DECLARATION

Name: Amanda Badenhorst

Student number: 33351589

Degree: Doctor of Philosophy in Management Studies

Exact wording of the title of the thesis as appearing on the electronic copy submitted for examination:

A framework for the reverse logistics management of consumer returns in online retailing

I declare that the above thesis is my own work and that all the sources that I have used or quoted have been indicated and acknowledged by means of complete references.

I further declare that I submitted the thesis to originality checking software and that it falls within the accepted requirements for originality.

I further declare that I have not previously submitted this work, or part of it, for examination at Unisa for another qualification or at any other higher education institution.

(The thesis will not be examined unless this statement has been submitted.)

ACKNOWLEDGEMENTS

This thesis is a tribute to all my helpers throughout this tough journey.

I first want to thank my supervisor, Prof Orpha Cilliers, for all her patience, support and insight. I have learned so much from Prof. This thesis would not have been possible without Prof by my side every step of the way.

I want to thank my employer, the University of South Africa, for the funding and support in completing this qualification. My thanks also include all colleagues who helped with the registration, funding, opportunities to take study leave, and submitting this lengthy thesis on Turnitin.

I would also like to thank my colleagues in the Department of Applied Management. Thank you to the several Chairs of the department, who assisted and supported me over the years. To the colleagues in the transport economics and logistics section, thank you for your support. You were graceful and kind, and I am fortunate to have colleagues like you. To the rest of my colleagues in the department, you all played a role in assisting and encouraging me. I thank you all sincerely.

To my family, I don't have the words to begin and thank you enough. To my dear mom, Prof Hannie Badenhorst-Weiss, thank you for everything. You are an inspiration both as a brilliant academic and a loving mother. Thank you for your support, advice, kindness, patience, love and prayers. Then, to my sister, Ellie, thank you so much for your support, encouragement, compassion, love and care. You sacrificed so much, especially in the final weeks, by making me breakfast, lunch and supper, buying food, giving me snacks and vitamins, praying for me and keeping our fur babies occupied, all while you were also working. You are truly the world's best sister. Also, to my dad, Dr Johan Badenhorst, thank you for always asking me how I was doing and supporting me from a distance. You also believed in me and always said you were proud of me. I love you all so much.

Also, a special thank you to Carmen Poole; you were such a wonderful and supportive friend throughout. You remained my friend even when I had no time to visit and meet you for lunch. You also asked others not to bother me for not attending lunch dates and other engagements. I love you, my friend.

Then, to my husband, Johnny Nieuwoudt. You were always graceful and understanding when I rarely had time with you. Your extreme empathy, love, encouragement, patience and prayers greatly helped me. When friends thought I was uninterested in socialising, you corrected them by explaining what it takes to complete a doctorate. You played a big role every step of the way. I love and thank you sincerely. I am so blessed to have a husband like you.

Finally, to my Father, Lord, Saviour and Helper, all glory and praise to You. This thesis would not have been possible without Your mercy, kindness, compassion and silent encouragement. You answered many prayers and comforted me when I wanted to give up. You wiped every tear and helped me write every word in this thesis. Therefore, I dedicate this thesis to You. Nothing is impossible with You by my side. Thank you, Lord.

ABSTRACT

The effective reverse logistics management (RLM) of consumer returns is critical for the survival of online retailers, given the inevitable nature of product returns in the online retailing industry and the rising volume thereof due to increased online shopping. This study aimed to address the challenges and gaps in RLM practices by examining consumer returns, reverse logistics (RL) processes, practices, and important factors, ultimately developing a framework for the effective RLM of consumer returns in online retailing. The primary objective of this study was to develop a comprehensive framework that online retailers can use to manage consumer returns efficiently, thereby enhancing performance and consumer satisfaction. The secondary objectives of the study aimed at examining RLM, determining the factors that influence RLM implementation and success, exploring consumer return types and RL processes from RL literature and inputs by industry experts, and investigating important factors for the effective RLM of consumer returns in online retailing. This multimethod qualitative study was conducted in three phases. Phase one involved a literature review to conceptualise RLM. Phase two used a qualitative content analysis of 289 journal articles to explore key elements of RLM. Phase three comprised 13 semi-structured interviews with industry experts to explore RLM in online retailing. Rigorous methods such as triangulation, thick description, and audit trails were employed to ensure the trustworthiness of the study. The study revealed that return prevention and control, service quality, and cost efficiency are critical for effective RLM. Service quality emerged as the most significant factor, indicating that online retailers should prioritise service-oriented and consumer-centric practices. The developed framework is a practical guide and benchmark for online retailers to manage consumer returns effectively. It also provides a foundation for future research to test and refine the framework in various settings, contributing to the broader field of RLM. Regarding policy, the study offers key insights and recommendations that can inform policymakers in developing guidelines and regulations to support effective RLM practices. The framework can serve as a policy tool to standardise RLM procedures, enhance consumer satisfaction and improve the sustainability of online retail operations.

Key words: Reverse logistics; Reverse logistics management; Consumer returns; Product returns; Reverse logistics practices; Reverse logistics processes; Reverse logistics barriers; Reverse logistics framework; Online retailing; Returns management

OPSOMMING

Die doeltreffende omgekeerde logistiekbestuur van terugsendings deur verbruikers is van kritieke belang vir die oorlewing van aanlyn kleinhandelaars, gegewe die onvermydelike aard van terugsendings van produkte in die aanlyn kleinhandelbedryf en die stygende volume daarvan weens ’n verhoging in aanlyn inkopies. Hierdie studie het probeer om die uitdagings en gapings in omgekeerde logistiekbestuurspraktyke aan te pak deur terugsendings deur verbruikers, omgekeerde logistiekprosesse, -praktyke en belangrike faktore te ondersoek, en uiteindelik ’n raamwerk te ontwikkel vir die doeltreffende omgekeerde logistiekbestuur van die terugsendings van verbruikers in aanlyn kleinhandel. Die primêre doelwit van hierdie studie was om ’n omvattende raamwerk te ontwikkel wat aanlyn kleinhandelaars kan gebruik om terugsendings deur verbruikers doeltreffend te bestuur, en op hierdie wyse prestasie en verbruikersbevrediging te bevorder. Die sekondêre doelwitte van die studie was daarop gerig om omgekeerde logistiekbestuur te ondersoek, die faktore te bepaal wat die implementering en sukses van omgekeerde logistiekbestuur beïnvloed, die tipes terugsendings deur verbruikers en omgekeerde logistiekprosesse van omgekeerde logistiekliteratuur en insette van bedryfskenners te verken, en belangrike faktore te ondersoek vir die doeltreffende omgekeerde logistiekbestuur van terugsendings deur verbruikers in aanlyn kleinhandel. Hierdie multimetode kwalitatiewe studie is in drie fases uitgevoer. Fase een het ’n literatuuroorsig om omgekeerde logistiekbestuur te konseptualiseer behels. Fase twee het ’n kwalitatiewe inhoudsontleding van 289 joernaalartikels gebruik om sleutelelemente van omgekeerde logistiekbestuur te verken. Fase 3 het bestaan uit 13 halfgestruktureerde onderhoude met bedryfskenners om omgekeerde logistiekbestuur in aanlyn kleinhandel te verken. Gestrenge metodes soos triangulasie, dik beskrywing en ouditspore is aangewend om die betroubaarheid van die studie te verseker. Die studie het onthul dat die voorkoming van terugsendings, die beheer van terugsendings, diensgehalte en kostedoeltreffendheid van kritieke belang is vir doeltreffende omgekeerde logistiekbestuur. Diensgehalte was die mees beduidende faktor, en het aangedui dat aanlyn kleinhandelaars voorkeur moet gee aan diensgeoriënteerde en verbruikersentriese praktyke. Die ontwikkelde raamwerk is ’n praktiese gids en maatstaf vir aanlyn kleinhandelaars om die terugsendings van verbruikers doeltreffend te bestuur. Dit bied ook ’n grondslag vir toekomstige navorsing om die raamwerk in verskeie omgewings te toets en te verfyn, wat sal bydra tot die wyer veld van omgekeerde logistiekbestuur. Wat beleid betref, bied die studie sleutelinsigte en -aanbevelings wat beleidmakers van ontwikkelende riglyne en regulasies kan aansê om doeltreffende omgekeerde logistiekbestuurspraktyke te ondersteun. Die raamwerk kan dien as ’n beleidsinstrument om omgekeerde logistiekbestuur-prosedures te standaardiseer,

verbruikersbevrediging te bevorder en die volhoubaarheid van aanlyn kleinhandelbedrywighede te verbeter.

Sleutelwoorde: Omgekeerde logistiek; Omgekeerde logistiekbestuur; Terugsendings van verbruikers; Terugsendings van produkte; Omgekeerde logistiekpraktyke; Omgekeerde logistiekprosesse; Omgekeerde logistiekstruikelblokke; Omgekeerde logistiekraamwerk; Aanlyn kleinhandel; Terugsendingsbestuur

OKUCASHUNIWE

Ukusebenza kahle kokuphathwa kokubuyiselwa kwempahla (RLM) ebuyiselwe abathengi kubalulekile ekusebenzeni ngempumelelo kwabathengisa ku-inthanethi, uma sibheka isimo esingenakusigwema sokubuyiselwa komkhiqizo embonini yokuthengisa ku-inthanethi kanye nenani elikhulayo lalokhu ngenxa yokudlondlobala kokuthenga ku-inthanethi. Inhloso yalolu cwaningo ukuxazulula izinselelo kanye negebe ekusebenzeni kwe-RLM ngokuthi sihlole imbuyiselo yabathengi, inqubo yokubuyiselwa kwempahla (RL), izindlela zokusebenza, nemithelela ebalulekile, ngokunjalo nokuqhamuka nohlaka olusebenza kahle lwe-RLM ngokwembuyiselo yabathenga ku-inthanethi. Inhloso enkulu yalolu cwaningo ukuthi kwakhiwe uhlaka oluphelele olungasetshenziswa abathengisi ku-inthanethi ukuze bengamele kahle imbuyiselo yabathengi, ngendlela ezothuthukisa ukusebenza nokwaneliseka kwabathengi. Inhloso yesibili yalolu cwaningo ukuthi kuhlolwe i-RLM, kuhlonzwe imithelela ethikameza ukuqaliswa kokusebenza ngempumelelo kwe-RLM, ukuhlola izinhlobo zembuyiselo yabathengi nezinqubo ze-RL ezivela emibhalweni ekhuluma nge-RL ngokunjalo nemibono yongoti kule mboni, kanye nokuphenya imithelela ebalulekile ngokusebenza kahle kwe-RLM ngokwembuyiselo yabathenga ku-inthanethi. Lolu cwaningo lusebenzise izindlela eziningi zokuhlolwa kweqophelo lwahlukaniswa izigaba ezintathu. Isigaba sokuqala sibandakanya ukubuyekezwa kwemibhalo ukuze sibe nesithombe esanele nge-RLM. Isigaba sesibili sisebenzise ukucwaningwa kwengqikithi yeqophelo kumajeneli angama-289 ukuze sihlole imithelela ebalulekile ye-RLM. Isigaba sesithathu sihlanganise izinhlolovo ezivulelekile eziyi-13 ezibanjwe nongoti kule mboni ukuze sihlole i-RLM ekuthengiseni nge-inthanethi. Lapha kusetshenziswe izindlela ezinqala ezifana nonxantathu, incazelo enzulu, nezindlela zokuhlola ukuze kuqinisekiswe ukuthenjwa kwalolu kocwaningo. Ucwaningo luveza ukuthi ukusebenza kahle kwe-RLM kuyinto ebalilekile uma sifisa ukuvimbela nokulawula imbuyiselo, iqophelo lokusebenza, kanye nokumelana nezindleko. Iqophelo lokusebenza livele njengento ebaluleke kakhulu, likhombisa ukuthi abathengisi ku-inthanethi kufanele babeke phambili umsebenzi kanye nabathengi babo. Kubaluleke kakhulu ukuba nohlaka lokulawula ukusebenza kanye nemikhawulo yabathengisi ku-inthanethi ukuze kulawuleke kahle imbuyiselo yabathengi. Lokhu kuhlinzeka ngesisekelo socwaningo lwesikhathi esizayo ukuze luhlole futhi luthole kahle uhlaka olulungiselelwe ngezindlela ezihlukahlukene, okuzolekelela kakhulu emkhakheni we-RLM. Mayelana nenqubomgomo, ucwaningo luhlinzeke ngolwazi olubalulekile nezincomo ezingazisa abasunguli benqubomgomo bakwazi ukuqhamuka nemihlahlandlela nemithethonqubo yokweseka ngokufanele izindlela zokusebenza kwe-RLM. Uhlaka lungasebenza njengenqubomgomo enemiyalelo emile ye-RLM, ukwenza ngcono ekwaneliseni abathengi kanye nokuphucula ukusimama kwemisebenzi yokudayisa ku-inthanethi.

Amagama amqoka: Ukubuyiselwa kwempahla; Ukuphathwa kokubuyiselwa kwempahla; Imbuyiselo yabathengi; Ukubuyiselwa komkhiqizo; Izindlela zokubuyiselwa kwempahla; Izinqubo zokubuyiselwa kwempahla; Imikhawulo yokubuyiselwa kwempahla; Uhlaka lokubuyiselwa kwempahla; Ukudayisa ku-inthanethi; Ukuphathwa kwembuyiselo

Chapter 1 - Introduction to the study

1.1 INTRODUCTION

"Returns are turning into the e-commerce Achilles' heel" (Bozzi, Neves & Mont'Alvão, 2022:27). Reverse logistics (RL) formed a part of retailing for more than a hundred years, with US retailers Sears Roebuck and Montgomery Ward delivering products by railroad. However, recently e-commerce led to an explosion of RL, which involves product returns from consumers to online retailers (Anderson, 2020:1). RL is an unavoidable fact of online retailing (Chen, Li & Zhan, 2016:175; Lamba, Yadav, Barve & Panda, 2020:381; Kiro, 2015:66) and consumer returns can be regarded as one of the most significant problems that online retailers experience (Bieniek, 2023:1; Dobroselskyi, Madleňákb & Laitkepc, 2021:318). Any kind of consumer considers the ability to return products as a vital part of a retailer's value proposition (Anderson, 2020:11). With a poor RL function, many consumers are likely to disregard online shopping (Dobson, 2023:4; Yang, 2014:160), which can be detrimental to the online retailer's profitability, market share and corporate image (Davidavičienė, & Al Majzoub, 2021:2; Jra, Cunhaa, Almeidaa, & Marinsa, 2017:29).

Consequently, *reverse logistics management (RLM)* plays a critical role in the sustainability of online retailers (Anderson, 2020:11), enabling them to reduce costs, limit negative impacts on the environment (Eriksson & Käck, 2023:4) and increase consumer buying confidence, satisfaction and retention (Castillo, 2023:7; Lin & Hsu, 2017:218; Jalil, 2019:1). Therefore, RLM of consumer returns in online retailing can be an important area in research (Foo & A-Jalil, 2021:45). This study focuses on the *RL processes, RL practices and important factors for the effective RLM of consumer returns*[1] *in online retailing*. In the following sections of this introduction, the key concepts of this study will be defined, followed by an overview of this chapter.

RL can be broadly defined as the process of moving returned products from the point of consumption to the point of origin for the purpose of recapturing value or proper disposal (Chen, Anselmi, Falasca & Tian, 2017:252). Badenhorst (2022:227) narrowly defined *RL* as "the management of all the activities involved in the flow of goods, demand information, and money in the opposite direction to the primary logistics flow; a reduction in the generation of waste, and the management of the collection, transport, disposal, and recycling of hazardous as well as non-hazardous waste in a way

[1] In this study, "consumer returns" will be used as a synonym for consumer product returns and product returns from consumers to online retailers.

that maximises the long-term profitability of the business". RL can include several *processes*, including a consumer return request (Bernon, Rossi & Cullen, 2011:491), gatekeeping (Agrawal, Singh & Murtaza, 2015:77), collection, transportation, inspection and sorting, returns processing, product disposition (Badenhorst, 2022:232) and redistribution (Hjort, Hellström, Karlsson & Oghazi, 2019:781).

Furthermore, RL can involve various *practices*, including information technology (IT) and systems, collaboration between supply chain (SC) parties, outsourcing strategies, RL standardisation and formalisation (Badenhorst, 2016:5; Badenhorst, 2017:606-607), gatekeeping and return avoidance strategies, establishing centralised return centres (CRCs) (Badenhorst, 2016:5), RL network/facility design (Agrawal, *et al.* 2015:88), cross-functional collaboration, strategic planning for RL, top management support, staff training (Badenhorst, 2017:606-607), disposition strategies (Khor & Udin, 2013:73), performance measurement (Bernon *et al.* 2011:499), commitment of resources (Morgan, Richey Jr. & Autry, 2016:307), and cost management (Ravi & Shankar, 2015:881). In general, *product returns* can be defined as the physical return of products backward in the SC (Andresen & Istad, 2019:9). Furthermore, a *consumer return* involves a consumer's decision to return a purchased product to the retailer or seller for a credit, refund or exchange (Badenhorst, 2022:231).

While no clear definition exists for RLM, the concepts of RL, returns management and RLM are often used interchangeably by industry professionals and scholars. For example, Reid (2023:1) and Winser, Tan and Leong (2023:421) stated that RL is often known as returns management. Additionally, Nandyala (2023:2) considered returns management and RLM as the same concepts for managing returns. Anderson (2020:5) added that managing RL can include any management approach based on the preference of organisations. According to Chen *et al.* (2017:252) *returns management* can be defined as a supply chain management (SCM) process that manages returns, RL, gatekeeping and return avoidance within the organisation and across key SC members. Jenkins (2021:2) indicated that *RLM* can be viewed as a management process, which starts with a consumer returning a products and continues with the movement of the returned product in the opposite direction of traditional forward logistics (FL) to any point in the SC. Based on these descriptions, this study considers RLM and returns management as concepts that cover all areas of managing consumer returns, from the return request stage to the stage of redistribution. Subsequently, this study defines *RLM* as an organisational process that involves the management of returns, RL processes and RL practices within the organisation[2] and across the SC for the purpose of long-term

[2] In this study the term organisation is used as a synonym for the terms "business", "firm" and "company".

economic and environmental sustainability.

Chapter 1 serves as an introduction to this study that focuses on the effective RLM of consumer returns in online retailing. Figure 1.1 provides an overview of chapter one.

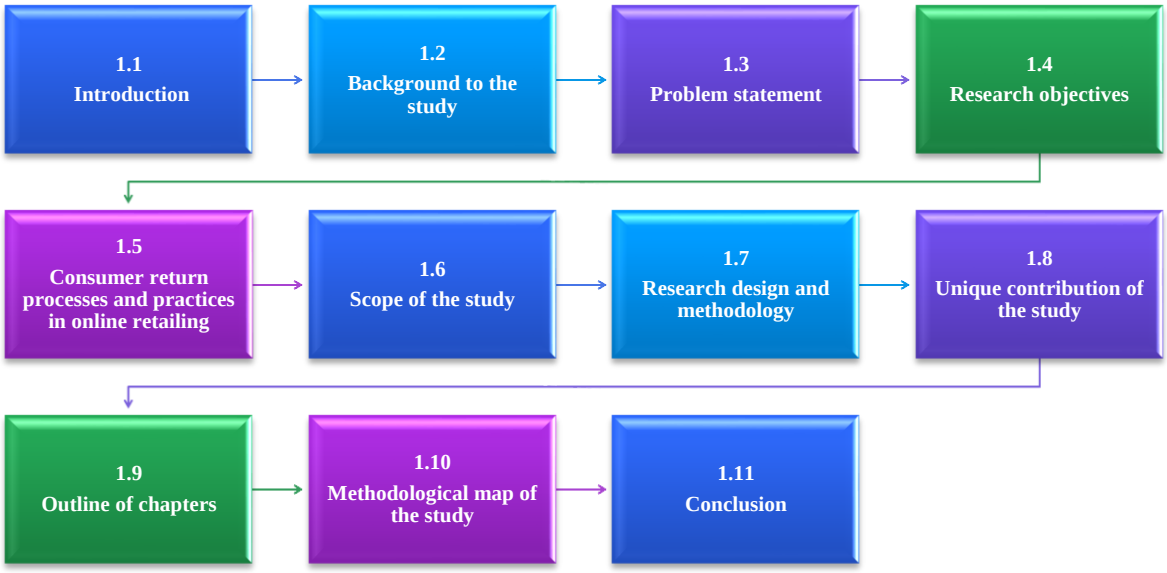

Figure 1.1 Overview of Chapter 1
Source: Compiled by the researcher

Figure 1.1 shows that Chapter 1 starts with the introduction, followed by the background, problem statement and research objectives of the study, whereafter an overview of the consumer return processes and practices in online retailing and a scope of the study will be provided. Thereafter, the research design and research methodology of the study will be discussed, followed by a discussion on the unique contribution of the study. Finally, the chapter will be end with an outline of the chapters, methodological map and the conclusion.

1.2 BACKGROUND TO THE STUDY

The e-commerce market can undoubtedly be characterised as one of the most promising and fast-growing markets in the world (Dobroselskyi *et al.* 2021:318). In South Africa, the e-commerce market is expanding at an unprecedented rate (Irine, 2023:7). Due to COVID-19, lockdowns and a decline in brick-and-mortar retail sales, online retailing in South African grew by 66% in 2020 (Daniel, 2021:1) and continued to grow by 25% in 2023 (Irine, 2023:1). Globally, South Africa is the 42nd largest e-commerce market with an estimated revenue of $7,217.8 million in 2023 (Irine, 2023:1). In fact, predictions show that South Africa's e-commerce market will be worth more than R400 billion (or US $21 billion) by 2025, expecting to exceed $25 billion by 2028 (Irine, 2023:1, 7).

Even before the e-commerce era, RL was regarded as problematic in SCs (Eliav, 2022:2). However, the massive increase in online retail sales contributed to an influx of product returns (Ashan & Rahman, 2021:3; Eliav, 2022:2; Wang, Dang & Nguyen, 2021:2), adding to the challenges of controlling consumer returns (Bozzi *et al.* 2022:27; Eliav, 2022:2). This caused reverse logistics management (RLM) to be more challenging and critical than ever before (Eliav, 2022:1). Despite the importance of RLM, many online retailers lack the capability to effectively manage consumer returns to win and retain their customers (Ashan & Rahman, 2021:3). Consequently, online retailers are increasingly facing problems with consumer returns (Das, Kumar & Rajak, 2020:8; Ashan & Rahman, 2021:3), and need to rethink the significance of RLM to manage consumer returns effectively (Rajagopal *et al.* 2015:47).

RL in online retailing involves the returns flow of online purchases from the consumer to the online retailer (Yan, Yong, Qinli & Stokes, 2012:251). Statistics show that 30% of all products ordered online are returned by consumers (Biswas & Abdul-Kader, 2018:1016; Castillo, 2023:2) for various reasons, including faulty, poor quality or damaged goods, late deliveries, inaccurate product descriptions on the website, a change of mind and incorrect fit (Ashan & Rahman 2022:138; De Araújo *et al.* 2018:348). Online consumers are limited to the presentation of products on websites and platforms, lacking the ability to touch, listen to, fit or smell products, which can lead to misconceptions about products and increased buyer risks (Dobroselskyia *et al.* 2021:319; Lin & Hsu, 2017:218; Nel & Badenhorst, 2020:115). Additionally, a factor that directly increases consumer returns in online retailing can be the uncertainty related to fit-dependent products, like clothes and shoes (Gustafsson, Jonsson & Holmström, 2021:878).

Consequently, the return rate of products bought online can be significantly higher than products bought from brick-and-mortar retailers (Castillo, 2023:2). In fact, Castillo (2023:2) and Kushwaha (2020:30) mentioned that online retailers experience an average return rate of 30% as opposed to traditional retailers that experience a return rate of 8.9%. Similarly, Espinosa, Stock, Ortinau and Monahan (2021:791) found that in-store return rates ranged from 5% to 10% of purchases, while online return rates ranged from 15% to 40% of purchases. Additionally, RL can be more complicated for online retailers in terms of their dependence consumers, lacking infrastructure to support operations, requiring systems, generating additional costs (Bozzi *et al.* 2022:22, 31), and supplying on-demand consumer return services through home product return pickups within limited timeframes (Eliav, 2022:1). Subsequently, RL and RLM in online retailing can be a more costly, complex and multifaceted process, which requires effective management and coordination of all parties involved (Eriksson & Käck, 2023:1). Ultimately, online retailers must pay more attention to the implementation of RL than their brick-and-mortar counterparts.

The intense competition in the online environment forces organisations to formulate and implement strategies to distinguish themselves from their competitors (Karlsson, Oghazi, Hellström, Patel, Papadopoulou & Hjort, 2023:3). Organisations may differentiate themselves through their RL strategies, processes and capabilities, which can positively impact financial, social and environmental performance (Shaik & Abdul-Kader, 2014:94). Additionally, the acceptance of consumer returns can be an important service feature offered by online retailers. Studies show that between 80 to 94% of consumers will stop purchasing from online retailers if product returns or exchanges are mismanaged (Dobson, 2023:4; Lin & Hsu 2017:218). Additionally, without clear RL processes, 27% of online consumers are likely to abandon their shopping carts and purchase products from competitors instead (Castillo, 2023:2). Therefore, improvements in RL will improve the online retailer's ability to effectively manage consumer returns (Davidavičienė & Al Majzoub, 2021:21), which in turn can increase consumer buying confidence, satisfaction, retention (Castillo, 2023:7; Lin & Hsu, 2017:218; Jalil, 2019:1), and the overall performance of the online retailer (Davidavičienė & Al Majzoub, 2021:21).

Nel and Badenhorst (2020:114) indicated that consumer returns can significantly impact the profitability of online retailers. While ineffective RL can reduce the profitability of online retailers by 8% to 15% (Kushawa, 2020:29), improved performance of RL can increase the overall financial performance of online retailers (Davidavičienė & Al Majzoub, 2021:1). Additionally, ineffective RLM of consumer returns can lead to a competitive disadvantage and a loss of market share (Foo & A-Jalil, 2021:57). Evidently, the significance of RL in online retailing can be vital for the survival of online retailers (Anderson, 2020:11; Yan *et al.* 2012:251). Despite this significance, many online retailers still fail to recognise the importance of RL and RLM, and view consumer returns as a cost and necessary evil to normal business (Bozzi *et al.* 2022:27; Chen *et al.* 2017:252; Dobson, 2023:2; Schooling, 2023:1). Consequently, many online retailers' ignorance about the importance of RL can be one of the biggest challenges in the online retailing industry (Davidavičienė & Al Majzoub, 2021:21; Wang, Liu & Wei, 2013:45), resulting in a loss of market share, reduction in profitability and poor corporate image (Davidavičienė & Al Majzoub, 2021:2; Jra, Cunhaa, Almeidaa & Marinsa, 2017:29).

With the drastic increase of online retailing, efficiencies of logistics and changing consumer requirements, the field of consumer returns and RL requires relevant research (Harris & Martin, 2014:1; Robertson, Hamilton & Jap, 2020:174). While a growing field in academic research, Frei, Jack and Brown (2020:1613) found that consumer returns are a unique and understudied topic, with only a few publications over the last two decades. This study in RL of online consumer returns confirmed this opinion of Frei *et al.* (2020:1613) with the qualitative content analysis (QCA) of RL

literature, which identified that only 4% of RL literature focused on consumer returns. Although research in RL and online retailing is gaining more attention (Das *et al.* 2020:50; Nel & Badenhorst, 2020:115), more empirical research is needed on effective RLM in online retailing (Chen *et al.* 2017:253). Additionally, Robertson *et al.* (2020:176) called for more academic research to determine practices that retailers can implement for more efficient consumer return processes.

Subsequently, this study addressed the perceived gap in research focusing on the RLM of consumer returns in online retailing. More specifically, this study explored and investigated consumer returns, RL processes, RL practices and important RLM factors in online retailing, and developed a framework for the effective RLM of consumer returns, thereby assisting online retailers to effectively deal with consumer returns, reduce costs, remain competitive, improve consumer satisfaction, increase market share and improve profitability.

Against this backdrop, the next section provides the problem statement of this study.

1.3 PROBLEM STATEMENT

From the background (section 1.2) it is evident that e-commerce sales and consequential returns increased phenomenally. Additionally, it was established that RL and RLM can be more complicated in online retailing and can significantly impact online retailers' performance in terms of cost, market share, image and customer service. Despite this, evidence shows that the importance of RL is not acknowledged nor effectively managed, with many online retailers failing to adopt consumer returns within their overall organisational strategy (Biswas & Abdul-Kader, 2018:1016; Robertson *et al.* 2020:172). Most online retailers focus on forward flows, giving limited attention to RL flows (Lamba *et al.* 2020:381). In fact, many online retailers consider managing returns and RL a headache (Hjort *et al.* 2019:767), costly and an unwanted burden (Schooling, 2023:1). Therefore, most online retailers still need to implement practices to effectively manage consumer returns to not only win and retain their customers (Ashan & Rahman, 2021:3) but also improve their profitability (Nel & Badenhorst, 2020:114). Accordingly, online retailers must view effective RLM as a critical part of their consumer acquisition and retention strategies (Schooling, 2023:1).

RL may be the most complex challenge for online retailers dealing with consumer returns (Davidavičienė & Al Majzoub, 2021:21) and developing a suitable approach to manage returns continues to be a growing challenge (Bieniek, 2023:1). Due to the complexity of RL and a lack of resources, many online retailers are unwilling and unable to manage RL effectively (Wang, Dang *et*

al. 2021:2)[3]. RL means that online retailers must repeat the same processes (as forward delivery) twice, resulting in duplication of operational expenses without the benefit of revenue (Bozzi *et al.* 2022:18). Consequently, RL and product returns generate cost for online retailers, including returned product handling costs, transportation costs, inventory holding costs, order-picking costs and tied up capital (Gustafsson, Jonsson & Holmström, 2021:877). Additionally, poorly managed RL processes can lead to consumer dissatisfaction, adding to the indirect costs of reputational damage and a loss of brand value (Bozzi *et al.* 2022:12). Subsequently, the costs of managing consumer returns are considerably higher than traditional FL because RL processes can be logistically more complicated and exception-driven (Robertson *et al.* 2020:174). According to Kushawa (2020:29), ineffective RL can reduce the profitability of online retailers by 8% to 15%. Moreover, failure to systematically collect, monitor or report consumer return data to senior management can generate considerable financial losses (Frei *et al.* 2020:1613). Evidently, consumer return processes can be complicated, ineffective and prone to internal and external fraud (Frei *et al.* 2020:1613).

Karlsson *et al.* (2023:5) found that online retailers often adopt an ad hoc approach to RLM instead of being guided by clear strategic thinking, which suggests that online retailers fail to comprehend the strategic implications of RLM. Neglecting RLM can lead to operational challenges (Franklin, 2022:1), consumer dissatisfaction and an increased RL cost (Foo & A-Jalil, 2021:45), which can be detrimental to the online retailer's profitability, market share and corporate image (Davidavičienė & Al Majzoub, 2021:2). Online retailers must realise the impact of consumer returns and RL on sales revenue, consumer satisfaction, costs and long-term profitability (Jalil, 2019:1; Nel & Badenhorst, 2020:116; Wang *et al.* 2021:2). Additionally, online retailers must determine and understand the reasons for consumer returns (Nel & Badenhorst, 2020:116), identify strategies and develop ways to improve their RL function (Zhang, Chang, Dong, Yue & Teo, 2022:3192). Gaining a deeper understanding of the RL process can help online retailers to increase efficiencies, reduce costs, maintain consumer satisfaction and loyalty (Eliav, 2022:1), and distinguish it from other organisational processes (Davidavičienė & Al Majzoub, 2021:4). Therefore, it can be critical for online retailers to understand every aspect of the RL process, establish efficient RL process to reduce costs and develop a comprehensive understanding of the reasons for consumer returns (Reid, 2023:2)

However, a lack of knowledge about the significance of RLM can cause various problems, including poor return processes, a lack of internal and external information and knowledge sharing, and a lack of research from the academic community (de Araújo *et al.* 2018:346). Lamba *et al.* (2020:398)

[3] The second surname is added since two different publications in the same year with the same starting surname is included in the bibliography. The other reference that this applies to include Wang, Wang *et al.* (2021).

indicated that a lack of understanding effective RL practices can be a main barrier in online retailing, inviting scholars to work with the industry to improve RL processes and practices. Therefore, RLM in online retailing must still mature, requiring scholars to identify problems in the management of consumer return processes and provide solutions to manage consumer returns effectively (Bernon, Cullen and Gorst, 2016:585; Robertson *et al.* 2020:175). According to Mishra and Napier (2014:46), exploratory research is needed to understand what prevents organisations from embracing RL and develop frameworks focused on RL implementation. Similarly, Frei *et al.* (2020:1613) contended that many retailers underestimate the scale of consumer returns, and more support in research must be provided in terms of frameworks and guidelines for the management of consumer returns. Furthermore, Lamba *et al.* (2020:388) mentioned that developing an effective RL framework can help online retailers to identify RLM barriers, save costs and realise profits.

Through a bibliometric analysis of RL literature, Bensalem and Kin (2019:15) revealed that RL is an emerging field of study with a strong identity. Although research in RL and online retailing is gaining more attention (Das *et al.* 2020:50; Nel & Badenhorst, 2020:115), more empirical research is needed on RLM (Chen *et al.* 2017:253) and RL in online retailing (Prajapati, Kant & Shankar, 2019:517). Additionally, Ratchford, Soysal, Zentner and Gauri (2022:170) indicated that most research on product returns is conducted from a theoretical perspective, in a brick-and-mortar context, meaning that more empirical research is needed on consumer returns in online channels. Similarly, Hjort *et al.* (2019:768) mentioned that in-depth research on RL processes and practices in online retailing is lacking, with Karlsson *et al.* (2023:1) adding that research on RLM strategy is scarce. While several studies focussed on optimal return policies to manage product returns, Robertson *et al.* (2020:175) suggested that more research must be conducted to explore alternative practices to manage consumer returns. Subsequently, few studies focused on RLM in the online retailing industry (de Araújo *et al.* 2018:346), warranting more academic research to determine practices that retailers can implement for efficient consumer return processes (Robertson *et al.* 2020:176).

From a local perspective, Mostert, Nieman and Kotzé (2017:2) suggested that effective RLM can be important in the retail industry of South Africa, indicating that more research must be conducted in the industry. Furthermore, Heyns and Kilbourn (2022:11) found that the ease of returning products is one of the most important factors for South African consumers in online shopping. Additionally, Badenhorst (2018:14) indicated that it can be important for South African organisations to understand the significance and impact of RL practices, which means that more empirical research in South Africa must be conducted to increase this understanding. Furthermore, Makaleng and Hove-

Sibanda (2022:24) suggested that more qualitative research on RL strategies for enhanced organisational competitiveness must be conducted in South Africa.

Essentially, with rising consumer return rates, online retailers must find ways to manage consumer returns cost effectively (Jenkins, 2021:14), making RL in online retailing a relevant area for both practitioners and academics to explore (Harris & Martin, 2014:1, 11). To this end this study responds to the call of Ratchford *et al*. (2022:156) for more research to be conducted on practices that can help retailers to manage online product returns more effectively. Accordingly, this study addressed the perceived gap in research by focusing on the RL processes, RL practices and important factors for the effective RLM of consumer returns in online retailing in South Africa. Considering the background, challenges that online retailers can experience in managing consumer returns effectively, and the notable gap in research and literature on the RLM of consumer returns in online retailing, the following problem statement was formulated:

> ***What are the RL processes, RL practices and important factors for the effective RLM of consumer returns in online retailing?***

Following this problem statement, the research objectives of this study will be outlined in the next section.

1.4 RESEARCH OBJECTIVES

The aim of this study was to fill the perceived gap in research and literature by focussing on consumer returns, RL processes, RL practices and RLM factors to serve as input in developing a framework for the effective RLM of consumer returns. The subsequent sections provide the primary and secondary research objectives of the study.

1.4.1 Primary research objective

The primary research objective of the study was to *develop a framework for the effective RLM of consumer returns in online retailing.*

1.4.2 Secondary research objectives

The secondary research objectives (SROs) of this study were as follows:

(1) to examine RLM and determine the factors that influence RLM implementation and success (SRO-1)

(2) to explore and analyse RL literature for consumer return types and pre-receipt RL processes of consumer returns (SRO-2)
(3) to explore and analyse RL literature for post-receipt RL processes of consumer returns (SRO-3)
(4) to explore and analyse RL literature for RL practices to manage consumer returns (SRO-4)
(5) to determine consumer return types and RL processes in online retailing, based on inputs from industry experts (SRO-5)
(6) to explore and identify important RL practices for managing consumer returns in online retailing, based on inputs from industry experts (SRO-6)
(7) to investigate and determine important factors for the effective RLM of consumer returns in online retailing (SRO-7)

Figure 1.2 provides an overview of the research objectives of this study.

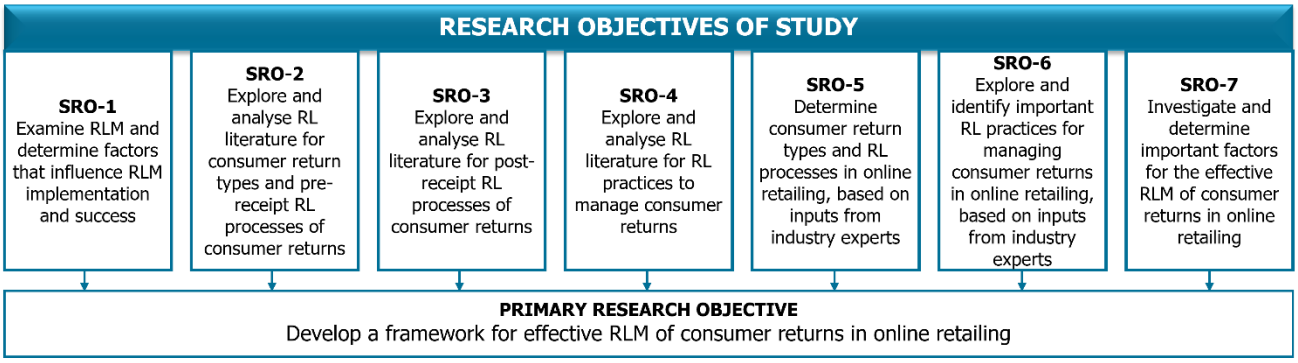

Figure 1.2 Overview of research objectives of the study
Source: Compiled by the researcher

Essentially, this study (1) established an overview of RLM, (2) identified drivers and benefits of effective RLM, barriers and problems to effective RLM and characteristics of effective RLM, (3) explored and analysed RL literature for consumer return types, RL processes of consumer returns and RL practices for managing consumer returns, (4) determined consumer return types and RL processes in online retailing, (5) explored and identified important RL practices for managing consumer returns in online retailing, and (6) investigated and determined important factors for the effective RLM of consumer returns in online retailing, which enabled the development of a framework for the effective RLM of consumer returns in online retailing.

In the next section, an overview of consumer return processes in the online retailing will be given.

1.5 OVERVIEW OF CONSUMER RETURN PROCESSES AND PRACTICES IN ONLINE RETAILING

As mentioned in the background and problem statement, RL can be important in online retailing due to higher return rates and the complexity of returns processes. Furthermore, effective RL for

consumer returns can be important for both customer service and the profitability of the online retailer. Unfortunately, many online retailers neglect RLM and lack effective consumer return processes to effectively manage consumer returns (sections 1.2 and 1.3). In this section a brief overview will be given of the consumer return processes and practices in online retailing.

1.5.1 Consumer return processes in online retailing

The consumer return process in online retailing is initiated by consumers that experience a gap between shopping expectations and the products received (Wei, Ma & Liu, 2021:489). Generally, consumer return processes in online retailing include a return request from customers (Kiro, 2015:71), gatekeeping, collection (Biswas & Abdul-Kader, 2018), receiving, processing, inspection, sorting, disposition (de Araújo *et al.* 2018:348) and redistribution (Hjort *et al.* 2019:781). Figure 1.3 provides a general overview of the key consumer return processes in online retailing.

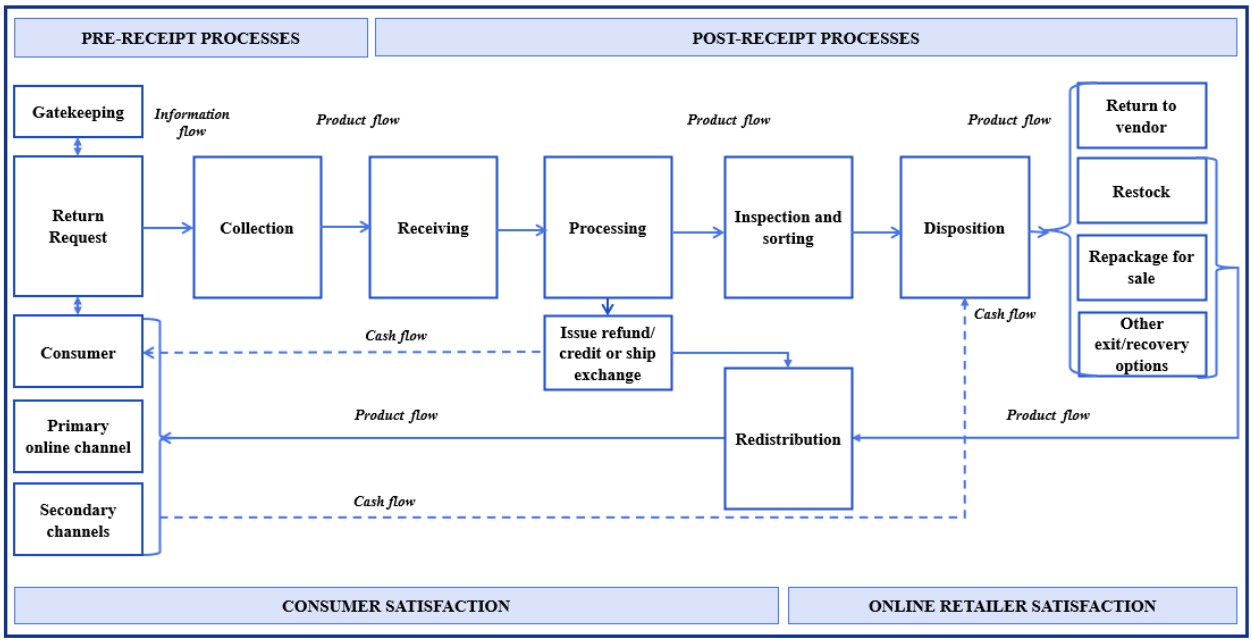

Figure 1.3 Key consumer return processes in online retailing
Source: Compiled by the researcher from Robinson (2014:4)

Figure 1.3 illustrates the key consumer return processes, which can be classified as pre-receipt and post-receipt processes. Additionally, the illustration shows the flows in the consumer return process, which can include information flow, product flow and cash flow (Harris & Martin, 2014:8). Finally, the illustration shows that consumers and the online retailer can be satisfied during various stages in the consumer return process, which must be the aim of this process. In the subsequent sections, the pre-receipt and post-receipt consumer return processes will be described, followed by a brief explanation about realising satisfaction in the consumer return processes.

1.5.1.1 Pre-receipt consumer return processes

The pre-receipt consumer return process starts with *information flow*, occurring when a consumer notifies the online retailer of their intention to return the product (Harris & Martin, 2014:8). Therefore, the first basic consumer return process in online retailing includes a *return request* from customers through the online platform (Biswas & Abdul-Kader, 2018:1019; Kiro, 2015:71). Once the online retailer becomes aware of the return intent, *gatekeeping* takes place, which can involve a return authorisation (Hjort *et al.* 2019:774) or rejection. Subsequently, the gatekeeping process involves determining if the product return can be accepted based on the return policy (Hjort *et al.* 2019:770; Harris & Martin, 2014:8). If the return request complies with the return policy requirements, return authorisation can be issued (de Araújo *et al.* 2018:348), which initiates product flow.

Consequently, *product flow* in the pre-receipt consumer return process starts when a product is *collected* from a consumer's location and returned to the facility of the online retailer (Harris & Martin, 2014:9). Alternatively, online retailers can use collection points, enabling consumers to take product returns to convenient locations, like petrol stations, post offices or convenience stores (De Leeuw, Minguela-Rata, Sabet, Boter & Sigurðardóttir, 2016:716). Additionally, online retailers can use third-party logistics (3PL) providers or couriers to collect products at consumer or drop-off locations (Nel & Badenhorst, 2020:123).

1.5.1.2 Post-receipt consumer return processes

The post-receipt consumer return process starts once the product arrives at the online retailer's facility. Evidently, the next consumer return process after return collection involves *receiving*, which entails (1) unloading of returned products from vehicles (de Araújo *et al.* 2018:348), (2) verification to determine if the returned product matches the original (purchased) product (Robinson, 2014:10), and (3) distribution of returned products to processing stations in the facility (de Araújo *et al.* 2018:348). Therefore, receiving in online retailing can be a labour-intensive process that requires skilled staff, ensuring accurate identification of returned products (Nel & Badenhorst, 2020:123).

At the processing stations in the facility, *returns processing* can be performed, which involves data entry (de Araújo *et al.* 2018:348), issuing a credit/refund or permitting a product exchange (de Araújo *et al.* 2018:348; Kiro, 2015:71; Robinson, 2014:9). Online retailers can use the options selected by consumers (e.g. product replacement or refund) during the return request as a basis for selecting processing outcomes (Hjort *et al.* 2019:770; Harris & Martin, 2014:8). Issuing a refund,

represents the *cash flow* path in the consumer return process of online retailers, while shipping an exchange involves *product flow*.

After receiving and processing, the *product flow* continues with *inspection* and *sorting* (Kiro, 2015:71; Robinson, 2014:5), which involves (1) analysing the condition of returned products (Nel & Badenhorst, 2020:123) and (2) classifying returned products based on return reasons and quality (Wei *et al.* 2021:489). The main purpose of inspection and sorting is to stream the returned items to the path of the highest selling price or recovery value (Robinson, 2014:10). Returned products can be routed to an appropriate disposition point (de Araújo *et al.* 2018:348) for restocking, repackaging, returning to vendors/suppliers and other disposition exit/recovery options (Nel & Badenhorst, 2020:123; Robinson, 2014:11).

Subsequently, the next consumer return process involves *disposition* (Kiro, 2015:71; Robinson, 2014:11), which entails *product* and *cash flows.* Disposition involves the selection and execution of disposition decisions based on inspection and sorting outcomes (Nel & Badenhorst, 2020:123). The highest recovery rate involves the *restocking* option, representing returned products in a new/unused condition (Robinson, 2014:11) that can be resold as new on the website (Biswas & Abdul-Kader, 2018:1019). The second highest recovery rate involves *repackaging*, representing returned products in "as new" condition that can be resold in clearance sales at a reduced price on the website (Robinson, 2014:11; Biswas & Abdul-Kader, 2018:1019).

Furthermore, online retailers can achieve full cost recovery through the *return to the vendor* option, which usually involves warranty claims or service level agreements (SLA) for returned products in defective conditions (Biswas & Abdul-Kader, 2018:1019; Robinson, 2014:11). If online retailers are unable to resell products on the website or return products to vendors, they can choose other disposition options (Robinson, 2014:11), like selling items as scrap (Biswas & Abdul-Kader, 2018:1019) or reselling the one the secondary market (De Leeuw *et al.* 2016:716). Additionally, other product recovery options may include repairing, refurbishing or remanufacturing (de Araújo *et al.* 2018:348). Evidently, the most value-producing disposition option with the least resource requirements involve reselling through the online platform, while the least value-producing disposition options with the most resource requirements involve product recovery options, like repair, refurbishment and remanufacturing (Hjort *et al.* 2019:771).

Finally, *product flow* ends with the final consumer return process of *redistribution,* converting the consumer return process into a forward logistics (FL) process (Wei *et al.* 2021:489). Particularly, redistribution in online retailing involves all FL activities to move returned products back to the markets, depending on the selected disposition options (De Leeuw *et al.* 2016:716). However,

redistribution can also be associated with the processing option of shipping exchanges/replacements. Subsequently, redistribution can involve the movement of new/unused or repackaged returned products to the original online channel, used/recovered products to secondary channels (De Leeuw *et al.* 2016:716), and new products (selected as exchanges/replacements in processing) to original consumers.

1.5.1.3 Realising satisfaction in the consumer return process

Figure 1.3 shows that *consumer satisfaction* can be realised through the effective management of several consumer return processes, including a return request, gatekeeping that results in return authorisation, collection, receiving, processing (issuing a refund or credit, or ship a product exchange), inspection/sorting and redistribution to consumers/markets that involves demand satisfaction. *Online retailer satisfaction* can be realised from inspection, sorting, disposition and redistribution processes. Specifically, identifying, classifying and selecting the best disposition options, including return to the vendor (manufacturer or supplier), restock, repackage for resale and other disposition exit/recovery options (e.g. resell on secondary markets), for returned products enables online retailer satisfaction.

Although online retailer satisfaction can involve cost recovery and profits through disposition, the efficiency of earlier consumer return processes (i.e. return request, gatekeeping, collection, receiving and processing) can influence consumer satisfaction, impacting the bottom line. Subsequently, effectiveness in the RL process of consumer returns can provide online retailers with opportunities to enhance their profitability, improve consumer satisfaction and recover costs.

In the next section, the value of RL in online retailing will be further explored with an overview of consumer return practices for the effective management of consumer returns in online retailing.

1.5.2 Consumer return practices in online retailing

With the growth of online shopping, online retailers must be more proactive in managing consumer returns for enhanced consumer satisfaction and cost efficiencies (Fox, 2023:24). Subsequently, within the information flow, product flow and cashflow of consumer return processes, several consumer return (or RL) practices can be implemented by online retailers to effectively manage consumer returns. Based on various literature sources, the key consumer return practices in online retailing can include (1) clear return policies and consumer communication, (2) gatekeeping and avoidance practices, (3) investment and use of appropriate IT, (4) outsourcing to third-party logistics

(3PL) or third-party RL (3PRL) providers, (5) internal management practices, and (6) collaboration. Each of these practices will be briefly described in the subsequent sections.

1.5.2.1 Clear return policies and consumer communication

Online retailers must implement sound and *clearly defined return policies* that clarify expectations (Fox, 2023:9; Nel & Badenhorst, 2020:126). A return policy can be important in online retailing and a trade-off between reducing the impact of returns and encouraging customers to buy must be considered (Robinson, 2014a:5). A clear return policy can help consumers to identify (1) returnable and non-returnable products, (2) product return timeline (Fox, 2023:9; Nel & Badenhorst, 2020:126), (3) acceptable return reasons, (4) credit/refund and exchange options (Fox, 2023:9), and (5) return procedures that must be followed (Nel & Badenhorst, 2020:127). Accordingly, online retailers can enhance consumer return effectiveness (Nel & Badenhorst, 2020:126), consumer satisfaction and communication, and reduce unnecessary returns through the implementation of a good return policy (Fox, 2023:9).

Moreover, online retailers must *clearly communicate* with consumers on both the online shop platform and throughout the return process. Particularly, the return policies and conditions must be available on obvious locations on the shop platform (Zhang *et al.* 2017:157). Additionally, online retailers must provide clear return instructions on requesting a return, shipping options and other requirements (e.g. packaging and labelling requirements) (Fox, 2023:19), which can be supplemented with a flow map of the return process (Zhang *et al.* 2017:157). Furthermore, online retailers must continue effective communication throughout the return process, which can involve prompt and professional responses about product return queries and concerns, regular return status updates, return tracking information and notifications regarding the processing of refunds or exchanges (Fox, 2023:19). Essentially, clear communication with consumers before, during, and after the return process can enhance consumer return experience (Fox, 2023:19), which can be important for the effective management of consumer returns.

1.5.2.2 Gatekeeping and return avoidance practices

Several studies identified the importance of practicing gatekeeping and return avoidance for the effective management of the consumer return process in online retailing. *Gatekeeping* can be important to protect the consumer return process from unwanted/fraudulent returns (Hjort *et al.* 2019:770). Additionally, online retailers can use gatekeeping as a practice to engage with consumers and identify the reasons for returns and potential return processing outcomes (e.g. issue a refund or an exchange) (Hjort *et al.* 2019:774).

Return avoidance involves any practices that online retailers can implement to prevent (or reduce) consumer returns (Hjort *et al.* 2019:770). While gatekeeping can be an important practice for return avoidance of unwanted consumer returns (Hjort *et al.* 2019:774), online retailers can implement various other measures to avoid unnecessary consumer returns, including pre-purchase information, consumer-related measures, logistics efficiency and SC-related measures. Online retailers can practise effective return avoidance by providing consumers with *adequate pre-purchase information* for correct purchasing decisions, which can include, (1) appropriate and detailed descriptions of products, (2) realistic and sufficient pictures of products (Hjort *et al.* 2019:777; Nel & Badenhorst, 2020:127; Zhang *et al.* 2017:156), (3) online videos (Nel & Badenhorst, 2020:127), and (4) accurate size guides (Hjort *et al.* 2019:778).

Furthermore, online retailers can implement *consumer-related measures* for return avoidance, which can include (1) targeting appropriate consumer groups to sell the right products to the right consumers (Hjort *et al.* 2019:776), (2) improving consumer service quality (Zhang *et al.* 2017:156), (3) listening to consumer feedback for product/service improvements, and (4) analysing consumer return statistics to block return abusers (Hjort *et al.* 2019:778). Additionally, *logistics efficiency* can be important for return avoidance, which can include improvements in procurement (Zhang *et al.* 2017:156), reducing picking and delivery errors and using appropriate packaging (Hjort *et al.* 2019:779).

Finally, online retailers can avoid future returns through *SC-related measures* like return information sharing and collaboration with suppliers to improve product quality issues (Hjort *et al.* 2019:778). Essentially, return avoidance practices not only decrease consumer returns but also improve purchase decisions, enhance consumer service, promote consumer satisfaction (Zhang *et al.* 2017:156) and promote SC collaboration.

1.5.2.3 Investment and use of appropriate IT

In reviewing the literature, investment and use of appropriate IT to manage consumer returns can be one of the most important practices in online retailing. Most authors mentioned specific technologies and systems that can improve and facilitate the management of consumer returns, including radio frequency identification (RFID) technology, the Internet of Things, returns management systems (RMS) and warehouse management systems (WMS).

RFID can be an important IT system for the management of consumer returns, providing online retailers with various benefits, including (1) optimising the consumer return process, (2) improving product return visibility, (3) improving product return monitoring (Biswas & Abdul-Kader,

2018:1021), (4) improving product return tracking, (5) facilitating return verification (e.g. correct product returned by the consumer), (6) reducing pilferage and increasing inventory accuracy (Frei *et al.* 2020:1616), (7) facilitating return processing (Zhang *et al.* 2017:157), and (8) facilitating product return sorting (Biswas & Abdul-Kader, 2018:1022; Zhang *et al.* 2017:157). However, RFID technology requires RFID tags that must be attached to return goods packaging (Biswas & Abdul-Kader, 2018:1022), and wireless hand-held devices (Zhang *et al.* 2017:157), which can be costly.

Like RFID technology, the *Internet of Things*, involving connections between smart devices and the internet, can be an important technology for managing consumer returns, providing online retailers with the ability to track products in real-time and in transit (Zhang *et al.* 2017:157). Furthermore, online retailers can invest in and use *RMS*, designed to automate and streamline the entire consumer return process (Fox, 2023:5). Particularly, RMS can provide online retailer with various benefits, including (1) improving product return speed, efficiency and accuracy, (2) enhancing consumer return experience through a hassle-free return process, (3) identifying return trends and areas for improvement in the consumer return process, and (4) facilitating product return avoidance (Fox, 2023:5).

Finally, online retailers can use traditional technology, like *WMS*, designed to streamline warehouse operations and manage consumer returns effectively (Fox, 2023:5). Specifically, a WMS provide several benefits for the consumer return process in online retailing, including (1) enhancing return inventory management, (2) improving return processing speed, (3) facilitating identification of returned products for quick restocking and resale, and (4) improving disposition efficiency (Fox, 2023:6).

Although these mentioned technologies can be important for the management of consumer returns, many other IT systems can be used in consumer return processes, which will be further explored in this study. Essentially, investing and using IT can be an important practice for managing consumer returns in online retailing, which can address challenges in the consumer return process (Nel & Badenhorst, 2020:126), streamline return processes, improve accuracy and speed, and save costs (Fox, 2023:17).

1.5.2.4 Outsourcing to 3PL/3PRL providers

Outsourcing to 3PL or 3PRL providers can be an important practice for online retailers to effectively manage consumer returns. While 3PL providers specialise in logistics and SCM, offering order fulfilment, inventory, warehousing and return services (Fox, 2023:6), 3PRL providers specialise in the return process, offering various return process services (Frei *et al.* 2020:1619).

However, online retailers must select a suitable partner, ensuring that 3P(R)L providers can successfully manage their consumer returns (Wang, Dang *et al.* 2021:11). Selecting the correct 3P(R)L partner can provide online retailers with several benefits, including (1) access RL expertise for efficient return processes, (2) economies of scale and effective management of return volume increases, (3) reduction of resource requirements, and (4) reduction of return costs through cost effective solutions (Fox, 2023:7). Essentially, online retailers can outsource to 3PL or 3PRL providers to improve the overall efficiency of the consumer return process for the effective management of consumer returns.

1.5.2.5 Internal management practices

Internal management practices involve top management support, performance measuring and monitoring, and staff training, which can help online retailers to manage consumer returns effectively. *Top management support* in online retailing can be important to address consumer return problems and improve consumer return processes (Ahlén & Johansson, 2023:31; Frei *et al.* 2020:1616). Additionally, top management support can enhance strategic decision making in RL, improve return policy design and enhance investment and resources for effective consumer return processes (Ahlén & Johansson, 2023:31), which can impact the online retailer's bottom line (Frei *et al.* 2020:1616).

Moreover, *RL performance measuring* and *monitoring* must be reported to the senior management of the online retailer, which can help with the identification of consumer product return problems and implementation of performance improvement practices (Frei *et al.* 2020:1618; Nel & Badenhorst, 2020:128). Subsequently, measuring and monitoring consumer return performance can be important for managing consumer returns. According to Fox (2023:13), consumer returns can be a valuable data source that provides insight into consumer return behaviour, product quality issues and consumer return process efficiencies, which can help with return avoidance practices (see section 1.5.2.2).

Online retailers can use various metrics for effective consumer return performance measurement, including (1) product return rate that involves the percentage of product returns, (2) return reasons provided by consumers in the return request process, and (3) consumer return costs that involve return processing, handling and restocking costs (Fox, 2023:13-14). These metrics can help online retailers to identify cost saving opportunities, understand the consumer return process and emphasise performance improvement opportunities (Fox, 2023:14-15). Consumer return monitoring can be equally important for the management of consumer returns. Online retailers must constantly monitor consumer return processes from the return request stage to returned product disposition, ensuring that

return processes can be improved and maintained, and consumer satisfaction and loyalty can be enhanced (Fox, 2023:15). Online retailers can monitor consumer return process efficiency by (1) tracking return metrics, (2) collecting consumer feedback and (3) performing return process audits (Fox, 2023:15).

Finally, *staff training* can be an important practice for the management of consumer returns, ensuring exceptional service during each stage of the return process (Nel & Badenhorst, 2020:125). Online retailers must train staff to (1) communicate with consumers effectively, (2) understand the return process, (3) use IT systems, (4) conduct accurate return inspections and (5) make correct disposition decisions (Fox, 2023:19-20). Essentially, staff training in RL ensures that staff involved in the consumer return process possess the right skills to reduce return cycle time (Nel & Badenhorst, 2020:125), improve return process efficiency and enhance consumer experience (Fox, 2023:20).

1.5.2.6 Collaboration in the SC

According to Hjort *et al.* (2019:770) consumer returns will always be part of online retailing and all SC parties will be involved to some extent. Consequently, collaboration and information sharing between SC parties can be important for the effective management of consumer returns. Online retailers can collaborate with consumers through effective communication and information sharing, which can improve return process efficiency and reduce unnecessary returns (Ahlén & Johansson, 2023:31). Additionally, online retailers can collaborate with SC partners, which can facilitate SC information exchange, improve operational efficiencies and reduce return costs for the entire SC (Ahlén & Johansson, 2023:31). For effective collaboration in the SC, online retailers can use integrated IT systems, linking all SC organisations throughout consumer return processes (Frei *et al.* 2020:1618). Essentially, effective collaboration in the SC can improve the management of consumer returns and improve relationships between online retailers, consumers and other SC partners.

With the various consumer return processes and practices identified in online retailing, the next section provides the scope of this study.

1.6 SCOPE OF THE STUDY

Although the scope of the study can be identified from the introduction, background, problem statement and research objectives (sections 1.1, 1.2, 1.3 and 1.4), it can be important to identify areas that will be included and excluded from a study. The scope of this study can be explained in terms of (1) concepts closely related to RL, (2) return types, parties and regions, (3) RL processes, (4) RL

practices, and (5) the research methods and aim of this study, which will be covered in the subsequent sections.

1.6.1 Scope of the study in terms of concepts closely related to RL

According to Badenhorst and Nel (2012:76) certain concepts are closely related to RL, including green logistics and green supply chain management. This study excludes green logistics and green supply chain management, which focus on the impact of logistics processes on the environment (see Badenhorst & Nel, 2021:77). While this study acknowledges and mentions the positive environmental impact of effective RLM, emphasis will mostly be on obtaining economic and market-related advantages, including profits, cost recovery, cost savings and consumer satisfaction, service and retention. This view is supported by Das *et al.* (2020:48), stating that RL drivers in online retailing centre mostly on economic gains, while in traditional retailing both environmental and economic factors can drive RL.

1.6.2 Scope of the study in terms of return types, parties and regions

Since RL can be regarded as a boundary-spanning function, it can be important to provide a scope in terms of return types, parties and regions. Regarding the *return types*, this study will focus on the management of *consumer returns* that originate from online purchases. Therefore, the scope of this study excludes the management of commercial product returns (known as distribution or business-to-business returns). Chapter 4 provides more detail on the type of product returns excluded from the study.

In terms of the *parties*, this study regards a *consumer* as any *end-user* that purchases products online for consumption, ranging from individuals to small businesses (e.g. purchasing office supplies). The main target market of the online retailer must be consumers, excluding commercial supplies and business-to-business transactions, for example wholesalers that sell products to retailers. While a distinction can be made between online-only, multichannel and omnichannel retailing, this study will only focus on the *online channel* part of consumer returns. This study regards *online retailers* as any organisations, including online-only, multichannel and omnichannel retailers, wholesalers and manufacturers, that directly sell products through an online platform to consumers. Subsequently, the scope of the study excludes brick-and-mortar retailing or any organisation without an online selling platform.

Although this study recognises that cross-border e-commerce sales are growing, the *region* of this study only included the *South African* market. The empirical research involved inputs from South

African industry experts in RL, which means that the framework developed in this study was aimed at facilitating online retailers in South Africa with the management of consumer returns. However, due to a lack of RL research in South Africa (see section 1.2 and 1.3), both international and local literature was used for the literature study and qualitative content analysis (QCA) of RL literature, which contributed to the final framework developed in the study.

1.6.3 Scope of the study in terms of RL processes

As described in section 1.5.1, this study focused on the RL processes of online retailers, starting with a consumer requesting a return and ending with redistribution of returned/recovered products for resale. RL processes can be classified as (1) *pre-receipt RL processes*, referring to all return processes before the arrival of returned products at the warehouse/facility, including a customer return request, gatekeeping, collection and transportation, and (2) *post-receipt RL processes*, referring to all return processes after the arrival of returned products at the warehouse or facility, including receiving, processing, inspection and sorting, disposition and redistribution processes.

While this study included various disposition options, like reuse, repair, refurbishment and other exit options, it excluded the disposition options of reconditioning, remanufacturing, recycling and waste management. Although all these disposition processes can be important, they mostly involve manufacturers, suppliers and third-party recovery firms (e.g. recyclers). Additionally, waste management and recycling can originate from commercial and household waste, which was beyond the scope of this research. Nevertheless, the roles of various third parties and other SC partners involved in RL processes and practices of consumer returns in online retailing were included in this study. Chapter 4 provides more detail on the RL processes and parties excluded from the scope of this study.

1.6.4 Scope of the study in terms of RL practices

This study defines a RL practice as “a measure, requirement, strategy, decision-making element or activity that can be implemented for the effective RLM of consumer returns”. As mentioned in sections 1.1 and 1.5.2, various practices can be adopted for the effective RLM of consumer returns, including IT, collaboration between SC parties, outsourcing, RL standardisation or formalisation, gatekeeping and return avoidance strategies, CRCs, RL network/facility design, cross-functional collaboration, strategic planning for RL, top management support, staff training, disposition strategies, performance measurement, commitment of resources, and cost management.

RL can include other practices that fall beyond the scope of this study, including green logistics practices, environmental management practices and any RL practices appropriate for upstream SC return processes. Nevertheless, as mentioned in section 1.6.1, this study recognised that the outcomes of RL practices can include improved environmental performance and compliance with environmental regulation. Chapter 6 provides details on the RL practices included and excluded from the scope of this study.

1.6.5 Scope of the study in terms of the research methods and aim

The RL processes, practices and factors that improve the RLM of consumer returns in online retailing were explored from a *practical industry perspective* and mirrors the RL processes and practices identified from literature (theory). However, any new RL process, practice and RLM factor identified during the interviews were included in the findings, because the interviews specifically focused on the RLM of consumer returns in online retailing in South Africa. Therefore, this study aimed at *building theory*, with limited focus on testing theory (only used for triangulation purposes.) The intent of the empirical part of the research was to develop a rich understanding of important RL processes, practices and factors that can help South African online retailers with the effective RLM of consumer returns.

While this study quantified some of the findings in the QCA of RL literature to identify the prominence of a process or practice, it excluded quantitative data, statistics, mathematical models, inferences or any other techniques appropriate for the analysis and interpretation of quantitative data. Therefore, this study focused on the collection and analysis of *qualitative data*, including literature and interview data. Chapters 3 and 7 provide details of the inclusion and exclusion criteria for the qualitative research methods of this study. Essentially, the aim of this research was to (1) facilitate online retailers with a framework for the effective RLM of consumer returns, (2) develop and produce new RL theory (literature) and (3) identify gaps that can be important for future research.

In the next section, a brief overview of the research design and methodology of this study is provided.

1.7 RESEARCH DESIGN AND METHODOLOGY OF THIS STUDY

A research design is a plan that includes choices about a research paradigm, approaches to theory development or testing, methodological choices, research methods, data collection techniques and data analysis methods (Saunders, Lewis & Thornhill, 2019:180). The overall research design adopted for this study included qualitative research, which can be described as a field of study based on

qualitative methods that encompasses subjectivity, flexibility and reflexivity, studying practical phenomena in a real-world environment (Tarab, 2019:3). Qualitative research can be characterised as follows: (1) researcher directly involved with the researched, (2) individuals taking part in the research are referred to as participants or informants, (3) mostly involves non-probability sampling techniques, (4) uses semi- or unstructured data collection methods, (5) data analysis involves conceptualisation and development of categories/themes, and (6) findings presented through words and images (Saunders *et al.* 2019:180).

According to Leedy and Ormrod (2021:258), qualitative research design can be appropriate when variables are unknown, the available information on a topic is limited and theory development is inadequate. Consequently, a qualitative research design can be appropriate for this study since limited studies focus on consumer returns, RL processes and practices in online retailing, and the RLM of consumer returns in online retailing in South Africa (see sections 1.2 and 1.3). Additionally, the nature of this study was both descriptive and exploratory. Firstly, this study was descriptive, since the objective was to gain an accurate profile of literature, concepts, processes and practices, which can be an extension of exploratory research (Saunders *et al.* 2019:187). Secondly, the study was exploratory in nature to gain an in-depth understanding of consumer returns, RL processes, practices and RLM factors in online retailing. Accordingly, qualitative exploratory designs can include literature studies, in-depth interviews with experts in the field of study (Saunders *et al.* 2019:188) and content analysis (Krippendorf, 2022:1), which were the research methods adopted in this study.

Figure 1.4 demonstrates the research onion adapted from Saunders et al. (2019:174), showing the overall research design of this study.

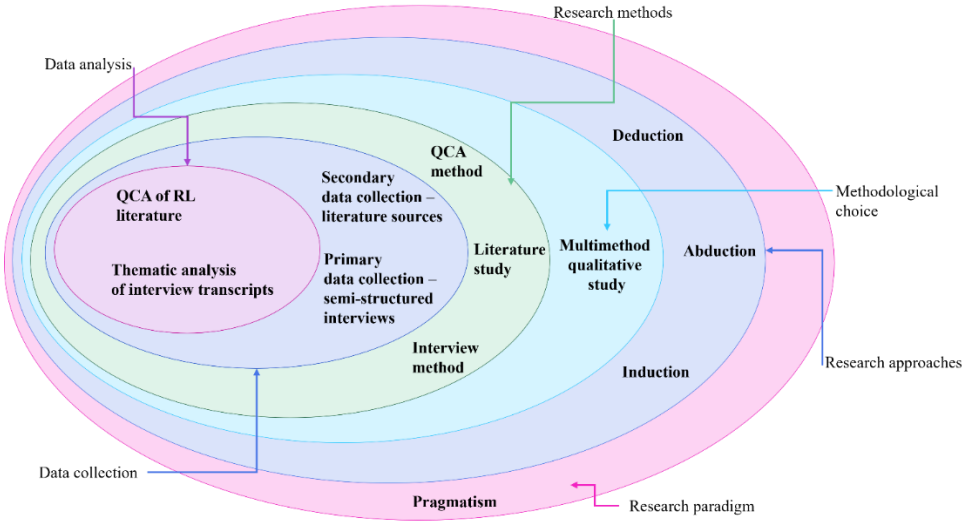

Figure 1.4 Research onion of this study
Source: Adapted from Saunders *et al.* (2019:174)

Specifically, the research onion of this study, presented in Figure 1.4, shows the adoption and selection of (1) pragmatism as a research paradigm, (2) deduction, induction and abduction as research approaches, (3) multimethod qualitative research as a methodological choice, (4) a literature study (phase 1), qualitative content analysis (QCA) (phase 2) and interviews (phase 3) as research methods, (5) secondary data collection (literature sources) and primary data collection (semi-structured interviews) as data collection techniques, and (6) QCA of RL literature and thematic analysis (TA) of interview transcripts as data analyses techniques.

In the subsequent sections, a brief overview of the research design of this study will be given, including the research paradigm and philosophical assumptions, research approaches, methodological approach and research methods, including data collection and analysis techniques. This section concludes with a brief discussion of the ethical implications of this study.

1.7.1 Research paradigm and philosophical assumptions of this study

A research paradigm can be defined as a philosophical framework that guides the way scientific research must be conducted (Collis & Hussey, 2021:39). The philosophical assumptions in research relate to a researcher's approach to ontology (nature of reality), epistemology (nature of knowledge), methodology (the research process) and axiology (role of values) (Collis & Hussey, 2021:39; Klenke, 2016a:13-14). As illustrated in Figure 1.4, this study adopted *pragmatism* as a research paradigm. Pragmatism developed in the late 19th and early 20th century with the aim of reuniting objectivism and subjectivism, accurate and rigorous knowledge, facts and value, and different experiences (Saunders *et al.* 2019:151). While most qualitative studies adopt interpretivism as a research design (Collis & Hussey, 2021:41), this qualitative study adopted pragmatism because the study involved (1) multimethod research, (2) practical organisational research (Saunders *et al.* 2019:151), (3) deductive, inductive and abductive approaches (Thornberg, 2022:245), and (4) questions designed to produce answers and address problems in practices (Klenke, 2016a:15; Salkind, 2010:1073).

Additionally, the *philosophical assumptions* of this study related to *pragmatism*, which included the (1) ontological assumption that reality can be complex, rich and practical (Saunders *et al.* 2019:145), (2) epistemological assumption that knowledge can be realised through experience (Morgan, 2017:18) and the researcher's subjective view to solve problems and inform practice, (3) methodological assumption that multimethod qualitative research can be used for practical outcomes and solutions (Saunders *et al.* 2019:145), and (4) axiological assumption that ethical and moral principles can be important aspects (Klenke, 2016a:27) in a value-driven research process (Saunders

et al. 2019:145). Chapter 3 explores the research paradigm and related philosophical assumptions in more detail.

1.7.2 Research approaches of this study

Figure 1.4 shows that the research approaches for theory development in this study included deductive, inductive and abductive approaches, which can be appropriate for a pragmatic multimethod qualitative study. Leedy and Ormrod (2021:45) describe theory development as an active and intentional thinking about a phenomenon through deduction, induction and abduction. In a qualitative study, a *deductive approach* involves the collection and analysis of theory or existing data for the development of a theoretical framework (Thornberg, 2022:246). Contrastingly, an *inductive approach* involves the collection and analysis of empirical (primary) qualitative data for the development of theories and concepts (Merriam & Grenier, 2019:6; Thornberg, 2022:248). An *abductive approach* moves between deduction and induction for the development of theories (Saunders *et al.* 2019:155). When existing theory (or literature) cannot adequately account for a phenomenon, a good researcher can abandon such theory and use abduction to formulate a more appropriate theory (Leedy & Ormrod, 2021:46). Alternatively, through abduction, the researcher can modify and elaborate upon existing knowledge by reorganising existing knowledge to produce new knowledge (Kenny & Thornberg, 2018:52).

Subsequently, in this study the (1) deductive approach involved the collection, analysis and write-up of available literature on RL, (2) inductive approach involved the collection, analysis and write-up of interview data, and (3) abductive approach involved the combination of deductive and inductive approaches for the development of the final framework for the effective RLM of consumer returns in online retailing. Chapter 3 elaborates on the description and application of the deductive, inductive and abductive approaches used for theory development in this study.

1.7.3 Methodological approach of this study

As illustrated in Figure 1.4, the methodological approach of this study included multimethod qualitative research. Multimethod research refers to the use of two or more methods drawn from the same paradigm and methodological approaches (Collis & Hussey, 2021:63). Consequently, a multimethod qualitative research study involves the use of more than one qualitative method in a single study (Wellman, Tröster, Grimes, Roberson, Rink & Gruber, 2023:1007). This study adopted multimethod qualitative research as a methodological approach to (1) improve soundness of the research findings (Cardano, 2020:101), (2) complement, develop, expand and triangulate findings (Reis *et al.* 2017:282), (3) obtain a more comprehensive understanding of a phenomenon from

differing perspectives (Hesse-Biber, Rodriguez & Frost, 2015:8; Schwandt & Lichty, 2015:592), (4) examine factors of high importance to managerial theory and practice (Wellman *et al.* 2023:1007), and (5) develop a new way of thinking about a phenomenon (Schwandt & Lichty, 2015:592). The significance of selecting multimethod qualitative research as the methodological choice of this study will be explored in chapter 3.

1.7.4 Research methods of this study

This study involved three qualitative research methods conducted in several phases, including phase 1 - literature study, phase 2 - qualitative content analysis (QCA) of RL literature, and phase 3 - interviews with industry experts. Firstly, the *literature study* (phase 1) aimed to explore the concept of RLM, the significance of RLM, barriers and problems to effective RLM and characteristics of RLM (SRO-01). Secondly, the *QCA of RL literature* (phase 2) aimed to explore and analyse RL literature for consumer return types, pre- and post-receipt RL processes of consumer returns and RL practices to manage consumer returns (SRO-02 – SRO-04). Finally, the *interviews with industry experts* (phase 3) aimed to gain inputs from RL experts in South Africa to identify and explore different types of consumer returns, RL processes and RL practices and important factors for the effective RLM of consumer returns in online retailing (SRO-05 – SRO-07). The findings of all three methods (literature study, QCA and interviews) were examined and combined to reach the primary research objective of the study, which was to *develop a framework for the effective RLM of consumer returns in online retailing*.

Figure 1.5 provides an overview of the qualitative research phases of the study, with the corresponding research objectives that were achieved.

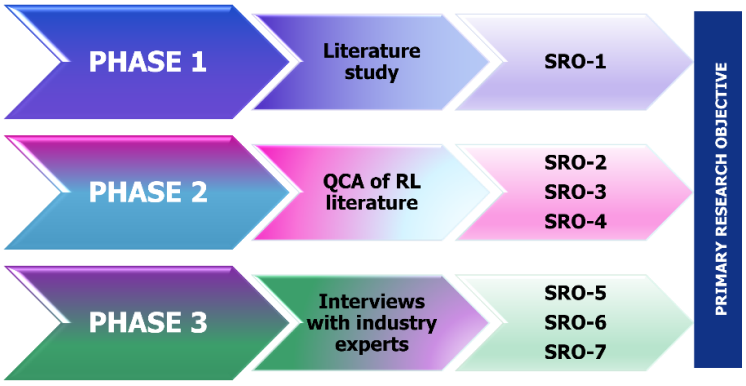

Figure 1.5 Phases of the multimethod qualitative study and related objectives
Source: Compiled by the researcher

The subsequent sections provide an overview of the qualitative research methods of this study.

1.7.4.1 Phase 1 - Literature study

According to Snyder (2019:333), building a research study on existing knowledge should be a priority for all academics, regardless of the discipline. Evidently, the first phase of the study was a literature study to *examine RLM and determine factors that influence RLM implementation and success (SRO-1).*

Figure 1.6 provides a graphical overview of phase 1 of this study, the chapter associated with the phase and the corresponding research objectives.

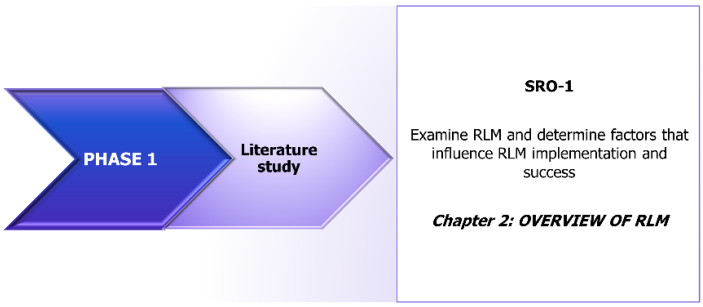

Figure 1.6 Phase 1 - Literature study
Source: Compiled by the researcher

A literature study involves a deductive approach to develop a theoretical framework of a concept (Saunders *et al.* 2019:160). According to Leedy and Ormrod (2021:82), a dissertation or thesis often includes an entire chapter (or more than one chapter) that provides a theoretical perspective from previous research findings. The sources used in the literature study included in books, journal articles, magazine articles, conference proceedings, blog post and other Internet sources (Leedy & Ormrod, 2021:82). Snyder (2019:333-334) explained that literature studies can be useful to (1) provide an overview of a research problem, (2) identify gaps in research, (3) provide an overview of disparate and interdisciplinary research, (4) discuss key concepts, (5) contribute to under-developed research fields, (6) build new conceptual frameworks, and (7) complement and/or integrate other research methods and empirical findings.

The literature study was descriptive in nature and largely focused on discussing the concept of RLM, which served as a theoretical basis for the other research methods (QCA method and interview method) and contributed to the development of the framework for the effective RLM of consumer returns in online retailing. Essentially, for this study, a literature study was conducted to (1) conceptualise RLM, (2) provide a theoretical overview of RLM, (3) explore the definitions of RL, (4) identify the barriers to effective RLM and implementation, (5) understand the significance of

RLM adoption, and (6) identify the success factors and outcomes of successful RLM. Chapter 2 provides a discussion of the findings from the literature study conducted in phase 1 of this study.

1.7.4.2 Phase 2 - Qualitative content analysis (QCA) of RL literature

Phase 2 of the study used QCA as a research method to explore and analyse RL literature for (1) *consumer return types and pre-receipt RL processes of consumer returns (SRO-2)*, (2) *post-receipt RL processes of consumer returns (SRO-3)*, and (3) *RL practices to manage consumer returns (SRO-4).*

Figure 1.7 provides a graphical overview of phase 2 of this study, the chapters associated with the phase and the corresponding research objectives.

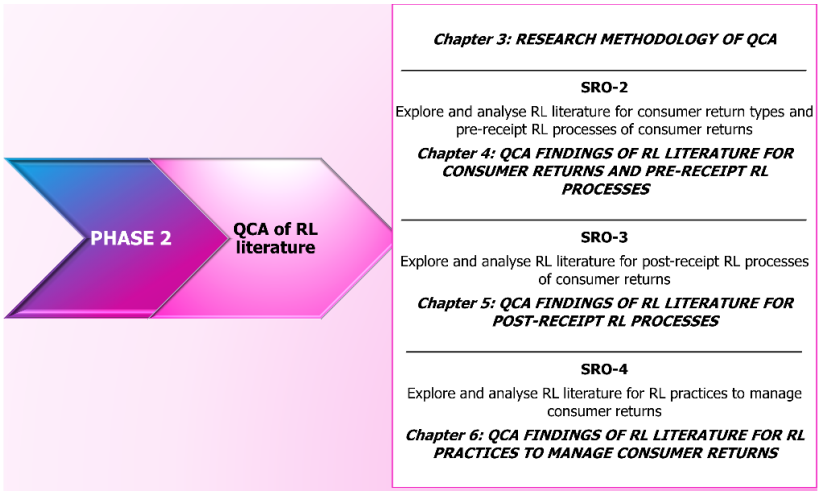

Figure 1.7 Phase 2 – QCA of RL literature
Source: Compiled by the researcher

Tarab (2019:8) described content analysis as a systematic method that is increasingly used in organisational research, which involves the selection and interpretation of material (text, verbal or visual) through coding and categories to develop a framework for an improved description of the material. Content analysis as a research method can either be qualitative or quantitative in nature. A QCA (qualitative content analysis) can be described as a highly flexible, pragmatic and systematic method to investigate various phenomena (Selvi, 2019:450), which offers new insights to increase the understanding of a phenomenon for practical application (Krippendorff, 2022:24). A quantitative content analysis (CA) as a quantitative research method usually involves larger volumes of text and the participation of a research team (Krippendorff, 2022:92) that uses the coding process as the basis for later stages of complex statistical analysis (Schreier, 2014:173; Selvi, 2019:442).

QCA was a suitable qualitative research method for the selection and analysis of RL literature because it can be appropriate for (1) pragmatism as a research paradigm, (2) wide range of materials,

including sampled texts from books, journals, websites, newspapers and magazines (Leedy & Ormrod, 2021:265), (3) multimethod qualitative studies (Leedy & Ormrod, 2021:266), (4) deductive, inductive (Selvi, 2019:450) and abductive approaches (Krippendorff, 2022:45), (5) purposive sampling techniques to select relevant material for answering the research questions (Krippendorff, 2022:122), and (6) the development of new conceptual frameworks (Snyder, 2019:334). Furthermore, Badenhorst (2018:2) suggested that QCA can be an important research method to provide greater insight into the field of RL.

QCA consists of various steps (or phases), including (1) deciding on a research question/objective, (2) selecting material, (3) building a coding frame, (4) executing the coding frame, (5) evaluating and modifying the coding frame, (6) conducting the main analysis, and (7) interpreting and presenting the findings (Schreier, 2012:17; Scheier, 2014:174). Table 1.1 provides a brief overview of the application and outcomes of the QCA of RL literature.

Table 1.1 Overview of the application and outcomes of the QCA of RL literature

QCA of RL literature phase	Application/outcomes
Deciding on a research question/objective	• Research questions in line with the secondary research objectives: ○ What are the types of consumer returns? (SRO-2) ○ What are the pre-receipt RL processes for consumer returns? (SRO-2) ○ What are the post-receipt RL processes for consumer returns? (SRO-3)
Selecting material	• Unit of analysis includes scientific peer-reviewed journal articles on RL • Non-probability purposive sampling • Final sample of 82 scientific journals, covering 289 peer-reviewed articles on RL, published between 2006 and 2016
Developing the coding frame	• Deductive development of code categories and codes • Main categories represent the research questions, including consumer returns, pre-receipt RL processes, post-receipt RL processes and RL practices • Preliminary literature review to identify subcategories (or deductive codes)
Executing and testing the coding frame	• Intra-coder agreement for two trial coding rounds 10 to 14 days apart • ATLAS.ti training in preparation for trial coding • Purposive sampling to select ten articles from the 289 sampled articles for trail coding
Evaluating the coding frame	• Quantitative and qualitative analysis of trial coding results to identify and resolve minor inconsistencies in the trial coding • Results of the trial coding deems the coding frame as appropriate
Conducting the main analysis	• Main coding of 289 articles in ATLAS.ti • Exporting code frequencies to Microsoft Excel for quantitative analysis • Exporting quotation output reports for each deductive code to Microsoft Word • Inductive coding in ATLAS.ti on quotation output reports (text assigned to each deductive code during the main analysis) • Creating new categories and subcategories from inductive coding for qualitative analysis
Interpreting and presenting findings	• Holistic interpretation of findings • Quantitative style of code frequencies and percentages, using bar charts and pie charts • Qualitative style of text matrices, discussion of text matrices to develop definitions and conceptual frameworks, data exploration to study code category relationships and a typology (summary of findings)

Source: Compiled by the researcher

The QCA of RL literature enabled the selection of appropriate RL literature to analyse, describe and provide conceptual frameworks, summaries of findings and managerial implications for the types of consumer returns, pre-receipt and post-receipt RL processes of consumer returns and RL practices to manage consumer returns, which (1) served as input for the interviews with industry experts, (2) enabled triangulation of interview findings, and (3) contributed to the final framework for the effective RLM of consumer returns in online retailing. The research methodology of the QCA of RL literature is discussed in more detail in chapter 3 (section 3.3) and the QCA findings of RL literature are presented and discussed in chapters 4 to 6.

1.7.4.3 Phase 3 - Interviews with industry experts

Phase 3 of the study used interviews with industry experts as a research method to (1) *determine consumer return types and RL processes in online retailing, based on inputs from industry experts (SRO-5),* (2) *explore and identify important RL practices for managing consumer returns in online retailing, based on inputs from industry experts (SRO-6),* and (3) *investigate and determine important factors for the effective RLM of consumer returns in online retailing (SRO-7).*

Figure 1.8 provides a graphical overview of phase 3 of this study, the chapters associated with the phase and the corresponding research objectives.

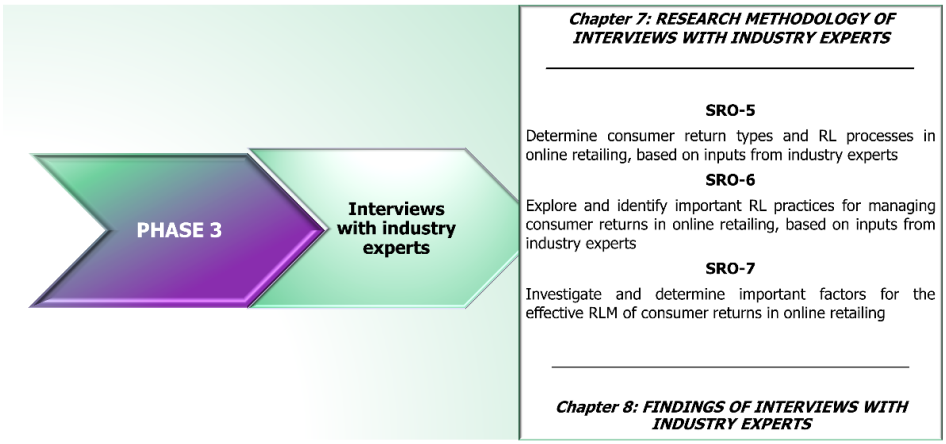

Figure 1.8 Phase 3 - Interviews with industry experts
Source: Compiled by the researcher

According to Collis and Hussey (2021:119), an interview is a research method for primary data collection in which sampled participants are asked questions related to the topic to gain inputs from their views, knowledge and experiences. Additionally, a qualitative interview can be described as a purposeful conversation between two individuals (the interviewer and the interviewee) to collect data on a specific topic (Salkind, 2010:633; Saunders *et al.* 2019:434). A qualitative interview can either be (1) unstructured with questions and themes identified from the interview conversation, or (2)

semi-structured with preestablished themes and key questions to guide the interview conversation (Saunders *et al.* 2019:437, 438). The interviews with industry experts followed a semi-structured approach based on findings from the QCA of RL literature.

Khor, Udin, Ramayah and Hazen (2016:106) indicated that qualitative research through semi-structured interviews can bring insight and in-depth information on the effective implementation of RLM. Furthermore, semi-structured interviews can be appropriate for (1) exploratory studies, (2) collection of rich and detailed data, (3) open-ended, complex and large number of questions (Saunders *et al.* 2019:444-445), (4) multimethod qualitative studies (Billups, 2022:37), (5) purposive data collection guided by formal research questions (Silverman & Patterson, 2021:68), (6) unexplored topics/subjects that require new understanding and knowledge (Akinyode & Khan, 2018:165; Billups, 2022:37), (7) professional participants who are enthusiastic about their work and field of expertise (de Villiers, Farooq & Molinari, 2021:12), and (8) development of new ideas, insights and variations of a phenomenon (Billups, 2022:37). Evidently, using interviews with industry experts as a research method was suitable for the collection and analysis of empirical data on the RLM of consumer returns in online retailing.

The interviews with industry experts involved several steps, including (1) defining the purpose and research questions, (2) considering ethical issues and practices, (3) developing an interview protocol, (4) sampling procedures and identifying participants, (5) pre-interview planning, (6) conducting interviews, (7) post-interview reflection, (8) data analysis, and (9) demonstrating trustworthiness (DeJonckheere & Vaughn, 2019:3). Table 1.2 provides a brief overview of the application and outcomes of the interviews with industry experts.

Table 1.2 Overview of the application and outcomes of the interviews with industry experts

Steps of interviews with industry experts	Application/outcomes
Defining the purpose and research questions	• The purpose and research questions in line with the secondary research objectives: o What are the reasons and types of consumer returns in online retailing? (SRO-05) o What are the RL processes of consumer returns in online retailing? (SRO-05) o What are important RL practices for managing consumer returns in online retailing? (SRO-06) o What are important factors for the effective RLM of consumer returns in online retailing? (SRO-07)
Considering ethical issues and practices	• Pre-interview ethics for research design and access to participants • Ethics during interviews • Post-interview ethics in processing and storage of data, data analysis and presentation of findings
Developing the interview protocol	• Structure of the interview protocol for interviews with industry experts: o Introduction to provide important information about the study o Opening question related to the experience of the participant in the field of RLM o Research-specific questions related to consumer returns, RL processes, RL practices and RLM factors o Closing questions to provide the participant with an opportunity to add anything new and recommend other potential participants (snowballing)

Steps of interviews with industry experts	Application/outcomes
	○ Conclusion to thank the participant
Sampling procedures and identifying participants	• Non-probability sampling procedures and recruitment • Target population of industry experts in RL with knowledge or work(ed) in the online retailing industry in South Africa • Purposive sampling and snowball sampling techniques • Inclusion criteria involve (1) access to the Internet and virtual meeting software, (2) minimum five-year experience in RL with an undergraduate degree, (3) proficient in English, (4) job description of owner, director, chair or manager of an organisation, (5) resided in South Africa • Exclusion criteria involve (1) unresponsiveness, (2) failure to respond to follow-up communication, (3) failure to attend schedule interview, (3) unable to participate in the data collection period, (4) unwillingness to provide consent, (5) withdrawn during the interview and (6) outside inclusion criteria • Recruitment through SAPICS, LinkedIn, Google and interviews with industry experts • Sample size justification through type of research, research methodology, sampling technique and principle of saturation • Final sample includes 13 industry experts in RL
Pre-interview planning	• Familiarisation through piloting • Setting the stage and scheduling the interviews • Reconfirming the interviews • Resending interview information • Preparation for online remote interviews
Conducting the interviews	• Online remote interviews via Microsoft Teams, Skype and Zoom due to lockdown during the Covid-19 pandemic • General structure of interview conversations includes (1) the introduction and building of rapport, (2) questions of the interview protocol with pre-identified and new probing questions, and (3) conclusion • Recording of interviews through built-in recording functions of Microsoft Teams, Skype and Zoom and voice recorder of cell phone
Post-interview reflection	• Reflection of sampling procedures on the impact of the Covid-19 pandemic • Reflection on using online video software for remote interviews
Data analysis	• Thematic analysis (TA) of interview data, using a codebook (deductive) approach and reflexive (inductive) approach • TA phases: ○ Familiarisation of interview data through transcription and editing of transcripts ○ Generating codes through deduction and induction ○ Performing a descriptive analysis on deductive codes ○ Generating themes by returning to interview data, exploring code relationships, summaries of potential themes and creating a thematic map ○ Developing and reviewing themes in coded extracts and entire data set through key questions, visualisations of developed themes and a thematic map ○ Refining, defining and naming themes by revisiting data and selecting quotations for theme narratives, describe the essence and uniqueness of each theme, naming candidate themes and creating a final thematic map ○ Write-up of interview data through quotation selection, selection of presentation style, selection of method to link interviews with literature and creating a presentation format
Demonstrating trustworthiness criteria	• Demonstrating credibility through triangulation • Demonstrating transferability through detailed methodological discussions and related applications of interview data • Demonstrating conformability through sufficient quotations in presentation of findings • Demonstrating dependability through multimethod data collection, rich documentation, detailed inclusion/exclusion criteria, and use of software for data collection, transcription and analysis

Source: Compiled by the researcher

Essentially, the purpose of the interviews with industry experts was to gain practical insight on the main themes of the study, namely, consumer return types, RL processes, RL practices and important

factors for the effective RLM of consumer returns in online retailing, which was also used to (1) triangulate (confirm and compare) the findings from the QCA on RL literature (consumer return types, RL processes and RL practices), (2) identify themes that can contribute to the effective RLM of consumer returns in online retailing, and (3) develop frameworks and summary of findings of themes for the effective RLM of consumer returns. Subsequently, the frameworks and summary of findings developed from the interviews with industry experts contributed to the final framework for effective RLM of consumer returns in online retailing. The research methodology of the interviews with industry experts is discussed in more detail in chapter 7, and the findings of the interviews with industry experts are presented and discussed in chapters 8.

1.7.5 Ethical principles applied to the research methods in the study

The research in this study was guided by the ethical standards of the University of South Africa (Unisa). According to the Policy on Research Ethics of Unisa (2016) students and academics require ethics clearance before data collection. Therefore, the researcher applied for and received ethical clearance from the Research Ethics Review Committee (RERC) of the College of Economic and Management Science (CEMS), Unisa, before primary data collection.

Research ethics refers to a set of standards (Saunders *et al.* 2019:252) and application of moral principles to the planning, executing and reporting of research (Myers, 2013:60). Some fundamental ethical considerations as outlined by the Policy on Research Ethics of Unisa (2016) are briefly discussed below.

- *Integrity of the researcher:* This means the researcher must act open, be truthful and promote accuracy (Saunders *et al.* 2019:257). Honesty can be an important principle in research and researchers should be honest about their data, findings and research methods (Myers, 2013:62). The researcher demonstrated integrity by complying to the following requirements of the Policy on Research Ethics (Unisa, 2016:5-6):
  - Obtained ethical clearance prior to the empirical research.
  - Demonstrated competency through the highest level of excellence and integrity in the research.
  - Refrained from undertaking research that contravenes the Policy on Research Ethics.
  - Conducted research that contributed to knowledge in the field of study.
  - Accepted responsibility and accountability for all aspects and consequences of the research activities.
  - Demonstrated honesty in all stages of the research.

- Abstained from plagiarism, falsification or the fabrication of results in any stages of the research process.
- Reported to the ethics committee on timeline changes for amended ethical clearance certificate.

- *Informed and non-coerced consent:* All information collected must comply with the Protection of Personal Information Act 4 of 2013 (Unisa, 2016:14). Without exercising any pressure or coercion, the researcher provided sufficient information and assurances to potential participants, enabling them to (1) understand the consequences of participation, and (2) reach fully informed and conscious decisions about participation (Saunders *et al.* 2019:257). Furthermore, participants must be given the assurance that they can withdraw at any stage after consent was given (Leedy & Ormrod, 2021:136). The researcher guaranteed informed and non-coerced consent by complying to the following requirements of the Policy on Research Ethics (Unisa, 2016:14):
    - Enabled participants to freely give informed consent.
    - Assured participants that they could withdraw from participation at any stage in the research process.
    - Provided participants with a participation information sheet containing details of the researcher, the aim of the research and data collection, reasons for selection, benefits and risk, confidentiality, data protection, incentives, proof of ethical clearance and contact information of the researcher and ethics representative with the attached informed consent.
    - Obtained written and signed informed consent from participants prior to data collection.

- *Right to privacy, anonymity and confidentiality:* Privacy can be a key principle that links several other principles, including avoidance of harm, voluntary and informed participation, anonymity and confidentiality, and responsible data reporting and management (Saunders *et al.* 2019:259). Confidentiality ensures that information from organisations and participants are kept confidential and anonymous (Saunders *et al.* 2019:259). To ensure privacy, anonymity and confidentiality, the researcher can assign each participant with a pseudonym (e.g. P1, manager, online retailer), referring to the pseudonym instead of the person's name in written documents (Leedy & Ormrod, 2021:138). To ensure the right to privacy, anonymity and confidentiality of participants, the researcher complied with the following requirements of the Policy on Research Ethics (Unisa, 2016:16-17):
    - Kept all information provided by the participants confidential.
    - Kept all personal information of participants confidential.

- Maintained privacy, anonymity and confidentiality by keeping all information in data collection, transfer, storage, access and disposal under the control of the researcher.
- Stored records in a manner to protect confidentiality of data and the anonymity of participants.
- Used pseudonyms for both participants and organisations to break obvious connections between data and participants/organisations.

Apart from integrity, informed consent, privacy, anonymity and confidentiality, *plagiarism* can be an important ethical principle in the reporting of findings. Plagiarism can be described as the deliberate act of copying the work of another person(s) and presenting it as one's own (Myers, 2013:50) without full acknowledgement (Leedy & Ormrod, 2021:139). Although the Internet contributed to an increase in plagiarised material, it also made it easy to identify plagiarism (Myers, 2013:50, 51). For example, Turnitin (www.turnitin.com) software compares a researcher's paper/article/thesis against more than 17 billion web pages, 200 million student papers, and various library databases and publications. Many universities use this software to prevent plagiarism (Myers, 2013:51), including Unisa.

Further details on the ethical practices for the interviews with industry experts are provided in chapter 7.

1.8 UNIQUE CONTRIBUTION OF THE STUDY

The main aim of this study was to "*develop a framework for the effective RLM of consumer returns in online retailing?".* Through an in-depth search of academic literature in leading databases, the conclusion was that no other research study was conducted with the aim of developing a framework for the effective RLM of consumer returns in online retailing. This study contributed to both research (theory/literature) and practice, which will be discussed in the subsequent sections.

1.8.1 Contribution to research

The contribution of this study to research included the development of RL literature and the collection and analysis of empirical research. This study contributed to the *development of RL literature* in terms of consumer returns, RL processes, RL practices and RLM in online retailing through the dissemination and synthesis of a wide selection of literature, scientific journal articles on RL, and inputs from industry experts in the South African market, which provided new insight and knowledge about RLM in online retailing. Furthermore, this study contributed to research by addressing perceived gaps in empirical research, including gaps in (1) research on consumer returns,

RLM and RL in online retailing, (2) research on RL in online retailing for a developing country, like South Africa, and (3) qualitative research in RL and the field of business management, which will be elaborated upon in the subsequent paragraphs.

According to de Araújo *et al.* (2018:346), the management of consumer return in online retailing is a relatively unexplored subject, with Ashan and Rahman (2022:138) adding that more research is needed on the key areas of RL in online retailing. Chen *et al.* (2017:253) indicated that more empirical research is needed on RLM because the management of FL has dominated the research scene for many decades. Moreover, Ratchford *et al.* (2022:156) indicated that more research is needed on practices that can help retailers manage online product returns effectively. Wang *et al.* (2017:667) contended that the development of an emerging research subject, like RLM in online retailing, requires a variety of researchers engaged in the field, focusing on different operational, strategic and geographic areas under study. Likewise, Eriksson and Käck (2023:27) suggested that analysing RL in specific countries can provide new insight into economic, cultural and environmental practices that shape the RL process and impact consumer satisfaction. Bozzi *et al.* (2022:31) conducted research on the product return processes of fashion online retailers in Brazil, suggesting that future studies on RL processes and consumer returns in online retailing must broaden the sample and include other geographies. Subsequently, this study *contributed to research* in the unexplored and relatively new subject field of the *RL* and *RLM of consumer returns in online retailing* and provided further development in the field through empirical inputs in the geographic area of South Africa.

Bouzon, Govindan, Rodriguez and Campos (2016:192), Eriksson and Käck (2023:27) and Le (2023:1) noted that most studies on RL focus on first world developed countries, with focus on RL still in a state of infancy in emerging economies. Furthermore, Davidavičienė and Majzoub (2021:2) mentioned that in developing countries, few research studies focus on RL in online retailing, and that more research in this context was needed. Additionally, Makaleng and Hove-Sibanda (2022:24) and Mostert *et al.* (2017:2) mentioned that more RL literature is needed in South Africa, especially in the retailing sector. Evidently, this study *contributed* to empirical *research on RL in online retailing in a developing country*, like *South Africa*.

Bernon *et al.* (2011:485) identified that RL research mostly includes quantitative research, which was reconfirmed by Prajapati *et al.* (2019:517), stating that quantitative research, including mathematical modelling and surveys, remain dominant in RL research. Furthermore, Le (2023:16) suggested that more qualitive research in RL across various industries and organisations are needed. In South Africa, this view is no different with Badenhorst (2016:10) suggesting that more qualitative

research in RL was needed, which was supported by Badenhorst (2017:619), Makaleng and Hove-Sibanda (2022:24) and Meyer, Niemann, Mackenzie and Lombaard (2017:16). Subsequently, this study *contributed* to *qualitative research in RL* by employing multimethod qualitative research on RL.

Apart from the need for more qualitative research in RL both locally and internationally, Lanka, Lanka, Rostron and Singh (2021:4) indicated that qualitative research in organisational research and management studies remain largely under-represented. Despite this under-representation, qualitative research can be essential in providing alternative perspectives and new knowledge for effective management in organisations (Lanka *et al.* 2021:4). Therefore, this multimethod qualitative study *contributed* to the *under-representation* of *qualitative research* in the field of *management studies*, providing online retailers with new knowledge about the effective management of consumer returns.

1.8.2 Contribution to practice

The background and problem statement of this study demonstrated the importance of managing consumer returns in online retailing (sections 1.2 and 1.3). Matching the gaps in empirical research, Lamba *et al.* (2020:381, 388) suggested that most online retailers pay attention to FL, instead of focussing on the significant impact of consumer returns and the management of RL. Additionally, Bozzi *et al.* (2022:18) highlighted that RL forms a key aspect of online retailing, and considered far more complex than FL. In fact, Dobroselskyia *et al.* (2021:318) mentioned that one of the most significant problems for online retailers relates to the effective management of RL to deal with consumer returns. Furthermore, Wang, Dang *et al.* (2021:2) indicated that many online retailers are unable to manage their RL effectively due to the complexity of RL and a lack of resources. Additionally, Lamba *et al.* (2020:398) founded that next to a lack of investment in RL, a lack of understanding about best practices in RL can be one of the most significant barriers to effective RLM in online retailing.

Mahadevan (2019:482) indicated that organisational practice can benefit from the development of frameworks that connect individual areas of management, including planning, techniques, systems, strategies, information sharing and SC integration (SCI). Similarly, Frei *et al.* (2020:1613) contended that many retailers underestimate the scale of consumer returns, and more research support must be provided in terms of frameworks and guidelines for the management of consumer returns. Furthermore, Lamba *et al.* (2020:388) suggested that an effective RL framework can bring considerable cost savings and other benefits for online retailers. A study conducted by Heyns and Kilbourn (2022:11) on online retailing in South Africa, found that, apart from delivery in selected

time slots, the ease of returning products was one of the most important factors for consumers. Therefore, online retailers in South Africa can benefit from the development of RL processes, RL practices and important factors to effectively manage consumer returns.

Essentially, this study contributed to practise through the development of framework for the RLM of consumer returns in online retailing. The framework provides guidance to existing and prospective online retailers in South Africa to (1) understand the concept of RL, (2) gain insight into consumer returns, RL processes and RL practices, (3) recognise the importance of effective RLM, (4) consider factors that can be important for management of consumer returns, and (5) identify and implement the most appropriate RL processes and practices for the effective RLM of consumer returns, which can assist them to effectively deal with consumer returns, reduce costs, remain competitive, improve consumer satisfaction, increase market share and improve profitability. The framework offers a benchmark for online retailers in their design and management of effective consumer return processes. The framework for the effective RLM of consumer returns in online retailing is provided in chapter 9.

The next section provides an outline of the chapters of this study.

1.9 OUTLINE OF CHAPTERS

In this section, an overview of the chapters of this study is given. Figure 1.9 illustrates the outline of the chapters of this study.

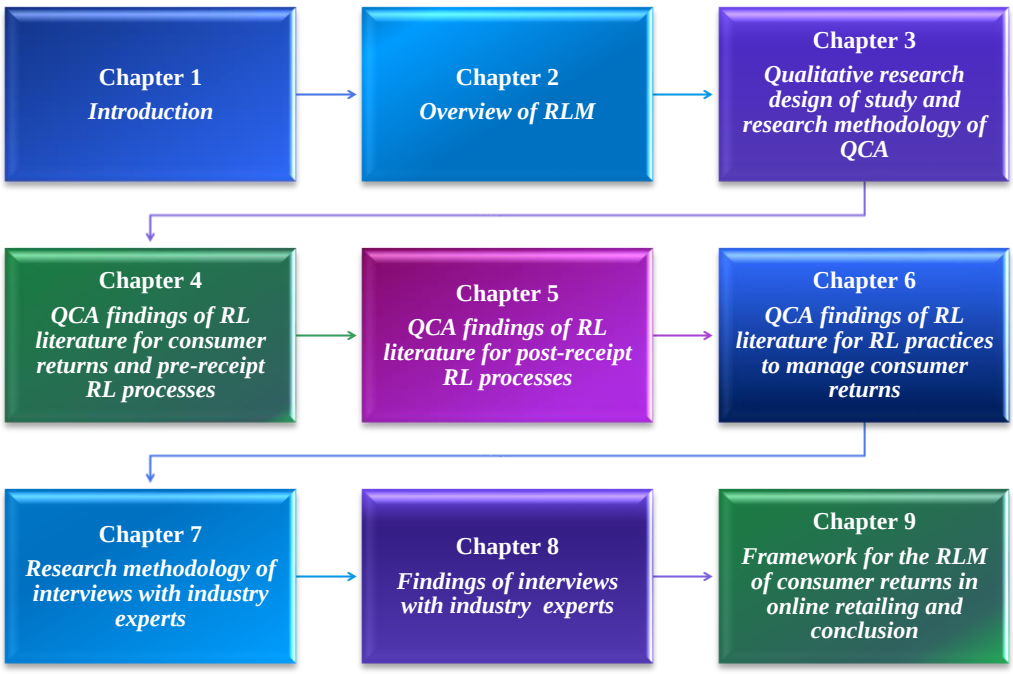

Figure 1.9 Chapter outline of the study
Source: Compiled by researcher

Based on Figure 1.9, a brief description of the chapters in this study is as follows:

- ***Chapter 1: Introduction.*** This chapter introduces the study with a background, problem statement and research objectives, overview of consumer return processes and practices in online retailing, scope, and research design and methodology. Further, this chapter emphasises the unique contribution of the study and concludes with an overview of the chapters and methodological map.
- ***Chapter 2: Overview of RLM.*** This chapter provides an overview of RLM, including a discussion based on literature on the definitions of RL, the barriers in RLM, significance of RLM and success factors for effective RLM. This chapter concludes with an overview of current knowledge and gaps in RL literature.
- ***Chapter 3: Qualitative research design of the study and research methodology of QCA.*** This chapter consists of two parts. The first part focuses on the overall qualitative research design of this study, including an overview of the justification of qualitative research designs, challenges in qualitative research, research paradigm and assumptions, research approaches to theory development and multimethod qualitative research. The second part focuses on the methodology and application of the QCA of RL literature, including an overview, phases and trustworthiness of the QCA of RL literature.
- ***Chapter 4: QCA findings of RL literature for consumer return types and pre-receipt RL processes of consumer returns.*** This chapter presents the findings of the QCA on RL literature for consumer returns and pre-receipt RL processes, including quantitative overviews (frequencies, percentages, bar charts and pie charts), qualitative data tables (text matrices), discussion of findings and further explorations on the relationship of categories with conceptual frameworks and summaries (typology) of findings and managerial implications.
- ***Chapter 5: QCA findings of RL literature for post-receipt RL processes of consumer returns.*** This chapter presents the findings of the QCA on RL literature for post-receipt RL processes, including quantitative overviews (frequencies, percentages, bar charts and pie charts), qualitative data tables (text matrices), discussion of findings and further explorations on the relationship of categories with conceptual frameworks and summaries (typology) of findings and managerial implications.
- ***Chapter 6: QCA findings of RL literature for RL practices to manage consumer returns.*** This chapter presents the findings of the QCA on RL literature for RL practices to manage consumer returns, including quantitative overviews (frequencies, percentages, bar charts and pie charts), qualitative data tables (text matrices), discussion of findings and further explorations on the

relationship of categories with conceptual frameworks and summaries (typology) of findings and managerial implications.

- ***Chapter 7: Research methodology of interviews with industry experts.*** This chapter provides the research methodology of the interview with industry experts. This chapter starts with an overview of interviews as a research method, including description of in-depth interviews in qualitative research, interview styles in qualitative research, roles of the researcher and participants in interviews, potential problems of interviews and motivating factors and advantage of interviews. Further, this chapter provides a discussion of the methodology and application of the interviews with industry experts in several steps, including purpose and research questions, ethical considerations, development of the interview protocol, sampling and recruitment, pre-interview planning, conducting interviews, post-interview planning, data analysis and trustworthiness.
- ***Chapter 8: Findings of the interviews with industry experts.*** This chapter provides the findings of the interviews with industry experts. This chapter consists of two parts, namely the presentation of findings for the descriptive analysis and findings for the reflexive TA. The first part compares the QCA of RL literature with the interview findings through qualitative data tables (text matrices) and a related discussion of findings. The second part presents the themes through a discussion of the findings with embedded quotations in the text. Further, the second part provides three frameworks based on the main themes of the study. Finally, this chapter provides summaries of the findings and managerial implications.
- ***Chapter 9: Framework for the effective RLM of consumer returns in online retailing and conclusion.*** This chapter provides an overview of the study, followed by the presentation of the final framework for the effective RLM of consumer returns in online retailing. Furthermore, this chapter provides a summary of main findings, recommendations and objectives realised, contributions, limitations and future research recommendations, and ending with the conclusion of this study.

In the next section, the methodology map of the study will be given, combining the elements discussed in chapter 1

1.10 METHODOLOGICAL MAP OF THE STUDY

Based on the purpose of the study, research objectives, research design and methodology and chapter outline, discussed in this chapter, a methodological map was created, as illustrated in Figure 1.10.

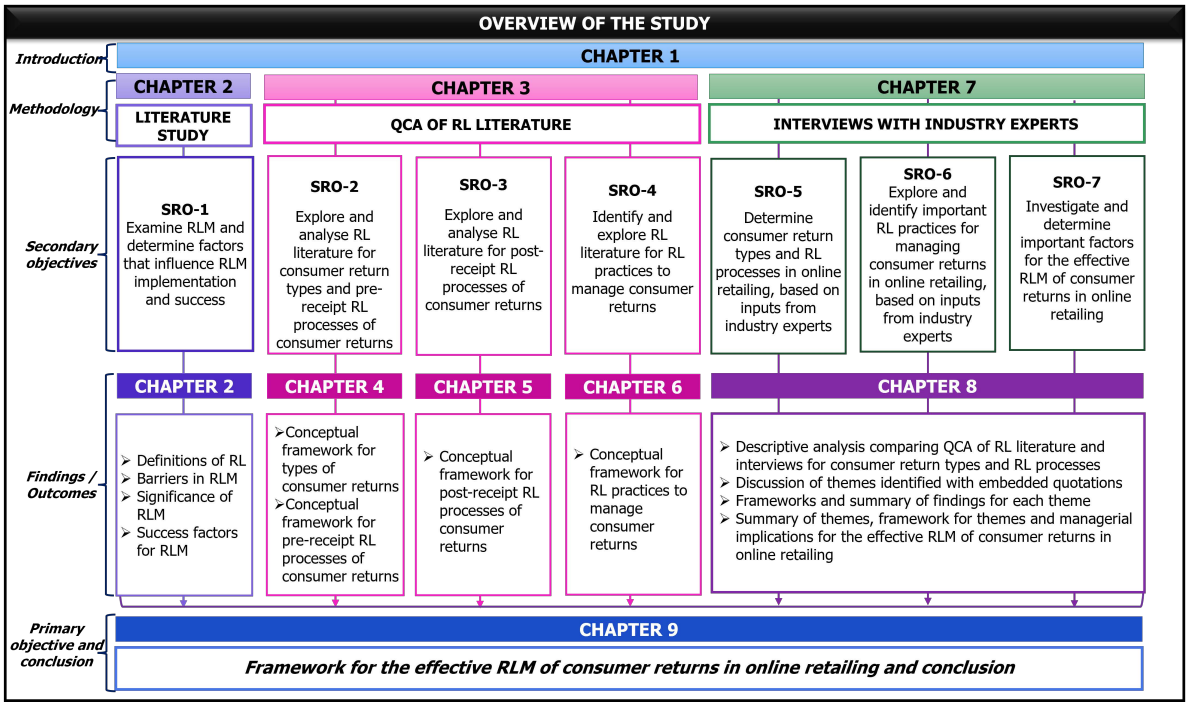

Figure 1.10 Methodological map of the study
Source: Compiled by the researcher

Specifically, the map shows the process of the study, starting with chapter 1, followed by the research methods with associated chapters, secondary objectives with associated chapters and findings/outcomes of research methods, primary research objective of developing a framework for effective RLM of consumer returns in online retailing in chapter 9, and concluding with chapter 10.

1.11 CONCLUSION

In this chapter the study was introduced with a background that focused on issues surrounding the importance of RL in online retailing and consumer returns, followed by a problem statement. It was evident that effective RLM can be essential in online retailing and that more scientific scholarly research must be conducted on the effective RLM of consumer returns in online retailing, especially in South Africa. The problem statement of this study included the following research question: "*What are the RL processes, RL practices and important factors for the effective RLM of consumer returns in online retailing?"*. Following the problem statement, the research objectives were identified, which included the primary objective of developing a framework for the effective RLM of consumer returns in online retailing, and seven related secondary research objectives.

Thereafter, an overview of consumer return processes and practices was given, which included the identification of (1) different flows, distinct processes and realisation of consumer and online retailer satisfaction in the consumer return process, and (2) distinct practices, including clear return policies and consumer communication, gatekeeping and avoidance practices, investment and use of

appropriate IT, outsourcing to 3PL and 3PRLproviders, internal management practices, and collaboration.

Next, a discussion of the scope of this study was given in terms of concepts related to RL, return types, parties, regions, RL processes, RL practices, research methods and aims. Following the scope, an overview of the research design and methodology of this study was given, which included the research paradigm and philosophical assumptions, research approach, methodological approach and research methods. Particularly, it was stated that this study selected (1) pragmatism as a research paradigm, (2) deductive, inductive and abductive approaches, (3) multimethod qualitative research as the methodological approach, and (4) a literature study, QCA of RL literature and interviews with industry experts as research methods.

Furthermore, the unique contribution of the study was identified as contributions to research and practice. The contributions to research included (1) the development of RL literature, (2) empirical research on consumer returns, RLM and RL in online retailing, (3) empirical research on RL in online retailing for a developing country, like South Africa, and (4) qualitative research in RL and the field of business management. The practical contribution entailed the framework that was developed for the effective RLM of consumer returns in online retailing, providing online retailers a guide to understand RL, gain insight into consumer returns, RL processes and practices, recognise the importance of effective RLM, consider important factors for the management of consumer returns and identify the most appropriate RL processes and practices to effectively manage consumer returns. Finally, this chapter concluded with an outline of the chapters and a methodological map of the study.

In the next chapter, the findings of the literature study (phase 1) will be given, providing an overview of RLM, which will include the definitions of RL, the drivers and benefits of effective RLM, the barriers and problems, and characteristics of effective RLM.

Chapter 2 Overview of reverse logistics management (RLM)

2.1 INTRODUCTION

As indicated in chapter 1, reverse logistics (RL) can be an important function due to its impact on the organisations, consumers and the natural environment. Since consumer returns are unavoidable for online retailers, the management of consumer returns can be an important part of RL in online retailing. The effective RLM of consumer returns can result in numerous benefits for online retailers, including cost savings, operational efficiencies, consumer satisfaction and loyalty (Eliav, 2022:1) and competitive advantage (Phuong, 2019:12). Despite the significance and benefits of the RLM of consumer returns, many online retailers neglect the effective management of consumer returns. Ignoring RLM can result in operational difficulties (Franklin, 2022:1), consumer dissatisfaction and higher RL expenses (Foo & A-Jalil, 2021:45), which can harm an online retailer's profitability, market share, and reputation (Davidavičienė & Majzoub, 2021:2). Consequently, various barriers and problems can prevent online retailers from realising the benefits of the effective RLM of consumer returns (Nel & Badenhorst, 2020:119; Wang, Dang *et al.* 2021:2). Fortunately, several authors/scholars proposed RL practices and strategies (as solutions) that can be implemented for the RLM of consumer returns.

In the research methodology section of chapter one (section 1.7, Figure 1.5), the research phases of the study were discussed. Chapter 2 forms part of the first research phase of this study, which can be viewed in Figure 2.1.

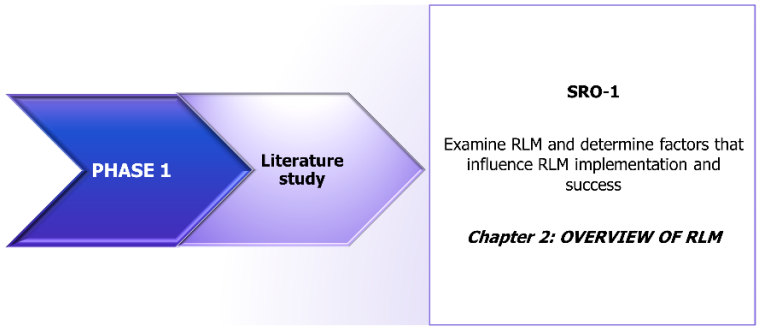

Figure 2.1 Literature study - Aim of chapter 2
Source: Compiled by the researcher

Figure 2.1. indicates that the aim of this chapter and phase one of the study is to achieve the *first* secondary research objective, which is ***to examine RLM and determine the factors that influence RLM implementation and success (SRO-1).*** Specifically, phase one involves a literature study to (1)

conceptualise RLM, (2) provide a theoretical overview of RLM, (3) explore the definitions of RL, (4) identify the barriers to effective RLM and implementation, (5) understand the significance of RLM adoption, and (6) identify the success factors and outcomes of successful RLM. Additionally, the findings and frameworks presented in this chapter contribute to the primary objective of the study, which is to *develop a framework for the effective RLM of consumer returns in online retailing.*

Figure 2.2 provides an overview of this chapter.

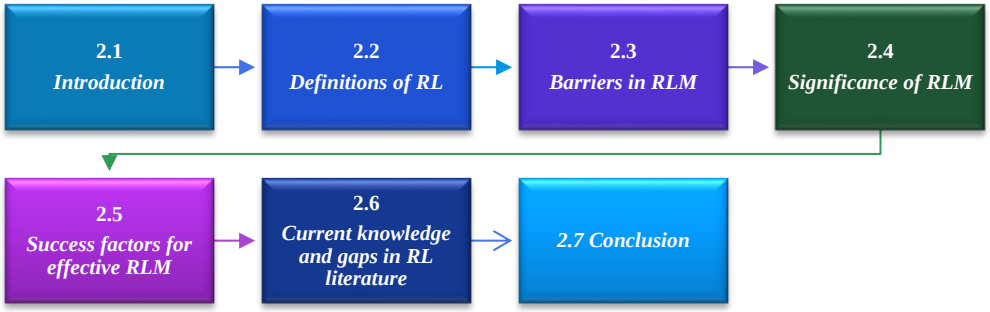

Figure 2.2 Overview of chapter 2
Source: Compiled by the researcher

Figure 2.2 provides an overview of chapter 2, starting with the introduction (this section), followed by the definitions of RL (section 2.2), RLM barriers (section 2.3), significance of RLM (section 2.4), success factors for effective RLM (section 2.5), and ending with an overview of current knowledge and gaps in RL literature (section 2.6) and the conclusion (section 2.7). The next section provides an overview of the various definitions of RL.

2.2 DEFINITIONS OF RL

Various authors/scholars over the decades defined RL in various ways. According to Badenhorst (2022:227) the scope of RL definitions constantly changes because RL represents one of the fastest developing fields in logistics. The scope of RL throughout the 1980s was limited to the movement of material against its primary flow (Bernon *et al.* 2011:486). In later literature various definitions for RL appeared, ranging from a general (broad) to more specific (narrow) scope. Table 2.**1** provides an overview of the various definitions of RL provided by various authors/scholars over the last three decades, ranging from general to specific.

Table 2.1 Definitions of RL

Scholar/Author	Definition
Bensalem and Kin (2019:16)	*RL is a backward flow of products, unlike classical forward processes that originate from the producer's end and end with the delivery of products to customers.*
Mishra and Napier (2014:33)	*RL refers to the flow of products or materials back into the supply chain.*
Harris and Martin (2014:1)	*RL is a practice that moves material physically from consumers for several reasons.*
Ayvaz *et al.* (2015:391)	*RL is a business strategy that drives the effective implementation of recovery activities to enhance sustainability.*
Ye *et al.* (2013:134)	*RL is a set of activities needed to collect products from the point of consumption, either for disposal or for economic and environmental value recovery.*
Sharma *et al.* (2011:101)	*RL is a process for moving end products from final destination to capture value and ensure appropriate disposal.*
Ravi and Shankar (2015:4)	*RL focuses on managing the flow of materials, information and relationships to add value and to properly dispose of products.*
CSCMP (2013:168)	*RL is a specialised function of logistics that focus on the management and movement of products and resources after the sale and after delivery to the consumer. RL includes product returns for repairs and/or refunds/credits.*
Dowlatshahi (2012:1265)	*RL is the process of gaining value or planning for proper disposal of products, including end of life products, returned by consumers or customer service centres.*
Gattorna and Ellis (2009:149)	*RL refers to the return of goods and packaging from intermediaries and end-users to upstream suppliers, restoring value and enabling disposal.*
Kannan *et al.* (2009:28)	*RL focuses on the backward flow of materials from customer to supplier (or alternate disposition) with the goals of maximising value from the returned item or minimising the total RL cost.*
Prakash and Barua, (2016ba:66)	*RL refers to the process of disseminating and movement of products/goods and related information from the consumption/distribution or use point back to the origin.*
Abraham (2011:211)	*RL is the process of collecting the raw materials and used products from first customers, and reusing, recycling or remanufacturing them into other products.*
Rajagopal *et al.* (2015:39)	*RL is a systematic approach to managing the flow of products, components and information from consumption to origin by expanding the traditional product life cycle.*
Govindan, Soleimani and Kannan (2015:603)	*In general, RL starts from consumers where used products are collected from consumers and then aims to manage returned products through various decisions related to repairing, remanufacturing, recycling and disposal.*
Badenhorst (2013:8)	*The process of RL involves managing the flow of goods and information from consumption to recovery, with the goals of waste reduction, value recapture, and proper disposal.*
Mahapatra *et al.* (2013:51)	*RL refers to the process of moving goods from their usual end destination to recapture value (through reuse, repairs, refurbishment, recycling and remanufacturing) or suitable disposal.*
Misni and Lee (2017:87)	*RL is the process of collecting and handling of returned end-of-life equipment, materials, components or products from the consumers back to the point of origin. It applies to all operations associated with the recovery of any used products and materials.*
Shi *et al.* (2012:219)	*RL encompasses the planning, implementation, and control of material and information flow from consumption to supply, with a focus on efficiency and cost-effectiveness.*
Srivastava and Srivastava (2006:530)	*RL is a process of planning, implementing and controlling the effective and efficient inbound flow, inspection and disposition of returned products and subsequent information for the goal of recovering value.*
Agarwal *et al.* (2016:1)	*RL can be defined as the processes of collection, inspection, sorting, repairing, refurbishing, remanufacturing, recycling and disposal to regain control products from the source of consumption back to the original source.*
Kussing and Pienaar (2012:447)	*RL is that part of returns management that plans, implements and controls the efficient and effective flow of goods and information from the point of consumption to the point of recovery to recover value or for appropriate disposal.*
Lamba *et al.* (2020:382)	*RL is about planning, controlling, and efficiently managing the flow of materials, inventory, finished goods, and information from consumption to origin to recapture RL process costs, secure profits or for thorough disposal.*
Lin and Hsu (2017:217)	*RL includes planning, implementation and control of the efficient and cost-effective flow of raw materials, processing inventory, finished goods and related information from the point of consumption to the point of origin to recapture value or correct disposal.*
Rogers and Tibben-Lembke (1998:268)[4]	*RL is the process of planning, implementing and controlling the efficient and cost-effective flow of raw materials, process inventories and finished goods and related information from consumption point to origin point for capturing value or appropriate disposal.*
Alamri (2011:236)	*The concept of RL involves managing the flow of products in reverse, incorporating recycling, remanufacturing, repairing, and more. RL expands the traditional forward process by addressing the return of used and reusable parts and products from customers with the aim of extending their usability, minimise waste, and conserve natural resources.*
Badenhorst (2022:227)	*RL involves managing the reverse flow of goods, demand information, and money, contrary to primary logistics. RL aims at reducing waste generation and managing collection, transportation, disposal and recycling of hazardous and non-hazardous waste to optimise long-term profitability.*
Bouzon *et al.* (2016:183, 182)	*RL is the process of moving goods from their typical final destination to capture value or to dispose of appropriately. RL encompasses the joint responsibility of producers and consumers to minimise waste generation through reuse, remanufacturing, recycling and safe disposal of unwanted products to improve the planet's absorption and regeneration capacity, contributing to sustainability and circular economy concerns.*

Source: Compiled by the researcher

From Table 2.**1** it is evident that RL involves a wide range of definitions with narrow to more broad contexts. To identify the most common elements of the definitions, Table 2.2 provides a data matrix for the elements that occur in two or more definitions per author/scholar.

- [4] Rogers and Tibben-Lembke are considered as the "originators" of research in RL.

