals will engage in pro-environmental behaviour. Sharma and Foropon (2018) propose that environmental knowledge has a direct positive influence towards environmental purchase intention, particularly in relation to green products. As such, this study proposes the following hypothesis:

H₂: Generation Y consumers' environmental knowledge significantly influences their purchase intention

4.4 Health consciousness

Health consciousness concerns an individual's cognisance of the degree to which their lifestyle and diet is deemed as healthy (Afable, 2019). According to Phan and Mai (2016:58), health consciousness is the subjective intent or motivation of consumers to improve their health. Wolfson (2019) indicates that organic food products are free from chemicals and not only benefit consumers by enhancing their health through consumption, but through improving the environment simultaneously. Tandon, Jabeen, Talwar, Sakashita and Dhir (2021:12) conclude that consumers who are increasingly concerned with food safety possess positive attitudes toward organic food products.

Compared to consumers' concerns regarding the protection of biodiversity and the environment, the health concerns of individual consumers are more widespread in the influence on organic purchases (Mazzocchi, Ruggeri & Corsi, 2019:155). Wolfson (2019) highlights that antioxidants, which are found in conventional soil, provide organic crops and foods with nutritional superiority, which become even healthier due to the absence of pesticides and chemicals.

According to Hernandez (2014), consumers are becoming increasingly concerned with their health, which has resulted in consumers attempting to obtain food that provides them with physical nourishment and mental satisfaction, with the aim of avoiding experiences which may have damaging and harmful effects on their health such as fast food consumption or the chemical compounds from food packaging. Espinosa and Kadić-Maglajlić (2018) propose that individuals who are more inclined to preserve their quality of life, are more likely to engage in certain health-conscious behaviours, with the aim of protecting and managing their health and wellbeing.

Consumers are becoming increasingly aware of their health, with increased purchases of natural and healthy food products (Sritharan, 2022). Besides being healthy and safe, organic foods are free of additives, chemical-free and eco-friendly, containing fewer pesticides and more nutrition, which results in an increasing number of consumers choosing organic foods over conventional foods (Van De Walle, 2018).

Therefore, this study proposes the following hypothesis:

H₃: Generation Y consumers' health consciousness significantly influences their purchase intention.

4.5 Purchase intention and behaviour

The purchase intentions of individual consumers are influential forces in both new product adoption and continued product retention (Bhuiyan & Sharma, 2017:354; Ali, Khan & Ahmed, 2011:219). Nairava (2013:74) delineates that the purchase intention of consumers is the degree to which a consumer is willing to act out a particular behaviour. Societal factors, such as social, culture and economic, form the foundation of environmental behaviour, highlighting the importance of developing an understanding of the environmental behaviour intentions of consumers (Chaudhary & Bisai, 2018:798).

According to Jeff et al. (2015:679), consumers who are classified as pro-environmental not only purchase environmentally friendly products but they also practise pro-environmental activities. Activities of this nature constitute becoming water and energy-efficient, consuming fewer animal products, reducing waste and recycling. As such, some consumers may only engage in certain activities, such as recycling and attempting to be more water conscious. While this constitutes pro-environmental behaviour, it does not induce any environmentally friendly purchases. Nonetheless, consumers have become increasingly cognisant of their ability to assist the environment, which has in turn forced organisations into implementing CSR strategies into their organisational operations (Huh & Chang, 2017:127; Yadav & Pathack, 2017:114). This highlights the need for academics and practitioners to develop a full understanding of the environmental purchase intentions and environmental behaviours of consumers to ensure they successfully incorporate environmentally friendly purchase adoption and continued product retention (Levine & Strube, 2012:322; Peattie, 2001:137).

Mayerl and Best (2019:354) postulate that environmental intent is the willingness or sacrifice a consumer is prepared to make in favour of environmental preservation. Bhuiyan and Sharma (2017:354) suggest that if organisations wish to increase the purchase intention of consumers to purchase environmental products, they will need to consider the implementation and use of more effective environmental marketing strategies, including CSR strategies. As higher levels of environmental concern are believed to increase the probability levels of green purchase intent (Sharma & Foropon, 2018:1024; Taufique & Vaithianathan, 2018:48), organisations need to ensure that they use their marketing efforts in such a way as to increase environmental purchase intentions (Chen & Chang, 2012:4).

H₄: Purchase intention has a significant influence on purchase behaviour of Generation Y consumers.

4.6 Generation Y

In 2020, it is estimated that approximately 37 percent of the population may be categorised as being part of Generation Y cohort in South Africa (Statistics South Africa, 2019). Constituting a third of the population, the Generation Y cohort represents a lucrative market segment to all organisations, based on its sheer size. For the purpose of this study, Markert (2004:21) defines this cohort as individuals born between 1986 and 2005, making this cohort aged between 17 and 36 years in 2022.

According to Eastman and Liu (2012:94), the individuals within the Generation Y cohort are the foot soldiers of the environmentalism movement. Owing to these individuals having been raised within an eco-conscious society, they are becoming increasingly environmentally conscious (Huh & Chang, 2017:127). As such, their behaviour is increasingly gravitating towards an environmentally sustainable lifestyle (Huh & Chang, 2017:127; Rogers, 2013). This may be seen in the purchasing patterns of Generation Y individuals. In addition, the individuals of this cohort choose to support socially responsible organisations who are making concerted efforts to integrate sustainability programmes into business operations, give back to the community or actively assist in environmental conservation (Huh & Chang, 2017:127; Smith, 2012:87; Jeff et al., 2015:676). Brand loyalty, trust and a competitive advantage are some of the many benefits that organisations who implement CSR into their organisational strategies are taking advantage of (Huh & Chang, 2017:127). Consequently, developing an understanding of the environmental Generational Y consumer is imperative for organisations, as these individuals involved in tertiary education are believed to represent both the

future consumer and the future of the environmental movement (Taufique & Vaithianathan, 2018:47; Kanchanapibul et al., 2014: 528). Consequently, there is a need for organisations to develop sustainable marketing strategies targeted towards this specific cohort.

Owing to the nature of the literature explained above the following theoretical is proposed:

Figure 1: Proposed Model

The proceeding section outlines the methodology section of the study.

5. Research methodology

This study followed a positivism research paradigm by means of quantitative analysis. In addition, this study made use of a casual, descriptive research design. Furthermore, the collected data was captured using a cross-sectional format. The proceeding section outlines both the procedures and parameters of the data collection process.

5.1 Target population

The target population encompassed individuals of the Generation Y cohort above the age of 18 who reside in South Africa. The data collection was conducted in July 2021, and the age parameters of the targeted participants were set at 18 to 35 years. The target population components are:

- Element: South African consumers
- Sampling unit: IPSOS panel
- Extent: South Africa
- Period: 2021
- Size: 500 participants

5.2 Sampling technique and data collection

A reputable data collecting organisation, namely Global Market Research and Public Opinion Specialist, IPSOS, was employed to collect the data of this study. IPSOS was chosen by the researchers as the organisation owns a database of 40 000 participant panellists all residing in South Africa. Owing to the sheer size of IPSOS' participant pool, the sample size of a researcher is regularly achieved in full. The collection of the questionnaires ran for a period of three days, whereby only participants aged between 18 to 35 were given the option to take part in the survey.

5.3 Sample size

In order to attain a good representation of the South African population, a sample size of 500 participants was chosen. Moreover, when conducting multivariate statistics, it is advised to have a minimum of 300 case samples. In addition, various published studies similar in nature were cross-examined for their sample sizes. The studies had similar sized samples, namely Bernabeu et al.

(2022:2) (sample size: 415), Ahmed et al. (2021) (sample size: 515), Suki et al. (2021) (sample size: 440) and Rausch and Kopplin (2021) (sample size: 464). Consequently, the 500-participant sample size may be considered adequate for the study.

5.4 Measurement instrument and data collection technique

IPSOS made use of their FastFact data capturing program to complete the data collection process. This system allows participants to undertake a structured self-administered questionnaire via an online platform. The participants were only allowed to complete the questionnaire once and participants were awarded ample time to ensure questionnaire completion. Scales from prior validated studies were assessed and adapted to make up the measurement instrument. The questionnaire itself comprised two sections namely: Section A which recorded the demographics of the participants and Sections B which included the measuring scale's constructs. Based on the current literature various validated scales were used to capture the unobserved variables. These variables are presented in Table 1 below.

Table 1: Measurement of constructs

Construct	Source
Attitudes towards environmental behaviour (ATT)	Leonidou et al. (2010)
I am concerned about the environment.	
I would be willing to reduce my consumption to help protect the environment.	
I would donate part of my own money to help protect wild animals.	
I have asked my family to recycle some of the things we use.	
Environmental knowledge (EK)	Mostafa (2007)
I know that I buy products and packages that are environmentally safe.	
I know more about recycling than the average person.	
I know how to select products and packages that reduce the amount of waste ending up in rubbish dumps.	
I understand the environmental phrases and symbols on product packages.	
I know a lot about environmental issues.	
Health consciousness (HC)	(Tarkiainen & Sundqvist, 2005)
I choose food carefully to ensure good health.	
I think of myself as a health-conscious consumer.	
I think often about health issues.	
Purchase Intentions (PI)	Mostafa (2007)
Over the next month, I will consider buying products because they are less polluting.	
Over the next month, I will consider switching to other brands for environmental reasons.	
Over the next month, I plan to switch to an green version of a product.	
Environmental purchase behaviour (EPB)	Lee (2008)
When I want to buy a product, I look at the ingredients label to see if it contains things that are	
I prefer green products over normal products when their product qualities are similar	
I choose to buy green products because they are environmentally-friendly.	
I buy green products even if they are more expensive than the non-green ones.	

Source: Own compilation

The questionnaire contained a cover letter for the purpose of explaining the intent of the study, assured anonymity and purported that all results would be reported in a statistical manner. In addition, the constructs captured participants' opinions using a six-point Likert scale, the scale range from one strongly disagree to six strongly agree.

Running the questionnaire was implemented using the FastFast program. This program does not allow participants to proceed to a new section or page unless they have answered every question of that specific page. A three-day maximum time limit along with a 500-response cap (whichever was reached first) was set for the questionnaire. In this specific case, the 500-participant target was reached well before the three-day limit. Owing to these conditions, the response rate was then 100 percent.

5.5 Data analysis strategy

Data analysis was conducted using version 27 of IBM's Statistical Package for Social Sciences (SPSS) and the add on program AMOS. The data set characteristics were analysed through descriptive statistics. The validity of the measuring scale will be assessed through the Cronbach alpha coefficient (α), a confirmatory factor analysis (CFA), and a correlation analysis to assess both the relationships between the variables which also tests for multicollinearity. The study utilised common fit indices to assess model fit of the proposed model these included: the chi-square degrees of freedom ratio (CMIN/df), the (NFI), the (RFI), the (IFI), the Tucker-Lewis index (TLI), the comparative fit index (CFI), and the root mean square error of approximation (RMSEA) (Hair, Black, Babin & Anderson, 2019).

6. Results and Findings

The proceeding section encompasses the results and findings of the study.

6.1 Descriptive statistics

Descriptive statistics were employed to evaluate the data, these statistics included means, standard deviations, skewness, and kurtosis values. Owing to the use of a 6-point Likert scale, values above 3.00 were considered positive associations. The results are presented in Table 2.

Table 2: Descriptive statistics

	N	Means	SD	α value	Skewness	Kurtosis
Attitude towards behaviour	500	4.84	0.93	0.76	-1.63	3.96
Environmental knowledge	500	4.58	0.94	0.87	-1.04	1.89
Health consciousness	500	4.71	1.05	0.86	-0.98	0.99
Purchase intention	500	4.70	1.03	0.91	-1.14	1.97
Environmental purchase behaviour	500	4.37	1.08	0.85	-0.75	0.33

Source: Own compilation

Each measuring construct achieved a mean greater than 3.00, this is indicative of Generation Y consumers being environmentally concerned individuals. These individuals display positive attitudes towards environmental behaviours, regard themselves as knowledgeable over current environmental issues and display a concern for their own health. Furthermore, these individuals plan to purchase green products in the future and display positive green purchase behaviour.

The internal consistency reliability of the data set proved to be reliable as all measuring constructs achieved a Cronbach's alpha value of above 0.70 (Hair et al., 2014). Therefore, the measuring instrument may be deemed reliable. The normality, shape and range of the data set was assured through analysing the Skewness and Kurtosis values. The data's distribution and shape were considered normal as skewness values fell between +2 and -2, whilst kurtosis values fell between the normal range of +7 and -7 (Kalkbrenner, 2022; Berndt & Petzer, 2011).

6.2 Correlation analysis

Correlation analysis has many uses including assessing relationships between constructs of a measuring scale and checking if multicollinearity is present within a data set (Pallant, 2016). This study made use of the Pearson's Product-Moment coefficient to assess the underlying relationships between constructs. The correlation matrix is presented in Table 3.

Table 3: Correlation matrix

	ATT	EK	HC	PI	EPB
ATT	1				
EK	0.59**	1			
HC	0.50**	0.68**	1		
PI	0.53**	0.62**	0.66**	1	
EPB	0.48**	0.66**	0.66**	0.77**	1

**Correlation is significant at the 0.01 level (2-tailed)

ATT=attitudes towards environmental behaviour, EK= environmental knowledge, HC= health consciousness,

Source: Own compilation

As can be seen in Table 3 above, each measuring construct recorded a positive statistically significant relationship amongst every corresponding construct at the $p = 0.000 \leq 0.01$ level. All correlated relationships were classified as having a strong association with each another ($r \geq 0.50$, $p = 0.000 < 0.01$), with exception of attitude towards behaviour ($r = 0.48$, $p = 0.000 < 0.01$) which is a medium strength relationship (Pallant, 2016).

The Pearson’s Product-Moment coefficient also detects if any multicollinearity is present in the data set. Correlation coefficients greater than 0.90 are indicative of multicollinearity. As no coefficients (r) were greater than 0.90, there was no concern for multicollinearity and that data set may be said to have nomological validity (Malhotra, 2010). As the data set was free of any concerns it was then decided that it was safe to conduct SEM analysis to predict the environmental health concerns of Generation Y consumers in South Africa.

6.3 Measurement Model Analysis

To confirm the items of the latent factors, a confirmatory factor analysis using the maximum likelihood approach was conducted on the measurement model. The first item loading of each latent factor was set at 1.0. The measurement model then estimated 190 sample moments and 48 parameters with 142 degrees of freedom. A significant chi-square of 452,427 ($p = 0.000$) was achieved based on an over identified model. The measurement model can be found in Figure 2 below.

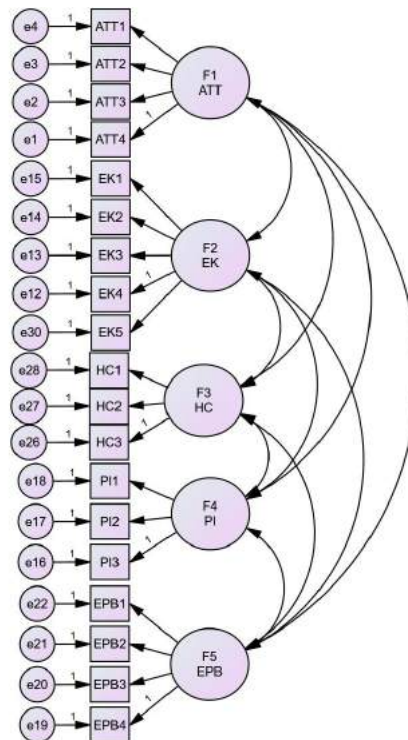

Figure 2: Measurement Model

The measurement model showcased no problematic estimates, no negative error variances were recorded, and all standardized estimates were in the specified range of -1.0 to 1.0 (Hair et al., 2014). Table 4 below illustrates the remaining analysis of the measurement model.

Table 4: Measurement Model Estimates

Latent factors	Standardised loading estimates	Error variance estimates	CR	AVE	$\sqrt{\text{AVE}}$
Attitudes towards behaviour (F1)	.644	.972	0.859	0.605	0.777
	.669	.871			
	.735	.539			
	.615	.928			
Environmental knowledge (F2)	.713	.690	0.714	0.515	0.717
	.810	.489			
	.778	.536			
	.738	.590			
	.735	.278			
Health concerns (F3)	.860	.246	0.871	0.576	0.754
	.845	.317			
	.755	.836			
Purchase intention (F4)	.882	.549	0.912	0.775	0.880
	.896	.395			
	.862	.949			
Purchase behaviour (F5)	.738	.595	0.861	0.675	0.821
	.792	.405			
	.842	.386			
	.735	.530			
Correlations	F1↔F2: 0.59	F2↔F3: 0.68			
	F1↔F3: 0.53	F2↔F4: 0.62			
	F1↔F4: 0.53	F3↔F4: 0.66			

Source: Own compilation

The measurements model's reliability was confirmed as all composite reliability (CR) values exceeded the 0.70 recommended cut of level, moreover the constructs also showed internal consistency reliability as shown in the previous section. All average variance extracted (AVE) values exceeded 0.50 and the square root of the AVE's for the independent variables were larger than the data sets bivariate correlations. Therefore, it may be inferred that discriminant validity has been achieved for the measurement model (Hair et al., 2014). Owing to a significant chi-square ($\chi^2 = 452.42$, $p = 0.000$), multiple incremental fit indices were used to determine if the measurement model had adequate fit. The indices included: GFI = 0.909, NFI = 0.910, IFI = 0.948, TLI = 0.937, CFI = 0.948, SRMR = 0.042 and RMSEA of 0.066. The results indicate that the measurement model has good fit as all incremental fit indices were greater than 0.90, whilst both the both the SRMR and RMSEA were below under 0.08 (Hair et al., 2014:631; Malhotra, 2010:732).

6.5. Structural Model Analysis

The structural model was carried out once confirmation of good model fit was achieved for the measurement model. The structural model investigated the underlying effects that the independent variables of attitude towards environmental behaviour (F1), environmental knowledge (F2) and health consciousness (F3) displays towards purchase intentions (F4). Thereafter, the structural model considered the effect with which purchase intentions has on Generation Y consumers' environmental purchase behaviour (F5). This model is depicted in Figure 3 below.

Figure 3: Proposed Model

Once again, a significant chi-square (496,701, $p = 0.000$) was produced by the structural model. Subsequently, the structural model's fit was then assessed using other incremental fit indices, namely: GFI = 0.899, NFI = 0.918, IFI = 0.941, TLI = 0.930, CFI = 0.941, SRMR = 0.050 and RMSEA of 0.070. All fit indices exceeded the recommended cut off level of 0.90 except for the GFI (0.899). The path estimates for the structural model are reported on in Table 5.

Table 5: Structural model estimates for the proposed model

Structural paths	Hypothesis	Parameter estimate (β)	P-value	Rejected / supported
Attitude towards behaviour → purchase intention	H ₁	0.230	0.019***	Supported
Environmental knowledge → purchase intention	H ₂	0.183	0.000**	Supported
Health consciousness → purchase intention	H ₃	0.478	0.000**	Supported
Purchase intention → environmental purchase behaviour	H ₄	0.894	0.000**	Supported
**Significant at the $p < 0.01$ level				
***Significant at the $p < 0.05$ level				

Source: Own compilation

All tested structural pathways were positively significant at the $p \leq 0.01$ level. The paths from attitudes towards behaviour ($\beta = 0.230$, $p < 0.05$), environmental knowledge ($\beta = 0.183$, $p < 0.01$) and health consciousness ($\beta = 0.478$, $p < 0.01$) are statistically significant predictors of Generation Y consumers' environmental purchase intentions. Moreover, environmental purchase intentions ($\beta = 0.894$, $p < 0.01$) has a significant positive influence towards environmental purchase behaviour of Generation Y consumers in South Africa. The squared multiple correlation coefficients of attitudes towards behaviour, environmental knowledge, and health consciousness, explained 65 percent of the variance in Generation Y consumers' environmental purchase intentions. In the same vein, environmental purchase intentions explained 80 percent of the variance towards Generation Y consumers' environmental purchase behaviour. The structural path estimates can be found in Figure 3.

Figure 3: Structural model of Generation Y consumers health concerns

7. Discussion and Conclusion

At the forefront of the environmental movement, the current youthful Generation Y cohort are changing societal lifestyles as we know it (Taufique & Vaithianathan, 2018:47; Verma & Chandra 2018:1153; Lee, 2009: 87). This study investigated the influence with which attitude towards behaviour, environmental knowledge, health consciousness and purchase intentions portray on Generation Y consumers' environmental purchase behaviour. This objective was achieved by analysing the current theoretical literature pertaining to health concerns of Generation Y consumers and subsequently testing an empirical model containing the theoretical constructs. Confirmation of the model was done through the use of structural equation modelling using data gathered from 500 Generation Y consumers from around South Africa.

The results concluded that the independent variable of attitude towards behaviour, environmental knowledge and health consciousness display a positive significant influence towards Generation Y consumers' intent to purchase green products. In addition, the study also concluded environmental purchase intent has a direct positive significant effect of increasing green purchase behaviour of Generation Y consumers.

This study found that the biggest driver of environmental preservation were consumers own personal health concerns. These health concerns foster positive environmental purchase intent, it is these health concerns that need to be exploited to encourage consumers to purchase environmentally friendly alternative products. As such, health concerns are imperative for the success of the green

movement as these consumers concerns directly contribute to buying behaviours pertaining to green or environmentally friendly products (Bizcommunity, 2017; Xie et al., 2015). The lowest, yet still positively significant path, was that of environmental knowledge. Increasing knowledge regarding environmental problems will most likely lead consumers to behave in a pro-environmental manner, as was the case in the works of both studies by Taufique and Vaithianathan (2018) and Yadav and Pathak (2017). Generation Y consumers attitudes towards green behaviour harbours strong intent to purchase green products. A favourable attitude towards any behavioural engagement situation would most likely result in positive behaviour thereof (Ajzen, 1991), the same can be applied to green products. Closely linked to the Theory of Planned Behaviour, purchase intention largely influences green product purchase behaviour. This holds true for today's health-conscious Generation Y consumer, marketing to this cohort is imperative for the future of this movement.

This study contributed to the literature of environmental purchase behaviour in which the Generation Y consumer in South Africa showcased strong intent to become environmental product purchasers. This find is important as this cohort are society's future influencers, trend setters, brand ambassadors of the world and more importantly the future leaders of the country (Chaudhary & Bisai, 2018; Taufique & Vaithianathan, 2018:47; Kanchanapibul et al., 2014: 528). Owing to today's technology of instant information available at your fingertips this cohort can quickly spread positive word of mouth, however, the opposite can also occur damaging an organisations reputation in an instant. Huh and Chang (2017) explain how the correct environmental business strategy may lead to new market share and award the organisation with a competitive edge over competitors who fail to implement greener strategies in their business models.

8. Managerial implications

The focus of this study was intended to showcase the potential of marketing to the lucrative South African Generation Y consumer. In addition, the study concentrates on environmental health concerns experienced by Generation Y consumers in South Africa.

This study highlights the need for using consumers environmental concerns to incorporate environmentally friendly methods in both business operations and/or products. Organisations seeking to capture the Generation Y market segment must create a culture within their business strategy which aims to improve the attitudes of green products, highlight or increase environmental knowledge, home in on the health benefits environmental products have on both the environment and consumers health (organic products). Furthermore, organisations can emphasis greener practices in their daily business operations to enforce a greener culture. These steps may attract a new environmentally conscious consumer who show great potential to purchase and behave in a pro-environmental manner.

HUMAN RESOURCE MANAGEMENT

Assuming Data Integrity and Empirical Evidence to The Contrary

Prof. Renier Steyn¹

¹ UNISA Graduate School of Business Leadership, Midrand, South Africa

Keywords

Research ethics; Data integrity; Measurement invariance; Common method bias

Abstract

Background: Not all respondents to surveys apply their minds or understand the posed questions, and as such provide answers which lack coherence, and this threatens the integrity of the research. Casual inspection and limited research of the 10-item Big Five Inventory (BFI-10), included in the dataset of the World Values Survey (WVS), suggested that random responses may be common.

Objective: To specify the percentage of cases in the BFI-10 which include incoherent or contradictory responses and to test the extent to which the removal of these cases will improve the quality of the dataset.

Method: The WVS data on the BFI-10, measuring the Big Five Personality (B5P), in South Africa (N=3 531), was used. Incoherent or contradictory responses were removed. Then the cases from the cleaned-up dataset were analysed for their theoretical validity.

Results: Only 1 612 (45.7%) cases were identified as not including incoherent or contradictory responses. The cleaned-up data did not mirror the B5P-structure, as was envisaged. The test for common method bias was negative.

Conclusion: In most cases the responses were incoherent. Cleaning up the data did not improve the psychometric properties of the BFI-10. This raises concerns about the quality of the WVS data, the BFI-10, and the universality of B5P-theory. Given these results, it would be unwise to use the BFI-10 in South Africa. Researchers are alerted to do a proper assessment of the psychometric properties of instruments before they use it, particularly in a cross-cultural setting.

1. Introduction

When casually examining the items of the personality assessment part of the World Values Survey (WVS) (Inglehart et al., 2014), the data presented seemed to be at odds with the structure of the Big Five Personality (B5P) conceptualisation (Costa & Macrae, 1985). The instrument used in the WVS was the 10-item Big Five Inventory (BFI-10) (Rammstedt & John, 2007), which measures with two items each the constructs of extraversion, agreeableness, openness, conscientiousness, and neuroticism. When analysing the full data set on the BFI-10 for confirmatory as well as exploratory factor analyses, a very poor fit was found (Ndofirepi & Steyn, 2022b), even after removing cases based on literacy and language proficiency (Ndofirepi & Steyn, 2022a). The matter which leads to alarm was that respondents provided obviously contradictory answers to some questions. For example, on a question on extraversion, some respondents provide affirmative replies to two contrasting items, stating “I am reserved” and “I am outgoing”. This raises serious questions about the respondent’s motivation, the instrument properties, and the interaction between the two.

The BFI-10 seems to function in a manner contrary to the B5P theoretical structure in the South African context. Ignoring the possibility of differential functioning of an instrument has the potential to compromise any substantive interpretations and comparisons resulting from the measurement

¹ E-mail address: steynr@unisa.ac.za

(Salzberger, Newton, & Ewing, 2014). Only once construct comparability is demonstrated does it become possible to interpret differences in test or scale scores as true representations of differences explained by group membership (Wu, Li, & Zumbo, 2007). This is referred to as measurement invariance, which reflects the extent to which an observed score on the measurement is reflective of an individual's standing on a construct, independent of his or her group membership (Meredith, 1993; Meredith & Millsap, 1992). The National Institute of Education and American Psychological Association Standards, for example, lists differential validity and differential prediction as a major concern of test fairness (Pässler, Beinicke & Hell, 2014). These concerns are in line with the requirements of the South African Employment Equity Act (Act 55 of 1998), which takes a strong stance against the adverse impact of psychometric testing.

The research aims to assess the magnitude of contradictory responses in the personality part of the VWS, and to assess whether the respondent who provide more coherent responses were more vigilant during the interviews, and whether the psychometric properties of the BFI-10 improves when the data was cleaned. Would removing the responses from clearly incoherent respondents assure that the remaining data is compatible with the B5P conceptualization?

2. Literature review

The Big Five Personality (B5P) (Costa & Macrae, 1985; McCrae & Costa, 1992) conceptualisation has a long history (Tupes & Christal, 1961/1992; Norman, 1963), and the five-factor structure has been proven as a robust predictor of individual differences in a variety of situations (Aglim & Horwood, 2021; Sun, Kaufman, & Smillie, 2018; Bui, 2017; Trapmann, Hell, Hirn, & Schuler, 2007; Vedel, 2016; Barrick & Mount, 1991; Pletzer, Bentvelzen, Oostrom, & De Vries, 2019; Van der Linden, te Nijenhuis, & Bakker, 2010). The B5P trait taxonomy is well established (John, 2021) and widely accepted, and at least at a configural level, a valid measure of personality in several, if not most contexts (Minkov, van de Vijver, & Schachner, 2019).

The items of the BFI-10 instrument (Rammstedt & John, 2007), as presented in the WVS, are shown in the table below. The BFI-10 form part of a new generation of short versions of the B5P assessment tools (Gosling, Rentfrow, & Swann, 2003; Langford, 2003; Soto & John, 2017), with other examples being Donnellan, Oswald, Baird, and Lucas's (2006) 20-item mini International Personality Item Pool-Five Factor Model (IPIP-FFM), and Gerlitz and Schupp's (2005) 15-item Big Five Personality Inventory (BFI-S).

Table 1: BFI-10 items and their quantification

Items: I see myself as someone who ...	B5P traits	Reverse coding
... is reserved	Extraversion	Yes
... is generally trusting	Agreeableness	No
... tends to be lazy	Conscientiousness	Yes
... is relaxed, handles stress well	Neuroticism	No
... has few artistic interests	Openness	Yes
... is outgoing, sociable	Extraversion	No
... tends to find fault with others	Agreeableness	Yes
... does a thorough job	Conscientiousness	No
... gets nervous easily	Neuroticism	Yes
... has an active imagination	Openness	No

Source: Adapted from Rammstedt and John (2007)

The BFI-10 is widely used (Balgiu, 2018; Kunnel John, Xavier, Waldmeier, Meyer, & Gaab, 2019; Sudzina, 2016) and was also included in the World Values Survey (6th Wave).

From table 1 it can be observed that half the items are reverse coded. It would thus be expected that those who answer affirmatively to "I am reserved" should answer disaffirming or negatively to "I am outgoing", if the responses are aligned to the B5P conceptualisation of Extraversion. Should the data not fit the conceptualisation, the theory, the motivation of the respondents, the quality of the

instrument, and the quality of the theory within the specific context where the instrument was used, should be questioned. One way of addressing this matter would be to consider measurement invariance testing. Do the people of a specific group perceive the questions in accordance with the proposed theory or is the theory applicable to the people from that group? This type of incomparability or inequivalence is an ever-present threat to the reliability and validity of personality scales in cross-cultural studies (Berry et al., 2011), and should be tested for. At a construct level, certain constructs may uniquely pertain to particular groups only; at a method level, the instrument may not measure the construct it is supposed to measure (due to translation errors, acquiescent responding, and group-influenced response patterns), and at an item and latent construct level, the construct indicator (the item) may systematically demonstrate a higher or lower score than expected with a particular group (Fontaine, Poortinga, Delbeke, & Schwartz, 2008; Meiring et al., 2005; Van de Vijver & Tanzer, 2004). The problem of group differences at item and construct level can be evaluated through test of measurement invariance (Jak et al., 2015).

A further concern in this study may be common method bias (CMB), where response patterns, rather than the respondents' standing on a construct, create systematic covariation between variables (Rodríguez-Ardura & Meseguer-Artola, 2020). Providing a high score at "I am reserved" and "I am outgoing" could be a perfect example of CMB, where respondents answer high on all items, irrespective of their standing on particular items. CMB may be present in the WVS as it is a lengthy questionnaire, which may lead to respondent fatigue, and subsequent systematic responses (Burisch, 1997; Podsakoff, MacKenzie, & Podsakoff, 2012). The questions in the BFI-10 may also be difficult to translate, and it is also known that ambiguity contributes to systematic answering of questions (Podsakoff, MacKenzie, Lee, & Podsakoff, 2003). The fact that WVS data is collected through interviews, thus limiting anonymity of the respondents, may moderate the response patterns of the respondents, soliciting socially desirable responses, which is also associated with CMB (Steenkamp et al., 2010). To the credit of the WVS, it should be mentioned that the response format of the questions differed from section to section, which counters similarity in response patterns (Podsakoff et al., 2012). Given these concerns, it was decided to test for CMB as a possible reason for the incoherent and seemingly contradictory responses found in the WVS BFI-10 data.

3. Method

This section discusses the study's design, data gathering procedures, research methods used, and ethical concerns.

3.1 Design

This study is based on an analysis of cross-sectional data gathered in South Africa as part of the WVS, with the 10-item Big Five Inventory (BFI-10) of Rammstedt and John (2007), included in the survey, as the main focus of the study.

3.2 Sampling

The collection of data is described in detail on the WVS website, and data from South Africa was used in the study. The WVS, as well as the agencies used to collect the data, employed all reasonable resources to enable the random sampling of individuals.

3.3 Measurement instrument

The BFI-10 (Rammstedt & John, 2007) was used to collect data on B5P constructs. The items as well as their relationship to the five personality traits are clearly presented in table 1. Respondents were required to answer to statements with five response categories ranging from 1, "strongly disagree" to 5, "strongly agree".

One more measure was used, also from the WVS, namely item V251, where the interviewer needed to report on the respondent's level of interest during the interview. Here the reported responses varied from 1, "The respondent was very interested", to 2, "The respondent was somewhat interested", to 3, "The respondent was not interested". Thus, low score indicated high levels of interest.

3.4 Methodology

The first aim of the study was to identify the number of incoherent cases in the sample, and this was done through creating three subgroups, with only one representing the coherent cases. A new variable was created to identify incoherent cases. The reasoning behind creating the variable was as follows: “There are 10 items in the questionnaire, half of which requires reverse coding. Should a group of respondents have strong views about all their traits, their response patterns should include five affirming (with scores of 5) and five disaffirming (with scores of 1) responses (see table 1), which when added, leads to a score of 30. Also, should another group of respondents have moderate views on their traits, their response patterns should include five semi-affirming (with scores of 4) and five semi-disaffirming (with scores of 2) responses, which when added, leads to a score of 30, the same scores of those with stronger views. Responses incoherent with the B5P theory, and the method in which it was measured in the VWS, would be responses which adds up to, say 50, where all questions were answered affirmatively (with scores of 5 on each item). Also, total scores of 10, which would indicate that all items were responded to negatively (with scores of 1 on each item), would be counter to the dynamics or logic proposed in the instrument. In general, it could be expected that a considered interpretation of the questionnaire would result in a score of plus-minus 30”.

Three groups were created, based on the argument above: One group to include respondents with scores lower than 25 (25/50), one with scores around 30 (30/50), and one with scores higher than 35 (35/50). The middle group were considered as those who provided coherent responses. The number of respondents per group is presented in the results section.

Next, the level of interest in the interviews, for the newly developed groups, were calculated. This was presented as a cross tabulation, and the impact was assessed by calculating chi-square. The mean scores of this ordinal data were also calculated, and compared using analyses of variance (ANOVA), for statistical significance, and Cohen d-scores, for practical significance (Hair, Black, Babin, & Anderson, 2010).

Thereafter, exploratory factor analyses (EFA) were performed, as a first step in testing for measurement invariance. This was done for all three groups; the groups were based on their total personality score. The aim was to determine if the number of factors and their loading patterns are consistent with the theory and across groups (Bialosiewicz, Murphy, & Berry, 2013). These were done following Kaiser’s rule regarding eigenvalues, where the natural fit of the data will be obtained when only factors with values more than 1 is included in the explanatory model. Structural equation modelling (SEM), often used as a test for structural validity (Boer, Hanke, & He, 2018; De Roover & Vermunt, 2019; Putnick & Bornstein, 2016; Vandenberg & Lance, 2000), was also applied in the past to test for the B5P structure (Marsh, Lüdtke, Muthén, Asparouhov, Morin, Trautwein, & Nagengast, 2010). Confirmatory factor analyses (CFA) were thus performed next. No tests of measurement invariance were performed, as it was clear after performing the EFA and the CFA that, even at a configural level, the groups were not mirroring the B5P conceptualisation.

Lastly, the test for common method bias (CMB) was performed. The Harman’s single-factor test, which is widely used as a statistical tool that detects CMB (Fuller, Simmering, Atinc, Atinc, & Babin, 2016), was applied. Here the rule-of-thumb is that if no more than 50% of the variance is captured in the first factor created in an EFA (Fuller et al., 2016), the instrument is free of CMB.

4. Results

Data for the 6th wave of WVS were collected in South Africa in 2013, and 3 448 responses were collected. From these, 48.3% were men and the rest, 51.7% female. The average age was 37.72 years, with a standard deviation of 15.67. Regarding ethnicity, blacks were the largest group, with 76.5% of the respondents, followed by whites, which made up 12.1% of the sample.

After creating groups based on deducted response patterns, as explained in the method section, most of the responses seemed to fall outside what would be deemed reasonable responses.

Table 2: Groups created based on response patterns: Coherent and incoherent responses

Group	Frequency	Per cent	Valid Per cent	Cumulative Per cent
Less or = 25/50 (Incoherent responses)	324	9.2	9.7	9.7
Around 30 (Coherent responses)	1 612	45.7	48.4	58.2
More or = 35/50 (Incoherent responses)	1 391	39.4	41.8	100.0
Total	3 327	94.2	100.0	-
Missing	204	5.8	-	-

Source: Author's own work.

Next analyses were performed on the created groups (see table 2). Table 3 is about the interest shown during the interview, and in this table the level of interest, as assessed by the interviewer, is presented per group.

Table 3: Cross tabulation of response patterns and interest showed during the interview

Personality score		Respondent			Total
		was very interested	was somewhat interested	was not interested	
Less or = 25/50 (Incoherent responses)	Count	198	101	25	324
	E-Count	189.0	111.7	23.4	324.0
	Percentage	61.1%	31.2%	7.7%	100.0%
Around 30 (Coherent responses)	Count	843	631	138	1 612
	E-Count	940.2	555.6	116.3	1 612.0
	Percentage	52.3%	39.1%	8.6%	100.0%
More or = 35/50 (Incoherent responses)	Count	900	415	77	1392
	E-Count	811.9	479.8	100.4	1392.0
	Percentage	64.7%	29.8%	5.5%	100.0%
Total	Count	1 941	1 147	240	3 328
	E-Count	1 941.0	1 147.0	240.0	3 328.0
	Per cent	58.3%	34.5%	7.2%	100.0%

Note: E-Count is the expected count.

Source: Author's own work.

In total, 61.1% of respondents in the "Less or = 25/50" group were very interested in the interview, with only 52.3% in the "Around 30" group, and then again a high percentage, 64.7% of respondents in the "More or = 35/50". The same pattern repeats itself across the other dimensions of interest in the interview, which was surprising.

When performing the chi-square test on the table presented above, the chi-square value is 49.673, with $p < .001$ ($df=4$). This indicates differences across cells. To specify or affirm where these differences were most pronounced, the mean score on interest in interviews were calculated per group.

Table 4: Mean scores on interest in the interviews, per group

Group	N	Mean	Std. Dev.	Std. Error	95% CI Lower Bound	95% CI Upper Bound
Less or = 25/50 (Incoherent responses)	324	1.46	0.634	0.035	1.39	1.53
Around 30 (Coherent responses)	1 612	1.56	0.647	0.016	1.53	1.59

More or = 35/50 (Incoherent responses)	1 391	1.41	0.594	0.016	1.38	1.44
Total	3 327	1.49	0.628	0.011	1.47	1.51

Source: Author's own work.

The highest mean score on interest in the interview was in the "Around 30" group. High scores represent a low level of interest during the interview. When conducting an analyses of variance, differences seem clear in these scores ($F(2, 3324) = 23.137, p < .001$). "Less or = 25/50" was smaller than "Around 30", with Cohen d-values of .159, and "More or = 35/50" was also smaller than "Around 30", with a Cohen d-value of .238. The differences were small to medium, at a practical significance level. The group which thus showed the highest level of interest in the interviews were those in the "More or = 35/50" group, with the "Around 30" being the least interested.

These results were not expected, as the higher the score on interest in the interview, the lower actual interest is, given that "The respondent was very interested" were allocated a score of 1, "The respondent was somewhat interested" attracted a score of 2, and "The respondent was not interested" were allocated a score of 3.

Next measurement invariance and structural validity were addressed. To test if the BFI-10 structure is more pronounced in the data where coherent responses were provided ("Around 30"), EFA were performed, first for the "Less or = 25/50", "Around 30", and also "More or = 35/50" groups. For "Less or = 25/50" four factors had eigenvalues larger than 1, and these declared 60.99% of the variance in the data. With the "Around 30" group, three factors had eigenvalues larger than 1, explaining only 48.42% of the variance in the dataset. "More or = 35/50" also had three factors with eigenvalues larger than 1, explaining 46.80% of the variance. The results of the Principal Component Analysis extraction and the Varimax with Kaiser Normalization rotation for all three groups are presented. Only factor loadings of more than .4 are presented in table 5.

Table 5: Factor loadings for BFI-10 for "Less or = 25/50", "Around 30", and "More or = 35/50"

	Less or = 25/50 (Incoherent responses)				Around 30 (Coherent responses)			More or = 35/50 (Incoherent responses)		
	1	2	3	4	1	2	3	1	2	3
E(R)	.804	-	-	-	-.721	-	-	.741	-	-
A	.789	-	-	-	.655	-	-	.698	-	-
C(R)	.542	-	-	-	-.617	-	-	.657	-	-
N	-	.859	-	-	.616	-	-	-	.699	-
O(R)	-	.708	-	-	-.495	-	-	-	.682	-
E	-	-	.813	-	-	-	-	-	.567	-
A(R)	-	-	.681	-	-	.734	-	-	.430	-
C	-	-	-	.643	-	-.663	-	-	-	.754
N(R)	-	-	-	.599	-	-	.818	-	-	.747
O	-	-	-	-.577	-	-	.649	-	-	.488

Note: All values smaller than .04 were suppressed; E=Extraversion, A=Agreeableness, C=Conscientiousness, N=Neuroticism, O=Openness, R=Reverse coding

Source: Author's own work.

From the table above, three things can be observed. In the first place, the number of factors extracted, using the Keiser rule, did not end up at the theorised number of five. Secondly, the expected loading pairings of E(R) and E, A and A(R), C(R) and C, N and N(R), as well as O(R) and O, where both indicators of a personality dimension load on the same factor, did not materialise either. Thirdly, the positive-negative loading expected per pair of indicators did not materialise as expected, not even in the middle ("Around 30") model. Even when forcing the data into a five-factor solution (not reported here), the results did not resemble the theorised model. When performing CFA on this data, the results

were also dismal (see Ndofirepi and Steyn, 2022a). No specific tests on measurement invariance were performed, as it was evident that the B5P model were not observable in any of the groups.

For the test of CMB, the Harman's single-factor test (Fuller et al., 2016) was applied to the total group as well as the three sub-groups. For the whole group, the first factor attracted 41.88% of the variance in the data. For the subgroup "Less or = 25/50" it was 22.35%, for "Around 30" it was 23.67%, and for "More or = 35/50" it was 22.02%. All these values were significantly less than the rule-of-thumb of 50% (Fuller et al., 2016), and this suggests the absence of CMB.

5. Discussion

The aim of the study was to demonstrate how, through cleaning up data, and by discharging cases with incoherent responses, the quality of the data can be improved. In this study, the focus was on a small part of the WVS, namely the personality part of the survey, and particularly the BFI-10. The BFI-10 measures the B5P constructs, and incoherent responses on this instrument were used to divide the respondents into groups of those who were presumed to be attentive (providing coherent responses) and those who were not attentive (providing incoherent responses).

The sample was relatively large (N=3 531), and randomly drawn, representing a wide range of South African citizens. Using coherent and incoherent response patterns as a guideline, three groups were created. The group of coherent responses was smaller than that of the incoherent responses, with only 1 612 (45.7%) of the respondents judged as providing coherent responses on the BFI-10.

Contrary to what was expected, those who provided coherent answers were reported to show less interest during the interview. This was demonstrated using the chi-squared test as well as analyses of variance. These differences had a small to medium practical significance.

When using the data from the three created groups, in neither case did the data resemble the B5P structure, not in terms of the number of factors, nor on the factor loadings. These results were surprising, as in an earlier study Ndofirepi and Steyn (2022a) were able to find the B5P structure in WVS data collected in the Netherlands and Germany. The reasoning was that "cleaning up" the South African data would result in similar results. Cleaning up the data had no effect on exposing the B5P structure in BFI-10 data in South Africa. Ludeke and Larsen (2017) also expressed concerns regarding the BFI-10 in the WVS.

Problems with the application of the B5P in foreign contexts are not uncommon (Gurven, Von Rueden, Massenkoff, Kaplan, & Lero Vie, 2013; Meisenberg, 2015; Minkov, van de Vijver, & Schachner, 2019; Spector, Liu, & Sanchez, 2015), although in the South African context these problems seem minimal in previous studies (Abrahams & Mauer, 1999; Hill, Adams, De Bruin, Nel, Van de Vijver, Valchev, & Meiring, 2013; McDonald, 2011). This is somewhat understandable, as South Africa is firmly a non-Westernised, Educated, Individualistic, Rich and Democratic (WEIRD) country (see Steyn, 2022), and problems regarding replicating the B5P mostly occur in non-WEIRD populations (Doğruyol, Alper, & Yilmaz, 2019; Laajaj et al., 2019).

It was not possible to demonstrate that when incoherent cases are removed from the dataset, that the instruments' psychometric properties improved. The B5P configuration was not found using EFA nor CFA, in neither of the groups.

The matters presented in the previous paragraph relate to response style (Rammstedt & Krebs, 2007). However, it could also relate to the nature of short tests, where some suggest problems with short measures of the B5P (Chapman & Elliot, 2019; Rammstedt, Danner, Soto, & John, 2018). Here the misunderstanding or the incorrect translation of one item could have catastrophic consequences.

The unexpected results may also be that the strategy applied in this research, to eliminate incoherent responses failed to improve the quality of the dataset. The coherent responses were "Around 30", which reflects coherent scores (as explained in the method section of this article), but also sets of

middle scores, of 3, 3, 3 and 3, as an example. It could well be that interviewers who witness such response patterns would easily judge such a respondent as not interested in the interview. This may explain the only part of the “failed” results, hypothesising that the “Around 30” group showed real interest during the interviews. However, the argument that extreme high or low total scores are indicative of not comprehending the content of the questions is more viable than the argument that “Around 30” scores are exclusively the result of a 3, 3, 3 and 3 responses. No explanation for these results can be presented, apart from that the B5P concept or the BFI-10 methodology is foreign to the South African context.

Given these results, researchers are alerted not to use the BFI-10 data, which resulted from the WVS as administered in South Africa, as being credible and are encouraged not to proceed with analyses unless a proper assessment of psychometric instruments is done. On a broader and more general level, researchers are encouraged to do proper assessment of instruments before they use them, particularly in a cross-cultural context. Professional bodies and regulators of psychometric instruments could also enhance research integrity. This could be done through awareness programmes, setting clear operational guidelines or funding research which focus on the use of “imported” instruments in the local context.

6. Conclusions

Few people could argue that cleaning up data is important, as not all respondents apply their minds or understand the questions and will as such provide answers which lack coherence; this threatens the integrity of a research project. However, this study failed to provide evidence that removing cases with seemingly incoherent responses from the dataset improved the psychometric properties of the instrument. It was concluded that either the strategy used to remove cases failed, or alternatively, that the B5P theory, or most likely, the BFI-10 methodology is invalid in the South African context. Researchers interested in applying psychometric instruments in a cross-cultural context should take note of these findings and are cautioned not to use data without thoroughly testing the psychometric properties of the instrument, particularly when the instrument is short in length, and even if the instrument is based on well-established theories and is widely used.

Developing Measures to Alleviate Graduate Unemployment in Mahikeng Municipality

Mr Zwelakhe Andrease¹, Prof Nelda Mouton^{2,*}

^{1,2} North-West University Business School, Potchefstroom, South Africa

Keywords

employment, unemployment, graduates, skills, training, internship, government, work experience

Abstract

In South Africa, graduate unemployment is a serious problem, with many graduates finding it difficult to find employment in the mainstream sector. To address the issue, this study was aimed at developing measures to alleviate graduate unemployment in Mahikeng municipality. The Human Capital Theory asserts that formal education is highly helpful and appropriate for enhancing a population's productive potential, and this study is based on that theory. The study adopted a qualitative research method and a social constructivist paradigm. Unemployed graduates, employees of Local Economic Development (LED), Broad-Based Black Economic Empowerment (BBBEE), and Small, Medium, and Micro Enterprises (SMMEs) were among the 35 participants whose data were collected online. The findings show that the schools attended, work experience, educational qualifications, gender, skills and level of training, nepotism, and racism all have an impact on graduate employability. According to the findings, the South African government's initiatives to reduce graduate unemployment have not been productive. In this case, the study recommends that the government should get involved in career management, training and development, internship programmes, labour and legislative improvement, entrepreneurial development, youth development policies and public strategic management in a bid to address graduate unemployment in Mahikeng.

1. Introduction

Unemployment refers to those who are employable and actively looking for employment but are unable to find one when needed. South Africa's consistently rising unemployment rate is cause for concern, as few young people find employment in the mainstream sector (Shanker, Cooper & Koi, 2015:6). According to the Department of Trade and Industry (DTI) (2019:24), these jobless people will most likely rely on provincial survival funds to fulfil their basic needs. This socio-economic issue adversely affects the government's finances and raises questions about South Africa's social and economic viability. In 2015, the unemployment rate was 24.5 %; in 2016, it was 26.5 %; in 2017, it was 26.7 %; and in 2018, it was 27.1%, rate of unemployment has continued to rise, reaching 29.1% in 2019, 35.1 % in the second quarter of 2020, and 32.5 % at the end of the year (Statistics South Africa, 2020).

Unemployment among graduates is a global issue that affects both developing and developed countries. However, while the South African government is concerned about youth unemployment in general, it is less concerned about graduate unemployment, and research on the subject is scarce. As a result, the goal of this research is to look into potential measures to increase the employability of unemployed graduates in the Mahikeng municipality of the North-West Province of South Africa.

The labour force keeps on increasing every year, rising from 21 211 in 2015 and 23 452 in 2020. This suggests that more jobs should be created every year to accommodate the marked growth in the labour force. Also, the North-West province (the study area) is in the fourth position out of 9 provinces regarding the high unemployment rate.

It is generally held that those with higher educational credentials have a competitive advantage in the labour market due to improved job opportunities. Often these graduates find it difficult to get into the South African graduate labour market since their skills do not match the market's requirements (Van Broekhuizen, 2015:5). While South Africa has undergone significant changes since 1994, South African graduates continue to face major job problems, endangering their own and the nation's futures.

A number of study gaps must be filled in order to determine if people who are unemployed are structurally or frictionally unemployed. Despite the contradictory claims, there is still a scarcity of research on graduate unemployment. There is a need for immediate strategies to alleviate graduate unemployment and to create jobs in all sectors so that the graduates could be absorbed immediately after graduation as graduate unemployment continues to rise in South Africa's North-West province.

2. Problem Investigated

It is generally held that those with higher educational credentials have a competitive advantage in the labour market due to improved job opportunities. Moreover, as Kraak (2013:77) points out, such an advantage is not always available to all graduates due to certain labour market factors. Often these graduates find it difficult to get into the South African graduate labour market since their skills do not match the market's requirements (Van Broekhuizen, 2015:5). While South Africa has undergone significant changes since 1994, South African graduates continue to face major job problems, endangering their own and the nation's future.

Therefore, some study gaps must be filled to determine if people who are unemployed are structurally or frictionally unemployed. There is a need for immediate strategies to alleviate graduate unemployment and to create jobs in all sectors so that the graduates could be absorbed immediately after graduation as graduate unemployment continues to rise in South Africa's North-West province.

3. Research Objectives

The research questions that this study seeks to address are as follows:

- What are the social-economic factors that act as a determinant of the employment status of graduates in Mahikeng municipality?
- What measures could be developed and adapted to enhance the employability of unemployed graduates in Mahikeng municipality?
- What recommendations could be made to alleviate graduate unemployment in Mahikeng municipality?

4. Hypotheses

The following hypotheses were formulated for the study:

- H1: Social-Economic factors are not adhered to when considering employment of graduates.
- H2: There are not sufficient measures to encourage employment of graduates.

5. Ethical considerations

A written consent letter was offered to each department to inform them about the proposed study. On acceptance, the details of the senior officials were collected for online interviews. Ethics clearance was obtained for this study and all Covid-19 protocols were adhered to.

6. Literature Review

6.1 Human Capital Theory

According to the Human Capital Theory, a country's performance is determined by its physical and human capital assets (McCracken *et al.*, 2017:49). The numerous investments in education and training that people create are explained in terms of projected returns. According to the Human Capital Theory, formal education is highly beneficial and suitable for increasing a population's productive capacity (Longley, 2019:1). The Human Capital Theory states that education increases the quantity of cognitive stock of economically viable human ability, which is a product of instinctive abilities and human investment. Longley (2019:1) affirms that human resource investment assists countries in achieving sustainable economic development. Individual rewards in the form of personal

economic achievements have been confirmed to be a result of these investments. Many economists argue that the character and speed of a country's economic and social growth are determined by its human resources rather than its capital or material resources. Human resources are therefore the most important component of a country's wealth (McCracken *et al.*, 2017:49).

The Human Capital Theory outlines how a worker's educational credentials correlate with increased income over the course of their career. The benefits of investing in education motivate individuals to set higher premiums on skills development through education. According to the human capital hypothesis, education boosts worker productivity (Holden & Biddle, 2017: 537). It accomplishes this through enhancing workers' knowledge and skills, which boosts the future wages of workers by increasing their lifetime earnings. According to Wright and Constantin (2021: 152), education and training improve future earnings. Also, according to Marginson (2019: 288), people with better education had higher age-earnings profiles with later peaks and steeper age earnings than those with less education.

Employees with more education, on the other hand, may start with lower pay than those with less education, but they quickly make up and earn more on average over the length of their careers. In addition to improved wages, Holden and Biddle, (2017:538) state that investing in education leads to enhanced work satisfaction throughout a person's lifetime as well as a stronger appreciation of non-market activities and hobbies.

6.2 Causes of graduate unemployment

Several factors are found to be central in graduate unemployment across the globe. In South Africa, Mncayi (2016: 64-66). Chinyamurindi and Mjoli (2018:3) identified, outlined and explained nine factors that determine the employment status of graduates. Jobs availability, wage expectations, insufficient labour market information, discouragement from the labour market, skills-education mismatches and types of jobs available, degree choices, job search activities, higher education institution attended, race, and gender are some of these factors. These factors include availability of jobs: employability, high wage expectations, economic circumstances, mismatches in skills, lack of experience in applying for jobs, inadequate labour market information, the quality of tertiary education received, forms of discrimination, and high expectations.

Furthermore, the lack of soft skills in graduates complicates the chances of their employment, limiting their performance in interviews and their respective positions. Many graduates, according to Mukasa (2019: 24), lack "soft skills," such as time management, communication, and creative thinking, or are unable to work independently. Higher education is regarded to create knowledge, skills, abilities, and beliefs (together referred to as "graduate-ness qualities") that are out of sync with employer standards and expectations, as well as the demands of a rapidly changing workplace, to varying degrees (Mncayi, 2016:68). Graduates' employability is determined by a number of criteria, including life skills, soft skills, work ethic, and independent thinking (Abel *et al.*, 2019:233). Employers respect higher education's conceptual basis, expertise, and intellectual approach to jobs, highlighting the need to address graduates' lack of soft skills.

Unemployment caused by a mismatch between job seekers' abilities and available positions on the market is referred to as structural unemployment. Structural unemployment refers to long-term unemployment induced by fundamental economic developments. Some of these economic changes are structural issues that often cause unemployment (Morsy & Mukasa, 2019:24).

According to Harry, Chinyamurindi, and Mjoli (2018:5), the push of globalisation to specialize in specific sectors of study in order to remain competitive is connected to the structural change in graduate demand. Demand shocks are transferred into graduate unemployment (Bushe, 2019:3), resulting in a shift in graduate demand and, as a result, a mismatch between demand and supply.

6.3 Consequences of graduate unemployment in South Africa

Unemployment has a variety of personal and negative social consequences. According to Matsilele (2015:5), these include severe financial hardship and poverty, debt, destitution and housing stress, family tensions and malfunction, boredom, alienation, shame and stigma, increased social isolation, crime, loss of confidence and self-esteem, deterioration of work skills, and illness. In addition, Leschke and Smith (2020:25) demonstrated in the findings of their study that unemployment is also the major cause of depression among young people across Europe. This form of depression is more common among young graduates who were unable to find jobs after graduation and those who were sacked from their jobs. In a study on the psychological consequences of unemployment in South Africa, Wilkinson *et al.* (2017: 18); Graham and Mlatsheni (2015:53); De Witte *et al.* (2012:236) report that physical effects of unemployment include, but are not limited to, headaches, sleep deprivation, heart diseases, lack of energy, and hypertension, while psychological effects include increased hostility, stress, anxiety, loneliness, emptiness, despair, fear, social isolation, and depression, suicidal thoughts.

Graduate unemployment also has an impact on not just the graduates, but also families, communities, and the country as a whole. De Witte *et al.* (2012:236) point out that unemployment has a negative impact on the family, resulting in increased parent-child conflict, emotional, mental, and physical abuse, family conflict, depression, and a decrease in family cohesiveness and financial well-being. Graduates represent hope for their families and communities to better their living standards, according to Wilkinson *et al.* (2017:21). When this hope is destroyed as a result of unemployment, Graham and Mlatsheni (2015:54) remark that a slew of negative health, social, and economic effects follow. Unemployment among young people has been linked to economic consequences. Long-term unemployment of university graduates, for example, has an influence on future earnings and hence the country's economic stability (Wilkinson *et al.*, 2017:22). Unemployment increases social inequality and alienation among the unemployed, resulting in a weak economy and lower government tax receipts in the future (Graham & Mlatsheni, 2015:54).

Numerous studies have been undertaken around the world to determine the factors that influence graduate job status. Many elements have been recognised as some of the factors that determine graduates' employment status in study areas in this regard. Authors such as Aloui, *et al.* (2020:6); Harry, Chinyamurindi and Mjoli (2018:3); Varathan, *et al.* (2018:139); Adejumo (2017:120-123); and Mncayi (2016:64-66) have spent time identifying various factors that influence graduate employment status in various countries around the world.

According to Patel and Chog (2018: 218-219), inequality, a high level of poverty, a bad education system, rural underdevelopment, and dysfunctional urban environments are all determinants of youth unemployment in South Africa. Patel and Chog (2018) posit that these factors arose from the apartheid history of the country. They argue that government could alleviate this situation when it takes certain decisive and proactive decisions and corresponding actions in the right direction. In this regard, Patel and Chog (2018) acknowledge numerous policy measures adopted by the government to adequately address these factors in the post-apartheid era.

7. Research Methodology

This research uses a non-empirical approach. The literature review is often used in non-empirical methodology. A qualitative research will be done where the researchers will conduct interviews with unemployed graduates, employees from Local Economic Development (LED), Broad-Based Black Economic Empowerment (BBBEE), and Small, Medium, and Micro Enterprise (SMMEs) through interviews, thereby obtaining detailed knowledge about their experiences.

An exploratory research design was used in this study. According to Baxter and Jack (2008:548) and Labaree (2013:6), an exploratory study is an investigation into a problem that provides a fresh viewpoint on the phenomenon under investigation. An exploratory study looks into a variety of factors to gain a deeper understanding of the phenomenon under investigation.

7.1 Sampling

The process of selecting credible participants to participate in a study to find solutions to the study's problem is known as participant selection. A total of thirty-five (35) participants participated in this study. Twenty (20) unemployed graduates were selected for this study through a purposive sampling technique. These are unemployed graduates that reside in Mahikeng municipality from ages 20-35 years. The unemployed graduates were South African graduates from diverse academic backgrounds. The researcher located the unemployed youths through the office of Broad-Based Black Economic Empowerment (BBBEE) and SMMEs. These participants were selected to know their experiences with unemployment and the major causes of unemployment. Twenty (20) unemployed graduates were selected for the study within the Mahikeng municipality area. The study included five employees each from the following departments: Local Economic Development (LED), Broad-Based Black Economic Empowerment (BBBEE), Small, Medium, and Micro Enterprise (SMMEs).

Table 1: Pseudo Names

PARTICIPANTS	PSEUDO NAMES	CODE
Participants 1-5	LED Pseudo names	LE1, LE2, LE3, LE4, LE5
Participants 6-10	BBBEE Pseudo names	BB1, BB2, BB3, BB4, BB5
Participants 11-15	SMME Pseudo names	SM1, SM2, SM 3, SM 4, SM 5
Participants 16-30	Graduates	UG1, UG2, UG3, UG4, UG5, UG6, UG6, UG7, UG8, UG9, UG10, UG11, UG12, UG13, UG14, UG15

7.2 Data collection

According to Gray (2014:352), data collection entails gathering raw responses from participants about how the study's problems might be solved. Data was collected using online interviews. This study's interview questions were divided into two sections, Sections A and B. The participants' biographical information was collected in Section A. Section B concentrated on the research questions. Open-ended questions were asked which gave the participants the freedom to express their opinions on the subject matter. Since the data collection was online, the researcher started sending the interview questions to all the participants as soon as the ethics was approved.

7.3 Data analysis

The data gathered through interviews was examined in accordance to the study's goal in this study. Atlas.Ti software (version 8.2) was used to analyse the data collected once it was transcribed into a readable form. Credibility, transferability, dependability, and confirmability were all preserved in this investigation as prescribed for a qualitative study.

8. Presentation and interpretation of results

Thirty participants completed the interviews. The biographical information collected in this study was further enhanced by the interview questions. From the analysis, 2 themes comprising of 4 categories each, were identified in Table 2 and will be discussed accordingly.

Table 2: Summary of themes and categories

NUMBER	THEME	CATEGORY
ONE	SOCIAL-ECONOMIC FACTORS	<ol style="list-style-type: none"> Choice of school/university Nepotism and race Training of graduates Choice of degree studied
TWO	EMPLOYABILITY	<ol style="list-style-type: none"> Policy implementation Government intervention Work experience and skills Internship and training programmes

8.1 Theme one: Social-economic factors

The purpose of this theme was to learn about the personal and socio-economic variables that influence graduates' employment status in Mahikeng municipality. The participants were asked to indicate the social-economic factors that determine the employment status of graduates. Their responses indicated that these determinants include the choice of school or university attended, nepotism and racial issues, training of graduates, and choice of degree studied.

Category 1: Choice of school/university

Participants confirmed that the choice of schools attended provides more opportunities to gain employment in the job sector. They further affirmed that employees tend to consider candidates who attended known universities more than those that attend universities in rural settings. Furthermore, few participants concurred that candidates that attended public universities are also preferred to those that attended FET colleges. Some excerpts from participants are as follows:

UG1 said "The choice of schools attended definitely determines the employees' choice to offer employment to the candidate".

UG6 affirmed "When you graduate from schools like Wits University or Stellenbosch, they will have more respect for you than when you graduate from local universities or FET schools".

LE2 said "From all indications, employees look for graduates from institutions of high repute. These graduates are viewed to be knowledgeable and exposed to their subject areas".

The findings from this section conform to that of Mncayi (2016: 70) who affirmed that the institution of higher learning one attends influences their employability. Mncayi (2016) further infers that most employers of labour are often on the lookout for fresh graduates from certain higher institutions, which they have developed special interest in their graduates, than others. However, the view of Baldry (2013:12) further confirms that employers accept more graduates from historically white universities than historically black universities as they are believed to provide more quality education.

Category 2: Nepotism and race

Concerning racism and nepotism, some participants indicated most jobs are given to some candidates without following due process and certain labour considerations. Some excerpts from the participants are as follows:

UG3 said "It is very hard to see whites who are unemployed in Mahikeng, we blacks, are unemployed...we are everywhere, we look for internships instead of main jobs...nobody is willing to take us."

UG13 said "They always allege that jobs are kept for the whites and Asians, I strongly disagree...the problem is that there are no jobs...only few whites and Asians reside here."

The findings of Mncayi (2016:70) affirm that most of white and Indian graduates and job seekers in South Africa stand a high opportunity to secure jobs than black or coloured South Africans and this is attributed to race which has continued to play a major role in influencing the social life in South Africa despite the end of apartheid. In confirmation, Morsy and Mukasa (2019:21), recognise that Black job searchers are the most likely to be unemployed for a relatively long period. Morsy and Mukasa (2019:21) further stated that race is situated as one of the strongest elements of employment of graduates in South Africa. However, Statistics Department affirms that Mahikeng is dominated by black people making 95% of the population. This depicts that racism induces unemployment as obtained in this section may not be logically applied to Mahikeng as most residents in Mahikeng are blacks.

Category 3: Training of graduates

This research question was directed only at the unemployed graduates. This section explored if the unemployed graduates have been involved in any training by any department or agency to help secure employment. It investigated the effectiveness of the implementation of the policies to enhance

graduate employment. Furthermore, this section explored if the unemployed graduates secured employment after completing the training or internship programmes.

The participants were asked if they have been involved in training programmes and most of them responded that they have neither been involved in training programmes nor internship programmes. Direct excerpts from the participants are as follows:

UG1 affirmed “I have never had any training or internship programmes”.

UG4 said “Since I graduated, I have been looking for a job...I have been so unlucky.... I cannot even get training or internship programmes.... It has not been easy for me”.

Category 4: Choice of degree studied

This section sought to know if the choice of degree plays a significant role in graduates' employment prospects in Mahikeng municipality. The participants indicated that the degree choice played significant roles in getting employment. Other participants concurred that the problem is not only the discipline of the candidate but availability of limited jobs. Few participants affirmed that there are high demands by the employers which makes it difficult to secure jobs in Mahikeng. Excerpts by the participants are as follows:

UG6 said “The degree choice plays a lot of roles in securing jobs”.

SM5 said “I like practical works, having twenty degrees does not make any sense if you cannot complete a task effectively”.

BB3 said “having good degrees from scarce skill discipline is very essential but having exceptional knowledge or skills are necessary to secure jobs”.

The findings from this section concur with Ryan (2013) who confirms that graduates who studied science and engineering do have greater opportunity to gain permanent employment, in contrast to those economics and management science, arts, humanities and languages. One of the most common reasons students continue their education beyond matriculation is the hope that higher education qualifications would improve their chances of landing a better-paying job. This is especially true in the case of South Africa, where labour demand is changing to highly qualified people. It is confirmed by ROA (2012:2) that arts and social science graduates experience more % age in the unemployment rate over the years which signifies more enduring challenges in entering the labour market with qualifications in these particular fields of study.

8.2 Theme 2: Employability

This section explored employability of graduates and identified 4 main categories: Policy implementation, government intervention, work experience, and, skills and internship and training programmes.

Category 1: Policy implementation

Participants indicated that the government do not implement these policies meant to alleviate unemployment effectively. Some of the participants concurred that the inability to effectively implement these policies are due to corruption of the people in charge of implementation. Some excerpts from the participants are as follows:

UG 15 affirmed “The implementation of policies is not effectively done”.

SM5 said “I think there is poor management in the implementation of the policies...the government should ensure that competent people are employed to ensure adequate implementation of policies”.

The findings of Ferreira and Rossouw (2016) affirmed that there were high expectations for the country's economic rebirth, which would be bolstered by supporting economic policies that prioritized job creation and the reduction of long-standing poverty and inequality. The effectiveness of economic policy in achieving these much-desired outcomes – particularly advances in employment – has gotten

little consideration until recently. In the same direction, Herwartz and Niebuhr (2011) point out that South African government have soluble policies to unravel the problem of unemployment but the issues rests on the management and implementation of the policies.