Table 2.2 RL definition elements

Table 2.2 shows that RL definitions (28) cover various elements, including the element categories of (1) traits (characteristics), (2) management activities, (3) tasks, (4) general flows, (5) flows of, (6) RL processes, (7) recovery activities, (8) points, (9) parties, and (10) goals, and related elements, which occur in two or more definitions by various authors/scholars. The number of elements per definition includes three (broadest definition), five, six, seven eight, nine, ten, twelve, thirteen, fourteen and fifteen (most narrow definition). Most definitions contain ten elements, closely followed by fourteen and six elements. Contrastingly, only one definition contains five elements, nine elements and fifteen elements.

Per element category, the most mentioned elements included (1) process (trait), (2) manage and control (management activities), (3) product return (task), (4) flows (general flow), (5) products/goods (flow of), (6) collection (RL process), (7) recycling (recovery activity), (8) point of consumption (point), (9) consumer (party), and (10) proper disposal (goal). Overall, the *most mentioned (top eight) elements* of RL definitions included the flows of products/goods (16 definitions), goal of proper disposal (15 definitions), flows (14 definitions), goal of recapture or maximise value (12 definitions), flows of information (11 definitions), consumers/end users as parties (10 definitions), point of consumption (nine definitions) and flows of material (nine definitions). Oppositely, several *elements* occur *in less than three definitions*, including opposite of forward logistics (FL) as a trait, credit as a task, flows of end-of-life products/equipment, transport/distribution and inspection/sorting as RL processes, refurbishment as a recovery activity, point of recovery, and goals of recapture/reduce costs, extending the product's life, sustainability and conserve natural resources.

Based on Table 2.2, a general and an extensive definition of RL can be identified as follow:

> "Generally, RL can be defined as a process that involves the flows of materials, products and information from consumers, the point of consumption, to the point of origin for the purpose of recapturing value or for proper disposal."
>
> "Extensively, RL can be defined as a process that manages (plans, implements and controls) the efficient and effective movement and backward flows of materials, inventory, parts, returned products/goods and information from consumers, the point of consumption, to suppliers, the point of origin, or the point of recovery, with the aims of maximising economic value recovery, securing profits, minimising RL costs, reducing waste, extending the product's life, conserving natural resources and enhancing environmental sustainability or proper disposal through return collection, transportation, inspection, sorting and disposition processes and the recovery activities of reuse, repair, refurbishment, remanufacturing and recycling."

Although consumers can be important parties in the definition of RL, the importance of servicing and satisfying consumers through RL processes and activities are mostly missing from RL definitions. According to Agrawal and Choudhary (2014:20), the voice of the consumer is one of the most important aspects of RLM. Consumers respond to the behaviours of organisations, and the goodwill developed through RL processes and activities can create significant consumer loyalty. Therefore, the

definition of RL must include strategies to satisfy the consumer. According to Karlsson *et al.* (2023:1), consumer returns can be viewed as a service offering, which requires effective management. As a service offering, consumer returns can be an integral part of the consumer's overall online shopping experience. Similarly, Lin and Hsu (2017:218) argued that satisfactory consumer service through RL can be critical for online consumer retention. In fact, studies indicated that up to 80% of online shoppers are less likely to repurchase from an online retailer because of a poor return experience (Dobson, 2023:4).

Since this study focuses on the *effective RLM of consumer returns in online retailing* the following definition can be derived from the above discussion and definitions:

> The reverse logistics (RL) of online consumer returns is the process of managing (planning, implementing and controlling) the efficient and effective flows of returned products and information from the consumer (point of consumption) to an online retailer (point of recovery) or upstream supplier (point of origin) to recapture value, save costs, increase profits, satisfy, serve and retain online consumers, and improve economic and environmental sustainability through RL processes and practices.

Consequently, this study focused on that part of RL that involves the management of products, information and cash flows from the consumer to the online retailer to improve economic performance and satisfy, service and retain online consumers through RL processes and RL practices, which will be identified and explored throughout this study.

In the next section, the barriers in RLM that prevents online retailers from implementing and managing consumer returns effectively will be explored.

2.3 BARRIERS IN RLM

According to Badenhorst (2022:228), organisations often regard RL as an unavoidable evil and a non-value adding and costly process, failing to recognise the importance of RLM. Especially, in online retailing RLM and RL processes can be costly and complex, impacting consumer satisfaction (Eriksson & Käck, 2023:1) and the financial performance of online retailers (Pramono, Ulkhaq & Aulia, 2021:1). Subsequently, several challenging factors can impede the effective management and implementation of RL, affecting the overall performance of organisations (Pramono *et al.* 2021:1).

The barriers in RLM involve internal and external problems and risks that not only prevent organisations to adopt RLM but also hamper effective implementation and management of RL (Badenhorst, 2022:229). Internal barriers and related problems represent RLM obstacles that exist within the organisation, whereas external barriers and problems involve hindrances from outside the organisations that disturb RLM and its implementation (Govindan & Bouzon, 2018:320). Additionally, internal and external risks associated with the barriers in RLM can cause additional

challenges to the implementation and management of RL (Panjehfouladgaran & Lim, 2020:1451; Senthil, Murugananthan & Ramesh, 2018:719). According to Wang, Wang and Chan (2021:61), RL risk can be described as a type of business risk that cannot be measured or predicted because of uncertainties about the future and possibility of unexpected occurrences, causing disruptions and negative outcomes.

The barriers in RLM can overlap and influence each another (Pramono *et al.* 2021:2), meaning that online retailers must collectively identify and address the barriers and related problems and risks to RLM and implementation. Based on the literature study, RLM implementation involves four main barriers, namely economic barriers, operational barriers, organisational barriers and external barriers (Badenhorst, 2022:229; Badenhorst, 2017:618), which will be discussed in the subsequent sections. The section concludes with a framework and summary of the barriers in RLM.

2.3.1 Economic barriers in RLM

According to De Borba, De Magalhães, Filgueiras and Bouzon (2020:137), economic barriers to RLM and implementation carry a significant weight because of financial constraints and high costs. Equally, Lamba, Yadav, Barve and Panda (2020:397) found that economic barriers, especially a lack of investment, can be the most significant barriers to the implementation and management of RLM in online retailing. The economic barriers to RLM can be categorised as (1) investment barriers, (2) financial constraint barriers and (3) financial risks, which will be discussed in the subsequent sections.

2.3.1.1 Investment barriers in RLM

A lack of investment in RLM can be a significant economic barrier (Lamba *et al.* 2020:397) since effective RLM *requires heavy economic investment* (Lamba *et al.* 2020:399; Huang, Wu & Rahman, 2012:854; Ravi & Shankar, 2015:15; Waqas, Dong, Ahmad, Zhu & Nadeem, 2018:4202). Due to the high levels of investment and slow rate of return in RL, managers tend to prioritise other types of investments with more visible return on investment (Ravi & Shankar, 2015:15). Therefore, *a lack of investment in resources* can be a significant barrier for online retailers to implement and manage RL effectively (Lamba *et al.* 2020:397; Zailani, Govindan, Shaharudin & Kuan, 2017:37).

Like traditional logistics management, RLM need investment in infrastructure, information technology (IT) and human resources (Badenhorst, 2022:229; Pramono *et al.* 2021:3; Zailani *et al.* 2017:35). Specifically, effective RLM and implementation require investment and funds for (1) supporting infrastructure, (2) supporting and trained workforce, (3) efficient IT and systems

(Pramono *et al.* 2021:3; Ravi & Shankar, 2015:15; Sirisawat & Kiatcharoenpol, 2018:304), and (4) product recovery activities (disposition options), like repair and refurbishment, recycling and proper disposal (Badenhorst, 2022:229; Ravi & Shankar, 2015:15; Sirisawat & Kiatcharoenpol, 2018:304). Unfortunately, organisations are more inclined to invest in forward logistics (FL) and SC resources and hesitant to invest in RLM resources because of *unclear economic benefits* (Mahadevan, 2019:483).

Consequently, a lack of financial investment can prevent organisations from reaping the economic benefits associated with the effective RLM and implementation (Badenhorst, 2022:229). Additionally, if organisations lack the desire to implement and manage RL successfully, they might be less inclined to allocate the needed funds for RLM investments (Pramono *et al.* 2021:3). A *lack of necessary funding* can hamper the implementation of appropriate product tracking and tracing systems (Jović, Schlierf, Heinen & Tijan, 2020:160; Frei, Jack & Brown, 2020:1619; Mai, Chen & Anselmi, 2012:49; Ravi & Shankar, 2015:20) needed for managing product return uncertainties in terms of volume, frequency and source (Mathu & Khunou, 2021:443). Moreover, a lack of funds can hamper effective education and training of staff necessary for the management of product returns (Andresen & Istad, 2019:17). Evidently, a lack of funds necessary for RLM resources and capabilities contributes to the lack of adoption and implementation of RLM (Zailani *et al.* 2017:37).

Essentially, investment barriers not only prevent the effective implementation of RLM but also contribute to operational support barriers (section 2.3.2.2) and management and functional (organisational) barriers (sections 2.3.3.1 and 2.3.3.3).

2.3.1.2 Financial constraint barriers in RLM

Financial constraints can be one of the most important barriers to effective RLM and implementation (Badenhorst, 2022:229; Pramono *et al.* 2021:3; Ravi & Shankar, 2015:17), involving *high RL costs* that further adds to organisations' reluctance to invest in effective RLM (Badenhorst, 2017:618). Specifically, financial constraints in RLM associate with (1) *RLM investment expenses* (Ahlén & Johansson, 2023:32), (2) *standard costs of online product returns* (Davidavičienė & Al Majzoub, 2021:2; Karlsson *et al*. 2023:1; Lin & Hsu, 2017:218; Wang *et al.* 2017:681), (3) *product return uncertainties and a lack of economies of scale* (Ahlén & Johansson, 2023:32; Lamba *et al.* 2020:397; Nel & Badenhorst, 2020:119), and (4) *indirect expenses* of product return mismanagement and service failures (Ahsan & Rahman, 2021:21; Bozzi *et al.* 2022:12).

Linking with the investment barriers (section 2.3.1.1), *RLM investment* involves various *expenses*, including IT development and implementation costs, recruitment costs of qualified staff, and staff

training and development costs (Zailani *et al.* 2017:35). Moreover, in online retailing the *cost of online product returns* can be double to the product's original value (Lin & Hsu, 2017:218), representing more than 35% of the total cost of the online retailer (Davidavičienė & Al Majzoub, 2021:2). Online consumer returns can be more costly than traditional retailing because of product return uncertainties and transportation, gatekeeping, inspection, disposition and redistribution costs (Ahsan & Rahman, 2021:16; Wang *et al.* 2017:681). However, the highest costs of online product returns involve the handling and transportation of returned products from the consumer's location to the online retailer's facility (Das, Kumar & Rajak, 2020:59). In fact, Gustafsson, Jonsson and Holmström (2021:877) found that returned product handling and transportation costs could amount to 72% of total RL costs. These costs could be even higher for failed pick-up attempts due to consumer unavailability (Bozzi *et al.* 2022:18).

Consequently, product returns involve duplication of operational expenses, adding to total costs and additional losses of returned product value (e.g. lower resale price) (Bozzi *et al.* 2022:22). Moreover, product return handling can be more costly due to *uncertainties* in volume, frequency, source, quality and condition of the returned products (Mathu & Khunou, 2021:443). Additionally, unlike the scale benefits of FL, erratic volume and smaller quantities of product returns cause a *lack of economies of scale,* contributing to high RL costs in online retailing (Ahlén & Johansson, 2023:15; Nel & Badenhorst, 2020:119).

Finally, ineffective RLM add to the *indirect RL expenses* of online retailers (Bozzi et al. 2022:12). Specifically, *mismanagement of product returns* and subsequent *service failures* can cause consumer dissatisfaction, resulting in a loss of brand value, reputational damage and a loss of market share (Ahsan & Rahman, 2021:21; Bozzi *et al.* 2022:12). Consequently, the financial constraints of costly investments, high RL costs and unwanted expenses can hamper the effective implementation and management of consumer returns in online retailing.

2.3.1.3 Financial risks in RLM

Based on the RL risk definition provided by Wang, Wang *et al.* (2021:61)[5], financial risks in RLM involve financial uncertainties about unexpected and unwanted financial outcomes that can hamper effective RL implementation and management. Several financial risks might cause disruptions in RLM, including (1) *financial instability, capacity and investment risks* (Khor *et al.* 2016:117; Panjehfouladgaran & Lim, 2020:1465), (2) *a loss of money* and *high RL cost risks* (Ermes &

[5]See footnote 3.

Niemann, 2023:7; Shaharudin, Zailani & Tan, 2015:221), and (3) *profit loss risk* (Ermes & Niemann, 2023:7; Hsueh & Lin, 2015:165).

Financial instability, capacity and investment risks associate with the unavailability of the financial resources needed for effective RLM (Panjehfouladgaran & Lim, 2020:1461). Effective RLM and implementation can cause the financial risks of losing investors, attracting investors and raising additional capital (Khor *et al.* 2016:117). Furthermore, organisations *risk* the *loss of money* due to *high RL costs* contributing to high operating expenses (Shaharudin *et al.* 2015:221). Additionally, online retailers can experience a *high RL cost risk* from lenient returns (Ashan & Raham, 2021:158; Robertson *et al.* 2020:174). Because of the fierce competition in online retailing (Nel & Badenhorst, 2020:120), some online retailers implemented lenient returns, for example, allowing consumers to buy multiple products online, and after delivery return the unwanted products (Biswas & Abdul-Kader, 2018:1016). Consequently, lenient return policies can increase product returns, contributing to the financial risk of higher product return costs (Ashan & Raham, 2021:158; Robertson *et al.* 2020:174).

Finally, organisations risk a *loss of profits* due to the loss of product resale value (Bozzi *et al.* 2022:22) and hidden RL expenses (Ermes & Niemann, 2023:7). Unexpected RL expenses might cause organisations to allocate additional funds not in the budget, resulting in diminishing profit margins (Ermes & Niemann, 2023:7). Alternatively, financial risk and profit loss might be caused by organisations that fail to recognise the added value and profits associated with RL processes and product recovery activities (Hsueh & Lin, 2015:165). Evidently, a lack of awareness of the economic significance of RLM implementation can contribute to financial risk, hampering the implementation of RLM.

Clearly, online retailers can face various economic barriers, problems and risks that may complicate the implementation and management of consumer returns. Therefore, online retailers must identify RLM success factors and practices to address investment barriers, financial constraints and financial risks for the effective RLM of consumer returns. In the next section, the operational barriers in RLM will be identified and discussed.

2.3.2 Operational barriers in RLM

The RL process in online retailing can involve various operational challenges in terms of unpredictability of demand, complexity of managing returns, dependability of appropriate IT and infrastructure (Bozzi *et al.* 2022:31; Chen *et al.* 2017:252). Consequently, operational barriers in RLM relate to the processes and characteristics of product returns, the requirements of IT and

infrastructure and related operational risks. The operational barriers to the management and implementation of RL can be classified as product return barriers, operational support barriers, and operational risks, which will be discussed in the subsequent sections.

2.3.2.1 Product return barriers in RLM

The complexity of product returns can impact the implementation and management of consumer returns (Chen *et al.* 2017:253). While traditional FL is predictable and planned (Bozzi *et al.* 2022:31), by nature, returned products are less efficient to handle (Robertson *et al.* 2020:174) due to unpredictable return demand and uncertainties (Bozzi *et al.* 2022:31). Therefore, many online retailers are overwhelmed with the complexity of RL and unable to implement and manage consumer returns effectively (Frei *et al*. 2020:1619). The product return barriers to effective RLM and implementation relate to product return uncertainties, limited product return visibility, forecasting and planning, and quality and condition of returned products (Badenhorst, 2022:330; Badenhorst, 2017:619; Misni & Lee, 2017:92-93).

Every aspect of the RL process involves *uncertainties* (Senthil *et al.* 2018:719), including uncertainties in product return quality, condition, frequency and volume (Mathu & Khunou, 2021:443). *Limited visibility* of returns can be problematic for many organisations (Badenhorst, 2022:330; Srivastava, 2013:65). RL is a reactive process due to less visibility, which adds to the complexity of planning and decision-making for RLM (Rajagopal *et al.* 2015:41). In online retailing, limited visibility can be attributed to unpredictable fluctuations because individual consumers ultimately hold the decision to initiate returns (Espinosa, Stock, Ortinau & Monahan, 2021:790: Rajagopal *et al.* 2015:41). Consequently, limited visibility causes a lack of knowledge about return volume and quality of returned products as well as an unpredictable demand on recovered materials (Lai *et al.* 2022:4; Starostka-Patryk *et al.* 2013:507).

Relating to the unpredictability of product return volume, *limited forecasting* and *planning* can also be significant operational barriers (Badenhorst, 2022:330). Bouzon *et al*. (2018:328) found that limited forecasting and planning can be the most important impediments to RLM implementation. The stream of returned products can only be forecasted based on previous consumer return behaviours (Frei *et al*. 2020:1620). Therefore, online retailers find it challenging to predict product return volumes, hampering effective forecasting and planning of inventory (Ahlén & Johansson, 2023:31; Badenhorst, 2022:330). Moreover, a lack of forecasting and planning for effective RLM impacts operational efficiency, effective resource allocation, economies of scale and realisation of financial benefits (Ahlén & Johansson, 2023:31).

Finally, product return barriers associate with problems with the *quality* and *condition* of *returned products* (Badenhorst, 2022:330; Badenhorst, 2017:619). According to Sirisawat and Kiatcharoenpol (2018:310), one of the most neglected aspects in RL is the quality and condition of returned products. While the quality and condition of products are uniform in FL, in RL products are returned in various conditions and quality, including new, used, defective or damaged conditions (Badenhorst, 2022:330; Pranomo *et al.* 2021:3). These uncertainties in the quality and condition of returned products add to the complexity of estimating the value of returned products (Lee & Lam, 2012:596) and effective planning and control of the RL process (Badenhorst, 2022:330). Additionally, the quality and quantity of returned products add to the complexity of managing the financial aspects of RLM (Lee & Lam, 2012:596) and hamper effective performance measurement (PM) in RLM (Ravi & Shankar, 2015:13).

Essentially, product return barriers can cause various challenges to effective RLM and implementation, contributing to other RLM barriers, including financial constraints and risks (sections 2.3.1.2 and 2.3.1.3), operational risks (section 2.3.2.3) and strategy, policy and control barriers (i.e. lack of PM) (section 2.3.3.2).

2.3.2.2 Operational support barriers in RLM

The effective implementation and management of RL requires strong information and infrastructure support (Jović *et al.* 2020:160; Mai *et al.* 2012:49). Accordingly, the operational support barriers in RLM involve inadequate information and technology systems, and a lack of infrastructure and development (Badenhorst, 2017:619; Badenhorst, 2022:330; Misni & Lee, 2017:92-93).

Inadequate IT and information systems as operation resources can be significant barriers to the successful implementation and effective management of RL (Badenhorst, 2022:330; Karlsson *et al*. 2023:7). While most organisations use effective information and technology systems to support FL, IT support for RLM still need further improvement (Lee & Lam, 2012:596). In fact, Karlsson *et al.* (2023:8) found that new IT is rarely implemented and used in the RL process. The information infrastructure of many online retailers involves fragmented IT systems, poor data management and poorly connected legacy systems, which hampers RL process efficiency (Frei *et al.* 2020:1619). Consequently, inadequate integration of IT systems for RLM can significantly impact the operational performance of online retailers (Soltany, Rostamzadeh & Skrickij, 2018:780; Dapiran & Kam, 2017:831). Additionally, online retailers that lack real-time IT systems to record purchases, product returns and refund data hampers the ability to track fraudulent returns (Zhang, Frei, Senyo, Bayer, Gerding, Wills & Beck, 2023:2, 10), adding to financial risks (section 2.3.1.3) and consumer buying behaviour barriers (section 2.3.4.2). Moreover, a lack of robust information systems to manage RL

processes contributes to lack of SC visibility and information sharing (Mahadevan, 2019:483), which further hampers RLM (see section 2.3.4.1).

Although facets of IT, like Big Data and Cloud, can help online retailers to effectively analyse product returns, the capabilities needed to support RLM are still lagging, creating severe challenges in RLM (Lai *et al.* 2022:4). Online retailers with poor consumer return portals not only reduces product return visibility, but also enable fraudulent consumer return behaviour (Zhang *et al.* 2023:7). Without proper information software and support, online retailers perform the RL process manually (Bozzi *et al.* 2022:15), which impedes return authorisation, tracking, visibility and handling (Badenhorst, 2022:330; Mai *et al.* 2012:49). Additionally, online retailers often fail to capture, analyse and use product return data for RLM decision-making, which impacts the management of consumer returns (Karlsson *et al* 2023:7). Therefore, limited access to information about product returns can hamper effective RL decision-making by RL staff (Espinosa *et al*. 2021:791). Evidently, failure to analyse return reasons can hamper improvements in the RL process and effective avoidance of future product returns (Bozzi *et al.* 2022:11).

Closely related to inadequate information systems and technology, *a lack of infrastructure* and *development* can be significant barriers to the implementation and management of RL (Lamba *et al.* 2020:398; Meyer *et al.* 2017:12). Inadequate infrastructure and a lack of development causes uncertainties and operational inefficiencies, hampering effective planning and management of RL processes (Badenhorst, 2022:330; Bai & Sarkis, 2013:307; Meyer *et al*. 2017:12, 13). Internal infrastructure for RL includes warehouse IT, facility space, vehicles used for return transportation and updated equipment (Davidavičienė & Al Majzoub, 2021:8). Consequently, a lack of infrastructure contributes to information systems and technology deficiencies (Srivastava, 2013:65), adding to inadequate IT as a barrier to effective RLM. Externally, online retailers face problems with collecting one product at a time, from various consumer home addresses, offering no infrastructure to support return processes (Bozzi *et al.* 2022:18). Moreover, most organisations lack the capability to manage RL networks because of the complexity of the RL process and resource constraints (Wang, Dang *et al.* 2021:2). Essentially, operational support barriers can be significant barriers to the successful implementation and management of RL, causing various operational challenges and inefficiencies in the RL process.

2.3.2.3 Operational risks in RLM

While financial risks mostly contribute to economic barriers (section 2.3.1.3), operational risks can be the results of operational barriers. Therefore, in line with the barriers discussed in the preceding sections, operational risks in RLM can involve consumer demand and forecast risks, product quality

risks, technological and data management risks, and inventory risks (Panjehfouladgaran & Lim, 2020:1461-1462; Senthil *et al.* 2018:718). Specifically, *demand* and *forecast risks* associate with the uncertainty of product returns, lack of visibility and limited forecasting (Panjehfouladgaran & Lim, 2020:1462). Consequently, online retailers face uncertainties in terms of the time, volume and product mix of returned products (De Borba *et al.* 2021:125), which complicate RLM.

Similarly, *product quality* risks relate to uncertainties in terms of the quality and condition of returned products (De Borba *et al.* 2021:125; Panjehfouladgaran & Lim, 2020:1462). Therefore, online retailers face the risk of receiving defective, damaged, incomplete (e.g. missing accessories) (Panjehfouladgaran & Lim, 2020:1462), and poor-quality products (Ermes & Niemann, 2023:7). Moreover, product quality risks occur when inadequate quality inspections are performed before reselling returned products (Ermes & Niemann, 2023:7). Therefore, online retailers' risk additional returns from poor quality inspections. Associating with the operational support barriers of inadequate IT, the *technology risks* in RLM relate to continuous changes in IT and reduction in existing IT capabilities for RLM (Panjehfouladgaran & Lim, 2020:1461). Moreover, poor information systems contribute to *data management risks,* relating to poor return information accuracy, security and disruptions (Senthil *et al.* 2018:718).

Finally, *inventory risks* in RLM are associated with a lack of infrastructure and operational inefficiencies. For instance, inadequate storage of returned products can cause damage, which further increases future damaged product returns (Senthil *et al.* 2018:718). Moreover, inventory risk involves pilferage of returned products, which can occur during any stage of the RL process (Ermes & Niemann, 2023:7). Consequently, if organisations fail in handling returned products efficiently, effectively and thoroughly, they risk considerable value loss (Prajapati, Kant & Shankar, 2021:15). Evidently, operational risks can add to the financial risk of high RL costs because of increases in product returns and profit loss due to the inability of recovering value from returned products (see section 2.3.1.3).

In essence, online retailers can face various operational barriers, problems and risks that may complicate the implementation and management of consumer returns. Therefore, online retailers must identify RLM success factors and practices to address product return barriers, operational support barriers and operational risks for the effective RLM of consumer returns. In the next section, the organisational barriers in RLM will be identified and discussed.

2.3.3 Organisational barriers in RLM

Organisational barriers relate to specific management issues and problems in implementing and managing RL effectively (Badenhorst, 2022:229; Bai & Sarkis, 2013:306; Chan, Chan & Jain, 2012:1318; Starostka-Patryk *et al.* 2013:506). Bouzon *et al.* (2018:328) found that the most important barriers in RLM are internal to the organisation, suggesting that organisations must start by addressing internal organisational barriers for effective RLM implementation. The organisational barriers can be classified as management barriers, strategy and policy barriers, functional barriers and organisational risk, which will be discussed in the subsequent sections.

2.3.3.1 Management barriers

According to Biswas and Abdul-Kader (2018:1016), RL is an increasingly important yet undermanaged organisational function. The absence of RLM interest, knowledge, awareness and commitment by managers can be significant barriers to the effective implementation and management of online consumer returns (Davidavičienė & Al Majzoub, 2021:6). Evidently, the management barriers in RLM involve a lack of awareness and knowledge about the importance of RLM, a lack of top management commitment to RLM, management inattention (Badenhorst, 2017:618; Badenhorst, 2022:229) and a resistance to change (Badenhorst, 2017:618; Pranomo *et al.* 2021:3)

A lack of awareness and knowledge about the *importance of RLM* can be a major barrier for successful RLM implementation (Aytekin, Çopuroğlu & Sariçiçek, 2016:505; Davidavičienė & Al Majzoub, 2021:6; Ravi & Shankar, 2015:15; Srivastava, 2013:66). Although RLM can be a differentiating advantage for online retailers, managers often fail to understand and realise the value of RLM (Chen *et al.* 2017:253; Lin & Hsu, 2017:218) and the significant impact of consumer returns on the organisation and the environment (Bozzi *et al.* 2022:27), which hampers effective RLM (Chen *et al.* 2017:253). Consequently, a lack of awareness about the importance of RLM is normally a result of a lack of recognition that effective RLM can create a competitive advantage (Phuong, 2019:12) and add value in terms of finances, brand image and the environment (Jra *et al.* 2017:29).

For online retailers to implement and manage RL effectively, commitment from top management is essential (Ahlén & Johansson, 2023:17). Accordingly, a *lack of top management commitment* is an important barrier in RLM (Bouzon *et al.* 2018:326; Ravi & Shankar, 2015:15; Starostka-Patryk *et al.* 2013:508) since effective RLM is impossible without management support (Panjehfouladgaran & Lim, 2020:1466). In fact, top management, plays a central role in enabling efficient RLM (Mostert *et al*. 2017:9). A lack of top management commitment to RLM hampers strategic planning, awareness about the importance of RLM and financial support for RLM (Andresen & Istad, 2019:17).

Consequently, top management is prone to neglecting and losing interest in resources and capabilities for RLM, resulting in a lack of effectiveness in managing consumer returns (Zailani *et al.* 2017:29). Such a negative attitude from management towards RLM can hinder operational practices and lead to suboptimal RL performance (Chen *et al.* 2017:252).

Subsequently, both a lack of knowledge about RLM importance and top management commitment can complicate effective RLM. For instance, a lack of awareness about RLM and top management support can reduce the likelihood of allocating sufficient resources for effective RLM (Chen *et al.* 2017:261). Moreover, the economic barriers (such as a lack of investment) in RLM may stem from *management inattention* to RLM (Badenhorst, 2022:229). The unimportance of RLM contribute to RLM implementation failures, a lack of IT and inadequate infrastructure for effective RLM (Solati, Shojaei, Alimohammadlou & Hesamabadi, 2023:14). Furthermore, a lack of knowledge, commitment and support from management can result in poor decision making for the implementation of appropriate RLM practices (e.g. poor return policies), causing RL inefficiencies, higher RL costs and reduced profits (Ahlén & Johansson, 2023:31). Without the understanding and support from managers, even the best RLM strategies, technologies and tools cannot achieve effective RLM outcomes (Chen *et al.* 2017:252).

Finally, a *resistance to change* can be a significant barrier in RL (Badenhorst, 2017:604; Kaynak *et al.* 2014:441; Srivastava, 2013:66; Starostka-Patryk *et al.* 2013:508). RLM implementation involves adaption in procedures, human resources and leadership priorities, which can cause a resistance to change (Govindan & Bouzon, 2018:321). Specifically, management might fear the unknown regarding RLM implementation (Zailani *et al.* 2017:27), causing resistance to successful RLM implementation (Pranomo *et al.* 2021:3). Additionally, RLM implementation signifies organisational change, which can generate scepticism and a resistance in the entire organisation and impact RL improvements (Pranomo *et al.* 2021:3). Therefore, this management barrier is generally reflected in the social aspect of RLM implementation because it is first created by managers and then staff (Starostka-Patryk *et al*. 2013:509). Furthermore, a resistance to change from management associates with organisational culture problems (Govindan & Bouzon, 2018:331). Weak management can contribute to poor organisational culture, resulting in suboptimal RL performance (Davidavičienė & Al Majzoub, 2021:9). Consequently, implementing RLM successfully demands a fundamental change in the mindset and practices of the entire organisation (Pranomo *et al.* 2021:3).

Essentially, many organisations, either unintentionally or intentionally, fail to give adequate management attention to RLM (Chen *et al.* 2017:253), not only hampering effective implementation

and management of RL but also contributing to various RLM barriers, including economic barriers, operational barriers and other organisational barriers.

2.3.3.2 Strategy, policy and control barriers

Strategy, policy and control barriers involve a lack of strategic planning for RLM (Badenhorst, 2017:618; Badenhorst, 2022:229), problems with organisational policies and problems in performance measurement (Badenhorst, 2022:229-230), which hamper effective RL implementation and management.

Karlsson *et al.* (2023:9) found that online retailers often lack proper RLM strategies with policies and procedures designed on an ad hoc basis over time. Therefore, *a lack of strategic planning* can be an important RLM barrier (Bouzon *et al.* 2018:326; Starostka-Patryk *et al.* 2013:506) since strategic planning and the identification and development of RLM goals can be crucial for effective RLM (Karlsson *et al.* 2023:3). Strategic planning in RLM involves the identification of goals and determining the most appropriate course to achieve those goals (Starostka-Patryk *et al.* 2013:509). Failure to make RLM part of an organisation's goals and strategic planning results in internal inefficiency, poor control and increasing RL costs (Karlsson *et al.* 2023:8). Furthermore, failure to create appropriate goals for RLM can foster a silo mentality and prevent internal coordination and integration (Karlsson *et al.* 2023:9). Consequently, without strategic planning and direction, organisations will find it difficult to manage and control product returns (Badenhorst, 2022:229; Chen *et al.* 2017:261), invest in RL improvement initiatives and commit sufficient resources (Chen *et al.* 2017:261). Furthermore, a lack of strategic planning can hamper the development of a RLM strategy, which can impact organisational performance and reputation (Karlsson *et al.* 2023:9) as well as the development of strategic resources (e.g. infrastructure) to support RL operations (Panjehfouladgaran & Lim, 2020:1461).

Problems with organisational policies relates to a lack of RL policies (Badenhorst, 2022:230), restrictive organisational policies (Bouzon *et al.* 2018:326) and poor return policies (Lamba *et al.* 2020:398), which can hamper RL implementation and management. In terms of a *lack of RL policies*, organisations might fail to implement policies in compliance with environmental standards and consumer pressures (Badenhorst, 2022:230). *Restrictive organisational policies* against RL implementation can be the most important barrier to the effective management of product returns (Bouzon *et al.* 2018:328). Therefore, restrictive organisational policies can create a significant barrier to RLM, for example, policy rules with too strict requirements might block the return flows or recovery (disposition) activities (Starostka-Patryk *et al.* 2013:509) and restrict future sales opportunities. Specifically, the fear of sales cannibalisation (i.e. new products competing with

recovered products in the market) can cause organisations to create policies against product recovery operations and RL activities (Bouzon *et al.* 2018:328).

The return policy of the online retailer can be one of the most significant factors for effective RLM (Andresen & Istad, 2019:46). Consequently, *poor return policies* (i.e. unclear, too lenient or too strict) can be a main barrier to RLM adoption in online retailing (Lamba *et al.* 2020:398). A return policy represents the degree and difficulty of the RL process (Nel & Badenhorst, 2020:122) and determines the risk sharing between retailers and consumers (Andresen & Istad, 2019:16). Return policies can impact consumer buying and return behaviours, making poor return policies a critical factor in the management of consumer returns (Karlsson *et al.* 2023:3). While lenient return policies lead to higher returns and higher RL costs (Andresen & Istad, 2019:57), adding to the financial risks (section 2.3.1.3), restrictive return policies can result in a loss of sales (Biswas & Abdul-Kader, 2018:1016; Zhang *et al.* 2023:10), increase product return complexity for consumers (Zhang *et al.* 2023:10), and ultimately impact consumer satisfaction (Badenhorst, 2022:230). Accordingly, in online retailing, poorly designed return policies can cause a loss of future sales and result in poor RLM performance (Davidavičienė & Al Majzoub, 2021:19).

Finally, *problems with RL performance measurement* can hamper RL control and management (Badenhorst, 2022:229). Performance measurement is a key element in enabling the RLM process of performance management, performance improvement and performance documentation (Ravi & Shankar, 2015:18). However, due to uncertainties in the return process, creating, implementing and managing true RL performance can be challenging (Badenhorst, 2022:229; Davidavičienė & Al Majzoub, 2021:2). Moreover, RL lacks specific performance metrics (Kaynak *et al.* 2014:441; Ravi & Shankar, 2015:15), which form a basis of an integrated performance management system (Kaynak *et al.* 2014:441). Consequently, many organisations lack sufficient performance measurement and performance management systems, hampering RL implementation and management (Lamba *et al.* 2020:385; Solati *et al.* 2023:14). Ultimately, effective RL implementation, control and management requires the development of RL performance measures and continuous RL performance monitoring (Karlsson *et al.* 2023:8; Lamba *et al.* 2020:385).

2.3.3.3 Functional barriers

The functional barriers that can impact RL implementation and management include a lack of staff training and education, a lack of internal coordination (Badenhorst, 2017:618) and poor internal information sharing (Zailani *et al.* 2017:29). Since staff training and education can be one of the main factors for organisational success, *a lack of trained and educated staff* can be a significant barrier to RLM implementation (Kaynak *et al.* 2014:441; Pranomo *et al.* 2021:3; Starostka-Patryk *et al.*

2013:508). Additionally, unskilled and untrained staff can hamper the management of RL processes (Ermes & Niemann, 2023:7), which means organisations must allocate sufficient staff resources for effective RLM (Sharma & Singh, 2013:34). Therefore, inadequate training and education can be the consequence of investment barriers and a lack of financial resource commitment to RLM (Andresen & Istad, 2019:17; Pramono *et al.* 2021:3; Zailani *et al.* 2017:35).

A lack of internal coordination can cause various RLM problems since RL is a cross-functional process, involving customer service, marketing, legal, logistics, operations, purchasing and finance (Badenhorst, 2022:229). Poor strategic planning for RLM can contribute to a lack of internal coordination and integration with inconsistent goals, fostering a silo mentality (Hjort *et al.* 2019:784; Karlsson *et al.* 2023:9). Therefore, each function focuses on optimising its performance at the expense of other functions, hampering cross-functional RLM implementation (Hjort *et al.* 2019:784). Additionally, poor internal coordination between marketing, procurement and logistics can result in poor RL practices, higher returns (Mai *et al.* 2012:49) as well as prevent organisations from achieving strategic objectives (Karlsson *et al.* 2023:3). Consequently, poor internal integration can be significant cost drivers in the RL processes of consumer returns (Hjort *et al.* 2019:770), contributing to the financial constraint barriers (section 2.3.1.2). Moreover, a lack of internal integration in many organisations contributes to poorly coordinated SC and RL processes (Karlsson *et al.* 2023:8). Therefore, effective RLM practice and implementation needs synchronisation from all functional levels of the organisation (Badenhorst, 2022:229; Bouzon, Spricigo, Rodriguez, de Queiroz & Cauchick, 2015:1369).

Closely related to a lack of coordination, *poor internal information sharing* between functions can hamper the effective management of product returns (Zailani *et al.* 2017:29). Relating to inadequate IT systems for RLM (section 2.3.2.2), poor information sharing can stem from poorly integrated IT systems, which significantly impacts the RL performance of online retailers (Soltany *et al.* 2018:780; Dapiran & Kam, 2017:831). Additionally, a lack of communication between functions prevents real-time information sharing, hampering commitment to RL practices across the organisation (Zailani *et al.* 2017:27). Finally, poor internal information sharing means that different departments capture different sets of return information data that cannot be reconciled (Frei *et al*. 2020:1619), which impacts the effective RLM of consumer returns (Karlsson *et al* 2023:7).

2.3.3.4 Organisational risks

The organisational risks include management risk, culture risk and labour risks (Panjehfouladgaran & Lim, 2020:1461; Senthil *et al.* 2018:718), which relate to management and functional barriers in RLM. *Management risk* can be the result of a lack of expertise and experience in RLM (Senthil *et al.*

2018:718), associating with a lack of knowledge and management inattention barriers. Additionally, management risk associates with different management styles that causes inconsistent decision making in RL (Panjehfouladgaran & Lim, 2020:1461), which may hamper effective RLM.

Culture risk relates to inadequate knowledge about the culture of different people in the organisation (Panjehfouladgaran & Lim, 2020:1462), which can stem from a resistance to change for RLM adoption (Senthil *et al*. 2018:718). Consequently, the culture risk created from a resistance to change can lead to poor RL performance (Davidavičienė & Al Majzoub, 2021:9), impacting RLM improvements (Pranomo *et al.* 2021:3). Finally, *labour risks* relate to a lack of skilled and trained staff, which can hamper effective RLM (Ermes & Niemann, 2023:7; Panjehfouladgaran & Lim, 2020:1461). Furthermore, unskilled and untrained staff tend to care less about RL processes and effective handling of product returns, causing damages and a subsequent increase in returns because of negligence (Ermes & Niemann, 2023:7).

Essentially, online retailers can face various organisational barriers, problems and risks that may complicate the implementation and management of consumer returns. Therefore, online retailers must identify RLM success factors and practices to address management barriers, strategy, policy and control barriers, functional barriers and organisational risks for the effective RLM of consumer returns. In the next section, the final barrier category focussing on external barriers in RLM will be identified and discussed.

2.3.4 External barriers in RLM

External barriers in RLM involve various challenges that impedes the adoption, implementation and management of RL practices (Ahlén & Johansson, 2023:17), including supply chain (SC) problems (Badenhorst, 2022:330), consumer behaviour barriers (Ahlén & Johansson, 2023:17), external support barriers and external risk (Senthil *et al.* 2018:718). These external barriers will be discussed in the subsequent sections.

2.3.4.1 Supply chain (SC) barriers

SC barriers involve various SC problems, including a lack of support from SC members, a lack of SC collaboration and a lack of SC information sharing, which can hamper the efficient and effective implementation and management of RL (Badenhorst, 2022:330). A *lack of support from SC members* can be detrimental to RLM implementation (Badenhorst, 2022:330; Bouzon *et al*. 2018:326) since support from SC members can be important for return visibility and cost savings (Badenhorst, 2022:330). Evidently, a lack of support from SC members can contribute to the product returns

barriers (section 2.3.2.1) and financial constraint barriers (section 2.3.1.2). Accordingly, the support of all stakeholders in the SC can be important for the effective management of RL (Andresen & Istad, 2019:16; Badenhorst, 2022:330).

Similarly, *a lack of SC collaboration* can be a barrier to effective RLM (Badenhorst, 2017:606; Badenhorst, 2022:330), especially if online retailers partially or entirely outsource RLM to third-party RL (3PRL) providers (Wang, Dang *et al.* 2021:11). Cooperation and collaboration between the organisation and 3PRL providers can be important to gain value from outsourcing RL to 3PRL providers. Consequently, a lack of collaboration between organisations and 3PRL providers can lead to poor consumer return service (Pathak, Joshi & Kumar, 2020:41), affecting the confidence of consumers and eventually the profits of the online retailer (Lamba *et al.* 2020:388). Additionally, fraudulent returns can increase if online retailers fail to collaborate with 3PRL providers (Zhang *et al.* 2023:7), contributing to consumer return behaviour barriers. Equally, a lack of collaboration from suppliers can be problematic for effective RLM. For example, Meyer *et al.* (2017:12) found that in the South African grocery industry, suppliers' non-compliance to packing specification can be a major external barrier to RLM practices since poorly packaged products can increase product damages, which in turn can increase product returns. Therefore, SC collaboration can be important for product return cost savings and management (Badenhorst, 2022:330).

Like a lack of SC support and collaboration, *a lack of SC information sharing* can be a barrier to effective RLM (Badenhorst, 2022:330). A lack of SC information sharing associates with a lack of SC collaboration. For instance, a shortage of data exchange and information unpredictability increase the failure to effectively collaborate in the SC, impacting the RL performance of the entire SC (Starostka-Patryk *et al.* 2013:509). Oppositely, inadequate SC coordination and collaboration causes a lack of systems integration between SC partners, which can reduce overall RL process efficiency (Bozzi *et al.* 2022:19). Therefore, a lack of shared information platforms hampers information sharing between SC partners, compromising data integrity, consistency and organisational efficiency (Meyer *et al.* 2017:12). Moreover, a lack of information sharing in the SC can hamper product return visibility and ultimately the effective management of product returns (Badenhorst, 2022:330). Consequently, the inability to integrate IT and ineffective management of SC information flows can hamper the overall effectiveness and efficiency of product returns (Bozzi *et al.* 2022:19; Zailani *et al.* 2017:29).

Essentially, the effective RLM of consumer returns requires support from SC parties, SC collaboration and cooperation and information sharing between SC parties (Badenhorst, 2022:330).

2.3.4.2 Consumer behaviour barriers

Consumer behaviour can be an external barrier that hampers the implementation and management of RL practices (Ahlén & Johansson, 2023:17). With the rise of online retailing, many consumers engage in impulsive and compulsive buying due to hassle-free return processes (Frei *et al.* 2020:1615). Specifically, *opportunistic buying behaviour* of consumers causes several problems for online retailers, particularly those with lenient return policies (Nel & Badenhorst, 2020:121). Due to intense competition, many online retailers introduced lenient and zero-return change policies, giving consumers the freedom to return products without any cost implications (Biswas & Abdul-Kader, 2018:1016). No-questions-asked return policies can encourage dishonest consumers to undertake wardrobing (i.e. buying a product with the intention of returning it later) with little regard for the costs and losses to the online retailer (Zhang *et al.* 2023:10). Likewise, some online retailers implemented the practice of affording consumers with the opportunity to reduce product uncertainties through trial periods, which opportunistic consumers exploit through wardrobing (Shang, Ghosh & Galbreth, 2017:1316). While illegitimate "borrowing" is becoming socially acceptable among consumers, online retailers face difficulties to stop these trends without impacting consumer service (Frei *et al.* 2020:1615).

Unethical consumers often exploit consumer-centric return policies, enabling them to learn new methods to generate profits or obtain products for free through fraudulent returns (Zhang *et al.* 2023:6). Therefore, another consumer behaviour barrier to effective RLM includes *fraudulent return behaviour,* which causes various problems for online retailers (Nel & Badenhorst, 2020:121). According to Zang *et al.* (2023:1), fraudulent returns can be viewed as an inevitable yet regrettable part of online retailing due to large financial losses and consumption of a large portion of resources (Zhang *et al.* 2023:1). While opportunistic buying behaviour can be a form of fraud, online retailers can face more extensive forms of fraudulent return behaviours. For example, some consumers can engage in the "exchange fraud behaviour", in which they exchange counterfeit or stolen goods for new items (Shi *et al.* 2021:2172; Nel & Badenhorst, 2020:119). Similarly, "price arbitrage" behaviour entails the purchase of a high-quality product and returning stolen, damaged, lower quality or counterfeit product for a full refund (Zhang *et al.* 2023:2).

Other fraudulent return behaviours include sending empty parcels back for a full refund, hoping online retailers fail to notice. In this case, online retailers not only lose the product but also incur financial losses by paying for the full refund and RL costs (Zhang *et al.* 2023:2), emphasising the importance of product return inspections. Additionally, "unpacking return fraud behaviour" involves removal of valuable parts and then returning the product for any reason, causing significant financial

losses for online retailers (Shi *et al.* 2021:2172). Consequently, fraudulent return behaviour by consumers can greatly impact RLM, causing monetary loss and a waste of RL resources related to manpower and time (Shi *et al.* 2021:2175).

Essentially, opportunistic buying and fraudulent return behaviours can contribute to various other barriers, including the economic barriers of investment, financial constraint, financial risk (section 2.3.1) and product return barriers (e.g. uncertainties with product returns) (section 2.3.2.1). Subsequently, studying consumer buying and return behaviours can be essential for the effective RLM of consumer returns (Ashan & Raham, 2021:151).

2.3.4.3 External support barriers

The external support barriers that can hamper effective RL implementation and management include external infrastructure and a lack of supportive laws and legislation. *External infrastructure*, including road structures and conditions, internet connection speed and areas available for warehouse space can create significant barriers to RL implementation and management (Ahlén & Johansson, 2023:17; Bouzon *et al.* 2015:1368; Davidavičienė & Al Majzoub, 2021:8). However, external infrastructure barriers mostly depend on the country or region where online retailers operate (Davidavičienė & Al Majzoub, 2021:8; Bouzon *et al.* 2015:1368). For instance, most developing countries suffer from poor infrastructure in terms of roads, internet connectivity, electricity and water, resulting in high operating costs and the eventual demise of organisations (Bouzon *et al.* 2015:1368). Consequently, the absence of strong and updated infrastructure causes significant obstacles for online retailers, resulting in poor RLM and performance (Davidavičienė & Al Majzoub, 2021:8).

A *lack of supportive laws and legislation* can be another significant external barrier to RLM implementation (Ahlén & Johansson, 2023:32; Bouzon *et al.* 2018:326; Srivastava, 2013:66). Some countries or regions lack enforceable laws, regulations or directives to motivate various stakeholders to engage in RL (Srivastava, 2013:66). While strict laws and regulations motivate RL implementation and management in developed countries, the opposite is true for developing countries (e.g. India and South Africa) where governmental laws and regulations that drive the adoption and implementation of RLM are still nascent (Lamba *et al.* 2020:383-384). Consequently, the reluctance of governments to adopt and implement policies that drive RL can be major barriers to successful RL implementation (Ahlén & Johansson, 2023:32; Pranomo *et al.* 2021:3). Additionally, a lack of inter-ministerial communication can generate conflicting laws, complicating the implementation of RLM (Govindan & Bouzon, 2018:328). Therefore, the development and implementation legislation that drive RLM implementation cannot be done without political involvement and commitment (Waqas *et al.* 2018:4202).

2.3.4.4 External risk

In contrast to other barrier categories in RLM, the most significant external challenge to RLM involves various external risks. While some external risks can be the result of internal and external barriers, other external risks can contribute to various internal and external barriers, hampering RL implementation and management. External risks relate to the external environment (Senthil *et al.* 2018:718), and include SC risks, outsourcing risks, market risks and political and external environment risks (Panjehfouladgaran & Lim, 2020:1461).

Relating to the SC barriers, the *SC risks* include a lack of shared goals, SC uncertainties and poor communication. Particularly, a *lack of shared goals* between SC parties relates to contrasting organisational culture and goals, which can impede successful SC relationships (Panjehfouladgaran & Lim, 2020:1461) needed for effective RLM. Likewise, *SC uncertainty risks,* like vague payment requirements and poor information sharing between SC partners in RL, can hamper SC relationships and ultimately RLM (Wang, Wang *et al.* 2021:66). Lastly, *poor communication risks* that can hamper RLM refer to any obstacles that prevent real-time and meaningful information exchange between SC parties (Panjehfouladgaran & Lim, 2020:1461). Consequently, the SC barriers of a lack of SC support, collaboration and information sharing can increase SC risks, adding additional challenges to successful RL implementation and management (see section 2.3.4.1)

Closely related to SC risks, *outsourcing risks* can be the most significant external risks to the management of RL processes for organisations that outsource RL (Ermes & Niemann, 2023:8). Outsourcing risks refer to any risks related to the outsourcing of RLM to 3PL or 3PRL providers (Panjehfouladgaran & Lim, 2020:1462), which can include hidden outsourcing costs (Senthil *et al.* 2018:718; Tavana *et al.* 2016:554), dependence risks, a loss of control, information risks and poor strategic development (Panjehfouladgaran & Lim, 2020:1461). The risk of *hidden outsourcing costs* refers to any RL costs that exceed the agreed upon costs in the outsourcing contract (Tavana *et al.* 2016:554), which can contribute to the financial constraint and risk barriers in RLM (see sections 2.3.1.2 and 2.3.1.3). Furthermore, *dependence risk* involves outsourcer (e.g. online retailer) penalties when switching 3PRL providers (Panjehfouladgaran & Lim, 2020:1461), which can further add to the financial difficulties in RLM. Therefore, online retailers that made poor outsourcing decisions might pay financial penalties for finding new 3PRL providers to manage returns effectively.

A significant outsourcing risk that organisations can face is a *loss of organisational control* (Panjehfouladgaran & Lim, 2020:1462; Tavana *et al.* 2016:554), which refers to the risk of losing information resources, data and materials (Panjehfouladgaran & Lim, 2020:1462; Tavana *et al.* 2016:555). Closely related to a loss of control, *information risk* in RLM outsourcing involves

incomplete, inconsistent, inaccurate, unavailable and unsecure information (Panjehfouladgaran & Lim, 2020:1461), which can be the result of a lack of SC collaboration and information sharing barriers in RLM (section 2.3.4.1). Finally, the risk of *poor strategic development* refers to the failure of 3P(R)L providers to develop strategic resources for the flexibility and innovation needed to manage RL effectively (Panjehfouladgaran & Lim, 2020:1461). A loss of flexibility in RL can cause significant operational problems and impact consumer service (Tavana *et al.* 2016:555). Moreover, a lack of skills and expertise from 3PRL providers can cause inaccurate analysis and product return forecasts, resulting in an increase in inventory and subsequent RL costs (Tavana *et al.* 2016:554). Therefore, poor strategic development from 3PRL providers not only add to financial constraint barriers (section 2.3.1.2) but also product return barriers and operational risks (sections 2.3.2.1 and 2.3.2.3), hampering effective RL implementation and management.

Market risks involve consumer and reputation risks related to the behaviour of consumers in the market. Specifically, *consumer risk* associates with consumer loyalty to specific products when various online retailers offer the same products (Panjehfouladgaran & Lim, 2020:1461). Consequently, online retailers risk a loss of consumers to competitors, which can impact the economic sustainability of the online retailers. Additionally, *reputational risks* can occur when consumers are dissatisfied with an online retailer's RL processes, which can ultimately result in a loss of sales and a loss of consumers (Frei *et al*. 2020:1619; Ahsan & Rahman, 2022:148, 158). Evidently, market risks can add to financial constraint barriers (i.e. indirect RL costs) (see section 2.3.1.2) but can be enhanced by strategy, policy and control barriers (i.e. a lack of strategic planning and poor return policies) (see section 2.3.3.2), SC barriers (section 2.3.4.1) and outsourcing risk (i.e. strategic development risk).

Finally, *political and external environment risks* involve political instability, changing regulations and macroeconomic uncertainty (Panjehfouladgaran & Lim, 2020:1461). Specifically, *political instability risk* that can hamper RLM adoption and implementation refer to major changes in political regimes. Moreover, organisations can be exposed to the risk of *changes to regulations,* like new environmental regulations, which can affect the RLM practices of organisations (Panjehfouladgaran & Lim, 2020:1462), Additionally, *macroeconomic uncertainty* can impact fluctuations economic activity and prices (Panjehfouladgaran & Lim, 2020:1461). Therefore, macroeconomic uncertainty involves changes to the financial markets (e.g. risk of tax changes), which can significantly impact organisations (Tavana *et al.* 2016:555) and contribute to investment, financial constraint and financial risk barriers to the effective RLM of consumer returns (see section 2.3.1).

Essentially, online retailers can face various external barriers, problems and risks that may complicate the implementation and management of RL. Therefore, online retailers must identify RLM success factors and practices to address SC barriers, consumer behaviour barriers, external support barriers and external risks for the effective RLM of consumer returns. In the next section, a framework and summary of RLM barriers will be given based on the literature study findings.

2.3.5 A summary of RLM barriers

Clearly, online retailers can face various economic, operational, organisational and external barriers that can hamper RL implementation and management. Therefore, online retailers must identify these barriers and related challenges and risks to identify and implement countermeasures for effective RLM (Badenhorst, 2022:330; Zailani *et al.* 2017:22). Based on the literature study findings presented in section 2.3, Table 2.3, provides a summary of the barriers in RLM, including specific barriers, challenges and risks, impact of barriers on other barriers and literature sources.

Table 2.3 RLM barriers, challenges and risks

ECONOMIC BARRIERS IN RLM			
Barriers	**Specific barriers, challenges and risks**	**Impact on other barriers**	**Sources**
Investment barriers	• ***Heavy financial investment*** • Prioritise investment into other functions due to higher return on investment visibility • ***Lack of investment in resources*** including infrastructure, IT and human resources • Lack of awareness of the ***economic benefits*** of RLM implementation • Impact the ability to reap economic benefits • ***Lack of necessary funding for RLM***	• Contributes a lack of IT • Cause a lack of skilled or trained staff • Contribute to inadequate infrastructure	Andresen and Istad (2019), Badenhorst (2022), Frei *et al.* (2020), Huang *et al.* (2012), Jović *et al*. (2020), Lamba *et al.* (2020), Mahadevan (2019), Mai *et al*. (2012), Pramono *et al.* (2021), Ravi & Shankar (2015), Sirisawat and Kiatcharoenpol (2018), Waqas *et al*. (2018), and Zailani *et al.* (2017)
Financial constraint barriers	• High RL costs • ***RLM investment expenses*** • ***High online product return costs*** • Additional product return transportation and handling costs • Unwanted costs of failed pickup attempts • Duplicate operational expenses • Higher costs due to *product return uncertainties* and a lack of *economies of scale* • ***Indirect expenses*** of product return mismanagement and service failures	• Hamper RLM investment • Contribute to financial risk	Ahlén and Johansson (2023), Ahsan and Rahman (2021), Badenhorst (2022), Biswas and Abdul-Kader (2018), Bozzi *et al.* (2022), Das *et al.* (2020), Davidavičienė and Al Majzoub (2021), Gustafsson *et al.* (2021), Karlsson *et al*. (2023), Lamba *et al.* (2020), Lin and Hsu (2017), Mathu and Khunou (2021), Nel and Badenhorst (2020), Pramono *et al.* (2021), Ravi and Shankar (2015), Wang *et al.* (2017), and Zailani *et al.* (2017)
Financial risk barriers	• ***Financial instability, capacity and investment risks*** • Unavailability of financial resources • Losing and attracting new investors • Raising additional capital • ***Loss of money and high RL cost risks*** • Lenient returns increase product returns and RL costs • ***Loss of profit risk*** • Profit margin loss due to loss of resale value of returned products and hidden RL expenses • Failure to recognise the added value and profits through RL processes and recovery activities	• Contribute to a lack of investment in RLM resources • Contribute to financial constraints	Ashan and Raham (2021), Bozzi *et al.* (2022), Ermes and Niemann (2023), Hsueh and Lin (2015), Khor *et al.* (2016), Panjehfouladgaran and Lim (2020), and Robertson *et al.* (2020)
OPERATIONAL BARRIERS IN RLM			
Barriers	**Specific barriers, challenges and risks**	**Impact on other barriers**	**Sources**
Product return	• Complexity of product returns impact RLM and implementation	• Add to financial constraints and	Ahlén and Johansson (2023), Badenhorst (2017), Badenhorst (2022), Bouzon *et al.*

barriers	• ***Product return uncertainties*** in quality, condition, volume and frequency • ***Limited product return visibility*** due to unpredictable consumer return demand • Limited visibility adds to the complexity of planning and decision-making in RLM • Results in a lack of knowledge about product return volume and quality • ***Limited forecasting and planning*** due to unpredictable return volume impact operational efficiency, economies of scale, resource allocation and financial benefits • Forecasting based on past consumer return behaviours • ***Quality and condition of returned products*** can be unpredictable • Complicates product return value estimation and planning and control of the RL process	risks • Contribute to operational risks • Contribute to problems with performance measures	(2018), Bozzi *et al.* (2022), Espinosa *et al*. (2021), Frei *et al*. (2020), Lai *et al.* (2022), Lee and Lam (2012), Mathu and Khunou (2021), Misni and Lee (2017), Rajagopal *et al*. (2015), Ravi and Shankar (2015), Senthil *et al*. (2018), Sirisawat and Kiatcharoenpol (2018), Srivastava (2013), and Starostka-Patryk *et al*. (2013)
Operational support barriers	• ***Inadequate information systems and technology*** • Limited implementation of new IT for RLM • Information infrastructure involve fragmented IT, poor data management and unintegrated legacy systems hampers RL efficiency • Lack of real-time IT to record transactions, returns and refunds can increase fraudulent returns, costs and consumer behaviour • Lack of robust IT system hampers SC visibility and information sharing • Manual RL processes • Poor return product visibility and inability to authorise, track and handle product returns, • Failure to analyse product return data for RLM decision-making, RL process improvements and return avoidance • ***Lack of infrastructure and development*** • Inadequate infrastructure cause uncertainties, operational inefficiencies and IT deficiencies • No infrastructure support to collect products from different consumer addresses • Lack of capability to manage RL networks	• Add to financial risks • Contribute to operational risks • Contribute to poor internal information sharing • Contribute to a lack of SC information sharing • Enable fraudulent return behaviours	Badenhorst (2017), Badenhorst (2022), Bai and Sarkis (2013), Bozzi *et al.* (2022), Dapiran and Kam (2017), Davidavičienė and Al Majzoub (2021), Espinosa *et al*. (2021), Frei *et al*. (2020), Jović *et al.* (2020), Karlsson *et al*. (2023), Lai *et al.* (2022), Lamba *et al.* (2020), Lee and Lam (2012), Mahadevan (2019), Mai *et al.* (2012), Meyer *et al.* (2017), Misni and Lee (2017), Soltany *et al.* (2018), Srivastava, (2013), Wang, Dang *et al.* (2021), and Zhang *et al.* (2023)
Operational risks	• ***Demand and forecast risks*** due to uncertainties in product return time, volume and product mix, poor visibility and limited forecasting • ***Product quality risks*** due to uncertainties in quality and condition of return products • Risk of receiving damaged, defective, incomplete and poor-quality products • Inadequate product return quality checks increase future returns • ***Technology risks*** due to continuous changes in IT and reduction of IT capabilities • ***Data management risks*** of return information accuracy, security and disruptions • ***Inventory risks*** due to inadequate storage, leading to damages and future damaged product returns • Pilferage of returned products in RL process • Loss of product value	• Increase financial risks of high RL costs and profit loss	De Borba *et al.* (2021), Ermes and Niemann (2023), Panjehfouladgaran and Lim (2020), Prajapati *et al.* (2021) and Senthil *et al.* (2018)

ORGANISATIONAL BARRIERS IN RLM

Barriers	Specific barriers, challenges and risks	Impact on other barriers	Sources
Management barriers	• ***Lack of awareness of the importance of RLM*** • Failure to recognise the value of RLM in terms of competitive advantage, finances, brand image and the environment • ***Lack of top management commitment*** impact financial support and resource allocation for RLM • Top management neglect and disinterest cause inefficiencies and suboptimal RL performance • ***Management inattention*** • Lack of knowledge, commitment and support result in poor RLM decision making and planning, higher costs and	• Contribute to a lack of investment for RLM • Enhance product return barriers • Contribute to a lack of IT and infrastructure for RLM • Hamper strategic	Ahlén and Johansson (2023), Andresen and Istad (2019), Aytekin *et al*. (2016), Badenhorst (2017), Badenhorst (2022), Bouzon *et al*. (2018), Bozzi *et al.* (2022), Chen *et al.* (2017), Davidavičienė and Al Majzoub (2021), Govindan and Bouzon (2018), Jra *et al*. (2017), Kaynak *et al.* (2014), Lin and Hsu (2017), Mostert *et al.* (2017), Panjehfouladgaran and Lim (2020), Phuong (2019), Pranomo *et al.* (2021), Ravi and Shankar (2015), Solati *et al.* (2023),

	reduce profits • Reduce ability to realise RLM benefits • ***Resistance to change*** hampers RLM implementation • Fear of the unknown causes a resistance to successful RLM implementation • RLM implementation involves organisational change, causing scepticism from the entire organisation • Poor management lead to poor organisational culture, causing suboptimal RLM performance	planning • Contribute to poor return policies • Contribute to the management risks • Add to culture risks	Srivastava (2013), Starostka-Patryk *et al*. (2013), and Zailani *et al.* (2017)
Strategy, policy and control barriers	• ***Lack of strategic planning*** hampers effective RLM, investment in RLM improvement and implementation, management and control of RL processes • Failure to include RLM in the organisation's goal and strategic planning lead to RL inefficiencies, poor control and increase in costs • Failure to create RLM goals increase silo mentalities and internal coordination problems • A lack of strategic plan can hamper the development of a RLM strategy, which impacts organisational performance, reputation and development of resources for RLM • ***Problems with organisational policies*** • A *lack of RL policies* counteracts RLM implementation in compliance with environmental and consumer pressures • *Restrictive organisational* policies hamper effective RLM of product returns • Restrictive policies can block product return flows and recovery and restrict future sale opportunities • Fear of sales cannibalisation results in the implementation of organisational policies against RL and product recovery activities • *Lenient return policies* increase returns and costs • *Strict return policies* cause a loss of future sales, increase product return complexity, and impact consumer satisfaction and RLM performance • ***Problems with RL performance measurement*** • Uncertainties of product returns cause difficulties in creating, implementing and managing true RL performance • RL lacks clear performance metrics • Organisations lack performance measurement and performance management systems needed for RL implementation, management and control	• Hamper economic investment • Add to financial constraints • Increases financial risk • Hamper infrastructure support • Impede internal coordination and integration • Contribute to opportunistic and fraudulent consumer behaviours • Contribute to market risks	Andresen and Istad (2019), Badenhorst (2017), Badenhorst (2022), Biswas and Abdul-Kader (2018), Bouzon *et al*. (2018), Chen *et al.* (2017), Davidavičienė and Al Majzoub (2021), Kaynak *et al.* (2014), Karlsson, *et al* (2023), Lamba *et al.* (2020), Panjehfouladgaran and Lim (2020), Ravi and Shankar (2015), Solati *et al.* (2023), Starostka-Patryk *et al*. (2013), and Zhang *et al.* (2023).
Functional barriers	• ***Lack of staff training and education*** • Lack of staff training and education can impact organisational success • Unskilled and untrained staff hampers RLM • ***Lack of internal coordination*** cause various RLM problems • Silo mentality with different functions focussing on separate goals • Poor coordination impacts strategic objectives, lead to poor SC and RL process coordination and result in poor RL practices, higher returns and higher RL costs • ***Poor internal information sharing*** • Poor internal information sharing relates to unintegrated systems that hamper RL performance • Lack of communication prevents real-time information sharing and impact organisational commitment to RL practices • Different departments capture different return information can impact effective RLM	• Contribute to financial constraints • Add to a lack of SC collaboration • Contribute to labour risk	Andresen and Istad (2019), Badenhorst (2017:618), Badenhorst (2022:229), Bouzon *et al.* (2015), Dapiran and Kam (2017), Ermes and Niemann (2023), Frei *et al.* (2020) Hjort *et al*. (2019), Karlsson *et al.* (2023), Kaynak *et al*. (2014), Mai *et al*. (2012), Pranomo *et al.* (2021), Sharma and Singh (2013), Soltany *et al.* (2018:780), Starostka-Patryk *et al*. (2013), and Zailani *et al.* (2017)
Organisation risks	• ***Management risk*** involves to a lack of expertise and experience in RL • Different management styles cause inconsistent decisions that hampers RLM • ***Culture risk*** involves inadequate knowledge about people's culture • Culture risk stems from a resistance to change and leads to	• None	Ermes and Niemann (2023), Davidavičienė and Al Majzoub (2021), Panjehfouladgaran and Lim (2020), Prajapati *et al.* (2021), Pranomo *et al.* (2021) and Senthil *et al.* (2018)

	poor RL performance that impacts RL improvements • ***Labour risk*** involves a lack of skilled and trained staff that hampers effective RLM • Unskilled and untrained staff are more careless with product return handling, causing damages due to negligence		
EXTERNAL BARRIERS IN RLM			
Barriers	**Specific barriers, challenges and risks**	**Impact on other barriers**	**Sources**
SC barriers	• ***Lack of support from SC parties*** can be detrimental RLM implementation • A lack of support can reduce product return visibility and increase RL costs • ***Lack of SC collaboration*** • A lack of collaboration with 3PRL provider impacts RL service, consumer confidence, profitability and increase fraudulent returns • A lack of collaboration from suppliers can be problematic for effective RLM • ***Lack of SC information sharing*** • Shortage of data exchange and information hampers SC collaboration • Poor SC coordination and collaboration causes a lack of systems integration between SC partners, which hampers SC information sharing • A lack of integrated systems and information sharing platforms reduce RL process efficiency and compromise data integrity and consistency • Poor information sharing between SC partners hampers product return visibility and the effective management of consumer returns	• Add to financial constraints • Contribute to product return barriers • Enable consumer fraudulent return behaviours • Increase SC risks • Increase outsourcing risks • Contribute to market risks	Andresen and Istad (2019), Badenhorst (2022), Bouzon *et al*. (2018), Bozzi *et al.* (2022), Lamba *et al.* (2020), Meyer *et al*. (2017), Pathak *et al.* (2020), Starostka-Patryk *et al*. (2013), Wang, Dang *et al*. (2021), Zailani *et al.* (2017), and Zhang *et al.* (2023)
Consumer behaviour barriers	• Consumers engages in impulsive and compulsive buying due to easy returns • ***Opportunistic buying behaviour*** causes various problems • Lenient return practices cause opportunistic consumers to engage in wardrobing practices • Illegitimate borrowing is difficult to counteract due to impact on consumer service • Opportunistic buying behaviour result in significant losses • ***Fraudulent return behaviour*** • Consumers use lenient returns to learn methods to engage in fraudulent return behaviour • Various forms of fraudulent return behaviours cause product and financial losses and waste resources	• Contribute to investment barriers • Add to financial constraints • Increase financial risks • Increase product return barriers	Ahlén and Johansson (2023), Biswas and Abdul-Kader (2018), Frei *et al.* (2020), Nel and Badenhorst (2020), Shang *et al*. (2017), Shi *et al.* (2021) and Zhang *et al.* (2023)
External support barriers	• ***External infrastructure*** hampers RLM • Poor roads, internet, water and electricity in developing countries result in high operating costs and eventual demise of organisations • Absence and support of external infrastructure result in poor RLM and RL performance • ***Lack of supportive laws and legislation*** • Developing countries lack enforceable laws, regulations or directives by governments that drive RLM and implementation • Reluctance of governments to adopt and implement policies that drive RL hampers successful RLM implementation • Lack of inter-ministerial communication generate conflicting laws that complications RLM implementation	• Add to financial constraints	Ahlén and Johansson (2023), Bouzon *et al*. (2015), Bouzon *et al.* (2018), Davidavičienė and Al Majzoub (2021), Govindan and Bouzon (2018), Lamba *et al.* (2020), Pranomo *et al.* (2021), Srivastava (2013), and Waqas *et al*. (2018)
External risks	• External risks relate to external environment, which can hamper RL implementation and management • ***SC risks*** include a lack of shared goals, SC uncertainty and poor communication that can hamper effective RLM • ***Outsourcing risks*** include hidden outsourcing costs, dependence risks, a loss of control, information risks and poor strategic development • Outsourcing risk can increase costs, hampers product return visibility, increase inventory and increase market	• Contribute to investment barriers • Increase financial constraints • Add to financial risks • Contribute to product return	Ashan and Rahman (2022), Ermes and Niemann (2023), Frei *et al*. (2020), Panjehfouladgaran and Lim (2020), Senthil *et al.* (2018), Tavana *et al.* (2016), and Wang, Wang *et al.* (2021)

	risks • ***Market risks*** include consumer and reputation risks of losing sales and consumers causing indirect financial losses • ***Political and external environment risks*** include political instability, changes in regulations and macroeconomic uncertainty add to economic barriers	barriers • Increase operational risks	

Source: Compiled by the researcher

Table 2.3 shows that many barriers and problems can hamper the effective RLM of consumer returns. Since the barriers in RLM often stems from a failure to recognise the importance of RLM, it is important that organisations understand the significance of RLM (Badenhorst, 2022:228). Consequently, a starting point to address the RLM barriers is to identify significance of RLM, which will be identified and discussed in the next section.

2.4 SIGNIFICANCE OF RLM

Many organisations worldwide adopt RL to cope with competition and strict environmental regulations, maximise profits and improve corporate opportunities (Solati et al. 2023:2). Therefore, RLM can be significant due to direct economic motives, competitive and marketing motives and concerns with the environment (Phuong, 2019:12; Aytekin *et al.*, 2016:505; Jalil, 2019). While the significance of RLM emphasise the benefits associated with RLM adoption, important success factors (practices and requirements) to successfully implement and manage RL can result in greater benefits (outcomes). These success factors RLM and related outcomes will be identified and explored in section 2.5. Consequently, the focus of this section is to provide a broad overview of the importance of RLM, and the expected benefits associated with RLM adoption, which can serve as a starting point to address RLM barriers.

Literature commonly identifies the drivers of RL as economic drivers, legal and regulatory drivers, consumer pressures, corporate citizenship, corporate social responsibility, environmental drivers and competitive drivers (Agrawal, Singh & Murtaza, 2015:81; Badenhorst, 2022:228-229; Solati *et al.* 2023:1). Like the barriers, these drivers of RLM are closely related and often influence each other, demonstrating that the significance of RLM covers multiple drivers and benefits. Based on the common drivers of RL, the significance of RLM was classified as (1) economic significance, (2) competitive significance, (3) social significance, (4) legal significance, and (5) environmental significance, which will be discussed in the subsequent sections. The section concludes with a framework and summary of the significance of RLM.

2.4.1 Economic significance of RLM

Regardless of the industry, the adoption of RLM involves various economic incentives (Jenkins, 2021:3). Especially in online retailing, the motivation for RLM mostly centres around financial gains (Das *et al.* 2020:48). According to Ahsan and Rahman (2021:21), online retailers might adopt RLM to take advantage of the opportunities to capture economic value from consumer returns. Additionally, online retailers in developing nations can benefits from adopting RLM as an opportunity to reduce costs (Le, 2023:15). Therefore, the economic significance of RLM can be demonstrated by direct financial gains in the form of profits, cost savings (Badenhorst, 2022:228) and economic power (Ahlén & Johansson, 2023:1).

Profits can be generated from the disposition process and related value adding recovery activities (Andresen & Istad, 2019:11-12; Badenhorst, 2022:228). Evidently, organisations can generate extra profit by reclaiming revenue through direct reuse and resale, repair, refurbishment or recycling of valuable products (Ahsan & Rahman, 2021:21; Chan *et al.* 2012:1320; Phuong, 2019:12;). Similarly, *cost savings* can be realised through reusing returned products and materials (Le, 2023:15; Meyer *et al.* 2017:12), which result in a reduction of raw material costs and disposal costs (Badenhorst, 2022:228).

Furthermore, the adoption of RLM is often associated with the circular economy, which can be described as continuous use of the same resources, for example, reusing products in an attempt to reduce waste (Fox, 2023:17). By adopting RLM, organisations adopt circular economy principles, which can enhance their *economic power* (Ahlén & Johansson, 2023:1). Consequently, organisations can gain a competitive advantage through the adoption of RLM (Le, 2023:15). Essentially, RLM adoption can enable higher recovery from product returns, enabling organisations to maximise profits and minimise costs (Phuong, 2019:12), which ultimately improve to the bottom line.

2.4.2 Competitive significance of RLM

The competitive significance of RLM associates with competitiveness, consumer satisfaction (Phuong, 2019:14), service, loyalty and trust (Govindan & Bouzon, 2018:326), According to Shaharudin *et al.* (2015:13), increasing consumer service and satisfaction can be significant competitive drivers to RLM adoption. Therefore in online retailing, competition can be a main reason for RLM adoption due to the importance of consumer satisfaction (Andresen & Istad, 2019:5). The aim is to offer a *better return service* to consumers than competitors and *discourage future entrants* to the market (Karlsson *et al*. 2023:3; Şükrü, Akdoğan & Coşkun *et al.* 2012:1643). In fact, satisfactory consumer service through RLM is critical for online *consumer retention* (Jalil, 2019:1; Lin & Hsu,

2017:218). Therefore, RLM can positively impact online consumer buying decisions (Triani, Anastaqiya, Setiawan & Octora, 2019:465) and *improve overall market share* and the subsequent profitability of organisations (Phuong, 2019:12).

Additionally, many retailers use lenient returns due to *competitive pressures* and *consumer satisfaction* (Andresen & Istad, 2019:5; Jalil, 2019:1). Adopting RLM can be an opportunity for online retailers to implement consumer-centric return processes and invest in systems, which can improve *competitiveness* (Eriksson & Käck, 2023:25), increase consumer *buying confidence* and enhance *consumer satisfaction* (Jalil, 2019:1). Moreover, the adoption of RLM is often associated with sustainable practices, which can enhance *consumer satisfaction* (Eriksson & Käck, 2023:24). Especially under severe *competitive pressures* and environmental problems, adopting RLM can be an important source of achieving *competitive advantage* and *serving consumers* (Phuong, 2019:10). Therefore, RLM adoption can help online retailers to distinguish themselves from their competitors while contributing to a sustainable future (Eriksson & Käck, 2023:26).

Additionally, focussing on disposition processes and product recovery initiatives (i.e. disposition options) through RLM adoption can *prevent competitors* from entering the market and gaining access to product technologies (Andresen & Istad, 2019:12; Le, 2023:4). For example, Apple uses device trade-ins as a RLM initiative, preventing competitors from accessing device technologies and simultaneously reduce damages to the environment (Fox, 2023:22; Franklin, 2022:11). Consequently, adopting RLM in the form of product recovery initiatives can improve consumer relationships, enhance green image and prevent non-compliance with potential future legislation, which furthers strengthens *competitiveness* (Andresen & Istad, 2019:12).

2.4.3 Social significance of RLM

The social significance of RLM involves consumer pressures, corporate social responsibility and corporate citizenship (Agrawal *et al.* 2015:81; Badenhorst, 2022:228-229; Govindan & Bouzon, 2018:320; Mahadevan, 2019:483; Solati *et al.* 2023:1). *Consumer requirements* can be viewed as a significant driver of RLM adoption (Huang & Yang, 2014:621). The South African Consumer Protection Act 68 of 2008 (CPA) enhanced *consumer awareness of their rights* to return products (Mathu & Khunou, 2021:443), which drive organisations to adopt RLM. Additionally, *consumers expect* organisations to engage in s*ocially responsible practices* and implement consumer-centric return policies and practices (Badenhorst, 2022:229). Therefore, *corporate social responsibility (CSR)* can be an important reason for organisations to adopt RLM due to consumer expectations (Badenhorst, 2022:229; Lee & Lam, 2012:591). For instance, organisations can use RLM to

demonstrate CSR with lenient return policies affording consumers to return products with fewer return restrictions (Badenhorst, 2022:229).

Since RLM is often associated with environmentally friendly practices, *consumers' awareness* of the environment can be important driver for organisations to adopt RLM (Bouzon *et al*. 2016:182; Govindan & Bouzon, 2018:332; Pramono *et al.* 2021:1). *Consumers' expectations* about environmentally conscious organisations are driving the increased focus on *corporate citizenship* and the implementation of RLM (Andresen & Istad, 2019:13; Lee & Lam, 2012:591). Corporate citizenship refers to the set of values that an organisation holds to be responsible with RL (Şükrü *et al.* 2012:1643; Badenhorst, 2022:229) and the extent to which organisations are *socially responsible* for meeting legal, ethical and economic responsibilities placed on them by stakeholders (Abdullah & Yaakub, 2014:157; Andresen & Istad, 2019:13; Govindan & Bouzon, 2018:327).

Organisations can adopt RLM to illustrate respect for the environment and society. For example, in South Africa, Woolworths' implemented recycling initiatives and developed partnerships aimed at reducing waste and increasing recycling rates in South Africa (Badenhorst, 2022:229). Essentially, online retailers can adopt sustainable RLM practices to show their commitment to environmental responsibility and align themselves with the ethical values of environmentally conscious consumers (Eriksson & Käck, 2023:25).

2.4.4 Legal significance of RLM

Regulation is one of the biggest enablers of RLM adoption (Govindan & Bouzon, 2018:325; Prajapati, Kant & Shankar, 2021:14; Ravi & Shankar, 2015:17), making the legal significance of RLM important. However, Lin and Hsu (2017:220) claim that regulations are commonly viewed as the primary external factor affecting an organisation's RL practices, but not always the most desired incentive for adopting RLM. Legislation in RL involves *government regulations* that motivates organisations to adopt RLM (Prajapati *et al.* 2021:14), take products back (Badenhorst, 2022:228; Le, 2023:5; Pramono *et al.* 2021:1; Şükrü *et al.* 2012:1643) and recover value from returned products or material (Govindan & Bouzon, 2018:326; Le, 2023:5; Srivastava, 2013:64). Therefore, legislation can be defined as a regulation or any law or directive imposed by a governing body that influences RLM adoption (Agrawal *et al.* 2016d:17; Hazen, Hall & Hanna, 2012:255), and comprises any juridical regulation that addresses product returns or take-back obligations of organisations (Le, 2023:5).

Legislation that drives RLM adoption mostly relates to the environment and consumer rights (Andresen & Istad, 2019:5; Badenhorst, 2022:228). According to Le (2023:5), strict *environmental*

legislation relates to extended producer responsibility that makes organisations responsible for accepting product returns and engaging in recovery activities. Especially in Europe, organisations must adopt RLM due to environmental legislation related to recycling quotas, packaging laws and manufacturing take-back concerns (Andresen & Istad, 2019:12). An example of a specific environmental legislation is the Waste Electrical and Electronic Equipment (WEEE) directive, which enforces European organisations to collect, recover and recycle all types of electronic products (Badenhorst, 2022:228). While regulations are mostly aimed at manufacturers to take-back and recover products, laws and regulations can also be important RLM drivers in online retailing (Andresen & Istad, 2019:5, 12). In terms of the environment, online retailers might be regulated by engaging in activities like recycle and recovery to protect the environment (Andresen & Istad, 2019:5).

Furthermore, online retailers are compelled by *consumer rights* and legislations to implement RLM (Andresen & Istad, 2019:13; Badenhorst, 2022:228). Badenhorst (2022:228) mentioned that in South Africa online retailers must adhere to the CPA that applies to every transaction, promotion, supply of any goods and services in the country. More specifically, the CPA compels retailers to accept product returns within seven days of purchase (Badenhorst, 2022:228). Similarly, Norwegian online retailers must adopt RLM due to their Cancellation Act, which forces online retailers to accept cancellations of returned products within 14 days (Andresen & Istad, 2019:13). Likewise, the Brazilian Consumer Defence Code (CDC) mandates that online purchases can be returned within seven days if the consumer is dissatisfied or if the product does not meet the advertised specifications (De Araújo *et al.* 2018:353). Evidently, legislation drivers can be important motivators for online retailers to adopt RLM.

Adhering to legislation through RLM adoption, organisations can experience other benefits, including improved brand image, elimination of legal costs for penalties (Phuong, 2019:14), and enhanced competitiveness (Makaleng & Hove-Sibanda, 2022:22). Essentially, organisations must be aware of legislation to not only adopt RLM but also guide the implementation of RLM (Rogers, Lembke & Benardino, 2013:44), ensuring compliance with regulation and laws (Badenhorst, 2022:228).

2.4.5 Environmental significance of RLM

The environmental significance of RLM relate to the economic significance (e.g. reducing disposal costs) (Badenhorst, 2022:228; Le, 2023:14), social significance (Govindan & Bouzon, 2018:332), and legal significance (environmental regulations) of RLM adoption. Particularly, the environmental significance of RLM involves concerns with the environment and sustainable development (Badenhorst, 2022:228; Ravi & Shankar, 2015:11) *Environmental concerns* encouraged many

organisations to explore different options for the recovery of returned products, thereby focusing on RLM in a sustainable way of managing waste (Badenhorst, 2022:228; Kinobe, Gebresenbet & Vinnerås, 2015:1). Furthermore, organisations implement RLM to *reduce impact on the environment*, counteracting air pollution and global warming (Le, 2023:6). Therefore, RLM can be viewed as a manifestation of *green innovation* (Badenhorst, 2022:22; Huang *et al.* 2012:854). For example, waste prevention and product reuse can be prioritised before recycling or disposal (Lai, Kuah, Kim & Wong, 2022:7).

Additionally, RLM can be important to the *circular economy* by reducing demand of natural resource harvesting and damages to the environment caused by raw material extraction and processing (Le, 2023:6). In online retailing, environmental concerns continuously pressure online retailers to adopt RLM to facilitate consumer product returns (Lin & Hsu 2017:217). Furthermore, RL is an important part of *sustainable practices* and a significant driver of sustainability (Prajapati *et al*. 2021:2), providing several benefits for online retailers. Specifically, online retailers can develop *environmentally sustainable practices* through RLM adoption, which can reduce waste, conserve resources (Eriksson & Käck, 2023:26), improve productivity, improve green image, avoid environmental sanctions (Badenhorst, 2022:228), realise competitive advantage and achieve high performance of CSR (Phuong, 2019:10).

In the next section, the significance of RLM will be summarised based on the literature findings.

2.4.6 A framework and summary of the significance of RLM

Clearly, economic benefits, sustainable competitiveness, consumer pressures, corporate social responsibility (CSR), corporate image, implementation of legislation, and environmental concerns are all important factors that motivate organisations to adopt RLM (Agrawal *et al.* 2015:89; Solati *et al.* 2023:2). Therefore, RLM can be significant as it enables organisations to reduce costs, maximise profits, (Phuong, 2019:12) increase competitiveness, comply with legislation and reduce waste (Prajapati *et al.* 2021:4-5).

Table 2.4 provides a summary of the significance of RLM, direct reasons and benefits, indirect benefits and related literature sources.

Table 2.4 Significance of RLM

SIGNIFICANCE	DIRECT REASONS AND BENEFITS	INDIRECT BENEFITS	SOURCES
Economic significance	• Capture economic value • Financial gains • Increase profits • Cost savings	• Reduce waste • Reuse of resources • Competitive advantage	Ahlén and Johansson (2023), Andresen and Istad (2019), Ahsan and Rahman (2021), Badenhorst (2022), Chan *et al.* (2012), Das *et*

	• Increase economic power • Improve the overall bottom line		*al.* (2020:48), Fox (2023), Le (2023), Meyer *et al.* (2017), and Phuong (2019:12)
Competitive significance	• Competitiveness • Consumer satisfaction • Increase consumer service • Increase consumer trust and loyalty • Discourage future entrants to the market • Increase market share • Competitive pressure • Consumer retention and confidence • Competitive advantage • Prevent competitor access	• Increase profits • Improve consumer relationships • Avoid non-compliance of future legislation • Enhance sustainability • Reduce environmental damage • Enhance green image	Andresen and Istad (2019), Eriksson and Käck (2023), Fox (2023), Franklin (2022), Govindan and Bouzon (2018), Jalil (2019), Karlsson *et al.* (2023), Le (2023), Lin and Hsu (2017), Phuong (2019), Shaharudin *et al.* (2015), Şükrü *et al.* (2012), and Triani *et al.* (2019)
Social significance	• Consumer pressures • Corporate social responsibility (CSR) • Corporate citizenship • Consumer requirements and awareness rights • Consumer expectations and awareness of the environment • Demonstrate commitment and respect for environment and society • Align ethical values with environmentally conscious consumers	• Satisfy consumer demand • Comply with laws • Reduce waste	Abdullah and Yaakub (2014), Agrawal *et al.* (2015), Andresen and Istad (2019), Badenhorst (2022), Bouzon *et al.* (2016), Eriksson and Käck (2023), Govindan and Bouzon (2018), Huang and Yang (2014), Lee and Lam (2012), Mahadevan (2019), Mathu and Khunou (2021), Pramono *et al.* (2021), Solati *et al.* (2023), and Şükrü *et al.* (2012)
Legal significance	• Regulation to implement RL • Government and juridical regulations for product take-back, recovery and recycling • Strict environmental laws • Extended producer responsibility mandates to accept products and engage in recover • Recycling quotas and packaging laws • Consumer protection laws to accept product returns • Compliance and respect for regulations and laws	• Improve brand image • Avoid legal costs for penalties • Enhance competitiveness • Protect the environment	Agrawal *et al.* (2016d), Andresen and Istad (2019), Badenhorst (2022), De Araújo *et al.* (2018), Govindan and Bouzon (2018), Hazen *et al.* (2012), Le (2023), Lin and Hsu (2017), Makaleng and Hove-Sibanda (2022), Phuong (2019), Prajapati *et al.* (2021), Pramono *et al.* (2021), Ravi and Shankar (2015), Rogers *et al.* (2013), Shaik and Abdul-Kader (2014), Srivastava (2013), and Şükrü *et al.* (2012)
Environmental significance	• Concerns with the environment • Sustainable development • Reduce impact on the environment • Green innovation • Reduce waste • Reduce environmental damage • Conserve natural resources • Improve green image • Environmentally sustainability • Avoid environmental penalties	• Reduce costs • Comply with legislation • CSR performance • Competitive advantage	Badenhorst (2022), Eriksson and Käck (2023), Govindan and Bouzon (2018), Huang *et al.* (2012), Kinobe *et al.* (2015), Lai *et al.* (2022), Le (2023), Lin and Hsu (2017), Phuong (2019), Prajapati *et al.* (2021), and Ravi and Shankar (2015)

Source: Compiled by the researcher

Table 2.4 shows the various economic, competitive, social, legislative and environmental reasons and benefits of RLM adoption. From the framework it is evident that all the reasons and benefits overlap, showing that adopting RLM for (1) economic reasons also provide environmental and competitive benefits, (2) competitive reasons also provide economic, social, legal and environmental benefits, (3) social reasons also provide competitive, legal and environmental benefits, (4) legal reasons also

provide economic, competitive, social and environmental benefits, and (5) environmental reasons also provide economic, competitive, social and legal benefits. However, based on the literature, the most significant benefit of RLM adoption (listed per bullet in the second column) include environmental benefits, followed by competitive benefits. Therefore, by adopting RLM online retailers automatically enhance environmental and competitive performance, while achieving various economic, social and legal benefits.

Essentially, providing clarity on the benefits of RL can help organisations to capitalise and understand the importance of an RLM (Meyer *et al.* 2017:2). Therefore, it is important that organisations recognise the significance of RLM, which can motivate them to implement RL successfully (Badenhorst, 2022:228; Meyer *et al.* 2017:2; Rogers *et al.* 2013:42). Additionally, identifying the significance of RLM can help online retailers to reduce the impact of RLM barriers and motivate them to explore success factors for effective RLM. In the next section, these success factors for effective RLM will be explored and discussed.

2.5 SUCCESS FACTORS FOR EFFECTIVE RLM

A major concern in RL is the efficient management of product return flows (Panjehfouladgaran & Lin, 2020:1450). Due to the nature of online retailing, online retailers experience higher return volumes than brick-and-mortar retailers and must, therefore, be prepared to manage consumer returns properly (Ashan & Rahman, 2021:154). RLM is regarded as a critical success factor to manage consumer product returns efficiently and effectively (Andresen & Istad, 2019:8). Accordingly, proper RLM practices can be important to improve the overall effectiveness of the return process (Pramono *et al.* 2021:2). In line with the significance of RLM, the implementation of effective RLM can offer online retailers several advantages, including cost savings and reductions (De Araújo, 2018:345; Ramana, Nikhitha & Reddy, 2023:2), increased profitability (Phuong, 2019:12; Ramana *et al.* 2023:2), improved market share and competitive advantage (De Araújo, 2018:345; Phuong, 2019:12), consumer satisfaction (Ramana *et al.* 2023:2), reduced resource requirements and an improved environmental image (Phuong, 2019:12).

A comprehensive understanding of key factors in RLM can help online retailers in their quest to develop and implement proper RLM strategies (Karlsson *et al.* 2023:9). In other words, online retailers must identify key success factors in RLM to help them understand and implement requirements and practices for the effective RLM of consumer returns. From the literature study, several key success factors were identified, which online retailers must consider for successful RLM. The success factors involve various practices or “countermeasures” that online retailers can

implement to address the barriers, problems and risks in RLM, confirm the significance and benefits of RLM adoption, and realise various outcomes associated with effective RLM.

While literature classified the barriers and drivers in RL, no clear classification of the success factors is evident in the literature. Consequently, based on the various success factors identified from the literature study, the key success factors for effective RLM were classified by the researcher as (1) strategic success factors, (2) design success factors, (3) resource success factors, (4) operational success factors, and (5) relation success factors. Additionally, since the success factors involve practices and requirements, can help address RLM barriers and result in favourable outcomes, the discussions of all the success factors will include an overview of the practices/requirements, barriers addressed and outcomes realised. Additionally, the significance of RLM will be confirmed where relevant to emphasise the value of RLM adoption.

In the rest of this section the various success factors for RLM will be discussed and concluded with a framework and summary of the key success factors for effective RLM.

2.5.1 Strategic success factors for effective RLM

According to Hjort *et al.* (2019:770), many online retailers increasingly regarded consumer returns as a strategic part of their business because of high RL costs and high return volumes. Therefore, it can be important to identify strategic success factors for effective RLM. Based on the literature study, the key *strategic success factors* that online retailers must focus on for successful RLM include (1) strategic importance and commitment, (2) strategic implementation of RLM, and (3) strategies and systems for RL, which will be discussed in the subsequent sections.

2.5.1.1 Strategic importance and commitment for successful RLM

According to Agarwal *et al.* (2016:480) few organisations consider the strategic importance of RLM, including the economic, competitive, social and environmental benefits. Therefore, recognising the importance of RLM can be an essential step towards successful RLM (Karlsson *et al*. 2023:8). Since competition is strong in the retail industry, with various traditional, multi/omnichannel and online retailers servicing consumers, effective RLM must be a key strategic focus for retailers (Ratchford, Soysal, Zentner & Gauri 2022:170). Evidently, online retailers must rethink RLM as a key part of their business strategy to manage high volumes of consumer returns effectively (Sackos, 2022:1).

To recognise the strategic importance of RLM and demonstrate commitment to RLM, online retailers can (1) adopt a RLM orientation, (2) adopt a holistic view of RLM, (3) recognise the advantages of effective RLM, (4) view RLM as a strategic asset, and (5) involve senior management. By *adopting a*

RLM orientation organisations can increase management attention and commitment to RLM and encourage resource commitment to develop RLM capabilities, which will subsequently enable successful RLM (Chen *et al.* 2017:261). Additionally, organisations can *adopt a holistic view of RLM*, which can facilitate the development of beneficial RLM strategies for successful RLM (Karlsson *et al.* 2023:8). Since a lack of awareness about RLM performance and management support can be the result of a lack of knowledge about the benefits of RLM (see section 2.3.3.1), *recognising the advantages of effective RLM* can be important. For instance, by recognising the economic advantages of RLM, online retailers can enhance top management awareness and support for RLM practices (Ahlén & Johansson, 2023:4).

Similarly, *viewing RLM as strategic asset* can be important to address barriers and problems in RLM (Frei *et al.* 2020:1619). Effective RLM must be regarded as a critical part of the online retailer's consumer acquisition and retention strategy (Schooling, 2023:1). To develop an understanding of consumer behaviours and intentions, organisations must focus on managing return processes strategically (De Borba *et al.* 2020:137). Consequently, to be successful, online retailers must recognise that effective RLM will positively impact their triple bottom line (Makaleng & Hove-Sibanda, 2022:22). Lastly, *senior management involvement* in product returns can be important for commitment to RLM (Frei *et al.* 2020:1616). Senior management must provide a clear vision for RLM implementation, develop appropriate strategic plans for RLM, and develop tactical plans for successful RLM execution (Pramono *et al.* 2021:3). Additionally, senior executives must oversee the RL function and report on consumer returns to the board of directors (Frei *et al*. 2020:1619), which can integrate aspects of product returns into corporate decision making (Makaleng & Hove-Sibanda, 2022:22).

Subsequently, organisations can *address various barriers* to RLM implementation and management by recognising the strategic importance of RLM and developing a commitment to RLM. Specifically, the strategic importance of and commitment to RLM can directly address the (1) *economic barriers* of investment, high costs and a lack of economies of scale (financial constraints and risks) (Ahlén & Johansson, 2023:32), (2) *operational barriers* of problems limited visibility and forecasting, problems with product quality (product return barrier and operational risks), lack of IT systems and a lack of infrastructure (operational support barriers) (Badenhorst, 2017:605, 618), (3) *organisational barriers* of a lack of attention, commitment and support to RLM, resistance to change (management barriers), a lack of strategic planning (strategy, policy and control barrier) and a lack of staff training and education (functional barrier) (Badenhorst, 2017:612), and (4) *SC barriers* of a lack of collaboration and support from SC partners (Badenhorst, 2017:611).

Moreover, various beneficial *outcomes* can be realised through the strategic importance of and commitment to RLM, including the (1) *economic outcomes* of higher profits (Andresen & Istad, 2019:11; Le, 2023:15), RL cost savings (Andresen & Istad, 2019:12; De Borba *et al.* 2020:137; Chen *et al.* 2017:262; Elive, 2022:1) and an improved bottom line (Frei *et al.* 2020:1616), (2) *operational outcomes* of enhanced RL process efficiency and forecasting (De Borba *et al.* 2020:137), (3) *organisational outcomes* of effective performance monitoring and evaluation (Frei *et al*. 2020:1619) and improved RL performance (Chileshe, Rameezdeen, Hosseini, Martek, Li & Panjehbashi-Aghdam, 2018:48), (4) *social outcomes* of enhanced social responsibility and corporate image (Chileshe *et al.* 2018:48), (5) *market-related outcomes* of increased consumer satisfaction (Elive, 2022:1; Le, 2023:15; Pathak, Joshi & Kumar, 2020:42) and consumer loyalty (Le, 2023:15), improved relationships with consumers (Chen *et al.* 2017:262) and a competitive advantage (Makaleng & Hove-Sibanda, 2022:22), and (6) the *SC outcome* of enhanced SC competitiveness (Pathak *et al.* 2020:42).

Essentially, online retailers must adopt a RLM orientation, view RLM holistically, recognise the advantage of RLM, view RLM as a strategic asset and involve senior management as practices to recognise the strategic importance of RLM and commit to RLM. In doing so, online retailers can successfully manage consumer returns, address various barriers and problems in RLM and achieve several outcomes. In the next section, strategic implementation of RLM as a strategic success factor for effective RLM will be discussed.

2.5.1.2 Strategic implementation of RLM

According to Prajapati *et al.* (2021:1), the selection of an appropriate RLM implementation strategy can be vital for effective RLM. Consequently, choosing to perform RLM in-house or outsource RLM to a third-party reverse logistics (3PRL) provider is a critical strategic concern for organisations (Anderson, 2020:7). The strategic implementation of RLM includes (1) selecting in-house RLM implementation or selecting outsourcing for RLM implementation, (2) performing a cost-benefit analysis, (3) considering the strategic implications and requirements of outsourcing, and (4) strategic selection of 3PRL providers.

Organisations can choose to strategically implement in-house RLM or find and contract a 3P(R)L provider partner to strategically implement RLM. Selecting to *implement RLM in-house* means that the main responsibility for the RL processes and RLM lies with the online retailer, including the economic and physical responsibility, which enables full control over RL operations (Prajapati *et al.* 2021:5). According to Lamba *et al.* (2020:338), online retailers must focus on their core competencies and RLM, only assigning basic logistics activities (e.g. collection and transport) to third

parties. Especially in South Africa, organisations view RLM outsourcing as the least favourable practice for addressing barriers in RLM (Badenhorst, 2017:616). In fact, online retailers prefer in-house implementation of RLM because it can be a more cost-effective option (Tavana *et al.* 2016:555) and driven by economic interests (Xu, 2019:32).

Nevertheless, many online retailers are unable to manage RL successfully due to the complexity of RL processes and resource constraints, choosing to outsource RLM (Wang, Dang *et al.* 2021:2). Selecting *outsourcing* to strategically *implement RLM* means that the online retailer contracts a 3PRL provider to perform RLM practices on their behalf, which means that the responsibility of the RL process lies with the outsourced service provider party (Prajapati *et al.* 2021:6). 3PRL providers are organisations that specialise in managing returns effectively and efficiently (Wang, Dang *et al.* 2021:2), mainly focussing on product return collection, transportation, inspection, disposition and redistribution (Tombido, Louw & Van Eeden, 2018:236). Some 3PRL providers may also manage consumer refunds (return processing) and perform SCM and inventory management (Sackos, 2022:1). Subsequently, outsourcing of RLM facilitates proper implementation of RLM and resource utilisation, including qualified human resources and appropriate IT solutions (Prajapati *et al.* 2021:6).

Before choosing the best form of RLM implementation, online retailers must first conduct a *cost-benefit analysis* based on (1) cost criteria, including RL expertise, initial investment requirements (e.g. facility and equipment), RL operations costs (e.g. transportation and inventory management costs) and RLM risks (i.e. design, technical, legal and environmental risks), and (2) benefit criteria, including economic benefits (e.g. reduced operations cost), competitive benefits (e.g. consumer loyalty), social benefits (e.g. improved corporate image and transparent and ethical practices), staff benefits (e.g. employee satisfaction), legal benefits (e.g. compliance with government policies), and environmental benefits (e.g. reduced emissions and energy savings) (Prajapati *et al*. 2021:14).

Moreover, online retailers must *consider the strategic implications* and *requirements of outsourcing* since the entry of 3PRL providers will impact the control structure of the SC and affect strategic decisions, including network design, transport planning and operations planning (Tombido *et al.* 2018:237). Additionally, outsourcing requires strategic alignment with the mission, strategic objectives and projective growth of the organisation (Tavana *et al.* 2016:555). Lastly, if the online retailer selected outsourcing, they must *strategically select a 3PRL provider*. Specifically, the online retailer must identify 3PRL provider selection criteria to choose the best partner (Tavana *et al.* 2016:545) as well as evaluate available 3PRL providers, ensuring that the selected 3PRL provider can add significant value for the online retailer (Davidavičienė & Al Majzoub, 2021:7).

Since in-house strategic implementation of RLM requires the implementation of other success factors, only the *barriers* that can be addressed through outsourcing will be described. According to Badenhorst (2017:611-613), outsourcing RLM can help address (1) *economic barriers*, including a lack of investment and financial constraints, (2), *operational barriers*, including problems limited visibility and forecasting, problems with product quality, lack of IT systems and a lack of infrastructure, (3) *organisational barriers*, including management inattention, lack of top management commitment, resistance to change, lack of strategic planning, lack of staff training and education and poor internal integration , and (4) *SC barriers*, including a lack of collaboration and support from SC partners. Furthermore, selecting outsourcing for RLM implementation can address risk barriers (Tavana *et al.* 2016:554), which can include financial risks, operational risks, organisational risks and external risks (see section 2.3).

Like the barriers, the *outcomes* of strategic implementation of RLM mostly involve outsourcing. The only direct benefits of strategically implementing RLM *in-house*, include the *economic outcomes* of cost savings, cost-effectiveness (Tavana *et al.* 2016:555) and profits and the *market-related outcome* of consumer confidence (Lamba *et al.* 2020:388). Consequently, online retailers must implement other RLM success factors to realise various benefits. Contrastingly, strategically implementing RLM through outsourcing can provide the (1) *economic outcomes* of enhanced profits (Tavana *et al.* 2016:554), lower investment costs (e.g. infrastructure and human resource development), reduction of assets (Le, 2023:15), cost efficiencies (Wang, Dang *et al.* 2021:2) and economies of scale (Gu, Wei, Zhang & Yan, 2019:160), (2) *operational outcome* of streamlined RL processes (Wang, Dang *et al.* 2021:2), (3) *organisational outcomes* of focussing on core competencies (Tavana *et al.* 2016:554), effective management of product returns (Wang, Dang *et al.* 2021:2) and reduction in resources and risks (Gu *et al.* 2019:160), (4) *environmental outcome* of environmental protection, (4) *social outcomes* of a green image (Tavana *et al.* 2016:554) and stakeholder satisfaction (Le, 2023:16), and (5) *market-related outcomes* of increased sales, market share, competitive advantage (Tavana *et al.* 2016:554) and consumer satisfaction (Le, 2023:16). Subsequently, the outcomes of the strategic implementation of RLM align with the economic, competitive, social and environmental significance of RLM (see section 2.4).

Essentially, through a cost-benefit analysis, strategic consideration of the impact of outsourcing, strategic alignment with organisational mission, goals and growth, the identification of 3PRL provider selection criteria and an evaluation of available 3PRL providers, online retailers can strategically implement RLM either in-house or through outsourcing. In doing so, online retailers can successfully manage consumer returns, address various barriers and problems in RLM and achieve

several outcomes. In the next section, strategies and systems for RLM as strategic success factors for effective RLM will be discussed.

2.5.1.3 Strategies and systems for RLM

Well-developed managerial strategies, skills, and knowledge increase the likelihood of success in the RL processes and activities of online retailers (Davidavičienė & Al Majzoub, 2021:6). Developing a RLM strategy can significantly impact the online retailer's performance and reputation (Karlsson *et al.* 2023:9). Consequently, online retailers must develop strategic plans, create a well-developed RL strategy and establish a well-developed RL system for the successful RLM of consumer returns. Specifically, during the design and implementation of RLM, it can be important to *develop a strategic plan* for RLM by determining the strategic goals, envisaged strategy for returns, and the potential impact of returns on all stakeholders (Hjort *et al.* 2019:769). Additionally, online retailers can benefit from including RLM in their overall strategic planning (Xu, 2019:33), incorporating the strategic plan for RLM within the overall strategic plan of the online retailer.

Moreover, online retailers must *develop a well-planned RL strategy* for RLM (Anderson, 2020:6; Andresen & Istad, 2019:41; Phuong, 2019:12). When developing a RL strategy, organisations must pay specific attention to the RL and marketing interfaces for successful RLM (Sajjanit & Rompho, 2019:790). Additionally, online retailers must focus on disposition (recovery) strategies and the return policy for a well-developed RL strategy since it can be essential for the recovery of value from consumer returns (Andresen & Istad, 2019:23). Therefore, online retailers must consider the strategic use of tactical recovery activities, including reuse, repair, refurbishment and reselling (Chen *et al.* 2017:255) for successful RLM. Lastly, a *well-developed RL system* can be important for successful return processes (Ahsan & Rahman, 2022:138). Online retailers must focus on establishing both an efficient and cost-effective RL system since it forms a basis for effective RLM (Xu, 2019:32), impacting cost-effectiveness, RL efficiency, competitiveness and consumer satisfaction of the online retailer (Prajapati *et al.* 2021:14).

Developing a *strategic plan for RLM* can *overcome various barriers* in RLM, including the (1) *operational barriers* of a lack of IT systems and a lack of an infrastructure, (2) *organisational barriers* of lack of knowledge about RLM importance, management inattention, lack of top management commitment and a lack of strategic planning, and (3) *SC barriers* of a lack of SC collaboration and information sharing (Badenhorst, 2017:611). Consequently, online retailers can indirectly address operational risks (e.g. technology and data management risks), organisational risks (i.e. management risks) and external risks (i.e. SC risks) (see sections 2.3.2.3, 2.3.3.4 and 2.3.4.4). Furthermore, including the strategic plan for RLM within the overall strategic planning of the

organisation, can result in various *outcomes*, including the *economic outcomes* of cost savings and higher profits as well as the *market-related outcome* of an increase in market share (Xu, 2019:33).

While literature lacks an indication of the impact of a RL strategy and RL system on the barriers in RLM, literature discussed the benefits of a well-developed RL strategy and system. Specifically, the *outcomes of a well-developed RL strategy* include the (1) *economic outcomes* of improved profitability (Chen *et al.* 2017:255; Ravi & Shankar, 2015:17), cost savings (Anderson, 2020:6; Ravi & Shankar, 2015:17), value and asset recovery (Andresen & Istad, 2019:23; Chen *et al.* 2017:255) and improved bottom line (Ahsan & Rahman, 2022:138), (2) *environmental outcomes* of reduction of raw materials usage (Ravi & Shankar, 2015:17), enhanced sustainability and compliance with environmental laws (Anderson, 2020:6), (3) *social outcomes* of an improved corporate image and reputation (Anderson, 2020:6), and (4) *market-related outcomes* of market opportunities (Ravi & Shankar, 2015:17), increased market share, competitive advantage (Phuong, 2019:12), and consumer satisfaction (Anderson, 2020:6). Consequently, creating a well-developed RL strategy can address the economic barriers of investment, financial constraints and financial risks, and external barriers of external risks (i.e. market risks and political and environmental risks) as well as confirm the economic, competitive, social, legal and environmental significance of RLM.

Finally, establishing *a well-developed RL system* can help online retailers realise the (1) *economic outcomes* of cost savings (Le, 2023:15) and cost effectiveness (Prajapati *et al.* 2021:14; Xu, 2019:32), (2) *operational outcome* of enhanced RL process efficiency (Davidavičienė & Al Majzoub, 2021:21; Prajapati *et al.* 2021:14; Xu, 2019:32) and speed (Xu, 2019:32), (3) *organisational outcome* of improved organisational performance (Davidavičienė & Al Majzoub, 2021:21) and (4) *market-related outcome* of a competitive advantage (Foo & A-Jalil, 2021:56; Le, 2023:15; Prajapati *et al.* 2021:14), enhanced consumer service (Le, 2023:15) and consumer satisfaction (Le, 2023:15; Prajapati *et al.* 2021:14). Evidently, a well-developed RL system can address the economic barriers of financial constraints and risks, the operational barrier of product return barriers, and the external risk of market risks (section 2.3), while confirming the economic and competitive significance of RLM (section 2.4).

Essentially, online retailers with well-developed strategic plans, RL strategies and RL systems can successfully manage consumer returns as well as address various barriers and realise various outcomes, making strategies and systems for RLM important strategic success factors for effective RLM. In the next section, design success factors for RLM will be identified and discussed.

2.5.2 Design success factors for RLM

Exploring the elements of RL design can be important for value creation (Pal, 2017:864), making the design elements of RL a significant component of RLM (Xu, 2019:30). While RL design factors can form part of the strategic success factors, it can also involve operational and tactical elements. The important design success factors for RLM include (1) return policy design for RLM, (2) return process design for RLM and (3) RL network design for RLM, which will be discussed in the subsequent sections.

2.5.2.1 Return policy design for RLM

One of the critical success factors of online retailers is the development of a return policy, which forms part of the overall marketing strategy of the online retailer (Das *et al.* 2020:48). Subsequently, the return policy can be one of the most significant factors for successful RLM in online retailing (Andresen & Istad, 2019:46). A well-designed return policy for RLM must be (1) aligned with RL strategies, (2) clear and (3) well-considered in terms of leniency and strictness.

The *alignment* of the *return policy* with *RL strategies* can be important for a well-designed return policy and optimal RLM performance (Karlsson *et al.* 2023:1, 9). Online retailers must develop a formal return policy in line with strategic objectives and RL strategies, which forms the foundation of a well-designed return policy needed to achieve RLM goals (Andresen & Istad, 2019:7; Makaleng & Hove-Sibanda, 2022:23). Additionally, a *well-designed policy must be clear* (Ahlén & Johansson, 2023:32; Jalil, 2019:3). According to Davidavičienė and Al Majzoub (2021:7), an unclear return policy can be the same as no return policy. In fact, Heyns and Kilbourn (2022:11) found that young online shoppers in South African consider an easy returns policy as one of the most important factors to migrate from traditional (brick-and-mortar) shopping to online shopping.

To design a clear return policy, online retailers must consider consumer behaviour and price sensitivity (Ahlén & Johansson, 2023:32) and identify the impact of the return policy on their RLM performance (Davidavičienė & Al Majzoub, 2021:4). A clear return policy represents an easy, hassle-free and flexible return policy (Dobson, 2023:10) that provides consumers with clear information about return processes and procedures and terms and conditions related to the products they buy (Nel & Badenhorst, 2020:127). Subsequently, an easy return policy can help consumers to overcome the perceived risk of buying products online (Lin & Hsu, 2017:21) and understand their roles and responsibilities during the return process (Nel & Badenhorst, 2020:127).

A *well-designed return policy* involves careful *consideration between* the *level of leniency and strictness* (Andresen & Istad, 2019:7), which requires cross-functional collaboration and input (Karlsson *et al.* 2023:9). A lenient return policy means that the online retailer carries the cost of returns, while a strict return policy means that consumers are responsible for the return costs and restricted in term of return time (Andresen & Istad, 2019:7). Online retailers can perform a cost-benefit analysis to determine the appropriate level of leniency and strictness. For example, the costs of a lenient return policy can be larger return volumes and higher RL costs (Andresen & Istad, 2019:7; Oghazi, Karlsson, Hellström & Hjort, 2018:190), while the benefits can be an increase in sales (Andresen & Istad, 2019:7; Dapiran & Kam, 2017:835) and profits (Davidavičienė & Al Majzoub, 2021:4). Oppositely, the costs of a strict return policy can be a loss of sales and consumers (Dobson, 2023:10), while the benefits can be fewer returns and lower RL costs (Andresen & Istad, 2019:7). In online retailing a more generous return policy can be critical since it forms part of the online retailer's service offering (Hjort *et al.* 2019:782). However, designing a lenient return policy requires careful consideration of the way the RL processes will be handled to recapture maximum value from the consumer returns (Dapiran & Kam, 2017:835).

Although literature lacks a comprehensive overview addressing RLM through well-designed return policies, a clear RLM barrier that can be addressed by a well-designed return policy can be the organisational barrier of poor return policies (see section 2.3.3.2). Furthermore, Badenhorst (2016:19) identified that establishing clear return policies can address the operational barriers of problems with product quality, limited visibility and a lack of forecasting. Additionally, Nel and Badenhorst (2020:126-128) indicated that a well-designed return policy can address various challenges in online retailing, including negative impact of returns on profitability, slow and complex RL processes and fraudulent returns. Evidently, online retailers can address the economic barriers of financial constraints and risks (section 2.3.1), operational barriers of product return barriers and operational risks (section 2.3.2) and the external barriers of consumer buying behaviours and external risks (market risks) (section 2.3.4).

Moreover, a well-designed return policy can result in various beneficial *outcomes*, including the (1) *economic outcome* of higher profits (Davidavičienė & Al Majzoub, 2021:4; Nel & Badenhorst, 2020:127), (2) *operational outcomes* of increased RL process efficiency, shorter RL cycle time, reduction in fraudulent returns (Nel & Badenhorst, 2020:128), (3) *organisational outcome* of increased organisational performance (Karlsson *et al.* 2023:1), (4) *social outcome* of a good reputation (Jalil, 2019:1), and (5) *market-related outcomes* of higher sales (Andresen & Istad, 2019:7; Dapiran & Kam, 2017:835), a competitive advantage, enhanced consumer satisfaction (Jalil, 2019:1; Nel & Badenhorst, 2020:127), consumer loyalty and trust (Dobson, 2023:10; Jalil, 2019:1; Oghazi *et*

al. 2018:190), and demand satisfaction (Jalil, 2019:1). Evidently, the outcomes of a well-designed return policy confirm the competitive and social drivers of RLM adoption (section 2.4).

Essentially, a well-designed return policy can help online retailers to successfully manage consumer returns, address several RLM barriers and achieve various outcomes, making return policy design an important design success factor for effective RLM. In the next section, return process design for RLM will be discussed.

2.5.2.2 Return process design for RLM

Designing a good return process can be important (Wang, Wang *et al.* 2021:66) to effectively manage consumer returns, creating various opportunities for financial control, reduction of unwanted returns (Solati *et al.* 2023:2) and effective utilisation of resources (Ramana, Nikhitha & Reddy, 2023:6). Therefore, online retailers must thoroughly prepare for returns and establish an efficient return process (Nel & Badenhorst, 2020:127). Closely related to a well-designed return policy, a well-designed return process for successful RLM must be (1) formalised, (2) clear and consumer-centric, and (3) streamlined.

Formalising the return process can be an important practice (Badenhorst, 2017:611), helping online retailers to effectively manage consumer returns (De Araújo, 2018:354). A formalised return process can be implemented through various tools, including written policies, documented procedures, job descriptions and staff responsibilities and flow charts (De Araújo, 2018:354). A formalised return process must be developed by experienced managers and provide clear and written guidelines for staff to understand their roles and responsibilities in RL to manage consumer returns efficiently (Davidavičienė & Al Majzoub, 2021:6).

Moreover, a well-designed return process must be *clear* and *consumer centri*c, requiring minimal consumer effort, fewer gatekeeping rules, quicker consumer return resolutions and speedy restocking of returned products (Das *et al*. 2020:48; Ahsan & Rahman, 2022:155). Especially in online retailing, the return processes must be as user-friendly as possible (Castillo, 2023:7) and offer consumers with several return options (Sackos, 2022:1). In fact, Heyns and Kilbourn (2022:11) found that young online shoppers in South Africa rated multiple return channel options as one of the most important service quality expectations. Consequently, a hassle-free and consumer centric return process can be a critical for the success of online retailers (Wang, Dang *et al.* 2021:2). Similarly, a well-designed return process for RLM must be *streamlined,* which can be important speed and efficiency (Nel & Badenhorst, 2020:127). For example, automating return request and gatekeeping processes can help

streamline the return process, which can help online retailers to manage consumer returns more efficiently (Hjort *et al.* 2019:788).

In terms of addressing the *barriers* in RLM, formalising the return process can address various barriers, including the (1) *operational barriers* of limited forecasting and visibility (product return barriers and operational risks), (2) *organisational barriers* of a lack of awareness about RLM, management inattention (management barriers) and poor functional integration (functional barrier), and (3) *SC barrier* of a lack of SC collaboration (Badenhorst, 2017:608, 611). Moreover, a well-designed return process can help online retailers control capital and reduce unwanted returns (Solati *et al.* 2023:2), which can address the economic barriers of investment and financial risks (section 2.3.1) and external barrier of consumer buying behaviour (section 2.3.4.2).

Most importantly, a well-designed return process can result in various *outcomes*, including the (1) *economic outcomes* of cost savings and reductions (Ashan & Rahman, 2021:154; Jenkins, 2021:5; Nel & Badenhorst, 2020:127; Phuong, 2019:12), higher profits (Ermes & Niemann, 2023:5; Frei *et al.* 2020:9; Phuong, 2019:12) and financial control (Solati *et al.* 2023:2), (2) *operational outcomes* of an efficient RL process (Das *et al*. 2020:48), a speedy return process (Ahsan & Rahman, 2022:155; Sackos, 2022:1; Ramana *et al.* 2023:6) and reduction of product returns (Frei *et al.* 2020:9; Nel & Badenhorst, 2020:128; Solati *et al.* 2023:2), (3) *environmental outcome* of reduced environmental impact (Frei *et al.* 2020:9; Jenkins, 2021:5), (4) *social outcome* of enhanced green image (Ramana *et al.* 2023:6), (5) *market-related outcomes* of a competitive advantage (Ermes & Niemann, 2023:5), increased sales, consumer trust (Sackos, 2022:1), consumer loyalty (Sackos, 2022:1; Wang, Dang *et al.* 2021:2), consumer satisfaction (Ashan & Rahman, 2021:154; Castillo, 2023:7; Ramana *et al.* 2023:6), consumer retention (Castillo, 2023:7; Jenkins, 2021:5) and improved consumer service (Ramana *et al.* 2023:6), and (6) *SC outcomes* of increased SC visibility (Jenkins, 2021:5) and reduced SC uncertainties (Wang, Wang *et al.* 2021:66).

Essentially, return process design for RLM confirms the economic, competitive, social and environmental significance of RLM adoption. Additionally, through a well-designed return process online retailers can successfully manage consumer returns, while mitigating RLM barriers and realising various advantages. In the next section, the final design success factor of network design for RLM will be discussed.

2.5.2.3 RL network design for RLM

Like traditional logistics network design, RL network design is a crucial and strategic issue (Solati *et al.* 2023:3), indicating that it can be important for successful RLM. Network design for RLM entails

the location, allocation and capacity of facilities in a RL network (Misni & Lee, 2017:92; Tombido *et al.* 2018:246). Additionally, designing a RL network focusses on return collection and physical transportation to move products between facilities and locations (Misni & Lee, 2017:91). In studying the literature, it is apparent that online retailers can consider various network designs for effective RLM each with some advantages and disadvantages. Therefore, the designing an optimal network for RLM requires careful consideration and possibly a trade-off or cost-benefit analysis. A well-designed RL network for RLM involves various elements, including (1) RL network design requirements, (2) identification of the network design type, and (3) identification of facility location(s) and types.

The *RL network design requirements* for RLM involve resource commitment, network technology, network coordination, robustness, and eco-friendliness (if desired). Particularly, online retailers must *commit* a significant *number of resources* in designing a suitable RL network for product return collection, transportation, handling, storage and subsequent disposition for successful RLM (Das *et al*. 2020:48). Additionally, online retailers can use *network technology* for a collaborative RL network design, focusing on *coordination* with consumers (Andresen & Istad, 2019:5). An important IT that can be used for the coordination of RL network design can be customer relationships management (CRM) software (Andresen & Istad, 2019:5). Additionally, the coordination of RL network design must focus on efficiency and cost-effectiveness (Misni & Lee, 2017:91). Consequently, a well-designed RL network for RLM must be *robust* (Misni & Lee, 2017:85) and must enable speedy collection and transportation from the consumer to the online retailer to realise maximum value (Das *et al.*2020:49). Lastly, if online retailers desire a more environmentally friendly approach towards RL network design, they can design an *eco-friendly RL network,* which focuses on reducing emissions through multiple facilities (Le, 2023:1).

Identification of the network design type requires careful consideration between centralisation and decentralisation. According to Karlsson *et al.* (2023:8), return reasons can influence the selection of a centralised and decentralised network for online consumer returns, indicating that a differentiated approach is required. Nevertheless, the type of network design mostly associates with implementing RLM in-house or through a 3PRL provider. Particularly, for online retailers that keep RLM in-house it might be more beneficial to select a *decentralised network design* since it allows for quicker return lead times (Karlsson *et al.* 2023:8). Consequently, in a decentralised design, various facilities are strategically located closer to consumers, enabling speed and agility (Bozzi *et al.* 2022:20). Oppositely, a *centralised network design* is usually the preferred design by 3PRL providers, focusing on economies of scale (Wang, Wang *et al.* 2021:67). Therefore, online retailers that outsource RLM might benefit from a centralised network to attain economies of scale (Wang, Wang *et al.* 2021:67).

Closely related to the type of RL network, the *identification of facility location(s) and types* can be important for RLM. According to Misni and Lee (2017:91), facilities must be placed in strategic locations to maximise consumer responsiveness and flexibility. Furthermore, online retailers must select between combined (hybrid) facility or a separate facility to manage consumer returns effectively. In an *integrated hybrid facility* both RL and FL processes are concurrently performed in one location, enabling sharing of resources and lower operating costs (Misni & Lee, 2017:92). However, using one facility to perform RL and FL processes can be complex, requiring sufficient space and coordination (Misni & Lee, 2017:92).

Meyer *et al.* (2017:13) suggested that a *dedicated RL facility* can be located on the same property as the main facility. Therefore, a dedicated RL facility next to the main facility can be beneficial in terms of greater economies of scale, while at the same time enable quick restocking or pickup from suppliers. Alternatively, online retailers can use a *centralised return centre* (CRC) that specialise in RL processes, offering economies of scale and cost advantages (Hjort *et al.* 2019:781). Additionally, these facilities can provide consolidated reports and enable the identification of poorly designed products or suppliers and performance evaluation (Dapiran & Kam, 2017:830). Consequently, online retailers can negotiate better price rates with suppliers (Dapiran & Kam, 2017:830) as well as identify areas of improvement to avoid unnecessary returns (e.g. picking errors). Nevertheless, CRCs can reduce RL process speed due to longer transportation distances, which can negatively impact service performance (Hjort *et al.* 2019:781). Subsequently, online retailers must consider service levels and costs when designing a suitable RL network for successful RLM.

Literature lacked clear mention of addressing specific *barriers* through a well-designed RL network for RLM. However, Misni and Lee (2017:85) indicated that a robust network can address various *risks* in RL. These risks might entail *financial risks* (e.g. high costs and a loss of profits) (section 2.3.1.3), *operational risks* (e.g. product quality risks and inventory risks) (section 2.3.2.3), *organisational risks* (e.g. labour risk) (section 2.3.3.4) and *external risks* (e.g. SC risks) (section 2.3.4.4). Additionally, from the practices and various outcomes (discussed next) a well-designed RL network might address the (1) *economic barrier* of financial constraints (e.g. high costs and lack of economies of scale) (section 2.3.1.2), (2) *operational barriers* of product returns (e.g. quality problems and limited visibility) and support (e.g. inadequate IT and infrastructure) (section 2.3.2), (3) *organisational barriers* of management (e.g. management inattention), strategy, policy and control (e.g. lack of performance measuring) and functional barriers (e.g. lack of staff training) (section 2.3.3), and (4) *external barriers* of SC (e.g. lack of SC collaboration and information sharing) and external infrastructure (e.g. poor road networks) (section 2.3.4).

Although the *outcomes* of a RL network design can depend on the structure, facility locations and types, a well-designed RL network can offer various advantages. Specifically, a well-designed RL network can result in the (1) *economic outcomes* of cost savings (Hjort *et al.* 2019:781; Misni & Lee, 2017:92), higher profits, cost-effectiveness (Misni & Lee, 2017:91), economies of scale (Meyer *et al.* 2017:13; Hjort *et al.* 2019:781; Wang, Wang *et al.* 2021:67) and optimised value recovery (Das *et al.*2020:49), (2) *operational outcomes* of reduced product return uncertainties (Wang, Wang *et al.* 2021:67), improved operational efficiency (Meyer *et al.* 2017:13; Misni & Lee, 2017:91), speedy return processes and shorter lead times (Bozzi *et al.* 2022:20; Das *et al.*2020:49; Karlsson *et al.* 2023:8), and increased RL flexibility (Misni & Lee, 2017:91), (3) *organisational outcome* of improved performance evaluation (Dapiran & Kam, 2017:830), (4) *environmental outcome* of reduced environmental pollution (Le, 2023:1), (5) *market-related outcomes* of increased consumer convenience (Bozzi *et al.* 2022:20), enhanced consumer responsiveness (Misni & Lee, 2017:91) and improved consumer coordination and communication (Andresen & Istad, 2019:5), and (6) *SC outcomes* of improved SC information sharing (Dapiran & Kam, 2017:830).

Essentially, RL network design for RLM confirms the economic, competitive and environmental significance of RLM adoption. Additionally, a well-designed RL network can facilitate the effective management of consumer returns, address barriers and result in several beneficial outcomes. In the next section, the resource success factors for RLM will be identified and discussed.

2.5.3 Resource success factors for RLM

Successful RLM is generally dependent on the commitment of sufficient resources (Govindan & Bouzon, 2018:320). Since product return flows are different and more complicated than standard forward flows, sufficient resources are needed (Lin & Hsu, 2017:217). While sufficient resources are needed for successful RLM, efficient utilisation of resources can be important for realising cost efficiencies and RL performance improvements (Mahindroo, Samalia & Verma, 2018:55). Evidently, both the commitment and utilisation of resources can be important for successful RLM. Based on the literature study, the key resource success factors for successful RLM include (1) resource commitment and investment for RLM, (2) IT resources for RLM, and (3) human resource development for RLM, which will be discussed in the subsequent sections.

2.5.3.1 Resource commitment and investment for RLM

Resource commitment and investment for RLM can be regarded as the allocation of financial resources and investment into specific resources required for successful RLM. If organisations invest in sufficient resources in RL, they can expect various advantages (Goedhart *et al*. 2022:1). Evidently,

effective RLM requires significant investments for the handling of consumer returns (Phuong, 2019:3). The key areas of resource commitment and investment for RL involve (1) financial resource commitment, (2) commitment and investment of IT resources, (4) infrastructure investment, and (3) human resource commitment and investment.

Final resource commitment and financial support can be critical for a well-functioning and well-managed RL process, providing support for the information, infrastructure and labour requirements of RL (Andresen & Istad, 2019:15). Additionally, financial resource commitment can be important for effective application of IT and internal and external communication in the return process (Lin & Hsu, 2017:21). Consequently, organisations must consistently devote sufficient capital for the efficiency and effectiveness of RL operations (Meyer *et al*. 2017:1). Similarly, the complexity of RL and the uncertainty of return flows, necessitates sufficient *commitment and investment of IT resources*, including software and hardware, to support the management of consumer returns (Ahsan & Rahman, 2022:157; Kaynak *et al.* 2014:440). Therefore, organisations need to invest in information and technology systems for the effective management of RL processes (Frei *et al.* 2020:1619; Jović *et al*. 2020:160; Misni & Lee, 2017:92-93; Ravi & Shankar, 2015:15).

Along with the investment of IT sources, organisations must *invest* in the development of *infrastructure* for RL flows (Meyer *et al*. 2017:13). Specifically, investing into the right infrastructure for RL can be essential for the efficiency, effectiveness and overall performance of RL (Abdulrahman *et al.* 2014:463; Davidavičienė & Al Majzoub, 2021:19; Jenkins, 2021:10). Equally important for effective RL is *human resource commitment* and *investment*, which can strengthen the financial performance of organisations (Meyer *et al*. 2017:13; Le, 2023:15). Additionally, online retailers must invest in the consumer service function, which can be important for the management and reduction of consumer returns (Nel & Badenhorst, 2020:127). Lastly, online retailers must commit managerial resources for successful use of IT resources and integration across departmental functions (Lin & Hsu, 2017:21), which can be important for effective RLM.