Category 2: Government intervention

Participants affirmed that the measures adopted by the government to alleviate graduate unemployment include Youth Employment Service, training programmes, adherence to Employment Equity Act, skills acquisition centres, internship programmes, and geographical subsidies. The participants concurred that Youth Employment Service (YES) is one of the policy measures adopted by the government to resolve graduate unemployment. Youth Employment Service is a government-led effort that encourages businesses to assist in the creation of important work experiences for young people in all parts of the country. YES aspires to generate one million job opportunities for unemployed black graduates and change their lives while assisting the businesses in which they are placed to develop. The excerpts from the participants are as follows:

UG7 said “The Youth Employment Service is implemented in all parts of South Africa but it is not really effective here in Mahikeng. We need to be the beneficiaries of this program”.

Concerning the training program, participants affirmed that it is one of the policy measures the government is using to alleviate graduate unemployment. Participants affirmed that training programme refers to series of activities that include taking one or more courses to improve with regard to performance, skills, and knowledge. Employees complete a defined curriculum as part of government training programmes to ensure compliance with legislation, policies, and procedures. Following the creation of content, it increases the level of awareness of the individual, also improves the abilities of candidates in one or more areas of competence and enhances candidates’ motivation to do a good job.

LE1 said “We train unemployed graduates in this office as a means to empower them till they get employed....we also pay them”.

UG3 confirms “I had the opportunity to be trained but afterwards, I was not given a full employment and this worsens my situation”.

The participants affirm that another policy measure adopted by the government to alleviate graduate unemployment is through the Employment Equity Act, No 55 of 1998. This Act was made to create workplace equity by fostering equal opportunity and fair treatment in employment by eliminating unjust discrimination and implementing affirmative action measures to address the disadvantages suffered by designated employees. Consultation and engagement between employers and unions are resolved under the Employment Equity Act. Excerpts from the participants are as follows:

UG2 said “Employment Equity Act has been the watchword of South African government in alleviating graduate unemployment but the issue is that we don’t see it effective in Mahikeng. They should make this program effective in every city/town”.

LE2 asserted “Employment Equity Act has been adopted as one of the measures by the government to curb the problem of unemployment”.

BB2 affirmed “This Act serves as a bedrock that eliminates unjust discrimination in providing employment opportunities for unemployed graduates”.

Category 3: Work experience and skills

Participants concurred that work experience is a high limitation towards the employability of graduates. They further affirm that employers need already experienced people to save time and costs of training. Regarding skills and training, participants confirmed that getting the right skills and training is the first step to securing a dream job. It was also highlighted by participants that employers tend to be interested in candidates that possess remarkable skills and those that have gone through intensive training. Concerning the level of education, participants concurred that possessing reputable

certificates matters a lot while searching for jobs as it is the first thing that an employer as about. Those without good level of education are abandoned. Excerpts from the participants are as follows:

UG1 Said “The truth is that skills and experiences are very vital to secure jobs. Employers sometimes get dissatisfied if applicants are not fully skilled and trained....

LE1 said “The level of education, acquisition of special skills, or other important training are highly needed during selection of candidates”.

SM2 affirms “You cannot hire a candidate who is not trained and abandon a candidate who holds a higher degree and highly skilled”.

BB3 concluded that apart from holding degrees, candidates need to be skilled and trained to secure meaningful jobs.

The findings in this section corroborate those of Farooq (2011:1) who indicated that the level of skills and experiences determines the employability of unemployed graduates. In the view of Shierholz *et al.* (2014:4), job mismatch, skills and experiences have added to the difficulties of unemployed youths to secure good jobs in South Africa. Mncayi (2016:70) further asserts that unemployed graduates should always equip themselves by gaining additional skills and other training remain employable in the mainstream economy.

Skills acquisition centres was also mentioned by the participants as one of the measures the government of South Africa adopts to combat unemployment. Skills acquisition refers to a learning programme in which a person's capacity to perform a task changes with time as a result of repetition. With enough practice, the task may eventually become improved which may demand little or no supervision. The participants attested:

UG1 said “Skill acquisition centres have been adopted to close the unemployment gap by the government over the years but the problem is that it is not effective in Mahikeng”.

UG3 confirms “I have not benefited from such programme; it needs to be effective. BB3 said... We have such programmes here but limited graduates are involved”.

Meyer (2014) further points out that South African government has been adopting legislative precepts such as Youth Employment Service, Employment Equity Act and other applicable Acts in the quest to alleviate unemployment. In the same view, Shanker *et al.* (2015) further confirm that South Africa's graduate unemployment rate has been on the rise over years despite the measures adopted by the government to resolve the social menace. Shanker *et al.* (2015) further state that the government of South Africa has introduced internship and training programmes, skills acquisition programmes and geographical subsidies with the view to reducing unemployment. Despite these initiatives, statistics show that unemployed youths are more than the available jobs and this is considered the greatest problem of unemployment. This calls for more government initiatives to create jobs to alleviate graduate unemployment.

Category 4: Internship and training programmes

In this section, the study wanted to determine whether the concerned departments ensure that graduates are employable after they have completed their internship/training programmes. The participants indicated that the concerned departments have implemented no soluble measures to alleviate unemployment. Most participants affirmed that they have never been lucky to be involved in internship programmes. Excerpts from the participants are as follows:

UG5 said “The departments do not have plans for us.... we have tried our best to be involved in active employment but there is no opportunity”.

It was noted that there are no plans by the departments to involve the unemployed graduates in active internships or skills development programmes. This conforms to the study of Meyer (2014) where it was highlighted that there is no goodwill by the concerned departments to resolve the problem of

unemployment in South Africa. Ferreira and Rossouw (2016) stated that there should be a serious intervention by the government to ensure that unemployment is resolved.

Internship programmes refers to a professional learning experience that provides meaningful, practical work relating to a candidate's area of study or career interest. The aims of internship programmes are to provide more experience and to put experiences into practice.

UG7 said "Internship programme is very necessary to transiently resolve the problem of unemployment and the government of South Africa has been adopting this measure in both urban and rural areas".

UG9 said "I have been involved in a paid internship but at the end of the day, I was not offered a permanent employment".

LE2 and BB3 confirms "We are running some internship programmes, we train and position some unemployed graduates to secure jobs".

The findings obtained in this section portray that the government of South Africa has been using diverse measures to combat unemployment in Mahikeng. The findings from this section conform to the study of Meyer (2014) who affirms that the creation of jobs enhances economic development and serves as a foundation of a booming economy. Despite various initiatives, statistics show that unemployed youths are more than the available jobs and this is considered the greatest problem of unemployment. This calls for more government initiatives to create jobs to alleviate graduate unemployment.

9. Recommendations and managerial implications

To alleviate graduate unemployment in Mahikeng, the following are the recommendations derived from the themes.

9.1 Theme 1: Socio-Economic Factors

Encouraging critical courses: The findings from the study verified that most graduates that studied critical courses have a high opportunity to secure good employment, the government should ensure adequate career management to encourage young school leavers to study critical courses.

Training and development: The government of South Africa should launch more paid training and development programmes for unemployed graduates to enable them to gain extra skills and professional development. This will aid in covering more graduates in Mahikeng who need to be engaged, also to improve them professionally and keep them focused in their areas of study.

9.2 Theme 2: Employability

Entrepreneurial development: Entrepreneurial development is considered essential for promoting job creation in the informal sector. Many unemployed graduates would be active in many dimensions of commerce and services only if the current government could alleviate unemployment through the funding of SMMEs.

Youth development policies: In order to increase youth empowerment, it is necessary for the politicians to enact policies that benefit youth. This study suggests that policies, rules, by-laws, and other actions be implemented to promote youth empowerment and job creation.

Sectoral development: According to the participants in this study, all sectors of the economy should be fully operational in order to create work for the unemployed graduates. There should be tremendous improvements and investments, particularly in black-dominated areas, to achieve a balance between white merchants and indigenous South Africans.

Establishment of an enabling business climate: According to this study, the government should enact legislation that offers a favourable environment for the survival of economic operations. Business activities, private and public investments, SMMEs, should all be supported through geographical subsidies to provide an enabling environment for job creation.

Strategic management: There should be adequate and proper management of unemployment programmes to ensure that it gets to the grass root level.

Encouragement of skills development for entrepreneurship: The government should make serious efforts to encourage craftsmanship, skills development, and entrepreneurial skills amongst youths so that they can be engaged in other practical skills rather than waiting for white collar jobs. It is discovered in the study that jobs are very few in Mahikeng, the encouragement of skills development/entrepreneurship will alleviate unemployment at a very quick rate.

10. Conclusion

According to reports by StatsSA, graduate unemployment has been on its rise in South Africa and the social menace puts pressure on the government's finances and raises concerns about South African social and economic stability. It was noted that the graduate unemployment rate as of 2021, has risen to 32.5%. This study, therefore, explored the measures to alleviate graduate unemployment in Mahikeng municipality. The prescripts of the study confirm that economic development leads to job creation and long-term employment, and jobs are the bedrock of any economy. Poverty, violence, and societal instability are all caused by the incompetence to create jobs for the youths. The study discovered that the government do not facilitate adequate training, internships, youth employment programmes, and skills acquisition programmes for unemployed graduates. Also, the government does not provide adequate sector-specific financial assistance to the private sector to ensure growth thereby improving the opportunities for job creation. As a result, the development of the informal sector has remained stagnant and the application of policies for improvement has been held in a very low esteem. To ensure reform in all facets of the economy, this social menace needs a new political dimension and policy overhaul. The study affirms that graduate unemployment could be alleviated by entry into the business sectors while entrepreneurship, skills acquisition, craftsmanship, and funding of business proposals must be promoted and supported by the government. Young graduates should be encouraged to improve their skills and engage in other entrepreneurial activities rather than waiting for white-collar jobs. The NDP's vision must be accepted and supported by all parties involved. Jobs for everyone as a strategy, as well as the recommendations of this study, should be applied to ensure job creation to alleviate unemployment in Mahikeng municipality.

Leading Towards Voice and Innovation: The Role of Psychological Contract

Larysa Botha^{1,*}, Renier Steyn²

¹⁻² Graduate School of Business Leadership (SBL), UNISA, Midrand, South Africa

Keywords

Psychological contract, psychological contract breach, leadership styles, innovative work behaviour, employee voice

Abstract

Background: Empirical evidence generally suggests that psychological contract breach (PCB) leads to negative outcomes. However, some literature argues that, occasionally, PCB leads to positive outcomes.

Aim: To empirically determine when these positive outcomes occur, focusing on the role of psychological contract (PC) and leadership style (LS), and outcomes such as employee voice (EV) and innovative work behaviour (IWB).

Method: A cross-sectional survey design was adopted, using reputable questionnaires on PC, PCB, EV, IWB, and leadership styles. Correlation analyses were used to test direct links within the model, while regression analyses were used to test for the moderation effects.

Results: Data with acceptable psychometric properties were collected from 11 organisations (N=620). The results revealed that PCB does not lead to substantial changes in IWB. PCB correlated positively with prohibitive EV, but did not influence promotive EV, which was a significant driver of IWB. Leadership styles were weak predictors of EV and IWB, and LS only partially moderated the PCB-EV relationship.

Conclusion: PCB did not lead to positive outcomes. Neither did LS influence the relationships between PCB and EV or IWB. Further, LS only partially influenced the relationships between variables, and not in a manner which positively influence IWB.

1. Introduction

This article discusses a comprehensive model linking psychological contract (PC), psychological contract breach (PCB), employee voice (EV) with innovative work behaviour (IWB), and how leadership style (LS) influences these relationships. The aim of the study was to empirically determine how different leadership styles affect employee voice and innovation under conditions of PCB, and how these variables relate to each other.

2. Problem statement

Fostering innovation is an important managerial task (Bos-Nehles, Renkema, & Janssen, 2017) and, as PCB is perceived as the norm, rather than the exception (Robinson & Rousseau, 1994), innovative work behaviour may be withheld (Ng et al., 2010). Organisations would be in a more advantageous position when all employees are willing to share creative ideas and recommendations towards operational and product improvements and are encouraged and feel free to engage in innovative work behaviour (IWB) (Akhtar et al., 2016; Milliken et al., 2003; Morrison, 2011; Zagenczyk et al., 2015). Although PCB may theoretically lead to innovation (Kiazad et al., 2014), this is seldom empirically demonstrated (Zhao, Wayne, Glibkowski, & Bravo, 2007), and the conditions under which this occurs

Note: This paper is a combination and a reworked version of the first and final chapters in the first author's doctoral thesis. Apart from it appearing in her thesis, it was not decimated in any other format

are largely unclear. Leadership is one way of influencing employees (Lee et al., 2020). As leadership is known to influence employee voice (Jada & Mukhopadhyay, 2018), and as employee voice relates to innovation (Zhou & George, 2001), soliciting appropriate employee voice via leadership may be the avenue to innovation, given PCB. However, the literature is silent on the complex relationship between PCB, employee voice, and innovation, and how leadership affects this relationship. Thus, managers are unclear as to how to apply themselves in an environment typified by PCB and where innovation is necessary. Given the dearth of literature, researchers and academics are ill-equipped to advise managers on how this dilemma might be resolved.

3. Goal of the study

The goal of the study was to empirically determine how different leadership styles affect employee voice and innovation under conditions of PCB, and how these variables relate to each other. As a result, the goal would be to advise managers on the appropriate leadership styles to employ, given the extent of PCB. Before activities to solve the empirical question could commence, intensive literature reviews were necessary, focusing on operationalising the variables and reporting on previous findings that specify the relationships between the variables.

4. Literature review

The literature review deals with the conceptualisation of PC, the link between PCB and IWB and the conceptualisation of EV. It is concluded with a comprehensive model linking these variables.

Present literature on psychological contracts is fragmented in many respects – this through being conceptualised in different ways across various studies – and thus poses a challenge to researchers and practitioners, as no conceptual standardisation exists. After reviewing reputable sources published between the years 1960 and 2020, a standard definition of the psychological contract is proposed, the most recognised typologies specified, and broad and sound measures identified. It was found that Rousseau's (1995) definition and typologies (transactional and relational contracts) are still widely used, and that the measuring scale for transactional and relational contracts by Millward and Hopkins (1998) demonstrates good psychometric properties and forms the basis for many research projects.

With PCB and IWB a systematic literature review methodology was followed to gather data, which were analysed focusing on broad adoption, theoretical coherency and, in the case of measurement, psychometric properties. In total, 14 articles were retrieved that measured the direct PCB-IWB link. PCB is most often defined and measured in terms of Robinson and Morrison's (2000) and Robinson and Rousseau's (1994) conceptualisations, while Janssen's (2000) framework is applied to IWB. Reliability information is reported for these measures. While many definitions and measures of the constructs are used, some are theoretically more comprehensive, while some are applied more often than others, and these are now specified.

With conceptualising EV, the aim was to present a review on the conceptualisation of voice, with the focus on the different ways in which the concept is defined, categorised and measured. Such a focus is required as a comprehensive and contemporary operationalisation of voice will ensure that future research is linked to the dominant body of knowledge. Subsequent to a review of a substantial number of the articles published in peer-reviewed journals between the years 1970 and 2019, the three most popular definitions of voice are presented, the three most common conceptualisations on the forms/types of voice identified, and the three most used measuring scales with acceptable reliability and validity acknowledged. Building on previous research, and considering recent publications, the comprehensive conceptualisation of voice is best described by the seminal work of Maynes and Podsakoff (2014), which integrates the extant knowledge on the topic and how it is operationalised. Their definition, typologies, and measuring instrument seems to be the standard in voice research. Maynes and Podsakoff's theorising on all three aspects is well accepted and forms the basis for many recent studies on voice.

As can be noted from the aforementioned, concepts were not only defined, but their typologies were provided, which made the operationalisation (and measurement) of the concepts in a model easier.

The identified measurement tools had acceptable psychometric properties and were suited for each construct.

Prior to commencing with the empirical investigations on the relationships between IWB and its antecedents, extensive foundational work was done in the form of literature reviews and linking the variables theoretically (using social exchange theory, psychological contract theory and conservation of resources theory). The conceptual work laid the foundation for empirical investigation, which collectively reports on the relative weighting of the different antecedents, information on what the main drivers of IWB were, and specifically, an explanation of how LS, which can be adjusted or modified, would influence these relationships. This is presented in Figure 1.

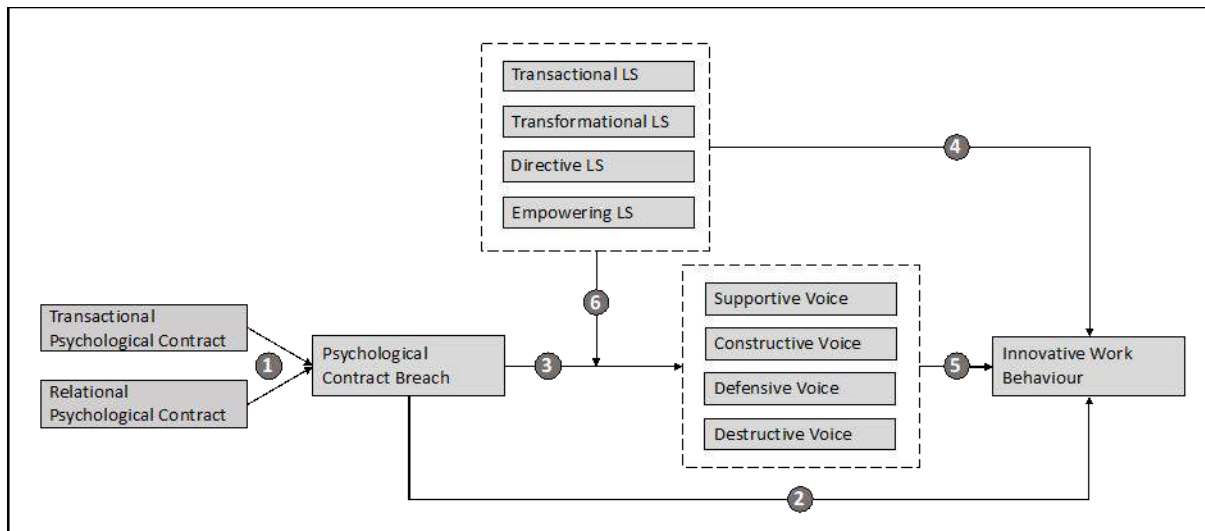

Figure 1: Unspecified conceptual framework. Source: Botha (2022)

The links within the model and how they were tested will be explained in the sections that follow.

5. Research methodology

5.1 Design

This study was carried out as a cross-sectional survey, and this design is appropriate where the intention is to describe the population and to investigate relationships between variables (Cooper & Schindler, 2011).

5.2 Respondents

The target population of this study were employees of medium-to-large South African organisations. Master of Business Leadership students were recruited to obtain access and gain permission to conduct research within these organisations. Given the existing relationships of students with specific organisations (some students were employees in these organisations), access to the organisations for the purposes of conducting surveys was, in general, obtained without difficulty. Therefore, the sampling of companies was based on convenience. The rationale behind the selection of medium-to-large organisations was based on the assumption that it is more likely that formalised processes and practices will exist in bigger organisations than in organisations of a smaller size, and that these organisational features and practices are typically observable, which might make reporting more uniform. The organisations that participated in the study represented a wide spectrum of state-owned and private sector companies.

The target population for this study included all employees, irrespective of race, ethnicity, gender, age, level of education and position in the company. There was only one exclusion criterion set for the sampling, and this was that all respondents should be able to converse adequately in English, as the questionnaire was composed in the English language only. Respondents (employees) were randomly selected from personnel lists provided by the staff in the human resources departments of the various

participating organisations. For each of the organisations, random samples were drawn until complete data had been collected for the target of 60 respondents. Although the sampling process was not perfect, an attempt was made to make the selection of respondents as random as possible, given the operational realities of recruiting respondents.

The final number of the respondents reflected in the different parts of this study is constant. Data was collected from 620 respondents, of which 313 were males (50.5%) and 301 were females (48.5%). Of this sample, most respondents, 440, were Black (71%), followed by 103 White respondents (16.6%), then by 42 Coloured respondents (6.8%) and finally, by 28 Asian respondents (4.5%).

In terms of education level, the majority in the sample, 254 respondents (41%), had a higher degree or diploma. Meanwhile, 203 respondents (32.7%) had obtained their first degree or diploma, 138 respondents (22.3%) had matric (senior certificate), and 19 respondents (3.1%) had less than 12 years of education. It could thus be reasonably expected that most of the respondents would be able to answer questionnaires with a high degree of comprehension.

The respondents were involved in core business (299 employees - 48.2%) and support services (311 employees – 50.2%). As far as positions in the company are concerned, the respondents were spread across all levels. The reported majority were employed in junior management roles (210 respondents – 33.9%), followed by middle managers (197 respondents – 31.8%), semi-skilled (34 respondents – 21.6%), and senior managers (45 respondents – 7.3%). Corresponding with educational level, 22 respondents (3.5%) indicated that they performed unskilled work.

The sample was also representative in terms of age. The youngest respondent was of 21 years of age and the oldest was 64 years of age, providing the sample's mean of 37.81 years old ($SD \approx 9$).

The respondents' tenure in their organisations ranged between 1 and 42 years, with an average of around seven years of service ($SD \approx 6$). This implies that most respondents were well capable of reporting on organisational practices.

It was concluded that the respondents in this study represented a wide spectrum of the South African workforce, demographically aligned with the data from Statistics South Africa (2020).

5.3 Research process

Following an extensive literature review (Botha & Steyn, 2020b, 2020a, 2021), several hypotheses were formulated. Testing these hypotheses unfolded systematically and incremental, firstly dealing with single antecedents before dealing with the antecedents as groups, and finally, combining groups of antecedents to predict the dependent variable. Once the data was collected (see section 3.2 above), these hypotheses were tested (see section 3.5 below), using research instruments identified in separate literature reviews (Botha & Steyn, 2020a, 2021).

5.4 Measurement

The identification of appropriate measuring instruments was based on their popularity in recent research, as well as their proven reliability and demonstrated validity. Table 1 presents the instruments selected for the study.

Table 1: Research constructs, instruments, and sources

Construct	Instrument	Source
Transactional psychological contract	20-item Psychological Contract Scale (PCS) (5 items retained)	Millward and Hopkins (1998)
Relational psychological contracts	13-item Psychological Contract Scale (PCS) (5 items retained)	Millward and Hopkins (1998)
Psychological contract breach and violation	9-item Psychological Contract Breach and Violation Scale	Robinson and Morrison (2000)
Supportive, constructive, defensive, and destructive employee voice	20-item Employee voice Questionnaire	Maynes and Podsakoff (2014)
Innovative work behaviour	14-item IWB questionnaire	Kleysen and Street (2001)
Transactional leadership style	5-item Transactional Leader Behaviour Factor	Podsakoff et al. (1990)
Transformational leadership style	24-item Transformational Leader Behaviour Factor (6 items retained)	Podsakoff et al. (1990)
Directive leadership style	10-item questionnaire comprised of two complementary (6-item and 4-item) measuring scales	Pearce and Sims (2003) (6-item) and Hwang et al. (2015) (4-item)
Empowering leadership style	10-item questionnaire	Ahearne et al. (2005)

Source: Botha (2022)

In order to decrease the length of the total questionnaire, the number of items in some of the instruments were reduced. This was achieved by selecting only those items which had the highest factor loadings within their respective scales. This procedure was also used by Bateman and Crant (1993), as well as by Strydom (2013) and Seibert et al. (2001), who reported evidence for the validity and reliability of the shortened scales.

5.5 Statistical analyses

The statistical analyses served three objectives, namely, to assess the suitability of the data for analysis, to test the reliability and validity of the data and to test the relationships between the independent and dependent variables. IBM SPSS Statistics was mostly used to perform these analyses (IBM Corp., 2020), apart from a few manual calculations. The calculation of descriptive statistics of the respondents were necessary to assess the extent to which the sample represented the population. This was done by mirroring obtained data with the information from Statistics South Africa (2020).

To test for the normality of the data, skewness and kurtosis data was generated and the data was found usable. With reliability, Cronbach's alpha coefficient larger than .7 was deemed as acceptable (Pallant, 2013), and this threshold was respected throughout the research. Factorial validity was assumed when items loaded in the expected manner, without significant cross-loadings. Common method bias was

managed using techniques proposed by Podsakoff, MacKenzie, Lee and Podsakoff (2003). When calculating correlations, the emphasis was on practical significance (medium effect $.30 < r > .49$ or $-.30 < r > -.49$; and large effect $.50 < r > 1.0$ or $-.50 < r > -1.0$) (Cohen, 1988).

Regression analyses were also performed. In this study, the total size of the regression coefficient was of less concern, with the focus primarily on the significance of the beta values of the different predictors. Significant predictors ($p < .01$) were considered as unique and substantial contributors to the variance in the dependent variable. Regression was also used to test for moderation, using the procedures suggested by Fairchild and MacKinnon (2009), which are well aligned with the recognised structure suggested by Baron and Kenny (1986). This method encompasses doing a regression without including the moderator in the model, adding the moderator, and finally adding the moderator and the predictor variable times the moderator. Here the interest is in ΔR^2 , and when interaction effect between the predictor and the moderator is significant, moderation is assumed.

All these analyses were combined to evaluate the proposed theoretical model in Figure 1. The subsequent data driven model is presented in Figure 2.

5.6 Ethical matters

All standard ethical guidelines regarding interaction with respondents, as well as the management of data collection and access to such data, were done in accordance with the requirements set out by University of South Africa's Graduate School of Business Leadership (GSBL). Once the researcher had obtained permission from the Research Ethics Review Committee of the GSBL (2019_SBL_001_CA dated 04 February 2019), the data collection has commenced. No adverse effects, nor incidents that could possibly threaten the integrity of the data collection process, were reported.

6. Results

The conceptual model in Figure 1 was tested sequentially. First, the effects of PC, and the breach thereof, on IWB was investigated (1 and 2 in Figure 1). Next, the effects of PCB on EV were tested (3 in Figure 1). The effects of LS on IWB were also assessed (4 in Figure 1). This was followed by testing which aspects of EV influence IWB (5 in Figure 1). This sequential testing of parts of the model was finalised by analysing how LS moderates the effects of PCB on EV (6 in Figure 1). The tests of each part of the model are presented below.

In the first part of the study the goal was to empirically determine how PCB affects the relationship between different PCs (relational and transactional) and IWB. Data were collected from 620 employees representing 11 South African organisations. The instruments showed acceptable psychometric characteristics. Three results were dominant: Transactional PC did not correlate with IWB, while relational PC did so in a significant way; PCB correlated positively and significantly with transactional PC, and negatively and significantly with relational PC, but not with IWB; PCB did not moderate the relationship between relational PC and IWB. It was evident that PC type (relational PC) has a direct effect on IWB, but PCB did not relate significantly with IWB. As PCB is known to affect discretionary behaviour, the last-mentioned result was surprising. Outside of the set hypotheses, it was found that PCB correlated positively and significantly with transactional PC, and negatively and significantly with relational PC. This suggests that, in transactional environments, PCBs are experienced more often, whereas perceptions of breach within relational environments are reported less often.

The next aim was to empirically determine how different types of PC are linked to different types of EV, and also, how PCBs affect these relationships. The paucity of literature on the relationship between the three variables necessitated this research. Relational PC correlates with promotive dimensions of EV, and similarly, though to a lesser extent, with prohibitive voice. Transactional PC and PCB, meanwhile, correlated with prohibitive dimensions of EV. The PC-EV relationship was moderated by PCB only in a transactional PC environment, and only for the prohibitive EV dimension. This could be explained by considering that, where interpersonal relations exist with higher levels of

RPC, and where non-monetizable issues are at play, PCB does not affect EV in a significant way. However, in the presence of strong transactional relations, where TPC levels are high, and where monetizable matters are a concern, PCB has a substantial effect on the prohibitive voices, and this occurs to a large extent. It is interesting to note the nature of moderation. The interaction effect was negative, which may suggest that when TPCs are breached, employees will be less willing to express their voices and may choose silence.

Furthermore, this research aimed to empirically determine how different dimensions of EV are linked to IWB, and also, to assess the relative importance of EV, compared to other two predictors of IWB, namely leadership styles and climate for innovation (Cfi). Supportive voice, and particularly constructive voice, positively correlated with IWB, while defensive and destructive voices had no effect on IWB. The model in which EV was used to predict IWB was superior to models that included leadership styles as well as Cfi. These results suggest that EV can contribute positively to IWB, depending on the type of EV expressed. In addition, EV, more than leadership styles and Cfi, predicts IWB.

Leaning on the social exchange and psychological contract theories, this research introduced the leadership style as the mechanism that may differentially buffer or exacerbate the effects of PCB on EV. With its aim to empirically determine how PCBs are linked to different types of EV, and also, how different leadership styles affect these relationships, this research reported the results that follow. The results pointed to three matters. Firstly, PCB correlates negatively with promotive types of EV, and positively with prohibitive types of EV. Secondly, leadership styles were a weaker predictor of EV than PCB. Finally, the PCB-EV relationship was, in most cases, partially moderated by leadership styles.

The results uncovered in these individual articles provide valuable insights into understanding the complexity of relationships between PC, PCB, EV, IWB and LS, and require further exploration. An integrated summary of the results, incorporating all the outcomes from different sub-studies, is provided in Figure 2.

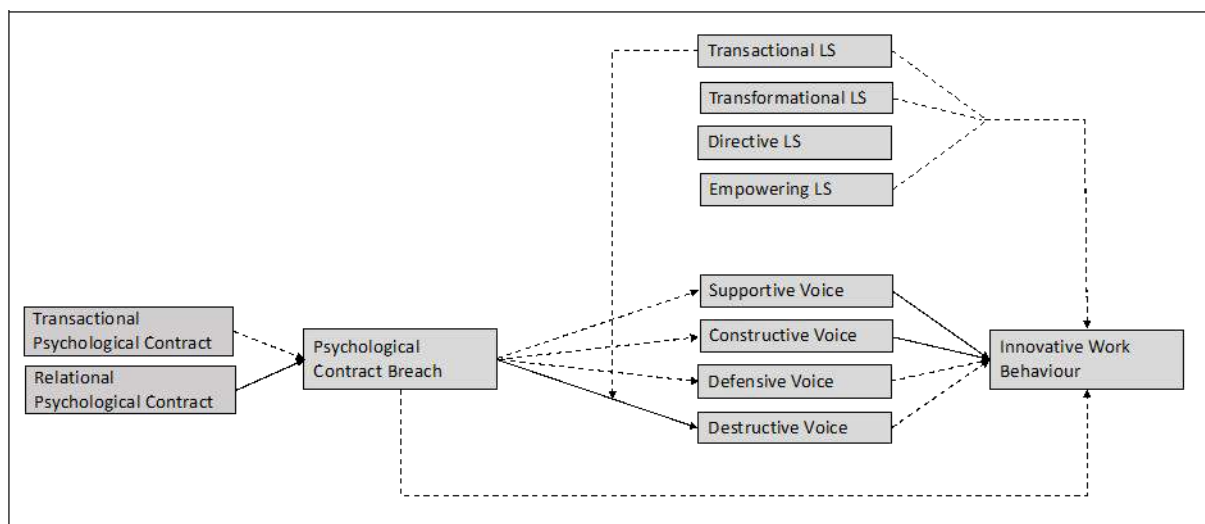

Figure 2: Specified conceptual framework. Source: Botha (2022)

Note: The statistically significant relationships between variables in Figure 2 are indicated with dotted lines ($p < .05$). The practically significant relationships between variables are indicated with solid lines ($r > .30$).

In terms of the overall results, this study revealed more than initially expected on the questions that the research aimed to answer. In brief, this additional information can be summarised as follows:

- According to the results, PCB does not lead to substantial changes in IWB. The relationship between breach and innovation was found to be very small.

- When EV was investigated as an antecedent of innovation, it was found that one particular type of voice, namely constructive voice, acted as a profound driver of innovation.
- Next, this research provided strong evidence that PCB influenced EV, particularly its prohibitive forms, namely defensive voice (DfV) and destructive voice (DsV), but not the promotive, particularly, constructive voice (CV) – the most critical in predicting IWB.
- Although leadership was found to influence the relationship between PCB and EV, it was not, however, shown to influence CV – the dimension of voice that would be beneficial in activating innovation.
- Finally, in comparing the relative strength of EV and LS as predictors for IWB, it appeared that LS acted as a less dominant predictor of IWB. The strongest predictor for innovation was EV, specifically, its constructive dimension.

Figure 2 provides a comprehensive integration of the results of this study. It is evident that the importance of EV, particularly its promotive forms, in predicting IWB outweighs the effects of LS on IWB. This makes a valuable contribution to understanding the complexities of the relationships between variables.

7. Conclusion

This research confirmed earlier results on the PC-IWB links, specifically, a negative relationship between TPC and IWB (Suh, 2002; Thompson & Heron, 2006) and a positive one between RPC and IWB (Chang et al., 2013; Thompson & Heron, 2006). Although in this study, the negative correlation between TPC and IWB is in line with previous research, its effect was statistically non-significant, which also confirmed results of the earlier investigations (Aggarwal & Bhargava, 2010). A surprising counter-intuitive finding in this study pertains to the relationship between PCB and IWB. Contrary to the existing evidence for the negative and statistically significant PCB-IWB link (Li et al., 2014; Vander Elst et al., 2016), in this study it was found that PCB had no effect on the innovative behaviour.

Outside of the original scope of this research, it also transpired that TPC correlated positively with PCB, while RPC correlated negatively with PCB. This leads to the conclusion that, under conditions of TPC, PCBs are experienced more often. The proposed explanation agrees with Zhao et al. (2007) who stated that, when employers fail to deliver on their explicit obligations, the PCB will result in immediate and extreme reactions from employees. The negative relationship between RPC and PCB suggests that, in situations where RPCs are observed, PCBs are experienced less often. This conclusion is in line with the assumption that employees often attribute the breach of the relational content of the PC to a miscommunication or bad luck, rather than to a deliberate breach on the part of the employer (Robinson & Morrison, 1995).

Rather surprisingly, this investigation illuminated the fact that no single leadership style was omnifluential. Nevertheless, it was found that transactional leadership style (TsL) had the most profound buffering effect on the PCB-EV links, for both defensive and destructive forms of voice. Furthermore, although the effect on constructive voice within a transactional environment was the opposite, TsL lessened the intensity of CV. This means that, within the transactional environments, when breaches happen, dealing with consequences of breach in an explicit manner will decrease prohibitive voices, but not necessarily increase promotive ones. Similar to the buffering effect of TsL on the PCB-EV link noted above, empowering leadership style (EL) also had a buffering effect on the PCB-EV link. This showed that, under transactional breaches, the empowering leader will lessen the expression of employees' destructive voice. These particular results are novel, as literature is scant on investigations of the effects of various leadership styles on multiple forms of employee voice.

8. Contribution

This research made a number of contributions. Firstly, this study attempted to solve the research problem, namely, that managers are unclear as to how to lead and apply themselves in environments typified by PCBs and where innovation is necessary. Given the paucity of the literature, researchers

and academics are ill-equipped to advise managers as to how this dilemma could be resolved. The literature provides extensive evidence that, when employees experience stress in their work environments, such as often stems from PCBs, they may withhold their discretionary efforts and extra-role behaviours, such as voice and innovation (Ng et al., 2010). However, achievement of employees behaving innovatively is an important managerial task (Bos-Nehles et al., 2017). There is no evidence of any studies that have attempted to investigate the issue of leading towards voice and innovation under conditions of PCB. The main contribution of this study is that it provided evidence that leadership style is not necessarily the first-choice remedy. As it turned out, there are more powerful factors involved in solving this research problem. One of these is the quality of the relationships between employers (with managers and supervisors as agents) and employees. Social exchange relationships, in the form of PCs, are fertile grounds for fostering discretionary actions of employees (Rousseau, 2004). In addition, the level of fulfilment of PCs by managers is a salient condition for activating the right employee voice, which leads to innovation. Practically, we saw that, particularly, constructive voice is the most powerful antecedent to innovation.

The second contribution pertains to the development of the conceptual Model, in which complex relationships between multidimensional constructs were explored. These relationships consisted of two types of PC (transactional and relational), two types of PCB (transactional and relational), four dimensions of EV (supportive, constructive, defensive and destructive) and four leadership styles (transactional, transformational, directive, and empowering). To the knowledge of the researcher, conceptually and theoretically, as well as methodologically, the relationships between these variables had not been investigated previously, and the set hypotheses had not been previously tested together, within one study.

Finally, the data for all tested models were collected from the same sample and analyses were done using the same measuring instruments. The similarity in the sourced data made it possible to compare as well as to combine models, which was essential to this study. When, for example, the links between leadership styles and innovation, organisational climate and innovation, and voice and innovation were tested, the same innovation construct was employed in each instance, along with the same measuring instrument, thus allowing for consistency in the results.

9. Limitations

The first limitation is that not all variables related to the dependent variables (IWB and EV) and independent variables (PC, PCB and leadership styles) were included in the research. For example, innovation or an expression of employee voice could be dependent on personality traits or individual characteristics, such as proactivity, that were not assessed in this study.

This study used a single source, single method approach. Data in a form of self-reported perceptions were collected from employees of organisations. Gaining information from managers as an additional source could be useful. Also, using interviews as an alternative source of data could be valid in establishing the links between variables.

The next limitation pertains to the researcher having limited the literature search to full-text articles in peer-reviewed and scholarly journals. These were retrieved from the four most popular and comprehensive academic databases in Business Management (EBSCOhost, Google Scholar, ProQuest and Sabinet). However, the fact that only these databases were searched could have resulted in pertinent literature being excluded from the search. Extending the search to other sources, such as conference papers and dissertations, could have yielded valuable and relevant information for this research study.

This study followed a cross-sectional design, which intends to describe the relationship between the variables. Using a longitudinal design, as suggested by Ployhart and Vandenberg (2010), would potentially add considerable value in investigating how changes in one variable (for example, in perceptions of PCB) relate to changes in other constructs, such as EV and IWB.

A final concern in this study relates to a common method bias (CMB), where the estimated relationship between constructs is inflated due to systematic covariation created by response patterns to questionnaires (Rodríguez-Ardura & Meseguer-Artola, 2020). At an ex-ante level, CMB was managed by making sure that the complete questionnaire provided to respondents was relatively short (Podsakoff et al., 2012) and was thus limited to 84 questions. Further, effort was made to select questions that were clearly and unambiguously worded (Podsakoff et al., 2003) so as to reduce the risk of CMB. The format of questions within the questionnaire differed from section to section, which counteracted similarity in response patterns (Podsakoff et al., 2012). As further ex-ante CMB management strategies, actual responses were solicited by asking respondents to answer all questions honestly, and by notifying the respondents in the informed consent form, that their anonymity (Steenkamp et al., 2010) would be safeguarded and that the research would have no direct impact on their lives (Steenkamp et al., 2010). These applied measures seemed to moderate possible CMB, as demonstrated in ex-post-tests. The Harman's single-factor test, which is widely used as a statistical tool that detects CMB (Fuller et al., 2016), revealed that factor 1 declared only 21.9% of the variance in the dataset, which is significant and is less than the rule-of-thumb of 50% (Fuller et al., 2016). Also, when considering the correlations between the constructs, all correlations were below the rule-of-thumb score, where correlations higher than .90 are a clear sign of CMB (Bagozzi, 1984; Bagozzi et al., 1991). The highest correlation ($r = .766$) was between TfL and TsL. The next highest correlation was .696, between TfL and EL. The average correlation between constructs was .208, with a standard deviation of .059. These results suggest that statistical CMB indicators in this study were below the thresholds, and it was concluded that CMB was not a concern in this investigation.

10. Recommendations and implications

Based on the research results, a number of recommendations can be put forward to academics as well as business practitioners.

To academics, this research offers a comprehensive model predicting IWB. The model provides the foundation for further research on this matter. From this research, it became apparent that PCB is not a dominant predictor of IWB, and that this may be excluded from further studies. Academics are, however, now informed that EV, more than LS, and more than PCB, is a dominant predictor of IWB. It is therefore suggested that models that aim at predicting IWB include EV construct, and models with other variables that may facilitate EV and IWB, be included in future research.

Secondly, researchers are advised to expand on the limitations of this study. The focus of this research was limited to employees' perceptions and behaviour, but it did not explore other possible influencing factors, such as personality traits of employees. Studying personality traits as a possible moderator could have shed light on the PCB-IWB link, which in this study was found to be non-significant. Alternatively, PCB could have led to innovation when proactive personalities or individuals with an internal locus of control were identified.

In terms of recommendations relevant to managers and business practitioners, many things can be done in order to foster their subordinates' voice and innovative behaviour. First and foremost, managers should maintain positive social exchange relationships with their employees. As the results show, regardless of the type of PC, managers should avoid breaching the contracts and endeavour to fulfil their promises and obligations to employees. Secondly, managers are advised to develop relational ties with employees, as these lead to higher levels of discretionary behaviours. The next suggestion is to create psychologically safe environments where employees will feel safe to speak up, and most importantly, when they do speak up, where employees' voices will be heard. Although this research found evidence of related importance of relational contracts in fostering EV and IWB, in the prevailing transactional environments, managers are advised to follow the "rulebook" – the fulfilment of explicit agreements. Finally, this study found no evidence of leadership style being a solution for enhancing promotive dimensions of EV – however, the results lead to a recommendation that applying transactional, transformational, and empowering leadership styles could buffer the levels of undesirable, prohibitive forms of employee voice behaviour.

Design For The Environment: A Driver For The Implementation Of Green Initiatives

Mr.Arthur Mashala¹

¹ Applied Management, College of Economic Management Science, University of South Africa, Pretoria, South Africa

Keywords

Supply chain, Green supply chain management, Green supply chain drivers, Green supply chain initiatives.

Abstract

The push for environmentally sensible supply chains (SC) has been inspired by the ecological impact of certain business activities. Environmental management has been recognised by companies as a key strategic issue that may have a lasting impact on organisational performance. In an effort to manage their environmental responsibility organisations have recognised that green supply chain management (GSCM) is an important approach. Green purchasing, green manufacturing, green packing, green distribution and marketing are core elements of GSCM. Although it has become apparent that easing environmental dilapidation and providing economic benefits is important, very little focus has been put on the drivers that do influence green supply chain initiatives (GSCI) particularly in Ekurhuleni. This study looks at the design for the environment as a driver that encourages green initiatives amongst manufacturers and endeavours to create awareness of the negative environmental effects associated with the entire life cycle of its products or services in Ekurhuleni.

1. Introduction

1.1. Problem Statement

Over the past three decades there has been increasing demand for manufacturing organisations to consider environmental aspects in their product's entire life cycle to improve environmental and economic performance of SC's. If actioned properly, this undertaking can reduce environmental degradation and drive GSCM practices. Green supply chain (GSC) adoption is driven by regulatory measures, competitor pressures, customer pressures and socio-cultural responsibility. These drivers ensure environmental compliance, healthy competition, customer satisfaction and socio-culturally responsible business practices in the SC. However, the influence of regulatory measures, competitor pressures, customer pressures and socio-cultural responsibility (GSC drivers) on manufacturing organisations' decision to adopt the Design for the environment (DfE) initiative has been under researched in South Africa, and not yet investigated in Ekurhuleni. This means that despite the importance of understanding these drivers, there is limited knowledge on SC drivers that foster the adoption of green initiatives in the South African context, particularly in Ekurhuleni. The Ekurhuleni municipality being one of three major metropolitan municipalities in the core of the Gauteng region. It covers an area of some 190147ha and has an estimated population of 2.5 million (SALGA, 2018).

1.2. Research aim and objectives

Based on the above problem statement, this study investigates the drivers that motivate manufacturers to adopt GSCM in Ekurhuleni. The objective is as follows:

Primary objective

- To determine the influence of GSC drivers on the company's decision to adopt DfE initiative. This study proposed the conceptual model, shown in **Figure 1.1**, to attempt to explain the influence of GSC drivers on the company's decisions to adopt the DfE initiative.

Secondary objective

- To explore the potential benefits derived from the use of the correct combination of green initiatives.

Figure 1.1: Conceptual model
Source: Researchers own compilation 2020.

1.3. Hypotheses

The following hypotheses were formulated for the study:

- H1: Regulatory measures have a positive influence on design for the environment.
- H2: Customer pressures have a positive influence on design for the environment.
- H3: Socio-cultural responsibility has a positive influence on design for the environment.
- H4: Competitor pressures have a positive influence on design for the environment.

2. Literature Review

2.1 Green supply chain management

Kirchoff, Tate and Mollenkopf (2016:3) define GSCM as a strategic capability because it is considered to be valuable, rare, inimitable, and able to be exploited by an organisation. McCarthy, Mohamed and Geng (2021) define GSCM as having numerous diverse aspects from, efficient buying, to the proper use of SC channels, to the manufacturing, as well as customer understanding and reverse logistics. Tumpa, Ali, Rahman, Paul, Chowdhury and Khan (2019:2) mention that GSCM contemplates the protection of the environment at every phase of the process, and is considered to be an effective technique in decreasing the adverse ecological impacts of the production of products. According to Baker and Hinton (2020), GSCM targets uninterrupted developments of manufacturing practices and products to reduce or stop pollution to air, water and land. Countries around the world are currently trying to address the negative impact of catastrophic levels of environmental contamination brought about by manufacturing activities. GSCM is seen as a forceful organisational concept to guide organisations in the management of key procedures that are aimed at plummeting ecological risks and improving environmental competence. Lee and Lim (2020) label GSCM as a notion that assimilates eco-friendly thinking into SCM whose activities are focused on plummeting or eradicating harmful chemicals, emissions and solid wastes generated in the SC process from product design, product purchase, the assembly process, and delivery to end users through the end of the product's life cycle. Vijayvargy, Thakkar and Agarwal (2017) indicate that the challenge in applying GSCM practices are due to its complexity, recourse needs and coordination issues and lower

inclination for adopting such practices. Previous studies showed that image of eco-friendly organisations was focused on marketing perspective or external GSCM practices.

2.2 Design for the environment

Somsuk and Laosirihongthong (2016:4) point to the understanding that experts and scholars recognise that the acceptance of GSCM practices can lead to sustainable competitive advantages, maintainable development and world-class performance. Mason and Norris (2018) ordered GSCM practices into four main groupings, namely internal environmental management, external GSCM practices, investment recovery, and eco-design dimensions. This study focuses on green supply chain initiatives GSCI, particularly the design for the environment (DfE). Thaib (2020) proposes that organisations currently face ample challenges from competitors to adopt GSCI's. Foo *et al.* (2019) stress that institutional pressures affect the consciousness of an organisation in determining its abilities to implement green purchasing practices that can lead to its competitiveness. According to Keivanpour and Ait Kad (2019), (DfE) 'is the environmental contemplation of the product development phase and the products whole life-cycle'. The International institute for sustainable development (IISD) (2020) recognise DfE as an umbrella term connected to procedures used to integrate an environmental component into products and services before they enter the production phase. Zheng, Govindan, Deng and Feng (2019) indicate that during the execution of DfE, organisations consider resource efficiency, environmental impact and remanufacturing during the design of products and furthermore organisations can decrease their resource consumption and production costs through effective implementation of the DfE for example, Canon has reduced its reliance on natural resources, waste and operation costs, and eventually provided a stable supply of resources through the improvement of technologies and product design (Zheng, Govindan, Deng & Feng, 2019). Burt and Sterling (2019) suggest that the main objective of DfE is to manufacture products in a way that, uses less energy, does not indirectly or directly contaminate the environment and can be reused or recycled at the end of their useful life. In line with Burt and Sterling (2019), the Product Design for the Environment (2020) suggest that DfE (which is also identified as green design) can be understood more entirely as a design method that must be considered for protecting and salvaging the earth's scarce resources, where energy and material consumption is optimised, minimal waste is produced and output waste streams from any procedure can be used as the raw material. According to Nambiar (2010), the DfE can be viewed as a manufactured goods design process that considers the potential environmental impact that assembled goods can prompt during its life-cycle and attempts to reduce the negative impact by addressing probable issues during the design stages of the product. Abdullah and Dawood (2017) point out that green product design concentrates on discovering a balance between man and nature, and takes into thought the possible negative impact to reduce the damage in the whole design process. The increased pressure from the public and ecologically mindful clients has led to certain environmental regulations or codes of practice being introduced (Azevedo, Carvalho & Machado, 2011). A case of such regulation in South Africa would be the Waste Classification and Management Regulation Act (Act 59 of 2008). Davis, Van Derk and Mahomed (2020) indicate that an organisation's market segment and profit aims, along with its manufacturing and financial performance, can be driven by an organisational product design and green activities. Hawkins and Mathews (2020) suggest that environmentally friendly natural resources, parts and components, should be used to design products. In light of this view Erkmen, Yavuz, Kavci and Sari (2020) state that in today's world the production of new eco-friendly raw materials is focused on the eradication of environmental pollution. South Africans generally do not take part in greening activities, particularly in the townships. So then what is the push for manufacturers to go green?

3. Research methodology

The target population for the study consisted of manufacturing organisations located in the EMM, particularly manufacturers of FMCG and pharmaceutical manufacturers because of their manufacturing environmental effects and geographical location. Within the abovementioned manufacturing organisations, the study focused on top and middle level management positions: production managers, supply chain managers, logistics managers, quality control managers and safety managers. The selected top and middle level management all had a direct or indirect influence on the product, be it before manufacturing, during manufacturing or post manufacturing. A probability

stratified sampling method was used to select managers within manufacturing organisations for this study. From the population size of 403 manufacturing organisations, an estimated sample size of 201 manufacturing organisations was determined. In this study, institutional theory is adopted to measure the extent to which a set of drivers motivate organisations to adopt GSCIs. The research objective for this study was based on theory development and prediction and thus employed the second-generation multivariate technique, structural equation modelling (SEM), to analyse data. The PLS-SEM reflective measurement was selected to conceptualise the measurement model reflectively. The study employed three indices to evaluate unidimensionality (outer model): Cronbach's alpha, Dillon-Goldstein's rho and eigen values. The quality of the inner model was assessed by examining the following indices: coefficient of determination (R^2), redundancy index, and the goodness-of-fit (GoF).

3.1 Measurement model evaluation

According to Ravand and Baghaei (2016), measurement model is evaluated in terms of the extent to which the indicators are unidimensional while the latent variables explain variations in the indicators and the constructs have discriminant validity. Van Niekerk (2019) suggests that a measurement model evaluation embraces evaluating the reliability and legitimacy of the manifest variables. Sanchez (2013) suggests that researchers can evaluate the measurement models using (PLS-PM) with the help of the PLS-PM package in R software environment. Hair, Hult, Ringle and Sarstedt (2017) suggest that to evaluate reflective measurement models, internal consistency as well as convergent and discriminant validity must be established. Each of these indicators was used in this study. The results of the unidimensionality of indicators is subsequently presented and interpreted.

3.2 Unidimensionality of indicators

The study employed three indices to evaluate unidimensionality: Cronbach's alpha, Dillon-Goldstein's rho and eigen values. The results, as presented in Table 1.1 indicate that the Cronbach's alpha for all the constructs were above the required cut-off point of 0.7, which indicate internal consistency. The Dillon-Goldstein's rho for all the constructs were above the recommended cut-off point of 0.7, which indicates homogeneity of the constructs. Therefore, the construct items are reliable and homogeneous.

Table 1.1: Unidimensionality assessment of measurement model 1

Model	Manifest variables (no of items)	Cronbach alpha	Dillon-Goldstein's rho
Regulatory measures	6	0,850	0.890
Customer pressures	5	0,805	0.865
Social-cultural responsibility	6	0,754	0.831
Competitor pressures	6	0,747	0.827
Design for the environment	7	0,869	0.901

Table 1.2 shows that the first eigen values of measurement model 1 were greater than 1, and the second eigen values were below 1 for only regulatory measures and customer pressures, while the remaining eigen values were above 1. This violated the unidimensionality thumb rule, which requires the second eigen values to be below 1. To address the violation of the unidimensionality thumb rule, a factor analysis of construct items is to be conducted.

Table 1.2: Unidimensionality eigen values

Unidimensionality			
Model	Manifest Variables (no of items)	1 st eigen value	2 nd eigen value
Regulatory measures	6	3.475	0.966
Customer pressures	5	2.816	0.876
Social-cultural responsibility	6	2.821	1.255
Competitor pressures	6	2.706	1.132
Design for the environment	7	3.990	1.332

Table 1.3 presents the factor loadings of measurement model 1. Items where factor loadings below 0.5 were dropped from the model as recommended by Van Staden (2014). This means that item V22 was dropped from the socio-cultural responsibility construct, and item V26 was dropped from the competitor pressure construct.

Table 1.3: Factor loadings of measurement model 1

Name	Block	Loading
V22	Socio-cultural responsibility	0.373
V26	Competitor pressure	0.418
V28	Competitor pressure	0.504
V35	Design for the environment	0.514
V23	Competitor pressure	0.549
V7	Regulatory measures	0.623
V13	Customer pressure	0.643
V17	Socio-cultural responsibility	0.645
V41	Design for the environment	0.656
V36	Design for the environment	0.661
V21	Socio-cultural responsibility	0.697
V6	Regulatory measures	0.699
V12	Customer pressure	0.702
V18	Socio-cultural responsibility	0.716
V14	Customer pressure	0.740
V10	Regulatory measures	0.743
V24	Competitor pressure	0.753
V19	Socio-cultural responsibility	0.760
V16	Customer pressure	0.776
V20	Socio-cultural responsibility	0.779
V25	Competitor pressure	0.779
V8	Regulatory measures	0.793
V27	Competitor pressure	0.797
V38	Design for the environment	0.800
V37	Design for the environment	0.812
V11	Regulatory measures	0.833
V15	Customer pressure	0.836
V9	Regulatory measures	0.837

After the dropping of the items with lower loadings (V26 and V22 for socio-cultural responsibility and competitor pressure, respectively) from the initial measurement model (measurement model 1) to ensure each item is unidimensional, the Cronbach's alpha values for all the constructs are above the suggested cut-off point of 0.7, as shown in Table 1.4. The results suggest that all the constructs are reliable with regards to internal consistency. Table 1.4 also shows that the Dillon-Goldstein's rho values for all the constructs are above 0.7, which indicates homogeneity of the constructs. The first eigen values of the measurement model are greater than 1, while the second eigen values are below 1

for all of the constructs, except for competitor pressures and design for the environment, which violates the unidimensionality thumb rule again. This requires the re-assessment of factor analysis of the items violating the unidimensionality rule to address the violation of the unidimensionality thumb rule. As shown in Table 1.4, the factor loadings of construct items were re-assessed to identify and drop the items of constructs that violate the unidimensionality rule.

Table 1.4: Unidimensionality assessment for Measurement model 2

Model	Manifest variables (no of item)	Cronbach's alpha	Dillon-Goldstein's rho	eigen. 1st	eigen. 2nd
Regulatory measures	6	0.850	0.890	3.475	0.966
Customer pressures	5	0.805	0.865	2.816	0.876
Socio-cultural responsibility	5	0.789	0.857	2.765	0.868
Competitor pressures	5	0.720	0.818	2.401	1.114
Design for the environment	7	0.869	0.901	3.990	1.332

Table 1.5 presents the factor loadings of measurement model 2 and items with factor loadings below 0.5 were dropped from the model as recommended by Van Staden (2014). The results show that all the items for the reflective blocks from V6 to V41 all scored above the cut off 0.5, meaning that they were acceptable.

Table 1.5: Factor loadings of measurement model 2

Name	Block	Loading
V6	Regulatory measures	0.696
V7	Regulatory measures	0.620
V8	Regulatory measures	0.790
V9	Regulatory measures	0.839
V10	Regulatory measures	0.746
V11	Regulatory measures	0.836
V12	Customer pressure	0.703
V13	Customer pressure	0.650
V14	Customer pressure	0.738
V15	Customer pressure	0.838
V16	Customer pressure	0.771
V17	Socio-cultural responsibility	0.666
V18	Socio-cultural responsibility	0.722
V19	Socio-cultural responsibility	0.798
V20	Socio-cultural responsibility	0.774
V21	Socio-cultural responsibility	0.681
V23	Competitor pressure	0.541
V24	Competitor pressure	0.753
V25	Competitor pressure	0.781
V27	Competitor pressure	0.805
V28	Competitor pressure	0.507
V35	Design for the environment	0.503
V36	Design for the environment	0.653
V37	Design for the environment	0.808
V38	Design for the environment	0.799
V39	Design for the environment	0.853
V40	Design for the environment	0.856
V41	Design for the environment	0.662

Since all the items for the reflective blocks of all constructs are above the cut-off point of 0.50, as shown Table 1.5, the unidimensionality of the measurement model was re-evaluated by means of principal component analysis (PCA) as some of the 2nd eigen values were above 1 rather than below 1. To achieve this end, factor analysis was once again performed using the Kaiser criterion to retain factors with 2nd eigen values greater than 1 for the competitor pressures, design for the environment constructs. Table 1.6 indicates the factor analysis results for design for the environment. The results show that two factors were retained as their eigen values are above 1 (factor 1 and factor 2) and accounted for 76% of the total variation for the design for the environment construct.

Table 1.6: Factor analysis Design for the environment

Factor analysis/correlation		Number of participants =	142	
Method: principal-component factors		Retained factors =	2	
Rotation: (un-rotated)		Number of parameters=	13	
Factor	Eigenvalue	Difference	Proportion	Cumulative
Factor1	3.990	2.657	0.570	0.570
Factor 2	1.332	0.695	0.190	0.760
Factor 3	0.636	0.280	0.0909	0.851
Factor 4	0.356	0.056	0.050	0.902
Factor 5	0.299	0.068	0.042	0.945
Factor 6	0.231	0.077	0.033	0.978
Factor 7	0.153	.	0.021	1.000

After performing principal component factor analysis, the competitor pressures and design for the environment constructs were structured and reported according to sub themes. Hence, the results of the remaining items of the final measurement model, as shown by Table 1.7, indicate that Cronbach's alpha values for all the constructs are within the recommended cut-off of 0.70, except for the Cronbach's alpha for the competitor pressures construct that is slightly below 0.7 (0.68 and 0.69 for competitor pressures 1 and competitor pressures 2, respectively). The Dillon-Goldstein's rho values for all the constructs are above 0.7, which indicates homogeneity and unidimensionality of the constructs or indicators. The first eigen values of the measurement model is greater than 1 and the second eigen values for all of the constructs are below 1, indicating that they are unidimensional. Based on the results of Cronbach's alpha, Dillon-Goldstein's rho and eigenvalues, this study therefore indicates that the items of the final measurement model are unidimensional, as all the measures or indicators meet the suggested thresholds.

Table 1.7: Final measurement model

Constructs	Sub constructs	Manifest variables (no of item)	Cronbach's alpha	Dillon-Goldstein's rho	eig. 1st	eig. 2nd
Regulatory measures		6	0.850	0.890	3.475	0.966
Customer pressures		5	0.805	0.865	2.816	0.876
Social-cultural responsibility		5	0.789	0.857	2.765	0.868
Competitor pressures	Competitor pressures 1	3	0.680	0.825	1.844	0.766
	Competitor pressures 2	2	0.694	0.867	1.531	0.468
Design for the environment	Design for environment 1	3	0.869	0.920	2.382	0.443
	Design for environment 2	4	0.843	0.896	2.741	0.720

3.3 Convergent validity

The quality of the measurement model was inspected by checking the convergent validity which shows the degree to which the indicators the constructs are related. Table 1.8 presents the convergent validity results obtained. The AVE extracted indicate that all of the variables loaded higher than 0.5 which suggests that correlation between the constructs exists which means that the measurement model met the convergent validity requirement.

Table 1.8: Convergent validity

AVE (Average variance extracted)	
Regulatory measures	0.577
Customer pressures	0.550
Social-cultural responsibility	0.550
Competitor pressures	0.607
Design for the environment	0.793

3.4 Discriminant validity

Hair *et al.* (2011) proposed two measuring indicators of discriminant validity, which are the Fornell-Larcker criterion and the cross-loadings. The Fornell and Larcker (1981) criterion posits that ‘the square root of the AVE of each construct must be greater than its correlations with other constructs’. This study used both measuring indicators and Table 1.9 and Table 1.10 show that the measurement model met both the Fornell-Larcker and cross loading requirements for discriminant validity.

Table 1.9: Fornell-Larcker criterion of the measurement model

	Regulatory measures	Customer pressures	Socio-cultural responsibility	Competitor pressures 1	Competitor pressures 2	Design for the environment 1	Design for the environment 2
Regulatory measures	0.760						
Customer pressures	0.601	0.742					
Socio-cultural responsibility	0.343	0.419	0.742				
Competitor pressures 1	-0.199	-0.145	0.072	0.779			
Competitor pressures 2	-0.318	-0.335	-0.187	0.273	0.856		
Design for the environment 1	0.162	0.105	0.049	-0.202	0.114	0.891	
Design for the environment 2	0.216	0.249	-0.173	-0.114	-0.060	0.530	0.826

Note: Correlations among constructs in the lower area of the triangle; the squared AVE values bolded on the diagonal.

Table 1.10 presents the cross loadings depicting the discriminant validity. The results of Table 1.10 cross loadings indicate that all the indicators load higher on their respective latent construct than the other latent constructs supporting discriminant validity.

Table 1.10: Cross loadings

Constructs	Regulatory measures	Customer pressures	Socio-cultural responsibility	Competitor pressures 1	Competitor pressures 2	Design for the environment 1	Design for the environment 2
Regulatory measures	0.744	0.286	0.285	-0.174	-0.153	0.152	0.121
Regulatory measures	0.593	0.289	0.203	-0.200	-0.369	0.027	0.042
Regulatory measures	0.746	0.532	0.225	-0.103	-0.194	0.082	0.191
Regulatory measures	0.852	0.494	0.249	-0.149	-0.345	0.104	0.221
Regulatory measures	0.754	0.577	0.296	-0.176	-0.208	0.228	0.177
Regulatory measures	0.842	0.581	0.299	-0.113	-0.213	0.127	0.212
Customer pressures	0.655	0.772	0.365	-0.271	-0.290	0.166	0.190
Customer pressures	0.541	0.663	0.394	-0.199	-0.465	0.097	0.154
Customer pressures	0.381	0.762	0.168	-0.057	-0.208	0.037	0.194
Customer pressures	0.287	0.799	0.244	-0.045	-0.177	0.044	0.198
Customer pressures	0.350	0.707	0.425	0.086	-0.231	0.002	0.185
Socio-cultural responsibility	0.390	0.464	0.697	0.045	-0.144	0.018	-0.052

3.5 Structural equation model assessment

The structural model was used to determine the model's explanatory power to test the developed hypothesis about the relationships among the constructs. The model's explanatory power was assessed through the coefficient of determination (R^2) redundancy index and goodness of fit (GoF) index and the significance of the path coefficients (Sanchez, 2013b, Ravand & Baghaei, 2016).

3.6. Coefficient of determination (R^2)

Hair, Hult, Ringle and Sarstedt (2014) state that 'this coefficient is a measure of the model's predictive accuracy and is calculated as the squared correlation between a specific endogenous construct's actual and predicted values'. Table 1.11 shows that the R^2 values for design for the environment 1 and design for the environment 2, are 0.107, 0.171, respectively. Based on Sanchez, Trinchera and Russolillo (2015)'s proposed threshold for R^2 values (above 0.60, between 0.30 and 0.60, and below 0.30 for high, moderate and low, respectively), the R^2 values, as shown in Table 1.11, are regarded as low results. This means they explain variations in the data to a low degree.

Table 1:11: Coefficient of determination (R²) and goodness of fit (GoF)

Constructs	R ²	GoF
Design for the environment 1	0.108	
Design for the environment 2	0.171	
		0.317

3.7. Goodness of fit

Sanchez (2013) indicates that there is no guidance about what number could be considered a good GoF value, but rather GoF can be used to gain better understanding of the models' predictive power. The GoF index of 0.317 for the whole model is well below the suggested cut-off of 0.70.

3.8. Significance of the path coefficients

The path coefficients act as determinants of relationships between the constructs, as hypothesised and are interpreted based on the range of -1 and 1, where coefficients nearing +1 indicate a strong positive relationship and -1 a strong negative relationship (Hair, Hult, Ringle, & Sarstedt, 2014). Bootstrapping was undertaken to determine the significance of each path coefficient using the confidence intervals, as recommended by several scholars such as Sanchez (2013) and Ravand and Baghaei (2016). The plspm algorithm output was used to examine relationships among constructs. However, in plspm in order to test the significance levels for each path estimate, 95% confidence intervals (with lower and upper percentiles) for all paths are generated by means of the bootstrapping function. Based on the output of 95% confidence intervals, the significance level of each path was determined. Table 1.12, indicates two positive significant paths which are: regulatory measures onto design for the environment 2, and customer pressures onto design for the environment 2. The table also shows two negative significant paths: socio-cultural responsibility onto design for the environment 2, competitor pressures 1 onto design for the environment 1 and the remaining six paths were no significant.

Table 1.12: Bootstrapping analysis of the structural model path coefficients

path	Original	Mean. Bootstrap Coefficient	Standard Error	95% Confidence Interval	
				perc.25	perc.975
Regulatory measures → Design for the environment 1	0.153	0.167	0.103	(-0.049, 0.371) ^{ns}	
Regulatory measures → Design for the environment 2	0.155	0.188	0.088	(0.029, 0.380)*	
Customer pressures → Design for the environment 1	0.044	0.047	0.112	(-0.170, 0.292) ^{ns}	
Customer pressures → Design for the environment 2	0.310	0.292	0.112	(0.054, 0.493) *	
Socio-cultural responsibility → Design for the environment 1	0.041	-0.005	0.149	(-0.282, 0.223) ^{ns}	
Socio-cultural responsibility → Design for the environment 2	-0.348	-0.353	0.080	(-0.504, -0.190) #	
Competitor pressures 1 → Design for the environment 1	-0.236	-0.218	0.091	(-0.373, -0.034) #	
Competitor pressures 1 → Design for the environment 2	-0.022	0.001	0.120	(-0.199, 0.243) ^{ns}	
Competitor pressures 2 → Design for the environment 1	0.250	0.206	0.140	(-0.103, 0.404) ^{ns}	
Competitor pressures 2 → Design for the environment 2	0.034	0.015	0.138	(-0.243, 0.245) ^{ns}	

p < 0.05, * denotes positive significant, # denotes negative significant, ns denotes no significant, perc.025 denotes lower percentile, perc.975 denotes upper percentile.

Figure 1.2 presents the measured research model indicating the paths with positive and negative significant relationships and non-significant relationships. The positive relationships are represented by solid bold lines while negative relationships are dashed bold lines and non-significant relationships are just dashed lines.

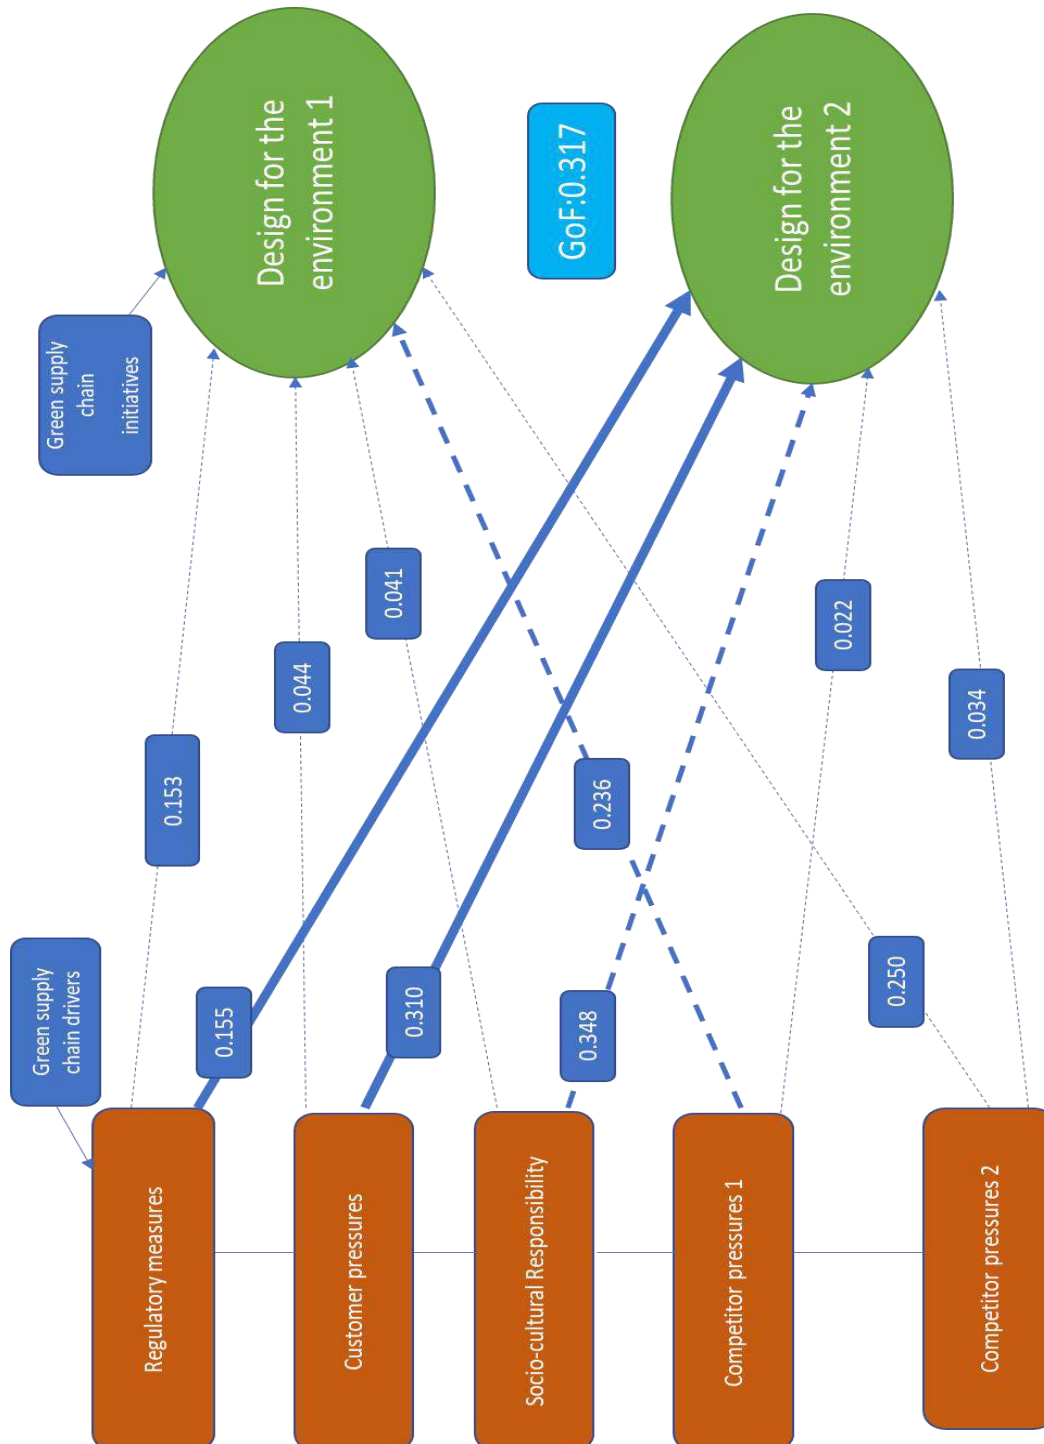

Figure 1.2 Measurement model

3.9 Hypotheses testing

This section tests the proposed hypotheses in relation to the bootstrapped results by assessing the path coefficient between two latent variables. The hypotheses testing was performed to determine the direction of the relationships (positive or negative) and the significance levels for each path estimate.

Several scholars (such as Wetzels *et al.*, 2009; Hair *et al.*, 2011) indicated that for the structural model to be accounted as having a certain impact, the path coefficient value (β) should be at 0.1. Table 1.20 presents the assessment outcome of the path coefficient and show that most proposed hypotheses are not supported (H1, H2, H3, H4) (refer to Table 1.19). The analysis of proposed hypotheses was performed using the 95% confidence interval (CI) and a path coefficient value (β) to determine the statistical significance and directional sign of the relationship (i.e. positive or negative).

Table 1.20: Hypotheses testing

Hypothesis statement		Path coefficient value (β)	Confidence intervals (.025, .95.7)	Results
H1	Regulatory measures have a positive influence on design for the environment	0.153 0.155	(-0.049, 0.371) (0.029, 0.380)	Supported
H2	Customer pressures have a positive influence on design for the environment	0.044 0.310	(-0.170, 0.292) (0.054, 0.493)	Supported
H3	Socio-cultural responsibility has a positive influence on design for the environment	0.041 -0.348	(-0.282, 0.223) (-0.504, -0.190)	Not supported
H4	Competitor pressures have a positive influence on design for the environment	-0.236 -0.022 0.250 0.034	(-0.373, -0.034) (-0.199, 0.243) (-0.103, 0.404) (-0.243, 0.245)	Not Supported

The analysis outcome shows that a positive influence of regulatory measures on design for the environment at two path coefficient values and two CI [$(\beta=0.153$ & 0.155 , $CI= (-0.049, 0.371)$ & $(0.029, 0.380)$]. The reason for using two path coefficient values and two CI is because the design for the environment construct was sub divided into two sub constructs (design for the environment 1 and design for the environment 2) in the search of unidimensionality of the final measurement model (refer to Table 1.14). As a result, hypothesis *H1 is supported*.

The analysis outcome shows that the positive influence of customer pressures on design for the environment at two path coefficient values and two CI [$(\beta= 0.044$ & 0.310 , $CI= (-0.170, 0.292)$ & $(0.054, 0.493)$]. The reason for using two path coefficient values and two CI is because the design for the environment construct was sub divided into two sub constructs (design for the environment 1 & design for the environment 2) in the search of unidimensionality of the final measurement model (refer to Table 1.14). As a result, hypothesis *H2 is supported*.

The analysis outcome shows that socio-cultural responsibility does not have a positive influence on design for the environment at two path coefficient values and two CI [$(\beta= 0.041$ & -0.348 , $CI= (-0.282, 0.223)$ & $(-0.504, -0.190)$]. The reason for using two path coefficient values and two CI is because the design for the environment construct was sub divided into two themes (design for the environment 1 & design for the environment 2) in the search of unidimensionality of the final measurement model (refer to Table 1.14). As a result, hypothesis *H3 is not supported*.

The analysis outcome shows that competitor pressures do not have a positive influence on design for the environment at four path coefficient values and four CI [$(\beta= -0.236, -0.022, 0.250$ & $0.034)$, $CI= (-0.373, -0.034)$, $(-0.199, 0.243)$, $(-0.103, 0.404)$ & $(-0.243, 0.245)$]. The reason for using four path coefficient values and four CI is because both the competitor pressures and design for the environment constructs was sub divided into two themes (competitor pressures 1, competitor pressures 2, design for the environment 1 & design for the environment 2) in the search of

unidimensionality of the final measurement model (refer to Table 1.14). As a result, hypothesis *H4* is *not supported*.

3.10 Data collection

To achieve the research objectives and test proposed hypotheses primary data was collected using self-administered in-person drop-off questionnaires, delivered to selected manufacturing organisations in the EMM. Prior to questionnaires administration to the respondents, they were pre-tested by twenty respondents from the EMM who were manufacturing or production personnel, logistics or operations managers, factory managers, procurement managers or quality control personnel in their companies. The pre-test enabled the researcher to determine whether the questionnaire instructions were clear and understandable and also know how much time it took to complete the questionnaire. The research instrument comprises two broad aspects: GSC drivers and GSCIs. It conceptualises the drivers of GSC adoption and GSCIs as multidimensional concepts. GSC drivers consisted of four constructs, namely, regulatory measures, competitor pressures, customer pressures and socio-cultural responsibility. A five-point Likert scale was used to measure both GSC drivers and GSCI as it assisted the researcher to determine the extent of the relationships. The measurement scales ranged from 1 – “strongly disagree” to 5 – “strongly agree” and from 1 – “does not exist at all” to 5 – “exists to a very high extent” for drivers of GSC adoption and GSCI constructs, respectively.

4. Results and Findings

The findings suggest that regulatory measures and customer pressures collectively measured a higher order GSC driver. These drivers serve to persuade manufacturing organisations’ in EMM to adopt various GSCI’s. The GSC drivers cause organisations to engage in green purchasing, green manufacturing and green packaging. This study argued that supply chain partners’ commitment to supporting greening endeavours of suppliers plays a vital role in ensuring mutually sought-after environmental benefits across the supply chain. To synergise such endeavour requires the design and monitoring of mutually managed environmental programmes across the supply chain. Arguably, this study points out that socio-cultural integration could streamline buyer-supplier relationships by supporting GSC practices and GSCIs. Most of studies have used CB-SEM to assess conceptual models on GSCM in both developed and developing economies because of its emphasis on multivariate normality. To the knowledge of the researcher, this study is the first to assess the conceptual model to test the relationships between drivers of GSC and GSCIs using PLS-PM. This study also argued that adopting GSC principles or initiatives can help organisations to build and maintain a healthy competitive advantage and improved organisational performance. It is also argued that mutual environmental benefits across the supply chain can only be ensured when supply chain partners commit to supporting suppliers’ greening efforts. This study’s data collection was restricted to FMCG and pharmaceutical manufacturing companies in the Ekurhuleni region, while other categories of manufacturing companies in the same region were not included.

5. Managerial Implications

Managers can use this study to assess the impact of adopting set regulations to stimulate customer purchases to gain a healthy competitive advantage using tactical resources to support strategic environmental management in their SC. Managers in EMM can adapt the green regulations set by governing bodies, this can have a positive impact on customer goodwill and further increase competitiveness. Managers can include customers in product development by conducting surveys directing the company to the kind of green footprint they want. Managers can uphold their social responsibility to ensure adherence to set regulations, whilst educating consumers about green practices in hopes of forcing the manufacturers to become responsible corporate citizens. The study also gives managers suitable ideas and courses of action to manage green practices in SC’s that eventually advance performance as well as give a clearer view of the potential GSCM strategies to increase organisational performance... Finally, managers could send selected staff members for training to better understand the new and advanced methods of green manufacturing.

Acknowledgments

A special thanks to Mrs Princess Ramokolo who ran the system to analyse the data as well as Dr. Francis Mpwanya who provided helpful insight on the topic.

Covid-19 pandemic

Abstract

Remote work recently became the new normal globally in various organisations due to the Covid-19 pandemic, which forced organisations to adapt quickly and strategically. Non-essential workers were required to work from home to help slow the spread of Covid-19. Due to the pandemic's unforeseen changes in the business world, not all companies promptly adapted to remote work. The coronavirus changed industries from traditional to remote work and left companies lacking electronic resources to continue business online. This change brought many challenges to businesses globally and afforded both employees and employers opportunities such as reduced travel time for employees and access to broader talent pools for employers. This research aimed to investigate the perceived influence of working remotely on employee productivity in South Africa. A quantitative research approach was followed using a survey, and the sample population was 102 remote workers between the age of 18 and 65 within a specific sector. The sampling method adopted for this research was purposive sampling using a compliment sampling approach. The results revealed that respondents preferred traditional work over remote work due to convenience and cost-efficiency. Respondents indicated that working in isolation, working longer hours remotely than in the office, and not having a social life outside of work, made them focus more on their work; however, it made them less productive overall as it negatively affected their well-being.

1. Introduction

Remote working has been in existence even before the Covid-19 pandemic. Recently remote working is more in use in different organisations worldwide due to the Covid-19 pandemic, which forced these organisations to adapt swiftly. Remote work has been studied under various terminology, all connected and, to some extent, meaning the same thing. Benjamin (2020) states that remote working is when the employee resides outside of the organisation's main office's geographical location for work. A remote working employee works away from the office and uses telecommunication (Lopaz, 2020). According to Virtanen (2020), remote work is working from other premises rather than the employer's premises. The previous authors inferred that remote work has had both negative and positive effects on organisations and employees and that some employees enjoy remote work more than others.

Traditional work differs from remote work in that employees have face-to-face interactions, which improves productivity since there is guidance from other employees. During face-to-face meetings, colleagues can read each other's body language and facial expressions when ideas are shared during the meeting. There is also a chance for team building, and performance management is more straightforward when employees work traditionally (Saurombe & Barkhuizen, 2022; Shingenge & Saurombe, 2022). Now that many businesses have transitioned to remote working, work is performed differently. Employees do not have much engagement, and team-building meetings or exercises are not considered a priority anymore. As for employees who depend on interactions with fellow

*Corresponding Author

employees, it is difficult for them. According to Thorstensson (2020), remote working decreases costs for organisations and employees and increases spending time with families. In addition, costs are cut due to not commuting to work. Organisations provide technological equipment to employees so that work can continue to be performed effectively and efficiently at home.

Many organisations worldwide continue to face tremendous change and challenges internally and externally because of the Covid-19 outbreak. Therefore, it is crucial to identify and understand the shift from the traditional workforce to what we now know as the new normal of working remotely (Singh et al., 2017). Even though many adverse effects were listed at the start of the pandemic, such as companies being unable to adapt to the sudden changes and many employees finding it difficult to work from home, companies must be able to adapt and provide all the resources needed to uphold job productivity and performance levels (Jalagat & Jalagat, 2019). Despite many adverse effects that different organisations in their respective industries might experience, the adoption of remote work is advisable to keep up with the change in terms of employment policy adjustments, new technology provision, and support to ensure that they survive in the new normal of doing business (Lal et al., 2021; Li et al., 2022). The Covid-19 pandemic is, therefore, an eye-opener for every organisation to meet the requirements needed to identify any future problems that may arise so that they can quickly adapt and survive.

2. Problem Investigated

Technology introductions significantly affect the change management system in the global market economy. Remote working as a research phenomenon had previously been practiced by developed countries, especially in the United Kingdom, Germany, and the United States; however, in developing countries, such as Mozambique and China, this is a new concept (Jalagat & Jalagat, 2019). South Africa is no exception. The Covid-19 crisis highlights how organisations utilised remote working to ensure they are safe and provide economic activity continuity. At the early stage of the virus, several governments worldwide recommended that companies facilitate working remotely to avoid employees physically gathering in the same environment (Belzunegui-Eraso & Erro-Garcés, 2020). Due to the pandemic's unexpected and rapid changes in the business world, not all companies have adapted to remote working promptly. This is experienced more in developing countries as there is a shortage of electronic resources to continue business online (Ngobeni et al., 2022). The Covid-19 pandemic transformed industries from traditional to remote workspaces. It is therefore essential for organisations to monitor the productivity of employees - particularly those who may continue to work from home or in a hybrid fashion in the long-term - compared to when they were working from the office environment full-time, as such studies will inform the long-term receptiveness of working remotely, even after the Covid-19 pandemic has eventually abated or ended. This was the aim of this study.

3. Research Aim and Objectives

3.1. Research Aim

The study sought to investigate the perceived influence of working remotely on employee productivity in three South African provinces.

3.2. Research Objectives

- To investigate the perceived influence of working from home during the Covid-19 pandemic on overall employee well-being.
- To identify the advantages and disadvantages of employees working remotely.
- To propose recommendations regarding the remote working of employees.

4. Main and specific research questions

4.1. Main research question

The main research question of this study was: what is the perceived influence of remote working on employee productivity in South Africa?

4.2. Specific research questions

- How does working from home during the Covid-19 pandemic influence perceptions on overall employee well-being?
- What are the advantages and disadvantages of employees working remotely?
- What are best practices regarding the remote working of employees?

5. Literature Review

5.1. The theoretical framework of the study

5.1.1. The Agency Theory

Agency theory is a concept used to explain the critical relationships between principals and their relative agents. In the most basic sense, the principal heavily relies on an agent to execute specific transactions resulting in fluctuating outcomes (Serapicos et al., 2020). Agency theory is commonly utilised to understand and explain corporate governance phenomena, including executive incentive alignment, board monitoring, and control of top managers; this literature is founded in economics and represents the bulk of the research in business and management (Payne & Petrenko, 2019). The theory assumes that once principals delegate authority to agents, they often have problems controlling them because agents' goals often differ from their own, and agents often have better information about their capacity and activities than principals (Kivistö & Zalyevska, 2015). In this study, the researcher sought to assess how working from home affects employee productivity in South Africa, mainly because it is argued that the distractions associated with working from home (especially when transitioned abruptly) often render employees less productive as the tendency is for them to prioritise their own duties than the work of their employer when away from the office (Nguyen, 2021), as inferred by the agency theory.

White (2018) delineated that when an employee works in the office, the firm has perfect knowledge of the employee's productivity and therefore offers to pay a constant wage determined by that level of productivity. This constant wage is based on the expected output of high-effort workers. Because the firm can ideally monitor office workers, it can differentiate effort (denoting high and low effort, respectively) from the stochastic output based on that effort and offer a fixed wage to workers that supply high effort. Further, it is assumed that location can affect productivity independent of effort level, such that office workers may be more productive than home workers and vice versa (White, 2018). This implies that during the Covid-19 pandemic, the productivity of employees working remotely could either have increased or decreased compared to before (when they were working from the office), depending on work circumstances and individual resilience.

5.2. Advantages and disadvantages of remote work for employees

According to Nield (2016), people who work remotely are more productive and happier than traditional workers, even though remote workers are not physically present in the office. Like any other work arrangement, remote working has advantages and disadvantages.

5.2.1. Advantages of remote work

Recent research has indicated that there are many benefits of working from home. Jalagat and Jalagat (2019) state that flexible working hours are advantageous for remote working employees. Firstly, individuals working from home enjoy the freedom of managing their schedule and can attend other appointments while working, making them feel less under pressure and letting them complete tasks efficiently (Giguari, 2020a). The second advantage is cost-saving, which makes remote working beneficial to employees. Employees save on transportation costs, fuel, and traveling time to work. The third advantage is a change of environment; employees tend to work more freely without micromanagement (Singer-Velush et al., 2020). The fourth advantage of remote work for employees is low levels of stress. Individuals traveling to work daily and being in traffic for long hours tend to be stressed when they reach work, negatively influencing their productivity for the day (Purwanto et al., 2020). Lastly, there is an increase in productivity and motivation. Remote working may increase job satisfaction, leading to increased employee productivity and motivation (Jalagat & Jalagat, 2019; Lal et al., 2021).

5.2.2. Disadvantages of remote work

In contrast, there are also pitfalls that employees experience due to the transition to working remotely, including the loss of motivation, due to the different atmosphere of a house compared to the office (Singer-Velush et al., 2020). One can get distracted by social media, television shows, entertainment, and family at home. Further, there is less teamwork; working remotely has led to employees communicating less with each other, which might cause employees not to be updated with current events or issues in the organisation (Thorstensson, 2020). Isolation and the reduced ability to interact and brainstorm may also negatively impact employees' productivity and reduce their sense of belonging (Purwanto et al., 2020; Li et al., 2022). Another disadvantage is employee personal cost increases. Even though organisations may save costs on office space, electricity, water, telephone bills, and other overheads and employees might save on transport, employees' savings go back into ensuring an office space at home (van Zoonen et al., 2021). Employees' costs may increase due to increased electricity consumption at their homes, data costs, mobile bill increase, buying comfortable chairs and a table to turn their home into comfortable office space, and an increase in their groceries budget as employees tend to eat more while at home. Other distractions associated with remote working, such as noise in the neighbourhood or restaurants and noisy kids at home, may impact concentration levels and employees' productivity (Purwanto et al., 2020; van Zoonen et al., 2021).

5.3. Advantages and disadvantages of remote work for organisations

5.3.1. Advantages of remote work

Deloitte (2020) mentions that organisational expenditures such as rent, repairs, computers, telephones, offices, utilities, supplies, parking spaces, and other expenses are minimized when employees work remotely. Organisations may also experience increased productivity, according to Deloitte (2020), as long commutes are eliminated and workplace disturbances (coffee breaks, co-worker disruptions, etc.) are reduced. Working remotely may further result in reduced absenteeism. According to Lupu (2017), diseases, family gatherings, harsh weather conditions, and mental breakdowns usually increase absenteeism, especially when employees have fixed, full-time office schedules. Another benefit is that remote working allows the possibility of employing those who may otherwise be unable to come to work, such as mothers, the disabled, and workers who live far from the workplace and do not want to relocate (Lupu, 2017).

5.3.2. Disadvantages of remote work

Deloitte (2020) states that working remotely can present power, internet access, and hardware problems, which are more challenging to address at home, even with remote IT support. Another setback to remote work is the loss of control over the employees. According to Thorstensson (2020) and Gigauri (2020b), organisations are concerned that employees will prioritise personal errands overwork or give their tasks to others to complete on their behalf, further reducing organisational power, as supported by the agency theory. This could result in data protection issues. The third setback is productivity and work quality problems; supervisors reported distractions in the employees' home environments as a disadvantage. They also complained about a lack of good work-related tools, such as technical equipment and files stored at the primary worksite required to conduct work-related tasks when remote working (Nguyen, 2021).

Finally, according to Thorstesson (2020) and Lal et al. (2021), the company's disadvantage is the risk of harm or misuse of office equipment and the liability issue that arises when the office equipment is off-site. Other drawbacks include the cost of repairing and transporting broken office equipment, identifying who is responsible for the repair (the company or the individual), and deciding how to replace the broken equipment (Greer & Payne, 2014; Thorstesson, 2020).

6. Research Methodology

6.1. Research approach

This research aimed to investigate the perceived influence of working remotely on employee productivity in South Africa. The study followed a quantitative approach by distributing a survey/questionnaire to the pertinent research sample. Data collected was carefully selected and studied for each variable. Since the data was collected through survey responses, the variables were

neither controlled nor manipulated. Although a qualitative, exploratory study may have been more pertinent to the study, due to the national Covid-19 lockdown regulations in South Africa at the time of data collection, which prevented face-to-face interviews, a lack of the appropriate equipment and resources for remote interviewing resulted in the researcher opting for a quantitative research approach, using electronically distributed surveys.

6.2. Population and sampling

According to South African law, the Basic Conditions of Employment Act (BCEA) No. 75 of 1997 stipulates that no employer should employ an individual under 15 years. Therefore, the respondents included working individuals from 18 years of age up to the retirement age, as the shift from traditional work to remote working affects all generations of the current workforce. The number of respondents targeted for this research was initially 150, although only 102 questionnaire responses were ultimately obtained. Due to time and financial constraints, the researcher did not continue with data collection, especially since the study did not primarily seek to establish cause-effect relationships but rather descriptive statistics; hence, the sample size was deemed appropriate (Adhikari, 2021). The focus was on employees with a minimum of more than three years of work experience, particularly in various sectors within three South African provinces. The minimum work experience requirement was to get respondents with at least ample experience working remotely during the Covid-19 pandemic.

The sampling technique used was purposive sampling, whereby the researcher's experience and knowledge were used to create samples. Through the application of the purposive sampling technique, the sample chosen for the study consisted of an array of individuals in full-time, flexible, and part-time remote work who agreed to be part of the research. A complementary snowball sampling technique was further applied, whereby surveys were completed by initially selected respondents who referred the study to other remote workers. The researcher encouraged them to disseminate the survey link to others in their field or profession.

6.3. Data Collection

The measuring instrument for this research was an adapted version of previous questionnaires compiled by the researcher. The survey consisted of two sections. Section A was based on the biographical information of the respondents, and Section B included pertinent sub-sections about the teleworking experiences of the respondents. The ranges used for the survey questions were: strongly agree, agree, neutral, disagree, and strongly disagree for section B. The data was collected electronically using a Google form link disseminated among the respondents. This was to minimise physical contact with respondents in adherence to the Covid-19 protocols and national lockdown regulations at the time of data collection. The survey was closed-ended and took approximately 15-20 minutes to complete, as suggested by the pilot study, which was conducted before the official data collection.

6.4. Data Analysis

After collecting the data via google forms, the data was collated, coded, and cleaned in a Microsoft Excel spreadsheet (Pallant, 2016). Statistical analysis was then utilised to analyse the collected data. Statistical analysis is a method for carrying out numerous statistical operations, where the goal is to quantify the data using some form of statistical analysis. Descriptive data, such as surveys and observational data, are examples of quantitative data. The statistical analysis software used was the Statistical Package for the Social Sciences (SPSS) (IBM, 2012).

6.5. Measuring Instrument

Measuring instruments are tools professionals and researchers use to evaluate or assess subjects or respondents in a particular study. These tools include surveys, scales, indexes, interviews, and informal observations. The instrument used for this research was an adapted version of previous questionnaires compiled by the researcher. A survey consisting of two sections was conducted, including biographical information questions and questions related to the perceived influence of remote work on employee productivity in South Africa.

6.6. Ethical Considerations

A deontological approach was used as follows to protect the credibility of this research paper, ensuring that no respondents were negatively affected in any way (Drost, 2011):

Voluntary participation: No intimidation or manipulation was used, and respondents were not compelled to participate. Respondents were assured that they were not obligated to participate and that there were no negative consequences if they chose not to.

Informed consent: Respondents were briefed about the study's intent and the existence of any possible adverse effects of their involvement. Respondents were also allowed to withdraw from answering the survey if they wished to.

Confidentiality and anonymity: Respondents' information was kept anonymous, and their organisations were not mentioned to protect their identities and occupations. Respondents were also asked for permission to use their responses for the research paper.

Accuracy of information: The information provided by the respondents was not altered or changed in any way. All data were presented as it was provided.

The researcher also adhered to ethical conduct and standards in compliance with the University of Johannesburg's ethical policy. The names and details of the respondents were kept confidential. An information sheet in the form of a letter was also provided to respondents. The University of Johannesburg's research ethics committee approved the letter, which included the researcher's details and the purpose of the research. Respondents signed a consent form, which proved that respondents agreed to participate in the research.

7. Results

7.1. Biographical information of the sample

The most significant portion of the sample worked in Gauteng, 89.22 percent (n=91), followed by those who worked in Limpopo, 5.88 percent (n=6). Moreover, the remainder of the respondents, 4.90 percent (n=5), worked in the Free State province.

Figure 1: Province of employment (author's own compilation)

The most significant portion of the sample were females, 60.78 percent (n=62), followed by 39.22 percent (n=40) males.

Figure 2: Gender (author's own compilation)

The most significant portion of the sample was from Generation Z, 49.02 percent (n=50), followed by 31,37 percent (n= 32) Millennials. Generation X comprised 16.67 percent (n=17) of the sample, and Baby boomers were 2.94 percent (n=3).

Figure 3: Generational codes (author's own compilation)

The most significant portion of the sample was Black with 58.82 percent (n=60), followed by Coloured with 26.47 percent (n=27). 4.90 percent (n=5) of the sample were whites, 4.90 percent (n=5) were Asian, and 4.90 percent (n=5) were from other ethnic groups that were not explicitly mentioned in the survey.

Figure 4: Ethnicity (author's own compilation)

The most significant portion of the sample, 59.80 percent (n=61), had 3-5 years' work experience; followed by 12.75 percent (n=13) who had 6-8 years' work experience; followed by 6.86 percent (n=7) who had 16-18 years' work experience; followed by 6.86 percent (n=7) who had 26+ years; followed by 4.90 percent (n=5) who had worked for 22-25 years; followed by 3.92 percent (n=4) who had worked for 9-15 years; followed by 3.92 percent (n=4) who had worked for 19-21 years. The remainder of the respondents, 0.98 percent (n=1), had 9-11 years of working experience.

Figure 5: Years of experience (author's own compilation)

The most significant portion of the sample had Matric or Grade-12, 35.29 percent (n=36); followed by those who possessed a 3-year degree, 30.39 percent (n=31); followed by those who possessed a 4-year (Bachelor's) degree, 23.53 percent (n=24); followed by those who had a Diploma, 4.90 percent (n=5); followed by those who had a master's degree, 4.90 percent (n=5). The remainder of the respondents, 0.98 percent (n=1), possessed a Doctoral degree.

Figure 6: Highest level of education/qualification (author's own compilation)

The most significant portion of the sample worked in the Banking sector, 30.39 percent (n=31); followed by 24.51 percent (n=25) who worked in “other” fields; followed by those who worked in Marketing/Communications, 22.55 percent (n=23); followed by those who worked in IT, 12.75 percent (n=13). The remainder of the respondents, 9.80 percent (n=10), worked in education.

Figure 7: Field of Work (author's own compilation)

7.2. Descriptive Statistics

Tables 1, 2, 3, 4, and 5 account for the descriptive statistics, the means, and standard deviations of the constructs investigated. Mean values were computed as the measures of central tendency for this study. All the tables presented below disclose the mean values for all the objects ranging between three and four, indicating that most respondents had either an unbiased (neutral) standpoint or agreed with the information provided. Standard deviation values were processed to measure the difference in reactions on each variable. Hair et al. (2003) posited that the connection between the mean and the standard deviation is that a slight projected standard deviation (SD) implies that responses were

steady and that the response allocations lay close to the mean. Conversely, a substantial standard deviation indicates fluctuating responses, constructing the response dissemination values away from the mean (Drost, 2011). Moreover, the standard deviation value “should be less than one, but it is recommended to at least include a value of less than 2 to ensure that there is no issue of outliers” (Drost, 2011p. 87).

Table 1: Working Alone

	N	Minimum	Maximum	Mean	Std. Deviation
WA1	102	1	5	3.40	1.145
WA2	102	1	5	3.73	1.136
WA3	102	1	5	3.55	1.105
WA4	102	1	5	3.49	1.088
WA5	102	1	5	2.52	1.132
WA6	102	1	5	2.87	1.158

Source: Own compilation

"Working Alone" (WA), which constituted part 1 of section B of the questionnaire, had the highest mean score of 3.73 (Item WA2), and the lowest mean score was 2.52 (Item WA5), giving a range of 1.21. The lowest mean, 2.52 (Item WA5), indicated that respondents struggled to create/ keep up a social life outside of work, while results highlighted that the highest mean score was 3.73 (Item WA2). Most respondents admitted they could work in isolation without a manager or a supervisor's support. Table 1 reveals that the WA scale had the highest standard deviation value reported at 1.158 (Item WA6), and the lowest standard deviation value was 1.088 (Item WA4). This information indicates that the data points are clustered around the mean. The Standard Deviation values are below 2, indicating no presence of outliers.

Table 2: Keeping Work and Home Life Separate

	N	Minimum	Maximum	Mean	Std. Deviation
KWAHLS1	102	1	5	3.32	1.136
KWAHLS2	102	1	5	3.12	1.196
KWAHLS3	102	1	5	3.24	1.276
KWAHLS4	102	1	5	3.15	1.277
KWAHLS5	102	1	5	2.92	1.325
KWAHLS6	102	1	5	3.24	1.314

Source: Own compilation

This study gives descriptive statistics for the second part of Section B, "Keeping Work and Home Life Separate" (KWAHLS), in Table 2. As illustrated in Table 2, the highest mean score was 3.32 (Item KWAHLS1), while the lowest mean score was 2.92 (Item KWAHLS5), as considering the range value, this resulted in a complete range of 0.4. The lowest mean (Item KWAHLS5) from the statistic table indicated that some respondents could not separate regular work from overtime while working from home as asked in the questionnaire. While the highest mean (Item KWAHLS1) revealed that most respondents were able to keep work and home apart during their working hours. Table 2 demonstrates that the KWAHLS scale had the highest standard deviation value reported at 1.325 (KWAHLS5), and the lowest standard deviation value was 1.136 (KWAHLS1). This reveals that the data support the mean with no presence of outliers.

Table 3: Self-Motivation and Productivity

	N	Minimum	Maximum	Mean	Std. Deviation
SMAP1	102	1	5	3.32	.997
SMAP2	102	1	5	3.43	.907
SMAP3	102	1	5	3.47	1.141
SMAP4	102	1	5	2.42	1.156
SMAP5	102	1	5	3.34	1.239
SMAP6	102	1	5	3.67	1.056

Source: Own compilation

“Self-Motivation and Productivity” (SMAP) indicated the lowest mean score of 2.42 (Item SMAP4) while the highest mean score was 3.67 (Item SMAP6), resulting in a range of 1.25. The lowest mean of 2.42 (Item SMAP4) from the table indicated that few respondents struggled to perform their tasks when working from home than when working from the office, while results highlighted the fact that the highest mean which its score was 3.67 (Item SMAP6) is in support of the respondents to admit that they are still able to pull weight in a team when working from home as when working from the physical office. Additionally, Table 3 reveals that the SMAP scale had the highest standard deviation value reported at 1.239 (Item SMAP5), and the lowest standard deviation value was .907 (Item SMAP1). This information suggests that the data points are clustered around the mean, and there is no presence of outliers. This means that individuals easily motivate themselves and maintain work productivity.

Table 4: Work-Related Travel

	N	Minimum	Maximum	Mean	Std. Deviation
WRT1	102	1	5	3.89	1.134
WRT2	102	1	5	3.66	1.139
WRT3	102	1	5	3.93	1.074
WRT4	102	1	5	3.51	1.217

Source: Own compilation

The "Work-Related Travel" (WRT) scale had the highest mean score of 3.93 (Item WRT3), and the lowest mean score was 3.51 (Item WRT4), giving 0.42 in the entire range. Consequently, the lowest mean from the table Item WRT4 (3.51) indicated that despite respondents not having to travel to and from work, some still struggle to have a good start and finish work time. In contrast, the highest mean Item WRT3 (3.93) reveals that most respondents view this shift as beneficial in some cases because they believe it has significantly impacted household expenditure due to less traveling. Moreover, Table 4 also illustrated the different standard deviation WRT scale values, including the highest standard deviation value reported at 1.217 (Item WRT4) with the lowest standard deviation value of 1.074 (Item WRT3). The results indicated that the data points or the SD average distance to the mean are close as they are all below 2; hence, there is no presence of outliers.

7.3. Reliability

Reliability was measured by Cronbach’s Alpha, where the values are expected to reach 0.6 to confirm reliability (Pallant, 2016). The results presented in table 5 show these reliability scores. The perceived influence of remote work in the table can be reliable because the variables are all above 0.6 and closely related as a group, which shows consistency.

Table 5: Cronbach's Alpha Reliability Scores

Variable	Cronbach's Alpha
WA	.743
KWAHLS	.822
SMAP	.834
WRT	.617

Source: Own compilation

7.4. Discussion

This research aimed to investigate the perceived influence of remote working on employee productivity in South Africa. Different literature indicated that transitioning from traditional to remote work was difficult for many employees. Employees prefer to work in traditional offices because they can interact with their colleagues and make friends, and it is easier for them to ask for assistance face-to-face (Stat International Writing Staff, 2020).

Higher mean scores from the study indicated that most respondents could work in isolation without support from a manager or supervisor. Respondents could also keep work and home apart during their working hours. Most respondents indicated that they still must pull their weight in a team when working from home and the physical office. The highest mean scores revealed that most respondents viewed a shift from traditional work as beneficial in some cases because it significantly impacted household expenditure due to less travelling. This is similarly revealed in the study by (Singer-Velush et al., 2020). Lastly, the highest mean scores showed that respondents knew precisely what was expected of them even when working from home.

On the other hand, literature revealed that most employees do not prefer to work remotely because they become unproductive, they have separation anxiety from being far from their colleagues and cannot separate work and personal lives because of difficulty to organise work (Lal et al., 2021; Li et al., 2022; Nguyen, 2021). The results from the study indicated that the lowest mean scores in different sections of the questionnaire revealed that respondents struggle to create or keep a social life outside of work. The low mean scores showed that some respondents struggled to outperform their tasks when working from home rather than when working from the office. Even though respondents did not have to travel to and from the office, which saves money, some indicated that they struggled to have a good start and finish work time.

Respondents indicated that they could still stay productive and collaborate well with their team members while working remotely, although this meant putting in additional hours and effort, which would not have been necessary if they were working from the office with easier access to information and their colleagues. These results were supported by various studies, which posited that remote working employees often feel the increased burden of proving that they are working and not just lounging around at home (Brough et al., 2020; van der Lippe & Lippényi, 2020). This often leads to good productivity (and sometimes over-productivity), although possibly at the risk of employees burning out in the long run (Gigauri, 2020).

8. Managerial Implications

Based on the above discussion, the literature, and results, it is evident that organisations in South Africa still need to properly align their policies for remote working employees and find ways to maintain and enhance their productivity. It is recommended that South African organisations find ways to reconstruct or restructure their business operations. It is recommended that HR professionals develop policies aligned with remote work to provide and allocate employees with jobs with additional or entirely changed roles and responsibilities as remote work deals with the online environment. On the other hand, future research should be conducted on HR practitioners, focusing on the challenges associated with aligning remote work with company policies and how measurements are aligned with employee performance contracts. This paper further recommends that future researchers consult a larger sample, cutting across various sectors in the South African context and

possibly mainly focusing on baby boomers' views of remote work, as they are arguably faced with more challenges when working remotely due to the technological aspect of such a work setup.

9. Conclusion

In the global economy, technological advancements have a significant impact on the change management system and the operations of businesses, and the outbreak of the Covid-19 pandemic further exacerbated this effect. Remote work had previously been practiced, and it is likely unavoidable in the future considering the world's trajectory due to technology; even though people are resistant to acknowledging its effect, less can be achieved if we still rely on old fashion ways of conducting business. Consequently, organisations and managers in South Africa must adopt appropriate strategies for managing remote working employees and team performance in the most effective way possible to ensure and maintain optimal productivity.

Analysing the Factors of Employees to Accept Change: A Case Study

Prof Nelda Mouton^{1,*}, Ms Chrisna Lloyd²

^{1,2} North-West University Business School, Potchefstroom, South Africa

Keywords

Business Management, change, executive human management, management
Process readiness to change, employees, management, resource operational management

Abstract

Employees are seldom willing to accept change in the workplace. In an ongoing changing world with regular technological development, employees struggle to adapt with constant change. Resistance can be due to the lack of communication, technical skills or organisational maturity. The service industry continually goes through work cycles and needs to change regularly to keep up with technology, customer demands and continuous growth. Businesses, therefore, need to function optimally in order to gain maximum profit and remain viable. To do so, many companies implement new processes to improve the way they operate.

This research will implement a quantitative research design to evaluate the impact, climate and readiness to change of a unit within an institution. A single stage sampling procedure was used as the researchers had access to the names in the population and the people could be sampled directly. The findings indicate that cognitive readiness leads to emotional readiness because people believe that they can handle change and the challenges that it provides. The outcome will be that workshops explaining the importance of process management, which provide training about the new processes, can still make a difference in the way the employees perceive the change.

1. Introduction

Every business goes through phases or life cycles and needs to change regularly to keep up with technology, customer demands and continuous growth. Businesses, therefore, need to function optimally in order to gain maximum profit and remain viable. To do so, many companies implement new processes to improve the way they operate (Rizoto-Vidala-Pesoa & Kuzņecova, 2017).

The service industry continually goes through work cycles and needs to change regularly to keep up with technology, customer demands and continuous growth. Businesses, therefore, need to function optimally in order to gain maximum profit and remain viable. To do so, many companies implement new processes to improve the way they operate (Rizoto-Vidala-Pesoa & Kuzņecova, 2017).

In this fast-changing world, especially with regular technological developments, organisations need to modify themselves constantly as the success of an organisation largely depends on its ability to adapt and cope with the constant change (Hashem, 2019). Business processes must stay ahead of recent development to keep up with customer demands regarding communication and production. Unfortunately, these changes to processes are often met with resistance from employees. This resistance can be due to the lack of communication, technical skills or organisational maturity. It is therefore an emotional element and a critical factor in the success of process implementation.

As such, the importance of change is recognized and due to the many problems encountered within this section of work, this study was motivated to provide directives to specific factors to instigate positive change.

2. Problem statement

Businesses are of the view that the regular evaluation and redesigning of processes will lead to the improvement of the organisation's performance, especially in this rapidly changing business environment (Hammer, 2007). Employees, on the other hand, may resist change. This article will focus on factors that will influence the attitudes of workers in an environment where constant change already occurred and where it is expected from workers to change the structure and organigramme of the work place, once again.

3. Aims

The aims are as follow:

1. To establish the process of change;
2. To identify the climate for successful change; in a service organization. and
3. To determine the readiness of employees to change within this specific sector and environment..

4. Limitations and assumptions of the study

This research is a case study of a unit consisting of 35 employees within a higher education institution. The limitation is that this type of research studies with small sample sizes run the risk of not gathering enough data to support expectations.

5. Applicable literature review in the service sector

5.1 Business Process Management (BPM)

Generally, the public considers BPM as similar to Information Technology (IT). IT, however, is just one aspect of BPM. The latter refers to a consolidation of disciplines and is roughly defined as “a process-centred approach that leads to substantial improvements in both performance and compliance of a system” (Vom Brocke & Rosemann, 2015:ix). Vom Brocke and Rosemann. (2015) believe that although the service sector has understood the importance of processes for a long time, these processes were only recognised in the service industry more recently.

Rummler and Ramias (in Vom Brocke & Rosemann, 2015), identified six core elements that are critical to the success of BPM. These elements are:

- **Strategic alignment**; defined as a tight link between the priorities and processes of a company.
- Governance; there should be a high level of transparency and accountability regarding the responsibilities of each level of the processes.
- In the context of BPM, methods are all the tools that are used throughout the entire process.
- The IT component of any modern business process is of great value, but it can be overwhelming, especially during this rapid development phase where new programs are developed daily.
- Any process needs people that are willing and able to manage and continually improve it.
- The importance of culture was recognised recently. Specific values must be present for BPM to succeed. This can be referred to as the **BPM-supportive business culture**.

Several authors investigated the development of certain capabilities structured around the core elements of BPM as mentioned above. These capabilities are structured in a capability framework as seen in Figure 1, which was proposed by De Bruin and Rosemann (2007). It is essential in creating process orientation in organisations (Kerpedzhiev *et al.*, 2020).

Strategic Alignment	Governance	Methods	Information Technology	People	Culture
Process Improvement Planning	Process Management Decision-Making	Process Design & Modeling	Process Design & Modeling	Process Skills & Expertise	Responsiveness to Process Change
Strategy & Process Capability Linkage	Process Roles and Responsibilities	Process Implementation & Execution	Process Implementation & Execution	Process Management Knowledge	Process Values & Beliefs
Enterprise Process Architecture	Process Metrics & Performance Linkage	Process Monitoring & Control	Process Monitoring & Control	Process Education	Process Attitudes & Behaviors
Process Measures	Process-Related Standards	Process Improvement & Innovation	Process Improvement & Innovation	Process Collaboration	Leadership Attention to Process
Process Customer & Stakeholders	Process Management Compliance	Process Program & Project Management	Process Program & Project Management	Process Management Leaders	Process Management Social Networks

Figure 1: The BPM capability framework (De Bruin & Rosemann, 2007)

5.2 BPM-supportive business culture

Literature emphasises the importance and effectiveness of BPM. In the end, it does not matter what techniques organisations use to implement or improve these processes, they will not succeed without the cooperation of their employees (Dinçer *et al.*, 2018).

Where social culture evaluates the norms and acceptability of behaviours, business or organisational culture evaluates and regulates the acceptability of behaviours within the organisation. The term ‘organisational culture’ refers to general ideas, traditions and rules that regulate the relationship between employees. A positive organisational culture is what brings employees together as a team and it is the reason why they support each other, whereas a favourable business culture affects the operations of an organisation positively and plays a big part in its success. Business cultures combine the organisation’s values with the employees’ personal values (Dinçer *et al.*, 2018).

Organisational culture is defined by Edgar Schein in his book *Organisational Culture and Leadership* (Schein, 2010) (cited by Wu *et al.*, 2019) as an invisible yet powerful ‘social force’ that drives the direction of the organisation. Three main types of organisational cultures have been identified in the past and are used widely in the analyses of organisational cultures. These are Innovative Organisational Culture (IOC), Bureaucratic Organisational Culture (BOC) and Trust and Supportive Organisational Culture (TOC).

With IOC, the emphasis is on creativity and opportunities which encourage employees to investigate new ways to do their work (Hogan & Coote, 2014). BOC is more hierarchical, with clear responsibilities; it focuses more on structure, rules and regulations. This type of culture involves centralisation and consistency, predictability and efficiency (Jie *et al.*, 2017). TOC focuses on teamwork, support and building trusting relationships with employees within the organisational setting (Ismail *et al.*, 2020).

Summarily, a BPM-supportive business culture is an organisational culture which supports and embraces the achievement of BPM (Schmiedel *et al.*, 2019). A study conducted by Schmiedel *et al.* (2019) found that a BPM culture, together with the method of implementation of a new business process, enhances the performance of the process. These authors identify several values that are important in a BPM culture, as can be seen in Table 1.

Table 1: Values specifying the BPM culture concept (Schmiedel et al., 2019)

Value	Customer orientation	Excellence	Responsibility	Teamwork
Sub-dimensions	The proactive and responsive attitude toward the needs of process output recipients; external customer orientation; and internal customer orientation	The orientation towards continuous improvement and innovation to achieve superior process performance; continuous process improvement; and process innovation	The commitment to process objectives and the accountability for process decisions; accountability for process objectives; and commitment to process objectives.	The positive attitude toward cross-functional collaboration; formal cross-functional teamwork; and informal cross-functional teamwork.

5.3 Process maturity

Process maturity entails the constant and systematic improvement of business processes and skills and is measured by the extent of the definition, measurement, management, control and effectiveness of the processes (Kucińska-Landwójtowicz, 2019). Hammer’s 2007 article *The Process Audit* (as cited by Vom Brocke & Rosemann, 2015), identified two groups of characteristics needed for business processes to perform well and to keep performing well. He referred to these groups as *process enablers* and *enterprise capabilities*. These groups create a framework that Hammer uses in his Process and Enterprise Maturity Model (PEMM). Hammer created this framework as an evaluation tool that any organisation can use to evaluate the maturity of their process as well as the receptiveness from the organisation.

5.4 Climate of change

The most significant purpose of all the change management models is inherently the same, namely, to create an organisational climate or culture where change is welcomed and embraced. Organisational climate or culture, refers to the perceptions and norms of the work environment and focuses mainly on the relationship between the organisation and its employees. The organisational climate has a significant influence on the motivation and job satisfaction of employees and therefore also influences the efficiency of the employees. When an organisation has a strong BPM-supportive culture, the climate of change is present, and change is welcomed and supported. Employees will have an “openness to change” and will be active participants of the change. Yue *et al.* (2019:2) regard openness to change as a precursor to readiness to change.

5.5 The role of leadership

A vital component in organisational change is leadership. With the perceived risks associated with change, employees are more reluctant to change unless they feel secure. Therefore, trust among employees and their management is vital when it comes to change readiness (Matthysen & Harris, 2018). Successful leaders understand that change is not only necessary but vital for organisations to be sustainable and thrive. In their book, *Making sense of change management*, Cameron and Green (2019) identified three dimensions of leadership that are important in change management. Leaders naturally concentrate on outcomes and results, however, they need to realise that underlying emotions, authority and power play an equally important role in change management.

5.6 Readiness for change

The term ‘readiness to change’ can be defined as the employees’ willingness, ability and preparedness to change. When readiness for change is present in the employees of an organisation, they will embrace change and resistance to change is reduced significantly. In their article *Cognitive beliefs and positive emotions about change: Relationships with employee change readiness and change-supportive behaviours*, Rafferty and Minbashian (2019) focussed specifically on “change recipients’ change attitudes” and “change readiness”. They identified change readiness as a mix of change beliefs,

positive attitudes towards change and behaviours that are supportive of change. They further identified five cognitive beliefs as an essential belief preceding the readiness to change. These five beliefs are:

- The **discrepancy belief** refers to a belief that change is needed to address a deficiency in the organisation.
- The **belief of appropriateness** is the belief that the specific change is the most appropriate step in rectifying an issue in the organisation.
- The **belief of self-efficacy** refers to the employee's belief that he is capable of implementing the change.
- The **belief of principal support** refers to the perceived support that the employees will receive from the leaders in the organisation.
- The **valence belief** can be defined as a belief that the change will have benefits, extrinsic as well as intrinsic.

It is evident that when change management is done correctly (as seen in the previously discussed models of change), these beliefs are all addressed during the different phases or stages of change management. Therefore, it is safe to assume that when an organisation has a BPM-supportive culture and change management is correctly applied, the stage of readiness to change will be reached much easier and the possibility of the successful implementation of change is much higher.

Emotional readiness to change is often also referred to as effective readiness and relates to the adaptability of employees. It implies that the employees will have a positive reaction to the implementation of change.

Cognitive readiness is defined by Fletcher and Wind (2014:27) as “the mental preparation (including skills, knowledge, abilities, motivations and personal disposition) an individual need to establish and sustain competent performance.” Cognitive readiness originated in the Department of Defence, when the department queried how to prepare soldiers to ensure that, while they were dealing with rapid change, they would take the best possible decision on the battlefield (Belack *et al.*, 2019). Cognitive readiness is associated with change efficacy or the perception of employees of certain capabilities, such as resource availability, task demands and outcomes of the change.

Intentional readiness for change refers to the effort that employees are willing to invest in the process of change (Bogan, 2017). Employees often realise that change is necessary and are willing to invest in it but due to other factors present in the organisation, they do not have confidence in the change process. This will negatively influence their readiness to change.

Using a change model when implementing change will therefore assist the organisation to fulfil the requirements necessary to ensure that employees are ready for change. Any one or a combination of the models examined in this section would thus be beneficial to the HEI unit currently under study.

5.7 Organisational change

Lewis and Sahay (2019:29) define organisational change as “any alteration or modification of organisational structures or processes” (Lewis & Sahay, 2019:29). The essence of Business Process Management (BPM) is to embrace and accept constant change in processes for the sake of the growth and prosperity within an organisation.

Before looking at the range of models to organisational change, it is valuable to consider the four key approaches to individual change. These approaches are the behavioural approach, the cognitive approach, the psychodynamic approach and the humanistic psychology approach:

5.7.1 The behavioural approach

The behavioural approach implies that the behaviours of others can be changed through reward and punishment. This approach supports the theory developed in 1957, McGregor's Theory X, which

assumes people are self-centred and will resist change unless they are persuaded by being rewarded or punished (Grigorov, 2020).

5.7.2 The cognitive approach

The cognitive approach is based on the assumption that a person's way of thinking is the main reason for their emotions and problems. This is based on self-conditioning and positive reframing to achieve results and focusses more on building positive attitudes and outcomes (Corr, 2020).

5.7.3 The psychodynamic approach

The psychodynamic approach focuses on the psychological process that people go through during change. Kubler-Ross identified five stages that people go through in her publication *On Death and Dying* in 1969 (Corr, 2020). These stages are denial (where people do not want to accept that there once again will be change as was the case with this service sector), anger (where people needed to get use to a new way of operating and change), bargaining (workers wanted to find a way not to change once again as the whole process is very stressful), depression (there is always the fear that people may lose their jobs and constant change within this sector leads to depression in some instances) and acceptance (eventually, workers "give-up" and they know they need to accept the changing environment. This approach will assist organisations in understanding the reactions of their employees during the process of change.

5.7.4 The humanistic psychology

The humanistic psychology approach focuses on and believes in healthy development and growth to achieve optimal potential. This approach follows the same beliefs as Maslow's hierarchy of needs, where the basic needs are the first to be met and the need for self-actualisation or the desire to succeed over and above basic survival, are at the top of the pyramid.

5.8 Change management models

There is a wide range of models and approaches to organisational change; many of which relate to specific metaphors. This paper will focus on Lewin's three-step model, Kotter's eight-step model and Bullock and Batten's phases of planned change.

5.8.1 Lewin's change management model

In as early as the 1940s, Lewin introduced the three-step model of change. These three steps consist of unfreeze, move and refreeze (Manzano, 2020). During the unfreezing stage, the motivation for change is created, bringing with it the psychological safety that enables employees to overcome anxiety about learning new skills. According to Manzano (2020), the second stage, 'move', is the most difficult stage. This is the stage that has the greatest impact on the employees, as it is also when the implementation of the change starts and where solutions are found in trial-and-error learning. During the refreezing stage, the new concepts are internalised. This model further suggests that the perception that change is necessary, in other words, change readiness, needs to be present before the change can be initiated.

Lewin's model is based on the idea of an organisation as an organism. The force field analysis was also introduced by Lewin. Managers should also use this form of analysis during the 'unfreeze' stage of Lewin's model, for the planning session. The implementation happens during the 'move' stage and the 'refreeze' stage is used as a 'post-implementation' review. Lewin's model can be time-consuming but is ideal for large scale changes in organisations.

5.8.2 Kotter's theory

In 1995, Kotter analysed 100 different organisations going through change (Kotter, 1995). It was during this analysis that he compiled eight crucial steps to ensuring that transformational efforts do not fail. These eight steps are:

1. **Establish a sense of urgency:** When a sense of urgency is created to initiate change, it will provide the energy necessary to get everybody on board and motivated. This can start with a

small group of employees who will in turn discuss the change with others and encourage each other.

2. **Form a powerful guiding coalition:** A strong core team is needed, creating cohesion, consisting of people from various levels of experience and skillsets that can reach out to every employee in the organisation.
3. **Create a vision:** The vision needs to be simple, short and definable. A clear description of the values that the change will achieve is necessary in simple enough language that everyone understands what is meant.
4. **Communicate the vision:** Regular meetings are suggested where management should not only share the vision but where feedback and discussions around the change are encouraged. This will not only encourage the employees but will also make them part of the change and may produce another angle of looking at the change to be initiated.
5. **Empower others to act on the vision:** One of the barriers to change is the lack of skills necessary when implementing change in processes. It is vital to develop the necessary skills needed for the change to be effective before implementing change.
6. **Plan for and create short-term wins:** When the initial motivation for change wears off, it is often difficult for employees to persist with the change if they do not see immediate results. Management must acknowledge and celebrate milestones to keep employees motivated.
7. **Consolidate improvements and produce more change:** During this stage, management takes stock of the change already initiated, evaluates the change and outcomes thereof and suggests improvements where necessary.
8. **Institutionalise new approaches:** New processes need to be documented in the organisation's quality manual and must become part of the culture of the organisation. A simple way to do this is to recognise the contributions of the original team responsible for the change process and to encourage feedback on the outcomes of the change.

The essence of the success of this model is not to lose traction after stage five. Thereafter, everyone involved should follow-through with as much enthusiasm as possible right to the end.

5.8.3 Bullock and Batten's phases of planned change

Bullock and Batten's model is based on a project management approach and implies that change is planned in four identified stages (Bullock & Batten, 1985). Their model is similar to Lewin's three-step model, with the difference in the 'unfreezing' stage of Lewin split into two phases, namely exploration and planning. The four stages of Bullock and Batten's model are:

1. **Exploration:** During this stage, the need for change is explored and resources are acquired to make the change.
2. **Planning:** During the planning stage, key decision-makers and technical experts are involved to make a diagnosis and a change plan is formulated.
3. **Action:** The change plan is implemented and constant feedback is given which will indicate if re-planning is necessary.
4. **Integration:** During integration, the change is aligned with other areas in the organisation and is formalised in the organisation's policies.

This model simplifies the change process by isolating the area in the organisation where the change will take place.

6. The research design

This section presents the research design and methodology used to collect data. It will also describe how the data was analysed to achieve the objectives and aim of this study. It should be noted that all ethical protocols were strictly adhered to throughout the study.

For this study, the data is collected via a quantitative research approach as quantitative research studies variables with the primary role of testing hypotheses.

Although the research design has most of the qualities of a conclusive design (with structured questions, quantitative data analysis and a specific purpose), the small sample size may influence the accuracy of the results. The next sections will focus in more detail on the research design.

6.1 Population

The population studied was selected using the convenience procedure of data sampling, which implies the sampling of data from a readily available population. The population of this study consists of a select group of support personnel in the operations management segment of a unit within an HEI in South Africa. The HEI established this unit in order to support faculties with the coordination and administration of all non-formal academic programmes that are not listed on the University PQM as formal programmes. These programmes may include short courses, workshops and short learning programmes and are referred to as Continuous Education (CEd) offerings. This self-sustaining unit within the University reports to the Deputy Vice-Chancellor: Teaching and Learning (DVC: T-L).

The population of the participants in this study consists of a select group of 35 support personnel in the operations management segment of a unit within an HEI in South Africa. These personnel are based on three sites within the HEI. Of the 35 employees in this unit, 26 employees agreed to participate in this study.

6.2 Data collection

Data was gathered by the distribution of structured quantitative questionnaires with close-ended questions to the employees in the unit. A Likert-type scale was used to evaluate each answer. The questionnaire was developed by Bouckenooghe, Devos and Van den Broeck (2009), as an instrument to specifically measure the climate of change or internal context, the process of change and the readiness for change (Bouckenooghe et al., 2009).

In designing the questionnaire as a measuring instrument, the researchers followed a step-by-step procedure. These steps were recommended by Hinkin (1998), who specified the content dimensions of climate of change. Hinkin conducted three independent field studies to examine the reliability and validity of the scales and concluded with the 10 dimensions and 53 items in the self-report battery, namely the OCQ-C, P, R (Organisational Change Questionnaire-Climate of Change, Processes and Readiness). This psychometrically sound instrument measures three dimensions, namely 1) Process of change; 2) Climate of change and 3) Readiness for change.

The researchers tested the items and scales in the organisations just before and during the implementation of change. They suggested that this tool be administered in the same conditions of change, before and during change implementation. This makes the questionnaire ideal for the current unit under study, as it needs to implement the newly developed QMS.

A summary of the dimensions and questions of the questionnaire is displayed in Table 2.

Dimension	Sub-dimension	Item on survey
Process of change	Quality of change communication	Questions 3, 12, 22, 36, 47, 65, 76, 20
	Participation	Questions 5, 11, 25, 34, 35, 42, 50, 51, 71, 74, 77
	Attitude of top management	Questions 17, 66, 69
	Support by supervisors	Questions 101, 37, 38, 15, 31, 40, 60
Climate of change / Internal Context	Trust in leadership	Questions 19, 44, 58
	Politicking	Questions 8, 9, 30
	Cohesion	Questions 2, 14, 24, 48, 61
Readiness for change	Emotional readiness for change EMRE	Questions 4, 33, 75, 55, 73
	Cognitive readiness for change COGRE	Questions 41, 59, 62, 39, 56
	Intentional readiness for change INRE	Questions 18, 57, 67

6.3 The positioning structure

In this HEI, the Council for Teaching and Learning (CTL) is responsible for governance, while the University Management Committee (UMC) is responsible for executive management of the HEI. The DVC: T-L, a member of the UMC, is responsible for teaching and learning. CED forms part of Teaching-Learning and as such the unit reports to the DVC: T-L. The DVC: T-L is supported by the Continuing Education Advisory Committee, composed of the executive deans of all faculties, in the alignment of CED across faculties, campuses and delivery sites. The position of this unit within the organisational structure is indicated in Figure 3.

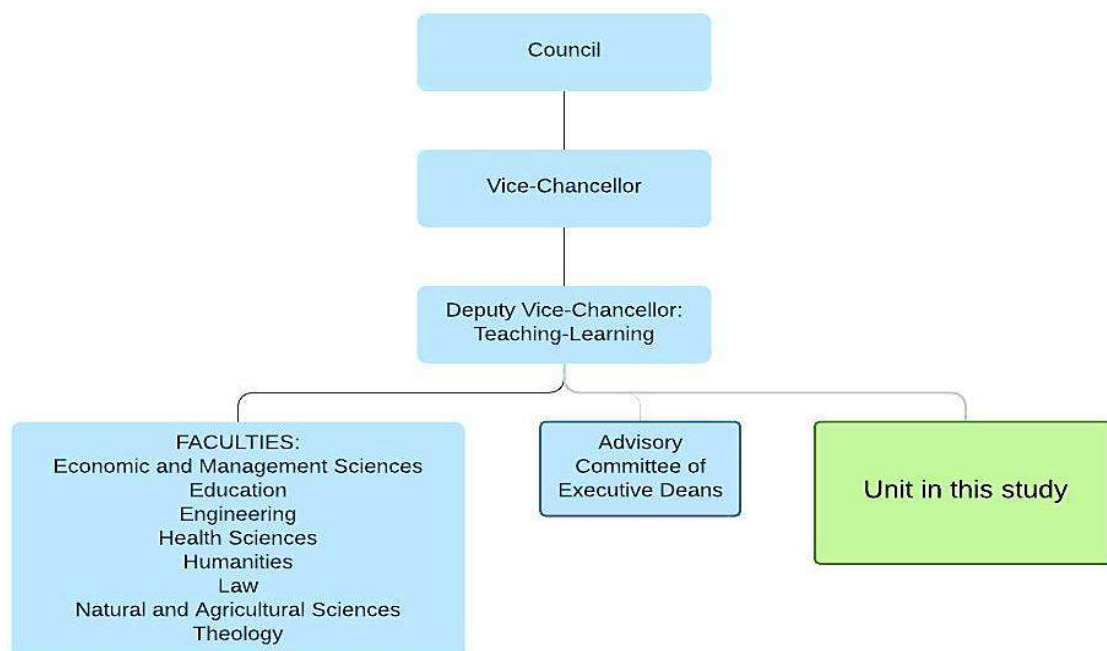

Figure 3: The position of the unit in the HEI

6.4 Data Analysis

Quantitative research transforms raw data into meaningful information which can be interpreted. The first step is data tabulation, where the responses (raw data) to the questionnaires were imported into an Excel spreadsheet and data cleaning was performed. Data cleaning is the process whereby the researcher removes any incorrect, duplicate or corrupted data. Coding was done by assigning values to the answers. The questions in the questionnaire were sorted according to the dimension which they

represent. The data were imported into SPSS and analysed to calculate the mean for each question. The mean refers to the average score when the sum of scores for each question is added and then divided by the number of participants. Once the data were analysed, patterns emerged and from these, the summaries in the next chapter were obtained.

6.5 Reliability and validity

Reliability occurs when the same answer is achieved multiple times when using the same instrument to measure something; the results are thus stable and consistent. Validity refers to the degree to which an instrument measures what it is intended to measure (Dudovskiy, 2018). Instruments used in the research therefore needed to adhere to reliability as well as validity.

In designing the questionnaire as a measuring instrument, the authors followed a step-by-step procedure. These steps were recommended by Hinkin (1998), who specified the content dimensions of climate of change. He developed items that would measure the domain as well as the extent of this measurement, which resulted in 63 items in 12 dimensions. In consultation with 10 experts, Hinkin conducted three independent field studies to examine the reliability and validity of the scales and concluded with the 10 dimensions and 53 items in the self-report battery, namely the OCQ-C, P, R (Organisational Change Questionnaire-Climate of Change, Processes and Readiness). This psychometrically sound instrument measures three dimensions, namely 1) Process of change; 2) Climate of change and 3) Readiness for change. Therefore, it can be concluded that the questionnaire adheres to the specifications needed to provide reliability and validity.

The authors of this questionnaire tested the items and scales in organisations just before and during the implementation of change. They suggested that this tool be administered in the same conditions of change, before and during change implementation. This makes the questionnaire ideal for the current unit under study, as it needs to implement the newly developed QMS.

When using a Likert-type scale in research questionnaires, the calculation of Cronbach's alpha coefficient is vital for internal consistency and reliability. Cronbach's alpha reliability coefficient ranges between 0 and 1, with greater internal consistency closer to 1.

The formula for Cronbach's alpha is $\alpha = \frac{rk}{[1+(k-1)r]}$ (Gliem & Gliem, 2003); where: k = the number of items considered and r = the mean of the inter-item.

Tables 4.4 to Table 4.7 display the Cronbach's alpha value for this study, as calculated using SPSS. When looking at the Cronbach's alpha in Table 4.4 for the whole questionnaire, the value of $\alpha=0.842$ implies that this questionnaire is reliable. If the Cronbach's alpha is calculated for the different dimensions that were measured separately, the dimensions of Process of change and Readiness for change still show reliability with $\alpha = 0.884$ and $\alpha = 0.817$, respectively. However, the dimension Climate of change shows a value of $\alpha = -0.36$. This value might be due to the small number of participants that were used in this study.

Table 2: Cronbach's alpha for questionnaire combined

Reliability Statistics			
Cronbach's alpha	Cronbach's alpha based on standardised items	N of items	
0.842	0.851	53	
Mean	Variance	Std. Deviation	N of Items
160.35	288.635	16.989	53

6.3.1 Analysis of process of change

The process of change was divided into four sub-dimensions, namely

1. Quality of change communication;
2. Participation;
3. Attitude of management towards change; and
4. Support provided by supervisors.

The mean values for these dimensions are displayed in Table 6 and the sub-dimensions are colour coded for convenience.

Table 6: Analysis for the dimension: Process of change

With an average score of 2.47 for change communication and 2.72 for participation, it was evident that the employees felt excluded in communication and did not feel part of the implementation of

change. According to Question 36, most employees felt that they heard about the change from a third party.

Management’s attitude towards change and supervisor support scored slightly higher. However, it was still a significantly low score and added to the presumption that the employees felt that change management was not properly handled in the unit.

The scores on Questions 34, 50, 71, 17, 69, 31, 60 showed that a significant number of employees felt that their line management or supervisors were open for discussion. This created the perception that the lack of communication stemmed largely from top management.

6.3.2 Analysis of climate of change

Table 7 below indicates the results for the dimension climate of change, which refers to the internal circumstances of the unit. The average score for trust in leadership was a concerning 3.01; Question 44 indicated that corporate management did not fulfil their promises. Although the score for politicking was still below 4 (average of 3.54), it should have raised red flags for management. The low average of cohesion indicated a lack of teamwork and team spirit in the unit.