Apart from the investment in IT for RLM, literature lacks a clear discussion on the *barriers* that can be addressed through financial, infrastructure and human resources. However, financial resources needed for infrastructure and human resources (Andresen & Istad, 2019:15) can clearly address economic, operational and management barriers. Specifically, financial resource commitment for infrastructure and human resources can address the (1) *economic barriers* of investment and financial risks (section 2.3.1), (2) *operational barrier* of support (i.e. lack of infrastructure) and operational risks (section 2.3.2), and (3) *organisational barriers* of functional barriers (i.e. lack of staff training) and management risks (e.g. management and labour risks) (section 2.3.3). Moreover, investment in IT

resources can address various barriers, including (1) *operational barriers* of a problems with product quality (Badenhorst, 2017:612), lack forecasting and visibility (product return barriers), a lack of IT systems (Badenhorst, 2016:9; Badenhorst, 2017:612) and a lack of infrastructure (support barriers), (2) *organisational barrier* of poor internal integration (functional barrier) and (3) SC (external) barriers of a lack of collaboration and information sharing (also SC risks) (Badenhorst, 2017:611-612).

Additionally, sufficient resource commitment and investment for RLM can provide various beneficial *outcomes*, including the (1) *economic outcomes* of cost savings and reduction (Le, 2023:15; Meyer *et al.* 2017:13), increased revenue/profits (Andresen & Istad, 2019:15; Le, 2023:15; Meyer *et al.* 2017:13; Phuong, 2019:12), enhanced cost control, increased asset recovery (Phuong, 2019:12), reduced inventory investment (Goedhart *et al*. 2022:1), (2) *operational outcomes* of increased RL process efficiency (Meyer *et al*. 2017:1), enhanced product return visibility (Ahsan & Rahman, 2022:157; Jenkins, 2021:10; Kaynak *et al.* 2014:440;) and product return reduction (Nel & Badenhorst, 2020:127), (3) *organisational outcomes* of improved RL performance (Davidavičienė & Al Majzoub, 2021:19), internal communication and integration (Lin & Hsu, 2017:21), and (4) *market-related outcomes* of improved consumer responsiveness (Lin & Hsu, 2017:21).

Essentially, resource commitment and investment for RLM, including financial resource commitment, investment and commitment of IT resources, infrastructure investment and human resource commitment and investment, can be significant success factors for effective RLM, addressing various barriers in RLM and providing several advantages. In the next section, the utilisation of IT resources for RLM will be explored.

2.5.3.2 Information technology (IT) resources for RLM

While the investment in IT can be regarded as important for RLM, appropriate implementation and use of IT resources can be critical for the effective RLM of consumer returns in online retailing (Davidavičienė & Al Majzoub, 2021:6; Karlsson *et al*. 2023:7). The implementation and successful use of the correct IT resources requires (1) knowledge about the functionalities of appropriate IT systems for RLM and (2) identification of the types of IT resources that can be implemented for RLM.

Appropriate IT for RLM involve various *functionalities* that online retailers can consider for the correct implementation and application of IT resources, including state-of-the-art, tracking, tracing, communication and integration capabilities, real-time information sharing, information quality and quantity, support decision-making, performance measurement, gatekeeping and return avoidance, and

return data capturing and analysis capabilities. *State-of-the-art IT* for product return *tracking* and *tracing* can be critical for effective RLM (Frei *et al.* 2020:1619; Ravi & Shankar, 2015:20). Additionally, appropriate IT for RLM must facilitate internal and external *integration, communication* and *real-time information sharing* (Karlsson *et al.* 2023:8), as well as possess the capabilities to be embedded into the website to facilitate RL processes (Bozzi *et al.* 2022:15).

Furthermore, to support RLM, appropriate IT must be capable of providing high *quality* and *quantity* of *information,* and *support decision-making* in RL processes (Starostka-Patyk, 2021:2594). Additionally, appropriate IT must be capable of *supporting performance measurement* in RL, *gatekeeping* and *return avoidance* (Karlsson *et al.* 2023:8-9). Especially, the IT system must facilitate the control of return rates, track return reasons and provide information to understand consumer behaviour (Bozzi *et al.* 2022:15; Jović *et al*. 2020:160). Subsequently, appropriate IT must be capable of *capturing* and *analysing data* about the nature, frequency and types of returns (Dapiran & Kam, 2017:832), enabling leveraging of data analytics for effective RLM and improvements (Ahlén & Johansson, 2023:31).

Following the knowledge on important functionalities of IT systems, online retailers must *identify the types of IT resources* that can be implemented for effective RLM. Specifically, online retailers must identify the appropriate computer systems and programmes, network requirements, software and electronic database resources to process, store and manage RL data (Davidavičienė & Al Majzoub, 2021:6). Additionally, online retailers can consider the implementation of dedicated return software and information systems (Hjort *et al.* 2019:788), tracking and Radio Frequency Identification (RFID) technologies (Starostka-Patryk, 2021:2591), the Internet of Things (Karlsson *et al.* 2023:8; Zhang *et al.* 2017:157), web-based systems (Robertson *et al.* 2020:172), blockchain technologies (Jović *et al*. 2020:164) and traditional technologies (Starostka-Patryk, 2021:2591).

To manage consumer returns effectively, online retailers can identify and implement *dedicated return software* and *information systems* aimed at automating returns, enabling streamlined and efficient RL processes (Ahlén & Johansson, 2023:31; Bozzi *et al.* 2022:21; Fox, 2023:5; Hjort *et al.* 2019:788). Specifically, online retailers can implement and utilise a Returns Management System (RMS) for various benefits related to speed, efficiency, consumer experience and return minimisation (Fox, 2023:5). Moreover, online retailers can identify and use computerised *return tracking systems* and *RFID technologies* for product return tracking and identification (Starostka-Patryk, 2021:2591). *RFID* can be an important IT system for the management of consumer returns in terms of product return monitoring (Biswas & Abdul-Kader, 2018:1021), tracking and verification and inventory management (Frei *et al.* 2020:1616). Like RFID technology, the *Internet of Things,* which involves

connections between smart devices and the internet, can be an important technology for managing consumer returns, providing online retailers with the ability to track products in real time and in-transit (Zhang *et al.* 2017:157).

Online retailers can identify *web-based systems* that facilitate the shopping process, enabling consumers to make more informed decisions, reducing unnecessary returns (Ahsan & Rahman, 2022:157; Robertson *et al.* 2020:172). Furthermore, online retailers can identify and implement *blockchain technology* that contains the attributes of appropriate IT resources for effective RLM. For example, blockchain that facilitate product identification, tracking and verification (Jović *et al*. 2020:164), as well as blockchain that can help prevent fraudulent behaviour (Shih, Huang, Chieh, Shih & Wu, 2021:2170). Lastly, online retailers can consider *traditional technologies* for RL, including Enterprise Resource Planning (ERP), Electronic Data Interchange (EDI), CRM and SCM systems (Starostka-Patryk, 2021:2591) and a Warehouse Management System (WMS) (Fox, 2023:5), which can enable successful management of RL processes (Fox, 2023:5; Starostka-Patryk, 2021:2591).

Based on the literature, the *barriers* in RLM that can be addressed by appropriate implementation and use of IT resources include (1) *economic barriers* of investments, high costs, lack of economies of scale (financial constraints) and risks (Ahlén & Johansson, 2023:32) and (2) *operational barriers* of limited visibility, lack of forecasting (product return barriers and operational risks) and inadequate of IT systems (operational support and risks) (Badenhorst, 2016:9). However, based on the abovementioned functionalities and outcomes (discussed next) the application of IT resources can address the (1) *organisational barriers* of strategic planning, policy and control (i.e. poor performance measurement) and functional barriers (i.e. lack of internal coordination and information sharing) (section 2.3.3), and (2) *external barriers* of SC (i.e. lack of SC collaboration and information sharing), consumer behaviour (i.e. opportunistic buying and fraudulent return behaviours) and external risks (i.e. SC risks) (section 2.3.4).

Apart from successful RLM, appropriate implementation and use of IT resources can provide various outcomes, including the (1) *economic outcomes* of cost savings (Jović *et al*. 2020:164), (2) *operational outcomes* of improved RL process efficiency and effectiveness (Ahlén & Johansson, 2023:31; Bozzi *et al.* 2022:23; Fox, 2023:5; Hjort *et al.* 2019:788; Jović *et al*. 2020:164; Starostka-Patryk, 2021:2591), speedy returns and disposition (Fox, 2023:5), improved inventory management and reduced pilferage (Fox, 2023:5; Frei *et al.* 2020:1616; Jović *et al*. 2020:164), product return visibility (Biswas & Abdul-Kader, 2018:1021; Frei *et al.* 2020:1619; Jović *et al*. 2020:164; Ravi & Shankar, 2015:20), return reduction, control (Ahsan & Rahman, 2022:157; Bozzi *et al.* 2022:15; Fox,

2023:5; Karlsson *et al.* 2023:8; Robertson *et al.* 2020:172) and monitoring (Biswas & Abdul-Kader, 2018:1021), (3) *organisational outcomes* of improved RL performance (Davidavičienė & Al Majzoub, 2021:6), improved RL decision making, information management, internal coordination (Karlsson *et al.* 2023:8-9; Starostka-Patyk, 2021:2594), internal information sharing and performance measurement (Karlsson *et al.* 2023:9), (4) *market-related outcomes* of improved consumer service (Ahsan & Rahman, 2022:157; Robertson *et al.* 2020:172) and experience (Fox, 2023:5), and (5) *SC outcomes* of improved SC coordination, communication and information sharing (Karlsson *et al.* 2023:8).

Clearly, the effective implementation and use of IT resources can be crucial for the successful management of consumer returns, addressing various RLM barriers and realising numerous outcomes. Therefore, online retailers must pay attention to the functionalities and types of IT resources to successfully implement and use IT resources for successful RLM. In the next section, the final resource success factor of human resource development will be discussed.

2.5.3.3 Human resource development for RLM

According to Badenhorst (2017:595), the training and development of staff can be one of the most important practices for effective RLM. Proper RL implementation and management requires appropriate human resources, including appropriate training and skills (Andresen & Istad, 2019:15; Lamba *et al.* 2020:384). Therefore, online retailers must allocate sufficient human resources to the RL process (Le, 2023:15; Meyer *et al*. 2017:13) in the form of training staff and skilled staff for RLM.

Pranomo *et al.* (2021:3) indicated that sufficient RL training must be conducted on all levels of the organisation, ranging from top-management level and operational level. However, a well-functioning RL process requires sufficient education and *training of staff* in the return process (Andresen & Istad, 2019:15), ensuring that staff possess sufficient knowledge in handling product returns (Dapiran & Kam, 2017:831). Online retailers must train staff to (1) communicate with consumers effectively, (2) understand the return process (Dapiran & Kam, 2017:831; Fox, 2023:19), (3) provide exceptional consumer service (Nel & Badenhorst, 2020:125), (4) conduct effective gatekeeping and uphold return policies (Dapiran & Kam, 2017:832; Zhang *et al.* 2023:10), (5) effective use of IT systems (Andresen & Istad, 2019:15; Fox, 2023:19; Lamba *et al.* 2020:384), (6) conduct accurate return inspections, and (6) make correct disposition decisions (Fox, 2023:19-20; Zailani *et al.* 2017:35). Furthermore, online retailers can consider training staff on fraud awareness, helping them to detect fraudulent return behaviour (Zang *et al.* 2023:16). Subsequently, online retailers must focus on human resource

development in terms of staff training (Lai *et al.* 2022:4), which can provide significant economic, social and environmental value in the return process (Pal, 2017:864).

Closely related to staff training for RLM, online retailers must ensure that both managers and staff acquire and possess the necessary *skills* for effective RLM (Karlsson *et al.* 2023:9). Equipped staff possess the right skills to facilitate product returns and disposition effectively (Davidavičienė & Al Majzoub, 2021:6; Nel & Badenhorst, 2020:128). Additionally, skilled RL staff will be able to practice effective gatekeeping, facilitate return claims and practice successful service recovery, contributing to both a cost-effective and service-focused RL process (Ahsan & Rahman, 2022:157). Furthermore, skilled staff will be able to analyse product return data and assess the product return performance, using various RL metrics (De Araújo *et al*. 2018:354). Therefore, RL staff must possess specialised knowledge and skills to operate consumer returns and add value to the online retailers (Karlsson *et al.* 2023:9).

Human resource development in terms of staff training and development can address various *barriers* in RLM, including the (1) *economic barriers* of investment and financial constraints (Badenhorst, 2017: 611), (2) *organisational barriers* of a lack of awareness about RLM importance, management inattention (Badenhorst, 2017:612) and resistance to change (Badenhorst, 2017:612; Bozzi *et al.* 2022:21; Mostert *et al.* 2017:14) (management barriers), lack of staff training and resources (Badenhorst, 2017:612; Pranomo *et al.* 2021:3), poor internal integration (functional barriers) (Badenhorst, 2017:612; Mostert *et al.* 2017:14) and organisational risks (e.g. culture and labour risks), and (3) *SC (external) barriers* of a lack of SC support and collaboration (Mostert *et al.* 2017:14). However, based on the requirements and outcomes, staff training and skills can potentially address the (1) *operational barrier* of product returns (e.g. product return uncertainties) and operational risks (e.g. data management and inventory risks) (section 2.3.2), (2) *organisational barrier* of strategic planning, policy and control (i.e. poor performance measurement) (section 2.3.3.2), and (3) *external barriers* of consumer behaviour (i.e. opportunistic buying and fraudulent return behaviours) and external risks (i.e. market risks) (section 2.3.4).

Additionally, effective human resource development can provide various beneficial outcomes for successful RLM, including the (1) *economic outcomes* of enhanced economic performance (Pal, 2017:864), cost savings (Ahsan & Rahman, 2022:157; Le, 2023:15; Meyer *et al*. 2017:13), increased profitability (Andresen & Istad, 2019:15; Le, 2023:15; Meyer *et al*. 2017:13) and improved asset recovery (Davidavičienė & Al Majzoub, 2021:6; Nel & Badenhorst, 2020:128), (2) *operational outcomes* of improved RL process efficiency (Ahsan & Rahman, 2022:157; Fox, 2023:20), speedy RL process (Ahsan & Rahman, 2022:157), reduced return lead time (Davidavičienė & Al Majzoub,

2021:6; Nel & Badenhorst, 2020:125), product return reduction (Dapiran & Kam, 2017:832) and fraudulent return reduction (Zang *et al.* 2023:16), (3) *organisational outcomes* of improved performance measurement (De Araújo *et al*. 2018:354) and staff compliance (Mostert *et al.* 2017:14), (4) *environmental outcomes* of enhanced environmental performance (Pal, 2017:864), (5) *market-related outcomes* of enhanced consumer experience, improved communication (Fox, 2023:20) and enhanced consumer service (Ahsan & Rahman, 2022:157; Nel & Badenhorst, 2020:125), and (7) *SC outcomes* of supplier benefits (Dapiran & Kam, 2017:831).

Essentially, human resource development can be a critical success factor for RLM, not only facilitating the effective management of consumer returns but also addressing RLM barriers and realising various outcomes. Consequently, online retailers must train staff and assign skilled staff to effectively manage consumer returns. In the next section, the operational success factors for RLM will be identified and described.

2.5.4 Operational success factors for RLM

Successful RLM operations requires monitoring and evaluation (Jenkins, 2021:10; Nel & Badenhorst, 2020:128), return avoidance and prevention (Anderson, 2020:7; Andresen & Istad, 2019:41), and management of risks (Panjehfouladgaran & Lim, 2020:1464; Senthil *et al.* 2018:718). Subsequently, the key operational success factors for RLM include (1) performance management for RLM, (2) return avoidance and prevention for RLM, and (3) risk management, which will be discussed in the subsequent sections.

2.5.4.1 Performance management for RLM

Performance measurement (PM) is often defined as the process of assessing the efficiency and effectiveness of an action (Euchi, Bouzidi & Bouzid, 2019:40). For the management of consumer returns, efficiency and effectiveness represents the degree of meeting consumer needs in the return process as well as the effective use of funds (or resources) to attain consumer satisfaction (Euchi *et al.* 2019:40). Therefore, online retailers must measure consumer returns and develop key performance indicators (KPIs) for overall financial success and sustainability (Karlsson *et al.* 2023:9). Performance management for RLM can involve various aspects, including (1) requirements for successful performance management, (2) performance focus areas, (3) development and capabilities of metrics for RLM, and (4) performance monitoring, evaluation and improvement.

Performance management for RLM involves several *requirements* to facilitate the measurement, monitoring and improvement of RL. Specifically, online retailers must use a sophisticated

performance measurement system for the measurement, management and improvement of RLM practices (Lamba *et al.* 2020:384). Similarly, to successfully measure consumer returns, online retailers must use appropriate *RL information systems* and *internal integration* for aligned and effective processes, common goals and appropriate cross-functional performance measures (Karlsson *et al*. 2023:9). Lastly, appropriate evaluation and monitoring of performance requires *skilled staff* and *managers* (De Araújo *et al*. 2018:354; Jenkins, 2021:10).

Focusing on the correct *areas of performance* can be important for successful performance management in RL. Specifically, the most important performance focus area in RLM include *consumers* (Sajjanit & Rompho, 2019:773). Therefore, online retailers must focus on consumer-centricity and consumer-oriented product returns for the development of appropriate KPIs (Karlsson *et al.* 2023:10; Sajjanit & Rompho, 2019:772). Additionally, online retailers must focus both on *efficiency and service performance* (Karlsson *et al.* 2023:9), including on responsiveness, speed, compensation (Karlsson *et al.* 2023:9-10; Sajjanit & Rompho, 2019:772), convenience, communication, empathy and reliability (Sajjanit & Rompho, 2019:772). Lastly, online retailers must focus on *costs, strategic intent,* and *return policy* and *process* design for the development of effective metrics (Karlsson *et al.* 2023:9).

Identifying the key performance focus areas can facilitate the *development of appropriate metrics for RLM.* Specifically, online retailers can develop various metrics for effective consumer return PM, including (1) product return rate, reasons and types (De Araújo *et al.* 2018:354; Fox, 2023:13), (2) return costs that involve return processing, handling and restocking costs (Fox, 2023:14), and (3) consumer service and efficiency that involve RL process speed, consumer responsiveness, service recovery (Karlsson *et al.* 2023:9) and consumers satisfaction (Jalil, 2019:2). These *developed metrics* for RL performance management must be *capable* of measuring, tracking and evaluating RL service performance (Sajjanit & Rompho, 2019:790). Additionally, these metrics must help online retailers to identify cost saving opportunities, understand the return process and emphasise performance improvement opportunities (Fox, 2023:14-15). Lastly, appropriate performance metrics must help with follow up on consumer responsiveness and product return efficiency (Karlsson *et al.* 2023:9).

Subsequently, successful performance management in RL involves *performance monitoring, evaluation* and *improvement.* Online retailers must consistently monitor and evaluate RL processes and practices (Jenkins, 2021:10; Nel & Badenhorst, 2020:128) to identify areas that require improvements (Nel & Badenhorst, 2020:128). Specifically, continuous performance monitoring of the RL process is needed from the return request stage to returned product disposition, ensuring that return processes can be improved and maintained (Fox, 2023:15), Online retailers can monitor

consumer return process efficiency by (1) tracking return metrics, (2) collecting consumer feedback and (3) performing return process audits (Fox, 2023:15). Moreover, RL performance measuring and monitoring must be reported to senior management, which can help with the identification of consumer product return problems and implementation of performance improvement practices (Frei *et al.* 2020:1618; Nel & Badenhorst, 2020:128). Additionally, online retailers can perform a profit and loss analysis from the measurements, which can facilitate understanding of the financial implications of RL processes and practices (Karlsson *et al.* 2023:9). Lastly, online retailers must conduct annual performance evaluation and examination of RL service metrics to facilitate the effective implementation of product return service strategies (Sajjanit & Rompho, 2019:790).

While literature lack clear discussions regarding the RLM *barriers* that can be addressed, performance management for RLM can clearly address the *strategy, planning and control (organisational) barrier* of problems with PM, including a lack of performance measurements and performance management systems (section 2.3.3.2). Additionally, from the abovementioned performance management requirements and practices, successful performance management can help address (1) *economic barriers* of investment, financial constraints and risks (section 2.3.1), (2) *operational barriers* of product returns (e.g. product return uncertainties) and operational support (i.e. lack of IT) (section 2.3.2), (3) *organisational barriers* of management (i.e. lack of knowledge about RLM importance, lack of top management commitment and management inattention) and functional barriers (i.e. lack of skilled staff and poor internal integration) (section 2.3.3), and (4) *external barriers* of consumer behaviour and external risks (i.e. market risks) (section 2.3.4).

Apart from successful RLM, performance management can help online retailers realise several beneficial *outcomes*, including the (1) *economic outcomes* of cost savings (Fox, 2023:14) and improved financial control (Euchi *et al.* 2019:40; Karlsson *et al.* 2023:9), (2) *operational outcomes* of RL process efficiency (Jenkins, 2021:10; Karlsson *et al*. 2023:9), speedy product returns, reduced fraudulent returns (Karlsson *et al.* 2023:10), (3) *organisational outcomes* of improved organisational and RL performance (Fox, 2023:14-15; Frei *et al.* 2020:1618; Jalil, 2019:2; Lamba *et al.* 2020:384; Nel & Badenhorst, 2020:128), enhanced performance measurement, monitoring and management (Frei *et al.* 2020:1618; Jenkins, 2021:10; Lamba *et al.* 2020:384; Nel & Badenhorst, 2020:128; Sajjanit & Rompho, 2019:773), and improved internal coordination (Karlsson *et al*. 2023:9), and (4) *market-related outcomes* of enhanced consumer responsiveness (Karlsson *et al*. 2023:9), loyalty (Fox, 2023:15) and satisfaction (Euchi *et al.* 2019:40; Fox, 2023:15; Sajjanit & Rompho, 2019:773).

Essentially, performance management can be an important success factor for the management of consumer returns, enabling online retailers to effectively measure, monitor, evaluate and manage RL

performance, as well as address RL barriers and realise several outcomes. In the next section, return avoidance and preventions as an operational success factor for RLM will be discussed.

2.5.4.2 Return avoidance and prevention practices for RLM

A significant focus area of effective RLM is on return avoidance and prevention, which aims at reducing returns and minimising the subsequent financial impact of returns (Andresen & Istad, 2019:41). In fact, one of the simplest ways to successfully manage RL is to avoid and prevent returns from taking place (Anderson, 2020:7). Literature extensively discusses return avoidance and prevention practices as an important part of RLM. Based on the literature, return avoidance and prevention practices can be practiced pre-sales, during the return process or after returns, and can range from fairly simple to more specialised and complicated with more serious intervention and improvement initiatives. Due to the comprehensive of literature discussions, the subsequent sections will discuss the general pre-sales, general post-sales and specialised return avoidance and prevention. At the conclusion of the section the barriers and outcomes of return avoidance and prevention will be identified.

2.5.4.2.1 General pre-sales avoidance and prevention

According to Dobson (2023:10), online retailers must implement any method thinkable to prevent consumer returns. Pre-sale return avoidance and prevention practices can include pre-purchase information, marketing initiatives, logistics efficiency and quality management.

Online retailers can practice effective return avoidance by providing consumers with adequate *pre-purchase information* for correct purchasing decisions and prevention of unnecessary product returns (Ahsan & Rahman, 2022:157; Nel & Badenhorst, 2020:127). Specifically, online retailers can provide (1) *appropriate and detailed descriptions of products* (Dobson, 2023:10; Chen *et al.* 2017:255; Gustafsson *et al.* 2021:877; Hjort *et al.* 2019:777; Nel & Badenhorst, 2020:127; Zhang *et al.* 2017:156), (2) *realistic and sufficient pictures of products* (Bozzi *et al.* 2022:15; Hjort *et al.* 2019:777; Nel & Badenhorst, 2020:127; Zhang *et al.* 2017:156), (3) *online videos* (Bozzi *et al.* 2022:15; Nel & Badenhorst, 2020:127), and (4) *accurate size guides* (Bozzi *et al.* 2022:15; Hjort *et al.* 2019:778).

Additionally, online retailers can implement *marketing measures* for return avoidance and prevention, which can include (1) *targeting appropriate consumer groups* to sell the right products to the right consumers (Hjort *et al.* 2019:776), (2) *promotional activities* (e.g. commercials) (De Araújo *et al.* 2018:359) and (3) *online consumer reviews* (Bozzi *et al.* 2022:29; Li, Ma & Chu, 2021:1824).

However, online consumer reviews may lead to higher expectations, which may lead to increasing returns. Li *et al.* (2021:1824) suggest a two-way dialogue with consumers to offset the potential negative impacts of consumer reviews by means of responding to comments and reviews publicly, employing chat apps, providing support by email or using FAQs on ancillary sites.

Furthermore, *logistics efficiency* can be important for return avoidance, which can include improvements in procurement (e.g. purchasing better quality products from reputable suppliers) (Zhang *et al.* 2017:156), reducing picking and delivery errors, and using appropriate packaging (Dobson, 2023:10; Hjort *et al.* 2019:779). *Quality management* directly impact the quantity and quality of product returns (Davidavičienė & Al Majzoub, 2021:19). Online retailers that practice quality management and control of products prior to sales can reduce defective product returns (Davidavičienė & Al Majzoub, 2021:19; Euchi *et al.* 2019:49).

2.5.4.2.2 General post-sales return avoidance and prevention

General post-sales return avoidance and prevention can take place during and after the return process. *During the return process*, online retailers can *establish a gatekeeping function* to differentiate and control the entry of products into the return stream (Anderson, 2020:10). Practicing gatekeeping can be important to protect the RL process from unwanted/fraudulent returns (Hjort *et al.* 2019:770). However, the gatekeeping function requires support from appropriate performance measures and RL information systems, ensuring that gatekeeping is practiced correctly (Karlsson *et al.* 2023:9).While gatekeeping can take place after the products arrive at the warehouse, Hjort *et al.* (2019:774) found that establishing a gatekeeping function at the point of the consumer can help online retailers interact with the consumer and implement consistent measures to prevent unwanted or unnecessary returns. For example, online retailers can perform home visits to ensure that the return reasons match the description of the product, before accepting the return (Hjort *et al.* 2019:770). Other prevention measures through gatekeeping can include early crediting or negotiating a discount, requesting the consumer to keep the product. (Hjort *et al.* 2019:770)

Post-sales avoidance and prevention practices *after the return process* can include product return data, consumer feedback and service and product quality improvements. According to Fox (2023:13), consumer returns can be a valuable *data source* that provides insight into consumer return behaviour, product quality issues and process inefficiencies, which can help with return avoidance. Furthermore, online retailers can *listen to consumer feedback* regarding product quality issues and return reasons for product/service improvements, which can help prevent future returns (Hjort *et al.* 2019:778; Meyer *et al*. 2017:13). Online retailers can use an information system to store product return data and consumer feedback information to critically review and *improve operational inefficiencies*

(Anderson, 2020:11; Meyer *et al*. 2017:13). Closely related to pre-sales quality management, online retailers can implement quality control and assessment systems to track consumer feedback and claims (Mahindroo *et al.* 2018:55), which can be used to *improve the quality of products* (Vlachos, 2016:425). Similarly, product return information sharing and collaboration with suppliers can help improve product quality issues and subsequently avoid future returns (Eriksson & Käck, 2023:24; Hjort *et al.* 2019:778).

2.5.4.2.3 Specialised return avoidance and prevention practices

While general pre- and post-sales return avoidance and prevention practices can help online retailers reduce unnecessary and unwanted product returns, specialised practices involve more sophisticated measures and interventions to curb both fraudulent and unnecessary future returns. However, the specialised practices can complement the general return avoidance and prevention practices, which can be implemented pre-sales, during the return process and after the return process. Based on the literature, specialised return avoidance and prevention practices can include (1) sophisticated information systems and technologies, (2) sophisticated data analysis techniques, (3) adjustment of the return policy and (4) human interventions.

Linking with the IT resources for RLM (section 2.5.3.2), online retailers can develop, implement and use *sophisticated information systems and technologies* for return avoidance and prevention. Specifically, *sophisticated web-based systems* can be used as pre-sales prevention measures, aimed at reducing consumer uncertainty during online shopping (Ahsan & Rahman, 2022:157; Robertson *et al.* 2020:172). For example, online retailers can use online chatbots and augmented reality to help the consumer find the right fit and style of the item prior to the purchase (Robertson *et al.* 2020:172). Additionally, online retailers can use various sophisticated IT systems, like *RFID* and *blockchain*, during the return process to avoid fraudulent and unnecessary returns. For instance, RFID tags on products can help online retailers to verify the accuracy of the return claim, preventing the acceptance of counterfeit or fraudulent returns (Frei *et al.* 2020:4; Zhang *et al.* 2023:15). Similarly, the information stored in the blockchain can confirm authenticity of the returned products and verify the return claim against the original purchase (Jović *et al*. 2020:164). Consequently, blockchain technology can be important for fraud detection and prevention in the RL process (Shi *et al.* 2021:2186).

Some sophisticated systems can be used for post-sales data collection, which can help improvement initiatives for unnecessary returns and prevention initiatives to avoid fraudulent returns. Particularly, online retailers can use an RMS (return management system) to identify return trends, identify service improvement opportunities and facilitate product return avoidance (Fox, 2023:5). Similarly, online

retailers can development of a sophisticated product return portal as a measure of preventing illegitimate and fraudulent product returns (Zhang *et al.* 2023:11). The product return portal can gather valuable product return data, including the identification of the returner, original order detailers, number of return requests and the selected return methods, which can help online retailers understand consumer return behaviour and identify suspicious return behaviour for further investigations (Zhang *et al.* 2023:11).

Closely related to the use of sophisticated IT for consumer return data, online retailers can use *data analytics and data analysis techniques* to identify root causes of returns and implement appropriate countermeasures. With data analytics online retailers gain meaningful insights from consumers to avoid unnecessary returns (Hjort *et al.* 2019:779). Additionally, online retailers can use statistical algorithms for the detection of fraudulent return behaviours that can be used to track and flag serial returners for targeted prevention (Bernon *et al.* 2016:585; Zhang *et al.* 2023:11). Some online retailers use consumer experience tools, like a net promoter score tool, to gain insights into customers' return patterns, which can help return avoidance (Hjort *et al.* 2019:778). Based on the statistics and data analytics online retailers can implement appropriate countermeasures, including (1) excluding fraudulent or serial returners from promotional emails and discount offers (Zhang *et al.* 2023:11), and (2) blocking the accounts of fraudulent or serial returns (Hjort *et al.* 2019:778; Zhang *et al.* 2023:11).

Online retailers that experience frequent fraudulent returns can consider *adjustments* to their *return policies.* Zhang *et al.* (2023:10) suggest that online retailers shortening the return period, use gift receipts or store credit or refunds through the same payment methods and refuse refunds for returns outside the return period, which can curb fraudulent returns but still maintain standard consumer service. Additionally, online retailers can use *human interventions* for return avoidance and prevention. According to Zhang *et al.* (2023:17), investment in human resources can be the most powerful tool in the prevention of fraudulent returns. Specifically, online retailers that experience high losses from fraudulent returns must consider the establishment of return prevention team, consisting of five to ten individuals to (1) investigate fraudulent returns, (2) call individual consumers suspected of fraudulent return behaviour, and (3) collect and analyse return data as evidence for future actions (Zhang *et al.* 2023: 11, 17). Additionally, online retailers must conduct regular staff training on fraud awareness, affording staff the skills to detect and prevent fraudulent returns (Zhang *et al.* 2023:16). Lastly, senior management involvement and cross-functional information sharing about fraudulent returns, which can help the creation of better return policies (marketing), adjustment of credit practices (finance) and implementation of appropriate systems (IT) (Zhang *et al.* 2023:12, 17).

Clearly, online retailers can address various RLM barriers through return avoidance and prevention practices, including *operational (product return) barriers* of product return uncertainties, limited visibility and poor return forecasting (Badenhorst, 2016:9). Additionally, from the practices and outcomes (described next), avoidance and prevention can help address the (1) *economic barriers* of investment, financial constraints and risks (section 2.3.1), (2) *operational barriers* of operational support (i.e. inadequate IT systems) and operational risks (i.e. demand, product quality, data management, technology and inventory risks) (section 2.3.2), (3) *organisational barriers* of management (i.e. lack of top management support and management inattention), strategy, policy and control (i.e. poor policies) function (i.e. lack of staff training and poor functional integration) and organisational risk (i.e. labour risk) (section 2.3.3), and (4) *external barriers* of SC (i.e. lack of SC collaboration and information sharing), consumer behaviour (i.e. opportunistic buying and fraudulent return behaviours) and external risks (i.e. SC, market and environment risks) (section 2.3.4). Consequently, effective return avoidance and prevention practices can address all RLM barriers, emphasising the significance of these practices for successful RLM.

Apart from successful RLM and product and fraudulent return reductions, online retailers can experience various outcomes through return avoidance and prevention practices, including the (1) *economic outcomes* of cost savings (Andresen & Istad, 2019:8; Eriksson & Käck, 2023:24-25; Gustafsson *et al.* 2021:877; Hjort *et al.* 2019:770; Jović *et al*. 2020:164), increased profitability and improved financial performance (Chen *et al.* 2017:255; Zhang *et al.* 2023:16-17), (2) *operational outcomes* of enhanced RL process and operational efficiencies (Eriksson & Käck, 2023:25; Fox, 2023:5; Meyer *et al*. 2017:13; Zhang *et al.* 2023:13), increased RL process speed (Fox, 2023:5; Zhang *et al.* 2023:13), enhanced product return visibility (Zhang *et al.* 2023:7) and improved inventory management (Jović *et al*. 2020:164; Zhang *et al.* 2023:11), (3) *organisational outcomes* of improved RL performance (Davidavičienė & Al Majzoub, 2021:19), RL decision making (Hjort *et al.* 2019:770), information management, internal communication, information sharing and collaboration (Zhang *et al.* 2023:11-12), (4) *environmental outcomes* of decreased pollution (e.g. less transportation) and waste reduction (Bozzi *et al.* 2022:30), (5) *social outcomes* of improved reputation (Eriksson & Käck, 2023:24-25; Zhang *et al.* 2023:16), (6) *market-related outcomes* of enhanced consumer services (Zhang *et al.* 2017:156) and experience (Fox, 2023:5), increased consumer satisfaction (Vlachos, 2016:425; Zhang *et al.* 2017:156) and loyalty (Eriksson & Käck, 2023:24-25; Vlachos, 2016:425), improved consumer engagement (Hjort *et al.* 2019:774) and enhanced consumer value (Ahsan & Rahman, 2022:157; Mahindroo *et al.* 2018:55), and (7) *SC outcomes* of improved SC collaboration and information sharing (Eriksson & Käck, 2023:24; Nel & Badenhorst, 2020:127; Zhang *et al.* 2017:156).

Essentially, return prevention and avoidance practices can be critical success factors for effective RLM. Consequently, online retailers can implement various pre-sales, post-sales and specialised return avoidance and prevention practices to not only manage consumer returns successfully but also to address various barriers and realise numerous advantages. Additionally, avoidance and prevention practices confirm the economic, competitive, social and environmental significance of RLM. In the next section, the final operational success factor of risk management will be briefly described.

2.5.4.3 Risk management for RLM

In general, risk management involves the identification, classification, mitigation and evaluation of SC risks, which can be an integral part of the operational strategy of a successful organisation (Senthil *et al.* 2018:718). Although the barriers in RLM involve various risks, limited studies in RL focused on risk management for RLM. Consequently, this section identifies elements of risk management based on the few studies from literature that focused on RL risk management. Like standard risk management, risk management for RLM requires risk identification, risk classification and assessment and risk mitigation (Ermes & Niemann, 2023:5; Panjehfouladgaran & Lim, 2020:1452; Senthil *et al.* 2018:718).

Risk identification for RLM entails defining all potential risks that can hamper effective RLM (Panjehfouladgaran & Lim, 2020:1452). Risk identification can be a significant part of risk management for RLM as it enables online retailers to develop appropriate mitigations strategies to minimise the negative impact of these risks on their performance and sustainability (Panjehfouladgaran & Lim, 2020:1450). As discussed in the barriers of RLM (section 2.3), online retailers can *identify* the potential risks in RLM as the (1) *financial risks* of financial instability, capacity and investment (Panjehfouladgaran & Lim, 2020:1465), a loss of money, high RL cost and profit loss risks (Ermes & Niemann, 2023:7), (2) *operational risks* of demand and forecast, product quality, technological, data management and inventory risks, (3) *organisational risks* of management, culture and labour risks (Panjehfouladgaran & Lim, 2020:1461-1462; Senthil *et al.* 2018:718) and (4) *external risks* of SC, outsourcing, market, political and external environment risks (Panjehfouladgaran & Lim, 2020:1461).

Following risk identification, online retailers can *classify* and *assess* risks since risk mitigation can be resource intensive (Panjehfouladgaran & Lim, 2020:1464). Classifying risks involve the grouping of RLM risks into categories (e.g. strategic, operational and tactical risks), which can help online retailers mitigate a set of risks through fewer risk mitigation measures (Panjehfouladgaran & Lim, 2020:1450, 1452). Following the classification, online retailers can assess RLM risks through a risk ranking or prioritisation assessment process whereby the most significant risks (i.e. highest

probability of occurring with the greatest potential loss) are addressed first (Senthil *et al.* 2018:718). Subsequently, based on the risk classification and assessment outcomes, online retailers can identify and implement risk mitigation strategies associated with higher risks first, followed by medium risks and lower risks.

Once the RLM risks are prioritised, online retailers can identify and implement *risk mitigation strategies* (Senthil *et al.* 2018:728). Identifying risk mitigation strategies can be essential for effective managerial decision making and the subsequent reduction of RLM disruptions (Panjehfouladgaran & Lim, 2020:1464). Online retailers can identify proactive and reactive risk mitigation strategies (Ermes & Niemann, 2023:8), which can be implemented based on the risk assessment. Based on literature, several *proactive risk mitigation strategies* can be implemented before the occurrence of RLM risks, including top management support, appropriate IT, return inspection, return prevention, establishment of risk procedures, skilled staff, organisational culture changes, appropriate RL network design and SC relationships. According to Panjehfouladgaran and Lim (2020:1466) effective risk management requires sufficient *top management support* since risk mitigation requires resources. Subsequently, with support from top management, the remaining proactive and later reactive risk mitigation strategies can be effectively implemented.

Appropriate IT can be a significant risk mitigation strategy for addressing various RLM risks. For example, implementing RFID increases product return visibility and enables real-time information sharing between SC parties (Ermes & Niemann, 2023:8), mitigating demand and forecast risks (section 2.3.2.3) and SC risks (e.g. poor SC communication) (section 2.3.4.4). Additionally, RFID improve product return tracking and increase inventory accuracy, which can mitigate inventory risks (e.g. pilferage) (Frei *et al.* 2020:4). Similarly, implementing a warehouse management system (WMS) can enhance operational security management, addressing inventory risks related to inadequate storage (Starostka-Patryk, 2021:2591). Additionally, through a robust IT system outsourcing risks related to information security risk can be mitigated (Panjehfouladgaran & Lim, 2020:1464).

Online retailers can use the *return inspection* process as a risk mitigation tool for potential risks taking place during RL process (Ermes & Niemann, 2023:5). For example, effective return inspections can mitigate product quality risk associated with poor inspection (section 2.3.2.3). Additionally, implementing *return prevention practices* can be a valuable strategy to reduce RL risks. For example, quality checks before products are dispatched and proper packaging design can mitigate risks related to unnecessary returns (Ermes & Niemann, 2023:8), like the financial risk of a loss of money and high costs (section 2.3.1.3). Additionally, proper packaging design can help consumers

with the product return and subsequently protect the product from damage and pilferage (quality and inventory risks) (Ermes & Niemann, 2023:9).

Another proactive risk mitigation strategy can include the *establishment of risk procedures,* which involves a step-by-step guide to help organisational members to understand their roles for effective risk management in the event of a disruption (Ermes & Niemann, 2023:9). Furthermore, *skilled staff* placed in strategic positions can be valuable as a mitigation strategy to combat risks during a disruptive event (Ermes & Niemann, 2023:9). Additionally, Ermes and Niemann (2023:9) found that instilling the correct *organisational culture* before a risk event can be an important mitigating strategy. Specifically, organisations can instil a problem-solving culture, which allows for quicker risk response and limited conflict between organisational members. Therefore, online retailers can address various organisational risks through these measures, including management risks (i.e. inconsistent decision making), culture risks (i.e. resistance to change) and labour risks (i.e. unskilled staff) (see section 2.3.3.4).

Designing a *robust RL network* can be used as a risk mitigating strategy, ensuring efficient product return flow to reduce SC risks (Misni & Lee, 2017:85). The final proactive risk mitigating strategy involve the development of *SC relationships.* Specifically, developing collaborative SC relationships can help with resources, knowledge and expertise to overcome a disruption more effectively (Ermes & Niemann, 2023:8). Likewise, online retailers can mitigate future risks by establishing strong partnerships and using multiple suppliers (Panjehfouladgaran & Lim, 2020:1464). Consequently, online retailers can mitigate financial risks (i.e. unavailability of financial resources) (section 2.3.1.3), organisational risks (i.e. lack of management expertise) (section 2.3.3.4) and SC risks (i.e. lack of shared goals) (section 2.3.4.4).

In contrast to proactive risk mitigation, *reactive mitigation strategies* are implemented in a response of a risk event or disruption. Only Ermes and Niemann (2023:9) identified some *reactive mitigation strategies* that can be implemented during a disruption in the SC. For example, online retailers can use consumer return data and refuse product returns from serial returners and customise return policies to accommodate fewer returns (Ermes & Niemann, 2023:9), indicating that both proactive and reactive risk management strategies involve return avoidance and prevention practices. Additionally, online retailers can establish a specific RL team, consisting of highly skilled individuals in RL, tasked at managing the risks during the disruptions (Ermes & Niemann, 2023:9). Essentially, online retailers can implement reactive strategies as an extension of the proactive strategies of return prevention and skilled staff.

Based on the discussions, risk management can clearly address all the *risks* identified in the *barriers* of RLM. Additionally, from the risk management practices and outcomes (discussed next), online retailers can potentially address the (1) *economic barriers* of investment and financial constraints (section 2.3.1), (2) *operational barriers* of product returns (i.e. limited visibility, quality problems and uncertainties) operational support (i.e. inadequate IT systems) (section 2.3.2), (3) *organisational barriers* of management (i.e. lack of top management support and management inattention), strategy, policy and control (i.e. poor policies) and function (i.e. lack of skilled staff) (section 2.3.3), and (4) *external barriers* of SC (i.e. lack of SC collaboration and information sharing) and consumer behaviour (i.e. opportunistic buying and fraudulent return behaviours) (section 2.3.4).

Moreover, several *outcomes* can be realised through effective risk management for successful RLM, including the (1) *economic outcomes* of cost savings, increased profits (Ermes & Niemann, 2023:5), higher recovery value, and reduced capital expenditure (Ermes & Niemann, 2023:10) and financial loss (Senthil *et al.* 2018:718) (2) *operational outcomes* of increased RL process efficiency (Ermes & Niemann, 2023:10; Misni & Lee, 2017:85), enhanced product return visibility and tracking (Ermes & Niemann, 2023:8; Frei *et al.* 2020:4), improved inventory management (Frei *et al.* 2020:4; Starostka-Patryk, 2021:2591), reduced pilferage (Ermes & Niemann, 2023:9; Frei *et al.* 2020:4), and fraudulent and product return reductions (Ermes & Niemann, 2023:9), (3) *organisational outcomes* of improved RL decision making (Ermes & Niemann, 2023:9; Panjehfouladgaran & Lim, 2020:1464), (4) *environmental outcomes* of improved environmental performance (Senthil *et al.* 2018:728), (5) *market-related outcomes* of increased sales, market share, competitive advantage, and consumer service, loyalty and retention (Ermes & Niemann, 2023:10-11), and (6) *SC outcomes* of improved SC information sharing, communication and collaboration (Ermes & Niemann, 2023:8; Panjehfouladgaran & Lim, 2020:1464).

Essentially, risk management can be an important success factor for effective RLM by mitigating RLM risks and barriers, while realising various beneficial outcomes. Therefore, online retailers must manage RL risks effectively through risk identification, classification, assessment and mitigation for the effective RLM of consumer returns. In the next section, relation success factors will be identified and discussed.

2.5.5 Relation success factors for RLM

Effective RLM of consumer returns in online retailing requires both internal (functional) coordination and external (SC and consumer) coordination (Ashan & Rahman, 2021:154). Subsequently, online retailers must adopt a multifaceted relation perspective to generate long-term benefits for the organisation, SC and consumers (De Borba *et al.* 2021:137). The key relation success factors that

organisations must focus on for successful RLM include (1) functional relationships for RLM, (2) SC relationships for RLM, and (3) consumer relationships for RLM, which will be discussed in the subsequent sections.

2.5.5.1 Functional relationships for RLM

Cross-functional collaboration and sharing of goals between different departments is essential in RLM to achieve common goals (Karlsson *et al.* 2023:9). Additionally, effective RLM practice needs synchronisation from all functional levels of the organisation, including lowest level to top management (Badenhorst, 2022:229; Bouzon *et al*. 2015:1369). Therefore, the development of good functional relationships can be important for successful RLM. To effectively manage functional relationships for RLM a few practices can be important, including organisational structure, organisational culture, functional integration and internal information sharing.

A conducive *organisational structure* focused on the needs of employees, operations and capacities can be important for the RLM performance of online retailers (Vlachos, 2016:424). In fact, an optimal organisational structure can change ineffective RL activities to a successful RLM function (Waqas *et al.* 2018:4202). According to Espinosa *et al.* (2021:791), effective RLM requires a flexible structure or an adaptability approach instead of a top-down management approach. This adaptability approach transforms managers into facilitators in RLM, empowering RL staff to self-organise, share information, develop relationships and acquire new knowledge through experience. Additionally, an *organisational culture* that supports the development of internal relationships through cross-functional coordination can be essential to address problems in RLM (Vlachos, 2016:424). The online retailer's top management and senior managers are responsible for creating a supportive organisational culture (Davidavičienė & Al Majzoub, 2021:9), emphasising the importance of senior management commitment to RLM (see section 2.5.1.1). Therefore, a good organisational structure and culture can be essential for effective RLM performance (Davidavičienė & Al Majzoub, 2021:19).

Similarly, efficient RLM requires *functional integration* between various departments (Ashan & Rahman, 2021:155). However, the establishment of functional integration for RLM requires top management commitment to RLM and close interdepartmental relationships (Mostert *et al.* 2017:9). Additionally, online retailers can facilitate functional integration by improving information availability and synchronising cross-functional RL processes (Mostert *et al.* 2017:1). Furthermore, sharing of cross-functional goals can be important in supporting functional integration (Karlsson *et al.* 2023:9). Aligning goals across functions can be supported through a centralised IT system, which can be essential for effective functional integration and controls (Mostert *et al.* 2017:9). Online retailers must especially focus on integrating the FL and RL functions for improved service

performance (Phuong, 2019:13) as well as the marketing, procurement and RL functions for joint decision-making in the development of appropriate RL policies and practices (Pal, 2017:874).

Closely related to functional integration, the development of good internal relationships for RLM requires effective *internal information sharing.* Appropriate IT systems can be critical for effective information sharing between departments. The centralised IT used for functional integration and alignment of goals can be used to internally coordinate and integrate RL information between functions (Mostert *et al.* 2017:8). Additionally, online retailers can consider modern technology, like Internet of Things, which provides visibility through storing and sharing of RL information across departments (Jović *et al*. 2020:164). Less sophisticated methods involve emails, messaging applications and cross-functional meetings (Mostert *et al.* 2017:8), which can further enhance internal integration and the development of good functional relationships.

While fewer RLM *barriers* can directly be addressed through functional relationships, from literature a few barriers that can be addressed included the (1) *operational barriers* of problems with quality, limited visibility and forecasting (Badenhorst, 2017:611) (product return barrier and operational risks), (2) *organisational barriers* of a lack of top management support (Mostert *et al.* 2017:9) (management barrier), problems with performance measurement (Karlsson *et al*. 2023:9) (strategy, policy and control barrier), a lack of internal coordination and information sharing (Badenhorst, 2017:611) (functional barriers) and problems with culture (Vlachos, 2016:424) (organisational risk), and (3) *external barrier* of a lack of SC collaboration (Karlsson *et al.* 2023:8) (SC barrier and SC risks). Additionally, effective establishment of functional relationships can indirectly address the operational support barrier of a lack of IT (section 2.3.2.2), which can in turn address various other barriers (see section 2.5.3.2).

Finally, online retailers can realise a few outcomes through functional relationships for RLM, including the (1) *operational outcomes* of improved RL process effectiveness (Waqas *et al.* 2018:4202), increased product return visibility and tracking (Jović *et al*. 2020:164), and product return reduction (Mostert *et al.* 2017:13), (2) *organisational outcomes* of improved RL performance (Davidavičienė & Al Majzoub, 2021:9), planning, control (Jović *et al*. 2020:164), information management (Ashan & Rahman, 2021:155), internal coordination (Ashan & Rahman, 2021:155; Karlsson *et al.* 2023:9; Mostert *et al.* 2017:1, Vlachos, 2016:424) and communication (Ashan & Rahman, 2021:155, Vlachos, 2016:424), (4) *environmental outcome* of improved environmental performance (Pal, 2017:885), (5) *social outcome* of improved corporate image (Pal, 2017:885), (6) *market-related outcomes* of enhanced consumer satisfaction (Sajjanit & Rompho, 2019:772), increased consumer convenience (Pal, 2017:885), improved consumer service (Mostert *et al.*

2017:13; Phuong, 2019:13) and competitive advantage (Phuong, 2019:13), and (7) *SC outcomes* of improved SC coordination and communication (Vlachos, 2016:424).

Essentially, the development of functional relationships through a good organisational structure, a supportive organisational culture, functional integration and internal information sharing can be important for successful RLM, addressing several barriers and realise various beneficial outcomes. Additionally, functional relationships for RLM emphasise the competitive, social and environmental significance of RLM. In the next section SC relationships for RLM will be discussed.

2.5.5.2 Supply chain (SC) relationships for RLM

According to Hjort *et al.* (2019:770) consumer returns will always be part of online retailing and all SC parties will be involved to some extent. Consequently, successful RLM is dependent on the support and participation of SC parties (Govindan & Bouzon, 2018:320). Like functional relationships, SC relationships involve several key practices, including effective SC alignment, SC collaboration, SC integration (SCI) and SC information sharing, which can be important for successful RLM.

SC alignment can be important for effective RLM, impacting overall operational efficiency and effectiveness (Dapiran & Kam, 2017:832). For successful SC alignment in RL, online retailers can align with SC partners by (1) sharing RLM responsibilities (Govindan & Bouzon, 2018:320), (2) integrating IT systems (Dapiran & Kam, 2017:835), (3) creating common return policies, (4) standardising RLM procedures, (5) establishing common performance measures, (6) sharing product return information, and (7) performing joint negotiations in RL (Dapiran & Kam, 2017:832). Similarly, *SC collaboration* can be important for the effective management of product returns (Badenhorst, 2022:330; Mahadevan, 2019:483). Effective SC collaboration requires sufficient information exchange between SC parties, cooperative policies (Ahlén & Johansson, 2023:32) and integrated IT systems, linking all SC parties in the return process (Frei *et al.* 2020:1618). Additionally, online retailers can establish collaborative partnerships in the reverse SC (RSC), which can enhance access to matching resources and RLM capabilities (Pal, 2017:883). Subsequently, collaborative SC relationships can benefit all SC parties, which can optimise RLM performance and address uncertainties (Wang, Wang *et al.* 2021:70).

Efficient RLM requires effective *SCI* since RL processes can involve manufacturers/suppliers, wholesalers/distributer, 3PLs or 3PRLs, retailers and consumers across various geographical regions (Ashan & Rahman, 2021:154). Successful *SCI* relates to the extent to which SC partners successfully align and collaborate (Mostert *et al.* 2017:9). Therefore, SCI can be realised through aligned RL

processes (Mostert *et al.* 2017:1), cooperative policies, SC information sharing (Ahlén & Johansson, 2023:32) and integrated information systems (Frei *et al.* 2020:1618). Moreover, online retailers can integrate with suppliers through contracts, stipulating shared responsibilities in RL, standardised RL processes, staff training, regular meetings, RL information sharing and product return data exchanges through systems, which can provide various RLM benefits (Mostert *et al.* 2017:10, 13).

Lastly, successful SC relationships for RLM require *effective SC information sharing,* which can be important for the coordination of RL operations across the RSC (Lai *et al.* 2022:4). Without SC collaboration and integration, effective information exchange and communication between SC parties will be unlikely (Ahlén & Johansson, 2023:32). Additionally, effective SC information sharing requires an information system accessible by SC partners that allows for efficient sharing of product return information (Meyer *et al*. 2017:13). Principally, the development of effective SC relationships for successful RLM requires a holistic implementation of SC alignment, collaboration, integration and information sharing.

SC relationships in the form of collaboration, integration and information sharing can address several RLM *barriers,* including the (1) *economic barriers* of investment and financial constraints, (2) *operational barriers* of problems with product quality, limited visibility and forecasting (product return barriers), a lack of IT systems and a lack of infrastructure (operational support barriers) (Badenhorst, 2017:613), (3) *SC barriers* of a lack of support from SC partners, a lack of SC collaboration and poor SC information sharing (Ahlén & Johansson, 2023:32; Badenhorst, 2017:611), and (4) *consumer behaviour barrier* of fraudulent return behaviour (Zhang *et al.* 2023:7). Consequently, SC relationships for RLM can help mitigate *financial risks* (i.e. lack of financial resources and high costs) (section 2.3.1.3), *operational risks* (i.e. demand and forecast, product quality, technology, data management and inventory risks) (section 2.3.2.3) and *external risks* (i.e. SC and outsourcing risks) (section 2.3.4.4).

Moreover, effective SC relationships for successful RLM can result in various beneficial *outcomes,* including the (1) *economic outcomes* of cost savings and reductions (Ahlén & Johansson, 2023:32; Badenhorst, 2022:330; Mostert *et al.* 2017:13), enhanced financial performance (Dapiran & Kam, 2017:835) and higher economic value recovery (Pal, 2017:865), (2) *operational outcomes* of improved operational efficiency and effectiveness (Ahlén & Johansson, 2023:32; Dapiran & Kam, 2017:835), enhanced product return visibility (Meyer *et al.* 2017:13; Wang, Wang *et al.* 2021:67), speedy RL processes and product return reduction (Mostert *et al.* 2017:1, 13), (3) *organisational outcome* of improved RL performance (Wang, Wang *et al.* 2021:70), (4) *environmental outcome* of improved environmental performance (Pal, 2017:883), (5) *social outcome* of enhanced corporate

image (Pal, 2017:865), (6) *market-related outcome* of increased consumer satisfaction (Lai *et al.* 2022:4; Mostert *et al.* 2017:13; Pal, 2017:865), and (7) *SC outcomes* of improved SC communication (Mostert *et al.* 2017:13), enhanced SC visibility and performance (Wang, Wang *et al.* 2021:67) and improved SC coordination (Lai *et al.* 2022:4).

Essentially, the development of effective SC relationships through SC alignment, collaboration, integration and information sharing can be important for successful RLM. Additionally, SC relationships for RLM can address various barriers and realise several outcomes, which can be important for the online retailers as well as the overall SC. In the next section, the final success factor of consumer relationships will be discussed.

2.5.5.3 Consumer relationships for RLM

According to Karlsson *et al.* (2023:8), online retailers must move away from only focusing on cost efficiencies and return avoidance and instead move towards a consumer-centric orientation for RLM. In fact, Wang, Dang *et al.* (2021:14) found that consumer engagement and information sharing are key determinants of RLM in online retailing. Subsequently, successful RLM in online retailing requires the establishment of consumer relationships. Several requirements and practices can be important for consumer relationships, including (1) adopting and implementing a consumer-centric approach, (2) consumer integration and collaboration, and (3) consumer information sharing and communication.

Adopting a consumer-centric approach involves offering a differentiated service to consumers for effective RLM (Karlsson *et al.* 2023:8). Specifically, a consumer-centric approach means that online retailers focus service efforts on enhancing consumer experience (Dobson, 2023:4; Karlsson *et al.* 2023:8) and meeting their expectations (Hjort *et al.* 2019:774). In the return process, consumer generally expect *accessibility* (Jalil, 2019:7), *responsiveness* (Lin & Hsu, 2017:219), *convenience* (Eriksson & Käck, 2023:25; Triani *et al.* 2019:469), *detailed information* (Triani *et al.* 2019:469), *transparency* (Eriksson & Käck, 2023:25; Hjort *et al.* 2019:774), *speedy return processes* (Hjort *et al.* 2019:774) and *flexibility* (De Borba *et al.* 2021:137). Additionally, online retailers must focus on intangible elements, like demonstrating *empathy and care*, which can be important service elements in the return process (Sajjanit & Rompho, 2019:789).

However, the adoption of a *consumer-centric approach* requires the *implementation* of several practices, including (1) functional integration and collaboration (Karlsson *et al.* 2023:8), (2) investment in an effective consumer return service (Nel & Badenhorst, 2020:127), (3) establishment of a consumer support system (Triani *et al.* 2019:471), (4) dedicated consumer service staff and (5)

maintenance of good consumer relationships (Davidavičienė & Al Majzoub, 2021:4). Additionally, online retailers must develop an understanding of consumer return behaviour, which can be essential for successful consumer service in RLM (Ashan & Raham, 2021:151). Particularly, understanding consumer return intentions and behaviours can help online retailers to improve their product return services, which can lead to a superior return service that benefit both consumers and online retailers (Ashan & Raham, 2021:151, 154; De Borba *et al.* 2021:137).

Like functional and SC relations success factors (sections 2.5.5.1 and 2.5.5.2), effective consumer relationships for RLM require *consumer integration* and *collaboration.* Consumer integration involves the alignment of consumer needs and values (Eriksson & Käck, 2023:25; Mostert *et al.* 2017:10) and aiding consumers with problems in the return process through effective communication and information sharing (Mostert *et al.* 2017:10). In terms of collaboration, online retailers must encourage consumer participation in the return process to create a service-driven return process (Sajjanit & Rompho, 2019:790). Additionally, like consumer integration, consumer collaboration involves information sharing and helping consumers make informed purchase decisions to avoid consumer dissatisfaction as well as unnecessary returns (Ahlén & Johansson, 2023:31). In essence, consumer integration and collaboration are the foundation of effective engagement, communication and information sharing with consumers before and during the return process, aiming to offer consumers a high-quality service and experience.

Subsequently, the most important elements of effective consumer relationships for RLM involves *consumer information sharing* and *communication,* taking place before, during and after the return process. Consumer information sharing and communication before the return process can take place pre-purchase and post-purchase. *Pre-purchase information sharing* and *communication* relate to return avoidance and prevention practices by educating consumers about product details for more informed purchase decisions (Mostert *et al.* 2017:10). Additionally, through a consumer support function on the online shopping site, online retailers can provide uncertain consumers with information about the return policy and procedures, making it more comfortable and easier if they decide to return the product (Triani *et al.* 2019:471). Therefore, online retailers must effectively communicate the return policy and procedures during the online shopping process (Zhang *et al.* 2023:10). Similarly, for effective *post-purchase information sharing* and *communication*, the return policies and conditions must be available at obvious locations on the shop platform (Zhang *et al.* 2017:157). Additionally, online retailers must provide clear return instructions on requesting a return, shipping options and other requirements (e.g. packaging and labelling requirements) (Fox, 2023:19), which can be supplemented with a flow map of the return process (Zhang *et al.* 2017:157). Therefore, consumer information sharing and communication must aim at increasing consumer awareness about

return and refund options (Mathu & Khunou, 2021:443) and providing consumers with a better understanding about the return process (Nel & Badenhorst 2020:127).

Furthermore, online retailers must continue *information sharing and communication during the return process* by providing full transparency about every RL process and activity (Eliav, 2022:3), using various communication channels, like email, Facebook Messenger, SMS and WhatsApp (Dobson, 2023:8). Specifically, effective information sharing and communication during the return process can include (1) prompt and professional responses about product return queries and concerns (Fox, 2023:19), (2) a notification that confirms pick-up (Eliav, 2022:3), (3) return tracking information (Dobson, 2023:8; Fox, 2023:19), (4) a notification that confirms receipt at the facility, (5) information about the estimated time of processing (Dobson, 2023:8) and (5) a notification that confirms reimbursement of a refund or shipment of an exchange (Fox, 2023:19; Eliav, 2022:3). Furthermore, for environmentally conscious consumers, online retailers can consider informing consumers about the repurposing or recycling of their returned products, emphasising their participation and contribution to sustainable practice (Eriksson & Käck, 2023:25). Lastly, *information sharing and communication after the return process* involve consumer feedback, which can be used for consumer service improvements in the return process (Jenkins, 2021:5; Lamba *et al.* 2020:388).

In terms of addressing the *barriers in RLM* through consumer relationships, online retailers can address the *economic barriers* related to investments, lack of economies of scale and high costs (financial constraints and risks), and the *SC barrier* related to poor SC coordination (Ahlén & Johansson, 2023:32). Furthermore, based on the practices and outcomes, online retailers can potentially address the (1) *operational barriers* of product returns (i.e. poor forecasting and limited visibility) and operational risks (i.e. demand and forecast risks) (section 2.3.2), (2) *organisational barrier* of function (i.e. lack of functional integration) (section 2.3.3.3), and (3) *external barriers* of consumer behaviour and external risks (i.e. market risks) (section 2.3.4).

Apart from successful RLM, the establishment of effective consumer relationships can result in various outcomes, including the (1) *economic outcomes* of cost reductions (De Borba *et al.* 2021:137), increased profitability (Bozzi *et al.* 2022:16) and economic value recovery (Ashan & Rahman, 2021:154), (2) *operational outcomes* of improved RL process efficiency (Ahlén & Johansson, 2023:31; De Borba *et al.* 2021:137), improved return forecasting (De Borba *et al.* 2021:137) and product return reduction (Ahlén & Johansson, 2023:31; Mostert *et al.* 2017:10; Nel & Badenhorst, 2020:127), (3) *organisational outcome* of improved RL performance (Davidavičienė & Al Majzoub, 2021:19), (4) *environmental outcome* of enhanced environmental performance (Eriksson & Käck, 2023:25), (5) *social outcomes* of enhanced corporate image (Eriksson & Käck, 2023:25;

Mathu & Khunou, 2021:443), green image (Eriksson & Käck, 2023:25) and reputation (Lin & Hsu 2017:219), (6) *market-related outcomes* of improved consumer service (Ashan & Raham, 2021:151; Davidavičienė & Al Majzoub, 2021:19; Lamba *et al.* 2020:338; Triani *et al.* 2019:469), increased competitive advantage (Dobson, 2023:8; Eriksson & Käck, 2023:25), met consumer needs (De Borba *et al.* 2021:137; Lai *et al.* 2022:4), and enhanced consumer satisfaction (Davidavičienė & Al Majzoub, 2021:19; Jalil, 2019:7), loyalty and retention (Dobson, 2023:4; Eliav, 2022:3; Eriksson & Käck, 2023:25), convenience (Triani *et al.* 2019:471), experience (Eriksson & Käck, 2023:25; Fox, 2023:19; Jenkins, 2021:5) and trust (Eliav, 2022:3; Eriksson & Käck, 2023:25; Triani *et al.* 2019:469), and (7) *SC outcomes* of improved SC coordination (Lai *et al.* 2022:4).

Essentially, the establishment of effective consumer relations through a consumer-centric approach, consumer integration and collaboration, and consumer information sharing and communication can be essential for successful RLM in online retailing. Additionally, consumer relationships for RLM confirms the economic, competitive, social and environmental significance of adopting RLM. Therefore, online retailers must focus on developing effective consumer relationships as a key RLM success factor to not only manage consumer returns effectively but also address several RLM barriers and realise various benefits. In the next section, the framework and summary of RLM success factors will be provided.

2.5.6 Summary of RLM success factors

Clearly, successful RLM contains various success factors, including strategic, design, resource, operational and relation success factors. RLM success factors involve several practices and requirements that can address various RLM barriers and realise numerous beneficial outcomes. Based on the literature study findings presented in section 2.5.6, Table 2.5, provides a summary of the success factors in RLM, including specific success factors, practices and requirements, addressed barriers, realised outcomes and literature sources.

Table 2.5 Success factors for effective RLM

STRATEGIC SUCCESS FACTORS FOR RLM				
SUCCESS FACTORS	**PRACTICES AND REQUIREMENTS**	**ADDRESS RLM BARRIERS**	**ACHIEVE OUTCOMES**	**SOURCES**
Strategic importance and commitment to RLM	***Adopt RLM orientation*** • Increase management attention and commitment • Enable resource commitment to RLM ***Adopt a holistic view of RLM*** • Enable the development of beneficial RLM strategies ***Recognise the advantages of RLM*** • Enhance top management commitment and support ***View RLM as a strategic asset***	***Economic barriers*** • Investment • Financial constraint • Financial risks ***Operational barriers*** • Product return • Operational support • Operational risk ***Organisational barriers*** • Management • Strategic planning,	***Economic outcomes*** • Profits • Cost savings • Improve bottom line ***Operational outcomes*** • RL process efficiency • Improve forecasting ***Organisational outcomes*** • Performance monitoring and evaluation • Improve RL performance	Ahlén and Johansson (2023) Andresen and Istad (2019) Badenhorst (2017) Chen *et al.* (2017) Chileshe *et al.* (2018) De Borba *et al.* (2020) Elive (2022) Frei *et al.* (2020)

	• RLM as part of consumer acquisition and retention • Enable an understanding of consumer behaviours and intention • Recognise impact on triple bottom line ***Involve senior management*** • Provide clear vision for RLM implementation • Develop strategic and tactical plans for RLM • Oversee RL function • Report to board of directors for returns to form part of corporate decision making	policy and control • Functional • Organisational risks ***External barriers*** • SC • Consumer behaviour • External risks	***Social outcomes*** • Enhance social responsibility • Enhance corporate image ***Market-related outcomes*** • Consumer satisfaction and loyalty • Improve consumer relationships • Competitive advantage ***SC outcome*** • Enhance SC competitiveness	Karlsson *et al.* (2023) Le (2023) Makaleng and Hove-Sibanda (2022) Pathak *et al.* (2020) Pramono *et al.* (2021) Ratchford *et al.* (2022) Schooling (2023)
Strategic implementation of RLM	***Strategically implement RLM inhouse*** • Full RLM responsibility and control ***Strategically implement RLM through outsourcing*** • RLM responsibility with 3PRL provider • Facilitate proper RL implementation and resource utilisation ***Perform a cost benefit analysis*** • Identify cost criteria • Identify benefit criteria ***Consider strategic implications and requirements of outsourcing*** • Impact on SC control • Impact on strategic decisions • Outsourcing decision must align with mission, goals and growth of organisation ***Strategically select the 3PRL provider*** • Identify selection criteria for best partner • Evaluate available 3PRLs to select a partner that offers the most value	***Economic barriers*** • Investment • Financial constraint • Financial risks ***Operational barriers*** • Product return • Operational support • Operational risk ***Organisational barriers*** • Management • Strategic planning, policy and control • Functional • Organisational risks ***External barriers*** • SC • External support • External risks	***Economic outcomes*** • Cost savings • Cost effectiveness and efficiency • Profits • Lower investment costs • Reduce assets • Economies of scale ***Operational outcome*** • Streamlined RL process ***Organisational outcomes*** • Focus on core competency • Effective management of returns • Reduce resources and risks ***Environmental outcomes*** • Environmental protection ***Social outcomes*** • Green image • Stakeholder satisfaction ***Market-related outcomes*** • Increase sales and market share • Increase consumer satisfaction • Competitive advantage	Anderson (2020) Andresen and Istad (2019) Badenhorst (2017) Davidavičienė and Al Majzoub (2021) Gu *et al.* (2019) Lamba *et al.* (2020) Le (2023) Prajapati *et al.* (2021) Sackos (2022) Tavana *et al.* (2016) Tombido *et al.* (2018) Wang, Dang *et al.* (2021)
RL strategies and systems	***Develop a strategic plan for RLM*** • Determine the strategic goals, • Envisaged strategy for returns • Consider the impact of returns on stakeholders • Include strategic plan for RLM into overall organisational strategic plan ***Develop a well-planned RL strategy*** • Focus must be on RL and marketing interface • Focus on the return policy • Focus on disposition strategies and strategic use of tactical recovery activities ***Create a well-developed RL system*** • Important for successful return processes • Focus on developing an efficient and cost-effective RL system	***Economic barriers*** • Financial constraint • Financial risks ***Operational barriers*** • Product return • Operational support • Operational risk ***Organisational barriers*** • Management • Strategic planning, policy and control • Organisational risks ***External barriers*** • SC • External risks	***Economic outcomes*** • Profits • Cost savings and effectiveness • Value and asset recovery • Improve bottom line ***Operational outcome*** • Enhance RL process efficiency • Increase RL process speed ***Organisational outcome*** • Improve performance ***Environmental outcomes*** • Reduce raw material use • Enhance sustainability • Compliance with legislation ***Social outcomes*** • Enhance corporate image and reputation ***Market-related outcomes*** • Increase market share and opportunities • Competitive advantage • Enhance consumer service • Consumer satisfaction	Anderson (2020) Ahsan and Rahman (2022) Badenhorst (2017) Chen *et al.* (2017) Davidavičienė and Al Majzoub (2021) Hjort *et al.* (2019) Le (2023) Phuong (2019) Prajapati *et al.* (2021) Ravi and Shankar (2015) Sajjanit and Rompho (2019) Xu (2019)
DESIGN SUCCESS FACTORS FOR RLM				
SUCCESS FACTORS	**PRACTICES AND REQUIREMENTS**	**ADDRESS RLM BARRIERS**	**ACHIEVE OUTCOMES**	**SOURCES**
Return policy design for RLM	***Well-designed return policy requires strategic alignment with RL strategies*** • Align with strategic objectives and RL strategy to achieve RL goals ***Well-designed return policy must be clear*** • Consider consumer behaviour and impact	***Economic barriers*** • Financial constraint • Financial risks ***Operational barriers*** • Product return • Operational risks	***Economic outcome*** • Higher profits ***Operational outcomes*** • RL process efficiency • Reduce RL process cycle time • Reduce fraudulent returns	Ahlén and Johansson (2023) Andresen and Istad (2019) Badenhorst (2016) Dapiran and Kam

	on RLM performance • Easy, hassle-free and flexible policy with clear information about RL processes and terms and conditions of returns • Helps consumers to understand their roles and responsibilities ***Well-design return policy must consider the level of leniency and strictness*** • Requires cross-functional collaboration • Consider the costs versus benefits of lenient and strict policies • Generous return policy as part of the service offering of the online retailers • A lenient return policy requires consideration of the way returns must be handled to ensure value recovery.	***Organisational barriers*** • Strategic planning, policy and control ***External barriers*** • Consumer behaviour • External risks	***Organisational outcome*** • Improve RL performance ***Social outcome*** • Good reputation ***Market-related outcomes*** • Increase sales • Competitive advantage • Enhance consumer satisfaction • Enhance loyalty and trust • Demand satisfaction	(2017) Das *et al.* (2020) Davidavičienė and Al Majzoub (2021) Dobson (2023) Heyns and Kilbourn (2022) Hjort *et al.* (2019) Jalil (2019) Karlsson *et al.* (2023) Lin and Hsu (2017) Makaleng and Hove-Sibanda (2022) Nel and Badenhorst (2020) Oghazi *et al.* (2018)
Return process design for RLM	***Well-designed return process must be formalised*** • Written policies • Document procedures • Job descriptions • Flow charts • Developed by experienced managers • Enable staff to understand their roles ***Well-designed return process must be clear and consumer centric*** • User-friendly and hassle-free return process • Minimise consumer effort • Fewer gatekeeping rules • Speedier return resolution and restocking • Offer consumer various return options ***Well-designed return process must be streamlined*** • Important for overall speed and efficiency • Automate pre-receipt return processes	***Economic barriers*** • Financial constraint • Financial risks ***Operational barriers*** • Product return • Operational risks ***Organisational barriers*** • Management • Functional ***External barriers*** • SC • Consumer behaviour • External risks	***Economic outcome*** • Cost savings and reduction • Higher profits • Financial control ***Operational outcomes*** • RL process efficiency • Speedy return process • Reduce returns ***Environmental outcomes*** • Reduce environmental impact ***Social outcomes*** • Enhance green image ***Market-related outcomes*** • Competitive advantage • Increase sales • Increase consumer satisfaction • Increase consumer loyalty and trust • Consumer retention • Improve consumer service ***SC outcomes*** • Enhance SC visibility • Reduce SC uncertainties	Ahsan and Rahman (2022) Badenhorst (2017) Castillo (2023) Das *et al.* (2020) Davidavičienė and Al Majzoub (2021) De Araújo (2018) Ermes and Niemann (2023) Frei *et al.* (2020) Heyns and Kilbourn (2022) Hjort *et al.* (2019) Jenkins (2021) Nel and Badenhorst (2020) Phuong (2019) Ramana *et al.* (2023) Sackos (2022) Solati *et al.* (2023) Wang, Dang *et al.* (2021) Wang, Wang *et al.* (2021)
RL network design for RLM	***RL network design requirements*** • Commit resources • Network technology and CRM software • Coordination with consumers • Robust • Eco-friendly ***Identification of the network design type*** • Centralised versus decentralised • Network type influenced by return reasons • Decentralised for speed and efficiency • Centralised for economies of scale ***Identification of facility locations and types*** • Focus on consumer responsiveness and flexibility • Integrated hybrid facility for RL and FL processes and sharing of resources • Dedicated RL facility at main facility for efficiency and scale • Centralised return centre (CRC) specialises in RL processing and provides information on poor quality products/suppliers and performance • CRC enables cost savings and scale but increases product return lead-time	***Economic barriers*** • Financial constraint • Financial risks ***Operational barriers*** • Product return • Operational support • Operational risk ***Organisational barriers*** • Management • Strategic planning, policy and control • Functional • Organisational risks ***External barriers*** • SC • External support • External risks	***Economic outcomes*** • Cost savings • Higher profits • Cost effectiveness • Economies of scale • Optimised value recovery ***Operational outcomes*** • Reduce product return uncertainty • Operational efficiency • Speedy returns and shorter lead times • Increase RL flexibility ***Organisational outcomes*** • Improve performance evaluation ***Environmental outcomes*** • Reduce environmental pollution ***Market-related outcomes*** • Increase consumer convenience • Enhance consumer responsiveness • Improve consumer coordination and communication ***SC outcomes*** • Improve SC information sharing	Andresen and Istad (2019) Bozzi *et al.* (2022) Dapiran and Kam (2017) Das *et al.* (2020) Hjort *et al.* (2019) Karlsson *et al.* (2023) Le (2023) Meyer *et al.* (2017) Misni and Lee (2017) Wang, Wang *et al.* (2021)

RESOURCE SUCCESS FACTORS FOR RLM				
SUCCESS FACTORS	**PRACTICES AND REQUIREMENTS**	**ADDRESS RLM BARRIERS**	**ACHIEVE OUTCOMES**	**SOURCES**
Resource commitment and investments for RLM	***Financial resource commitment*** • Important for well-functioning and well-managed RL process • Support information, infrastructure and labour requirements • Important for appropriate IT use and cross-functional integration • Consistently devote capital resources ***Commitment and investment of IT resources*** • Important for the return complexity and uncertainty • Invest in hardware and software ***Infrastructure investment*** • Right infrastructure required for efficiency and effectiveness • Important for RL performance ***Human resource commitment and investment*** • Important for financial performance • Managerial resources required for effective use of IT resources and functional integration	***Economic barriers*** • Investment • Financial risks ***Operational barriers*** • Product return • Operational support • Operational risk ***Organisational barriers*** • Functional barriers • Organisational risks ***External barriers*** • SC • External risks	***Economic outcomes*** • Cost savings and reductions • Increase revenue/profits • Increase cost control • Increase asset recovery • Reduce investment in inventory ***Operational outcomes*** • RL process efficiency • Enhance product return visibility • Reduce product returns ***Organisational outcomes*** • Improve RL performance • Improve internal communication and integration ***Market-related outcomes*** • Improve consumer responsiveness	Abdulrahman *et al.* (2014) Ahsan and Rahman (2022) Andresen and Istad (2019) Badenhorst (2016) Badenhorst (2017) Davidavičienė and Al Majzoub (2021) Frei *et al.* (2020) Jenkins (2021) Jović *et al*. (2020) Kaynak *et al.* (2014) Le (2023) Lin and Hsu (2017) Meyer *et al*. (2017) Misni and Lee (2017) Nel and Badenhorst (2020) Ravi and Shankar (2015)
IT resources for RLM	***Functionalities of appropriate IT*** • State-of-the art with tracking and tracing capabilities • Facilitate integration, communication and real-time information sharing • Ability to integrate with website • Provide high quality and quantity information • Support decision-making • Support performance measurement • Support gatekeeping and return avoidance • Capability to capture and analyse data ***Types of IT resources for implementation*** • Requires computer hardware, networks, software and electronic database • Dedicated return software and information systems, like RMS, to automate returns • Return tracking and RFID technologies for tracking and product identification • Internet of Things for tracking in real-time • Web-based systems for shopping assistance • Blockchain for tracking, monitoring and fraud • Traditional technologies, like ERP, EDI, CRM system, SCM system, and WMS	***Economic barriers*** • Investment • Financial constraint • Financial risks ***Operational barriers*** • Product return • Operational support • Operational risk ***Organisational barriers*** • Strategic planning, policy and control • Functional ***External barriers*** • SC • Consumer behaviour • External risks	***Economic outcomes*** • Cost savings ***Operational outcomes*** • RL process efficiency and effectiveness • Speedy returns and disposition • Improve inventory management and reduce pilferage • Improve product return visibility • Improve product return reduction, control and monitoring ***Organisational outcomes*** • Improve RL performance • Improve RL decision making • Improve information management • Improve internal coordination and information sharing • Improve performance measurement ***Market-related outcomes*** • Improve consumer service • Enhance consumer experience ***SC outcomes*** • Improve SC coordination • Improve SC communication and information sharing	Ahlén and Johansson (2023) Ahsan and Rahman (2022) Badenhorst (2016) Biswas and Abdul-Kader (2018) Bozzi *et al.* (2022) Dapiran and Kam (2017) Davidavičienė and Al Majzoub (2021) Fox (2023) Frei *et al.* (2020) Hjort *et al.* (2019) Jović *et al*. (2020) Karlsson *et al*. (2023) Ravi and Shankar (2015) Robertson *et al.* (2020) Shih *et al.* (2021) Starostka-Patyk (2021) Zhang *et al.* (2017)
Human resource development for RLM	***Staff training*** • RL training important on all organisational levels • Staff training in RL important for the handling of product returns • Train staff to communicate with consumers and understand RL processes • Train staff to provide exceptional consumer service • Train staff to conduct gatekeeping • Train staff to use IT appropriately • Train staff to conduct good inspection and disposition of returns • Train staff to identify fraud ***Skilled staff*** • Managers and staff require knowledge and	***Economic barriers*** • Investment • Financial constraint ***Operational barriers*** • Product return • Operational risk ***Organisational barriers*** • Management • Strategic planning, policy and control • Functional barriers • Organisational risks ***External barriers*** • SC • Consumer behaviour • External risks	***Economic outcomes*** • Enhance economic performance • Cost savings • Increase profits • Improve asset recovery ***Operational outcomes*** • RL process efficiency • Speedy RL process • Reduce return lead time • Reduce product returns • Reduce fraudulent returns ***Organisational outcomes*** • Improve performance measuring • Improve staff compliance ***Environmental outcomes*** • Enhance environmental	Ahsan and Rahman (2022) Andresen and Istad (2019) Badenhorst (2017) Bozzi *et al.* (2022) Dapiran and Kam (2017) Davidavičienė and Al Majzoub (2021) De Araújo *et al.* (2018) Fox (2023) Karlsson *et al.* (2023) Lai *et al.* (2022)

	skills for RLM • Skilled staff can facilitate product returns and disposition • Skilled staff can practice gatekeeping and facilitate speedy returns processing • Skilled staff can practice service recovery • Skilled staff can analyse product return data and assess RL performance		performance ***Market-related outcomes*** • Enhance consumer experience, service and communication ***SC outcomes*** • Benefit suppliers	Lamba *et al.* (2020) Le (2023) Meyer *et al.* (2017) Mostert *et al.* (2017) Nel and Badenhorst (2020) Pal (2017) Pranomo *et al.* (2021) Zailani *et al.* (2017) Zhang *et al.* (2023)
OPERATIONAL SUCCESS FACTORS FOR RLM				
SUCCESS FACTORS	**PRACTICES AND REQUIREMENTS**	**ADDRESS RLM BARRIERS**	**ACHIEVE OUTCOMES**	**SOURCES**
Performance management	***Performance management requirements*** • Performance measurement system • RL information systems • Internal integration • Skilled staff and managers ***Performance focus areas*** • Consumers • Service performance and efficiency • Costs and strategic intent • Return policy and process design ***Development and capabilities of appropriate metrics*** • Product return rate, reasons and types • Return cost metrics • Consumer service and efficiency metrics • Capable of measure, track and evaluate • Facilitate cost savings and improvement opportunities • Help understanding the return process • Help with follow up of responsiveness and efficiency ***Performance monitoring, evaluation and improvement*** • Constant monitoring and evaluation for improvements • Use return tracking, consumer feedback and performance audit to monitor RL • Report to senior management • Perform profit and loss analysis • Conduct annual performance evaluation and examination of RL metrics	***Economic barriers*** • Investment • Financial constraint • Financial risks ***Operational barriers*** • Product return • Operational support ***Organisational barriers*** • Management • Strategic planning, policy and control • Functional ***External barriers*** • Consumer behaviour • External risks	***Economic outcomes*** • Cost savings • Improve financial control ***Operational outcomes*** • RL process efficiency • Speedy returns • Reduce fraudulent returns ***Organisational outcomes*** • Organisational and RL improvement • Enhance performance measurement, monitoring and management • Improve internal coordination ***Market-related outcomes*** • Enhance consumer responsiveness • Enhance consumer satisfaction and loyalty	De Araújo *et al.* (2018) Euchi *et al.* (2019) Fox (2023) Frei *et al.* (2020) Jalil (2019) Jenkins (2021) Karlsson *et al.* (2023) Lamba *et al.* (2020) Nel and Badenhorst (2020) Sajjanit and Rompho (2019)
Return avoidance and prevention practices	***General pre-sales return avoidance and prevention*** • *Adequate pre-purchase information* – detailed product descriptions, good photos, videos and accurate size guides • *Marketing measures* – target correct consumer, promotions, online reviews, chatbots, support emails and FAQs • *Logistics efficiency* – improve purchases, reduce picking and delivery errors and use correct packaging • *Quality management* and control ***General post-sales return avoidance and prevention*** • *Establish a gatekeeping function during the return process* • Requires information system and PM • Engage with consumer through home visits • Early crediting and discount negotiations • *Use data sources, feedback and quality improvements* • Use consumers as sources of data	***Economic barriers*** • Investment • Financial constraint • Financial risks ***Operational barriers*** • Product return • Operational support • Operational risk ***Organisational barriers*** • Management • Strategic planning, policy and control • Functional • Organisational risks ***External barriers*** • SC • Consumer behaviour • External risks	***Economic outcomes*** • Cost savings • Increase profitability • Improved financial performance ***Operational outcomes*** • RL process and operational efficiency • Increase RL process speed • Enhance product return visibility • Improve inventory management • Reduce product and fraudulent returns ***Organisational outcomes*** • Improve RL performance and decision making • Improve information management • Improve internal communication, information sharing and collaboration ***Environmental outcomes*** • Decrease pollution • Reduce waste ***Social outcomes***	Ahsan and Rahman (2022) Anderson (2020) Andresen and Istad (2019) Badenhorst (2016) Bozzi *et al.* (2022) Chen *et al.* (2017) Gustafsson *et al.* (2021) Davidavičienė and Al Majzoub (2021) De Araújo *et al.* (2018) Dobson (2023) Eriksson and Käck (2023) Euchi *et al.* (2019) Fox (2023) Frei *et al.* (2020) Hjort *et al.* (2019) Jović *et al.* (2020) Karlsson *et al.* (2023)

	• Listen to consumer feedback • Use data to improve inefficiencies • Product quality control systems and supplier information sharing to improve product quality ***Specialised return avoidance and prevention*** • *Sophisticated IT systems* • Pre-sales shopping assistance through sophisticated web-based systems • RFID to verify the accuracy of the claim • Blockchain confirms authenticity of product and verify return claim • RMS identify returns trends • Sophisticate returns portal to identify return abusers • *Data analytics and analysis* • Statistical algorithms and experience tools for fraud detection • Enables fraud countermeasures • *Adjust return policy* – reduce return time and adapt refund terms • *Human interventions* • Establish a return prevention team • Conduct regular fraud detection training • Involve senior management and share information with other functions		• Improve reputation ***Market-related outcomes*** • Enhance consumer service and experience • Increase consumer satisfaction and loyalty • Improve consumer engagement • Enhance consumer value ***SC outcomes*** • Improve SC information sharing and collaboration	Li *et al.* (2021) Mahindroo *et al.* (2018) Meyer *et al.* (2017) Nel and Badenhorst (2020) Robertson *et al.* (2020) Vlachos (2016) Zhang *et al.* (2017) Zhang *et al.* (2023) Shih *et al.* (2021) Bernon *et al.* 2016
Risk management	***Risk identification*** • Identify all risk that can hamper RLM • Helps to identify risk mitigation strategies ***Risk classification and assessment*** • Group risk for fewer mitigation strategies • Rank and prioritise risk based on highest probability and greatest loss potential • Mitigate highest risk first, then medium and low risks ***Risk mitigation strategies*** • *Proactive risk mitigation* – before risk event • Top management support • Appropriate IT for visibility, tracking, inventory and information security • Return inspection reduce quality risks • Return prevention through improved quality checks and better packaging • Establish risk procedures • Skilled staff • Organisational culture shift to a problem-solving culture • Robust network for efficient returns • SC relationships to share risks, resources and expertise • *Reactive risk mitigation* – after risk event • Return avoidance to reduce return accommodations • RL team to manage risks	***Economic barriers*** • Investment • Financial constraint • Financial risks ***Operational barriers*** • Product return • Operational support • Operational risk ***Organisational barriers*** • Management • Strategic planning, policy and control • Functional • Organisational risks ***External barriers*** • SC • Consumer behaviour • External risks	***Economic outcomes*** • Cost savings • Increase profits • Higher recovery value • Reduce capital expenditure and financial loss ***Operational outcomes*** • RL process efficiency • Enhance product return visibility and tracking • Improve inventory management • Reduce pilferage • Reduce fraudulent and product returns ***Organisational outcomes*** • Improve RL decision making ***Environmental outcomes*** • Improve environmental performance ***Market-related outcomes*** • Increase sales and market share • Increase competitive advantage • Increase consumer service, loyalty and retention ***SC outcomes*** • Improve SC communication and information sharing • Improve SC collaboration	Ermes and Niemann (2023) Frei *et al.* (2020) Misni and Lee (2017) Panjehfouladgaran and Lim (2020) Senthil *et al.* (2018) Starostka-Patryk, (2021)

RELATIONSHIP SUCCESS FACTORS FOR RLM

SUCCESS FACTORS	PRACTICES AND REQUIREMENTS	ADDRESS RLM BARRIERS	ACHIEVE OUTCOMES	SOURCES
Functional relationships for RLM	***Organisational structure*** • Focus on needs of staff, operations and capacities • Adaptability approach with managers acting as facilitators and empower RL staff to self-organise, share information and obtain new knowledge ***Organisational culture*** • Supportive culture to promote functional	***Operational barriers*** • Product return • Operational support • Operational risk ***Organisational barriers*** • Management • Strategic planning, policy and control	***Operational outcomes*** • Improve RL process effectiveness • Increase product return visibility and tracking • Reduce product returns ***Organisational outcomes*** • Improve RL performance • Improve RL planning and control	Ashan and Rahman, (2021) Badenhorst (2017) Davidavičienė and Al Majzoub (2021) Espinosa *et al.* (2021) Karlsson *et al.* (2023)

	relationships and integration • Top management and senior managers must be responsible for a supportive culture ***Functional integration*** • Requires top management commitment • Requires close functional relationships • Increase information visibility and develop cross-functional processes • Share cross-functional goals • Use centralised IT system • Integrate FL and RL functions • Integrate RL, marketing and procurement ***Internal information sharing*** • Use centralised IT and alignment of goals • Use technology like Internet of Things • Use emails, messaging applications and cross-functional meetings	• Functional • Organisational risks ***External barriers*** • SC • External risks	• Improve information management • Improve internal coordination and communication ***Environmental outcomes*** • Increase environmental performance ***Social outcomes*** • Improve corporate image ***Market-related outcomes*** • Enhance consumer satisfaction • Increase consumer convenience • Improve consumer service • Competitive advantage ***SC outcomes*** • Improve SC coordination and communication	Mostert *et al.* (2017) Pal (2017) Phuong (2019) Sajjanit and Rompho (2019) Vlachos (2016) Waqas *et al.* (2018)
SC relationships for RLM	***SC alignment*** • Requires sharing of RLM responsibilities, integrated IT, common return policies and PM, standard procedures, information sharing and joint negotiations ***SC collaboration*** • Requires information sharing, cooperative policies and integrated IT • Establish collaborative partnerships to match resources and RLM capabilities ***SCI*** • RL process involves various SC parties from various geographical regions • SCI requires SC alignment and collaboration • Create contracts that stipulates RL responsibilities • Standardise processes, train staff, conduct meetings, share RL information and product return data exchange through IT ***SC information sharing*** • Important for coordination across the SC • Requires SCI and collaboration • Requires accessible IT for RL information sharing	***Economic barriers*** • Investment • Financial constraint • Financial risks ***Operational barriers*** • Product return • Operational support • Operational risk ***External barriers*** • SC • Consumer behaviour • External risks	***Economic outcomes*** • Cost savings and reduction • Enhance financial performance • Higher economic value recovery ***Operational outcomes*** • Improve operational efficiency and effectiveness • Enhance product return visibility • Enhance RL process speed • Reduce returns ***Organisational outcomes*** • Improve RL performance ***Environmental outcomes*** • Improve environmental performance ***Social outcomes*** • Enhance corporate image ***Market-related outcomes*** • Increase consumer satisfaction ***SC outcomes*** • Improve SC communication and coordination • Enhance SC visibility and performance • Effective SC collaboration and integration	Dapiran and Kam (2017) Badenhorst (2022) Mahadevan (2019) Ahlén and Johansson (2023) Frei *et al.* (2020) Pal (2017) Wang, Wang *et al.* (2021) Ashan and Rahman, (2021) Badenhorst (2017) Mostert *et al.* (2017) Lai *et al.* (2022) Meyer *et al*. (2017) Zhang *et al.* (2023)
Consumer relationships for RLM	***Adopt a consumer-centric approach*** • Offer a differentiated service in RL • Focus on consumer experience and expectations – access, responsiveness, detailed information, transparency, speed returns, flexibility and empathy • Requires function integration • Invest in consumer return service • Establish a consumer support system • Dedicated staff • Maintenance of good consumer relations • Understand consumer behaviours ***Consumer integration and collaboration*** • Align with consumer values and needs • Aid consumers through effective information sharing and communication • Encourage consumer participation ***Consumer information sharing and communication*** • *Pre-purchase* – educate consumers on purchases and use support system with details about the return policy • *Post-purchase* – return policies and procedures clearly available on website,	***Economic barriers*** • Investment • Financial constraint • Financial risks ***Operational barriers*** • Product return • Operational risk ***Organisational barriers*** • Functional ***External barriers*** • SC • Consumer behaviour • External risks	***Economic outcomes*** • Cost reduction • Increase profitability • Increase economic value recovery ***Operational outcomes*** • RL process efficiency • Improve forecasting • Reduce returns ***Organisational outcomes*** • Improve RL performance ***Environmental outcomes*** • Enhance environmental performance ***Social outcomes*** • Enhance corporate • Enhance green image • Enhance reputation ***Market-related outcomes*** • Improve consumer service • Competitive advantage • Meet consumer needs • Enhance consumer satisfaction • Enhance consumer loyalty and retention	Ahlén and Johansson (2023) Ashan and Raham (2021) Bozzi *et al.* (2022) Davidavičienė and Al Majzoub (2021) De Borba *et al.* (2021) Dobson (2023) Eliav (2022) Eriksson and Käck (2023) Fox (2023) Hjort *et al.* (2019) Jalil (2019) Jenkins (2021) Karlsson *et al.* (2023) Lai *et al.* (2022) Lamba *et al.* (2020) Lin and Hsu (2017) Mathu and Khunou (2021) Mostert *et al.* (2017)

	provide instructions about the return process and a return flowchart • *During the return process* • Full transparency during all RL stages • Use various communication channels • Provide prompt professional assistance • Provide time estimates • Notify on pick-up, receipt and refund or exchange • Provide tracking information • *After return process* obtain feedback		• Enhance consumer trust • Enhance consumer experience and convenience ***SC outcomes*** • Improve SC coordination	Nel and Badenhorst (2020) Sajjanit and Rompho (2019) Triani *et al.* (2019) Wang, Dang *et al.* (2021) Zhang *et al.* (2017) Zhang *et al.* (2023)

Source: Compiled by the researcher

Table 2.5 shows that various success factors can be adopted to manage consumer returns. While the success factors involve various requirements, several RLM barriers can be mitigated and various outcomes can be realised. Most success factors can address economic, operational, organisational and external barriers and realise various economic, operational, organisational, environmental, social, market and SC outcomes. Therefore, identifying and adopting success factors can be important for the effective RLM of consumer returns in online retailing.

In the next section, an overview of the current knowledge and gaps in RL literature is provided.

2.6 CURRENT KNOWLEDGE AND GAPS IN RL LITERATURE

From the literature study, several observations can be made regarding the current body of knowledge and the gaps in research. Firstly, the literature contains various definitions of RL, some more narrow while others are more comprehensive in scope. However, the literature lacks definitions for the concept of RLM and important elements related to consumer satisfaction and service (see section 2.2).

Secondly, the literature identified several barriers to the adoption and implementation of RLM, especially economic, operational, organisational and external barriers (section 2.3). However, the literature lacks adequate discussion/cover of economic, operational, organisational and external risks that can hamper effective RLM. Additionally, more literature can be directed towards consumer behaviour as an RLM barrier in online retailing.

Thirdly, the literature identified various drivers and reasons that represent the significance of RLM, including economic, legislative, competitive, corporate citizenship and environmental drivers (section 2.4). However, more literature is needed to identify the impact of circular economic principles and the 4th industrial revolution in adopting RLM. Furthermore, the literature lacks economic, legislative, competitive, corporate citizenship and environmental issues from a South African perspective.

Finally, the literature identified several RLM practices and strategies that may help with effective RLM but lacks a comprehensive analysis of addressing RLM barriers and realising ways to achieve successful RLM (section 2.5). Additionally, the literature paid considerable attention to return policy design, implementation of appropriate return processes, IT resources, performance management, general return avoidance practices and SC relationships. However, limited literature identified and covered the implementation of strategic management, specialised return avoidance, risk management, internal relationship management and consumer relationships.

While RL literature contains comprehensive overviews of barriers, drivers and practices (success factors), it lacks focus on the barriers, drivers and success factors for the RLM of 'consumer returns in online retailing'. Therefore, this study contributes to the gaps in the literature by examining consumer returns, processes and practices for the effective RLM of consumer returns in online retailing.

In the next section, the conclusion of this chapter is provided.

2.7 CONCLUSION

This chapter addressed the first secondary research objective of this study, which was ***to examine RLM and determine the factors that influence RLM implementation and success (SRO-1).*** The objective was achieved through a literature study aimed at (1) conceptualising RLM, (2) providing a theoretical overview of RLM, (3) exploring the definitions of RL, (4) identifying the barriers to effective RLM and implementation, (5) understanding the significance of RLM adoption, and (6) identifying the success factors and outcomes of effective RLM. Additionally, the findings in this chapter contributed to the primary objective of the study, which was to *develop a framework for the effective RLM of consumer returns in online retailing*.

This chapter started with the introduction (section 2.1), which was followed by an overview of the various definitions of RL (section 2.2), whereafter the barriers in RLM (section 2.3), significance of RLM (section 2.4) and the success factors for effective RLM (section 2.5) were explored and discussed. The chapter concluded with an overview of current knowledge and gaps in RL literature (section 2.6). The overview of the *RL definitions* included (1) a table to provide various definitions of RL from various authors/scholars that ranged from general to specific, (2) a data matrix table to explore definition elements that occur in two or more RL definitions, (3) an analysis of the definition elements to provide a general and an extensive definition for RL, and (4) a final definition of RL with a focus on the effective RLM of consumer returns.

The *barriers in RLM* involved internal and external barriers, problems and risks that hampers effective RL implementation and management. From the literature study the barriers were classified and identified as the (1) economic barriers of investment, financial constraints and risks, (2) operational barriers of product returns, operational support and operational risks, (3) organisational barriers of management, strategy, policy and control, function and organisational risks, and (4) external barriers of SC, consumer behaviour, external support and external risks.

The *significance of RLM* involved a broad overview of the importance of RLM, and the expected benefits associated with RLM adoption, serving as a starting point to address RLM barriers. The significance of RLM was classified as (1) economic significance, (2) competitive significance, (3) social significance, (4) legal significance, and (5) environmental significance.

The *success factors of effective RLM* involved various practices and requirements that online retailers could implement to address the barriers in RLM, confirm the significance and benefits of RLM adoption, and realise various outcomes associated with effective RLM. The success factors for effective RLM were classified as the (1) strategic success factors of strategic importance and commitment to RLM, strategic implementation of RLM, and strategies and systems for RLM, (2) design success factors of return policy, return process and RL network design for RLM, (3) resource success factors of resource commitment and investment, IT resources and human resource development for RLM, (4) operational success factors of performance management, return avoidance and prevention, and risk management for RLM, and (5) relation success factors of functional, SC and consumer relationships for RLM.

Finally, the current and knowledge and gaps in RL literature were identified, focusing on RL definitions, barriers in RLM, significance of RLM and success factors for effective RLM. Essentially, it was identified that this study contributes the lack of literature on the RLM of consumer returns in online retailing.

In the next chapter (chapter 3), the research methodology for the qualitative content analysis (QCA) of RL literature will be provided.

Chapter 3 - Qualitative research design of the study and research methodology of qualitative content analysis (QCA)

3.1 INTRODUCTION

This chapter was divided into two parts, with the first part focusing on the overall qualitative research design of this study, and the second part focusing on the qualitative content analysis (hereafter QCA) of RL literature. Specifically, in the first part an overview and justification of the qualitative research design of this study will be given in terms of justifying qualitative research designs, challenges in qualitative research, research paradigm and assumptions, research approaches to theory development and multimethod qualitative research. Additionally, in the second part the methodology and application of the QCA of RL literature will be discussed in terms of an overview, characteristics, phases and trustworthiness of QCA. The third part of the research methodology of this study will be given in chapter 7, focusing on the research methodology for the interviews with industry experts.

Figure 3.1 outlines the main sections of chapter 3, which includes (1) the introduction (section 3.1), (2) the qualitative research design of this study (section **Error! Reference source not found.**), (3) the QCA of RL literature (section 3.3), and (4) the conclusion (section **Error! Reference source not found.**).

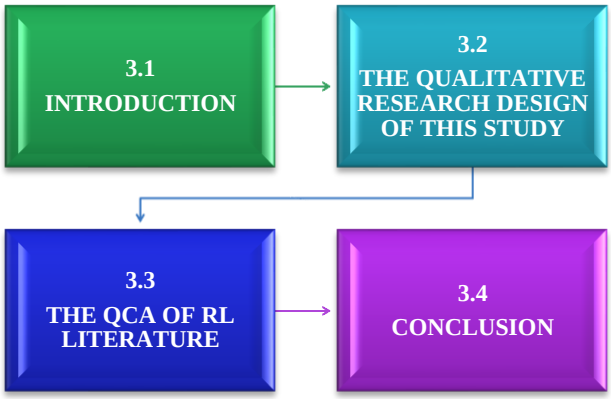

Figure 3.1 Overview of chapter 3
Source: Compiled by the researcher

Following Figure 3.1, the subsequent sections provide an overview and justification for a qualitative research design, the methodology and application for the QCA of RL literature and the conclusion for this chapter.

3.2 THE QUALITATIVE RESEARCH DESIGN OF THIS STUDY

The focus of this section is to provide an overview and justification of the qualitative research design adopted in this study. Figure 1.4 demonstrated the research design onion of this study, which showed the paradigm, approaches and methodological choice of this study, which will be the focus of this section. The specific research methods, data collection and data analysis techniques of this study will be discussed separately in section 3.3 (QCA method) and chapter 7 (interview method). Chapter 1 and 2 provided the methodology and findings of the literature study as one of the methods adopted to answer the research question.

This section starts with justifying qualitative research, followed by an overview of the challenges in qualitative research. Thereafter, an overview will be provided of the research paradigm and related assumptions of this study, followed by the research approaches adopted in this study for theory development. Finally, this section concludes with an overview and justification of adopting multimethod qualitative research as the methodological choice of this study.

3.2.1 Justifying qualitative research

Qualitative research designs progressed significantly through scientifically defensible theory, sampling strategies and analytical strategies (Trotter, 2012:398). Qualitative research can be characterised by a set of distinguishing features that sets it apart from quantitative research (Klenke, 2016a:8). While qualitative and quantitative research cannot be regarded as exact opposites, the two genres can be distinguished in terms of philosophical and research approaches, sampling and data collection methods and data analysis (Tarab, 2019:4). Consequently, to emphasise the value of qualitative research, a distinction between qualitative and quantitative research can be important. In the following sections, motivations for selecting qualitative research over quantitative research will be briefly described, followed by a justification of qualitative research in the field of business management and organisational practices.

3.2.1.1 Motivation for qualitative over quantitative research in philosophical perspectives

In a quantitative research design a positivist and objectivist epistemological perspective is followed, while in a qualitative research design a subjective ontology with an interpretivist approach is followed (Gupta & Awasthy, 2021:5; O'Gorman & MacIntosh 2015:59). While positivists aim at measuring social phenomena, interpretivists aim at exploring and understanding social phenomena (Collis & Hussey, 2021:41). Consequently, positivists adopt quantitative research methods, utilising questionnaires and demographics to produce statistical analysis, which contrasts interpretivists' adoption of qualitative research methods, seeking answers through interviews, observations and

documents (Tarab, 2019:4). Evidently, qualitative paradigms operate under different assumptions about ontology, epistemology, methodology, and axiology (see section 3.2.3), which require new ways of conceptualising the research process (Klenke, 2016a:18).

The specific research methods of qualitative inquiry reflect an underlying philosophy of science with the posture of "not knowing", underpinning the belief that social reality can only be subjective, which contrasts the traditional positivist belief in an objective reality that can only be understood through detached scientific inquiry (Collis & Hussey, 2021:40-41; Klenke, 2016a:13). Unlike quantitative researchers who perform statistical tests of prediction and control associated with a positivist approach, qualitative researchers seek a deeper understanding of the phenomenon (or topic) under investigation through thick descriptions (Klenke, 2016a:29). In other words, the interpretive perspective of qualitative researchers relates to understanding the way individuals experience and interact with their social world, and its meaning to them (Merriam & Grenier, 2019:4).

The key to understanding the value of qualitative research lies with the research philosophy, which specifies that meaning can be socially constructed by individuals interacting with their world, and not be based on the positivist approach of a fixed, single, agreed upon or measurable phenomenon in quantitative research (Merriam & Grenier, 2019:3). Consequently, qualitative research involves the core assumption that social reality is constructed, and that subjective meaning is a critical component of knowledge-building (Hesse-Biber *et al.* 2015:4).

Nevertheless, under the increasing use of multiparadigm, multimethod research, it can be counterproductive to view all qualitative methodologies under a single interpretive paradigm (Morgan, 2017:17; Klenke, 2016a:27). Therefore, this study adopted pragmatism as a research philosophy that contain some elements of interpretivism and minor elements of positivism. The research paradigm and assumptions will be discussed in section 3.2.3.

3.2.1.2 Motivation for qualitative over quantitative research in researcher roles

The orientation of qualitative researchers contrasts sharply with that of quantitative researchers on many dimensions (Suter, 2012:343), including active versus passive roles in research, engagement with data collection methods and approaches to data analysis and findings.

Specifically, a qualitative *researcher's role* can be different from a quantitative researcher in terms of focusing on an in-depth and comprehensive understanding of qualitative findings and playing an active role in the research process (Schutt & Chambliss, 2014:324). Evidently, a qualitative researcher can be an "instrument" or "tool" in data collection and analysis processes (Merriam & Grenier, 2019:5; Salkind, 2010:1160; Schutt & Chambliss, 2014:324). Instead of treating the

researcher as an invisible other, like in quantitative research, a qualitative researcher's individual standpoint and impact on research can be an integral part of the qualitative research process (Eaken & Gladstone, 2020:4; Klenke, 2016a:11). Qualitative researchers consistently interpret and re-interpret data, attempting new and provisional conceptual frameworks and explanatory frameworks, revisiting data collection strategies and even adapting research questions throughout the course of their research (Eaken & Gladstone, 2020:4). This characterisation acknowledges that qualitative researchers bring their experiences, values, insights, knowledge and identities to research by filtering all interpretations and observations (Eaken & Gladstone, 2020:4; Salkind, 2010:1160).

Contrastingly, a quantitative researcher can be described as a neutral instrument whose personal characteristics cannot significantly shape the responses of research respondents (Klenke, 2016a:11). Quantitative researchers focus on validity through strict adherence to research protocols and interpret results based on predetermined numeric criteria (Eaken & Gladstone, 2020:4). Consequently, a quantitative researcher can be described as a dispassionate (passive) investigator of relations among discrete variables (Schutt & Chambliss, 2014:324), seeking causal determination, prediction and generalisation of findings (Klenke, 2016a:8). Evidently, in quantitative research a researcher's presence must be minimised and neutralised (Morgan, 2017:19; Salkind, 2010:1161).

In terms of *data collection* processes, qualitative researchers can (1) expand their understanding through nonverbal and verbal communication, (2) process data immediately, (3) clarify and summarise material, (4) check with participants for accuracy of interpretation, and (5) explore unusual or unanticipated responses (Merriam & Grenier, 2019:5). Therefore, qualitative methods bring researchers closer to their informants, eliminating the need to rely on more remote, inferential (statistical) empirical materials (Klenke, 2016a:11). The qualitative researcher as a human instrument can not only adjust data collection processes but also simultaneously analyse the data, which may provide a more robust analysis and understanding of a phenomenon (Merriam & Grenier, 2019:5).

Consequently, qualitative and quantitative researchers can be different in their approaches to *data analysis*. Unlike quantitative researchers who perform statistical tests of prediction and control, qualitative researchers strive for deep understanding of a phenomenon through thick description (Klenke, 2016a:29), which requires creativity in analysis (Suter, 2012:343). For instance, qualitative researchers must record data through a variety of methods (interviews, observations, notes and documents), code and categorise data, identify themes or main categories, link and combine (or integrate) abstract concepts, create theory from generated themes, and produce an understanding of findings (Suter, 2012:348). Therefore, qualitative researchers focus on descriptions and analysis of words instead of numbers and quantification of data in analysis (Tarab, 2019:3).

Essentially, a qualitative researcher focuses on (1) meanings instead of on quantifiable phenomena, (2) a collection of limited cases/data instead of many cases/data, and (3) rich descriptions of the world rather than measurement of specific variables (Schutt & Chambliss, 2014:324). The practical approach of this study (e.g. determining RL processes, RL practices and RLM factors of consumer returns that informs online retailers) warrants a qualitative researcher who actively engages in the research process through qualitative data collection and analysis, which will be further motivated in the subsequent discussions.

3.2.1.3 Motivation for qualitative over quantitative research in research approaches and designs

Qualitative approaches are increasingly recognised as appropriate for exploring new questions beyond methodological and theoretical traditions of quantitative research approaches (Salmons, 2015:545). Quantitative research designs and approaches can be classified as fixed and predetermined, ensuring that mathematical assumptions underlying statistical tests can be realised (Salkind, 2010:1160). Consequently, quantitative research can be viewed as deductive, objective and general in nature, focusing on numbers and generalisation (Morgan, 2017:18), lacking flexibility and in-depth understanding of phenomena (Tarab, 2019:5).

While qualitative research can involve deductive approaches, qualitative research follows mostly inductive approaches for deeper understanding and exploration (Tarab, 2019:4). Consequently, qualitative designs can be classified as emergent and flexible, often resting on inductive approaches for knowledge creation (Morgan, 2017:18; Salkind, 2010:1160) through in-depth examinations of specific people in specific situations (Morgan, 2017:20). The inductive characteristic of qualitative research designs associates with building concepts, hypotheses or theory, rather than deductively deriving at hypotheses tested in quantitative research (Merriam & Grenier, 2019:6; Morgan, 2017:17). In other words, qualitatively driven approaches tend to be more open to exploratory research and theory generation because a researcher's goal can be to generate a hypothesis, not to test one (Hesse-Biber *et al.* 2015:6; Suter, 2012:353). Additionally, the aims of inductive approaches entail (1) condensing raw textual data into a summary of findings format, (2) establishing distinct links between the research questions and summary of findings, and (3) developing a conceptual framework from the summary of findings (Gupta & Awasthy, 2021:20).

Contrasting rigid quantitative research designs, qualitative research designs involve flexibility in data collection and analysis, which affords researchers with opportunities to pursue new paths of discovery throughout the research process (Gupta & Awasthy, 2021:20). Additionally, well-designed qualitative research contributes to science by a logical chain of reasoning, ruling out rival hypotheses

with convincing arguments and solid data (Suter, 2012:345). Nevertheless, qualitative research can build upon theory, existing knowledge and theoretical frameworks, allowing the researcher to extend existing knowledge with new knowledge (Gupta & Awasthy, 2021:21).

Therefore, a qualitative research design was appropriate for this study because it (1) started with a QCA of RL literature that involved exploring RL literature, identifying consumer return, RL process and RL practice categories and developing conceptual frameworks, (2) continued with empirical research that involved interviewing industry experts in RL, exploring raw interview data, discovering new RL practices and RLM factors and developing new frameworks from interview findings, and (3) concluded with a final framework for effective RLM derived from literature, QCA of RL literature and the interviews with industry experts. Section 3.2.4 discusses the research approaches adopted for theory development in the study.

3.2.1.4 Motivation for qualitative over quantitative research in sampling procedures and data collection

As mentioned in section 3.2.1.2, qualitative and quantitative researchers differ in their approaches in data collection, which also applies to sampling strategies (Salkind, 2010:1161). Evidently, the strategies, logics, and purposes of sampling clearly differentiate qualitative and quantitative methods (Cardano, 2020:30).

Particularly, quantitative research involves probability sampling designs, including simple random sampling, systematic sampling, stratified sampling, clustered sampling, and multistage clustered and stratified sampling (Salkind, 2010:923). These sampling designs are pre-planned in detail prior to data collection procedures (Cardano, 2020:16) and estimated mathematically based on preselected parameters and objectives (Salkind, 2010:923). Additionally, quantitative research requires large sample sizes (to reduce sampling errors) and statistical analyses (such as factor analysis or linear structural equation modelling techniques) to generalise results (Klenke, 2016a:9; Shaheen, Pradhan & Ranajee, 2019:26). Consequently, the large sample requirements of quantitative research can cause questions about reliability for effective generalisations across a population (Collis & Hussey, 2021:46; Tarab, 2019:5).

In contrast, qualitative research involves in-depth studies instead of wider populations or samples, typical of quantitative research (Cardano, 2020:30). Additionally, unlike probability sampling techniques in quantitative research, qualitative research involves non-probability sampling techniques, including convenience sampling, purposive sampling, quota sampling and snowball sampling (Saunders *et al.* 2019:317; Trotter, 2012:399). With non-probability sampling techniques,

the researcher intentionally selects participants who can contribute an in-depth, information-rich understanding of the phenomenon under investigation (Klenke, 2016a:9; Merriam & Grenier, 2019:13; Salkind, 2010:1161). Furthermore, contrasting quantitative research, qualitative research excludes stringent requirements about sample size (Shaheen *et al.* 2019:26). Evidently, large, random, representative samples are rarely the goal of qualitative research (Salkind, 2010:1161), making sample size less significant in qualitative research than in quantitative research (Collis & Hussey, 2021:46; Klenke, 2016a:9).

Qualitative research can be beneficial through in-depth interviewing, which enables a researcher to pursue new topics that emerged from conversations with participants (Morgan, 2017:24). Consequently, at the core of qualitative research, participants' voices and perspectives can be significant, giving a researcher the opportunity to learn from others' experiences and expertise (Klenke, 2016a:10; Morgan, 2017:24). Predominantly, participants with expertise in a particular field (such as RLM in online retailing) share their experiences with the researcher (e.g. during interviews), knowing that the researcher accepts and respects their knowledge as a valuable contribution to the topic or field of study (Klenke, 2016a:10).

Essentially, participants receive the opportunity to reveal their perspectives and express themselves in their own words without the researcher imposing any predetermined concepts or opinions on them (Azungah, 2018:384; Cardano, 2020:36). This openness permits a more accurate representation of the phenomena studied (Cardano, 2020:36), which can be important in this study to investigate RLM based on input from industry experts. Additionally, to infer statistics from a random probable sample to answer quantitative questions, like "how much?" or "how often?" (Merriam & Grenier, 2019:13; Salkind, 2010:925), falls outside the aim of this study. Therefore, the nonprobability sampling techniques associated with qualitative research can be more appropriate for an in-depth understanding into RL processes, RL practices and important RLM factors for the effective management of consumer returns (see sections 1.2 and 1.3).

3.2.1.5 Motivation for qualitative over quantitative research in data analysis and findings

As mentioned in section 3.2.1.3, qualitative research contrasts quantitative research in terms of inductive approaches to research designs. Consequently, qualitative data analysis mostly follows inductive approaches to data analysis that explicit theories, contrasting, strictly deductive approaches in quantitative data analysis that test specific hypothesis or theories (Suter, 2012:346). The exploration of data can be flexible and multifaceted, allowing qualitative researchers to be open to new concepts and develop hypotheses and theories without predefined and known variables associated with quantitative data analysis (Gupta & Awasthy, 2021:16; Suter, 2012:351). Evidently,

findings can be inductively derived from qualitative data (e.g. interviews and literature) in the form of themes, categories, typologies, concepts, tentative hypotheses, or even a substantive theory (Merriam & Grenier, 2019:6).

Qualitative data analysis often starts in the data collection phase and can be less linear than quantitative analysis (Gupta & Awasthy, 2021:5; Suter, 2012:352). Instead, qualitative data analysis can be described as iterative, which entails back-and-forth movement between raw data (such as interview transcripts), categories, codes and explanations (Suter, 2012:351; Terry & Hayfield, 2020:434). Throughout the research project, qualitative researchers often develop the analysis through experience-driven strategies and reflexivity to contextualise meanings (Eaken & Gladstone, 2020:5), which encourages generation of conceptual categories and themes (Gupta & Awasthy, 2021:17; Suter, 2012:346). Instead of focussing on numbers to arrive at a p value, qualitative data analysists find themes, identify meaningful patterns, and write creatively about their discoveries (Eaken & Gladstone, 2020:4; Suter, 2012:362). Therefore, the findings of qualitative data analysis typically focus on generating theory from identified patterns, which contrasts the testing of theory through statistical relationships in quantitative data analysis (Gupta & Awasthy, 2021:16; Morgan, 2017:18-19; Suter, 2012:351).

As mentioned in sections 3.2.1.2 and 3.2.1.3, qualitative researchers and participants play more active roles in qualitative research. Likewise, in qualitative research the presentation of findings involves a combination of the researcher's voice and participants' voices (Cardano, 2020:31). The participants' voices enter the text principally through quotations chosen by the researcher from empirical material, like interview transcripts and other documents collected (Cardano, 2020:31; Merriam & Grenier, 2019:6). Most importantly, combining the voices of the researcher and participants provide readers with the evidence of findings and soundness of proposed interpretations (Cardano, 2020:31; Merriam & Grenier, 2019:6).

Essentially, qualitative data analysis can be appropriate for this study, because it seeks to understand a phenomenon from the participants' (e.g. industry experts') perspectives and provide rich descriptions, new perspectives and useful insights from qualitative data, like literature and interview data (Merriam & Grenier, 2019:6; Suter, 2012:352). Additionally, the researcher can generate new knowledge about RLM in online retailing by reconceptualising known practices, reconfiguring known beliefs, and understanding (Eaken & Gladstone, 2020:12) about efficient and effective RLM in online retailing.

Derived from Hesse-Biber *et al.* (2015:4) and Leedy and Ormrod (2021:113), Table 3.**1** summarises the differences between qualitative research and quantitative research in terms of philosophical

approaches, research goals, research questions and problem statements, nature of research process, data collection, data analysis and presentation of findings/results.

Table 3.1 Differences between qualitative research and quantitative research

Element	Qualitative research designs	Quantitative research designs
Philosophical approaches	• Interpretivism and constructivism • Idealism • Subjective view • Social reality is multiple • Individuals are experts • Through intersubjectivity human behaviour can be studies • No definitive subject–object split in knowledge-building	• Positivism • Realism • Objective view • The social world is concrete • Scientists are the experts • Goal is to ascertain "the truth" to predict and uncover "laws" of human behaviour through objective social inquiry
Research goals	• To understand a phenomenon • To describe, explain, explore and interpret • To build theories	• To generalise, predict, control and validate • To test theory
Research questions and problem statements	• Focus on answering what, how and why questions	• Statement of relationship between independent and dependent variable • Question phrased in terms of a hypothesis • Answering how much or how often questions
Nature of research process	• Holistic with flexible guidelines • Unknown variables • Emergent methods • Bound by context • Personal view important	• Focused with established guidelines • Known variables • Pre-planned methods • Context-free • Detached view important
Data collection	• Textual or image-based data • Small and informative samples • Non-standardised instruments • Naturalistic setting: participant observation (fieldwork) • In-depth interviews • Focus groups • Unobtrusive data: Documents • Researcher acts as an instrument	• Numerical data • Representative and large samples • Standardised instruments • Experiments: randomised controlled trials • Surveys • Systematic reviews/meta-analyses • Researcher is passive, using questionnaire, tests and scales as instruments
Data analysis	• Inductive for theory generation • Analysis can be subjective and potentially biased • Search for general themes/patterns in the data • Uses thick descriptions • Compares and contrasts thematic data • Examples: grounded theory, narrative analysis, thematic analysis	• Deductive for hypothesis/theory testing • Objectivity important in analysis • Explain variation in the independent variables by controlling the dependent variables • Focus on statistical measurement • Examples: factor analysis, t-tests and inferences
Presentation of findings/results	• Use words • Narratives and participant quotations • Visual illustrations and nonnumerical graphs • Literarily style with personal voice (in some disciplines)	• Use numbers • Statics and aggregated data • Illustrate through graphs • Scientific style with formal voice

In the next section, the final justification for qualitative research in business management and organisational practices will be provided.

3.2.1.6 Justifying qualitative research in business management and organisational practices

According to Myers (2013:13), qualitative research may be the best way for research in business management to simultaneously become rigorous and relevant. Qualitative research can be valuable in examining various organisational subjects, including marketing, information systems, strategies, finance and international business (Gupta & Awasthy, 2021:14). Evidently, qualitative research provides several advantages for business and management practices (Boodhoo & Purmessur, 2009:6).

Ciesielska and Jemielniak (2018:2) claims that certain questions in organisational research cannot be answered through quantitative research. Qualitative research provides a more realistic view of the business world that cannot be understood in numerical data and statistical analysis of quantitative research (Boodhoo & Purmessur, 2009:6). Consequently, qualitative research can be important in providing organisations or managers with different and new perspectives, which cannot be realised through quantitative research (Lanka *et al.* 2021:2).

An in-depth qualitative study must look at the complexity of organisations and often unquantifiable issues in organisations (Myers, 2013:13). The contribution of qualitative methodologies can be fundamental to inform practice and provide knowledge to organisational decision makers (i.e. managers and directors) (Guercini, 2014:670; Lanka *et al.* 2021:3). Evidently, qualitative research allows a researcher to see and understand the context within which decisions and actions take place in an organisational setting (Myers, 2013:5).

Although qualitative research remains under-represented in management studies, it can be essential in providing alternative perspectives and new knowledge (Lanka *et al.* 2021:4). Qualitative methods can be useful for unravelling and understanding what lies behind a little-known phenomenon (O'Gorman & MacIntosh 2015:66), enriching knowledge and understanding of effective management practices (Lanka *et al.* 2021:1). Therefore, qualitative research can be important in the context of organisations, enabling the researcher to provide organisations and managers with new insights into effective organisational practices (Tarab, 2019:17). Consequently, this study can bring value by addressing the under-representation of qualitative research in the field of RL management (RLM), providing online retailers with new knowledge about the effective management of consumer returns.

Essentially, qualitative research can be suitable for studying new topics (e.g. RLM in online retailing) in depth through exploratory research, addressing gaps in the research field (Myers, 2013:9), opening novel areas of research and enabling opportunities to generate new theories (Tarab, 2019:18). Because of limited research in South Africa on the topic of RLM in online retailing (see section 1.8), a qualitative research design can be valuable for exploring, understanding and determining consumer returns, RL processes, RL practices and important factors for the effective RLM of consumer returns in online retailing, addressing gaps in literature and practice.

Despite the importance and value of qualitative research, understanding common challenges in qualitative research before adopting a qualitative research design can be important. Consequently, the next section provides and overview of the challenges in qualitative research.

3.2.2 Challenges in qualitative research

Although the use of qualitative research was comprehensively motivated, certain challenges in qualitative research should be noted and addressed. These challenges in qualitative research relate to time, amount of data, budget, data collection and sampling, data analysis and interpretations, and the rigour of findings.

Qualitative research can be *time-consuming* (Glinka & Hensel, 2018:245) since qualitative researchers tend to collect a large amount of data (despite smaller sample sizes), which makes managing the *volume of data* challenging (Leedy & Ormrod, 2021:259; Myers, 2013:120). This overwhelming aspect of qualitative research could lead researchers, living in the real world, subjected to time and *budget constraints* (Roller, 2016:9; Tarab, 2019:16). Evidently, it may be a daunting task for qualitative researchers to take enormous amounts of data, in the form of interview transcripts or detailed field notes and communicate the findings in a credible way (Suter, 2012:364; Shaheen *et al.* 2019:38).

Additionally, qualitative *data collection* procedures often lack uniformity and largely depends on the researcher's creativity (Cardano, 2020:37). Coupled with a lack of uniformity in data collection, novice qualitative researchers often lack knowledge about the range of available qualitative research methods and appropriate application of these methods (Lanka *et al.* 2021:1). Nevertheless, a lack of uniformity can be regarded as context-sensitivity, which guarantees special accuracy of qualitative research (Cardano, 2020:38). In other words, the qualitative researchers can adapt data collection procedures to fit the aim of their studies, instead of relying on strictly prescribed quantitative data collection approaches (see section 3.2.1).

In terms of *sampling*, the most encountered problem in qualitative research associates with nonprobability samples, which varies by the nature of research questions and type of data collected (Salkind, 2010:923). Qualitative researchers must evaluate the most appropriate sampling technique(s), consider the protentional impact of the sampling technique(s) on their research and explicitly explain potential shortcomings of the selected sampling technique(s) (Shaheen *et al.* 2019:39), which can be less important in quantitative research that relies on mathematical estimations (Salkind, 2010:923). Furthermore, unlike quantitative research, characterised by large sample sizes, it can be difficult in qualitative research to generalise findings to a population (Myers, 2013:9), which may lead to questions about the reliability of outcomes (Tarab, 2019:4). Additionally, it can be challenging to determine sample size in qualitative research, as it relies on the notion of saturation, or the point that no new information can be obtained from the data (Salkind, 2010:924). Consequently, qualitative researchers need to identify the point of informational redundancy in data collection where

further data adds nothing new to the study (Gentles *et al*. 2015:1781; Klenke, 2016a:9; Saunders *et al.* 2019:315) (also see section 7.3.4.4.3).

Due to the complexity of qualitative research, the *analysis* of qualitative data can be problematic (Roller, 2016:9). In fact, qualitative data analysis can be far more challenging, time-consuming and creative than quantitative data analysis (Salkind, 2021:168; Suter, 2012:352). Subsequently, the more in-depth the data, the more challenging and time-intensive it can be to analyse (Forman & Damschroder, 2008:44). Furthermore, qualitative researchers face the analytic challenge to reduce data, code data, identify categories, develop themes and offer meaningful conclusions (Suter, 2012:353).

Additionally, like the lack of uniformity in qualitative data collection, qualitative research lacks a prescribed formula or procedures for conducting qualitative data analysis (Eakin & Gladstone, 2020:3). Therefore, the interpretation of qualitative data depends on the background and creativity of the researcher far more than the interpretation of quantitative data (Suter, 2012:364). Inexperienced qualitative researchers often fail to venture beyond surface-level meanings and pre-established conceptual frameworks, which hampers their ability to provide creative analyses and interpretations (Eakin & Gladstone, 2020:2). Essentially, the analysis process in qualitative research requires synthesis, creative insight and careful documentation of processes to enhance credibility of findings (Suter, 2012:353).

However, the concepts of reliability and validity in qualitative research can be less consistent than quantitative research (Suter, 2012:364), which poses significant challenges in terms of *rigour* and credibility of findings (Tarab, 2019:16). Additionally, the nature of qualitative research (in terms of time and large volumes of data) may lead researchers to succumb to a less-than-rigorous analytical process (Roller, 2016:9). Therefore, qualitative researchers must establish rigorous processes to manage the trustworthiness of their studies, while maintaining data confidentiality (Tarab, 2019:16).

Due to smaller sample sizes, the lack of generalisability in qualitative research excludes the statistical power of measuring reliability and validity in quantitative research (Cardano, 2020:37). Additionally, reliability and generalisability in qualitative research rely strongly on the information provided by participants (Shaheen *et al.* 2019:26). Moreover, replication can be difficult to achieve in qualitative methods, mainly because concepts can be tied to a researcher's point of view (Abdalla *et al.* 2018:17). Consequently, these mentioned challenges (or weaknesses) in qualitative research can be synthesised with an unappealable accusation of a lack of rigour (Cardano, 2020:37). Nevertheless, qualitative research cannot be subjected to the same criteria (reliability and validity) as quantitative

research since other criteria (related to trustworthiness) can be applied to demonstrate rigour (Braun & Clarke 2006:95).

Despite these abovementioned challenges in qualitative research, the justification of qualitative research over quantitative research, provides sufficient motivation for selecting a qualitative design in this study. Additionally, several strategies were implemented to counteract the identified challenges in qualitative research. Section 3.3. and chapter 7 provide more details of the strategies and processes adopted for effective qualitative data collection, sampling, analysis and trustworthiness.

In the next section, the research paradigm and philosophical position of this study is discussed.