Table 7: Analysis for the dimension: Climate of change

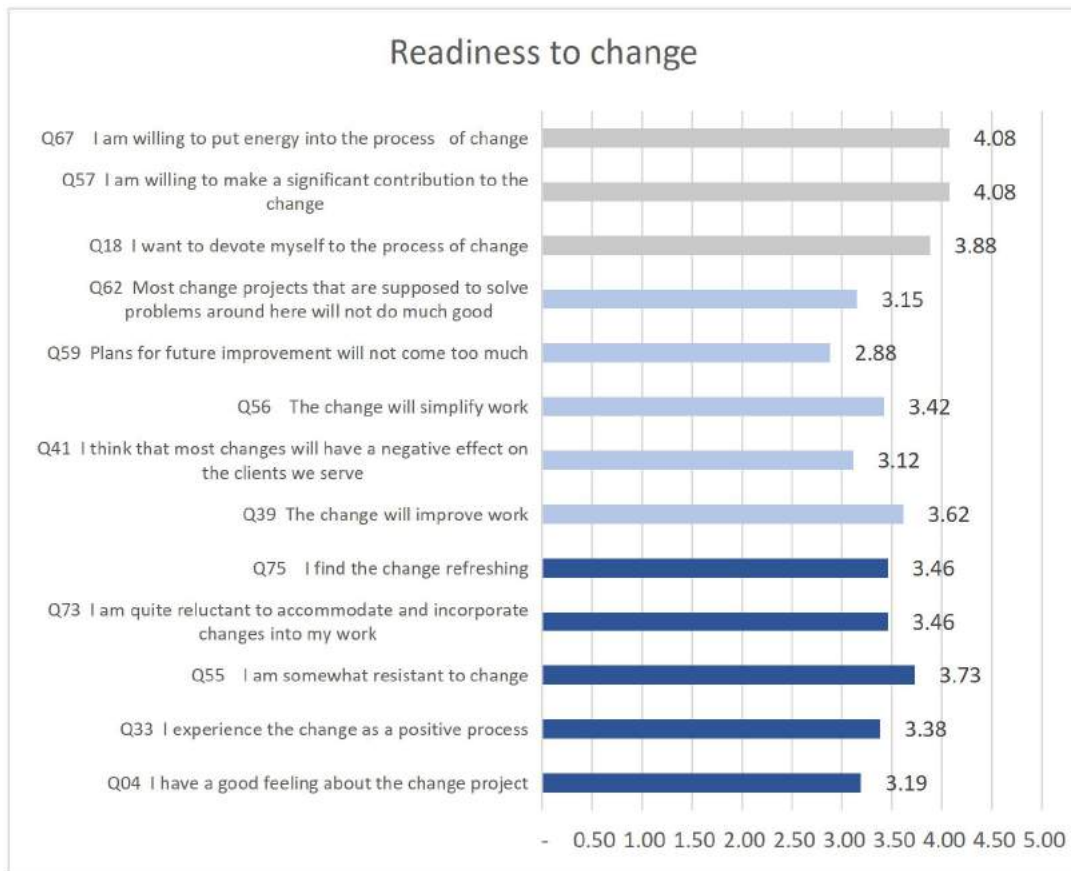

6.3.3 Analysis of readiness to change

Table 8 displays the average scores for the dimension readiness to change. Readiness to change is measured in three sub-dimensions, namely Emotional, Cognitive and Intentional readiness to change. Emotional readiness to change (EMRE) refers to the employees’ emotional reaction towards the implementation of change. With an average of 3.45 and the highest score of 3.73 for question Q55, there was a definite indication that the employees did experience some anxiety towards change. Cognitive readiness to change (COGRE) refers to the employees’ thoughts and beliefs about change. With an average of 3.24, it was evident that the employees did not feel very positive about change. Intentional readiness to change (INRE) refers to the employees’ willingness to put the effort into

change. INRE had the highest score of all the dimensions. With an average of 4.01, it was evident that the employees were willing to put effort into change.

Table 8: Analysis for the dimension: Readiness to change

7. Findings

Based on the analysis as stated in the previous sections, the following can be finding with regard to the process -, climate – and readiness to change were reached:

7.1 Process of change

The correct way to handle the process of change is to ensure readiness to change. Engaging employees in the process of change and regular communication regarding the change is vital to guarantee the participation of the employees. In the unit that was studied, change communication was not optimal and caused the employees to lose confidence and trust in management.

7.2 Climate of change

Creating cohesion in an organisation ensures that the employees work together as a team towards a common goal. When employees do not trust their leaders and the decisions made by them or communication provided by them, they do not feel loyal towards the organisation. In the unit that was studied, the lack of cohesion was evident in the research and has a negative influence on teamwork.

7.3 Readiness to change

Readiness to change is considered one of the core attributes in the successful implementation of change. Cognitive readiness leads to emotional readiness because people believe that they can handle change and the challenges that it provides.

When looking at the history of the unit, the lack of trust in management is no surprise. The lack of leadership contributes a great deal towards the lack of consistency and therefore the low score for the process of change is understandable. This is because employees who have trust in leadership feel secure and are more likely to accept change. The researchers found that the history of the unit created a culture where management was inconsistent and not trusted.

8. Recommendations

8.1 Process of change

It is crucial that employees should be engaged in the whole process. They should be included in discussions and communication. It is also vital that they are provided with a platform where their inputs can be discussed.

8.2 Climate of change

Teamwork is of utmost importance. It is also important that there is consistency and trust in leadership. Leadership should first be established prior to initiating change.

8.3 Readiness to change

It is important that the above two recommendations must first be established. After this is done, staff will feel more comfortable to venture on a changing process. Throughout this process, it is vital that there should be ongoing discussions and communication. It is also strongly recommended that the emotions and fears of staff should be considered.

9. Conclusion

Readiness to change is dependent on the process of change, as employees who are prepared for change will perceive change positively and will not resist change. This study can conclude that the employees in this unit were not ready for the implementation of change. Management needs to tread cautiously and provide the employees with a better understanding of the change that needs to be implemented. Workshops explaining the importance of process management, which provide training about the new processes, can still make a difference in the way the employees perceive the change.

The Compliance of South African Public Companies With IFRS 13 in Relation to Biological Assets

Khathide, Philane¹, Baigrie, Ingrid^{2,*}

^{1,2} School of Accounting, University of Johannesburg, South Africa

Keywords

Agriculture; biological assets; disclosure; fair value; IAS 41; IFRS 13; valuation

Abstract

The agricultural sector, historically a significant contributor to the South African economy has shrunk in recent years from representing more than 10% of the economy in the 1960s to below 2.5% today. The agricultural sector plays a significant stabilising role in emerging economies and is linked to overcoming poverty and enhancing food security. This study analyses the financial statements of nineteen South African agricultural companies listed on the Johannesburg Stock Exchange (JSE) in order to determine their compliance with the requirements of International Financial Reporting Standards (IFRS) 13, Fair Value Measurement. It was found that all companies but one stated that they had applied IFRS 13, and that all companies had applied level 3 inputs to the valuation of their biological assets. In terms of the valuation techniques used, the results indicate that there was significant consistency within the four categories of biological assets. The study concludes that, while agricultural companies are attempting to comply with the recognition, measurement and disclosure requirements of IFRS 13, it is debatable whether this compliance is adding value, particularly in an industry already faced with many challenges and financial constraints. This study is aligned with the findings of other researchers who have called for the International Accounting Standards Board to reconsider the implementation of fair value accounting in the agricultural sector.

1. Introduction

In South Africa, the agricultural sector has been a significant contributor to the economy historically but, in recent years, this sector has shrunk from representing more than 10% of the economy in the 1960s to below 2.5% in more recent times (Greyling, 2015). The sector's contribution to the economy can be evaluated according to five main themes, namely as a provider of food, an earner of foreign exchange, an employment provider, a source of capital, and as a buyer of goods or provider of inputs to the manufacturing sector (Agri SA, 2021). Even today, the agricultural sector uses more than 80% of available land and around 60% of available water. In developing countries, the agricultural sector plays a vital stabilising role: "In much of Sub-Saharan Africa, agriculture is a strong option for spurring growth, overcoming poverty, and enhancing food security." (World Bank, 2008).

A significant contributor to the decline in the agricultural sector in South Africa in recent years has been the deregulation of agricultural markets as well as the signing of international trade agreements. This has had a very negative impact on the agricultural sector, most notably the poultry industry. A recent report by the Bureau for Food and Agricultural Policy (2019) has indicated that an increase in imports has led many to question the competitiveness and sustainability of the domestic industry. In addition to a significant increase in chicken imports, South Africa also currently imports over 50% of its annual wheat consumption (Grain SA, 2017).

Food security is a goal that has been mentioned by President Cyril Ramaphosa in every State of the Nation Address (SONA) since his election as president. In a speech in October 2020, he reiterated that "broadening access to agricultural land for commercial production and subsistence farming is a

national priority” (news24, 2020). Since the declaration of Covid-19 as a global pandemic in March 2020, the South African Agricultural sector has benefitted from being classified as an essential service. While the economy as a whole declined by 7% during 2020, due significantly to lockdown restrictions in many sectors of the economy, the agricultural sector achieved an overall growth of 13,1% over this period. This despite the challenges experienced in the alcohol and tobacco sub-sectors, due to restrictions on sales and consumption of these products at various stages of the lockdown (Agri SA, 2021).

The World Wildlife Fund (WWF) (2010:4) describes agriculture as the foundation of a developing economy. As a developing economy, it is essential that South Africa maintains a healthy agricultural industry that contributes to the country's gross domestic product (GDP). In addition, an active agricultural sector also plays a significant role in relation to food security, social welfare, job creation and ecotourism.

International Accounting Standard (IAS) 41 Agriculture, issued by the International Accounting Standards Board (IASB), provides guidance on how to account for, present and disclose biological assets in financial reporting (IASB, 2001: IN1) and requires entities to measure biological assets at initial and subsequent recognition, and agricultural produce at point of harvest, at fair value less costs to sell. Cairns (2006) identifies IAS 41 as the first accounting standard issued by the International Accounting Standards Committee (IASC) that required the use of fair value accounting for the subsequent measurement of non-financial assets.

2. Problem Investigated

Like many of the existing accounting standards, IAS 41 offered users a number of different options for the fair value measurement of biological assets, which resulted in a lack of comparability between entities within the same agricultural sub-sector (Baigrie & Coetsee, 2016). The IASB also reached the conclusion that the fair value guidance provided in the various accounting standards was not consistent and that inconsistencies in the measurement and disclosure of items measured at fair value contributed significantly to diversity in practice and impeded comparability of information contained in financial statements (IASB, 2011: BC5).

In an attempt to improve comparability and to increase standardisation of disclosure, the IASB issued International Financial Reporting Standard (IFRS) 13, Fair Value Measurement, in May 2011 as a single source of fair value measurement guidance. IFRS 13 is applicable in all situations where a specific International Accounting Standard or an International Financial Reporting Standard requires an entity to measure assets or liabilities at fair value (IASB, 2011: 5). The financial reporting standards issued by the IASB were developed over many years, which has resulted in these standards containing varying measurement and disclosure requirements, which in turn has led to a lack of comparability. (IASB, 2011: BC4).

IFRS 13 clarifies the definition of fair value and contains a fair value hierarchy consisting of three distinct levels. While level 1 gives highest priority to unadjusted, quoted market prices for identical assets, level 2 inputs reflect prices for similar assets observable from the market, and level 3 inputs are unobservable inputs, that is valuation techniques and inputs not directly observable in the market (IASB, 2011: 72-90). In addition, IFRS 13 provides guidance on the disclosure requirements for items measured at fair value, with increased disclosure required where items are categorised within levels two and three of the fair value hierarchy (IASB 2011: 91-93). The aim of this additional disclosure is to increase comparability where market-based prices are not used.

There has been considerable international research on financial reporting by entities engaged in agricultural activities in various part of the world (Argilés, Aliberch. & Blandon, 2012; Argilés, Blandon & Monllau, 2011; Argilés & Solf, 2001; Baigrie & Coetsee, 2016; Cristea, 2017; Dowling & Godfrey, 2001; Elad, 2004; Elad & Herbohn, 2011; Grege-Staltmane, 2010; He, Wright & Evans, 2018; Herbohn, 2006; Herbohn & Herbohn, 2006; Perry, 2008 & Waine, 2009), but, since the

introduction of IFRS 13 in January 2011, there has not been much research on how this standard impacts on entities with biological asset holdings.

3. Research Objectives

The aim of this study is therefore to determine the extent to which South African companies listed on the Johannesburg Stock Exchange (JSE) with significant holding of biological assets are complying with the recognition, measurement and disclosure requirements of IFRS 13. The financial statements of companies listed on the JSE were scrutinised and nineteen companies were identified with biological assets in their statements of financial position. This study therefore includes all JSE-listed agricultural companies, that is, companies with biological assets in their financial statements. This study aimed to determine whether or not these companies were applying IFRS 13 to the valuation of their biological assets and, if so, the level at which their biological assets were classified. In addition, the valuation technique applied to the valuation of these biological assets and the extent of their compliance with the required IFRS 13 disclosures applicable to the level at which their biological assets were classified in terms of the IFRS 13 fair value hierarchy were also analysed.

IAS 41 identifies four discrete categories of biological assets, namely bearer plants, consumable plants, bearer livestock, and consumable livestock. A content analysis of the annual financial statements of the selected companies identified holdings of all four categories of biological assets across the different companies. The analysis of the companies' compliance with the recognition, measurement and disclosure requirements of IAS 41 was undertaken based on these four distinct categories.

This paper begins by looking at recent literature related to the reporting of fair value, particularly in relation to biological assets, and goes on to describe the research methodology used in more detail. The results of the research are then discussed, followed by a discussion of conclusions drawn from the research findings and the implications of these findings.

4. Contribution

This paper provides an analysis of South African listed companies' compliance with the recognition, disclosure and measurement requirements of IFRS 13 in relation to their holdings of biological assets which are required, in terms of IAS 41, to be measured at fair value. While other research has looked at the compliance of other South African companies with the requirements of IFRS 13 (Razak & Stainbank, 2018), no research has yet been done in relation to entities with material holdings of biological assets. The research took place after the implementation of IFRS 13 in January 2013 and before the amendments to IAS 41 came in to effect in January 2016. As such, in addition to providing a snapshot of the compliance of these companies over this period, it also provides foundational information with which future research may be compared.

5. Literature Review

Previous Accounting studies have focused on the compliance of entities holding biological assets with the disclosure requirement of IAS 41 in various countries. In South Africa, an article by Baigrie and Coetsee (2016) looked at the compliance of JSE-listed entities with the disclosure requirements of IAS 41. This study focusses on the compliance of companies holding biological assets with the valuation and disclosure requirements of IFRS 13.

IFRS 13 is applicable in all situations where a specific International Accounting Standard or an International Financial Reporting Standard requires an entity to measure assets or liabilities at fair value (IASB, 2011: 5). Among others, IFRS 13 is applicable to entities that are required to apply IAS 41, Agriculture, to the fair value measurement of their biological assets.

IAS 41 provides guidance on how to account for, present and disclose biological assets for the purpose of financial reporting (IASB, 2001: IN1). IAS 41 requires entities to measure biological assets at initial and subsequent recognition, and agricultural produce at point of harvest, at fair value less costs to sell. When IAS 41 was issued it contained guidance on how the fair value of biological

assets should be determined. IAS 41 suggests a number of different methods for the measurement of fair value while movements in the fair value are required to be accounted for in profit or loss. The fair value requirements contained in IFRS 13 have replaced those in IAS 41 for reporting periods beginning on or after 1 January 2013 (IASB, 2011: C1).

The IASB had a number of objectives in issuing IFRS 13. IFRS 13 was intended to provide preparers of financial statements with a single set of requirements for all fair value measurements in the hope of improving the comparability of financial statements. In addition, it aimed to provide preparers with a single definition of fair value applicable across all financial reporting standards as well as with fair value disclosure requirements intended to assist users to assess the valuation techniques and inputs used in the calculation of the fair values of assets and liabilities (IASB, 2011: BC6).

The revised Conceptual Framework for financial reporting (IASB, 2018: 1.2) states that the objective of financial reporting is to provide the users of an entity's annual financial statements with useful financial information about the entity, and identifies relevance and faithful representation as the two fundamental qualitative characteristics of useful financial information. In reviewing the literature around the fair value reporting of biological assets, four significant themes were identified, namely the relevance of financial information, the faithful representation of this information, the comparability of financial statements, and the standardisation of disclosure of biological assets in the financial statements.

5.1 Relevance of fair value reporting of biological assets

Financial information is relevant when it can be used to predict future outcomes and when it provides useful feedback to users about previous financial performances (IASB, 2018: 2.6-2.9). Relevant information is also determined by how material a particular piece of information is to those using it. Information is material, and therefore also relevant, if misstating or omitting this information will have an impact on the decisions that will be taken by users regarding the reporting entity (IASB, 2018: 2.11). Cristea (2017), in a discussion of the advantages and disadvantages of both fair value and historical-cost accounting of biological assets, concludes by saying that fair value is irrelevant, because it lacks verifiability, while historical cost is relevant because it is precise and cost computations are certain.

Argilés-Bosch, Miarons, García-Blandon, Benavente and Ravenda (2018), in their empirical analysis of the relevance of accounting information when biological assets are measured at fair value as compared to historical cost, report that the fair value valuation of biological assets is more reliable when predicting future cash flows. This is because the proportion of biological assets to total assets increases compared to historical cost valuations. However, they found that this does not apply to bearer plant holdings.

Da Silva, Rezende and Braunbeck (2016) conclude that the use of the fair value measurement of biological assets is more relevant than historical cost. They also point out that reliability is still a concern because of the different approaches used to determine the fair value of assets when there is no active market.

5.2 Faithful representation of biological assets

The usefulness of financial information is enhanced by its faithful representation. To satisfy the qualitative characteristic of faithful representation, information needs to be complete, neutral and free from error (IASB, 2018: 2.13). Elad (2004) states that the value of biological transformation is better reflected when net market value is used, which faithfully represents a biological asset's future economic benefits.

Abdullatif (2016), who researched the issues faced by external auditors in Jordan, found that auditors were concerned that companies took advantage of fair value estimates to overvalue their assets, which would make fair value information less reliable. Filip, Hammami, Huang, Jeny, Magnan and Moldovan (2017) conclude that while the application of the IFRS 13 fair value hierarchy will benefit

capital market participants, the fair value hierarchy is not sufficiently stable at levels 2 and 3 and the use of level 3 allows managers to manipulate financial information.

Landsman (2007) warns of the potential of management deliberately to manipulate fair values within any fair value methodology, as well as the problem of measurement error in the fair valuing of assets and liabilities. While a certain amount of earnings volatility can be directly attributed to the underlying economic volatility inherent in agricultural activities, the use of fair values in an industry like the agricultural sector exacerbates the problem of earnings volatility, which in turn reduces the faithful representation of these assets. Users of financial information will have more confidence in this information if they know that it is both relevant and faithfully reported: The Conceptual Framework emphasises that financial information that is both relevant and faithfully represented assists users in the decision-making process (IASB, 2018: 2.41).

The Conceptual Framework states that “although a single economic phenomenon can be faithfully represented in multiple ways, permitting alternative accounting methods for the same economic phenomenon diminishes comparability” (IASB, 2018: 2.29). One of the main reasons for the introduction of IFRS 13 in 2011 was to increase comparability through greater consistency in fair value measurement and disclosure (IASB, 2011: 72).

5.3 Comparability of financial statements

The IASB states that information reported in financial statements “is more useful if it can be compared with similar information about other entities and with similar information about the same entity for another period or another date” (IASB 2018: 2.24). Elad and Herbohn (2011) state that IAS 41, instead of enhancing comparability and changing accounting practices, created an illusion of comparability. This is because, prior to the implementation of IFRS 13, IAS 41 provided too many alternative valuation methods and allowed management too much room to apply different methods of estimation. These authors conclude that it is almost impossible for the application of IAS 41 to improve comparability unless entities within the same industry agree to use similar valuation methods. Comparability is compromised by allowing different accounting methods to be used by entities in the same industry (IASB, 2018: 2.26-2.27). Van Biljon (2016) states that the use of IAS 41 on its own leads to financial statements that cannot usefully be compared, because the standard does not have a single detailed valuation method. Van Biljon (2016) also states that because a number of alternative valuation methods are permitted in IAS 41, comparability will be directly affected by the method a particular entity uses. She highlights the fact that the valuation methods in IAS 41 allow for the extensive use of estimates, and that this will impact on the credibility of the information produced, because inconsistencies in estimates among entities will also impair comparability.

The consensus to date seems to be that IAS 41 has failed to enhance comparability among agricultural entities (Aryanto, 2011; Elad & Herbohn, 2011; Fisher, Mortensen & Webber, 2010; Herbohn, 2006; Ore, 2011). While Baigrie and Coetsee (2016) suggest that entities in the same economic sub-sectors need to agree to apply similar valuation methods for biological assets if they want to increase comparability, it remains to be seen whether the introduction of IFRS 13 and its application to agricultural entities have resolved this problem.

5.4 Standardisation of disclosure

The aim of standardised disclosure is to make financial statements more easily understandable by diverse users across the globe. An increase in the standardisation of disclosure requirements will make it easier for users to know what to expect and how to read and interpret the financial information of any entity, which in turn will enable them to make more informed decisions.

Maina and Wingard (2013) discuss the problems associated with the increased costs of obtaining fair values for biological assets under financially constrained circumstances, particularly in developing economies. Van Biljon (2016) states that most agricultural organisations face challenges such as the cost of obtaining valuations, a lack of understanding of the valuation model, and issues relating to the measuring of the age and condition of plants and bearer livestock. She further states that most

companies struggle with the valuation of biological assets because they only perform such a valuation once a year. She suggests that if valuations were done more frequently, it would enhance the skills and experience required to perform these valuations, which would in turn make fair value reporting more accurate and less burdensome.

A correlation between compliance with IFRS 13 and the size of both the firm and its auditors was also identified. Clavano (2014) mentions that, while there is a positive correlation between firm size and the valuation methods used, it is the perceived importance of any required disclosure by the audit firm that determines whether or not the disclosure is included in the entity's financial statements.

Baigrie and Coetsee (2016) found greater consistency in disclosure between companies in the same industry sector. They conclude that standardisation of disclosure is intended to improve the comparability of financial statements of different entities, and that the introduction of more extensive compulsory disclosures in the accounting standards will lead to greater standardisation of disclosure. This in turn should lead to greater comparability within economic sectors and across economic regions (Baigrie & Coetsee, 2016: 835). Philander (2016: 16) argues that "usefulness can be measured as the degree or extent to which financial information provides a sound basis to make informed decisions". A greater emphasis on the standardisation of disclosure should lead to the increased usefulness of financial information.

IFRS 13, through increased comparability of disclosure and more accurate use of fair value in financial statements, has the potential to enhance the qualitative characteristics of relevance and faithful representation. Faithful representation is enhanced when financial information is comparable and disclosed in a standardised way. Prior to the implementation of IFRS 13, IAS 41 made it difficult to compare financial information across entities, because it allowed for the use of many different valuation methods (Baigrie & Coetsee, 2016). IFRS 13, with its increased emphasis on the use of market-based valuations combined with greater disclosure requirements when other valuation methods are used, should lead to an increase in the standardisation of disclosure. However, there is a concern that disclosing too much information will not always be value relevant and it is hoped that standardised disclosure can be achieved through the use of minimal but relevant information.

6 Research Methodology

In June 2014 the IASB issued a paper entitled "Agriculture: Bearer Plants" (IASB, 2014) as an amendment to IAS 41 and IAS 16, Property, Plant and Equipment (IASB, 2003). This amendment removes bearer plants from the scope of IAS 41 and places them within the scope of IAS 16 (IASB, 2014: 1). Companies are required to apply these amendments to their financial statements for financial periods beginning on or after 1 January 2016 (IASB, 2014: 81K).

It is a JSE requirement that all JSE-listed companies comply fully with IFRS. In addition, the South African Companies Act 71 of 2008 (South Africa, 2008) requires all public companies to be fully IFRS-compliant. The financial statements of JSE-listed companies were carefully scrutinised to identify companies with holdings of biological assets in their statements of financial position.

Nineteen JSE-listed companies were identified as holding biological assets and were therefore selected for inclusion in this study. Financial statements analysed were for the first reporting periods beginning on or after 1 January 2015 since, while this was not the first reporting period in which IFRS 13 was applicable, it represents the period after which the application of IFRS 13 became mandatory and before the amendments removing bearer plants from the scope of IAS 41 came in to effect.

A qualitative approach was adopted which involved a content analysis of the annual financial statements of the selected companies. In terms of IAS 41, entities with biological assets are required to record these assets at fair value at the end of every reporting period. Previous research (Baigrie & Coetsee, 2016) looked at the compliance of South African companies with material holdings of biological assets with the disclosure requirement of IAS 41. Subsequent to this research, the IASB issued IFRS 13 Fair Value Measurement, which requires entities that hold assets and liabilities which

must be carried at fair value to apply the valuation and additional disclosure requirements of this standard (IASB, 2011: 5). In addition, IFRS 13 recommends three different valuation techniques, namely the market approach, the cost approach and the income approach (IASB, 2011: 62).

The research for this study seeks to determine the extent to which South African public companies with material holdings of biological assets have complied with the valuation and disclosure requirements of IFRS 13 in relation to these assets.

To achieve this, the following analyses were undertaken:

- an analysis of the annual financial statements of the selected companies to identify whether or not they indicated that they applied IFRS 13 to their biological assets;
- an identification of the level of the IFRS 13 fair value hierarchy to which these biological assets were assigned;
- a categorisation of the valuation techniques used for the recognition and measurement of these biological assets; and
- an analysis of the compliance of these companies with the disclosure requirements of IFRS 13 applicable to the level at which their biological assets were classified.

A detailed analysis of the accounting policies and biological assets notes to the financial statements of the selected companies was conducted. The results were collected and analysed using Microsoft Excel. For the purposes of this analysis, companies were divided into those with plants as biological assets and those with livestock as biological assets. A further sub-division within the category of plants was made between bearer plants and consumable plants, and in the category of livestock between bearer livestock and consumable livestock. Bearer plants included assets like fruit trees, vineyards and root stocks with a life of over twelve months, while consumable plants would be crops like vegetables, sugar cane and wheat that are harvested annually. Similarly, bearer livestock included dairy cows, laying poultry kept to produce eggs and abalone stock kept for breeding purposes, while consumable livestock included animals like sheep, poultry and perlemoen. Timber plantations would also be considered consumable plants because, although they have a life span of more than twelve months, in the end they are used and not the fruit they bear.

Although all the data used for this research was publically available secondary data, ethical clearance for this research was obtained from the relevant research ethics committee of the university at which this research was conducted (SAREC20181010-010).

7 Results and Findings

Of the nineteen companies selected, it was found that thirteen had plants as biological assets and nine had livestock. Some companies therefore had both plants and livestock as biological assets and were included in both categories. Table 1 shows the number of companies found to hold the different categories of biological assets used in this study.

Table 1 Breakdown of companies according to categories of biological assets

Plants		Livestock	
Bearer	Consumable	Bearer	Consumable

Source: Own analysis

7.1 Application of IFRS 13

Of the nineteen companies selected for this study, only one provided no indication of whether or not it applied either IAS 41 or IFRS 13 to the valuation of its biological assets. The remaining eighteen companies, making up 95% of those selected, indicated that they applied IFRS 13 to their biological assets.

7.2 Categorisation within IFRS 13 Fair Value Hierarchy

The IFRS 13 fair value hierarchy favours the use of level 1 inputs, which are quoted prices in active markets, followed by level 2 inputs, which are either directly or indirectly observable inputs, followed by level 3 inputs, which consist of unobservable inputs (IASB, 2011: 72). Depending on the level at which the assets are categorised, IFRS 13 requires different levels of disclosure (IASB, 2011: 91-93). IFRS 13 requires all companies that measure assets or liabilities at fair value to disclose the fair value measurement at the end of the reporting period, as well as the level of the fair value hierarchy at which the fair value measurements are categorised (IASB, 2011: 91-93). An initial analysis of the financial statements of the selected companies showed that all companies that applied IFRS 13 to the valuation of their biological assets, categorised these biological assets at level 3 of the IFRS 13 fair value hierarchy. A summary of the IFRS 13 compulsory disclosures was developed and used in the analysis to ascertain whether companies with biological assets complied with these requirements during the financial reporting period analysed. This detail is provided in Tables 4 and 5 to follow.

Table 2 IFRS 13 disclosures excluded from analysis

Paragraph	IFRS 13 requirement	Reason for exclusion
93(c)	Transfer between levels 1 and 2, and reasons for transfers	Not applicable, all biological assets classified as level 3
93(d)	Any changes in valuation techniques if applicable, and reasons for changes	No way of knowing if disclosure is applicable or not
93(e)	Total gains and losses included in other comprehensive income (OCI) per line item	IAS 41 does not permit use of OCI
93(h)(i)	A narrative description of the sensitivity of the fair value measurement to changes in unobservable inputs if a change in those inputs could result in a significantly higher or lower fair value measurement	No way of knowing whether or not disclosure is applicable
93(h)(ii)	For financial assets and financial liabilities, effect of change of reasonably possible alternative assumptions on fair value	Not applicable to IAS 41
93(i)	If highest and best use differs from current use, the fact that the asset is not being valued according to its highest and best use, and the reason why it is being used in a manner that differs from its highest and best use	No way of knowing whether or not disclosure is applicable

Source: Own construction

Six of the disclosures were found either not to be applicable or not to be testable since it was not possible from a quantitative content analysis to identify if their omission was due to the fact that the disclosure was not applicable or if it had been omitted in error. Table 2 shows the disclosures excluded from the analysis and the reasons for their exclusion. The disclosures which were included in the analysis are shown in detail in Tables 4 and 5 with the results of the analysis.

7.3 Valuation techniques applied

The results of the analysis that was carried out to identify the various categories of biological assets held by each company and the valuation techniques used by these companies are shown in Table 3. The three valuation techniques identified in IFRS 13 that may be used to establish fair value are the market approach, the cost approach and the income approach. The differences between these methods are that the market approach uses information from transactions of similar or identical assets and liabilities in the market to establish fair value, while the cost approach uses current replacement cost and the income approach uses discounted future cash flows to estimate current fair value (IASB, 2011: B5-B11). One of the companies used different measurement approaches to sub-divide its bearer plant holdings, namely replacement cost for banana plants and deciduous and macadamia trees, and amortised cost for sugarcane roots. This company has been listed under the cost approach in Table 3.

Table 3 Valuation techniques applied to biological assets

	Market approach	Cost approach	Income approach	Amortised cost
Bearer plants	10%	50%	20%	20%
Consumable plants	27%	18%	55%	0%
Bearer livestock	67%	11%	0%	22%
Consumable livestock	75%	12.5%	0%	12.5%

Source: Own analysis

The first three approaches listed in Table 3 are fair value approaches as defined in IFRS 13. The last classification, amortised cost, is not a fair value measurement and does not form part of IFRS 13. There is no broad definition of amortised cost in any of the IFRS statements except for the definition relating to financial assets and liabilities in IFRS 9 and the definition of amortisation contained in IAS 38 *Intangible Assets*. IAS 39 defines amortisation as “the systematic allocation of the depreciable amount of an asset to profit or loss over its useful life” (IASB, 2010: 8). The analysis in Table 3 shows that a number of companies are still using amortised cost to measure their biological assets. These companies are therefore not compliant with IAS 41.

The results show that, for companies with holdings of bearer plants, 50% used the cost approach and 20% measured these assets at amortised cost. The majority of these companies (70%) were already using a cost basis prior to the amendments to IAS 14 and IAS 16, which remove bearer plants from IAS 41 and require them to be measured using the cost model in IAS 16. This would indicate that companies in this sector support the IASB decision to remove bearer plants from IAS 41.

While companies with consumable plant holdings are fully compliant with IAS 41 and IFRS 13 in terms of the measurement of their biological assets, the analysis found that 22% of companies with bearer livestock holdings and 12.5% of companies with consumable livestock holdings were non-compliant with IAS 41, electing to measure these biological assets at amortised cost.

It is clear from the results shown in Table 3 that companies with different categories of biological assets use different valuation techniques. While there is very little consistency across the different categories, there is relative consistency within each category. It may still be, however, that each company is using the approach that it finds the most practical, regardless of what is seen as the best measure within the industry sector in question.

7.4 Disclosure

Using the framework described earlier, a further analysis was carried out on the compliance of the selected companies with the IFRS 13 required disclosures. The results of this analysis are shown in Tables 4 and 5.

Table 4 Compliance with IFRS 13 disclosures by companies with plant holdings

Par.	IFRS 13 requirement	Bearer	Consumable
91(a)	Identification of valuation technique and inputs used	100%	100%
91(b)	Effect on profit or loss for the period	80%	100%
93(a)	Fair value at the end of the period	80%	100%
93(b)	Level in fair value hierarchy	80%	100%
93(d)	Description of valuation techniques and inputs used	80%	100%
93(d)	Quantitative details of significant unobservable inputs used and their impact on fair value	40%	55%
93(e)	Total gains or losses recognised in profit or loss and the line item in which those gains or losses are recognised	50%	73%
93(e)	Reconciliation of opening to closing balances showing purchases and sales	80%	100%
93(f)	Total gains and losses attributable to unrealised gains and losses in profit or loss	0%	0%
93(g)	Detailed description of valuation processes used	10%	9%

Source: Own analysis

As seen in Table 4, all of the companies with bearer and consumable plants identified the valuation techniques used to measure these assets. While 80% of companies with bearer plant holdings provided 60% or more of the compulsory disclosures required by IFRS 13, 100% of the companies with consumable plants provided 60% or more of these disclosures. The disclosures with which companies were less compliant were those relating to the quantitative details of unobservable inputs used and the separate disclosure of the unrealised gains and losses for the period. In addition, only one of these companies provided a detailed description of the valuation processes used to measure their bearer and consumable plants.

As indicated earlier and as seen in Table 5, one of the companies with bearer and consumable livestock did not indicate whether it applied either IAS 41 or IFRS 13 to these assets. Apart from this, 78% of companies with bearer livestock provided 70% or more of the compulsory disclosures required by IFRS 13, and 88% of the companies with consumable livestock provided 70% or more of these disclosures.

Table 5 Compliance with IFRS 13 disclosures by companies with livestock holdings

Par.	IFRS 13 requirement	Bearer	Consumable
91(a)	Identification of valuation technique and inputs used	89%	88%
91(b)	Effect on profit or loss for the period	78%	88%
93(a)	Fair value at the end of the period	78%	88%
93(b)	Level in fair value hierarchy	78%	88%
93(d)	Description of valuation techniques and inputs used	78%	88%
93(d)	Quantitative details of significant unobservable inputs used and their impact on fair value	56%	63%
93(e)	Total gains and losses in profit or loss per line item	78%	88%
93(e)	Reconciliation of opening to closing balances showing purchases and sales	78%	88%
93(f)	Total gains and losses attributable to unrealised gains and losses in profit or loss	11%	13%
93(g)	Detailed description of valuation processes used	11%	13%

Source: Own analysis

A similar picture emerges in relation to companies with plants, in that the disclosures with which companies with livestock were less compliant were those relating to the quantitative details of unobservable inputs used and the separate disclosure of the unrealised gains and losses for the period, as shown in Table 5. Like companies with plants, only one of these companies provided a detailed description of the valuation processes used to measure their bearer and consumable plants.

Overall, these results show that the JSE-listed companies selected for this study complied with most of the disclosure requirements of IFRS 13. Four companies used amortised cost to value one or more category of biological assets and were therefore compliant with neither IAS 41 nor IFRS 13 in relation to these assets. The one disclosure with which 90% of the companies were non-compliant relates to providing a detailed description of the valuation processes used in arriving at the level 3 valuations of their biological assets. In addition, there was only one company that split the gains or losses for the period into realised and unrealised gains. This separation of realised and unrealised gains is something that should add value to biological asset reporting, especially in a volatile economic climate like South Africa.

These results show greater consistency of compliance across the different categories of biological assets than previous research as well as increased disclosure compliance by companies with livestock (Baigrie & Coetsee, 2016). It would seem therefore that IFRS 13 has led to increased consistency of disclosure by South African listed companies with biological asset holdings.

8 Conclusion

The purpose of this research was to assess the extent to which the nineteen JSE-listed companies selected for this study applied IFRS 13 to their biological assets, to determine the valuation techniques used by these companies to value their biological assets, and to determine the extent of these companies' compliance with the disclosure requirements of IFRS 13.

As indicated in Section 5 of this paper, recent literature suggests that a lack of disclosure of relevant information combined with a lack of standardisation of disclosure has led to a lack of comparability between the financial statements of different entities in the agricultural sector. In addition, the usefulness of financial information is enhanced by the faithful representation of information as well as by the disclosure of information relevant to the decisions users need to make in relation to the financial statements.

The current study found that the majority of companies with bearer plant holdings used a replacement cost approach for the valuation of these assets, while the majority of companies with consumable plant holdings used an income approach to measure these assets. However, three companies still used amortised cost to measure their bearer plant holdings, while none of the companies used amortised cost to measure its consumable plant holdings. As long as companies in the same industry continue to use different valuation techniques to measure the fair value of their holdings, a comparison of companies for decision-making purposes will remain difficult.

There was greater consistency in the valuation techniques used among companies with livestock holdings, with the majority of companies with both bearer and consumable livestock holdings using a market approach to value these assets. However, two companies still used amortised cost, one to measure its bearer livestock holdings only and the other to measure both bearer and consumable livestock holdings. Comparison among companies with livestock holdings for decision-making purposes is therefore more reliable than among companies with plant holdings.

In terms of the IFRS 13 minimum disclosure requirements, all of the companies that used one of the methods for assessing fair value advocated in IFRS 13 complied with the majority of the standard's disclosure requirements. Disappointingly, only 10% of companies with bearer plant holdings, 9% of companies with consumable plant holdings, 11% of companies with bearer livestock holdings, and 13% of companies with consumable livestock holdings complied with the IFRS 13 disclosure

requirement to provide a detailed description of the valuation process applied to arrive at the level 3 valuation used.

This research has shown that JSE-listed companies with material holdings of biological assets are, with a few exceptions, applying IFRS 13 to their biological assets and are compliant with most of the standard's disclosure requirements. Companies should ensure that they consider all factors affecting the biological asset in question in determining its fair value. Increased disclosure relating to the valuation methods used will achieve value relevance for many different types of biological assets, particularly those like forests and plantations, which require several inputs in order to arrive at a fair value. Companies with biological assets will need to achieve a balance between over-disclosure and under-disclosure. This can be done by disclosing more technical information about biological assets when market values are not available.

The objective behind the issuing of IFRS 13 was to provide preparers of financial statements with a single set of requirements and disclosures for all items measured at fair value, with the intention of increasing comparability of financial statements between entities with similar assets. While IFRS 13 and IAS 41 have encouraged entities to disclose more information about their biological assets, many preparers are still struggling with the cost of obtaining these fair values as well as issues relating to the various inputs required to value items classified at level 3 of the IFRS 13 fair value hierarchy. A 2018 study by Razak and Stainbank (2018: 19), which interestingly did not include companies with biological assets, concluded that where JSE-listed companies have the option of applying fair value to the valuation of their assets and liabilities, they are still avoiding fair value accounting, preferring to value these assets at historical cost. In addition, a recent study by He, Wright and Evans (2018) concluded that the fair value of biological assets does not provide incremental forecasting power for future operating cash flows.

The findings of this study are consistent with the findings of previous studies which provide "empirical support for the call by Elad and Herbohn in 2011 for the International Accounting Standards Board to revisit the implementation of fair value accounting in the agricultural sector" (He, Wright & Evans, 2018: 555). In an industry already faced with many challenges and financial constraints, the illusion of compliance with the fair value requirements of International Financial Reporting Standards may be a cost that they should not have to bear.

A Motorcycle Manufacturer's Strategic Positioning – Past and Present

Me Zoé Julie Bosch¹, Mr Dirk Rossouw², Dr Maria Bounds^{3,*}

¹⁻³ Department of Business Management, University of Johannesburg, South Africa

Keywords

Case study; strategy; strategic position and environment

Abstract

This study investigated the case of a motorcycle manufacturer in South Africa, and the relevant strategic positioning for change, as the motorcycle industry faces a market decline. As the changes in environment become more apparent in our daily lives, the literature provides evidence of the need for strategy modifications, thus allowing the manufacturer to realise a continuously strong strategic positioning.

The aim of this study was to determine the past and current strategies that the motorcycle manufacturer has implemented. This further led to the identification of strategies to improve its strategic positioning and simultaneously, a competitive advantage is thus maintained for the brand among competitors.

Using a qualitative research approach, 29 interviewees were purposively sampled with an element of convenience sampling. Making use of the interpretive paradigm allowed for semi-structured interviews to be held, thus allowing for an in-depth understanding of interviewee perceptions, opinions and experiences to be derived. Once the data had been collected, a process of transcribing followed, which allowed for the coding of multiple emerging themes from the interviews.

It was established that further training is required for the staff to ensure the equal understanding and knowledge of decisions and strategic implementations, while keeping up to date with the increasing technologies. Additionally, it is deemed necessary for the manufacturer to modify and incorporate the necessary strategies to target and acquire new markets.

1. Introduction

Through the evolution of the manufacturing of motorcycles, it is evident that we are surrounded by continuous change in the business world. Therefore, organisations, such as motorcycle manufacturers, need to redefine, adapt and modify strategy and strategic positioning continuously in order to keep up with the inevitable changes and challenges that are presented on a daily basis in the business environment (Alexander, 2015).

The motorcycle industry within South Africa faces a new arduous challenge. At the end of March 2020, a national lockdown was implemented, restricting movement and travel, owing to the rapidly spreading respiratory virus COVID-19 (About COVID-19, 2020). During this lockdown, only essential services were permitted to operate, which left motorcycle manufacturers applying for permits to perform strictly essential services only, for example in the case of the breakdown of an essential service provider. This pandemic would change the course of business, and increasingly, the economy, on a national and global scale, leaving motorcycle manufacturers unable to operate at full capacity (Masuku, 2020).

³ E-mail address: mariab@uj.ac.za

During level 5, severe lockdown was implemented. Only essential services were allowed to operate and the rest of the population were forced to remain at home restricting trade, business and social gatherings. Additionally, a national curfew was implemented. At alert level 3, resumption of further economic activity was allowed, with the exception of those sectors and businesses where the risk of transmission remained high. At this level, the automotive sector was able to operate again, including the motorcycle industry. Alert level 2 called for the further easing of restrictions, with the interprovincial travel ban lifted and tourism operations resuming to cater for leisure tourists between provinces only, as international travel remained prohibited (Friedman, 2020).

During COVID-19, businesses were obligated to look into a crisis response as a method of survival, as most countries globally were faced with lockdown regulations, strict laws and, for some, the decline of business. Based on the direction of the market, organisations were required to follow health and safety protocols, perhaps even providing more for the community, as a way of setting a favourable image for customers. Financials needed to be remodelled as circumstances and the state of affairs remained unstable, including the incorporation of new models into the strategy as a safety net for the recurrence of a similar situation (Butler and Rivera, 2020). Decreased business activities led to the loss of employment, the reduction in national content of all vehicles within the automotive sector and the loss of any localisation benefits gained in the two years prior to the pandemic (West, 2020). Limited business led to the struggle of many motorcycle manufacturers to generate a profitable income. However, distributors remained optimistic about the situation, and about the recovery following the lockdown in South Africa and throughout the rest of the world (Masuku, 2020).

2. Problem Investigated

From literature, the problem that applies to the motorcycle manufacturer is the apparent decrease in motorcycle sales in South Africa. This requires the manufacturer to make certain changes to position themselves better in the market. The marketing gap allows for an understanding to be developed of how the brand needs to modify, adjust and implement strategies

The main principle of the study revolves around the declining market - in terms of sales - of the motorcycle industry within Gauteng. The focus of the study was on a particular motorcycle manufacturer and their dealerships across the Gauteng province. It is evident that a change is required in its strategic positioning to ensure that a competitive advantage is gained in the changing environment and declining market of the motorcycle industry.

3. Research Objective

To determine the motorcycle manufacturer's understanding of strategic positioning, its current strategic positioning and strategies to ensure competitiveness.

4. Literature Review

The literature review mainly alludes to change within the motorcycle industry, strategy and strategic positioning in general, but also to that of the motorcycle manufacturer under study.

4.1 Change in the motorcycle industry

Through its strategic positioning, the motorcycle manufacturer can compare itself with competitors in terms of strengths and weaknesses, as well as comparing essential values and providing development suggestions for the future. Owing to the ever-changing environment and fast-paced development of the industrial revolutions, the motorcycle manufacturer is likely to change its long-term vision with regard to the target market, as well as products and processes to maintain and gain increased competitive advantage within the motorcycle industry (Chereau and Meschi, 2017). The present industrial revolution has an impact on economic growth and technological advancements. Through this, organisations gain a newfound understanding of the changes in the market (Deloitte and McKinsey & Company, 2019). The dynamism of the environment, as well as the change and growth that take place, requires the motorcycle manufacturer in question to reassess its organisational goals. This leads to the modification of the manufacturer's strategy, and therefore

strategic positioning, within the industry in order to keep up with the demand of the target market (Martin, 2019).

The motorcycle industry within South Africa has changed significantly over the years, and the industry growth or even decline is connected to the South African economic growth statistics. For example, during the worldwide financial crisis in 2009 and 2010, motorcycle imports increased by 26.3%, thereafter decreasing again, to the point where South Africa faced the lowest number of sales in 2015 (Mtanga and McCamel, 2019). Figures showed that in 2019 motorcycle sales in South Africa increased by 4.7% from the year prior to a total number of 20 963. From these numbers, the increased sale of Chinese-produced motorcycles is recognised. However, with the nation being put under lockdown on 27 March 2020 owing to the COVID-19 pandemic, and most dealerships operating only to provide essential services until June 2020, a shift across the motorcycle industry is expected (Masuku, 2020).

4.2 Strategy

Strategy has also been interpreted to include an organisation's mission statement, vision and lastly, goals. Recognised as the outcome of various decisions that are made by executives, it is deemed essential to maintain and gain competitive advantage, as well as to achieve and increase the organisation's long-term value (Favaro, 2012). Johnson and Scholes (quoted by Tutor2u, 2018) define strategy as the "direction and scope" that is achieved by an organisation in a long-term period. Further developments are pursued in the acquisition of an increasingly advanced competitive advantage, using resources to meet customer demands, while positioned in a challenging environment. It is vital for an organisation to adopt a strategy that is distinct from others. In the game of attracting customers and creating value for them, it is necessary for an organisation to set itself apart from its competitors, creating an advantage that is unique and not easily mimicked. It has been said that a strategy is an uninterrupted work-in-progress, and will never realise as a final product, as it evolves further and more intricately over time (Gamble, Peteraf and Thompson, 2017). Owing to the occurrence of continuous changes, it is evident that the most effective strategies are rarely ever completely planned from the beginning. They arise from the numerous decisions that are taken at the different levels and departments within an organisation. These emerging strategies are based on the cultures and reactions that have been adopted by individuals, forming a pattern of actions that are learnt. Therefore, through learning from experiences, organisations are able to strive and grow (Bates, 2000).

4.3 Strategic positioning

When an organisation defines the business strategy, it is critical for it to determine the strategic positioning, meaning how customers are served in the market and in terms of the competitive advantage. To build a long-lasting customer relationship, three elements are important, namely attracting customers, customer satisfaction and customer retention, which are described to be at the core of customer bonding (Dean and Company, 2018). Porter (1980) states that organisations need to position themselves in various scopes and to various extents within the marketplace. Accurate strategic positioning enables the organisation to gain a competitive advantage and this forces competitive pressures to remain at a distance (Alden, Stayman and Hoyer, 1994).

According to Wickham (2001), strategic positioning is defined as the way in which an organisation differentiates itself from competitors through the value chain, as well as the way in which value is delivered to the target market and various consumer segments. Baines, Kay, Adesola and Higson (2005) describe strategic positioning as a concept to guide the organisation when achieving goals and objectives set according to the value chain.

4.4 Competitive landscapes changing strategic positioning

Challenges in the market for increased innovative and technological requirements are observed. Successfully addressing these requires organisations to acquire the skill of reacting in a swift, yet flexible manner to the various emerging problems both internally and externally. Suggestions for a

viable solution include the ability to achieve increased stability in the products, manufacturing processes and quality (Schröder, Schmitt and Schmitt, 2015).

Owing to increased technology in this modern era, the rate at which products are becoming outdated has increased significantly. Furthermore, environmental aspects, such as labour force and markets, the legal sector, the economy, distribution and supply channels, are influencing the competition at an increased rate. By incorporating the various influences, organisations have drastically changed the way they are managed, not only to keep up to date with the competition, but equally to ensure survival (Garrett and Welcher, 2018).

Competition in various industries has experienced a significant global increase over the years, resulting in the reduction of product and service prices, as well as the decrease in life cycles (Pistoni and Songini, 2017). To secure and increase competitive advantage, an organisation must ensure the execution of continuous innovation, which is to create, modify or invent a new good or service. This requires flexibility in strategy to adapt to the changing needs of customers and new competitors entering the market (Bateman, Snell and Konopaske, 2019).

Through an increased level of difficulty in competing in the markets, an organisation's ultimate survival is dependent on the capability of ensuring that sufficient profits are gained through accurate forecasting of future economic circumstances, along with the impact created by competitive and technological advancements (Pistoni and Songini, 2017). To make a product or the visit to a store, or even the use of a specific manufacturer more enjoyable and appealing to a customer, it is crucial for an organisation to provide the service at a level that is expected by customers. This allows an organisation to create and build on long-term relationships, thereby enabling it to either gain more or sustain competitive advantage. Even though it is vital to keep quality in mind, organisations increase their competitive advantage when delivering products at a higher speed than rivals. Today, speed has become, as organisations call it, a "strategic imperative" (Bateman *et al.*, 2019). A further driver of success is sustainability. Sustainability can take a variety of different meanings. However, for the purpose of this study, and in this context specifically, sustainability can lead to competitive advantage (Bateman *et al.*, 2019).

The 21st century has seen major changes in the manufacturing industry, as it has been transformed swiftly through globalisation as well as the increased use of advanced technology (Low, 2019). The global motorcycle industry will encounter various challenges, one of which will be to confront stagnating markets within the well-developed markets, which, in turn, will lead to a growth in demand in the emerging markets. Furthermore, legislation regarding CO₂ emissions is increasing, resulting in significant growth in the use of electric engine powered vehicles, forcing the required changes in strategy and strategic positioning (Mitterreiter, 2018).

Apart from the factors mentioned above, a new challenge has entered the market, which will change the course of business. Since the implementation of a national lockdown in South Africa on 27 March 2020, owing to the COVID-19 pandemic, a survey suggested that almost half of the businesses would not be able to operate post lockdown, as a result of insufficient funds (Ngalonkulu, 2020).

4.5 The past and present of the global motorcycle industry

Industrial revolutions have taken place over the years, causing more dramatic changes globally each time. The First Industrial Revolution dates back to the 18th century and further evolutions are taking place even today. According to Schwab (2016) the industrial revolution involves anything that has anything to do with artificial intelligence and devices, which work off a network. It also includes the use of information technology, the automation of production schedules through new electronics, the modification of human genes and the digitalisation of manufacturing processes. Lehmacher noted in (2017) the World Economic Forum's head of supply chain and transport industry, the transformation from fuel-driven vehicles to electric vehicles will greatly influence the world. Furthermore, a reduction in oil usage and transport for logistical matters will be apparent, thereby becoming eco-friendlier.

From the early years of the 20th century, the motorcycle industry began to show increasing rates of growth owing to processes of manufacturing and production being simplified. However, the industry was severely impacted by World War I, the Great Depression and World War II. Moreover, the Great Depression resulted in a number of large motorcycle manufacturers disappearing. Subsequently, the main motorcycle manufacturers found during this time were made up of small family businesses, which, in addition, eventually faded in the wake of the increased frequency and influence of the environmental shocks caused throughout the industry (Pel, 2019).

Following World War II, the production of motorcycles included improved engineering sold at a lower cost, as well as improved roads, leading to the emerging success of the global motorcycle industry. As motorcycles became the primary mode of transport in Asia, and with the portrayed image of motorcycle clubs or gangs, the global interest in motorcycles sparked. Today motorcycles are found to be extremely popular, as they provide an affordable and efficient means of transport. Over 200 million riders worldwide use motorcycles daily (History of Motorcycle, 2020).

Over the past few decades, the motorcycle industry globally has experienced various phases, including the appearance of several decline phases. Between 1950 and 1980, the motorcycle industry faced a decline owing to varying product strategies, rather than environmental effects such as the World Wars (Klepper, 1997). During this time period, in 1960, the Asian motorcycle manufacturers entered the market. Initially, their first production line was based on the imitation of existing products, but at a low quality during the recovery of the economy. Once the economy had recovered, the Asian industry manufactured motorcycles that were comparable in quality to the European industry yet were sold at a lower cost. The cost-based competition was strong and could have led to the European motorcycle industry vanishing entirely. Eventually, the entirety of the global market became more open to the Asian motorcycles, which resulted in the Asian motorcycle manufacturers claiming up to half of the market share globally in 1980 (Pel, 2019).

Research by Pel (2019) concludes that the level of production plays a crucial role in the survival of motorcycle manufacturers. Researchers and developers are constantly under pressure to identify and determine customer preferences, as well as newly available emerging market segments (Mtanga and McCamel, 2019).

4.6 Strategic positioning of the motorcycle industry

Cokayne (2016b) states that the motorcycle industry was forced to take an aggressive approach in terms of strategy and had to grow the segment of smaller motorcycles below 500cc to achieve forecasted increased sales of 50% by 2020. Droppa (2018) confirms that both affordability and safety play a role in preventing people from purchasing motorcycles. The South African rand has also depreciated, causing motorcycle prices to increase (Droppa, 2018). Cokayne, 2016a further suggests that this may be a contributing factor to motorcycle sales declining further since 2014. The depreciating rand is of particular concern as motorcycles are imported rather than manufactured locally.

Owing to the declining nature of the motorcycle industry within South Africa, it is obvious that many dealerships have closed down, such as East Coast Motorcycles in 2014 and DNA thereafter. Companies need to compete in declining environments to settle down and target specific market levels that are consistent with existing market opportunities. Not only does the motorcycle industry find itself in a fast-changing environment, but the motorcycle lifestyle is changing too. The motorcycle industry also targets millennials, and therefore places much-needed attention on their needs and demands. As a result of the increase of digitalisation, motorcycle manufacturers are more focused on e-commerce. This is to provide as much information as possible, as well as reviews, while remaining available to the customer that comes to the dealer personally (Lawrence, 2019).

Based on the above forecasts and statements made by Cokayne (2016b), motorcycles were found to dominate the markets in 2019. Based on the type of vehicle, the motorcycle category had a 75% market share in that year, and it was forecast to maintain this. However, contrary to the statement

made by Cokayne (2016a), it was found that motorcycles above 500cc were favoured in the market in 2019, with the segment ranging between 251cc and 500cc next in line. It was then forecast that the motorcycle industry would maintain these figures for the next five years to come (Business Wire, 2020). However, because of the COVID-19 pandemic these forecasts are expected to change.

5. Research Methodology

An interpretivist research paradigm was selected, making it possible to understand the world according to the insights and experiences of the interviewees (Thanh and Thanh, 2015), followed by a qualitative approach that can be thought of as the phrasing of an argument to convince the community of the credibility of the conclusions reached (Cardano, 2020), infused by inductive reasoning.

Inductive reasoning is acknowledged as a good base to start with to ensure a systematic approach that is progressive throughout the research (Tjora, 2018), supporting qualitative research to frequently provide content-rich reports, allowing a full interpretation and understanding of the context. With an interpretive, naturalist paradigm, an interactive process is followed, thus being influenced by the researcher's personal history, background, gender and possibly even ethnicity, as well as by the interviewees. Therefore, the interpretive researcher generates a structure from the sequence of responses and findings, collaborating these with the topic in question (Denzin and Lincoln, 2008).

A research approach is defined as an overall direction in which the research will be conducted (Bryman and Bell, 2014). For the purpose of this research, a qualitative research method were used. Through them, research subjects can be studied in their natural environment, endorsing an interpretation to be established on the meaning and purpose of the subject's appearance in that specific setting.

Using exploratory research provides for the maximisation of generalisations, resulting in a description as well as understanding of various social settings or even psychological extents. It can be defined as a scientific process from one perspective, or even as a peculiar approach to the research methodology to collect and analyse as much data as possible (Hunter, McCallum and Howes, 2018). For this study specifically, this was deemed beneficial as it motivates the research to be conducted in an interactive and unrestricted manner. This creates an advantage, as more flexibility is created, and underlying opinions, reasons and motivations gathered by interviewee responses and secondary research can be investigated further.

There are various research strategies, all of which consist of different frameworks and evaluation methods, chosen for the data collection process and its analysis. The design chosen enables the establishing of solutions to the research question, with the aim of achieving the research objectives (Bryman and Bell (2014) have listed five possible research designs. Since a case study strategy enables the collection of rich data that is detailed in content within the social context, thus allowing for a better understanding of the environment in question (Willis, 2007), this strategy was selected. A case study strategy also allows for an exhaustive and in-depth study of the motorcycle manufacturer and employees' perceptions around the manufacturer's strategic positioning to gain maximum competitive advantage.

The population was the motorcycle manufacturer in South Africa with its numerous dealerships across the country. However, for the sample, the head office and a few dealerships spread across Gauteng were selected, as most dealerships were situated in this province. Both methods of convenience sampling and purposive sampling were used for the initial contact with the individual dealerships and head office. Thereafter, further interviewees were suggested based on the requirements established and the purpose of the study, to allow the required data to be gathered as efficiently as possible.

The data collection process involved semi-structured interviews conducted with various interviewees within their individual dealerships and head office. An interview guide was used to assist in pre-determining topics or questions, ensuring consistency between interviews. The data were analysed by

means of content analysis. This followed a specific process, assisted through the use of Atlas.ti, while following the steps set out by Du Plooy-Cilliers *et al.*, (2014).

Measure of trustworthiness, authors such Bryman and Bell (2014) propose that qualitative studies should be evaluated differently from quantitative studies. This is due to the argument that multiple accounts can be present in a social phenomenon. Thus, the measure of trustworthiness is implied as a valid criterion for qualitative research.

6. Results and Findings

Section 1: Biographical data

This section contains some personal information on the research interviewees, enabling insight to be derived in relation to the responses received. These are based on how long the interviewees had been involved with the brand, the period in their specific positions, as well as their role and the training that they had undergone. These responses assist in understanding the extent of the perceptions and knowledge portrayed, and the possible influences of these on the answers provided in the main section of the interview. Although these questions were not necessarily central to the research, the data facilitates the contextualisation of the findings, benefiting the researcher in the formulation of suitable and proper recommendations, as well as conclusions.

The interviews were carried out at the head office of the brand and a further five dealerships situated in the main regions of Gauteng, South Africa. Six interviewees were interviewed at head office level, five each were interviewed at four of the dealerships and three were interviewed at one dealership.

6.1 Duration of involvement with the brand

The interviewees had been involved in the brand as short as one month up to 23 years. Of the 29 interviewees, two had been involved with the brand in the racing scene, prior to their current employment at the manufacturer. Thus, they had increased knowledge and experience with the brand, although not being corporately involved.

Figure 1: Interviewees' period of involvement with the brand

6.2 Length of time employed in current position

Some interviewees had occupied different positions during their employment with the brand while others had remained in the same positions throughout the duration of their involvement with the brand.

Figure 2: Duration of employment in current position

6.3 Interviewees' role in the brand

To achieve the intent of purposive sampling, interviewees were employed under the following positions. The role of the dealer principal was explained as one that takes on the general operations of the individual dealership, ensuring “that the business is economically viable, and that it is actually worth investing in, as well as giving a return back to the individuals that have invested into this business”. The managing director took on a similar role, only on a broader spectrum, namely overseeing “the entire scope of the business”.

Figure 3: Interviewee roles within the brand

6.4 Training completed by interviewees

The following figure indicates the manner in which the interviewees had acquired their training, but also to a certain extent their knowledge levels. A greater part of the interviewees (19) confirmed that they had undergone formal training with the head office of the brand. For further and more in-depth training, some employees were sent to headquarters, located in Europe. This training was specifically for those working at head office level and the head technicians to ensure product knowledge.

Figure 4: Training completed by interviewees

Section B:

This section consists of the main interview questions on the research objective of the study. Whereas the first section of questions allowed for a better understanding to be gained of the interviewees’ biographical information, the second section elicited the interviewees’ knowledge of the subject of the study and within the brand.

6.5 Understanding “strategic positioning”

In probing the interviewees on strategic positioning, the responses varied from a definition applied to the brand to no explanations provided at all.

Figure 5: Understanding "strategic positioning"

6.5.1 Discussion

Some interviewees believed that the term “strategic positioning” specifically dealt with the location of the manufacturer’s dealerships and their job positioning. However, it was observed that interviewees were unsure of the definition of the term. Although less acquainted with the definition, interviewees simultaneously contributed to the definition provided by Baines et al. (2005), who state that strategic positioning entails the role of adequate decision-making by management, ensuring the support of the value chain for further growth and developments to be achieved.

Utilising organisational resources and capabilities has provided the possibility for offers to be packaged specifically for clients, ensuring the achievement of a competitive advantage, as is further noted by Gamble et al. (2017). Gartenstein (2018) notes the importance of strategic planning as it provides for a method of guiding daily decisions. It was further established that strategic planning provided the manufacturer with the necessary insight into the market and business environment.

Based on data analysed from the interviews, it is evident that the key factors for success as identified by Bateman et al. (2019) have a significant impact on organisational success. Some of the factors were mentioned by the interviewees when defining their understanding of the term “strategic positioning”, and evidently these were some of the few keys that resulted in the organisation gaining and maintaining a competitive advantage within the market, allowing them to have the majority of the market share in the industry. In addition, it was established that the brand needed to develop according to the competitors in the market. This is in line with Low (2019) who stresses the importance of accurate management of information, to ensure survival over and above a strong strategic positioning.

Although some important factors that the manufacturer needed to keep in mind when making certain decisions were mentioned, the importance of appropriate strategic positioning was missed by some of the employees.

6.6 Current strategic positioning of the brand

Interviewees alluded to the current strategic positioning of the brand as indicated in the table below.

Table 1: Current strategic positioning of the brand

	Number of interviewees		Number of interviewees
Accessibility of dealerships	2	Advanced development and technologies	3
Popular adventure segment	1	Attract and retain the same audience	2
Customer satisfaction	4	Acknowledge the declining market	2
Leaders in the industry	8	It is a lifestyle	4
Opportunities to attract new markets	5	Dominating in the off-road segment	7
Based on passion	2	Increased product development	4
Focus on the racing scene	4	Increased use of social media	3
Strong brand	3	The brand is unique	5
Strategies linked to core values	5	Strong warranty system in place	2

6.6.1 Discussion

It was found that the current strategic positioning entails a variety of aspects. The strategic positioning was elaborated from the development of the motorcycles, to the accessibility of the dealerships, to the unique image portrayed by the brand. The manufacturer has a well-thought-out plan to achieve the goals and objectives set out. It has four core values, which form the basis of all further decisions made to grow the brand. Ranging from the marketing strategy through to the technological advancements apparent in the product development, those four core values are always expressed. Through the implementation of these decisions, the manufacturer is differentiated from competitors. This is in line with Baines et al. (2005), who define strategic positioning as a notion to guide an organisation to reach specific objectives, while decisions need to be made about the operations occurring both internal and external to the organisation, ensuring that the requirements set for the value chain are met.

Torok (2019) explains that strategies are modified and strengthened according to the competition in the market. This was further observed in the manufacturer, as interviewees stated, that the brand is continuously looking to improve their service and their products, while remaining the technological leader when it comes to the development of motorcycles.

The brand was recognised as the leader in the industry on multiple occasions by interviewees. Proving the obvious growth of the manufacturer globally, as confirmed by an anonymous source (Anon, 2019b) and additionally verified by a website (News24, 2019), the brand is still managing to acquire increased market share in South Africa. While the brand has always been known to focus more on the offroad and adventure segment, the variety of motorcycles has increased, allowing for a broadened market to be targeted and acquired Torok (2019).

The strength of the motorcycle manufacturer's current strategic positioning was further grounded by the majority of the interviewees stating that the target market is reacting positively. As per Dean and Company (2018), determining the strategic positioning entails how the customers should be served to pursue and ensure competitive advantage. Therefore, based on the interview conversations, it was found that the interaction between customers and the motorcycle manufacturer had increased, as it was described that a "bigger awareness" has been achieved. The manufacturer is seen to constantly meet customer expectations and their changing demands, which is achieved through continuous developments and ever-increasing quality. It was noted by interviewees that the manufacturer "listens to the customers".

It is through this that the brand is able to cater for the different markets and has allowed for the opportunities of pursuing further markets to be exploited. In support of this is McGrath's established principle (2013) that organisations are required to listen to the voice of customers to recognise the changing demands, to appropriately implement the necessary changes. Based on the interviews, it was established that the introduction of new models of motorcycles and the variety that the brand provides create an excitement among the market, which in turn has allowed for a stronger positioning of the manufacturer, especially in South Africa.

In keeping up with the trends and environmental changes, the manufacturer is able to increase customer retention. Apart from the brand implementing the correct strategies to ensure the proper service and care given to the customers, brand loyalty is achieved by (Cokayne, 2016a).

6.7 Reaction of the target market to the strategic positioning

When interviewees were asked to describe the reactions of the target market towards the motorcycle manufacturer to determine the actual current strategic positioning, the responses ranged from positive to negative and unknown. Only one of the 29 interviewees was unsure of the target market's reaction. However, with the increasing technological advancements, an interviewee said that "there is a whole new customer coming". This customer was described as being technologically more advanced and "far superior" than most. Being accepting of e-technology, these new customers no longer felt the need to, for example, "shift through a gearbox or [pull] a clutch".

Although youngsters were described as loving the brand, interviewees added that customers made purchases beyond the simple motorcycle - "they don't just buy the bikes, they buy the bikes, the clothes, the jackets, the boots, the whole thing" and that "they go the whole 9 yards".

6.7.1 Discussion

Generally, the target market was found to be reacting positively to the brand's strategic positioning. It was found that customer involvements with the brand go beyond the purchase of a motorcycle. Customers were described as wanting to be a part of a lifestyle.

The increased technology advancements seem to be enjoyed by some and not others. It was found that although the older generation still prefers the roar of the motorcycle's engine, the newer generation, the one that is exposed to technology far more than anyone before, enjoys the aspect of an electronic motorcycle. It must be noted that the newer generation did not grow up with motorcycles that had the bare minimum when it came to technology and are therefore unaware how to operate such machines. This is also observed by Doepker (2019) who states that advancements require increased creativity. It was established that a change in skills and knowledge is required for future innovations and fast-approaching changes, which is in line with Low (2019).

Some customers prefer the adventure scene, but others prefer to be more “hard core” on the streets. This is a strong position for the manufacturer as they can provide for the majority of motorcycle riders, both in South Africa and the rest of the world. This is in line with Klepper’s heritage theory used by Morrison and Boschma (2019).

Therefore, it was found that the motorcycle manufacturer is filling numerous gaps within the industry. This is owing to the vast range of offerings that are presented to the customer. Traditionally, the customer would have to go through various brands to fulfil the differing needs of riding styles.

6.8 Current strategies to address the strategic positioning for a competitive advantage

The aim of this question was to gain further insight into the current strategies implemented. Based on the responses received, interviewees felt more comfortable and at ease with a better understanding of the various terms. Interviewees listed the strategies as depicted in the figure 6 to address the strategic positioning and to ensure a competitive advantage for the motorcycle manufacturer.

Figure 6: Current strategies

6.8.1 Discussion

As stated by Gamble et al. (2017), the establishing of strategies requires management to examine and select a strategy among various possibilities in line with the opportunities sought. Ultimately, innovative strategies are said to result in the creation of superior value propositions for customers or prompt the manufacturer to penetrate different markets. The manufacturer is recognised as a diversified company through the variety of motorcycles provided, including the sale of accessories. In addition, the manufacturer covers other vehicle types, but for the purpose of this study, the motorcycle section was focused on. The current focus lies on various aspects of the organisation, starting from customer satisfaction to the incorporation of the core values.

The main and most prevalent strategy mentioned was ensuring customer satisfaction. To achieve this, interviewees made note of further strategies that have been implemented. On numerous occasions throughout this analysis and the discussions, the topic of training appeared several times. As stated before, the brand focuses on manufacturing “premium-quality performance vehicles”. As part of the strategy to ensure a strong strategic positioning and to maintain this focus, the manufacturer ensures that adequate and in-depth training is provided to the staff members on a regular basis (Anon, 2019a). It is important to ensure that the employees understand the products, the reasons behind the developments, as well as the function of individual new features and how these add value for the

customers. This knowledge ensures that customers are provided with the best possible service, as they are assisted efficiently and effectively.

Another current strategy is increasing the strength of the dealer network. By strengthening the network, dealerships will receive increased support from one another, making it easier, in turn, to increase market share and sales. The dealer network additionally provides the benefit of information becoming more accessible, which can be used to further ensure that the needs and expectations of the customers are met. This strategy corresponds to the opportunities sought through market development. As was argued by Wanjiru, Muathe and Kinyua-Njuguna (2019), market development affects the performance of manufacturing organisations.

The manufacturer is currently strategising to increasingly implement means of digitalisation. As technology is seen to make people's day-to-day lives effective and efficient, through increased digital means the manufacturer could strive for further increased sales, as people are increasingly making purchases online. It was stated that the manufacturer is currently focusing on e-commerce, thus making information accessible to customers, while ensuring that the dealerships are made available to customers personally as well. This forms part of the product development strategies, enabling the organisation to remain current and up to date with the necessary innovations and market examinations (Wanjiru *et al.*, 2019).

A final strategy was the introduction of new apps. Incorporated as part of the technology and product development strategy, according to an interviewee, the manufacturer continuously reinvests a percentage of the turnover into R&D. This ensures the development of systems and components required for the production of the continuously envisioned "premium quality vehicles" (Gamble *et al.*, 2017:349). As the technologies on the motorcycles increase, new apps and features are included. These new apps provide an array of services, which customers seem to enjoy as they track their rides and plan their routes for outrides and breakfast runs. Further apps are currently in the process of being released, one of which will in essence provide for the additional comfort of safety for riders.

Asking this question would have provided enough data on the current happenings of the manufacturer, but further details were investigated. Interviewees were asked to elaborate further on the changes that had occurred strategically in the past. Considering the timeline, the strategic changes over the past decade were considered, see 6.9.

6.9 Strategic changes within the motorcycle manufacturer in the past decade

According to the interviewees strategic changes the motorcycle manufacturer had undergone in the past decade were around the motorcycles itself and then also in terms of technology, the brand and market. Regarding the motor cycles, specific changes are indicated in figure 7.

Figure 7: Strategic changes to motorcycles

6.9.1 Discussion

Further strategic changes have been made in the motorcycle development for many years. The manufacturer strives to improve the product range annually. Whereas today those changes entail the inclusion of technological advancements, throughout the past decade, these changes involved the innovations to the engines from carburetor to fuel-injection.

Further apparent changes to the motorcycles compared to the past decade are the increased use and advancements of technology. Motorcycles come out with an increasing number of gadgets, software, technologies and added features, all of which are recognised as added value to the customers as their demands change. Additionally, with the market heading into a more digitalised environment, it was found that customers today are more and more informed when walking into a dealership to make a purchase. The advancements in technology are driven by the manufacturer's main focus, by making the increased levels of innovation possible, while the motorcycle manufacturer expands into further markets (Anon, 2019b).

Another strategic change entails the improvements and technological advancements of digital tools to be used in the workshop. Technicians and mechanics used to get their hands dirty to find a fault, but with increasing time constraints, fault finding has now become a much simpler process. Today, technicians are able to fix the problems and carry out work much quicker and more efficiently with the diagnostic tools provided. This reduces the waiting period for work on motorcycles to be completed and provides additional customer satisfaction with the expected service.

Further apparent strategic changes over the past decade involve the brand. Over the years, the manufacturer has successfully grown the corporate strength and identity, adding to its strategic positioning in the industry. The brand is now more recognised in the industry. As the brand has strengthened, so have the products, thus creating the correlation between a quality product and the brand (News24, 2019).

7. Managerial Implications

Having knowledge of strategic positioning and the reason behind certain decisions will provide employees with the capability of achieving the goals set out by the organisation within their specific departments. Therefore, it is suggested that employees know what the current focus of the manufacturer is, why specific strategies are in place and how the different goals could drive the brand in South Africa to gain a stronger positioning, while ensuring further growth.

Increased up-to date technology training will ensure that staff have the necessary skills to operate specific tools or machines and accomplish different tasks. This training and preparation could additionally motivate employees and allow them to become more open to the changes that will arise.

Welcoming these changes is an advantage on its own, as managers are prompted to modify strategies on a regular basis and can ensure that beneficial involvement will still be provided by employees. Therefore, training employees and providing them with the necessary knowledge, will create a more flexible mindset. Along with the following suggestion, the importance of training is reflected in accurate decision-making and completing of tasks.

The motorcycle manufacturer is to make continuous adjustments to the organisation's strategy and goals by constantly investigating the markets and identifying the changing demands. When demands can be met, success and growth become constant in the motorcycle industry, despite the declining market in South Africa. It was realised that by spending more time with the customers, a relationship and trust are created. Through this relationship customers reveal expectations and what needs to change. Therefore, spending more time with customers ensure their voice is heard and to address their needs in a better way.

Also, the brand should focus more on e-commerce segment allowing customers the option to purchase online. Online financing of the motorcycle could also be arranged (Morton, 2020). Other strategies include the development of their dealer network, to continue leading in the successful segments, as well as working towards increased market share in the other motorcycle ranges. The use of Frenken's diversification theory could be considered which allows organisations to grow through increased knowledge spillover from other industries, or in this case, the different types of motorcycles (quoted by Kublina, 2015).

8. Conclusion

In summary, it is evident that the motorcycle industry is currently facing a decline in sales in South Africa. Through the changes instilled by technological advancements, information technology and the COVID-19 pandemic, the motorcycle manufacturer is faced daily with new challenges. This can also reflect as a new opportunity to develop the necessary skills and adjust strategy. Enhancing employees' knowledge levels would not only make them more aware of brand, but also create positioning opportunities to strengthen the brand and consequently ensure the motorcycle manufacturer's competitiveness.

Human Resource Management and Performance, and the Moderators and Mediators Influencing This Relationship

Ayanaw Yeneneh Wongelu¹

¹ Graduate School of Business Leadership, University of South Africa, Midrand, South Africa

Keywords

Human Resource Management, Performance, Moderators, Mediators, Relationships.

Abstract

The execution of human resource management practices (HRMP) serves many functions, but from a monetary perspective, the most important function should be to enhance employee performance, a proxy to organisational performance. The aim of this study is to identify the nature of the HRM-performance relationship, as to understand the mechanisms through which HRM contributes to performance. An extensive desktop review of articles regarding the HRM-performance relationship was conducted, identifying both moderator and mediator variables, as well as the effect of each. HRM practice is frequently used as a predictor of both employee and organizational performance. The results reveal that employee performance is significantly and positively associated with training & development, promotion & career management, performance appraisal & management, employee empowerment practice and job security practices, while organizational performance is moderately and positively associated with employee training & development, performance appraisal & management, employee participation and employee empowerment practices. The HRM-employee performance relationship is better mediated by job satisfaction, engagement transformational leadership and motivation as well as moderated by individual pay for performance, work environment and motivation. The HRM-organizational performance model is better mediated by job satisfaction, organizational commitment, organizational citizenship behaviour and motivation and moderated by organizational culture, creativity climate and transformational leadership. This information is valuable to those interested in enhancing performance, as it identifies which HRMP and attitudes to target in their interventions.

1. Introduction

Human resource management (HRM) is an important concept, as it relates to employee and organizational performance. Due to this reason, the connection between human resource management (HRM) and performance has been a fundamental part of the management studies during the past three decades (Wood, 2021). Human resources have typically been considered the most vital role in many kinds of organizations (Anwar & Abdullah, 2021), and the way in which an organization manages people influence both employee and organizational performance (Huselid, 2014; Becker, Huselid & Ulrich, 2001). Previous researchers such as Hameed and Waheed (2011) suggest that performance of an employee will lead to the organizational effectiveness. The structure of HRM-performance researches emerged from two domains: first HRM practice associates with employee performance (e.g., Boxall and Purcell, 2016; Wamuuru, 2018 and Taibu, 2016), and second it links with organizational performance (e.g. Boselie, 2019; Anwar, 2021; Jawaad, 2020 and Hassan, 2016).

HRM and performance are inherently linked (Armstrong, 2020). Several scholars; starting from the ground-breaking HRM works (e.g., Barney, 1991; Delaney & Huselid, 1996; Guest, 1987; Becker & Gerhart, 1996) to the recent ones (e.g., Gould-Williams, 2021; Armstrong, 2020; Wood, 2021;

¹ E-mail address: 64020819@mylife.unisa.ac.za

Glaister, 2018; Anwar, 2021), investigated the link between human resource management and performance and found that they were positively associated. For example, Beer (1984) established the Harvard model of HR management, showing the link between HRM practice and various employee and organizational performance. In addition, Guest (1987) also developed an input-output model of HRM depicting link between HRM practices with employee outcomes such as employee commitment and employee motivation.

HRM practices have a universal effect on employee and organizational performance (Wood, 2021). The structure of HRM–performance models has two domains: first HRM practice associates with employee performance (e.g., Boxall and Purcell, 2016; Wamuuru, 2018 and Taibu, 2016), and second it links with organizational performance (e.g. Boselie, 2019; Anwar, 2021; Jawaad, 2020 and Hassan, 2016). The employee performance refers to an outcome and accomplishment of employees at work (Nethmini and Ismail, 2019); and the result achieved at individual level in an organization (Rozi and Sunarsi, 2020), as well as the result of work achieved by employees as per the job requirements in a company (Bangun, 2012); employee productivity and output in an organization (Hameed and Waheed, 2011). Organizational performance refers to the attainment of overall organizational goals (Milkovich, 2004); and outcomes achieved at organizational level such as investment, financial and market performance, and productivity (van Esch, 2018; Becker & Gerhart, 1996); financial performance (profits, return on assets, return on investment, etc.); product market performance (sales, market share, etc.); and shareholder return (Richard, Devinney & Johnson, 2009), and service delivery performance (Shishiwa, 2021; Taibu, 2016).

2. Research Objective

This study was undertaken with the aim of comprehensively reviewing HRM literatures on HRM–performance relationship, to identify those HRM practices which fundamentally drive performance, and also moderator and mediator variables, as well as the effect of each thereof, on performance. Consolidating the research on this topic will allow scholars to better understand the link between HRM–performance, to identify those HRM practices which fundamentally drive performance, and also moderator and mediator variables used to bridge the relationships.

3. Literature Review

This section presents the literature review section, in which the concept of performance, mediation and moderation are explained.

The term ‘performance’ has been defined contextually as per the nature and structure of studies that researchers intended to inspect (Abu-Jarad, Yusof and Nikbin, 2010). For example, Rivai (2004) defined the term performance as the overall outcome or success of a person during certain periods of duty compared to the standard of the work. It is defined as the target or criteria that have been determined in advance and have been agreed a process of how the work takes place to achieve the work (Katili, 2021); as well as achievement or implementation of work (Suwanto Donni, 2011).

Mediation and moderation are two of the most widely used statistical tools in the social sciences (Hayes, 2017). Inserting appropriate mediating and moderating variables is a strategy of enhancing business research designs, as well as generating more realistic and accurate findings (relating to studies Namazi, 2016).

A mediation variable is also called ‘an intervening or process variable’ a variable used to explain and kind and effects of the relationship between independent and dependent variables in an attempt to determine the nature of the study more accurately and functionally (Baron & Kenny, 1986; Kenny, 2014; Muller, 2005), while a moderating variable is a moderator is a qualitative (e.g., sex, race, class) or quantitative (e.g., level of reward) variable that affects the direction and/or strength of the relation between an independent or predictor variable and a dependent or criterion variable, and introduced when there are unexpectedly weak or inconsistent relations between a predictor and an outcome across studies (Baron & Kenny, 1986). In this regard, moderators address “when” or “for whom” a predictor is more strongly related to an outcome, a mediator establishes “how” or “why” one variable

predicts or causes an outcome variable. More specifically, a mediator is defined as a variable that explains the relation between a predictor and an outcome (Baron & Kenny, 1986; Holmbeck, 1997; James & Brett, 1984).

4. Methodology

The research methodology is directly linked to the aim of this article, namely to provide a systematic and qualitative review of published academic literature on HRM-performance relationships, moderator and mediator variables, as well as the effect of each. Systematic literature reviews have become widely accepted during the past two decades (Kable, Pich & Maslin-Prothero, 2012). It is a rigorous and highly valued approach to reviewing and evaluating literature on specific topics as it enhances the quality as well as results of the review process (Schutte and Steyn, 2015), by deploying a transparent and reproducible procedure Tranfield, (2003) and by incorporating a comprehensive and unbiased search for identifying and evaluating an extensive amount of literature (Mulrow, 1994). The HRM-performance relationships and both moderator and mediator variables of the different researchers were thus systematically reviewed by the researchers, qualitatively. According to Creswell and Poth (2016), a qualitative approach is an interpretive practice.

The reporting on the articles focused on three elements: identifying the direct HRM- performance relationships, determining the moderator or mediator variables included in the (proposed or hypotheses) model and finally detecting those elements in the models which contributed significantly to performance and success.

The technique was by searching all articles published since 2016 which showed up when using the keywords 'human resource management and performance relationships including the moderators and mediators variables' available in Google Scholar. The data for this study was collected from 352 articles in line with the inclusion and exclusion criteria set in the study. As including criteria, in terms of date, 2016 was used. The search was also limited to article which were located using the word "Human Resource Management (HRM)" and "Performance" in the search line. When doing this search, some articles appeared in the output, which could clearly contribute to this study was also included. Other works were included because of kept appearing. This, some works were included (e.g., Huselid, 1995; Wood and De Menezes, 1998; Guest, 1987; Beer, Spector & Lawrence, 1984; Storey, 1989, Hendry, 1995; Stredwick, 2013; Flippo, 1984). By default, unpublished materials were not parts of this study. Also, papers written in another language other than English were not included in this study.

These objectives were met by following four major strategies: First, relevant materials on HRM-performance as well as with mediation and moderation model were collected. Second, materials were categorised as: HRM-employee performance; HRM-organizational performance, and with mediating and moderating relationships. Third, the list of correlation and regression results of materials on the relationships between HRM-employee and organizational performance as well as mediating and moderating variables were performed. Finally, the results on the correlation and regression coefficient values of materials were performed and interpreted thereof.

The correlation coefficients (r) values were labelled and categorize using the rule of thumb for interpreting the size of a correlation coefficient developed by previous authors (E.g., Taylor, 1990; Weber & Lamb 1970 and Mason, Lind & Marchal, 1983). In this case, the r values of 0.1 to 0.35 are generally interpreted as low or weak correlations, 0.36 to 0.67 modest or moderate correlations, and 0.68 to 1.0 strong or high correlations and the r coefficients of 0.90 and above are very high correlations.

The effect size of the calculated R^2 was interpreted using the set of descriptors proposed by Cohen (1988). An effect size measure for simple or multiple regressions is the regression coefficient, R^2 (Kotrlík, Williams and Jabor, 2011). In this case, the R^2 values of .02 to .12 are generally interpreted as small effect size, 0.13 to 0.25 medium effect sizes, and 0.26 to 1.0 large effect sizes.

5. Results and Findings

In total 352 articles were identified to address the specified topic, empirically investigating human resource management and performance, and the moderators and mediators influencing this relationship. This section contains the result of major findings related with human resource management and performance, and the moderators and mediators variables.

Table 1 shows the summary of studies conducted on the HRM – performance relationships.

Table 1: Summary of HRM and performance studies

R/ship	Mediating/moderating variables list	HRM and employee performance		HRM and organizational performance		Total
		Frequency	Authors	Frequency	Authors	
Direct	—	22%	E.g., Boxall, 2019; Otoo, 2019; Mira, 2019 and Taib, 2018.	25%	E.g. Al-Tit, 2016; Gao, 2020; Qureshi, 2020 and Qadir, Saeed & Khan, 2017.	47%
			None	1%	E.g., Taamneh, Alsaad and Elrehail, 2018.	1%
Mediating	Organizational citizenship behaviour		None	1%	E.g., Taamneh, Alsaad and Elrehail, 2018.	1%
	Knowledge management		None	3%	E.g., Al-Tit, 2016; Rahman, Ab Hamid, and Mustaffa, 2018.	3%
	Job satisfaction	9%	E.g., Uddin, 2017; Boxall & Hewagama, 2019; Mira & Yap, 2019; Alsafadi, 2021 and Heffernan & Harney, 2016.	1%	E.g., Rahman, Ab Hamid, and Mustaffa, 2018	10%
	Engagement	3%	E.g., Taib, Saludin and Hanafi, 2018; Almaaitah, Alsafadi, Altahat, and Yousfi, 2020.	3%	E.g., Taib, Saludin and Hanafi, 2018; Almaaitah, Alsafadi, Altahat, and Yousfi, 2020.	6%
	Well-being	3%	E.g., Khoreva and Wechtler, 2018.			2%
	Organizational commitment	1%	E.g., Torlak, Kuzey, and Ragom, 2018.	6%	E.g., Torlak, Kuzey, and Ragom, 2018; Almaaitah, Alsafadi, Altahat, and Yousfi, 2020.	6%
	Employee motivation	1%	E.g., Qadir, Saeed & Khan, 2017.	4%	E.g., Qadir, Saeed & Khan, 2017 Dar & Bashir, 2014; Waseem and Majid, 2017; Taamneh, 2018	6%
	Employee competency		None	3%	E.g., Otoo, 2019; Van Esch, Wei and Chiang, 2018	3%
	Innovation		None	3%	E.g., Riana & Suparna, 2020.	3%
	Moderating	Transformational leadership		None	1%	E.g., Almaaitah & Alsafadi, 2020
Creative climate			None	2%	E.g., Van Esch, Wei and Chiang, 2018.	1%
Management philosophy			None	1%	E.g., Ismail & Awawdeh, 2020.	1%
Individual pay for performance		2%	E.g., Yang, Huang, Tang, Yang, 2021.	1%	E.g., Yang, Huang, Tang, Yang, 2021.	3%

Organizational culture		None	2%	E.g., Al-Tit, 2016.	1%
Organizational /management support	3%	E.g., Waseem and Majid, 2017 and Al-Tit, 2016.	3%	E.g., Waseem and Majid, 2017 and Al-Tit, 2016.	3%
Working environment	2%	E.g., Badriantand Ekhsan, 2020.		None	1%
Individual performance			1%	E.g., Masood, 2010.	1%

Source: Own compilation, 2022.

The result presented in Table 1 shows, substantial number (25%) of studies (e.g., Al-Tit, 2016; Gao, 2020; Qureshi, 2020 and Qadir, Saeed & Khan, 2017) were conducted on the HRM - organizational performance model, while the remaining (22%) studies (e.g., Boxall, 2019; Otoo, 2019; Mira, 2019 and Taib, 2018) were conducted on HRM practice and employee performance links.

Mediating and moderating variables are common in HRM-performance studies. The most frequently used mediating variables between HRM and organizational performance are organizational commitment (6%) (E.g., Torlak, Kuzey, and Ragom, 2018; Almaaitah, Alsafadi, Altahat, and Yousfi, 2020); employee motivation (4%) (Qadir, Saeed & Khan, 2017 Dar & Bashir, 2014; Waseem and Majid, 2017; Taamneh, 2018); knowledge management (3%) and engagement (3%); while job satisfaction (9%) (e.g., Uddin, 2017; Boxall & Hewagama, 2019; Mira & Yap, 2019; Alsafadi, 2021 and Heffernan & Harney, 2016); engagement (3%) (e.g., Taib, Saludin and Hanafi, 2018; Almaaitah, Alsafadi, Altahat, and Yousfi, 2020) and well-being (3%) (Khoreva and Wechtler, 2018) are top mediating variables on the HRM- employee performance model.

Moderating variables are also vital in the HRM- performance studies. Organizational and management support (3%) (e.g., Waseem and Majid, 2017 and Al-Tit, 2016); organizational culture (2%); and Yang, Huang, Tang, Yang, 2021 and creative climate (2%) (e.g., Van Esch, Wei and Chiang, 2018) are most frequently used moderating variables between HRM and organizational performance models, while organizational and management support (3%) (e.g., Waseem and Majid, 2017 and Al-Tit, 2016); individual pay for performance (2%) (e.g., Yang, Huang, Tang, Yang, 2021); and working environment (2%) (e.g., Badriantand Ekhsan, 2020) are most frequently used moderating variables on HRM - employee performance studies.

Correlations and Regression results between HRM and Performance

In this study, the results on the correlation and regression coefficient values of previous studies were performed and interpreted. According to Asuero, Sayago and Gonzalez (2006), correlation and regression are different, but not mutually exclusive, techniques. Roughly, regression is used for prediction whereas correlation is used to determine the degree of association.

Correlations between HRM and Performance

The Pearson correlation results of previous studies were systematically reviewed to determine the relationship between separate HRM practice and employee and organizational performance. Asuero, Sayago and Gonzalez (2006), stated that “correlation is used to determine the degree of association between variables. The analysis result presented in Table 2 shows the correlation results of previous authors.”

Table 2: Correlation between HRM and performance

#	Single score measure of HRM	Organizational performance			
		Correlation (r) values	Level of Corr.	Correlation (r) values	Level of Corr.
1	Compensation & incentive management	r=.153 (p=.00) (Boxall, Hewagama, Cheung, & Hutchison, 2019).	Low	r=.17 (p=.00) (Delaney & Huselid, 1996).	Low
		r=0.288 (p=.002) (Ahmad and Shahzad, 2011).		r=0.220, p=0.00 (Masood, 2010).	
		r=0.122, p=0.00 (Masood, 2010).		r=.27 (p=.00) (Singh, 2000).	
		r=.086 (p=.00) (Mira, Yap & Chan, 2019).		r=0.174 (p=.00) (Ismail, 2020).	
2	Training and development	r=0.477 (p=.00) (Otoo, 2019).	Moderate	r=.406 (p=.00) (Anwar & Abdullah, 2021).	Moderate
		r=.438 (p=.00) (Taib, Saludin and Hanafi, 2018).		r=.50 (p=.00) (Quresh, Akbar, Khan, Sheikh & Hijazi, 2010). r=0.36 (p=.00) (Otoo, 2019).	
3	Performance appraisal and management	r=0.368, p=0.00 (Masood, 2010).	Moderate	r=.36(p=.00) (Gao, 2020).	Moderate
		r=0.476 (p=.00) (Otoo, 2019).		r=.56 (p=.00) (Quresh, Akbar, Khan, Sheikh & Hijazi, 2010).	
4	Recruitment and Selection	r=.088 (p=.00) (Mira, Yap & Chan, 2019).	Low	r=.01 (p=.00) (Delaney & Huselid, 1996).	Low
		r=0.123 (p=.00) (Otoo, 2019).		r=.24 (p=.00) (Singh, 2000).

Correlations between HRM and Employee Performance

The result shows that employee performance has moderately and positively correlated with employee training and development $r=0.477$, $p=.00$ (Otoo, 2019); $r=.438$, $p=.00$ (Taib, Saludin and Hanafi, 2018); performance appraisal and management $r=0.368$, $p=0.00$ (Masood, 2010) and $r=0.476$, $p=.00$ (Otoo, 2019); promotion and career management $r=0.359$, $p=0.00$ (Masood, 2010); $r=0.46$, $p=.00$ (Otoo, 2019); $r=.553$, $p=.00$ (Taib, Saludin and Hanafi, 2018) and $r=.546$, $p=.00$ (Quresh, Akbar, Khan, Sheikh & Hijazi, 2010); job security $r=.576$, $p=.00$ (Taib, Saludin and Hanafi, 2018) and employee empowerment practices $r=.489$ ($p < 0.01$) (Qadir, Saeed & Khan, 2017); $r=0.384$ ($p=.002$) (Manzoor, 2019). Other studies (e.g., Boxall, Hewagama, Cheung, & Hutchison, 2019; Mira, Yap & Chan, 2019; Khoreva and Wechtler, 2018), reported that employee performance has low level ($r < 0.35$, $p < 0.01$) and positive links with compensation management, recruitment and selection, employee participation, job analysis and design, organizational and management support, employee relation and well-being and employee safety & health practices. Moreover, the relationship between HRM and employee performance is significant at 1% level.

Correlations between HRM and Organizational Performance

The result shows that organizational performance has moderately and positively associated with employee training and development $r=.406$ ($p=.00$) (Anwar & Abdullah, 2021 and $r=.50$ ($p=.00$) (Quresh, Akbar, Khan, Sheikh & Hijazi, 2010); performance appraisal and management $r=.36$ ($p=.00$) (Gao, 2020), $r=.56$ ($p=.00$) (Quresh, Akbar, Khan, Sheikh & Hijazi, 2010); employee participation $r=.405$ ($p=.00$) (Gao, 2020), $r=.50$ ($p=.00$) (Quresh, Akbar, Khan, Sheikh & Hijazi, 2010); job security $r=.381$ ($p=.00$) (Anwar & Abdullah, 2021) and employee empowerment practices $r=.358$ ($p < 0.01$) (Qadir, Saeed & Khan, 2017). Other studies (e.g., Masood, 2010, Ismail, 2020, Gao, 2020 and Otoo, 2019), proved that organizational performance has low level ($r < 0.35$, $p < 0.01$) and positive links with compensation management, recruitment and selection, job analysis and design, organizational and management support, employee relation and well-being and employee safety & health practices. Moreover, the result shows that the relationship between HRM and organizational performance is significant at 1% level.

Regression between HRM and Performance Models

Multiple regression models has been used by different researchers to determine the relative contribution of each of HRM practices to the employee performance (e.g., Mira, Yap & Chan, 2019; Otoo, 2019; Manzoor, 2019 and Qadir, Saeed & Khan, 2017), and organizational performance (e.g., Boxall, 2019; Al-Tit, 2016; Gao, 2020 and Ogunyomi, 2016). The following section describes the regression results on the HRM- performance relationships.

Regression between HRM and Employee Performance

The regression result between HRM practice as an independent variable and employee performance as dependent variable indicates that the top HRM practices that influence employee performance are compensation and incentive management practices (e.g., $R^2=0.340$, (Masood, 2010 and $R^2=0.405$, Mira, Yap & Chan, 2019); training and development practices (e.g., $R^2=0.357$, Masood, 2010); employee participation (e.g., $R^2=0.334$ (Masood, 2010); empowerment (e.g., $R^2=.354$, Qadir, Saeed & Khan, 2017) and social support (e.g., $R^2=.287$, Mira, Yap & Chan, 2019).

Table 2: Regression between HRM and performance Models

#	HRM Practice	Employee performance	Adjusted R ²	Effect size	Organizational performance	Adjusted R ²	Effect size
1	Compensation & incentive management	$\beta=0.338$ (p=0.00) (Mira, Yap & Chan, 2019); $\beta =0.271$ (p=.003) and Ahmad and Shahzad, 2011). Source: Own compilation

Those HRM practices with moderate level of influence on employee performance are performance appraisal and management practice (e.g., $R^2=0.337$, Masood, 2010); recruitment and selection (e.g., $R^2=0.267$, Masood, 2010); job analysis and design (e.g., $R^2=.21$, Mira, Yap & Chan, 2019); employee relations (e.g., $R^2=.22$, Mira, Yap & Chan, 2019) and employee well-being (e.g., $R^2=.32$, Khoreva and Wechtler, 2018). But, employee promotion & career management practice has small level of influence on employee performance (e.g., $B=0.115$, $p=.039$, Bowra, Sharif, Saeed, and Niazi, 2012; $\beta=0.053$, $p=.225$, Otoo, 2019 and $\beta=0.094$, $p=0.00$, Masood, 2010).

Regression between HRM and Organizational Performance

The regression result between HRM practice as an independent variable and organizational performance as dependent variable indicates that the top HRM practices that influence organizational performance are training and development practices (e.g., $R^2=.41$, Qureshi, 2020; $R^2=.488$, Gao, 2020 and $R^2=.396$, Al-Tit, 2016); performance appraisal and management practice (e.g., $R^2=.42$, Qureshi, 2020; $R^2=.392$, Al-Tit, 2016 and $R^2=.488$, Gao, 2020); promotion and career management practice (e.g., $R^2=.369$, Al-Tit, 2016, $R^2=0.113$, Masood, 2010; $R^2=.05$, Singh, 2000); employee participation (e.g., $R^2=0.121$, Masood, 2010; $R^2=.04$, Singh, 2000); job security (e.g., $R^2=.376$, Al-Tit, 2016); empowerment (e.g., $R^2=.341$, Al-Tit, 2016; $R^2=.205 < 0.01$, Qadir, 2017); $R^2=.488$, Gao, 2020; $R^2=.03$, Singh, 2000); job analysis and design (e.g., $R^2=0.34$, Mira, Yap & Chan, 2019) and health & safety (e.g., $R^2=.328$, Al-Tit, 2016), while Compensation & incentive management practice has moderate level influence on organizational performance (e.g., $R^2=0.090$, Masood, 2010 and $R^2=.07$, Singh, 2000).

HRM – performance relationship with intermediate (mediating and moderating) variables

HRM – employee performance relationship with intermediate (mediating and moderating) variables

The result presented in table 3 shows that the top mediating variables between HRM and employee performance relationship are job satisfaction (e.g., $r=0.465$, $p=0.00$, Mira & Yap, 2019; $r=.42$ $p = .01$,

Khan, 2019); $r=0.490$, $p=0.00$, Ahmad 2014); $r=0.465$, $p=0.00$, Heffernan, 2016); engagement ($r=0.453$, $p=0.00$, Taib, 2018) and motivation (e.g., $r=.511$, $p=.00$, Qadir, Saeed & Khan, 2017). Moreover, best moderating variables between HRM – employee performance model are individual pay for performance (e.g., $r=0.33$, $p=0.00$, Yang, Huang, Tang, Yang, 2021); work environment (e.g., $r=0.235$, Badriant and Ekhsan, 2020); transformational leadership (e.g., $r=0.21$, $p=0.00$, Almaaitah, Alsafadi, Altahat, and Yousfi, 2020).

HRM – organizational performance relationship with mediating and moderating variables

The HRM- organizational performance relationship is better mediated by job satisfaction (e.g., $r=0.504$, $p=0.00$ (Rahman, Ab Hamid, and Mustaffa, 2018); organizational commitment (e.g. $r=0.437$, $p=0.00$, Torlak, 2018); organizational citizenship behaviour (e.g., $r=0.346$, $p=0.00$, Taamneh, Alsaad and Elrehail, 2018) and motivation (e.g., $r=.358$, $p= 0.00$, Qadir, Saeed & Khan, 2017; $r=.732$, $p=0.0$, Dar, 2014).

Moreover, best moderating variables between HRM – organizational performance model are organizational culture (e.g., $r=0.148$, $p=0.00$, Al-Tit, 2016); creativity climate (e.g., $r=0.165$, $p=0.00$, Van Esch, Wei and Chiang, 2018) and transformational leadership (e.g., $r=0.148$, $p=0.00$, Almaaitah, Alsafadi, Altahat, and Yousfi, 2020).

Table 3: Correlation results of other variables included in HRM-performance models

Variable	Employee performance			Organizational performance r/ships		
	Correlation (r) values	Level of corr.	Kind of r/ship	Correlation (r) values	Level of corr.	Kind of r/ship
Job satisfaction	$r=0.465$, $p=0.00$ (Mira & Yap, 2019); $r=.42$ $p = .01$ (Khan, 2019); $r=0.490$, $p=0.00$ (Ahmad 2014); $r=0.465$, $p=0.00$ (Heffernan, 2016).	Moderate	Mediator	$r=0.504$, $p=0.00$ (Rahman, Ab Hamid, and Mustaffa, 2018).	Mode rate	Mediator
Organizational commitment	$r=0.535$, $p=0.00$ (Torlak, Kuzey, and Ragom, 2018).	Moderate	Mediator	$r=0.437$, $p=0.00$ (Torlak, 2018).	Mode rate	Mediator
Knowledge management	None	None	None	$r=0.182$, $p=0.00$ (Rahman, 2018); $r=0.219$, $p=0.00$ (Al-Tit, 2016).	Low	Mediator

6. Discussion

This study was undertaken with the aim of comprehensively reviewing HRM literatures and HRM-performance relationship, identifying both moderator and mediator variables, as well as the effect of each thereof, in order to work towards some consensus opinion on what it entails, which is necessary to do research which contribute to an existing body of knowledge. The discussion that follows is thus a synthesis of the findings described above.

The results reveal that HRM practice is frequently used as a predictor of both employee and organizational performance. Regarding to the direct link between HRM practice and employee performance, employee training & development, promotion & career management, performance appraisal & management, employee empowerment practice and job security practices are most effective in directly predicting employee performance.

There is significant relationship between HRM practice and organisational performance. The five HRM practices namely: employee training & development, performance appraisal & management, employee participation and employee empowerment practices are significantly linked to organizational performance.

The HRM-performance model is better bridged by using mediating and/or moderating variables. Job satisfaction, engagement and motivation are most important mediators of the HRM-employee performance relationship. In addition, individual pay for performance, work environment and motivation are important moderating variables between HRM practice and employee performance relationship. The HRM-organizational performance model is better mediated by job satisfaction, organizational commitment, organizational citizenship behaviour and motivation and moderated by organizational culture, creativity climate and transformational leadership.

7. Conclusion

The present study aimed at investigating into the nature of the HRM-performance relationship, identifying both moderator and mediator variables, as well as the effect of each. For this purpose, an extensive desktop review of articles regarding the HRM-performance relationship was conducted, identifying both moderator and mediator variables, as well as the effect of each.

The two major HRM practices, namely: employee training & development and employee empowerment practice are common predictors of both employee and organizational performance. In addition, promotion & career management and job security practices are most effective in directly predicting employee performance, while employee training and participation practices are most potently linked to organizational performance.

Organizational culture, creativity climate and transformational leadership are commonly used moderators between HRM and organizational performance, with organizational culture, having the largest effect. Frequently used mediators were HRM and employee as well as organizational performance, with job satisfaction, having the largest effect. The findings identified the six major HRM practices, namely employee training & development, promotion & career management, performance appraisal & management, employee empowerment, job security, performance appraisal & management and employee participation practices are most potent in directly predicting

performance, as well as the fundamental mechanisms which influence the HRM-performance relationship.

8. Managerial Implications

This study provides valuable implication for managers. First, there is a significant relationship between HRM practice and employee as well as organisational outcomes. Second, HRM practice is frequently used as a predictor of both employee and organizational performance. Third, the HRM-performance model is better bridged by using mediating and/or moderating variables.

9. Acknowledgements

We would like to thank all staff members at the University of South Africa (UNISA) for their very helpful support and assistance at the early stage of this article. We would also like to thank the IBC for giving us the opportunity to participate and publish our article at the 2022 IBC Conference.

Keywords

Agricultural sector; farm worker equity share schemes; government intervention; land reform

Abstract

During the period 1999 to 2009, there has been various studies conducted in South Africa on farm worker equity share schemes, but none focused on the role of government in managing these schemes, hence the focus of this paper. The primary objective of this study was to assess the perceptions of beneficiaries on the role of government in ensuring the success of these schemes. A quantitative research design was employed using a survey by means of self-administered structured questionnaires that was completed during group sessions. Non-probability sampling was used by means of convenience and judgemental sampling. A total of 341 questionnaires were distributed to farmworkers on 20 farms within the designated population. The empirical results showed that farm worker equity share schemes are influenced by government interventions. Hence the need for government to relook at how it has been managing these farm worker equity share schemes in South Africa.

“The equity schemes were introduced by the state as an alternative land reform solution. The aim was to improve the poor socio-economic conditions of farmworkers by creating opportunities for them to acquire shares in a farm’s business or land value. But there has been very little oversight of these projects and government has not properly monitored whether the schemes are benefiting the people they were intended for the farmworkers”. (Daily Maverick, 2019)

1. Introduction

The land dispossession of indigenous people of South Africa by the colonisers resulted to disproportionate allocation of land, where only 13% was given to the African majority and the rest reserved for the minority white population (Lahiff & Li, 2012:3). The agricultural policies at the time focused on food security which gave rise to the larger and mechanised farms that were operated by a few individuals or organisations (Kirsten & van Zyl, 1999:326). Post 1994, the democratically elected government of South Africa introduced land reform programmes intended to transfer 30% of agricultural land in possession of white population to black South Africans within five years (Hall, 2013:157). Some of the initiatives include six programmes for restitution, redistribution and post-settlement support that were introduced in South Africa (Binswanger-Mkhize, 2014:257). That led to the formation of the farm worker equity share schemes in the 1990s (Knight, Lyne & Roth, 2003:1).

Farm worker equity-share schemes are arrangements whereby privately-owned farms are reorganised as companies with the original owner of the farm and the farm workers as shareholders (Knight & Lyne, 2002:2). Government supports such partnerships with hope that the beneficiaries (farm workers with share ownership) would be empowered by the original farm owner to achieve profitable and sustainable production (Tiwana, 2017:3).

Despite government's ambitious goals of transforming land ownership in the agricultural sector in general within a stipulated period, it has been faced by numerous challenges. By 2014, only less than 10% of the redistribution target had been achieved as opposed to the set target of 30% (Kloppers & Pienaar, 2014:677). One of the contributing factors to the failure to address these challenges faced by emerging farmers and equity share schemes is that such challenges are often incorrectly identified (Khapayi & Celliers, 2016:26). The challenges identified by Khapayi and Celliers (2016:37) were low education levels, lack of farming skills on crop and livestock production, poor management skills, high transportation cost, lack of market information, poor support services from the government, and participating in low remunerative marketing channels. Greenberg (2010:4) distinguishes the two major challenges on the land reform programme, as the speeding up of the transfer of land and support on the productive use of the transferred land.

Considering that the government's ambitious goals have not yet been fulfilled and some of the problems have been identified, it is sufficing to state that there is a need to review the role of government interventions in the performance of these farm worker equity share schemes. Thus, the role of government in managing farm worker equity share schemes in South Africa is the main focus of this paper.

2. Problem Investigated

Since the establishment of the equity share schemes in the 1990s, there have been two government moratoriums, the first in 1999 and second in 2009, supposedly due to poor performance of farm worker equity share schemes (Hall & Cousins, 2018:5, Hall & du Toit, 2014). The government's focus has been on the performance in terms of payment of dividends, where it has been reported that out of 88 equity share schemes at the time, only nine were able to pay out dividends (Cousins, 2016:8) in the range of R200 and R2000 per beneficiary (Hall & Cousins, 2018:5).

It appears that a noticeable government intervention has been limited to instituting moratoriums as opposed to active participation in the monitoring and providing support to the running of the equity share schemes, hence Khapayi and Celliers (2016:37) cited poor support services from the government as one of the challenges. Despite government vested interest in farm worker equity share schemes, limited research has been done regarding the role of government in managing effectively farm worker equity share schemes in South Africa. The role of government cannot be limited to introducing policies, programmes and offering grants, thereafter, assuming that schemes will function effectively without further government intervention or support.

Against this background this paper addresses the following key research questions:

- How do beneficiaries perceive the role of government in managing effectively farm worker equity share schemes in South Africa?
- Are government interventions failing beneficiaries of farm worker equity share schemes?

It is envisaged that this study will contribute immensely to the body of knowledge regarding farm worker equity share schemes in South Africa, particularly regarding the role of government in managing them.

3. Research Objectives

The primary objective of this study is to assess beneficiary perceptions regarding the role of government in managing effectively farm worker equity share schemes in South Africa. The secondary research objectives of this study are intended to make the primary research objective effective, through:

- Reviewing the literature pertaining to farm worker equity share schemes.
- Empirically assessing beneficiary perceptions regarding farm worker equity share schemes in South Africa.
- Providing guidelines and making recommendations to government to assist in improving the performance of these schemes.

4. Proposed Conceptual Model of the Paper and Hypothesis

A conceptual model of beneficiary perceptions regarding the role of government in managing effectively farm worker equity share schemes in South Africa, is shown in Figure 1. This model will be tested in this paper.

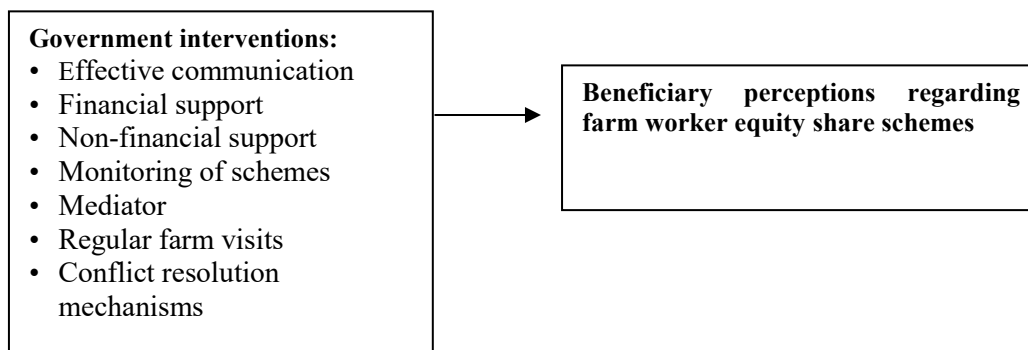

Figure 1: Proposed conceptual model of the paper

Source: Author's own construction

Based on this hypothetical model of beneficiary perceptions regarding the role of government in managing effectively farm worker equity share schemes, the following null-hypothesis is thus formulated:

H0₁: There is no relationship between government intervention and beneficiary perceptions regarding farm worker equity share schemes in South Africa.

5. Literature Review

5.1 History of rural development and land reform in South Africa

Land reform in South Africa began in the 1990s, where the initial focus was on rebalancing land ownership, but later it moved to productive use and agribusiness (Greenberg, 2013:1). Rural development and land reform are critical drivers for economic and social equity, increasing job opportunities, and building stronger social cohesion (Lahiff & Li, 2012:3). Although land reform has an impact on food security, it also affects the maintenance of food production levels, development of small businesses and residential settlement (Hall, 2013:156).

One of the biggest hurdles post the first democratically elected government was dealing with the issue of unequal distribution of land in the country (Kloppers & Pienaar, 2014:677). Despite this, Khapayi and Celliers (2016:25) note that for the past several years, government introduced numerous policies and programmes as well as increased the budget spent on the agricultural sector for the support of emerging farmers. However, agriculture initially was not a high priority for the post-apartheid government, as there were budget cuts (Greenberg, 2010:2).

South African small and emerging farmers are often producing less crops than the available land allows, due to prolonged droughts, longer dry spells, limited water and nutrient availability, degraded soils and inefficient farming practices (Myeni, Moeletsi, Thavhana, Randela & Mokoena, 2019:1).

5.2 Equity share schemes

The first equity share scheme was established in 1992 in Elgin in the Western Cape Province, thereafter, those that followed in all nine provinces in South Africa copied this model (Knight & Lyne, 2002:3). The farm owner, together with farm workers would enter into some agreement and become shareholders, where shareholders would obtain tradable voting and benefit (dividends and capital

gains) rights in proportion to their financial investment obtained from the assistance of government through grants (Knight, Lyne & Roth, 2003:1-2). The equity-share schemes are not limited to farm workers, even neighbouring rural communities could obtain grants and become shareholders (Gray, 2004:80). Government interest in agricultural development is to improve the livelihoods of the rural poor, which mostly was exacerbated by the previous unjust policies (Cloete, 2013:3495).

The grants offered since the 1990s permitted black South African citizens to access land specifically for agricultural purposes and the amounts varied over the years as the programmes revolved, amounting to R16 000, R20 000 and up to R100 000 per beneficiary (Tiwana, 2017:1-2). The larger amounts of grants have stringent requirements, for example, to qualify for a grant of R20 000, the applicant must contribute a minimum of R5 000 in cash, sort of labour towards a sustainable farming enterprise, and R100 000 can be accessed if the beneficiary is able to contribute R400,000 in savings and loan finance (Knight & Lyne, 2002:2).

5.3 Challenges of farm worker equity share schemes

Bless and Higson-Smith (2004:15-16) reviewed previous research studies and noticed that it presented contradictory results or questionable approaches. However, the essence of these studies pointed out that the achievements thus far regarding farm worker equity share schemes in South Africa are dissatisfying and sub-standard – this is evident in the reflections effected by the Department of Rural Development and Land Reform by instituting the moratoriums. The performance of these schemes is limited on the financial gains achieved by the beneficiaries of the equity share schemes (Klaas, 2011:34-35), whilst in reality there could be non-financial benefits as well.

Some argue that regardless of the number of underperforming equity share schemes, the ultimate goal should be to exceed the workers' expectations and minimise or eliminate any unfavourable situations pertaining to the performance of the equity share schemes (Makamure, 2014:25, 64). For government to reap maximum benefit from the equity share schemes it has supported over the years, there is scope for government to play a major role in ensuring the success of these equity share schemes.

5.4 Previous studies on land reform and farm worker equity share schemes

This section only covers a few of the studies conducted on land reform and farm worker equity share schemes in South Africa and the role of government. It provides an overview of four desktop studies and the resulting findings.

Approaches and progress with land reform in South Africa (Kirsten & van Zyl, 1999)

This study tracks the approaches followed for land reform in South Africa with a view to improving the situation created by the previous regime. The study outlines that there are five key lessons to be learnt from international experience regarding land reform: the speed of implementation of the programme; economic viability of the farm models; political acceptability and legitimacy of the programme; clear definition of the role that the public sector can and will play; and land reform is only one part of a comprehensive programme of economic reconstruction.

A crucial point made regarding the last point is that additional services are required to sustain higher productivity. Additional services could be infrastructure, markets, incentives and health services. The recommended approach to land redistribution is a market-assisted approach, as opposed to a public sector operated approach which tends to be bureaucratic and which might introduce conflicting results. This approach recommends government intervention in providing grants in order to facilitate the land reform programme and beneficiaries who buy from willing sellers. Land reform is based on restitution, redistribution and tenure reform. The long start-up time delayed delivery in the land reform process. The conclusions drawn from the implementation were:

- Equity sharing projects should be embarked upon as a (final) part of a process whereby farm workers were upgraded into management systems;
- Trust between owner and workers remain a vital ingredient for a successful partnership;
- High value farming allows a substantial and measurable return to participants within an acceptable time period;

- Continued support and commitment from the existing land owner/manager/farmer is necessary to allow the maintenance of farm income streams;
- Clear entrance and exit rules are required; and
- Business considerations should be the main value system driving deals.

The study concludes by suggesting that land reform has failed in South Africa due to government being the major player, hence, the redistribution targets have not been met (Kirsten & van Zyl, 1999).

Examination of the impact of share equity schemes on beneficiaries in the Western Cape and Mpumalanga (Fast, 1999)

Fast's (1999) study concentrated on the achievements of the expected results by farm workers regarding equity share schemes and the objectives of the land reform programme. The study explored four schemes: one chicken farm, one livestock farm and two fruits farms. The study identified gaps in terms of the establishment of these schemes, such as, lack of clarity to beneficiaries about land reform and housing options; beneficiaries not participating in decision-making pertaining to financial and legal arrangements; and challenges in the assessment of farm value and financial viability. The study further acknowledged the level of education of farm workers as a contributing factor. There is a need to explore these challenges more broadly, rather than focusing on a narrow view of the schemes, so as to achieve certain objectives without acknowledging particular stumbling blocks.

The study revealed that beneficiaries were disappointed with the tangible benefits such as high salaries and improved living conditions. One of the reasons provided for the lack of tangible benefits is the scheme's focus on capital-intensive production, which takes a while to produce results. In order to realise immediate benefits, the study recommends the following:

- Encourage equity schemes that provide for regular cash flow.
- Use Department of Land Affairs funds to subsidise a declining interest rate subsidy.
- Establish equity schemes that specialise in cash crop production. It seems that when equity share schemes are established, farm workers have certain expectations that are not clearly articulated at the beginning, thus creating confusion (Fast, 1999).

Measuring the performance of equity-share schemes in South Africa: A focus on financial criteria (Gray, Lyne & Ferrer, 2004)

This study focused on the financial criteria for equity share schemes and does not address the non-financial aspects. The study states that the success of these schemes is determined by the redistribution of wealth, worker empowerment, retaining or attracting quality management, creditworthiness, improved worker productivity and power relations, as well as provision for ownership and control to be fully transferred to previously disadvantaged shareholders. It concluded that no single study has adequately assessed the performance of equity share schemes in terms of a comprehensive set of criteria that objectively measures the broader goals of agrarian reform. Gray *et al.* (2004) state that it is important to develop a holistic approach for measuring the performance of these schemes in order to gauge, monitor and identify reasons for their success or failure. The results of this study indicate that the former Department of Land Affairs is lagging behind in terms of research and keeping track of existing share schemes.

The focus of the study conducted by Gray *et al.* (2004) on financial performance includes profitability, solvency, liquidity, risk, efficiency and growth status. The study was restricted to four of the seven equity share schemes in the Western Cape Province, from 2002 to 2003. The study only covered financial matters and overlooked non-financial matters. The study's intention was to develop a framework within which to gauge and monitor the financial performance of share schemes. It was discovered that the four equity share schemes performed badly due to adverse market conditions (Gray *et al.*, 2004).

Willing-buyer-willing-seller: South Africa's failed experiment in market-led agrarian reform (Lahiff, 2007)

This study reviewed the approach adopted by Government for land reform where willing buyers negotiate with willing sellers. The study suggests that the slow progress of land reform is worsened by the lack of mobilisation and militancy amongst the rural poor and the landless. Equity share schemes, which some view as the success story of land reform, created a gap between the owner and the workers and have produced no benefits for the workers. It was mentioned that good quality land is sold at an auction or private contract within a short space of time, as the process of buying land through land reform takes longer. The study assumes that the land made available for equity share schemes is because either the owner is really committed to land reform or the land cannot be disposed of at an open market due to poor location or poor quality of land. In the study, various points of a well-functioning system were mentioned as important for consideration in assessing share schemes (Lahiff, 2007).

5.5 Government interventions

Government intervention refers to regulatory actions taken by government in order to affect or interfere in decisions made by individuals, groups or organisations regarding social and economic matters (Belsky & Wacter (2010); Huang & Du (2016); Olowa & Olowa (2014)). Government intervention in any sector including the agricultural sector is to achieve desired policy goals (Ali & Khan, 2012:103). The intervention may include among others the efficiency increase of agricultural production; protection of farmers' income; national food safety and security, and external effects and public goods in agriculture (Jelić, Đurović, Radojčić & Aničić, 2014:174).

Government intervention can lead to either positive or negative outcome, depending on the circumstances; however, the experience of government intervention when there was a moratorium of the equity share schemes in 1999, resulted in reduced number of government-assisted transfers during 2000 and 2001, with an increase in 2002 (Lyne & Roth, 2004:11). This is due to the fact that grants are from government, and when there is a moratorium there are no grants offered. In some instances, government intervention in one of the competing sectors can have unintended consequences, as was the case during 1960s-1970s, when government intervention in favour of industrialisation led to the neglect of agriculture, which resulted to poor growth performance, and low labour productivity in the informal service sector (Badiane & Makombe, 2014:3-5).

The economists argue that in welfare economics, government intervention results to inefficient outcomes and generates a loss in social welfare. However, when there is market failure such as instability of agricultural markets, government intervention is justifiable to correct market failure (Sakai, Managi, Vitanov & Demura, 2007:254). The same can be said about the equity share schemes, where government intervention is justifiable considering that for several years the equity share schemes have not performed to the acceptable standard. This is supported by Aliyeva, Huseynova, Babayeva, Huseynova, Nasirova & Hasanzade (2019:12-13) who state that the economic sector where government intervenes is the agricultural sector, where restrictive, regulatory, and supportive interventions are applied.

This study provided an investigation into the role of government in managing effectively farm worker equity share schemes in South Africa.

6. Research Design and Methodology

6.1 Research paradigm

The empirical study followed a positivistic research paradigm by means of a quantitative research approach. This enabled the collection of quantitative data from the responses provided by farm workers regarding the measuring instrument.

6.2 Research Approach

Given the nature of the study, the research approaches followed in this study are exploratory and descriptive in nature. The aim was to explore a relatively new and under-explored area in the field of

farm worker equity schemes in South Africa (especially in the light of the moratorium placed on these schemes) and describing beneficiary perceptions regarding farm worker equity share schemes in South Africa.

6.3 Population

The population of this study is all existing farm worker equity share schemes operating in South Africa. There is no updated published information on registered farm worker equity share schemes in South Africa making it difficult to determine the exact population of this study. It was estimated that about 88 or more farm worker equity share schemes exist as per the information contained in the confidential study report produced in 2010 (Hall & du Toit, 2014). This is comparable to the figure of 88 reported by Hall and Cousins (2018:5).

6.4 Sampling

The sampling for this study was guided among other by the analyses to be employed in this study. Yong and Pearce (2013:80) state that factor analysis requires a sample size of at least 300 participants. As the population was self-created (no published data base) and some information was outdated, non-probability sampling was used. Convenience and purposive sampling were used to select the 20 farms for participation in this study. Ideally, a total of 15 farm workers were targeted per farm to whom the measuring instrument was administered. However, due to a variation in these farm worker equity share schemes, less than 15 workers were selected on some farms while more than 15 workers were selected in others, resulting in a total sample size of 341 farm workers.

6.5 Data collection

The secondary sources for the literature review were obtained through desktop research using journal articles, textbooks and the Internet. The primary data for this study was obtained using the survey method by means of self-administered structured questionnaires used in group sessions. The purpose was to assist farm workers to understand and complete the structured questionnaire. The farms identified and willing to participate in this study were in the Eastern Cape, Gauteng, Mpumalanga and Western Cape Provinces.

6.6 Questionnaire design

The questionnaire consisted of three sections.

- Section A assessed the impact of government intervention on beneficiaries' perceptions regarding farm worker equity share schemes in South Africa. A seven-point ordinal scale ranging from strongly agree to strongly disagree was used.
- Section B assessed beneficiary perceptions regarding farm worker equity share schemes, using a seven-point ordinal scale ranging from strongly agree to strongly disagree.
- Section C used nominal-scaled questions to solicit background information from the respondents (demographic characteristics) such as gender, age, ethnic group, educational background and employment level.

6.7 Data analysis

Data obtained was transferred to an Excel spread sheet and analysed by means of the Statistica computer programme. Various statistical methods are used in this study. The measuring instrument was assessed for both validity and reliability. Face and content validity were assessed through a pilot study and expert judgement from researchers in the field of management, ethics and statistics. Exploratory factor analysis was used to assess construct validity through both convergent and discriminant validity. A cut-off point of 0.4 was used and at least three items needed to load per factor in order to be regarded as acceptable. Cronbach's alpha coefficient was used to assess the internal reliability of the study variables. Regression and correlation analysis were used to test relationships between the dependent and independent variables and to test the stated null-hypothesis of the study.

7. Results and Findings

7.1 Demographical profile of respondents

Table 1 shows the demographic profile of respondents.

Table 1: Demographical profile of respondents

Demographics	Range	%
Gender	Male	57
	Female	41
	No answer given	2
Age (Years)	below 16	2
	16 – 20	7
	21 – 30	41
	31 – 40	20
	41 – 50	18
	51 – 60	8
	Above 60	2
	No answer given	2
Scheme Benefits	Only Dividends	72
	Only Assets	9
	Dividends & Assets	14
	No answer given	5
Type of Farming	Wine	24
	Dairy	2
	Summer Crops	12
	Winter Crops	1
	Oilseed Crops	1
	Sugar Cane	0
	Deciduous Fruit	0
	Subtropical Fruit	1
	Citrus Fruit	56
	Animal Production	1
	Dairy Production	0
	Vegetables	1
	Other	0
	No answer given	3
Employment Contract	Full-Time	49
	Part-Time	8

	No answer given	3

Source: Author's own construction

The results show that the majority of the respondents were male (57%) and between 21 and 30 years (41%). About 72% of the schemes only paid dividends and 56% of the participating workers were employed on citrus farms. Only 49% of the participants were full time employees and 48% had been

in employment for a period between one and five years. About 35% of the schemes had been in operation between nine and 12 years and 55% were no longer members of these schemes.

7.2 Exploratory factor analysis and reliability testing results

An exploratory factor analysis was done and the results is provided in Table 2. Factor loadings of greater than 0.4 were considered significant.

Table 2: EFA results and Cronbach's alpha coefficients of the latent variables

Latent Variable	Items	Minimum factor loadings	Maximum factor loadings	Cronbach's alpha
Government intervention	GI1 – GI5	0.48	0.77	0.76
Perceptions regarding farmworker equity share schemes	FES1 – FES8	0.52	0.78	0.84

Source: Author's Own Construction

The EFA results clearly shows the minimum and maximum factor loadings and that all variables have loadings above 0.40. All the variables used for government intervention (GI1-5) loaded onto one factor. Eight of the 15 variables used to assess validity of perceptions regarding farm worker equity schemes (FES1-8) loaded onto one factor with loadings above 0.40. Table 1 further indicates that both variables/factors are internally reliable and Cronbach's alpha values above 0.70 (0.76 and 0.84 respectively).

7.3 Regression analysis

Table 3 depicts the regression analysis results of the influence of the government intervention on perceptions regarding farm worker equity share schemes.

Table 3: Regression analysis: Influence of government intervention on farm worker equity share schemes

Regression summary for government intervention on farm worker equity share schemes						
Parameter	Beta b*	Std. Error	B	Std Error	T value	P-value
GI	0.292	0.053	0.285	0.052	5.451	0.000***
*** = p < 0.001						

Source: Author's own construction

Table 3 shows that government intervention ($b = 0.285$, $p < 0.001$) is positively related to farm worker equity share schemes with a coefficient of 0.292. This means that the role of government can help achieve the intended objectives of equity share schemes, where farm workers understand the formation of the equity share schemes and the kind of support to be provided by government for the benefit of farm workers. Farm workers feel that government should timeously monitor the implementation of equity share scheme policies based on a legal framework. The higher the t-value, the stronger the impact on farm worker equity share schemes. In this case, government intervention with the t-value of 5.451 has a moderate impact.

7.4 Findings on hypothesised relationship

Based on the results, the relationship between government intervention and farm worker equity share schemes, the following hypothesis was rejected:

H_{O1} *There is no relationship between government intervention and beneficiary perceptions regarding farm worker equity share schemes in South Africa.*

There is thus a statistically significant positive relationship between government intervention and beneficiaries' perceptions regarding farm worker equity share schemes ($p < 0.001$) with $r = 0.292$ and t value ($t=5.451$).

8. Managerial Implications

Government intervention is important and happens in different forms, however, as far the land market is considered, Kloppers and Pienaar (2014:692-693) state that the new government made a commitment not to intervene in the land market, but instead of getting involved in the purchase of land for redistribution, the government to adhere to the principle of "willing-buyer, willing-seller", by providing resources to finance market-led redistribution transactions without government becoming the owner of the land. However, government has realised the weaknesses of this principle, hence, they have considered abolishing it and moving towards a more aggressive approach of expropriation (Kloppers & Pienaar, 2014:693). A study conducted by Xaba and Roodt (2016) mentions lack of support for farmers once they become landowners as the common cause of failure, because government neglected them.

The farm workers believe that government intervention is important for the establishment of equity share schemes. This is so because when the government is involved in equity share schemes, the farm workers feel protected in the sense that there is someone to ensure that their expectations are fulfilled. However, if there is no government presence, farm workers feel that they are on their own in realising their expectations. The presence of government is not enough, as its support should be felt. In the case of the Solms-Delta farm, which implemented an equity share schemes, Jordan (2017:8) reports that it experienced cash flow problems due to delayed government promises for financial support. This farm is a good example of the importance of government intervention, not just government presence without the necessary support. Jordan (2017:8) reported that Minister Nkwinti of the Department of Rural Development and Land Reform visited Solms-Delta farm and commended the owners for setting a land reform benchmark. Furthermore, the government agreed to fund a business turnaround strategy to make the farm profitable, however, these funds were delayed.

9. Conclusions and Recommendations

This study highlighted the importance of government intervention in influencing perceptions regarding farm worker equity share schemes. The success of the equity share schemes relies on a team effort from all relevant stakeholders in the industry, including active participation of government. The empirical finding specifically highlighted the following statistically significant finding:

The results indicated that there is a significant relationship between government intervention and beneficiaries' perceptions regarding farm worker equity share schemes in South Africa (H_0 rejected). Without the active involvement of government through various initiatives, programmes and policy formulation, these schemes seemed to be doomed for failure.

The findings of this study further revealed that government intervention should include government officials explaining land reform to the beneficiaries of equity share schemes and monitoring the implementation of equity share scheme policies based on a legal framework. This is supported by Tom (2006:4), who states that policy makers have a duty to include a comprehensive monitoring programme and to perform an evaluation of equity share schemes. The empirical findings of the study also revealed that beneficiaries believe that they participate effectively in equity share schemes when government eradicates corrupt practices in order to promote the effective management of the equity share scheme.

Table 4 provides some general guidelines to stakeholders on the role of government in managing effectively farm worker equity share schemes in South Africa.

Table 4: General guidelines of government’s role regarding farm worker equity share schemes

Recommendations regarding government interventions:	
1	Regulatory actions taken by government should affect or interfere in decisions made by individuals, groups or organisations regarding social and economic matters.
2	Government officials should clearly explain land reform to the beneficiaries of the equity share scheme in understandable language.
3	Government should provide additional financial support for the equity share scheme to ensure its financial sustainability.
4	Government should also provide non-financial support to scheme members (e.g. conflict resolution and mobile medical facilities).
5	Government should monitor the implementation of equity share scheme policies based on a legal framework.
6	Government can be a mediator and leader within, or the creator of, an enabling environment for equity share schemes – important that government visibility is recognised all the time.
7	A mistake that government should not make is to visit farms with equity share schemes only once and disappear after its establishment.
8	It is important that government contacts equity share schemes regularly in order to monitor progress and to understand the challenges in place to meet the set targets for equity share schemes and, where possible, to work together to resolve these challenges.
9	The Department of Agriculture, Land Reform and Rural Development should engage in on-going research and keeping track of existing share schemes with an updated database.
10	Government should strive to provide clarity to beneficiaries about land reform and housing options; allow participants in decision-making pertaining to financial and legal arrangements; and assist with challenges regarding the assessment of farm value and financial viability.

Source: Author’s own construction

The following extract seems appropriate to conclude this paper with:

“When properly implemented farm worker equity scheme initiatives could provide a path to farm workers sharing in equity growth – but only if managed correctly, and if they include substantial provisions for increasing farm worker representation ... concerns raised by farm workers suggest that these are still lacking ... also highlight the severe shortcomings of policy, further exacerbated by government’s poor monitoring of the schemes. This absence raises questions about the government’s commitment towards improving the farm workers’ lives, and raises questions about the future of farm workers who remain marginalised, and who continue to suffer exploitation and evictions despite laws and policies in place that are meant to avoid it ... government must respond to the demands listed in the memorandum and ensure that laws are enforced to respond to the farm workers’ primary demands, which include secured tenure, decent living conditions, improved wages, enforcement of the minimum wage, and access to land for their own use.” (Beerwinkel, 2019)

management

Abstract

Organisational sustainability and success are dependent on the retention of intellectual capital. If employees exit without a strategy to ensure the transfer of intellectual capital, knowledge is lost, and this may be difficult or even impossible to recover. This loss can inhibit competitive advantage, stifle organisational agility and lower profit margins.

In the South African automotive sector, the loss of highly experienced technical experts is compounded by a shortage of skilled younger employees. Succession planning is often used to ensure knowledge and skills transfer. When implemented effectively, it creates an internal pool of skilled and talented individuals, while preserving institutional knowledge.

This quantitative and survey-based study, undertaken in partial fulfilment of the degree Master of Business Administration, was conducted in Gqeberha, located in the Eastern Cape province of South Africa. Technical knowledge and skills transfer was investigated in an automotive component manufacturing plant (n=168). The findings of the study revealed some positive experiences of the transfer process. Further, talent management, succession planning, trainee characteristics, training design and work environment all demonstrated positive correlations with the transfer process, with succession planning and work environment demonstrating significant predictive relationships.

1. Introduction

Intellectual capital is the organisation's invisible source of competitive advantage (Kamukama, 2013) and represented by the collective knowledge and experience of employees (Song & Chermach, 2008). However, many organisations face the challenge of losing intellectual capital due to employee layoffs, staff turnover, retirement, mergers and acquisitions, and headhunting (Makhubela & Ngoepe, 2018). When employees exit it is important that strategies are in place to ensure the transfer of invaluable intellectual capital (Khumalo, 2012).

The focus of this study is on the South African automotive sector which faces skills shortages (Sowetanlive, 2022) linked to the work of fitters, artisans, technicians, millwrights, electricians,

*Corresponding Authors

¹ E-mail address: bridget.devilliers@mandela.ac.za

² E-mail address: gavenpro@gmail.com

toolmakers, process and quality engineers, body builders and painters, amongst others (Laseinde & Kanakana, 2017). In addition to the inevitable turnover of employees (Ali & Mehreen, 2019), the aging workforce presents a global concern linked to the retention of intellectual capital (Makhubela & Ngoepe, 2018). This is partly manifested in the retirement of the “Baby Boomer” generation (Ansara & Davids, 2018). This “brain drain” is amplified by the changing work and career behaviours and preferences of younger generations as well as general lack of new talent entering the automotive industry over the past two decades (Calitz & Cullen, 2017).

When employees who possess critical skills leave the organisation, they take with them their accumulated knowledge about past research, developmental project successes and failures, resources, and organisational procedures. Unfortunately, it is only when these employees leave that organisations realise the importance of this knowledge (Makhubela & Ngoepe, 2018). Further, concern is expressed in relation to the less experienced employees who step into the role of exiting employees (Burmeister & Deller, 2016). Within the automotive sector the loss of organisational knowledge has been found to contribute to errors, duplication of work and additional investments in training and development (Calitz & Cullen, 2017). At the same time, the competitiveness of the automotive industry is critical to South Africa’s economic sustainability, with the sector consistently contributing over 7% to South Africa’s GDP (Laseinde & Kanakana, 2017).

While interventions, such as the use of part time contracts and the services of consultants have been utilised to bridge the skills gap, these are short-term and unsustainable alternatives. Short-term contract rates are costly and do not include a clause for knowledge transfer. In addition, consultants deliver work and leave without a long-lasting impact, again at a greater expense (Levy, 2011; Liebowitz, 2008). Aggressive recruiting is another response to skilled trade shortages; however, this is also regarded as a short-term solution (Burkett, 2019). For this reason, it is important that organisations, as part of a broader knowledge management framework, preserve institutional knowledge through developing existing talent and implementing effective knowledge and skills transfer mechanisms.

Knowledge can be broadly described as explicit (know-that) or tacit (know-how). The transfer and retention of knowledge is made possible through strategies involving education, training, developing a community of practice, utilising professional networks, documenting processes, and using advanced software to capture work processes, best practices, case studies and job manuals (Makhubela & Ngoepe, 2018; Mazorodze & Buckley, 2020). While it is important to retain both forms of knowledge, tacit knowledge is more difficult to transfer as it represents knowledge acquired over years of experience (Makhubela & Ngoepe, 2018). The knowledge transfer process is facilitated through succession planning which entails developing employees to fill key positions in the future. Succession planning has been identified as focusing particularly on the knowledge transfer necessitated by an aging workforce (Mazorodze & Buckley, 2020) and ensuring the availability of internal resources to fill key positions (Ali & Mehreen, 2019).