3.2.3 Research paradigm and assumptions of this study

All research projects are based on some philosophical assumptions about the nature of the world and knowledge that can be obtained about the world (King & Brooks 2019:4; Myers, 2013:24). A paradigm involves the practice of science through various traditions, ideas, methods and concepts (Ciesielska & Jemielniak, 2018:9). Additionally, a research paradigm can be defined as a philosophical framework that guides the way scientific research must be conducted (Collis & Hussey, 2021:39), involving a pattern, model, plan (Klenke, 2016a:11) or theoretical framework (O'Gorman & MacIntosh 2015:54). Subsequently, a research paradigm can be important because it guides the research effort towards effective execution of a scientific research study (Ciesielska & Jemielniak, 2018:9).

According to Klenke (2016a:13) it can be impossible to conduct rigorous research without understanding its philosophical underpinnings. Furthermore, the purpose of setting out a research philosophy can be to help others understand a researcher's findings and the basis on which such claims were made (O'Gorman & MacIntosh, 2015:52). Qualitative researchers must especially be transparent about their paradigmatic assumptions and positions (Klenke, 2016a:18) and demonstrate a conscientious selection and defence of the most suitable philosophical approach (O'Gorman & MacIntosh 2015:52).

Although interpretivism mostly associate with qualitative research designs (see section 3.2.1.1), utilising multimethod qualitative research can be more suitable to a pragmatic research philosophy, which will be described in section 3.2.3.2. Regardless of the research approach, a researcher's philosophical assumptions about ontology, epistemology, methodology, and axiology can be critical in framing the research process (Klenke, 2016a:13-14), which will be discussed in the next section.

3.2.3.1 Philosophical assumptions in research

The philosophical assumptions of any research involve ontology, epistemology, methodology and axiology, which require careful consideration and justification by a qualitative researcher (Klenke, 2016a:13-14). The subsequent sections provide a description of each assumption and the associated beliefs from the main two paradigms, including positivism and interpretivism, as well as pragmatism as the adopted research paradigm in this study. This section will be concluded with a summary table comparing the philosophical assumptions of positivism, interpretivism and pragmatism.

3.2.3.1.1 Ontology assumption

According to Klenke (2016a:15) the first paradigmatic question is about *ontology*, which asks: "what is the nature of reality?". Ontological questions interrogate fundamental ideas about what is real (Salkind, 2010:1159), thus, ontology is the study of reality (O'Gorman & MacIntosh 2015:55; Salkind, 2010:1159) and the problem of existence (Ciesielska & Jemielniak, 2018:10). A philosophical question about reality affects the way research can be conducted (Gupta & Awasthy, 2021:4; Klenke, 2016a:15). Despite the importance of ontological questions, the term is rarely used beyond academic institutions as it may be difficult to describe (O'Gorman & MacIntosh 2015:55).

Ontological assumptions can be broadly divided into objective and subjective configurations (O'Gorman & MacIntosh 2015:56). Particularly, positivists view reality as objective and separate from the researcher, involving one reality and interpretivists view reality as subjective because it is socially constructed (Collen & Hussey, 2021:43). An *objective* perspective to ontology, follows a quantitative approach that views reality as solid objects that can be measured and tested, verifying relationships between variables (Lanka *et al.* 2021:3; O'Gorman & MacIntosh 2015:56). This perspective can be described as realism, in which something exists objectively and independently from the human mind (Ciesielska & Jemielniak, 2018:11). Therefore, an objective ontology assumes that reality exists independently from the researcher, and that it can be possible to establish and explain universal principles and facts through robust and replicable methods (O'Gorman & MacIntosh 2015:57).

In contrast, a *subjective ontology* looks at reality as made up of the perceptions and interactions of living subjects (O'Gorman & MacIntosh 2015:56). Unlike the realism of objective ontology, subjective ontology entails idealism, in which the world only consists of concepts, meanings and the terms created by humans to describe reality (Ciesielska & Jemielniak, 2018:11). Additionally, idealism reflects the aims of understanding subjective experiences of individuals in qualitative research (Lanka *et al.* 2021:3). A subjective ontology sees facts as culturally and historically located

and subject to various behaviours, attitudes, experiences and interpretations, associating with the subjectivity of the observer and the observed (O'Gorman & MacIntosh 2015:57). Subsequently, qualitative researchers endorse a relativistic ontology that is always subjective, socially constructed and shaped by context (Klenke, 2016a:15).

Nevertheless, objective and subjective ontologies are not mutually exclusive, and many researchers delineate their positions somewhere between the two (O'Gorman & MacIntosh 2015:58), which was the ontological position of this study due to its pragmatic approach. Under the *ontological approach of pragmatism*, researchers can renegotiate and interpret realities based on the context of their studies (Allemang, Sitter & Dimitropoulos, 2021:40) and as practical effects of ideas (Saunders *et al.* 2019:151). Consequently, questions related to the nature of reality are less central to pragmatism, focusing more on the usefulness of knowledge (Morgan, 2017:19). Evidently, pragmatists reject a distinction between objective and subjective ontologies but accept the differences between facts and values and different methods of inquiry appropriate to each (Klenke, 2016a:27).

3.2.3.1.2 Epistemology assumption

Epistemology refers to a theory of knowledge and cognition (Ciesielska & Jemielniak, 2018:10; O'Gorman & MacIntosh 2015:59; Salkind, 2010:1159), which addresses the second paradigmatic questions, "how do we know what we know?" and "what counts as knowledge?" (Gupta & Awasthy, 2021:9; Klenke, 2016a:15). Subsequently, epistemology can be concerned with the way a researcher obtains valid knowledge (O'Gorman & MacIntosh 2015:58), including questions about human cognition and roles of experience in knowledge creation (Ciesielska & Jemielniak, 2018:10).

Furthermore, epistemology can be the branch of philosophy that deals with the origin, nature and limits of human knowledge and the relationship between the knower and the known (Klenke, 2016a:15). Clarity on the manner that valid knowledge can be obtained provides clarity about the nature of any knowledge claim (O'Gorman & MacIntosh 2015:59). Additionally, epistemology deals with ways of knowing and the researcher's belief system about the nature of knowledge, for example, beliefs about certainty, structure, complexity, and sources of knowledge (Klenke, 2016a:15).

Every researcher brings some set of epistemological assumptions into the research process and these assumptions influence their understanding and interpretation of their data (Gupta & Awasthy, 2021:3; Klenke, 2016a:15). Particularly, (1) positivists adopt an independent and objective stance, believing that only observable and measurable phenomena can be regarded as knowledge, (2) interpretivists adopt a subjective stance with limited distance between the researcher and the researched, believing that knowledge comes from participants (Collis & Hussey, 2021:43), and (3) pragmatists consider

knowledge as unique, believing that all knowledge comes from individual experiences (Morgan, 2017:18) that can be used for problem solving and informed future practice (Saunders *et al.* 2019:145). Subsequently, the epistemological position of this study focuses on obtaining knowledge from the experiences and expertise of researchers (literature) and practitioners (industry experts), enabling the development of new knowledge.

3.2.3.1.3 Methodology assumption

Ontological and epistemological assumptions can be translated into specific methodologies, relating to the third philosophical question of "how should we study the world?" (Klenke, 2016a:16). Methodology sets the boundaries for development of theoretical and methodological frameworks (Klenke, 2016a:16), involving a set of choices about the way that a phenomenon can be studied (Ciesielska & Jemielniak, 2018:14). Consequently, methodologies signify practical ways of learning about the world through various research methods and analysis of quantitative or qualitative data (Ciesielska & Jemielniak, 2018:15), addressing issues like types of sampling, data collection, data analysis, and consequences of methodological choices (Klenke, 2016a:16). Like ontology and epistemology, the methodology of positivists, interpretivists and pragmatists can be different.

Particularly, (1) positivists usually adopt a deductive approach, employing quantitative research methods and using questionnaires or experiments to produce statistical analysis, (2) interpretivists usually adopt an inductive approach, employing qualitative research methods and using interviews and observations to develop theories (Collis & Hussey, 2021:42; Tarab, 2019:4), and (3) pragmatists usually adopt a combination of abductive, inductive and deductive approaches (Kelly & Cordeiro, 2020:7), employing mixed or multi research methods based on the usefulness of answering research questions (Collis & Hussey, 2021:49) for practical solutions and outcomes (Saunders *et al.* 2019:145).

Following the pragmatic approach to methodology, this study adopted multimethod qualitative research as a methodological position, involving multiple types of qualitative sampling, data collection and analysis, which will be discussed in section 3.2.5.

3.2.3.1.4 Axiology assumption

Collis and Hussey (2021:43) and Klenke (2016a:17) added axiology to the paradigmatic triad of ontology, epistemology and methodology, which refers to the role of values and ethics in research. Consequently, axiology can be described as the philosophical study of value, which involves ethics and aesthetics. Research ethics must inform data collection and values must inform the biases of a researcher (O'Gorman & MacIntosh 2015:69).

Like other philosophical elements, positivists, interpretivists and pragmatists operate on different axiological assumptions. Particularly, (1) positivists believe that researchers must be independent from the researched, which results in a value-free and unbiased research process, (2) interpretivists believe that researchers can bring their values to the research, which results in acceptable value-laden findings the acknowledges biases (Collis & Hussey, 2021:43), and (3) pragmatists view axiology as the cornerstone of their paradigm and place a premium on ethical and moral issues (Klenke, 2016a:27), which results in a value-laden and practical research process (Allemang *et al.* 2021:40).

Subsequently, pragmatist embed ethical considerations throughout the research process, which means they value different types of knowledge (Kelly & Cordeiro, 2020:7). Since this study adopted pragmatism as a research paradigm, axiology can be an important philosophical element. The role of the researcher in the interview process and the ethical considerations and practices of this study were discussed in chapter 7.

Essentially, research assumptions relate to a philosophical paradigm, involving issues of ontology (nature of reality), epistemology (nature of knowledge and relationship of the researcher to that being researched), methodology (research methods and techniques in a study) and axiology (role of values in a study) (Klenke, 2016a:15-17; O'Gorman & MacIntosh 2015:67).

Based on the discussions of the different philosophical elements, **Table 3.2** provides a comparison between the positivism, interpretivism and pragmatism paradigms with related ontological, epistemological, methodological and axiological assumptions.

Table 3.2 Comparison of research paradigms and philosophical elements

Research paradigm	Ontology	Epistemology	Methodology	Axiology
Positivism	• Reality is objective and separate from the researcher • Beliefs in one reality • Involves critical realism	• Knowledge stems from objective evidence about measurable phenomena • Knowledge excludes moral content • The researcher is distant from the studied phenomena	• Researcher adopts a deductive approach • Researcher uses statistical designs • Generalisations lead to prediction • Quantitative methodology, like surveys and experiments • Requires large samples • Quantitative data analysis • Results are accurate and reliable	• The researcher is independent from the study • Universal reason • Value-free research • Researcher adopts an objective stance
Interpretivism	• Complex and rich • Social reality is subjective and connected to the researcher • Beliefs in multiple realities, meanings and interpretations • Involves relativism or idealism	• Knowledge stems from subjective evidence and participants • Knowledge involves abstract descriptions of meanings through lived experiences of humans • The researcher interacts with the phenomena under study • Focus is on narratives, perceptions and	• Researcher adopts an inductive approach • Categories are identified in the research process • Patterns and theories are developed • Qualitative methodology, like case studies, interviews, phenomenology, hermeneutical and ethnography	• The researcher acknowledges that research is subjective with biases • Researcher is part of the researched • Value-bound research • Value-laden in context • Researcher's interpretation is key • Researcher is reflexive

		interpretations • Contributes to new understanding and worldviews	• Involves small samples • Qualitative data analysis • Findings are accurate and reliable through verification	
Pragmatism	• Complex and rich • Reality is the practical consequences of ideas • Renegotiates reality based on usefulness of the situation	• Knowledge is gained from experience and researcher subjectively looks at the objective meaning of actions • Knowledge is derived from interactions between people and their environments • Transactional realism • Focus is on problems, practices and relevance • Contributes to problem solving and informed future practice	• Researcher adopts abductive, inductive and deductive approaches • Follows research problems and questions • Mix methods, multimethod qualitative or quantitative research and action research • Involves case study, documents, interviews and surveys • Small and/or large samples • Various qualitative or quantitative data analysis techniques • Emphasis is on practical outcomes and solutions	• Regards ethical and moral issues as significant. The researcher's and participants' values are important • Value-driven research • Value-laden in practice • Researcher is reflexive

Source: Adapted from Allemang *et al.* (2021:40), Collis and Hussey (2021:42), Klenke (2016a:20) and Saunders *et al.* (2019:144-145)

Essentially, this study adopted the philosophical assumptions for pragmatism as a research paradigm, adopting the (1) ontological assumption that reality can be complex, rich, adaptable and practical, (2) epistemological assumption that knowledge can be realised through experience and the researcher's subjective view to solve problems and inform practice, (3) methodological assumption that multimethod qualitative research through a combination of deduction, induction and abductive reasoning can be used for practical outcomes and solutions, and (4) axiological assumption of ethical and moral principles as important aspects in a value-driven research process.

In the next section, a more comprehensive overview and justification for adopting pragmatism as a research paradigm in this study will be provided.

3.2.3.2 Pragmatism as the research paradigm of this study

Pragmatism as a research paradigm developed in the late 19th and early 20th century (Kelly & Cordeiro, 2020:2), stemming from the recognition that absolute truths can exist in various phenomena (Leedy & Ormrod, 2021:31). Pragmatism as a new research paradigm can be positioned in the middle of realism (positivist) and constructivism (interpretivist) (Morgan, 2017:17), taking into consideration the changing context of research, as organisations and society move into different directions (Klenke, 2016a:28). Subsequently, pragmatism focus on the value of knowledge (Morgan, 2017:4) and presents a practical and applied research philosophy that is oriented toward action (Klenke, 2016a:26).

In pragmatism, the research process starts with a research problem and objectives aimed at practical solutions, which can inform future practice (Saunders *et al.* 2019:151). Since pragmatism allows

flexibility in data collection and analysis, pragmatist researchers can follow an abductive approach, combining existing knowledge (deduction) with new knowledge (induction) (Kelly & Cordeiro, 2020:7). In other words, following an abductive approach in pragmatism means that the researcher moves back and forth between theory and data for effective theory building (Saunders *et al.* 2019:155-156). Nevertheless, pragmatism can include all three approaches, including deduction, induction and abduction (Thornberg, 2022:245), which was adopted in this study. Consequently, pragmatism enables researchers to consider theories, concepts, ideas and findings in terms of contribution to practice (Saunders *et al.* 2019:151).

Furthermore, Collis and Hussey (2021:49) explained that pragmatism can be independent from one philosophy and reality, and a freedom of choice can be given to individual researchers, which means pragmatic researchers can use various research methods. This methodological principle of pragmatism allows a researcher to study a phenomenon from various angles (Kelly & Cordeiro, 2020:3), justifying the use of mixed and multiple methods to holistically address research problems (Allemang *et al.* 2021:38; Collis & Hussey, 2021:49). Consequently, the research problem and research questions can be the most important determinants of selecting a research design and methodology (Saunders *et al.* 2019:151). Nevertheless, the researcher must plan to integrate multiple methods to drive the process of inquiry for successful application of pragmatism (Morgan, 2017:20).

According to Saunders *et al.* (2019:151), pragmatism can be an important research paradigm in organisational research, aiming to inform organisational practices. Similarly, Kelly and Cordeiro (2020:1) viewed pragmatism as a useful and significant paradigm for studying organisational processes and practices through qualitative research methods. A qualitative researcher that adopts pragmatism as a paradigm might be interested in practical questions designed to produce answers and address organisational problems (Klenke, 2016a:15; Salkind, 2010:1073). Since the epistemology of pragmatism recognises that knowledge comes from individual experiences (Morgan, 2017:18), pragmatism can be valuable to gain inputs from experienced individuals in organisations as a tool of problem solving in organisational processes and practices (Kelly & Cordeiro, 2020:3,4). Furthermore, pragmatism allows a researcher to improve problematic situations through decision-making elements that can be explored concurrently and interactively, which can result in policy suggestions, new practices and organisational change (Salkind, 2010:1073).

Essentially, pragmatism can be the best research paradigm in this study because it (1) identified practical problems with research questions aimed to inform RLM practices in online retailing, (2) adopted deductive, inductive and abductive approaches combining established knowledge (from RL literature) and with new knowledge (from industry experts) for theory development, (3) employed multiple qualitative methods for holistic problem solving, (4) involved organisational research about

consumer returns, RL processes and practices, (5) gained input from industry experts to solve RLM problems of online retailers, and (6) enabled the development of a RLM framework from various qualitative research findings, contributing to policy formulation and adoption of strategic RLM practices that can benefit the society (e.g. consumers, online retailers and supply chains) as a whole.

In the next section, the research approaches associated with pragmatism, will be described and applied.

3.2.4 Research approaches of this study for theory development

According to Leedy and Ormrod (2021:45) theory development entails active and intentional thinking about a phenomenon, which involves deduction, induction and abduction. Although qualitative studies adopt induction approaches, researchers must be aware of the value that deductive and abductive approaches can bring in qualitative research (Thornberg, 2022:225). As indicated in section 3.2.3.2, the pragmatic research paradigm selected in this study enabled the combination of deductive, inductive and abductive approaches.

While mostly associating with quantitative research (see section 3.2.1.3), Thornberg (2022:245) indicates that *deductive approaches* can be used in qualitative studies. Contrary to a deductive approach in quantitative studies, which involves testing of a hypothesis or theory testing through measurements of variables (Saunders *et al.* 2019:154), a deductive approach in qualitative research means that theory or existing data can be collected and analysed to develop a theoretical framework (Thornberg, 2022:246). Consequently, a deductive approach in qualitative research involves the use of existing theory (such as literature) for the collection and analysis of data (Kenny & Thornberg, 2018:50). Additionally, Thornberg (2022:225) indicated that qualitative research always starts from a theoretical framework, despite the intention to be explorative and discover new knowledge.

Evidently, in this study a deductive approach entailed a literature study and a QCA method of RL literature, which contributed to the final framework of this study. Although the interview data mostly involved inductive approaches, the researcher used the categories (related to consumer returns and RL processes) identified from the of QCA of RL literature and conducted a codebook thematic analysis (TA), using a pre-developed code framework to analyse interview data (see section 7.3.8). Additionally, the categories identified in the QCA of RL literature findings formed part of the interview questions, which not only enabled “development” as a motivating factor for multimethod research (see section 3.2.5.2) but also enabled abduction (see discussion below).

As indicated in section 3.2.1.3, an *inductive approach* aims at building concepts and theories through the discovery of themes, patterns, categories and concepts from empirical qualitative data (Merriam

& Grenier, 2019:6; Thornberg, 2022:248). Furthermore, in an inductive approach, participant experiences drive the analysis of raw (interview) data (Azunga, 2018:391), which means that the researcher avoids existing theory and knowledge in the development of themes (Collis & Hussey, 2021:62). Subsequently, induction allows the researcher to study a phenomenon in-depth and analyse qualitative data, resulting in theory formulation, often expressed as a conceptual framework (Saunders *et al.* 2019:155).

In this study an inductive approach was used in the QCA of RL literature and the interviews with industry experts. In the QCA of RL literature, the researcher used existing theory (literature) and inductively discovered new patterns and concepts through inductive coding and category development (see section 3.3.2.6), which enabled the development of conceptual frameworks for further exploration. Additionally, in the data analysis of the interviews with industry experts a reflexive TA was applied for the generation of themes and discovery of new concepts and practices, avoiding existing theory and knowledge. While parts of the TA used a codebook approach, which was deductive in nature (e.g. confirming literature and theory), new inductive codes and themes through a reflexive TA enabled the researcher to add new knowledge to existing knowledge (Gupta & Awasthy, 2021:21). Like the deductive approach, the findings produced through an inductive approach, contributed to the final framework of this study.

Saunders *et al.* (2019:155) indicated that organisational researchers often adopt *abductive* research approaches, moving between deductive and inductive approaches to develop theories. Likewise, in qualitative research, an abductive approach enables researchers to move back and forth between deduction, induction and abduction until meaningful conclusions can be reached (Thornberg, 2022:249). An abductive approach involves the discovery of new concepts, explanations and practices that cannot be explained through existing knowledge (Kenny & Thornberg, 2018:52). Furthermore, when existing theory (or literature) cannot adequately account for a phenomenon, a good researcher can abandon it and formulate a more appropriate theory (Leedy & Ormrod, 2021:46). Alternatively, the researcher can modify and elaborate upon existing knowledge by reorganising existing knowledge to produce new knowledge (Kenny & Thornberg, 2018:52). Consequently, an abductive approach involves a creative research process, which can lead to new theoretical knowledge about a phenomenon (Thornberg, 2022:246).

In this study, the findings of the QCA of RL literature allowed the formulation of a “provisional hypothesis” (see Thornberg, 2022:249), meaning that the researcher envisaged that the RL processes and practices identified from the QCA of RL literature (through deduction and induction) can also apply online retailing. Based on this provisional hypothesis, the researcher continued data collection by interviewing industry experts about consumer returns, RL processes and RL practices in online

retailing, exploring if practice confirms theory. Although this study confirmed that most RL processes and practices identified in the QCA of RL literature findings can apply to online retailing, new practices and RLM factors were identified, extending and modifying existing knowledge about RL in online retailing. Subsequently, an abductive approach was followed throughout the research process, which enabled the effective development of the final framework for the RLM of consumer returns in online retailing. Particularly, abduction enabled the utilisation of existing knowledge (from theory and confirmed in practice) about consumer returns, RL processes and RL practices and discovered knowledge (from practice) about RL in online retailing to create new knowledge and theory about RL processes, practices and RLM factors important for the effective RLM of consumer returns in online retailing. The final framework derived from deductive, inductive and abductive reasoning will be presented in chapter 9.

Essentially, adopting deductive, inductive and abductive approaches, created a strong iterative research process between data and theory and data collection and analysis, which enabled the researcher to effectively contribute to the field of RLM in online retailing (Kenny & Thornberg, 2018:64). In the next section, multimethod qualitative research as part of the methodological pragmatist approach of this study will be discussed, explained and justified.

3.2.5 Multimethod qualitative research as the methodological choice of this study

Research methods are the tools, techniques or processes that can be used in research (Klenke, 2016a:17). Multimethod research refers to the use of two or more methods drawn from the same paradigm and methodological approaches (Collis & Hussey, 2021:63). New high-tech tools, the internet and sharing of information caused some strain on the traditional single research methodologies, like surveys, experiments, observations and interviews, which prompted a "hybridisation" between different qualitative methodologies (Guercini, 2014:663). Evidently, researchers started conducting qualitative research studies with more than one qualitative research method to explore topics in depth (Roller, 2016:15). Therefore, multimethod qualitative research uses more than one method and multiple ways to collect and analyse data within a qualitative research design (Salmons, 2015:524; Saunders *et al.* 2019:179).

According to Guercini (2014:667), contemporary qualitative research studies associate with a combination of two or more qualitative methods, which can include new (1) techniques in content analysis, text analysis software and applications, (2) software for analysing texts and website content, (3) forms and applications of traditional methods in management research, (4) methods stemming from qualitative research techniques and, (5) ways to apply traditional qualitative methods to management research. Consequently, qualitative multimethod research can be balanced by integrating

theoretical and empirical qualitative data (Reis, Amorim & Melão 2017:287), which was adopted in this study.

In subsequent sections the significance of selecting multimethod qualitative research as the methodological choice of this study will be explored with specific reference to (1) the differences between multimethod and mixed-method research, (2) motivations for conducting multimethod qualitative research and (3) forms of multimethod mixing adopted in this study.

3.2.5.1 Differences between mixed method and multimethod research

Mixed method and multimethod research are often used as synonyms in literature, but in practice clear distinctions can be made. Mixed method research refers to the use of methods drawn from different paradigms (e.g. positivism and interpretivism) by collecting, analysing and integrating qualitative and quantitative data in a single study (Collis & Hussey, 2021:63). In contrast, multimethod research refers to the use of more than one method from the same paradigm (e.g. interpretivism), involving either a quantitative research design or a qualitative research design in one study (Collis & Hussey, 2021:63; Hunter & Brewer 2015:187). In other words, mixed method research involves the collection and integration of qualitative and quantitative data, logics and philosophies, while multimethod research involves the collection of data using a multiple qualitative or quantitative methodologies and techniques (Johnson & Walsh, 2019:5).

Although mixed method research often overshadows multimethod research, Johnson and Walsh (2019:5) argues that both mixed method and multimethod studies can be important and bring new ideas for studying a phenomenon. However, unlike mixed method research that can be restricted to qualitative and quantitative data collection and analysis, multimethod research can be open to a variety of possible methodological combinations, enabling multiple data collections, techniques, analysis and ways in presenting findings in a single study (Hunter & Brewer, 2015:187).

The most significant differences between mix method and multimethod studies relate to the reasons for adopting mixed or multimethod research approaches (Reis, *et al.* 2017:285). For mixed method research designs, the combination of quantitative and qualitative research can be used to (1) enhance generalisability of qualitative data, (2) enhance validity and reliability of the research, (3) assist with defining the population, (4) obtain a more robust understanding of qualitative findings, (5) generate new questions, and (5) test qualitative theory (Hesse-Biber *et al.* 2015:7-8).

Although mixed method research can involve motivations related to complementarity, development, triangulation and expansion, these motivations can be more important in multimethod research designs (Reis, *et al.* 2017:285). Additionally, triangulation (the convergence of findings across

methods) can be a stronger motivating factor in multimethod research, seeking empirical divergence and knowledge using different perspectives of the phenomenon (Johnson & Walsh, 2019:5). The reasons of complementarity, development, expansion and triangulation that can distinguish multimethod from mixed method research will be described in section 3.2.5.2.

Essentially, mixed method research combines qualitative and quantitative methods in a single study to (1) overcome potential weaknesses of using a single qualitative or quantitative approach, (2) enhance credibility of findings and (3) gain a greater understanding of a phenomenon. Multimethod research combines two or more qualitative or quantitative research methods that are conducted separately, rigorously and completely (e.g. the findings of each method can be used independently), enabling (1) triangulation of findings, (2) an in-depth understanding of a phenomenon (e.g. RLM) and (3) development of a comprehensive framework (e.g. framework for the RLM of consumer returns in online retailing) (Schwandt & Lichty, 2015:587).

In the next section, the motivations for multimethod qualitative research will be described in greater detail.

3.2.5.2 Motivating multimethod qualitative research

Multimethod qualitative research involves the use of more than one qualitative method in a single study, providing various benefits (Wellman, Tröster, Grimes, Roberson, Rink & Gruber, 2023:1007). According to Schwandt and Lichty (2015:588), multimethod qualitative research signifies actual scientific investigation by deploying multiple qualitative methods and research designs to generate knowledge and develop in-depth understanding of phenomena. Researchers may conduct qualitatively driven multimethod research for several reasons (Hesse-Biber *et al.* 2015:6), which can be summarised as follows:

- Unexpected findings in a single-method qualitative study that require further exploration to answer the research question (Hesse-Biber *et al.* 2015:9)
- Improve soundness of the research findings (Cardano, 2020:101) and increase the credibility of a study to reduce scepticism about qualitative research findings (Hunter & Brewer 2015:186; Schwandt & Lichty, 2015:588)
- Use multiple methods to complement, develop, expand and triangulate findings (Reis *et al.* 2017:282)
- Develop a more rounded understanding or theoretical framework (Hesse-Biber *et al.* 2015:8; Wellman *et al.* 2023:1007)

- Obtain a more comprehensive understanding of a phenomenon from differing perspectives (Hesse-Biber *et al.* 2015:8; Schwandt & Lichty, 2015:592), using deductive, inductive and abductive approaches (Wellman *et al.* 2023:1012)
- Facilitate a more complete understanding of organisations and empirically examine factors of high importance to managerial theory and practice (Wellman *et al.* 2023:1007)
- Facilitate innovation in scientific practice and new way of thinking about a phenomenon (Schwandt & Lichty, 2015:592)

Subsequently, researchers can adopt multimethod qualitative research to improve their understanding of phenomena and produce findings that provide new knowledge and add value to research and practice. Nevertheless, Wellman *et al.* (2023:1007) indicated that researchers must provide clear justifications for selecting multiple methods and demonstrate the value of multiple methods in advancing theory in the fields of their studies. Consequently, the following sections emphasise the motivating factors for selecting qualitative multimethod research as the methodological choice of *this study*, which associate with the dimensions of complementarity, development, expansion, triangulation, practical problem-solving and innovation (also see section 3.2.5.1).

3.2.5.2.1 Complementarity, development and expansion as motivating factors for qualitative multimethod research

According to Reis *et al.* (2017:285) and Hunter and Brewer (2015:188), pure multimethod qualitative studies are mostly used for *complementarity* purposes. Complementarity involves the combination of qualitative methods to compensate for any weaknesses in one of the methods (Schwandt & Lichty, 2015:588-589). Therefore, the findings of one qualitative method (e.g. QCA of RL literature) can complement the findings of another qualitative method (e.g. interviews with industry experts), strengthening the overall findings of a study (Schwandt & Lichty, 2015:588-589; Reis *et al.* 2017:276). Evidently, complementarity enhances the validity of research findings, which adds to the trustworthiness of a qualitative study (Reis *et al.* 2017:276). Furthermore, complementarity can involve mixing of inductive and deductive approaches to test and explore qualitative data, offering creative ways of investigating a phenomenon and generating new ideas and categories (Wellman *et al.* 2023:1010, 1012).

Development as a motivating factor in multimethod qualitative research relates to the use of findings from one method to develop or inform data collection and analysis of another method (Reis *et al.* 2017:284). For instance, in this study the findings of the QCA in RL literature (phase 2) informed the interview protocol (questions) and codebook TA approach of the interviews with industry experts (phase 3), forming part of the deductive approach of this study (see section). Subsequently, like

complementarity, development can enhance the validity and trustworthiness of qualitative research findings (Reis *et al.* 2017:285).

Finally, the *expansion* dimension means that more than one method extends the breadth and range of a study for different inquiry components (Reis, *et al.* 2017:284). Evidently, a lack of expansion in multimethod research means that researchers apply different methods to test one hypothesis or answer the same research questions, which can only add value in replication of findings/results and not significant value in the field of study (Wellman *et al.* 2023:1011). Subsequently, this study applied different secondary objectives and research questions to different qualitative methods, which extended the range of the study and allowed for significant contribution to the field of RLM in online retailing.

3.2.5.2.2 Triangulation as a motivating factor for qualitative multimethod research

Although complementarity, development and expansion can be important motivating factors for employing qualitative multimethod research, literature mostly focuses on triangulation to motivate multimethod research. According to Abdalla, Oliveira, Azevedo and Gonzalez (2018:3) one of the most popular ways of seeking confirmation in qualitative research can be triangulation, which involves using different angles to study the same phenomenon or research topic. Particularly, triangulation relates to the use of multiple methods, techniques and data sources to (1) overcome the flaws of a single method (Abdalla *et al.* 2018:11) and (2) verify the findings from one research method with the findings of another research method (Schwandt & Lichty, 2015:588). Evidently, like the complementarity dimension, triangulation enables the researcher to capitalise on the strengths of each approach, reducing the weaknesses of a single approach (Salkind, 2010:1539).

Researchers can employ various forms of triangulation, including data triangulation, methodological triangulation and between-methods triangulation. *Data triangulation* means collecting data in different time periods from different sources for a richer and more detailed description of the phenomena (Abdalla *et al.* 2018:8; Collis & Hussey, 2021:63). For example, in this study, qualitative data (from the QCA RL literature and interviews with industry experts) was collected at different times (i.e. in 2016 and 2020) to gain an in-depth understanding of consumer returns, RL processes, RL practices and RLM factors from theory and practice.

Methodological triangulation refers to more than one method of collecting and analysing data (Collis & Hussey, 2021:63). For example, this study combined QCA[6] and interviews as methods of data collection as well as combined QCA and TA (thematic analysis) as methods of analysing data (see section 3.2.5.3). This allowed the researcher to use multiple qualitative methods to obtain comprehensive data about the phenomenon (e.g. RLM in online retailing) (Abdalla *et al.* 2018:8).

Between-methods triangulation offers the possibility that the biases of one approach will be mitigated by the inclusion of other sources of data, methods or researchers (Salkind, 2010:1538). Therefore, researchers may use multiple sources of data or multiple approaches of data analysis to enhance credibility of a research study (Salkind, 2010:1538) and offset limitations of single methodologies (Wellman *et al.* 2023:1009). Evidently, between-methods triangulation can enable complementarity, ensuring that weaknesses in one method can address the weaknesses of another method (see section 3.2.5.2.1), and producing diverse data sources.

Although the nature of many research studies justifies the use of more than one triangulation method (Glinka & Hensel, 2018:249), researchers might place different emphasis on the purpose of triangulation. For instance, some researchers view triangulation as critical to establish corroborating evidence, while other researchers (including the researcher of this study) view triangulation as critical to provide multiple lines of sight and contexts for a rich understanding of a research question or problem (Salkind, 2010:1538). Consequently, information coming from different angles can be used to confirm, develop or illuminate the research problem (Abdalla *et al.* 2018:7).

Essentially, triangulation offers the opportunity to (1) deepen the understanding of the research question, (2) explore multiple realities (Salkind, 2010:1539), (3) create inventive methods (Abdalla *et al.* 2018:7), (4) reduce the impact of potential biases, and (5) increase the possibility of reproducing findings (Abdalla *et al.* 2018:7; Bowen, 2009:28).

3.2.5.2.3 Practical problem-solving and innovation as motivating factors for qualitative multimethod research

The final motivating factors for adopting qualitative multimethod research involves practical problem-solving and innovation that associates with pragmatism. Particularly, multimethod qualitative research was appropriate because it enabled (1) thorough investigation of a research problem (Reis, *et al.* 2017:280), (2) asking different questions about a given phenomenon of interest

[6] Qualitative content analysis (QCA) can be a research method that involves different methods of data collection and steps to analyse qualitative data. Therefore, unlike thematic analysis, which is purely a qualitative data analysis technique, QCA can be broader in scope and used as a research method. Section 3.3 discusses QCA as a research method in greater detail.

(Brannen & O'Connell 2015:259; Hunter & Brewer 2015:199), and (3) solving of managerial problems in practice (Guercini, 2014:664).

Additionally, multimethod research can be a credible form of inquiry not only for practical utility but also for innovation in scientific practice (Schwandt & Lichty, 2015:588). Multimethod research can be suitable for topics/fields of studies that lack theoretical frameworks, enabling effective exploration of under-researched areas, like RLM in online retailing (Hesse-Biber *et al.* 2015:9). Furthermore, multimethod researchers can create new knowledge that significantly develops theory, contributing to organisational success (Wellman *et al.* 2023:1013). Subsequently, multimethod qualitative research can be open to new, innovative and, at times, unanticipated techniques for effective problem-solving in management practice (Hunter & Brewer 2015:187).

Essentially, a multimethod qualitative study is not only a pragmatic option for dealing with different elements of a phenomenon/topic and addressing practical challenges, but also for producing innovative research findings using two or more methods in a single research study (Ahmed & Sil, 2012:936). In the next section, the forms of multimethod mixing adopted in this study will be explored.

3.2.5.3 Forms of multimethod mixing adopted in this study

Various forms of multimethod mixing (or combining) can occur in a qualitative study. The focus of this section is on the forms of mixing used in this multimethod qualitative study, including mixing (or a combination) of research paradigms and approaches, sampling and data collection methods, data analysis methods and presentation of findings, which will be described in the subsequent sections.

3.2.5.3.1 Mixing of research paradigms and approaches

A specific paradigm can be coupled with another tradition (Klenke, 2016a:27) and various paradigms and perspectives can be used to determine a research design and approach of a study (Merriam & Grenier, 2019:5). Since this study adopted pragmatism as a research paradigm, which falls between the positivists and interpretivists paradigms, and uses multiple methods to solve complex problems (see section 3.2.3.2), it can be viewed as multi-paradigmatic. Therefore, pragmatism can include elements of positivism and interpretivism, depending on the research design. Subsequently, this study involves qualitative research, which means that some elements of interpretivism can apply (see section 3.2.3).

Similarly, using pragmatism as a paradigm enabled mixing of research approaches in this study, including deductive, inductive and abductive approaches, enabling effective theory development (see

section 3.2.4). Moreover, Saunders *et al.* (2019:156) indicated that pure deduction and induction can be impossible to achieve in organisational research, which necessitates a combination of deduction, induction and abduction. Consequently, the mixing of research approaches in this study was critical to effectively contribute to management practices.

3.2.5.3.2 Mixing of sampling and data collection methods

Purposive sampling (non-probability sampling) can often be combined (or mixed) with two or more sampling strategies to select adequate evidence for answering the research questions (Suri, 2011:72). Saunders *et al.* (2019:325) describes this as multi-stage sampling, which, depending on the research design, refers to any two probability or non-probability sample techniques occurring in succession. Evidently, this study used multiple or multi-stage non-probability sampling techniques to obtain the necessary data for answering the research question.

Although both the QCA of RL literature and interviews with industry experts involved purposive non-probability sampling techniques, the interviews with industry experts added snowball sampling. While purposive sampling involves the selection of individuals or objects that can provide the best information about the topic, snowball sampling involves asking existing participants to refer or recruit other individuals (e.g. industry professionals) with experiences and knowledge relevant to the topic (Leedy & Ormrod, 2021:272). Subsequently, employing purposive and snowball sampling techniques can increase the sample size (Collis & Hussey, 2021:119) and provide a greater understanding of the field of study. The sampling techniques employed for interviews with industry experts will be discussed in section 7.3.4.

Sections 3.2.5.1 and 3.2.5.2 mentioned that multimethod studies involve multiple forms of data collection methods, which in this study, involved mixing of (1) online databases, e-journals, library and Internet searches for RL literature, with (2) online interviews (e.g. using Ms Teams) with industry experts. The purpose of combining data collection methods in a qualitative research design can be to develop specific strategies to increase the scope of the phenomenon (Klenke, 2016a:27), investigate new problems (Silver & Lewins, 2014:11) and obtain comprehensive data about the phenomenon (Abdalla *et al.* 2018:8). Evidently, using multiple methods of data collection added value in terms of scope, problem investigation and comprehensiveness of data.

3.2.5.3.3 Mixing of data analysis methods and presentation of findings

Like data collection techniques, a multimethod research approach often features two or more types of qualitative data analysis (Ahmed & Sil, 2012:936). This study used different data analysis methods to analyse different sets of qualitative data. Particularly, QCA was used as a method to analyse RL

literature and TA as a qualitative data analysis technique was used to analyse interview data. Additionally, within each qualitative data analysis method more mixing occurred. For instance, the QCA of RL literature involved deductive development code categories with deductive coding of RL articles and inductive development of codes and categories with inductive coding on coded materials (i.e. only using the quotations assigned to deductive codes as text for the coding process).

Similarly, the TA used for the interview findings involved two approaches, including a codebook approach and a reflexive approach (section 7.3.8), representing between-methods triangulation (also see section 3.2.5.2.2). While the codebook approach enabled a descriptive analysis comparing the QCA findings with the interview findings, the reflexive approach enabled a true reflexive TA generating inductive themes for the discovery of new concepts.

Accordingly, presentation of findings can be mixed to support different qualitative data analysis techniques. Qualitative researchers can present findings through themes supported by direct quotations from interview transcripts, descriptions and models of processes, diagrams and visual illustrations of key concepts, and narratives that represent participants' experiences (Roulston, 2014:305). The findings of the QCA of RL literature involved a mixed approach, including (1) quantitative results in terms of deductive code frequencies, (2) text matrices (data tables) for the presentation of inductive categories, subcategories, supporting authors and key quotations (from RL literature), (3) discussion of findings from the data tables, (4) development of conceptual framework for main deductive categories, and (5) conceptual frameworks and typologies to explore the relationships between categories (see section 3.3.2.7).

Furthermore, the interviews with industry experts involved (1) a codebook TA, which compared the QCA findings with the interview findings, using the presentation style of the QCA of RL literature (i.e. data tables to present categories and key quotations from interviews and discussion of findings), and (2) reflexive TA, which involved narrative discussions with supporting quotations embedded in the discussions and analytical frameworks that summarise key findings. Subsequently, like the mixing of data analysis techniques, between-methods presentation of findings occurred throughout the study.

Essentially, the aim of multiple methods and techniques can be to adequately address a research question (or problem statement) and secondary objectives that drives the research project (Morse & Maddox, 2014:525). Therefore, it can be important that qualitative researchers adapt research approaches, methods and techniques to reach meaningful conclusions for valuable contributions to their fields of study.

In the next section the methodology and application of the QCA of RL literature will be discussed.

3.3 THE QUALITATIVE CONTENT ANALYSIS (QCA) OF RL LITERATURE

The aim of this section is to provide the methodology and practical application of conducting the QCA method of RL literature. Particularly, QCA as a method was applied to phase two of the study, as illustrated in Figure 3.**2**. The research questions that stemmed from the research objectives (presented Figure 3.**2**), will be described in the first phase of the QCA of RL literature (section 3.3.2.1). Additionally, the findings of the QCA of RL literature will be presented and discussed in chapters 4 to 6.

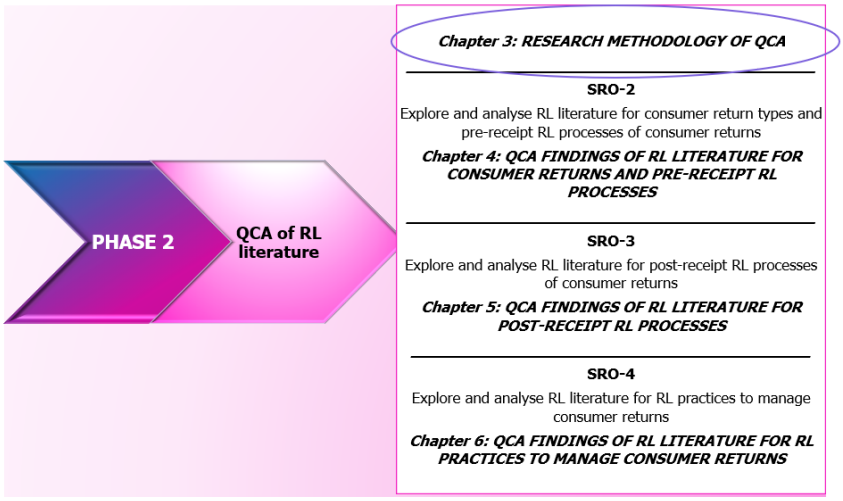

Figure 3.2 Methodology of QCA of RL literature and related objectives and chapters
Source: Compiled by the researcher

The overall purpose of the QCA of RL literature was to gain a theoretical perspective from RL literature on the types of consumer returns, RL processes and RL practices, which was used to (1) identify consumer return types, RL processes and practices from theory for triangulation with the interview method (chapter 8), (2) develop conceptual frameworks for consumer return types, pre-receipt and post-receipt RL processes and RL practices for the management of consumer returns (chapters 4 – 6), and (3) contribute to the final framework for effective RLM of consumer returns in online retailing (chapter 9).

In the subsequent sections, the methodology and application of the QCA of RL literature will be discussed in terms of (1) an overview of QCA as a research method, (2) phases in the QCA of RL literature and (3) trustworthiness of the QCA of RL literature.

3.3.1 Overview of QCA as a research method

As a research method, QCA stands out as a preferred choice for researchers from various disciplines because it can be categorised as a highly flexible, pragmatic and systematic method to investigate various phenomena (Selvi, 2019:450). In the past many researchers viewed QCA as a mere analytical tool but increasingly QCA can be viewed as distinguished qualitative research method (Graneheim, 2017:33) that offers new insights to increase the understanding of a phenomenon for practical application (Krippendorff, 2022:24). Subsequently, QCA as a research method can be appropriate for pragmatism as a research paradigm (see section 3.2.3.2).

Furthermore, Klenke (2016b:95) suggested that QCA can be viewed as a systematic and rule-based method, preserving some of the strengths of quantitative content analysis (hereafter CA). Therefore, it can be important to understand the similarities and differences between QCA and CA. In the subsequent sections, the overview of QCA as a research method will be provided by explaining the similarities and differences of QCA and CA and characteristics of QCA. The overview will be concluded with this study's definition of QCA as a method.

3.3.1.1 Similarities and differences of QCA and CA

QCA and CA share some similarities and differences, which can be important to understand. Schreier (2014:173) provided a clear overview of the similarities between QCA and CA, which included (1) a systematic approach, (2) clear procedures related to a coding frame, categories, segmenting data in coding unit, conducting a pilot study and main analysis, (3) quality criteria of reliability and validity (less strict for QCA), and (4) findings that can be quantified (i.e. frequency counts). Krippendorff (2022:92) added that both QCA and CA involves research questions that guide the implementation of procedures. Subsequently, QCA builds upon the rule-orientated and the systematic values of CA (Mayring, 2020:2).

Nevertheless, like the differences between qualitative and quantitative research (see section 3.2.1), QCA and CA can be distinguished in terms of approaches, aims, trustworthiness criteria and presentation of findings. Specifically, *CA* as a quantitative method usually involves larger volumes of text and the participation of a research team, requiring explicit description of procedures and steps to ensure reliability and validity (Krippendorff, 2022:92). Furthermore, like other quantitative methods, researchers conduct CA to test hypotheses, involving the development of a purely deductive coding framework (Schreier, 2014:173; Selvi, 2019:442). Evidently, CA involves objective coding and data-mining tools (Preiser *et al.* 2022:279), focusing on manifest (clear or apparent) meaning (Schreier, 2014:173; Selvi, 2019:442). Finally, quantitative researchers view the coding process as the basis for

later stages of complex statistical analysis, excluding qualitative analysis and presentation of data (Schreier, 2014:173; Selvi, 2019:442).

In contrast, in QCA, researchers normally work alone with the data and may be less concerned with replicability (Krippendorff, 2022:92). Researchers can adopt various research questions and apply multi-valued codes to the topic of interest (Krippendorff, 2022:93). Furthermore, unlike CA, the coding frame in QCA can include deductive and inductive data-driven codes, focusing on both manifest and latent (context-dependent) meaning (Schreier, 2014:173). Consequently, researchers derive meaning from text, which requires careful reading and sound judgement (Preiser, García, Hill & Klein, 2022:279).

Although QCA can include (limited) elements of reliability and validity, trustworthiness criteria can be added, distinguishing QCA from CA (Krippendorff, 2022:93). Finally, QCA involves a detailed account of the data (Schreier, 2014:173; Selvi, 2019:442), which can be supported by including quotations with the discussion of findings, elaborating on the meaning of data and providing readers with compelling context of the analysed data (Krippendorff, 2022:93).

Essentially, QCA and CA share some characteristics in terms of procedures and structure but can be distinguished in terms of approaches to the analysis, quality criteria and presentation of findings. In the next section, QCA will further be explored through a description of the characteristics of QCA.

3.3.1.2 Characteristics of QCA

The analysis of textual content originated with quantitative newspaper analysis, which developed into CA in the 1930s that focused purely on quantification of large volumes of text (Krippendorff, 2022:11, 12). However, newer research approaches lead the development of QCA (Krippendorff, 2022:21), which included detailed and systematic examination of the contents of material to identify categories, patterns and/or themes and determine the meanings derived from text (Leedy & Ormrod, 2021:265; Preiser *et al.* 2022:270).

Krippendorf (2022:1-4) suggested that contemporary content analysis (including QCA and CA) can be characterised as (1) an empirically grounded method that involves exploratory research with inferential intent, (2) extends historical views of symbols, contents and researcher intents, and (3) an individual and separate research methodology, involving systematic planning, execution, communication and critical evaluation of qualitative and/or quantitative analyses. Additionally, QCA as a research method can be characterised as (1) a scientific and systematic method, (2) an integrative and flexible design and approach, (3) research question and category orientated, (4) suitable for large

bodies of variety material, and (5) a time-consuming process, which will be described in the subsequent sections.

3.3.1.2.1 Scientific and systematic method

QCA can be described as a scientific and systematic method, which contrasts other qualitative research methods that can be regarded as less scientific and systematic (see section 3.2.1). Various scholars claimed that QCA can be a scientific tool or method, which involves a series of steps and procedures that allow for replicability (Krippendorff, 2022:24; Mayring, 2014:53; Salkind, 2010:235). However, for QCA to be classified as a scientific method, researchers must carefully record and describe research procedures, working at different times with the data (applicable to single researcher) or creating training and coding instructions (applicable to multiple researchers/coders) (Krippendorff, 2022:86; Mayring, 2014:53; Salkind, 2010:235).

Accordingly, QCA can be characterised as a rule-based systematic method that involves a step-by-step process (Mayring, 2020:3). Subsequently, a systematic procedure means that the researcher form rules for the analysis in advance and establish a comprehensive procedural framework, stipulating well-defined steps (Mayring, 2014:39). These well-defined steps take the researcher from the identification of appropriate material based on the research question(s) to the final analysis and interpretation of data (Klenke, 2016b:96). Additionally, procedures within QCA steps can be systematic, for example, the development of a coding frame can be systematic through double coding of selected material to test category definitions (Schreier, 2014:171).

Consequently, in this study the QCA of RL literature can be characterised as a scientific and systematic research method that entailed a detailed recording and description of procedures and a rule-based step-by-step systematic process. The systematic procedures and phased followed in the QCA of RL literature will be discussed in section 3.3.2.

3.3.1.2.2 Integrative and flexible design and approach

According to Mayring (2020:12), QCA can be an important starting point in a qualitative study. Evidently, QCA may form part of a larger qualitative study (Leedy & Ormrod, 2021:266), indicating that QCA fit well in a multimethod research study. The qualitative nature of QCA enables a flexible design, allowing researchers to use the research questions/objectives as guides to integrate QCA with other qualitative research methods (Leedy & Ormrod, 2021:267).

Although QCA involves systematic procedures, Mayring (2014:39) stressed the importance of adapting QCA procedures to fit the objectives, material and research approaches adopted in a study.

Subsequently, QCA can be flexible in research approaches, meaning that deductive, inductive and abductive approaches can be adopted in QCA. This flexibility enables researchers to derive code categories both from relevant and existing theory (deductive) and from the data (inductive) (Selvi, 2019:450). Therefore, the coding framework of QCA allows for flexibility and can be partly concept-driven and partly data-driven, providing researchers with the flexibility of matching material to existing theory (Schreier, 2014:171). Moreover, Krippendorff (2022:45) indicated that QCA involves abduction, originating from text and concluding with answering of research questions, emphasising the pragmatic nature of QCA.

Essentially, QCA can be an appropriate qualitative research method for this study due to the ability of integrating QCA with other research methods and flexibility of deductive, inductive and abductive approaches. Section 3.2.4 provided an overview of the research approaches used for theory development, explaining deduction, induction and abduction.

3.3.1.2.3 Research question and category orientated

Research questions can be important in QCA, which relates the empirical grounded characteristic of content analysis (Krippendorff, 2022:39). Therefore, QCA can be characterised as a research question orientated qualitative research method (Mayring, 2020:3). Formulating research questions in advance and focusing on answering the research questions throughout the QCA procedures protects researchers from aimless abstractions and self-serving categorisation (Krippendorff, 2022:40). Subsequently, guided by the aim and research questions, researchers can select appropriate samples and adopt procedures that enable them to provide relevant answers to their questions (Krippendorff, 2022:39; Mayring, 2020:3).

Apart from research questions, QCA can be characterised as category orientated (Mayring, 2020:3), which means that categories form the central instrument of the analysis (Mayring, 2014:40). Furthermore, using categories enables intersubjectivity, allowing for replicability (Mayring, 2014:40) and contributing to the scientific characteristic of QCA (section 3.3.1.2.1). Categories allow researchers to select and analyse only parts of the text that brings meaning to the analysis (Mayring, 2020:3). Subsequently, QCA helps reducing vast amounts of text, enabling researchers to select parts of text related to their research questions (Schreier, 2014:170).

In this study, the research questions were formulated in advance and guided data collection, analysis and presentation of findings, adhering the research question orientated characteristic of QCA. Additionally, categories formed a central part of the analysis and presentation of findings with the researcher only selecting relevant extracts (or quotations) to answer the research questions of the

QCA. The research questions and categories developed for the QCA of RL literature, will be discussed in section 3.3.2.

3.3.1.2.4 Suitable for large and variety bodies of material

QCA as a research method is suitable for the collection and analysis of large bodies of material (Mayring, 2020:7). Additionally, QCA can be appropriate for a wide range of materials, including (1) sampled texts from books, journals, websites, newspapers and magazines, (2) self-generated transcribed text or audio recordings from interviews or focus groups, and (3) sampled audio and visual materials, like films, music, art and television (Leedy & Ormrod, 2021:265; Schreier, 2014:180). However, visual materials must be treated as texts, requiring appropriate software (Mayring, 2014:44), like ATLAS.ti to assign categories/codes to audio and video materials (see Friese, 2014:99).

Additionally, large bodies of text call for the utilisation of computer software to convert material in manageable depictions and preserve data to effectively answer the research questions (Krippendorff, 2022:5). In this study, the material selected can be described as sample text from online scientific databases for the selection of published articles in RL. Additionally, ATLAS.ti was used as the software to support most procedures in the QCA of RL literature. The selected text and the use of ATLAS.ti will be described in sections 3.3.2.

3.3.1.2.5 Time-consuming process

Linking with the large bodies of material, QCA can be characterised as a time-consuming process associated with reading, coding and analysis of material. Accordingly, coding and analysing text in the QCA can be classified as the most time- and effort-consuming phases, involving familiarisation of the data (Klenke, 2016b:104), careful reading of documents, attaching codes to relevant sentences, remembering codes and code definitions (Kunz, 2019:2), identifying patterns in the data (Preiser *et al.* 2022:280) and building and applying conceptual or theoretical frameworks (Klenke, 2016b:104). Evidently, QCA can be a mentally challenging and slow process (Kunz, 2019:2), requiring the allocation of sufficient time to carefully read, code and work through the data (Preiser *et al.* 2022:280).

Nevertheless, as mentioned in the preceding section, researchers can use software, like ATLAS.ti, to simplify systematic coding and analysis of the data, eliminating time-consuming manual tasks (Friese, 2014:1). Subsequently, using ATLAS.ti for the QCA of RL literature helped the researcher to avoid additional time-consuming manual processes of managing documents, manually coding data and manually extracting quotations for the presentation of findings. However, the QCA of RL

literature was a time-consuming process in the data collection, analysis, interpretation and presentation of findings, emphasising the importance allocating sufficient time and effort for a successful QCA.

Based on the overview of QCA discussed in section 3.3.1 this study defines *QCA as a pragmatic, scientific, empirical grounded, systematic and flexible research method that can be part of mixed method or multimethod qualitative research designs, involving (1) step-by-step procedures (2) research question(s), (3) development of categories, (4) large and variety bodies of text, audio or visual material, and (5) time-consuming data coding and analysis processes, which can benefit from appropriate computer software (e.g. qualitative data analysis software, like ATLAS.ti) for effective data collection, analysis and presentation of qualitative findings*.

In the next section, a detailed discussion of the systematic (step-by-step) procedures of the QCA of RL literature will be provided.

3.3.2 Phases in the QCA of RL literature

As indicated in the characteristics and this study's definition (section 3.3.1.2), QCA involves step-by-step procedures. Although literature describe QCA procedures in steps, this study created phases based on the steps provided by Schreier (2012)[7] and Schreier (2014) and added several steps within these phases (if applicable). The steps of standard QCA includes (1) deciding on a research question/objective, (2) selecting material, (3) building a coding frame, (4) executing the coding frame, (5) evaluate and modify the coding frame, (6) main analysis of the qualitative data, and (7) interpreting and presenting the findings (Schreier, 2012:17; Scheier, 2014:174).

Based on these steps from Schreier (2012:17) and Schreier (2014:174), Table 3.3 provides an overview of the phases applied to the QCA of RL literature, including related descriptions and steps (except phase 3) developed by the researcher.

Table 3.3 Overview of phases in the QCA of RL literature

Phase	Name	Description	Steps in the phase
1	Identifying the research objectives and questions for the QCA of RL literature (section 3.3.2.1)	This phase involves the development of research objectives and questions based on the problem statement of a study.	-

[7] Margrit Schreier is as a seminal author in QCA, popularised by the 2012 publication of her book "Qualitative Content analysis in Practice". The book provides clear and step-by-step descriptions with practical examples of a QCA. Therefore, using Schreier as a reference was critical for the effective application of the QCA of RL literature.

2	Selecting materials for the QCA of RL literature (section 3.3.2.2)	This phase involves the selection of material that can be appropriate for answering the research questions. The unit of analysis can be identified, and a sampling strategy can be selected. The inclusion and exclusion criteria for the material must be defined and the process of selecting the material must be defined. This phase concludes with the identification and presentation of selected material.	• **Step 1**: Defining the unit of analysis for the QCA of RL literature • **Step 2**: Developing a sampling strategy for the QCA of RL literature • **Step 3:** Identifying sample material and data sources for the QCA of RL literature • **Step 4**: Defining search criteria for the QCA of RL literature • **Step 5**: Creating alerts and searching RL literature • **Step 6**: Scanning RL literature for sample selection • **Step 7**: Describing material excluded from for the QCA of RL literature • **Step 8**: Identifying and presenting the final sample of the QCA of RL literature
3	Developing the coding frame for the QCA of RL literature (section 3.3.2.3)	In this phase the coding frame is developed, which involves the identification, structure and description of categories and codes.	• **Step 1**: Selecting relevant categories for the QCA of RL literature • **Step 2**: Structuring the coding frame for the QCA of RL literature • **Step 3**: Defining categories for the QCA of RL literature • **Step 4**: Revising and expanding the coding frame for the QCA of RL literature (Schreier, 2012:91; Schreier, 2014:174)
4	Testing the coding frame for the QCA of RL literature (section 3.3.2.4)	The purpose of this phase is to test the developed coding frame. The phase involves sample selection for testing, preparation for coding and two trial coding rounds on the selected sample (if one researcher is involved). If software is used for the coding of documents, this phase can involve software training.	• **Step 1**: Training in ATLAS.ti for trial coding • **Step 2**: Selecting material for trial coding • **Step 3**: Preparing for trial coding in ATLAS.ti • **Step 4**: First trial coding round on selected sample • **Step 5**: Second trial coding round on selected sample
5	Assessing the coding frame of the QCA of RL literature (section 3.3.2.5)	In this phase the results of the two trial coding rounds completed in phase 4, are examined. The purpose of this phase is to determine consistency of the trial coding rounds and the validity of the coding frame.	• **Step 1**: Exporting trial coding results from ATLAS.ti • **Step 2**: Quantitative analysis of trial coding results • **Step 3**: Qualitative analysis of trial coding results • **Step 4**: Assessing outcomes of the coding frame analysis
6	Main analysis in the QCA of RL literature (section 3.3.2.6)	In this phase all material in the selected sample is coded with the developed and tested code frame. This phase is one of the most time-consuming phases in QCA. Depending on the approach followed in the development of the coding frame, this phase can include inductive coding and development of inductive categories from content assigned to deductive codes.	• **Step 1**: Creating a new project and adding documents in ATLAS.ti • **Step 2**: Preparing codes in ATLAS.ti for the main analysis of RL literature • **Step 3**: Coding articles in ATLAS.ti • **Step 4**: Exporting results and generating quotation output reports • **Step 5**: Inductive coding on quotation output reports
7	Interpreting and presenting the findings of the QCA of RL literature (section 3.3.2.7)	In this phase the QCA is concluded with interpretation and presentation of findings. The findings can be presented quantitatively and qualitatively through various styles of presentation.	-

Source: Compiled by the researcher

In subsequent sections, greater details of the phases and steps for the QCA of RL literature, will be provided. Due to the comprehensiveness of some of the phases and steps, some content was added to

appendices, which will be referenced in relevant discussions. This section concludes with a final table presenting a short summary of the content discussed in phases 1 to 7 for the QCA of RL literature.

3.3.2.1 Phase 1: Identifying the research objectives and questions for the QCA of RL literature

QCA process begins with deciding on the research questions (Selvi, 2019:444), which can be the most important phase for a successful QCA research design (Krippendorff, 2022:387). However, before the research questions can be formulated, the topic of interest (e.g. RL) must first be researched (Klenke, 2016b:96) for the identification of research gaps and problems (see sections 1.2 and 1.3). Thereafter, research problems must be converted into research objectives and related research questions (Krippendorff, 2022:386).

Evidently, the researcher must start by defining a study's objectives to develop research questions that must guide QCA procedures (Kunz, 2019:7). In this study the aim of the QCA of RL literature was to (1) *explore and analyse RL literature for consumer return types and pre-receipt RL processes of consumer returns (SRO-2)*, (2) *explore and analyse RL literature for post-receipt RL processes of consumer returns (SRO-3),* and (3) *explore and analyse RL literature for RL practices to manage consumer returns (SRO-4).* Subsequently, the research questions used to guide the of QCA of RL literature, included:

- *What are the types of consumer returns? (SRO-2)*
- *What are the pre-receipt RL processes for consumer returns? (SRO-2)*
- *What are the post-receipt RL processes for consumer returns? (SRO-3)*
- *What are the RL practices to manage consumer returns? (SRO-4)*

Identifying the purpose and research questions of the QCA of RL literature, enabled effective selection of materials, which will be described in the next section.

3.3.2.2 Phase 2: Selecting materials for the QCA of RL literature

Before building a coding frame, suitable amounts of material must be selected, reflecting a full diversity of sources (Schreier, 2014:175; Selvi, 2019:444). Selecting the materials in the QCA of RL literature involved several steps that will be described in subsequent paragraphs.

3.3.2.2.1 Step 1: Defining the unit of analysis for the QCA of RL literature

Before material can be selected, the researcher must first define the required material (Mayring, 2014:56), which entails a description of the unit of analysis that must be based on the purpose and research questions of a study (Kunz, 2019:7). With the expansion of the Internet and full-text

electronic databases, researchers can access large bodies of content-analysable texts (Krippendorff, 2022:391).

Although literature can include various forms, like scientific journal articles, conference proceedings, books, industry articles and magazines, this study only focused on scientific peer-reviewed journal articles since textbooks, working and conference papers and Internet articles may go through less rigorous peer-reviewed processes (Santos & D'Antone 2014:1014). Additionally, other publications that analysed RL literature used scientific journal articles as a unit of analysis (see section 3.3.2.2.3). Accordingly, the unit of analysis for the QCA of RL literature included *scientific peer-reviewed journal articles in RL.*

3.3.2.2.2 Step 2: Developing a sampling strategy for the QCA of RL literature

Due to the large volumes of available literature, Krippendorff (2022:392) and Schreier (2014:175) suggested that researchers break material down into smaller units. Therefore, the selection of materials can include a sampling strategy (Mayring, 2014:12), enabling the selection of statistically or conceptually representative subsets from the unit of analysis (Krippendorff, 2022:122).

Since this study involved qualitative research, the sampling strategy for the QCA of RL literature included *non-probability sampling,* which involves subjective judgement to reach objectives and answer research questions (Saunders *et al.* 2019:315). Particularly, *purposive sampling* was used to carefully select material that contributed to answering the research questions (Krippendorff, 2022:122; Saunders *et al.* 2019:321). Subsequently, the aim of purposive sampling was not to obtain a statistical representation from the population of material but to obtain relevant material to answer research questions, thereby excluding any irrelevant material (Krippendorff, 2022:123).

Nevertheless, sampling in QCA requires exact descriptions of the origin of data sources, conditions of selecting material (Mayring, 2014:57) and inclusion and exclusion criteria (Kunz, 2019:7), which will be described in subsequent steps.

3.3.2.2.3 Step 3: Identifying sample material and document sources for the QCA of RL literature

The identification of materials started in February 2016 with an initial search on Google Scholar for RL articles that contained either content analysis on RL literature or literature reviews in RL. The aim was to identify appropriate accredited peer review journals that was previously used by other scholars to analyse RL literature. A few articles with similar methodologies were identified, which enabled the identification of potential journals as a starting point in the selection of appropriate materials for the

QCA of RL literature. Specifically, the journals were identified from Hazen, Hall and Hanna (2012), Govindan, Soleimani and Kannan (2015) and Agrawal, Singh and Murtaza (2015).

Following the identification of materials, document sources must be identified (Kunz, 2019:7). For the QCA of RL literature, the University of South Africa's (Unisa's) online library e-journal search function was used to identify online databases that provide access to identified journals. These databases included Science Direct, Emerald, Tandofline, Wiley online library, ProQuest and Springer Link. However, since the identified journals were international or non-local, South African databases, namely Sabinet African Journals and AOSIS, were added as document sources to access local journals.

3.3.2.2.4 Step 4: Defining search criteria for the QCA of RL literature

Before searching the literature, Kunz (2019:7) indicated that search criteria for the identification of relevant literature must be defined. The keywords "returns management or reverse logistics management", "consumer returns", "reverse logistics processes" and "reverse logistics practices" formed part of the search criteria for the QCA of RL literature. Furthermore, only articles published between 2006 and 2016 was included in the search criteria. A date range of ten years was identified as standard for the analysis of literature, for example, Hazen *et al.* (2012) selected publications from 2000 to 2010.

3.3.2.2.5 Step 5: Creating alerts and searching RL literature

Since the selection of material for the QCA of RL literature commenced in 2016, the keywords defined in step 4 were used to create Google Scholar alerts. The Google Scholar alert function sends notifications via email, containing links to articles that may be relevant for answering the research questions. Additionally, the Google Scholar alerts resulted in the identification of additional peer-reviewed scientific journals, which were added to the journal sample.

From the accessible online databases, the advanced search function for each journal was used to add the keywords, "returns management or reverse logistics management", "consumer returns", "reverse logistics processes" and "reverse logistics practices" and to set the publication range between 2006 and 2016. An Excel spreadsheet was used to create a data matrix, listing the journal names in rows of the first column and the remaining column headings with the year of publication from 2006 to 2016 and publication totals. This document was used to present the final sample, provided in step 8.

3.3.2.2.6 Step 6: Scanning RL literature for sample selection

Step 6 involved scanning of RL literature to identify published articles in RL that can be included in the sample. Krippendorff (2022:88) indicated that reading material during the initial stages of QCA can involve scanning of words, sentences, paragraphs or whole publications for sample selection. For the QCA of RL literature the researcher scanned the entire article to purposively identify if the content of the article can be appropriate for answering the research questions.

A new data matrix was created in Ms Excel for each journal to record the scanning results. The data matrix included six columns with the following headings: (1) full reference, (2) consumer return type/reason, (3) pre-receipt RL process, (4) post-receipt RL process, (5) RL practice and (6) non-applicable. Columns two to five represented elements from the research questions (see section 3.3.2.1), ensuring that the sample contained articles that can be used to answer the research questions.

The references for all articles generated from the search results were added to the first column, whereafter each recorded article was scanned. The results of the scan enabled completion of the remaining columns in the data matrix. If an article contained sufficient content related consumer return types/reasons, pre-receipt RL processes, post-receipt RL processes or RL practices, it was marked with a corresponding "X", downloaded and saved in a folder. Furthermore, the data matrix created in step 5 was completed, adding a number to the relevant journal and date of publication. However, any article that excluded content related to the research questions was marked as non-applicable and discarded from the sample. If a journal failed to produce any relevant articles, it was deleted from the sample data matrix. The same scanning procedure applied to new published articles identified from the Google Scholar alerts.

Apart from identifying an appropriate sample, scanning of materials in QCA can be important for the development of conceptions and identification of potential points of analyses (Krippendorff, 2022:391). Consequently, scanning RL literature helped the research to identify potential subcategories for the development of the coding frame in phase 3.

3.3.2.2.7 Step 7: Describing materials excluded from the QCA of RL literature

Describing content excluded from the QCA can be important for transparency and replicability of a study (Kunz, 2019:7). For the QCA of RL literature, the researcher was unable to access some of the journals identified from Hazen *et al.* (2012), Govindan *et al.* (2015) and Agrawal *et al.* (2015). Unlike the 2020s', fewer open-access journals existed in 2016, which restricted access to journals from databases attainable through the researcher's institution (Unisa). However, some journals identified

from these studies lacked articles relevant for answering the research questions that were subsequently omitted from sampled journals.

Furthermore, the sample excluded RL articles that contained inadequate descriptions for a qualitative analysis, for example articles that mostly involved quantitative models, equations and statistical results. Nevertheless, the sample included a few RL articles with quantitative methodologies that contained sufficient descriptions of consumer return types, pre-receipt RL processes, post-receipt RL processes and/or RL practices. Consequently, the sample for the QCA of RL literature excluded any inaccessible and irrelevant material outside the scope of the research questions, unit of analysis and defined search criteria.

3.3.2.2.8 Step 8: Identifying and presenting the final sample of the QCA of RL literature

The final step of selecting material involves the identification and presentation of the final sample, which can contain defined characteristics, like publication names and years (Kunz, 2019:2). Due to the comprehensiveness of the sample, the data matrix (see steps 5 and 6), containing journal names, year of publications and corresponding number of publications, was used to present the final sample. Table 3.4 illustrates this data matrix, including details of the journals, the corresponding year ranges and total number of articles that was included in the final sample of the QCA of RL literature.

Table 3.4 Final sample of QCA of RL literature

Journal name	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	Total

Source: Compiled by the researcher

Table 3.4 shows that the final sample of the QCA of RL literature covered 82 (international and local) journals with a combined total of 289 peer-reviewed scientific articles in RL published between 2006 and 2016. The journal with the highest number of RL publications included the International Journal of Production Research with 27 publications, followed by the Journal of Production Economics with 25 publications. Contrastingly, 41 journals included only one publication in RL relevant for answering the research questions.

Additionally, the highest number of articles (44) used for this study were published in 2016, while the least number of articles (13) were published in 2006. Essentially, RL literature that focused on consumer returns, RL processes, RL practices and RL management (RLM) increased by at least 50% between 2006 and 2016, which shows the increasing importance of RL as a research topic. The full list of the articles selected in the sample of the QCA of RL literature can be viewed in Appendix A.1.

In the next section, the development of a coding frame for the QCA of RL literature will be discussed.

3.3.2.3 Phase 3: Developing the coding frame for the QCA of RL literature

The coding frame can be described as the heart of the QCA method (Schreier, 2014:174), which functions as a system that transforms data into smaller more manageable units (Selvi, 2019:444). A coding frame provides rules for a scientific, systematic and logical QCA (Klenke, 2016b:98). Developing a coding frame involves the deductive and/or inductive identification of main categories and subcategories (or codes) (Schreier, 2014:176). A deductive approach uses existing knowledge and theory, like other research studies, to identify categories (Mayring, 2014:97; Schreier, 2014:176;

Selvi, 2019:446). An inductive approach uses the selected material to develop code categories and subcategories (Mayring, 2014:97; Schreier, 2014:176).

For the development of the coding frame for the QCA of RL literature, a deductive approach was used to identify categories and codes. However, later stages of the analysis involved inductive coding derived quotations assigned to deductive codes, which will be described in section 3.3.2.6. Schreier (2012:91) and Schreier (2014:174) indicated that the process of developing a coding frame can include several steps, including (1) selecting relevant categories, (2) structuring the coding frame, (3) defining categories and (4) revising and expanding the coding frame, which will be described in the subsequent sections.

3.3.2.3.1 Step 1: Selecting relevant categories for the QCA of RL literature

In this step the researcher determines the relevant and irrelevant parts of material. While sampling material involves inclusion and exclusion criteria, selecting relevant parts of material involves the identification of categories (Krippendorff, 2022:104). The relevant categories can be identified by (1) breaking down data according to sources or (2) breaking down data according to topic (Schreier, 2012:91). Furthermore, categories can be identified from the research questions or from theoretical constructs (Klenke, 2016b:103). For the QCA of RL literature, data was reduced according to topic, which covered consumer returns, pre-receipt RL processes, post-receipt RL processes and RL practices. Subsequently, only categories relevant to the research questions were selected as main categories in the coding frame.

As indicated in the introduction of section 3.3.2.3, code categories or subcategories can be derived deductively from theory and knowledge about the topic under investigation (Klenke, 2016b:103). The code categories for the QCA of RL literature were deductively identified, through a preliminary literature review on consumer returns, RL processes and RL practices. The preliminary literature review showed that consumer returns are limited in scope, meaning that no further code categories can be assigned to consumer returns. Contrastingly, RL processes and practices are broader in scope, requiring the identification of several code categories (subcategories). The code categories for the pre- and post-receipt RL processes were identified from Bernon, Rossi and Cullen (2011), Hazen *et al.* (2012) and Stock and Mulki (2009), and the code categories for the RL practices were identified from Badenhorst (2013) and Lambert *et al.* (2011).

Particularly, the code categories (or subcategories) for the (1) pre-receipt RL processes included a consumer return request, gatekeeping, collection and transportation, (2) post-receipt RL processes included receiving, processing, inspection/sorting, disposition and redistribution, and (3) RL practices

included information technology (IT), integration, outsourcing/insourcing, disposition practices, performance measurement (PM), facility/location practices, resource commitment (RC), financial management (FM), return avoidance and gatekeeping practices, procedural practices and staff and management practices. Some broader code categories required further subdivisions, which can be viewed in the coding framework presented in Appendix A.2.

3.3.2.3.2 Step 2: Structuring the coding frame for the QCA of RL literature

After selecting relevant categories, the coding frame can be structured for effective analysis. Although a deductive approach was used to identify code categories, Schreier (2012:102) suggested that a coding frame should allow for additional inductive categories (new categories identified during the analysis) by creating residual categories (miscellaneous categories). Since consumer returns as a main category excluded subcategories, two subcategories were created, namely general consumer returns and miscellaneous return types. Additionally, a miscellaneous category was assigned to the remaining main categories, enabling the identification of new categories or codes.

Using ATLAS.ti for the coding of RL articles, Friese (2012:1) suggested that coding categories must be structured according to the main category (such as Category A) and subcategories (such as Category A_sub1). When importing codes in ATLAS.ti (see section 3.3.2.6.2) the software automatically arranges the codes in alphabetical and numerical order. Therefore, the structure facilitated the grouping of main categories with related subcategories, simplifying the coding process in ATLAS.ti. Table 3.5 shows the broad structure of the coding frame for the QCA of RL literature.

Table 3.5 Broad structure of the coding frame for the QCA of RL literature

Main category	Code categories
CatA: Pre-receipt processes	CatA_Sub1: Customer return request CatA_Sub2: Gatekeeping process CatA_Sub3: Collection CatA_Sub4: Transportation of return CatA_Sub5: Miscellaneous pre-receipt process
CatB: Post-receipt processes	CatB_Sub1: Receiving CatB_Sub2: Processing CatB_Sub3: Inspection/sorting CatB_Sub4: Disposition CatB_Sub5: Redistribution CatB_Sub6: Miscellaneous post-receipt processes
CatC: Consumer returns	CatC_Sub1: General consumer returns CatC_Sub2: Miscellaneous types of returns

CatD: RL Practices	CatD_Sub1: IT practice CatD_Sub2: Integrations CatD_sub3: Outsourcing/insourcing CatD_sub4: Disposition practices CatD_sub5: Performance measurement CatD_sub6: Facility/locations strategies CatD_sub7: Resource commitment CatD_sub8: Financial management practices CatD_sub9: Return avoidance and gatekeeping practices CatD_sub10: Procedural practices CatD_sub11: Staff and management practices CatD_sub12: Miscellaneous practices

Source: Compiled by the researcher

Since some of the broader code categories included additional subcategories, additional code labels were assigned to the code categories, for example, CatB_sub4_1, CatB_sub4_2 and so forth. All categories identified in the coding frame represented deductive codes used for the main analysis of RL literature. Due to the comprehensiveness of the coding framework, these additional subcategories can be viewed in Appendix A.2.

3.3.2.3.3 Step 3: Defining categories for the QCA of RL literature

Following the structuring of the code frame for the QCA of RL literature, the next step involves category definitions (Selvi, 2019:446). Category definitions represent coding rules or selection criteria for assigning data to relevant categories (Mayring, 2014:82; Schreier, 2012:105). While brief descriptions can be provided for main categories, subcategories/codes can include more extensive definitions, enabling effective selection of relevant data (Selvi, 2019:446). Particularly, code definitions must describe the meaning of the code, provide decision rules (Friese, 2014:159; Schreier, 2014:177) or include examples that list the characteristics of the code (Krippendorf, 2022:142; Leedy & Ormrod, 2021:265).

Friese (2014:159) indicated that the process of defining categories and writing code definitions improves methodological rigour, forcing the researcher to think about a code's meaning in comparison to other codes. For the QCA of RL literature the codes were defined in several ways: (1) self-explanatory descriptions that excluded examples, (2) definitions identified from literature, (3) descriptions/examples of content relevant to the code, and/or (4) descriptions of content irrelevant to the code. The category/code definitions for the QCA of RL literature can be viewed in Appendix A2.

3.3.2.3.4 Step 4: Revising and expanding the coding frame for the QCA of RL literature

The final step in the development of the coding frame includes revision and expansion (Selvi, 2019:446), which involves the identification of categories/codes that must be included, excluded or altered in the coding frame (Scheier, 2012:115). Since the coding frame was developed from the

research questions and specific deductive subcategories derived from literature, no expansion, exclusions or changes were made during this stage of the QCA. However, the structure of the coding frame can only be finalised after the testing phase, which will be discussed in the next section.

3.3.2.4 Phase 4: Testing the coding frame for the QCA of RL literature

Before conducting the main analysis, pretesting is needed to recognise and modify any shortcomings in the coding frame. Since QCA excludes standardised instruments (of reliability and validity), a pilot study must be conducted to test the coding frame (Mayring, 2014:41). The process of testing the coding frame involves the selection and preparation of material and trial coding.

According to Mayring (2014:111), trial coding can either involve intra-coding agreement (one coder conducting two coding rounds) or inter-coder agreement (two coders), which measures the reliability of the coding frame. For the QCA of RL literature, intra-coding was conducted to test the coding frame, which involved coding of selected material on two separate occasions, approximately 10 to 14 days apart (Schreier, 2014:179). The aim of the trial coding was to obtain a structured code list that can be applied to the rest of the data in the main analysis (Friese, 2014:17).

Testing the coding frame for the QCA of RL literature consisted of several steps, including (1) ATLAS.ti training for trial coding, (2) selecting material for trial coding, (3) preparing for trial coding in ATLAS.ti, (4) first trial coding round on selected sample and (5) second trial coding round on selected material. These steps will be described in subsequent sections.

3.3.2.4.1 Step 1: Training in ATLAS.ti for trial coding

According to Klenke (2016b:109) threats to reliability of the QCA include inadequate coder training. Consequently, training in the use of computer-assisted qualitative analysis software (CAQDAS), like ATLAS.ti, can be essential for a sound QCA (Preiser *et al.* 2022:280). Nevertheless, Smit and Scherman (2021:3) indicated that few research studies provide examples for using ATLAS.ti to analyse literature. Evidently, training in ATLAS.ti was important for the QCA of RL literature.

Although limited research provided examples of using ATLAS.ti for literature reviews, Friese (2014) published a book, titled "Qualitative data analysis with ATLAS.ti", which was purchased prior to formal training. Containing practical examples and training exercises, the book was used as a reference in the QCA of RL literature. In 2016, the researcher's institution (Unisa) offered several ATLAS.ti workshops and training sessions, which the researcher attended in preparation for trial coding in August 2016. Consequently, the book and training ensured adequate preparation for the

effective testing (and later main analysis) of the developed coding frame for the QCA of RL literature.

3.3.2.4.2 Step 2: Selecting material for trial coding of the QCA of RL literature

Before trial coding can be conducted, a sample must be selected from the body of materials selected for the analysis. According to Schreier (2014:178), material selected in the trial coding phase must cover all aspects of the data (e.g. entire article) and most categories of the coding frame. Like the main process of selecting a sample (see section 3.3.2.2), purposive sampling was used to identify articles with sufficient content to test the coding frame.

The Excel data tables that recorded the results of the initial scanning of RL articles for each journal (see section 3.3.2.2.6) were used as a starting point to identify articles that covered most main categories derived from the research questions. Thereafter, each article was scanned to identify if the article contained sufficient content for effective testing of the coding frame. Subsequently, ten articles were selected from the 289 articles that sufficiently covered consumer returns, RL processes and RL practices and most categories in the coding frame. Table 3.**6** provides details of the articles purposively selected for trial coding, including the article number (generated in ATLAS.ti), full reference and justification for selection.

Source: Compiled by the researcher

These ten articles presented in Table 3.**6**, represented valuable articles in the sample of 289 articles, which in combination applied to the entire code frame. The scope of other articles was limited, meaning that only parts of the coding frame can be applied to these articles. Subsequently, pilot testing on these articles would be futile and add additional time to the QCA process.

3.3.2.4.3 Step 3: Preparing for trial coding in ATLAS.ti

This step involves preparation of documents, codes and code definitions in ATLAS.ti for trial coding. A project file called a hermeneutic unit (HU) in ATLAS.ti is (Friese, 2014:23), was created and named "Trial coding 1" for the first trial coding round. Various file types can be added to ATLAS.ti, for example, text documents (e.g. interview transcripts, reports or articles), images (e.g. screenshots or photos), audio recordings (e.g. interviews, music or podcasts), video clips, geo data (Google Earth) and PDF files (Friese, 2014:24).

For this study, PDF documents were added since all sampled articles (289) were downloaded in PDF format. Subsequently, the ten articles selected for the trial coding (Table 3.**6**) were added to the project file (Trial coding 1). ATLAS.ti automatically arranges the files in alphabetical order and assign the letter "P" [8] and a number to the document. The letter "P" represents the ATLAS.ti term "primary documents" or "P-Docs" and the number represents the numerical order of the document. For example, the first document will be "P1" and the second document "P2".

After adding the documents and saving the project file, the codes must be added to the project. In ATLAS.ti codes can be imported from an external source, eliminating the need of creating codes manually in the programme. The coding frame developed in phase 3 was copied (without definitions) into an Excel worksheet and saved. Thereafter, the code list was imported using the codebook import function in ATLAS.ti, which organised the codes in alphabetical and numerical order. Section 3.3.2.6 provides more details on importing a coding frame into ATLAS.ti.

Following the import of codes in the project file, the definition of each code was manually added using the code comment function of ATLAS.ti. The importance of code definitions was discussed in

[8] The letter "P" was replaced with "D" (documents) in later ATLAS.ti versions

section 3.3.2.3.3. When selecting the code in ATLAS.ti, the definition becomes visible, ensuring that the content is coded consistently and accurately. Subsequently, the project was saved, concluding the preparation step in phase 4 of the QCA of RL literature. The application of ATLAS.ti will be described in greater detail in phase 6 (section 3.3.2.6), involving the main analysis phase of the QCA of RL literature.

3.3.2.4.4 Step 5: First trial coding round on selected sample

Following the preparation of materials, the first trial coding round of selected material (Table 3.**6**) commenced. The coding process involved reading each article, line by line, to identify if the content can be applied to the coding frame (Mayring, 2014:82). If a sentence, sentences, paragraphs or sections from the article applied to the coding frame, it was selected and assigned with the relevant code. The process of coding in ATLAS.ti will be explained in greater detail in section 3.3.2.6. Subsequently, ten articles were meticulously coded with the coding frame developed in phase 3 of the QCA of RL literature. No problems with the developed coding frame, including code definitions, were identified in the first trial coding round.

3.3.2.4.5 Step 6: Second trial coding round on selected sample

As suggested by Scheier (2014:19), the second trial coding round started two weeks (14 days) after the first trial coding round concluded. The same preparation process of creating a project file ("Trial coding 2"), adding documents (ten articles from the sample), importing codes and creating code definitions in ATLAS.ti applied to the second trial coding round.

In the second trial coding round of the QCA of RL literature, the researcher repeated the coding process, meticulously reading each article, line by line, without referring to the results of the previous coding round (Mayring, 2014:111). Like the first trial coding, the second trial coding confirmed that the coding frame and definitions can be used for the main analysis. The second trial coding round concluded phase 4, involving effective application of the developed code frame for the QCA of RL literature. In the next phase, the results of the trial coding rounds will be analysed.

3.3.2.5 Phase 5: Assessing the coding frame of the QCA of RL literature

In this phase the results of the two trial coding rounds (section 3.3.2.4) must be examined in terms of consistency and validity, which can help to identify potential problems with the coding frame and coding process. The higher the consistency between the two trial coding rounds, the higher the quality of the coding frame (Schreier, 2014:175). Additionally, the validity of the coding frame involves the extent to which the categories adequately describe the content and concepts related to the research

questions (Schreier, 2014:175). Consequently, if the coding frame requires significant revision, a second round of trial coding rounds must be conducted, meaning that phases 4 and 5 of the QCA must be repeated (Schreier, 2014:175).

In the subsequent sections, the steps for the assessment of the coding frame of the QCA of RL literature will be described.

3.3.2.5.1 Step 1: Exporting trial coding results from ATLAS.ti

The "Code-Document-Analysis" function of ATLAS.ti can be used for quantitative results (i.e. code frequencies) of coding, which can be exported to Excel for analysis. The exported results in Excel include a tabulation of the code categories, document names and corresponding frequency of codes assigned to quotations (passages). Table 3.7 shows the combined results of the two trial coding rounds to assess the coding frame for the QCA of RL literature.

Table 3.7 Trial coding results for the QCA of RL literature

Trial coding 1	**P1**	**P2**	**P3**	**P4**	**P5**	**P6**	**P7**	**P8**	**P9**	**P10**	**TOTALS:**
Pre-receipt RL processes	4	1	6	0	10	3	3	1	1	1	30
Post-receipt RL processes	14	10	10	11	20	2	1	36	12	28	144
RL practices	42	24	27	24	16	17	18	21	25	21	235
Consumer returns	3	2	3	0	0	3	2	1	0	0	14
TOTALS:	63	37	46	35	44	25	24	59	38	50	423
Trial coding 2	**P1**	**P2**	**P3**	**P4**	**P5**	**P6**	**P7**	**P8**	**P9**	**P10**	**TOTALS:**
Pre-receipt RL processes	4	2	6	0	12	3	3	1	1	1	33
Post-receipt RL processes	17	12	12	13	22	3	1	39	15	30	164
RL practices	44	29	29	25	18	18	19	23	26	22	253
Consumer returns	3	2	3	0	0	3	2	1	0	0	14
TOTALS:	68	46	50	38	52	27	25	64	42	53	464

Source: Compiled by the researcher

Due to the comprehensiveness of the coding frame, only the main categories from the coding frame are presented in Table 3.7. The table shows the results of the two trial coding rounds, including code frequencies per document and category, total code frequencies per document and category and combined totals. The assessment of the results will be described in the subsequent steps.

3.3.2.5.2 Step 2: Quantitative analysis of trial coding results

Table 3.7 illustrates minor inconsistencies between the two trial coding rounds of the QCA of RL literature. Particularly, the results showed that more quotations were assigned to the codes in the second trial coding round, which required further examination. These inconsistencies were investigated by reviewing the subcategory codes, for example, comparing the results of "consumer

return request", "gatekeeping", "collection" and "transportation" as codes in the pre-receipt RL processes. Using article "P5" as an example, the results showed that codes in the pre-receipt RL process category were assigned to ten quotations (e.g. sentences and/or paragraphs from the article) in the first trial coding round and twelve quotations in the second trial coding round. In reviewing the subcategory codes, the discrepancies originated from "collection" as a pre-receipt RL process code. Particularly, the collection code was assigned to three quotations in the first coding round and five quotations in the second coding round. Subsequently, these inconsistencies require further investigation, which will be described in the next step.

3.3.2.5.3 Step 3: Qualitative analysis of trial coding results

Following the quantitative comparison of inconsistencies for each code, the qualitative findings between the two trail coding rounds were compared to identify the causes for inconsistencies. Continuing with the example for article P5 and inconsistencies with the pre-receipt RL process code "collection", it was noted that in the first trial coding round the collection code was assigned to a paragraph, but in the second coding round the collection code was only assigned to relevant sentences in the same paragraph. In other words, in the second trial coding the collection code was assigned to three sentences instead of an entire paragraph that also contained irrelevant content.

In terms of other, less frequent, inconsistencies, it was noted that some quotations were missed in the first coding round, which was attributed to the researcher's familiarisation of the coding frame. Subsequently, in the second coding round the researcher was more familiar with the coding frame, resulting in more accurate application of the coding frame.

3.3.2.5.4 Step 4: Assessing outcomes of the trial coding analysis

To address this problem for the main analysis, the researcher determined that the relevancy of the content was more important for accurate findings. Therefore, instead of coding an entire paragraph, only the sentence(s) that specifically refer to the code category will be coded. Evidently, the frequencies of the codes will be higher but the content per code will be more relevant, ensuring the validity of the coding frame.

This can be described as segmentation, ensuring that relevant parts of the text are assigned to the coding frame (Schreier, 2012:139; Schreier, 2014:178). Segmentation can include one word or an entire article, depending on the code category definition (Schreier, 2014:178). The segmentation units can either be formally identified (e.g. end of sentence or paragraph) or thematically identified (e.g. change of topic) (Schreier, 2014:178). Since published articles are formally written with clear separation of sections, paragraphs, sentences and themes, a combination of formal and thematic

segmentation was used to determine aspects of the content relevant to the coding frame. Consequently, analysing the coding frame provided valuable insight into the significance of selecting relevant quotations from the articles for effective analysis.

Since the results of trial coding involved minor inconsistencies in terms of segmentation, the researcher was satisfied that the coding frame (see Appendix A2) can be applied to entire dataset (289 articles). Subsequently, no further analysis of the coding frame was needed, meaning that the main analysis phase for the QCA of RL literature can commence.

3.3.2.6 Phase 6: Main analysis in the QCA of RL literature

Phase 6 represents the main analysis that involves the official coding process in QCA (Selvi, 2019:447), meaning that the finalised coding frame must be applied to all material. The aim of the coding process is to reduce qualitative data and organise large bodies of text into fewer content categories (Klenke, 2016b:103) to effectively answer the research questions (Mayring, 2014:79).

Evidently, phase 6 in the QCA of RL literature involved coding of 289 published articles in the selected sample (see Appendix A.1). The steps of creating a project, adding documents, importing codes, creating code definitions and creating output reports in ATLAS.ti were briefly described in phase 4, testing the coding frame (see section 3.3.2.4). In this phase, the application of ATLAS.ti for the QCA of RL literature will be described in greater detail, with supporting screenshots provided in Appendix B.

Phase 6 of the QCA of RL literature included (1) creating a new project and adding documents in ATLAS.ti, (2) preparing codes for the main analysis of RL literature, (3) coding articles in ATLAS.ti, (4) creating output reports in ATLAS.ti for further analysis and (5) inductive coding on content from coded categories, which will be described in subsequent sections.

3.3.2.6.1 Step 1: Creating a new project and adding documents in ATLAS.ti

ATLAS.ti can assist a researcher to keep track of search terms, keywords, database sources and journals along with the functionality of adding documents and articles from any folder or database (Smit & Scherman, 2021:2). For the main analysis, a new ATLAS.ti project was created and saved as "Main analysis of QCA RL literature".

Next, the 289 articles selected in the sample (see Appendix A.1) were added to the project. The software Mendeley was used to create a bibliography for the 289 sampled articles in the QCA of RL literature. This step ensured that all articles selected in the sample was added to the ATLAS.ti project.

Finally, the “document comment” function of ATLAS.ti was used to provide the bibliographical and in-text citation of each article. Appendix B.1 provides an example of adding files and creating document definitions in ATLAS.ti.

3.3.2.6.2 Step 2: Preparing codes in ATLAS.ti for the main analysis of RL literature

The next step was adding the coding frame (see Appendix A.2) to the main analysis project in ATLAS.ti. The codebook import function in ATLAS.ti was used to import the code frame from an Excel spreadsheet. During the trial coding phase, the older version 7 of ATLAS.ti was used, which excluded the option of importing codes with code definitions. However, version 8 of ATLAS.ti was used for the main coding phase, which included the option to import a codebook with definitions. Subsequently, this not only ensured that all codes included definitions in ATLAS.ti but also reduced the time of manually adding code definitions to each code. Appendix B.2 shows the codebook import function in ATLAS.ti and the example of the Excel spreadsheet with the coding frame, including definitions, which was imported for the main analysis.

Finally, the codes were grouped according to the main categories, namely pre-receipt RL processes, post-receipt RL processes, RL practices and consumer returns, using the code group manager function in ATLAS.ti. Using the group function simplify the interpretation and presentation of findings, which will be discussed in section 3.3.2.7. Appendix B.3 demonstrates the group code function in ATLAS.ti for the grouping of codes into main categories.

3.3.2.6.3 Step 3: Coding articles in ATLAS.ti

With the code preparation completed, the coding process for the QCA of RL literature in ATLAS.ti commenced. The initial coding process started from December 2016 and care was taken that no new articles relevant to the study was omitted from the final sample. It was noted that no new articles relevant to the QCA of RL literature was published in December 2016, therefore, the researcher was confident that the sample was appropriate.

Each article (document) can be opened and read in ATLAS.ti, and the codes can be assigned to the text (sentences, paragraphs or sections) in an article. Coding in ATLAS.ti involves highlighting texts (quotations) and assigning codes, which can be used to collect and link various quotations that share a common characteristic (Smit & Scherman, 2021:2). More specifically, coding of the articles involved (1) selecting the sentence/paragraph of the article, (2) selecting the code (from the code menu) and (3) dragging the code to the highlighted passage (called a quotation). To facilitate the discussion and presentation of findings, the quotation comment function was used to add the in-text citation

(including the page reference) of the relevant article. Appendix B.4 demonstrates the process of coding and using the quotation comment function to add the in-text citation of the article.

After the initial coding process, it was necessary to review the accuracy of the results. At that stage ATLAS.ti excluded an automatic code-function. Instead, the search and code functionality in ATLAS.ti was used, which enables text (or keywords) searches within a single article or across multiple articles (Smit & Scherman, 2021:2). For example, the keyword "collection" was entered in the text search function, which lists extracts (e.g. paragraphs) from all articles that contained the word "collection". Consequently, if a relevant passage excluded the collection code, the functionality in ATLAS.ti enables the assignment of relevant codes, like the collection code, to the text. Evidently, to address potential human error in the coding process, each code name (e.g. collection, transportation and inspection) from the coding frame was entered in the search function of ATLAS.ti to identify if any relevant text was miscoded.

This cross-checking process was performed once all articles were manually coded, which enhanced the reliability and trustworthiness of the findings of the QCA of RL literature. The elements of trustworthiness in the QCA of RL literature will be discussed in section 3.3.3. Appendix B.6 shows an example of utilising the search function in ATLAS.ti to ensure that no quotations were missed during the main coding process.

3.3.2.6.4 Step 4: Exporting results and generating quotation output reports

After the coding process, the results and findings can be explored through the "code-document analysis", "code-manager" and "report" functions in ATLAS.ti. The use of these functions for further analysis will be briefly discussed in subsequent paragraphs.

The code-document analysis function of ATLAS.ti can be used to generate quantitative results from the coding process. Particularly, the codes, code-groups and documents (articles) can be selected, which provides a cross-tabulation of the code frequencies assigned to text in the articles. These results can be exported to Excel, which can be used for further explorations. Appendix B.7 illustrates the code-document analysis function in ATLAS.ti that was used to export coding results to Excel.

Since QCA involves analysis of qualitative data, quotation output reports must be created to explore and analyse qualitative findings. The output report can be generated for a single code, multiple codes, code groups or all codes, which provides all the quotations assigned to the selection. In the code-manager of ATLAS.ti the code (e.g. inspection) and report function can be selected, which then opens a separate window to select output options. The output options include (1) date and users (appropriate

for multiple coders), (2) comments (of selected code), (3) groups (associated to the code), and (4) quotation options (such as type of content, date and users, content and comments).

For the QCA of RL literature the researcher selected the code comment option (which showed the code definition) and quotation options, including (1) content (all coded quotations) and (2) comments (in-text citations). After selecting the output options the report is generated in a document format, which can be saved as a document in Ms Word. An example of a generating a quotation output report, including selecting a code in the code manager, selecting the report function, selecting output options and generating the report in Ms Word, can be viewed in Appendix B.7. Essentially, the process was repeated for each code category from the coding frame, which enabled inductive coding and further analysis, discussed next.

3.3.2.6.5 Step 5: Inductive coding on quotation output reports

According to Leedy and Ormrod (2021:266), if coded material (quotations assigned to codes) in QCA involves complex or lengthy items, the researcher can divide the material into smaller more manageable units that can be separately analysed. Therefore, coded material can further be reduced and analysed through additional deductive and/or inductive coding processes (Mayring, 2014:104).

Since the main analysis process in the QCA of RL literature resulted in large amounts of quotations assigned to deductive codes (from the coding frame in Appendix A.1), additional coding was needed. A new ATLAS.ti project was created for each deductive code/code category and the quotation output report of the code, generated in step 4, was added as a document. This enabled the identification of inductive (new data-driven) codes from content, originally assigned to deductive codes during the initial coding process of the main analysis. Subsequently, instead of recoding the content from 289 articles, only quotations (passages) assigned to original codes were recoded with inductive codes.

As an example, in a new ATLAS.ti project created for the original code “inspection”, the quotations assigned to the inspection code were studied to identify new inductive codes. Following this, the option “add code” was selected to enter a name for the inductive code, which can be added to the selected text. Eventually, with several inductive codes identified, the “add code” option includes a list of all entered inductive codes, which can be selected and added to the text. Since inductive codes are identified while reading the content, the material must be recoded a second or third time, ensuring that the inductive code list gets equally assigned to all material in the project. Appendix B.8 illustrates this example of adding inductive codes in the ATLAS.ti project created for “inspection” as a deductive code.

Once inductive codes were identified and assigned to coded material, inductive code categories were created to group inductive codes. According to Mayring (2014:52), inductive category development can be one of the most common procedures in a QCA, involving step-by-step augmentation of categories while working through the text. Subsequently, inductive codes that share commonalities can be grouped, resulting in the creation of inductive code categories. Eventually, the inductive code categories were standardised across "deductive code" projects for RL processes and RL practices. For example, the inductive code categories for most RL processes included (1) characteristics, (2) activities, (3) facilities and (4) parties.

Essentially, the process of inductive coding ensured that the QCA of RL literature included data-driven content, which can be important for QCA (Schreier, 2014:173). Additionally, inductive coding divided the coded material into manageable units for effective interpretation and presentation of findings, which will be discussed in the next section.

3.3.2.7 Phase 7: Interpreting and presenting the findings of the QCA of RL literature

Phase 7 involved the interpretation and presentation of the findings from the QCA of RL literature. Depending on the aim of a study, all categories in the QCA can form part of the interpretation of findings (Mayring, 2014:81). Interpretation in a QCA can be supported by providing quotations, constructing parallelisms between code categories and elaborating on key elements identified in the analysis, which can be compelling for readers interested in the context of analysed texts (Krippendorf, 2022:93). The findings of a QCA can be presented in a quantitative and qualitative style (Schreier, 2014:180). An overview and application of these styles will be given in subsequent sections.

3.3.2.7.1 Quantitative presentation of QCA findings

Quantification in QCA involves frequency counts, statistics, percentages, charts and graphs (Selvi, 2019:447). Presenting findings of QCA in a quantitative style can involve absolute frequencies, descriptive group comparisons and inferential statistics (Schreier, 2012:242). *Absolute frequencies* involve the identification of codes and categories that occurred most frequently in the content (Mayring, 2014:41; Schreier, 2012:242). This can be done through data matrices (Schreier, 2012:242) or software (like ATLAS.ti) that automatically provide frequency counts (Mayring, 2014:42). Furthermore, frequency counts can be presented in bar charts or transformed into percentages (Schreier, 2012:245).

Descriptive group comparisons can be used to compare the code frequencies of different groups (Schreier, 2012:242). For example, comparing the code frequencies between different articles,

journals or years of publications. Finally, *inferential statistics* in QCA extends descriptive group comparisons, involving t-tests and chi-square tests (Schreier, 2012:248-249). Nevertheless, Mayring (2014:41) indicated that reasons for using quantitative presentation of findings in QCA must be justified.

For the QCA of RL literature, the document-code analysis function in ATLAS.ti was used to identify absolute frequencies of code categories (see Appendix B.6), including frequency counts presented in bar charts and percentages presented in pie charts. The purpose of the quantification of findings was to demonstrate the importance of code categories in literature as well as identify potential gaps in literature. Appendix C contains the quantitative results of the main categories, categories and subcategories from the QCA of RL literature. The bar charts with frequencies and pie charts with percentages were presented in chapters 4 to 6 in the findings of the QCA of RL literature.

3.3.2.7.2 Qualitative presentation of QCA findings

Although quantitative results can be used, the findings of QCA mostly focus on detailed descriptions of the content under analysis (Schreier, 2014:173). Therefore, the presentation of qualitative findings takes precedence over the quantification of code categories, group comparisons and statistics. The presentation of findings in QCA mostly involves categories and/or themes (Graneheim, 2017:32; Selvi, 2019:447), which can be based on the structure of the coding frame (Schreier, 2014:180). Furthermore, ATLAS.ti can be used to categorise codes and identify quotations assigned to specific codes, which can be useful in the write-up of findings (Smit & Scherman, 2021:2). Qualitative findings in QCA can be presented in several styles, including continuous text, text matrices and additional data explorations (Schreier, 2014:180).

Using *continuous text* can be the standard qualitative writing and presentation style, involving a description of the category, summary of the essence of the category and description of concepts underlying the category. Additionally, the description and summary can be illustrated with several quotations from the content (Schreier, 2012:231). *Text matrices* can be appropriate for large coding frameworks and large amounts of coded content and quotations (Schreier, 2012:233). Instead of writing continuously, a text matrix provides an overview of the findings with illustrative quotations. Nevertheless, text matrices must be accompanied by written text, providing more detailed descriptions of the findings (Schreier, 2012:233). Finally, *additional data exploration* can involve (1) exploring patterns in the findings and co-occurrences (relationships) between categories for further analysis, and (2) constructing a typology to summarise and condense findings (Schreier, 2012:239-240).

In this study a combination of these styles was applied to effectively interpret and present the findings of the QCA of RL literature. Firstly, the *structure* of the original *coding frame* (Appendix A.2) was used as a basis for presenting the main categories, which represented the deductive codes of the coding frame. Secondly, due to the large variety of categories and amounts of material (from 289 published articles) *text matrices* or qualitative data tables were used as the main form of presentation. The data tables presented the categories (inductive code categories), subcategories (inductive codes), authors (references) and key quotations (examples to support discussion of findings).

Thirdly, the tables used for presenting the QCA findings were supplemented by a *discussion* and an interpretation of the findings, which culminated into the creation of definitions and conceptual frameworks for each main (deductive code) category. Finally, *data exploration* was used for further analysis, including studying the relationships between categories in terms of shared subcategories and unique subcategories, which resulted in a final conceptual framework and a summary of findings (typology).

Essentially, the result of the QCA of RL literature was a comprehensive and holistic presentation of findings, which included quantitative overviews (frequencies, percentages, bar charts and pie charts), qualitative data tables (text matrices), discussion of findings and further explorations on the relationship of categories with conceptual frameworks and summaries (typology) of findings. The interpretation and presentation of findings for the QCA of RL literature can be viewed in chapter 4 (consumer returns and pre-receipt RL processes), chapter 5 (post-receipt RL processes) and chapter 6 (RL practices). Table 3.8 provides a summary of the phases applied to the QCA of RL literature.

Table 3.8 Summary of the application of phases in the QCA of RL literature

PHASES	SUMMARY OF APPLICATION
Identifying the research objectives and questions for the QCA of RL literature (section 3.5.1)	• Research questions for the QCA of RL literature identified as: ○ What are the types of consumer returns? (SRO-2) ○ What are the pre-receipt RL processes for consumer returns? (SRO-2) ○ What are the post-receipt RL processes for consumer returns? (SRO-3) ○ What are the RL practices to manage consumer returns? (SRO-4)
Selecting materials for the QCA of RL literature (section 3.5.2)	• Unit of analysis identified as scientific peer-reviewed journal articles in RL • Non-probability purposive sampling strategy • Identifying sample material from similar studies • Finding online databases to access local and international journals • Search criteria for sample selection included (1) "returns management or reverse logistics management", "consumer returns", "reverse logistics processes" and "reverse logistics practices" as keywords and (2) publication year range between 2006 – 2016 • Creating publication alters in Google Scholar • Searching online journals for appropriate RL articles • Scanning and identifying relevant/irrelevant RL articles • Downloading and saving relevant RL articles in folders • Exclusion criteria included (1) inaccessible or irrelevant journals, (2) articles with limited or inadequate discussions, (3) quantitative articles with models and equations

PHASES	SUMMARY OF APPLICATION
	that lack qualitative content and (4) RL literature outside the scope of the research questions, unit of analysis and search criteria • Identifying final sample of 82 journals, covering 289 peer-reviewed scientific journal articles in RL, published between 2006 and 2016.
Developing the coding frame for the QCA of RL literature (section 3.5.3)	• Deductive development of code categories and codes • Main categories represented the research questions, including consumer returns, pre-receipt RL processes, post-receipt RL processes and RL practices • Preliminary literature review was used to identify subcategories (or deductive codes) • The coding frame structure included: o Pre-receipt RL processes (CatA) – consumer return request (CatA_Sub1), gatekeeping (CatA_Sub2), collection (CatA_Sub3), transportation (CatA_Sub4) and miscellaneous pre-receipt processes (CatA_Sub4) o Post-receipt RL processes (CatB) – receiving (CatB_Sub1), processing (CatB_Sub2, inspection/sorting (CatB_Sub3), disposition (CatB_Sub4), redistribution (CatB_Sub5) and miscellaneous post-receipt processes (CatB_Sub6) o Consumer return (CatC) – general consumer returns (CatC_Sub1) and miscellaneous return types (CatC_Sub2) o RL practices (CatD) – IT (CatD_Sub1), integration (CatD_Sub2), outsourcing/insourcing (CatD_Sub3), disposition practices (CatD_Sub4), PM (CatD_Sub5), facility/location practices (CatD_Sub6), RC (CatD_Sub7), FM (CatD_Sub8), return avoidance and gatekeeping practices (CatD_Sub9), procedural practices (CatD_Sub10), staff and management practices (CatD_Sub11) and miscellaneous practices (CatD_Sub12) • Code category definitions ranged from (1) self-explanatory descriptions that excluded examples, (2) definitions identified from literature, (3) descriptions/examples of content relevant to the code, and/or (4) descriptions of content irrelevant to the code
Testing the coding frame for the QCA of RL literature (section 3.5.4)	• Intra-coder agreement for trial coding conducted 10 to 14 days apart • ATLAS.ti training in preparation for trial coding • Purposively selected ten articles from the 289 sampled articles based on the comprehensiveness of content and coverage of the coding frame • Preparing for trial coding in ATLAS.ti included (1) creating a project, (2) adding documents, (3) importing codebook and (4) adding code definitions. • First trial coding round conducted in the ATLAS.ti project, named "Trial coding 1" • Second trial coding round conducted in ATLAS.ti project, named "Trial coding 2", two weeks after concluding the first trial coding round
Assessing the coding frame of the QCA of RL literature (section 3.5.5)	• Assessing the results of the trial coding for consistency and validity • Using the "Code-Document Analysis" function in ATLAS.ti to export trial coding results to Excel • Combining the trial coding results in a table for further analysis • Quantitative analysis of trial coding results involved identifying inconsistencies in subcategories (codes) • Qualitative analysis of trial coding involved comparison of coded text to examine inconsistencies in subcategories • The outcome of the trial coding analysis included segmentation, involving strictly coding relevant passages, excluding the assignment of irrelevant content to a code • No additional trial coding rounds or adjustments to the coding frame required
Main analysis in the QCA of RL literature (section 3.5.6)	• Main coding of 289 published articles • Creating a new project, "Main analysis of QCA RL literature" in ATLAS.ti • Adding 289 articles to the ATLAS.ti project • Adding 289 articles to Mendeley for bibliographical details • Using the document comment function to add bibliography details (full reference and in-text citation) of each article • Using the import codebook function in ATLAS.ti to important codes with definition

PHASES	SUMMARY OF APPLICATION
	from Excel • Using the code group function in ATLAS.ti to group codes into main categories • Main coding process for the QCA of RL literature started • Coding involved selecting the text, dragging the relevant code to the text and selecting the quotation comment function to add the in-text citation of the article • Using the "search and code" function of ATLAS.ti to review the accuracy of coding results • Reviewing the text search results and assigning relevant codes to miscoded text • Using "document-code analysis" function in ATLAS.ti to export quantitative results of coding to Excel • Using the code-manager and report functions in ATLAS.ti to generate quotation output reports in Word for qualitative findings • Creating ATLAS.ti projects and adding quotation output reports for each deductive code • Inductive coding on quotations assigned to deductive codes in the initial coding process • Creating inductive code categories to group inductive codes that share commonalities
Interpreting and presenting the findings of the QCA of RL literature (section 3.5.7)	• Holistic interpretation and presentation of findings • Quantitative style of absolute frequencies, using bar charts to present deductive code frequencies and pie charts to present frequency percentages • Using deductive coding frame to structure the presentation of qualitative findings • Qualitative style of text matrices, presenting (inductive code) categories, subcategories (inductive codes), authors and key quotations • Qualitative style of discussing the findings from text matrices, resulting in main category (deductive code) definitions and conceptual frameworks • Qualitative style of data exploration, including studying relationships between main categories (deductive codes) in terms of shared and unique subcategories, creating conceptual frameworks and summary (typology) of findings

Source: Compiled by the researcher

In the next section, the trustworthiness of the QCA of RL literature will be provided.

3.3.3 Trustworthiness of the QCA of RL literature

Various criteria can be used to determine and demonstrate the quality and trustworthiness of QCA. While Krippendorff (2022:93) indicated that quantitative measures of reliability and validity may be less important in QCA, Scheirer (2012:177, 186) indicated that reliability and validity can be useful in QCA. Nevertheless, QCA researchers often adopt and describe standard qualitative criteria of trustworthiness (Krippendorff, 2022:93), including credibility, dependability, conformability and transferability (Elo, Kääriäinen, Kanste, Pölkki, Utriainen & Kyngäs, 2014:1; Graneheim *et al.* 2017:33).

In this study, the standard trustworthiness criteria of qualitative research, and reliability and validity criteria, in terms of application to QCA, will be adopted as the elements of trustworthiness in the QCA of RL literature. These trustworthiness criteria in QCA can be described as follows:

- *Reliability* as a traditional quantitative criterion can be used in assessing the quality of a coding frame (viewed as the research instrument) to produce error-free data (Schreier, 2012:177). Additionally, reliability in QCA can be realised by implementing a systematic step-by-step procedure and demonstrating transparency throughout the implementation of procedures (Schreier, 2012:37).
- *Validity* as a traditional quantitative research criterion can be particularly important in evaluating the quality of QCA. Validity involves the extent that a coding frame (the research instrument) (1) covers all areas of a study's concepts and (2) helps to realise the aims or answer the research questions of the QCA (Schreier, 2012:196).
- *Credibility* as a traditional qualitative research criterion in QCA relates to the selection of appropriate data sources, accurate description of the data sources (Elo *et al.* 2014:2) and sufficiency of data sources in the sample (Graneheim *et al.* 2017:33). Additionally, credibility in QCA associate with accurate descriptions of the analysis, findings and trustworthiness Elo *et al.* 2014:7)
- *Dependability* as a traditional qualitative research criterion relates to the consistency of data over different times and under different circumstances, which can be realised by describing sample selection criteria and main characteristics of a sample (Elo *et al.* 2014:2). Additionally, dependability in QCA associates with the development of categories, decisions about selecting relevant codes for the categories and assigning relevant quotations to codes (Graneheim *et al.* 2017:33).
- *Conformability* as a traditional qualitative research criterion in QCA associates with objectivity and effectively demonstrating accuracy, relevancy and the meaning of data (Elo *et al.* 2014:2), proving that the interpretation of data was not invented by the researcher (Elo *et al.* 2014:6).
- *Transferability* as a traditional qualitative research criterion in QCA involves rich descriptions of the QCA procedures (Graneheim *et al.* 2017:33), which enables replicability or transference of findings to another setting or study (Elo *et al.* 2014:2).

The trustworthiness criteria of qualitative research will be discussed in greater detail section 7.9 (methodology for the interviews with industry expert).

According to Graneheim *et al.* (2017:33), the challenge of QCA involves the establishment of trustworthiness throughout procedures, ensuring a sound method of qualitative data collection and analysis. In this study, adequate preparation, description of QCA procedures and implementation of trustworthiness criteria throughout phases in the QCA of RL literature contributed towards the overall

trustworthiness of the QCA of RL literature. The subsequent sections provide details on realising trustworthiness in the QCA of RL literature through these measures.

3.3.3.1 Trustworthiness in preparation and description of the QCA of RL literature

According to Elo *et al.* (2014:8) the trustworthiness of QCA starts with adequate preparation before QCA procedures can be initiated. Particularly, QCA requires significant skills in data collection, analysis of content, discussion of trustworthiness and presentation of findings (Elo *et al.* 2014:8). For the QCA of RL literature adequate *preparation* involved (1) understanding the importance qualitative research, (2) identifying the philosophical assumptions of the study, (3) describing the approaches of theory development, (4) justifying the adoption of multimethod qualitative research, (5) justifying the selection of QCA as a research method, (6) identifying the characteristics of QCA, and (7) studying the methodology and application of QCA from seminal authors, like Schreier (2012) and Mayring (2014).

Accordingly, to establish trustworthiness in QCA, researchers must strictly follow systematic and transparent phases, while incorporating qualitative research qualities, like flexibility, creativity and iterations, throughout procedures (Selvi, 2019:443). Consequently, researchers employing QCA must be more explicit about the phases in QCA to demonstrate rigour (Krippendorff, 2022:92). Furthermore, the researcher must describe the procedures in adequate detail to persuade readers of the trustworthiness of QCA (Graneheim *et al.* 2017:33). Evidently, the better the documentation and description of phases, the greater the trustworthiness of QCA (Elo *et al.* 2014:8).

As illustrated throughout section 3.3.2, the phases of the QCA of RL literature was systematically applied and adequately described, demonstrating trustworthiness and rigour. Additionally, Schreier (2012:45) explained that the systematic nature of QCA in terms of following the same sequence of steps, regardless of the type of research questions and materials selected, enhances the reliability of QCA. Essentially, the trustworthiness of the QCA of RL literature can be established through adequate preparation and detailed description of procedures. Nevertheless, further elements of trustworthiness can be demonstrated throughout the phase of the QCA of RL literature, which will be described in the next section.

3.3.3.2 Trustworthiness in the phases of the QCA of RL literature

Although trustworthiness of QCA can be realised through preparation and detailed description of procedures, trustworthiness criteria can be applied to every phase of QCA, including selection of material, development, testing and assessment of the coding frame, main analysis, and interpretation

and presentation of findings. The subsequent sections demonstrate the establishment of trustworthiness in the phases of the QCA of RL literature.

3.3.3.2.1 Trustworthiness in selection of materials for the QCA of RL literature

Care and effort must be taken in the collection of suitable material in QCA, which starts by choosing the best method of data collection for answering the research questions (Elo *et al.* 2014:3). The elements of trustworthiness in the selection of materials for the QCA of RL literature included reliability, credibility, dependability and transferability.

Reliability was demonstrated by providing accounts of the relevancy of the sampled material for answering the research questions (Krippendorf, 2022:401). Particularly, in section 3.3.2.2 the justification of the selecting published literature in RL was provided and aligned with the aims of exploring and analysing RL literature for consumer return types, pre-receipt RL processes, post-receipt RL processes and RL practices for the management of consumer returns.

Similarly, *credibility* was realised through the selection of a suitable unit of analysis and adequate description thereof (Elo *et al.* 2014:5). Subsequently, the unit of analysis for the QCA of RL literature was motivated and described in terms of application to the research questions. Additionally, using scientific published literature in RL as the unit for analysis added to credibility of appropriate data sources (see section 3.3.2.2.1).

Moreover, selecting sufficient material added to the credibility (Graneheim *et al.* 2017:33) of the QCA of RL literature, involving the selection of 289 published articles in RL. Nevertheless, the appropriateness of the sample in QCA can depend on the aim, research questions and data saturation (Elo *et al.* 2014:4). Consequently, further trustworthiness in the selection of material was realised through detailed description of the sampling method and characteristics of the sample (Elo *et al.* 2014:8), as evidenced in section 3.3.2.2.2.

Similarly, *dependability* of the QCA of RL literature was realised by adequately describing the selection criteria and characteristics of the sample (Elo *et al.* 2014:4), which included specific keywords and publication parameters and an overview of the journals and publications per year with a detailed references of the sample included in Appendix A.1. Finally, the detailed documentation of selecting materials and sampling procedures ensured *transferability* (Graneheim *et al.* 2017:33) of the QCA of RL literature. Essentially, the trustworthiness of the QCA of RL literature can be established through the realisation of reliability, credibility, dependability and transferability in the selection of materials.

3.3.3.2.2 Trustworthiness in the development, testing and assessment of the coding frame for the QCA of RL literature

According to Klenke (2016b:98) the *development* of a high-quality coding frame can be central to trustworthiness of QCA. The element of trustworthiness in the development of a high-quality coding frame for the QCA included validity. Particularly, the coding frame of the QCA of RL literature can be regarded as *valid* because the categories adequately represented the concepts of the research question (Schreier, 2012:186). For instance, the main categories identified associated with the concepts of consumer returns, pre-receipt RL processes, post-receipt RL processes and RL practices. Furthermore, subcategories related to the concepts were identified from literature, adding to the validity of the coding frame. Finally, the development of the coding frame for the QCA of RL literature can be regarded as trustworthy because detailed descriptions were given in the selection of categories (Elo *et al.* 2014:5), which can be viewed in section 3.3.2.3.

Testing and *assessment* of the coding frame can be combined to determine the trustworthiness of the QCA of RL literature and the coding frame, covering reliability and validity as trustworthiness criteria. Particularly, *reliability* was established through adequate training of ATLAS.ti to test the coding frame (see section 3.3.2.4). Consequently, preparation and pre-testing of the coding frame can be import for trustworthiness in QCA (Elo *et al.* 2014:3). Reliability was further established through the pilot phase and application of intra-coder agreement (Mayring, 2014:111), which involved two trial coding rounds or double coding on the same material at different points of time (Schreier, 2014:179). In this regard, reliability can be translated into stability or consistency, which can be realised through the extent that trial coding results remained fixed over time (Schreier, 2012:178).

Subsequently, reliability in the QCA of RL literature was established through assessment and comparison of the two trial coding rounds, which involved minor inconsistencies that was investigated and mitigated through application of segmentation (see section 3.3.2.5). Moreover, the coding frame for the QCA of RL literature was established as reliable since categories and code definitions were consistently applied to concepts in the text between the two trial coding rounds. For example, in both coding rounds the code “collection” was applied to the same text (e.g. same sentence or paragraph in the same article) at different points of time, demonstrating reliability.

Finally, based on the trial coding rounds, the *validity* of the coding frame for the QCA of RL literature was further demonstrated with using miscellaneous categories. According to Schreier (2012:179), assigning a high number of quotations to residual categories indicates low validity. In the trial coding rounds of the QCA of RL literature, no quotations were assigned to the miscellaneous categories of consumer returns, pre- and post-receipt RL processes and RL practices, which demonstrated the

validity of the coding frame. Likewise, in the main analysis limited quotations were assigned to miscellaneous categories, which further assured validity of the coding framework of the QCA of RL literature.

Essentially, the trustworthiness of the QCA of RL literature can be established through the demonstration of reliability and validity in the development, testing and assessment of the coding frame.

3.3.3.2.3 Trustworthiness in the main analysis, interpretation and presentation of findings for the QCA of RL literature

According to Selvi (2019:450), a clear description of procedures in the *main analysis* can be the most common strategy for establishing trustworthiness in QCA. Clear descriptions of the steps followed in the main analysis of the QCA of RL literature was provided in section 3.3.2.6, enhancing trustworthiness. Additionally, establishing reliability, validity and dependability in the main analysis phase further demonstrated the trustworthiness of the QCA of RL literature.

Particularly, *reliability* of the main analysis was established by using software, like ATLAS.ti (Krippendorff, 2022:217), which enabled careful documentation of coding procedures (Mayring, 2014:116). Likewise, appropriately using ATLAS.ti for the main analysis improved the *validity* (Friese, 2012:267) of the QCA of RL literature. Moreover, Schreier (2012:46) claimed that establishing validity means that the categories and codes closely reflect the data, which was established through inductive coding and category development in the main analysis of the QCA of RL literature (see section 3.3.2.6.5).

Dependability in the main analysis of the QCA of RL literature was established through a reliable and valid code frame and segmentation (i.e. assigning only relevant text to codes), which guided effective selection of quotations (Graneheim *et al.* 2017:33). Additionally, using the "search and code" function in ATLAS.ti to identify any text that was miscoded during the main coding round ensured dependability of assigning appropriate codes to appropriate text.

In terms of the *interpretation* and *presentation of findings*, the trustworthiness of findings can depend on the availability of rich and appropriate data and the extent to which the categories represent the data (Elo *et al.* 2014:7,8). Subsequently, trustworthiness of interpretation and presentation of findings depend on the trustworthiness of other QCA phases, including data collection, development of categories and analysis (Elo *et al.* 2014:8). Accordingly, the interpretation and findings of the QCA of RL literature can be considered trustworthy based on the established trustworthiness of material selection, coding frame development, testing and assessment and the main analysis.

Additionally, trustworthiness of interpretation and presentation of findings for the QCA of RL literature was established through reliability, validity, credibility, conformability and transferability. Specifically, using software, like ATLAS.ti, can add to the *reliability* of the interpretation of QCA, which relates to the ability of returning to well-recorded and well-organised data (Mayring, 2014:116). Likewise, effectively using ATLAS.ti for QCA can increase the *validity* of finding (Friese, 2012:1), indicating that ATLAS.ti collectively helped to achieve reliability and validity of the interpretation and findings of the QCA of RL literature.

Credibility of the findings can be enhanced with the use of figures and tables to explain the categorisation of findings and demonstrate the structure of concepts (Elo *et al.* 2014:7). Evidently, using tables (text matrices) and creating conceptual frameworks for the main categories that demonstrated key categories and subcategories (findings), enhanced the credibility of the findings of the QCA of RL literature. Additionally, *conformability* of the QCA of RL literature was established through the presentation of quotations from literature, demonstrating that the findings reflected the data (literature) (Elo *et al.* 2014:6). Subsequently, accurate description of the analysis coupled with clear demonstration of the relationships between findings and data, allows for objectivity, giving others (e.g. readers or researchers) to draw conclusions about the trustworthiness of findings (Elo *et al.* 2014:7).

Furthermore, *transferability* of the QCA of RL literature was established through systematic, careful, adequate, rich and extensive reporting of findings and clear connections between findings and data (Elo *et al.* 2014:7). Nevertheless, high quality findings can be realised by ensuring that the structure of findings can answer the research questions and achieve the aims of the QCA (Elo *et al.* 2014:6). Accordingly, the findings presented in chapters 4 to 6 clearly answered the research questions and achieved the objectives set for the QCA of RL literature, demonstrating high quality and trustworthy findings.

Essentially, after discussing the main processes, approaches to analysis and presentation of findings, trustworthiness can further be enhanced through discussion of the trustworthiness of QCA based on quality criteria (Elo *et al.* 2014:7). Evidently, concluding the discussion of the QCA of RL literature with an overview of trustworthiness criteria, reemphasised that the QCA of RL literature can be regarded as reliable, valid, credible, dependable, conformable and transferable.

In the next section, the conclusion of chapter 3 will be provided, containing a summary of the discussions in chapter 3.

3.4 CONCLUSION

This chapter consisted of two parts, with the first part focusing on the qualitative research design of this study and the second part focusing on the QCA of RL literature. Particularly, the first part included an overview and justification of *the qualitative research design of this study,* which included discussions of the (1) justification of qualitative research, (2) challenges in qualitative research, (3) research paradigm and assumptions of the study, (4) research approaches for theory development in the study and (4) multimethod qualitative research.

Particularly, *justification of qualitative research* for this study included motivations for qualitative research over quantitative research regarding philosophical paradigm and assumptions, researcher roles, research approaches, sampling and data collection techniques, data analysis and presentation of findings. Additionally, justification was provided regarding the importance of qualitative research in business management and organisational practices.

The *challenges in qualitative research* related to the time, amount of data, budget, data collection and sampling, data analysis and interpretations, and the rigour of findings. Specifically, the challenges in qualitative research involved (1) time-consuming procedures, (2) large volumes of data, (3) budget constraints, (4) lack of uniformity of data collection procedures, (5) motivation requirements of sampling techniques and difficulties of determining sampling sizes, (6) lack of uniformity of qualitative data analysis and requirements for creativity, data reduction, category and code development, coding of data, theme development and unique and valuable conclusions, and (7) difficulties in demonstrating rigour and trustworthiness of procedures and findings.

The *research paradigm* of the study was identified as *pragmatism,* which included a discussion of the different ontology, epistemology, methodology and axiology assumptions of positivists, interpretivists and pragmatists. The philosophical assumptions identified in this study associated with pragmatism and included the (1) ontological assumption that views reality as complex, rich, adaptable and practical, (2) epistemological assumption that views experiences and the researcher's subjective view as sources of knowledge to solve problems and inform practice, (3) methodological assumption that views multimethod qualitative research through a combination of deductive, inductive and abductive reasoning as important for practical outcomes and solutions, and (4) axiological assumption that views ethical and moral principles as important aspects for a value-driven research process. Additionally, the motivations for adopting pragmatism as a research paradigm was discussed and identified as appropriate for this study because of (1) practical problems and research questions aimed at informing practice, (2) deductive, inductive and abductive approaches, (3) multimethod

qualitative research, (4) organisational research, (5) interviewing experts to solve practical problems, and (6) policy formulation and adoption of strategic practices to benefit the society as a whole.

Multimethod qualitative research was identified as the methodological choice of the study, which included a discussion of the differences between mixed-method and multimethod research, motivations for multimethod qualitative research and forms of multimethod mixing in the study. Mixed- and multimethod research can be different in paradigms and assumptions, quantitative and/or qualitative methods of data collection and analysis, and motivation. While mixed method research involves mixed paradigms, qualitative and quantitative methods of data collection and analysis and motivations of demonstrating rigour and testing qualitative theory, multimethod research mostly involves single paradigms, multiple methods of qualitative or quantitative data collection and analysis and motivations of complementarity, development, expansion and triangulation.

Subsequently, multimethod qualitative research was motivated through dimensions of complementarity, development, expansion and triangulation as well as pragmatic characteristics related to practical problem-solving and innovation. Lastly, the forms of multimethod mixing of this study included mixing (or a combination) of paradigms, research approaches, sampling techniques, data collection techniques, data analysis techniques and presentation of findings.

The second part included the methodology and application of *the QCA of RL literature*, which included (1) an overview of QCA, (2) phases in the QCA of RL literature, and (3) trustworthiness of the QCA of RL literature. The *overview of QCA* included a discussion of the differences between QCA and CA (quantitative content analysis) and characteristics of QCA. The overview was concluded with this study's definition of QCA, which described "QCA as a pragmatic, scientific, empirical grounded, systematic and flexible research method that can be part of mixed method or multimethod qualitative research designs, involving (1) step-by-step procedures (2) research question(s), (3) development of categories, (4) large and variety bodies of text, audio or visual material, and (5) time-consuming data coding and analysis processes, which can benefit from appropriate computer software (e.g. qualitative data analysis software, like ATLAS.ti) for effective data collection, analysis and presentation of qualitative findings."

The *phase of the QCA of RL literature* included (1) identifying the research objectives and questions for the QCA of RL literature, (2) selecting materials for the QCA of RL literature, (3) developing the coding frame for the QCA of RL literature, (4) testing the coding frame for the QCA of RL literature, (5) assessing the coding frame of the QCA of RL literature, (6) main analysis in the QCA of RL literature, and (7) interpreting and presenting the findings of the QCA of RL literature. Additionally, most phases included various steps for the effective description and execution of the QCA of RL

literature. Table 3.3 provided an overview of the phases, including descriptions and steps of each phase, and Table 3.8 provided a summary of the application of the phases in the QCA of RL literature. The discussion of the phases was supported by relevant content in Appendices A and B.

Finally, the *trustworthiness criteria of the QCA of RL literature* included reliability, validity, credibility, conformability, dependability and transparency. The trustworthiness of the QCA of RL literature was established with adequate preparation and detailed descriptions of procedures. Additionally, trustworthiness was further established in the phases of the QCA of RL literature, including trustworthiness of (1) material selection that included elements of reliability, credibility, dependability and transferability, (2) development of the coding frame that included the element of validity, (3) testing and assessment of the coding frame that included elements of reliability and validity, (4) main analysis that included elements of reliability, validity and dependability, and (5) interpretation and presentation of findings that included elements of reliability, validity, credibility, conformability and transferability.

In the next three chapters, the findings of the QCA of RL literature will be presented and discussed, including chapter 4 that focus on consumer returns and pre-receipt RL processes, chapter 5 that focus on post-receipt RL literature and chapter 6 that focus on RL practices for the management of consumer returns. Chapter 7 will continue with the research methodology of the study, focusing on the interviews with industry experts.

Chapter 4 – QCA findings of RL literature for consumer return types and pre-receipt RL processes of consumer returns

4.1 INTRODUCTION

The importance of understanding consumer returns and RL processes can be significant to the success of online retailers. According to Nel and Badenhorst (2020:116), online retailers must identify and understand the reasons for *consumer returns*. Additionally, Davidavičienė and Al Majzoub (2021:4) indicated that an understanding of *RL processes* can enable online retailers to understand their return operations and distinguish it from other organisational processes. However, few studies focus on consumer returns and the RL processes of consumer returns in online retailing (see sections 1.2 and 1.3). Therefore, exploring and analysing RL literature for consumer return types and RL processes can be a good starting point in providing online retailers with improved understanding of consumer return types and RL processes that may apply to online retailing.

The QCA of RL literature focused on *types of consumer returns* and the *RL processes* of consumer returns, which starts with a consumer requesting a return and ending with redistribution of returned products for resale. As emphasised in section 1.5, RL processes can be categorised as pre-receipt RL processes and post-receipt RL process. Additionally, this study focused on identifying various *RL practices* to improve the management of consumer returns. Subsequently, the main categories for the QCA of RL literature include types of consumer returns, pre-receipt RL processes, post-receipt RL processes and RL practices. Due to the comprehensiveness of the findings, the main categories were presented in three chapters. Particularly, chapter 4 presents the QCA findings of RL literature for consumer return types and pre-receipt RL processes, chapter 5 presents the QCA findings of RL literature for post-receipt RL processes, and chapter 6 presents the QCA of RL literature for RL practices to manage consumer returns.

In the research methodology section of chapter one (section 1.7, Figure 1.5), the research phases of the study were discussed. Chapter 4 forms part of second research phase of this study, which can be viewed in Figure 4.1.

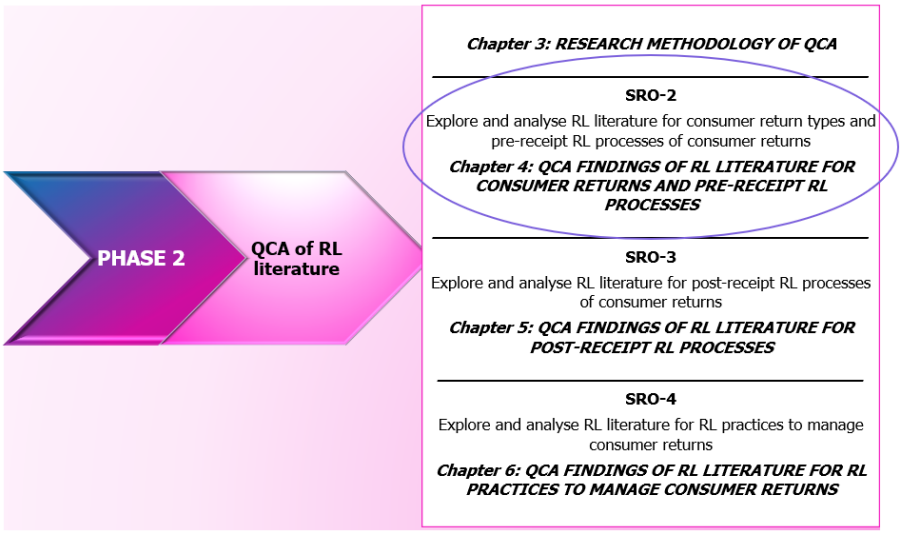

Figure 4.1 QCA of RL literature - Aim of chapter 4
Source: Compiled by the researcher

Figure 4.1 indicates that the aim of this chapter is to achieve the *second* secondary research objective, which is ***to identify and explore RL literature for consumer return types and pre-receipt RL processes of consumer returns (SRO-2)***. The QCA findings of RL literature for consumer returns and pre-receipt processes resulted in the development of conceptual frameworks for consumer return types and pre-receipt RL processes of consumer returns, a typology of the findings and managerial implications, which will be describe in section 4.2. The findings presented in this chapter contributes to the primary objective of the study, which is to *develop a framework for the effective RLM of consumer returns in online retailing.* Therefore, important findings related to consumer return types, pre-receipt RL processes and RLM considerations are identified in this chapter, contributing to the final framework for the effective RLM of consumer returns in online retailing.

Figure 4.2 provides an overview of this chapter.

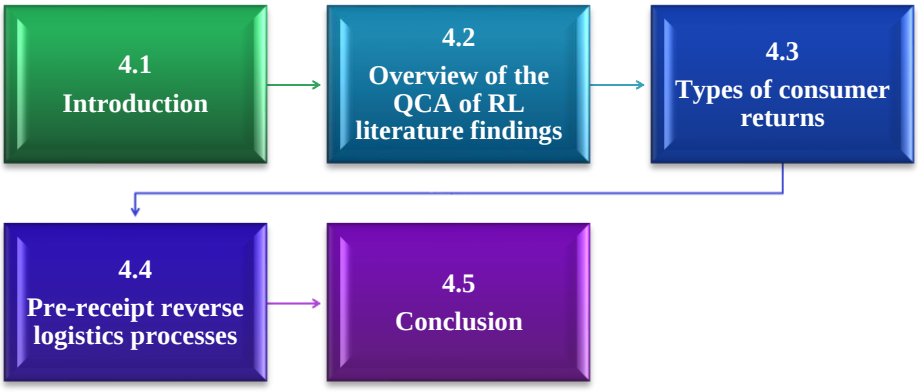

Figure 4.2 Overview of chapter 4
Source: Compiled by the researcher

The introduction (this section) is followed by overviews of the QCA of RL literature findings (section 4.2), where after the types of consumer returns (section 4.3) and the pre-receipt RL processes (section 4.4) will be analysed. Finally, the chapter will conclude with the conclusion (section 4.4).

4.2 OVERVIEW OF THE QCA OF RL LITERATURE FINDINGS

In this section an overview of presenting the QCA of RL literature findings will be given, followed by an overview of the main categories of the QCA of RL literature and a demarcation for consumer returns and RL processes.

4.2.1 Overview of presenting the QCA of RL literature findings

In chapter 3, an overview and application of the QCA of RL literature was provided, including the various phases employed to effectively analyse and explore RL journal articles (hereafter referred to as literature or content) published between 2006 and 2016. Furthermore, it was indicated that the findings of the QCA of RL literature involves a holistic presentation, including quantitative overviews (frequencies, percentages, bar charts and pie charts), qualitative data tables (text matrices), discussion of findings and further explorations on the relationship of categories with conceptual frameworks and summaries (typology) of findings (see section 3.3.2.7). The *quantitative results* of the QCA of RL literature associate with the main categories and (deductive) code categories from the coding frame (see Appendix A.2). The quantitative results provide an overview of the importance of the main categories and code categories in RL literature and identify potential gaps in RL literature. The quantitative results of each category and subcategories can be viewed in Appendix C.

Nevertheless, most of the data obtained from the QCA, will be presented in a *qualitative* manner. The *qualitative data tables* include (1) categories (inductively identified from inductive codes), (2) subcategories (inductive codes identified from quotations assigned to deductive codes) related to the categories, (3) sources that support the subcategories (frequency that the subcategory was coded across literature sources from the QCA), and (4) key quotations (from coded sources) that support the discussion of the findings. Consequently, the findings presented in the qualitative data tables were supplemented with *supporting discussions* and interpretation of findings. Both the data tables and supporting discussions, culminated in *definitions* and *conceptual frameworks* for each code category (i.e. deductive codes from the code framework). Finally, an *overall conceptual framework, summary* (typology) *of findings* and *managerial implications* are provided for the main categories of the QCA of RL literature (i.e. consumer returns, pre-receipt RL processes, post-receipt RL processes and RL practices) aimed at answering the research questions.

In some instances, however, the findings are too comprehensive to include all the information in one table, in which case the tables are divided, presented, and discussed separately in subsections. Therefore, the categories with limited findings will be included in one table, while categories with more comprehensive findings will be presented in several tables.

In the next section, an overview of the main categories of the QCA of RL literature will be provided.

4.2.2 Overview of the main categories of the QCA findings of RL literature

As mentioned in section 4.1, the main categories of the QCA of RL literature related to the secondary objectives (SRO-02 - SRO-04) and included types of consumer returns, pre-receipt RL processes, post-receipt RL processes and RL practices.

Figure 4.3 provides an overview of the distribution of the four main categories of the QCA of RL literature (see Appendix C.1 for code frequencies for the main categories).

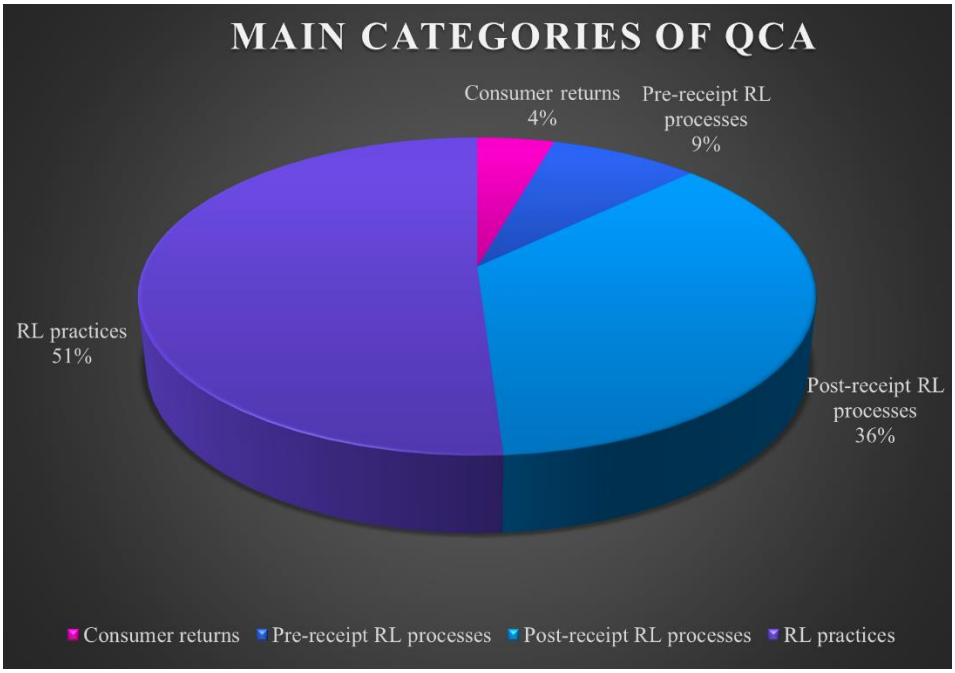

Figure 4.3 Main categories of the QCA of RL literature
Source: Compiled by researcher

Figure 4.3 shows a distribution of the percentages for the main categories of the QCA of RL literature derived from code frequencies (number of quotations assigned to code categories within the main categories see Appendix C.1). The pie chart clearly shows that RL practices (51%) dominate the RL literature. Additionally, post-receipt RL processes (36%) cover RL literature to a moderate extent. Contrastingly, the pre-receipt processes (9%) and types of consumer returns (a%) cover RL literature to a limited extent. While the percentages can be explained in terms of the number of code categories

assigned to each main category, for example, type of consumer returns include one code category, pre-receipt RL processes include four code categories, post-receipt processes include six code categories and practices include 11 code categories, the results emphasise more research can be conducted that focuses on consumer returns and pre-receipt RL processes.

In the next section a demarcation of consumer returns and RL processes are given, providing specific scope of the categories included/excluded from the QCA of RL literature.

4.2.3 Demarcation of consumer returns and RL processes

In section 1.6, the scope of this study was provided, which briefly indicated the type of returns and RL processes included/excluded. In this section, the demarcation of the findings for the QCA of RL literature for consumer returns and RL processes extends the general scope of the study. In section 1.5, an overview was given of the consumer return processes in online retailing, which provided an indication of the different RL processes appropriate for consumer returns in online retailing. Throughout chapter 1 it was mentioned that limited studies focus on RL and consumer returns in online retailing, which meant that general RL literature, containing content that can answer the research questions, was included in the sample for the QCA of RL literature.

Nevertheless, the researcher only included categories and subcategories that may apply to consumer return types and RL processes in online retailing. The following points provides an overview of the categories and subcategories *included* in consumer return types, pre-receipt and post-receipt RL processes, parties and facilities (inductive subcategories in the findings):

- *Types of consumer returns* – Any consumer return types that may be applicable to RL in online retailing, including business-to-consumers (B2C) commercial returns, end-of-use (EoU) returns, warranty returns, service returns and recalls.
- *Pre-receipt RL processes* – Any RL processes before returns arrive at the warehouse/facility that can be applicable to the RL processes of consumer returns in online retailing, including a customer return request, gatekeeping, collection and transportation.
- *Post-receipt RL processes* – Any RL processes after returns arrive at the warehouse/facility that can be applicable to the RL processes of consumer returns in online retailing, including receiving, processing, inspection and sorting, disposition and redistribution.
- *Parties* – Any parties that may be directly/indirectly involved in consumer returns and RL processes of consumer returns in online retailing, including consumers, retailers (i.e. online-only, multi-channel or omni-channel), wholesalers, third-party service providers, third-party buyers, distributors, and suppliers/manufacturers (for return to the vendor disposition option).

- *Facilities/locations* – Any facility/location that may be part of the RL processes of consumer returns in online retailing, including consumer locations, retailer locations (e.g. shops used by multi/omni-channel retailers for receipt of online consumer returns), traditional facilities (e.g. warehouses and distribution centres), any facilities used for RL processes (e.g. centralised return centres, inspection centres and processing centres), recovery facilities (e.g. repair and refurbishment facilities), primary markets and secondary markets.

Although various return types, RL processes, parties and facilities/locations can associate with the RL processes of consumer returns in online retailing, certain types of returns, pre-receipt and post-receipt RL processes, parties and facilities were excluded from the discussions. The following points provides an overview of the categories and subcategories *excluded* from consumer return types, pre-receipt and post-receipt RL processes, parties and facilities/locations:

- *Types of returns* – Any return types that exclude consumer returns, including *distribution returns* (returns between organisations) and *manufacturer returns* (internal returns), were excluded from the QCA of RL literature. However, *end-of-life (EoL)* returns as a consumer return type, was excluded from the QCA of RL literature because it associates with manufacturers and disposition options like remanufacturing and recycling.
- *Pre-receipt RL processes* – Excluded from the pre-receipt RL processes was *acquisition*, which mostly relates to EoL or distribution returns focussed on acquiring products/product parts from customers. Therefore, organisations, like manufacturers, in the SC initiate the return process through acquisition as the first pre-receipt RL process. Furthermore, some content related to the collection process was excluded, including *refuse collection* and *waste management*.
- *Post-receipt RL processes* – Some *disposition options* were excluded from the disposition processes in the QCA of RL literature, including *reconditioning*, *recycling*, *remanufacturing* and *waste management (disposal)*. These options are performed by third parties and manufacturers and involve product parts/materials and waste materials, which excludes consumer product returns in online retailing. Additionally, some exit options were excluded due to limited findings in the QCA of RL literature, namely selling as scrap, destroy and donate.
- *Parties* – Some parties were excluded, including *manufacturers*, *the government* and *non-governmental agencies* since they fall outside the scope of this study. However, as indicated above manufacturers are only included in the "ship to a vendor" exit option. Essentially, manufacturers play a secondary role in the discussion of the findings presented in the QCA of RL literature.

- *Facilities* – Some facilities were excluded, including *remanufacturing facilities*, *recycling facilities* and *waste management facilities*, because the purpose of these facilities is remanufacturing, recycling and handling of waste, which falls outside the scope of this study

In the next section, the QCA findings of RL literature for consumer returns will be discussed and analysed.

4.3 TYPES OF CONSUMER RETURNS

Consumer returns involve the backward flow of products and resources after the sale and after delivery to the customer or the point of consumption (De Araújo *et al*. 2017:346; Gonçalves & Silva, 2016:71; Huscroft *et al.* 2013a:231). *Product* returns in general refer to the physical distribution of used, defective or unused goods from the point of consumption to the point of origin for the purpose of product recovery (De Araújo *et al*. 2017:346; Ye *et al.* 2013:134).

Consumer returns in this study refer to the return of a product purchased by a customer back to a retailer (Chen & Chen, 2015:1; Yang *et al.* 2015:361). In most of the cases, consumer returns are initiated by the consumer due to a variety of reasons such as (i) faulty, poor quality, or damaged goods, (ii) late delivery, (iii) inaccurate description of products online, and (iv) change of mind returns (Asham & Rahman 2021: 3; De Araújo, et al., 2017:348; Shaharudin *et al.* 2015:222). However, consumers are not always responsible for returns, which are deduced from the different types of consumer returns. Therefore, the consumer return types could either be "push consumer return" (returns initiated by consumers or consumer faults/errors), "pull consumer return" (initiated by supply chain organisations), or "push and pull consumer returns" (initiated by the consumer due to organisational errors or policies).

Five types of consumer returns, appropriate for retailing, were identified from the QCA of RL literature, including (1) business-to-consumer (B2C) commercial returns, (2) end-of-use (EoU) returns, (3) warranty returns, (4) service returns and (5) recalls. In the rest of this section, the findings related to these above-mentioned consumer return types will be presented and discussed in subsections. Then the section will be concluded with a conceptual framework for consumer returns.

4.3.1 B2C commercial returns

From the QCA of RL literature findings, B2C commercial returns (hereafter B2C returns) included several categories, namely product condition, consumer-error return reasons, organisational-error return reasons and other reasons and disposition options. Table 4.1 provides an overview of the

findings related to *B2C returns*, including detail on the categories, related subcategories, supporting literature sources and key quotations to support the discussion of the findings.

Table 4.1 Findings related to B2C returns

CATEGORY	SUBCATEGORY	SUPPORTING AUTHORS	KEY QUOTATIONS
Product condition	***New and unused***	De Leeuw *et al.* (2016:715) Genchev (2009:140,) Mazahir *et al.* (2011:93) Piplani and Saraswat, (2012:1424) Ruiz-Benítez *et al.* (2014:54)	• *"A significant number of the returned products are in perfect condition for resale."* (De Leeuw *et al.* 2016:715) • *"[…] untouched or barely used products […]."* (Mazahir *et al.* 2011:93) • *"Commercial returns are usually as good as new, as they have only been lightly used or not used at all."* (Piplani and Saraswat, 2012:1424)
	Defective upon arrival	Genchev (2009:140,146) Jena and Sarmah (2015:822)	• *"Defective […] product was inoperable at first use."* (Genchev 2009:146) • *"[…] failure of new products […]."* (Jena & Sarmah, 2015:822)
Consumer error/fault return reasons (push returns)	***Order errors***	Ghezavati and Nia (2015:3059) Kabir (213:96) Li and Olorunniwo (2008:385) Min and Ko (2008:179) Min et al. (2006:57) Olorunniwo and Li (2011:4) Roy *et al.* (2006:59)	• *"Other reasons stated for customer returns include wrong products ordered."* (Li & Olorunniwo 2008:385) • *"Most products are returned not because they are defective or damaged, but for other reasons such as […] the wrong product was ordered in the first place."* (Olorunniwo & Li, 2011:4)
	False failures	Bernon and Cullen (2007:48) Ruiz-Benítez *et al.* (2014:54) Xu *et al.* (2015:90)	• *"Many customers could not operate the equipment and therefore returned the product as faulty."* (Bernon & Cullen, 2007:48) • *"[…] most product returns are in perfect working order– that is they have no defects. These returned products are commonly referred to as false failure returns and they constitute more than two-thirds of all returns."* (Ruiz-Benítez *et al.* 2014:54)
	Problems experienced with products	Bernon and Cullen (2007:48) Bernon *et al.* (2011:491) Bower and Maxham (2012:114) Gonçalves and Silva (2016:71) Jena and Sarmah (2015:822) Li and Olorunniwo (2008:385)	• *"A major reason for returns was the difficulty that customers experienced with the instructions provided with the products."* (Bernon & Cullen, 2007:48) • *"[…] problems with item descriptions, installation, or instructions; […]."* (Bower & Maxham, 2012:114) • *"[…] customers return the products for several reasons, for example […] the customers are unhappy with the functionality of the product […]."* (Gonçalves & Silva, 2016:71)
	Buyer's remorse/ change of mind	Bernon *et al.* (2011:491) Bower and Maxham (2012:114) Genchev (2009:140) Huscroft *et al.* (2013a:231) Li and Olorunniwo (2008:385) Mollenkopf *et al.* (2007:242) Olorunniwo and Li (2011:4) Piplani and Saraswat (2012:1424) Seo *et al.* (2015:2) Subhashini (2016:9)	• *"[…] variety of reasons including, buyer's remorse […]."* (Bernon *et al.* 2011:491) • *"Marketing-related causes for returns must also be addressed, including […] customers who change their mind after the initial purchase".* (Genchev, 2009:140) • *"[…] consumer-induced returns (e.g., customer changed mind, did not like the product after seeing it, did not like styling)."* (Mollenkopf *et al.* 2007:242) • *"Most products are returned not because they are defective or damaged, but for other reasons such as […] the customers changing their minds […]."* (Olorunniwo & Li, 2011:4) • *"[…] most common reasons for product returns were […] change of mind […] and regret about buying impulsively."* (Seo *et al.* 2015:2)
	Dissatisfaction	Genchev (2009:140) Gonçalves and Silva (2016:71), Jena and Sarmah (2015:822) Lai *et al.* (2013:107, 453) Piplani and Saraswat (2012:1424) Seo *et al.* (2015:2) Subhashini (2016:9) Yang *et al.* (2015:363) Yoo (2014:147)	• *"[…] customer is not satisfied with the product's quality."* (Li *et al.* (2013:453) • *"After receiving and trying the product, the customer may feel that it does not match its expectations, and then decide to return back the product."* (Yang *et al.* (2015:363)

Other reasons	***Seasonal changes/supply and demand***	Genchev (2009:140) Sharif *et al.* (2012:2517)	• *"The return needs of […] end users […] add a market-related dimension to the mix in that seasonal surges in demand must be accommodated."* (Genchev, 2009:140) • *"[…] mismatches in demand and supply in terms of timing or product quality (B2C commercial returns)."* (Sharif *et al.* 2012:2517)
	Liberal return policies	Bernon and Cullen (2007:48)	• *"A significant number of products that are returned by customers are found to have no problem. The problem is linked to the liberal returns policies that companies offer to customers."* (Bernon & Cullen, 2007:48)
Disposition options	***Direct reuse***	Alshamrani *et al.* (2007:596) Jayaraman *et al.* (2008:411) Ruiz-Benitez *et al.* (2014:55)	• *"Products in their original form returned for […] direct reuse."* (Alshamrani *et al.* 2007:596) • *"[…] the reuse option, […] if a product was returned because the consumer changed their mind about their purchase […]."* (Jayaraman *et al.* 2008:411) • *"[…] such that false-failure returns may be immediately returned to the shelf for resale."* (Ruiz-Benitez *et al.* 2014:55)
	Repair	Alshamrani *et al.* (2007:596) Bernon *et al.* (2011:491)	• *"Products in their original form returned for repair […]."* (Alshamrani *et al.* 2007:596)
	Refurbishment	Bernon *et al.* (2011:491)	• *"If the product is defective or damaged it may undergo repair or refurbishment."*

Source: Compiled by the researcher

Table 4.1 shows that B2C consumer returns associate with a few product conditions, and various reasons/causes and disposition options, which will be explore in the subsequent sections.

4.3.1.1 Product condition of B2C returns

Although B2C returns normally involves new or unused products in perfect working condition, some products might be used and returned by consumers for several reasons, like false failures (see section 4.3.1.2).

Additionally, new products could be in damaged or defective condition due to organisational-related errors, for example, transportation damages and defective condition at first use. Although defective

and damaged products can relate to the condition of products, it forms part of the organisational error reasons for B2C returns.

Finally, the product condition can link to the type of disposition options, discussed in section 4.3.1.3, and explored in depth in section 5.6. Subsequently, product condition can be an important indicator to the reasons for B2C consumer returns and most suitable disposition options.

4.3.1.2 Reasons/causes for B2C returns

The reasons/causes for B2C returns can be categorised as consumer errors, organisational errors and other reasons, which will be described in the subsequent sections.

4.3.1.2.1 Consumer error (push) as reason for B2C returns

Table 4.1 shows that many reasons for returns can be associated with consumer-related errors, including order errors, false failures, problems experienced with products, buyer's remorse or a change in mind, dissatisfaction and unwanted products. Consequently, most B2C returns can be regarded as "push returns" that are initiated and caused by consumers. Each of these consumer error reasons will be discussed below.

Order errors as a consumer error reason involves consumers ordering the wrong products, which can be difficult to avoid. Order errors can be a likely possibility in online retailing since consumers might select incorrect options/products on the shopping site. In terms of *false failure returns,* consumers might perceive a product in a perfect working condition as faulty because of the inability to operate the product correctly. False failure returns mostly include electronic products, showing the importance of including clear instructions and detailed descriptions of products.

Closely related to false failure returns are *problems experienced with the product*. For instance, consumers might misunderstand product instructions and choose to return the item. Alternatively, problems experienced with products can associate with incorrect descriptions or instructions, installation issues or unclear information for use. Consequently, consumers might return the product due to frustrations with the products and dissatisfaction related to the functionality of the product, resulting in a return. From these findings it can be deduced that organisations could also be blamed for problems experienced with products due to inadequate instructions or the user-unfriendliness.

Although *buyer's remorse* and a *change of mind* as return reasons can be regarded as consumer errors, consumers might unintentionally experience regret when making the purchase initially. Consequently, buyer's remorse mostly occurs when consumers buy impulsively only to regret their

purchases later or change their minds after receiving the products (e.g. disliking the product once received). Additionally, a change of mind can be significant in the apparel industry of online returns, where garments are returned due to size, colour and fit issues.

Closely related to buyer's remorse and a change of mind is *dissatisfaction.* Consumers might either be dissatisfied with the functionality of the product or with the quality of the product. Therefore, dissatisfaction can be described as return reasons associated with unmet expectations, which might lead to buyer's remorse and a change of mind. Finally, consumer error return reasons can include *unwanted products*. Although the findings lack a clear description, unwanted products might associate with other return reasons, including order errors, problems with products, buyer's remorse and dissatisfaction.

Essentially, consumer-related B2C returns error can be significant in online retailing industry since consumers order products online without physically touching, feeling, seeing or smelling the products, which can result in order errors, false-failure returns, problems with the products, buyer's remorse, a change of mind, dissatisfaction and unwanted products.

4.3.1.2.2 Organisational errors (push and pull) as reason for B2C returns

Table 4.1 shows that some of the B2C returns can be the result of organisational errors, including wrong delivery, problems with quantity, damaged/defective goods and problems with quality. These B2C return reasons can be described as "push and pull returns", since it is initiated by the consumer but caused by the organisation. Each of these B2C return reasons related to organisational errors are discussed in the following paragraphs.

Wrong deliveries can include products delivered to the wrong destination or wrong products shipped to consumers. Wrong delivery can be associated with shipments to the wrong destination because of misinformation, which might either be errors in providing the correct addresses or errors made by transportation parties (e.g. couriers). If wrong deliveries associate with wrong product shipments, the causes might include picking errors or faults/glitches on the systems. Wrong deliveries are likely in the online retailing since products are delivered to consumer locations (at residences or workplaces). If organisations find that wrong deliveries are common occurrences, they must investigate the reasons behind such errors. Consequently, wrong delivery should be avoided since it can lead to unnecessary returns. Closely related to wrong deliveries are *incorrect quantities,* meaning that the consumer might return excess quantities if they receive more items than what was initially ordered. For example, a consumer orders a pair of shoes but receives two pairs, resulting a return of the extra shoes.

Earlier it was mentioned that *damaged* and *defective* products point to the product's condition as well as reasons for B2C returns. Return reasons for *damaged products* associate with damages during shipment or in-transit damages and packaging problems. Therefore, any handling procedures during delivery can potentially result in damages. Nevertheless, consumers might refuse to accept products with outer packaging damages, believing that the products inside might also be damaged. These findings demonstrate that damaged products, as a reason for B2C returns, can be a likely possibility in online retailing, as products are physically transported to consumer locations.

In contrast, *defective products*, as a B2C return reason, relate to products that are inoperable at first use. Therefore, the defect relates to manufacturing faults, not shipping damages associated with damaged product returns. Closely related to defective products, *quality problems with products*, as a B2C return reason, can be the result of poor manufacturing practices. However, unlike defective products, quality problems associate with poor performance/quality of products in working condition. Additionally, quality problems can contribute to consumer dissatisfaction, which can be regarded as consumer-related errors (see section 4.3.1.2.1). Subsequently, by selling lower quality products, organisations can play a role in consumers returning unwanted products due to dissatisfaction. Although defective products and quality issues originate from manufacturers, these return reasons can be prevalent in online retailing.

Essentially, all the organisational-related errors in B2C returns could be applicable to the RL processes of consumer returns in the online retailing industry.

4.3.1.2.3 Other reasons for B2C returns

Other reasons for returns include seasonal changes or changes in demand/supply and liberal return policies. *Seasonal changes* or *changes* in *demand/supply* as reasons for B2C returns, add a market-related dimension to B2C returns. Furthermore, mismatches in supply and demand in terms of timing or quality can lead to B2C returns. Evidently, organisations must use accurate forecasting techniques to reduce the impact of these B2C return types.

Liberal return policies can cause unnecessary returns of products in new condition without defects/damages. While consumers can abuse liberal return policies, organisations can be blamed for the implementation of liberal return policies. Therefore, liberal return policies can be classified as "push and pull" B2C consumer returns.

4.3.1.3 Disposition options associated with B2C returns

Table 4.1 shows that B2C consumer returns can involve reuse, repair and refurbishment as disposition options, based on the product condition and/or return reasons.

For example, the direct reuse option can be appropriate for products in new, unused or minor-used condition, and the repair or refurbishment options can be appropriate for faulty/damaged/defective products. However, repair and refurbishment options mostly apply to other consumer return types such as EoU returns, warranty returns and product recalls, which will be discussed in subsequent sections. Consequently, repair or refurbishment options only apply to organisational error B2C consumer return reasons, related to damages and defects of new products.

Other examples relate to consumer-related errors, like a change of mind or false-failure returns, which can be appropriate for direct reuse. Evidently, direct reuse relates to consumer error (push) return reasons and repair and refurbishment relates to organisational error (push and pull) return reasons. The disposition options associate with the post-receipt RL process of disposition, which will be explored in section 5.7.

Based on the findings presented in this section, this study will describe B2C consumer returns as follows:

> B2C consumer returns involve consumers returning new/unused/minor used products in good or defective/damaged condition for various reasons. Return reasons can include (1) consumer errors (push returns), involving, order errors, false failure returns, problems with operating the product, buyer's remorse or a change of minds, dissatisfaction and unwanted products, (2) organisational errors (push and pull returns), involving wrong deliveries, inaccurate quantities, defective/damaged products and quality issues, and (3) other reasons, involving seasonal changes, changes in supply and demand and liberal return policies. Depending on the condition and return reasons B2C product returns can include direct reuse, repair or refurbishment as disposition options.

In the next section, EoU returns as a consumer return type will be analysed and discussed.

4.3.2 End-of-use (EoU) consumer returns

From the QCA of RL literature findings, EoU returns included several categories, including the (1) product condition associated with EoU returns, (2) the reasons/causes for EoU returns, (3) types of products associated with EOU returns and (4) disposition options associated with EoU returns. Table 4.2 provides an overview of the findings related to *EoU returns*, including detail on the categories, related subcategories, supporting literature sources and key quotations to support the discussion of the findings.

Table 4.2 Findings related to EoU consumer returns

Source: Compiled by the researcher

Table 4.2 shows that EoU consumer returns associate with a few product conditions, and various reasons/causes, types of products and disposition options, which will be explore in the subsequent paragraphs.

As the name indicates, EoU returns are associated with used products, meaning that consumers used products for some time prior to the return. Despite being in *used condition*, products must be in relatively good condition, which indicates that products must still be usable. Consequently, products in defective condition might be less appropriate for EoU returns. Nevertheless, some findings indicated the repair can be a potential disposition option for EoU returns, which implies that some EoU returns might be in minor defective or damaged conditions.

Several reasons/causes associate with EoU returns, namely technological advancements, incentives, product exchange programmes and product upgrades. These return reasons can be classified as "push

and pull" consumer returns reasons since organisations can initiate EoU returns based on changing consumer preferences. Particularly, *technological advances* can cause a change in consumer preferences, leading to products becoming obsolete. The results of these technology advancements can relate to the other reasons/causes for EoU returns. For instance, organisations can offer *product exchange programmes* and *product upgrades* to address the changes in consumer preferences due to technological advancements. Therefore, organisations allow consumers to exchange used products for newer more technologically advanced ones. Additionally, organisations can make use of incentives to encourage consumers to return their used products. For instance, Apple[9] incentivise consumers to trade-in used devices for discount on new products (Fox, 2023:22). Essentially, EoU return reasons can be driven by organisations, with consumers playing indirect roles by seeking latest products.

In terms of the *type of products*, EoU returns mostly associate with electronic product categories. For example, EoU returns can include mobile phones, computers, computer accessories and household appliances, emphasising return reasons related to technological advances and product upgrades. However, other product categories, like carpets, can be associated with EoU returns, involving product exchange programmes.

Finally, Table 4.2 shows the *disposition options* associated with EoU returns include reuse, repair and/or resale in secondary markets. The disposition option of direct *reuse* normally associates with B2C returns, since the product is normally in a new condition. However, for EoU returns, reuse associate with reselling products on the *secondary markets*, without repairing the product. Therefore, used products in good and non-defective condition can be directly resold in the secondary markets at discounted prices. Alternatively, EoU products in defective condition might need to be *repaired* before resale on the secondary market can be possible.

Based on the findings presented in this section, this study will describe EoU consumer returns as follows:

> EoU consumer returns involve consumers returning used products, in good or defective condition (i.e. electronics, computers and cell phones) due to technological advances, product exchange programmes, incentives and product upgrades. EoU consumer returns can be initiated by organisations based on changing consumer preferences (push and pull returns). Depending on the condition of the product, EoU returns can include product reuse, repair and resale in secondary markets as disposition options.

In the next section, warranty returns as a type of consumer return will be discussed.

[9] Although Apple is a manufacturer, it can be classified as an online retailer, selling products directly to consumers online. See section 1.6 for more details.

4.3.3 Warranty consumer returns

From the QCA of RL literature findings, warranty returns included several categories related to product condition, reasons/causes for returns, types of products and disposition options. Table 4.3 provides an overview of the findings related to *warranty returns*, including detail on the categories, related subcategories, supporting literature sources and key quotations to support the discussion of the findings.

Disposition options	• ***Repairs*** • ***Refurbishment***	Chan *et al.* (2012:1320, 1322) Kara and Onut (2010:717) Lambert *et al.* (2011:568) Piplani and Saraswat (2012: 1426) Sharma and Singh (2013:39) Wu (2014:52) Xanthopoulos and Iakovou (2009:1704)	• *"[…] many products under warranty are returned for repair […]"* (Ho *et al.* 2012:29) • *"[…] warranty returns […] refurbished […]."* (Janse *et al.* 2010:510) • *"[…] warranty return usually calls for repair […]."* (Khor & Udin, 2012:7) • *"[…] defective warranty components. […] could possibly be tried for repair […] such that value could be reclaimed from these products […]."* (Ravi 2014:301)

Source: Compiled by the researcher

Table 4.3 shows that warranty returns associate with a few product conditions, reasons/causes, types of products and disposition options, which will be explore in the subsequent paragraphs.

The *product condition* associated with warranty returns include used and/or defective. If the product is in a *used condition*, it means that the consumer used the product for some time but returned it before the warranty expired. Alternatively, the product might be in a *defective condition* and returned as such within the warranty period. However, like B2C returns, warranty returns can associate with false failures, meaning that consumers mistakenly believe that products, in working condition, are defective. Essentially, if a consumer purchase a product with a warranty that becomes defective during use or false failure upon first use, a warranty return will replace B2C returns.

Evidently, warranty *return reasons* can be closely related to B2C return reasons and classified as "push and pull consumer returns". A warranty return refers to the return of products that are under manufacturer warranty over a pre-specified period. If the *product fails* during the warranty period, a consumer can return the product, indicating that *quality failures* can be warranty return reasons (pull returns). Alternatively, if the consumer mistakenly believes that a non-defective product under warranty is defective, the warranty return can be described as a described as a *false failure warranty return* (push return).

Although the product condition and reasons in warranty returns point towards electronic products, only *vehicles* and *computers* as *product types* were identified as product types in the findings. Nevertheless, the findings indicated that the warranty periods can be different for different product categories. For instance, the warranty period for a passenger car might be three years, while the warranty for a laptop computer might be one year. Evidently, warranty return time windows can associate with the type of product and potentially the product quality (higher product quality represents longer warranty period).

Finally, warranty returns associate with the disposition options of *repair* and *refurbishment,* pointing to the used/defective conditions of products (still under warranty). However, a false failure warranty return can exclude the repair or refurbishment disposition options and can be potentially returned to the original consumer or resold in the secondary markets.

Although manufacturers can issue warranties, warranty returns can be appropriate for online retailing since consumers can use the online retailer's platform to return a product under warranty. For instance, Wu (2014:53) mentioned that warranty claims are handled by retailers and often included in the return policies of retailers. For this reason, warranty returns as a consumer return type is included in this study.

Based on the findings presented in this section, this study will describe warranty returns as follows:

> Warranty consumer returns refer to consumers returning used, good condition and/or defective products (e.g. computers and vehicles) under manufacturer warranty. Warranty returns can include various reasons, including product failures, quality failures, warranty claims, defectiveness or false failures ("push and pull" returns). Based on the reasons for warranty returns and the condition of the product, warranty returns can involve repair, refurbishment or other disposition options (such as resell on secondary markets).

In the next section, service returns as a consumer return type will be analysed and discussed.

4.3.4 Service consumer returns

Despite limited findings, service returns were categorised as: (1) product condition associated with service returns, (2) reasons/causes for service returns, (3) types of products associated with service

returns and (4) disposition options related to service returns. Table 4.4 provides an overview of the findings related to *service returns*, including detail on the categories, related subcategories, supporting literature sources and key quotations to support the discussion of the findings.

Table 4.4 Findings related to service returns

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
Product condition	• ***Relatively good condition*** • ***Used***	None	• *"Repair is more efficient for products of relatively good quality."* (Niknejad & Petrovic, 2014:145) • *"[…] repair services, and retrieval process from the used products […]."* (Kim *et al.* 2013:510)
Reasons/ causes	• ***Product failures*** • ***False failures*** • ***Repair service requests***	None	• *"Products are returned for repair mainly due to failure of quality conformity."* (Chan *et al.* 2012:1320) • *"[…] it is often found that returned products do not need any repair service […] the problems are caused by customers who do not fully understand how to operate the products correctly."* (Banomyong *et al.* 2008:40) • *"[…] where customer requests and handling of product/service returns […]."* (Ravi, 2014:2523)
Types of products	• ***Computers*** • ***Mobile phones*** • ***Cameras*** • ***Vehicles***	None	• *"[…] electronic products […] contributes to the growth of return flows requiring repair service."* (Li *et al.* 2016:223) • *"[…] computers, mobile phones, and cameras […] for after-sale repair services."* (Li *et al.* 2016:223) • *"[…] vehicle returns and provide repair service […]."* (Chan *et al.* 2012:1322)
Disposition option	• ***Repair***	Ahsan and Rahman (2016:627) Chan *et al.* (2012:1320) Ghezavati and Nia (2015:3059) Lai *et al.* (2013:107) Shaharudin *et al.* (2015:4)	• *"Service […] return […] calls for repair."* (Khor & Udin, 2012:7) • *"[…] service returns for repair […]."* (Subhashini (2016:9)

Source: Compiled by the researcher

Table 4.4 shows that service returns associate with few product conditions, types of products, reasons/causes, types of products and disposition options, which will be explore in the subsequent paragraphs.

Like that of EoU and warranty returns, the *product condition* associated with service returns include used products in relatively good condition. However, the disposition options and reasons for service returns can point to products that can be in damaged or defective condition. For instance, the *reasons/causes* for service returns can associate with *product failures*, *false failures* and *repair service requests*. Like B2C and warranty returns, service returns can involve false failures, if consumer mistakenly belief products are defective.

Service returns can involve electronics, mobile phones, cameras and vehicles as *product types*, emphasising the possibilities of false failure return reasons. Finally, linking with the reasons of product failures and repair service requests, service returns associate with the *disposition option* of repair. From the findings related to the repair option (presented in section 5.6.3) products can be defective and faulty condition, illustrating that service returns can involve defects.

Although limited findings associate with service returns, consumers might return products to online retailers for repair. Therefore, service returns as a consumer return type is included in this study. Based on the findings of the presented in this section, this study will describe service consumer returns as follows:

> Service consumer returns (mostly "pull" returns) involve consumers returning relatively good quality, used and/or defective products (e.g. computers, cameras, cell phones or vehicles) due to quality failures, inability to operate the product (false failure reasons) or a repair service request, involving repair as disposition option.

In the next section, the final consumer return type will be analysed and discussed.

4.3.5 Recalls in consumer returns

The final return type, *recalls*, includes four categories, namely the (1) product condition related to recalls, (2) reasons/causes for recalls, (3) types of products associated with recalls and (4) disposition options associated with recalls. Table 4.5 provides an overview of the findings related to *product recalls*, including detail on the categories, related subcategories, literature sources and key quotations to support the discussion of the findings.

Table 4.5 Findings related to recalls in consumer returns

CATEGORIES	SUBCATEGORIES	SUPPORTING SOURCES	KEY QUOTATIONS
Product condition	• ***Defective***	None	• *"Defective products may be […] resulting in a pull back of products through the chain (product recalls)."* (Kabir, 2013:96) • *"[…] defective products […] in a product recall."* (Ni *et al.* 2014:310) • *"[…] defect fixation via a product recall."* (Sharma & Singh 2013:39)
Reasons/ causes	• ***Defects*** • ***Quality failures*** • ***Safety issues*** • ***Notifications/ announcements***	Sharma and Singh (2013:39)	• *"For example, products suffered from production defects, which then resulted in product recall."* (Chan *et al.* 2012:1320) • *Recalls and returns differ mainly because of the notification aspects."* (Kabir, 2013:96) • *"[…] a retailer's recall announcement […]."* Ni *et al.* 2014:309) • *"There are elements of both quality (defective products) and product safety involved in a product recall."* (Ni *et al.* 2014:310)
Types of products/ industries	• ***Automobile*** • ***Pharmaceutical / medicine*** • ***Food*** • ***Toys*** • ***Infant/baby products*** • ***Household products*** • ***Outdoors*** • ***Sports***	Narayana *et al.* (2014:393) Roy *et al.* (2006:59)	• *"[…] automobile industry […] including unavoidable product recalls […]."* (Chan *et al.* 2012:1318) • *"[…] product recalls are of growing concern to hospital pharmacies."* (Kumar *et al.* 2009:189) • *"[…] product recalls resulting from safety problems (e.g., food and automobile)."* (Lai *et al.* 2013:107) • *"[…] consumer products, including toys, infant and children's products, household products, outdoor products, and sports and recreation products."* (Ni *et al.* 2014:310) • *"[…] product recall […] the lead-based toys as hazardous substances."* (Sarkis *et al.* 2010:345) • *"Another recall example occurred with a baby stroller and infant formula products."* (Sarkis *et al.* 2010:345)
Disposition options	• ***Repairs***	Sharma and Singh (2013:39)	• *"[…] recalled products […] repairs."* (Ni *et al.* 2014:309)

Source: Compiled by researcher

Regardless of the rich description from Ni *et al.* (2014) on recalls, some examples from industry articles/websites, excluded from the QCA, were included to supplement the discussion of recalls below. Each of the categories and subcategories, presented in Table 4.5 will be discussed in the rest of this section.

4.3.5.1 Product condition and reasons/causes for product recalls

Product recalls as a consumer return type involves products in *defective condition,* which links with the reasons/causes and disposition option of repair (see section 4.3.5.3). However, recalls can be distinguished from other return types in terms of health and safety issues.

Like other consumer return types, *return reasons* of recalls can include product-related problems, like *production defects* and *quality failures*. However, recalls can involve a greater sense of urgency and include a notification or announcement, not present in B2C consumer returns, EoU returns, warranty returns and service returns. Consequently, return reasons in recalls can include *product safety issues*, forcing retailers to notify consumers via special announcements to return unsafe/defective products. Evidently, product recalls are initiated by organisations in the SC and can be regarded as "pull consumer returns".

4.3.5.2 Types of products in product recalls

Table 4.5 shows that various types of products associate with product recalls, including automobile, food, medicines (pharmaceuticals), toys, infant or baby product types, household, outdoors and sports products. Given the return reasons discussed in the previous section, it is easy to identify potential health and safety problems associated with these product types.

For example, in 2018, South Africa experienced a recall of certain cold meat products due to a listeria outbreak, which claimed the deaths of 183 consumers (Mngadi, 2018:1). South African grocery retailers, such as SPAR announced on their website that customers can return cold meat products for a full refund (SPAR, 2019), demonstrating the involvement of retailers and notifications associated with recalls. Another example is the recall of almost one million vehicles from ten top South African car brands for inspection as a precautionary measure because of faulty airbags that could harm or kill vehicle occupants (Rekord, 2021). In addition, in May 2022 Unilever SA recalled Knorr 'Cup-a-Soup Beef and Vegetable Lite' due to mistake in content (Mhamba, 2022) and Shoprite and Checkers recalled a specific batch of canned tuna products owing to possible defects in the cans (Fin24, 2022).

Ni *et al.* (2014:315) mentioned that product types in recalls can be classified by (1) risk of death, illness or injury highly likely, (2) risk of death unlikely but illness or injury likely and (3) risk of illness or injury unlikely but possible. Subsequently, product recalls can be appropriate for any product type that can result in risk of death, illness or injury.

4.3.5.3 Disposition options associated with product recalls

Like warranty returns and service returns, product recalls associate with the *repair* disposition options, emphasising the defective condition of products. However, the repair option can only be appropriate for certain product categories, such as domestics appliances, machinery and electronic equipment (Singhry, 2015:121). If the recalled product is food or medicine, the disposition option might involve destroy (see Kabir 2013:97 and Xie & Breen, 2014:466). However, destroy was excluded from disposition/exit options due to a lack of findings in the QCA of RL literature.

Essentially, findings related to product recalls mostly focus on reasons for recalls and product types associated with recalls, with limited focus on the potential disposition options (recovery or exit options) related to recalls. Therefore, it is possible that other disposition/exit options could be used to treat recalled products. The findings presented in this section indicates that product recalls could be an important consumer return type in the online retailing industry. Furthermore, Ni *et al.* (2014:318) explained that retailers play an important role in product recalls, in that they are not only responsible for announcing the recall and issuing refunds (financial implications) but also due to their proximity to consumers. Based on these reasons, product recalls as a consumer return type will be included in this study, and be described as follows:

> Product recalls are consumer returns, initiated by organisations in the supply chain (pull returns), that entail announcements/notifications to consumers of potential risks of harm, injury, illness or death, related to the use/consumption of consumer goods (e.g. toys, medicine, food, household goods or sports equipment), due to production defects, quality failures, safety and health issues. The consumers are advised to return potentially harmful/hazardous and defective products for a refund or repair.

In the next section, the QCA findings of RL literature for consumer return types will be illustrated in a conceptual framework and concluded with a summary of the findings and important RLM considerations.

4.3.6 Conceptual framework and summary of findings for consumer return types

Clearly, the findings presented section 4.3 shows that various types of consumer returns can occur involving product conditions, return reasons/causes, product types and disposition options. Based on the findings, Figure 4.4, shows a conceptual framework for consumer return types that may occur in online retailing.

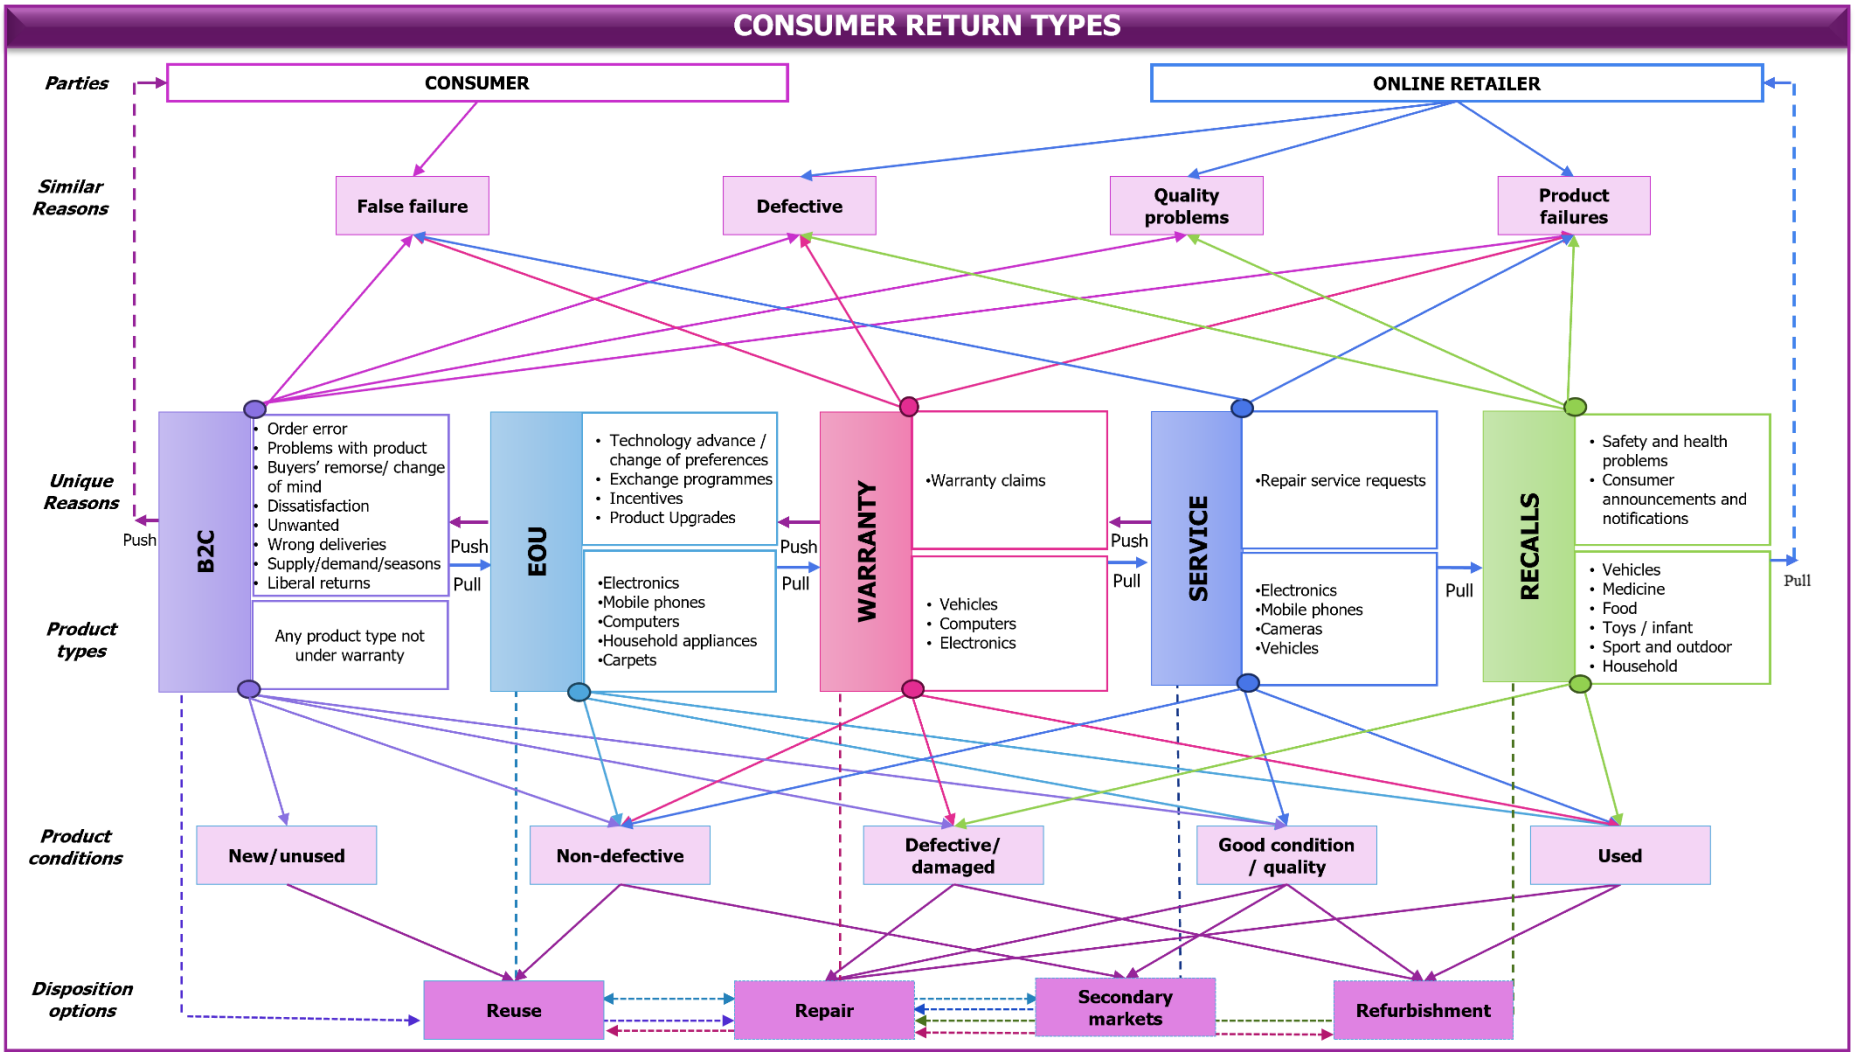

Figure 4.4 Conceptual framework of consumer return types
Source: Compiled by researcher

Figure 4.4 highlights the linkages between the parties, reasons of returns, the main consumer return types, product types, product condition and disposition options. Furthermore, the framework demonstrates the similarities and differences between the reasons for consumer return types.

Based on Figure 4.4 and discussions in section 4.3, Table 4.6 provides a summary of the findings and managerial implications for types of consumer returns that may occur in online retailing.

Table 4.6 Findings and managerial implications for consumer return types

CATEGORIES	KEY FINDINGS	MANAGERIAL IMPLICATIONS
Parties	• Consumers can be directly/indirectly responsible for various return reasons that can be described as push return reasons, including false failures, order errors, problems with products, buyers' remorse, change of mind, dissatisfaction, unwanted products, abuse of liberal return policies, technological change of preferences, warranty claims and repair service requests • Online retailers can be directly/indirectly responsible for various return reasons that can be described as pull return reasons, including defective, quality problems, product failures, liberal return policies, wrong deliveries, exchange programmes, incentive returns, product upgrades, warranty claims, health and safety notifications and announcements	➢ All consumer return types, including B2C, EoU, warranty, service and recall returns can occur in online retailing. ➢ Although some consumer return reasons are unavoidable, online retailers must focus efforts on avoiding unnecessary returns ➢ Online retailers must pay attention to B2C consumer returns to generally reduce returns ➢ Although false failure returns are classified as consumer errors, online retailers can reduce false failures through improved instructions or additional information ➢ Defective products are often associated with consumer returns, which means that online retailers must identify products or product brands that are often returned as defective and change suppliers or discontinue selling these products. ➢ Since EoU returns include organisational initiatives, focus should be placed on RL costs efficiencies, process effectiveness and disposition strategies for effective value recovery ➢ Online retailers must understand and prepare for consumer returns, regardless of their product offering ➢ Online retailers that stock products that can result in health and safety issues must implement strategies to effectively notify consumers and collect products from consumers ➢ Online retailers that stock electronics, cell phones, computers and automobiles must implement focus on implementing effective RL processes to manage consumer returns associated with these product types ➢ Online retailers that mostly experience B2C consumer
Reasons	• Common return reasons can include false failures (consumer errors), defective products, quality problems and product failures (organisational errors) • B2C consumer returns associate with the highest number of reasons • B2C consumer returns involve unique return reasons, including order errors, problems with products, buyers' remorse, change of mind, dissatisfaction, unwanted products, wrong deliveries, supply/demand variations and liberal return policies • EoU consumer returns involve unique return reasons, including technological advance / change of preferences, exchange programmes, incentives and product upgrades • Warranty consumer returns involve warranty claims as a unique reason • Service consumer returns involve request for a repair service as a unique reason • Product recall consumer returns involve unique return reasons, including safety and health problems, consumer announcements and notifications	
Product types	• B2C consumer returns can include any product type not under warranty • EoU returns, warranty returns, and service returns include electronics • Warranty returns, service returns and product recalls can include vehicles • EoU returns and warranty returns can include cell phones • EoU returns uniquely involve carpets • Service returns uniquely involve cameras • Recalls uniquely involve medicine, food, toys, infant products, sports and outdoor products in	

	recalls	returns must prepare to handle products in any condition
Product condition	• Product condition associates with various return types • B2C returns include the greatest variety of product conditions • Only B2C returns can include new/unused products • All consumer return types, except recalls, can include non-defective products (due to false failures) • All consumer return types, except B2C returns, can include and used products • B2C returns, warranty returns and product recalls can include defective/damaged products • B2C, EoU and service returns can include products in relatively good condition	➢ Online retailers must implement reuse strategies to effectively deal with non-defective products ➢ Online retailers must implement recovery strategies to effectively deal with used products ➢ Online retailers must implement disposition strategies, regardless of the consumer return type
Disposition options	• All consumer return types can involve disposition options • The reuse option associates with B2C, EoU and warranty returns and new/unused or non-defective products • The repair option associates with all consumer return types in defective/damaged condition • Secondary markets mostly associate with EoU returns in non-defective and/or good condition • The refurbishment option associates with warranty returns for products in defective/damaged, good and used conditions	➢ Online retailers must implement product repair strategies, regardless of the consumer return type

Source: Compiled by the researcher

Table 4.6 indicates the importance of understanding the various types of consumer returns, including parties responsible for initiating returns, return reasons, types of products, product condition and disposition options. Additionally, several managerial implications associate with consumer return types, which online retailers can consider for the effective RLM of consumer returns. The findings presented in this section will contribute to the final framework for the effective RLM of consumer returns in online retailing.

In the next section, the QCA finding of RL literature for pre-receipt RL processes will be discussed and analysed.

4.4 PRE-RECEIPT RL PROCESSES

In this section, the QCA findings of RL literature for pre-receipt RL processes will be provided. Pre-receipt RL processes start when a consumer notifies a retailer of a return and ends just before the retailer receives the product at a facility. Based on the coding framework of the QCA of RL literature (see Appendix A.2), the pre-receipt RL processes were structured into four main categories, namely customer return request (CRR), gatekeeping, collection and transportation. While return transportation can occur before returns arrive at facilities, this study acknowledges that transportation can be part of post-receipt RL processes, taking place as returned products moves between facilities in the reverse supply chain (RSC).

Figure 4.5 provides an overview of the distribution of the pre-receipt processes based on the results of the QCA of RL literature (see Appendix C.2 for quantitative results).

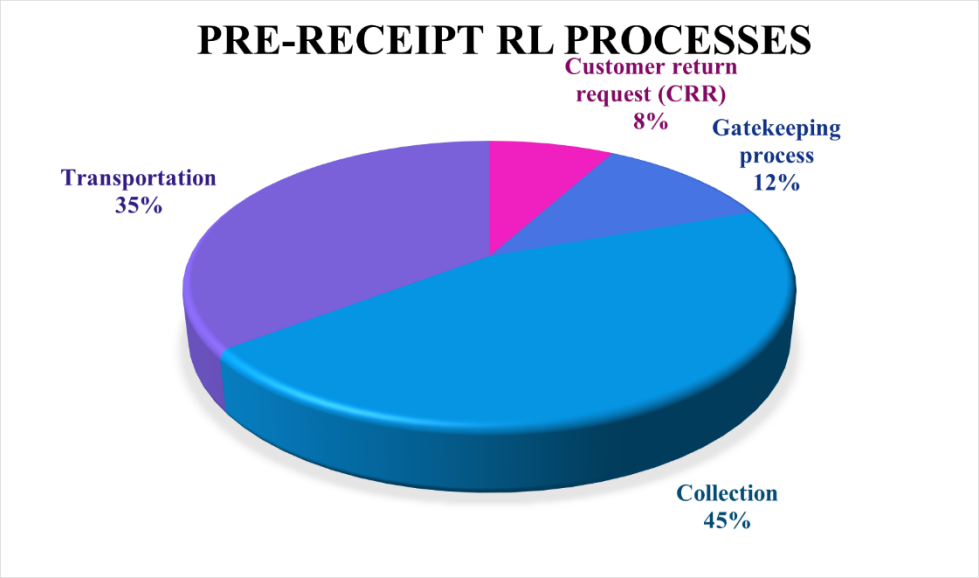

Figure 4.5 Distribution of pre-receipt RL processes
Source: Compiled by researcher

Figure 4.5 shows a distribution for the pre-receipt RL process categories of the QCA of RL literature derived from code frequencies (number of quotations assigned to code categories for the pre-receipt RL processes, see Appendix C.2). The pie chart clearly shows that most content on the pre-receipt RL processes focus on the collection process (45%), followed by transportation (35%). Contrastingly, limited literature on the pre-receipt RL processes focuses on gatekeeping (12%) and CRR processes (8%). Therefore, more research can be conducted on CRR and gatekeeping as pre-receipt RL processes for consumer returns.

The rest of this section will include presentations and discussions of the findings related to CRR, gatekeeping, collection and transportation processes. The section concludes with a conceptual framework and a summary of the findings for pre-receipt RL processes of consumer returns.

4.4.1 Customer return request (CRR) process of consumer returns

Customer return request (CRR) can be viewed as the first part of the RL process of consumer returns, which means that the consumer "asks" a retailer to return a product. As mentioned in section 4.2.1, the pre-receipt RL processes of consumer returns in online retailing include CRR, making it an important process in this study. Despite this importance, limited sources include and discuss CRR as a RL process (see Figure 4.5), erroneously viewing the RL process as starting from gatekeeping or collection. Consequently, some scholars view RL processes in a narrow sense, while others,

including the researcher of this study, view RL processes in a broad sense by regarding all possible processes and activities associated with consumer returns as important.

Regardless of being limited, the findings related to the CRR sufficed for describing CRR and included the following categories: (1) characteristics of CRR, (2) activities in CRR, and the (3) parties involved in CRR. Table 4.7 provides an overview of the findings related to the *CRR process of consumer returns*, including detail on the categories, related subcategories, literature sources and key quotations to support the discussion of the findings.

Table 4.7 Findings related to the CRR process of consumer returns

Source: Compiled by the researcher

Table 4.7 shows that the CRR process involves a few characteristics, activities and parties, which will be discussed in the subsequent sections and concluded with a description and conceptual framework.

4.4.1.1 Characteristics of the CRR process

The characteristics of the CRR process include (1) starts with the consumer, (2) initial RL process, (3) recognition of a product return, (4) important, (5) relates to return reasons, (6) linked to processing, and (7) inspection processes (post-receipt processes). The most significant characteristic of the CRR process can be the *consumer starting* the RL process, which confirms that the CRR can be viewed as the first *initial RL process* of consumer returns. Additionally, CRR involves the *recognition* by the retailer of a consumer's intent to *return a product*, demonstrating the importance of establishing effective communication avenues with the consumer.

Additionally, the CRR process can be *important* since consumers provide important information about the condition of the product and the *return reason*, which can be valuable at later stages in the RL process. Subsequently, the CRR process can *link* with the post-receipt RL processes of *processing* and *inspection*, in terms of the information provided by consumers. For example, during a return request the consumer can select the option exchange, which processing staff can use as input for choosing the appropriate processing outcome (e.g. issue credit or ship an exchange). The link between CRR and other RL processes confirms the importance of including CRR as a RL process for consumer returns in online retailing.

4.4.1.2 Activities and parties of the CRR process

The CRR process can include several *activities*, namely (1) communication of the return, (2) record return reasons, (3) initial assessment of product condition, (4) review the request, and (4) pre-return authorisation or rejection. These activities relate to the characteristics of the CRR process, for example, *communication* can be important for the recognition of a product return. Additionally, communication can be important in the other CRR activities of recording return reasons, initial assessment and pre-return authorisation or rejection. In online retailing, the consumer can *record the return reason* on the retailer's website, which provide important information about the condition of the product. Based on the return reason and before receiving a product, the retailer can *review the request* and make an *initial assessment of the product condition,* which can either result in a *pre-return authorisation* or *rejection.* While a pre-return authorisation continues the RL process, a rejection ends the return process, indicating that in some instances RL can be limited to pre-receipt RL processes.

Both the characteristics and activities of the CRR process, clearly demonstrates *the parties* involved in the CRR process. Consequently, *consumers* are involved in logging the return request, communicating with retailers and providing the return reason, and *retailers* are involved in assessing

the return request, communicating the outcome of the assessment to the consumer, and issuing a pre-return authorisation or rejecting the return.

4.4.1.3 Description and conceptual framework of the CRR process.

Based on the findings, presented in section 4.4.1, the CRR process can be an important pre-receipt RL process of consumer returns, and will be described as follows:

> The CCR process of consumer returns is an important process that can be described as the first pre-receipt RL process, starting with a consumer and the recognition of a product return. The CRR process relates to the return reasons and links with the processing and inspection processes. The CRR process involves activities related to information flows, including communication, recording of return reasons, reviewing the request, initial assessment of product condition and pre-return authorisation or rejection, which can be performed by the consumer and retailer.

Figure 4.6 provides a conceptual framework for the CRR process that may apply to consumer returns in online retailing.

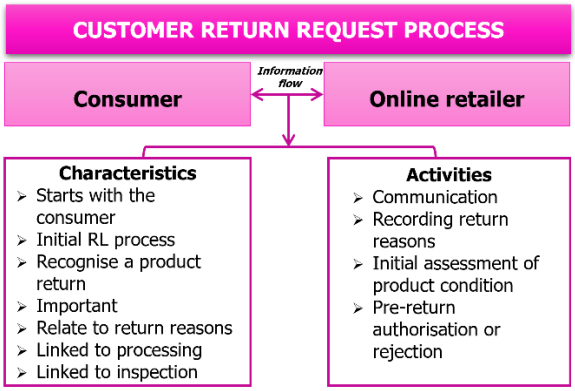

Figure 4.6 Conceptual framework of the CRR process
Source: Compiled by the researcher

Figure 4.6 illustrates consumers and retailers as the main parties in the CRR process. Additionally, the highlights the characteristics and activities of the CRR process and the flow of information between the consumer and retailer, throughout the process.

In the next section, the QCA findings of RL literature for gatekeeping as a pre-receipt RL process of consumer returns, will be analysed and discussed.

4.4.2 Gatekeeping process of consumer returns

The gatekeeping process of consumer returns focus on consumer communication that mostly takes place through the implemented information systems of online retailers (Hjort *et al*. 2019:774). The purpose of the gatekeeping process is screening of a product to identify if the product is acceptable as a return, or not, based on the return policy (Andresen & Istad, 2019:8).

From the QCA of RL literature, the gatekeeping process involve the following categories: (1) characteristics of gatekeeping, (2) activities in gatekeeping, (3) facilities associated with gatekeeping and (4) parties involved in gatekeeping. Table 4.8 provides an overview of the findings related to the *gatekeeping process of consumer returns*, including detail on the categories, related subcategories, supporting literature sources and key quotations to support the discussion of the findings.

Source: Compiled by the researcher

Table 4.8 shows that the gatekeeping process involves various characteristics, activities, facilities and parties, which will be discussed in the subsequent sections and concluded with a description and conceptual framework.

4.4.2.1 Characteristics of the gatekeeping process

The characteristics of gatekeeping include (1) the entry point of the RL process, (2) identify if the return is allowed, (3) based on a return policy and (4) links with other RL processes. The *entry point of the RL process* means that the gatekeeping process ultimately allows a product return to enter the RSC. Consequently, gatekeeping can be characterised as a pre-receipt RL process that involves *identifying if the product return is allowed*. While the CRR process involves decisions based on return reasons (see section 4.4.1), the gatekeeping process involves decisions *based on return policies.* For example, a return policy might specify that returns are allowed within 14 days of purchase, where after no returns will be accepted.

Finally, the gatekeeping process can *link with other RL processes,* including collection, processing, inspection, sorting and disposition. Particularly, gatekeeping links with the *collection process*, as acceptance of the product return triggers the collection process. The link between the gatekeeping process and the post-receipt RL processes of processing, inspection, sorting and disposition, depends on the point of gatekeeping. Although gatekeeping takes place before collection, gatekeeping can occur a second time during *processing, inspecting* and *sorting* processes. For example, the product return was allowed based on the return reason and return policy parameters of unopened/unused products, but during processing, inspection or sorting the staff notice that the product was used, which may lead to the rejection of the return. Alternatively, processing, inspection and sorting can confirm the accuracy of return information and condition of the product, which links gatekeeping

with the disposition process. The post-receipt RL processes will be explored in greater detail in chapter 5.

4.4.2.2 Activities and facilities in the gatekeeping process

The gatekeeping process involves a *few activities*, namely (1) screening of a product returns, (2) making decisions, (3) return authorisation, and (4) communication. The *screening of* a *product return* links with the gatekeeping characteristics of identifying if a product return is allowed based on the return policy. Following the screening of a product, the gatekeeper must *make the decision* to accept or reject the return. Accepting the return, triggers the next activity of *return authorisation*, which involves issuing a return merchandise authorisation (RMA) to the consumer. Subsequently, the outcome of the gatekeeping activities must be *communicated* to consumers or other interested parties. The strategies related to decision making in gatekeeping will be explored in chapter 6 as part of the RL practices to manage consumer returns.

As explained in the characteristics (section 4.4.2.1) gatekeeping can take place before return receipt and post receipt during processing, inspection or sorting. Subsequently, the gatekeeping process can involve any facilities used for post-receipt RL processes, including *centralised return centres (CRCs)* and *processing* facilities. Alternatively, initial pre-receipt gatekeeping can be conducted at the facilities through information systems and communication with consumers. Finally, multichannel retailers can use their *stores* to perform gatekeeping activities.

4.4.2.3 Parties involved in the gatekeeping process

The gatekeeping process can involve several parties, including consumers, retailers, third parties and suppliers. These parties can fulfil secondary, active or influential roles in the gatekeeping process. While *consumers* play the secondary role of waiting for the outcome of the gatekeeping process, *retailers* play primary roles of performing the gatekeeping activities, including screening, decision-making, return authorisation and communication. Alternatively, if retailers outsource RL processes, *third parties*, like third party RL (3PRL) providers, can play active roles and perform gatekeeping activities on behalf of the retailers. Finally, *suppliers* can play influential roles in the gatekeeping process. For example, retailers might first request authorisation from suppliers before issuing an RMA for a warranty return.

4.4.2.4 Description and conceptual framework of the gatekeeping process

Based on the findings, presented in section 4.4.2, the gatekeeping process can be an important pre-receipt RL process of consumer returns, and will be described as follows:

> The gatekeeping process of consumer returns can be described as the entry point of the RL process to determine if a product return is allowed based on the return policy. The gatekeeping process links with other RL processes, including collection, processing, inspection, sorting and disposition processes. Gatekeeping can be performed virtually before returns are received and/or physically during processing, inspection and sorting in CRCs, processing facilities or retail stores. The retailer (or its outsourced 3PRL provider) performs the gatekeeping activities of screening, decision making, return authorisation (or RMA) and communicating the outcomes to the consumers. Suppliers may play influential roles by accepting/rejecting RMA requested by retailers.

Figure 4.7 provides a conceptual framework for the gatekeeping process that may apply to consumer returns in online retailing.

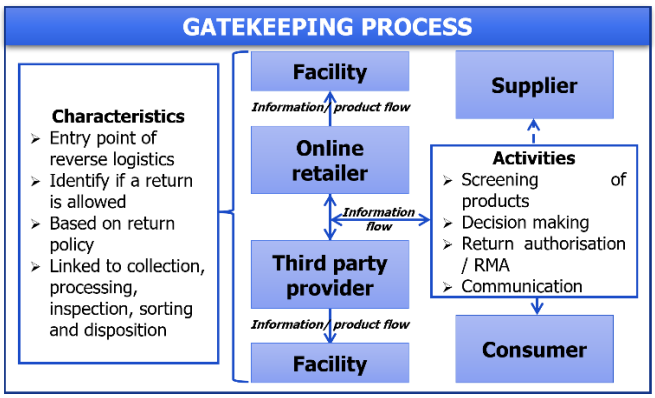

Figure 4.7 Conceptual framework of the gatekeeping process
Source: Compiled by the researcher

Figure 4.7 illustrates the gatekeeping process, with the characteristics of gatekeeping, interfaces between parties and facilities, activities and flows. Information flow takes place throughout gatekeeping, including between facilities, retailers or 3PLs (responsible for activities), suppliers (influencing decisions) and consumers (waiting for outcomes). However, if gatekeeping takes place post-receipt, both information and product flows can occur.

In the next section, the QCA findings of RL literature for collection as a pre-receipt RL process of consumer returns, will be analysed and discussed.

4.4.3 Collection process of consumer returns

Collection as a pre-receipt RL process involves the physical retrieval of product returns from consumers. From the QCA findings of RL literature, the collection process included the following categories: (1) characteristics of collection, (2) activities in collection, (3) collection methods, (4) facilities and locations associated with collection and (5) the parties involved in collection.

Table 4.**9** provides an overview of the findings related to the *collection process*, including detail on the categories, related subcategories, supporting literature sources and key quotations to support the discussion of the findings.

Source: Compiled by the researcher

Table 4.**9** shows that the collection process involves various characteristics, activities, methods, facilities/locations and parties, which will be discussed in the subsequent sections and concluded with a description and conceptual framework.

4.4.3.1 Characteristics of the collection processes

The collection process involves various characteristics, including (1) the start of product flow in RL process, (2) involve costs (3) availability, retrieval, possession and accumulation of products of

products, (4) depend on the product types, condition and return reasons, and (5) linked to other RL processes (gatekeeping, transportation, returns processing, inspection, sorting and disposition).

While CRR and gatekeeping processes mostly involve information flows (sections 4.4.1 and 4.4.3), the collection process involves the *start of the product flow*. Therefore, collection can be regarded as the first post-receipt RL process that involves product flow. Additionally, the collection process involves *costs*, relating to the collection activities and parties involved, including transportation, handling, storage (temporary), labour and inventory costs. Furthermore, the collection process involves *availability, retrieval, possession and accumulation of products,* emphasising storage and inventory costs associated with collection.

Like CRR and the gatekeeping process, the collection process can *depend* on certain factors, namely *product types, product condition* and *return reasons,* which can influence party responsibilities. For example, consumers might be responsible to pay collection costs for a non-defective unwanted fridge. Additionally, the collection process can be *linked* to *other* pre-receipt and post-receipt *RL processes*. Collection links with other pre-receipt process in terms of process flows. Consequently, collection takes place before gatekeeping and after transportation, *linking* the collection process with *gatekeeping* and *transportation processes*. However, some sources view transportation as an activity in collection instead of a separate RL process (see Lambert *et al.* 2011:568), which can establish a link between collection and transportation.

Like pre-receipt RL processes, collection can link with post-receipt RL processes in terms of the sequences of processes and activities implemented by retailers. For example, retailers might process returns (e.g. issue a refund) upon collection and parties responsible for collection might perform inspection and sorting, and make disposition decisions at the collection point, *linking* the collection process with *processing, inspection, sorting* and *disposition processes.* Alternatively, viewing transportation as an activity can mean that processing, inspection and sorting processes take place after collection, which can establish a link between collection and any other subsequent process. The links between collection and post-receipt RL processes will be further explored in chapter 5.

4.4.3.2 Activities in the collection process

Collection can involve a few activities, including (1) loading of vehicles, (2) handling and storage of products, (3) product shipping, (4) product movement and (5) product delivery. *Loading of vehicles* can take place at the consumer locations by the collection party. Additionally, returned products are physically *handled* at the point of collection and *stored* in the vehicles during *product movement* from the consumer location to the next destination. Subsequently, these activities emphasise the

characteristics of collection, include product flows, retrieval, possession and accumulation of products, and handling, storage, labour and transportation costs (see section 4.4.3.1).

Finally, collection involves traditional logistics activities, like *product shipment* and *product delivery* but occurs in reverse from the point of consumption (e.g. consumer location) to the point of origin (e.g. online retailer facility). Since collection activities involve transportation, like product movement, in-transit storage and delivery, this study recognises that transportation activities can be part of the collection process. Nevertheless, based on literature, transportation will be regarded as a RL process for consumer returns in online retailing, which will be explore in section 4.4.4.

4.4.3.3 Types of collection

Table 4.**9** shows that three types of collections are possible for consumer returns, including pick-up, drop-off and postal-drop collection methods. Firstly, *pick-up collection* is associated with third parties or carriers collecting products from a customer's location. Since this study focuses on online retailing, pick-up collection can be a likely method used by online retailers for the physical collection of products from consumer locations (residences or workplaces).

Drop-off collection means that the consumer takes the product to a specified location for collection. For example, online retailers might utilise physical collection points, like convenience stores (petrol stations), as a drop-off collection option. In South Africa, Pargo is a click-and-collect service that certain online retailers offer to enable consumers to collect their products at pick-up points (Pargo, 2018), which can also be used for product returns and drop-off collection. Alternatively, online retailers can use their facilities as drop-off collection locations. Similarly, multi/omnichannel retailers can use their bricks-and-mortar stores for drop-off collection of online consumer returns. Subsequently, drop-off collection can be an important option for consumer returns in online retailing.

Finally, *postal collection* can be a possibility in online retailing because of the physical distances between consumers and online retailers. However, owing to a problematic postal service and strong courier market, the use of postal collection will be less appropriate for consumer returns in South Africa. Nevertheless, international online retailers might use of postal collection options for consumers abroad. Additionally, postal collection might be used for specific type of products, like high-value consumer goods, emphasising the collection characteristic labelled as "based on product type".

4.4.3.4 Facilities/locations and parties in the collection process

Several *facilities/locations* can be used for the collection process, which mostly associate with drop-off collection methods and the movement and delivery activities of collection. For instance, *retail stores* and *collection points* associate with the options that multichannel and online-only retailers can use for consumer drop-off collection. From the consumer or drop-off locations products can be moved and delivered to a variety of facilities for post-receipt RL processes, including *collection facilities, warehouses, distribution centres (DCs), inspection centres (facilities)* and *disassembly facilities*. Essentially, consumer and drop-off locations can be regarded as points of origin and facilities as points of destination in the collection process

Similarly, the *parties* in the collection process can be classified by their roles/responsibilities and position point. Particularly, *consumers* can be responsible to "return", "bring" or "drop" the products at facilities/locations, implying that consumers can be responsible for shipping, movement and delivery in the collection process. Therefore, consumers can be viewed as points of origin in the collection process. *Retailers* can be responsible for the collection of products from consumer or drop-off locations and delivery at facilities or they can serve as collection points for drop-off collection. Subsequently, retailers can be viewed as points of collection and destination in the collection process.

Alternatively, *third parties,* including 3PL providers, 3PRL providers, carriers and collectors, can act as intermediaries for retailers and perform pick-up collection from consumer locations or drop-off locations. Additionally, third parties can provide facilities/locations (e.g. collection facilities) in the collection process, meaning that third parties, like retailers, can be regarded as points of collection and destination. Due to the nature of online retailing, the use of third parties for collection from consumer locations can be a likely possibility. Consequently, third parties can be important players in the collection of consumer returns in online retailing.

For example, retailers might first request authorisation from suppliers before issuing an RMA for a warranty return.

4.4.3.5 Description and conceptual framework of the collection process

Based on the findings, presented in section 4.4.3, the collection process can be an important pre-receipt RL process of consumer returns, and will be described as follows:

> The collection process of consumer returns can be described as the start of product flow in the RL process, involving costs, availability, retrieval, possession and accumulation of products. Collection can be based on the type of product, product condition and return reasons and linked to other pre- and post-receipt RL processes.

The collection processes can include various activities, including loading of vehicles and handling, shipping, storage, moving and delivery of returned products through various collection methods, including pick-up, drop-off or postal collection, performed by consumers, retailers and/or outsourced third parties at retail stores, collection points, warehouses, DCs, collection facilities, inspection facilities or disassembly facilities.

Figure 4.8 provides a conceptual framework for the collection process that may apply to consumer returns in online retailing.

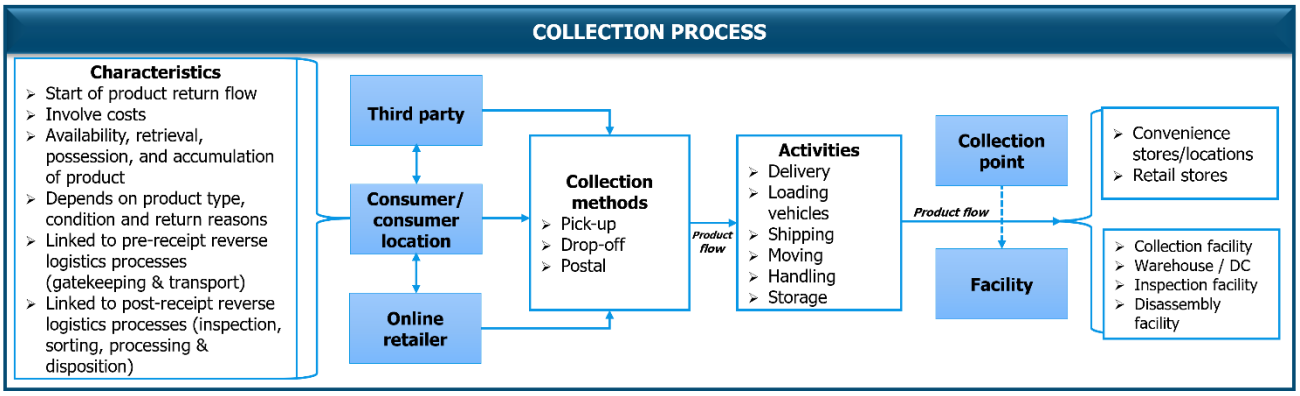

Figure 4.8 Conceptual framework of the collection process
Source: Compiled by the researcher

Figure 4.8 illustrates the (1) various characteristics of collection, (2) link between the main parties, namely consumers, online retailers and third parties, (3) collection methods, (4) activities in collection and (5) the destination/facilities associated with collection. Additionally, the framework shows that a third party or online retailer can collect the product from the consumer for movement to a facility. Alternatively, the consumer can either drop the product at a collection point or at a facility. If the consumer drops a product at the collection point, the online retailer or third party can collect the product from the collection point for transportation to the facility. Consumers, online retailers and third parties can be responsible for the collection activities.

In the next section, the findings related to the transportation of consumer returns will be discussed and analysed.

4.4.4 Transportation process of consumer returns

Transportation is often discussed as a RL process, which involves the physical movement of products between locations. Transportation can be an important RL process of consumer returns in online retailing, due to the physical distances between online retailers and consumers. Although transportation can take place during various stages of the RL process (pre- and post-receipt RL processes), a discussion here is necessary, since transportation can take place before the online retailer receives the returned product. However, it should be noted that the content of this section also applies to the transportation after initial receiving, involving the movement of returned products between facilities for disposition/exit processes.

The categories of transportation, identified from the QCA on RL literature, included the (1) characteristics of transport, (2) the activities in transport, (3) the facilities/locations related to transport and (4) the parties involved in transport. Table 4.10 provides an overview of the findings related to the *transportation process*, including detail on the categories, related subcategories, supporting literature sources and key quotations to support the discussion of the findings.

Table 4.10 Findings related to the transportation process of consumer returns

Source: Compiled by the researcher

Table 4.10 shows that the transportation process involves various characteristics, activities, facilities/locations and parties, which will be discussed in the subsequent sections and concluded with a description and conceptual framework.

4.4.4.1 Characteristics of the transportation process

The transportation process in RL involves various categories, including (1) important and complex, (2) involve product return flows between locations, options, decisions and costs, (3) lack economies of scale and distance, (4) require equipment and efficient handling and storage, and (5) link with other RL processes.

Transportation can be described as an *important and complex,* emphasising the important role of transportation in the movement of consumer returns in online retailing. Consequently, like the collection process, transportation involves *product return flows between locations.* Additionally, the transportation process can involve *various options and decisions,* which can add to the complexity of return transportation. Particularly, organisations must consider/choose (1) between its own fleet or a third-party fleet, (2) most appropriate mode of transportation, (3) equipment and fuel requirements, and (4) intermodal transportation.

The fuel and equipment requirements as considerations emphasise other characteristics of transportation, including costs and equipment requirements. Consequently, the transportation process *involves costs,* which not only point to the expensiveness of transportation but also its complexity. Transportation costs can be influenced by the types of returned products, transportation modes, return product volumes, service levels and return policies, pointing to a need for strategic and managerial decision-making. Furthermore, higher transportation costs can be the result of a *lack of economies of scale and distance.* In traditional forward logistics (FL), organisations can plan for economies of scale and distance, but in RL the product return volume and locations can be uncertain, demonstrating the importance of implementing appropriate RL practices to effectively manage consumer returns. RL practices that can improve economies of scale in the RL process will be explored in chapter 6.

Furthermore, the considerations related to equipment requirements indicate that transportation requires equipment indicated that transport *requires equipment*, which associates with loading, unloading and materials handling equipment. Additionally, transportation can cause product damages, demonstrating the requirement of *efficient handling* and *storage* of returned products.

Transportation can link with the collection process and most other post-receipt RL processes, including processing, inspection, sorting, disposition and redistribution. The *link* between the transportation process and the *collection process* relates to overlapping activities, facilities and parties (see sections 4.4.3.2 and 4.4.4.2). Additionally, the link between transportation and the *receiving process* relates to the arrival of the transport vehicle at the facility for receiving. The link

with other post-receipt RL processes mostly shows that transportation can take place at various stages in the RL process. For example, returned products can be transported to a facility for *processing*, *sorting* and *inspection* and then shipped to the next facility or location for *disposition*. Finally, transportation can link with the *redistribution process*, through the transportation of recovered/return products to facilities for redistribution to the markets. Subsequently, the link between the transportation process and other RL processes not only emphasise the importance and complexity of transportation but also the high cost associated with transportation.

4.4.4.2 Activities in the transportation process

The activities of transportation include (1) product movement, (2) shipping, (3) product transfer, (4) loading/unloading, (5) handling, (6) storage, (7) delivery and (8) consolidation, which not only demonstrate the purpose of transportation but also the characteristics of transportation. For example, the activities of *loading/unloading*, *handling* and *storage* show the need for equipment and handling and storage efficiency. Additionally, *movement, transfer, shipment and delivery of products* demonstrate that transportation involves product flows between facilities/locations.

Subsequently, most activities in transportation correspond to the collection process, emphasising that transportation and collection processes are often viewed as one RL process (see section 4.4.3). However, since transportation can take place at various stages in RL and regarded as an important and complex process, transportation must be viewed as a separate RL process for the movement of consumer returns. Additionally, the transportation process can include *consolidation* as an additional activity not mentioned in the collection process. Nevertheless, the consolidation activity of combining various products in larger shipments mostly relates to post-receipt RL transportation. Consolidation demonstrates that organisations can achieve some economies of scale for return transportation, implying that initial transportation from the consumer location to the facility can be costlier.

4.4.4.3 Facilities/locations in the transportation process

As emphasised in sections 4.4.4.1 and 4.4.4.2, transportation involves the movement of returned products between facilities/locations, demonstrating that transportation can take place pre- and post-receipt. The facilities associated with transportation can be classified as first-, second- and third-tier facilities.

First-tier facilities/locations are closest to the consumer and represent the facilities that receive product returns directly from consumer locations, which can be viewed as destination points for pre-

receipt RL processes. First-tier facilities/locations can include *retail stores, collection facilities, CRCs, warehouses, processing, inspection, disassembly, repair facilities and service centres,* which confirms that the collection process can involve these facilities/locations (see section 4.4.3.4).

Nevertheless, some of the first-tier facilities can be *second-tier* facilities, including warehouses and repair facilities that receive returned products from other facilities/locations (e.g. retail stores and collection facilities). This finding shows that the network and facility location strategies of the organisation can influence the order and type of facilities utilised for product returns. Other second-tier facilities can include refurbishment facilities and recovery facilities, which emphasise the links between transportation and the disposition process (see section 4.4.4.1).

Similarly, a *third-tier* facility can involve *DCs* responsible for redistributing returned/recovered products to the markets, emphasising the link between transportation and the redistribution process. Consequently, returned products can be transported from second-tier facilities to DCs, which concludes the transportation process and initiates the redistribution process as the final post-receipt RL process (see section 5.7).

Essentially, transportation can take place from point-of-origin (first consumer location) to the point-of-recovery (online retailer or third-party locations) and, finally, to the point-of-redistribution (final location before redistribution to markets).

4.4.4.4 Parties in the transportation process

Table 4.10 shows that transportation includes the same parties as the collection process, namely consumers, retailers and third parties.

Consumers can be regarded as the parties-of-origin for transportation from consumer locations to facilities. Additionally, consumers might be responsible for transportation costs, reemphasising that service levels and return policies can influence transportation costs (see section 4.4.4.1). Evidently, online retailers with stricter return policies can charge shipping costs and online retailers with higher service levels with lenient return policies can offer free returns.

Subsequently, *retailers* might be responsible for transportation costs and considering the factors that influence transportation decisions (such as type of transportation, outsourcing decisions and service levels). Apart from retailers that as location points in transportation, literature lacks clear indication of the roles of retailers. Nevertheless, if retailers insource the transportation process might be

responsible for the activities of shipping, product transfer, loading/unloading, handling, storage, delivery and consolidation (see section 4.4.4.2).

Finally, *third parties* can be involved in the transportation process if retailers outsource return transportation to 3PL providers. Subsequently, 3PL providers (such as couriers) might be responsible for the physical transportation of returned products between locations (e.g. between consumers and retailers) and transportation activities (described in the preceding paragraph).

4.4.4.5 Description and conceptual framework of the transportation process

Based on the findings, presented in section 4.4.4, the transportation process can be an important pre- and post-receipt RL process of consumer returns, and will be described as follows:

> The transportation process can be described as important and complex, involving product flows between locations in the RL process, options, decisions and costs. The transportation process of consumer returns requires equipment and efficient handling and storage, lack economies of scale and distance and links with other pre- and post-receipt RL processes. Transportation includes various product flow activities, including the movement, shipment, transfer, loading/unloading, handling, storage, delivery and consolidation of returned products from the point-of-origin (consumer) to a point-of-recovery (online retailer/third parties, first-tier and second-tier facilities) and/or point-of-redistribution (third-tier facilities).

Figure 4.9 provides a conceptual framework for the transportation process that may apply to consumer returns in online retailing.

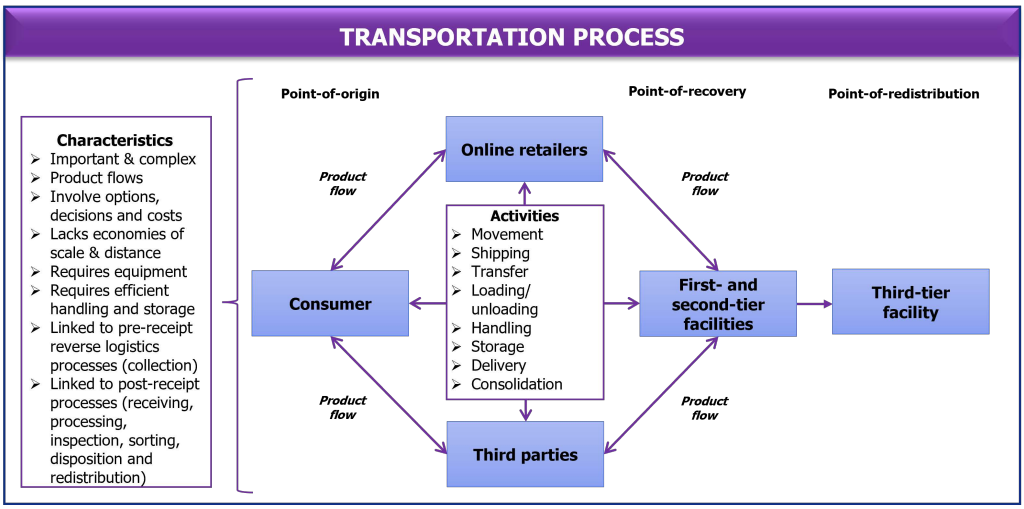

Figure 4.9 Conceptual framework of the transportation process in product returns
Source: Compiled by the researcher

Figure 4.9 provides a basic overview of the transportation process of consumer returns, indicating that transportation can take place at every stage in the RL process and involves product flows between consumers, online retailers and/or third parties, and first-, second- and third-tier facilities. Additionally, the framework illustrates the various characteristics and activities of transportation and emphasises the movement of returned products starting with a point-of-origin to a point-of-recovery and ending at a point-of-redistribution.

In the next section, the QCA findings of RL literature for pre-receipt RL processes of consumer returns will be illustrated in a conceptual framework and concluded with a summary of the findings and important RLM considerations.

4.4.5 Conceptual framework and summary of findings for the pre-receipt RL processes of consumer returns

Clearly, the findings presented section 4.4 shows that all pre-receipt RL processes identified in the QCA findings of RL literature, including CRR, gatekeeping, collection and transportation, can apply to consumer returns in online retailing. Based on the findings, Figure 4.10, shows a conceptual framework for pre-receipt RL process of consumer returns that may occur in online retailing. Particularly, the framework highlights the linkages between the pre-receipt RL processes with shared and unique characteristics and activities. Furthermore, the framework demonstrates the parties and facilities involved or associated with the pre-receipt RL processes.

Based on Figure 4.10 and the discussions given in section 4.4, Table 4.11 provides a summary of the findings and managerial implications for pre-receipt RL processes of consumer returns in online retailing.

Table 4.11 Findings and managerial implications of the pre-receipt RL processes

CATEGORIES	KEY FINDINGS	MANAGERIAL IMPLICATIONS
Shared characteristics	• CRR, gatekeeping and collection processes can be regarded as the start of RL flows • CRR and transportation processes can be important RL processes • CRR and collection processes relate to return reasons • All the pre-receipt RL processes, except CRR, can be linked • All the pre-receipt RL processes can be linked to post-receipt RL processes • Collection and transportation processes involve costs and product flows	➢ All the pre-receipt RL processes (CRR, gatekeeping, collection and transportation) can be applicable to consumer returns in online retailing ➢ All pre-receipt RL processes must be considered for the management of consumer returns ➢ Online retailers must pay attention to CRR and transportation processes ➢ Online retailers must consider return reasons for effective CRR and collection processes ➢ Online retailers must consider the links between pre-receipt and pro-receipt RL process to manage consumer returns effectively ➢ Online retailers must develop cost strategies to manage the collection and transportation processes of consumer returns effectively
Unique characteristics	• The CRR process can be the initial RL process, starting with consumers and recognising a product return • The gatekeeping process involves identifying if a product return can be allowed based on the return policy • The collection process in RL involves availability, retrieval, possession and accumulation of a returned product and depends on the product type and condition • The transportation process in RL can be complexed, involving decisions and options, lacking economies of scale and distance, and requiring equipment and efficient handling and storage	➢ Online retailers must focus on consumers in the CRR process and develop a service strategy for RL ➢ Online retailers must develop an appropriate return policy and base gatekeeping as a pre-receipt RL process on the return policy ➢ Focus must be placed on the availability, retrieval and accumulation of product returns for effective collection ➢ Online retailers must consider the product type and condition for effective collection in RL ➢ Online retailers must implement practices to understand the transportation of product returns ➢ Attention must be given to effective decision-making and consideration of various options for the effective implementation of the transportation process of consumer returns ➢ Online retailers must develop strategies to attain economies of scale and distance (such as outsourcing)

CATEGORIES	KEY FINDINGS	MANAGERIAL IMPLICATIONS
		➢ Online retailers must allocate sufficient resources for the effective transportation of consumer returns.
Unique activities	• The CRR process includes recording of the return reason and initial assessment of product condition • The gatekeeping process includes screening of products and decisions on accepting or rejective a product return • The collection process in RL excludes unique activities but involves different methods of collection, including pick-up, drop-off and postal collection • The transportation process in RL includes product transfer and consolidation	➢ For an effective CRR process, online retailers must implement systems that effectively capture return reasons and assess product condition before receipt ➢ For an effective gatekeeping process, online retailers must implement practices for effective screening of product returns and decision-making on accepting/rejective a product return ➢ Online retailers must consider the appropriate collection methods, including pick-up, drop-off and postal, developing strategies for effective collection processes of consumer returns ➢ Consolidation and transfer of products can be important activities for effective transportation of consumer returns
Shared activities	• The CRR and gatekeeping processes includes communication and return authorisation activities • The collection and transportation processes in RL involve handling, loading/unloading, shipping, delivery, movement and storage activities	➢ Online retailers must develop communication and return authorisation strategies for effective CRR and gatekeeping processes ➢ Online retailers must implement appropriate practices for handling, loading/unloading, shipping, delivery, movement and storage activities for effective collection and transportation processes in RL
Parties/facilities	• Consumers can perform communication, handling, shipping and movement activities • Online retailers can perform any activities in the pre-receipt RL processes • Third parties can perform handling, loading/unloading, shipping, delivery, movement and storage activities on behalf of online retailers • Pre-receipt RL processes of consumer returns relate to several facilities, including RL specific facilities, traditional FL facilities and recovery facilities that can be owned by online retailers or third parties • The facilities link pre-receipt and post-receipt RL processes	➢ Online retailers must establish appropriate communication channels with consumers ➢ Online retailers must consider insourcing or outsourcing of collection and transportation activities, ensuring the most effective implementation of handling, loading/unloading, shipping, delivery, movement and storage activities ➢ Facilities and location strategies must be considered for the effective implementation of pre-receipt RL processes
Process flows	• The pre-receipt RL processes include information and product flows • Information flow takes place between the CRR and gatekeeping processes • Product flow takes place in the collection and transportation processes of consumer returns	➢ Online retailers must pay attention to information flows for effective CRR and collection processes ➢ Online retailers must pay attention to product flows for effective collection and transportation processes of consumer returns

Source: Compiled by the researcher

Table 4.11, provides a detailed understanding of the RL processes before returned products arrive at facilities. Additionally, several managerial implications must be considered by online retailers for the effective RLM of consumer returns. Essentially, the findings presented in this section will contribute to the framework for the RLM of consumer returns in online retailing, presented in chapter 9.

In the next section, the conclusion of chapter 4 will be given.

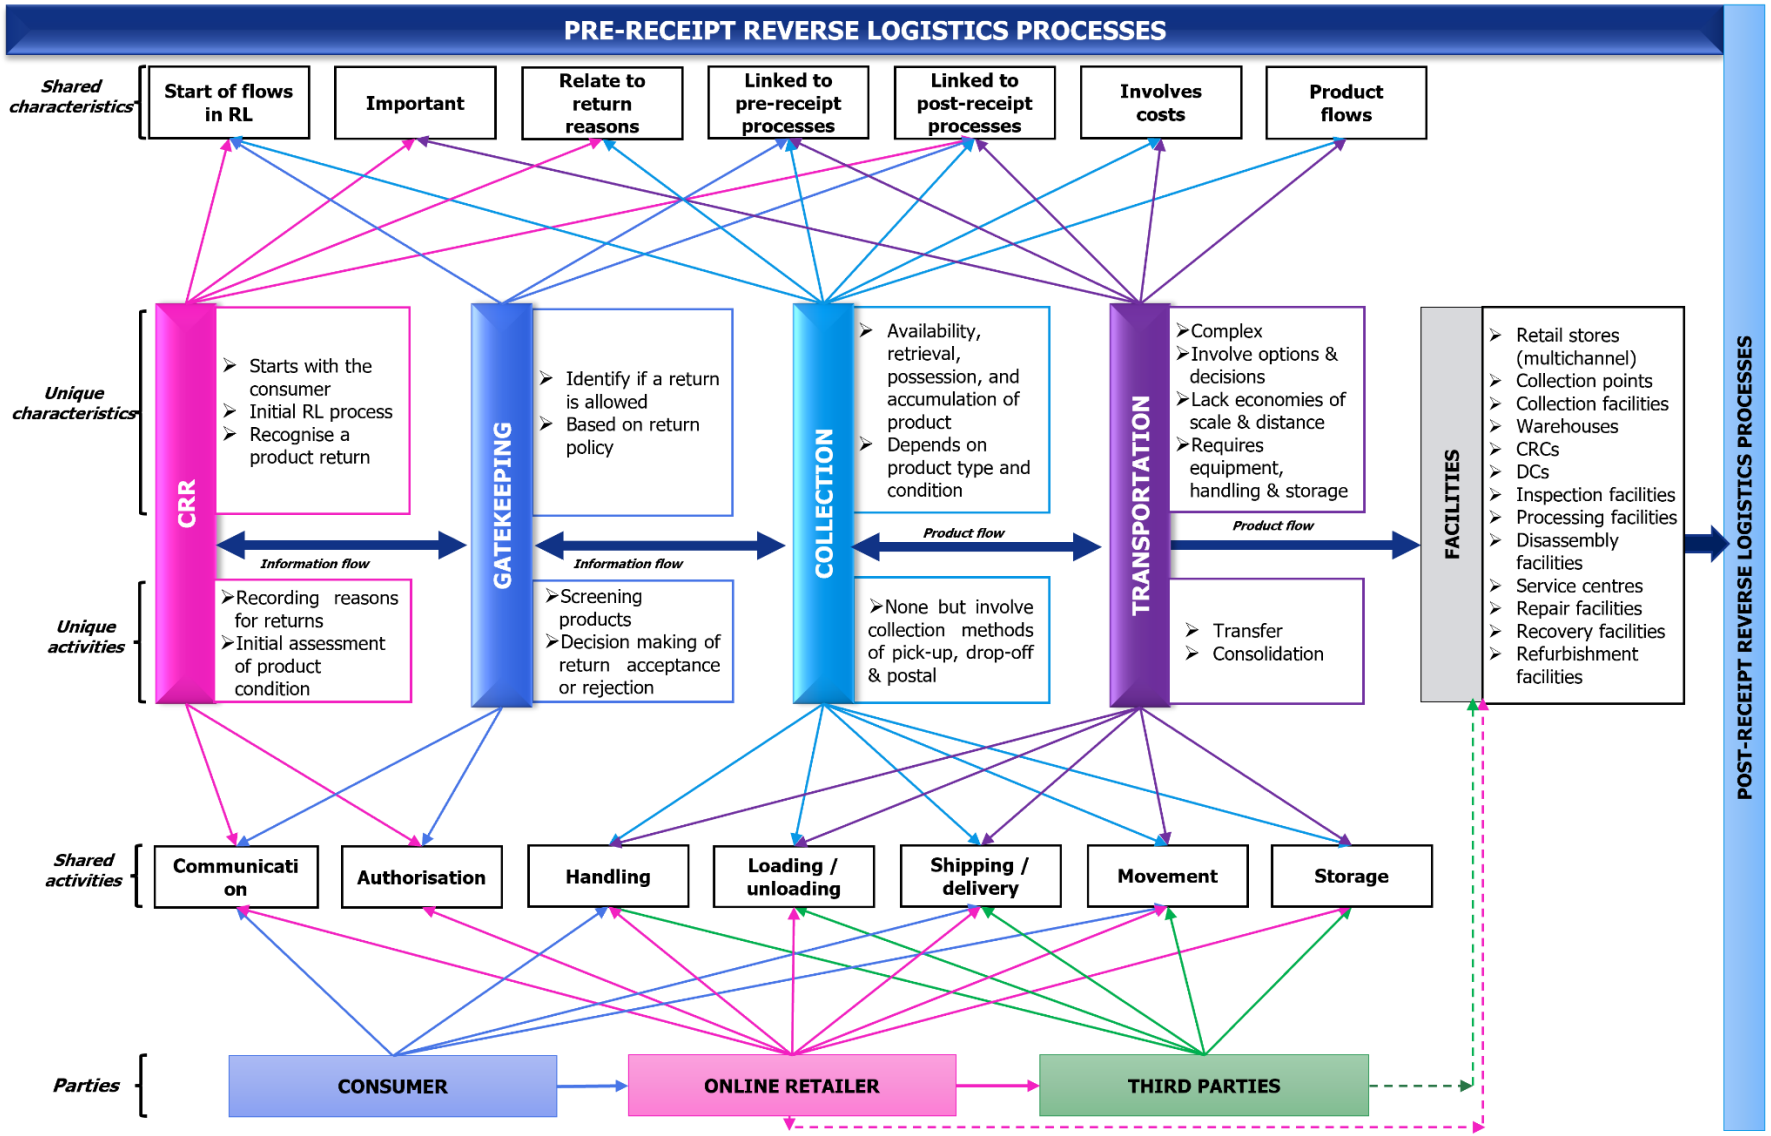

Figure 4.10 Conceptual framework for pre-receipt RL processes of consumer returns

4.4 CONCLUSION

This chapter addressed the second secondary research objective of ***identifying and exploring RL literature for consumer return types and pre-receipt RL processes of consumer returns (SRO-2)***. Especially, the objective was achieved through the QCA findings of RL literature for consumer return types and pre-receipt RL processes of consumer returns, which included the development of conceptual frameworks, typology (summaries) of the findings and managerial implications for online retailers. Additionally, the findings in this chapter contributed to the primary objective of the study, which was to *develop a framework for the effective RLM of consumer returns in online retailing*.

The chapter started with the introduction (section 4), which was followed by an overview of the QCA of RL literature findings (section 4.2), where after the types of consumer returns (section 4.3) and the pre-receipt RL processes (section 4.4) was discussed and analysed. The overview of the QCA of RL literature findings included an overview of presenting the findings, an overview of the main categories of the QCA of RL literature, including consumer return types, pre-receipt and post-receipt RL processes and RL practices, and demarcation of consumer return types and RL processes.

The QCA findings of RL literature was presented as follows: (1) qualitative data tables, with overviews of the categories, subcategories, sources and key quotations, (2) discussion and interpretation of the findings presented in the qualitative data tables, (3) description and/or conceptual frameworks for each category, (4) final conceptual framework and summary of findings in text tables for the main categories.

The *types of consumer returns* identified from the QCA of RL literature included B2C consumer returns, EoU returns, warranty returns, service returns and recalls. The main findings showed that online retailers must focus on (1) reducing unnecessary returns, especially for B2C returns, (2) understanding of and preparing for consumer returns, (3) product type and condition for all consumer return types, and (4) implementing appropriate reuse, recovery and reselling strategies.

The *pre-receipt RL processes* included a CRR, gatekeeping, collection and transportation processes. The main findings showed that (1) all the pre-receipt RL processes can be applicable to consumer returns in online retailing, (2) all the pre-receipt RL processes must be considered for managing consumer returns in online retailing, (3) appropriate strategies and practices must be developed and implemented for each pre-receipt RL process based on shared and unique characteristics and activities, (4) online retailers must focus on effective communication with consumers, and (5) online

retailers must consider facility, location and insourcing/outsourcing strategies for the pre-receipt RL processes of consumer returns.

In the next chapter (five), the QCA findings of RL literature for *post-receipt* RL processes of consumer returns will be presented, discussed and analysed.

Chapter 5 - QCA findings of RL literature for post-receipt RL processes of consumer returns

5.1 INTRODUCTION

In this chapter, the QCA findings of RL literature continues, focusing on the post-receipt RL processes of consumer returns. In chapter 4, an overview was given on the presentation of the QCA of RL literature findings, main categories and demarcation of RL processes, which applies to chapter 5 (see section 4.2). While chapter 4 focused on the QCA findings of RL literature for consumer return types and pre-receipt RL processes, chapter 5 focuses on the QCA findings of RL literature for post-receipt RL processes. Chapter 6 will conclude the QCA of RL literature by focusing on the RL practices to manage consumer returns.

As indicated in section 1.5.1, the post-receipt RL processes involve all processes at and within the facilities, ranging from receiving at facilities to redistribution from facilities to consumers/markets. In the research methodology section of chapter one (section 1.7, Figure 1.5), the phases of the study were discussed. Chapter 5 forms part of second research phase of this study, which can be viewed in Figure 5.1.

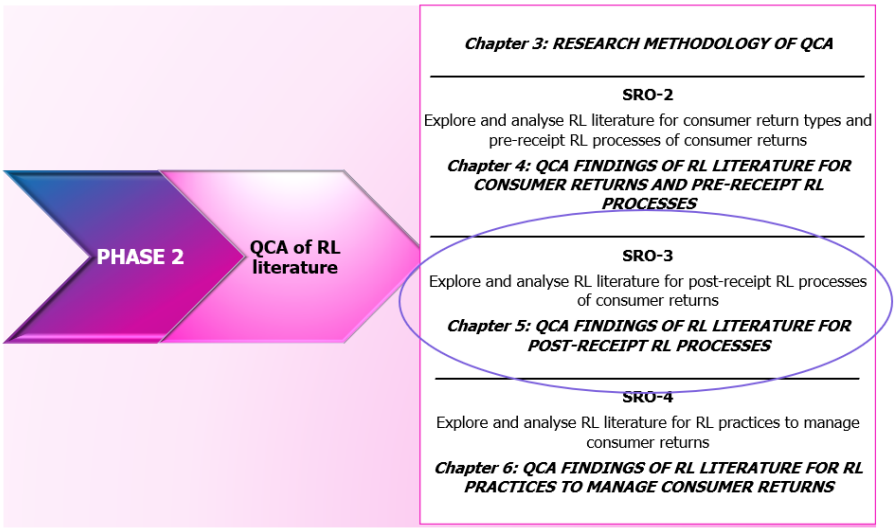

Figure 5.1 QCA of RL literature - Aim of chapter 5
Source: Compiled by the researcher

Figure 5.1 indicates that the aim of this chapter is to achieve the *third* secondary research objective, which is ***to identify and explore RL literature for post-receipt RL processes of consumer returns (SRO-3)***. The QCA findings of RL literature for the post-receipt RL processes resulted in the

development of a conceptual framework for post-receipt RL processes of consumer returns, a typology of the findings and managerial implications. The findings presented in this chapter contributes to the primary objective of the study, which is to *develop a framework for the effective RLM of consumer returns in online retailing.* Therefore, important findings related to post-receipt RL processes and RLM considerations are identified in this chapter, contributing to the final framework for the effective RLM of consumer returns in online retailing.

Figure 5.2 provides an overview of chapter 5.

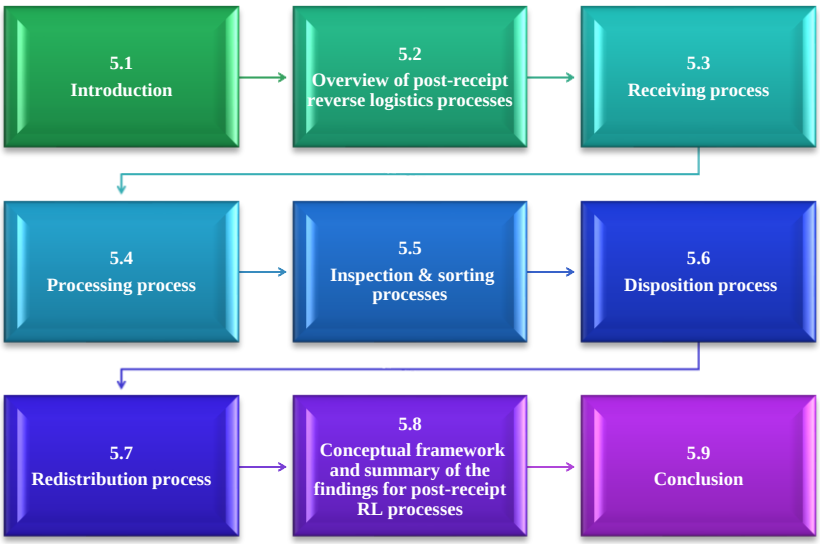

Figure 5.2 Overview of chapter 5
Source: Compiled by the researcher

Figure 5.2 provides an overview of chapter 5, starting with the introduction (section 5.1), followed by an overview of post-receipt RL processes (section 5.2), where after the post-receipt RL processes are discussed and analysed, including the receiving process (section 5.3), processing process (section 5.4), inspection and sorting processes (section 5.5), disposition processes (section 5.6) and redistribution process (section 5.7). Finally, the chapter will conclude with a conceptual framework and summary of findings for the post-receipt RL processes of consumer returns (section 5.8) and the conclusion (section 5.9).

In the next section, an overview of the post-receipt RL process is given.

5.2 OVERVIEW OF POST-RECEIPT RL PROCESSES

In this section, an overview of the post-receipt RL processes of consumer returns will be provided. Figure 4.3 (in chapter 4) demonstrated that the post-receipt RL processes covered 36% of the QCA findings of RL literature. The post-receipt RL processes start when a product return arrives at the facility and ends with the redistribution of returned/recovered products to the markets. Based on the coding framework of the QCA of RL literature (see Appendix A.2), the post-receipt RL processes

were structured into five main categories, namely receiving, processing, inspection and sorting, disposition and redistribution processes.

Figure 5.3 provides an overview of the distribution of the post-receipt RL processes based on the results of the QCA of RL literature (see Appendix C.3 for quantitative results).

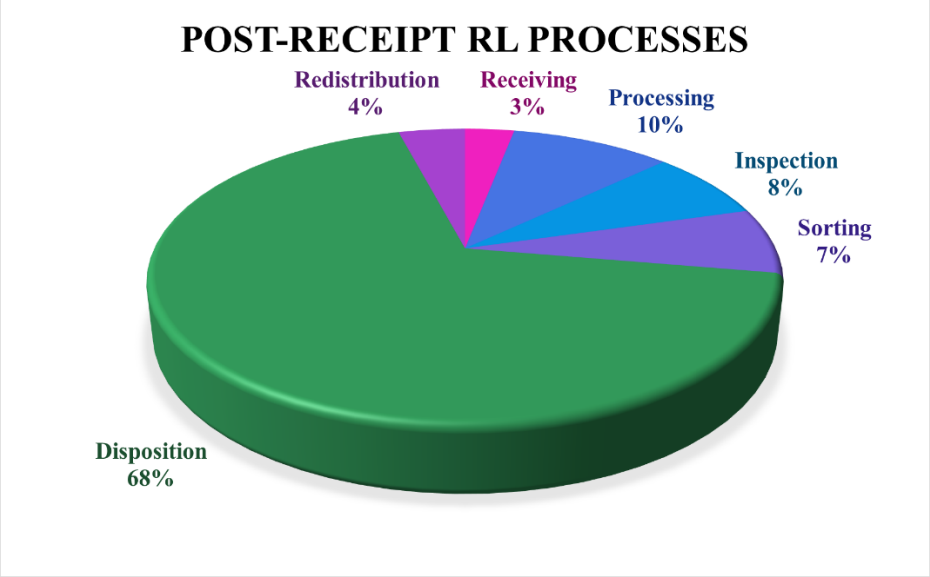

Figure 5.3 Distribution of post-receipt RL processes
Source: Compiled by the researcher

Figure 5.3 shows a distribution for the post-receipt RL process main categories of the QCA of RL literature derived from code frequencies (number of quotations assigned to code categories for the post-receipt RL processes, see Appendix C.3). The pie chart clearly shows that most content on the post-receipt RL processes focus on the disposition process (68%), while the rest of the post-receipt processes represent 32% of the content, including processing (10%), inspection (8%), sorting (7%), redistribution (4%) and receiving (3%). These results imply that disposition can be regarded as the most important post-receipt RL process, but that RL literature might be saturated with discussions of disposition processes. Contrastingly, receiving and redistribution might be less important post-receipt RL processes, but more research can be conducted on initial and final post-receipt RL processes.

In the subsequent sections, the qualitative findings for each post-receipt RL process will be provided based on the sequential order that RL literature discuss/mention these processes, including receiving, processing, inspection and sorting, disposition and redistribution processes.

5.3 RECEIVING PROCESS OF CONSUMER RETURNS

Receiving consumer returns can be the first post-receipt RL process, taking place after collection and transportation from consumers and involving all the activities related to the delivery of returned products to facilities. Despite being limited, the findings related to the receiving process sufficed for

describing the process. The categories of the receiving process, identified from the QCA on RL literature, included the (1) characteristics of receiving, (2) activities in receiving, (3) facilities and areas of receiving and (4) parties in receiving.

Table 5.1 provides an overview of the findings related to the *receiving process of consumer returns* including detail on the categories, related subcategories, sources to support the subcategories and key quotations to support the discussion of the findings.

Table 5.1 Findings related to the receiving process of consumer returns

Source: Compiled by the researcher

Table 5.1 shows that the receiving process involves a few characteristics, activities, facilities/locations and parties, which will be discussed in the subsequent sections and concluded with a description and conceptual framework.

5.3.1 Characteristics of the receiving process

The receiving process in RL involves a few characteristics, which can be classified as general, involvement and linked with characteristics. The *general characteristics* of receiving include arrival, inbound flow and labour intensiveness. Specifically, as the first post-receipt RL process, receiving represents the *arrival* of returned products at the facility, which can be described as the *inbound flows* of product returns. The *labour intensiveness* of receiving can link with various receiving activities that require physical and manual labour, for example, unloading, moving, handling and

organising (see section 5.3.2). Similarly, the *involvement* characteristics of technology and documentation can relate to the receiving activities. For example, receiving can involve the use of *technology,* like scanning devices for scanning of returned products. Additionally, the *documentation* in receiving involves invoices, which can be used to check the quantity of returned products and verify the accuracy of return information captured during gatekeeping.

Finally, the *linked with characteristics* of the receiving process include links with the *pre-receipt RL processes* of gatekeeping, collection and transportation and *post-receipt RL processes* of processing, inspection, sorting and disposition. Relating to the documentation (involvement) characteristic, receiving can *link* with *gatekeeping* in terms of identifying the legitimacy of the return information provided by consumers during the gatekeeping processes. Additionally, receiving can link with the *collection* and *transportation processes* in terms of parties and facilities/locations. For example, a third-party collector collects a product from the consumer and performs receiving at the collection facility (see section 5.3.2) and a third-party transporter unloads vehicles at the receiving dock, emphasising the general characteristic of inbound flows.

Furthermore, the receiving process can link with the *processing process* by checking the legitimacy of product returns, which can be important during returns processing. For example, an illegitimate product return (e.g. opened game disk) can be noted at receiving, which can help avoid issuing a refund for a fraudulent return (also see section 5.4). Subsequently, the receiving process can link with *inspection* and *sorting processes* in terms of performing preliminary inspection and sorting activities at the receiving gate. For instance, preliminary visual inspection can be performed to identify if the product return is legitimate, and preliminary sorting can be performed by sorting and organising returned products before movement into the facility, emphasising the labour intensiveness of receiving.

Similarly, receiving links with the *disposition process* through pre-disposition decisions (initial decisions about what to do with the returned product). Nevertheless, the receiving process can link with the disposition process in terms of disposition taking place after receipt at the facility. This might apply to receipt at recovery facilities, like repair or refurbishment facilities, which perform disposition activities (see section 5.6). Finally, receiving can link with the *redistribution process* if the receiving party takes care of the redistribution of return products.

5.3.2 Activities, facilities and parties in the receiving process

Receiving involves *activities* related to administrative processes and physical handling of returned products, which can be classified as information flow and product flow activities. Particularly,

information flow activities in receiving involves administration and registration, verification, identification and scanning. Therefore, before entering the facility, returned products must be (1) identified and scanned, (2) recorded and registered (administration), and (3) verified with accompanying documentation and information provided by the consumer. The *product flow* activities of receiving involve unloading from the vehicle, handling, movement, organising/ staging and arranging of products or pallets and dispatching/distribution into the facility, reemphasising the receiving characteristics of labour intensiveness and link with sorting.

The *facilities* in the receiving process mostly refer to first-tier facilities (facilities used at the start of the RL process), which indicates that the focus of the receiving process in RL literature is mostly on the initial receipt of the product return. The initial first-tier facilities used for receiving activities include collection facilities, processing facilities, warehouses, return facilities and DCs. Therefore, retailers can either use forward logistics facilities, like *warehouses* and *DCs*, or use RL process facilities, like *collection, processing* and *return facilities*, for receiving operations. Furthermore, the receiving process takes place at the *receiving docks* and *gates* at the entry of facilities, which represents allocated areas at the facilities used for receiving activities.

The *parties* include consumers, retailers, staff, distributors and third parties that are indirectly or directly involved in the receiving process. *Consumers* can be indirectly involved in the receiving process since the information provided by the consumer during gatekeeping is verified at receiving. Additionally, the consumer can be the supplier of the product return required for the receiving process. *Retailers* that insource RL can be directly involved in the receiving activities of consumer returns. Subsequently, the *staff* of the retailers can directly perform receiving activities or may indirectly benefit from receiving activities. For example, RL managers and inspection staff can benefit from the receiving activities of pre-disposition decisions and verification of information for efficient inspection and disposition processes, emphasising the links between receiving and the inspection and disposition processes.

Alternatively, retailers can outsource RL activities to *third-party collectors* that can perform all receiving activities on their behalf. Finally, *third-party transporters* can be responsible for transporting returned products from consumers and unload returned products at the receiving dock, emphasising the link between the receiving and transportation process of consumer returns.

5.3.3 Description and conceptual framework of the receiving process of consumer returns

Based on the findings presented in section 5.3, receiving can be an important post-receipt RL process of consumer returns, and will be described as follows:

The receiving process of consumer returns can be described as the arrival and inbound flow of returned products, which can be labour intensive. Receiving involves technology and documentation and links with other pre- and post-receipt RL processes. The receiving process involves the (1) information flow activities of administration, registration, verification, product identification and scanning, and (2) product flow activities of unloading, handling, movement, organising/staging and arranging products/pallets, and distribution/dispatch, which can be performed by the staff of online retailers or other third parties at the receiving gate and dock of various first-tier FL facilities (such as warehouses and DCs) or RL facilities (such as collection, processing and return facilities).

Figure 5.4 provides a conceptual framework for the receiving process in RL that that may apply to consumer returns in online retailing.

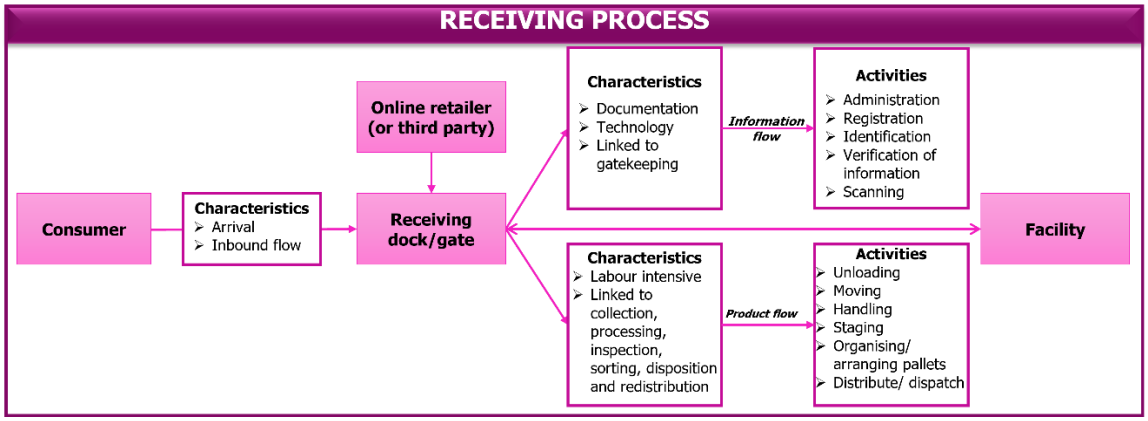

Figure 5.4 Conceptual framework of the receiving process
Source: Compiled by the researcher

Figure 5.4 provides a basic overview of the receiving process, illustrating the parties, area/facility, flows, characteristics and activities. Specifically, the framework demonstrates the consumer returning a product to the online retailer, whereafter the arrival and inbound flow (general characteristics) at the receiving gate and dock of the facility take place. Additionally, third parties can be involved in the process by being responsible for bringing the products from consumers and either perform all receiving activities or some (e.g. unloading). Furthermore, the framework shows two types of flow, namely information flow and product flow, each associated with distinct characteristics and activities. Once these activities/processes are completed, the products are dispatched into different areas of the facility.

In the next section, the return processing process as a post-receipt RL process is analysed.