This study focused on the retention of intellectual capital, and specifically on employee experiences of the technical knowledge and skills transfer process. The study was conducted in an automotive component manufacturing company based in Gqeberha, which is located in the Eastern Cape province of South Africa. In this organisation succession planning was deployed as a vehicle to ensure the transfer of knowledge and skills. It was thus deemed important to examine employee experiences of succession planning and whether it was perceived to positively influence the transfer process. Further, as succession planning frequently forms part of a broader talent management strategy, it was also important to consider employee experiences of talent management. Finally, Baldwin and Ford (1988) identified training input factors that have an influence on the transfer process (Blume, Ford, Surface & Olenick (2019), these being trainee characteristics, training design and work environment factors. This study further sought to examine the role of these variables in promoting the technical knowledge and skills transfer process.

1.1 Study aim and objectives

The main aim of the study was to investigate the retention of intellectual capital through exploring employee experiences of technical knowledge and skills transfer at an automotive component manufacturer. Based on this primary aim the research objectives were to determine:

- i. employee experiences of the technical knowledge and skills transfer process
- ii. employee experiences of talent management and succession planning.
- iii. whether experiences of talent management and succession planning influenced the technical knowledge and skills transfer process
- iv. whether the training input factors of trainee characteristics, training design and work environment influenced the technical knowledge and skills transfer process.

Based on the main aim and objectives of the study, the technical knowledge and skills transfer process was identified as the dependent variable, and talent management, succession planning, trainee characteristics, training design and work environment as the independent variables.

2. Methodology

2.1 Research approach

The study was conducted from a positivistic paradigm with the assumption that social phenomena can be objectively explored through measurement and analysis of a sample and generalisations made to the broader population of interest. The phenomena under study was the retention of intellectual capital, in particular employee experiences of technical knowledge and skills transfer in the automotive manufacturing sector. The study adopted a descriptive research design with a view to providing numeric descriptions of the perceptions of respondents (Creswell, 2014). Further, a correlational approach was implemented to explore for relationships between the study variables (Bryman, Bell & Hirschsohn, 2021).

2.2 Research method

A quantitative research approach was adopted with a structured questionnaire in form of a self-administered survey as the data collection tool. This approach was deemed appropriate as it allowed for the collection of the data that could be analysed to describe and explain the phenomenon under study. This is achieved via the quantitative method through measuring constructs and testing relationships among variables (Leavy, 2017).

2.3 Population, sample and data collection

The target population for this study was 300 technical employees at an automotive company based in Gqeberha, located in the Eastern Cape province of South Africa. These employees were identified as potential respondents by the company's human resource department. Prior to data collection ethical clearance was obtained from the university from where the study was conducted (ethics approval reference number H20-BES-BUS-057). Thereafter, permission to conduct the study was applied for and granted by the company. The researcher was provided with a list of the email addresses of the potential respondents. The survey was forwarded via email under a covering letter to these employees who were invited to participate on a voluntary basis. The completed questionnaire was returned via email to the researcher. A final sample of 168 was achieved, representing a 56% response rate. A non-probability convenience sampling approach was thus adopted. No identifying information such as name or identity number was requested in the survey, and no record was maintained of individual participation in the study; hence confidentiality was ensured.

2.4 Measuring instrument

In addition to gathering demographic information, the survey comprised six scales, these being experiences with the technical knowledge and skills transfer process, talent management, and succession planning; and the three training input factors of trainee characteristics, training design and work environment. In developing suitable items for the scales linked to the transfer process, talent management and succession planning, reference was made to Massingham (2018), Burmeister (2016), Calitz and Cullen (2017) and Blume et al (2019), amongst others. For the scale items linked to the

training input subscales, the Baldwin and Ford (1988) model was consulted (Grossman & Salas, 2011; Homklin, Takahashi & Techakanot, 2014; Nazli et al, 2015; Sahoo & Mishra, 2019; Wen & Lin, 2014). The guidelines of Babbie and Mouton (2015) were considered in the construction of the questionnaire. The scale items were accompanied by a five-point Likert-type response scale ranging from “strongly disagree” (1) to “strongly agree” (5), with a midpoint (3) allowing for a “neutral” response option.

2.5 Validity and reliability considerations

The validity of the questionnaire was achieved using face, content, and construct validity (Bryman, et al, 2021). Face and content validity were ensured through scrutiny of the questionnaire by a senior academic well-versed in the concept of knowledge and skills transfer. Construct validity was ensured by developing the questionnaire based on the literature review. The internal reliability of the measuring instrument was determined by calculating Cronbach’s alpha coefficients (Bryman, et al, 2021). The coefficients resulting from this analysis ranged between 0.65 and 0.85. (Table 1), indicating fair to excellent internal reliability (Zikmund, Babin, Carr & Griffin, 2013).

Table 1: Cronbach’s alpha coefficients: Reliability of the measuring instrument (n=168)

Variable	Cronbach’s Alpha
Technical knowledge and skills transfer process	0.73
Talent management	0.84
Succession planning	0.85
Trainee characteristics	0.77
Training design	0.65
Work environment	0.80

3. Literature Review

3.1 Retaining intellectual capital through knowledge and skills transfer

Intellectual property leakage has been linked to a lack of organisational knowledge management strategies (Mazorodze & Buckley, 2020). When staff exit, intellectual capital is lost, and a knowledge gap is created. This loss can influence the agility of the organisation (Samani, Sadeghiyan, Keshavarz & Ziglari, 2017), reduce organisational output and productivity, undermine organisational strategy, and increase risk (Massingham, 2018). It is therefore important that organisations implement knowledge management strategies to ensure effective knowledge transfer. While this is essential for almost every organisation, Burmeister and Deller (2016) highlight that it is especially important when the workforce is “skewed” towards knowledge residing in those close to retirement age.

In setting a strategy to mitigate knowledge loss when employees exit it is important to set clear and relevant objectives. To this end it is important to address questions in relation to whose knowledge, if lost, would pose a threat to the functioning and performance of the organisation (Martins, 2010). This requires the identification of key roles and the development of knowledge and skills profiles associated with the holders of these roles. A further question concerns the nature of the knowledge to be retained. Knowledge can be broadly defined as explicit or tacit in nature (Burmeister & Deller, 2016). Table 2 presents a distinction between explicit and tacit knowledge as originally advanced by Polanyi (1966).

Table 2: Distinction between tacit and explicit knowledge

Explicit knowledge	Tacit knowledge
Objective, rational and technical	Subjective, cognitive, experiential learning
Structured	Personal
Context independent	Context sensitive/specific
Fixed content	Dynamically created
Externalised	Internalised
Easy to codify	Difficult to capture and codify
Easy to share	Difficult to share
Exists in high volumes	Has high value
Easily documented	Hard to document
Easily transferred/taught/learned	Hard to transfer/teach/learn
	Involves a lot of human interpretation

Source: Tantisuwankul, Nugroho, Kula, Hata, Rungsawang, Leelaprute & Matsumoto (2019)

Explicit knowledge is described as unambiguous information that can be documented and retained for transfer purposes in the form of reports, documents, books, memos, training manuals or stored in archives. It is knowledge that is easy to identify and articulate and therefore easy to share and use (Tantisuwankul, Nugroho, Kula, Hata, Rungsawang, Leelaprute & Matsumoto, 2019). Examples of explicit knowledge include following standard operating procedures or using an instruction manual. Tacit knowledge, which resides in an individual's mind, is deeply rooted in an individual's experiences, ideals, values, and emotions. It is therefore "hidden" and difficult to explain, access and use. Examples include the ability to innovate on the job or be a good leader. It is thus by nature implicit and ambiguous and cannot be overtly shared. However, tacit knowledge can be transferred through processes like mentoring and coaching (Mazorodze & Buckley, 2020).

With knowledge retention, the importance of tacit knowledge is emphasised as it is particularly valuable to the organisation (Burmeister & Deller, 2016). It is accumulated over many years of experience and practice (Makhubela & Ngoepe, 2018) and includes knowledge about the industry, customers, products, and services. Employees possessing high levels of tacit knowledge are typically identified as those with task-related problem-solving skills and a good understanding of the organisational culture, politics and general functioning, processes, and systems. Further, they develop internal and external networks over time which allows them to connect different knowledge sources within an organisation (Burmeister & Deller, 2016).

Massingham (2018) highlights that when valuable knowledge exits it can influence the organisation in three ways. First, there is the impact on employees who remain. This impact could be psychological and manifest in the form of anxiety, stress, job insecurity or anger, or experienced as a work disruption in the form of an increased workload or lost social network. Second, there is the loss of subject matter expertise leading to a loss of know-how. Third is the impact on organisational capability when the knowledge required for innovation, problem-solving and creativity is lost. If organisations are unable to retain exiting employees' knowledge, remaining employees will not be able to learn from their experiences. Therefore, to avoid "reinventing the wheel" it is important to retain or capture the knowledge of experienced employees before they leave (Makhubela & Ngoepe, 2018).

Knowledge retention is dependent on the successful transfer of knowledge (Burmeister & Deller, 2016). Knowledge transfer refers to the knowledge exchange that occurs between individuals or groups of individuals. It can also occur from individuals to explicit sources, and between a group and the organisation (Cepeda-Carrion, Martelo-Landroguez, Leal-Rodríguez & Leal-Millán, 2016). Knowledge transfer is defined as any method employed to recreate existing knowledge in a new setting. It is further elucidated as the way in which incumbent employees share their skills with less experienced employees to ensure their future success in the incumbents or related positions (Singh &

Premarajan, 2007). This can include the sharing of good work practices and ways to solve problems (Margherita & Bua, 2021).

While knowledge transfer is the process through which one social unit learns from another or is influenced by the experience of another unit (Argote & Fahrenkopf, 2016), transfer only takes place when employees are able to successfully use the new skills, expertise, techniques and behaviours attained in new contexts (Burmeister & Deller, 2016). Transfer therefore refers to the ability to use, maintain and generalise learned knowledge, skills, and attitudes to facilitate effective performance (Blume, et al., 2019).

There are a variety of transfer activities and tools that can be used as part of a knowledge retention strategy. These include communities of practice, succession planning, coaching, storytelling, knowledge repositories, mentoring and job rotation (Mazorodze & Buckley, 2020). Many of these form part of organisational talent management approaches and strategies. For this reason, it is important to consider the role of talent management in retaining organisational knowledge

3.2 The role of talent management in retaining organisational knowledge

Organisations compete in a talent economy that is reliant on the information, networks, and knowledge of its employees. Organisational talent describes those high performing and high potential employees who contribute significantly to current and future organisational performance. Talent describes a set of skills, abilities, experience, mastery, knowledge, and potential for development (Mohammed, Gururajan & Hafeez-Baig, 2017).

Broadly defined, talent management deals with the attraction, development, and retention of organisational talent, while knowledge management refers to the creation, application, capture, storage, dissemination, and organisation of knowledge (Mohammed, et al, 2017). Shabane (2017) maintains that organisations can benefit from integrating talent management and knowledge management. To this end talent management should focus on preserving knowledge. Königová and Urbancová (2012) highlight the benefits of integration as including facilitation of the identification of talented and knowledgeable employees; improved staff retention and knowledge preservation, including when key employees exit; enhanced staff development; and improved organisational image and performance.

Both HR and line managers are involved in driving talent management processes. In a study conducted by Tafti, Mahmoudsalehi and Amiri (2017) in the Iranian automotive sector, managerial challenges and barriers was identified as a factor mitigating against the success of talent management practices. This included a lack of involvement and cooperation among managers in implementing talent management processes, and a lack of understanding about the importance and significance of talent management. Tafti et al (2017) further identified structural challenges and barriers including a lack of integrated HR systems, a lack of alignment between HR and business strategies and a lack of an integrated approach to talent management. These findings suggest the importance of HR and line management working together to identify and address specific barriers and challenges to ensure effective talent management practices. In this way talent management will assist in with knowledge retention.

3.3 Succession planning

Organisations have adopted succession planning as a vehicle to ensure knowledge transfer and retention (Ejakpomewhe, 2017). Succession planning can be defined as a systematic and long-term process in which the goals, needs and roles of the organisation are determined, and individuals or groups of employees prepared for responsibilities linked to retirement, promotion and resignation (Ali & Mehreen, 2019). Succession planning focuses on retaining and developing intellectual capital for the future (Rothwell, 2011).

Organisations need to be prepared for the inevitable and unavoidable replacement of key employees (Simoneaux & Stroud, 2014) Succession planning allows the organisation to respond to skills

shortages by developing a durable pool of internal talent within the ranks of less experienced employees (Rothwell, 2011). Organisations that implement succession planning that promotes tacit knowledge transfer are seen to improve bench strength. Bench strength describes the organisation's ability to promote employees from within, as opposed to recruiting from outside (Rothwell, Jackson, Ressler, Jones & Brown, 2015).

Succession planning frequently involves the use of mentoring and coaching to share technical and organisational knowledge and skills (Tarus, 2014). Mentoring is a process whereby a trusted and knowledgeable mentor provides guidance to a mentee over a long period of time (Jakubik, Eliades, Weese & Huth, 2016). In this process the mentor (source) transfers knowledge and expertise through building a relationship with the mentee (recipient) (Brondyk & Searby, 2013). In this way the mentee builds skills, becomes more efficient in the execution of his/her current job, and is better prepared for a future position. Through ensuring "future fit" internal candidates, mentoring aids in developing and sustaining institutional knowledge (Crumpton, 2014). Coaching is used as a vehicle of knowledge transfer in highly technical knowledge organisations as it facilitates training transfer from theory to practice (Ogunyomi, 2013). It is regarded as an effective method of promoting efficiency (Rothwell, et al., 2015) and enhances the performance of teams, groups, or individuals (Grover & Furnham, 2016).

3.4 Training input factors

While there is considerable investment in employee training programmes, research suggests that only a small percentage of acquired competencies are transferred to the work environment. Estimates indicate this to be less than 10% of training and development expenditure (Ma, Bai, Bai, Ma, Yang & Li, 2018). It is thus important that factors that facilitate or inhibit the transfer of training are identified (Yaqub, Singh & Dutta, 2020). Baldwin and Ford (1988) provided a model that identifies training input factors that influence the transfer process, these being trainee characteristics, training design and work environment (Blume, et al, 2019; Ma, et al, 2018; Suleiman, Dassanayake & Othman, 2018).

3.4.1 Trainee characteristics

The trainee characteristics that have shown the strongest and most consistent relationships with transfer are cognitive ability, self-efficacy, motivation, and perceived utility of training (Grossman & Salas, 2011). People with high cognitive ability are better able to process, retain and generalise trained skills (Blume, et al., 2019). Self-efficacy, which is conceptualised in the social learning theory of Bandura (1982), relates to the judgements that people make about their ability to perform a task successfully. It is the belief that people have in their ability to mobilise motivation, cognitive resources, and action to control the direction of events in their lives (Sahoo & Mishra, 2019). People with high self-efficacy tend to set more challenging goals for themselves and therefore benefit more from training (Wen & Lin, 2014). This is because they are motivated to acquire knowledge and subsequently make use of this knowledge (Yaqub, Singh & Dutta, 2020). Motivation is central to training transfer. Grossman and Salas (2011) indicate that it is important for employees to remain motivated throughout the training and development process to enable transfer to occur, believe that training will increase their performance, and believe that performance improvements will benefit them. Motivation to transfer is thus linked to motivation to learn (Wen & Lin, 2014). People who perceive training as valuable and useful are more likely to apply new competencies on the job and will be more motivated to learn (Mozammel, 2019).

3.4.2 Training design

In terms of training design, behavioural modelling, error management and a realistic training environment have been found to positively influence the transfer of learning (Grossman & Salas, 2011). Behavioural modelling provides opportunities for trainees to observe and practice learned skills and receive feedback, which aids in the retention of new information. Allowing employees to make errors and providing error management instructions has found to facilitate the use of trained knowledge and skills (Grossman & Salas, 2011). In relation to a realistic training environment, training transfer is more effective when training approaches are consistent with real job situations (Yaqub, Singh & Dutta, 2020). For this reason, many organisations conduct on-the-job training in the

environment in which the tasks and activities to be learnt will be performed (Grossman & Salas, 2011). Further, both the training content and instruction method are important as these need to be linked to the job to facilitate knowledge acquisition (Ma, et al, 2018).

3.4.3 Work environment

Work environment includes the elements of transfer climate, support, opportunity to perform and follow-up. Training programmes will yield positive transfer outcomes when the work environment inspires the use of the required behaviours. This is because training effectiveness is largely dependent on the employees' ability to practice newly acquired skills and competencies on the job. The transfer climate should thus facilitate the use of learned skills through situational cues, peer support, the opportunity to practice skills, and feedback following the application of skills (Grossman & Salas, 2011; Homklin et al, 2014). Support from supervisors, peers and the organisation are important (Nazli, Sipon, Zumrah & Abdullah, 2015). The role of the supervisor is particularly highlighted in providing opportunities and space for the employee to use newly learned skills (Obaid, Zainon, Eneizan & Wahab, 2016). Finally, the learning experience is incomplete if continuous opportunities are not provided for enhancing and maintaining learning. This includes training debriefing, reflection on training, post-training follow-up and feedback (Grossman & Salas, 2011).

4. Analysis and findings

Data collected in this study was subjected to descriptive and inferential analysis making use of the STATISTICA analytics software package.

4.1 Demographic information

There were 168 respondents in this study of which 70% were male, with the majority (68%) between 36 and 55 years of age. Eleven respondents indicated that they were aged 60 years or older. In terms of education, 67% indicated that they held a matric qualification, and 19% a tertiary qualification. Table 3 presents the occupational level of the respondents expressed as a percentage.

Table 3: Occupational level (n=168)

Occupational level	Job title	Percentage
Technical	Trainee, graduate, operator, setter, team leader, picker/packer, inspector, spray painter, welder.	77
Advanced technical	Supervisor, fitter, electrician, millwright, technician, engineer, specialist, tool maker.	11
Administrative	Administrative, managerial and others.	11

4.2 Employee experiences of the technical knowledge and skills transfer process

The dependent variable in this study was employee experiences of the technical knowledge and skills transfer process. Table 4 presents the frequency counts, mean scores and standard deviations achieved in this regard. In reporting on all sections of the survey instrument, the five-point Likert-type scale responses have been grouped in term of level of disagreement (disagree and strongly disagree) and agreement (agree and strongly agree).

Table 4: Technical knowledge and skills transfer process

Technical knowledge and skills transfer process	% Disagree	% Neutral	% Agree	Mean	Std. Dev.
I am willing to be coached / trained by my seniors or experienced employees	5.36	2.98	91.67	4.19	0.781
Employees are equipped with tools, skills and knowledge on how to handle potential errors / failures	16.67	14.29	69.05	3.60	0.911
My manager provides the necessary support I need to perform my duties as expected	18.45	13.10	68.45	3.59	1.057
My line manager knows my skills gaps	23.21	14.88	61.90	3.47	1.099
My manager provides feedback on my performance	29.76	8.93	61.31	3.38	1.167
Experienced employees at my company have a structured and well documented training plan to train new or junior employees	33.33	16.67	50.00	3.18	1.096
Employees are encouraged to explore and make mistakes	43.45	18.45	38.10	2.91	1.162
Aggregate mean score				3.47	

While the responses to most of the items tended towards “agree”, only the first item, dealing with *personal willingness to be coached/trained by more senior or experienced employees* demonstrated consistency of response ($SD < 0.80$). This suggests that experiences varied as to the extent to which employees believed they were *equipped to deal with errors* and *provided with managerial support* to ensure the transfer process, including the *identification of skills gaps* and *provision of performance feedback*. Grossman and Salas (2011) emphasise the value of error management to promote the proper use of targeted knowledge and skills in the workplace. Mozammel (2019) highlights the importance of supervisor support through setting performance goals and providing positive feedback. Responses for the items relating to *experienced employees having plans for the development of less experienced employees* and *encouragement to explore and make mistakes* indicated bimodality of response suggesting that some employees may have experienced this, while others not.

4.3 Talent management

Talent management can play an important role in the knowledge and skills transfer process. Table 5 presents the data in relation to employee experiences linked to talent management.

Table 5: Talent management

Talent management	% Disagree	% Neutral	% Agree	Mean	Std. Dev.
When a problem is outside the team's scope, a few experts/specialists are readily available to assist	18.45	14.29	67.26	3.55	0.965
The right people are recruited and effort is made to help them develop their skills	22.62	20.24	57.14	3.38	1.070
My company effectively fosters a high-performance work culture to retain talented employees	24.40	19.64	55.95	3.34	1.043
My company effectively develops and nurtures employees' skills and talents	31.55	18.45	50.00	3.17	1.105
My company effectively identifies employees with special skills and talents	35.71	22.02	42.26	3.05	1.093
An internal pool of experts is ready to fulfil the requirements of highly specialised jobs	38.10	21.43	40.48	3.02	1.080
My company is effective in training employees in highly specialised jobs	39.29	19.05	41.67	2.99	1.100
When a highly skilled person resigns, performance and efficiency is maintained	41.07	21.43	37.50	2.98	1.105
When people retire, problems related to machines, equipment and processes are simply solved by junior employees	42.26	22.02	35.71	2.89	1.137
Replacements of experienced employees with scarce skills are planned sufficiently in advance	57.14	12.50	30.36	2.60	1.154
When a highly skilled person leaves, it is easy to find a replacement internally	62.50	16.07	21.43	2.48	1.126
Aggregate mean score				3.04	

While an aggregate mean score of 3.04 might indicate neutrality of response, incidences of bimodality and a spread of scores ($SD > 0.80$) suggests that employees may have differing experiences regarding talent management. This is noted for the items that relate to the *effective identification of talent*, the *existence of a ready-made internal pool of talent*, the *effectiveness of training employees for highly specialised jobs*, the *ability of junior employees to solve problems when people retire*, and the *advance planning of replacements for experienced employees with scarce skills*. This is further evidenced by the disagreement that emerged in relation to the *ease with which an internal replacement can be found when a highly skilled person exits*. Overall, this suggests that talent management practices could be improved. This is important if organisations are to retain intellectual capital. Shabane (2017) contends that effective knowledge management depends on effective talent management and for this reason talent management practices should be integrated with knowledge management strategies. This is because talented employees are the creators and repositories of tacit and explicit knowledge. Shabane (2017) maintains that talent management practices such as career management, training and development and talent retention are likely to institutionalise a culture of knowledge creation and retention.

4.4 Succession planning

In the company that formed the basis for this study, succession planning was utilised to promote knowledge and skills transfer. Table 6 presents the findings in relation to employee experiences in this regard.

Table 6: Succession planning

Succession planning	% Disagree	% Neutral	% Agree	Mean	Std. Dev.
Employees have opportunities to work comfortably with senior / experienced employees	20.83	12.50	66.67	3.57	1.098
My Personal Development Plan (PDP) is linked to my career path	22.62	11.31	66.07	3.45	1.066
My Personal Development Plan (PDP) is clear	24.40	12.50	63.10	3.45	1.120
My Personal Development Plan (PDP) makes provision for external training modules and courses to support my career path	28.57	13.10	58.33	3.30	1.109
My line manager knows my skills gaps and reviews my progress on regular basis	33.33	14.29	52.38	3.23	1.177
My manager manages employees with a view of preparing them for future succession	33.93	16.07	50.00	3.15	1.158
Employees are developed and trained adequately for future role(s)	38.10	16.67	45.24	3.07	1.084
In my company, employees have equal opportunities for growth and development	40.48	14.29	45.24	2.99	1.176
Promotion processes are transparent	39.88	20.83	39.29	2.91	1.168
Promotion decisions are fair	45.24	22.02	32.74	2.77	1.227
Aggregate mean score				3.19	

Once again, a spread of scores ($SD > 0.80$) provides evidence of the differing perceptions of respondents. There may have been some satisfaction with the *opportunities provided to work with senior or more experienced employees* as well as with the *setting of clear and career-directed PDPs* that made *provision for external training*. However, bimodality of response suggests that some managers may, and others may not be seen as future focused through the *identification of skills gaps* linked to *regular progress reviews* and subsequent *talent management for future succession*. This extended to perceptions of the *provision of equal opportunities for growth and development*. The spread of scores in relation to the *transparency of promotion processes* and *fairness of promotion decisions* also revealed a potential range of experiences. Overall, these findings suggest that succession planning may not have involved all employees; alternatively, that it was not perceived to be effectively done by some employees. Succession planning is crucial in addressing potential retirement, death or the early exit of employees and the subsequent flight of intellectual capital (Ali & Mehreen, 2019). In a longitudinal study measuring the impact of knowledge loss in Australian organisations Massingham (2018) determined that newly appointed employees did not contribute as much to the organisation's knowledge score as remaining employees or those who had exited. The development of internal human resources is therefore vital in preserving institutional knowledge.

4.5 Training input criteria

4.5.1 Trainee characteristics

Table 7 presents the data in relation to trainee characteristics

Table 7: Trainee characteristics

Trainee characteristics	% Disagree	% Neutral	% Agree	Mean	Std. Dev.
I eagerly learn from others whenever I can	6.55	2.98	90.48	4.14	0.871
My work behaviour shows that I believe that every employee is responsible for his/her area of work	5.36	2.98	91.67	4.10	0.739
I willingly invest effort in my work. I persist in my work even in the face of difficulties	5.95	5.36	88.69	4.10	0.813
I look forward to learning new skills during training and applying them in my job	11.90	5.36	82.74	3.96	1.020
I see myself being able to perform highly specialised jobs in the near future, if given a chance	14.29	10.71	75.00	3.88	1.073
I look forward to coming to work to do my job	11.90	10.71	77.38	3.84	0.999
I have the capabilities required to do advanced or complex jobs	13.10	7.74	79.17	3.79	0.934
In general, employees in the organisation are eager to develop specialised skills	19.64	16.67	63.69	3.50	1.009
	Aggregate mean score			3.91	

An aggregate mean score of 3.91 is suggestive of agreement in relation to these items. This is supported by the mean scores and standard deviations (close to or below 0.80) obtained for the items relating to *eagerness to learn*, *responsible work behaviour* and *willingness to invest and persist in the face of difficulties*. Other items showed less consistency of response but nonetheless highlight the positive way that the respondents viewed *learning and applying new skills in their job*, the *opportunity to perform in highly specialised jobs in the future* and *possessing the capabilities to take on more advanced or complex jobs*. Positivity as also expressed in terms of *working in current job*. These findings could provide evidence that the respondents experienced a sense of self-efficacy. In a study determining the factors influencing transfer with a management training intervention, Singh and Dutta (2020) indicate that trainees with high self-efficacy have more confidence in their ability to acquire competencies and solve workplace problems as opposed to those with low self-efficacy.

4.5.2 Training design

Table 8 presents the data in relation to training design.

Table 8: Training design

Training design	% Disagree	% Neutral	% Agree	Mean	Std. Dev.
Standard operating procedures are emphasised	4.17	8.93	86.90	4.02	0.700
During training, correct and incorrect workplace behaviours are discussed	10.12	10.71	79.17	3.83	0.896
There is on the job training, were experienced employees coach other employees	16.07	11.31	72.62	3.72	0.991
Error management and instruction processes are available to ensure rapid response	12.50	14.29	73.21	3.70	0.872
During training, the facilitator(s) allows us to make mistakes / errors, as a way of learning	20.24	13.10	66.67	3.56	1.031
Training and development needs of the employee are assessed	31.55	12.50	55.95	3.30	1.104
	Aggregate mean score			3.69	

The design of any training intervention should aid the trainee's ability to apply what has been acquired in training (Singh & Dutta, 2020). Training design factors that have been found to influence training transfer include content relevance, error management, behavioural modelling, and technological support (Ma et al, 2018). In this study respondents indicated consistent agreement in relation to the emphasis laid on *standard operating procedures being emphasised*, which could be an indication of content relevance. There was also some consistency for the *discussion of appropriate work behaviours, error management and instruction processes forming part of training design*. Less consistency was evidenced for *on-the-job training as a form of coaching and making errors as a way of learning*. This is perhaps supported for the item on the scale assessing training transfer, this being *employees are encouraged to explore and make mistakes*, that attracted bimodality of response and a 43% disagreement frequency count. The bimodality of responses in relation to the *assessment of employee training and development needs* suggests that not all employees may have experienced this. This links to the scales measuring experiences of succession planning, where inconsistency of response emerged in relation to the *identification of skills gaps linked to regular progress reviews and the management and development of employees to ensure that they are "future fit"*.

4.5.3 Work environment

Table 9 presents the information in relation to work environment.

Table 9: Work environment

Work environment	% Disagree	% Neutral	% Agree	Mean	Std. Dev.
Employees work together as a team to gain the rewards	16.07	13.69	70.24	3.76	1.075
Managers enable employees to go and attend training	16.07	9.52	74.40	3.68	0.998
Colleagues co-operate with each other to achieve standards of excellence irrespective of diverse personal feelings	18.45	10.71	70.83	3.68	1.040
My company recognises good performance and rewards employees	17.26	11.31	71.43	3.67	1.092
When we return from training, my peers and I apply the knowledge that we have learned	16.07	13.10	70.83	3.66	0.996
My effectiveness is a direct consequence of the training I have received	25.00	11.90	63.10	3.49	1.044
When I return from training, I always find opportunities to apply the new skills and knowledge I have learned	22.62	12.50	64.88	3.47	1.077
After training, I get feedback from other employees on how well I am applying what I have learned from training	35.71	17.86	46.43	3.10	1.024
Aggregate mean score				3.56	

Factors linked to the work environment that promote training transfer include the transfer climate, supervisor and peer support, opportunity to perform, accountability and feedback (Nazli, et al, 2015; Ma, et al, 2018). In this study while the responses to the work environment scale tended towards agreement, all received standard deviations exceeding 0.80, indicating inconsistency of response. This consistency was less so for the items dealing with *managers enabling employees to attend training* and *the opportunity to apply training knowledge on the job*. Bimodality of response was received in relation to *feedback from other employees on how well knowledge/skills are applied after training*.

5. Independent and dependent variables: analysis of sub-scale correlations

Pearson product-moment correlation coefficients (Table 10) were calculated to determine whether relationships existed between the independent and dependent variables as well as establish the strength and direction of any emerging relationships (Bryman et al., 2021).

Table 10: Pearson product-moment correlation coefficients (n=168)

Independent variables	Dependent variable – technical skills & knowledge transfer	Interpretation
Talent management	0.659	Strong positive relationship
Succession planning	0.716	Very strong positive relationship
Trainee characteristics	0.496	Strong positive relationship
Training design	0.608	Strong positive relationship
Work environment	0.679	Strong positive relationship

Strong positive relationships emerged between technical knowledge and skills transfer and the five variables of interest, with implementation of succession planning showing a very strong positive

correlation. To determine whether the independent variables predicted the dependent variable multiple linear regression analysis was conducted (Bryman, et al., 2021) (Table 11).

Table 11: Multiple linear regression analysis (n=168)

	Beta coefficient	Std. Error	B Coefficient	Std. Error	t value	p-value
Intercept			0.654	0.244	2.677	0.008
Talent management	0.125	0.093	0.120	0.090	1.336	0.183
Succession planning	0.355	0.101	0.307	0.087	3.526	0.001
Trainee characteristics	0.067	0.071	0.075	0.079	0.950	0.344
Training design	0.121	0.084	0.138	0.096	1.438	0.152
Work environment	0.196	0.091	0.189	0.088	2.157	0.032

The nature of the relationships between the independent variables of succession planning (0.001) and work environment (0.032) and the dependent variable technical knowledge and skills transfer were found to be predictive and statistically significant ($p < 0.05$). The beta coefficients suggests that succession planning explained 35.5% of the variance in technical skills transfer and work environment 19.6%. This confirms that succession planning and a supportive and enabling work environment contributed to knowledge and skills transfer in the company that formed the basis for this study.

6. Discussion of results

The study aimed to add knowledge surrounding the transfer of technical knowledge and skills in the automotive industry, understanding that there are organisations who have technical tacit knowledge embedded in employees who may exit voluntarily or involuntarily. The automotive sector, both nationally and globally, is experiencing a “brain drain” (Cullen & Calitz, 2017). A challenge arises when knowledge owners vacate employment without transferring their intellectual capital to other employees (Khumalo, 2012). To this end, this study explored employee experiences of the knowledge and skills transfer process. This also included an examination of the role played by talent management, succession planning, and the training inputs factors of trainee characteristics, training design and work environment.

While, in general, employees reported agreement in terms of the variables under study, for many of the items across the various scales measuring the dependent and independent variables there was a lack of consistency and bimodality of response. This suggests that the respondents had differing experiences. This may or may not be linked to demographic factors that were not investigated as part of this study, including age, qualification, occupational level, tenure, and department.

In relation to experiences of the transfer process, consistency of response was obtained in relation to the willingness to be coached or trained by senior or more experienced employees. The differing experiences regarding other items suggest that employees need greater support from their manager in terms of resources, knowledge, support, and feedback. Further, experienced employees need to be equipped with structured and well documented plans to facilitate the succession planning process.

In relation to experiences of talent management and succession planning, these emerged as areas for improvement, as it was with these two variables that the greatest inconsistency of response was received. This inconsistency suggests that improvements could be made, more particularly in relation

to the timely identification of internal talent, specifically that linked to highly specialised jobs. This is essential in ensuring a pool of employees to replace experienced employees when they exit. This finding raises consideration of a need to integrate talent management and knowledge management practices. Shabane (2017) reiterates the fact that when talented employees exit the organisation, tacit knowledge, which is particularly important in a manufacturing operation, exits with them. Integrating talent management and knowledge management practices will enable the organisation to identify employees who possess critical knowledge and create mechanisms to encourage them to share this knowledge with others. To this end Mazorodze and Buckley (2020) emphasise the role of mentoring and coaching as part of succession planning in transferring tacit knowledge.

A further finding relates to the importance of clearly defined PDPs as part of the succession planning process. If succession planning is being used as a vehicle to transfer knowledge and skills it is essential that the PDPs of recipients are clearly formulated and based on the demands of the planned position; further that there is a thorough and ongoing assessment of the skills gap of the recipient over time. This requires regular performance monitoring and feedback. With the mixed responses received in relation to equal opportunity, transparency, and fairness, it is important that management openly communicate about opportunities that are available as part of succession planning as well as the criteria for inclusion. Goh (2002) highlights that transparency in decision-making and the sharing of information is essential in enabling a knowledge-sharing culture.

In this study three training input criteria were examined for their role in the transfer process. These were trainee characteristics, training design and work environment. For trainee characteristics the respondents demonstrated self-efficacy through their expressed willingness to learn and persist, take responsibility, and confidence in their ability to take on more specialised jobs and complex tasks. While trainee characteristics did not emerge as a predictor of training transfer as highlighted by Singh and Dutta (2020) and Nazli et al (2015), this finding may suggest that employees need to be made aware of their role in ensuring the transfer process, more particularly as it relates to their sense of self-efficacy. This could be reinforced through recognition and reward programmes that celebrate milestones reached in demonstrating evidence of skills transfer (Obaid, et al., 2016). In terms of training design, the bimodal responses received in relation to the assessment of training and development needs suggests that this is an aspect that needs attention. This is supported by the finding in relation to the setting of PDPs linked to succession planning. While employees may be provided with PDPs, line managers may not always be aware of employee skills gaps. Lastly, regarding work environment, it appears that the respondents were enabled to attend training and apply newly learnt knowledge on the job. However, a more supportive work environment could be created by allowing greater opportunities for feedback, more particularly that from peers.

One of the objectives set of this study was to determine whether relationships existed between the independent variables (talent management, succession planning and training input factors) and the dependent variable (knowledge and skills transfer process). Positive relationships were determined for all with implementation of succession planning revealing a strong positive relationship. Multiple regression analysis further demonstrated a significant predictive effect for succession planning and work environment. This suggests the importance of ensuring best practices to promote technical knowledge and skills transfer. These are elucidated on in the managerial implications which follow.

7. Managerial Implications

Bansal (2014) emphasises the importance of retention in preserving institutional knowledge. However, understanding that highly experienced staff members will not be retained forever, it becomes important to deploy systems to transfer tacit knowledge. To this end succession planning is used. In this study the challenges that emerged in relation to knowledge and skills transfer centered on the implementation thereof and highlight the important role played by both management and HRM in this regard. They also highlight the need for an integration of knowledge management and talent management practices. To ensure this integrated approach the following considerations are raised:

- The development of a purposeful strategy to reinforce the importance of knowledge transfer programmes in retaining the organisation's intellectual capital. This strategy would entail identifying the reasons for knowledge and skills transfer, the risks of not doing so and the areas in which the company is at greatest risk for knowledge loss linked to key functions, roles, and scarce skills. The focus would be on those employees who possess tacit knowledge and skills accumulated over many years. These functions, roles and skills should be ranked in terms of severity of the associated loss.
- Succession planning and other knowledge and skills transfer mechanisms should be embedded in the organisational culture through regular formal and informal communication, including the provision of status updates. This communication should be transparent in terms of the expectations of the knowledge and skills transfer process, highlight the criteria for eligibility and stress the importance of equity and equality.
- Strategy must be supported at an operational level through identifying suitable recipients for succession planning. The relationship between source and recipient should be anchored in the requirements of the transfer process and this entails the clear identification of knowledge and skills gaps, and setting PDPs with clear objectives, time frames and developmental goals.
- HRM should assist in creating structured plans for knowledge and skills transfer linked to PDPs, as well as performance review and feedback schedules to ensure that recipients are provided with opportunities to experiment with new skills.
- HRM should ensure that the parties to the relationship are provided with the necessary training and information sessions to enable them to fulfil their respective roles in the transfer process, including identifying skills gaps, managing performance, and providing feedback. Further, all sources should have training focused on how to facilitate the transfer of tacit and explicit knowledge. This would include training on mentoring, coaching and presentation skills.
- A supportive transfer environment must be created that provides the opportunity to perform newly learned skills. To this end employees should be encouraged to explore and learn from their mistakes and provided with ample opportunities for feedback. This is facilitated where there is a good relationship between the source and recipient, so it is advisable that mentors are paired with trainees with whom they are willing to work. This will require the establishment of a pool of potential mentees and the need for transparency in the recruitment and identification of potential candidates at all levels of the organisation.
- HRM and managers should be jointly held accountable for succession planning in terms of transparency and fairness. This will require an audit of current positions by line managers and HRM to examine skills, years of service, years remaining to retirement, skills required for future positions, identification of potential employees, and setting of PDPs.
- Employees should be encouraged to explore opportunities for active self-development including seeking out mentors, self-study and demonstrating volunteerism to build on their sense of self-efficacy.
- The link between recognition and reward systems and the knowledge and skills transfer process should be made very clear in acknowledging effective transfer.

8. Limitations and further research

This study sought to provide recommendations to facilitate the knowledge and skills transfer process that is imperative when tacit knowledge threatens to exit with the departure of skilled and experienced employees. While the study was conducted in an automotive component manufacturer, the findings could be generalised beyond the automotive sector as experiences linked to the loss of intellectual capital are widespread in South Africa, more particularly in the manufacturing sector. The study is limited to the extent that it was conducted in one organisation and represents the impressions of respondents in that company. Further, no distinction was made between the source and beneficiary of the knowledge and skills transfer process understanding that the perceptions of these two groupings may have differed. Finally, no further analysis was conducted to determine whether the perceptions differed among employees from different departments, job families and levels of the organisation.

Future research could include determining the key identifiers of successful knowledge transfer through succession planning in the automotive sector as this may highlight valuable information in the planning and execution of transfer programmes. In this regard it would be valuable to determine the extent to which a successful mentoring programme facilitates effective transfer. Finally, it would be valuable to determine the value of incentivisation in motivating transfer best practices versus the role of internal (personal) drivers linked to transfer success.

9. Conclusion

In this study employee experiences of the technical knowledge and skills transfer process were investigated at an automotive component manufacturer. This included an examination of employee experiences with talent management, succession planning, and certain training input factors, these being trainee characteristics, training design and work environment. The study was conducted with a view to providing insight to improve the organisation's ability to retain intellectual capital, more particularly that experienced when employees exit. It is important that organisations plan proactively for both voluntarily and involuntary exits to ensure effective knowledge and skills transfer. This includes understanding the factors that influence the success of transfer programmes.

Succession planning and work environment were found to exert a significant and predictive effect on the knowledge and skills transfer process. These findings suggest the importance of ensuring that well-structured succession plans are implemented through the identification of key positions and future incumbents, and the setting of clearly developed PDPs linked to identified skills gaps to ensure the future suitability of employees to fill these key positions. Further, it is vital that a supportive work environment is created in which trainees are provided with opportunities to practice newly acquired skills and provided with feedback by both supervisors and peers in this regard.

Keywords

Organisational performance; Employee retention; Incentives; Employee Share Ownership Plans; Transparency

Abstract

In Africa, organisations are seeking strategies that can enhance competition, performance, employee retention and commitment. Numerous strategies as well as incentives have been introduced by management to help achieve their stated goals and desires. This article introduces ESOPs in Nigeria as a strategic incentive that can create a win-win situation for both organisation and its employees. This implies utilising ESOPs as an incentive that can increase organisational performance and provide financial support for employees during retirement. This article provides a conceptual framework and implications that promotes organisational success and employee well-being in Africa.

1. Introduction

Organisations that succeed in meeting the obligations of stakeholders ensure that top management develops a working relationship with their employees (Farach, Musnadi & Kesuma 2020; Pratheepkanth 2011, Sithole 2019). Management expects employees to perform their duties reliably, learn new skills and be responsive to organisational needs whilst employees expect management to provide them with a good working environment, as well as fair pay and fair treatment. Furthermore, motivation is required to address the mutual expectations of both management and employees. Organisations can therefore use motivation to achieve their stated goals and objectives as well as employees' expectations. Rogers (2021) concurs by stating that employees believe that the adoption of ESOPs had a positive effect on employees' effectiveness as the employees feel that they are "all in this together". Therefore, some form of cohesiveness is created.

Blasi, Kruse and Freeman (2018) concur with The Employee Ownership Association (2015a) by stating that ESOPs have been adopted by numerous organisations to motivate their employees to enhance productivity and performance. In addition, ESOP is a fundamental strategy that offers a more diverse ownership model, which organisations can employ for competing globally as well as improving productivity and profitability. Thompson (2005) and Tran (2020) assert that the notion behind the adoption of ESOPs is as a result of the beneficial outcome it produces. This implies that when employees are offered a stake in the organisation for which they work, the psychological effect of ownership makes them stay committed to the organisation. Employees are motivated to work harder and smarter as a result of them having a psychological sense of ownership. In addition, Ding and Chea (2021) found that ESOPs are cost effective, and that the adoption of ESOPs increase the value of the organisation, while organisations that adopted ESOPs have higher survival rates and lower employment turnover rates (Tran 2021).

The utilisation of ESOPs is gaining popularity in few Africa countries, such as Egypt and South Africa (Rosen 2013). In addition, the USA and European Countries have shown increasing interest and support in the utilisation of ESOPs as a result of the benefits it offers upon implementation (Martes 2012). As stated by Bryant and Brown (2022), the adoption of ESOPs leads to higher return

*Corresponding Author

³ E-mail address: Janine.kruger@mandela.ac.za

on assets, enhanced financial performance and increased productivity amongst better engaged employees. The successful adoption and implementation of ESOPs in these countries is dependent upon the mechanism utilised by management (Sithole 2019). Mazibuko and Boshoff (2003) and Yukl and Becker (2006) report that mechanism such as decision-making and empowerment is effective for the successful adoption of ESOPs. Furthermore, Logue and Yates (2015) purport that transparency and two-way communication can be utilised as a mechanism to aid the adoption of ESOPs. This study introduces ESOPs adoption in Nigeria and investigates the effectiveness of utilising transparency as a mechanism in the adoption of ESOPs.

2. Problem Investigated

Based on previous research (Olugbenga 2011; Saka & Ajayi 2010), most organisations in Nigeria are implementing financial incentive schemes such as profit sharing, premium bonus, measured day work, simple piece work, geared incentive schemes, performance-related and group-incentive schemes. In addition, some Nigerian organisations also adopted the use of piece rate, commissions, gain sharing, golden handcuffs and stock options (Ude & Coker 2012). Dede (2019) also noted the inclusion of employee participation in management decision making in any form (including ESOPs) is not frequently used in developing countries such as Nigeria. These financial incentive schemes assist in motivating employees, thus reducing idle time, job dissatisfaction and absenteeism, while increasing employee effort and organisational performance (Armstrong 2010; Ude & Coker 2012). On the contrary, Eneh, Anyadighibe and Etul (2019) conducted a study at an organisation in the South-South of Nigeria who failed to pay bonuses. The recommendation was to adopt a bonus scheme other than a bonus payout as there was no significant relationship between the bonus payment and employee output. Therefore, as there are many different types of financial incentive schemes, it is essential to implement the best financial incentive scheme that will assist in achieving the desired outcomes for both management and employees (Amos, Ristow, Ristow & Pearse 2009).

Although the financial incentive schemes present various benefits for organisations, many Nigerian organisations did not achieve their desired goals of retaining talented employees and enhancing employee commitment. Therefore, the financial incentive schemes implemented by some of the organisations in Nigeria did not contribute to the desired outcomes as identified by management (Armstrong 2010; Saka & Ajayi 2010). In addition, the adoption of ESOPs amongst organisations in Nigeria is not common. A possible reason for the lack of adoption of ESOPs in Nigeria is cited as the absence of financial structures required for the management of ESOPs and the lack of legislation supporting wider employee ownership (UK Essay 2013). Abdullah and Cheluget (2020) highlighted that the first ESOP in Africa was established in Egypt in 1989 and thereafter spread to other African countries; however, the participation rate and the determinants of participation are not clear. The reasons cited by Abdullah and Cheluget (2020) are the lack of transparency and limited research regarding ESOPs in Africa. A study by Davies and Lucky (2018) highlighted that the use of share base payments in Nigeria, such as ESOPs, are more appropriate for organisations where funding for the organisation is obtained from public investors and when cash payments are not financially prudent. It was also noted that policies for share base payments should be integrated and harmonised with the ownership structures of the organisation.

Furthermore, for the adoption of ESOPs to be successful, timely, clear and open information is required by employees and trade unions. Therefore, transparency is of vital importance as it enhances trust and creates an environment that is conducive for effective decision-making, collaboration and co-operation; all important aspects for the successful adoption of ESOPs (L'Etang & Pieczka 2012). Although literature regarding ESOPs is available, there is a lack of academic literature relating to the adoption and corporate governance of ESOPs in Nigeria.

3. Research Objectives

The primary objective of this study is to investigate the effectiveness of transparency in the adoption of ESOPs. Furthermore, this study investigates the outcomes of the adoption of ESOPs. Therefore, the secondary objectives are the following:

- SO¹ To determine the influences of transparency and what the influence is of these antecedents are transparency when adopting ESOPs.
- SO² To determine how transparency of adoption of ESOPs influences the outcomes of adoption of ESOPs.

4. Hypotheses

The research hypotheses formulated are based on the conceptual framework depicted in Figure 1. The conceptual framework depicts the influence and outcomes of the adoption of ESOPs as measured by transparency. In addition, the conceptual framework shows that the adoption of ESOPs (transparency) will produce outcomes, namely, organisational performance, employee retention and employee commitment. Based on the conceptual framework, the research hypotheses of this study are stated as follows:

- H¹*: There is a relationship between trade union responsiveness and the adoption of ESOPs (transparency).
- H²*: There is a relationship between reforms and the adoption of ESOPs (transparency).
- H³*: There is a relationship between awareness of employee benefits and the adoption of ESOPs (transparency).
- H⁴*: There is a relationship between taxation implication and the adoption of ESOPs (transparency).
- H⁵*: There is a relationship between the adoption of ESOPs (transparency) and organisational performance.
- H⁶*: There is a relationship between the adoption of ESOPs (transparency) and employee retention.
- H⁷*: There is a relationship between the adoption of ESOPs (transparency) and employee commitment.

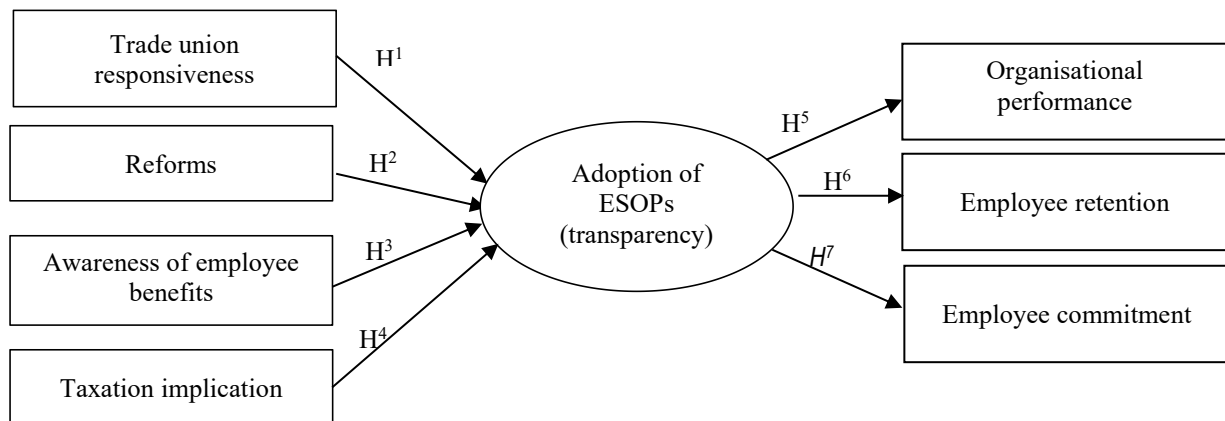

Figure 1: Proposed relationships between influences of and the outcomes of ESOPs through transparency

5. Literature Review

This section provides discussions on the influence (trade union responsiveness, reforms, awareness of employee benefits and taxation implication) and outcomes (organisational performance, employee retention and employee commitment) of the adoption of ESOPs (transparency).

5.1. Transparency as a mechanism of ESOP adoption

ESOPs are defined contribution plans or employee-owner programmes that allow management to provide its employees with ownership interest in the organisation (Groll, Maxfield & Nedrow 2010, Handayani & Yurniwatti 2020). In addition, ESOPs can also be described as retirement or compensation plans (Townsend 2020) that allow employees to become owners of equity or stock (shareholders) in the organisation for which they work. Numerous findings reveal a positive association between ESOPs and concepts such as employee commitment, productivity,

behaviour/attitudes, participation and involvement, as well as retention and organisational performance (Singadimedja, Rahmawati & Mantili 2021; Zhu, Hoffmire, Hoffmire & Wang 2013). Employee Ownership Association (2015b) and Singadimedja et al. (2021) purport that when ESOPs are used as compensation, it enhances and aligns the interest of employee-owners and management and increases employee commitment, organisational performance, talent retention, profitability, productivity and innovation.

Various organisation in numerous countries have successfully adopted and implemented ESOP as a strategic tool to achieve both employee and organisational goals (Sithole 2019). A study by Bezuidenhout, Bischoff and Mashayamombe (2020) found the reason for employees striking to be a hidden transcript involving the ESOP and dividend taxes that were unexpectedly levied. Thus, the employees did not trust the unions to represent them adequately. Therefore, in order to successfully adopt ESOP and enjoy the benefits it provides certain mechanism must be in place. Ura (2015) and Logue and Yates (2015) support this notion by stating that that the adoption of ESOPs will only be successfully if mechanism such as transparency and two-way communication are in place. Furthermore, Mazibuko and Boshoff (2003) suggest that mechanism such as decision-making is required for the successful adoption of ESOPs. Yukl and Becker (2006) purport that utilising ESOPs as a tool for empowering employees promotes successful ESOP adoption. The empirical findings of Gamble, Culpepper and Blubaugh (2002) show that employee empowerment is fundamental to the successful adoption of ESOPs. Therefore, transparency, two-way communication, decision-making and empowerment are effective mechanism required for the successful adoption of ESOP. This study focuses on investigating the effectiveness of transparency in the adoption of ESOP in Nigeria.

Henriques (2007) defines transparency as conveying the truth, the absence of corruption and the presence of ethical practices in an organisation. Furthermore, Zowghi and Jin (2014) define transparency as the provision of true, relevant and timely information about the actions and activities of organisations to the public. Transparency refers to stakeholders' rights and access to information. In other words, transparency refers to management's ability to be open and present precise and true information to all stakeholders (Singadimedja et al. 2021; Villeneuve 2014). Transparency is a fundamental and key aspect of the business environment. One of the key successes of any organisation is their ability to operate in a manner that is honest and open to all stakeholders. Research regarding ESOPs reveals that transparency is a critical component for the successful adoption of ESOPs. In order for management to successfully adopt ESOPs, timely, clear and open information must be given to employees and trade unions. Transparency enhances trust and it creates an environment for the effective decision-making, collaboration and co-operation of all parties involved in the adoption of ESOPs (L'Etang & Pieczka 2012). Furthermore, Oge (2016) argues that transparency in the adoption of ESOPs will help management to be open in their dealings. According to Oge (2016), transparency will also eliminate corruption related to the misappropriation of shares and nepotism. Logue and Yates (2008) support that the successful adoption of ESOPs is an advantage that management can achieve from communicating and sharing timely and full information. Villeneuve's (2014) research reveals that transparency in a system leads to greater trust, increases stakeholder participation and improves governance. Therefore, insufficient and false information provided by management, on the adoption of ESOPs, will negatively influence the interest and participation levels of employees and trade unions.

5.2. Factors influencing transparency in the adoption of ESOPs

This section outlines and provide theoretical discussion of the possible factors that influences the effectiveness of transparency in the adoption of ESOPs. Figure 1 shows that the influences of transparency in the adoption of ESOPs comprises of trade union responsiveness, reforms, awareness of employee benefits and taxation implication.

5.2.1. Trade union responsiveness

Trade unions are referred to as representatives of employees as they fight against discrimination and promote equality, in addition to which they bargain and protect the rights and interests of employees (Ethical Trading Initiative 2010) while positively influencing employees' overall life satisfaction.

(Lee 2022). Trade union responsiveness is the ability of trade unions to have an effective relationship and share accurate information regarding ESOPs with members and management (Peetz 1998). For the purpose of this study, trade union responsiveness refers to the extent to which trade unions respond quickly to the suggestions, requests, complaints and questions from trade union members and management regarding the adoption of ESOPs.

According to Poole and Jenkins (2013) and Townsend (2020), trade unions perceive ESOPs to be a potential threat that weakens their bargaining power as well as their ability to represent employees. Irrespective of the negative attitude that trade unions have regarding the adoption and implementation of ESOPs, Soos (2011) states that trade unions are beginning to understand, support and view ESOPs differently. In addition, McHugh, Cutcher-Gershenfeld, and Polzin (1999) state that trade unions have understood that ESOPs can be valuable when they help members gain secured employment, prevent unfavourable takeovers and restrict management control that impedes on the rights of their members. Due to this advantage, trade unions are willing to carefully embrace the adoption and implementation of ESOPs as highlighted by Sithole (2019), especially within the mining industry.

5.2.2. Reforms

Reforms are approaches taken by the government to bring change, transformation and improvement to the economy (Bouvard, Dohrmann & Lovegrove 2009). Reforms refer to the ability of the government to enforce change in order to improve a condition. For the purpose of this study, reforms refer to government intervention in creating an adjustment or improvement in legislative policies or bills regarding the adoption of ESOPs and the wider financial participation of employees. Currie (2005) suggests that the success or failure of an economy is dependent on the decisions and policies created by policy makers. In addition, policies to achieve success in reforms are necessary for rapid and sustainable growth as well as improvement in institutional, legal and economic conditions. Government intervention through the creation of reforms is crucial for the successful adoption of ESOPs. The legislative bills and policies that the government enacts can positively or negatively influence the adoption of ESOPs. Ripperger (2013) states that reforms concerning ESOPs are a strategy that assists owners of organisations to exist without shutting down or selling out, while Sithole (2019) indicates that most developing countries are using ESOPs as a reform strategy. The reforms created by the government can encourage the wider financial participation of employees and it can encourage organisations to become employee-owned organisations (Ripperger 2013).

5.2.3. Awareness of employee benefits

Awareness refers to being knowledgeable and well-informed about a particular situation of interest (Mishra 2007). In addition, awareness of employee benefits refers to having an in-depth understanding of employee ownership. Awareness of employee benefits in this study refers to employees' level of understanding and knowledge of ESOPs. In addition, awareness of employee benefits stretches to management's ability to enlighten trade unions and employees with full information (how to participate, benefits, process, percentage of ownership, risks and drawbacks) regarding ESOPs (Employee Ownership Association 2015b; Landau, Mitchell, O'Connell & Ramsay 2007a). The awareness of ESOPs is crucial for the successful adoption of ESOPs. This implies that when employees, management and trade unions understand and are familiar with the concept, process, benefits and risks of ESOPs they are likely to show considerable interest in the adoption of ESOPs (Employee Ownership Association 2015b). The increased awareness of ESOPs will have a positive influence on their adoption while the lack of awareness of the relevance and benefits of ESOPs is likely to negatively influence the adoption of ESOPs (Employee Ownership Association 2015b).

5.2.4. Taxation implication

ESOPs are perceived to have numerous benefits and one of these includes tax advantages for ESOP organisations. Management is likely to adopt ESOPs as a result of the advantages of tax incentives from which they can benefit. In addition, government may intervene and encourage the adoption of ESOPs so as to also benefit from tax, within certain limits (NCEO 2015a; Rauh 2006; Singadimedja, et al. 2021; Sithole 2019). Sylvain (2011) states that governments promote the adoption of ESOPs through advantageous tax provisions that they grant to organisations. In addition, Kruse (1996)

indicates that the special tax incentives on ESOPs provided by the government may be the reason why numerous organisations adopt ESOPs. Furthermore, organisations facing high tax burdens or recent increases in taxed income may increase the probability of ESOP adoption by organisations.

5.3. The outcomes of transparency in the adoption of ESOPs

This section focuses on the outcomes of transparency in the adoption of ESOPs. Figure 1 shows that the outcomes of transparency in the adoption of ESOPs are organisational performance, employee retention and employee commitment.

5.3.1. Organisational performance

Organisational performance refers to management's success in achieving its stated goals, objectives and targets that relate to financial, market, shareholder value and production outcomes (Thomas, Deshmukh & Kumar 2008). Organisational performance is the basic responsibility of top management and it enables top management to evaluate results and actions as well as benchmark or compare their performance with their competitors (Richard, Devinney, Yip & Johnson 2008). Therefore, management seeks strategies that can help them enhance the performance of the organisation. According to Hallock Ronald and Venneman (2003), Sithole (2019) and Ding and Chea (2021), an ESOP can be utilised by management as an effective strategy to improve the performance of both employees and the organisation. Yeni, Suprasto and Astika (2019), Abdullah and Chluget (202) and Ding and Chea (2021) found that there is a positive and significant relationship between the adoption of ESOPs and organisational performance. In addition, organisations adopt transparency as a mechanism for ESOP adoption not only to positively influence the attitudes and behaviours of employees but also to improve organisational productivity and performance, as well as to strengthen their competitive edge (Hua 2006). Caramelli's (2015) research findings reveal that there is a significant and positive relationship between transparency in ESOPs and organisational performance. The utilisation of transparency as a mechanism for ESOPs adoption will enable management to achieve high performance that will satisfy the needs of both stockholders and stakeholders (Armstrong 2012).

5.3.2. Employee retention

Employee retention refers to the process by which management implements strategies that are designed to increase the retention of talented employees with the skills and knowledge needed for the achievement of success (Giri 2008). Employee retention is vital to ensure the long-term survival and success of any organisation because it assists in avoiding the high cost associated with high employee turnover (employee that leaves an organisation). Costs associated with employee turnover include low productivity, high expense in recruiting and training new employees and low employee morale (Phillips & Connell 2004). In addition, retaining employees with outstanding skills, talent and knowledge is crucial for organisational success and competitiveness. Numerous organisations understand the advantage of having highly talented employees and, as a result, they devise strategies to attract, recruit, reward and retain talents. The research findings of Landau, Mitchell, O'Connell, Ramsay and Marshall (2009) reveal that ESOPs are used as a strategy by organisations to attract, recruit and retain skilled employees. Pratt (2009) maintains that ESOPs are an effective strategy utilised by HRM to attract and retain skilled employees while Tran (2021) highlights that the adoption of ESOPs result in lower employment turnover rates. The utilisation of ESOPs allows employers to share capital ownership with employees on a long-term basis. KPMG (2011) affirms that retention is one of the key drivers for ESOPs. In addition, the popular reason for the adoption and implementation of ESOPs is to create wealth for employees and to attract and retain employees. Furthermore, KPMG (2011) investigated organisations' objectives for adopting and implementing ESOPs. Their study revealed that the retention of skilled employees is the key objective for the adoption of ESOPs by the organisations being investigated.

5.3.3. Employee commitment

Employee commitment refers to the extent to which employees are willing to persist in meeting organisational goals, without reluctance to changing plans but having a sense of obligation to achieving organisational success (Dixit & Bhati 2012; Vance 2006). Thus, employee commitment

refers to employees' unwavering dedication and loyalty to their organisation's mission and values as well as their persistence in achieving the stated goals and objectives. Vance (2006) adds that in exchange for employee commitment, numerous organisations provide some form of value, such as job security, compensation or incentives (ESOPs, profit sharing or performance bonuses). Landau, Mitchell, O'Connell and Ramsay (2007b) and Sithole (2019) assert that a plethora of research in human resource management focusses on the investigation of the influence of the capacity of ESOPs on employee commitment. These researchers report that organisations adopt and implement ESOPs as a means to increase the commitment of employees which is aligned with the findings of Dede (2019).

6. Research Methodology

The following sub-sections address the research design, the sample selection and measuring instrument as well as the statistical analysis adopted for this study.

6.1. Research Design

Based on the ontology, epistemology and methodology (Graham & Thomas 2008), a positivistic paradigm using the quantitative research method is adopted for this study. The quantitative research method assists in theories and hypotheses to be tested using a large representative sample of the population (Rubin & Babbie 2009). The quantitative research method gathered secondary and primary data in order to attain the objectives of the study.

6.2. Sample Selection

Nigeria comprises of six geopolitical zones (North-Central, North-East, North-West, South-East, South-South and South-West). The four largest geopolitical zones in terms of size are selected for this study. Therefore, the population of this study included all employees located in Lagos (South-West), Abuja (North-Central), Port-Harcourt (South-South) and Kano (North-West). The non-probability sampling technique, and more specifically convenience and snowball sampling, was used to select respondents for the four geopolitical zones. The sample frame for this study is the list of organisations within the financial services, consumer goods, oil and gas, and service sectors located in Abuja, Kano, Port Harcourt and Lagos (representation of the four geopolitical zones namely North-Central, North-West, South-South and South-West). The four sectors selected for this study are the four largest sectors in terms of market capitalisation on the Nigerian Stock Exchange at the time of data collection (The Nigerian Stock Exchange 2015).

As this study forms part of a larger study, the sample size for the full study was 375 respondents (employees). The sample size was calculated as follows: 15 variables (7 independent, 5 mediating and 3 dependent) * 5 items per variable * 5 respondents per item equal a sample size of 375 employees. In order to have an adequate number of respondents for the four largest sectors from the four geopolitical zones, a total of 1 000 questionnaires were distributed to achieve the sample size of 375. However, after the completion of the fieldwork in the four geopolitical zones, a total of 773 completed questionnaires were obtained. It should be noted that only 4 of the original 15 independent, 1 of the original 3 mediating variables and the three independent variables form part of the current study presented.

6.3. Measuring Instrument

A self-administered questionnaire was used to gather data from the trade unions and management of organisations in Nigeria. Trained fieldworkers were used to distribute and collect the data. The fieldworkers were selected due to their familiarity with and experience in data collection, and their access to the target population of the study. The questionnaire used in this study contained items that were self-developed and adapted from previous studies. Items from previously used scales with sufficient reliability were adapted are for the 5 items used measuring trade union responsiveness (Mazibuko & Boshoff 2003), the 5 items used to measure taxation implication (Oberholzer & Stack 2014; Revenue-Irish Tax & Customs 2013), the 5 times used measuring transparency (Al-Mahayreh & Abedel-qader 2015, Schnackenberg 2010; Rawlins 2008), the 7 items used to measure organisational performance (Tshuma 2013; Xingwana 2013), the 7 items used to measure employee retention (Kyndt, Dochy, Michielsen & Moeyaert 2009) and the 7 items used to measure employee

commitment (Gathungu 2016; Jaros 2007). The items used to measure reform (5 items) and awareness of employee benefits (5 items) were self-developed from existing literature. The adapted items were paraphrased and modified to suit the context of this study. The questionnaire comprised of two sections, namely Section A and Section B. Section A of the questionnaire employed the use of a 7-point Likert scale ranging from strongly disagree to strongly agree to measure the variables under investigation. Section B of the questionnaire solicited biographical information from the respondents. The cover letter detailing the purpose of the study and the rights of the respondents accompanied the questionnaire.

6.4. Statistical analysis

A pilot study was conducted among 25 respondents in order to pre-test and evaluate the correctness of the measuring instrument before it was deployed on a larger sample size of research interest. Based on the feedback received, the necessary changes were made to the questionnaire. After the collection of the data, the primary data gathered was coded with Microsoft Excel and data analysis was carried out using Statistica software package (version 12). The data analysis consisted of four distinct stages namely, exploratory factor analysis (EFA), reliability (Cronbach's alpha), descriptive statistics (mean and standard deviation) and regression analysis.

Everitt and Hothorn (2011) indicate that EFA is a complex multivariate statistical method utilised by researchers to identify the underlying structure of a large set of variables. EFA was utilised in this study as a psychometric evaluator for construct validation. This study obtained evidence of convergent and discriminant validity through EFA. Kline (2014) indicates that factors are dimensions that explain the relationship between variables by their factor loadings. Asthana and Bhushan (2016) and Ostello and Osborne (2005) explain that 0.40 is considered as a practical and significant loading in an EFA matrix. Brink, Van Der Walt and Van Rensburg (2006) describe reliability as the extent to which a measuring instrument is consistent, stable and provides results that are similar when utilised repeatedly. This study considered a Cronbach's alpha coefficient of 0.7 and above as an acceptable level of reliability (Baggio & Klobas 2011). Multiple regression analysis is a statistical technique used to determine the relationship or how well the independent variables explain the dependent variable (Baran & Jones 2016).

7. Results

The descriptive statistics of both the respondents and the variables under investigation are discussed. The discussion is followed by the validity and reliability of the measuring instrument where after the MRA results are presented.

7.1. Descriptive statistics of respondents and variables under investigation

The results from the descriptive analysis of the respondents were presented as means and standard deviations. The sample size obtained after fieldwork was 773 comprising of 369 were male and 404 female respondents. Forty-two percent (42%) of respondents belonged to the age group 30 to 39 years while the lowest percentage, five percent (5%), were 60 years and older. Eleven percent (11%) of respondents belonged to the manufacturing organisational sector, whilst the highest representative industry is service delivery with 38%.

Furthermore, the highest percentage (26%) of employees has been employed for a period of 16 to 20 years while sixteen percent (16%) have been under the employ of their organisation for 11 to 15 years. Thirty-four percent (34%) of the respondents indicated that they belonged to a trade union whilst sixty-six percent (66%) reported that they do not belong to a trade union. Organisations listed on the stock exchange constitute thirty-two percent (32%) of the respondents' organisations, while sixty-eight percent (68%) are not listed on the stock exchange.