5.4 PROCESSING PROCESS OF CONSUMER RETURNS

The processing process of consumer returns often takes place after receiving in the facility and involves credits/refunds or exchanges. The categories of processing, identified from the QCA on RL literature, included the (1) characteristics of processing, (2) activities in processing, (3) facilities/areas used for processing, and (4) parties involved in processing. Due to vastness of content related to the processing, separate tables were created for each of the categories associated with

processing. This format will also apply to presentation of the findings for inspection, sorting and disposition processes.

5.4.1 Characteristics of the processing process of consumer returns

In this section, the findings related to the characteristics of the processing process will be presented and discussed. Table 5.2 provides an overview of the findings related to the *characteristics of the processing process of consumer returns*, including detail on the characteristics, supporting sources for the characteristics and quotations from the literature.

Table 5.2 Findings related to the characteristics of the processing process of consumer returns

CHARACTERISTICS	SUPPORTING SOURCES	KEY QUOTATION
Internal process	None	• *"[…] focuses on the internal process of […] processing […]."* (Hall *et al.* 2013:777) • *"[…] total cost of internal processing."* (Serrato *et al.* 2007:4304)
Challenging and complex	Bernon *et al.* (2016:593) Mollenkopf *et al.* (2007:241)	• *"[…] processing rules and procedures makes this the most challenging process related to returns."* (Genchev *et al.* 2011:253) • *"[…] complex returns processing since there could be multiple reasons for product returns."* (Stock & Mulki 2009:49) • *"[…] costs of […] processing […] are too complex and substantial to ignore."* (Zikopoulos & Tagaras 2015:442)
Uncertainty/variability	Sasikumar *et al.* (2010:1224)	• *"[…] increasing processing cost due to the variance in condition […]."* (Ferguson & Toktay 2006:356) • *"[…] highly variable processing times."* (Jayaraman, 2006:983)
Time-consuming	Hall *et al.* (2013:775) Genchev (2009:145) Genchev *et al.* (2011:252) Srivastava (2008:542) Srivastava and Srivastava (2006:532)	• *"[…] the time taken up by […] processing returns."* (Bernon & Cullen (2007:54) • *"[…] highly variable processing times."* (Sasikumar *et al.* 2010:1224) • *"[…] total returns processing time."* (Stock & Mulki, 2009:43) • *"[…] determine the disposition mode up-front thereby minimising […] processing time […]."* (Jayaraman *et al.* 2008:417)
Requires financial and infrastructural resources	Prakash and Barua (2016b:64) Sasikumar and Kannan (2008b:234)	• *"[…] capital investments focused upon increased returns processing […]."* (Griffis *et al.* 2012:291) • *"[…] resource investment to build up operational capabilities in returns processing […]."* (Griffis *et al.* 2012:283) • *"[…] requires a specialized infrastructure […] for the processing of returns […]."* (Ko & Evans, 2007:347) • *"[…] dedicated equipment for the processing of returns."* (Kannan *et al.* 2009:28)
Requires IT	Li and Olorunniwo (2008:384) Govindan *et al.* (2016:758) Li and Olorunniwo (2008:384) Kannan *et al.* (2009:28) Ko and Evans (2007:347) Sasikumar and Kannan (2008b:234) Morgan *et al.* (2016:295)	• *"[…] information technology as an enabler for return processing […]."* (Bokade & Raut, 2013:42) • *RFID assisting with the integration of returned goods processing […]."* (Jayaraman *et al.* 2008:424) • *"IT use in […] the returns processing operations."* (Olorunniwo & Li, 2010:458) • *"[…] return needs […] advance IT and tracking system […] for the processing of returns […]."* (Prakash & Barua, 2016b:64) • *"[…] technology and skills for processing returns […]."* (Srivastava, 2008:548)
Requires skills/ trained staff	Srivastava (2008:548)	• *"[…] processing station where qualified personnel […]."* (Asdecker 2015:3) • *"[…] training […] focused upon increased returns processing speed […]."* (Griffis *et al.* 2012:291) • *"[…] processing of returns and trained manpower […]."* (De Leeuw *et al.* 2016:718) • *"[…] level of technology and skills for processing returns[…]."* (Prakash & Barua 2016b:64)
Require accuracy	Genchev (2009:145) Morgan *et al.* (2016:295) Zikopoulos and Tagaras (2015:442)	• *"[…] number one priority remains […] accurate processing […]."* (Genchev *et al.* 2011:250)
Requires speed	Genchev *et al.* (2011:250, 251) Morgan *et al.* (2016:295) Mollenkopf *et al.* (2007:241) Genchev (2009:145)	• *"Processing speed […] in terms of the speed at which a customer receives a credit for their returned purchase […]."* (Bernon *et al.* 2016:595) • *"[…] quick returns processing is important […]."* (De Leeuw *et al.* 2016:718) • *"[…] speed is essential to returns processing."* (De Leeuw *et al.* 2016:723) • *"[…] faster returns processing is correlated with customer retention […]."* (Griffis *et al.* 2012:291) • *"[…] timely processing returns that do occur, customer service will improve."* (Hall *et al.* 2013:777)
Requires economies of scale	None	• *"[…] importance of […] achieving economies of scale in processing […]."* (De Leeuw *et al.* 2016:718)
Involves costs	Atasu and Cetinkaya (2006:477) Bernon *et al.* (2011:491) Badenhorst (2013:3) Chen and Chen (2015:3)	• *"Returns can be prohibitively expensive […] due to the high processing costs […]."* (Janakiraman *et al.* 2016:226) • *"This involves average processing costs […]."* (Asdecker 2015:9) • *"[…] processing cash costs and inflows at each stage of the reverse logistics*

CHARACTERISTICS	SUPPORTING SOURCES	KEY QUOTATION

Source: Compiled by the researcher

Table 5.2 shows that the processing process can involve various characteristics, which can be classified as (1) general characteristics, (2) requirement characteristics, (3) involvement characteristics, (4) influenced by characteristics and (5) linked with characteristics. These characteristics will be briefly discussed in the subsequent paragraphs.

The *general characteristics* of the processing process include (1) internal process, (2) challenging/complex, (3) uncertain/variable, and (3) time-consuming. Processing can be viewed as an internal, complex/challenging, uncertain and time-consuming process. Processing as an *internal process* implies that retailers (original seller of the returned product) mostly perform processing in-house. Furthermore, processing can be a *challenging* and *complex* post-receipt RL process, which relates to other characteristics, including return policies (containing rules and procedures), various conditions of returned products and processing costs (see subsequent discussions). Similarly, the *uncertainty/variability* of the processing process can be attributed to different product condition, various return reasons, and inconsistent processing times. This uncertainty and complexity of the processing process emphasise that returns processing can be *time-consuming*, indicating that strategies (e.g. pre-disposition decisions) must be implemented to reduce processing times.

The *requirement characteristics* of the processing process include financial and infrastructural resources, technology, trained staff, accuracy, speed and economies of scale. The processing process *requires financial and infrastructural resources*, like capital investments and dedicated equipment, to enhance return process efficiency. Similarly, *information technology (IT)* can be important for effective execution of processing activities, including information sharing and tracking (see section 5.4.2). The requirement of *trained staff* demonstrates the complexity of the processing process and the requirements of resources, accuracy and speed. *Accuracy* and *speed* can be important processing requirements since consumers are concerned with receiving accurate and speedy refunds, credits or replacements after returning their products. Lastly, the *economies of scale* requirement of the processing process might associate with the resource requirements. For example, retailers that lack economies of scale (due to lower return volumes), might be less likely to assign appropriate resources for returns processing efficiencies.

The *involvement* characteristics of the processing process include costs, customer service and

accounts. Linking with the resource, staff training and economies of scale requirements, the *costs* of the processing process involve fixed costs (e.g. facilities and assets), variable costs (e.g. labour) and cash flows (e.g. refunds), which indicates that processing can be an expensive process. Additionally, *customer service* and *accounts* emphasise the importance of speed and accuracy of refunds/credits and costs of processing. Therefore, online retailers can benefit from implementing appropriate consumer service and financial management strategies in the processing process of consumer returns.

The *influenced by characteristics* of the processing process include product type, condition and quantity, carrier service levels, channel type and return policies. Particularly, processing efficiency process can be *influenced* by *product type, condition and carrier service levels*. For instance, fashion items can be time-sensitive due to seasonal/demand changes, which requires speedy and efficient processing. Similarly, a returned product in defective condition, might need inspection before refunds can be issued, impacting processing lead-time. Additionally, carriers can affect processing speed through pick-up schedules/times of collecting and transporting returned products to a facility, which might impact customer service levels and speed of refunds or product exchanges.

Furthermore, processing efficiency and costs can be *impacted* by *quantity* and *channel type.* Specifically, higher returned product quantities mean greater processing efficiencies but higher processing costs, indicating that a cost-benefit analysis might be important for the processing process. Similarly, for the channel types online retailing can involve longer processing times and higher processing costs than traditional retailing since returned products must first be transported to facilities for processing. Lastly, the *return policy* can impact the processing activities, for example, the return policy might specify that no exchanges are allowed on certain products and as result only refunds/credits can be issued if such products are returned.

Finally, the *linked with characteristics* of the processing process include links with all RL processes, including the *pre-receipt RL processes* of CRR, gatekeeping, collection and transportation and *post-receipt RL processes* of receiving, inspection, sorting, disposition and redistribution. Particularly, Processing links with the *CRR process* by using the information provided by consumers during return request as inputs in selecting applicable processing activities. Similarly, *gatekeeping* plays a role in identifying the condition of the returned product, which can be important for accurate return processing. Additionally, the link between processing and *collection* can involve the possibility of processing returns at return pickup, for example, issuing an instant credit. The link between *transportation* and processing relates to their shared characteristics of economies of scale and costs (see section 4.4.4).

The link between processing and the *receiving* process associates with the sequence of RL processes,

demonstrating that products must first be received at a facility before processing can be conducted. Similarly, processing can link with the *inspection* and *sorting* in terms of the sequence of RL processes implemented by organisations. For example, some retailers might first require full inspection and sorting before a refund or exchange can be issued. Alternatively, if processing takes place during product recovery, inspection and sorting processes can take place before processing, which links processing and *disposition*. Additionally, processing and disposition can link through the processing activity of pre-disposition decisions. Lastly, the link between processing and *redistribution* can relate to product exchanges or through redistribution of products to new markets/consumers.

Essentially, the characteristics demonstrates that processing involves information flows (e.g. technology requirements), product flows (e.g. links with sorting, inspection, collection and transportation) and cash flows (e.g. customer accounts and processing costs). In the next section the activities of the processing process will be presented and discussed.

5.4.2 Activities of the processing process of consumer returns

In this section an overview of the activities in the processing process is given. Table 5.3 provides an overview of the findings related to the *activities of processing*, including detail on the characteristics, supporting sources for the characteristics and quotations from the literature.

Table 5.3 Findings related to the activities of the processing process of consumer returns

ACTIVITIES	SUPPORTING SOURCES	KEY QUOTATIONS
Credit/refund authorisation	None	• *"[…] to the buyer's account including credit authorization [sic] […]."* (Genchev *et al.* 2011:255) • *"[…] processing these returns, including […] authorizing [sic] the refund […]."* (Griffis *et al.* 2012:287)
Cross-verification of return authorisation	None	• *"The next task is to undertake a cross-verification of the returned item with the return authorization [sic] given at gatekeeping."* (Shaik & Abdul-Kader 2014:97) • *"[…] activities are involved in processing […] including authorizing the return, […] verifying and […] authorizing [sic] the refund […]."* (Griffis *et al.* 2012:287)
Recordkeeping	None	• *"Recording the length of time required to handle charge backs […]."* (Genchev *et al.* 2011:256) • *"Expedite […] procedures for charge backs, record […] them […]."* (Genchev *et al.* 2011:256)
Information sharing and communication	None	• *"[…] charge backs […] communicate them internally and externally […]."* (Genchev et al. 2011:255) • *"[…] returns processing via effective information sharing […]."* (Morgan *et al.* 2016:295)
Data entry/capture	None	• *"[…] needing special information systems for tracking/capturing data, […] for the processing of returns […]."* (Ko & Evans 2007:347) • *"The electronic profiles usually include product specifications and the reason for the return […] in returns processing."* (Genchev *et al.* 2011:251) • *"Processing — consists of activities such as data entry […]."* (Stock & Mulki (2009:41)
Tracking	Ko and Evans (2007:347) Prakash and Barua (2016b:64) Sasikumar and Kannan (2008b:234)	• *"[…] information systems for tracking […] the processing of returns."* (Kannan *et al.* 2009:28)
Issue credits/refunds	Griffis *et al.* (2012:285, 287) Skinner *et al.* (2008:524) Hall *et al.* (2013:769) Stock and Mulki (2009:41)	• *"Customers may be refunded at this stage […]."* (Asdecker 2015:3) • *"Processing […] in terms of the speed at which a customer receives a credit […]."* (Bernon *et al.* 2016:595) • *"This process involves the charge back to the buyer's account including credit […]."* (Genchev *et al.* 2011:255)

ACTIVITIES	SUPPORTING SOURCES	KEY QUOTATIONS
		• *"[…] a monetary credit may be issued to the customer."* (Lambert *et al.* 2011:573)
Claims settlements and verification of accurate fund transfers	None	• *"This process involves […] potential claim settlements with customers."* (Genchev *et al.* 2011:255) • *"Check whether post-crediting transfer of funds was accurately charged back […]."* (Genchev *et al.* 2011:256)
Product exchange	None	• *"[…] difficulties in processing product exchanges […]."* (De Leeuw *et al.* 2016:722) • *"If an exchanged product is sent back to the customer, it must be the same model or of equivalent quality, performance, and functionality."* (Lambert *et al.* 2011:573)
Handling	Subhashini (2016:10)	• *"[…] facilities are dedicated to return handling and processing […]."* (Min & Ko, 2008:179) • *"[…] the costs of returns handling and processing […]."* (Zikopoulos and Tagaras 2015:442)
Restocking	None	• *"[…] processing of returns may lead to […] restocking […]."* (De Leeuw *et al.* 2016:725) • *"Once the […] processing is done, the products are returned to the customers or kept in stock."* (Lambert *et al.* 2011:576)
Pre-disposition decisions	Ferguson *et al.* (2011:777) Griffis *et al.* (2012:287) Hall *et al.* (2013:775) Rogers *et al.* (2012:115)	• *"The task of deciding what will be done with processed returns is known as assigning disposition."* (Genchev, 2009:146) • *"[…] crediting and/or disposition options are also registered […] for increased speed in returns processing."* (Genchev *et al.* 2011:251) • *"Processing involves activities where treatment options such as repair, reuse, remanufacturing, upgrade, and repackaging of the returned product are envisaged."* (Lambert *et al.* 2011:570)

Source: Compiled by the researcher

Table 5.3 shows various activities of processing, which can be classified as information, cash and product flow activities. Particularly, *information flow activities*, include credit and refund authorisation, recordkeeping, cross-verification of return authorisation, information sharing and communication, data entry/capturing and tracking, which emphasise the importance of IT in processing (see section 5.4.1). For instance, IT can be important for *cross-verification of return authorisation* captured during gatekeeping (see section 4.4.2) and internal (between departments) and external (with consumers and carriers) *information-sharing and communication* about *credit/refund authorisation*.

Additionally, credit/refund authorisation can relate to the retailer's return policy. For example, the return policy specifies that unused/unopened returned products can be refunded and based on this condition a credit or refund can be authorised, emphasising the characteristic of the impact of return policies on processing. Lastly, IT can be important for *recordkeeping*, *data entry* and *data capturing*, relating to update of accounts (after issuing refunds) and stock/inventory levels (after restocking), and *tracking* to ensure visibility in the process.

The *cash flow activities* of processing involve issuing credits/refunds, settling claims and verifying accuracy of fund transfers. *Issuing a refund or credit* can be viewed as the main purposive of consumer return processing, linking with various processing characteristics (section 5.4.1) and information flow activities. Particularly, issuing refunds/credits links with the processing characteristics of high processing costs, customer service and accounts and return policy, as well as the information flows processing activities of credit/refund authorisation, information sharing and communication, recordkeeping and data entry/capturing of information. Additionally, *claim settlements* and *verification of accurate transfers* relates to the processing characteristic of "requiring

accuracy" since retailers must ensure that consumers receive the correct refunds.

The *product flow activities* involve product exchanges, handling and restocking. Like issuing refunds/credits, *product exchanges* can be a main activity of processing, representing an alternative outcome of shipping (or redistributing) a replacement product back to the original consumer. However, product exchanges can be more complexed than credits/refunds since (1) the characteristics of the returned/exchanged product must be similar (i.e. the same brand/model or colour), (2) additional transportation must be organised, and (3) the replacement product might be out of stock. Essentially, product exchanges emphasise the links between processing, transportation and/or redistribution (see section 5.4.1). Product returns *handling* demonstrate that returned products are physically handled during the processing process, which adds handling costs to overall return processing costs. The *restock* activity demonstrates the link between processing and disposition processes since returned products in new/unused can be reused (disposition option).

Finally, the *pre-disposition decision* activity can involve both *information* and *product flows* since preliminary disposition decisions can be recorded on the system and products can be dispositioned after processing, reemphasising the restocking activity and links between the processing and disposition processes.

In the next section, the facilities used for processing returns will be discussed.

5.4.3 Facilities and areas used for the processing process

The third category in processing involves the facilities and areas used for processing. Table 5.4 provides an overview of the findings related to the *facilities and areas used for the processing process of consumer returns*, including details on the facilities, sources to support the mentioned facilities and key quotations to support the discussion of the findings.

Table 5.4 Findings related to the facilities used for the processing process of consumer returns

FACILITIES/AREA	SUPPORTING SOURCES	KEY QUOTATIONS
Centralised Return Centres (CRCs)	Rogers *et al.* (2012:108) Tuzkaya and Gülsün (2008:346)	• *"[…] centralized [sic] returns centers for achieving economies of scale in processing […] for minimizing [sic] […] costs."* (De Leeuw *et al.* 2016:718) • *"[…] establish distinct returns facilities, potentially increasing the return processing costs […]."* (Griffis *et al.* 2012:283) • *"Centralized [sic] return centers [sic] are dedicated to return […] processing."* (Min *et al.* 2006:58)
Collection facilities	Govindan *et al.* (2016:758) Yu and Solvang (2016:4)	• *"[…] processing may be […] carried out […] at collection centers [sic] […]."* (Srivastava & Srivastava, 2006:528)

Source: Compiled by researcher

Table 5.4 shows that the facilities used for processing can be categorised as RL process facilities, traditional FL facilities, recovery facilities, stores and processing areas.

The *RL process facilities*, like *CRCs* (used exclusively for returns), *collection facilities* (used for collecting and processing of returns) and *processing facilities* (used for processing activities), emphasises the characteristics of processing (section 5.4.1) in terms of resource requirements (such as specialised infrastructure) as well as costs associated with the processing of returns (e.g. maintenance costs). Additionally, CRCs can contribute to the economies of scale requirement for realising processing efficiency, and collection facilities emphasise the link between processing and collection processes. Moreover, processing facilities can be used in online retailing, emphasising the importance of returns processing in the RL processes of consumer returns in online retailing.

The *traditional FL facilities/locations* used for processing include *stores*, *warehouses* and *DCs*. Using *retail stores* for processing, emphasise the characteristic related to the influence of the channel type on processing (section 5.4.1). While online retailers must use facilities for returns processing, multi/omnichannel retailers can use their stores. When using *warehouses* for returns processing, organisations can use existing infrastructure and technology (such as RFID) for both FL process and RL processes, emphasising the IT requirement characteristic. Similarly, *DCs* that can traditionally be used for distributing products to the market can perform returns processing before redistributing products back to original consumers for product exchanges as an activity in processing (section 5.4.2).

Finally, *repair facilities* and *service centres* as product recovery facilities[10] can perform processing activities, which emphasise the characteristic of the links between processing and disposition processes (section 5.4.1) and the processing activity of pre-disposition decisions (section 5.4.2). In the next section, the parties involved in the processing of product returns are discussed.

[10] Product recovery facilities is used as a collective name for dedicated facilities that perform disposition options or recovery operations, including repair/service facilities, refurbishment facilities, disassembly facilities and other facilities excluded from this study (such as remanufacturing and recycling facilities).

5.4.4 Parties associated with the processing process of consumer returns

Several parties can be involved in the processing process of consumer returns, which will be identified and discussed in this section. Table 5.5 provides an overview of the findings related to the *parties involved in the processing process of consumer returns*, including detail on the parties, sources to support the parties in processing and key quotations from the literature, followed by a discussion.

Table 5.5 Findings related to the parties in the processing process of consumer returns

PARTIES	SUPPORTING SOURCES	KEY QUOTATIONS
Consumers	Asdecker (2015:3) Genchev *et al.* (2011:255;251) Lambert *et al.* (2011:573) Mollenkopf *et al.* (2007:241)	• *"[…] customer […] receive a credit or exchange."* (Bernon *et al.* 2016:589) • *"[…] processing these returns, including […] the refund for the customer."* (Griffis *et al.* 2012:287) • *"[…] focus their attention on prompt and accurate service to customers by assigning additional resources for processing."* (Genchev 2009:145) • *"[…] understand what each customer is willing to accept in terms of timeliness, […] for […] processing times."* (Hall *et al.* 2013:776) • *"[…] timely processing returns that do occur, customer service will improve."* (Hall *et al.* 2013:777)
Retailers	Bernon and Cullen (2007:54) Chen and Chen (2015:3) Rogers *et al.* (2012:115)	• *"Retailer manages […] processing product returns using a third party […]."* (Ahsan & Rahman, 2016:611) • *"[…] retailers indicated that they used […] their warehouse space for returns processing […]."* (Stock & Mulki, 2009:41) • "*Returns can be prohibitively expensive for retailers due to the high processing costs […]."* (Janakiraman *et al.* 2016:226) • *"[…] costs of processing these returns […] is generally higher for online-only retailers compared to conventional multi-channel retailers […]."* (De Leeuw *et al.* 2016:711) • *"[…] online retailers […] are involved in processing these returns, including […] authorizing [sic] the refund for the customer."* (Griffis *et al.* 2012:287) • *"[…] retailer is often responsible for […] administering the refunds, exchanges or repairs."* (Ni *et al.* 2014:312) • *"[…] retailers have the most complex returns processing since there could be multiple reasons for product returns."* (Stock & Mulki 2009:49) • *Retailers can […] making decisions on processing […]."* (Stock & Mulki, 2009:53)
Wholesalers	None	• *"[…] include […] wholesalers […] in the processing of returns."* (Genchev *et al.* 2011:243) • *"[…] wholesalers use less […] of their existing warehouse space for processing returns."* (Stock & Mulki, 2009:41) • *"[…] wholesalers […] assessing total returns processing time."* (Stock & Mulki, 2009:43)
Departmental functions/ staff	None	• *"[…] processing […] which is often sent to customer service."* (Asdecker, 2015:3) • *"Senior distribution center [sic] management, corporate customer service, and sales team involvement become mandatory in processing […]."* (Genchev *et al.* 2011:253) • *"[…] processing station where qualified personnel open each item […]."* (Asdecker, 2015:3) • *"[…] store personnel processing returns."* (Bernon & Cullen, 2007:54) • *"Returns processing is executed […] returns inspectors have a guaranteed workday load."* (Genchev, 2009:140) • *"[…] managers can […] plan for […] processing […]."* (Hall *et al.* 2013:776)
Third parties	Stock and Mulki (2009:34) Genchev *et al.* (2011:243)	• *"[…] processing product returns using a third party […]."* (Ahsan & Rahman, 2016:611) • *"[…] 3PLs have also become important players in reverse logistics since […] return operations require […] infrastructure […] for the processing of returns."* (Ko & Evans, 2007:347) • *"[…] carriers can affect return processing time […]."* (Genchev *et al.* 2011:252) • *"[…] steps performed jointly by the […] transportation service provider […]."* (Griffis *et al.* 2012:285) • *"The 3PRL partner has to deal with […] activities like […] processing."* (Prakash & Barua 2016b:64)

Source: Compiled by the researcher

Table 5.5 shows that the parties involved in processing include consumers, retailers, wholesalers, departmental functions and staff/employees, and third parties.

The role of *consumers* in the processing process relates to the activities of receiving credits/refunds or product exchanges, demonstrating that consumers can be opportunistic players in RL. Additionally, as mentioned in the characteristics of processing (section 5.4.1), efficient and speedy

processing can improve consumer service levels, which will benefit the consumers of product returns.

In contrast, *retailers* play significant roles in the processing of returns, including (1) choosing third parties to perform processing (outsourcing decisions), (2) using facilities (such as warehouses) and processing stations or stores for processing activities, (3) carrying processing costs, and (4) performing processing activities (such as issuing credits/refunds or product exchanges). Alternatively, if *wholesalers* sell directly to consumers, they might perform similar roles as retailers in the processing process of consumer returns.

Additionally, retailers' *departmental functions* and *staff* can be involved in the processing process of consumer returns. Particularly, the *customer service department/function* can be directly involved in processing process by communicating to consumers regarding the outcomes/status of their refunds/product exchanges, emphasising the characteristic of customer service in processing (section 5.4.1). Additionally, *management* and the *sales team* can be involved in the processing of consumer returns, which emphasise the importance of internal information sharing and communication as processing activities (section 5.4.2). Oher staff involved in processing can include *processing staff* and *store staff*, which emphasise the use of facilities in online retailing and stores in traditional retailing for returns processing. Lastly, *inspectors* can be the recipients of returned products after processing, emphasising the link between processing and inspection processes.

Finally, various *third parties* can be involved in the processing process of consumer returns, including third-party transport providers/carriers, 3PL providers or 3PRL providers. *Third-party transport providers/carriers* can be responsible for transporting product returns from consumers for processing and/or product exchanges back to consumers, emphasising the links between processing and transportation and redistribution processes (section 5.4.1). Additionally, carriers associate with the processing characteristic labelled as "influenced by carrier service levels", which impact processing speed.

Alternatively, *3PL* or *3PRL providers* can be responsible for performing all processing activities on behalf of retailers. Retailers can benefit from using 3P(R)L providers to take advantage of economies of scales and access specialised resources for returns processing, emphasising the economies of scale, financial and infrastructural resources, IT and skilled/trained staff requirements as processing characteristics (section 5.4.1). The next section concludes the processing process of consumer returns with a description and conceptual framework.

5.4.5 Description and conceptual framework of the processing process of consumer returns

Based on the findings presented in section 5.4, processing can be an important post-receipt RL process of consumer returns, and will be described as follows:

> The processing process of consumer returns can be described as an internal, challenging/complex, uncertain/variable, and time-consuming RL process, which (1) requires financial and infrastructural resources, technology, trained staff, accuracy, speed and economies of scale, (2) involves costs, customer service and accounts, (3) can be influenced by product type, condition and quantity, carrier service levels, channel type and return policies, and (4) can be linked with other pre- and post-receipt RL processes. The activities of the processing process involve (1) information flow activities, including credit and refund authorisation, recordkeeping, cross-verification of return authorisation, information sharing and communication, data entry/capturing, tracking and pre-disposition decisions, (2) cash flow activities, including issuing credits/refunds, settling claims and verifying accuracy of fund transfers, and (3) product flow activities, including product exchanges, handling, restocking and pre-disposition decisions, which can benefit consumers and be performed by departments/staff of the online retailer and/or 3P(R)L providers in RL-specific facilities (CRCs, collection facilities and processing facilities), traditional FL facilities (DCs and warehouses) or recovery facilities (repair facilities or service centres).

Figure 5.5 provides a conceptual framework of the processing process in RL process that may apply to consumer returns in online retailing. Particularly, the framework provides a basic overview of the processing process of consumer returns, illustrating characteristics unrelated to flows, the main parties involved in returns processing, including consumers, online retailers (also representing department/staff) and third parties, and the processing station in the facility (representing any type of facility that can be used for processing). Finally, the framework demonstrates the cash, information and product flows in the processing process with corresponding activities and characteristics related to these flows.

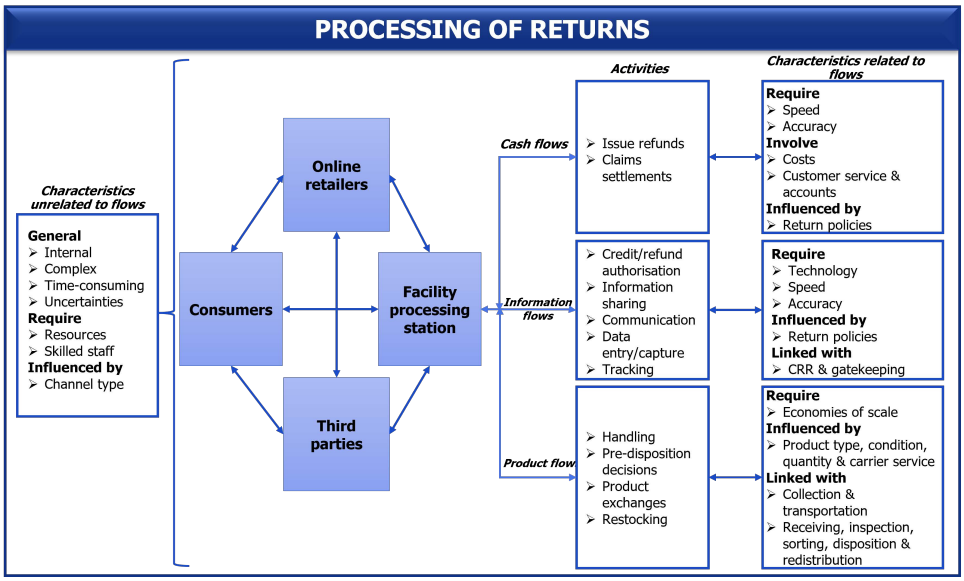

Figure 5.5 Conceptual framework of the processing process
Source: Compiled by the researcher

In the next section, inspection and sorting as post-receipt RL processes are discussed and analysed.

5.5 INSPECTION AND SORTING PROCESSES OF CONSUMER RETURNS

In this section, inspection and sorting as post-receipt RL processes of consumer returns will be discussed. From the QCA findings of RL literature it was noted that inspection and sorting processes are discussed either as different processes or as one RL process (e.g. inspection/sorting process), often sharing the same characteristics, activities, facilities and parties. This observation is confirmed by El Korchi and Millet (2011:591) who stated that inspection and sorting processes are often linked in the RL process.

However, inspection and sorting processes can include unique characteristics, activities and facilities, which means that they can be regarded as distinct processes in RL. Consequently, these processes are discussed separately in the subsequent sections, starting with the inspection process of consumer returns in section 5.5.1, followed by the sorting process of consumer returns in section 5.5.2. While each process will be described separately, the large overlaps between the parties, facilities, characteristics and activities, warrants a single conceptual framework, which will be presented in section 5.5.3.

5.5.1 Inspection process of consumer returns

In this section, the findings and interpretation of the findings related to the inspection process of consumer returns will be presented and discussed. The categories identified from the QCA of RL literature, included the (1) characteristics of inspection, (2) activities in inspection, (3) facilities used for inspection and (4) parties involved in the inspection process, which will be presented and discussed in subsequent sections, and concluded with a description.

5.5.1.1 Characteristics of the inspection process of consumer returns

The inspection process of consumer returns can involve various characteristics that will be identified and discussed in this section. Table 5.6 provides an overview of the findings related to the *characteristics of the inspection process* of consumer returns, including detail on the characteristics, supporting sources for the characteristics and quotations from the literature.

Table 5.6 Findings related to the characteristics of the inspection process of consumer returns

CHARACTERISTICS	SUPPORTING SOURCES	KEY QUOTATIONS
Important	None	• *"An important component of the reverse logistics process is to accurately evaluate each product returned in order to determine the most optimal disposition option."* (Stock & Mulki, 2009:34) • *"[…] inspection procedure is in effect is an important issue […]."* (Zikopoulos & Tagaras, 2015:437)
Complex	None	• *"[…] inspection […] is innovative and difficult to set up […]."* (El Korchi & Millet, 2011:594) • *"[…] returns inspection is the most complicated function performed at the facility."* (Genchev, 2009:142)
Labour intensive	Narayana *et al.* (2014:395)	• *"[…] inspection […] is labor [sic] intensive […]."* (De Leeuw *et al.* 2016:723)

CHARACTERISTICS	SUPPORTING SOURCES	KEY QUOTATIONS
		• *"[…] based on manual inspection […]."* (Toyasaki *et al.* 2013:1215) • *"Manpower […] for inspection […]."* (Srivastava & Srivastava 2006:529)
Time-consuming	None	• *"[…] inspection […] takes time and all products have to be thoroughly inspected."* (De Leeuw *et al.* 2016:723) • *The inspection […] process requires some […] time."* (Tuzkaya *et al.* 2011:4547)
Requires skilled staff	None	• *"Manpower is skilled for inspection […]."* (Srivastava & Srivastava, 2006:529)
Involves costs	El-Sayed *et al.* (2010:424) Toyasaki *et al.* (2013:1219)	• *"Expected inspection cost […]."* (Lee *et al.* 2012:5619) • *"[…] these include […] inspection and sorting costs […]."* (Kumar *et al.* 2016:4)
Influenced by product and return type, product quality, channel type and return policy	Alshamrani *et al.* (2007:596) Chan *et al.* (2012:1323) El Korchi and Millet (2011:590) Kongar *et al.* (2015:57) Suyabatmaz *et al.* (2014:77) Das and Dutta (2013:722) Prahinski and Kocabasoglu (2006:421) Srivastava and Srivastava (2006:530) Kannan *et al.* (2016:5) Min and Ko (2008:179) Ni *et al.* (2014:312) Niknejad & Petrovic, 2014:143) Suyabatmaz *et al.* (2014:75) Zandieh and Chensebli (2016:6)	• *"[…] consumer electronics or domestic appliances need […] inspection […]."* (Ruiz-Benítez *et al.* 2014:55) • *In the apparel sector, […] most returned products, after a quick visual inspection, can be put back on the shelf and sold again as new products."* (Ruiz-Benítez *et al.* 2014:55) • *"[…] inspection of returns can be handled at the retail level such that false-failure returns may be immediately returned to the shelf for resale."* (Ruiz-Benítez *et al.* 2014:55) • *"[…] all returned products are inspected […] based on their quality."* (Eskandarpour *et al.* 2014:1396) • *"Good quality products require less number of processes in terms of inspection […]."* (Pokharel & Mutha, 2009:176) • *"In the e-tail environment […] the physical inspection of the product necessary to assess appropriateness generally must be delayed until receipt of the goods."* (Mollenkopf *et al.* 2007:224) • *"The quality of retrieved products is also uncertain. They need to be inspected […]."* (Mazahir *et al.* 2011:94) • *"[…] inspecting […] and […] recording any discrepancies with the […] return policy […]."* (Beh *et al.* 2016:12) • *"[…] inspector assigns a disposition code for the return according to predetermined policy […]."* (Genchev, 2009:142)
Linked to CRR and gatekeeping processes	None	• *"[…] customers' requests to return product(s) proves invaluable in the inspection process."* (Genchev, 2009:145) • *"[…] inspection process. The information on […] customer RA request is detailed on a screen."* (Genchev, 2009:145) • *"[…] inspection of the merchandise to confirm the legitimacy of the return (i.e., gatekeeping)."* (Griffis *et al.* 2012:285)
Linked to the collection process	Srivastava and Srivastava (2006:528) Pourmohammadi *et al.* (2008:5) Alumur *et al.* (2012:68) Assavapokee and Wongthatsanekorn (2012:134, 136) Das and Dutta (2013:722) Fattahi and Govindan (2016:6) Kannan (2009:399) Konstantaras *et al.* (2010:452) Mazahir *et al.* (2011:100) Suyabatmaz *et al.* (2014:77) Gu and Tagaras (2014:5157)	• *"Inspection […] is the next stage which may be carried out either at the […] time of collection itself or afterwards."* (Agrawal & Choudhary, 2014:15) • *"[…] returned products are collected […] and quality inspection operation is performed […]."* (Zandieh & Chensebli, 2016:6) • *Products […] are collected and delivered to the facilities for inspection […]."* (Agrawal *et al.* 2015:86) • *"[…] returned products are collected […] and after inspection […]."* (Ghezavati & Beigi, 2016:4)
Linked to the transportation process	Zandieh and Chensebli (2016:6) Suyabatmaz *et al.* (2014:77)	• *"Products are returned […] and are transported for inspection […]."* (Agrawal *et al.* 2015:86) • *"[…] inspection process, where item […] is delivered and […] shipped […]."* (Alamri, 2011:238) • *"[…] transporting the […] used products […] after inspection."* (Gu & Tagaras, 2014:5157)
Linked to the receiving process	García-Rodríguez *et al.* (2013:588) Griffis *et al.* (2012:285) Genchev *et al.* (2011:262) Hsu *et al.* (2009:527)	• *"[…] inspection upon receiving a returned item […]."* (De Leeuw *et al.* 2016:723) • *"[…] in the receiving area, the inspectors tackle the first pallet in line […]."* (Genchev, 2009:142) • *"[…] inspection of the product necessary to assess appropriateness generally must be delayed until receipt of the goods."* (Mollenkopf *et al.* 2007:224)
Linked to processing	Genchev (2009:146)	• *"[…] inspected returns […] are moved to the disposition stage of returns processing."* (García-Rodríguez *et al.* 2013:588) • *"[…] they should undergo a detailed inspection when being processed […]."* (García-Rodríguez *et al.* 2013:588)
Linked to the sorting process	Selvi and Kayar (2016:17) Srivastava and Srivastava (2006:528) Suyabatmaz *et al.* (2014:77) Ruiz-Benítez *et al.* (2014:61) Toyasaki *et al.* (2013:1215) Agrawal et al. (2016a:934) El-Sayed *et al.* (2010:424) Kumar *et al.* (2016:4) Luitel *et al.* (2014:86) Mazahir *et al.* (2011:100) Narayana *et al.* (2014:395)	• *"Inspection/ Sorting is the next stage which may be carried out […]."* (Agrawal & Choudhary, 2014:15) • *"[…] a separate inspection of each item is required for sorting the products."* (Agrawal *et al.* 2015:78) • *"[…] for overall operations such as […] sorting and inspection […]."* (Kongar *et al.* 2015:57) • *"Product inspection is linked to product sorting."* (El Korchi & Millet, 2011:591) • *"[…] processes are performed simultaneously and in parallel to inspection and sorting."* (Konstantaras et al. 2010:452) • *"Inspection […] may encompass […] sorting […]."* (Sasikumar & Kannan, 2008a:160)

CHARACTERISTICS	SUPPORTING SOURCES	KEY QUOTATIONS
	Prakash and Barua (2016b:64)	
Linked to the disposition process/ exit options	Kannan *et al.* (2016:5) Alumur *et al.* (2012:72) Das and Dutta (2012:467) Mazahir *et al.* (2011:100) Pokharel and Mutha (2009:179) Suyabatmaz *et al.* (2014:77) Konstantaras *et al.* (2010:452) Lee *et al.* (2012:5619) Ruiz-Benítez *et al.* (2014:61) Salema *et al.* (2010:339)	• *"[…] inspection process, where item […] is delivered to a primary market and the rest […] are shipped to a secondary market."* (Alamri, 2011:238) • *"[…] used products to the remanufacturer after inspection."* (Gu & Tagaras, 2014:5157) • *"[…] the goods must […] have a certificate of inspection […] and must be destined for direct re-use […] or recovery […]."* (De Oliveira *et al.* 2012:1601) • *"[…] inspection is […] performed […] and related disposition options have to be accounted for […]."* (Genchev, 2009:142) • *"[…] each retailer uses its own systems and processes, inspection and disposition […]."* (Ni *et al.* 2014:312) • *"Product recovery practices on […] inspection […] of reusable parts and their reuse in repairing, refurbishing, or remanufacturing […]."* (Lai *et al.* 2013:110) • *An objective of inspection and disposition is to determine […] an appropriate product recovery strategy."* (Prahinski & Kocabasoglu, 2006:421)

Source: Compiled by the researcher

Table 5.6 shows that the characteristics of the inspection process can be classified as general, requirement and involve characteristics, influenced by characteristics and linked with characteristics. Particularly, the *general characteristics* of the inspection process include (1) important, (2) complex, (3) labour intensive, and (4) time-consuming. The *importance* and *complexity* of inspection stems from the need to determine the quality and condition of the returned product and make the correct disposition decisions (see section 5.5.1.2). Additionally, inspection can be *labour intensive* and *time-consuming* since manual labour is needed to thoroughly inspect each returned product. Consequently, the *requirement characteristic* of the inspection process includes the need for *skilled staff* to effectively perform inspection activities. Moreover, the *involve characteristic* of costs indicates that inspection can be expensive, involving cash outflows in the RL process.

The *influenced by characteristics* of the inspection process include product and return type, product quality, channel type and return policy. Particularly, the *product and return type* and *product quality* can influence the type of inspection activities and degree of inspection needed. For example, unwanted (B2C return) clothes in new condition require quick visual inspections, and defective electronic products require more intensive inspection that can involve product disassembly and testing activities (see section 5.5.1.2). Additionally, the *channel type* can influence the place and time of inspection. For example, multi/omnichannel retailers can use their stores for immediate inspection, but online-only retailers must wait for products to arrive at their facilities, impacting inspection lead time. Furthermore, the return type and quality of the product can be uncertain in online retailing, which can add to the complexity and time-consuming characteristics of inspection. Lastly, the influence of the *return policy* on inspection relate to the activities of verification of information (e.g. ensuring that the return reason given by consumers align with the policy) and disposition decisions (e.g. return policy stipulates that only defective parts of electronic products can be repaired).

Finally, the *linked with characteristics* of the inspection process involve links with all the *pre-receipt RL processes*, including CRR, gatekeeping, collection and transportation, and most *post-receipt RL*

processes, including receiving, processing, inspection, sorting and disposition. The links with pre- and post-receipt RL processes can either relate to information flows or product flows. In terms of information flows, the CRR process plays an important role in the inspection process since consumers provide information regarding the reason for return/condition of the product (see section 4.4.1), which can impact inspection activities. Similarly, the returns merchandise authorisation (RMA) provided during *gatekeeping* is verified during inspection to identify the legitimacy of the product returns (see sections 4.4.2 and 5.5.1.2). Moreover, inspection links with *processing* in terms of providing important information regarding the validity of refund/credit based on inspection outcomes.

Regarding product flows, the link between *collection* and inspection relates to the place or time of inspection. Specifically, inspection can either take place at collection (e.g. the driver visually inspects the product at pickup) or after collection within the facility (performed by official inspectors). Likewise, inspection can link with transportation through the sequence of RL activities, either occurring before transportation to facilities or after transportation in facilities. The link between inspection to *receiving* also showed that inspection can either take place at the time of receipt (such as at the receiving dock) or after receipt (within the facility). As mentioned in the introduction of section 5.5, inspection and sorting can be viewed as one process or can be intricately linked in terms of shared characteristics, activities, facilities and parties, which will be explored in section 5.5.2.

The final product flow link involves a three-fold link between inspection and the *disposition* process. Specifically, inspection can either take place before disposition to identify product quality or at the time of product recovery (e.g. during repairs). Additionally, inspection can link with disposition in terms of the shared activity of disposition decisions. Essentially, all the links with other RL processes and characteristics show that various degrees of inspection can take place at multiple stages in the RL process, emphasising the importance of the inspection process.

In the next section, the findings related to the inspection activities will be discussed.

5.5.1.2 Activities of the inspection process of consumer returns

In this section, the activities of the inspection process will be explored. Table 5.7 provides an overview of the findings related to the *activities of the inspection process of consumer returns*, including details on the activities, supporting sources of the inspection activities and key quotations to support the discussion of the findings.

Table 5.7 Findings related to the activities of the inspection process of consumer returns

ACTIVITIES	SUPPORTING SOURCES	KEY QUOTATIONS
Verification of information	None	• *"The verification process is centered [sic] on comparing this data to the physical condition of the product."* (Genchev, 2009:145) • *"[…] with verification and inspection of the merchandise to confirm the legitimacy of the return […]."* (Griffis *et al.* 2012:285)
Product evaluation and assessment	Agrawal *et al.* (2015:78) Beh *et al.* (2016:12) Genchev (2009:142) Mazahir *et al.* (2011:100) Rogers *et al.* (2012:108) Zikopoulos and Tagaras (2015:436) Suyabatmaz *et al.* (2014:75) Selvi and Kayar (2016:17) Srivastava and Srivastava (2006:530)	• *"[…] the goods […] need to be evaluated […] for their condition […]."* (Jayaraman *et al.* 2008:416) • *"[…] inspection of the product necessary to assess appropriateness […]."* (Mollenkopf *et al.* 2007:224) • *"During the inspection […] employees must determine functionality […] requirements."* (Prahinski & Kocabasoglu, 2006:422) • *"Inspection […] denotes those operations that determine whether a given product is in fact reusable and to what extent."* (Sasikumar & Kannan, 2008a:160) • *"[…] evaluate each product returned in order to determine the most optimal disposition option."* (Stock & Mulki, 2009:34)
Determine disposition/ exit options	Prahinski and Kocabasoglu (2006:421-422) Rogers *et al.* (2012:108) Sasikumar *et al.* (2010:1228) Stock and Mulki (2009:34) Subhashini (2016:9) Suyabatmaz *et al.* (2014:75) Toyasaki *et al.* (2013:1219) Alumur *et al.* (2012:68) Chan *et al.* (2012:1323) Eskandarpour *et al.* (2014:1396) Jayaraman *et al.* (2008:416) Piplani and Saraswat (2012:1426) Ruiz-Benítez *et al.* (2014:55) Zandieh and Chensebli (2016:2) Genchev (2009:145) Sasikumar and Kannan (2008a:160) Orboobadi (2009:834)	• *"Inspection […] for determining the action which recovers the most value from the returned product, and products are disposition accordingly."* (Agrawal *et al.* 2015:86) • *Based on the test results, it is decided whether they are eligible […] for reuse, redistribution, and/ or proper disposal."* (Kongar *et al.* 2015:59) • *"[…] inspecting the condition and […] assigning […] predisposition codes for returns […]."* (Beh *et al.* 2016:12) • *"[…] inspection […] determines the appropriate route that the return should take."* (Niknejad & Petrovic, 2014:143)
Product classification	Zandieh and Chensebli (2016:6) Srivastava and Srivastava (2006:530) Zikopoulos and Tagaras (2015:436) Ayvaz and Bolat (2014:35) Eskandarpour *et al.* (2014:1396)	• *"The inspecting process is mainly used to classify collected items or work-in-process items into reusable items or non-reusable items (out-of-date or severely broken units)."* (Assavapokee & Wongthatsanekorn, 2012:134) • *"[…] inspecting collected products and classifying them into predefined categories […]."* (Assavapokee & Wongthatsanekorn, 2012: 136) • *"[…] the returns are inspected and classified into three groups: scraps, disposal, and reusable parts."* (Tuzkaya & Gülsün, 2008:340) • *"[…] returned products are to be inspected for their quality and then they are segregated in two categories."* (Kannan *et al.* 2016:5) • *"[…] inspection […] result in splitting the flow of used products according to distinct reuse (and disposal) options."* (Sasikumar & Kannan, 2008a:160)
Grading	None	• *"[…] needs for […] grading of return products, addressing uncertainty of return products […]."* (Ayvaz *et al.* 2015:319) • *"Inspection denotes all operations determining whether a given product is in fact re-usable and also grading it."* (Srivastava & Srivastava, 2006:530)
Disassembly	Sasikumar and Kannan (2008a:160) Gu and Tagaras (2014:5155)	• *"The inspected products can be disassembled into components."* (Alumur *et al.* 2012:68) • *"[…] the inspectors […] disassemble it and begin the […] inspection process."* (Genchev, 2009:145) • *"[…] assessing the condition and quality of the product […] begins with the product disassembly."* (Khor & Udin, 2013:74) • *"[…] inspection, disassembly, […] and testing to ensure it meets the desired product standards."* (Östlin *et al.* 2008:336) • *"After disassembly and inspection operations […]."* (Salema *et al.* 2010:339) • *"[…] for establishing returns classifications procedures; complete disassembly […] and visual inspection are […] employed in practice for used products quality evaluation."* (Zikopoulos & Tagaras, 2015:436)
Testing of products	Kongar *et al.* (2015:59) Suyabatmaz *et al.* (2014:75) Zikopoulos and Tagaras (2015:436) Östlin *et al.* (2008:336) Ponce-Cueto *et al.* (2011:108) Toyasaki *et al.* (2013:1219) Zandieh and Chensebli (2016:2)	• *"[…] testing returned product, that can identify the type of activities […] considered."* (Dhib *et al.* 2016:376) • *"[…] needs for testing […] of return products, addressing uncertainty of return products […]."* (Ayvaz *et al.* 2015:319) • *"Those parties would first do testing and inspection on the returned vehicle. If the vehicle is in good condition […]."* (Chan *et al.* 2012:1323) • *"[…] testing […] including electrical and visual inspection of the device and its components."* (Hahler & Fleischmann, 2013:3) • *"Inspection […] may encompass […] testing […]."* (Sasikumar & Kannan, 2008a:160)
Storage	None	• *"Inspection […] may encompass […] storage steps."* (Sasikumar & Kannan, 2008a:160)

Source: Compiled by the researcher

Table 5.7 shows that the only information flow of inspection includes verification of information, while all other activities involve product flows, including product evaluation, determine disposition/exit options, product classification, grading, disassembly, testing and storage. As emphasised in the links between inspection and CRR, gatekeeping and processing (see section 5.5.1.1), inspection involves the *verification of information* to identify the accuracy of information provided by consumers during the CRR and confirming the legitimacy of the returned product needed for return authorisation and issue of a credit/refund. Consequently, inspection can play an important role in online retailing, eliminating unnecessary and fraudulent returns.

The main product flow activities of inspection include product evaluation, disposition decisions and product classification since other activities might be excluded because of the influence of product type and quality on inspection (see section 5.5.1.1). For example, both clothing and electronic products require product evaluation, disposition decisions and classification, but only electronic products will include testing and disassembly assembly activities. As a main inspection activity, *product evaluation* involves the identification of product condition and quality to *determine the* more appropriate *disposition/exit option*. Resultingly, returned products can be *classified* based on the disposition decisions, for example, *reusable* and non-reusable groups. Similarly, the *grading* activity might be present in inspection to classify returned products based on their quality condition (such as high quality, acceptable quality or low quality).

As indicated, *disassembly*[11] and *testing* activities during inspection mostly associate with specific product categories, for example, a faulty cell phone requires disassembly and testing to identify the faulty part (see section 5.5.1.1). Furthermore, testing can be an important part of the main product evaluation activity, facilitating with effective identification of the product condition (i.e. working or in faulty condition). Finally, *storage* might be an important activity in inspection either keeping grouped products in separate spaces or keeping disassembled parts in storage units to prevent loss. In the next section, the facilities used for inspection will be discussed.

5.5.1.3 Facilities used for the inspection process of consumer returns

In this section, the facilities that can be used for the inspection process will be identified. Table 5.8 provides an overview of the findings related to the *facilities used for the inspection process of consumer returns*, including details on the inspection facilities, supporting sources and key quotations to support the discussion of the findings.

[11] Sasikumar and Kannan (2008a:160) described disassembly as a method of splitting a product into parts and components.

Table 5.8 Findings related to the facilities used for the inspection process of consumer returns

FACILITIES	SUPPORTING SOURCES	KEY QUOTATIONS
Retail stores/ collection points	Agrawal and Choudhary (2014:15) Srivastava and Srivastava (2006:530)	• *"[…] initial collection points […] inspection of returned products is carried out during this stage."* (Sasikumar *et al.* 2010:1225) • *"[…] inspection of returns can be handled at the retail level […] may be immediately returned to the shelf for resale."* (Ruiz-Benítez *et al.* 2014:55)
Warehouses	Abraham (2011:218) Konstantaras *et al.* (2010:452-453) Lee *et al.* (2012:5617) Luitel *et al.* (2014:86)	• *"Direct flow to warehouse […] where an inspection is performed to determine their condition."* (Mazahir *et al.* 2011:100)
Collection facilities	Dhib *et al.* (2016:376) Fattahi and Govindan (2016:6) Ghezavati and Beigi (2016:3) Kannan *et al.* (2016:5) Pishvaee *et al.* (2010:270) Pourmohammadi *et al.* (2008:5) Yu and Solvang (2016:4) Zandieh and Chensebli (2016:2)	• *"[…] inspecting […] at dedicated collection centre."* (Luitel *et al.* 2014:86)
Processing facilities	Assavapokee and Wongthatsanekorn (2012:137) Mutha and Pokharel (2009:336)	• *"[…] the central processing facility inspects […] the returns after which they are reintroduced into the marketplace."* (Ruiz-Benítez *et al.* 2014:56)
CRCs	Min *et al.* (2006:58), Ni *et al.* (2014:312) Rogers *et al.* (2012:108) Sasikumar *et al.* (2010:1225)	• *"In the CRCs, the returns are inspected […]."* (Tuzkaya *et al.* 2011:4545)
Inspection centres	Alumur *et al.* (2012:72) Ayvaz and Bolat (2014:35) Ghezavati and Beigi (2016:3) Pishvaee *et al.* (2010:270)	• *"These returned products are collected in specific centers [sic] and quality inspection operation is performed […]. These locations are […] inspection centers [sic] […]."* (Zandieh & Chensebli, 2016:2)
Disassembly facilities	El-Sayed *et al.* (2010:424) Kumar *et al.* (2016:4) Salema *et al.* (2010:339)	• *"[…] used products are […] shipped to disassembly centers [sic] where inspection, sorting, and disassembly operations are performed."* (Aras *et al.* 2008:1224)
Repair facilities	Ko and Evans (2007:350)	• *"[…] repair facilities where returned products […] were inspected […]."* (Min & Ko, 2008:176)

Source: Compiled by the researcher

Table 5.8 shows that the inspection process involves various facilities, which can be classified as (1) traditional FL facilities, (2) RL facilities and (3) recovery facilities. The *traditional FL facilities* used for inspection include retail stores (used as collection points in multi/omnichannel retailing) and warehouses, which emphasise the influence of channel type on inspection locations. Evidently, multi/omnichannel retailers can use their *stores* for inspection, while online-only retailers must use their facilities, like *warehouses*, for returned product inspection. Additionally, using warehouses for inspection demonstrates that online retailers can choose to perform RL processes in the same facilities used for forward operations.

Alternatively, *RL process facilities* can be used for inspection, including collection facilities, processing facilities, CRCs, inspection and disassembly facilities, which can demonstrate various inspection characteristics and activities. Using *collection facilities* and *processing facilities* for inspection demonstrates the links between inspection and collection and inspection and processing processes. The use of *CRCs* (specialised return facilities) and dedicated *inspection facilities* for inspection, emphasise the inspection characteristics of complexity, importance and need for skilled/trained staff (see section 5.5.1.1). Furthermore, using *disassembly facilities* for inspection, emphasise the disassembly and testing activities in inspection (see section 5.5.1.2).

Finally, using *recovery facilities*, like *repair facilities*, for inspection emphasise the links between

inspection and disposition processes and the inspection activities, involving disposition decisions, and disassembly and testing (also activities in repair discussed in section 5.6.3).

In the next section, the final category in inspection, namely the parties, will be presented and discussed.

5.5.1.4 Parties associated with the inspection process of consumer returns

In this section, the various parties involved in the inspection process will be explored. Table 5.9 provides an overview of the findings related to the *parties associated with the inspection process of consumer returns*, including details on the parties, sources to support the identified parties and key quotations to support the discussion of the findings.

Table 5.9 Findings related to the parties in the inspection process of consumer returns

PARTIES	SUPPORTING SOURCES	KEY QUOTATIONS
Consumers	Orboobadi (2009:834)	• *"The electronic profile […] following customers' requests to return product(s) proves invaluable in the inspection process."* (Genchev, 2009:145) • *"[…] customers return their used products […] which are located nearer to them. The inspection of returned products is carried out during this stage."* (Sasikumar *et al.* 2010:1225)
Retailers	Ni *et al.* (2014:312, 313) Ruiz-Benítez *et al.* (2014:55) Stock and Mulki (2009:53)	• *"[…] retailer […] recover the value from a returned product […] after inspection […]."* (Chen & Chen, 2015:3) • *"[…] online retailers […] are involved in […] verifying and inspecting the merchandise […]."* (Griffis *et al.* 2012:287) • *"Once customers return the products to retailers, they are shipped to a location for inspection."* (Orboobadi 2009:834)
Staff/department	Assavapokee and Wongthatsanekorn (2012:136) Sasikumar *et al.* (2010:1228)	• *"[…] returns inspection is the most complicated […] and related disposition options have to be accounted for by returns inspectors."* (Genchev, 2009:142) • *"The electronic profile created by customer service […] proves invaluable in the inspection process."* (Genchev, 2009:145) • *"[…] stations or physical locations are set up in the facility handling the product returns where personnel evaluate each item being returned."* (Stock & Mulki, 2009:34)
Third parties	Agarwal *et al.* (2016:5) Bai and Sarkis (2013:313) Kannan (2009:399) Prakash and Barua (2016a:70) Mazahir *et al.* (2011:100)	• *"The 3PRL partner has to deal with […] activities like […] inspection […]."* (Prakash & Barua, 2016b:64) • *"3PL's […] operations […] where the inspection […] is held […] of the products that are recoverable."* (Suyabatmaz *et al.* 2014:77) • *"The 4PL […] putting more efforts in […] quality inspection […]."* (Mukhopadhyay & Setaputra, 2006:725)

Source: Compiled by the researcher

Table 5.9 shows the parties associated with inspection include consumers, retailers, staff/departments and third parties. *Consumers* can play secondary roles in the inspection process by providing information during the CRR process that must be verified in during inspection, reemphasising the link between inspection and CRR. Additionally, consumers can act as suppliers by taking used products to locations that perform return product inspection.

Retailers can play both primary and secondary roles in the inspection process. As a primary role, retailers conduct inspection internally at any locations, and as a secondary role, retailers can send returned products to other facilities (such as CRCs) for inspection. Playing a secondary role indicates that retailers can either outsource the inspection process or send consumer product returns to suppliers for inspection. Likewise, the s*taff/departments* of retailers can play both primary and

secondary roles in the inspection process. Particularly, *inspectors* (dedicated inspection staff) play primary roles, responsible for main inspection activities (e.g. product evaluation, disposition decisions, testing and grading). Contrastingly, customer service staff can play secondary roles in capturing CRR information to be verified during inspection.

Finally, *third parties*, including 3PL, 3PRL and 4PL providers, can play direct roles, performing inspection activities on behalf of the retailer. Using third parties to conduct inspection, emphasise the complexity and importance of inspection (see section 5.5.1.1). The next section concludes the inspection process of consumer returns with a description.

5.5.1.5 Description of the inspection process of consumer returns

Based on the findings presented in section 5.5.1, inspection can be an important post-receipt RL process of consumer returns, and will be described as follows:

> The inspection process of consumer returns can be described as an important, complex, labour-intensive and time-consuming RL process, which (1) requires skilled/trained staff, (2) involves costs, (3) can be influenced by product and return type, product quality, channel type and return policy, and (4) can be linked with other pre- and post-receipt RL processes, especially sorting. The activities of the inspection process involve the (1) information flow activity of verification of information provided by consumers/customer service department, and (2) product flow activities of product evaluation, determining disposition/exit options, product classification, grading, disassembly, testing and storage, which can be performed by the inspectors of the online retailer and/or 3P(R)L or 4PL providers in traditional FL facilities (such as warehouses), RL process facilities (CRCs and collection, processing, inspection and disassembly facilities) or recovery facilities (such as repair facilities).

The conceptual framework that relates to the description of inspection, will be illustrated in section 5.5.3. In the next section, the findings related to the sorting process in RL will be presented and discussed.

5.5.2 Sorting process of consumer returns

In this section, the findings and interpretation of the findings related to the sorting process of consumer returns will be presented and discussed. The categories identified from the QCA of RL literature, included the (1) characteristics of sorting, (2) activities in sorting, (3) facilities used for sorting and (4) parties involved in the sorting process, which will be presented and discussed in subsequent sections, and concluded with a description.

5.5.2.1 Characteristics of the sorting process of consumer returns

In this section the characteristics of sorting will be discussed. Table 5.10 provides an overview of the findings related to the *characteristics of the sorting process of consumer returns*, including detail on the characteristics, sources to support the characteristics and key quotations to support the discussion of the findings.

Table 5.10 Findings related to the characteristics of the sorting process of consumer returns

CHARACTERISTICS	SUPPORTING SOURCES	KEY QUOTATIONS
Important and complex process	None	• *"Sorting […] is a crucial step in the reverse logistics process because employees make decisions on what ultimately happens to the returned product."* (Agrawal & Choudhary, 2014:15) • *"[…] sorting […] is innovative and difficult to set up […]."* (El Korchi & Millet, 2011:594)
Labour intensive	Bai and Sarkis (2013:308) De Leeuw *et al.* (2016:723) Narayana *et al.* (2014:395) Srivastava and Srivastava (2006:529)	• *"[…] the most labor [sic] intensive process […] is the manual sorting […]."* (Hsu *et al.* 2009:519)
Time-consuming	De Leeuw *et al.* (2016:723) Hsu *et al.* (2009:519)	• *"It is also time-consuming to perform the sorting."* (Sundin & Dunbäck, 2013:6)
Requires skilled/trained staff	None	• *"Manpower is skilled for […] sorting […]."* (Srivastava & Srivastava, 2006:529) • *"[…] sorting […] must be properly done and […] personnel should be informed and educated, so that money not wasted […]."* (Subhashini, 2016:2) • *"[…] experienced/trained sorters […]."* (Hsu *et al.* 2009:523)
Involves costs	El-Sayed *et al.* (2010:424) Toyasaki *et al.* (2013:1219)	• *"[…] these include […] sorting costs […]."* (Kumar *et al.* 2016:4) • *"[...] retailer incurs a unit reverse logistics cost [...] for sorting [...]."* (Alptekinoglu & Grasas, 2014:879)
Influenced by product type and characteristics	Abraham (2011:224) Rogers *et al.* (2012:111)	• *"[…] sort […] activity […] separate different product categories (e.g., fashion and consumer electronics […]."* (Asdecker, 2015:3) • *"[…] sorted […] based on their specific physical characteristics such as weight, size, shape, density, […]."* (De Oliveira *et al.* 2012:1604)
Influenced by product quality, condition and return type	El Korchi and Millet (2011:590) Gu and Tagaras (2014:5156) Kongar *et al.* (2015:57) Lhafiane *et al.* (2015a:1830) Rogers *et al.* (2012:111) Suyabatmaz *et al.* (2014:75, 77)	• *"The quality or condition of returned products […] is required for sorting the products into different categories."* (Agrawal *et al.* 2016a:934) • *"[...] by taking into consideration return quality, which is related to sorting […]."* (Ayvaz & Bolat, 2014:33) • *"[…] some products in bad condition are sorted in a longer time […]."* (Kara & Onut, 2010:718) • *"In order to decrease or even eliminate the uncertainty associated with returns quality, […] may establish a sorting operation [...]."* (Zikopoulos & Tagaras, 2015:438) • *"[…] can be classified […] into categories […] defective merchandise […] end-of-life merchandise […]."* (Hsu *et al.* 2009:519) • *"[…] damaged merchandise […] for this is the manual sorting that takes place […]."* (Hsu *et al.* 2009:525) • *"[…] sorting for […] warranty returns."* (Janse et al. 2010:510)
Linked to the gatekeeping process	Lhafiane *et al.* (2015b:399)	• *"[…] must then examine the item in view of deciding how to treat it […] to undertake a cross-verification […] given at gatekeeping."* (Lambert *et al.* 2011:562)
Linked to the collection process	Agrawal *et al.* (2015:86) Agrawal *et al.* (2016b:93) Kara and Onut (2010:718) Luitel *et al.* (2014:86) Srivastava and Srivastava (2006:528) Suyabatmaz *et al.* (2014:77)	• *"[…] Sorting […] may be carried out either at the point/ time of collection itself or afterwards."* (Agrawal & Choudhary, 2014:15) • *"Used items are collected from customers and brought to a warehouse facility where […] sorting […] occurs."* (Konstantaras *et al.* 2010: 453) • *"[…] returned product is collected […] for sorting […]."* (Baker & Zabinsky, 2008:252) • *"The collector is responsible not only for collecting but also for sorting […]."* (Gu & Tagaras, 2014:5169)
Linked to the transportation process	Chari *et al.* (2016:2) Silva *et al.* (2013:379) Stock and Mulki (2009:41) Suyabatmaz *et al.* (2014:77) Tuzkaya and Gülsün (2008:346)	• *"After used products […] are shipped […] sorting, and disassembly operations are performed."* (Aras *et al.* 2008:1224) • *"[…] returned product is […] transported […] for sorting […]."* (Barker & Zabinsky, 2008:252) • *"The transportation […] in sorting activities […]."* (Hsueh & Lin, 2015:164) • *"[…] are sorted […] and then shipped to their next destination."* (Jayaraman *et al.* 2008:416) • *"Some of them are sorted […] and then transported […]."* (Kara & Onut, 2010:718) • *"The initial sorting […] must be properly done […] so that money not wasted on unnecessary transportation."* (Subhashini, 2016:2)
Linked to the receiving process	De Leeuw *et al.* (2016:723) Li and Olorunniwo (2008:382) Shaik and Abdul-Kader (2014:97)	• *"[...] receives returns [...] and [...] sorts […] products […]."* (Zuluaga *et al.* 2016:2) • *"A preliminary sorting first occurs upon reception of the returned product […]."* (Lambert *et al.* 2011:568-570)
Linked to the processing process	Agrawal and Choudhary (2014:15) Baker and Zabinsky (2008:252) Jayaraman *et al.* (2008:416) Shaik and Abdul-Kader (2014:97) Suyabatmaz *et al.* (2014:75)	• *"[…] sorted into specific product categories before promoted for processing."* (Achillas *et al.* 2010:2594) • *"[…] sort […] activity prepares the efficient processing of incoming items."* (Asdecker, 2015:3) • *"[…] initial sorting and by making decisions on processing […]."* (Stock & Mulki, 2009:53) • *"[…] the products are sorted, processed and shipped to their next destination."* (Tuzkaya & Gülsün, 2008:346)
Linked to the inspection process	Abraham (2011:218) Agrawal *et al.* (2016b:93) De Leeuw *et al.* (2016:723) De Oliveira *et al.* (2012:1604) El-Sayed *et al.* (2010:424) Ghezavati and Beigi (2016:4)	• *"[...] include [....] inspection and sorting [...]."* (Kumar *et al.* 2016:4) • *Inspection/ Sorting is the next stage which may be carried out […]."* (Agrawal & Choudhary, 2014:15) • *"[…] inspection of each item is required for sorting the products into different categories."* (Agrawal *et al.* 2016a:934) • *"[…] where inspection, sorting, and disassembly operations are performed."* (Aras *et*

Source: Compiled by the researcher

Table 5.10 shows that, like the inspection process, the characteristics of the sorting process can be classified as general, requirement and involve characteristics, influenced by characteristics and linked with characteristics. Particularly, the *general characteristics* of the sorting process include *important, complex*, *labour-intensive* and *time-consuming*. The *importance* and *complexity* of sorting stems from the need to determine the appropriate outcome of the returned product. Additionally, sorting can be *labour intensive* and *time-consuming* since manual labour is needed to sort returned products effectively. Consequently, the *requirement characteristic* of the sorting process includes the need for *skilled/trained staff* to effectively perform sorting activities and avoid unnecessary and costly mistakes (e.g. sorting a new/unused product into the destinated for recovery group). Evidently, the *involve characteristic* of costs demonstrate that the sorting process can be costly and involve cash outflows in the RL process.

The *influenced by characteristics* of the sorting process include product type, characteristic, quality and condition and return type, which associate with the physical sorting of products into groups. For example, clothing and electronic products will be sorted into separate groups, products of the same weight and size will be sorted into the same group, high-quality and low-quality products will be sorted into separate groups, and defective products (from defective or warranty returns) and new/unused products (from unwanted returns) will be sorted into separate groups. Subsequently, the

influenced by characteristics of sorting emphasise the importance, complexity, labour intensive, time consuming and skilled staff characteristics of sorting.

Finally, the *linked with characteristics* of the sorting process involve links with most *pre-receipt RL processes*, including gatekeeping, collection and transportation, and all *post-receipt RL processes*, including receiving, processing, inspection, disposition and redistribution. Particularly, the links between sorting and other RL processes can be explained by (1) flows, (2) related/shared activities, (3) related/shared facilities and parties, and (4) occurring more than once, during or at the same time as other RL processes. Specifically, the link between sorting and the *gatekeeping process* involves information flows and the related activity of verification of information. The link between sorting and the *collection process* involves products flows, shared parties (e.g. collectors performing sorting activities), shared facilities/locations (e.g. collection points/facilities) and sorting occurring at the time of collection or after collection. The link between sorting and the *transportation proces*s relates to product flows and the transportation/shipment of returned products, which can occur (1) before sorting (e.g. a damaged product transported from the consumer to the warehouse for sorting) or (2) after sorting (e.g. damaged product sorted into the repair group for transportation to a repair facility).

The link between sorting and the *receiving process* involves product flows and preliminary sorting taking place at the receiving dock of a facility (see section 5.3) and taking place after receiving within a facility. Furthermore, the link between sorting and the *processing process* involves product flows with sorting occurring before processing (e.g. preliminary sorting at the receiving dock) and after processing in the facility. Alternatively, organisations might opt to perform sorting activities before issuing refunds. Apart from the shared activity of verification of information that involves information flows, the links between sorting and the *inspection process* involves product flows, relating to shared activities (e.g. product classification) and sorting occurring before or directly after inspection. Additionally, sorting and the inspection process share several characteristics, facilities and parties, explaining the view that sorting and inspection can represent a single RL process. The links between sorting and inspection will further be explored in the subsequent sections and shared conceptual framework presented in section 5.5.3.

The link between sorting and the *disposition process* involves product flows and relates to (1) disposition decisions and product classification as sorting activities (e.g. sorting products according to disposition/exit option) and (2) sorting occurring before disposition. Similarly, the link between sorting and the *redistribution process* involves product flows and relates to the sorting activity of classifying products according to exit options (e.g. sell in the secondary market) and sorting taking place in a redistribution facility, before redistribution (to the secondary market). In the next section, the activities of sorting will be discussed.

5.5.2.2 Activities of the sorting process of consumer returns

In this section, some of the activities associated with the sorting process of consumer returns will be examined. Table 5.11 provides an overview of the findings related to the *activities of the sorting process of consumer returns*, including details on the sorting activities, supporting literature and key quotations to support the discussion of the findings.

Table 5.11 Findings related to the activities of the sorting process of consumer returns

ACTIVITIES	SUPPORTING SOURCES	KEY QUOTATIONS
Verification of information	Lhafiane *et al*. (2015b:399)	• *"[…] must then examine the item in view of deciding how to treat it […] to undertake a cross-verification […] given at gatekeeping."* (Lambert *et al*. 2011:562)
Updating information on systems	None	• *"The sorters' decisions on the levels of damages/desirability are an essential […] the sorting information is constantly updated to the database […]."* (Hsu *et al*. 2009:523)
Product evaluation	Shaik and Abdul-Kader (2014:97) Suyabatmaz *et al.* (2014:75) Zikopoulos and Tagaras (2015:438)	• *"[...] sorting [...] activities that evaluate the condition of the returned goods […]."* (Jayaraman *et al*. 2008:411) • *"[…] must then examine the item in view of deciding how to treat it."* (Lambert *et al*. 2011:562) • *"[…] analysing [sic] the returned products quality, during the sorting process […]."* (Lhafiane *et al*. 2015a:1830)
Determine disposition/exit options	Abraham (2011:218) Agrawal, *et al.* (2015:86) De Oliveira *et al.* (2012:1604) Konstantaras *et al.* (2010:452) Min and Ko (2008:179) Rogers *et al.* (2012:108) Silva *et al.* (2013:379) Beh *et al.* (2016:6) Daaboul *et al.* (2014:3) De Oliveira *et al.* (2012:1604) Shaik and Abdul-Kader (2014:97) Hsu *et al.* (2009:523) Suyabatmaz *et al.* (2014:75) Lhafiane *et al.* (2015b:397; 399)	• *"[...] sorting [...] determine the most appropriate mode of disposition i.e. reuse, recycle or remanufacture."* (Jayaraman *et al*. 2008:411) • *"Sorting […] refers to deciding what to do with each product […] that will be […] sold or disposed. It is a crucial step in the reverse logistics process because employees make decisions on what ultimately happens to the returned product."* (Agrawal & Choudhary, 2014:19) • *"[…] sorted […] and a disposition decision is made."* (Rogers *et al*. 2012:111) • *Detailed sorting […] decides the fate of each returned item."* (Lambert *et al*. 2011:562) • *"[…] the sorting process […] must […] identify the treatment option."* (Lhafiane *et al*. 2015a:1830)
Product classification and grouping	Agrawal and Choudhary (2014:19) Agrawal *et al.* (2015:77) Agrawal *et al.* (2016b:93) Agrawal *et al.* (2016c:41) Agrawal et al. (2016a:934) Asdecker (2015:3) Chan *et al.* (2012:1329) Kinobe *et al.* (2015:89) Li and Olorunniwo (2008:384) Shaik and Abdul-Kader (2014:97) El Korchi and Millet (2011:590) Gu and Tagaras (2014:5156) Pishvaee *et al.* (2010:270) Tan and Kumar (2006:339) Zandieh and Chensebli (2016:6) Hsu *et al.* (2009:519) Konstantaras *et al.* (2010:452) Zikopoulos and Tagaras (2015:436)	• *"[…] classification is simply a sorting process."* (Shi *et al*. 2012:219) • *"[…] grouping of the collected products based on subsequent operations […]."* (De Oliveira *et al*. 2012:1604) • *"[…] they are divided into recoverable products and scrapped products."* (Ghezavati & Beigi, 2016:4) • *"[…] sorted into specific product categories […]."* (Achillas *et al*. 2010:2594) • *"[…] sort the goods according to potential sale value […]."* (Abraham, 2011:218)
Separation	Kinobe *et al.* (2015:83) Fehr and Santos (2013:291)	• *"Sortation and separation can make RL activities very labor [sic] intensive […]."* (Bai & Sarkis, 2013:308) • *"[…] separation and sorting are conducted."* (Bing *et al*. 2014:128) • *"Typical sorting processes include […] separation […]."* (De Oliveira *et al*. 2012:1593)
Storing	Agrawal and Choudhary (2014:19) Chan *et al.* (2012:1329)	• *"Sorting and storing […] each product […]."* (Shaik & Abdul-Kader, 2014:97) • *"[…] returned products […] sorted for potential repair […] stored long enough to create volume for freight consolidation."* (Min & Ko, 2008:179) • *"[...] most sorting processes happen during storage."* (Zhou *et al*. 2007:64) • *"[...] sorts and keeps products in stock until they are assigned and sent to a secondary channel."* (Zuluaga *et al*. 2016:2)
Moving products	None	• *"The sorting processes take up the majority of time in moving the returned product through the reverse logistics process."* (Hsu *et al*. 2009:523)

Source: Compiled by the researcher

Table 5.11 shows that sorting includes the (1) information flow activities of verification of information and updating sorting information, and (2) product flow activities of product evaluation, determine disposition/exit options, product classification and grouping, separation, storage and movement. Evidently, the sorting and inspection process share several activities, including verification of information, product evaluation, determine disposition option, product classification and storage, which reemphasise the intricate link between sorting and inspection.

However, if inspection and sorting take place separately, some shared activities might be excluded from inspection and sorting. For example, if the inspection involves the *information flow activity* of *verification of information* to confirm the accuracy of information captured during gatekeeping, sorting might exclude verification of information. Nonetheless, the unique sorting activity of *updating sorting information* on a database illustrates that sorting involve information flows in the RL process.

Similarly, for the *product flow activities,* sorting might exclude product evaluation if inspection was conducted, and inspection might exclude product classification if sorting is conducted. Alternatively, the product type and condition might dictate the required activities in each process. For example, a defective electronic product requires full product evaluation performed by the inspector and a new/unused clothing item requires quick visual *evaluation* performed by the sorter, reemphasising the influence of product type, condition and return type on both inspection and sorting processes.

Nevertheless, the dominant activities in the sorting process involve *determining the disposition/exit options* and *classifying* and *grouping products* according to their disposition/exit options (e.g. return to stock, repair and destroy). Consequently, the sorting process involves *separation* of products, for example, separating unused clothes from used clothes, which emphasise the labour-intensive characteristic of sorting. In terms of *storage,* sorted products might be stored for a period before disposition or until sufficient products can be consolidated for cost-effective transportation, emphasising the link between sorting and transportation processes. Finally, *product movement* relates to the transfer of products to and from the sorting areas in the facility (e.g. from inspection to sorting and from sorting to storage) and movement of products during sorting (e.g. while grouping and separating products). Consequently, both storage and product movement activities emphasise that sorting can be a time-consuming process that predominantly involves product flows (see section 5.5.2.1).

In the next section, the findings related to the facilities used for sorting will be presented and discussed.

5.5.2.3 Facilities used for the sorting process of consumer returns

Several facilities can be used for the sorting process in RL, which will be identified and discussed in the rest of the section. Table 5.12 provides an overview of the findings related to *the sorting process of consumer returns*, including details on the sorting facilities, supporting literature and key quotations to support the discussion of the findings.

Table 5.12 Findings related to the facilites used for the sorting process of consumer returns

FACILITIES	SUPPORTING SOURCES	KEY QUOTATIONS
Stores or collection points	Agrawal and Choudhary (2014:15)	• *"Sorting may be carried out either at collection points […]."* (Srivastava & Srivastava, 2006:528) • *"[…] sorting takes place at the store […]."* (Hsu *et al.* 2009:523)
Warehouses	Luitel *et al.* (2014:86)	• *"Used items are […] brought to a warehouse facility where sorting […] occurs."* (Konstantaras *et al.* 2010:452-453)
Collection facilities	Baker and Zabinsky (2008:254) Kara and Onut (2010:718) Luitel *et al.* (2014:86) Subhashini (2016:9) Toyasaki *et al.* (2013:1219)	• *"[…] returned products are sorted in the collection center [sic] […]."* (Alshamsi & Diabat, 2015:590) • *"[…] products are sorted […] at […] the collection site […]."* (Baker & Zabinsky, 2011:560) • *"Sorting may be carried out […] at collection […] facilities […]."* (Srivastava & Srivastava, 2006:528)
Inspection centres	Ghezavati and Beigi (2016:3)	• *"[…] sorting […] in inspection centers [sic] […]."* (Ayvaz & Bolat, 2014:33)
Centralised return centre (CRC)	Baker and Zabinsky (2011:560) Min *et al.* (2006:58) Rogers *et al.* (2012:111) Tuzkaya and Gülsün (2008:346)	• *"[…] returned product is […] transported to a central facility for sorting […]."* (Baker & Zabinsky, 2008:252) • *"[…] the manual sorting that takes place once the merchandise reaches the CRC."* (Hsu *et al.* 2009:525) • *"Once a product is returned to the retailer, it should be sent to a centralised return centre (CRC) where they are sorted […]."* (Jayaraman *et al.* 2008:417)
Processing facilities	None	• *"[…] processing facility, where employees […] sort these products into different categories […]."* (Li & Olorunniwo, 2008:384) • *"[…] processing centers [sic] […] are responsible for […] sorting […]."* (Lu & Bostel, 2007:301-302)
Disassembly facilities	El-Sayed *et al.* (2010:424)	• *"[…] used products are […] shipped to disassembly centers [sic] where […] sorting […] operations are performed."* (Aras *et al.* 2008:1224) • *"Disassembly locations [...] include [....] sorting [...]."* (Kumar *et al.* 2016:4)
Refurbish facilities	None	• *"Sorting […] take place at the refurbishing site."* (Gu & Tagaras, 2014:5156)
Redistribution facilities	None	• *"A reverse distribution center [sic] [...] receives returns [...] and [...] sorts […] products […]."* (Zuluaga *et al.* 2016:2)

Source: Compiled by the researcher

Table 5.12 shows that the sorting process involves various facilities, which can be classified as (1) traditional FL facilities, (2) RL facilities, (3) recovery facilities and (4) exit facilities. Like inspection, the *traditional FL facilities* used for sorting include retail stores (used as collection points) and warehouses, implying that the channel type (influenced by characteristic of inspection) might also influence the sorting process.

Additionally, sorting involves the same *RL process facilities* used for inspection, including collection facilities, processing facilities, CRCs, inspection and disassembly facilities, which not only demonstrate the links between sorting and inspection but sorting and other processes. For example, using *collection facilities* and *processing facilities* for sorting establishes the links between sorting and collection and sorting and processing processes. Moreover, the use of *CRCs* and dedicated *inspection facilities* for sorting, emphasise the complexity and skilled/trained staff characteristics of sorting. Additionally, using *disassembly facilities* for sorting, demonstrates the possibility of sorting

product parts after disassembly (inspection activity), for example, separating defective and non-defective parts of electronic products.

In terms of *recovery facilities*, sorting can take place at *refurbishment facilities*, which demonstrate that sorting can occur at the disposition point, emphasising the link between the sorting and disposition process. Finally, sorting associate with *redistribution facilities* as *exit facilities* in the RL process, which emphasises the link with sorting and the redistribution process. Subsequently, the facilities that can be used for sorting shows that sorting can take place at various stages in the RL process, from initial facilities (e.g. collection points) to exit facilities, indicating the importance of sorting as post-receipt RL process of consumer returns.

In the next section, the parties involved in the sorting process will be discussed.

5.5.2.4 Parties associated with the sorting process of consumer returns

In this section, the parties involved with the sorting process of consumer returns will be explored. Table 5.13 provides an overview of the findings related to the *parties associated with the sorting process of consumer returns*, including details on the sorting parties, supporting literature sources and key quotations to support the discussion of the findings.

Table 5.13 Findings related to the parties involved in the sorting process of consumer returns

PARTIES	SUPPORTING SOURCES	KEY QUOTATIONS
Consumers	None	• *"[…] from customers […] products […] are sorted […]."* (Kara & Onut, 2010:718) • *"Used items are collected from customers and brought to a warehouse facility where […] sorting […] occurs."* (Konstantaras *et al.* 2010:453)
Retailers	Cardoso *et al.* (2013:445) Stock and Mulki (2009:53)	• *"[...] retailer incurs a unit reverse logistics cost [...] for sorting [...]."* (Alptekinoglu & Grasas, 2014:879) • *Once a product is returned to the retailer, it should be […] sorted […]."* (Jayaraman *et al.* 2008:411)
Staff	Kinobe *et al.* (2015:83) Li and Olorunniwo (2008:384)	• *"The sorter […] responsible for sorting activities."* (Daaboul *et al.* 2014:4) • *The sorting processes take up the majority of time in moving the returned product […] by well-managed […] experienced/trained sorters […]."* (Hsu *et al.* 2009:523) • *"The sorters' decisions on the levels of damages/desirability are an essential stepping stone of the whole reverse logistics process."* (Hsu *et al.* 2009:523) • *"Sorting […] is a crucial step in the reverse logistics process because employees make decisions on what ultimately happens to the returned product."* (Agrawal & Choudhary, 2014:19) • *"[…] employees doing the sorting […]."* (Wilcox *et al.* 2011:88) • *"[…] sorting […] must be properly done […] so the store personnel should be informed and educated […]."* (Subhashini, 2016:2)
Third parties	Prakash and Barua (2016b:64)	• *"[…] traders sort the goods […]."* (Abraham, 2011:218) • *3PRL provider […] carries out the […] sorting […]."* (Agarwal *et al.* 2016:5) • *"The collector is responsible not only for collecting but also for sorting […]."* (Gu & Tagaras, 2014:5169) • *"3PL's […] operations […] where inspection/sorting is held, consolidation of the products that are recoverable."* (Suyabatmaz *et al.* 2014:77)

Source: Compiled by the researcher

Table 5.13 shows the parties associated with sorting include consumers, retailers, staff and third parties. *Consumers* can play secondary roles in sorting by taking used products to locations that perform sorting activities. Since sorting can involve verification of information captured during

gatekeeping (see section 5.5.2.2), consumers can play indirect roles by providing the verifiable information.

Retailers mostly play primary roles in the sorting process, which involve providing facilities for sorting, employing staff to physical sort returned products and incurring sorting costs, emphasising the sorting characteristic of involving costs. Particularly, retailers can employ specialised *staff*, like *sorters*, who play primary roles in the sorting process by performing sorting activities, like grouping products into appropriate categories for disposition. Using specialised sorting staff in the sorting process proves the importance, complexity and skilled/trained staff characteristics of sorting (see section 5.5.2.1). However, retailers might use *standard employees* (e.g. store staff of multichannel retailers) for basic sorting activities (e.g. separating, moving and storage).

Otherwise, retailers might play secondary roles by choosing to outsource the sorting process to *third parties*, like *3P(R)L providers* to perform sorting activities on their behalf. The possibility of using specialised third parties for sorting reconfirms the importance, complexity and skills requirement (characteristics) in sorting. However, other third parties, like *traders* (buyers of used products from retailers), can perform sorting activities (also see section 5.6.5.3), illustrating the link between the sorting and disposition process. The next section concludes the sorting process of consumer returns with a description.

5.5.2.5 Description of the sorting process of consumer returns

Based on the findings presented in section 5.5.2, sorting can be an important post-receipt RL process of consumer returns, and will be described as follows:

> The sorting process of consumer returns can be described as an important, complex, labour-intensive and time-consuming RL process, which (1) requires skilled/trained staff, (2) involves costs, (3) can be influenced by product type, characteristics, condition and quality, and return type, and (4) can be linked with other pre- and post-receipt RL processes, especially inspection. The activities of the sorting process involve the (1) information flow activities of verification of information from gatekeeping and updating sorting information, and (2) product flow activities of product evaluation, determining disposition/exit options, product classification and grouping, separation, storage and movement, which can be performed by sorters (or other staff) of the online retailer and/or 3P(R)L providers in traditional FL facilities (such as warehouses), RL processes facilities (such as CRCs and collection, processing, inspection and disassembly facilities), recovery facilities (such as refurbishment facilities) and exit facilities (such as redistribution facilities).

In the next section, the conceptual framework related to this description will be provided.

5.5.3 Conceptual framework of the inspection and sorting processes of consumer returns

From the discussions in section 5.5, the strong association between the inspection and sorting processes was established. While inspection and sorting involve unique elements, most characteristics, activities, facilities, parties and flows correspond. Accordingly, Figure 5.6 provides a

conceptual framework of the inspection and sorting processes in RL that may apply to consumer returns in online retailing. Particularly, the framework provides an overview of the inspection and sorting processes of consumer returns, illustrating the parties, facilities, flows, characteristics and activities. Specifically, the framework demonstrates the two specialised parties in the inspection and sorting processes, with the inspector representing the inspection process (all turquoise blocks) and the sorter representing the sorting process (all purple blocks). The shared partes, facilities, activities and characteristics are represented through turquoise/purple gradients. Subsequently, consumers, online retailers, third parties, FL and RL facilities and recovery/exit facilities can be involved in both processes. Furthermore, both inspection and sorting involve cash flows (shared characteristic of costs), information flows (shared characteristic of gatekeeping and activity of verification) and product flows (with various shared activities and characteristics) as well as share characteristics unrelated to the flows. Finally, the framework distinguishes between inspection and sorting, illustrating the unique characteristics and activities (inspection turquoise and sorting purple). Clearly, the framework reaffirms the interrelatedness of the inspection and sorting processes of consumer returns.

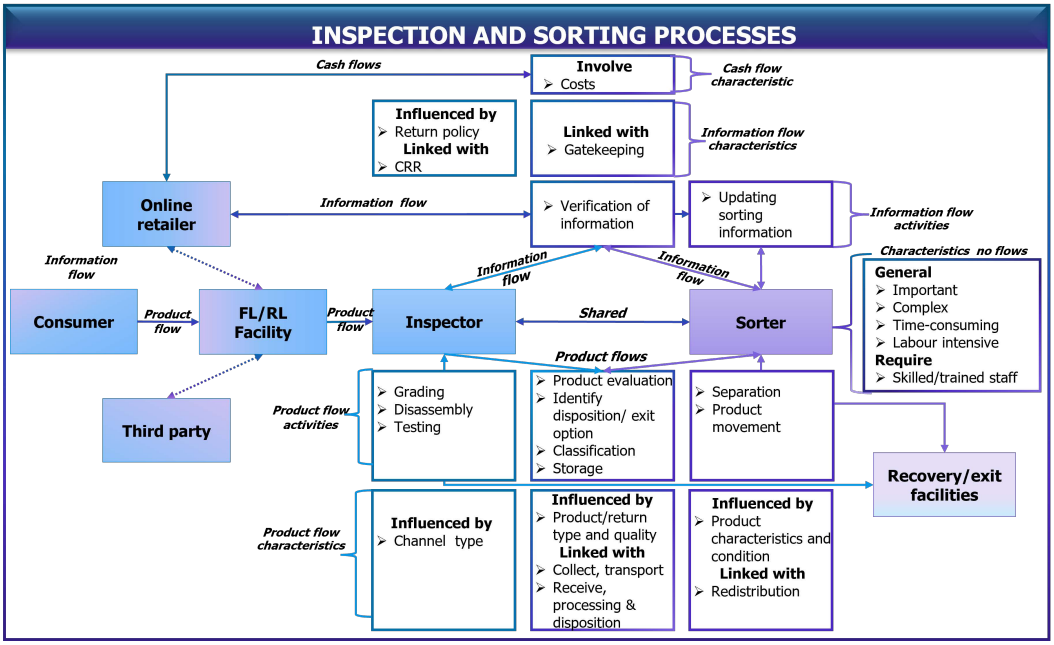

Figure 5.6 Conceptual framework of the inspection and sorting processes
Source: Compiled by the researcher

In the next section, the disposition process will be discussed and analysed.

5.6 DISPOSITION PROCESS OF CONSUMER RETURNS

In this section, the findings and interpretation of the findings related to the disposition process of consumer returns will be presented and discussed. The disposition process is not only the most widely discussed processes in literature (see Figure 5.3) but also include important outcomes. Due to

the vastness of content on the disposition process several subcategories were included in the coding framework for the QCA of RL literature (see Appendix A.2). Figure 5.7 provides an overview of the distribution of the subcategories of the disposition process based on the results of the QCA of RL literature (see Appendix C.3 for quantitative results), including general disposition processes and various disposition/exit options discussed in this section.

Figure 5.7 shows a distribution of the subcategories in the disposition process derived from code frequencies (number of quotations assigned to subcategories for the disposition process) of the QCA of RL literature. The pie chart clearly shows that most content on the disposition process is mostly evenly distributed, with refurbishment (27%) receiving the most attention, followed by repair (23%), general disposition process (19%) and exit options (18%). Reuse received the least attention in the content (13%), implying that more research can be conducted on reuse as a disposition option for consumer returns.

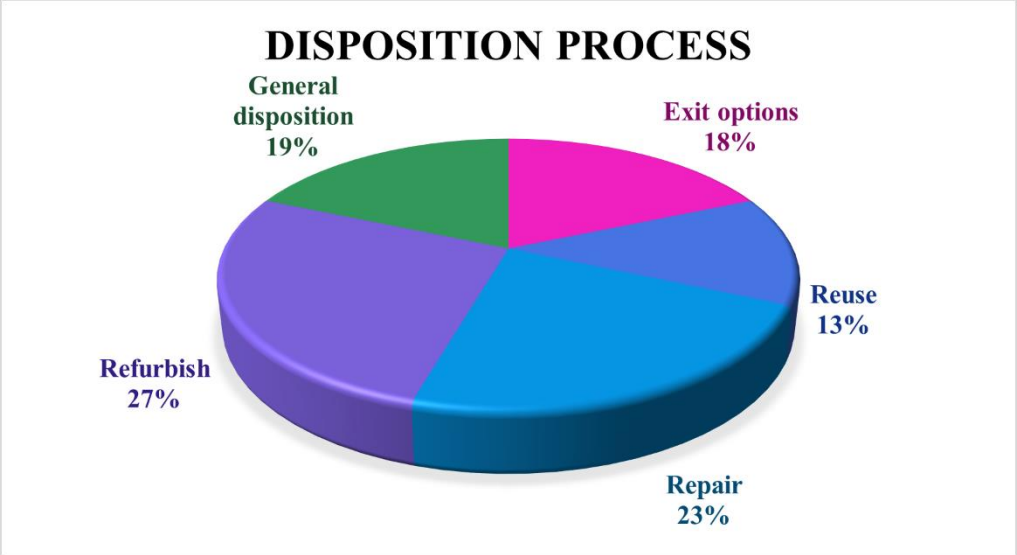

Figure 5.7 Distribution of disposition processes
Source: Compiled by the researcher

In the subsequent sections, the qualitative findings for each disposition process subcategory will be provided, including general disposition process, direct reuse, repair and refurbishment as disposition options[12], and exit options in the disposition process. While each disposition and exit option contains a description and conceptual framework, this section concludes with an overall description of the disposition process and conceptual framework for disposition as a post-receipt RL process of consumer returns.

[12] In section 4.2. a demarcation for the post-receipt RL processes was given, mentioning that only reuse, repair, refurbishment and several exit options were included in the findings. While other disposition options, like reconditioning, remanufacturing, recycling and disposal, can be possible, these options were excluded since they fall outside the scope of this study.

5.6.1 General disposition process of consumer returns

In this section the findings related to the disposition process in general will be given. Several categories were identified from the QCA of RL literature related to the disposition process, which included the (1) characteristics of disposition, (2) activities in disposition, (3) facilities used for disposition, (4) parties in disposition, and (5) outcomes of disposition. These categories of the disposition process will be presented and discussed in subsequent sections.

5.6.1.1 General characteristics of the disposition process of consumer returns

In this section, the findings related to the characteristics of the disposition process will be presented and discussed. Table 5.14 provides an overview of the findings related to these *general characteristics of the disposition process of consumer returns*, including detail on the characteristics, supporting literature sources and key quotations to support the discussion of the findings.

Table 5.14 Findings related to the general characteristics of the disposition process

CHARACTERISTICS	SUPPORTING SOURCES	KEY QUOTATIONS
Important process	None	• *"[…] the important decisions is to disposition returned products […]."* (Agrawal *et al.* 2016b:93) • *"[…] final disposition […] were highlighted as critical."* (Bernon *et al.* 2011:491) • *"[…] disposition of the product is essential."* (Dowlatshahi, 2010a:1374)
Complex process	Min *et al.* (2006:57) Rogers *et al.* (2013:47)	• *"This complexity stems from a high degree of uncertainty due to […] the variety of disposition options […]."* (Dhib *et al.* 2016:373) • *"[…] the complex decision-making process of final disposition […]."* (Jayaraman *et al.* 2008:418) • *"Understanding the […] difficulty of dispositioning […]."* (Rogers *et al.* 2012:115)
Time-consuming	Badenhorst and van Zyl (2015:157)	• *"[…] consume a lot of time […] in the decision of the right disposition mode […]."* (Jayaraman *et al.* 2008:416) • *"Regardless of their disposition, the process can take considerable time."* (Ruiz-Benítez *et al.* 2014:55)
Requires resources	Khor and Udin (2013:71, 74)	• *"[…] disposition options all require significant resources […]."* (Skinner *et al.* 2008:518)
Requires technology	Srivastava and Srivastava (2006:530)	• *"[…] technology for the […] disposition."* (Jayaraman *et al.* 2008:413) • *"[…] software […] suggests an appropriate disposition method for the product."* (Subhashini, 2016:9) • *"ERP must also track the disposition of the returned items and coordinate various activities."* (Jayaraman *et al.* 2008:418)
Involves costs	Beh *et al.* (2016:19) Hsu *et al.* (2009:521) Rogers *et al.* (2013:47) Shaik and Abdul-Kader (2014:97)	• *"[…] returns handling as it has a direct impact on […] disposition costs."* (Asdecker, 2015:11) • *"[…] money spent on determining the most suitable disposition option […]."* (Badenhorst & Van Zyl, 2015:157) • *"Costly product returns process especially in the disposition […] process."* (Shaharudin *et al.* 2015:229) • *"[…] determine the disposition mode up-front thereby minimising the costs of transportation […]."* (Jayaraman *et al.* 2008: 417) • *"Understanding the cost and difficulty of dispositioning […]."* (Rogers *et al.* 2012:115) • *"[…] disposition […] involves […] investment."* (Srivastava & Srivastava, 2006:530)
Involves options/ alternatives	Agrawal *et al.* (2015:77) Agrawal *et al.* (2016b:93) Dhib *et al.* (2016:373) Keh *et al.* (2012:27) Khor *et al.* (2016:97) Sharma *et al.* (2016:409) Hazen *et al.* (2012: 260) Rogers *et al.* (2013:47) Srivastava (2008:547) Srivastava and Srivastava (2006:530)	• *"[…] product disposition options (repair, recondition, remanufacture, recycle and disposal)."* (Khor & Udin, 2013:74) • *"This disposition process includes options ranging from simply reusing the product to properly disposing of the product."* (Hazen *et al.* 2012:245) • *"[…] a number of options are available as to disposition, i.e. what is done with the returned product."* (Skinner *et al.* 2008:523) • *"With returned product, a wide range of disposition options is available […]."* (Rogers *et al.* 2012:108)
Involves routes, channels, destinations and markets	Agrawal *et al.* (2016b:98) Bernon and Cullen (2007:52, 54) Daaboul *et al.* (2014:2, 3)	• *"The process of "final disposition" refers to the exit route returned products finally take."* (Bernon *et al.* 2011:492) • *"The goods are […] routed based on typical recovery strategies […]."* (Silva *et al.*

Source: Compiled by the researcher

Table 5.14 shows that the disposition process can involve various characteristics, which can be classified as (1) general characteristics, (2) requirement characteristics, (3) involvement characteristics, (4) influenced by characteristics and (5) linked with characteristics. These characteristics will be briefly discussed in the subsequent paragraphs.

The *general characteristics* of the disposition process include *important, complicated* and *time-consuming.* The *importance* of disposition relates to correct disposition decisions, which can result in beneficial outcomes (such as profits and cost-savings). The *complexity* of disposition can be attributed to various disposition options, correct disposition decision-making and high degree of uncertainty associated with product returns. Similarly, disposition decisions and disposition operations (such as performing repair) can be *time-consuming*. The *requirement characteristics* of the disposition process include resources and technology. Particularly, *resources* are needed to perform product recovery disposition options, like repair and refurbishment operations (sections 5.6.3 and 5.6.4). Additionally, the disposition process requires *technology* for (1) effective disposition decision-making, (2) tracking product recovery progress, and (3) recovery operations, which emphasise the resources requirements in the disposition process.

The *involvement* characteristics of the disposition process include costs, options/alternatives, routes, channels, destinations and markets. Linking with the resources and technology requirements, disposition *costs* can be attributed to (1) logistics costs (e.g. handling and transportation costs), (2) disposition decisions process, and (3) investments (resources) to perform recovery operations. Accordingly, the disposition process involves various *options/alternatives* related to disposition decisions (e.g. direct reuse, repair and refurbishment) for the recovery of value from returned products, emphasising the importance and complexity of disposition. Similarly, the routes, channels, destinations and markets associate with the disposition options, with the (1) *routes* representing the paths of the returned/recovered products, (2) *channels* specifying the type of SC for the returned/recovered product, which can include primary and secondary (or even tertiary) channels, (3)

destinations representing the recovery locations (e.g. repair facility) or market locations (e.g. factory stores), and (4) *markets* relating to the reselling of recovered products (such as a refurbished television) on the primary market or secondary markets. Essentially, in the disposition process products can be routed (directed) towards various destinations necessary to recapture value from the returned product.

The *influenced by characteristics* of the disposition process include industry/organisation and product type, return types/reasons, product condition, quality and characteristics and return policies. The influence of the *industry/organisation* on disposition can be demonstrated through the different disposition options, for example, the apparel industry might be more appropriate for direct reuse, minor repairs and selling on secondary markets, while the electronics industry might be more appropriate for repair and refurbishment. Similarly, *product type, return type/reasons* (see section 4.3) and *product condition* play a role in the chosen disposition options, for example, new/unused unwanted fashion items (such as dresses and scarves) can be reused/resold, while defective electronic products (such as computers and cameras) might need repair or refurbishment. Likewise, lower *quality* products might be resold as scrap and higher quality might be repaired/refurbished. Additionally, various *product characteristics,* including product design, price, value, transportation costs, perishability and market demand can influence the disposition process, reconfirming the complexity of the disposition process. Lastly, the *returns policy* of a retailer can influence disposition decisions and facilitate the disposition process. For example, a return policy specify that only defective products are allowed, which limit disposition decisions to repair, refurbishment or selling to third parties.

Finally, the *linked with characteristics* of the disposition process involve links with most *pre-receipt RL processes,* including gatekeeping, collection and transportation, and all *post-receipt RL processes,* including receiving, processing, inspection, sorting and redistribution. The links with pre- and post-receipt RL processes can either relate to information flows, cash flows or product flows. In terms of *information flows,* the link between disposition and *gatekeeping* can associate with return authorisation and the captured reasons of returns that may guide disposition decision-making (e.g. warranty return must be shipped to the supplier).

Regarding *product flows,* the link between disposition and *collection* relates to the sequence of RL processes, for example, product returns must first be collected from consumers before disposition can take place. Additionally, the link between disposition and *transportation* mostly associates with disposition taking place at various facilities, reconfirming the involvement characteristic of destinations. Similarly, the link between disposition and the *receiving* process associates with the

sequence of RL processes and facilities used for disposition. Evidently, receiving must take place at facilities before disposition can be conducted within the facilities.

The link between disposition and *processing* involves *information, product and cash flows*. For example, the processing activity of pre-disposition decisions (see section 5.4) can provide important information to determine the final disposition option. Additionally, the product flow link between disposition and processing associates with the sequence of RL processes, with processing either taking place before disposition or after disposition. Evidently, if disposition takes place before processing, determining the disposition option can trigger the processing activity of issuing a refund, which represents cash flows.

Continuing with the *product flows*, the links between the disposition and *inspection* and *sorting* processes associate with inspection/sorting activities of determining disposition/exit options, taking take place before disposition because the condition of the returned product must first be determined during inspection (see section 5.5.1) and sorted into disposition option categories during sorting (see section 5.5.2). Finally, the link between *redistribution* and disposition processes is emphasised through the routes, destinations and markets associated with disposition, since redistribution involve transportation of returned/recovered products to the markets.

In the next section, the activities of disposition will be discussed.

5.6.1.2 General activities of the disposition process of consumer returns

In this section, the general activities associated with the disposition process applicable to consumer returns will be identified. Table 5.15 provides an overview of the findings related to the *general activities of the disposition process of consumer returns*, including details on the activities, supporting literature sources of the activities and key quotations to support the discussion of the findings.

Table 5.15 Findings related to the general activities of the disposition process

Repackaging	De Leeuw *et al.* (2016:716) Hsu *et al.* (2016:95)	• *"[…] new packaging […] these costs are referred to as disposition costs."* (Asdecker, 2015:2) • *"[…] disposition […] and repackaging."* (Shaik & Abdul-Kader, 2014:97) • *"[…] disposition […] returned product may be […] repackage and sell as new […]."* (Rogers *et al.* 2012:115) • *"[…] product disposition is handled […] by repackaging […]."* (Stock & Mulki, 2009:41, 42)
Restocking / return to inventory	Bernon *et al.* (2016:589) Genchev *et al.* (2011:254)	• *"[…] disposition […] the product […] can be put into stock […]."* (De Leeuw *et al.* 2016:716) • *"[…] product disposition […] send a portion of their products directly to inventory […]."* (Stock & Mulki, 2009:42)
Testing, disassembly, sorting and cleaning	None	• *"Product recovery includes performance testing, sorting, cleaning […]."* (Das & Dutta, 2013:724) • *"[…] disassembly is necessary to harvest valuable inventories from every product disposition options […]."* (Khor & Udin, 2013:71)
Replacement and upgrade	None	• *"Product recovery includes […] replacing components as necessary, and, in some cases, upgrading the product […]."* (Das & Dutta, 2013:724)
Storage	None	• *"Disposition—putting the product back into inventory or temporary storage […]."* (Stock & Mulki, 2009:41, 42)
Handling	None	• *"[…] returned products would mainly be handled in one of three different ways. These are direct reuse, product recovery and waste handling"* (Chan *et al.* 2012:1323) • *"[…] handling and disposition of goods returned from the customer."* (Skinner *et al.* 2008:518)
Reselling	Badenhorst and Van Zyl (2015:147) Govindan *et al.* (2015:603) Rogers *et al.* (2012:108, 115) Sharif *et al.* (2012:2517) Khor *et al.* (2016:97) Srivastava (2008:540)	• *"[…] disposition alternative […] reuse and resell as new; or repair or refurbish and resell […]."* (Agrawal *et al.* 2016b:93) • *"[…] disposition […] the product is fit for resale and […] the product can be made fit for resale after rework […]."* (De Leeuw *et al.* 2016:716) • *"[…] selling through the secondary market to a disposition […]."* (Rogers *et al.* 2012:112) • *"The first disposition (sell directly without rework) […]."* (Srivastava & Srivastava, 2006:530) • *"[…] recovery rates for its returned products […] the item can be resold."* (Stock & Mulki, 2009:48)

Source: Compiled by the researcher

Table 5.15, shows that the activities of the disposition process can be classified as information flow, product flow and cash flow activities. The *information flow* activities of the disposition process involve administration, scanning and communication. Particularly, *administration* activities of disposition involve paperwork, assigning disposition codes on the system and documentation that can facilitate the disposition process. For example, sending a product for repairs to another facility with accompanied documentation with important information (e.g. type of return and product condition). Accordingly, disposition involves *communication* between parties involved in the disposition process, which can be important for information sharing. Lastly, *scanning* can associate with the registering the returned/recovered product at every facility, emphasising the link between disposition and the receiving process (scanning of products at receipt). Consequently, the information flow activities in the disposition process emphasise the technology requirement characteristic of disposition (section 5.6.1.1).

Various *product flow* activities exist in the disposition process, including product evaluation/examination, disposition decisions, restocking or return to inventory, testing, disassembly,

sorting, cleaning, replacement, upgrade, storage, handling and repackaging. *Product evaluation* emphasise the disposition characteristics associated with product quality and condition and links between disposition and inspection and sorting processes (see section 5.6.1.1). While product evaluation can occur at inspection/sorting to verify gatekeeping information and determine disposition options, product evaluation in the disposition process can involve recovery operations (e.g. identify faulty part for repair). Although various RL processes can involve identification of disposition options, one of the most common activities of the disposition process involves *disposition decisions.* Evidently, the disposition process finalise the envisaged disposition/exit options determined in other post-receipt RL processes, ensuring that the most value can be recovered from the product. Since disposition decision-making is strategic in nature, the disposition practices related to effective disposition decisions will be explored in section 6.6.

Some product flow activities in the disposition process can associate with specific disposition options. For example, the direct reuse option involves *repackaging* and *restocking/return to inventory* (see section 5.6.2), repair can involve *testing, disassembly, sorting* and *cleaning* (see section 5.6.3) and refurbishment can involve *upgrading* and *replacement* (see section 5.6.4). *Storage* can either be related to the returning of returned/repackaged products to stock or temporarily store products before shipment to various facilities/locations. Lastly, product *handling* in disposition emphasises all the other product flow activities, where products are handled during restocking, disassembly, testing, repackaging and storage, amongst others.

Finally, the *cash flow* activity of disposition involves *reselling,* which represents the ultimate purpose of disposition. Reselling can take place, (1) directly after the return of unused/new products, (2) after recovery (repair or refurbishment), or (3) when choosing the exit options of selling on secondary markets or to third parties (see section 5.6.5).

In the next section, the facilities used for the disposition process will be discussed.

5.6.1.3 General facilities/locations used for the disposition process of consumer returns

In this section, the findings related to the facilities used for the disposition process will be presented and discussed. The findings in this section only focus on the facilities mentioned specifically when authors describe the disposition process, excluding some potential facilities associated with specific disposition options. Therefore, the facilities discussed in this section provide a basis for the types of facilities that can be used for disposition in general.

Table 5.16 provides an overview of the findings related to the *general facilities of the disposition process of consumer returns*, including details on the facilities, sources to support the mentioned facilities and key quotations to support the discussion of the findings.

Table 5.16 Findings related to the general facilities/locations used for the disposition process

FACILITIES	SUPPORTING SOURCES	KEY QUOTATIONS
Stores	None	• *"[…] disposition […] can be extended to many other types of retail store […]."* (Beh *et al*. 2016:6) • *"Disposition can also be done in stores […]."* (De Leeuw *et al*. 2016:716) • *"[…] disposition, such as a factory outlet store […]."* (Rogers *et al*. 2012:112)
Collection facilities	Srivastava (2008:547)	• *"The first disposition (sell directly without rework) is carried out at collection centers [sic]."* (Srivastava & Srivastava, 2006:530)
CRCs	None	• *"Product disposition may take place in a central facility, after which it is put in central stock […]."* (De Leeuw *et al*. 2016:716) • *"[…] merchandise can all be disposed of […] by the CRC."* (Hsu *et al*. 2009:521) • *"CRC […] in the complex decision-making process of final disposition of the returned product."* (Jayaraman *et al*. 2008:418) • *"[…] the various dispositions leaving the CRC […]."* (Rogers *et al*. 2012:111)
Processing facilities	None	• *"[…] processing centre […] to determine the most appropriate disposition."* (Khor & Udin, 2013:72)
Repair and refurbishment facilities	None	• *"There are two types of such centers [sic] depending upon the disposition decision […] repair and refurbish center[sic] […]."* (Srivastava & Srivastava, 2006:530)

Source: Compiled by the researcher

Table 5.16 shows the facilities used for the disposition process can include stores, RL process facilities and recovery facilities. *Stores* represent locations in the disposition process, which can be used by multi/omnichannel retailers to return new/unused products to stock for reselling through primary channels or can be used for selling products in secondary markets (e.g. factory stores). Regardless, stores emphasise the disposition activity of reselling returned products for value recovery.

The RL process facilities associated with disposition include collection facilities, CRCs, and processing facilities. *Collection facilities* can associate with the direct reuse option for returned products that can be resold as new, which emphasise the link between the disposition and collection process. *CRCs* as dedicate RL facilities can (1) employ direct reuse (put new/unused returned products to stock), (2) make disposition decisions, and (3) route returned products to other facilities for recovery. *Processing facilities* associate with disposition decision-making, which may involve return to stock or routing of products to other facilities for recovery.

The *recovery facilities* in the disposition process include *repair facilities* and *refurbishment facilities*, which associate with specific disposition options. Accordingly, a repair facility specialises in repair operations and a refurbishment facility specialises in refurbishment. The functions of the recovery facilities will be explored in sections 5.6.3 and 5.6.4.

In the next section, the parties involved in the disposition process will be discussed.

5.6.1.4 General parties involved in the disposition process of consumer returns

Disposition involves a variety of parties, which will be identified in this section. Table 5.17 provides an overview of the findings related to the *general parties involved in the disposition process of consumer returns*, including details on the parties, sources to support the mentioned parties and key quotations to support the discussion of the findings.

Table 5.17 Findings related to the general parties in the disposition process

Staff	None	• *"Disposition can also be […] that the store clerk can restock the product immediately if it is fit for resale […]."* (De Leeuw *et al.* (2016:716) • *"[…] help the employees in the complex decision-making process of final disposition […]."* (Jayaraman *et al.* 2008:418) • *"During the […] disposition process, employees must determine functionality […]."* (Prahinski & Kocabasoglu, 2006:422) • *"[…] dispositioning on a state-by-state basis could be extremely helpful to the manager responsible […]."* (Rogers *et al.* 2012:115) • *"Operations and supply chain managers […] selecting the most appropriate reverse disposition method."* (Skinner *et al.* 2008:532)
Suppliers/ vendors	None	• *"[…] the vendors and retailers when merchandise is waiting for disposition."* (Hsu *et al.* 2009: 526) • *"[…] retailer's first choice of disposition is to return the items for full credit back to the supplier."* (Rogers *et al.* 2013:42) • *"[…] the company and its vendors […] suggest an appropriate disposition method for the product."* (Subhashini, 2016:9)
Third parties	Bernon and Cullen (2007:54) Das (2012:1439) Jayaraman *et al.* (2008:418) Kinobe *et al.* (2015:89) Narayana *et al.* (2014:395) Prakash and Barua (2016b:70) Rogers *et al.* (2012:113)	• *"[…] third-party logistics providers specializing [sic] in […] disposition […]."* (Genchev *et al.* 2011:254) • *"The recovery process can be handled by […] 3P Logistics."* (Das & Chowdhury, 2012:210) • *"[…] outsourcing partner to manage product […] disposition decisions."* (Prakash & Barua 2016a:70) • *"[…] approaches to product disposition is through salvage brokers […]."* (Rogers *et al.* 2013:46) • *"The recovery option thus determines the […] type of actors involved (e.g. […] transportation providers, logistics providers, brokers […])."* (Gobbi 2011:774)

Source: Compiled by the researcher

Table 5.17 shows that the parties involved in the disposition process can include consumers, retailers, staff, suppliers or vendors and various third parties. *Consumers* can play several roles in the

disposition process, including (1) returning products for disposition, (2) providing information to facilitate disposition decisions, (3) receiving repaired products (original consumer), and (4) creating a demand for recovered/used products (second consumers). The significance of consumers in disposition, points to the importance of the disposition process of consumer returns in online retailing.

Retailers can play both primary and secondary roles in the disposition process. Particularly, the primary role of retailers can include (1) covering the cost of disposition, (2) making disposition decisions, (3) employing staff to perform disposition options and activities and/or (4) choosing to outsource disposition. The secondary role involves second retailers operating in the secondary markets, linking with outlet/factory stores (disposition locations) for the reselling of used/recovered products after disposition. The roles of *staff* can be linked to the activities of disposition (see section 5.6.1.2), including (1) product flow activities (e.g. restocking, handling and evaluating the product condition), (2) cash flow activities related to reselling product returns, and (3) disposition decisions (mostly managerial involvement).

In the context of this study, *supplier or vendors*[13] associate with the ship to a vendor option selected by retailers, which involves directing consumer returns to the supplier or manufacturer of the product. Subsequently, retailers can shift their responsibilities in the disposition process to vendors, indicating that vendors can play primary roles in terms of crediting the consumer, repairing the product and/or paying for disposition costs. The specific role of vendors will be explored in section 5.6.5.2.

Finally, various *third parties* can play primary or secondary roles in the disposition process. Third parties that play primary roles, include 3PL providers who specialise in product disposition and perform disposition on behalf of retailers (if the retailer decide to outsource disposition). The third parties that can play secondary roles in disposition include third parties responsible for (1) buying returned products (such as salvage dealers) and (2) transporting products between facilities in the disposition process. Essentially, the disposition process can involve primary channel and secondary channel parties, emphasising the channel involvement characteristic of disposition (section 5.6.1.1). The importance of disposition, will be explored in the outcomes of disposition, discussed in the next section.

[13] Vendors can be any type of business, selling to retailers, but this study will view the vendor as the manufacturer or supplier of the product (see the exit options).

5.6.1.5 General outcomes of the disposition process of consumer returns

In this section, the findings related to the outcomes (the results of performing disposition effectively) of the disposition process are discussed. The outcomes of disposition were categorised as (1) economic outcomes, (2) product-related outcomes and (3) environmental outcomes. However, other outcomes associated with performing specific disposition options (not discussed here) are also possible, including market-related outcomes and social outcomes (see sections 5.6.2 - 5.6.5). Table 5.18 provides an overview of the findings related to these *outcomes of the disposition process of consumer returns*, including detail on the categories, outcomes, literature sources to support the outcomes and key quotations to support the discussion of the findings.

Table 5.18 Findings related to the general outcomes of the disposition process

CATEGORIES	OUTCOMES	SUPPORTING SOURCES	KEY QUOTATIONS
Economic outcomes	***Cost savings***	None	• *"Disposition can also be done in stores […]. This saves considerable logistics costs […]."* (De Leeuw *et al.* 2016:716) • *"[…] determine the disposition mode up-front thereby minimising the costs of transportation […]."* (Jayaraman *et al.* 2008:417) • *"[…] disposition options for returned product need to be identified […] for cost minimization [sic] […]."* (Rogers *et al.* 2013:46) • *"[…] an appropriate disposition method […] can also reduce the labor [sic] costs."* (Subhashini, 2016:9)
	Profits	Rogers *et al.* (2012:112) Rogers *et al.* (2013:47)	• *"[…] disposition of the merchandise […] for a profit […]."* (Hsu *et al.* 2009:521)
	Cost/asset recovery	Ravi and Shankar (2015:876) Hazen *et al.* (2012:248)	• *"The next step is to dispose them […] to […] recapture value […]."* (Agrawal *et al.* 2015:77) • *"[…] dispositioning routes designed to maximise asset recovery."* (Bernon & Cullen, 2007:54) • *"[…] disposition options […] to reclaim value from returns."* (Skinner *et al.* 2008:518) • *"Product disposition refers to the different ways […] to recover the costs of the products that were returned."* (Stock & Mulki, 2009:38)
Product-related outcomes	***Improved product quality/condition***	De Leeuw *et al.* (2016:716)	• *"[…] disposition options that improve the quality of the returned product to functional condition in order to enable resale."* (Khor *et al.* 2016:97)
	Extend product's life cycle	None	• *"At disposition […] creating a second life for the goods […]."* (Beh *et al.* 2016:6) • *"[…] recovery loops to extend products' useful life […]."* Khor *et al.* (2016:97)
	Recover products	Silva *et al.* (2013:379) Ferguson *et al.* (2011:777) Khor and Udin (2013:73)	• *"[…] multiple cycles of recovery to allow reuse of […] products […]."* (Khor *et al.* 2016:97) •
Environmental outcomes	***Reduce waste***	Khor *et al.* (2016:97)	• *"[…] products […] are properly dispositioned and do not end up in landfills."* (Hazen *et al.* 2015:167)
	Reduce resource consumption	None	• *"[…] product disposition […], firms ought to undertake environmentally proactive approaches to generate benefits from resources that are undeservingly discarded as landfill waste."* (Khor & Udin, 2013:71)

Source: Compiled by the researcher

Table 5.18 show that the disposition process involves several beneficial outcomes, including (1) economic outcomes (i.e. cost savings, profit and cost/value and asset recovery), (2) product-related outcomes (i.e. improved product quality, extending product life and product recovery), and (3) environmental outcomes (i.e. reduce waste and resource consumption), which emphasise the importance of the disposition process.

The *economic outcome* of *cost savings* in disposition, relate to the location of disposition and the value of early and correct disposition decisions in RL. Multichannel retailers can use their stores for

disposition, resulting in RL cost savings (e.g. collection and transportation costs). Online-only retailers that can only use facilities for disposition can realise cost savings through early and appropriate disposition decisions, indicating the importance of identifying disposition options in processing, inspection and sorting processes. Regardless of the retail channel, the remaining economic outcomes of *profitability* and *cost/asset recovery* can be realised through the reselling activity of disposition (see section 5.6.1.2). Subsequently, the economic outcomes of the disposition process involve *cash (money) flows* in the RL process of consumer returns.

Associating with *product flows*, the *product-related* outcomes relate to recovery operations (repair and refurbishment), which can *improve* the *quality* of the returned product, and *extends the product's useful life*. Furthermore, disposition allows for the *recovery of products*, which can contribute to the economic outcomes of cost/asset recovery possible through reselling of recovered products.

In linking with the product-related outcomes, the disposition process involves *environmental outcomes*, which can include *reduction* in *waste* and *natural resources*. Therefore, through product recovery, organisations can prevent used/defective products from ending up landfills and reduce the need for natural resource consumption. For example, repairing a part prevents the procurement of a new part, eliminating the use of natural raw materials for manufacturing.

All the outcomes associated with the disposition process will be explored in the following sections that focus on the different disposition/exit options. The description and conceptual framework related to the general disposition processes and other subsequent categories will be given in section 5.6.6. In the next section, direct reuse as a disposition option will be discussed and analysed.

5.6.2 Direct reuse as a disposition option for consumer returns

The direct reuse[14] option associates with unwanted B2C returns of products in new/unused condition, which online retailers can select to recover value. The categories of direct reuse identified from the QCA of RL literature, included (1) characteristics of direct reuse, (2) activities/processes in direct reuse, (3) facilities/locations in direct reuse, (4) parties involved in direct reuse, and (5) outcomes of direct reuse. Table 5.19 provides an overview of the findings related to *direct reuse* as a disposition option for consumer returns, including detail on the categories, related subcategories, sources to support the subcategories and key quotations to support the discussion of the findings.

[14] It should be noted that the term "reuse" is often used as an outcome for performing certain recovery disposition options (e.g. after refurbishment the product is reused). Therefore, a distinction is made by referring to the term "direct reuse" as a disposition option associated with reselling unused/new returned products to recover value.

Table 5.19 Findings related to direct reuse as a disposition option for consumer returns

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
Characteristics	***Important***	None	• *"Product recovery activities such as […] direct reuse is becoming integral to […] supply chains."* (Barker & Zabinsky, 2011:558)
	Requires less resources, work and activities	Li and Olorunniwo (2008:385) Lieckens and Vandaele (2012:24)	• *"[…] activities of reuse […] when fewer resources are required […]."* (Hazen *et al.* 2011:382) • *"The first disposition (sell directly without rework) […] involves no substantial investment."* (Srivastava & Srivastava, 2006:530) • *"[…] less works was associated with reuse […]."* (Eskandarpour *et al.* 2014:1394) • *"Reuse […] may not require rework if no damages are found on the returned product."* (Khor & Udin, 2012:7) • *"[…] product can go back to the shelf […] if the product needs minimum changes."* (Ruiz-Benítez *et al.* 2014:55)
	Involves some costs	None	• *"[…] the returned product has […] reuse processing cost […]."* (Dowlatshahi, 2010a:1376) • *"Reuse costs – cost incurred to repackage each product return […]."* (Tan & Kumar, 2006:335)
	Influenced by industry and product type,	None	• *"[…] case of apparel and fashion […] reuse […] plays the major role […]."* (Beh *et al.* 2016:6) • *"[…] sectors such as consumer electronics or domestic appliances need more […] in order to decide whether the product can go back to the shelf."* (Ruiz-Benítez *et al.* 2014:55)
	Influenced by product quality	Jayaraman (2006:981) Lieckens and Vandaele (2012:24)	• *"Higher quality returns result in simple repackaging […]."* (Tan & Kumar, 2006:336) • *"[…] primary quality, which may be sold as a new product […]."* (De Leeuw *et al.* 2016:716)
	Influence by product/package condition	Agrawal *et al.* (2016b:94) Badenhorst (2016:4) Chan *et al.* (2012:1320) De Leeuw *et al.* 2016:716) Hazen *et al.* (2012:248) Khor and Udin (2012:7) Kim and Goyal (2011:2545) Lieckens and Vandaele (2012:24) Reimann (2016:36) Rogers *et al.* (2012:112) Ruiz-Benítez *et al.* (2014:55) Xiao *et al.* (2010:171) Xie and Breen (2014:456)	• *"[…] products being returned are in […] perfect condition […]."* (Stock & Mulki, 2009:38, 48) • *"Reuse involves new unopened returned items […]."* (Agrawal *et al.* 2016c:42) • *"[…] direct reuse […] includes products that are completely unused […]."* (Hazen *et al.* 2011:375) • *"[…] related to products that are new with the original manufacturer's seal intact, is to place them back in new inventory as sellable."* (Genchev, 2009:146) • *"[…] a product can only be available for reuse […] to retail condition."* (Hazen *et al.* 2011:375) • *"[…] the item is in good condition, with no apparent damage […]."* (Ruiz-Benitez & Muriel, 2014:573) • *"Reuse […] if no damages are found on the returned product."* (Khor & Udin, 2012:7) • *"[…] returned products, which are found to be defect- or damage-free, may be redistributed […]."* (Min *et al.* 2006:58) • *"[…] products being returned are in damaged boxes yet are in otherwise perfect condition […]."* (Stock & Mulki, 2009:38)
	Influenced by return type	None	• *"[…] reuse […] of unwanted items […]."* (Bouzon *et al.* 2016:183) • *"[…] the reuse option, […] if a product was returned because the consumer changed their mind about their purchase […]."* (Jayaraman *et al.* 2008:411) • *"[…] such that false-failure returns may be immediately returned to the shelf for resale."* (Ruiz-Benitez *et al.* 2014:55)
	Influenced by legislation	None	• *"[…] countries have enforced legislation for […] collect and reuse the unused products […]."* (Chan *et al.* 2012:1320) • *"[…] collected for reuse […] due to strict legislations."* (Das & Dutta, 2013:724)
Activities during reuse	***Cleaning***	Kim *et al.* (2006:280) Singhry (2015:121)	• *"Direct reusable products require only minor […] cleaning […]."* (Agrawal *et al.* 2015:84) • *"Some items may be reused directly […] after cleaning […]."* (Sasikumar & Kannan, 2008a:157)
	Relabelling	None	• *"[…] returned products, which are found to be defect- or damage-free, may be redistributed to customers after […] relabelling."* (Min et al. 2006:58)
	Minor repair/rework	Li and Olorunniwo (2008:385) Olorunniwo and Li (2011:4)	• *"Reuse […] after […] minor repairs."* (Singhry, 2015:121) • *"[…] some rework may have to be done in the product in order to make it suitable for sale […]."* (Ruiz-Benítez *et al.* 2014:55) • *"In terms of direct reuse and minor repairs […] process takes place."* (Subhashini, 2016:9)
	Minor maintenance	Sasikumar and Kannan (2008a:157)	• *"Direct reusable products require only […] minor maintenance."* (Agrawal *et al.* 2015:84)
	Re-kit	Olorunniwo and Li (2011:4)	• *"[…] products are processed […] with a little re-kit […]."* (Li & Olorunniwo, 2008:385)
	Minor inspection	None	• *"Direct reusable products require only minor inspection […]."* (Agrawal *et al.* 2015:84) • *"[…] most of the returned products, after a quick visual inspection, can be put back on the shelf […]."* (Ruiz-Benítez *et al.* 2014:55)
	Repacking	Badenhorst (2016:4) Li and Olorunniwo (2008:385) Rogers *et al.* (2012:112) Skinner *et al.* (2008:524) Tan and Kumar (2006:335)	• *"[…] repackaged and sold as new […]."* (Khor & Udin, 2012:7) • *"Returned products […] with simple […] repacking."* (Li *et al.* 2013:453) • *"[…] product return that […] only requires some minor reprocessing activities like repackaging […]."* (Lieckens & Vandaele, 2012:24) • *"[…] returned products, which are found to be defect- or damage-free, may be redistributed to customers after repackaging […]."* (Min *et al.* 2006:58) • *"[…] repackaging of the items can take place immediately […]."* (Stock & Mulki, 2009:38)

Source: Compiled by the researcher

Table 5.19 shows that reuse as a disposition option involves various characteristics, activities and processes, facilities/locations, parties and outcomes, which will be discussed in the subsequent sections and concluded with a description and conceptual framework.

5.6.2.1 Characteristics, product condition and return type of direct reuse as a disposition option for consumer returns

Direct reuse can include general, require (less), involve (some) and influenced by characteristics. The *general characteristic* relates to the *importance* of direct reuse as a disposition option, which can be illustrated by the *require characteristics* of *less resources, work* and *activities.* Consequently, the direct reuse option can result in the highest recovery rates since less work and activities are needed before products can be resold. However, the *involvement characteristic* of some *costs* can be expected during direct reuse, which can include reuse processing costs and activity costs (e.g. costs of repacking and labour costs of returning products to inventory).

Lastly, the *influenced by characteristics* of direct reuse involves industry and product type, product and package condition, quality, return type and legislation. The *industry* and *product type* can influence the types of activities associated with reuse. For example, fashion/apparel products need minor activities (such as checking for buttons on a shirt), while appliances and electronics need more activities and testing to ensure that the product is in working condition. The *product condition, quality* and *return types* influence the selection of the direct reuse option. Particularly, the direct reuse option can be selected for *higher quality* products in *perfect, new/unused/unopened, good/resalable* and *defect/damage free* condition, reemphasising the fewer activity and resource

requirements. However, direct reuse can be possible for returned products with *minor use* and/or *damaged packaging*, which associates with the repackaging activity of reuse (see section 5.6.2.2). Subsequently, direct reuse can be selected for *B2C consumer return types* with return reasons related to unwanted products, buyer's remorse/change of mind and false failures (i.e. consumer mistakenly believe a working product is faulty).

Finally, direct reused can be influenced by *legislation*, which means that governments can drive organisations to be involved in direct reuse activities. For example, in South Africa the Consumer Protection Act (No. 68 of 2008:56) gives consumers the right to return products that was not pre-examined prior to delivery. Without legislation, organisations might see no value in allowing unused/new products returns destined for direct reuse.

5.6.2.2 Activities/processes in direct reuse as a disposition option for consumer returns

Table 5.19 shows that the activities/processes in direct reuse can be classified as activities/processes (1) during reuse, which include cleaning, relabelling, minor maintenance, minor repair/rework, re-kitting, repackaging and minor inspection, and (2) after direct reuse, which include back to inventory/shelf (restocking), storage, resale and redistribution or shipment. Consequently, most activities of direct reuse involve product flows, with resale as the only cash flow activity.

The *activities/processes during reuse* associate with the influenced by characteristics of direct reuse, including industry/product type, product and package condition and type of return. For example, minor use of the returned product may need (1) *cleaning* and *relabelling* for clothing/apparel and (2) *minor repair, minor maintenance* and *re-kit* (e.g. adding a missing instruction manual or accessory) for electronics/appliances. Additionally, *repackaging* can be performed on new/unused products with damaged packaging, illustrating the influence of package condition on the selection of direct reuse. Lastly, *minor inspection* forms part of the inspection process, which can include visual inspection (e.g. confirming that the product is new/unused) or inspecting false failure returns (B2C consumer return type). The need for minor inspection reaffirms the link between the disposition and inspection process and the significance of inspection as a post-receipt RL process of consumer returns (see section 5.5.1)

The *activities after direct reuse* associate with the influenced by characteristics, outcomes and locations of reuse. For example, *back to inventory/shelf* and *storage* emphasise that the returned product is in performed, new/unused and good condition. Additionally, directly *reselling* the new/unused returned product points to economic outcomes (e.g. profits), representing cash flows in the direct reuse option. Furthermore, *redistribution* or *shipment* emphasise that the new/unused

returned products are destined for the markets (locations of direct reuse). Evidently, redistribution as part of the direct reuse option, illustrates the important link between the disposition and redistribution process. Redistribution as a post-receipt RL process of consumer returns will be discussed in section 5.7.

5.6.2.3 Facilities/locations and parties in direct reuse as a disposition option for consumer returns

Table 5.19 shows the *facilities/locations* used for direct reuse include (1) traditional FL facilities/locations (such as stores/collection points and DCs), (2) RL process facilities (such as (collection facilities, CRCs and processing facilities) and markets (such as primary or secondary markets). In terms of *traditional FL facilities/locations* for direct reuse, retail *stores* (also used as collection points by multi/omnichannel retailers) or *DCs* can be used to restock new/unused product returns for resale. Subsequently, retailers can use any location/facilities in their primary forward sales channel for the direct reuse option. Alternatively, *RL process facilities* (of online retailers or third parties), including *collection facilities, CRCs* and *processing facilities* can be used for direct reuse, which can range from direct reselling from the collection centre, identifying the disposition option of reuse in CRCs and storage of new/unused products in processing facilities.

The final locations (or destinations) of direct reuse include *markets,* which associates with redistribution (product flows) and reselling (cash flows) activities of reuse. The direct reuse option mostly involves redistribution and resale in the primary market, which associate with the traditional FL facilities/locations. However, secondary markets might be a possibility in direct reuse, for example, the online retailer might resell repackaged unused products through online factory stores (separate for primary online store). While secondary markets can be locations in the disposition process, selling on the secondary market form part of the exit options in the disposition process, which will be explored in section 5.6.5.1.

The *parties in direct reuse* include consumers, retailers, distributors and third parties. *Consumers* can play important roles in direct reuse and can be classified as (1) *original consumers* responsible for returning new/unused products and (2) *second consumers* responsible for creating demand for returned products. However, original consumers can play secondary roles by receiving their returned products back from the retailer (e.g. shipping a false failure return in non-defective condition back to the consumer).

Likewise, *retailers* can be classified as original and second retailers, playing either primary or secondary roles in direct reuse. Specifically, the *original retailer* can play a primary role in direct

reuse by (1) receiving (or allowing) B2C unwanted returns and (2) performing direct reuse activities (e.g. repackage, restock, reselling and shipment). Contrastingly, the *second retailer* play a secondary role by receiving new/unused returned products from original retailers (the original sellers) for reselling on the secondary markets. Evidently, both second consumers and second retailers emphasise the importance of markets as locations in direct reuse.

Finally, *distributors* and *third parties* (such as 3PL providers) can play primary roles in the direct reuse option by being responsible for shipping/redistributing products to the markets. Alternatively, retailers might outsource specific direct reuse activities to 3P(R)L providers, for example, minor repairs, maintenance and repackaging.

5.6.2.4 Outcomes of direct reuse as a disposition option for consumer returns

Table 5.19 shows that direct reuse as a disposition option can result in economic, environmental and market-related outcomes, which demonstrates the importance of direct reuse (characteristic). The *economic outcomes* in direct reuse relate to profits and financial performance, cost saving and economic value recovery, representing cash flows in direct reuse. The *profitability* in direct reuse can be the result of reselling the returned product as new/unused on the primary or secondary market. The *cost savings* can be realised if products can be returned to stock and resold as new without effort, emphasising the require less characteristics of direct reuse (see section 5.6.2.1). Essentially, direct reuse can be the most economic value-producing (*value recovery*) and least resource demanding option, with the highest economic recovery rate in the disposition process.

The *environmental outcomes* in direct reuse include *environmental sustainability* and *waste reduction* and reduction of natural resource consumption. Particularly, retailers can reduce waste and protect the environment by taking unwanted products back from consumers (preventing disposal by consumer) and placing these products back on the market. Additionally, direct reuse can indirectly *reduce natural resource consumption* by reducing the need for additional purchases to replenish stock (lower production requirements).

Finally, the *market-related outcome* of direct reuse includes *demand satisfaction* which associate with markets as locations and the second consumers as parties in the direct reuse option (see section 5.6.2.3). Evidently, demand satisfaction can be realised through reselling and redistribution activities, linking to the economic outcome of profits and environmental outcomes of waste reduction.

5.6.2.5 Description and conceptual framework of direct reuse as a disposition option for consumer returns

Based on the findings presented in section 5.6.2, direct reuse can be an important disposition option in the disposition process for consumer returns, and will be described as follows:

> Direct reuse as a disposition option for consumer returns can be described as an important disposition option that (1) requires less resources, activities and work, (2) involves some costs, and (3) can be influenced by industry and product type, product and package condition, quality, return type and legislation. The activities/processes of direct reuse can be classified as activities/processes (1) during direct reuse, including cleaning, relabelling, minor maintenance, minor repair/rework, re-kitting, repackaging and minor inspection (product flows), and (2) after direct reuse, including back to inventory/shelf (restocking), storage, redistribution or shipment (product flows), and reselling (cash flows), which can be performed by online retailers and/or 3P(R)L providers in traditional FL facilities/locations (stores and DCs) and/or RL process facilities (collection facilities, CRCs and processing facilities).
>
> The aims of direct reuse as a disposition option are to (1) recover value from new/unused/repackaged returned products received from original consumers, and (2) resell and redistribute returned products to second consumers in the primary markets, other second market retailers or second consumers in the secondary markets. Direct reuse as a disposition option can result in (1) economic outcomes (profits, cost savings, value recovery and financial performance) (2) environmental outcomes (environmental sustainability, reduce waste and reduce natural resource consumption), and (3) market-related outcome (demand satisfaction).

Figure 5.8 provides a conceptual framework for the direct reuse as a disposition option that may apply to consumer returns in online retailing.

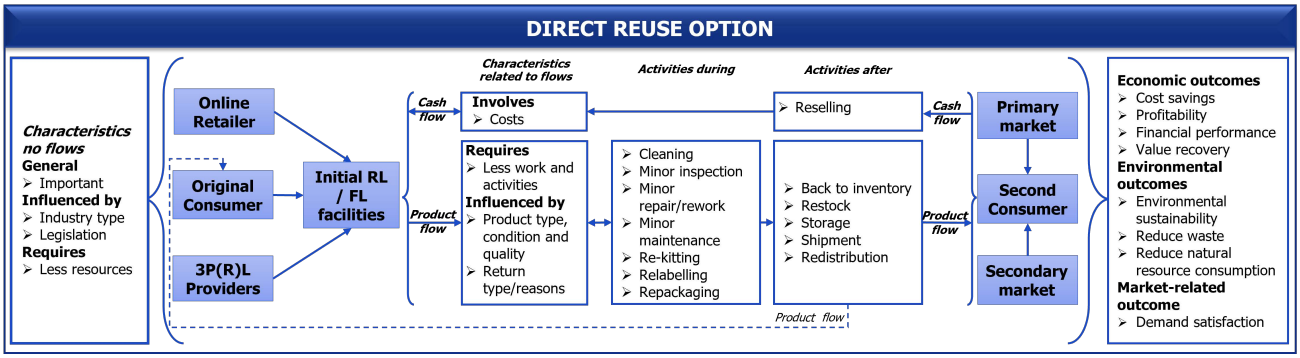

Figure 5.8 Conceptual framework of direct reuse as a disposition option
Source: Compiled by the researcher

Figure 5.8 gives a basic overview of direct reuse as a disposition option, illustrating the parties, facilities/locations, flows, characteristics and activities. Particularly, the framework illustrates that the direct reuse option starts with the original consumers returning products to the FL or RL facilities of the online retailer or 3P(R)L provider. Additionally, the flows in direct reuse involve cash flows and product flows, with related characteristics, activities during reuse and activities after reuse. Furthermore, the framework shows the primary market and secondary market locations with a second consumer purchasing the product (involving a cash inflow to the online retailer) and receiving the product (involving product outflow to the second consumer). Alternatively, the original consumer might receive the returned product back (involving product outflow to the original consumer). Finally, the framework demonstrates the characteristics unrelated to flows as well as the

outcomes of direct reuse. In the next section, repair in the disposition process will be discussed and analysed in detail.

5.6.3 Repair as a disposition option for consumer returns

Repair can be selected as a disposition option for various types of consumer returns to recover (economic, product-related, environment and market-related) value from returned products in used/damaged/defective condition. The categories of *repair* identified from the QCA of RL literature, included (1) characteristics of repair, (2) activities/processes in repair, (3) facilities/locations in repair, (4) parties involved in repair, and (5) outcomes of repair. Due to the comprehensiveness of the findings for repair as a disposition option, each of these categories, which will be presented and discussed in separate sections. This section concludes with a description and conceptual framework of repair as a disposition option.

5.6.3.1 Characteristics of repair as a disposition option for consumer returns

In this section, the characteristics of repair will be discussed. Table 5.20 provides an overview of the findings related to the *characteristics of repair as a disposition option for consumer returns*, including detail on the characteristics, sources to support the characteristics and key quotations to support the discussion of the findings.

Table 5.20 Findings related to the characteristics of the repair disposition option

CHARACTERISTICS	SUPPORTING SOURCES	KEY QUOTATIONS
Complex	None	• *"[…] complexity of repairing […] returned products […]."* (Min & Ko, 2008:177)

Influenced by regulations	None	• *"[…] effect of regulatory pressure is particularly significant for repair […]."* (Khor *et al.* 2016:101)

Source: Compiled by the researcher

Table 5.20 shows that repair as a disposition option can include general, require, involve and influenced by characteristics. The *general characteristic* of repair relates to the *complex* and *time-consuming* nature of repair as a disposition option. The complexity and time-consuming nature of repair can relate to repair operations needed to restore defective/damaged products to working order (see section 5.6.3.2) and repair lead-time, which can include the time of (1) receiving the returned product for repairs, (2) completing repair activities and (3) returning the repaired product to the consumer. Additionally, the complexity of repair can be emphasised through the repair *requirement characteristics* of *skilled/trained staff, resources, equipment* and *technology.* Consequently, to effectively engage in repair operations, online retailers must commit or invest in financial resources, human resources (skilled staff) and physical resources (equipment and technology).

The *involvement* characteristics of repair include costs and consumer returns. Particularly, the *costs* of repair can include holding costs for repairable products (e.g. inventory carrying costs and storage), fixed costs (e.g. rent and fixed salaries) and direct costs (e.g. testing and replacement costs), indicating the repair can be an expensive disposition option. Additionally, repair can *involve* any type of *consumer return*, including B2C consumer returns, end-of-use (EoU), service returns, warranty returns and product recalls, emphasising the significance of repair as a disposition option for any type of online retailer. Evidently, unlike other disposition/exit options, the type of return plays no influential role on the selection of repair as a disposition option.

Nevertheless, the *influenced by characteristics* of product type, product quality, product condition and legislation can influence the selection of repair as a disposition option. For example, certain *product types*, including clothes, electronic products and equipment, vehicles, printers, appliances, mobile phones, computers and cameras, can be more suitable for repair activities. However, the type of product may also influence the degree/level of repair, for example, clothing items (such as a dress) will require less effort or resources than vehicles. Furthermore, the *product quality* and *condition* can influence the selection of repair as a disposition option. Particularly, repair can be selected for new or used *higher/good quality* products in *good* but *faulty*, *defective* and *damaged condition*, implying that it might be too costly to repair low quality products in poor condition. For example, the repair costs of a severely damaged fridge of lower quality might be higher than the costs of buying a new fridge. Finally, like direct reuse, repair can be influenced by *legislation*, for example, governments can create laws and regulations that enforce organisations to accept warranty and service returns for repair. In the next section, the activities/processes in repair will be discussed.

5.6.3.2 Activities/processes in repair as a disposition option for consumer returns

Repair activities/processes were categorised as activities/processes before, during and after repair. Table 5.21 provides an overview of the findings related to the *activities/processes in repair* as a disposition option for consumer returns, including details on the activities, sources to support the activities and key quotations to support the discussion of the findings.

Table 5.21 Findings related to the activities/processes in repair as a disposition option

	Redelivery to original consumer	Agrawal *et al.* (2015:85) Agrawal *et al.* (2016c:48) Banomyong *et al.* (2008:38) González-Torre *et al.* (2010:897) Min and Ko (2008:177) Wu (2014:52)	• *"After repair, the products are […] delivered back to the […] customers."* (Li *et al.* 2016:225)
	Remarketing	None	• *"Repairing items […] and marketing them."* (Brix-Asala *et al.* 2016:3) • *"[…] then repaired and remarketed."* (Gobbi, 2011:781)
	Reselling or charging	Abraham (2011:219) Agrawal *et al.* (2016b:98) Asdecker (2015:3) Assavapokee and Wongthatsanekorn (2012:137) De Oliveira *et al.* (2012:1597, 1601) Gobbi (2011:781) Khor *et al.* (2016:97) Kim and Goyal (2011:2537) Kumar *et al.* (2016:4) Olorunniwo and Li (2010:454) Pochampally and Gupta (2012:1355) Ponce-cueto *et al.* (2011:107) Srivastava and Srivastava (2006:525, 5230) Tan and Kumar (2006:335)	• *"[…] product can be made fit for resale after […] repair […]."* (De Leeuw *et al.* 2016:716) • *"[…] repair, to be sold to customers."* (Agrawal & Choudhary, 2014:19) • *"All the repaired […] products can be sold […]."* (Yu & Solvang, 2016:5) • *"[…] the repair staff […] charges the customer […]."* (Östlin *et al.* 2008:343)

Source: Compiled by the researcher

Table 5.21 shows that the activities/processes in repair can be classified as activities/processes (1) before repair, including collection, transportation, sorting, storage and communication, (2) during repair, including disassembly, treatment, fixing, parts replacement, (re)testing, restoration, upgrade, servicing and washing/cleaning, and (3) after repair, including back to inventory, trading, redistribution, delivery, remarketing, reselling and charging. Evidently, most activities/processes of repair involve product flows with communication and remarketing as the only information flow activities and reselling, trading and charges as the only cash flow activities.

The *activities/processes before repair* mostly represent other RL processes, including collection, transportation and sorting. Subsequently, repair can include *collection* and *transportation* of returned products from consumers to initial facilities for repair and/or from initial facilities to recovery facilities for repair. Additionally, products can be *sorted* according to appropriate disposition options (in this case repair) and *stored* for freight volume consolidation before transportation to recovery facilities. While volume consolidation can reduce repair costs, storage can increase repair lead-time, which might influence customer service and value depreciation. The *communication* activity before repair associates with consumers and retailers interacting about warranty claims for used products destinated for repair, demonstrating the involvement of warranty returns in the repair option (characteristic).

The *activities during repair*, including disassembly, treatment, fixing, parts replacement, (re)testing, restoration, upgrade, servicing and washing/cleaning, can associate with product type and condition as (influenced by) characteristics of repair. For example, the repair activities for vehicles can include *disassembly, testing, restoration, upgrading, parts replacement, washing* and *servicing*, and the repair activities for cloths can be limited to *fixing* and *cleaning*. Additionally, products in defective/faulty condition may require *fixing, parts replacement* and *retesting* and products in damaged condition may require *restoration* and *cleaning*.

The *activities/processes after repair* demonstrate the recovered condition of the repaired product, which enables the activities/processes of *back to inventory*, *trading*, *redistribution, remarketing* and *reselling.* Additionally, products sent for warranty or service repairs can involve *charges* and *redelivery* back to the original consumers, representing cash inflows and product outflows. Furthermore, the activities/processes after repair can associate with the outcomes of repair (see section 5.6.3.5). For example, *reselling* and *trading* the repaired product points to economic outcomes of repair (e.g. profits and cost recovery), representing cash inflows. Additionally, *remarketing* of the repaired product points to market-related outcomes of repair (e.g. demand satisfaction), representing information flows. Similarly, redelivery to the original consumer points to the market-related outcomes of repair (e.g. consumer service and satisfaction). Finally, *redistribution*

emphasise that recovered/repaired returned products are destined for the markets/second consumers, which will be further explored in the next section.

5.6.3.3 Facilities/locations in repair as a disposition option for consumer returns

In this section the facilities/locations used for repair as a disposition option will be explored. Table 5.22 provides an overview of the findings related to the *facilities/locations of repair* as a disposition option for consumer returns, including details on the facilities, sources to support the mentioned facilities and key quotations to support the discussion of the findings.

Table 5.22 Findings related to the facilities/locations of the repair disposition option

FACILITIES / LOCATIONS	SUPPORTING SOURCES	KEY QUOTATIONS
Warehouses	Tan and Kumar (2006:343)	• *"The warehouse serves as a hub between front end and back end of the repair network."* (Janse *et al.* 2010:510) • *"[…] repairing for returned product […] at current warehouse […]."* (Lee *et al.* 2012:5629) • *"[…] warehouses […] may dedicate their space for repair."* (Min & Ko, 2008:179)
Distribution Centres (DCs)	Banomyong *et al.* (2008:37)	• *"[…] distribution centers [sic] […] designated for repair service […]."* (Du & Evans, 2008:2620) • *"[…] the part for repair can […] then forwarded to […] a regional DC."* (Piplani & Saraswat, 2012:1426)
Collection facilities	Soleimani and Govindan (2014:487)	• "*Repaired […] products are treated in collection center [sic]."* (Dhib *et al.* 2016:376) • *"[…] if it needs repair […] returned product may be transferred […] through a collection centre."* (Chan *et al.* 2012:1321) • *"After repair, the products are delivered back to the collection sites […]."* (Du & Evans, 2008:2620) • *"After repair, the products are daily delivered back to the respective collection points."* (Li *et al.* 2016:225) • *"[…] repair […] activities […] may be carried out […] at collection centers [sic] […]."* (Srivastava & Srivastava, 2006:528)
Processing facilities	None	• *"[…] processing facility is responsible for repairing used electronics for resale […]."* (Assavapokee & Wongthatsanekorn, 2012:137)
Disassembly facilities	None	• *"Disassembly locations […] to the operation of […] repairing […]."* (El-Sayed *et al.* 2010:425) • *"[…] repairing by […] disassembly centers [sic] […]."* (Soleimani & Govindan, 2014:487)
Service centres / shops	Agrawal *et al.* (2016c:48) Lambert *et al.* (2011:576)	• *"[…] to a service centre […] to complete the repair process."* (Piplani & Saraswat, 2012:1426) • *"[…] returned products are repaired at the service shops."* (Banomyong *et al.* 2008: 39) • *"[…] after repair re-enter the network and travel towards the service centres."* (Piplani & Saraswat, 2012:1426) • *"[…] service centers [sic] near customers […] to help minimize [sic] customers inconvenience […] to access […] repair services […]."* (Banomyong *et al.* 2008:37)
Workshops	None	• *"Repair […] carried out in informal or semi-formal workshops."* (De Oliveira *et al.* 2012:1607)
Repair facilities	Aitken and Harrison (2013:755) Du and Evans (2008:2618, 2620) Keh *et al.* (2012:31) Jayaraman (2006:982) Lee *et al.* (2012:5629) Srivastava and Srivastava (2006:530)	• *"[…] if it needs repair […] returned product may be transferred to a repair centre […]."* (Chan *et al.* 2012:1321) • *"[…] repair facilities where returned products […] were […] repaired […]."* (Min & Ko, 2008:176) • *"[…] repair […] centres […] that repair […] goods […]."* (Turrisi *et al.* 2013:567) • *"[…] repaired goods from the […] repair center [sic]."* (Kumar *et al.* 2016:4) • *"[…] repair shop where the repair […]."* (Östlin *et al.* 2008:343)
Refurbishment facilities	Kim *et al.* (2006:281) Srivastava and Srivastava (2006:530)	• *"[…] refurbishing centres […] that repair […] goods […]."* (Turrisi *et al.* 2013:567)
Recovery centres	None	• *"[…] after some repairs and must be transferred to recovery centers [sic] […]."* (Eskandarpour *et al.* 2014:1396)
Redistribution facilities	None	• *"[…] repaired goods to the redistribution center [sic]."* (Kumar *et al.* 2016:4)
Customer location	None	• *"Repairing network is concerned with repairing, and servicing of products and return of those products to the customers"* (Agrawal *et al.* 2015:85) • *"After repairs […] send back the goods to the customers […]."* (Banomyong *et al.* 2008:38)

FACILITIES / LOCATIONS	SUPPORTING SOURCES	KEY QUOTATIONS
		• *"Repair operations can be performed at the customer's location […]."* (Jayaraman, 2006:982) • *"Repair: […] from customer sites […]."* (Keh *et al.* (2012:31)
Markets	De Oliveira *et al.* (2012:1597) Govindan *et al.* (2015:603) Kim and Goyal (2011:2545) Pochampally and Gupta (2012:1355) Ponce-cueto *et al.* (2011:107) Soleimani and Govindan (2014:487, 491) Srivastava and Srivastava (2006:525)	• *"[…] repair […] and resell […] in secondary market […]."* (Agrawal *et al.* 2016b:98) • *"[…] defective lots are bought from the market, then repaired […]."* (Gobbi 2011:781) • *"[…] repair […] that improve products to working order so that they enter the […] market […]."* (Khor & Udin, 2012:12) • *"[…] repaired […] products can be sold in both primary and secondary markets."* (Yu & Solvang, 2016:5)

Source: Compiled by the researcher

Table 5.22 shows the *facilities/locations* used for the repair option include (1) traditional FL facilities (such as warehouses and DCs), (2) RL process facilities (such as collection facilities, processing facilities and disassembly facilities), (3) recovery facilities (such as service centres, workshops, refurbishment facilities, repair facilities and recovery centres), (4) exit facilities (such as redistribution facilities), and (5) consumer and market locations. The functionalities of these facilities and locations can be described in terms of the activities/processes in repair as a disposition option (see section 5.6.3.2).

The *traditional FL facilities* used for repair can include warehouses and DCs. *Warehouses* can be used as initial locations that perform (1) processes/activities before repair, for example, receiving collected and transported returned products from consumers, sorting and storage of returned products, and transporting of returned products to other facilities for repair, or (2) activities during repair, for example, repairing and cleaning clothes. In contrast, *DCs* might be second tier locations (e.g. regional DCs) that receive products from initial locations, like warehouses, to perform repair activities. Additionally, DCs might be responsible for redistributing repaired products to markets, forming part of exit facilities. Therefore, organisations can combine FL operations alongside repair activities in their existing warehouses and DCs.

Similarly, RL process facilities, including collection, processing and disassembly facilities can be used for activities/processes before, during and after repair. Particularly, *collection facilities* can (1) receive returned products through collection and transportation from consumers and then ship/transport returned products to recovery facilities (second tier) for repair, (2) perform activities during repair (e.g. fixing and cleaning), and (3) receive repaired products from other facilities for activities after repair (e.g. resale and redistribution) to markets. Similarly, *processing facilities* can perform activities during repair (e.g. testing and fixing) and activities after repair (e.g. resale). In contrast, *disassembly facilities* can be second tier RL facilities, used for activities during repair (e.g. disassembly and testing).

The *recovery facilities* represent facilities that specialise in disposition and recovery activities, including service centres, workshops, refurbishment facilities, repair facilities and recovery centres. *Service centres* can receive products for repair directly from consumers and can be located closely to consumer locations. Alternatively, service centres can be utilised as second tier facilities that receive returned products from first-tier facilities/locations (e.g. collection facilities). Both service centres and *workshops* are dedicated to performing activities during repair (e.g. servicing, fixing, restoration and cleaning). Similarly, *refurbishment facilities* can perform activities during repair, but their main functionality involves refurbishment as a disposition option for consumer returns (see section 5.6.4.4).

Repair facilities specialise in activities during repair and represent second-tier facilities that receive returned products from initial facilities/locations for repair. However, repair facilities can be responsible for activities after repair (such as redistribution and delivery), implying that repair facilities can also be exit facilities in repair. *Recovery centres* represent the only recovery facilities that receive repaired products from locations, implying that these centres can be responsible for activities after repair (e.g. reselling or redistribution). Evidently, recovery centres can also be regarded as *exit facilities,* like *redistribution facilities,* specialising in the reselling and redistribution of repaired products to markets.

The *locations of repair* include consumer and market locations, which relate to activities during and after repair. *Consumer locations* represent the locations of the original consumers, which can be used for activities during repair or serve as locations after repairs. Evidently, repair activities can be performed at *consumer locations* (e.g. consumer residences), excluding the physical return of products to facilities for repairs. This option can be valuable in terms of reducing repair/RL costs and improving consumer service. Alternatively, consumer locations associate with the activity of redelivery after repair, representing original consumers that returned products to facilities for repairs. Finally, *markets* signify reselling (cash flows) and redistribution (product flows) activities in repair (see section 5.6.3.2) and relate to second consumers. Like direct reuse disposition (see section 5.6.2.3), repaired products can be destined for primary markets or secondary markets.

In the next section, the various parties involved in repair will be discussed.

5.6.3.4 Parties involved in repair as a disposition option for consumer returns

In this section the parties in repair as a disposition option for consumer returns will be identified and discussed. Table 5.23 provides an overview of the findings related to the *parties in repair* as a

disposition option for consumer returns, including details on the parties, sources to support the mentioned parties and key quotations to support the discussion of the findings.

Table 5.23 Findings related to the parties in repair as a disposition option

PARTIES	SUPPORTING SOURCES	KEY QUOTATIONS
Consumers	González-Torre *et al.* (2010:897) Lambert *et al.* (2011:576) Li *et al.* (2016:225) Olorunniwo and Li (2010:454) Piplani and Saraswat (2012:1426)	• *"[…] used product from the customers for the purpose of […] repair […]."* (Agrawal *et al.* 2015:76) • *"[…] customers explain the causes of service failure and claim product […] repair […]."* (Ahsan & Rahman, 2016:627) • *"[…] customer return […] to the retailer […] or third-party can decide on different options such as repair […]."* (Badenhorst & Van Zyl, 2015:148) • *"After repairs are made […] the customers themselves come to pick up the repaired goods."* (Banomyong *et al.* 2008:37, 38) • *"Customers would bring their products back to repair […]."* (Chan *et al.* 2012:1320) • *"[…] repairing and sending returned products back […] end-customers."* (Min & Ko, 2008:177) • *"Repair operations can be performed at the customer's location […]."* (Jayaraman *et al.* 2006:982) • *"[…] customers are encouraged to return products that can be repaired."* (Khor & Udin, 2012:13) • *"[…] products after repairing […] are sold to secondary customers."* (Kumar *et al.* 2016:4) • *"[…] consumers may be asked to […] receive a repair kit […]."* (Ni *et al.* 2014: 313) • *"[…] the repair staff […] charges the customer […]."* (Östlin *et al.* 2008:343) • *"[…] consumer will […] seek a warranty repair […]."* (Sharma & Singh, 2013:39) • *"[…] repaired […] products […] based on the customers' demands."* (Soleimani & Govindan, 2014:491) • *"Second customers […] are interested in repaired […] products […]."* (Soleimani & Govindan, 2014:491)
Retailers	None	• *"[…] sold through e-business or e-retailers […] because only minor repair […] is required."* (Agrawal *et al.* 2016b:98) • *"[…] retailers interact with customer where customers […] claim product […] repair […]."* (Ahsan & Rahman, 2016:627) • *"[…] the retailer will send the printer back to the […] third-party can decide on […] repair […]."* (Badenhorst & Van Zyl, 2015:148) • *"[…] products from retailers […] were […] repaired […]."* (Min & Ko, 2008:176) • *"[…] the retailer is often responsible for […] repairs."* (Ni *et al.* 2014:312, 320)
Staff	Assavapokee and Wongthatsanekorn (2012:130)	• *"Employees tasked with […] repairing […] items."* (Stock & Mulki, 2009:49) • *"[…] the repair staff […] charges the customer […]."* (Östlin *et al.* 2008:343) • *"[…] the service personnel identify the faulty module […] to complete the repair process."* (Piplani & Saraswat, 2012:1426)
Third parties	Ko and Evans (2007:347)	• *"[…] third-party can decide on different options such as repair […]."* (Badenhorst & Van Zyl, 2015:148) • *"[…] a third-party transportation service provider is involved […] to return the repaired products […]."* (Banomyong *et al.* 2008:39) • *"[…] the jobber will undertake repair […]."* (Bernon *et al.* 2011:492) • *"The 3PL provider immediately transports the returned products to repair […]."* (Du & Evans, 2008:2619, 2620) • *"[…] distribution centers [sic] of the 3PL provider should be designated for repair service […]."* (Du & Evans, 2008:2619, 2620) • *"LSP […] receives also repaired […] products back, retests them again and takes care of redistribution."* (Janse *et al.* 2010:510) • *"3PLs that offer value-added services such as repair […]."* (Min & Ko, 2008:176) • *"The repair operation may be carried out […] by […] repair vendors […]."* (Piplani & Saraswat, 2012:1424)
Re-distributors	None	• *"[…] repairing and sending returned products back to their distributors […]."* (Min & Ko, 2008:177) • *"[…] repaired […] and then forwarded […] through redistributors."* (Soleimani & Govindan, 2014:491) • *"Redistributors manage to send […] repaired […] products to the second markets […]."* (Soleimani & Govindan, 2014:491)

Source: Compiled by the researcher

Table 5.23 shows that repair involves several parties with various roles, including consumers, retailers, staff, third parties and (re)distributors. Like direct reuse, *consumers* can play significant roles in the repair option and can be classified as original consumers and second consumers. The *original consumers* can play primary roles in repair by being responsible for (1) returning and

transporting products for repairs, (2) explaining causes of product failures (or return reasons), (3) submitting warranty claims for repairs, (4) providing a repair location (residences or workplaces), (5) conducting repair activities through repair kits, (6) paying repair costs, and (7) receiving repaired products back. Contrastingly, the *second consumer* play indirect roles in repair by creating a demand for repaired products and purchasing repaired products. Subsequently, consumers can be responsible for information, product and cash flows in repair.

Similarly, *retailers* can play various roles in repair, including (1) receiving consumer returns for repairs, (2) interacting (communicating) with consumers regarding warranty claims, (3) selecting repair as a disposition option, (4) outsource repair to third parties or conduct repair in-house, and (5) (re)sell repaired products. Consequently, like consumers, retailers can be responsible for information, product and cash flows in repair. Repair can involve specialised *repair staff* employed by retailers (or third parties) to perform activities during repairs (e.g. testing, disassembly, servicing, fixing, replacing and washing) and activities after repair, like charging consumers. Essentially, repair staff emphasise the repair requirement characteristics of skilled/trained staff and human resources (see section 5.6.3.1).

Repair involves multiple *third parties*, including transport service providers, 3P(R)L providers, jobbers[15] and repair vendors, playing various roles, including (1) collecting and transporting product from consumers to facilities for repair (transporters, 3PL and LSP), (2) selecting repair as a disposition option (3PLs), (3) owning facilities used for repair (3PLs), (4) conducting repair operations (3PLs, jobbers and repair vendors), and (5) redistributing/redeliver of repaired products (transporters, 3PLs and LSP). Evidently, third parties are responsible for product flows in repair as a disposition option for consumer returns.

Likewise, *(re)distributors* are responsible for product flows in repair with the main role of redistributing repaired products to the markets. Consequently, they are involved in the activities after repair and indirectly provide value to the repair process. In the next section the outcomes of repair will be identified.

5.6.3.5 Outcomes of repair as a disposition option for consumer returns

The outcomes of repair were divided into several categories, namely economic, product-related, environmental and market-related outcomes. Table 5.24 provides an overview of the findings related

[15] *Jobbers* are third parties that buy product returns from retailers for the purpose of recovery and resale (Bernon & Cullen, 2007:49) and will be discussed in section 5.6.6.3.

to the *outcomes of repair* as a disposition option for consumer returns, including detail on the categories, outcomes, sources to support the outcomes and key quotations to support the discussion of the findings.

Table 5.24 Findings related to the outcomes of the repair as a disposition option

CATEGORIES	SUBCATEGORIES	SUPPORTING SOURCES	KEY QUOTATIONS
Economic outcomes	***Economic benefits and profitability***	Chan *et al.* (2012:1320) Khor and Udin (2012:12, 13) Pishvaee *et al.* (2010:269) Serrato *et al.* (2007:4290)	• *"[…] returns accepted for repair […] are profitable for business."* (Khor *et al.* 2016:106) • *"[…] prefer repair […] to minimize [sic] potential revenue losses."* (Ni *et al.* 2014:320) • *"[…] profits generated from selling the repaired products."* (Yu & Solvang, 2016:11) • *"[…] economic benefits can be obtained through […] repair […]."* (Yu & Solvang, 2016:12)
	Value recovery	Gobbi (2011:787) Subhashini (2016:9)	• *"[…] repairing […] termed value-added recovery […]."* (Jayaraman *et al.* 2006:984)
	Cost savings and effectiveness	None	• *"[…] repair […] to save money […]."* (Han *et al.* 2010:1077) • *"[…] product repair activities gain cost-effectiveness […]."* (Khor & Udin, 2013:77)
Product-related outcomes	***Functional/ working and good-as-new products***	Gobbi (2011:773) Khor and Udin (2012:7, 12) Khor and Udin (2013:73) Konstantaras *et al.* (2010:452) Piplani and Saraswat (2012:1424) Selvi and Kayar (2016:17) Sharma *et al.* (2016:416) Singhry (2015:121)	• *"In repair, used products are returned to ''working order'' […]."* (Choi *et al.* 2007:764) • *"Repair […] that improve the quality of the returned product to functional condition […]."* (Khor *et al.* 2016:97) • *"The purpose of repair is to return failed products to working condition […]."* (Sasikumar & Kannan, 2008a:159) • *"[…] repair usually involves activities necessary to restore a damaged product into the working order […]."* (Niknejad & Petrovic, 2014:143) • *"[…] repair […] goods in order to make them almost "as good as new" […]."* (Turrisi *et al.* 2013:567)
	Extend product lifecycle	Khor and Udin (2012:11) Khor *et al.* (2016:103)	• *"Repair prolongs the product's lifecycle."* (Khor & Udin, 2013:78) • *"[…] products can be […] repaired, thus, extending their useful life."* (Shaik & Abdul-Kader, 2014:92)
	Recover product/parts for reuse	Hazen *et al.* (2012:248) Niknejad and Petrovic (2014:143) Ye *et al.* (2013:134)	• *"[…] repairing […] for component recovery […]."* (Assavapokee & Wongthatsanekorn, 2012:137) • *"[…] repairable items collected […] for recovery."* (Bazan *et al.* 2015:309) • *"[…] the recovery of products […] achieved through processes such as repair […]."* (Cardoso *et al.* 2013:437) • *"[…] repair, as the lowest level of product recovery activity […]."* (Khor & Udin, 2012:13) • *"[…] repair […] through whole unit recovery […]."* (Khor & Udin, 2012:13) • *"Repair is done […] and product recovered […]."* (Subhashini, 2016:9) • *"Repair […] involve making the product reusable for its intended purpose […]."* (Agrawal & Choudhary, 2014:19) • *"[…] returned products […] may be re-used (even partially), after some form of repair […]."* (Nenes & Nikolaidis, 2012:1362)
Environmental outcomes	***Environmental protection and sustainability***	Serrato *et al.* (2007:4290)	• *"[…] green and ecologically friendly, because repairing […] a product instead of throwing it in a landfill protects the environment."* (Hsu *et al.* 2016:95) • *"[…] repair diminishes products' threat to the environment […]."* (Khor & Udin, 2012:12) • *"[…] the significant environmental contribution […] through repair […]."* (Khor *et al.* 2016:103) • *"[…] environmentally responsible which includes […] repair […]."* (Sasikumar & Kannan, 2008a:165)
	Reduce resource consumption	None	• *"[…] repair […] to […] reduce natural resources."* (Han *et al.* 2010:1077)
Market-related outcomes	***Customer service/ satisfaction***	Alinovi *et al.* (2012:1243) Du and Evans (2008:2619) Ferguson *et al.* (2011:783) Li *et al.* (2016:223) Min and Ko (2008:176) Pishvaee *et al.* (2010:269) Sasikumar and Kannan (2008b:234) Shaharudin *et al.* (2015:10)	• *"[…] repair services for customers in order to maintain a high customer service level."* (Chan *et al.* 2012:1322) • *"[…] enhanced after sales or repair service to customers […]."* (Banomyong *et al.* 2008:37) • *"[….] value-added services such as […] repair."* (Ko & Evans, 2007:347) • *"[…] products returned for repair […] insure that the customer will be satisfied."* (Morgan *et al.* 2016:305) • *"Repair and after-sales service […] can also enhance a company's ability to market its product […]."* (Pokharel & Mutha, 2009:178)
	Satisfy demand and supply	Soleimani and Govindan (2014:491)	• *"These used products after repairing […] are sold to […] customers according to demand."* (Kumar *et al.* 2016:4) • *"[…] repair […] enables the company to meet production target."* (Khor & Udin, 2012:12)

Source: Compiled by the researcher

Table 5.24 shows the outcomes of repair can include economic, product-related, environmental and market-related outcomes, indicating that repair as a disposition option for consumers can add value to the RL process.

The *economic outcomes* of repair include economic benefits, profitability, value recovery and cost savings and effectiveness, representing the cash flows in the repair option. The *economic benefits* and *profitability* in repair can be the result of reselling/trading the repaired product on the primary or secondary market. Additionally, *value recovery* represents the monetary value that can be recovered through repair activities. *Cost savings* and *effectiveness* may be realised by selecting repair as the most economical disposition option (e.g. instead of refurbishment) and performing repair activities cost effectively. For example, using consumer locations for repair, which can save collection, transportation, receiving, storage and handling costs.

The *product-related outcomes* relate to product flows and represent the main purpose of repair, which involves fixing or restoring a defective/damaged/used product to a working and functional condition. A *working/functional (good as new) product*, *extending the product life* and *product (or parts) recovery for reuse* as product-related outcomes of repair emphasise the (1) repair activities of fixing, restoring and replacing of parts, back to inventory, reselling and redistribution, (2) economic outcomes of repair (such as value recovery) and (3) environmental outcomes (such as preventing products from entering landfills).

The *environmental outcomes* of repair, include *environmental protection, sustainability* and reducing natural resource consumpti*on*. Particularly, retailers can protect the environment by accepting products for repair, repairing returned products and reselling/redistributing products, which prevents products from entering landfills or incineration plants. Additionally, like direct reuse, repair can *reduce natural resource consumption* by reducing the need for buying new products/parts (lower production requirements). Consequently, the environmental outcomes of repair represent product flows.

The *market-related outcomes* of repair include consumer service/satisfaction, demand satisfaction and supply satisfaction. Specifically, *consumer service* and *satisfaction* can be *improved* through service/warranty returns by providing repair as a value-added service to consumers. Therefore, retailers can serve and satisfy the original consumers by offering repair as a disposition option for consumer returns. Furthermore, demand satisfaction can be realised through reselling, remarketing and redistribution of repaired products to second consumers. Finally, linking with the environmental outcome of reducing natural resources, repair can reduce production requirements, which can lead to *supply satisfaction*. Alternatively, repair may reduce the need for retailers to purchase new products

since repaired products can be restocked. Essentially, the market-related outcomes represent cash flows, information flows and product flows in repair.

In the next section, the description and conceptual framework of repair will be provided.

5.6.3.6 Description and conceptual framework of repair as a disposition option for consumer returns

Based on the findings presented in section 5.6.3, repair can be an important disposition option in the disposition process of consumer returns, and will be described as follows:

> Repair as a disposition option for consumer returns can be described as a complex and time-consuming disposition option that (1) requires skilled/trained staff, resources, equipment and technology, (2) involves costs and consumer returns, and (3) can be influenced by product type, quality and condition, and legislation. The activities/processes of repair can be classified as activities/processes (1) before repair, including collection, transportation, sorting, storage (product flows) and communication (information flows), (2) during repair, including disassembly, treatment, fixing, parts replacement, (re)testing, restoration, upgrade, servicing and washing/cleaning (product flows), and (3) after repair, including back to inventory, redistribution, delivery (product flows), remarketing (information flow), trading, reselling and charging (cash flows), which can be performed by repair staff of the online retailer and/or other third parties in traditional FL facilities (warehouses and DCs), RL process facilities (collection, processing and disassembly facilities), recovery facilities (service centres, workshops, refurbishment facilities, repair facilities and recovery centres), exit facilities (redistribution facilities), or at consumer locations (residences).
>
> The aims of the repair option are to (1) recover value from used/damaged/defective returned products received from original consumers, (2) restore products to working/resalable condition, and (3) redeliver repaired to the original consumer or resell and redistribute repaired products to second consumers in the primary markets or secondary markets. Repair as a disposition option can result in (1) economic outcomes (profits, economic benefits, value recovery and cost savings and effectiveness), (2) product-related outcomes (working product, extending the product life and product or parts recovery for reuse) (3) environmental outcomes (environmental protection and sustainability, and reduce natural resource consumption), and (4) market-related outcome (consumer service/satisfaction, demand satisfaction and supply satisfaction).

Figure 5.9 provides a conceptual framework for repair as a disposition option in the disposition process that may apply to consumer returns in online retailing.

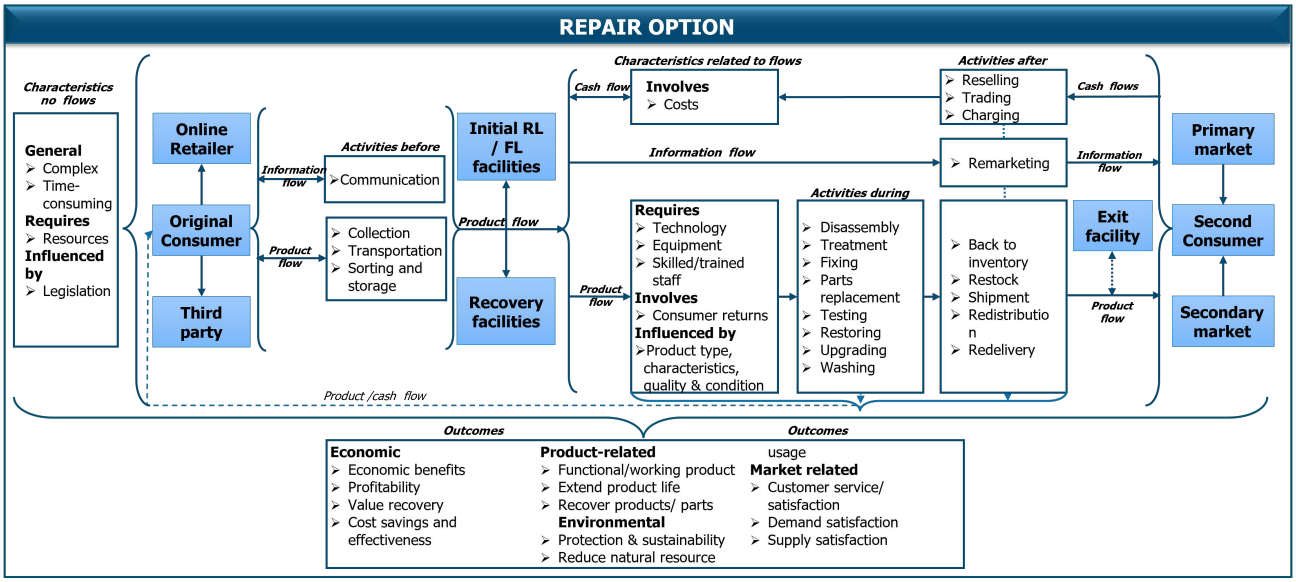

Figure 5.9 Conceptual framework of the repair disposition option
Source: Compiled by the researcher

Figure 5.9 provides a basic overview of repair as a disposition option, illustrating the parties, facilities/locations, flows, characteristics and activities. Particularly, the framework illustrates that the repair option starts with the original consumer, online retailer and third party, performing activities before repair that involve information (communication) and product (collection, transportation, sorting and storage) flows. Additionally, the framework shows that the returned products from consumers can be directed to FL/RL facilities and/or recovery facilities (owned by the online retailers and/or third parties) for further repair operations. In the facilities (of online retailers and third parties) the cash, information and product flows with related characteristics, activities during repair and activities after repair continues. Furthermore, the framework shows that the repaired products can either be delivered from FL/RL and recovery facilities to exit facilities for redistribution to markets or can directly be redistributed to the markets. The markets can include primary or secondary markets with a second consumer purchasing and receiving the repaired product (involving product outflow to the second consumer and cash inflow to the online retailer). Alternatively, the repaired product can be redelivered to the original consumer that may include charges for repair (involving product outflow to the original consumer and cash inflow to the online retailer). Additionally, the framework presents the repair characteristics unrelated to flows. Finally, the framework illustrates the various economic, product-related, environmental and market-related outcomes of repair, which can be realised through successful implementation and execution of repair as a disposition option for consumer returns.

In the next section, refurbishment as a disposition option for consumer returns will be discussed.

5.6.4 Refurbishment as a disposition option for consumer returns

Refurbishment can be selected as a disposition option for consumer returns to recover (economic, product-related, environment and market-related) value from returned products in used/damaged/defective condition. The categories of *refurbishment* identified from the QCA of RL literature included (1) characteristics of refurbishment, (2) activities/processes in refurbishment, (3) facilities/locations in refurbishment, (4) parties involved in refurbishment, and (5) outcomes of refurbishment, which will be presented and discussed in the subsequent sections and concluded with a description and conceptual framework of refurbishment as a disposition option for consumer returns.

5.6.4.1 Characteristics of refurbishment as a disposition option for consumer returns

In this section, the characteristics of refurbishment will be discussed. Table 5.25 provides an overview of the findings related to the *characteristics of refurbishment* as a disposition option for

consumer returns, including detail on the characteristics, sources to support the characteristics and key quotations to support the discussion of the findings.

Table 5.25 Findings related to the characteristics of refurbishment as a disposition option

CHARACTERISTICS	SUPPORTING SOURCES	KEY QUOTATIONS
Complex	None	• *"[…] a more complex refurbishing process."* (Ruiz-Benítez *et al.* 2014:55)
Requires more effort/work	None	• *"Refurbishing […] more work involved […]"* (Rogers et al. 2012:115) • *"[…] considerable effort has to be undertaken to rapidly refurbish the returned product […]."* (De Leeuw *et al.* 2016:711) • *"Refurbishing denotes higher degree of repair […]."* (Sharma *et al.* 2016:416)
Requires expertise and skilled staff	None	• *"[…] specialist technical expertise in terms of product refurbishment […]."* (Bernon & Cullen 2007:54) • *"[…] specialized [sic] personnel and refurbishment […]."* (Gobbi 2011:785) • *"[…] skills for […] refurbishing […]."* (Srivastava & Srivastava, 2006:530)
Requires investments, resources, technology and equipment	Weeks *et al.* (2010:1090)	• *"[…] investment of unnecessary cost to refurbish […]."* (Barker & Zabinsky, 2008:257) • *"[…] logistics infrastructure […] in terms of product refurbishment […]."* (Bernon & Cullen, 2007:54) • *"[…] transportation and handling investment, refurbishment […]."* (Chan *et al.* 2012:1327) • *"[…] dedicated investments in […] refurbishment equipment […]."* (Gobbi, 2011:785) • *"[…] refurbishing […] require significant resources […]."* (Skinner *et al.* 2008:533) • *"[…] appropriate level of technology […] for […] refurbishing returned products."* (Srivastava & Srivastava, 2006:530) • *"[…] refurbishment […] a significant return on investment."* (Vahabzadeh *et al.* 2015:336)
Requires authorisation	None	• *"[…] authorization [sic] for refurbishment […] due to […] refurbishment costs."* (Gobbi, 2011:780)
Involves costs	Kannan *et al.* (2016:13)	• *"[…] the transportation costs for shipping refurbished products […]."* (Assavapokee & Wongthatsanekorn, 2012:137) • *"[…] cost to refurbish a product […]."* (Barker & Zabinsky, 2008:257) • *"[…] refurbishment […] taking into account the costs of the reverse logistics process."* (Bernon & Cullen, 2007:50) • *"[…] refurbishing cost of wheels […]."* (Chan *et al.* 2012: 1327) • *"[…] refurbishment […] fixed costs associated with new facilities."* (Gobbi, 2011:780) • *"[…] excessive refurbishment costs […]."* (Gobbi, 2011:780) • *"[…] processing cost for […] refurbishment […]."* (Piplani & Saraswat, 2012:1428)
Involves time	None	• *"[…] total lead time to perform […] refurbishment […]."* (Gobbi, 2011:780)
Involves technology	Sharma *et al.* (2016:416)	• *"Replacement […] with a higher level of technology is regarded as refurbishing."* (Chan *et al.* 2012:1324) • *"[…] refurbishing is combined with technology upgrading by replacing outdated modules and parts with technologically superior […]."* (Jayaraman *et al.* 2006:982)
Involves product design	None	• *"[…] products could be designed to refurbish […]."* (Das, 2012:1440)
Influenced by market value	None	• *"If the equipment has market value it will be refurbished […]."* (Vahabzadeh *et al.* 2015:335)
Influenced by product type	Agrawal *et al.* (2016b:98) Dowlatshahi (2010a:1367) Ene and Öztürk (2015:287, 295) Gobbi (2011:780; 781) Guarnieri *et al.* (2016:1111) Jayaraman (2006:989) Luitel *et al.* (2014:88) Mazahir *et al.* (2011:100) Piplani and Saraswat (2012:1431) Ponce-cueto *et al.* (2011:108) Ravi (2014:296, 298) Rogers *et al.* (2013:45) Serrato *et al.* (2007:4290) Vahabzadeh *et al.* (2015:335)	• *"[…] mobile phones for refurbishing […]."* (Lau & Wang, 2009:453) • *"[…] office equipment […] to be refurbished […]."* (Alshamrani *et al.* 2007:596) • *"[…] refurbishing […] equipment and machines."* (Alumur *et al.* 2012:67) • *"[…] medical device refurbishing […]."* (Barker & Zabinsky, 2008:250) • *"[…] refurbished […] auto parts […]."* (Chan *et al.* 2012:1321) • *"[…] refurbish the vehicle […]."* (Chan *et al.* 2012:1323) • *"Transmissions can be refurbished […]."* (Chan *et al.* 2012:1327) • *"[…] refurbishment […] of car batteries […]."* (Chan *et al.* 2012:1327) • *"[…] electrical and electronic equipment (EEE) destined for […] refurbishment […]."* (De Oliveira *et al.* 2012:1595) • *"[…] sell refurbished […] TV, refrigerators and mobile handsets […]."* (Das & Dutta, 2013:727) • *"[…] used appliances that may be […] refurbished […]."* (De Oliveira et al. 2012:1597) • *"The refurbished computers […]."* (De Oliveira *et al.* 2012:1606) • *"[…] refurbishment of […] IT equipment […]."* (Gobbi, 2011:788) • *"Refurbished servers […]."* (Keh *et al.* 2012:31) • *"[…] refurbished […] cameras […]."* (Kumar & Putnam, 2008:308) • *"[…] refurbishment […] of printer cartridges […]."* (Mafakheri & Nasiri, 2013:193) • *"[…] spare parts […] for refurbishment […]."* (Mafakheri & Nasiri, 2013:193)
Influenced by product quality and condition	Assavapokee and Wongthatsanekorn (2012:134) Gobbi (2011:773, 781)	• *"[…] items having a low-quality level can be instantaneously refurbished […]."* (Alinovi *et al.* 2012:1243) • *"Replacement of dated parts or components […] is regarded as refurbishing."* (Chan *et al.* 2012:1324)

CHARACTERISTICS	SUPPORTING SOURCES	KEY QUOTATIONS

Influenced by regulations	None	• *"[…] strict environmental regulations […] to refurbish […]."* (Eskandarpour *et al.* 2014:1394) • *"[…] refurbishing […] meeting […] regulatory norms."* (Srivastava & Srivastava, 2006:542)

Source: Compiled by the researcher

Table 5.25 shows that refurbishment as a disposition option can include general, require, involve and influenced by characteristics. The *general characteristic* of refurbishment relates to the *complexity* of refurbishment as a disposition option, which can be explained through the *requirement characteristics* of refurbishment. In comparison with other disposition options (direct reuse and repair), refurbishment requires more work, expertise, skilled staff, investment, resources, equipment and technology. Particularly, refurbishment involves a higher degree of repair, requiring *more effort* and *work* to recover a product. Additionally, refurbishment *staff* must be specialised and well-trained in refurbishment, possessing the necessary technical *expertise* and *skills* to perform refurbishment operations effectively. Accordingly, refurbishment requires financial *investments*, sufficient *resources* (e.g. financial, human, physical and infrastructure), *equipment* and *technology*. Furthermore, refurbishment uniquely *requires authorisation* due to the complexity and high cost of refurbishment.

Subsequently, the *involvement characteristics* of refurbishment include costs, time, technology and product design. Particularly, the *costs* of refurbishment can include (1) transportation and shipping costs, (2) direct costs of refurbishment operations, (3) general RL process costs, and (4) fixed costs, explaining the need for refurbishment authorisation. While the content on refurbishment excluded the general characteristic labelled as "time-consuming", refurbishment can *involve* an element of *time.* Specifically, like repair, refurbishment involves a lead-time, which refers to the total time of performing activities/processes before, during and after refurbishment. Therefore, the refurbishment lead-time may start at product collection and conclude with resale and redistribution to the markets, implying that refurbishment might be a time-consuming disposition option.

In addition to technology as a requirement to execute refurbishment operations, refurbishment *involves technology*, associating with the replacement of outdated technology components in

returned products with newer technology. Lastly, refurbishment can *involve product design,* which refers to the design of products with future refurbishment in mind. For example, a laptop computer can be designed for easy disassembly and parts removable during refurbishment.

Like other disposition options, refurbishment contains various *influenced by characteristics,* including market value, product type, quality and condition, return type and regulation. All these factors influence the selection (or appropriateness) of refurbishment as a disposition option. Specifically, returned products must possess sufficient *market value,* indicating that refurbishment can be inappropriate (due to high investments and costs) for lower value products. Additionally, refurbishment can only be performed on certain types of products, including mobile phones, office equipment (including printer cartridges), machines, electronics, vehicles and automotive parts, medical devices, household appliances, TVs, cameras and other IT equipment, emphasising the require and involve characteristics of expertise and technology.

Furthermore, refurbishment can be appropriate for *lower quality used* products in *good* but *outdated, defective/faulty* or *damaged condition*. Consequently, refurbishment can be more appropriate for lower quality product, emphasising more work, skills and resource requirements in refurbishment. While a product can be low quality, the market value must still drive the appropriateness of refurbishment to ensure that sufficient value can be recovered from the product. In terms of *return types,* refurbishment as a disposition option can be selected for *B2C consumer returns* (dead-on-arrival defective and damaged products) and *warranty returns,* implying that these returned products must be irreparable for refurbishment to be appropriate. Finally, refurbishment as a disposition option for consumer returns can be influenced by *regulations.* Some regions (e.g. Europe) developed environmental regulations, enforcing organisations to accept outdated/damaged/defective/used product returns for refurbishment. In 2023, South Africa is yet to implement such environmental regulations that enforces the refurbishment of returned products. In the next section, the activities/processes in refurbishment will be discussed.

5.6.4.2 Activities/processes in refurbishment as disposition option for consumer returns

Like other repair, the activities in refurbishment can be divided into activities before, during and after refurbishment. Table 5.26 provides an overview of the findings related to the *activities/processes of refurbishment* as a disposition option for consumer returns, including details on the activities, sources to support the activities and key quotations to support the discussion of the findings.

Source: Compiled by the researcher

Table 5.26 presents the activities/processes associated with refurbishment, including the activities/processes before refurbishment, the activities during refurbishment and the activities/processes after refurbishment, which will be mentioned and explained below.

Like repair, the *activities before* refurbishment mostly involve other RL processes, including *collection, transportation, receiving, inspection* (evaluation) and *sorting* (product classification). All these RL processes involve product flows, which explains *handling* as an important activity before refurbishment. Additionally, like repair, *storage* of product returns might be necessary before these products are transported to other facilities, for the purpose of volume consolidation to save transportation costs and reduce refurbishment costs. While most activities before refurbishment involve product flows, authorisation and instructions as activities before refurbishment involve

information flows. Since refurbishment requires authorisation (characteristic), receiving *authorisation* for refurbishment can be an important activity before returned products can be refurbished. Additionally, due to the complexity of refurbishment (general characteristic), pre-refurbishment activities can involve the provision of *instructions* (e.g. instruction manuals) to staff before refurbishment can be performed.

The *activities during refurbishment*, including disassembly/dismantling, refining, renovating, cleaning, treatment, repairing/fixing, restoring, parts replacement, testing, reworking, upgrading and assembly, can associate with product type and condition as (influenced by) characteristics of refurbishment. For example, refurbishment of computers and cell phones can involve *testing, disassembly, repairing/fixing, restoring, parts replacement, upgrade* and *assembly*, while *vehicles* can also include *treatment, renovation, reworking, restoration* and *cleaning*. Additionally, refurbishment of returned products in defective/faulty condition can involve *testing* and *fixing/repair*, used products in outdated condition can involve *parts replacement* and *rework*, and products in damaged condition may require *restoration* and *cleaning*. Essentially, all activities during refurbishment involve product flows.

Finally, several *activities/processes* can take place *after* refurbishment, including retesting, repackaging, back to inventory, storage, packaging, shipping, transportation, redistribution, remarketing and reselling. *Retesting* of a refurbished product may be needed to ensure that the product is fit for resale. Additionally, the refurbished product can be *repackaged, placed back in inventory, stored* and *packed* for *shipment* and *transportation* to the next location (e.g. initial facility) or *redistribution* to markets, involving product flows in refurbishment. Furthermore, like repair, refurbishment can include remarketing activities, involving information flows, and reselling activities, involving cash flows, which can point to the economic and market-related outcomes (such as profits and demand satisfaction) of refurbishment (section 5.6.4.5).

In the next section, the facilities/locations in refurbishment will be explored.

5.6.4.3 Facilities/locations in refurbishment as a disposition option for consumer returns

Various facilities/locations associate with refurbishment as a disposition option for consumer returns, which will be identified and discussed in this section. Table 5.27 provides an overview of the findings related to the *facilities/locations in refurbishment* as a disposition option for consumer returns, including details on the facilities, sources to support the mentioned facilities and key quotations to support the discussion of the findings.

Table 5.27 Findings related to the facilities/locations in refurbishment as a disposition option

FACILITIES / LOCATIONS	SUPPORTING SOURCES	KEY QUOTATIONS
Warehouses	None	• *"Products that may be refurbished are shipped to a warehouse […] and then they are refurbished […]."* (Barker & Zabinsky, 2008:257) • *"Used items are […] brought to a warehouse facility where […] refurbishing occurs."* (Konstantaras *et al.* 2010:453) • *"Some warehouses, however, may dedicate their space for […] refurbishment […]."* (Min & Ko, 2008:179) • *"At warehouses […] returned products should be inspected for quality failure, sorted for […] refurbishment, stored […] and then shipped […]."* (Min & Ko, 2008:179)
CRCs	None	• *"[…] centralized [sic] return centers where returned products are […] sorted for refurbishment […] and shipped […]."* (Min *et al.* 2006:58)
Collection facilities	None	• *"[…] refurbished products are treated in collection center [sic]."* (Dhib *et al.* 2016:376) • *"[…] refurbishing activities […] may be carried out […] at collection centers [sic] […]."* (Srivastava & Srivastava, 2006:528)
Processing facilities	None	• *"Processing facility […] functionalities include […] refurbishing […]."* (Assavapokee & Wongthatsanekorn, 2012:137) • *"[…] the central processing facility […] refurbishes […]."* (Ruiz-Benítez *et al.* 2014:56)
Disassembly facilities	None	• *"[…] refurbishing quantity cannot exceed the capacity of the disassembly site […]."* (Kim *et al.* 2006:284)
Repair facilities	None	• *"[…] repair facilities, returned products should be inspected for quality failure, sorted for […] refurbishment, stored […] and then shipped […]."* (Min & Ko, 2008:179) • *"[…] products are inspected for […] refurbishment […] and shipped to […] repair depots […]."* (Min *et al.* 2006:58) • *"[…] repair facilities where returned products […] were […] refurbished […]."* (Min & Ko, 2008:176) • *"Repair […] center […] for […] refurbishing returned products."* (Srivastava & Srivastava, 2006:530) • *"[…] repair […] centres […] that […] refurbish goods […]."* (Turrisi *et al.* 2013:567)
Service centres	None	• *"[…] refurbished components at their service center [sic] […]."* (Agarwal *et al.* 2016:5) • *"[…] refurbishment at service centres."* (Piplani & Saraswat, 2012:1428)
Workshops	None	• *"[…] refurbishment of PCs is a very common practice carried out in informal or semi-formal workshops."* (De Oliveira *et al.* 2012:1607)
Recovery centres	None	• *"[…] recovery centers [sic] are sufficient to refurbish […]."* (Gobbi, 2011:789)
Refurbishment facilities	Bernon and Cullen (2007:49 Kim *et al.* (2006:284)	• *"[…] refurbishing take place at the refurbishing site."* (Gu & Tagaras, 2014:5156) • *"[…] refurbishing center [sic] for a more complex refurbishing process."* (Ruiz-Benítez *et al.* 2014:55) • *"[…] refurbish center [sic]: A rework facility using appropriate level of technology and skills for […] refurbishing returned products."* (Srivastava & Srivastava, 2006:530) • *"[…] refurbishing centres […] that […] refurbish goods […]."* (Turrisi *et al.* 2013:567)
Redistribution facilities	None	• *"[…] reverse distribution center [sic] […] refurbishes […] if necessary."* (Zuluaga *et al.* 2016:2) • *"Redistribution locations are responsible for the distribution of refurbished products to the second customers."* (El-Sayed *et al.* 2010:425)
Secondary market retail stores	None	• *"[…] retail stores (so called secondary market) who sell refurbished […] handsets […]."* (Das & Dutta, 2013:727) • *"[…] refurbished and sold through a couple of newly developed clearance stores."* (Bernon & Cullen 2007:49)
Markets	Agarwal *et al.* (2016:5) Agrawal *et al.* (2016a:935) Bernon and Cullen (2007:49) Das and Dutta (2013:721) De Oliveira *et al.* (2012:1597, 1606) Janse *et al.* (2010:510) Kannan *et al.* (2016:9) Keh *et al.* (2012:31) Kumar and Putnam (2008:308) Mukhopadhyay and Setaputra (2006:719) Ponce-cueto *et al.* (2011:107) Rogers *et al.* (2012:107) Shaharudin *et al.* (2015:7) Srivastava and Srivastava (2006:525) Tan and Kumar (2006:337) Vahabzadeh *et al.* (2015:335)	• *"[…] refurbish and resell in secondary market."* (Agrawal *et al.* 2016b:98) • *"[…] effective refurbishment […] through traditional and emerging novel secondary […] to market."* (Bernon & Cullen, 2007:52) • *"[…] parts are shipped to the secondhand market after refurbishing operations."* (Ene & Öztürk, 2015:287) • *"[…] refurbishes […] after which they are reintroduced into the marketplace."* (Ruiz-Benítez *et al.* 2014:56) • *"[…] create and exploit the markets for refurbished […] goods."* (Jayaraman *et al.* 2008:412) • *"Demand of refurbished products and components occurring from the secondary market […]."* (Kannan *et al.* 2016:6) • *"Refurbished products are kept […] and are later sold […] in a secondary market at a reduced price."* (Konstantaras *et al.* 2010:452) • *"[…] refurbished, it is sold through auctions or catalog [sic] sales […]."* (Mazahir *et al.* 2011:100) • *"Refurbishing […] before entering the markets."* (Subhashini, 2016:9) • *"A consumer who purchases a refurbished laptop […] are good examples of selling on the secondary market […]."* (Rogers *et al.* 2013:45)

Source: Compiled by the researcher

Table 5.27 shows the *facilities/locations* used for the refurbishment option include (1) traditional FL facilities (such as warehouses), (2) RL process facilities (such as CRCs, collection, processing, and disassembly facilities), (3) recovery facilities (such as repair facilities, service centres, workshops, recovery centres and refurbishment facilities), (4) exit facilities (such as redistribution facilities), and (5) market locations. The functionalities of these facilities and locations can be described in terms of the activities/processes in refurbishment as a disposition option (see section 5.6.4.2).

The *traditional FL facilities* used for repair can include warehouses, which can perform (1) processes/activities before refurbishment, including receiving products from consumers, inspection, sorting, authorisation, instructions, handling and storage of returned products before shipment to other facilities for refurbishment, or (2) activities during refurbishment (e.g. testing, treatment and cleaning). Evidently, organisations can combine FL operations alongside refurbishment activities in their existing warehouses.

Additionally, RL process facilities, including CRCs and collection, processing and disassembly facilities can be used for refurbishment activities/processes. *CRCs* can be the only RL facility responsible for processes/activities before refurbishment, for example, collection, transportation, receiving, evaluation, authorisation, sorting, storage and shipment. Therefore, CRCs can be regarded as first-tier (or initial) facilities in refurbishment. In contrast, *collection facilities*, *processing facilities* and *disassembly facilities* can be used for activities during refurbishment. Consequently, these RL process facilities can be second tier facilities that represent product flows in refurbishment, excluding information and cash flow activities.

Like repair, the *recovery facilities* that can be used for refurbishment include repair facilities, service centres, workshops, recovery centres, and refurbishment facilities. *Repair facilities* represent the only recovery facilities that can perform activities/processes before refurbishment, including inspection, sorting, handling, storage and shipment to other facilities for refurbishment. Alternatively, repair facilities can perform activities during refurbishment, like *service centres*, *workshops*, *recovery centres*, and refurbishment facilities. Consequently, the same facilities that can be used for repair operations can be used for refurbishment. However, *refurbishment facilities* specialise in refurbishment activities, possessing the necessary expertise, skills and technology required (characteristics) for effective refurbishment operations (see section 5.6.4.1).

In terms of *exit facilities*, *redistribution facilities* can perform activities during and after refurbishment, implying that some redistribution facilities specialise in recovery activities. However, redistribution facilities represent the only facilities in refurbishment with the function of redistributing refurbished products to secondary market retail stores and markets as locations in

refurbishment. *Secondary market stores* can perform activities after redistribution, including remarketing and reselling of refurbished products on the secondary markets. Consequently, refurbished products are predominantly destined for *secondary markets*, emphasising the higher recovery rate of direct reuse and repair options that involve sales in the primary markets (section 5.6.2 and 5.6.3).

In the next section, the parties in refurbishment will be analysed and discussed.

5.6.4.4 Parties involved in refurbishment as a disposition option for consumer returns

In this section, the parties that can be involved in refurbishment will be identified and discussed. Table 5.28 provides an overview of the findings related to the *parties in refurbishment* as a disposition option for consumer returns, including details on the parties, sources to support the mentioned parties and key quotations to support the discussion of the findings.

Table 5.28 Findings related to the parties in refurbishment as a disposition option

PARTIES	SUPPORTING SOURCES	KEY QUOTATIONS
Consumers	Agrawal *et al.* (2016a:21) Alinovi *et al.* (2012:1243) Chan *et al.* (2012:1321) Guarnieri *et al.* (2016:1108) Konstantaras *et al.* (2010:454) Kumar and Putnam (2008:308) Min and Ko (2008:176, 177) Morgan *et al.* (2016:305) Mukhopadhyay and Setaputra (2006:726) Skinner *et al.* (2008:521) Tan and Kumar (2006:337)	• *"[…] consumer returns increase the maximum supply of new and refurbished units […]."* (Reimann, 2016:51, 52) • *"[…] refurbishing: […] according to […] customer demand […]."* (Keh *et al.* 2012:31) • *"[…] distribution of refurbished products to the second customers."* (El-Sayed *et al.* 2010:425) • *"[…] refurbished items which can be sold to some customers […]."* (Assavapokee & Wongthatsanekorn, 2012:134) • *"[…] shipping refurbished products and/or components to online customers […]."* (Assavapokee & Wongthatsanekorn, 2012:137) • *"They are held until a customer order is received, and then they are refurbished to fill the order […]."* (Barker & Zabinsky, 2008:257) • *"A consumer who purchases a refurbished laptop […]."* (Rogers *et al.* 2013:45) • *"Refurbishing […] before delivery to the consumer […]."* (Selvi & Kayar, 2016:17) • *"[…] refurbishment […] of the return of products by customers."* (Bernon & Cullen, 2007:50)
Retailers	Mafakheri and Nasiri (2013:193)	• *"[…] retailers and considerable effort has to be undertaken to rapidly refurbish the returned product […]."* (De Leeuw *et al.* 2016:711) • *"[…] products from retailers or end-customers were […] refurbished […]."* (Min & Ko, 2008:176) • *"[…] product demands at the retailers are satisfied through the refurbishment."* (Piplani & Saraswat, 2012:1430) • *"[…] retailer can refurbish and resell consumer returns […]."* (Reimann, 2016:32) • *"[…] to refurbish […] consumer returns, the retailer will strengthen its bargaining position […]."* (Reimann, 2016:52) • *"[…] retailers […] do not have specialist technical expertise in terms of product refurbishment […]."* (Bernon & Cullen, 2007:54)
Staff	None	• *"[…] dedicated […] personnel and refurbishment […]."* (Gobbi, 2011:785) • *"[…] reverse logistics manager […] is charged with collecting electronics for refurbishing […]."* (Guarnieri *et al.* 2016:1111) • *"Employees tasked with […] refurbishing items."* (Stock & Mulki, 2009:49)

PARTIES	SUPPORTING SOURCES	KEY QUOTATIONS
		offers it for sale […].” (Mukhopadhyay & Setaputra, 2006:718) • *“Refurbished products […] are acquired by brokers.”* (Gobbi, 2011:782) • *The customers for these refurbished parts […] could be the secondary markets such as dealers, resellers […].”* (Tan & Kumar, 2006:337)

Source: Compiled by the researcher

Table 5.28 shows that several parties, including consumers, retailers, staff and third parties, can play various roles in refurbishment as a disposition option for consumer returns, which will be briefly described in the following paragraphs.

Consumer can play primary roles in refurbishment with (1) *original consumers* responsible for supplying (returning) products for refurbishment, and (2) *second consumers* creating a demand for refurbished products, and ordering, buying and receiving refurbished products. Consequently, consumers can contribute to the outcomes of refurbishment, including economic outcomes (such as profitability through buying), environmental outcomes (such as reducing waste by supplying products) and market-related outcomes (such as increasing sales), which will be explored in section 5.6.4.5.

Similarly, *retailers* can play various roles in refurbishment, including (1) receiving consumer returns for refurbishment, (2) selecting refurbishment as a disposition option, (3) developing skills/expertise to perform inhouse refurbishment, (4) outsource refurbishment to third parties, (5) (re)sell refurbished products and (6) creating a demand for refurbished products. Evidently, retailers in refurbishment include the original retailer of the returned product for refurbishment and the second retailer that buy and resell refurbished products. Furthermore, original retailers can employ *staff* to perform activities before and during refurbishment. Particularly, *RL managers* can be responsible for activities before refurbishment, including collection and transportation of products for refurbishment, and specialised *refurbishment staff* (with the skills and expertise) can be responsible for activities during refurbishment (e.g. disassembly, refining, renovating, treatment, repairing/fixing, restoring, parts replacement, testing, reworking, upgrading and assembly).

The roles of *third parties* in refurbishment can include activities before, during and after refurbishment and buying of refurbished products. Particularly, *collectors* can be responsible for activities before refurbishment, including collection and transportation of products for refurbishment. Additionally, *3P(R)L providers*, *LSPs*, *4PL providers* and *third-party refurbish specialists* can be outsourced parties that provide facilities and expertise to perform refurbishment activities on behalf of retailers. Some third parties operate in the secondary markets performing activities during and after refurbishment. For instance, *jobbers* and *recovery service providers (RSPs)* can perform activities during refurbishment and *RSPs* can perform activities after refurbishment, including

reselling of refurbished products. Finally, *brokers*, *dealers* and *resellers* can buy refurbished products from other third parties or retailers for resale in secondary markets. Some of these parties' associate with the exit options in the disposition process, which will be discussed in section 5.6.5.

In the next section, the significance of refurbishment as a disposition option for consumer returns will be explored through the outcomes.

5.6.4.5 Outcomes of refurbishment as a disposition option for consumer returns

The refurbishment outcomes were divided into categories, including economic, product-related, environmental and market-related outcomes. Table 5.29 provides an overview of the findings related to the *outcomes of refurbishment* as a disposition option for consumer returns, including detail on the categories, outcomes, sources to support the outcomes and key quotations to support the discussion of the findings.

Table 5.29 Findings related to the outcomes of refurbishment as a disposition option

CATEGORIES	SUBCATEGORIES	SUPPORTING SOURCES	KEY QUOTATIONS
Economic outcomes	***Economic benefits and profitability***	Agarwal *et al.* (2016:5) Jayaraman (2006:997) Jayaraman *et al.* (2008:413) Mafakheri and Nasiri (2013:188, 193) Mukhopadhyay and Setaputra (2011:5319) Reimann (2016:41) Srivastava and Srivastava (2006:542) Vahabzadeh (2015:336)	• *"Revenue […] is generated by selling the refurbished products […]."* (Kannan *et al.* 2016:9) • *"[…] re-sells refurbished products creates an additional source of income."* (Dowlatshahi, 2010a:1368) • *"[…] the cost of refurbishing is more than compensated for by the profit generated by the sale of the products."* (Piplani & Saraswat, 2012:1424) • *"[…] the profits increase as sales increase and as more used units are collected for refurbishing […]."* (Konstantaras *et al.* 2010:461) • *"[…] refurbished […] options can provide significant […] economic benefits […]."* (Serrato *et al.* 2007:4290) • *"[…] refurbishment […] of the product […] a significant return on investment."* (Weeks *et al.* 2010:1090)

	Satisfy demand	Keh *et al.* (2012:31) Piplani and Saraswat (2012:1430) Srivastava and Srivastava (2006:542)	• *"Consumer awareness and social acceptability […] will motivate them to buy refurbished […]."* (Agrawal *et al.* 2016a:21) • *"[…] customer order is received, and then they are refurbished to fill the order […]."* (Barker & Zabinsky, 2008:257) • *"[…] refurbished […] and then returned to the supply chain to satisfy future demands."* (Jayaraman *et al.* 2008:424) • *"Demand of refurbished products […] from the secondary market."* (Kannan *et al.* 2016:6) • *"[…] demand from people […] who buy refurbished equipment […]."* (Luitel *et al.* 2014:88) • *"[…] demand for the refurbished item […]."* (Mukhopadhyay & Setaputra, 2006:720) • *"Customer demand is satisfied by both new and refurbished products."* (Mukhopadhyay & Setaputra, 2011:5319)
	Customer service/satisfaction	None	• *"[…] refurbishment ensures that the customer will be satisfied."* (Morgan *et al.* 2016:305) • *"[…] improve services provided to customers as regards […] refurbishing returned products […]."* (Alinovi *et al.* 2012:1243)

Source: Compiled by the researcher

Table 5.29 shows the outcomes of refurbishment can include economic, product-related, environmental and market-related outcomes, indicating that refurbishment as a disposition option for consumers can add value to the RL process.

The *economic outcomes* of refurbishment include economic benefits, profitability, cost savings, cash and value recovery, representing the cash flows in the refurbishment option. The *economic benefits* of refurbishment can be realised through *revenue/income/profits* of reselling refurbished products and receiving a return on investment for expenses related to refurbishment. Therefore, the expertise,

skills resources and investment requirements (characteristics) for refurbishment (see section 5.6.4.1) can be justified through profits and return on investment through sales of refurbished products. Additionally, *cost savings* in refurbishment may be realised through recovery activities by avoiding purchasing costs of new products/parts. Furthermore, the *cash* or *value recovery* from refurbishment activities can contribute to cost savings and economic benefits associated with refurbishment. Particularly, refurbishment allow for (1) cash recovery of RL costs, (2) additional value out of assets and (3) high resale value of returned products.

Relating to product flows, the *product-related outcomes* in refurbishment include working and like new products, increase in quality and a new warranty, extend the product life and product recovery for reuse. Therefore, through refurbishment a used/defective/damaged/outdated returned product can be restored to a *working* and *good as new* product with improved *quality* and a *new warranty,* which *extends the product life* through reselling the refurbished product. Essentially, like the repair option (see sections 5.6.3.5) the returned *product* is *recovered* through refurbishment.

Refurbishment involves various *environmental outcomes,* which include environmental benefits and performance, environmental protection and waste reduction, comply with environmental laws and save natural resources. In terms of the *environmental benefits,* refurbishment can be viewed as a green and environmentally friendly disposition option, which enhances an organisation's environmental *performance.* Additionally, through refurbishment *waste* can be *reduced* by preventing returned products from entering landfills, resulting in *environmental protection.* Additionally, refurbishment can allow organisations to *comply with environmental laws* or *regulations,* which emphasise the influence of legislation (characteristic) on choosing refurbishment as a disposition option (see section 5.6.4.1). Furthermore, refurbishment can *save natural resources,* which emphasise the potential production cost savings (purchasing costs) associated with refurbishment.

The *market-related outcomes* of refurbishment include market benefits and competitiveness, an increase in sales, satisfy demand and customer service/satisfaction. In contrast to repair (section 5.6.3.5), refurbishment allow for greater *market benefits* and can enhance an organisation's competitiveness in the market. Particularly, refurbished products can compete with new products, confirming the product-related outcomes of higher quality, new warranty and like new products. Evidently, by selling refurbished products alongside new products, organisations can *increase their sales,* contributing to the profitability associated with refurbishment and cash inflows. Finally, some consumers/markets may also demand refurbished products, leading to *demand satisfaction* and *increase customer service/satisfaction.*

From the discussion above follows that the refurbishment disposition option is favourable due to various economic, product-related, environmental and market-related benefits, which can motivate online retailers to develop expertise, invest in resources and skilled staff as refurbishment requirements. In the next section, the description and conceptual framework of refurbishment will be given.

5.6.4.6 Description and conceptual framework of refurbishment as a disposition option for consumer returns

Based on the findings presented in section 5.6.4, refurbishment can be an important disposition option in the disposition process of consumer returns, and will be described as follows:

> Refurbishment as a disposition option for consumer returns can be described as a complex disposition option that (1) requires expertise, skilled staff, investments, resources, equipment, technology and authorisation, (2) involves costs, time, technology and product design, and (3) can be influenced by product type, quality and condition, return type and regulations. The activities/processes of refurbishment can be classified as activities/processes (1) before refurbishment, including collection, transportation, receiving, inspection, sorting, handling, storage (product flows) authorisation and instructions (information flows), (2) during refurbishment, including disassembly/dismantling, refining, renovating, cleaning, treatment, repairing/fixing, restoring, parts replacement, testing, reworking, upgrading and assembly (product flows), and (3) after refurbishment, including retesting, repackaging, back to inventory, storage, packaging, shipping, transportation, redistribution (product flows), remarketing (information flow) and reselling (cash flow), which can be performed by refurbishment staff of the online retailer and/or other third parties in traditional FL facilities (warehouses), RL process facilities (CRCs, collection, processing and disassembly facilities), recovery facilities (repair facilities, service centres, workshops, recovery centres and refurbishment facilities) and exit facilities (redistribution facilities).
>
> The aims of the refurbishment option are to (1) recover value from used/damaged/defective/outdated returned products received from original consumers, (2) restore products to a like new condition and increase the quality of the product, and (3) resell and redistribute refurbished products to second consumers in the secondary markets or other second market retailers. Refurbishment as a disposition option can result in (1) economic outcomes (economic benefits, profitability, cost savings, cash and value recovery), (2) product-related outcomes (working and like new products, increase in quality and a new warranty, extend the product life and product recovery) (3) environmental outcomes (environmental benefits and performance, environmental protection and waste reduction, comply with environmental laws and save natural resources), and (4) market-related outcomes (market benefits and competitiveness, an increase in sales, satisfy demand and customer service/satisfaction).

Figure 5.10 provides a conceptual framework for refurbishment as a disposition option that may apply to consumer returns in online retailing. Particularly, the framework provides a basic overview of refurbishment as a disposition option, illustrating the parties, facilities/locations, flows, characteristics and activities. Particularly, the framework illustrates that the refurbishment option starts with the original consumer, online retailer and third party, performing activities before refurbishment that involve information (authorisation and instructions) and product (collection, transportation, receiving, inspection, sorting, storage and handling) flows. Additionally, the framework shows that the returned products from consumers can be directed to FL/RL facilities and/or recovery facilities (owned by the online retailers and/or third parties) for further refurbishment operations. In the facilities (of online retailers and third parties) the cash, information and product

flows with related characteristics, activities during refurbishment and activities after refurbishment continues.

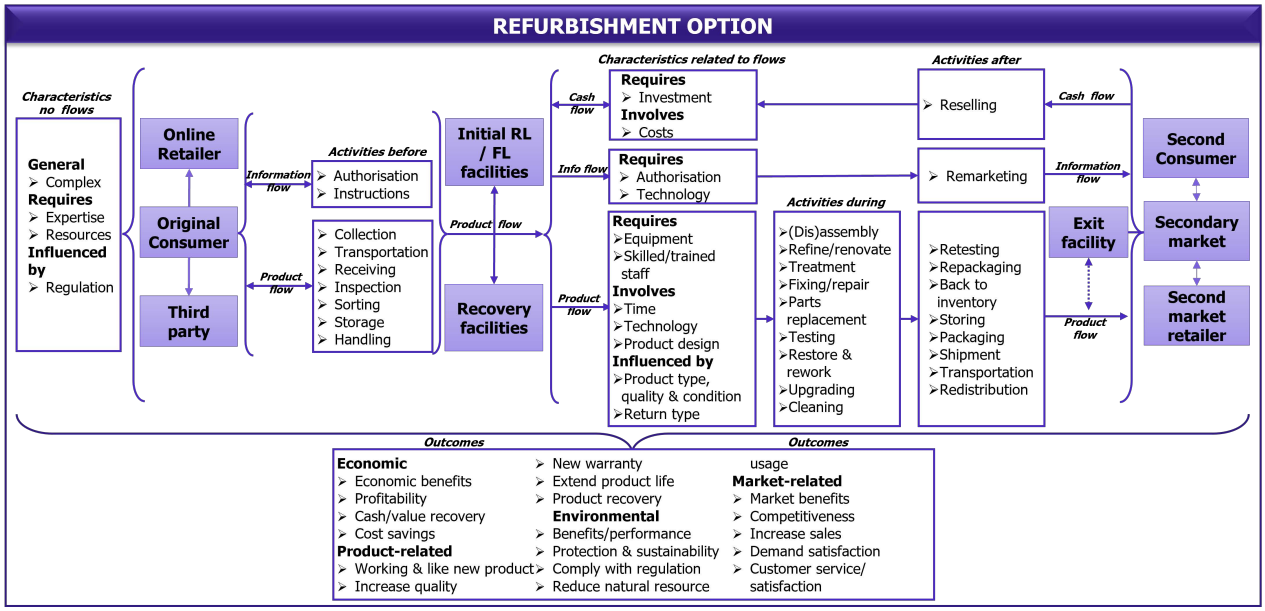

Figure 5.10 Conceptual framework of refurbishment as a disposition option
Source: Compiled by the researcher

Furthermore, the framework shows that the refurbished products can either be delivered from FL/RL and recovery facilities to exit facilities for redistribution to markets or can directly be redistributed to the markets. The markets can include secondary markets that may include second market retailers that purchase refurbished products from the original retailers (or third party) and resell refurbished products to second consumers on the secondary markets. Alternatively, refurbished products can be remarketed, resold and redistributed directly to second consumers on the secondary market. Regardless of the approach, refurbishment results in information outflow through remarketing, product outflow through redistribution to the second consumer/second market retailers and cash inflows to the original retailer. Additionally, the framework presents the refurbishment characteristics unrelated to flows. Finally, the framework illustrates the various economic, product-related, environmental and market-related outcomes of refurbishment, which can be realised through successful implementation and execution of refurbishment as a disposition option for consumer returns

In the next section, the final category of exit options in the disposition process of consumer returns will be discussed.

5.6.5 Exit options in the disposition process of consumer returns

The final category in the disposition process focusses on additional exit options or alternatives, some of which were mentioned in the disposition options (such as secondary markets or selling to third parties). Essentially, the focus of this section is on alternative options for online retailers (except for

outsourcing) in dealing with consumer returns, which exclude direct reuse and product recovery (repair and refurbishment) options.

As mentioned in section 4.2, some exit options, including selling as scrap, destroy and donate, lacked sufficient findings in RL literature, and were subsequently excluded from the findings. However, this study recognises that these exit options may apply to consumer returns in online retailing. The exit options identified in the coding framework (Appendix A.2) with sufficient RL literature findings, included (1) selling in the secondary markets, (2) ship to a vendor and (3) selling to third parties. The findings related to each of these mentioned exit options will be presented and discussed in the rest of the section.

5.6.5.1 Selling in secondary markets as an exit option for consumer returns

Selling in secondary markets are one of the alternatives in the RL product disposition process (Agrawal *et al.* 2016b:95), which mostly relates to used consumer product returns that cannot be resold in the primary market (original market). The secondary market is not a single marketplace, but the name for the network of companies that buy and sell product that cannot be sold, as new in the primary channel (Rogers *et al.* 2013:46).

The categories of *selling in secondary markets* as an exit option for consumer returns identified from the QCA of RL literature included (1) characteristics of selling in secondary markets, (2) activities/processes for selling in secondary markets, (3) secondary market options/locations, (4) parties involved in secondary markets, and (5) outcomes of selling in secondary markets. Table 5.30 provides an overview of the findings related to *selling in secondary markets* as an exit option for consumer returns, including detail on the categories, related subcategories, sources to support the subcategories and key quotations to support the discussion of the findings.

Table 5.30 Findings related to selling in secondary markets as an exit option

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
Characteristics	***Important***	None	• *"[…] secondary market can play an important role in the success of RL […]."* (Agrawal *et al.* 2015:77)

Source: Compiled by the researcher

Table 5.30 shows that selling in secondary markets as an exit option involves various characteristics, secondary market options, activities/processes, parties and outcomes, which will be discussed in the subsequent sections and concluded with a description and conceptual framework.

5.6.5.1.1 Characteristics of selling in secondary markets as an exit option for consumer returns

The characteristics of selling in secondary markets as an exit option can include general, involve and influenced by characteristics. Particularly, the *general characteristics* relates to the importance and complexity of selling in secondary markets. Secondary markets can be *important* for successful RL, offering organisations alternative options to recover value from returned products. However, selling in secondary markets can be more *complicated* than sales in primary markets, which may stem from the *involve characteristics* of network design, global operations and risks. Specifically, using primary markets, established facilities can be used for RL processes, while secondary markets involve different facilities and require additional *network design* and strategies. Additionally, secondary

markets can involve overseas markets with *global operations,* which can add to the complexity of effective selling in secondary markets. The *risks* of selling in secondary markets include supplier constraints to enter secondary markets by protecting brand equity and preventing brand cannibalisation (new and recovered products compete). Moreover, selling in secondary markets involve *discounted/lower prices,* indicating that secondary markets can be less profitable than selling returned products on the primary market.

Like other disposition options, selling in secondary markets contains various *influenced by characteristics,* including product condition, product or industry type, organisational capabilities and preferences, manufacturer specifications, return volume, return type and selling period. While the *product condition* mostly influences the selection of other disposition options, selling in secondary markets can be appropriate for products in any condition. For example, returned products can be in (1) no-recovery condition, involving products in relatively new (e.g. only damaged packaging or manufacturer seal broken), good and used conditions, (2) recovery condition, involving products in damaged/defective condition, and (3) post-recovery condition, involving products in repaired and refurbished condition. Consequently, the product condition along with product type can influence the activities/processes associated with selling in secondary markets. For example, returned electronic products in recovery condition need disassembly and parts retrieval. Moreover, certain *product* or *industry types,* including apparel, household appliances, computers, cell phones and car parts (such as tires and radiators), can be more suitable for the selection of selling in secondary markets. Consequently, an online retailer that operates in the apparel, electronics, cell phone, computer and/or automotive industry can utilise secondary markets as an exit option.

Furthermore, selling in secondary markets can be selected as an exit option if *organisations lack capabilities* or are *unwilling* to obtain value from returned products through recovery operations. Additionally, returned products outside *manufacturer specifications* can influence the selection of selling in secondary markets, which may be associated with relatively new products with broken manufacturing seals (see preceding paragraph). Moreover, *higher return volumes* can complicate returned product handling in established facilities, making selling in secondary markets a more suitable option in the disposition process of consumer returns. While products can be in any condition, selling in secondary markets can be more suitable for *EoU returns* or products at the *end* of their *selling period* (e.g. clothing). Therefore, if an online retailer receives returns of new/unused clothing from consumers but the clothing is at the end of their selling period, direct reuse and selling on the primary market might be less attractive.

5.6.5.1.2 Activities/processes of selling in secondary markets

In contrast to other disposition options (reuse, repair and refurbishment), the activities/processes of selling in secondary markets can only be classified as activities/processes *before* selling[16] in secondary markets, which mostly entail product flows (except remarketing).

Mostly, the activities/processes of selling in secondary markets involve various RL processes, including *collection, transportation, processing* and *redistribution,* emphasising the links between the disposition process and other pre- and post-receipt RL processes. Relating to the recovered condition and product types (influenced by characteristics), selling in secondary markets can involve recovery activities like *disassembly* and *parts retrieval*. Similarly, the *repackaging* activity can be performed for relatively new returned products with damaged packaging or products in recovered. Evidently, selling in secondary markets might involve any activities associated with the repair and refurbishment options since products in repaired and refurbished condition can be appropriate for selling in secondary markets (see section 5.6.5.1.1).

Additionally, returned products can be *stored* in facilities before *redistribution* to secondary markets for selling in secondary markets. Finally, as the only information flow activity, *remarketing* can be important for returned products in recovered condition, emphasising the importance of remarketing as an activity after repair and refurbishment (see sections 5.6.3 and 5.6.4).

5.6.5.1.3 Secondary market options/locations and parties

Table 5.30 shows that several *secondary market options/locations* can be used for selling in secondary markets, including factory shops, clearance stores, online marketplaces, catalogue sales, online retailing platforms, auctions, flea markets, pawn shops, value retailers and overseas markets. Evidently, online retailers selecting selling in secondary markets as an exit option for consumer returns can opt to sell returned products to secondary market retail stores, like *factory shops* and *clearance stores,* or can keep in familiar territory through online selling, using *online marketplaces, catalogue sales* and other *online retailing* platforms. Consequently, using an online platform as a secondary market option can be important for (primary market) online retailers since they can use existing resources and capabilities for online selling in secondary markets.

Other options, including *auctions* (also online potential), *flea markets, pawn shops* and *value retailers*, emphasise discounted prices (involve characteristic) and products in used condition

[16] Reselling was excluded as an activity since the exit option involves selling in secondary markets.

(influenced by characteristic) associated with selling in secondary markets. Lastly, the overseas market option emphasises the complexity (general characteristic), global operations and risks (involvement characteristics) of selling in secondary markets (see section 5.6.5.1.1).

Closely related to the secondary market options/locations, selling in secondary markets can involve various *parties*, including consumers, retailers, staff/departments, wholesalers, suppliers and third parties. Like other disposition options (repair and refurbish), *consumers* as parties of selling in secondary markets can be classified as original and second consumers with opposite roles. Particularly, *original consumers* can act as suppliers for selling in secondary markets by returning products purchased on the primary market. In contrast, *second consumers* can establish a demand for and buy used/recovered products in secondary markets. Likewise, *retailers* can be classified as original retailers and second market retailers. While *original retailers* can be sellers of recovered/used products (returned by original consumers) to second consumers or other parties (e.g. third parties or other retailers) in secondary markets, *second market retailers* can act as second consumers creating demand for and purchase returned/recovered products from original retailers as well as act as suppliers/sellers of returned/recovered products to second consumers. Evidently, both consumers and retailers can be involved in the product and cash flows of selling in secondary markets.

Additionally, retailers can employ and allocate roles to *staff/departments* for selling in secondary markets, which may include (1) identifying returned products appropriate for secondary markets (e.g. the responsibility of inspectors or sorters in RL department) and (2) marketing and sales of returned/recovered products in the secondary markets (e.g. the responsibility of the sales department/staff). Therefore, staff, employed by original retailers can be responsible for disposition decisions (choosing selling in secondary markets as an exit option), while staff employed by the original or second market retailers can perform remarketing activities for effective selling in secondary markets.

Like second market retailers, *wholesalers* can be secondary market customers and represent organisations that buy used/recovered from original retailers and resell these products to second retailers or second consumers. Associating with the risks (involve characteristic) and manufacturer specifications (influenced by characteristic) of selling in secondary markets, original brand *suppliers* (from the original SC) can be concerned with brand cannibalisation or protecting brand equity, which might hamper efforts for selling in secondary markets. Nevertheless, suppliers (manufacturers) can drive selling in secondary markets with strict manufacturer specifications (like broken manufacturer seals), preventing resale in primary markets (see section 5.6.5.1.1).

Finally, the *third parties* that operate in secondary markets include brokers and jobbers, acting, like second market retailers and wholesalers, as buyers and suppliers in secondary markets. However, brokers and jobbers are third-party buyers of returned products that can perform recovery operations (such as repair), and form part of the other exit option of selling to third-party buyers, which will be discussed in section 5.6.5.3.

5.6.5.1.4 Outcomes of selling in secondary markets as an exit option for consumer returns

Table 5.30 shows that selling in secondary markets can be beneficial in terms of various economic, product-related, environmental, market-related and social outcomes. Specifically, the *economic outcomes* of secondary markets include profits/revenue, cost savings and asset/value recovery. The *profitability* of selling in secondary markets relates to the *revenue* obtained through the sales of used/recovered products. Furthermore, the *cost savings* of selling in secondary markets relate to the environmental outcome of preventing returned product disposal, resulting in savings of disposal costs (e.g. transporting products to landfills). Lastly, *asset/value recovery* emphasise the importance of selling in secondary markets since organisations can recover value from returned products that cannot be sold in primary markets. Evidently, economic outcomes can represent cash flows in secondary markets.

Closely related to the economic outcomes of costs savings and asset/value recovery, the *product-related outcome* of selling in secondary markets includes *extending the* returned *product's life*. Since selling in secondary markets associate with EoU returns and products at the end of their selling periods, selling in secondary markets can extend the use of the product. Subsequently, the *environmental outcomes* of secondary markets relate to *waste reduction*, *environmental benefits* and *sustainable practices*. Essentially, by selling returned/recovered products in secondary markets can prevent these products from entering the landfills, which can enhance an organisation's environmental performance.

The *market-related outcomes* of secondary markets include improved customer trust and service, and *satisfaction of demand* and *consumer needs*. For example, a fashion online retailer that stock designer clothes can sell returned clothes (at the end of their selling period) through a second online store offering the same designer clothes at a discount, which can enhance *consumer trust* and *service* and *satisfy the demand* of consumers who cannot afford to designer clothes at full prices. Evidently, selling in secondary markets can enable retailers to meet various niche consumer needs.

Finally, selling in secondary markets can, uniquely, result in *social outcomes*, which can involve *improved social performance*, *positive contribution* to the *society* and *job creation*. Therefore, selling

in secondary markets can improve the corporate image and reputation of retailers by contributing to the national economy of the country through job offerings, linking with environmental sustainability and satisfying the demand of niche consumer needs. Essentially, selling in secondary markets holistically offer various benefits for organisations, the environment, consumers and society.

5.6.5.1.5 Description and conceptual framework of selling in secondary markets as an exit option for consumer returns

Based on the findings presented in section 5.6.5.1, selling in secondary markets can be an important exit option in the disposition process of consumer returns, and will be described as follows:

> Selling in secondary markets as an exit disposition option for consumer returns can be described as an important and complex exit option that (1) involves network design, global operations, risks and discounted/lower prices, and (2) can be influenced by product condition, product or industry type, organisational capabilities and preferences, manufacturer specifications, return volume, return type and selling period. The activities/processes of selling in secondary markets involve collection from the original consumer, transportation, processing, disassembly, parts retrieval, repackaging, storage, remarketing and redistribution before returned/recovered products can be sold by the original online retailer to second consumers or other parties in secondary markets, which can include factory shops, clearance stores, online marketplaces, catalogue sales, online platforms, auctions, flea markets, pawn shops or overseas markets. Selling in secondary markets as an exit option can result in (1) economic outcomes (economic benefits, profitability, cost savings and asset/value recovery), (2) product-related outcome (extend the product life), (3) environmental outcomes (waste reduction, environmental benefits and sustainable practices), (4) market-related outcomes (customer trust and service, and satisfaction of demand and consumer needs), and (5) social outcomes (social performance, positive contribution to the society and job creation).

Figure 5.11 provides a conceptual framework for selling in secondary markets as an exit option that may apply to consumer returns in online retailing.

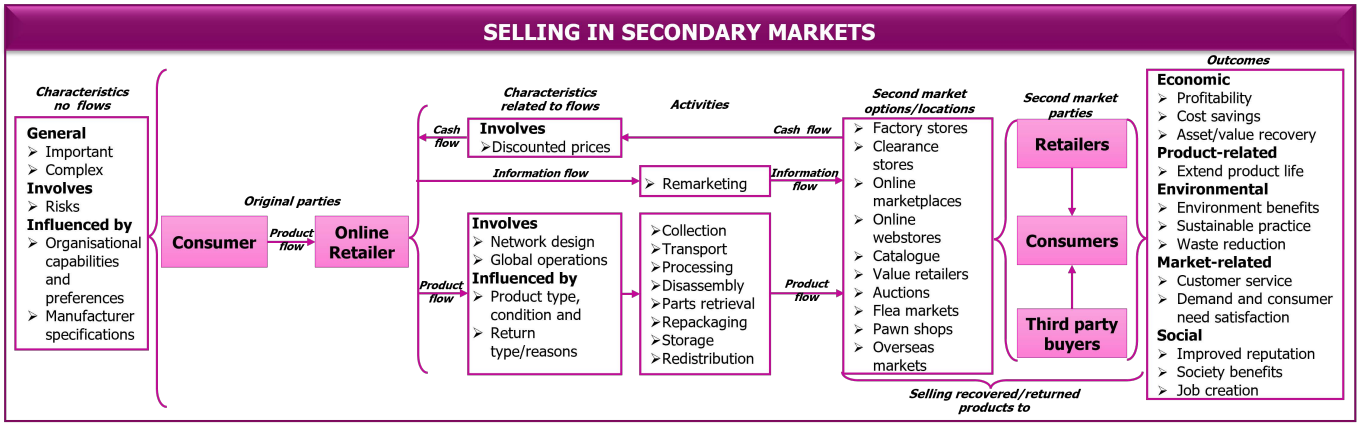

Figure 5.11 Conceptual framework of selling in secondary markets as an exit option
Source: Compiled by the researcher

Figure 5.11 provides a basic overview of selling in secondary markets as an exit option in the disposition process, illustrating the original and second market parties, flows, characteristics, activities, secondary market options and outcomes. Particularly, the framework illustrates that selling in secondary markets starts with the original consumers returning products to the original online retailer. Additionally, the flows of selling in secondary markets involve cash, information and product flows with related characteristics and activities. Once the activities are completed, product

outflows and cash inflows continue with selling returned/recovered products in secondary markets (through various options) to second retailers, consumers or other third parties. Finally, the framework demonstrates the characteristics unrelated to flows as well as the outcomes of selling in secondary markets.

In the next section, the second disposition exit option of shipping to the vendor is discussed.

5.6.5.2 Ship to a vendor as an exit option for consumer returns

Ship to a vendor mainly relates to a retailer returning a consumer return directly to the supplier/manufacturer of the product. Although manufacturers as a party are excluded from the study, the possibility of shipping to a vendor (as an exit disposition option) still exists for an online retailer who deals with consumer returns. In the rest of this section, vendor will be used as a term, representing any organisation (manufacturer, supplier or wholesaler) that supplied the product to the retailer, which was purchased and returned by the consumer to the retailer. Despite limited findings (from the QCA of RL literature), the ship to a vendor exit option included several categories, namely the (1) characteristics of ship to a vendor, (2) activities related to ship to a vendor, (3) facilities in ship to a vendor, (4) parties involved in ship to a vendor, and (5) outcomes of ship to a vendor.

Table 5.31 provides an overview of the findings related to the *ship to a vendor as an exit option for consumer returns*, including detail on the categories, related subcategories, sources to support the subcategories and key quotations to support the discussion of the findings.

Source: Compiled by the researcher

Table 5.31 shows that ship to a vendor as an exit option involves various characteristics, activities/processes, facilities, parties and outcomes, which will be discussed in the subsequent sections and concluded with a description and conceptual framework.

5.6.5.2.1 Characteristics of ship to a vendor as an exit option for consumer returns

The characteristics of ship to a vendor as an exit option can include general, involve and influenced by characteristics. The *general characteristics* of ship to a vendor include high priority and back to origin. Particularly, ship to a vendor can be a *high priority* for the retailer since consumer returns become the responsibility of the vendor, emphasising the characteristic of *back to origin* (product

returned to the point of supply or production). Additionally, ship to a vendor as an exit option associates with various *involvement characteristics,* including costs, credits/refunds, contracts or service agreements, negotiations, information sharing and relationships. The involvement of *costs* and *credits/refunds* emphasise the high priority attributed by the retailer in selecting ship to a vendor. Specifically, the vendor becomes responsible for RL costs, including packaging costs, shipping costs and handling costs, and providing refunds/credits to retailers, which covers at least retailer purchasing costs.

Additionally, ship to a vendor relates to SC relationship between the retailer and vendor, involving contracts or service level agreements (SLA), negotiations, sharing of information and partnership relationships. The *contracts or SLAs* dictate the conditions of ship to the vendor, which can include return type, product type, product condition, reimbursements (e.g. credits/refunds) and party responsibilities (e.g. paying costs). Furthermore, in creating these contracts, *negotiations* are needed to specify party responsibility and costs regarding consumer returns. Consequently, ship to a vendor involves *information sharing* and a *relationship* between the vendor and retailer. In section 6.4 (chapter 6) the strategies and practices related to supply chain integration (SCI) and relationships between retailers and other SC parties in RL will be further explored.

Ship to a vendor as an exit option involve a few *influenced by characteristics*, including, contractual conditions, manufacturer requirements, party power in the SC, and stock rotation and replenishment. Particularly, *contractual conditions* can influence the return type, product type and product condition that can be shipped to the vendor. For example, the contract can stipulate that B2C returns of new/unused/unopened without apparent damage printer ink or B2C returns of DOA (dead-on-arrival) electronic products can be shipped to the vendor. Similarly, some *manufacturers requirements* of strict quality controls and high standards can influence the selection of ship to a vendor as an exit option, meaning that some retailers must select ship to vendor as an exit option without a choice. Moreover, *party power in the SC* can influence party responsibilities in ship to a vendor, for example, a large retailer can be more powerful in the SC and dictate that the vendor must be responsible for all RL costs associated with ship to a vendor as an exit option. Apart from manufacturer requirements, *stock rotation* and *replenishment* requirements can influence the selection of ship to a vendor. For instance, the retailer may select direct reuse of new/unused products due to stock levels and replenishment requirements instead of selecting ship to a vendor as an exit option.

5.6.5.2.2 Activities/processes in ship to a vendor as an exit option for consumer returns

Like selling in secondary markets, all activities/processes in ship to a vendor must take place before returned products arrive the vendor. Additionally, the activities/processes in ship to a vendor include (1) information flow activities, including, communication and information sharing, authorisation and scanning, and (2) product flow activities, including, inspection, processing, repackaging, picking, handling, packing, consolidation and transportation/distribution.

In terms of the *information flow activities, communication* and *information sharing* must take place between the retailer and the vendor regarding the shipment of a consumer return to the vendor, which emphasise the involve characteristic of information sharing in ship to a vendor. Additionally, the retailer might request *authorisation* from the vendor before selecting ship to a vendor as an option, which might be a stipulation in the contractual agreements (involve and influenced by characteristics). Receiving authorisation can enable the retailer to *scan* the products that must be shipped to the vendor.

Regarding the *product flow activities* of ship to the vendor, some manufacturers might perform returned product *inspections* at retailer locations before accepting consumer returns from retailers. Evidently, authorisation might only be given after the manufacturer inspected the product. Other product flow activities, including *processing, repackaging, picking, handling, packing, consolidation* and *transportation/distribution*, can be the responsibility of the retailer. However, vendors might be responsible for carrying the costs of some activities, for example, packaging, handling and transportation costs, representing cash flows in ship to a vendor. Furthermore, the vendor might request that the retailer consolidate returns before shipment to the vendor for the purpose of reducing transportation costs.

Essentially, all activities emphasise the significance of contractual agreements, negotiations, partnership relationships and manufacturer requirements as characteristics of ship to a vendor as an exit option (section 5.6.5.2.1).

5.6.5.2.3 Facilities used in ship to a vendor as an exit option for consumer returns

Table 5.31 shows that the facilities used for ship to a vendor include retail stores, DCs, CRCs and manufacturing facilities. Therefore, ship to the vendor option include traditional FL facilities/locations, RL process facilities and destination facilities. For the FL facilities/locations, the use of *retail stores* emphasises that multi/omnichannel retailers receive consumer returns, perform return processing activities before shipment to the vendor. Furthermore, both the retailer and vendor can use their standard *DCs* in ship to a vendor. Specifically, retailer DCs can be used to perform the

activities in ship to a vendor (e.g. authorisation, scanning, handling and consolidation) and vendor DCs represent destinations that receive consumer returns from retailer DCs, emphasising transportation and distribution activities in ship to a vendor. However, DCs may also be used as locations for negotiations and the establishment of SLAs (involve characteristics of ship to a vendor).

While retail stores can be used by multi/omnichannel retailers, online retailers can use dedicated *RL process facilities*, like *CRCs*, to perform activities/processes in ship to a vendor. CRCs might be ideal locations for consolidation activities, avoiding space constraints that might be a problem in retail stores or DCs used for forward sales and operations. Finally, like the DCs of vendors, *manufacturer facilities* can be used as *destination facilities* in ship to a vendor, emphasising the general characteristic of back to the origin in ship to a vendor (see section 5.6.5.2.1).

Essentially, the facilities emphasise that most of the RL processes and activities for ship to a vendor occur at retailer facilities/locations, which will be further emphasised in the next section.

5.6.5.2.4 Parties and outcomes of ship to a vendor as an exit option for consumer returns

Table 5.31 shows the *parties* in ship to a vendor include consumers, retailers, staff/departments, vendors and distributors. *Consumers* play secondary roles in ship to a vendor option by being responsible for returning new or defective/damaged products to retailers. Therefore, consumers can be viewed as suppliers in the reverse supply chain (RSC) of ship to a vendor.

In contrast, *retailers* play primary roles in ship to a vendor by (1) selecting ship to a vendor as an exit option for consumer returns, (2) performing processes and activities in ship to a vendor, (3) engaging in negotiations and establishing agreements with vendors, and (4) charging vendors with RL costs. Additionally, *staff* (such as supervisors/managers) employed by retailers can be responsible for communication and information sharing activities with the vendors/suppliers regarding the consumer returns. Therefore, staff can be involved in maintaining relationships with vendors and ensuring that contract stipulations are followed.

Like retailers, *vendors (suppliers/manufacturers)* play primary roles in ship to a vendor by (1) setting the terms for SLAs (such as authorisation and product condition), (2) performing inspections (if required by the manufacturer) at retailer locations, (3) paying RL costs and issuing refunds/credits for consumer returns, and (4) receiving consumer returns from retailers. Additionally, vendors represent the destination party in the ship to a vendor option and can be responsible for product recovery disposition options for damaged/defective B2C returns.

Finally, retailers can use *distributors* in the ship to a vendor exit option, making them responsible for transportation and distribution activities in ship to a vendor. Essentially, the ship to a vendor option emphasises a basic RSC, involving a point-of-consumption (consumers), point-of-sale (retailers) and point-of-origin (vendors).

Since the focus of the study is on retailers and consumer returns, the *outcomes* of ship to a vendor associate with the benefits that retailers can realise in ship to a vendor. Consequently, the outcomes of ship to a vendor were limited to economic and product-related outcomes. The *economic outcomes* of ship to a vendor relate to *full economic recovery* through credits/refunds and payment of RL costs by the vendor. Consequently, the general characteristic of a high priority (see section 5.6.5.2.1) can demonstrate the economic benefits of selecting a ship to a vendor as an exit option, enabling retailers to *avoid RL costs*. Similarly, the *product-related outcome* relates to product recovery, meaning that retailers can avoid the selection of costly disposition options, like refurbishment, by selecting ship to a vendor as an exit option for consumer returns.

Consequently, all outcomes of ship to a vendor relate to the ability of retailers to push consumer returns to vendors, avoiding RL costs and product recovery activities in the disposition process. However, based on the discussion of all previous disposition and exit options (see from section 5.6.2), ship to a vendor involves the least number of outcomes for the retailer, emphasising the importance of correct disposition decisions. The disposition strategies and practices for effective disposition decisions will be explore in-depth in section 6.6.

5.6.5.2.5 Description and conceptual framework of ship to a vendor as an exit option for consumer returns

Based on the findings presented in section 5.6.5.2, ship to a vendor can be an important exit option in the disposition process of consumer returns, and will be described as follows:

> Ship to a vendor as an exit disposition option for consumer returns can be described as a high priority and back to the origin exit option that (1) involves costs, credits/refunds, contracts and SLAs, negotiations, information sharing and relationships, and (2) can be influenced contractual conditions, manufacturer requirements, party power in the SC, and stock rotation and replenishment. The activities of ship to a vendor can include the (1) information flow activities of communication and information sharing, authorisation and scanning, and (2) product flow activities of inspection, processing, repackaging, picking, handling, packing, consolidation and transportation/distribution, mostly performed by the online retailer (except inspection) in FL or RL facilities (such as DCs and CRCs) for the shipment of returned products (using distributors) to the DCs or facilities of vendors. The aim of ship to a vendor as an exit option is to return consumer product returns to vendors for full credit and reimbursement of RL costs, resulting in the economic outcomes of full economic recovery and avoidance of RL costs and product-related outcome of product recovery (without direct involvement in product recovery activities).

Figure 5.12 provides a conceptual framework for ship to a vendor as an exit option that may apply to consumer returns in online retailing.

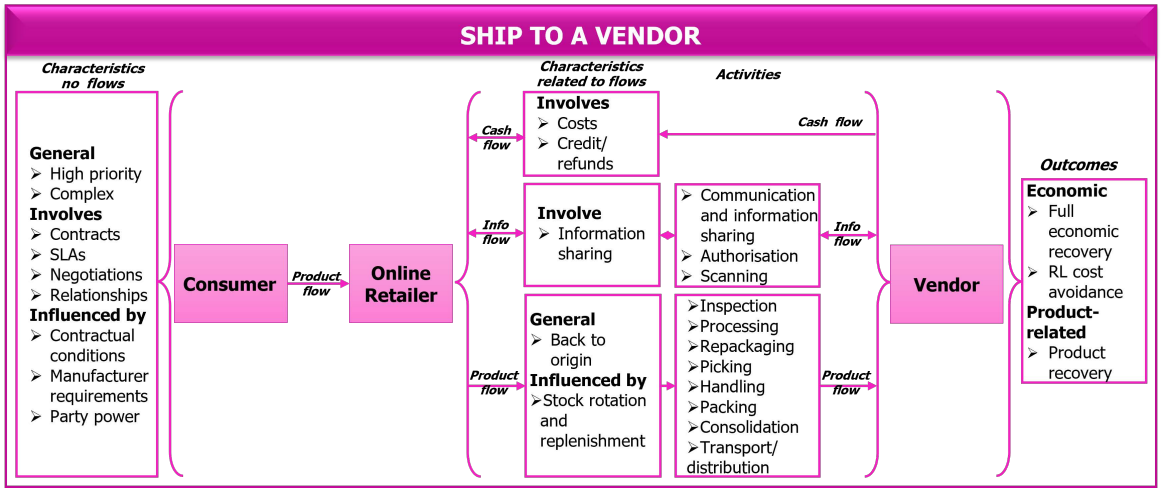

Figure 5.12 Conceptual framework of ship to a vendor as an exit option
Source: Compiled by the researcher

Figure 5.12 provides a basic overview of ship to a vendor as an exit option in the disposition process, illustrating the parties, flows, characteristics, activities and outcomes. Particularly, the framework illustrates that ship to a vendor starts with original consumer returning a product to the online retailer. Additionally, the flows of ship to a vendor involve cash, information and product flows with related characteristics and activities. Once the activities are completed, product outflows and cash inflows continue with shipping the returned product to the vendor and receiving a credit/refund and reimbursement of RL costs from the vendor. Finally, the framework demonstrates the characteristics unrelated to flows as well as the outcomes of ship to a vendor.

In the next section, the final potential exit option of selling to third-party buyers is explored.

5.6.5.3 Selling to third-party (3P) buyers as an exit option for consumer returns

Selling to third-party (3P) buyers is the final potential exit options included in this study for consumer returns in online retailing. Several categories were identified from the QCA of RL literature, including (1) characteristics of selling to 3P buyers, (2) activities in selling to 3P buyers, (3) facilities used for selling to 3P buyers, (4) 3P buyer options, (5) other parties involved in selling to 3P buyers, and (6) outcomes of selling to 3P buyers. Each of these categories will be presented and discussed in subsections below.

Table 5.32 provides an overview of the findings related to *selling to 3P buyers* as an exit option for consumer returns, including detail on the categories, related subcategories, sources to support the subcategories and key quotations to support the discussion of the findings.

Table 5.32 Findings related to selling to third-party buyers as an exit option

Source: Compiled by the researcher

Table 5.32 shows that selling to 3P buyers as an exit option involves various characteristics, activities/processes, facilities, 3P buyer options, other parties and outcomes, which will be discussed in the subsequent sections and concluded with a description and conceptual framework.

5.6.5.3.1 Characteristics of selling to 3P buyers as an exit option for consumer returns

The characteristics of selling to 3P buyers as an exit option can include general, involve and influenced by characteristics. The *general characteristic* relates to the *complexity* of selling to 3P buyers. Particularly, various 3P buyers operate in secondary markets, which complicates the identification of appropriate 3P buyers to recover value from returned products. Additionally, the complexity of selling to 3P buyers can associate with a few involve and influenced by characteristics, which will be emphasised in the subsequent paragraphs.

The *involvement characteristics* of selling to 3P buyers include specialised 3P buyers, reasons, lower prices, decisions, risks, selling platforms and auctions, value-added services, demand information sharing, negotiations and partnerships/contracts. Specifically, selling to 3P buyers involve *specialised RL parties* who buy and resell consumer returns in secondary markets, forming an aftermarket SC. Furthermore, the selection of selling to 3P buyers as an exit option *involve reasons*, which can include (1) simplifying disposition for retailers, (2) assisting with unwanted consumer returns, (3) licencing regulations that prevent resale of returned products in primary markets, and (4) buying unsold returned products after several markdowns. Evidently, selling to 3P buyers as an exit option *involve lower* asking *prices*, often below cost price, indicating that less costs can be recovered than other exit options (i.e. selling in secondary markets and ship to a vendor).

Selling to 3P buyers *involve* various *decisions* about the (1) appropriate type of 3P buyer, (2) selection criteria of 3P buyers and (3) methods of getting the products to 3P buyers, which emphasise the complexity of selling to 3P buyers. Moreover, selling to 3P buyers can *involve* several *risks*, including a loss of control, a loss of brand equity and non-compliance of instructions, which add to the complexity of choosing appropriate 3P buyers. Consequently, organisations relinquish control by

allowing 3P buyers to take ownership of their products and engage in trading activities in secondary markets.

Relating to selling in secondary markets (section 5.6.5.1), selling to 3P buyers often *involve selling platforms*, like websites, and *auctions*, which can be used by retailers to sell consumer returns to 3P buyers. Using a website as a selling platform can be a viable exit option for online retailers since they already possess online capabilities and web-based technology for online sales. Furthermore, selling to 3P buyers can *involve value-added services*, for example, the retailer offers to wash, dry and package clothing for the 3P buyer for an added fee. The specific value-added services, which form part of the activities/processes in selling to 3P buyers will be discussed in section 5.6.5.3.2.

In terms of *demand information sharing*, retailers may request updates on consumer demands for the items sold by 3P buyer on the secondary markets and 3P buyers may provide information of their demands or requests to the retailers, emphasising the involvement of *negotiations* and *partnerships/contracts.* While negotiations can be short term, relating to the asking price for a batch of items, longer term partnerships or contracts can be created between retailers and 3P buyers. Evidently, like ship to a vendor (section 5.6.5.2), selling to 3P buyers can involve SC relationships and collaboration, which may reduce the need to continuously identify and select 3P buyers for selling consumer returns.

Adding to the complexity of selling to 3P buyers, the *influenced by characteristics* of selling to 3P buyers include product return volume, product type and product condition that influence the selection of the type of 3P buyer. For example, high *product return volume* for specific items can be more appropriate for salvage brokers or dealers that buy in bulk and lower product return volumes for a batch of items can be more appropriate for jobbers that buy in smaller job lots. Likewise, with *product types*, for example, vehicles and equipment can be sold to dealers and designer merchandise can be sold to jobbers. Furthermore, *product condition* might influence the appropriateness of 3P buyers, for example, damaged/defective products can be sold to jobbers or speciality brokers with product recovery capabilities and used and/or recovered (e.g. repaired or refurbished) products can be sold to general dealers and salvage brokers. Essentially, most characteristics relate to the careful selection of appropriate 3P buyers, making selling to 3P buyers a challenging exit option in the disposition process of consumer returns.

5.6.5.3.2 Activities/processes in selling to 3P buyers as an exit option for consumer returns

The activities/processes in selling to 3P buyers can take place before, during and after 3P buyers taken possession of purchased products. Specifically, the activities/processes before selling to 3P

buyers can be performed by retailers and 3P buyers, the activities/processes during selling to 3P byers can be the responsibility of the retailer, and the activities/processes after selling to 3P buyers can be the responsibility of the 3P buyers. Additionally, the activities/processes can be classified according to information, product and cash flows, which will be emphasised in the following discussions.

The *activities/processes before selling to 3P buyers* include the (1) product flow RL processes/activities of processing, sorting and de-branding and (2) information flow activities of remarketing, communication and ordering/bidding. *Processing* and *sorting* as RL processes take place after consumer returns arrive at the facility. Therefore, retailers can issue credit/refunds or ship exchanges to consumers and classify returned products according to disposition/exit options (e.g. grouping products in a selling to 3P buyer group). Additionally, retailers might *de-brand* products by removing labels, trademarks and serial numbers before remarketing, communication and ordering/bidding activities. Evidently, de-branding might reduce the risks (involvement characteristic) of selling to 3P buyers (see section 5.6.5.3.1). While other disposition/exit options normally conclude with *remarketing* and reselling[17] activities, remarketing starts in the early stages of selling to 3P buyers. Remarketing can involve advertising and placing returned products for sale on a web platform (e.g. online store) or auction (online or physical), enabling 3P buyers to *order* or *bid* for returned products. After successful purchase of returned products, the retailer and 3P buyer can *communicate* about arrangements/requirements for transfer of products from the retailer to the 3P buyer, directing the subsequent activities/processes.

Specifically, the *activities/processes during selling to 3P buyers* represent all operations that takes place at the retailer's location. Relating to the communication activity, 3P buyers might request some value-added services (identified as an involvement characteristic) to be performed by the retailers, which can include the product flow activities of dismantling, cleaning, washing, drying, packaging, packing, loading, shipping and delivery. These activities can associate with the 3P buyer requests, product condition and product type. For instance, a 3P buyer can request that the retailer *dismantle* (or disassemble) defective electronics or *wash, clean* and *dry* used clothing. Additionally, 3P buyers might request packaging and transportation as part of the value-added services, which can include *packing, loading, shipping* and *delivery* to the 3P buyer. Lastly, the retailer can *charge* 3P buyers a value-added service fee, which represents additional cash flows in selling to 3P buyers as an exit option.

[17] Like selling in secondary markets, selling by retailers are not included as an activity because selling to 3P buyers is the purpose of the exit option.

Finally, *activities/processes after selling to 3P buyers* represent the activities/processes performed by 3P buyers, which include the (1) product flow activities of collection, product evaluation/grading and product recovery, and (2) cash flow activities of trading and reselling. While some 3P buyers can request value-added activities related to delivery of purchased returned products, others might prefer to *collect* products from retailer facilities/locations. Additionally, 3P buyers can be responsible for other RL processes, including inspection to *evaluate* and *grade* purchased products and, if necessary, perform *product recovery* (disposition) activities. These activities/processes of selling to 3P buyers emphasise the general characteristic of specialised parties in RL, possessing the capabilities to recover value from used/damaged/defective products. The final activities involve *trading* and *reselling*, which relates to buying from retailers and selling purchased products in secondary markets for profit. Evidently, after returned products are sold to 3P buyers, cash flows continue with further trading between second market parties and/or reselling to consumers in secondary markets.

5.6.5.3.3 Facilities/locations in selling to 3P buyers as an exit option for consumer returns

Table 5.32 shows the *facilities/locations* used for the selling to 3P buyers as an exit option include (1) traditional FL facilities/locations (such as retail stores and DCs), (2) RL process facilities (such as CRCs), and (3) secondary market locations. Regarding *traditional FL facilities/locations*, the actual selling activity to 3P buyers can take place in *retail stores*, indicating that the product returns of multi/omnichannel retailers can be prepared for sales to 3P buyers, alongside new products for sale to consumers (in the primary market). Additionally, retailers (online-only and multi/omnichannel) can use standard DCs for selling to 3P buyers, indicating that retailers can combine FL activities (e.g. fulfilment of online orders from consumers) with selling to 3P buyer activities/processes.

Alternatively, retailers can use *RL facilities*, like *CRCs*, for the selling of product returns to 3P buyers. Since CRCs (centralised return centres) can be regarded as specialised RL facilities, various selling to 3P buyer activities/processes can be conducted, including de-branding (e.g. removal of labels), remarketing, communication, value-added activities (e.g. cleaning, drying, packing and loading) and charging (see section 5.6.5.3.2). Additionally, using CRCs can enhance relationships with 3P buyers through dedicated RL staff and activities. Consequently, using CRCs can be a viable option for online retailers to sell consumer returns to 3P buyers.

Finally, *secondary markets* can be regarded as destination locations in selling to 3P buyers. While retailers sell to 3P buyers as RL parties in the secondary markets, 3P buyers resell purchased products from retailers in the secondary market to other 3P buyers or consumers, which emphasise the trading activity of selling to 3P buyers. Therefore, like refurbishment and selling in secondary

markets (sections 5.6.4 and 5.6.5.1), selling to 3P buyers result in the final sale of returned/recovered products to second consumers in secondary markets.

5.6.5.3.4 3P buyer options and parties involved in selling to third-party buyers as an exit option for consumer returns

Table 5.32 indicates that several 3Ps can buy consumer returns from retailers, including salvage dealers/brokers, jobbers, general brokers and general dealers. *Salvage dealers/brokers* are 3P buyers that (1) operate in secondary markets, (2) engage in trading (buying and selling) activities, and (3) collect bulk quantities of product returns from various retailers. Therefore, salvage dealers/brokers buy large volumes of returned products at bulk discounts from retailers to obtain profits from reselling returned products at higher prices in secondary markets.