Table 1 presents a summary of the descriptive statistics (mean and standard deviation) of the variables used in this study. The descriptive statistics is presented as means and standard deviation. Table 4 shows that the majority of the mean score falls between 4.33 and 4.66. This implies that employees, to some extent, agree that the responsive nature of trade unions regarding their rights and interests will

influence their ability to welcome the adoption of ESOPs. Employees will slightly agree to the adoption of ESOPs if the government will create favourable reforms and employees are likely to consider the adoption of ESOPs if they are aware of all the benefits that the compensation plan offers.

Table 1: Descriptive Statistics of the Variables Under Investigation

Variables	Mean	SD
Trade union responsiveness (TUR)	4.33	1.17
Reforms (REF)	4.34	1.27
Awareness of employee benefits (AOEB)	4.50	1.24
Taxation implication (TAX)	4.38	1.22
Transparency (ESOP)	4.36	1.28
Organisational performance (OP)	4.42	1.25
Employee retention (ER)	4.50	1.20
Employee commitment (EC)	4.66	1.37

In addition, employees agree to a certain extent that they will support and welcome the adoption of ESOPs if they can enjoy the benefits of paying lower taxes. Employees agree that transparency (ESOP) is needed for them to welcome and support the adoption of ESOPs. Employees feel that they will support ESOP adoption if management provides them with true and full information regarding the process, benefits and risks of ESOPs. Employees agree, to some extent, that the adoption of ESOPs will be beneficial in improving profitability, service delivery, efficiency, and innovation in their organization. In addition, employees, to some extent, agree to remain and stay committed to their respective organisations if management adopts an ESOP.

7.2. Validity and reliability

Table 2 provides a summary of the results after EFA and summary of all constructs and items (factor loadings of 0.40 as minimum) that loaded together to define a construct.

Table 2: Summary of Factor Loading Matrix of All Variables

Variables	Items accepted	Minimum loadings	Maximum Loadings
Trade union responsiveness	7	0.407	0.715
Reforms	7	0.522	0.665
Awareness of employee benefits	10	0.435	0.675
Taxation implication	5	0.594	0.701
Transparency	5	0.495	0.692
Organisational performance	7	0.518	0.769
Employee retention	10	0.486	0.719
Employee commitment	4	0.632	0.794

The retained variables and the items measuring each of the variables are summarized in Table 3.

Table 3: Empirical Factor Structure – Influences and Outcome

Latent variables	Items
Trade union responsiveness (TUR)	TUR 1-6; MR 1
Reforms (REF)	REF 1-6; TKO 6
Awareness of employee benefits (AOEB)	COMP 1-6; ESOPA 3-6
Taxation implication (TAX)	TAX 2-6
Transparency (ESOP-1)	ESOPT 1-5
Organisational performance (OP)	OP 1-7
Employee retention (ER)	ER 1-7; EC 1-3
Employee commitment (EC)	EC 4-7

The results in Table 4 indicate that the Cronbach alpha values of all variables measured lies between 0.7 and 0.8. Therefore, the measuring instrument developed for this study demonstrated sufficient and acceptable reliability.

Table 4: Cronbach's Alpha – Internal Consistency

Latent variables	Cronbach's alpha
Trade union responsiveness (TUR)	0.81
Reforms (REF)	0.85
Awareness of employee benefits (AOEB)	0.88
Taxation implication (TAX)	0.79
Transparency (ESOP-1)	0.79
Organisational performance (OP)	0.84
Employee retention (ER)	0.86
Employee commitment (EC)	0.72

As the measuring instrument is valid and reliable, the data can be further analysed.

7.3. Regression analysis

Regression analysis is a statistical technique that describes, explains and predicts the relationship and the effect of the relationship among given variables (independent and dependent variables) (Seber & Alan 2012). This study carried out multiple regression analysis in order to explore and estimate the forms of the relationship among the independent and dependent variables. The researcher investigated whether the independent variables had a considerable influence on the adoption of ESOPs, as measured by transparency. In addition, the relationship between the mediating variables and dependent variables was investigated. Table 5 provides the results of the regression analysis between the independent variables and the adoption of ESOPs as measured by transparency.

Table 5: Relationship between Independent Variables and the Adoption of ESOPs as Measured by Transparency

N=773	Regression summary for dependent variable					
	b*	Std.Err. of b*	B	Std.Err. of b	t(766)	p-value
Intercept			0.759	0.172	4.406	0.000
TUR	0.091	0.036	0.101	0.039	2.561	0.011
REF	0.317	0.037	0.320	0.037	8.642	0.000
AOEB	0.205	0.040	0.212	0.041	5.157	0.000
TAX	0.123	0.036	0.129	0.037	3.467	0.000

Table 5 provides a summary of the influence of trade union responsiveness, reforms, awareness of employee benefits and taxation implication on the adoption of ESOPs, as measured by transparency.

Table 5 indicates that although trade union responsiveness ($b = 0.101, p < 0.011$) has a moderate relationship with transparency, reforms ($b = 0.320, p < 0.000$), awareness of employee benefits ($b = 0.212, p < 0.000$) and taxation implication ($b = 0.129, p < 0.000$) are positively related to transparency as an attribute of the adoption of ESOPs. The four variables collectively indicate that 40% of variability in the model explains the transparency in the adoption of ESOPs. The moderate relationship between trade union responsiveness and the adoption of ESOPs as measured by transparency can be linked to the trade unions' willingness to embrace the adoption and implementation of ESOPs (Sithole 2019). The positive relationship between reforms and the transparency in the adoption of ESOPs is due to the wider participation of employees to become employee-owned organisations and the use of ESOPs to reform organisations (Ripperger 2013; Sithole 2019). The positive relationship between awareness of employee benefits and transparency in the adoption of ESOPs is aligned with Employee Ownership Association (2015b) and Landau et al. (2007a). The results of the relationship between the taxation implications and transparency in the adoption of ESOPs supports the results of Kruse (1996) and Sylvain (2011).

Tables 6, 7 and 8 indicate that relationships exist between the adoption of ESOPs as measured by transparency and each of the three dependent variables, namely organisational performance, employee retention and employee commitment.

Table 6: Relationship between Adoption of ESOPs as Measured by Transparency and Organisational Performance

Regression summary for dependent variable: OP						
N=773	b*	Std.Err. of b*	B	Std.Err. of b	t(769)	p-value
Intercept			1.093	0.162	6.767	0.000
Transparency	0.275	0.036	0.268	0.035	7.651	0.000

Table 6 shows that transparency ($b = 0.268, p < 0.000$) in the adoption of ESOPs exert a positive significant influence on organisational performance. This result concurs with the results of HallockRonald and Venneman (2003), Sithonel (2019) and Ding and Chea (2021).

Table 7: Relationship between Adoption of ESOPs as Measured by Transparency and Employee Retention

N=773	Regression summary for dependent variable: ER					
	b*	Std.Err. of b*	B	Std.Err. of b	t(769)	p-value
Intercept			1.320	0.156	8.488	0.000
Transparency	0.222	0.036	0.207	0.034	6.145	0.000

Table 7 shows that transparency ($b = 0.207$, $p < 0.000$) in the adoption of ESOPs is significantly related to employee retention which supports the results reported by Landua et al. (2009), Pratt (2009) and KPMG (2011).

Table 8: Relationship between Adoption of ESOPs as Measured by Transparency and Employee Commitment

N=773	Regression summary for dependent variable: EC					
	b*	Std.Err. of b*	B	Std.Err. of b	t(769)	p-value
Intercept			1.823	0.197	9.267	0.000
Transparency	0.091	0.040	0.097	0.043	2.281	0.022

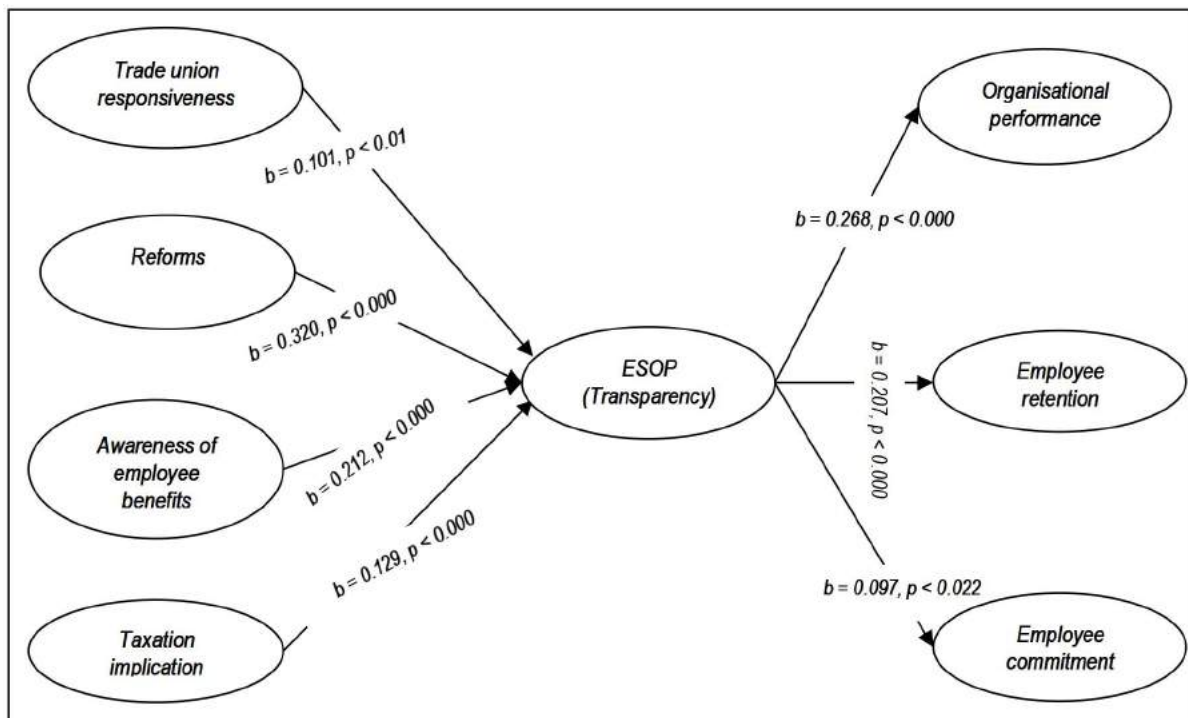

Furthermore, Table 8 indicates that transparency ($b = 0.097$, $p < 0.022$) has a moderate and significant relationship with employee commitment. The results reported by Landua et al. (2007b), Sithole (2009) and Vance (2006) are similar to those presented in Table 8.

7.4. Findings on the formulated hypotheses

Based on the results presented in Table 5, a statistically significant positive relationship exists between trade union responsiveness ($b = 0.101$, $p < 0.05$) and the adoption of ESOPs, as measured by transparency. Therefore, H^1 , stating that there is a relationship between trade union responsiveness and the adoption of ESOPs (transparency), is accepted. In addition, a statistically significant positive relationship exists between reforms ($b = 0.320$, $p < 0.000$) and the adoption of ESOPs, as measured by transparency. Therefore, H^2 , stating that there is a relationship between reforms and the adoption of ESOPs (transparency), is accepted. Evident from Table 5, there is a significant positive relationship between awareness of employee benefits and the adoption of ESOPs as measured by transparency ($b = 0.212$, $p < 0.000$). Therefore, H^3 is accepted. Furthermore, H^4 , stating that there is a relationship between taxation implication and the adoption of ESOPs (transparency), is accepted as taxation implication ($b = 0.129$, $p < 0.000$) is significantly and positively related to the adoption of ESOPs, as measured by transparency.

The fifth hypothesis states that there is a relationship between the adoption of ESOPs (transparency) and organisational performance. Evident from Table 6, the adoption of ESOPs, as measured by transparency ($b = 0.268$, $p < 0.000$), has a significant and positive relationship with organisational performance. Therefore, H^5 is accepted. In addition, H^6 that proposes a relationship between the adoption of ESOPs (transparency) and employee retention, is accepted as a statistically significant positive relationship is found between the adoption of ESOPs, as measured by transparency ($b = 0.207$, $p < 0.000$), and employee retention (see Table 7). Based on Table 8, a statistically significant moderate relationship exists between the adoption of ESOPs, as measured by transparency ($b = 0.097$, $p < 0.05$), and employee commitment. Therefore, H^7 hypothesising that a relationship exists between the adoption of ESOPs (transparency) and employee commitment, is accepted.

The hypothesised results of the relationships between variables, based on employee perceptions of transparency and the adoption of ESOPs, are illustrated in Figure 2.

The empirical results indicate that employees feel that if an ESOP is adopted, trade union leaders will act in their best interests and provide them with feedback regarding the ESOP decisions made by their organisations. The empirical results show that employees believe that if an ESOP is adopted, trade union leaders will carefully negotiate the ESOP terms and conditions with management on their behalf.

In order to successfully adopt ESOPs, and address issues relating to ESOP adoption, there should be a strategic collaboration between trade union and management. Organisations are required to consult trade unions and inform them of the intention to adopt and implement ESOPs. During dialogues (bargaining and negotiating ESOP terms and conditions), management is advised to share true and concise information regarding ESOP adoption to the trade unions. Furthermore, trade union heads should promote strategic collaboration between the union and employees. Trade union heads should carefully represent employees and negotiate the terms and conditions of ESOP with management. Trade union heads should be responsive by providing employees with feedback and answers regarding ESOP-related decisions made by management.

8.2. Reforms

The empirical results show that the successful adoption of ESOPs is dependent on government intervention through the creation of advantageous reforms in policies and laws that can aid the adoption of ESOP. The implications of these results are that employees believe that the government will create reforms for ESOP adoption to promote a sense of ownership for employees and shared capitalism.

The successful adoption of ESOPs is dependent on government intervention through the creation of reforms in policies and laws. Therefore, government should create reforms on taxation policies and shared capitalism. The reform on taxation (tax incentives) should be specific and meant for organisations and employees who are willing to adopt and implement ESOPs in their organisations. The adoption of ESOPs will be successful if the government creates reforms in laws focused on promoting shared capitalism and the economic empowerment of employees. In other words, the government should ensure that it supports lower income employees by creating reforms in laws that encourage a broader spread of ownership.

8.3. Awareness of employee benefits

The empirical results reveal that employees will consider the adoption of ESOPs if they have more knowledge of how ESOPs benefit them. Therefore, employees feel they will consider the adoption of ESOPs if they know that it can assist them in saving for retirement and can provide financial security for themselves and their family.

Awareness of employee benefits is crucial for promoting the adoption of ESOPs. The lack of awareness of ESOPs is the primary barrier to ESOP adoption. Therefore, to create awareness and promote the adoption of ESOPs, government and organisations should resort to utilising advertisement tools (TV, radio, hand-bills and billboards) to create ESOP awareness and attract the attention of a large number of people. Furthermore, ESOPs can be promoted by the government and public organisations through the utilisation of cell phone sms, car wraps, social media and pay-per-click (PPC) advertisements. Private organisations can utilise media such as internal notice boards, newsletters, emails, mails to create awareness of ESOPs within the organisation.

8.4. Taxation implication

The implication of these results is that employees believe that, when an ESOP is adopted, they will enjoy an increased sum in their retirement savings to cover their income tax. Employees feel that, if an ESOP grants them tax incentives, they will accept tax charges from ESOP dividends, accept their civic responsibility to pay their taxes continuously and declare all additional income they receive.

Numerous organisations and employees are burdened by the increase in and payment of high taxes. Organisations and employees evade paying taxes, primarily, due to the high tax rate. ESOP will be welcomed by employees and adopted organisations if the government creates tax incentives. The federal taxation incentive is one of the major reasons why organisations adopt ESOPs and why ESOP organisations improve financially. This is in line with the discussions of Gamble (1998).

8.5. Transparency

The success and effectiveness of an ESOP in an organisation depends on how transparent management is with employees regarding the plan, how management communicates the plan and how the ESOP is utilised to empower employees. The empirical results reveal that employees feel that, for ESOPs to be successfully adopted in the organisation, management must provide them with full information regarding ESOP adoption. In addition, employees feel that ESOPs will be successfully adopted if management provides them with ESOP adoption information in a language that they understand. Furthermore, the empirical investigation found that the adoption of ESOPs will be successful if management is accountable to all employees for its actions regarding ESOP adoption. Employees believe that the adoption of ESOPs will be successful if they can review information regarding ESOP adoption at any time and if management discloses details regarding the financial aspects of ESOP adoption.

Transparency is an important component in the adoption of ESOPs. Employees expect management to be transparent in their dealings with them regarding ESOP adoption. The failure of management in the area of transparency in ESOP adoption will lead to employees developing doubts and fears related to the plan. Therefore, in order to successfully adopt, manage and operate ESOPs, management is required to disclose ESOP information and grant employees access to ESOP information. Furthermore, management should be committed to performing its duties and be accountable for its actions regarding ESOP adoption. A high level of transparency in the form of accountability is effective in preventing the failure of ESOPs.

9. Conclusion

This study investigated the role of transparency in the adoption of ESOPs as well as the influence of ESOPs (transparency) on organisational performance, employee retention and commitment. This study provided theoretical findings on influential factors and likely outcomes of the adoption of ESOPs. The empirical results of this study indicate that transparency by trade union responsiveness, transparency by governments in the creation of reforms, awareness of employee benefits and taxation

implication is required to successfully adopt ESOPs. Furthermore, the adoption of ESOPs will lead to organisational performance, employee retention and employee commitment if management, trade unions and government are transparent with their dealings on ESOPs with employees. This study contributed to the body of knowledge by expanding the current understanding of the adoption of ESOPs and identifying underlying reinforcers or attributes that can be used as a strategy in the adoption of ESOPs.

Factors Affecting the Performance of Women-Owned Businesses in the Informal Sector: The 5 M Framework Perspective

Refilwe Xaba^{1,*}, Brownhilder Neneh²,

¹ Centre for Development Support, University of the Free State, Bloemfontein, South Africa

² Department of Business Management, University of the Free State, Bloemfontein, South Africa

Keywords

5 M framework; informal sector; performance; women entrepreneurs

Abstract

Worldwide, while there has been a significant drive to understand challenges facing women-owned businesses, many women entrepreneurs, particularly in developing countries, are still plagued with gender-specific challenges that adversely affect their performance. This study draws on the 3 dimensions (i.e., money, management (human capital and social capital), and motherhood (work-family conflict and family support)) of the gender-aware 5 M framework to assess the factors influencing the performance of women entrepreneurs in the informal sector. The study adopted a quantitative research method and collected data using a questionnaire. The questionnaire was distributed to 300 women entrepreneurs in Mangaung Metropolitan Municipality. The convenience and snowball sampling techniques were used to recruit the participants. The findings showed a positive and significant relationship between access to finance and the performance of women entrepreneurs. The results also revealed a positive and significant relationship between human capital, social capital, financial capital and the performance of women entrepreneurs. Family work conflict (FWC) had a negative association with the performance of women entrepreneurs. Furthermore, family instrumental support had a positive association with the performance of women entrepreneurs. This study culminates with managerial and policy implications on how the performance of women-owned businesses can be enhanced.

1. Introduction

All over the world, the significance of women entrepreneurs is highlighted by their potential to influence their countries' economies through job creation, economic growth, and development (Aboidun & Amos, 2018; Adikaram, & Razik, 2022). Women-owned businesses occupy a highly visible part of every economy in Sub-Saharan Africa's major cities (World Bank Report, 2019). Most women-owned businesses are based in the informal sector due to the limited public and private employment (Gharbiyeh, Hakspiel, and Arab Women's Enterprise Fund, 2020). As such, the informal sector has received increasing attention because of its significant role in employment creation, poverty alleviation, economic growth and development, and sustainable livelihoods (Guvén and Karlen, 2020; Musara & Nieuwenhuizen, 2020). According to Webb, Tihanyi, Ireland and Sirmon (2009), informal sector entrepreneurship is a set of illegal but legal activities undertaken by people who identify and take advantage of business opportunities. Informal businesses are defined as unregistered, unregulated, unrecorded, untaxed businesses that commonly operate from homes, street sidewalks, or other informal arrangements that do not have trading licenses or town-planning agreements (Horn, 2011). Statistics South Africa (2022) noted that the informal sector contributes a significant share to the South African job creation as indicated by an increase in the employment contribution of 171 000

*Corresponding Author

persons from this sector compared to 2021. Regarding the informal sector, Kubheka (2018) reported that more women were employed in the informal sector as 47.6% of women were employed in the informal sector compared to 30.6% men. Also, Bowmaker-Falconer and Herrington, (2020) reported that female entrepreneurship is on the rise in South Africa as the ratio of male to female entrepreneurial activity increased to 1.14 (10.9 male: 9.6 female entrepreneurs in 2019). However, regardless of their increased economic participation even during the pandemic, only 21.9% of South African business owners in 2021 are women, a slight increase from 2020 (21.1%) that keeps the country's 44th place in the global ranking (Mastercard Report, 2022). This suggests that their progress in entrepreneurship has lagged behind other nations of comparable size such as Botswana, Uganda and Ghana. Also, the Mastercard Report (2020) revealed that 59% of women entrepreneurs operate in sectors like retail, restaurants, food shops and domestic services, which were severely affected by the economic downturn and thus negatively affected the performance of their businesses. The South African National Development Plan 2030 (NDP) recognises women as one of the most vulnerable groups adversely affected by unemployment, poverty, and inequality (South African Government, 2012). Consequently, the South African government has significantly emphasised fostering women-owned businesses as they play a vital role in income and employment generation.

While extant research (OlaREVaju & Fernando, 2020; Mulaudzi & Schachtebeck, 2022; Neneh, 2018) have shed more light on the factors influencing the performance of women entrepreneurs, limited studies have focused on the gender-aware 5 M framework for a holistic understanding of women entrepreneurship (Al-Qahtani, Fekih Zguir, Al-Fagih, & Koç, 2022). This is because women entrepreneurs are still experiencing gender-specific challenges, adversely affecting their businesses (Adikaram & Razik, 2022; McWalter, 2021). The Covid-19 pandemic further exacerbated these gender-specific challenges (Casale & Posel 2020; Casale & Shepherd 2020), affecting women-owned businesses. As such, a recent study by OlaREVaju and Fernando (2020) has called for more research on the gendered nature of women entrepreneurship. This is because empowering women entrepreneurs will act as an engine for growth and innovation and also bolster a community for successful women entrepreneurs to thrive. Also, women entrepreneurs flourish in different environments and with different kinds of support than their male counterparts and thus the need to identify gender-specific policies for women entrepreneurs (McWalter, 2021). This study draws on the 3 dimensions of the 5 M framework (money, management, and motherhood) to shed light on the factors influencing the performance of women entrepreneurs in the informal sector to provide new insights that would assist policymakers in providing gender-specific measures to advance women's entrepreneurship.

1.1 Problem statement

Globally, there has been an upsurge in the economic participation of women entrepreneurs, thus significantly contributing to job creation and the socio-economic development of economies (Neneh & Welsh, 2022). In South Africa, women comprise 51.2% of the adult population (Statistics South Africa, 2019). Nonetheless, only 19.4% of South African business owners are women suggesting that their progress in entrepreneurship is still low. Also, these women are still experiencing gender-related challenges, which negatively impact their business performance. According to Harrichurran (2021), women in South Africa often spend less time on leisure activities than men because they devote much of their time to work and family obligations. Like men, most working women put in more than 40 hours a week at their occupations (Stat SA, 2021) but are still responsible for taking care of most domestic duties.

Also, limited studies have focused on the gender-aware 5 M framework to provide a holistic understanding of the factors influencing the performance of women-owned businesses in the informal sector in South Africa. As such, in responding to the call by OlaREVaju and Fernando, (2020) to research the gendered nature of women entrepreneurship, this study draws on the 5 M framework to identify the factors influencing the performance of women entrepreneurs in the informal sector.

1.2 Research Methodology

This study adopted a quantitative research method where primary numerical data was collected and analysed using statistical tools. The study population consisted of women entrepreneurs in the

informal sector in the Mangaung Metropolitan Municipality operating businesses in sewing, hairdressing, nanny, fast foods, street-hawking, shebeen and spaza shops. Data was gathered using self-administered questionnaires. Convenience and snowball sampling techniques were used as there is no database for women entrepreneurs operating businesses in the informal sector in the Free State and in South Africa. Most of the respondents were between 34-38 years, constituting (25%) of the respondents, followed by those 55 years and above (15.7%). Regarding the level of education, most of the respondents have reached high school, even though they did not complete it (44%), while 29.7% completed matric (i.e. high school certificate). Most women entrepreneurs (46.3%) were married, and 34.7% were single. The majority had two children (39.3%), followed by those with one child (25%). The majority of the children (50.3%) were below 18 years. As such, the assumption is that the children are still being taken care of by the women. Regarding prior experience, 64.7% of the women entrepreneurs had prior working experience. Nevertheless, most (89.7%) women entrepreneurs did not have formal training before establishing their businesses.

1.2.1 Measures

Work-family conflict (WFC and FWC) was measured using 5 items adapted from Netemeyer et al. (1996). Sample items for WFC include; "the demands of my work interfere with my home and family life" and sample items for FWC included; "the demands of my family or spouse/partner interfere with work-related activities." All of these items were responded to on a five-point Likert-type scale ranging from 1 "strongly disagree" to 5 "strongly agree".

Measures for family support were adapted from existing studies (Imbaya, 2012; Neneh, 2019; Mari et al., 2016; Neneh, 2017). Family instrumental support was operationalised using 3 items. Sample items included, "family members provide me constructive feedback and business-oriented advice." Family emotional support was measured using 2 items. Sample items included, "family members encourage, motivate and inspire me to pursue my entrepreneurial goals, especially when I encounter difficulties during the entrepreneurial process." Family financial support was measured using 2 items. Sample items included, "family members contribute financially to the establishment and subsequent running of my business."

Access to financial capital was operationalised using 4 items adapted from existing studies (Bates et al., 2007; Brush et al., 2009). Sample items included; "lack of collateral security needed to obtain a loan (Reverse)." Human capital was operationalised using 6 items adapted from existing studies (Bates et al., 2007; Brush et al., 2009). Sample items included, "managerial and overall business experience." Social capital was measured using 3 items adapted from existing studies (Yetim, 2008; Presutti, Boari & Fratocchi, 2016). Sample items included, "maintain close social relationship with customers." Performance is defined as the attainment of the venture's goals (Dzomonda, 2021). Business performance was measured using 6 self-reported subjective measures of performance adapted from existing studies (Brockman et al., 2012; Neneh, 2016; Neneh, 2017). All the items from the constructs were anchored on a five-point Likert-type scale ranging from 1 "very dissatisfied" to 5 "very satisfied." In this case, scores ranging from 2 and below were regarded as weaker performance while a score of 3 was regarded as moderate performance and a score of 4-5 was regarded as favourable performance.

1.3 Objectives of the study

This study aims to identify the factors that influence the performance of women-owned businesses drawing from the 5 M framework.

1.3.1 Hypotheses

The following hypotheses were formulated for the study:

- H1: Access to finance will have a positive relationship with the performance of women-owned businesses
- H2a: Human capital will have a positive relationship with the performance of women-owned businesses

- H2b: Social capital will have a positive relationship with the performance of women-owned businesses
- H3a: Work-family conflict will negatively affect the performance of women-owned businesses.
- H3b: Family-work conflict will have a negative relationship with the performance of women-owned businesses H4:
- H4a: Family instrumental support will have a positive relationship with the performance of women entrepreneurs
- H4b: Family emotional support will have a positive relationship with the performance of women entrepreneurs
- H4c: Family financial support will have a positive relationship with the performance of women entrepreneurs

2. Theory development

The current study is built on the family embeddedness theory, social capital theory, and role theory to understand the factors affecting the performance of women entrepreneurs drawing from 3 (money, management, and motherhood) of the 5M dimension of the framework

Brush et al. (2009) built on the 3Ms (markets, money and management) developed by Bates, Jackson and Johnson (2007) and added two more variables (motherhood and meso/macro-environment) to develop the 5 M framework. The 5M component comprises money, management, motherhood, market and macro/meso environment. This framework considers the influence of gender on business performance (Brush et al., 2009), which is supported by Jennings and McDougald (2013), who state that men and women experience gender differences that affect their performance as entrepreneurs differently. Following this framework, "Market" refers to the opportunity identified by the entrepreneur (Bates, et al, 2007; Brush et al., 2009). "Meso" refers to institutional policies and structures, while 'macro' refers to the social and cultural norms. "Money" refers to access to financial capital. "Management" comprises the human and social capital.

Mirchandani (1999, p. 230) argued that the abbreviated letter M'THER in the framework validates "gender as a process integral to business ownership." Motherhood represents the household/family context which is believed to have more impact on the performance of women entrepreneurs (Jennings & McDougald, 2007). The family context puts women entrepreneurs in a position where they have to play multiple roles in the family, which may influence their businesses differently from those run by men. The motherhood dimensions adopted by this study are work-family conflict and family support.

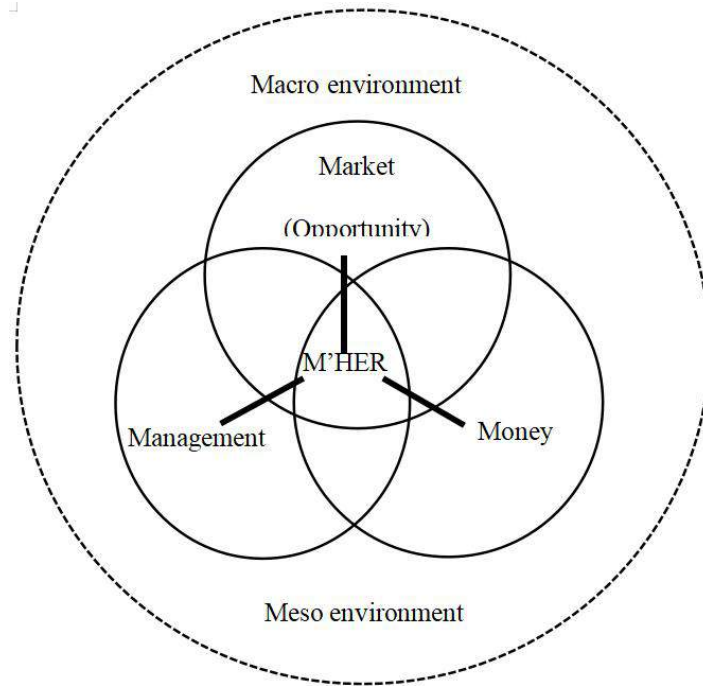

Figure 1: The 5 M framework
Source: Brush, de Bruin and Welter (2009).

This study also adopted the role theory (Kahn et al., 1964) to understand work-family conflict. According to the role theory, individuals play several different roles in their life, which may result in conflicting demands. Work and family are salient roles to most people (Kahn et al., 1964; Neneh, 2017). According to Kahn et al. (1964, p. 445), "given the finite resources available to individuals, when the expectations, responsibilities, norms, and behaviours of one role are at odds with acting another role, it is difficult to fulfil the requirements of one or multiple roles." The competing demands from enacting salient roles such as work and family result in work-family conflict (Kahn et al., 1964; Neneh, 2017). Also, the social capital theory highlights the importance of relationships that can benefit a person outside their original context of creation and lead to the accumulation of human capital. Furthermore, this study adopted the family embeddedness theory to explain how family support affects women entrepreneurs' performance (Aldrich & Cliff, 2003). The family embeddedness theory postulates that family and business domains are entwined, particularly for women. Thus, the support (in the form of financial, instrumental, and emotional) the women receive from their families and close networks can help women entrepreneurs to perform optimally in these domains and assist them in mitigating the challenges facing their businesses. Aldrich and Cliff (2003, p. 574) argued that "connecting the "unnaturally separated" social institutions of family and business will pave the way for more holistic-and more realistic-insights into the fascinating processes by which new business opportunities and new business ventures emerge." Figure 1; present the conceptual model

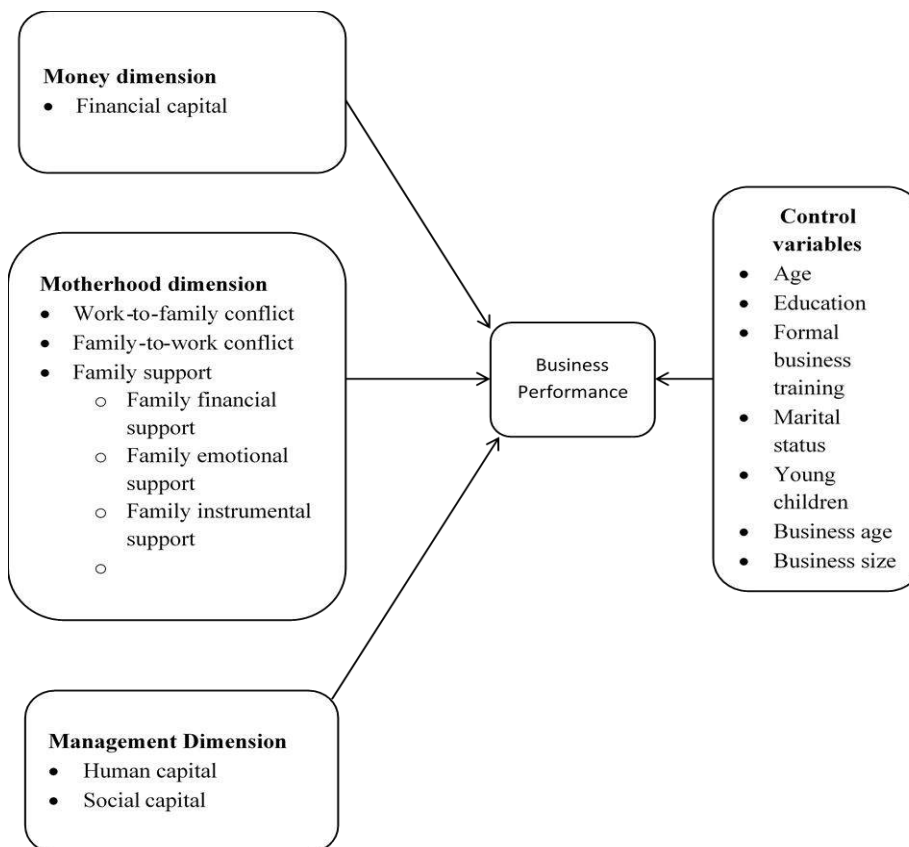

Figure 1: Conceptual model linking the three dimensions of the 5 M framework and business performance

2.1 Factors affecting the performance of women-owned businesses

It is crucial to uncover factors that influence the performance of women entrepreneurs to enhance the success rate of this unique group. This study will only focus on 3 (money, management, and motherhood) of the 5M dimension of the framework. These factors are explained in the following subsections.

2.1.1 Money (access to financial capital) and performance of women-owned businesses

Bates et al. (2007) describe access to finance as one of the essential resources required by any business. Khaleque (2018) defines access to finance as the ability of an individual to access credit and other sources of funding for their business. Finance can come from different sources, such as family members, friends, investors, and banks (Morazzoni & Sy, 2022). Having the ability to access funds from these sources is very crucial to the success of a business (Metu & Nwogwugwu, 2022). Essentially, finance is required at each stage of the business life cycle. Nevertheless, women entrepreneurs in developing countries face many challenges in accessing finance than their male counterparts which negatively influences their performance (Aliyu, Ahmad & Nordin, 2019). Most women entrepreneurs self-finance their businesses or depend on government grants (McWalter, 2021). Men are four times more likely to obtain venture capital or angel investments than women-owned businesses. Also, many women entrepreneurs use their savings to finance their businesses, max their credit cards, rely on friends and family or use a combination of all of these methods to finance their business (Burns, 2021)

In South Africa, several women entrepreneurs find it challenging to access finance due to a lack of collateral security and being economically excluded for a long time (Chinomona & Maziriri 2015). The Mastercard Report (2022) also revealed that women entrepreneurs in South Africa are constrained by poor access to finance (ranked 40th). Access to finance enables the business to acquire critical resources such as qualified employees and technology required for the growth and sustainability of a business (Neneh 2016; Koko, Maishanu & Hassan, 2017; Aliyu et al., 2019).

Finance is required to smoothen the cash flow of a business such that it can pay its suppliers and employees on time (Neneh 2016; Khaleque, 2018). Existing studies agree that access to finance has a positive association with the performance of women-owned businesses (Abiodun & Amos, 2018; Khaleque, 2018). Based on this evidence, this study hypothesises that;

H1: Access to finance will have a positive relationship with the performance of women-owned businesses.

2.1.2 Management and Performance of women-owned businesses

The management factors this study focuses on are; human capital and social capital. Colombo and Grilli (2005) describe human capital as skills, competencies, and understanding, as well as additional characteristics necessary for a specific economic activity. Brush, Ali, Kelley and Greene (2017, p.106) noted that "human capital resources, such as education, experience, attitudes, beliefs and perceptions, are the most important resources a nascent entrepreneur brings to an emerging venture." Human capital, which includes education and experience, enhances women entrepreneurs' entrepreneurial self-efficacy, boosting their confidence in running the business (Brush et al., 2017). An entrepreneurship career requires particular skills, which means women entrepreneurs who are well qualified and skilled will likely perform well in their ventures. In South Africa, while the enrollment rate in tertiary education is higher for women than for males, nonetheless, it is still very low on the global scale (Mastercard Report, 2022). Existing studies agree that human capital factors such as level of education, business-related skills, and experience positively affect the performance of women-owned enterprises (Adom & Asare-Yeboah, 2016; Brush et al., 2017).

Social capital is a multi-layered concept that different authors have conceptualised differently. As such, this study adopts Nahapiet and Ghoshal definition of social capital, which considers social capital as "the network of relationships possessed by an individual or social unit, and the sum of actual and potential resources embedded within, available through and derived from such network" (1998:243). From the definition of social capital, bonding and bridging social capital are two types of social capital this study focuses on. Bonding capital is the strong ties between familiar individuals, while bridging capital is characterised by distant relationships between various social class, groups or other important socio-economic characteristics (Andriani, 2013). Existing studies show that all the resources required to establish and grow a business are tied to the entrepreneur's networks (Neneh, 2017; Weisul, 2017; Dzomonda & Masocha, 2019). Bonding and bridging social capital can enable resource-constrained women entrepreneurs to unlock financial resources, market opportunities, and valuable business information from their networks, which will increase the performance of their businesses (Neneh, 2017; Neneh, 2018). Prior studies have found a positive association between social capital and the performance of women-owned businesses (Neneh, 2017; Mozumdar, Farid & Sarma, 2017; Olamide & Ogbechie, 2021; Neneh, 2018).

Based on the above, this study hypothesises that;

H2a: Human capital will have a positive relationship with the performance of women-owned businesses

H2b: Social capital will have a positive relationship with the performance of women-owned businesses

2.1.3 Motherhood and performance of women-owned businesses

The motherhood dimensions adopted by this study are work-family conflict and family support (financial, emotional, and instrumental). These factors are explained in more detail below.

2.1.3.1 Work-family conflict and performance of women-owned businesses

Work-family conflict is defined as "a form of inter role conflict in which the role pressures from the work and family domains are mutually incompatible in some respect" (Greenhaus and Beutell, 1985, p. 77). Work-family conflict is bi-directionality - work-family conflict (WFC) and family-work conflict (FWC). WFC occurs when experiences and obligations at work domain interfere with the

family domain, while FWC arises when experiences and responsibilities in the family context interfere with the work domain. The increased research on WFC and FWC is due to the increasing representation of dual-earners and single parents in the workplace. As such, devoting attention to multiple roles can result in conflict as participation in these roles become difficult.

Traditionally, women are expected to assume the role of primary caregivers to their families and are therefore responsible for the undertaking of household duties (Neneh & Welsh, 2022). However, the significant increase in the number of women starting a business (Adikaram & Razik, 2022) globally has caused disruptions in women's traditional roles. As such, women have 'double shift' days as they have to attend to work and family responsibilities (Nani, 2011:42). Besides their work responsibilities, many women still assume responsibility for most of the domestic work and childcare, nearly twice more than their male counterparts (Waithaka, Wegulo & Mokuu, 2016; Smith & Johnson, 2020). This double shift often results in home duties not getting done due to work responsibilities, as well as the work responsibilities not getting done owing to the unending family responsibilities, which ultimately interferes with both work and family life. This situation is much worse for some women in developing countries where there is an unequal distribution of labour, with women assuming a larger share of unproductive labour (Neneh, 2018; Germano, 2019; Neneh & Welsh, 2022). Consequently, women entrepreneurs who assume these multiple roles will find it difficult to balance the conflicting demands of the roles, leading to underperformance in their businesses and dissatisfaction in their family life. This view collaborates with extant research (Erkmen & Esen, 2014; Waithaka et al., 2016; Neneh, 2018; De Clercq et al., 2022) that has shown that both WFC and FWC negatively affect the performance of women entrepreneurs. Hence, this study hypothesises that

H3a: Work-family conflict will negatively affect the performance of women-owned businesses.

H3b: Family-work conflict will have a negative relationship with the performance of women-owned businesses.

2.1.3.2 Family support and the performance of women-owned businesses

The family domain plays an important role in business creation, success, and growth. Family support refers to the social support women entrepreneurs receive from their family members (Aldrich & Cliff, 2003). The family context can offer women entrepreneurs with various forms support including financial, emotional, and instrumental support (Poggesi et al., 2015; Neneh, 2017; Welsh et al., 2017; Welsh et al., 2018). These different forms of family support result in the growth and sustainability of women-owned enterprises (Neneh & Welsh, 2022). For instance, existing literature indicates that women entrepreneurs find it difficult to access external sources of finance from banks (Chinomona & Maziriri, 2015; Aliyu, Ahmad & Nordin, 2019). Women entrepreneurs experience high credit application rejection rate than their male counterparts (Su et al., 2015). Consequently, women entrepreneurs end up relying on their savings, which are often insufficient to sustain the business (Su et al., 2015; Neneh, 2017). Hence, family members act as a primary source of finance for most women entrepreneurs (Neneh, 2017; Welsh et al., 2018). Families can provide non-interest-bearing financial support to women entrepreneurs, which helps them to scale their businesses. According to Neneh (2017), financial support from family members can help women entrepreneurs acquire assets and other resources required at the business's start-up stage, enhancing the venture's performance. Family members can help women entrepreneurs to apply for and secure external funding, which allows them to attain work-life balance (Mari et al., 2016; Neneh, 2019; Welsh et al., 2018). Family members can also provide unpaid services to the business, which helps the women entrepreneur to retain some money meant to hire employees to grow the business (Neneh, 2017). Existing studies have found that women entrepreneurs who receive financial support from their families tend to succeed in their businesses (Su et al., 2015; Neneh, 2017).

Another crucial intangible resource for women entrepreneurs is emotional support from family members (Ramadani et al., 2015). An entrepreneurship career demands emotions and time commitments, which can be stressful for women entrepreneurs (Welsh et al., 2021). This often results in issues of WFC and FWC, where the woman entrepreneur finds it difficult to strike a balance

between the demands of work and family domains which becomes emotionally draining (Aldrich & Cliff, 2003). According to the family embeddedness theory (Aldrich & Cliff, 2003), emotional support from family may help diminish role conflict, enhancing the performance of their ventures. Welsh et al. (2021) argued that "family emotional support (i.e., the provision of reassurance, acceptance, and encouragement in times of stress by family members) enhances an individual's self-esteem." Likewise, existing studies (Neneh & Welsh, 2022; Ramadani et al., 2015; Welsh et al., 2021) express that a supportive family helps women entrepreneurs distress and find the strength to focus on their businesses which positively influences performance.

Instrumental support refers to support related to physical resources, feedback on the business, mentorship, and strategic support from the family (Mari et al., 2016; Neneh, 2019; Welsh et al., 2021; Neneh & Welsh, 2022). Instrumental family support boosts women entrepreneurs' confidence, enhancing their ventures' success rate (Neneh & Welsh, 2022). Existing studies found a positive relationship between instrumental support and the performance of women-owned entities (Welsh et al., 2016; Welsh et al., 2021; Neneh & Welsh, 2022). Hence, we argue that having access to family support in the form of financial, emotional, and instrumental support will help women entrepreneurs maintain work-life balance by diminishing role conflict and thus enhancing their business performance. Hence, this study hypothesises that:

H4a: Family instrumental support will have a positive relationship with the performance of women entrepreneurs

H4b: Family emotional support will have a positive relationship with the performance of women entrepreneurs.

H4c: Family financial support will have a positive relationship with the performance of women entrepreneurs

3. Results

3.1 Descriptive statistics

Table 1: Descriptive statistics

Factors	Mean (M)	Standard deviation (S.D.)
Family-work conflict (FWC)	2.519	1.525
Work-family conflict (WFC)	2.577	1.512
Family instrumental support (FIS)	2.779	1.498
Family emotional support (FES)	3.160	1.547
Family financial support (FFS)	2.443	1.386
Financial capital (FC)	2.511	1.403
Human capital(HC)	1.754	1.008
Social capital (SC)	4.307	0.948
Performance	3.164	0.977

The results from Table 1 reveal that women entrepreneurs in the study had low levels of human capital (M=1.754, SD=1.008); WFC (M=2.577, SD=1.512), FWC (M=2.519, SD=1.525); financial capital (M=2.511, SD=1.43); emotional support (M=3.160, SD=1.547); instrumental support (M=2.779, SD=1.498) and financial support (M=2.511, SD=1.403). Also established is that women entrepreneurs had a moderate performance (M=3.164, SD=0.977). What is important to note is the high levels of social capital (M=4.307, SD=0.948) received by these women entrepreneurs.

3.2 Evaluation of the measurement model

3.2.1 Reliability and convergent validity

Construct reliability was evaluated using Cronbach's alpha (CA) and composite reliability (CR), while convergent validity was assessed using the average variance extracted (AVE). AVE estimate denotes the average variance extracted from a construct by its parallel items (Fornell & Larcker, 1981). An AVE minimum value of 0.5 shows sufficient convergent validity.

Table 2: Reliability and convergent validity

Factors	Items	Factor loadings	CA	CR	AVE
Family–work conflict	FWC1	0.979	0.987	0.989	0.949
	FWC2	0.975			
	FWC3	0.978			
	FWC4	0.962			
	FWC5	0.979			
Work–family conflict	WFC1	0.940	0.980	0.984	0.927
	WFC2	0.980			
	WFC3	0.984			
	WFC4	0.976			
	WFC5	0.933			
Family instrumental support	FIS1	0.834	0.908	0.943	0.846
	FIS2	0.962			
	FIS3	0.958			
Family emotional support	FES1	0.936	0.862	0.936	0.879
	FES2	0.939			
Family financial support	FFS1	0.833	0.870	0.913	0.841
	FFS2	0.995			
Financial capital	FC1	0.871	0.874	0.913	0.726
	FC2	0.885			
	FC3	0.733			
	FC4	0.909			
Human capital	HC1	0.929	0.921	0.937	0.713
	HC2	0.929			
	HC3	0.841			
	HC4	0.857			
	HC5	0.707			
	HC6	0.783			
Social capital	SC1	0.965	0.853	0.913	0.782
	SC2	0.967			
	SC3	0.692			
Performance	PER1	0.935	0.940	0.952	0.770
	PER2	0.892			
	PER3	0.905			
	PER4	0.766			
	PER5	0.871			
	PER6	0.884			

Table 2 presents the evaluation of the measurement model in terms of reliability and convergent validity. The findings showed that the factor loadings are acceptable as most of the loadings are above 0.7, which is in line with the recommended threshold value (Hair et al., 2019). Construct reliability

was assessed using CA and CR. Table 2 reveals that the alpha values were between 0.853 and 0.987, while the composite reliability values were between 0.913 and 0.989. Therefore, all the constructs showed adequate levels of construct reliability as they are above the recommended threshold of 0.8 for the alpha values and 0.7 for CR (Henseler, Ringle & Sinkovics, 2009). Convergent reliability was examined using the AVE. From Table 2, it is observed that the AVE values were between 0.713 and 0.949, indicating adequate levels of convergent reliability for all the major constructs in the model according to the commonly accepted threshold value of 0.5 (Henseler et al., 2009).

3.2.2 Discriminant validity and correlation matrix

Discriminant validity was assessed using the Fornell-Larcker criterion. The data in bold in Table 3 is the square-root of the AVE, while the rest of the data is the correlation coefficients.

Table 3: Correlation matrix of internal factors and business performance

Factors	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
(1) Family-work conflict	0.97*								
(2) Work-family conflict	0.67	0.96*							
(3) Family instrumental support	-0.47	-0.43	0.92*						
(4) Family emotional support	-0.45	-0.45	0.64	0.94*					
(5) Family financial support	-0.23	-0.24	0.63	0.59	0.92*				
(6) Financial capital	-0.06	-0.03	0.02	0.01	0.02	0.85*			
(7) Human capital	-0.29	-0.26	0.47	0.46	0.17	0.17	0.85		
(8) Social capital	-0.08	-0.09	0.49	0.46	0.33	0.16	0.20	0.88	
(9) Performance	-0.29	-0.25	0.53	0.46	0.25	0.38	0.55	0.47	0.88*

*Square root of the AVE on the diagonal (bold). Significance level *p<0.05, **p<0.01

The results in table 3 show that the square roots of the AVE values (i.e. the figures are in bold) for all the model constructs were greater than their corresponding inter-construct correlations, thus indicating that Fornell-Larcker criterion has been met. Also established is that FWC and WFC have a significantly negatively correlation with performance, suggesting that an increase in conflict results in a decrease in performance. Furthermore, the results show that all three forms of family support had a positive and significant correlation with performance, with instrumental family support showing the biggest influence (Coef=0.53). Additionally, the results show a significant positive correlation between human capital and performance (Coef=0.55), social capital and performance (Coef=0.47), and financial capital and performance (Coef=0.38).

3.3 Regression model

Table 4 presents the regression models that take into account the joint effect of all three dimensions of the 5 M framework in a single regression model as presented in the conceptual model.

Table 4: Regression analysis showing the joined effect of 3 dimensions of the 5 M framework on the performance of women-owned businesses

The results in Table 4 show none of the control variables had a significant association with the performance of women-owned businesses. Family–work conflict has a negative and significant relationship with the performance of women-owned businesses. Also, family instrumental support, financial capital, human capital and social capital have a positive and significant relationship with the performance of women-owned businesses.

3.4 Discussion

This study assesses the factors that influence the performance of women-owned businesses in the informal sector, drawing from the 5 M framework. The results reveal that the factors that influence the performance of women-owned businesses in the informal sector are family-work conflict, instrumental support, financial capital, human capital and social capital. Firstly, family-work conflict having a negative relationship with the performance of women-owned businesses corroborates extant studies (Neneh, 2018; Waithaka et al., 2016), which also reported that FWC had a negative association with the performance of women-owned businesses. A possible explanation for this result is that while women's participation in the labour force has considerably increased over the last decade, most women are still in charge of the majority of the domestic and childcare responsibilities alongside the running of their businesses. This situation is particularly worse in some African countries where the traditional gender role expectations require that women prioritise their family over work (Hundera et al., 2019). Consequently, given that entrepreneurship is an all-time commitment that necessitates entrepreneurs to devote long work hours to be successful, the number of hours women entrepreneurs spend on their household responsibilities reduces their time on their businesses, negatively affecting their performance.

Secondly, family instrumental support having a positive relationship with the performance of women-owned businesses is in accordance with extant studies (Neneh, 2017; Poggesi et al., 2015; Neneh & Welsh, 2022). This finding suggests that instrumental family support is a vital resource for women entrepreneurs, consistent with the family embeddedness theory (Aldrich & Cliff, 2003). The family context can supply instrumental support from both the family and the work domain. In the family domain, family members can offer women entrepreneurs with instrumental support in the form of domestic, childcare, and elderly care (Shelton, 2006; Neneh & Welsh, 2022). In the work domain, family members can offer women entrepreneurs with instrumental support in the form of feedback regarding their businesses, physical and financial resources (Leung, Mukerjee & Thurik, 2020).

Third, the results showed a positive association between financial capital, human capital, social capital, and performance. Regarding finance, extant studies (Aliyu et al., 2019; Burns, 2021). This raises the need for policymakers to identify tailored-made sources that can assist women in the growth and survival of their businesses. Also, human capital has a positive relationship with the performance of women-owned businesses, which collaborate with extant studies (Adom & Asare-Yeboah, 2016; Brush et al., 2017). However, women entrepreneurs in this study had a low level of human capital which is a call for concern. Zolin, Stuetzer and Watson (2013) reported that women entrepreneurs typically have less managerial expertise compared to their male counterparts. Besides encouraging women entrepreneurs to upskill themselves, they are also encouraged to tap into the instrumental support their family members can provide in the business domain through constructive feedback and acting as mentors (Welsh et al., 2016). However, women entrepreneurs must exercise caution when tapping into the instrumental support from the business domain, as existing studies (Welsh et al., 2016; Welsh et al., 2021) found that family support provided by family members might sometimes be detrimental to the business due to unwarranted interference and conflicts. Furthermore, social capital has been widely acknowledged as vital in enhancing the performance of women entrepreneurs (Neneh, 2017; Neneh, 2018; Burns, 2021). Through social capital, women entrepreneurs can tap into networks and increase collaboration, share expertise and experience, and foster trust amongst various teams (Burns, 2021; Wang, Cai, Zhu & Deng, 2022).

4. Implications

This study offers theoretical, policy, and practical/managerial implications.

Theoretical implications

In terms of theoretical contributions, this study responds to the call by Olarevaju and Fernando (2020) to research the gendered nature of women entrepreneurship by using the family embeddedness theory, social capital theory, and role theory to understand the factors affecting the performance of women entrepreneurs drawing from the 5M framework. This study revealed that the family domain can provide family instrumental support to the women entrepreneur in the work and family domain.

Likewise, social capital can enable resource-constrained women entrepreneurs to unlock financial resources, market opportunities, and valuable business information from their networks, which is vital for the success and growth of their businesses.

5. Managerial implications

The practical implications are fourfold. First, since FWC negatively influences women entrepreneurs' performance, women must tap into the family instrumental support from the family domain by delegating some of their household and childcare responsibilities to the family so they can dedicate the extra time to their businesses. Second, the findings also indicated that social capital is a crucial resource for women entrepreneurs. Thus, women entrepreneurs must invest in developing their social capital to unlock financial resources, market opportunities, and valuable business information which can enhance their performance. One way to achieve this is by participating in several women's business forums, such as the B'avumile Skills Development Initiative and South African Women Entrepreneurs Network, where women entrepreneurs share business information and opportunities. Third, women entrepreneurs are also encouraged to upskill themselves with business management skillsets to foster their level of human capital. As such, government agencies such as the National Empowerment Fund, Small Enterprise Development Agency, Free State Development Corporation, and the National Youth Development Agency should develop business education programmes that will enhance the performance of these women. The business education programme should provide basic knowledge of sales and marketing, personal and business financial management, costing, product differentiation, operational management, and general management training

Fourth, given that most women entrepreneurs still experience barriers in accessing finance to grow their businesses, the government and policymakers need to identify alternative funding models tailored toward women entrepreneurs. An example will be to explore microfinancing as a possible funding model for these women. India, one of the fastest-growing emerging countries, adopted microcredit to assist disadvantaged borrowers without collateral security with access to affordable loans to grow their businesses. Also, government support agencies need to develop funding programmes tailored to the unique needs of women entrepreneurs.

Policy implications

Regarding policy implications, policymakers are encouraged to develop tailored made policies that can foster women's entrepreneurship as their needs and challenges significantly differ from their male counterparts, considering that women enact multiple roles in the work and family domain.

6. Conclusion and Limitations of the study

The study sheds new insights on the combined factors that influence the performance of women entrepreneurs in the informal in South Africa drawing from the 5M framework, which extends the current knowledge on women entrepreneurship in South Africa. This study highlights the vital role of family instrumental support, social capital, human capital, and financial capital in enhancing the performance of women-owned businesses and the detrimental effect FWC has on women-owned businesses.

This study presents some limitations which necessitate further research. Firstly, this study only focused on women entrepreneurs in the informal sector in the Mangaung Metropolitan Municipality (Bloemfontein, Botshabelo and Thaba'Nchu). The findings cannot be generalised to all women entrepreneurs in South Africa. Thus, future studies may extend this study by incorporating larger samples from other provinces in South Africa. Secondly, this study only focused on 3 of the 5 dimensions of the 5M framework. Future research should also include all 5 dimensions of the 5M framework to provide more insights into the gendered nature of women entrepreneurship.

Keywords

Unified Communication;
Collaboration;
Employee performance.

Abstract

Effective communication is vital component in any organisation. Unified Communication (UC) solutions are an important pillar of an organisation's IT strategy. UC keeps employees and customers connected, improves services, enables work collaboratively and allows daily organisational functions to operate effectively. Ineffective communication within organisations yields negative outcomes because of unclear goals, inefficiencies, poor productivity and low morale. Organisations are increasingly implementing UC tools to address communication challenges. This study was conducted to evaluate and develop techniques to improve communication efficiency and effectiveness when implemented using unified communication technology within an organisation. This study followed a positivistic research philosophy and the approach was deductive. A quantitative study using a questionnaire was conducted to test the conceptual model. The survey was conducted amongst employees and management of a large industrial development zone in South Africa, in order to establish the factors that contribute to the use of UC and collaboration technologies in the organisation. The data from this survey were statistically analysed, including Exploratory Factor Analysis. The most important determinants for UC technology collaboration were the factors Presence and Internet Protocol Telephony. The findings of the study indicated that most of the respondents positively agreed that UC improved productivity, UC increased employee performance and UC created positive effectiveness among employees.

1. Introduction

Communication entails the transmission and exchange of information from one party to another through a medium (Fluker & Murray, 2017). The landscape of organisations' communication has evolved over the years due to advances in information technology (IT). New concepts and communication models are the result of the constant evolution of IT (Dziembek & Turek, 2018). Global human interconnectivity is permanently shifting and information and communication now move freely, driving change (Mygatt, Steele & Voloshchuk, 2020). Effective communication and collaboration within an organisation contribute to setting benchmarks for successful and efficient organisational operations. Internal and external organisational operations and transactions are often conducted through various modes of communication, in addition to face-to-face (Burg, 2013). These multiple types of communication need to be structured to form a strategic communication strategy. Strategic communication is seen as strategic when it integrates all those communications that are associated with organisational goals and strategies and the operations of the organisation (Van Ruler, 2018).

Unified Communication (UC) is defined as communication with devices integrated to optimise organisations' processes within reasonable time frames or to optimise organisations' processes and enhance human communications by reducing latency, managing flows and eliminating device and media dependencies (Singhal & Agarwal, 2016). Exchange of knowledge will allow employees to be more effective in their jobs. Today's users are used to a range of different communication methods, including instant messaging, voice and video calls, Zoom, Microsoft Teams, emails or social media. The communication tools involved with UC technology consist of instant messaging, presence technology, conferencing and Internet Protocol Telephony (IPT). Email, telephony, conferencing, social networking tools and instant messaging have a presence but as a built-in capability (Elliot, Blood & Fernandez, 2022; Collins, 2018). Present trends for UCs include UC as a service (UCaaS). UCaaS is a cost-effective model for on-demand delivery of unified communications services in the cloud (Tefamicael et al., 2015). The most important barriers of UCaaS include:

- Security issues;
- Technical barriers;
- Legal barriers;
- Psychological barriers; and
- Market barriers (Dziembek & Turek, 2018).

The COVID-19 pandemic has forced people to work from home, which has presented a new range of challenges, which have been attended to with technology solutions for communication (Sanders et al., 2020). Communication with employees and external stakeholders has always been important pre-COVID-19 and still is the focus of some organisations post-COVID-19. Organisational communication strategies and practices play important roles in giving employees information, direction and support (Kartikawangi & Dahesihsari, 2020). Technology brings numerous benefits, but with the new technologies there are many challenges to overcome (Oertig & Buerger, 2006). UC technologies are very important and available in the market. UC becomes a strategic decision for businesses because it can address communication issues in new ways by delivering an integrated platform where all these applications are in use in a shared or unified environment (Scopserv, 2021). UC as a service enables an organisation to shrink costs, but it also enables it to place its emphasis on core competencies and allocate employees efficiently and thus focus on competitive diversity and advantage (Panetta, 2017).

The aim of this study was to determine the factors that influence the use of UC technologies within an organisation. The study investigated how management and employees in an Industrial Development Zone organisation, perceived the use of UC technology. The paper proceeds as follows: the problem investigated and the research objectives are discussed. A discussion on the background literature with a general overview of UC including benefits, drivers for adoption as well as components and the proposed UC conceptual model to improve employee efficiency and employee productivity follow. The remaining sections discuss the research methodology, the results and conclusions.

2. Problem Investigated

Organisations continue to become more fragmented and employees, at the same time, become more mobile. UC enables people to work together in real time and provides new ways of being more efficient (Silic & Back, 2016). With UC, employees are always accessible. This study investigated how employees in an organisation identify and use UC technology. It further investigated how access to the communications of organisations has been changed into effective collaborative communication. Due to improvements in technology and market growth, different studies support that the trend for UC is beneficial. The success, usability and ease of use of UC systems and technologies are however dependent on the applications being user-friendly. To improve communication, various communications and collaboration tools have been developed to enhance the efficiency and productivity of employees. The research problem investigated in this study is that communication with and between employees within the workspace has been challenging and the enabling factors have not been identified.

3. Research Objectives

The services offered by the IT (Information Technology) department, as an enabler to achieve corporate goals, must be strategic, methodical and delivered with unyielding commitment and passion. IT acts as a strategic enabler, by providing IT solutions that will support the organisation to achieve its strategic goals. The IT department of an organisation must provide high quality technology-based services, in the most cost-effective manner in collaboration with organisations, to meet the needs of the organisation.

The main objectives of this study were:

- To determine the factors that influence employees' perception of the use UC technology; and
- To propose a model to improve communication by using UC technology within the organisation.

4. Hypotheses

The following hypotheses were formulated for the study:

- H₁: The UC **presence** has a positive effect on the effective communication within the organisation.
- H₂: The UC **collaboration** has a positive effect on the effective communication within the organisation.
- H₃: The UC **Internet protocol telephony** has a positive effect on the effective communication within the organisation.
- H₄: The UC **video conferencing** has a positive effect on the effective communication within the organisation.
- H₅: The UC **instant messaging** has a positive effect on the effective communication within the organisation.
- H₆: The **usage** of UC technology has a positive effect on effective communication within the organisation.
- H₇: The **efficiency** of UC has a positive effect on the effective communication within the organisation.
- H₈: The employee perception of **technology** has a positive effect on the effective communication within the organisation.
- H₉: The **employment benefits** using UC technology have a positive effect on effective communication within the organisation.
- H₁₀: The **Organisations benefits** using UC technology have a positive effect on the effective communication within the organisation.

5. Literature Review

UC technology signifies innovations in communication technology that have grown over time into solutions, which combine various communications channels and collaborative technologies to expedite the cooperative use of information sharing and multiple communication methods (Elliot et al., 2022). UC offers a multi-faceted communications infrastructure that enhances communication to drive relationship building and abolish physical barriers that frequently impede effective communication and consequently productivity among the employees in an organisation. Fluker and Murray (2017) in Figure 1 show the path that effective communication leads to improved productivity.

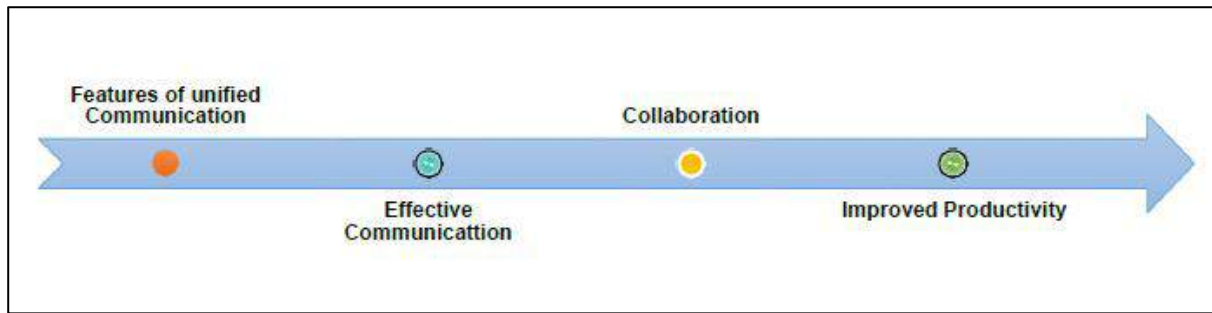

Figure 1: Path to effective communication and productivity (Fluker & Murray, 2017)

The long-established and efficient way of communicating in organisations were by travel and meetings (Denstadli et al., 2013). According to Perlow et al. (2017), a survey was conducted with 182 executive managers, which revealed that 62% stated that meetings had led to lost opportunities. In the survey, 65% stated that meetings caused them to delay the completion of urgent tasks and 71% stated that meetings are unproductive and inefficient. Most of the respondents to the survey, however, considered that meetings are sometimes essential to collate information for organisations efficiency, even though they are viewed as unproductive and inefficient. Information and technology have advanced to the extent that teams and service providers distributed over a geographically wide area can collaborate and communicate in real time by using UC (Aguilera, 2008). In a global environment, as employees become more mobile and organisations continue to get further fragmented, UC empowers individuals to collaborate in real time and enables efficient communication with various clients, suppliers and stake-holders for problem solving through information sharing via multiple communication methods (Elliot et al., 2022).

Recent advances in IT have propelled innovation in UC technologies into various modes of collaboration (Arnold, 2018). Most organisations' communications have moved from face-to-face to communication media such as email and conference calls (Burg, 2013). Distributed work, telework and virtual work are not new phenomena, specifically during the COVID-19 pandemic period (Henry, Le Roux & Parry, 2021). Effective communication entails not only the content of the message but also the comprehension of the content, the acceptance of the message and the delivery channel (Den Hartog, Boon, Verburg & Croon, 2013).

UC provides a platform to integrate collaboration applications into a single interface, with a consistent user experience across endpoints and network environments. The pillars of UC include voice, video, messaging, conferencing and mobility (Young, 2017) and can help organisations construct well-rounded collaboration plans (Figure 2).

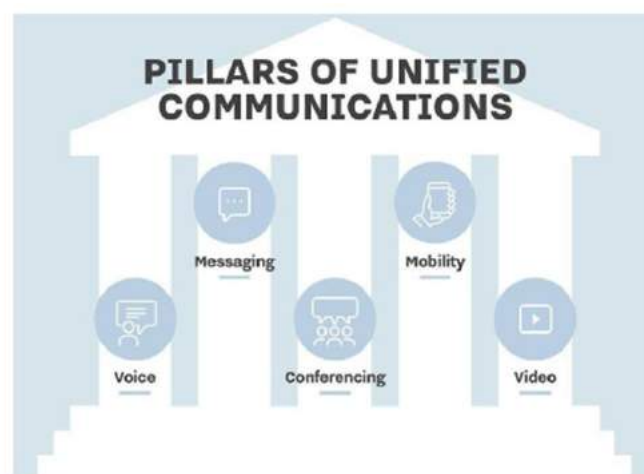

Figure 2: Pillars of Unified Communications (Young, 2017)

Recent advances in IT have propelled innovation in UC technologies into various modes of collaboration considerably (Arnold, 2018). Most organisations' communications have moved from face-to-face to communication media such as email and conference calls using technologies such as Zoom and Teams (Burg, 2013). Figure 3 illustrates the integration of various communication tools in a UC ecosystem, for example voice, instant messaging (IM), presence, desktop sharing, audio conferencing and video conferencing interacting in a unified way (AT&T Organisations, 2018).