As specialised RL parties, *jobbers* can be described as 3P buyers that (1) buy products in smaller quantities (known as job lots) from retailers, (2) perform product disposition/recovery activities and (3) resell recovered/returned products as wholesalers in secondary markets. Additionally, jobbers create a demand for returned products and request value-added services from retailers, providing an additional source of income for retailers. *General brokers* share some characteristics with jobbers and salvage dealers/brokers. Particularly, general brokers can (1) buy recovered/returned products in larger quantities (truckloads) from retailers, (2) perform product disposition/recovery activities and (3) engage in trading activities by reselling the products in smaller quantities to other 3P buyers. General brokers can be viable 3P buyers for retailers since they buy returned products in any condition and can engage in partnership relationships (involve characteristic) with retailers.

Similarly, *general dealers* can be valuable in sharing information on secondary market demand with retailers, indicating that SC relationships can be created with general dealers. Additionally, general dealers can (1) request value-added services from retailers, like packing and delivery (activities during selling to 3P buyers), (2) buy recovered (e.g. repaired and refurbished) products from retailers, (3) perform product evaluation and grading (activities after selling to 3P buyers) and (4) resell recovered products in secondary markets.

Apart from 3P buyers, consumers, retailers and staff can play various roles in selling to 3P buyers as an exit option for consumer returns. Specifically, the *consumers* in selling to 3P buyers represent *second consumers*, playing the secondary roles of (1) creating demand for recovered/used products in secondary markets, (2) buying from 3P buyers in the secondary markets, and (3) provide a direct source of income for 3P buyers. While original consumers can be responsible for supplying returned products, the focus of selling to 3P buyers is the creation of an aftermarket/alternative SC with

original retailers as the main suppliers, 3P buyers as the wholesalers/retailers and second consumers as end users.

Retailers in selling to 3P buyers represent original retailers, playing primary roles, and second retailers, playing secondary roles. The roles of *original retailers* include (1) selecting selling to 3P buyers as an exit option in the disposition process, (2) selling returned products to 3P buyers, (3) sharing information, communicating and creating partnerships with 3P buyers, (4) performing de-branding, remarketing and charging activities, and (5) providing value-added services based on the requests of 3P buyers (also see section 5.6.5.3.2). S*econd retailers* can act as buyers in the secondary market, purchasing returned/recovered products from 3P buyers and providing an indirect source of income to original retailers. Moreover, original retailers employ *staff* responsible for selling returned/recovered products to 3P buyers and performing value-added activities. Therefore, staff can play primary roles in selling to 3P buyers by facilitating in value recovery activities, which will be further identified in the outcomes of selling to 3P buyers.

5.6.5.3.5 Outcomes of selling to 3P buyers as an exit option for consumer returns

Table 5.32 shows that certain economic, product-related and market-related outcomes can be realised in selling to 3P buyers as an exit option for consumer returns.

The *economic outcomes* of selling to 3P buyers include profits/revenue, cost savings and value/asset recovery. Specifically, *profits/revenue* relate to the selling of returned/recovered products to 3P buyers and performing value-added activities for 3P buyers. Additionally, *cost savings* relate to the selling of returned products to jobbers, which eliminates the need for retailers to perform costly product recovery (e.g. repair and refurbishment) activities. Consequently, jobbers not only provide an additional source of revenue by buying returned products and requesting value-added activities but also enable cost saving by performing repair and refurbishment on defective/damaged/outdated products (see section ss). While the economic outcomes of selling to 3P buyers can be beneficial for retailers, 3P buyers can also realise economic benefits through trading/reselling activities of returned/recovered products at higher prices in secondary markets. Additionally, jobbers and dealers can maximise *value* and *asset recovery* through recovery activities (like repair), emphasising the value of repair and refurbishment as disposition options in RL.

Accordingly, the *product-related outcomes* relate to repair and refurbishment activities (performed by retailers or 3P buyers), which enables *product recovery* and extending the product's life (see sections 5.6.3 and 5.6.4). Finally, the *market-related outcome* involves *demand satisfaction*, where retailers can directly satisfy the demand of 3P buyers and indirectly the demand of secondary market

buyers (other 3Ps and retailers) and/or second consumers. Essentially, the biggest motivation for engaging in selling to 3P buyers relate to the economic benefits that can be realised by retailers and 3P buyers, explaining their willingness to engage in partnerships (involve characteristic).

5.6.5.3.6 Description and conceptual framework of selling to 3P buyers as an exit option for consumer returns

Based on the findings presented in section 5.6.5.3, selling to 3P buyers can be an important exit option in the disposition process of consumer returns, and will be described as follows:

> Selling to third-party (3P) buyers as an exit option for consumer returns can be described as a complex exit option that (1) involves specialised RL parties, reasons, decisions, risks, lower prices, selling platforms and auctions, value-added services, demand information sharing, negotiations and partnerships/contracts, and (2) can be influenced by product return volume, product type and product condition. The activities/processes of selling to 3P buyers can be classified as activities/processes (1) selling to 3P buyers, including processing, sorting, de-branding (product flows), remarketing, communication and ordering/bidding (information flows), (2) during selling to 3P buyers, including dismantling, cleaning, washing, drying, packaging, packing, loading, shipping, delivery (product flows) and charging (cash flow), and (3) after selling to 3P buyers, including collection, product evaluation/grading, product recovery (product flows), trading and reselling (cash flows), which can be performed by the online retailer in FL/RL facilities (such as stores DCs and CRCs) and 3P buyers, operating in secondary markets. The aims of selling to 3P buyers are to recover value by reselling returned/recovered products to salvage dealers/brokers, jobbers, general brokers or general dealers, providing value-added services for 3P buyers, and establishing an aftermarket SC, involving trading between 3P buyers and reselling of returned/recovered products to second retailers and/or second consumers in secondary markets. Selling to 3P buyers as an exit option can result in (1) economic outcomes (profits/revenue, cost savings and value/asset recovery), (2) product-related outcome (product recovery), and (3) market-related outcome (demand satisfaction).

Figure 5.13 provides a conceptual framework of selling to third parties as an exit option in the disposition process that may apply to consumer returns in online retailing.

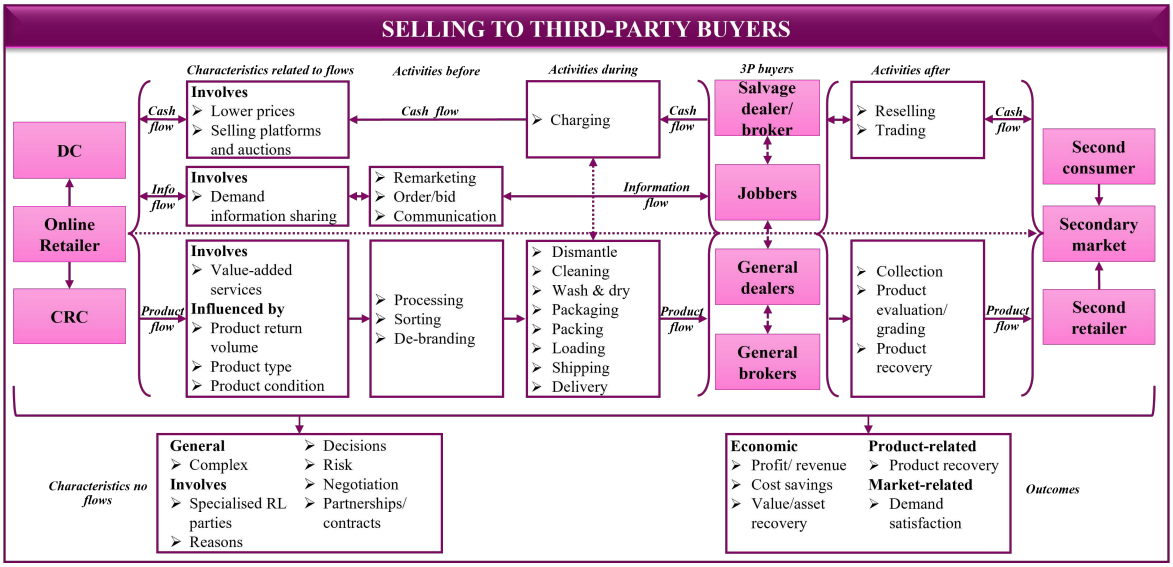

Figure 5.13 Conceptual framework of selling to 3P buyers as an exit option
Source: Compiled by the researcher

Figure 5.13 shows a basic overview of selling to 3P buyers as an exit option in the disposition process of consumer returns, illustrating the parties, facilities, flows, characteristics, activities and outcomes. Particularly, the framework illustrates that selling to 3P buyers starts with the original

online retailer using DCs or CRCs. Additionally, the framework indicates that cash, information and product flows with related characteristics and activities can occur in selling to 3P buyers. While the information flow activities during selling to 3P buyers can be performed by the online retailer and 3P buyers, the product and cash flow activities before and during selling to 3P buyers can be performed by the online retailer. Following the activities during selling to 3P buyers, the 3P buyers take possession of the products and perform activities after selling to 3P buyers, which involve cash and product flows. Once the activities are completed by the 3P buyers, product outflows and cash inflows continue with selling returned/recovered products in secondary markets to second retailers and/or second consumers. However, 3P buyers can also engage in trading with other 3P buyers (e.g. general dealer buys from jobber) before products are resold in secondary markets. Finally, the framework demonstrates the characteristics unrelated to flows and the outcomes of selling to 3P buyers.

In the next section, the overall conceptual framework and description of the disposition process for consumer returns and online retailing will be presented.

5.6.6 Overall description and conceptual framework of the disposition process of consumer returns

This section provides an overall description and conceptual framework of the disposition process of consumer returns. The description and framework included all parties, characteristics, activities and facilities of the general disposition process (section 5.6.1), as well as all outcomes mentioned throughout section 5.6. Furthermore, any characteristic and activity/process that occurred more than once in the findings (presented in section 5.6) were added to the overall description and framework. However, to simplify the overall description and framework, the activities/processes were described and illustrated in terms of flows, excluding the before, during and after activities/processes associated with various disposition/exit options (section 5.6.2 to 5.6.5). Likewise, the various parties and facilities/locations of the disposition and exit options were excluded to simplify the description and framework. Instead, the different disposition and exit options that can be selected in the disposition process are mentioned and illustrated.

Accordingly, the disposition process of consumer returns can be described as follows:

> The disposition process of consumer returns can be described as an important, complex and time-consuming RL process, which (1) requires skilled/trained staff, resources, equipment and technology, (2) involves costs, options/alternatives, routes, channels, destinations, markets, risks, discounted/lower prices, contracts, negotiations, information sharing and relationships/partnerships, (3) can be influenced by industry/organisation type, product type, condition, quality and characteristics, return type/reasons, return volume, manufacturer requirements/specifications, return policies and legislation, and (4) links with other pre- and post-receipt RL processes. The disposition process can include the (1) information flow activities of administration, scanning, communication and remarketing, (2) product flow processes/activities of collection, transportation, processing, sorting, inspection/product evaluation, disposition decisions, (re)testing, disassembly/ dismantling,

cleaning/washing, fixing/repair, treatment, replacement, restoration, upgrade, repackaging, restocking/return to inventory, storage, handling, packing, loading, shipment, redistribution and delivery, and (3) cash flow activities of trading, reselling and charging, which can be performed by the staff of online retailers and/or 3P(R)L providers in traditional FL facilities/locations (such as stores, warehouses and DCs), RL process facilities (such as collection facilities, CRCs, processing and disassembly facilities) and recovery facilities (such as recovery centres, repair and refurbishment facilities).

The aims of the disposition process can include (1) recovery of returned products through direct reuse, repair or refurbishment, (2) shipment of returned products back to vendors or original consumers, (3) reselling of returned/repaired products in primary markets, and (4) selling of returned/recovered/used products to second consumers, second retailers or 3P buyers in secondary markets. The disposition process can result in (1) economic outcomes (economic benefits, profitability, revenue, cost avoidance, savings and effectiveness, cash/cost and economic/value recovery and improved financial performance), (2) product-related outcomes (improve product quality, restore product to a working/functional condition, new warranty, extend the product's life and recover products/parts for reuse), (3) environmental outcomes (environmental benefits, performance, protection and sustainability, comply with environmental laws, and reduce waste and natural resource consumption), (4) market-related outcomes (market benefits, competitiveness, increase in sales, demand/supply/consumer need satisfaction, and customer trust, service and satisfaction), and (5) social outcomes (improve reputation, society benefits and job creation).

Based on the description, Figure 5.14 provides a conceptual framework of the disposition process in RL that may apply to consumer returns in online retailing.

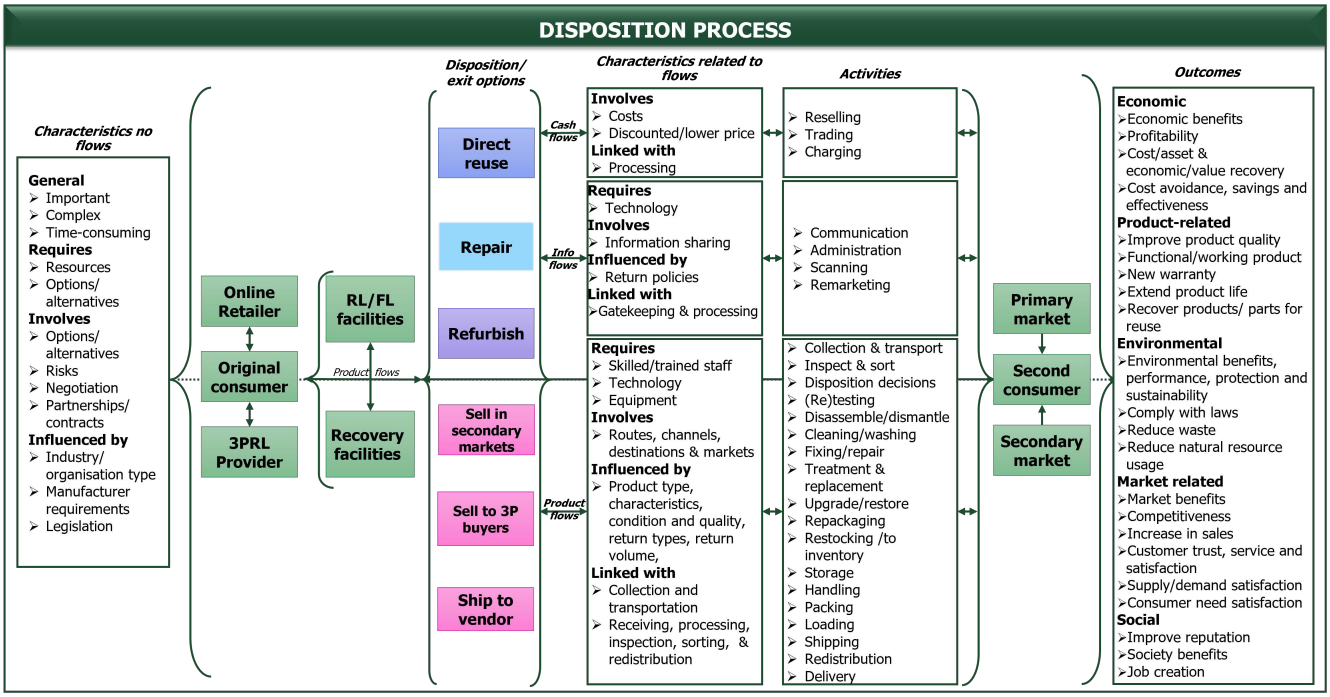

Figure 5.14 Conceptual framework of the disposition process for consumer returns
Source: Compiled by researcher

Figure 5.14 provides a basic overview of the disposition process of consumer returns, illustrating the parties, facilities, disposition/exit options, flows, characteristics, activities, markets and outcomes. Particularly, the framework illustrates that the disposition process starts with the original consumer, returning a product to the original online retailer or third-party provider. The product enters the RL/FL facility and/or recovery facility (depending on the options) for disposition operations. Additionally, the framework demonstrates the various disposition and exit options that can be selected in the disposition process as well as cash, information and product flows with related characteristics and activities. Once the activities are completed, the cash, information and product flows continue as products re-enter the markets, which can either be the primary market or secondary

market. Ultimately, the disposition process concludes with the second consumer purchasing and receiving the returned/recovered/used products. Finally, the framework demonstrates the characteristics unrelated to flows as well as the various outcomes of the disposition process. The practices related to the disposition process will be discussed in section 6.6.

In the next section, redistribution as the final post-receipt RL process of consumer returns, will be discussed and analysed.

5.7 REDISTRIBUTION PROCESS OF CONSUMER RETURNS

Redistribution was introduced in the disposition process, as a process responsible for activities to ship and deliver returned/recovered products to the markets. Like the disposition process, the categories identified from the QCA of RL literature for redistribution included (1) characteristics of redistribution, (2) activities in redistribution, (3) facilities/locations in redistribution, (4) parties involved in redistribution, and (5) outcomes of redistribution.

Table 5.33 provides an overview of the findings related to the *redistribution process of consumer returns*, including detail on the categories, related subcategories, sources to support the subcategories and key quotations to support the discussion of the findings.

Source: Compiled by the researcher

Table 5.33 shows that the redistribution process involves various characteristics, activities, facilities/locations, parties and outcomes, which will be discussed in the subsequent sections and concluded with a description and conceptual framework.

5.7.1 Characteristics of the redistribution process of consumer returns

The redistribution process can involve various characteristics that can be classified as (1) general characteristics, (2) requirement characteristics, (3) involvement characteristics, (4) influenced by characteristics and (5) linked with characteristics.

The *general characteristics* describe the redistribution process as the exit of RL, costly and time-consuming. While the consumer return request (CRR) process can be classified as the start of the RL process (see section 4.4), redistribution can be classified as the *exit* of the RL process. Therefore, once returned/recovered products enter the market and gets delivered to the end user (second consumer), the RL process is completed. Furthermore, the redistribution process can be a *costly* due to transportation expenses (such as shopping costs and freight rates), indicating that redistribution costs can impact the ultimate economic, value or cost recovery that can be realised through disposition (see section 5.6.6). Nevertheless, without redistribution, no value can be recovered, making redistribution an important RL process. Lastly, redistribution can be *time-consuming*, which can associate with the activities and time it takes for returned/recovered products to be transported from facilities to the markets.

The *requirement characteristics* of the redistribution process include speed and resources. Although the redistribution process can be time-consuming, *speed* can be an important requirement because the demand for time-sensitive returned/recovered products can change (e.g. clothing goes out of fashion or a new model release of a smart phone). Furthermore, *resources* can be important for speedy redistribution, indicating that organisations must invest in resources that focus on enhancing redistribution efficiency and maximising value recovery.

The *involvement* characteristics of the redistribution process include technology, networks and product reuse. Since redistribution is the final RL process, *technology* can be important for updating inventory and tracking systems as returned/recovered products exit the facility and enter the markets. Furthermore, redistribution involves networks, covering the movement of returned/recovered products from facility locations to market/consumer locations. Consequently, redistribution involves *product reuse*, which relates to the delivery of returned/recovered products to consumers for consumption.

The *influenced by characteristics* of the redistribution process include product type, condition and quality, return type, demand and legislation, which can influence the type of transportation, market locations in redistribution and redistribution speed and activities. Specifically, *product type* and *condition* can influence the vehicle type used for redistribution. For example, smaller products in unused/new condition can be redistributed in small loads in a standard passenger vehicle and larger products in used/defective or damaged condition (e.g. fridge or furniture) must be redistributed on larger open trucks. Furthermore, *return type, product condition and quality* can influence market locations, redistribution speed and activities. For example, B2C (unwanted) returns of new/unused products can directly be redistributed to primary markets, ensuring speedy redistribution. In contrast, B2C and warranty returns of defective/damaged and/or poor-quality products must first be recovered (through repair or refurbishment), meaning that products must be resalable and reusable before redistribution to markets can take place. Consequently, the product condition can influence redistribution activities, for example, repaired and refurbished products need retesting, repackaging and relabelling before redistribution (see section 5.7.1), emphasising the time-consuming characteristics of redistribution. Furthermore, products in recovered and used condition can only be redistributed to secondary markets (see sections 5.6.4 and 5.6.5), requiring additional remarketing activities.

Similarly, market/product *demand* can influence the market location, redistribution activities and speed of redistribution. For example, if the demand for new condition returned products is higher in the secondary market, the redistribution process might exclude delivery in the primary market. Additionally, returned/recovered products with a lower market demand require storage and remarketing activities, adding to the time constraints in the redistribution process. Lastly, *legislation* can influence the market locations in redistribution, for example, consumer protection laws might stipulate that any returned product in a used can only be redistributed to secondary markets, excluding primary markets.

Finally, the *linked with characteristics* of the redistribution process involve links with a few *pre-receipt RL processes*, including collection and transportation, and all *post-receipt RL processes*,

including receiving, processing, inspection, sorting and disposition. Particularly, the links between redistribution and the *collection* and *transportation* processes in RL associate with the movement of returned products between locations. For example, products can be collected from consumers and transported to facilities for eventual redistribution to the markets. Additionally, returned/recovered products can be collected from facilities and transported to DCs for redistribution, emphasising the involvement of networks in redistribution. Consequently, the links between redistribution and pre-receipt RL processes associate with product flows in the RL process.

Likewise, redistribution can *link* with other *post-receipt RL processes* in terms of *receiving* returned products at facilities (product inflows), *processing*, *inspection*, *sorting* and *disposition* of returned products in facilities and *redistribution* of returned/recovered products from facilities (product outflows). However, the most significant link is between redistribution and disposition since the redistribution process entails the delivery of returned/recovered products to primary markets (direct reuse or repair disposition options) or secondary markets (repair and refurbish options). Additionally, redistribution forms part of the activities/processes of all disposition/exit options (except ship to a vendor) as illustrated throughout section 5.6. Essentially, all links between redistribution and other RL processes involve product flows, emphasising the main purpose of the redistribution process of consumer returns.

5.7.2 Activities in the redistribution process of consumer returns

Table 5.33 shows that the activities of the redistribution process can mostly be classified as product flow activities, with remarketing as the only information flow activity and reselling as the only cash flow activity. Consequently, the redistribution process involves various *product flow* activities, including retesting, cleaning, repackaging, relabelling, storage, packing, loading, shipping and delivery. While some of these activities can occur during disposition operations (see section 5.6.6), redistribution facilities or DCs can be responsible for preparing returned/recovered products for redistribution to the markets. Linking with the impact of product condition (influenced by characteristic) on redistribution (section 5.7.1), recovered (repaired or refurbished) and used products might need *retesting*, *cleaning*, *repackaging* and *relabelling.*

Moreover, slower-moving products might be stored before redistribution, emphasising the time-consuming nature of redistribution (general characteristic) and influence of market demand on redistribution activities (influenced by characteristic). The final few product flow activities represent the movement of products from the facilities to market locations, which can be regarded as the opposite of receiving activities (see section 5.3). While receiving entails inbound product flows into

facilities, redistribution entails outbound product flows, involving *packing* and *loading* onto vehicles, *shipment* from facilities and *delivery* to consumer/market locations.

Additionally, redistribution can include the *information flow activity* of *remarketing* and *cash flow* activity of *reselling*, indicating that the market locations of the redistribution process can include retail locations/facilities for remarketing and reselling activities before delivery to (online) second consumers. Evidently, redistribution may include two phases, namely redistribution from redistribution facilities to retail locations for remarketing and reselling of returned/recovered products, and again redistribution from retail locations to consumer locations, reemphasising the time-consuming nature of redistribution. The facilities and locations in redistribution will further be explored in the next section.

5.7.3 Facilities/locations in the redistribution process of consumer returns

Table 5.33 demonstrates that redistribution involves several facilities and locations, which can be classified as specialised facilities, traditional FL facilities/locations, RL process facilities and market locations. Although redistribution facilities can be regarded as exit facilities in the RL process, any other traditional FL or RL process facility that perform redistribution can be an exit facility since redistribution can be classified as the exit of the RL process (general characteristic). Therefore, *redistribution facilities* were classified as *specialised facilities* in the redistribution process, matching repair facilities used for repair activities and refurbishment facilities used for refurbishment activities (see sections 5.6.3.3 and 5.6.4.3). Additionally, redistribution facilities can be owned by specialised redistribution parties, like redistributors, performing various redistribution activities, like storage, packing, loading, shipment and delivery to markets (see section 5.7.4).

Traditional FL facilities/locations in redistribution can include retail stores, DCs and warehouses. As explained in the activities of redistribution (section 5.7.2), the redistribution process can involve delivery of returned/recovered products to retail locations, like *retail stores*, for remarketing and reselling. Additionally, *warehouses* can be used for the redistribution activity of storage, implying that warehouses can be responsible for packing, loading and shipment activities in redistribution. Similarly, *DCs* can be exit facilities responsible for redistribution of returned/recovered products to market locations. Using traditional facilities for redistribution indicates that organisations can combine FL distribution of new products with RL redistribution of returned/recovered products to market/consumer locations, which might reduce redistribution costs (e.g. using the same vehicle for new and used products).

Alternatively, RL facilities, like CRCs, processing facilities and disassembly facilities can be used for redistribution activities. Specifically, *CRCs* and *processing facilities* can be (1) initial facilities responsible for receiving, processing, inspecting/sorting and disposition of consumer returns and (2) exit facilities responsible for redistribution activities, including packing, loading, shipment and delivery to market locations. Evidently, using RL-specific facilities, like CRCs and processing facilities, for all post-receipt RL processes, emphasise the links between redistribution and other post-receipt RL processes and related product flows (see section 5.7.1). Similarly, using *disassembly facilities* for redistribution demonstrates the link between redistribution and the disposition process since disassembly facilities are mostly responsible for product recovery (e.g. repair or refurbishment) activities (sections 5.6.3.3 and 5.6.4.3). Additionally, using disassembly facilities in the redistribution process reemphasises that damaged/defective returned products must first be recovered before redistribution to markets can be possible (influenced by characteristic). Furthermore, disassembly facilities can either be (1) intermediary facilities, responsible for shipment of recovered products to exit facilities (e.g. DCs), or (2) exit facilities, responsible for final redistribution of recovered products to markets.

Accordingly, *markets* represent the destination locations that receive returned/recovered products through redistribution. Additionally, the market locations in redistribution can be influenced by various factors, like product condition, return type, market demand and legislation (see section 5.7.1). For instance, redistribution to the *primary market* can be appropriate for new/unused B2C (unwanted) returns, while redistribution to the secondary market can be appropriate for recovered products, good condition products based on market demand, or used products based on legislation. Finally, markets as destinations in redistribution emphasise the remarketing, reselling and delivery activities of redistribution and demonstrate consumers as the end parties in redistribution that ultimately receive returned/recovered for reuse (involve characteristic). In the next section, the various parties in redistribution will be discussed in more detail.

5.7.4 Parties involved in the redistribution process of consumer returns

Table 5.33 shows that redistribution involves several parties, including consumers, retailers, suppliers, redistributors and third parties, playing primary or secondary roles in the redistribution process. *Consumers* can play both secondary and primary roles in the redistribution process. Specifically, the *original consumer* plays a secondary role by acting as a supplier of new/unused or defective/damaged/used product for redistribution. Contrastingly, the *second consumer* plays primary roles in redistribution by (1) creating a demand for returned/recovered products, (2) buying returned/recovered products and (3) receiving returned/recovered products through redistribution.

Evidently, consumers can represent both be the parties of origin and parties of destination in the redistribution process.

Similarly, *retailers* in the redistribution process can represent original retailers and second retailers with various (mostly primary) roles in redistribution. For example, the *original retailer* receives product returns (from the original consumer) and perform other post-receipt RL processes (such as processing, inspection, sorting and disposition), before redistributing products (new/used/recovered) to the markets. Like second consumers, the *second retailer* can be buyers and receivers of returned/recovered products through redistribution. However, both the original and second retailer can own retail stores and be responsible for remarketing and reselling of returned/repaired products (see section 5.7.3), which can ultimately be redistributed (delivered) to second consumers. While retailers mostly play primary roles in redistribution, the possibility of outsourcing redistribution to third parties indicate that original retailers can play secondary roles in redistribution.

Suppliers in the redistribution process can be any intermediary party, like retailers, wholesalers or other sellers, operating in the primary or secondary markets that can be responsible for reselling and redistributing returned/recovered products to second consumers. Therefore, suppliers are mostly located in the markets, closer to consumers, mirroring a traditional forward SC. Evidently, the redistribution process represents an alternative SC, with original consumers as original suppliers, retailers/third parties as second suppliers and second consumers as end users.

Linking with redistribution facilities as specialised facilities (see section 5.7.3), *redistributors* can be regarded as specialists in the redistribution process. Subsequently, redistributors play primary roles by being responsible for various redistribution activities, including repackaging, packing, loading, shipment and delivery of returned/recovered products to the markets. Moreover, like original retailers, redistributors can be responsible for product return collection from original consumers, other post-receipt RL processes and ultimate redistribution to markets, implying that redistributors can be outsourced parties responsible for the entire RL process. Alternatively, redistributors can act as intermediaries or suppliers by receiving recovered products from disassembly facilities for redistribution to market locations. Furthermore, redistributors can play roles in considering factors that can influence redistribution (influenced by characteristics), for example, redistributing returned/recovered products to appropriate markets based on consumer demands.

Like redistributors, *third parties* can represent outsourced parties, performing some or all redistribution activities on behalf of retailers. For instance, *transporters* might only be responsible for the delivery activity in redistribution, emphasising the link between redistribution and the transportation process in RL (section 5.7.1). Alternatively, *3PL providers* can be responsible for the

entire redistribution process, which can include repackaging, relabelling, cleaning, storage, packing, loading, shipping, delivering, remarketing and reselling (section 5.7.2). Essentially, the potential of outsourcing redistribution to various parties emphasises the costly nature and speed and resource requirements of redistribution (general and requirement characteristics). In the next section, the outcomes of redistribution will be identified, which can demonstrate the importance of effective redistribution.

5.7.5 Outcomes in the redistribution process of consumer returns

Table 5.33 shows that the redistribution process can include economic, product-related, environmental and market-related outcomes. The *economic outcomes* of redistribution include *revenue* and *value recovery*, which can be realised through the remarketing, reselling and delivery of returned/recovered products to the markets. Evidently, redistribution represents the final RL process that can contribute to the recovery of value from consumer returns.

Similarly, the *product-related outcome* of redistribution includes the *extension of a product's live* through delivery of returned/recovered/used products to consumers for reuse and consumption. Subsequently, redistribution can include *environmental outcomes* by preventing returned products from entering landfills. Particularly, redistribution can enhance *environmental sustainability* and *reduce waste,* which can be valuable for the environmental performance of organisations.

Finally, the *market-related outcomes* of redistribution can include demand satisfaction and market expansion. The *satisfaction* of *consumer demand* emphasises the importance of considering market demand (influenced by characteristic) for redistribution to appropriate markets (see section 5.7.1). Additionally, redistribution can help organisations to exploit alternative markets (such as secondary markets), which enables *market expansion.* Expanding markets might increase sales and contribute to revenue (profitability) outcome of redistribution.

Essentially, redistribution as the final RL process of consumer returns can holistically provide various economic, product-related, environmental and market-related benefits through the redistribution of returned/recovered products to primary and secondary markets and ultimately to second consumers as end users in RL.

5.7.6 Description and conceptual framework of the redistribution process for consumer returns

Based on the findings presented in section 5.7, redistribution can be an important post-receipt RL process of consumer returns, and will be described as follows:

The redistribution process of consumer returns can be described as a costly, time-consuming and exit process in RL, which (1) requires speed and resources, (2) involves technology, networks and reuse, (3) can be influenced by product type, condition and quality, return type, market demand and legislation, and (4) can link with other pre- and post-receipt RL processes. The redistribution process can include the (1) product flow activities of retesting, cleaning, repackaging, relabelling, storage, packing, loading, shipping and delivery, (2) information flow activity of remarketing, and (3) cash flow activity of reselling, which can be performed by online retailers, redistributors, transporters and/or 3PL providers in specialised facilities (redistribution facilities), traditional FL facilities/locations (such as stores, warehouses and DCs), RL process facilities (such as CRCs and processing and disassembly facilities) and market locations. The aims of the redistribution process include preparing of returned/recovered products for remarketing, reselling and redelivery to suppliers/second retailers and/or second consumers in primary or secondary markets. The redistribution process can result in (1) economic outcomes (revenue and value recovery), (2) product-related outcome (extend the product's life), (3) environmental outcomes (environmental sustainability and waste reduction), and (4) market-related outcomes (demand satisfaction and market expansion).

Figure 5.15 provides a conceptual framework of the redistribution process that may apply to consumer returns in online retailing.

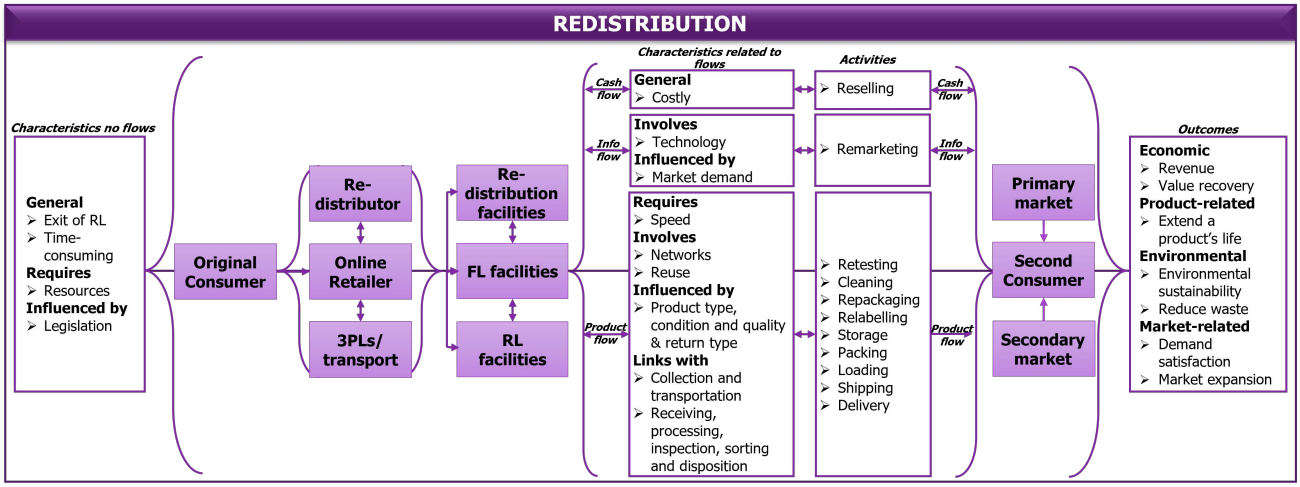

Figure 5.15 Conceptual framework of the redistribution process of consumer returns
Source: Compiled by the researcher

Figure 5.15 provides a basic overview of the redistribution process of consumer returns, illustrating the parties, facilities, flows, characteristics, activities, markets and outcomes. Particularly, the framework illustrates that the redistribution process starts with the original consumer, returning a product to the original online retailer or third-party provider. The returned product enters the FL, RL and/or redistribution facility for redistribution operations. Additionally, the framework demonstrates the cash, information and product flows with the related characteristics and activities of redistribution. Once the activities are completed, the cash, information and product flows continue as products re-enter the markets through redistribution, which can either be the primary market or secondary market. Ultimately, the redistribution process concludes with the second consumer purchasing and receiving the returned/recovered/used products in the primary or secondary market. Finally, the framework demonstrates the characteristics unrelated to flows as well as the outcomes of the redistribution process.

In the next section, the post-receipt RL processes are concluded with a conceptual framework and summary of findings.

5.8 CONCEPTUAL FRAMEWORK AND SUMMARY OF FINDINGS FOR THE POST-RECEIPT RL PROCESSES OF CONSUMER RETURNS

In this section, the findings and conclusions of the findings related to the post-receipt RL processes are given. Figure 5.16 illustrates a conceptual framework for the post-receipt RL processes based on the findings presented in chapter 5.

Clearly, the findings presented in chapter 5 shows that all post-receipt RL processes identified in the QCA findings of RL literature, including receiving, processing, inspection, sorting, disposition and redistribution, can apply to consumer returns in online retailing. Based on the findings, Figure 5.16, shows a conceptual framework for the post-receipt RL process of consumer returns that may apply to the online retailing industry. Particularly, the framework highlights the linkages between the post-receipt RL processes with shared and unique characteristics and activities. Furthermore, the framework demonstrates the parties and facilities/locations involved or associated with the post-receipt RL processes, followed by the outcomes (benefits) through the effective implementation and execution of the post-receipt RL processes.

Based on Figure 5.16 and the discussions given in chapter 5, Table 5.34 provides a summary of the findings and managerial implications for post-receipt RL processes of consumer returns in online retailing.

Table 5.34 Findings and managerial implications of the post-receipt RL processes

CATEGORIES	KEY FINDINGS	MANAGERIAL IMPLICATIONS
Shared characteristics	•All the post-receipt RL processes include general characteristics •Receiving, processing, inspection and sorting can be labour-intensive •Inspection, sorting and disposition process can be important post-receipt RL processes •Processing, inspection, sorting and disposition can be complex RL processes •All post-receipt RL processes, except receiving, can be time-consuming •All the post-receipt RL processes include involve characteristics •Processing, inspection, sorting and disposition involve costs •Receiving and redistribution involve technology (IT) •All the post-receipt RL processes include links with characteristics •All post-receipt RL processes link with pre- and post-receipt RL processes •All the post-receipt RL processes, except receiving, include require characteristics •Processing, inspection, sorting and disposition require skilled/trained staff •Processing, disposition and redistribution requires resources, IT and/or equipment •Processing and redistribution require speed •All the post-receipt RL processes, except receiving, include influenced by characteristics	•All the post-receipt RL processes (receiving, processing, inspection, sorting, disposition and redistribution) can be applicable to consumer returns in online retailing •Online retailers must allocate sufficient staff for effective receiving, processing, inspection and sorting processes in RL •Online retailer must pay more attention to inspection, sorting and disposition processes for the management of consumer returns •Online retailers must identify practices to streamline processing, inspection, sorting and disposition processes in RL •Time-saving strategies must be implemented for all post-receipt RL processes (except receiving) •Online retailers can use IT for effective receiving and redistribution processes in RL •Online retailers must develop cost saving strategies to manage processing, inspection, sorting and disposition processes in RL •Online retailers must pay attention to the links between pre- and post-receipt RL process to manage consumer returns effectively •Online retailers must invest in staff training and focus on developing staff skills for the effective management of processing, inspection, sorting and disposition processes in RL •Online retailers must invest in resources, IT and equipment to effectively manage processing, disposition and redistribution processes in RL •Online retailers must implement practices to enhance processing and redistribution speed in RL •Online retailers must consider the type of industry, organisation and/or channel for effective processing, inspection and disposition processes in RL

CATEGORIES	KEY FINDINGS	MANAGERIAL IMPLICATIONS
	•Processing, inspection and disposition can be influenced by industry, organisation or channel type •All the post-receipt RL processes, except receiving, can be influenced by product type, condition, quality and/or type of returns •Processing, inspection and disposition processes can be influenced by return policies •Disposition and redistribution processes can be influenced by legislation (laws)	•Online retailers must consider the product type, condition, quality and/or type of returns for the effective execution of post-receipt RL processes (except receiving) •Online retailers must consider their return policies for effective processing, inspection and disposition processes in RL •Legislation must be considered for compliant disposition and redistribution processes/activities
Unique characteristics	•The receiving process includes arrival and inbound flows (general characteristics) and involves documentation •Processing can be an internal and uncertain RL process (general characteristics) that (1) requires accuracy and economies of scale, (2) involves customer service and accounts, and (3) can be influenced by carrier service levels •Inspection and soring processes exclude unique characteristics •The disposition process involves options, routes, channels, destinations, markets, risks, discounted/lower prices, contracts, negotiations, information sharing and relationships/partnerships •The disposition process can be influenced by return volume and manufacturer specifications/requirements •The redistribution process can be described as costly and the exit process of RL (general characteristics) that (1) involves networks and product reuse and (2) can be influenced by market demand	•Online retailers must develop strategies to enhance visibility of the arrival and inbound flows of returned products for an effective receiving process in RL •Online retailers can use documentation for effective receiving processes •Online retailers must develop strategies to enhance internal capabilities for processing •Practices must be identified to reduce uncertainties in the processing of consumer returns •Online retailers must implement strategies to enhance processing accuracy and achieve economies of scale in the processing process in RL •Online retailers must focus on consumers in the processing process and develop service strategies •Online retailers can implement integration practices between processing and accounting staff for an effective processing process in RL •Customer service strategies Online retailers must pay attention to customer service and ac processing of returns in their customer service strategy •Carrier service levels must be considered for effective processing in RL •Online retailers can develop strategies to identify the most appropriate disposition/exit options for an effective disposition process in RL •Online retailers must develop strategies to mitigate risks in the disposition process •Product pricing strategies can be important for an effective disposition process in RL •Online retailers can implement supply chain integration (SCI) strategies to effectively manage the disposition process of consumer returns •Product return volume and manufacturer specifications/ requirements must be considered for an effective disposition process •Network design can be important for effective disposition and redistribution processes •Online retailers must identify strategies to reduce redistribution costs •RL exit strategies can be developed for the redistribution process of consumer returns •Online retailers can focus on product reuse for effective redistribution of consumer returns •Online retailers must consider market demand for an effective redistribution process
Unique activities	•The receiving process includes product registration and identification, (information flow activities), unloading returned products, arranging pallets and dispatching products/pallets into the facility (product flow activities) •The processing process includes data entry and tracking, authorisation, recordkeeping (information flow activities), issuing and verifying credits/refunds, claims settlements (cash flow activities), and product exchange (product flow activity) •The inspection process includes grading (product flow activity) •The sorting process includes updating of sorting information (information flow activities) and product separation (product flow activity) •The disposition process includes product fixing, treatment, parts replacement, upgrade and restore (product flow activities), and trading and charging (cash flow activities) •The redistribution process includes relabelling (product flow activity)	•For an effective receiving process in RL, online retailers can establish systems for product registration and identification activities •For an effective receiving process, sufficient space at the facility must be allocated to streamline returned product unloading, arrangement of pallets and dispatch into the facility •For an effective returns processing, online retailers can establish systems with capabilities to enter processing information, track, authorise, issue and verify refunds/credits, and settle claims •Integration with FL processes can facilitate effective product exchanges in the processing process of consumer returns •For an effective inspection process, online retailers can establish a returned product grading system •Online retailers can use information systems to effectively update sorting information •Sufficient space must be allocated in the facility to streamline returned product separation during the sorting process •For an effective disposition process, online retailers can consider the development of internal capabilities or selection of third parties with appropriate capabilities for the fixing, treatment, parts replacement, upgrade and restoration of returned products in defective/damaged/ used condition •For an effective disposition process, online retailers can implement cost recovery strategies that focus on the trading and charging activities of consumer returns •As a value-added or brand protection activity, online retailers can consider relabelling of returned products in the redistribution process
Shared activities	•All post-receipt RL processes include information flow activities •Receiving, processing and disposition includes	•For effective receiving, processes and disposition processes, online retailers can establish communication and information-sharing platforms

CATEGORIES	KEY FINDINGS	MANAGERIAL IMPLICATIONS
	communication and information sharing activities •Receiving, processing, inspection and sorting processes include the verification of product return information provided by consumers during CRR and gatekeeping (pre-receipt RL) processes •Receiving and disposition processes include administration and scanning activities •Disposition and redistribution processes include remarketing •All post-receipt RL processes include product flow activities •Receiving, inspection and sorting processes include organising, grouping and classing of returned products •Processing, inspection, sorting and disposition processes involve some form of disposition decision-making •All post-receipt RL processes include some form of returned product handling and movement •Inspection, sorting and disposition processes include product return evaluation and disassembly activities •Processing and disposition processes can include restocking or back to inventory activities •Inspection, sorting, disposition and redistribution processes include product return storage and (re)testing activities •Disposition and redistribution processes including cleaning, repackaging, packing, loading, shipping and delivery activities •Disposition and redistribution are the only post-receipt RL processes that include the cash inflow activity of reselling	•For streamlined receiving, processing, inspection and sorting processes, online retailers can establish an integrated information system for verification of product return information •To streamline the receiving and disposition process, online retailers can implement scanning solutions •The administration function must support receiving and disposition processes in RL •Online retailers must focus on remarketing strategies for effective disposition and redistribution processes •For effective, receiving, inspection and sorting processes, sufficient space at the receiving dock and within the facility must be allocated for organising, grouping and classing of returned products •Managers must be involved in the processing, inspection, sorting and disposition processes for effective disposition decision-making in RL •Appropriate material handling equipment and systems must be provided for a streamlined post-receipt RL process •For effective inspection, sorting and disposition processes, online retailers must appoint product specialist and technical staff for efficient product evaluation and disassembly activities •Inventory strategies must be implemented in the processing and disposition processes for effective return to inventory and restocking of resaleable product returns •Sufficient storage space must be allocated for returned product storage in the inspection, sorting, disposition and redistribution processes •Inspectors and/or technical staff can be appointed for sound testing and/or retesting of returned/recovered products in the inspection, sorting, disposition and redistribution processes •As value-added activities, online retailers can consider the cleaning and repackaging of returned/recovered products in the disposition and redistribution processes •For effective disposition and redistribution processes, online retailers must implement appropriate facility dispatch and transportation systems/strategies for the packing, loading, shipping and delivery of returned/recovered products •To maximise cost/value recovery, online retailers can implement a sales strategy for the reselling of returned/recovered products in the disposition and redistribution processes
Parties	•Various parties can be involved in post-receipt RL processes •Consumers can be classified as the (1) first (original) consumer responsible for supplying product returns and (2) second consumer responsible for creating a demand for and buying of returned/recovered products •The online retailer is responsible for receiving consumer returns and performing all or some post-receipt RL processes, including selling of returned/recovered products to 3P buyers (third parties), second retailers (other) and second consumers •Third parties can represent (1) outsourced service providers (e.g. 3P(R)Ls and 4PLs) responsible for all or some post-receipt RL processes, including reselling of returned/recovered products to second consumers and retailers, and (2) 3P buyers responsible for buying returned/used/recovered products, performing some post-receipt RL processes and trading and selling of returned/used/recovered products to second consumers or retailers •Other parties can represent (1) vendors (suppliers/manufacturers) responsible for accepting consumer returns from online retailers and performing some post-receipt RL processes, (2) second retailers responsible for buying returned/recovered from online retailers or 3P buyers and reselling of returned/recovered products to second consumers, and (3) specialised parties (e.g. repair vendors, refurbishment specialists and redistributors) responsible for product recovery and redistribution activities	•Online retailers can implement consumer integration (CI) initiatives and develop a customer relationship strategy for streamlined post-receipt RL processes •Online retailers must develop appropriate resale and remarketing strategies to stimulate the demand for and buying of returned/recovered products to second consumers •Online retailers must implement RL insourcing and/or outsourcing strategies for an effective post-receipt RL process •Online retailers that select a RL insourcing strategy must develop internal RL capabilities, implement a RL process strategy and allocate sufficient resources for an effective post-receipt RL process •Online retailers that select a partial or full RL outsourcing strategy must identify and select appropriate third-party service providers and implement subsequent SC integration (SCI) initiatives for an effective post-receipt RL process •Online retailers interested in selling returned/used/recovered products to 3P buyers and/or second retailers can implement an after-market sales strategy, create reselling agreements and implement SCI initiatives for effective disposition and redistribution processes •Online retailers interested in shipping consumer returns to vendors can establish supplier agreements and relationships with vendors to optimise economic/value recovery from consumer returns •Online retailers interested in selling returned/recovered products to second retailers can establish contractual agreements for effective •Online retailers that lack product recovery and/or redistribution capabilities can use specialists for effective disposition and redistribution processes
Facilities/locations	•Various facilities/locations can be used for post-receipt RL processes •Traditional forward logistics (FL) facilities/locations, including warehouses, DCs and stores, can be used for all or some post-receipt RL processes •RL process facilities, including centralised return centres (CRC) and collection, processing, inspection and disassembly facilities, can be used for all or some post-receipt RL processes •Recovery facilities, including repair and refurbishment facilities, service centres, workshops and recovery centres, can be used for some RL processes, including inspection,	•Facility and locations strategies and RL network design must be developed for post-receipt RL processes •Online retailers must identify appropriate facilities that can be used for post-receipt processes •Online retailers that select traditional FL facilities for post-receipt RL processes must effectively separate FL and RL processes and allocate sufficient space and staff resources for post-receipt RL processes •Online retailers with space constraints in traditional FL facilities can consider using RL process facilities for post-receipt RL processes •Online retailers can establish or use third-party recovery facilities to effectively perform inspection, sorting, disposition and redistribution processes

CATEGORIES	KEY FINDINGS	MANAGERIAL IMPLICATIONS
	sorting, disposition and redistribution processes •Exit facilities, including DCs and redistribution facilities, can be used for disposition and redistribution processes •Market locations can include primary and secondary markets that represent the destinations of returned/recovered/used products in disposition and redistribution processes	•Online retailers can use established DCs or use redistribution facilities for effective disposition and/or redistribution processes •Online retailers must identify appropriate market locations as destinations for disposition and redistribution processes
Process flows	•The post-receipt RL processes include cash, information and product flows •All post-receipt RL processes, except receiving, involve cash flows •Cash flows in the post-receipt RL process can include (1) cash outflows, relating to costs of RL processes and issuing credit/refunds in processing, and (2) cash inflows, relating to returning returned products to vendors for credit and cost recovery and selling returned/recovered/used products in the disposition and redistribution processes •All post-receipt RL processes involve information and product flows •Information flows can take place forward and backward between the post-receipt RL processes •Product flows mostly move forward in the post-receipt RL process, starting at receiving of consumer returns and concluding with final delivery of returned/recovered products to the markets	•Online retailers must focus on cash, information and product flows for effective post-receipt RL processes •Online retailers must minimise cash outflows and optimise cash inflows for cost-effective post-receipt RL processes •Online retailers must implement integrated information sharing strategies to optimise information flows in the post-receipt RL process •Online retailer must establish practices that streamline product flows in the post-receipt RL process
Outcomes	•The post-receipt RL processes, especially disposition and redistribution, can result in economic, product-related, environmental, market-related and social outcomes •Economic outcomes include various financial benefits, relating to profitability, cost avoidance, savings and effectiveness and economic recovery •Product-related outcomes include various product-related benefits, including improving the quality of returned products, restoring the functionality of returned products, extending the returned product's life, recover products/parts for reuse and creating new warranties for refurbished products •Environmental outcomes include various environmental benefits, relating to environmental performance, protection and sustainability, compliance to environmental legislation and reduction of waste and natural resource consumption •Market-related outcomes include various market-related benefits, including competitiveness, increase in sales, consumer trust, service and satisfaction, supply/demand/ need satisfaction and expansion of markets •Social outcomes include various social benefits, relating to improved reputation (or corporate image), benefits for the society and job creation	•The effective implementation and execution of post-receipt RL processes can result various benefits •Online retailers seeking economic benefits in the post-receipt RL process must identify and implement appropriate practices/strategies to maximise cost recovery and revenue from consumer returns •Online retailers seeking product-related benefits in the post-receipt RL process must identify and implement appropriate practices/strategies to extend the life of returned products and optimise product recovery for product reuse •Online retailers seeking environmental benefits in the post-receipt RL process must identify and implement appropriate practices/strategies to enhance environmental performance and sustainability and reduce waste and natural resource consumption •Online retailers seeking market-related benefits in the post-receipt RL process must identify and implement appropriate practices/strategies to enhance competitiveness, increase sales, improve consumer trust, service and satisfaction, enhance supply/demand/need satisfaction and expand markets •Online retailers seeking social benefits in the post-receipt RL process must identify and implement appropriate practices/strategies to improve corporate image and enhance benefits for the society

Source: Compiled by the researcher

Table 5.34 provides a detailed understanding of the post-receipt RL processes for consumer returns that can be applicable to online retailing. Additionally, each category included several managerial implications that online retailers can consider for the implementation and execution of post-receipt RL processes for the effective RLM of consumer returns. The findings presented in chapter 6 will contribute to the final framework for the RLM of consumer returns in online retailing, presented in chapter 9.

5.9 CONCLUSION

This chapter addressed the second secondary research objective of ***identifying and exploring RL literature for post-receipt RL processes of consumer returns (SRO-3)***. Especially, the objective was achieved through the QCA findings of RL literature for post-receipt RL processes of consumer returns, which included the development of conceptual frameworks, typology (summaries) of the findings and managerial implications for online retailers. Additionally, the findings in this chapter contributed to the primary objective of the study, which was to *develop a framework for the effective RLM of consumer returns in online retailing*.

The chapter started with the introduction and overview of the chapter (section 5.1), followed by an overview of the post-receipt RL processes (section 5.2), whereafter the receiving process (section 5.3), processing process (section 5.4), inspection and sorting processes (section 5.5), disposition process (section 5.6) and the redistribution process (section 5.7) of consumer returns were discussed and analysed. The chapter concluded with a conceptual framework and summary of findings for the post-receipt processes of consumer returns (section 5.8). The QCA findings of RL literature was presented as follows: (1) qualitative data tables, with overviews of the categories, subcategories, sources and key quotations, (2) discussion and interpretation of the findings presented in the qualitative data tables, (3) description and conceptual frameworks for each category, and (4) final conceptual framework and summary of findings in text tables for the main categories.

The main findings showed that (1) all the post-receipt RL processes can be applicable to consumer returns in online retailing, (2) all the post-receipt RL processes must be considered for managing consumer returns in online retailing, (3) appropriate strategies and practices must be developed and implemented for each post-receipt RL process based on shared and unique characteristics and activities, (4) online retailers must focus on the development of relationships and implementation of integration strategies with other parties involved in the post-receipt RL process, (5) facility/locations strategies and RL network design must be a priority for online retailers to effectively manage post-receipt RL processes, (4) online retailers must implement appropriate practices and strategies to streamline cash, information and product flows in the post-receipt RL process, and (5) online retailers must implement strategies and practices for the executive execution of post-receipt RL processes to realise optimum economic, product-related, environmental, market-related and social benefits.

In the next chapter (chapter 6), the QCA findings of RL literature for the RL practices to manage consumer returns will be presented, discussed and analysed.

Chapter 6 – QCA findings of RL literature for RL practices to manage consumer return

6.1 INTRODUCTION

RL and the management of consumer returns can be the most complicated challenge for online retailers (Davidavičienė & Al Majzoub, 2021:21), and most online retailers still need to implement practices to effectively manage consumer returns (Ashan & Rahman, 2021:3). Consequently, identifying and implementing RL practices to manage consumer returns effectively can be critical in online retailing.

Concluding the QCA findings of RL literature, this chapter (chapter 6) provides an in-depth discussion of all RL practices that can be implemented for the management of consumer returns. An overview of the presentation styles used for the QCA of RL literature findings was provided in chapter 4 (see section 4.2), which applied to chapter 6. In the research methodology section of chapter 1 (section 1.7, Figure 1.5), the research phases of the study were discussed. Chapter 6 forms part of second research phase of this study, as illustrated in Figure 5.1.

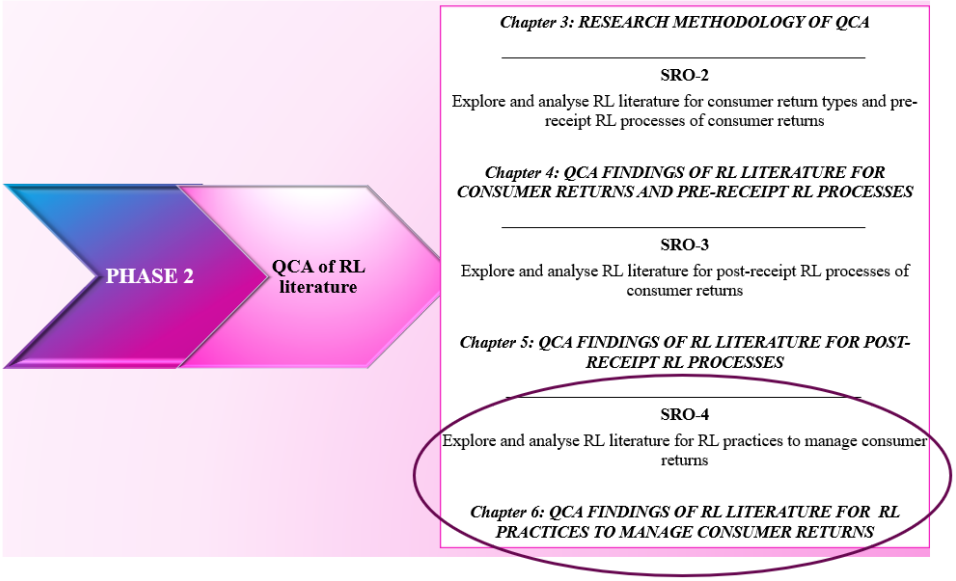

Figure 6.1 QCA of RL literature - Aim of chapter 6
Source: Compiled by the researcher

Figure 5.1 indicates that the aim of this chapter is to achieve the *fourth* secondary research objective, which is ***to identify and explore RL literature for RL practices to manage consumer returns (SRO-***

4). The QCA findings of RL literature for RL practices resulted in the development of a conceptual framework for the RL practices to manage consumer returns, typology of the findings and managerial implications. Additionally, separate frameworks, typology of findings and managerial implications were provided for each main practice category. The findings presented in this chapter contributes to the primary objective of the study, which was to *develop a framework for the effective reverse logistics management (RLM) of consumer returns in online retailing*. Therefore, important findings related to RL practices for the management of consumer returns are identified in this chapter, contributing to the final framework for the effective management of consumer returns in online retailing. Additionally, the findings of this chapter served as a basis for the interviews with industry experts, to determine if any of the RL practices identified in this chapter can be appropriate for the effective management of consumer returns in online retailing.

Figure 5.2 provides an overview of this chapter.

Figure 6.2 Overview of chapter 6
Source: Compiled by the researcher

Figure 5.2 provides an overview of chapter 6, starting with the introduction (section 5.1), followed by an overview of RL practices (section **Error! Reference source not found.**), where after the various RL practices are discussed and analysed, including information technology (IT) practices (section 6.3), integration practices (section 6.4), RL insourcing and outsourcing practices (section 6.5), RL

disposition practices (section 6.6), performance measurement (PM) practices (section 6.7), facility and location practices (section 6.8) and other RLM practices (section 6.9). Finally, the chapter will conclude with a conceptual framework and summary of findings for the RL practices for the management of consumer returns consumer returns (section 6.10) and the conclusion (section 5.9).

In the next section, an overview of RL practices included and excluded from the study is given.

6.2 OVERVIEW OF RL PRACTICES

In this section, an overview of the RL practices to manage consumer returns will be provided. Figure 4.3 (in chapter 4) demonstrated that RL practices covered 51% of the QCA findings of RL literature. Consequently, RL practices dominate the RL literature, emphasising the importance of identifying and implementing appropriate practices to manage RL effectively. Based on the coding framework of the QCA of RL literature (see Appendix A.2), the RL practices were structured into eleven main practice categories.

Figure 6.3 provides an overview of the distribution of the RL practices based on the results of the QCA of RL literature (see Appendix C.4 for quantitative results).

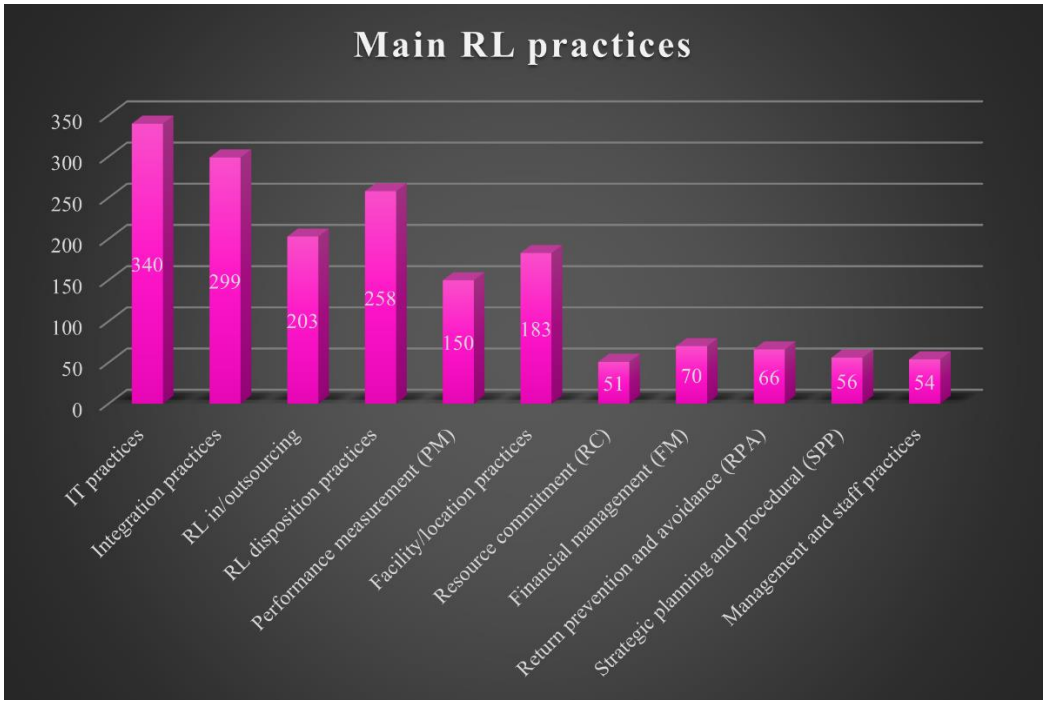

Figure 6.3 Distribution of main RL practice categories
Source: Compiled by researcher

Figure 6.3 shows a distribution for the main RL practice categories of the QCA of RL literature derived from code frequencies (total number of quotations assigned to code categories). Specifically, the bar chart shows that RL literature from the QCA focused on information technology (IT) (340 quotations), integration (299 quotations), RL disposition (259 quotations) and RL in/outsourcing practices (203 quotations) to a *high extent*, followed by facility/location (183 quotations) and performance measurement (PM) (150 quotations) practices to a *moderate extent*. In contrast, RL literature from the QCA focuses on resource commitment (RC) (51 quotations) and financial management (FM) (71 quotations), return prevention and avoidance (RPA) (66 quotations), strategic planning and procedure (SPP) (56 quotations) and management and staff practices (55 quotations) practices to a *limited extent*, which demonstrates a gap in RL literature.

Since RC, FM, RPA, SPP and management and staff practices represent limited findings, these practices were be combined in section 6.9 (other RLM practices) for a more even distribution of the main practice sections. Additionally, as part of the main QCA coding frame (Appendix A.2), some practice categories (e.g. IT and integration) consisted of sub-practice categories with quantitative results, which will be presented in the introduction of the main practice sections. Despite the distribution, all RL practices can be important for the management of consumer returns, which will be evident from the findings presented throughout this chapter.

In the rest of this section, an overview of the RL practices and related elements *included* in the QCA is provided, followed by a description of the RL practices and related elements *excluded* from the QCA.

6.2.1 RL practices and related elements included in the study

As mentioned in the introduction, the aim of this chapter was to identify the RL practices that can contribute to the final framework to manage consumer returns.

This study defines a RL practice as a "*a measure, requirement, strategy, decision-making element or activity that can be implemented for the effective management of consumer returns".* As part of the RL practices, this study focuses on the costs (strategies and requirements) of implementing RL practices and the resulting benefits (outcomes), which represents a cost-benefit analysis. This study defines the *costs* of RL practices as *"measures, strategies, requirements and decision-making elements/factors that can result in benefits"*. Additionally, this study defines the *benefits* of RL practices as *"outcomes that can be realised from implementing the costs of RL practices."*

As mentioned in the introduction of section **Error! Reference source not found.**, the RL practices included in this chapter are based on the *coding framework for the QCA of RL literature* (see Figure 6.3). However, smaller practice categories were combined for a more even distribution of the main RL practice sections. Based on the abovementioned definitions and main RL practice categories of the coding framework (Figure 6.3), the RL practices (in order of presentation) for the management of consumer returns included:

- *Information technology (IT) practices,* including (1) general IT strategies, requirements and outcomes, (2) Internet and web-based IT strategies, requirements and outcomes, (3) traditional logistics IT (TLIT) strategies, requirements and outcomes, (4) barcode and RFID IT strategies, requirements and outcomes, and (5) RL information technology (RLIT) strategies, requirements and outcomes (section 6.3)
- *Integration practices,* including (1) supply chain integration (SCI) strategies, requirements and outcomes, (2) consumer integration (CI) strategies, requirements and outcomes, and (3) cross-functional integration (CFI) strategies, requirements and outcomes (section 6.4)
- *RL in/outsourcing practices,* including (1) strategic considerations and analyses for RL in/outsourcing, (2) strategic decisions and strategies related to RL outsourcing, (3) requirements of RL in/outsourcing and (4) RL in/outsourcing outcomes (section 6.5)
- *RL disposition practices,* including (1) disposition strategies, (2) strategic understanding and analysis for disposition decisions, (3) RL disposition requirements, (4) RL disposition decision factors and (5) RL disposition outcomes (section 6.6)
- *Performance measurement (PM) practices,* including (1) PM strategies, (2) PM requirements, (3) PM elements for RL, and (4) PM outcomes (section 6.7)
- *Facility/location practices,* including (1) general facility/location strategies, decision factors, requirements and outcomes, (2) separate facility/location strategies, requirements and outcomes, (3) integrated facility/location strategies, requirements and outcomes, (4) centralisation strategies, requirements and outcomes, (5) decentralisation strategies, requirements and outcomes, and (6) centralised return centre (CRC) strategies, requirements and outcomes (section 6.8)
- *Other RLM practices,* including (1) resource commitment (RC) strategies, requirements and outcomes, and (2) financial management (FM) strategies, requirements and outcomes, (3) return prevention and avoidance (RPA) strategies, requirements and outcomes, (4) strategic planning and procedures (SPP) strategies, requirements and outcomes, and (5) management and staff strategies, requirements and outcomes (section 6.9)

In the next section, an overview of the RL practices and related elements excluded from the study will be provided.

6.2.2 RL practices and related elements excluded in the study

In section 1.6, the scope of this study briefly mentioned RL practices excluded from the study. Specifically, RL practices that fall outside of the scope of this study, include manufacturing and product design practices, environmental, green procurement and green logistics practices, waste management, recycling and remanufacturing practices or any RL practices unrelated to the management of consumer returns. Nevertheless, environmental outcomes (benefits) and practices related to relationships with manufacturers and disposition decisions that focus on all recovery strategies/decisions will be included for its potential importance in managing consumer returns effectively.

Additionally, the RL practices discussed in this chapter can be important for any type of organisation that deal directly or indirectly with consumer returns, including manufacturers, service providers, wholesalers and retailers, hence, the comprehensiveness of RL practices covered in this chapter. Accordingly, unlike chapters 4 and 5, the term "organisation" will be used instead of "online retailer" in the discussions and summaries of findings. Nevertheless, in chapter 8, the interview findings, the focus will be on the RL practices for online retailers (e.g. multi/omnichannel and online-only retailers), containing more retailer-specific practices for the effective management of consumer returns.

As mentioned in section **Error! Reference source not found.**, the focus of this chapter is on the strategies, requirements (costs) and outcomes (benefits) of RL practices, which means that unrelated categories/findings are excluded. Consequently, unlike chapters 4 and 5 (RL processes), characteristics, activities, facilities and parties as categories for RL practices are excluded in chapter 6. Essentially, all the RL practices discussed in this chapter must provide benefits for the effective management of consumer returns.

In the next section the first practice category, IT practices, will be explored, analysed and discussed.

6.3 INFORMATION TECHNOLOGY (IT) PRACTICES TO MANAGE CONSUMER RETURNS

According to Sasikumar and Kannan (2008b:234) and Jović *et al.* (2020:160) RLM requires specialised information systems for tracking and processing of returns. Additionally, Davidavičienė and Al Majzoub (2021:7) and Prakash and Barua (2015:611) indicated that investment in technology for RL can be a top management solution to address RL inefficiencies. Therefore, information technology (IT) can be an important RL practice to manage consumer returns.

Based on the coding frame of the QCA of RL literature (Appendix A.2), IT practices included (1) general IT practices (2) Internet or web-based technology, (3) traditional logistics information technologies (TLIT), (4) barcode and Radio Frequency Identification (RFID) technologies and (5) RL information technologies (RLIT).

Figure 6.4 provides an overview of the distribution of the IT practice categories from the QCA of RL literature (see Appendix C.4). Specifically, Figure 6.4 shows that general IT practices and RFID and barcode IT are evenly distributed throughout the QCA of RL literature (29% each), followed by traditional logistics IT (TLIT) for RL (21%). Evidently, literature mostly refer to IT in general (hereafter general IT practices) or RFID and barcode IT for RL. In contrast, RL information technology (RLIT) (11%) and Internet and web-based IT (10%) received limited attention, showing a gap in RL literature.

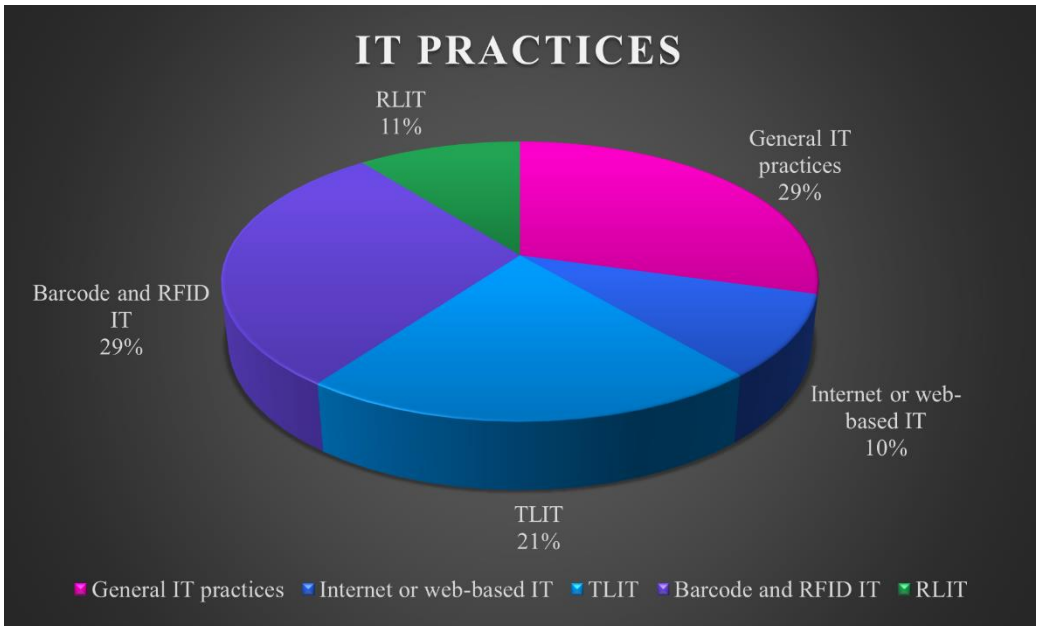

Figure 6.4 Distribution IT practices in RL
Source: Compiled by the researcher

In the subsequent sections an overview of the practices related to general (non-specific) IT for RL will be provided, followed by distinct IT categories (Internet or web-based IT, TLIT, barcode and RFID technologies and RLIT). This section concludes with a conceptual framework and summary of findings for IT practices to manage consumer returns.

6.3.1 General IT practices in RL

According to Olorunniwo and Li (2011:8) and De Leeuw *et al.* (2016:719), IT is vital for managing RL processes. Davidavičienė and Al Majzoub (2021:7) found that IT systems can be one of the most significant factors for the effective execution of consumer returns in online retailing. This demonstrates the importance of IT practices to manage consumer returns effectively. Based on the findings (identified from the QCA of RL literature) general IT in RL involve (1) strategies of general IT, (2) requirements of general IT and (2) outcomes of general IT, which will be presented and discussed in subsequent sections. The section will be concluded with a conceptual framework of general IT practices to manage consumer returns.

6.3.1.1 Strategies and requirements of general IT practices

General IT practices include general IT strategies and general IT requirements, which were categorised as economic, organisational and supply chain requirements. Table 6.1 provides an overview of the findings related to the *strategies and requirements of general IT* to manage consumer returns, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Source: Compiled by the researcher

Table 6.1 indicates that general IT practices involve several strategies and requirements, which will be discussed in subsequent sections.

6.3.1.1.1 Strategies of general IT practices in RL

General IT practices in RL involve several strategies, including (1) prioritising general IT, (2) strategic considerations for general IT, (3) strategic considerations related to the IT types, (4) strategic redesign, improvement and expansion of existing IT for RL, (5) continuous development of IT, (6) strategic development and implementation of a new/current IT infrastructure, (7) strategic matching and combining of IT and resources, (8) strategic development and utilisation of IT competency and capabilities, (9) strategic development and use of integrative and compatible IT, (10) strategic development and use of IT with information management capability, (11) performing a cost-benefit analysis, (12) strategic implementation and appropriate use of state-of-the-art and capable IT for RL, and (13) implementing efficient and effective, real-time and responsive.

Relating to the importance of IT for the efficiency and effectiveness of all business functions, organisations must *prioritise general IT* for RL. Therefore, general IT must be included in the organisation's strategic planning to address the barriers in RL (see section 6.3.1.2). Furthermore, before investing or implementing IT for RL, organisations must *strategically consider* the IT of SC partners to ensure compatibility of the IT solutions.

Other *strategic considerations* that can be important in IT practices *relate* to the *IT types* that can be used for RL. For instance, organisations can consider (1) Internet and web-based technologies (see section 6.3.2), (2) traditional forward logistics technologies, like Enterprise Resource Planning (ERP), Electronic Data Interchange (EDI), and Warehouse Management Systems (WMS) (section 6.3.3), (3) barcode and Radio Frequency Identification (RFID) technology (see section 6.3.4), and (4) reverse logistics information technology (RLIT) (see section 6.3.3), which will be discussed and analysed in subsequent sections. Nevertheless, IT solutions evolve, which means that organisations must consider the latest IT available on the market to manage consumer returns.

Alternatively, organisations may choose to *strategically redesign, improve and expand existing IT for RL*. However, organisations must *continuously develop IT*, ensuring that the general IT system addresses the chancing and uncertain RL environment. Furthermore, organisations must *match* and *combine IT* with *resources* for RL, demonstrating a link between IT practices and resource commitment (RC) practices (see section 6.9.1) to manage consumer returns. Similarly, organisations must *strategically develop* and *utilise IT competencies and capabilities,* which can contribute to intangible resources for RL (e.g. RL expertise and capabilities).

IT infrastructure can be important for RL, which means that organisations must *strategically develop* and *implement a new or current IT infrastructure* for managing consumer returns. Relating to the strategic considerations, organisations must *strategically develop* and *use integrative* and *compatible IT*, ensuring that RL information can be effectively shared internally (functions) and externally (SC parties). Similarly, organisations must strategically *develop* and *use IT* with *information management capabilities* to not only manage information but also enable inputs of information that can influence RL processes. For example, the IT system must be able to capture information about the Consumer Protection Act (CPA) of South Africa (2008:18), stipulating information about the return acceptance of defective/damaged products, which can be important for managing consumer returns.

As part of the general IT strategies, organisations must *perform* a *cost-benefit analysis* to identify the trade-offs between the costs and investment requirements of general IT and the potential benefits of implementation for RL. Therefore, analysing both the cost (strategies and requirements) and benefits (outcomes) of general IT can be important for the efficiency and effectiveness of RLM.

After the strategic considerations, development of current/new IT and IT infrastructure, matching of resources, and performing a cost-benefit analysis, organisations must *appropriately use* and *strategically implement state-of-the-art* and *capable IT* for RL. Particularly, organisations must *implement efficient* and *effective, real-time,* and *responsive* IT to effectively manage RL processes and share information with RL parties (like consumers).

6.3.1.1.2 Requirements of general IT practices in RL

The requirements of general IT practices in RL include economic, organisational and SC requirements. The *economic requirements* of IT practices involve *investment* and *costs* for implementing and using general IT for RL, which can include capital costs, labour costs, training costs and operational costs. The investment and cost requirements for general IT demonstrates the

importance of performing a cost-benefit analysis (strategy) for the efficient and effective RLM of consumer returns.

The *organisational requirements* of general IT include management involvement, IT staff involvement, and staff training. *Management involvement* can be important for developing and implementing general IT strategies for RL, like developing and implementing appropriate IT systems and infrastructure and performing a cost-benefit analysis. Similarly, *IT staff involvement* can be important for developing and implementing appropriate IT systems and infrastructure for RL, emphasising the importance of internal cooperation between functions/departments to manage consumer returns. Associating with the economic requirements of general IT, *staff training* can be important for operating IT systems appropriately.

Finally, the *SC requirement* of general IT practices involves *SCI, SC collaboration* and *4PL/3PL providers*, emphasising the importance of the general IT strategies of considering IT compatibility with SC parties and developing and using integrative and compatible IT systems for RL. Consequently, organisations need to implement SCI practices (see section 6.4.1) to effectively use general IT to manage consumer returns. Furthermore, organisations that lack the capability of utilising appropriate IT for RL must use third-party logistics (3PL), third-party RL (3PRL), fourth-party RL (4PLs) and third-party software providers (*3PL*s) gain access to world-class technologies for RL, linking general IT practices with RL outsourcing practices (see section 6.5).

In the next section, the outcomes of general IT practices (strategies and requirements) will be analysed and discussed.

6.3.1.2 Outcomes of general IT practices in RL

The outcomes can be described as the results of incorporating the strategies and requirements of general IT practices for the effective management of consumer returns. Like the strategies and the requirements, the outcomes (benefits) of general IT were divided into categories, namely economic, operational (related to RL processes), organisational, environmental, social, market-related and SC outcomes.

Table 6.2 provides an overview of the findings related to the *outcomes of general IT* practices to manage consumer returns, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.2 Findings related to outcomes of general IT practices to manage consumer returns

Source: Compiled by the researcher

Table 6.2 shows that general IT practices associate with economic, operational, organisational, environmental, social, market-related and SC outcomes, which will be discussed in subsequent sections.

6.3.1.2.1 Economic outcomes of general IT practices in RL

The economic outcomes of general IT include (1) addressing economic barriers, (2) economic benefits and performance, (3) cost effectiveness, (4) cost savings, and (5) profitability. RL involves economic barriers, like high costs, which can be problematic for effective RLM (see section 2.3.1). Nevertheless, several RL practices can *address* the *economic barriers* in RL, like general IT. Particularly, managers (organisational requirement) can perform a cost-benefit analysis (general IT strategy) for general IT and realise that appropriate IT for RL can mitigate the high-cost barrier in RL.

Additionally, through the strategic improvement of existing IT for RL, continuous development of IT (general IT strategies) and investment (economic requirement), *economic benefits* and *economic performance* improvements can be realised. Consequently, general IT can lead to *cost effectiveness* in RL, reemphasising the importance of IT in addressing economic barriers in RL.

Furthermore, *cost savings* (e.g. savings in labour, information management, operational and other hidden costs) can be realised through the strategic implementation and appropriate use of capable IT (strategy) and IT investment (economic requirement). Finally, strategic development and use of integrative and compatible IT (strategy) and investment (economic requirement) can improve *profitability*, demonstrating the importance of performing a cost-benefit analysis for general IT.

6.3.1.2.2 Operational outcomes of general IT practices in RL

The operational outcomes of general IT include (1) addressing operational barriers in RL, (2) improving forecasting, visibility and tracking, (3) addressing IT barriers in RL, (4) facilitating and support RL processes and activities, (5) increasing RL process efficiency and effectiveness, (6) increasing operational efficiency and flexibility, (7) facilitating operational planning and inventory management, and (8) simplifying RL transactions.

Like addressing the economic barriers in RL, general IT can *address* the *operational barriers* in RL, which include limited forecasting and visibility, uncertainties in product returns, lack of IT systems and lack of appropriate infrastructure (developmental barriers) in RL. Specifically, operational barriers can be addressed through the (1) strategic implementation and use of state-of-the-art IT, (2) implementation and use of real-time, and responsive IT (strategies), (3) investment in IT (economic requirement) and (4) 3PRL providers (SC requirement).

Subsequently, prioritising general IT, adapting current IT for RL, implementing and appropriately using efficient state-of-the-art IT (strategies) and investment in IT (economic requirement), can *improve forecasting*, *visibility* and *tracking* of consumer product returns. Additionally, *IT barriers*, like a lack of appropriate IT systems for RL (see section 2.3.2), can be *addressed* through (1) the strategic development and use of integrative and compatible IT, (2) the strategic implementation and appropriate use of state-of-the-art IT (strategies), (3) investment in IT (economic requirement), and (5) SC collaboration, 3PL and software providers (SC requirements).

In addition to overcoming operational barriers, general IT practices, including the (1) general IT strategies of developing an IT infrastructure for RL, matching IT with resources, developing and using integrative and compatible IT, implementing efficient IT, (2) organisational requirements of involving management and IT staff, and (3) SC requirement of SCI, can *facilitate and support RL processes*. Specific RL processes and activities that can be facilitated by general IT include collection, gatekeeping, returns processing, inspection, sorting, disposition and reselling activities, emphasising the important role of IT in managing consumer returns.

Additionally, *RL process efficiency* and *effectiveness* can be increased through the general IT strategies of considering compatibility of IT with SC partners, developing and using integrative and compatible IT, redesigning or expanding existing IT and developing an IT infrastructure for RL, and the organisational requirements of management and IT staff involvement. Additionally, *flexibility* and *operational efficiency* can be *increased* through the strategic implementation and appropriate use of responsive IT for RL.

Moreover, general IT practices, like the SC requirement of 3PRL provider IT systems, can *facilitate operational planning* and *inventory management* in RL, demonstrating the value of combining IT and outsourcing practices to manage consumer returns. Finally, the strategic development of IT capabilities can *simplify RL transactions* by avoiding manual and paper-based transactions.

6.3.1.2.3 Organisational outcomes of general IT practices in RL

Several organisational outcomes associate with general IT practices in RL, including (1) addressing organisational barriers, (2) facilitating RL design, implementation and innovation, (3) improving RL capabilities and competencies, (4) successful and flexible RL program, (5) enhancing RL performance, (6) facilitating and supporting RLM, (7) facilitating decision-making and information management, (8) facilitating CFI and information sharing, and (9) facilitating facility/location practices.

Organisations can *address organisational barriers,* like resistance to change and lack to management support and attention to RL (see section 2.3.3), by prioritising general IT (strategy). Furthermore, the strategic implementation and appropriate use of capable IT systems and adapting an existing IT for RL (general IT strategies) can *facilitate RL design, implementation* and *innovation.* Additionally, organisations can *improve RL capabilities* and *competencies* through the strategic development and utilisation of IT competencies (general IT strategy), IT investment (economic requirement) and SC collaboration (SC requirement). Subsequently, through the strategic implementation and appropriate use of state-of-the-art and capable IT (general IT strategy), organisations can establish a *successful* and *flexible RL program,* emphasising the operational outcome of flexibility (see section 6.3.1.2.2).

Furthermore, *RL performance* can be *enhanced* through the general IT strategies of considering system compatibility with SC partners and developing and using integrated and compatible IT solutions, and the economic requirement of IT investment. Similarly, general IT practices, including (1) continuous development and improvement of IT for RL, (2) strategic development and use of IT capabilities and competencies, (3) strategic development and use integrated and compatible IT, (4) strategic development and use of IT with information management capability, (5) strategic implementation and appropriate use of state-of-the-art IT (general IT strategies), (6) management involvement (organisational requirement), and (7) 3PL providers (SC requirement), can *facilitate* and *support RLM.*

Additionally, general IT practices, including the strategic implementation and appropriate use of IT for RL, can *facilitate decision-making* (such as disposition decisions) and *information management* in RL, emphasising the role of general IT in supporting RL processes and enhancing visibility and tracking of product returns. Likewise, *cross-functional integration* (CFI) and internal *information sharing* can be facilitated by developing IT capabilities and appropriately using IT for RL (general IT strategies), showing a link between general IT and integration practices in RL.

Finally, general IT can *facilitate facility/location practices* in RL, including network control, separate facility/location practices, integrated facility/location practices and centralisation practices (see section 6.8), which demonstrate the impact of general IT practices on the successful implementation of other RL practices to manage consumer returns.

6.3.1.2.4 Environmental and social outcomes of general IT practices in RL

Although green logistics and waste management practices falls outside the scope of this study, any benefits associated with the RL practices of consumer returns will be included in the findings.

Evidently, general IT involves *environmental outcomes* that include environmental benefits and environmental protection. Specifically, the general IT strategies of redesigning, improving and expanding existing IT and continuously developing IT for RL can bring e*nvironmental benefits* and enable *environmental protection*, demonstrating the role of IT in the environmental drivers of RLM (see section 2.3.2.2).

The *social outcome* of IT involves *social responsibility* that can be *enhanced* through the general IT strategy of redesigning, improving and expanding existing IT for RL. Evidently, like the role of IT in the environmental drivers, IT can associate with corporate social responsibility (CSR) drivers in RL (e.g. pressures from consumers to adopt sustainable business practices like RL) (see section 2.3.2.2).

6.3.1.2.5 Market-related outcomes of general IT practices in RL

The market-related outcomes of general IT include (1) a competitive advantage, (2) meeting consumer demands/needs, (3) improving consumer satisfaction, service and retention, and (4) enabling consumer information sharing and consumer relationship management (CRM). Specifically, general IT practices in RL, including matching IT with organisational resources (general IT strategy), can help organisations to obtain a *competitive advantage* in RL. Additionally, organisations can *meet consumer needs/demands* by strategically implementing and appropriately using IT for RL.

Subsequently, organisations can *improve consumer satisfaction, service* and *retention* by not only implementing and appropriately using IT (general IT strategy), but also by investing in IT for RL (economic requirement), emphasising the operational outcome of improving RL process efficiency and effectiveness (see section 6.3.1.2.2). Finally, the strategic implementation and appropriate use of capable IT for RL (general IT strategy) *enables consumer information sharing* and *CRM*, showing the importance of general IT practices for successful consumer integration (CI) in RL (discussed in section 6.4.2)

6.3.1.2.6 SC outcomes of general IT practices in RL

The SC outcomes of general IT include (1) improving SCM, (2) facilitating SCI, coordination and collaboration, (3) improving information sharing and communication, and (4) improving SC visibility and transparency. Particularly, organisations can *improve SCM* through the strategic development and implementation of new or existing IT infrastructure for RL (general IT strategy) and the IT of a 4PL provider (SC requirement).

Furthermore, general IT practices, including the strategic implementation and appropriate use of IT for RL, can *facilitate SCI, coordination* and *collaboration.* Evidently, general IT practices in RL not only require SCI (see section 6.3.1.1.2) but also facilitate with the successful implementation of SCI, demonstrating that general IT practices can address SC barriers in RL (see section 2.3.4). Additionally, like the organisational outcome of internal information sharing (section 6.3.1.2.3) and the market-related outcome of consumer information sharing (section 6.3.1.2.5), general IT practices can *improve SC information sharing* and *communication,* which can further contribute to effective SCM and SCI in RL.

Finally, through the strategic development and implementation of new/existing IT infrastructure for RL (general IT strategy), IT investment (economic requirement) and 3PRL providers (SC requirement) organisations can improve *SC visibility* and *transparency,* which emphasise the operational outcomes of improved forecasting, visibility and tracking of consumer returns (see section 6.3.1.2.2).

Essentially, general IT practices can be important for addressing several barriers in RL, including economic, operational, organisational and SC barriers (see section 2.3), and providing various economic, operational, organisational, environmental, social, market-related and SC benefits in RL, contributing to the effective RLM of consumer returns.

In the next section, a description and conceptual framework of general IT practices in RL will be presented and analysed.

6.3.1.3 Description and conceptual framework of general IT practices to manage consumer returns

Based on the findings, presented in section 6.3.1, general IT practices can be important for the management of consumer returns, and will be described as follows:

> General IT practices for the management of consumer returns involve (1) general IT strategies, including prioritising general IT practices, strategic considerations, strategic redesign, improvement and expansion of existing IT for RL, continuous development of IT, strategic development and implementation of a new/current IT infrastructure, strategic matching and combining IT with resources, strategic development and utilisation of IT competency and capabilities, strategic development and use of integrative and compatible IT, strategic development and use of IT with information management capability, performing a cost-benefit analysis, strategic implementation and appropriate use of state-of-the-art and capable IT for RL, and implementing efficient and effective, real-time and responsive IT and (2) general IT requirements, including economic requirements (investment and costs), organisational requirements (management and IT staff involvement and staff training), and SC requirements (SCI, collaboration, and 3(R)PL, 4PL and software providers).
>
> The general IT strategies and requirements can result in several outcomes, including (1) economic outcomes (address economic barriers, economic benefits and performance, cost effectiveness and savings, and profitability), (2) operational outcomes (address operational barriers, improve forecasting, visibility and

tracking, address IT barriers, facilitate and support RL processes, increase RL process efficiency and effectiveness, operational efficiency and flexibility, facilitate operational planning and inventory management, and simplify transactions), (3) organisational outcomes (address organisational barriers, facilitate RL design, implementation and innovation, improve RL capabilities and competencies, facilitate successful and flexible RL program, enhance RL performance, facilitate and support RLM, facilitate decision-making and information management, facilitate CFI and information sharing, and facilitate facility/location practices), (4) environmental and social outcomes (environmental benefits and protection, and enhance social responsibility), (5) market-related outcomes (competitive advantage, meet consumer needs/demands, increase consumer satisfaction, service and retention, and facilitate consumer information sharing and CRM), and (6) SC outcomes (improve SCM, facilitate SCI, coordination and collaboration, and improve SC information sharing, communication and visibility).

Figure 6.5 provides a conceptual framework of general IT, which includes the general IT strategies, requirements and outcomes to manage consumer returns.

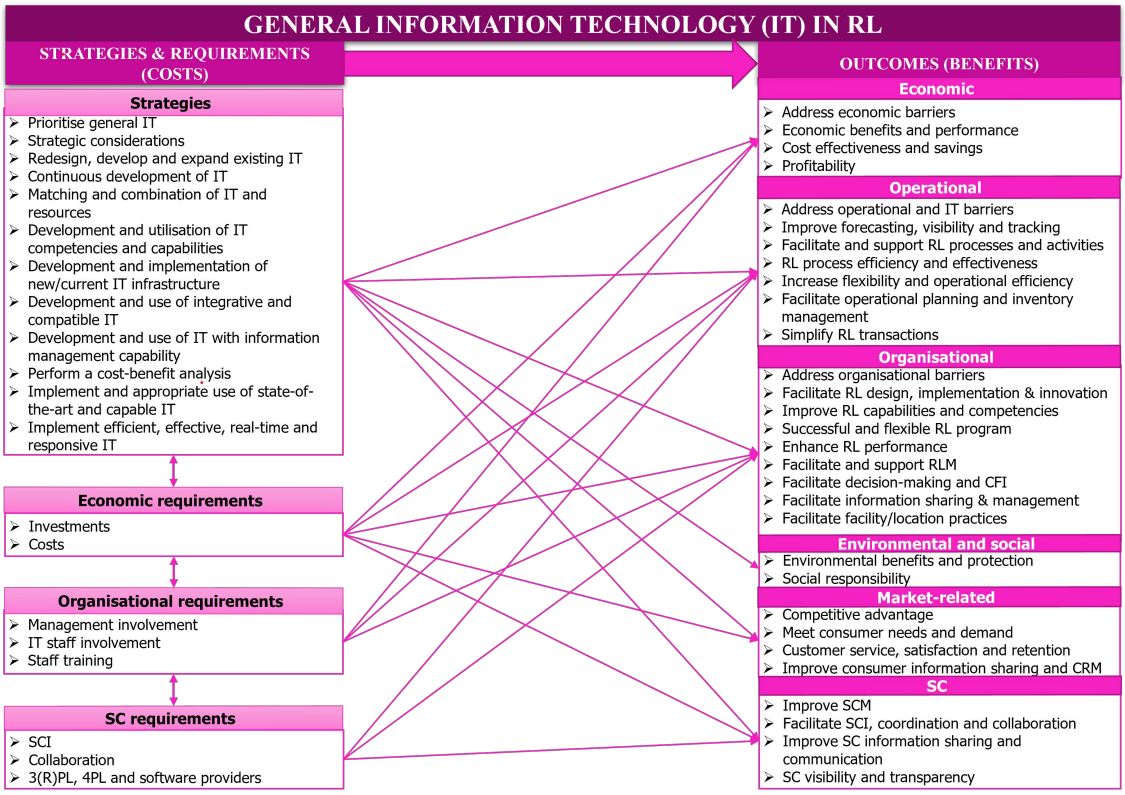

Figure 6.5 Conceptual framework of general IT practices to manage consumer returns
Source: Compiled by researcher

Figure 6.5 illustrates the links between the strategies, requirements and outcomes of general IT practices in RL, demonstrating a cost and benefit relationship. For example, the organisational requirements of management involvement can link with costs (economic requirement), performing a cost-benefit analysis, redesign and expansion of current IT systems and development and implementation of IT infrastructures (strategies), and the SC requirements of SCI and collaboration links with the strategic considerations and development of integrative and compatible IT.

Regarding the links between the strategies, requirements and outcomes of general IT, the framework demonstrates that general IT strategies can be the most significant practice category, linking with all

the general IT outcomes, including economic, operational, organisational, environmental, social, market-related and SC outcomes. Therefore, organisations must pay attention to the general IT strategies to achieve optimum results for the management of consumer returns. From the general IT requirements, the economic requirements (especially investment) contribute to all the outcomes, except for the environmental and social outcomes, emphasising the importance of performing a cost-benefit analysis for general IT practices and outcomes.

In terms of the outcomes, operational and organisational outcomes can be the most significant outcomes (associated with most of the practice categories), which means that general IT practices can be the most beneficial for organisations that experience operational and organisational challenges or problems in the RL process. The environmental and social outcomes can be the least significant outcomes, meaning that general IT practices may be less important for organisations that seek environmental and social benefits through RL practices. Nonetheless, all the outcomes of general IT practices provide important benefits to manage consumer returns, and therefore, can be considered as viable practices to manage consumer returns effectively.

In the next section, Internet and web-based technologies as IT practices in RL will be presented and explored.

6.3.2 Internet and web-based IT practices to manage consumer returns

Internet and web-based IT can be described as the most used IT used for RL (Olorunniwo & Li, 2010:457; Olorunniwo & Li, 2011:7), demonstrating the potential value of Internet and web-based IT to manage consumer returns. Despite this, limited RL literature from the QCA discussed Internet and web-based IT practices (see Figure 6.4), indicating a gap in RL literature. Nevertheless, like general IT practices, Internet and web-based IT practices include strategies, requirements and outcomes, which will be presented and discussed in the rest of this section. Table 6.3 provides an overview of the findings related to the *Internet* and *web-based IT* practices to manage consumer returns, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Source: Compiled by the researcher

Table 6.3 shows that Internet and web-based IT practices involve several strategies, requirements and outcomes, which will be discussed and concluded with a description and conceptual framework.

6.3.2.1 Strategies and requirements of Internet and web-based IT practices in RL

Internet and web-based IT practices in RL involve several *strategies*, including (1) a strategic approach, (2) strategic development of online return capabilities, (3) strategic development, testing and implementation of web-based systems and applications, (4) strategic integration of web-based IT with existing IT infrastructure, (5) strategic integration of Internet and web-based IT with other IT, (6) strategic development, testing and implementation of a collaborative web-based IT, (7) strategic integration of web-based IT with SC IT, (8) strategic implementation and utilisation of the Internet and website for RL, and (9) strategic utilisation of Internet and web-based network and linkages.

For the effective implementation of Internet and web-based IT in RL, organisations need to adopt a *strategic web-based approach*, which can guide the development and implementation of Internet and web-based IT strategies for RL. Additionally, organisations must *strategically develop online return capabilities*, which may contribute to IT and other intangible resources as a competitive differentiator in RL.

Accordingly, organisations can *strategically develop, test* and *implement web-based systems and applications* for RL and *integrate* the *web-based IT* with the *existing IT structure.* Additionally, organisations can *strategically integrate the Internet and web-based IT* with other *IT* for RL, for example, Internet-based EDI, ERP or RFID or a web-based RLIT (also see sections 6.3.3, 6.3.4 and 6.3.3). Nevertheless, like general IT practices (see section 6.3.1), the IT used by SC parties can be important for an effective reverse supply chain (RSC).

Consequently, organisations may benefit from the *strategic development, testing and implementation of a collaborative web-based IT* for RL, which can involve the *strategic integration of the web-based IT* of the organisation with the *IT* of SC parties. Therefore, like general IT, Internet and web-based IT demonstrates the important link between IT practices and SCI practices to manage consumer returns.

Additional Internet and web-based IT strategies can include the *strategic implementation and utilisation* of the *Internet* and *website* for RL, which can be important for organisations (like online retailers) that use the web and Internet to sell products online to manage consumer returns. Furthermore, organisations can *strategically implement* and *utilise Internet* and *web-based IT*

networks and *linkages*, which can include the Internet of Things (IoT) and computer networks that share information and communicate across devices utilising the Internet.

The *requirements* of Internet and web-based IT practices in RL include economic and market-related requirements. The *economic requirements* of Internet and web-based IT involve *investment* and *costs* including, capital costs (e.g. costs of developing, testing and implementing a web-based IT) and operational costs (e.g. maintenance of servers, software upgrade costs and break-down or repair costs), implying that a cost-benefit analysis may be important for Internet and web-based IT. Finally, the *market-related requirement* of Internet and web-based IT involves *return information from consumers*, which means that consumers must cooperate and provide information on the return reason (e.g. defective and damaged product) through the web-based system.

In the next section, the outcomes of Internet and web-based IT practices will be discussed.

6.3.2.2 Outcomes of Internet and web-based IT practices in RL

The outcomes of Internet and web-based IT practices include (1) economic outcomes, (2) operational outcomes, (3) organisational outcomes, (4) market-related outcomes, and (5) SC outcomes.

The *economic outcomes* of Internet and web-based IT practices include addressing economic barriers, reducing costs and asset requirements. Since the Internet can be utilised for various business processes, organisations can *address economic barriers* in RL by avoiding high costs of developing, implementing and using special/new technologies for RL. Consequently, utilising the Internet can avoid additional training costs and software and hardware investments, reducing economic risks in RL.

Additionally, organisations *can reduce RL costs* (such as transport cost) through the Internet and web-based strategies of developing online capabilities and implementing and utilising a website for RL. Evidently, organisations, like online retailers, that sell products online can use existing software and capabilities for RL and reduce RL costs. Furthermore, organisations can *reduce asset requirements* through the strategic integration of Internet and web-based IT with other IT (such EDI and ERP) and strategic implementation and utilisation of the Internet for RL, emphasising reduction in investment requirements.

Numerous *operational outcomes* can be realised through Internet and web-based IT, including (1) addressing operational barriers, (2) facilitating forecasting, visibility and product return tracking, (3)

addressing problems with product quality, (4) addressing IT and infrastructure barriers, (5) reducing operational errors and inconsistencies, (6) improving RL process speed, flexibility and efficiency, and (6) facilitating RL processes. Like general IT (section 6.3.1.2), Internet and web-based IT strategies, including adopting a strategic web-based approach and implementing and utilising IT for RL, can address operational barriers in RL (see section 2.3.2).

Accordingly, Internet and web-based IT practices, including the strategies of (1) adopting a strategic web-based approach, (2) developing, testing and implementing web-based applications for RL, (3) integrating Internet and web-based IT with other IT (such as RFID), and (4) implementing and utilising the Internet and website for RL, can *facilitate forecasting, visibility* and *product return tracking.* Additionally, *product return quality problems* and *IT* and *infrastructure barriers* (developmental barriers) (section 2.3.2) can be *addressed* through the Internet and web-based strategies of adopting a strategic web-based approach and implementing and utilising IT for RL. Similarly, organisations can *reduce operational errors* and *inconsistencies* through the strategic implementation and utilisation of the Internet for RL, demonstrating that Internet and web-based practices can be critical for organisations that experience operational challenges in RL.

Several Internet and web-based practices can *improve RL process speed, flexibility* and *efficiency*, including (1) strategic development of online return capabilities, (2) strategic implementation and use of the Internet and website for RL, (3) strategic development and use of Internet and web-based networks and linkages, and (4) return information from consumers (market-related requirement). Ultimately, Internet and web-based strategies, like using the Internet and website for RL, and using Internet and web-based networks and linkages (e.g. IoT), can *facilitate RL processes,* including (1) a customer return request or gatekeeping for capturing the return reason and other related information, (2) collection and transportation for scheduling pick-ups and tracking shipments, (3) returns processing (such as issuing credits/refund), (4) inspection and sorting, and (5) disposition.

In contrast to the operational outcomes, limited *organisational outcomes* associate with Internet and web-based IT practices. Nevertheless, organisations can *improve RL performance*, *RLM* and *information management* through the strategic implementation and use of the Internet and website for RL, demonstrating an advantage to online retailers that can use existing websites to effectively manage consumer returns.

The *market-related outcomes* of Internet and web-based IT practices include (1) enhancing consumer satisfaction and convenience, (2) meeting consumer needs, and (3) facilitating consumer information

sharing and communication. Specifically, organisations can *enhance consumer satisfaction* and *convenience* by developing online return capabilities and implementing and using websites for RL (strategies), reemphasising the importance of Internet and web-based practices for online retailers. Additionally, the Internet can be utilised to capture consumer information, allowing organisations to incorporate changes (if necessary) to *meet consumer needs.* Similarly, utilising the Internet and website for RL and developing and using Internet and web-based network linkages can *facilitate consumer information sharing* (e.g. sharing return policies and procedures) and *communication* (e.g. keeping consumers informed on product return status).

Finally, Internet and web-based practices associate with several *SC outcomes*, including facilitating SCM, SCI and collaboration, SC information sharing and communication, and improving SC visibility. Specifically, *SCM* can be *facilitated* through the Internet and web-based strategy of developing and using Internet and web-based networks and linkages (such as using IoT and e-business IT) for RL. Additionally, several Internet and web-based practices can *facilitate SCI* and *collaboration,* including the (1) strategic development, testing and implementation of web-based IT, (2) strategic development, testing and implementation of a collaborative web-based IT, (3) strategic integration of web-based IT with SC IT, (4) strategic development and use of Internet and web-based networks and linkages, and (5) economic requirements of investment and costs.

Subsequently, Internet and web-based strategies, including the development, testing and implementation of web-based IT and implementation and utilisation of the Internet for RL, can *facilitate SC information sharing* and *communication.* Lastly, several Internet and web-based strategies can *improve SC visibility*, including (1) developing, testing and implementing web-based IT, (2) integrating Internet and web-based IT with other IT (e.g. RFID), (3) developing, testing and implementing a collaborative web-based IT system, and (4) developing and using Internet and web-based networks and linkages (such as IoT).

Essentially, Internet and web-based IT practices can be important for the management of consumer returns, providing several economic, operational, organisational, market-related and SC benefits. In the next section, a description and conceptual framework of Internet and web-based IT practices in RL will be presented and analysed.

6.3.2.3 Description and conceptual framework of Internet and web-based practices to manage consumer returns

Based on the findings presented in section 6.3.2, Internet and web-based IT practices can be important for the management of consumer returns, and will be described as follows:

> Internet and web-based practices the management of consumer returns involve (1) strategies that include a strategic approach, development of online return capabilities, development, testing and implementation of web-based systems and applications, integration of web-based IT with existing IT infrastructure, integration of Internet and web-based IT with other IT, development, testing and implementation of a collaborative web-based IT, integration of web-based IT with SC IT, implementation and utilisation of the Internet and website for RL, and utilisation of Internet and web-based network and linkages, and (2) requirements that include economic requirements (investment and costs), and a market-related requirement (return information from consumers). The Internet and web-based IT strategies and requirements can result in several outcomes, including (1) economic outcomes (address economic barriers, reduce costs and asset requirements), (2) operational outcomes (address operational barriers, improve forecasting, visibility and tracking, address product return quality problems, address IT and infrastructure barriers, reduce operational errors and inconsistencies, improve RL process speed, flexibility and efficiency, and facilitate RL processes), (3) organisational outcomes (improve RL performance, RLM and information management), (4) market-related outcomes (enhance consumer satisfaction and convenience, meet consumer needs/demands and facilitate consumer information sharing and communication), and (5) SC outcomes (facilitate SCM, SCI, collaboration, SC information sharing and communication, and improve SC visibility).

Based on the findings, Figure 6.6 provides a conceptual framework for Internet and web-based IT to manage consumer returns.

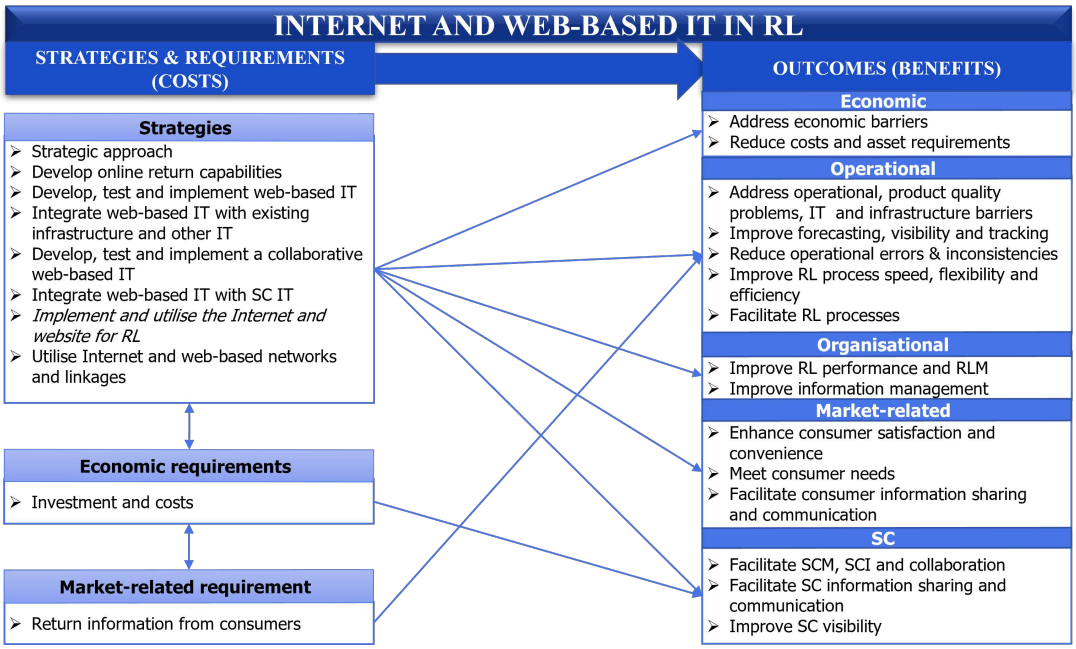

Figure 6.6 Conceptual framework for Internet and web-based IT practices to manage consumer returns
Source: Compiled by the researcher

Figure 6.6 illustrates the links between the strategies, requirements and outcomes of Internet and web-based IT practices in RL, demonstrating a strategy, cost and benefit relationship. For example, the economic requirements of investment and costs links with the development, testing and

implementation of web-based systems for RL and the market-related requirement of return information from consumers link with implementing and utilising the Internet and website for RL, linking the requirements and strategies of Internet and web-based IT.

In terms of the links between the strategies, requirements and outcomes, the framework demonstrates that Internet and web-based IT strategies, can be the most significant practice category, linking with all the outcomes, including economic, operational, organisational, market-related and SC outcomes. Specifically, implementing and using the Internet and website for RL (emphasised through italics) can be the most important Internet and web-based IT strategy, contributing to all the outcome categories. Evidently, organisations can achieve various benefits in RL by utilising the Internet and website for managing consumer returns.

In contrast, Internet and web-based requirements, including economic and market-related requirements, associate with limited outcomes, implying that investment, costs and return information from consumers may be less important. Nevertheless, as mentioned above, the requirements link with the strategies, and can, therefore, contribute indirectly to several outcomes.

In terms of the outcomes, operational and SC outcomes can be the most significant (associated with the most practice categories), which means that Internet and web-based practices can be the most beneficial for organisations that experience operational and SC challenges or problems in RL. The other outcomes, namely economic, organisational and market-related outcomes, associate only with the Internet and web-based strategies, implying that Internet and web-based practices may be less important for organisations that seek economic, organisational and market-related benefits through RL practices. Nonetheless, all the outcomes of Internet and web-based practices provide important benefits to manage consumer returns, and therefore, can be considered as viable practices to manage consumer returns effectively.

In the next section, traditional logistics IT practices in RL will be presented and explored.

6.3.3 Traditional logistics IT (TLIT) practices to manage consumer returns

Although TLIT systems focus on managing forward logistics processes, RL literature (in the QCA) suggests that traditional solutions, like EDI, ERP and WMS (most cited TLIT systems), can be used for RL, offering various benefits to manage consumer returns. Evidently, like other IT practices, the categories associated with TLIT include strategies, requirements and outcomes, which will be

discussed in subsequent sections, and concluded with a description and conceptual framework for TLIT practices to manage consumer returns.

6.3.3.1 Strategies and requirements of TLIT practices

TLIT practices include general strategies and requirements, including economic, operational, organisational, market-related and supply chain requirements. Table 6.4 provides an overview of the findings related to the *strategies and requirements of TLIT* practices to manage consumer returns, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.4 Findings related to the strategies and requirements of TLIT practices to manage consumer returns

Operational requirements	***High transaction volume***	None	• *"EDI […] is viable only in […] which the volume of transaction is very high."* (Olorunniwo & Li, 2011:5)
	Computer hardware	None	• *"A warehouse management system […] requires […] the computer […]."* (De Leeuw *et al.* 2016:723)
Organisational requirements	***Management involvement***	None	• *"Managers need to keep track of shipments and receipts that flow […] Warehouse management software now keeps track of the type of goods […]."* (Jayaraman *et al.* 2008:420) • *"[…] using […] EDI, […] Logistics managers should give top priority to ICT related issues in reverse logistics programs."* (Ravi & Shankar, 2015:890)
	IT staff involvement	None	• *"Computer experts in charge […] attending the related ERP systems."* (Hernández *et al.* 2011:84)
	Staff training	None	• *"EDI […] requiring […], training of manpower on […] requires heavy degree of investment from companies."* (Ravi & Shankar, 2015:885)
	Manual/staff input	None	• *"A warehouse management system […] requires checking something with the hands, and manual data input […]."* (De Leeuw *et al.* 2016:723)
Market-related requirement	***Consumer input***	None	• *"Consumers […] enter data manually and the ERP then recognises that inventory […]."* (Jayaraman *et al.* 2008:419)
Supply chain (SC) requirements	***SC relationships***	None	• *"EDI […] can be interpreted only by the information systems of organizations [sic] which are in some form of relationships […]."* (Olorunniwo & Li, 2011:5)
	TLIT suppliers	None	• *"ERP suppliers indicated […] increasing use of installed base management […]."* (Janse *et al.* 2010:503)

Source: Compiled by the researcher

Table 6.4 indicates that TLIT practices involve several strategies and requirements, which will be discussed in subsequent sections.

6.3.3.1.1 Strategies of TLIT practices in RL

TLIT practices in RL involve several strategies, including (1) prioritising TLIT, (2) strategic integration and customisation of TLIT systems, (3) strategic integration and customisation of TLIT and other IT, (4) strategic development, implementation and utilisation of an electronic data interchange (EDI) for RL, (5) strategic development, redesign and utilisation of an existing enterprise resource planning (ERP) system for RL, (6) strategic development, customisation and utilisation of a

warehouse management system (WMS) for RL, (7) strategic utilisation of a transport management system (TMS) for RL, (8) strategic utilisation of logistics information management systems (LIMS) for RL, (9) strategic utilisation of point-of-sale (POS) and ordering systems for RL, (10) strategic implementation of a customer relationship management (CRM) system for RL, (11) strategic development, redesign and utilisation of an existing advanced planning and scheduling (APS) system for RL, and (12) strategic utilisation of materials requirement planning (MRP) system for RL.

Like general IT (section 6.3.1), TLIT can be *prioritised* for RL, which means that organisations can choose to prioritise the development and use TLIT systems for managing consumer returns. Additionally, organisations can *strategically integrate* and *combine* different *TLIT* systems, for example, integrating ERP with TMS and combining EDI with inventory management and POS for RL. Similarly, organisations can *strategically integrate* and *combine TLIT with other IT*, like an Internet-based ERP or EDI and integrating ERP or WMS and RFID, implying that TLIT alone may lack the capability to manage consumer returns.

Nevertheless, organisations can develop, redesign and use several types of TLIT for RL. For instance, organisations can *strategically develop, implement* and *utilise EDI* for RL information sharing and management. Similarly, organisations can *strategically develop, redesign* and *utilise existing ERP* to support and manage RL processes. Furthermore, organisations can *strategically develop, customise* and *use* execution systems like traditional *WMS* and *TMS* for RL processes and activities.

Additionally, *LIMS* can be *strategically utilised* for RL to manage consumer return information and facilitate decision-making. Likewise, traditional retailing IT, like *POS* and *ordering systems*, can be *strategically utilised* for managing consumer returns, emphasising the potential of TLIT practices for the effective management of consumer returns. Additionally, organisations can *strategically implement* consumer-focussed IT like *CRM* solutions for RL, which may assist with consumer integration (CI) practices in RL (see section 6.4.2).

Finally, other traditional logistics planning systems like APS and MRP can be *strategically developed, redesigned* and *utilised* for RL support and management. Consequently, the TLIT strategies mainly involve the identification, development, integration, customisation and utilisation of TLIT systems to manage consumer returns.

6.3.3.1.2 Requirements of TLIT practices in RL

The requirements of TLIT practices in RL include economic, operational, organisational, market-related and SC requirements. The *economic requirements* of TLIT practices involve investment, financial obligation and costs. Particularly, organisations must *invest* in TLIT (such as EDI, ERP and POS) and carry *financial obligations* and *costs* for implementing and operating TLIT for RL.

The *operational requirements* of TLIT include high transaction volume and computer hardware for specific TLIT systems. For instance, a *high transaction volume* can be important to effectively utilise EDI for RL, implying that organisations with lower product return (transaction) volume may need to explore other TLIT for RL. Additionally, organisations need *computer hardware* to effectively operate a WMS for RL, emphasising the investment requirements for TLIT in RL.

The *organisational requirements* of TLIT practices include management involvement, IT staff involvement, staff training and manual/staff input. *Management involvement* can be important for (1) prioritising TLIT (such as EDI) in RL and (2) operating TLIT (such as a WMS) to manage RL processes. Additionally, *IT staff,* like computer experts, can be important for the development, redesign and maintenance of TLIT (such as ERP) for RL, emphasising the costs and financial obligations for TLIT. Likewise, *staff training* requirements for TLIT (such as EDI) demonstrates the importance of investment requirements to effectively utilise TLIT for RL. Furthermore, TLIT, like WMS, requires *manual/staff input,* demonstrating the importance of management and staff involvement in operating TLIT for RL.

Similarly, the *market-related requirement* of *consumer input* can be important for the effective utilisation of TLIT in RL. For instance, consumers must manually enter product return information, like the type of product or order number, on the system (e.g. website electronic return form), which provides the ERP with inventory-related information. The consumer input requirement demonstrates the importance of integrating TLIT with other IT, like an Internet/web-based ERP (see section 6.3.3.1.1).

Finally, the *SC requirements* of TLIT involves SC relationships and TLIT suppliers. Specifically, EDI as a TLIT requires *relationships* between organisations in the *SC,* demonstrating the importance of combining IT practices and SCI practices (see section 6.4.1) in RL. Additionally, ERP as a *TLIT* requires *suppliers,* which may be service providers that develop, redesign and maintain TLIT for organisations to manage consumer returns.

Essentially, the requirements mostly associate with specific TLIT (such as EDI, ERP and WMS), involving financial, infrastructure and human resources, and consumer and SC party relationship requirements for the effective management of consumer returns. In the next section, the outcomes of TLIT practices (strategies and requirements) will be analysed and discussed.

6.3.3.2 Outcomes of TLIT practices in RL

The outcomes of TLIT practices can be described as the results of incorporating the TLIT strategies and requirements for the effective management of consumer returns. The outcomes of TLIT practices in RL include (1) economic, (2) operational (3) organisational (4) environmental, (5) market-related and (6) SC outcomes. Table 6.5 provides an overview of the findings related to the *outcomes of TLIT* to manage consumer returns, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.5 Findings related to outcomes of TLIT practices to manage consumer returns

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
Economic outcomes	***Address economic barriers***	None	• *"Firms tend to use a variety of complex and compound information systems due to […] high switching costs (e.g., employees' limited skills and high training costs, software and hardware investments, possibilities of new installation failure, etc.). The IT types most frequently cited are […] ERP […] EDI […] and warehouse management systems (WMS) […]."* (Olorunniwo & Li, 2011:7) • *"ERP is deployed securely over the web, it […] reduces costly investment in databases."* (Jayaraman *et al.* 2008:418-419)
	Economic benefits	None	• *"Technology-enabled transport systems resulted in […] economic […] gains […]."* (Bernon &Cullen, 2007:51)
	Control RL cost	None	• *"WMS systems […] Control handling costs of returns […]."* (Lhafiane *et al.* 2015b:397)
	Profitability	None	• *"Integration of forward and reverse logistics […] through the use of integrated logistics information management system […] to improve profitability."* (Lau & Wang, 2009:459)
	Reduce asset requirements	None	• *"Implementing the […] Internet-based EDI […] requires fewer asset (infrastructure) specificities than traditional EDI […]."* (Olorunniwo & Li, 2011:5) • *"[…] Internet-based […] ERP […] requires fewer asset (infrastructure) […] than […] traditional ERP."* (Olorunniwo & Li, 2011:5)
Operational outcomes	***Improves forecasting, visibility and tracking***	None	• *"[…] improving data quality for forecasting […] related to […] ERP […]."* (Janse *et al.* 2010:503) • *"[…] MRP or ERP systems can be used to coordinate the processing and flow […] for RL, basic information such as the quantity, location, and expected arrival times […] can be relayed […]."* (Biehl *et al.* 2007:466) • *"Receiving/sending shipment notices, advanced ship notices through EDI […]."* (Cheng & Lee, 2010:1116) • *"[…] critical for success of RL […] companies have started using […] EDI […] for the purpose of tracking and tracing the returned products […]."* (Ravi & Shankar, 2015:885) • *"Managers need to keep track of shipments and receipts that flow into and out of their facility. […] Warehouse management software now keeps track of the type of goods […]."* (Jayaraman *et al.* 2008:420)
	Improve control of product returns	None	• *"To support the return process, […] WMS were extended with proprietary systems to control returns."* (Lhafiane *et al.* 2015b:397)
	Reduce manual operations	None	• *"[…] use the electronic data interchange system (EDI) […] to establish an information sharing platform […] the well configured platform, […] makes reverse logistics remain in the electronic stage […]."* (Shi *et al.* 2012:222)
	Increase RL process speed and efficiency	None	• *"[…] shorten the processing time of RL through the […] use of […] EDI […]."* (Shi *et al.* 2012:228) • *"EDI […] enhances the company's RL operation […]."* (Sharif *et al.* 2012:2522) • *"To optimise the flow of […] merchandise, retailers employ technology such as […] electronic point of sale (EPoS) […]."* (Beh *et al.* 2016:15)

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
	Facilitate and support RL processes and activities	Bernon *et al.* (2011:495)	• *"[…] to support RL […] electronic data interchange, have become more readily available in recent years."* (Huscroft *et al.* 2013a:233) • *"Consumers can now enter data manually and the ERP then recognises that inventory and sends back authorisation and item-specific labels that move the product appropriately from point-to-point in the RL recovery system."* (Jayaraman *et al.* 2008:419) • *"[…] a warehouse management system that validates if products are allowed in the reverse stream."* (De Leeuw *et al.* 2016:720) • *"A warehouse management system can help retailers organize [sic] the handling of product returns […] which requires checking something with the hands, and manual data input in the computer […]."* (De Leeuw *et al.* 2016:723) • *"Warehouse management systems can provide decision making for further recovery options […]."* (Lhafiane *et al.* 2015b:397) • *"MRP/ERP systems Support different recovery options of returns […]."* (Lhafiane *et al.* 2015b:397) • *"To properly reconcile inventory and accommodate various disposition activities, […] ERP must receive notification […] and […] track the disposition of the returned items and coordinate various activities."* (Jayaraman *et al.* 2008:418) • *"The coordination between the activities requires a management information system (MIS) […]."* (García-Rodríguez *et al.* 2013:586)
	Facilitate RL and forward logistics (FL) integration	None	• *"[…] enterprise systems also enable information sharing of forward logistics and reverse logistics […]."* (Shi *et al.* 2012:228) • *"Integration of forward and reverse logistics […] through the use of integrated logistics information management system […]."* (Lau & Wang, 2009:459)
Organisational outcomes	***Successful RL program***	None	• *"[…] for successful reverse logistics programs […] companies have heavily invested in terms of […] EDI […]."* (Ravi & Shankar, 2015:890)
	Enhance and facilitate RLM	Ravi (2014:298)	• *"[…] use technology like […] electronic data interchange (EDI) […] to enhance […] reverse logistics management."* (Vijayan *et al.* 2014:12) • *"[…] development of new design, planning and control of existing ERP and APS systems […] have tremendous potential to effectively manage return flows […]."* (Jayaraman *et al.* 2008:427)
	Facilitate decision-making	None	• *"ERP suppliers indicated to see increasing use of installed base management for strategic decision support at their customers."* (Janse *et al.* 2010:503) • *"Warehouse management systems can provide decision making for further recovery options […]."* (Lhafiane *et al.* 2015b:397) • *"[…] an expert system or knowledge management system may streamline the decision-making process."* (Hsu *et al.* 2009:525) • *"[…] advanced planning and scheduling (APS) software […] provide a support for decision making […]."* (Daaboul *et al.* 2014:7)
	Facilitate information management	None	• *"ERP system can record and provide […] data, the generation of […] data will be faster*." (Tsai & Hung, 2009:5408) • *"[…] warehouse Management (WMS) for returns […] support consistent and updated product data […]."* (Lhafiane *et al.* 2015b:397)
	Facilitate internal information sharing and communication	None	• *"[…] enterprise systems also enable information sharing of forward logistics and RL […]."* (Shi *et al.* 2012:228) • *"Warehouse management software […] provides information to forklift operators […]."* (Jayaraman *et al.* 2008:420) • *"[…] ERP systems are mainly used for […] communication […]."* (Lhafiane *et al.* 2015b:399) • *"[…] ERP is deployed securely over the web, it is available to anyone […]."* (Jayaraman *et al.* 2008:419) • *"To optimise the flow of information […] retailers employ technology such as […] electronic point of sale (EPoS), which transmit information on size, style and colour of products back to the head office."* (Beh *et al.* 2016:15)
	Facilitate cross-functional integration (CFI)	None	• *"ERP is an information system integrating all facets of an organization [sic] on a common database."* (Olorunniwo & Li, 2011:5)
	Facilitate return prevention and avoidance (RPA)	None	• *"[…] use the electronic data interchange system (EDI) […] to establish an information sharing platform […] the well configured platform, […] reduces the actual occurrence of reverse logistics […]."* (Shi *et al.* 2012:222) • *"[…] retailers could track, through their ordering systems, those customers who routinely abuse the system and put in place processes that restrict these practices."* (Bernon *et al.* 2016:599)
	Facilitate facility/ location practices	None	• *"[…] advanced planning and scheduling (APS) software […] provide a support for decision making in designing a reverse logistics network."* (Daaboul *et al.* 2014:7)
Environmental outcomes	***Environmental benefits***	None	• *"Technology-enabled transport systems resulted in […] environmental gains […]."* (Bernon &Cullen, 2007:51)
	Reduce waste	None	• *"[…] through the use of integrated logistics information management system to reduce waste […]."* (Lau & Wang, 2009:459)
	Improve environmental performance	None	• *"[…] use the electronic data interchange system (EDI) […] to establish an information sharing platform […] the well configured platform, […] reduces the actual occurrence of reverse logistics and ultimately accomplishes low-carbon technology improvement of reverse logistics […]."* (Shi *et al.* 2012:222)
Market-related outcomes	***Provide market trend information***	None	• *"[…] information for market trends of product deliveries and returns, mainly extracted from POS […]."* (Hsu *et al.* 2009:525)
	Improve consumer	None	• *"[…] combination of interactive dual direction technologies like point of sale (POS) […] EDI and*

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
	experience		*inventory management systems […] Offering an effective and easy-to-use returns procedure can give consumers the confidence to […] send back any items that fall short of their expectations."* (Hong *et al.* 2008:177)
	Reduce consumer uncertainty	Shi *et al.* (2012:222)	• *"EDI is known to help reduce uncertainty between the customer and supplier"* (Mukhopadhyay & Setaputra, 2011:5329)
	Improve consumer responsiveness	None	• *"EDI forms an interface […] responding to customer pull exerted upon the retailer […]."* (Shakantu *et al.* 2009:83)
	Facilitate consumer information sharing and communication	None	• *"[…] EDI allows better communication with its customers […]."* (Sharif *et al.* 2012:2522) • *"Consumers can now enter data manually and the ERP […] Since the host ERP is deployed securely over the web, it is available to anyone […]."* (Jayaraman *et al.* 2008:419)
SC outcomes	***Facilitate SC innovation***	None	• *"The MIS helps […] the supply chain, encouraging the continuous adaptation of companies, their products and services."* (García-Rodríguez *et al.* 2013:586)
	Successful and efficient reverse SC (RSC)	None	• *"[…] effective combination of interactive dual direction technologies like point of sale (POS) […] EDI and inventory management systems, firms may improve RSC ease of use."* (Hong *et al.* 2008:177) • *"EDI […] was identified as being key to the success of the 'backward supply chain."* (Sharif *et al.* 2012:2522)
	Facilitate SCI and coordination	None	• *"EDI […] allows the proper coordination among supply-chain participants […]."* (Sharif *et al.* 2012:2522) • *"Computer experts in charge […] support the interoperability between the main customer and the […] supplier by attending the related ERP systems."* (Hernández *et al.* 2011:84)
	Improve SC information sharing and communication	Li and Olorunniwo (2008:384)	• *"[…] EDI […] establish an information sharing platform […]."* (Shi *et al.* 2012:222) • *"Since the host ERP is deployed securely over the web, it is available to anyone […]."* (Jayaraman *et al.* 2008:419) • *"[…] MRP or ERP systems […] basic information such as the quantity, location, and expected arrival times […] can be relayed through the reverse supply chain […]."* (Biehl *et al.* 2007:466) • *"Warehouse management systems […] communication […] to other actors involved in RL network […]."* (Lhafiane *et al.* 2015b:397) • *"The MIS helps the communication and information exchange throughout the supply chain."* (García-Rodríguez *et al.* 2013:586)
	Improve SC visibility	None	• *"[…] information sharing with trading partners, use of Electronic Data