Figure 3: Unified Communications tools (Computer Station Co., 2014)

5.1 Drivers for adoption of UC

The drivers of UC include improved employee collaboration, improved internal and external communication and creating a more mobile workforce (Figure 4).

Figure 4: Organisations Drivers for UC (Fairbrother, 2015)

There are three main organisational drivers for the adoption of UC technology as follows:

- **Usage:** Venkatesh (2000) stated that behavioural intent (usage) has a positive effect on the purpose to use UC and collaboration technology;
- **Efficiency:** In order to accomplish speed and efficiency for user requirements, many organisations have used UC as a replacement or to complement out-dated communication channels to connect with customers and employees (Fikry & Mukhtar, 2012). UC offers provision for efficiency, speed, multi-tasking and increasing interpersonal relationships; and
- **Technology:** UC and collaboration technology offer pathways for the broadcasting of knowledge, enablement of decision making and UC of employees within the digital world (Vermesan et al., 2011). An effective technology platform provides access to information, supports plug and play communication and enables the revolution of knowledge and

information (Landoli, 2009). Furthermore, it provides tools for the quick creation of teams and networks to be flexible and adaptive based on open standards.

5.2 Employee and organisation benefits of UC

Contemporary UC technologies allow employees to collaborate and effectively share information in real time. A well-designed and implemented UC system significantly lessens multiple communications mechanisms in favour of faster, ad-hoc, one-on-one or group meetings expedited by instant messaging, presence, video, voice and web conferencing capabilities (Kelly, 2010). Online education is another notable application enabling employees' participation in training initiatives from various locations in real time benefitting the organisation by incorporating learning into the workday demands (Heather & Mckeen, 2011). Furthermore, UC tools empower employees to keep in touch with experts instantaneously when probing for particular proficiencies.

Productivity is a vital component of sustainable growth and competitiveness in the management process (Kongkiti et al., 2009). UC and collaboration have proven to enrich customer service, flexibility and competitiveness and reduced costs (Rash, 2010). According to Jones (2017), various explorations illustrated that knowledge exchange has a positive impact and leads to organisational growth and success. A vital component of organisation strategy is the development of a communication system to support effective sharing of knowledge. This notion is further fuelled by the knowledge economy that has triggered a rise of decentralised organisational structures resulting in a rapid virtualised working environment, which depends on virtual teams to achieve organisational objectives (Dušan, Krum & Zorana, 2014).

Collaboration technology perceptively increases the amount of potential expertise and partners accessible to an organisation and, in recent years, a variety of types of inter-organisational associations have become common place (Pisano & Verganti, 2008). Integration from supply chain to design coordination to innovative partnerships have become the norm (Attaran, 2007). In essence, UC improves productivity, reduces costs, enhances performance and user experience (Scott, 2020). The benefits of UC (Orange Organisations Services, 2018) are presented in Figure 5 and focuses on employee connectivity.

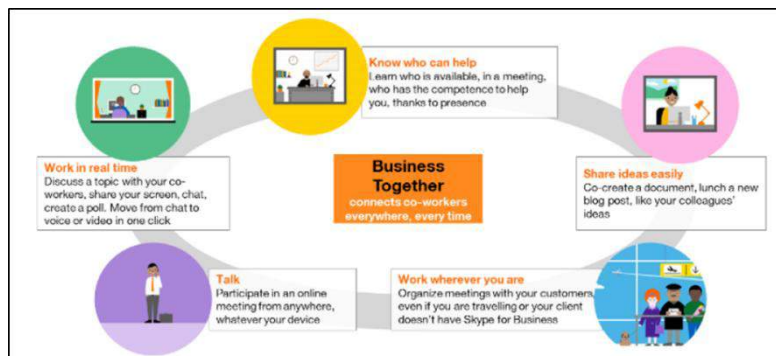

Figure 5. Benefits of UC (Orange Organisations Services, 2018)

5.3 Factors that drive adoption and use of unified communication

Most organisations aim to attain cost reduction and cost efficiency through economies of scale. Through UC a cost savings opportunity is achieved by having platform consolidation with Internet Protocol telephony (IPT), which can lead to the replacement of desk phones with mobiles (Bai, 2020). Another core area of UC, conferences, presents cost savings opportunities by replacing travel with telepresence. Instant messaging introduces additional cost savings which are achieved with the reduced number of phone calls and the ability to keep in touch with employees and clients.

UC enables organisations to improve organisations agility and increase flexible and dynamic working practices (Forrester, 2008). According to Almeida and Lourenço (2011), organisations identify the importance of UC technologies for increasing customer satisfaction, improving productivity and

reducing communications costs. These benefits however, come with Internet risks, which should be mitigated with firewall mechanisms, virtual private network (VPN) technologies and admission control security endpoints within the organisations.

The following factors, which were operationalised from the literature, influence employees' perceptions of the use of UC.

Presence

One of the greatest strengths of UC technologies is the features that include circumstantial presence tracking, which provides details about individual communication method preference and individual availability, intelligent notification services and on-demand switching between communications channels (Gartner, 2008). *Presence is defined as someone who is available or present but not necessarily seen* (Oxford Dictionary). Furthermore, presence information assists employees to perceive the availability of others and notify of their availability so that others know how to reach them easily (Fikry & Mukhtar, 2012). UC has accomplished empowering complex forms of presence signalling. The user's presence can be inferred from technical devices which indicate user presence statuses and can be combined to signal the status of a group (Riemer & Taing, 2009).

Collaboration

Globalising organisations, mobile work, outsourcing, inter-organisational teams, innovation and fulfilling customer and supplier's desires are motivating today's pre-requisite to enhance collaboration within organisations. IT is at centre of these trends (Heather & Mckeen, 2001). IT provides information integrity and connectivity, without which most collaboration energies would not be effective. A key enabler of collaboration is well-designed IT architecture (Johansen, 2007). Collaboration technologies include hardware, software and applications that support the achievement of collaboration (Camarinha-Matos et al., 2009). Collaboration forms part of the internal communication strategy and enables actively working together to achieve mutual goals (Scott, 2020).

Virtual interaction is being enhanced progressively every day with the proportion of time employees' work virtually increasing. Collaboration technologies show a critical role in enhancing knowledge generating and sharing practices and also in developing new products, processes and services (Fink, 2007). Additionally, Pisano and Verganti (2008), stated great ideas can come from anywhere and IT has dramatically reduced the cost of accessing them.

Internet Protocol Telephony (IPT)

The progress of UC was determined by advancement in Internet Protocol infrastructures along with revolutions in software-based communication media, such as instant messaging. In this regard, several voice communications will deliver a smooth and extensive communication experience to employees and clients. The growth of VoIP and other digital tools available on the market has directed organisations communications to enter into a new golden age by enabling the teams to be more productive and effective, where VoIP delivers strong telephony functionality, with texting, messaging and video conferencing added on (Grech, 2008). According to various investigations, the average savings that organisations receive after switching to VoIP range from 30% to 75% savings over traditional phone systems and this saving is likely to be higher than the average if the organisations require rich communications features, international calling or long distance calling (Collins, 2018).

Video Conferencing (VC)

Fikry and Mukhtar (2012) urge that the real-time conferencing (web and video conferencing) condenses the time for decision making for the organisation as it provides easy setup, point-and-click conference launches and links to present management. The use of video-communication is not new and has considerable benefits for connecting individuals in diverse locations, reducing travel time and expense (Oeppen, Shaw & Brennan, 2020). In a face-to-face work setting, teams often have impromptu meetings as they pass each other in the passage or over tea, which is possible on most video conferencing platforms, such as Microsoft Teams or Zoom. The concern with video conferencing is how to instil corporate culture and build trust and cohesion within groups (Alexander,

De Smet & Mysore, 2020). Gartner (2008) predicts that only 25% of organisations meetings will take place in person by 2024 (Karl, Peluchette & Aghakhani, 2021). Limited bandwidth, however, can result in major shortcomings, frustration, reduced performance and less effective action planning when compared to standard face to face meetings (Oeppen et al., 2020).

Instant Messaging (IM)

IM is widely accepted in society, however it is relatively under used in the work environment (Ou & Davison, 2010). IM permits team members to chat using text-based messages. If a team member needs clarity or quick answers, a simple “Instant Message” to each other may be a powerful tool that works in partnership for maximum communication clarity (Quan-Haase, Cothrel & Wellman, 2017). IM has become a valuable tool to support informal communication (Isaacs et al., 2004). The IM feature in UC is vital for effective communication between employees, as it can save time and improve instant communication among employees despite the belief that it can be disruptive (Ou & Davison, 2010). The IM functionality, if it is managed correctly, lets the employees send text messages to one another or to a group, which enables clarification or quick discussions removing the need for lengthy email communication (Aldea et al., 2012).

Conceptual Model

The literature revealed certain factors, which are illustrated in Figure 6, the conceptual model, which was tested in this study. The factors that affect employee perceptions include Usage, Efficiency, Technology and Employee and Business benefits. UC technologies include the factors Presence, Collaboration, IPT, VC and IM.

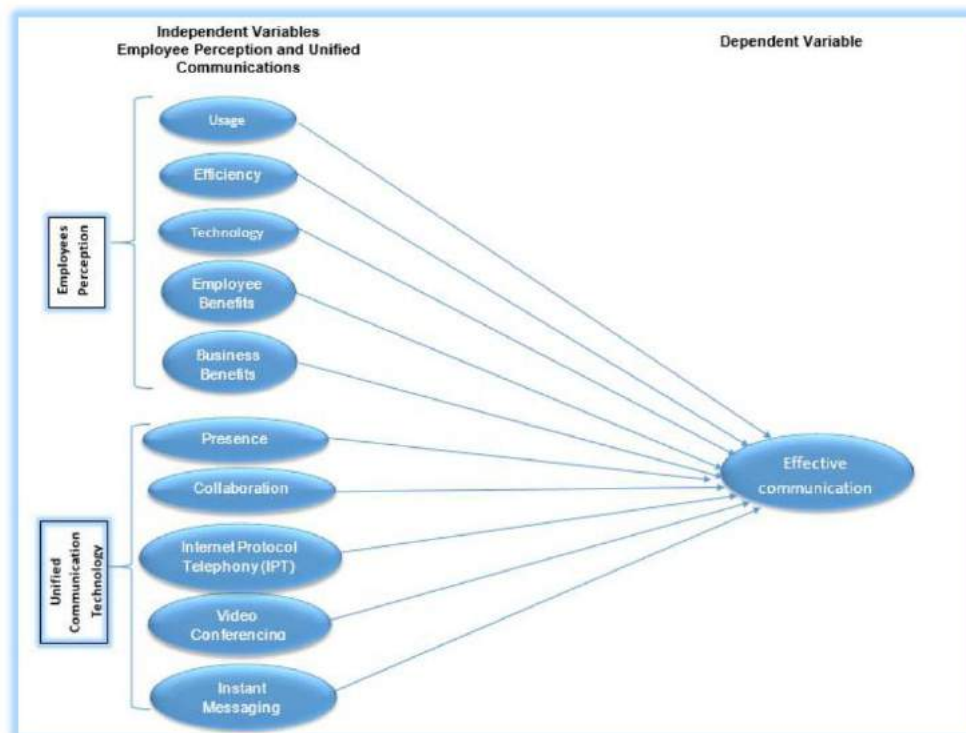

Figure 6: Conceptual model

6. Research Methodology

The study followed a positivistic research paradigm, which is deductive in nature. An empirical evaluation was conducted on the developed UC model containing factors (Figure 6) that influence effective communication and productivity of organisations. The questionnaire was divided into the following sections:

- Section 1 collected demographic information of the employees, who responded to the survey. Demographic information in this section included: age, gender, time period within the organisation, level of qualification, level of job position (operational staff, senior staff and management), preferred method of communication in personal life and preferred method of communication in the working environment;
- Section 2 incorporated a 5 point Likert scale with the statements aimed at gathering respondents' perception with regard to the influence of different factors of (UC) technology like the presence, collaboration, voice internet protocol (VoIP), video conferencing and instant messaging within organisations. Furthermore, section two gathered respondents' perception (EP) with respect to usage, efficiency, technology, employee benefits and organisations benefits on the adoption of this new technology, unified communication, within an organisation; and
- Section 3 asked respondents which functions under UC technology were used most often. A comprehensive list of commonly known UC technologies was outlined for selection by the respondents.

A pilot study was conducted with a convenience sample to examine if there were any impending issues. The pilot study required that the questionnaire be amended before being sent to the respondents. The sample included employees within the organisation who use UC technology for operational purposes. The sample size for this study was 300 respondents throughout the organisation who are currently using UC technology. One hundred and ninety five participants successfully completed the questionnaire representing a 65% response rate.

A 5-point Likert scale was used, ranging from (1) Strongly disagree to (5) Strongly agree. The online survey platform, QuestionPro was used to collect the responses and the university statistical consultant performed the statistical analysis using the Statistica software. Descriptive statistics, ANOVA and Exploratory Factor Analysis (EFA) were conducted using Statistica. Ethics approval was obtained from the university Ethics Committee.

7. Results and Findings

The respondents (n=195) in this study included 47% (n=91) males and 53% (n=104) females (Table 1). The age distribution of respondents for this study ranged from 18 years to older than 56 years. The working experience with the current employer depicted that the majority 51% (n=100) worked in the organisation for 5 years and more. Twenty-three percent (n=44) of the respondents had a diploma qualification, 26% (n=50) a degree qualification and 36% (n=71) a post-graduate degree qualifications. The respondents were 46% (n=90) operational staff, 28% (n=54) senior staff and 26% (n=51) were management level.

Table 1: Demographics (n=195)

Education	Matric	Higher Certificate and Diploma	Degree	PG Degree
	13(7%)	61(32%)	50(26%)	71(36%)
Work experience	<1 year	1-3 years	4-5 years	5+ years
	24(12%)	29(15%)	42(22%)	100(51%)
Level at work	Operational staff	Senior Staff	Management	
	90(46%)	54(28%)	51(26%)	
Gender	Female	Male		
	104(53%)	91(47%)		

The reliability of the measuring instrument is illustrated in Table 2. The Cronbach alpha coefficients reliability was 'excellent' for all the independent factors.

Table 2: Cronbach Alpha Coefficients (reliability) and correlations

Factors	μ	S.D.	Cronbach Alpha	Reliability	p-value	Correlation	Hypotheses
IF ₁ : Presence	3,95	0,70	0,90	Excellent	<.0005	0,455	H ₁ Accepted
IF ₂ : Collaboration	3,89	0,61	0,94	Excellent	<.0005	0,522	H ₂ Accepted
IF ₃ : Internet Protocol Technology	3,89	0,72	0,92	Excellent	<.0000	0,562	H ₃ Accepted
IF ₄ : Video Conference	3,90	0,59	0,83	Excellent	<.0005	0,668	H ₄ Accepted
IF ₅ : Instant messaging	3,84	0,62	0,90	Excellent	<.0005	0,665	H ₅ Accepted
IF ₆ : Usage	2,52	1,10	0,85	Excellent	<.0005	0,266	H ₆ Accepted
IF ₇ : Efficiency	3,75	0,68	0,91	Excellent	<.0005	0,610	H ₇ Accepted
IF ₈ : Technology	3,71	0,66	0,88	Excellent	<.0005	0,673	H ₈ Accepted
IF ₉ : Employment Benefit	3,91	0,64	0,90	Excellent	<.0005	0,702	H ₉ Accepted
IF ₁₀ : Organisation's Benefits	4,06	0,62	0,92	Excellent	<.0005	0,619	H ₁₀ Accepted
DF: Effective Communication	3,50	0,76	0,97	Excellent	0.093		

A correlation coefficient is statistically significant at 0.05 level for a sample size n ranging from 150 to 200 if $|r| \geq r_{crit}$ ranging from 0.159 to 0.138. A correlation coefficient with an absolute value greater than 0.300 can be considered as almost significant and of reasonable scale and those more than 0.50 represents a strong statistical correlation. The results of the analysis show that the most important determinants for UC technology collaboration are Presence ($r = 0.455$, $p < 0.005$) and Internet Protocol Telephony (IPT) ($r = 0.562$, $p < 0.005$). These UC technology factors are more critical and significant for collaboration of technology within the organisation and explain 88% of the variance in UC technology collaboration. Factors such as presence and IPT are more likely to improve the collaboration of technology that can influence effective communication within organisations. The independent factor Usage did not correlate ($r=0,222$) with Effective Communication and was not included in the final model.

Results further indicate that the most important determinants for employee perception factors are Technology ($r = 0,673$, $p < 0.005$) and Employee Benefits ($r = 0.702$, $p < 0.005$). These employee perceptions factors along with collaboration factors are more critical and significant for effective communication within the organisation. Factors such as technology and employee benefits are more likely to improve the employees' perception that can impact effective communication within organisations.

According to the multiple regression r^2 , two (2) independent variables for employee perception along with collaboration explain 54% of the variance in effective communication within an organisation, which is an indication that the selected variables are important factors influencing effective communication within an organisation. Technology and employee benefits and collaboration are more important in employee perceptions and can influence effective communication within an organisation. The employee perceptions along with collaboration have influence on effective communication within an organisation. Henceforth, it is significant that UC technology collaboration along with employee perception can influence communication in the organisation.

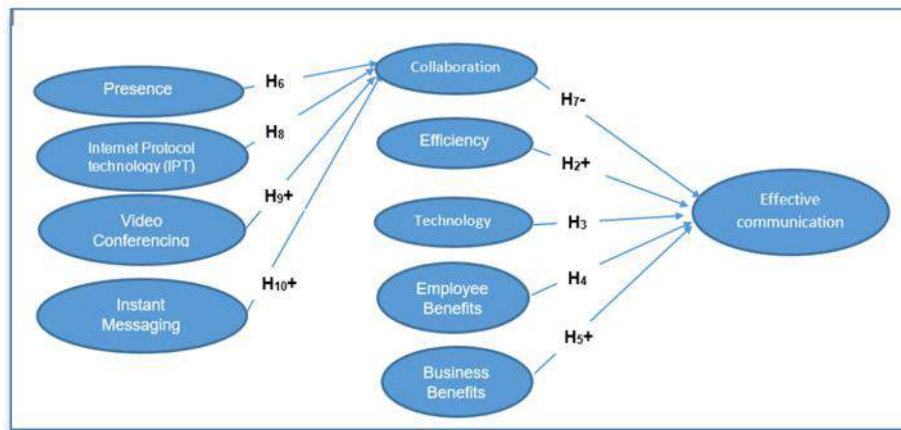

Figure 7: Final tested model after EFA

The final model illustrated in Figure 7 proved to be a satisfactory model for evaluating the effective communication within an organisation with unified technology. In this model, the factor Usage was removed. The results from the study shows that UC Presence and Internet protocol telephony (IPT) are factors that are most likely capable of influencing Collaboration of UC technology. The employees’ perception UC technology and Employee Benefits along with Collaboration are most likely to influence effective communication within an organisation.

8. Managerial Implications

Unified Communications will play an increasingly important role as people adapt to the evolving digital world through which they communicate and collaborate to improve the productivity within the organisation. Presence, which is defined as being available or present but not necessarily seen, attributes to growing employee flexibility, availability and accessibility and the sharing of knowledge which makes it easier to make decisions and respond quickly. Presence allows employees to work flexibly, which is in keeping with the new world of work and working from anywhere. This functionality depends on the IPT to be in place, structured properly and functioning well within an organisation to manage what is demanded in business in real time. This improves the competitive edge and makes service to customers more proactive and efficient in response time. The findings of this study highlight the importance of an organisation’s communications strategy. Table 3 highlights management interventions recommended by this study.

Table 3: Proposed managerial interventions (Author’ construction)

Business outcome	Description	Outputs to achieve outcomes
Cost efficiency	Reduction in national and international travel. Reduction in telephony costs.	Less dead time travelling. Reduce direct travel costs and carbon footprint.
Growth	Collaborate more effectively with distributed customers and partners. Effective collaboration with internal stakeholders	Open new geographic areas for opportunities. Productive collaborative interaction.
Time to Market	Team across geo-diverse regions.	Faster decision making through real time collaboration.
Credibility	Robust secure platforms.	High quality communication through infrastructure and networks.
Sustainability and talent attraction	Enable employees to collaborate in the workspace of tomorrow.	Work from anywhere. Flexibility. Increased agility. Improved collaboration- internally and externally.

9. Conclusions, limitations and future research

Previous studies have shown that efficient organisational processes coupled with the use of unified collaboration improves knowledge transfer and employee productivity (Riemer & Taing, 2009). Ferris et al. (2009) state that a good working relationship between team members, irrespective of physical nearness, is the basis of how most of the work is accomplished and objectives are reached within an organisation. The findings of this empirical study on effective communication, indicated that most of the respondents positively agreed that UC improved communication, UC increased employee performance and UC created positive effectiveness among employees. Further analysis of the results for this study indicated that the majority of the respondents agree that UC technology, along with Collaboration, have an effect on communication within an organisation.

Comparing Effective Communication within the organisation and various demographics, it was determined that a significant relationship existed between age and effective communication, between length of service and effective communication and between level at work and effective communication. The findings imply that younger people are familiar and see all the advanced UC technologies available in the market, adapt them and change the means of communication to accommodate their daily routines much more easily.

Furthermore, it was also evident that junior staff and management agreed and accepted that UC technologies can make communication more effective within the organisation, which is different to the view of middle management. It implies that the communication amongst and between junior staff and management is more efficient and effective than that of other levels of staff. This supported the statement by Reeves et al. (2008) that more collaborative and networked structures create conducive leadership and work environments with transparent information and competences, which enables decision making in accordance with the organisation's values, beliefs and responsibilities.

This study indicated that Effective Communication is essential for an organisation to function more efficiently by developing a strong working relationship amongst employees. Communication tools are essential as they make employees more efficient. The use of the correct UC technologies and collaboration, creating awareness of the UC technologies and providing training on the UC technologies for the employees within an organisation can create efficient communication and improve the productivity within organisations. The significant findings from this study are that UC improves collaboration between employees and this collaboration could increase employee productivity through effective communications within organisations. It was also evident that UC provides an improved communication flow encouraging stronger relationships among employees contributing to enhanced collaboration and a better quality of work.

Management should create awareness on how the use of UC technology benefits the employees. Furthermore, management must also create awareness among the employees how UC technology will assist the organisation to be competitive in the market with cost reductions and effective strategy. Creating awareness only, will not improve effective communication, it should also be accompanied by training on UC technology features given to the employees. Strategic Communication is essential in a digitally transforming and globally distributed workforce. For this to happen, communication must be clear and accessible across a number of touchpoints (Scott, 2020). Effective Communication is essential for an organisation to function more efficiently by having productivity enhancement and a strong working relationship among employees.

The limitations of the study is that it was conducted during the COVID-19 pandemic which limited the response rate. Future research will focus on the impact of the COVID-19 pandemic and how it has forced people to work from home, thus future research should focus on UC post-COVID-19.

Work engagement

Abstract

The outcomes of low levels of public service motivation are low job satisfaction, organisational commitment, engagement and high levels of counterproductive work behaviour. This study's primary aim was to develop a framework to assess the influence of public service motivation on core work evaluation (job satisfaction, organisational commitment, work engagement) and counterproductive work behaviour among employees at 11 North West provincial government departments

The study was conducted within the quantitative research paradigm using a cross-sectional correlational survey design. The population included 61 954 public-service employees. The study used a stratified random sampling method consisting of four subgroups: senior management, middle management, junior middle management, and elementary employees.

The results revealed a positive correlation between PSM and JS, while OC positively correlated with PSM. Work engagement, PSM, OC and JS are positively related, while CWB negatively affects PSM, JS and WE. The measuring instruments were reliable and valid in the North West provincial government departments.

This study provides a theoretical and conceptual framework that public-sector managers can use to assess the impact of public service motivation on core work evaluation and counterproductive work behaviour.

1. Introduction

This research aimed to construct a framework to evaluate the impact of public service motivation (PSM) on core work evaluation (job satisfaction, organisational commitment, work engagement) and counterproductive work behaviour (CWB). Extensive research has investigated the influence of public service motivation on behavioural and work attitudes such as job satisfaction (Stefurak *et al.*, 2020; Homberg *et al.*, 2015; Crucke *et al.*, 2021; Bright, 2021; Palma, 2016; Kim *et al.*, 2013; Prysmakova & Vandenabeele, 2020; Boyd, Nowell, Yang & Hano, 2018), organisational commitment (Potipiroon & Ford, 2017; Pratama & Nurhidayah, 2019; Boyd & Nowell, 2020), work engagement (Vinarski Peretz, 2020; Mussagulova, 2021; De Simone *et al.*, 2016; Cooke, 2019), and counterproductive work behaviour (Vogel *et al.*, 2016; Koumenta, 2015). However, the literature is inconclusive about the influence of PMS on JS, OC, WE and CWB.

No previous research has investigated the influence of PSM (independent variable) on CWE such as JS, OC, WE and CWB (dependent variables) within the South African public-service context. These dependent variables can also be regarded as outcomes of PSM. Therefore, this study filled the gap by developing a framework to assess the influence of PSM on core work evaluation (JS, OC, WE) and CWB of employees in all 11 North West provincial government departments.

This study developed a theoretical and conceptual framework for evaluating the impact of PSM on CWE (JS, OC, WE) and CWB. This research contributes to the theory and application of behavioural dimensions such as PSM, JS, OC, WE and CWB. Additionally, the measuring instruments were validated within the South African public service context. The study's results confirmed PSM's potential positive outcomes or consequences. For example, high levels of PSM led to high levels of JS, OC, WE and low levels of CWB. Therefore, motivated public service employees will have high JS, OC and WE, and these positive work behaviours will help prevent counterproductive behaviour (including corruption), which is necessary for effective corporate governance, service delivery, policy formation and implementation.

The following sections focus on the problem investigated, research objectives, hypotheses, literature review, methodology, results, discussion of results, managerial implications and conclusion.

2. Problem investigated

Public-service employees' low degree of PSM, JS, OC and WE and a high degree of CWB have been significant concerns (Perry & Vandenabeele, 2015). *The problem that was investigated is that the low levels of PSM led to decreased CWE (JS, OC, WE) and increased CWB.*

3. Research objectives

The study's objectives are to:

- Establish whether public service motivation, job satisfaction, organisational commitment, work engagement and counterproductive work behaviour scales are reliable and valid within the South African public-sector context.
- Investigate the relationship between public service motivation, job satisfaction, organisational commitment, work engagement and counterproductive work behaviour.

4. Hypotheses

The following hypotheses were developed in line with the research objectives:

- H1₀: The PSM, JS, OC, WE, and CWB scales will not be reliable and valid within the South African public-sector context.
- H1_A: The PSM, JS, OC, WE, and CWB scales will be reliable and valid within the South African public-sector context.
- H2₀: There is no positive relationship between PSM, JS, OC and WE and no negative relationship between PSM and CWB.
- H2_A: There is a positive relationship between PSM, JS, OC and WE and a negative relationship between PSM and CWB.

5. Literature review

The literature review focuses on the five constructs used in this study. The independent variable is PSM, while the dependent variables are JS, OC, WE and CWB. The literature review is aligned with the research objectives and hypotheses. Therefore, the literature review focuses on public service motivation, core work evaluation (job satisfaction, organisational commitment, work engagement) and counterproductive work behaviour. After that, the reliability and validity of the measuring instruments and the relationship between the constructs are discussed.

5.1 Public service motivation

Andersen *et al.* (2020) assert that PSM is an individual's attitude toward providing services to others to benefit society. Public service motivation is a broad term for "an individual's commitment to providing services to others to do good for individuals and society" (Caillier, 2014). According to Van Loon *et al.* (2018), PSM can be viewed as an individual's drive toward presenting public offerings that stem from rational (desiring to participate in and embellish public offerings), normative (dedication to the public hobby and a sense of duty), and affective (compassion and identification

with others) motives. According to Kim (2018), PSM is a multidimensional term comprising (1) self-sacrifice (SS); (2) compassion (COM); (3) attraction to public service (APS); and (4) commitment to public values (CPV). This study used Kim *et al.*'s (2013) International Public Service Motivation Scale to measure PSM. The scale consists of 16 items and four factors: attraction to public service – 4 items; commitment to public values – 4 items; compassion – 4 items and self-sacrifice – 4 items.

5.2 Core work evaluation

Core work evaluation (CWE) is a summary psychological assessment of an individual's work environment that focuses on the job, organisation and work activities (Webster *et al.*, 2014). The three sub-constructs comprising the core work evaluation are job satisfaction, work engagement and organisational commitment.

5.2.1 Job satisfaction

Job satisfaction is a happy or positive emotional state that results from an evaluation of one's job or experiences, or, more simply, "the degree to which individuals like (satisfaction) or loathe (dissatisfaction) their employment" (Top *et al.*, 2015). Job satisfaction consists of various dimensions and factors. In this study, the Facet Satisfaction Scale developed by Bowling *et al.* (2018) was used to measure JS. There are five factors and 25 items on the JS facet scale: work itself – 5 items; supervision – 5 items; co-workers – 5 items; pay – 5 items; and promotion – 5 items.

5.2.2 Organisational commitment

Organisational commitment refers to an employee's psychological relationship with their employer (Potipiroon & Ford, 2017), while Albdour and Altarawneh (2014) define OC as "the degree to which an individual identifies with and participates in a particular organisation." Meyer and Allen contributed to the literature on OC by proposing a three-component model of OC, including normative, emotional and perseverance (Thabane *et al.*, 2017). Regarding OC, Buda and Ling (2017) called these three key elements: affective (AC), continuance (CC) and normative (NC).

A worker's emotions are intimately tied to AC, which refers to the employee's emotional attachment to the organisation. It mainly entails forming an emotional bond with the organisation, identifying with it, and wanting to remain loyal to it. Continuance commitment refers to an employee's awareness of the costs associated with leaving or remaining with the organisation (Buda & Ling, 2017; Thabane *et al.*, 2017). If people believe that remaining with the organisation is greater than the cost of leaving, they will prefer to remain. Unlike AC, CC refers to a psychological attachment that encompasses the effort, time and growth invested in staying with the same organisation for many years. Finally, NC displays a worker's feeling of organisational duty. It has to do with the employee's strong level of obligation to continue working (Buda & Ling, 2017; Koc, 2018).

The organisational commitment was measured using Allen and Meyer's OC scale (1996), as validated by Maqsood *et al.* (2012). The questionnaire consists of three factors and 22 items: AC – 8 items, CC – 6 items and NC – 8 items.

5.2.3 Work engagement

Work engagement is defined as a positive, satisfying and work-related state of mind with three components: physical, emotional and cognitive (Wang *et al.*, 2017), while Pandita and Singhal (2017) defined work engagement as an attitude or behaviour characterised by being drawn to, committed to, busy with, involved in, and retained in the work or organisation. The three components of WE are vigour, commitment and immersion (Wang *et al.*, 2017). According to Junça-Silva, Caetano and Lopes (2017), there is a need to extend research on job engagement and examine it as a process due to its potential to improve workplace outcomes. Costa *et al.* (2016) presented a three-dimensional structure of WE, characterised by vigour (high levels of energy when working), dedication (strong involvement in one's job, experiencing a sense of enthusiasm), and absorption (complete concentration on one's work).

The Work Engagement Scale (WES), developed by Schaufeli and Bakker (2004), was utilised to measure WE. The questionnaire has 17 questions and three factors: vigour – 6 items, dedication – 5 items and absorption – 6 items.

5.3 Counterproductive work behaviour

Counterproductive work behaviour is defined as “a set of volitional acts as opposed to accidental or mandated that harm or intend to harm organisations and their stakeholders” (Spector *et al.*, 2006). In addition, counterproductive work behaviour is defined as any purposeful act by a member of an organisation that is deemed to go against the organisation’s legitimate interests (Whelpley & McDaniel, 2016). Workplace counterproductive behaviour encompasses a range of actions, including unproductive work behaviour, workplace misbehaviour, workplace deviance and workplace bullying (Fatima, 2016). According to DeShong *et al.* (2015), CWBs result in some undesirable consequences, including financial losses (e.g. paying or accepting bribes, fraud) and damage to the corporation’s reputation (e.g. discriminating against co-workers). In addition, counterproductive work behaviour can negatively impact the performance and wellbeing of the individual engaged in CWB, the individuals interacting with the one engaging in CWB, and the organisations where CWB occurs (Whelpley & McDaniel, 2016).

This study focuses on two dimensions of CWB: counterproductive workplace behaviour – organisation; and counterproductive workplace behaviour – person. Therefore, the CWB checklist developed by Spector *et al.* (2006) was utilised to assess CWB. The questionnaire includes 45 items and two factors. However, Spector *et al.* (2006) excluded items 12 and 45 in their analysis. Therefore, these two items were also excluded from this study.

5.4 Reliability and validity of the measuring instruments

The measuring instruments were validated and found to be reliable by the developers of the scales. Cronbach’s alpha internal consistency coefficient was used to determine each scale’s reliability. A Cronbach’s alpha value of 0.7 or greater is widely considered acceptable, whereas a value between 0.5 and 0.7 indicates moderate sample adequacy (Taber, 2018; Bell *et al.*, 2018). However, a scale with a value less than 0.5 is considered inconsistent (Walsh, 2003). Table 1 shows Cronbach’s alphas for the factors and scales.

Table 1: Reliability analysis

Scale and sub-scales	Authors	Cronbach's alpha	Number of items
APS	Kim <i>et al.</i> (2013)	0.70	4
CPV		0.54	4
Compassion		0.69	4
SS		0.78	4
PSM Scale		0.74	16
Work itself	Bowling <i>et al.</i> (2018)	0.72	5
Supervision		0.83	5
Co-workers		0.77	5
Pay		0.83	5
Promotion		0.82	5
Facets JS Scale			
AC	Allen and Meyer (1996) as validated by Maqsood <i>et al.</i> (2012)	0.83	8
CC		0.61	6
NC		0.64	8
OC Scale		0.84	22
Vigour	Schaufeli and Bakker (2004)	0.83	6
Dedication		0.92	5
Absorption		0.82	6
WE Scale			17
CWB-Organisation	Spector <i>et al.</i> (2006)	0.84	21
CWB-Person		0.85	22
CWB Scale		0.81	43

CFA is often used for studies developing and adapting scales with specific reference to (i) psychometrically evaluating measurements, (ii) validation of the structure, and (iii) testing the effect of the model (Kořar & Kořar, 2015). The International PSM instrument was validated by Kim *et al.* (2013), and the confirmatory factor analysis (CFA) revealed 16 items and four factors and found that the model fit is quite strong (SB_x^2 [df= 98] = 564.1, $p < .05$; CFI = 0.989; root mean square error of approximation (RMSEA) = 0.041 [.038,.044]; SRMR = 0.042). Therefore, the results support convergent validity, while the composite reliability of the set of reflective indicators for each dimension of PSM ranged from .716 to .824, indicating adequate internal consistency. The factor structure showed a four-factor structure with all items loading significantly onto their *a priori* dimension ($p < .05$), and the SFLs ranged from .556 to .812. The results support discriminant validity as the correlation estimates between the four factors ranged from .482 to .851.

The CFA of the facets JS scale measuring JS indicated that the FFM produced marginally good fit ($\chi^2 = 537.78$, $df = 265$; RMSEA = 0.08; CFI = 0.91; TLI = 0.90; SRMR = 0.06) (Bowling *et al.*, 2018). Bowling *et al.* (2018) also found that each “subscale produced high levels of internal consistency reliability, test-retest reliability and construct validity.” Maqsood *et al.* (2012) validated Allen and Meyer’s (1996) OC scale by conducting a CFA to test how well data supported the factor structure of the measures on individual item scores. Goodness-of-fit statistics of the three-factor model of the OCQ were “ $X^2 = 636.76^*$; $df = 206$; RMR = .10; RMSEA = .07; GFI = .87; AGFI = .84; IFI = .89; NFI = .85; CFI = .89; AIC = 783.97 and CAIC = 1021.53.” In addition, the correlation matrix of factors revealed that AC relates with NC ($r = .50$, $p = .01$) and with subscale of CC ($r = .29$, $p = .01$); and CC relates to NC ($r = .33$, $p = .01$).

A CFA of the UWES 17-item questionnaire to determine the factor structure and inter-correlations revealed “ $N = 1,242$; $X^2 = 1859.93$; $df = 232$; GFI = .82; AGFI = .77; RMSEA = .08; NFI = .86; NNFI = .85 and CFI = .87.” (Schaufeli & Bakker, 2004). The correlations between factors of UWES were very high (Vigour - Dedication .89; Dedication - Absorption .90 and Vigour - Absorption .90) (Schaufeli & Bakker, 2004).

Barbaranelli *et al.* (2013) conducted a CFA to validate the two-factor CWB scale. The two factors indicated “a significant and high correlation of .80”. Goodness-of-fit indices indicated an ambiguous solution: $X^2(859, N = 856) = 1,897, p < .001, RMSEA = .038$ [90% confidence interval: LL = .035, UL = .040, $p(RMSEA.05) = 1$], comparative fit index (CFI) = .88, TLI = .87, and weighted root mean square residual (WRMR) = 1.55. The RMSEA indicated an excellent fit to the data, while the other fit indices converged, evidencing an inadequate fit,

5.5 Relationship between public service motivation, job satisfaction, organisational commitment, work engagement and counterproductive work behaviour

Public service motivation affects CWE such as JS, OC, work engagement (WE) and CWB, either positively or negatively. A meta-analysis done by Homberg *et al.* (2015) revealed a “positive relationship between public service motivation (PSM) and job satisfaction (JS)” and considered PSM as a predictor of job satisfaction. Crucke *et al.* (2021) also found that PSM is a predictor of JS. Furthermore, studies by Bright (2021), Palma (2016) and Kim *et al.* (2013) revealed that PSM positively related to JS significantly. This positive relationship was confirmed in a study by Prysmakova and Vandenabeele (2020) among police officers in Poland and Belgium, which showed “that officers with higher levels of public service motivation also have higher levels of job satisfaction.” Furthermore, Breugh *et al.* (2018) found that “APS and CPV were significantly related to JS, while SS and COM were not.” However, a study by Boyd, Nowell, Yang and Hano (2018) showed that PSM was not significantly correlated to JS.

Wu, Ming and Huang (2019) found a negative relationship between JS and unethical behaviour. This negative relationship was confirmed by Wang *et al.* (2020), who found that JS and OC are negatively related to workplace deviance. However, Czarnota-Bojarska (2015) found a weak correlation between counterproductive work behaviour and work satisfaction.

Castaing's (2006) findings revealed a positive association between PSM, affective, normative and continuance commitment, while Potipiroon and Ford (2017) also found that PSM had a significant positive effect on OC. The study results of Nikkah-Farkhani *et al.* (2017) showed that OC “had a negative and significant effect on counterproductive work behaviour.” Baysal *et al.* (2020) found a negative relationship between abuse, withdrawal, affective and NC. In addition, there was a negative correlation between abuse, theft, withdrawal and continuance commitment.

Ugaddan and Park's (2017) study revealed a positive relationship between PSM and WE. On the other hand, Ariani (2013) found “a negative relationship between work engagement and counterproductive work behaviour”, while Filipkowski and Derbis (2020) confirmed “a negative correlation between work engagement and counterproductive work behaviour.”

The results of a study done by Vogel *et al.* (2016) showed a negative association between PSM and deviant behaviour (CWB), while Koumenta (2015) also found a negative and significant relationship between PSM and CWB. Vandenabeele (2009) found “that two of the four dimensions of PSM, namely politics and self-sacrifice, are entirely mediated by job satisfaction and normative and affective commitment, respectively.”

Based on the literature, the results revealed that high levels of PSM positively affect JS, OC and WE, and negatively affect CWB.

6. Methodology

6.1 Research method and design

This study was conducted within the quantitative paradigm. Therefore, a cross-sectional correlational design was deemed the most appropriate design to attain the research objectives.

6.2 Population

The study's target population comprises employees between post levels 1 and 16 at 11 North West provincial government departments. These include the Department of Education and Sports Development, Department of Public Works and Roads, Department of Community Safety and Transport Management, Department of Social Development, Department of Rural, Environment and Agricultural Development, Premiers Office, Department of Health, Department of Local Government and Human Settlement, Department of Tourism, Department of Economy and Enterprise Development, and Department of Culture, Arts and Traditional Affairs.

6.3 Sampling method

The study used a stratified simple random sampling method consisting of four subgroups (strata), namely senior management (SMS salary levels 13-16); middle management (MMS salary levels 11-12), junior middle management (JMM salary levels 8-10) and elementary employees (salary levels 1-7). A total sample size of 1 546, in line with the recommendation of Krejcie and Morgan (1970), was selected from the study population in the 11 provincial government departments to represent the strata: senior management, middle management, junior management and elementary staff. The sample of 1 546 representing the four subgroups (strata) per department is depicted in Table 2.

Table 2: Sample size per strata and department

Department	Senior management	Middle management	Junior management	Professionals/Elementary
Department of Education and Sport Development	14	33	29	77
Department of Public Works and Roads	12	27	39	92
Department of Community Safety and Transport Management	19	41	36	190
Department of Social Development	16	21	32	62
Department of Rural, Environment and Agricultural Development	9	18	14	67
Premiers Office	18	36	45	138
Department of Health	5	12	9	68
Department of Local Government and Human Settlement	8	15	12	55
Department of Tourism	8	19	13	61
Department of Economic and Enterprise Development	11	8	19	76
Department of Culture, Arts and Traditional Affairs	4	12	8	38
Total	124	242	256	924

Out of 1 546 questionnaires distributed, 1 031 were completed and returned. The response rate was 66.68%.

6.4 Measuring instruments

The questionnaire was divided into six sections. Section A comprises the respondents' demographic characteristics, including gender, age group, post-salary level, years of service, provincial government department and qualification; Section B comprises the questions relating to PSM; Section C measured JS; Section D OC; Section E WE, and Section F CWB.

The International PSM Scale, developed by Kim *et al.* (2013), was used to measure PSM. The Facet Satisfaction Scale of Bowling *et al.* (2018) measured job satisfaction. Allen and Meyer's (1996) scale, as validated by Maqsood *et al.* (2012), was used to measure OC. The shortened WES of Schaufeli and Bakker (2004) was used to measure WE, while the Counterproductive Work Behaviour Checklist, developed by Spector *et al.* (2006), was used to measure CWB.

6.5 Data analyses

The data was analysed using the following statistical techniques to attain the study's research objectives:

Descriptive statistics

Tables, graphs, means and standard deviations were used to present descriptive data. A frequency table was created to summarise the respondents' demographic information, including gender, age group, post-salary level, years of service, department and qualification.

Reliability and validity of the measuring instruments

Cronbach's alphas were calculated to determine the reliability of the factors and scales measuring PSM, JS, OC, WE and CWB. The validity of the measuring tools was determined using exploratory and confirmatory factor analyses. Exploratory and confirmatory factor analyses were done to determine the validity of the measuring instruments within the South African public service context.

Pearson's product-moment correlation

Pearson's product-moment correlation (r) was used to measure the relationship between PSM, JS, OC, WE and CWB.

7. Results

According to Table 3, the sample was almost evenly distributed by gender, with 50.2 % of respondents ($n = 518$) identifying as male and 49.8 % ($n = 513$) as female. The majority of respondents ($n = 370$; 35.9 %) fell into the 40 to 49 age bracket, followed by respondents in the 50 to 59 age bracket ($n = 242$). Additionally, 22.4 % ($n = 231$) of the sample fell into the 30 to 39 age bracket, while 10.1 % ($n = 104$) fell into the 20 to 29 age bracket. The smallest group of respondents were aged 60 and over ($n = 84$; 8.1 %). The 16 post-salary levels were divided into four subpopulations, namely senior management (SMS – salary levels 13-16), middle managers (MMS salary levels 11-12), junior middle managers (JM salary levels 8-10) and elementary staff (professionals salary levels 1-7). Most respondents ($n = 431$; 41.7 %) had worked for the North West provincial administration (departments) for six to ten years, while the fewest respondents, 1.2 % ($n = 12$), had at least 21 years of work experience. The Department of Community Safety and Transportation Management employed 18.5 % ($n = 191$) of the respondents, followed by the Premier's Office ($n = 158$; 15.3 %), while the Department of Culture, Arts and Traditional Affairs (CATA) employed only 4% ($n = 41$) of the sample. This was expected, as CATA is one of the province's smallest departments. Finally, most respondents (36.7 %) presented a diploma as their highest qualification, followed by 22.8 % ($n = 235$) with a master's degree, and only 4.1 % ($n = 42$) with a doctoral degree (PhD).

Table 3: Demographic characteristics of the sample

Variable	Level of the variable	N	%	Cumulative %
Gender	Male	518	50.2	50.2
	Female	513	49.8	100.0
Age	20-29	104	10.1	10.1
	30-39	231	22.4	32.5
	40-49	370	35.9	68.4
	50-59	242	23.5	91.9

Source: Own compilation

The study's first objective was to determine the reliability and validity of scales measuring PSM, JS, OC, WE and CWB within the South African public-sector context. The Cronbach's alpha coefficient for the JS scale was 0.888, considered acceptable and consistent. Therefore, given the sample characteristics, the scale will revert to the same results after several iterations. Similarly, JS sub-scales ranged from 0.715 to 0.845. Cronbach's alpha values for AC, CC, NC, and OC were between 0.5 and 0.7, indicating moderate sample reliability for the specified scales (see Table 4). The Cronbach's alpha coefficient for the WES was 0.947, considered excellent, with sub-scales ranging from 0.849 to 0.876. Similarly, the PSM scale was 0.833, reliable, with sub-scales ranging from 0.553 (i.e. commitment to the public service) to 0.806 (i.e. commitment to the public service) (i.e. self-sacrifice).

Simultaneously, the reliability coefficient for CWB was 0.968, with the two sub-scales reverting to 0.893 for organisational CWB and 0.970 for individual CWB.

Table 4: Results of the reliability test

Factor and scales	Items	Cronbach's alphas	Mean	Std. dev.
Work itself	5	0.715	19.41	5.420
Supervision	5	0.834	18.26	8.046
Co-workers	5	0.793	24.34	5.647
Remuneration	5	0.845	19.80	7.265
Promotion	5	0.820	13.35	6.891
JS Scale	25	0.888	95.16	22.979
AC	8	0.642	27.93	7.162
CC	6	0.600	21.78	5.801
NC	8	0.524	27.01	6.032
OC Scale	22	0.664	76.72	12.697
Vigour	6	0.849	30.68	7.105
Dedication	5	0.876	25.19	7.636
Absorption	6	0.851	30.87	7.397
WE Scale	17	0.947	86.75	21.048
APS	4	0.726	18.80	1.480
CPS	4	0.553	18.52	1.749
Compassion	4	0.743	18.539	1.601
SS	4	0.806	15.81	3.031
PSM Scale	16	0.833	71.688	5.599
CWB-Organisation	20	0.893	28.70	8.018
CWB-Individual	22	0.970	26.67	8.898
CWB Scale	43	0.968	56.46	16.211

Source: Own compilation

Exploratory and confirmatory factor analyses were used to determine the validity of the measuring instruments. On scales of PSM, CWE constructs (JS, WE, and OC), and CWB, the Kaiser-Meyer-Olkin (KMO) sampling adequacy measure and Bartlett's test of sphericity were computed first. After the EFA, CFA was performed to retain the number of factors and determine the validity of each scale.

Results in Table 5 present the factor loadings based on a principal component extraction with Oblimin and Kaiser normalisation rotation for PSM. According to the results, six items loaded onto Factor 1 measuring APS. This factor was labelled *attraction to public service*. All six items loaded positively onto the first factor. Four items loaded onto Factor 2, measuring CPV. This factor was labelled *commitment to public values*. All four items loaded positively onto the second factor. Two items loaded onto Factor 3 measuring compassion. This factor was labelled *compassion*. One item loaded positively, and the other loaded negatively onto the third factor. Finally, four items loaded onto Factor 4, measuring self-sacrifice. This factor was labelled *self-sacrifice*. All four items loaded negatively onto the fourth factor.

Table 5: Factor loadings based on a principal component extraction with Oblimin with Kaiser normalisation rotation for PSM

Statements	Factors			
	1	2	3	4
It is fundamental that the interests of future generations are taken into account when developing public policies.	0.897			
To act ethically is essential for public servants.	0.800			
I empathise with other people who face difficulties.	0.789			
I feel sympathetic to the plight of the underprivileged.	0.619			
It is important to contribute to activities that tackle social problems.	0.513			
It is important that citizens can rely on the continuous provision of public services.	0.415			
I would agree to a good plan to make a better life for the poor, even if it costs me.		0.901		
I am willing to risk personal loss to help society.		0.814		
I believe in putting civic duty before self.		0.778		
I am prepared to make sacrifices for the good of society.		0.614		
I think equal opportunities for citizens are very important.			-0.860	
I admire people who initiate or are involved in activities to aid my community.			0.531	
Meaningful public service is very important to me.				-0.864
It is important for me to contribute to the common good.				-0.827
I get very upset when I see other people being treated unfairly.				-0.738
Considering the welfare of others is very important.				-0.598

A parallel analysis was conducted to confirm the existence of the JS scale's factor count. As determined by the analysis, five factors had eigenvalues greater than the corresponding criterion value for a similarly-sized randomly generated data matrix. A confirmatory analysis was conducted using a forced five-factor rotation, as shown in Table 6. The forced five-factor loading based on a principal component extraction with Oblimin and Kaiser normalisation rotation for JS is depicted in Table 6. Four items were loaded onto Factor 1, measuring supervision according to the results. Therefore, this factor was labelled *supervision*. Of the four items, all four items loaded positively onto the component with factor loadings ranging between 0.918 and 0.793; for example, "All in all, I am very satisfied with this person as my manager" with a high factor loading of 0.918. Seven items loaded onto Factor 2 measuring promotion. This factor was labelled *promotion*. Five items loaded positively onto the second factor, and one item loaded negatively; for example, "I would be more content with my job if my promotion opportunities were not so poor", with a factor loading of 0.551; also, "All in all, I would rather have more opportunities for promotion" with a factor loading of 0.545. Three items loaded onto Factor 3 measuring pay. This factor was labelled *pay*. All three factors loaded positively onto the third factor, with factor loadings ranging between 0.894 and 0.882. Five items loaded onto Factor 4 measuring co-workers. Therefore, this factor was labelled *co-workers*. Of the five items, all the items loaded positively, with factor loadings ranging between 0.941 and 0.415. Four items loaded onto Factor 5 measuring work itself. This factor was labelled *work itself*. All four items loaded positively onto Factor 5; for example, "All in all, I would rather have some other kind of duties in my work" with a factor loading of 0.837; also, "I would be more content with my job if I were doing tasks that are different from the ones I do now", with a factor loading of 0.818.

Table 6: Forced five-factor loading based on a principal component extraction with Oblimin and Kaiser normalisation rotation for JS

Statements	Factors				
	1	2	3	4	5
All in all, I am very satisfied with this person as my manager	0.918				
Overall, I am very pleased with the way my manager supervises me	0.872				
I am more satisfied with my manager than with almost anyone I have ever worked for	0.866				
All and all, I would rather work for some other manager	0.793				
I am more satisfied with my opportunities for promotion now than with almost any other promotion opportunities I have ever had	0.480				
All in all, I am very satisfied with my chances for promotion		-0.332			
I would be more content with my job if my pay were not so low		0.844			
I would be more content with my job if my manager did not work here		0.789			
I would be more content with my job if my co-workers did not work here		0.648			
All in all, I would rather have better pay		0.591			
I would be more content with my job if my promotion opportunities were not so poor		0.551			
All in all, I would rather have more opportunities for promotion		0.545			
I am more satisfied with my pay now than I have almost ever been			0.894		
Overall, I am very pleased with how much money I earn			0.887		
All in all, I am very satisfied with my pay			0.882		
All in all, I would rather work with some other kind of co-workers				0.496	
All in all, I am very satisfied with my co-workers				0.941	
Overall, I am very pleased to work with my co-workers				0.732	
I am more satisfied with my co-workers than with almost anyone I have ever worked with before				0.692	
I am more satisfied with the types of work I currently do that with almost any other work I have ever done				0.342	
All in all, I would rather have some other kind of duties in my work					0.837
I would be more content with my job if I were doing tasks that are different from the ones I do now					0.818

Statements	Factors			
All in all, I am very satisfied with the things I do at work				0.628
Overall, I am very pleased with the types of activities that I do on my job				0.318

Table 7 presents the factor loadings based on a principal component extraction with Oblimin and Kaiser normalisation rotation for the WES. According to the results, eight items are loaded onto Factor 1, measuring employee dedication. This factor was labelled *dedication*. All eight items loaded positively onto the first factor. Next, six items loaded onto Factor 2, measuring employee absorption. This factor was labelled *absorption*. All the six items loaded positively onto the second factor. Finally, three items loaded onto Factor 3, measuring employee vigour. This factor was labelled *vigour*. All three items loaded positively onto the third factor.

Table 7: Factor loadings based on a principal component extraction with Oblimin with Kaiser normalisation rotation for WE

Statements	Factors		
	1	2	3
When I get up in the morning, I feel like going to work.	0.917		
At my job, I feel strong and vigorous.	0.915		
My job inspires me.	0.910		
I find the work that I do full of meaning and purpose.	0.858		
I am enthusiastic about my job.	0.832		
At my work, I feel bursting with energy.	0.828		
When I am working, I forget everything else around me.	0.749		
I feel happy when I am working intensely.	0.562		
To me, my job is challenging.		0.892	
I get carried away when I am working.		0.877	
It is difficult to detach myself from my job.		0.792	
At my job, I am very resilient, mentally.		0.603	
I can continue working for very long periods at a time.		0.588	
I am immersed in my work.		0.486	
I am proud of the work that I do.			0.732
At my work, I always persevere, even when things do not go well.			0.724
Time flies when I am working.			0.697

Source: Own compilation

A confirmatory analysis was conducted using a forced three-factor rotation; the results are shown in Table 8. Table 8 presents the factor loadings based on a principal component extraction with Oblimin and Kaiser normalisation rotation for OC. According to the results, eight items loaded onto Factor 1 measuring CC. All the eight items loaded positively onto the mentioned factor with factor loadings ranging between 0.804 and 0.368. Six items loaded onto Factor 2 measuring AC. Therefore, this factor was labelled *affective commitment*. Five of the six items loaded negatively, with one loading positively onto the second factor. Seven items loaded onto Factor 3 measuring NC. Consequently, this factor was labelled *normative commitment*. All three items loaded positively onto the third factor. Of the seven items, five loaded positively onto the third factor, and two loaded negatively. For example, “I do not believe that a person must always be loyal to his or her organisation” with a factor loading of 0.532. Similarly, “I do not think that wanting to be a “company man” or “company woman” is sensible anymore”, with a factor loading of 0.690.

Table 8: Forced three-factor principal component extraction with Oblimin and Kaiser normalisation rotation for OC

Statements	Factors		
	1	2	3
Too much in my life would be disrupted if I decided I wanted to leave my organisation now	0.804		
Things were better in the days when people stayed with one organisation for most of their careers	0.693		
It would be very hard for me to leave my organisation right now, even if I wanted to	0.682		
Right now, staying with my organisation is a matter of necessity as much as desire	0.647		
If I got another offer for a better job elsewhere I would not feel it was right to leave my organisation	0.581		
One of the major reasons I continue to work for this organisation is that I believe that loyalty is important and therefore feel a sense of moral obligation to remain	0.501		
I am not afraid of what might happen if I quit my job without having another one lined up	0.486		
I feel that I have too few options to consider leaving this organisation	0.368		
I enjoy discussing my organisation with people outside it		-0.375	
I would be very happy to spend the rest of my career with this organisation		-0.478	
I do not feel a strong sense of belonging to my organisation		-0.851	
I do not feel like ‘part of the family’ at my organisation		-0.840	
This organisation has a great deal of personal meaning for me		-0.737	
I think that I could easily become as attached to another organisation as I am to this one		0.517	
Jumping from organisation to organisation does not seem at all unethical to me			0.353
I do not think that wanting to be a company man or company woman is sensible anymore			0.690
I think that people these days move from company to company too often			-0.534
I do not believe that a person must always be loyal to his or her organisation			0.532
I really feel as if this organisation’s problems are my own			0.491
I was taught to believe in the value of remaining loyal to one organisation			-0.469
It would not be too costly for me to leave my organisation now			0.342

Source: Own compilation

A confirmatory analysis was conducted using a forced two-factor rotation; the results are shown in Table 9. The results in Table 9 present the factor loadings based on a principal component extraction with Oblimin and Kaiser normalisation rotation for CWB. Results revealed that 27 items loaded onto Factor 1 measuring CWB aimed at an individual. Therefore, this factor was labelled *CWB–individual*. All the aforementioned items loaded positively onto the factor with factor loadings ranging from

0.960 to 0.406. Moreover, 14 items loaded onto Factor 2, measuring CWB towards the organisation. Therefore, this factor was labelled *CWB–organisation*. All the mentioned items loaded positively with factor loadings ranging from 0.795 to 0.363.

Table 9: Forced two-factor loading principal component matrix with Oblimin and Kaiser normalisation rotation for counterproductive

Statements	Factors	
	1	2
Took money from your employer without permission	0.960	
Threatened someone at work with violence	0.953	
Played a mean prank to embarrass someone at work	0.941	
Hit or pushed someone at work	0.925	
Made an obscene gesture (the finger) to someone at work	0.913	
Stole something belonging to someone at work	0.913	
Purposely dirtied or littered your place of work	0.907	
Destroyed property belonging to someone at work	0.901	
Started or continued a damaging or harmful rumour at work	0.888	
Verbally abused someone at work	0.880	
Did something to make someone at work look bad	0.870	
Put in to be paid for more hours than you worked	0.843	
Withheld needed information from someone at work	0.787	
Looked at someone at work's private mail/property without permission	0.745	
Threatened someone at work, but not physically	0.729	
Hid something so someone at work couldn't find it	0.728	
Said something obscene to someone at work to make them feel bad	0.722	
Made fun of someone's personal life	0.708	
Stolen something belonging to your employer	0.684	
Blamed someone at work for error you made	0.663	
Refused to help someone at work	0.657	
Insulted or made fun of someone at work	0.639	
Took supplies or tools home without permission	0.634	
Refused to take on an assignment when asked	0.582	
Purposely did your work incorrectly	0.557	
Ignored someone at work	0.502	
Started an argument with someone at work	0.406	
Left work earlier than you were allowed to		0.795
Daydreamed rather than did your work		0.731
Told people outside the job what a lousy place you work for		0.717

Statements	Factors
Purposely wasted your employer's materials/supplies	0.653
Tried to look busy while doing nothing	0.636
Purposely failed to follow instructions	0.617
Purposely came late to an appointment or meeting	0.572
Stayed home from work and said you were sick when you were not	0.562
Purposely worked slowly when things needed to get done	0.532
Purposely interfered with someone at work doing his/her job	0.517
Failed to report a problem so it would get worse	0.505
Insulted someone about their job performance	0.439
Came to work late without permission	0.428
Taken a longer break than you were allowed to take	0.363

Source: Own compilation

The fourth objective was to investigate the relationships between PSM, JS, OC, WE and CWB. A Pearson product-moment correlation was conducted to determine the strength of the relationship among the variables, with results displayed in Table 10 below.

Table 10: Results of the correlation test

Variable		PSM	JS	OC	WE	CWB
PSM	R	1				
	P					
JS	R	0.106	1			
	P	0.001**				
OC	R	0.137	0.430	1		
	P	0.000**	0.000**			
WE	R	0.417	0.675	0.368	1	
	P	0.000**	0.000**	0.000**		
CWB	R	-0.289	-0.127	0.085	-0.223	1
	P	0.000**	0.000**	0.006**	0.000**	

Note: $p \leq 0.05$, $p \leq 0.01$ **; small effect $r = 0.10$ to $r = 0.29$; medium effect $r = 0.3$ to $r = 0.49$; large effect $r = 0.5$ to $r = 1.0$

As can be seen from the Pearson product-moment correlation results, JS had a statistically significant small correlation with PSM as seen from the r-value of 0.106 howbeit significant on the 99th percentile. The correlation was positive; therefore, as one increases, there would be a concomitant increase in the other. OC similarly had a small statistically significant correlation with PSM ($r = 0.137$; $p = 0.000$ **) and a medium statistically significant correlation with JS ($r = 0.430$; $p = 0.000$ **). The relationship was positive. Work engagement had medium associations with both PSM ($r = 0.417$; $p = 0.000$ **) and OC ($r = 0.368$; $p = 0.000$ **), while the same had a large statistically significant correlation with JS ($r = 0.675$; $p = 0.000$ **). Lastly, CWB reverted negative small correlations with PSM ($r = -0.289$; $p = 0.000$), JS ($r = -0.127$; $p = 0.000$ **) and WE ($r = -0.223$; $p = 0.000$ **). Therefore, CWB would decrease with an increase in JS, PSM and WE. However, CWB had a small statistically significant positive relationship with OC ($r = 0.085$; 0.006 **).

8. Discussion of results

The study's first objective was to determine the reliability and validity of scales measuring PSM, JS, OC, WE and CWB within the South African public sector context. Cronbach's alpha is the most frequently used test to determine the internal consistency of an instrument. The average of all

correlations across all split-half combinations is computed using this test. A reliability score of 0.7 or greater is considered satisfactory (Bell *et al.*, 2018). Taber (2018) states that “a value between 0.5 and 0.7 indicates moderate sample adequacy.”

The Cronbach alpha coefficient for the JS scale was 0.888, which is considered acceptable and consistent. Additionally, JS sub-scales ranged between 0.715 and 0.845. Cronbach’s alpha values for OC were 0.664 with sub-scales, *inter alia*, AC, CC and NC ranging between 0.524 and 0.642, indicating moderate sample reliability for the specified scales. The Cronbach alpha coefficient for the WE scale was 0.947, considered excellent, with sub-scales ranging from 0.849 to 0.876. Similarly, the reliability coefficient for the PSM scale was 0.833, with sub-scales ranging from 0.553 (i.e. CPS) to 0.806 (i.e. CPS or SS). Simultaneously, the reliability coefficient for CWB was 0.968, with the two sub-scales reverting a reliability coefficient of 0.893 for organisational CWB and 0.970 for individual CWB.

Table 11: Comparison of Cronbach’s alpha coefficients of this study with previous studies

Scale and sub-scales	Authors	Cronbach’s alphas	Cronbach’s alphas for this study	Number of items
APS	Kim <i>et al.</i> (2013)	0.70	0.73	4
CPV		0.54	0.55	4
Compassion		0.69	0.74	4
SS		0.78	0.81	4
PSM Scale		0.74	0.83	16
Work itself	Bowling <i>et al.</i> (2018)	0.72	0.72	5
Supervision		0.83	0.83	5
Co-workers		0.77	0.79	5
Pay		0.83	0.85	5
Promotion		0.82	0.82	5
JS Scale			0.89	25
AC	Allen and Meyer (1996) validated by Maqsood <i>et al.</i> (2012)	0.83	0.64	8
CC		0.61	0.60	6
NC		0.64	0.52	8
OC Scale		0.84	0.66	22
Vigour	Schaufeli and Bakker (2004)	0.83	0.85	6
Dedication		0.92	0.88	5
Absorption		0.82	0.85	6
WE Scale			0.95	17
CWB-Organisation	Spector <i>et al.</i> (2006)	0.84	0.89	21
CWB-Person		0.85	0.97	22
CWB Scale		0.81	0.97	43

Exploratory and confirmatory factor analyses were done to determine the validity of the measuring instruments within the South African public service context.

Validity for public service motivation

The factor loadings based on a principal component extraction with Oblimin and Kaiser Normalisation rotation for PSM revealed that six items loaded onto Factor 1 measuring APS and four loaded onto Factor 2 measuring CPV. In addition, two items loaded onto Factor 3, measuring compassion, and four loaded onto Factor 4, measuring SS. Although these factors are similar to the scale developed by Kim *et al.* (2013), the items loaded differently onto the identified facets. Table 12 compares the factors and item loading of the scale developed by Kim *et al.* (2013) with results obtained by the research under discussion.

Table 12: Comparison of PSM factors and item loadings

Kim <i>et al.</i> (2013)	This study
Factor 1: Attraction to public service	Factor 1: Attraction to public service
I admire people who initiate or are involved in activities to aid my community	It is fundamental that the interests of future generations are taken into account when developing public policies.
It is important to contribute to activities that tackle social problems	To act ethically is essential for public servants.
Meaningful public service is very important to me	I empathise with other people who face difficulties.
It is important for me to contribute to the common good	I feel sympathetic to the plight of the underprivileged.
Factor 2: Commitment to public values	It is important to contribute to activities that tackle social problems.
I think equal opportunities for citizens are very important	It is important that citizens can rely on the continuous provision of public services.
It is important that citizens can rely on the continuous provision of public services	Factor 2: Commitment to public values
It is fundamental that the interests of future generations are taken into account when developing public policies	I would agree to a good plan to make a better life for the poor, even if it costs me.
To act ethically is essential for public servants	I am willing to risk personal loss to help society.
Factor 3: Compassion	I believe in putting civic duty before self.
I feel sympathetic to the plight of the underprivileged	I am prepared to make sacrifices for the good of society.
I empathise with other people who face difficulties	Factor 3: Compassion
I get very upset when I see other people being treated unfairly	I think equal opportunities for citizens are very important.
Considering the welfare of others is very important	I admire people who initiate or are involved in activities to aid my community.
Factor 4: Self-sacrifice	Factor 4: Self-sacrifice
I am prepared to make sacrifices for the good of society	Meaningful public service is very important to me.
I believe in putting civic duty before self	It is important for me to contribute to the common good.
I am willing to risk personal loss to help society	I get very upset when I see other people being treated unfairly.
I would agree to a good plan to make a better life for the poor, even if it costs me	Considering the welfare of others is very important.

Validity for JS

The forced five-factor loading based on a principal component extraction with Oblimin and Kaiser normalisation rotation for JS revealed that four items were loaded onto Factor 1 measuring supervision. There are seven items that loaded onto Factor 2 measuring promotion; three items that loaded onto Factor 3 measuring pay; five items loaded onto Factor 4 measuring co-workers; and four items loaded onto Factor 5 measuring work itself. Although the factor loadings are the same, the items of this study are differently loaded compared with the study of Bowling *et al.* (2018)

Table 13: Comparison of JS factors and item loadings

Bowling <i>et al.</i> (2018)	This study
Factor 1: Work itself	Factor 1: Work itself
Overall, I am very pleased with the types of activities that I do on my job	All in all, I would rather have some other kind of duties in my work
I would be more content with my job if I were doing tasks that are different from the ones I do now	I would be more content with my job if I were doing tasks that are different from the ones I do now
I am more satisfied with the types of work I currently do that with almost any other work I have ever done	All in all, I am very satisfied with the things I do at work
All in all, I am very satisfied with the things I do at work	Overall, I am very pleased with the types of activities that I do on my job
All in all, I would rather have some other kind of duties in my work)	
Factor 2: Supervision	Factor 2: Supervision
Overall, I am very pleased with the way my manager supervises me	All in all, I am very satisfied with this person as my manager
I would be more content with my job if my manager did not work here	Overall, I am very pleased with the way my manager supervises me
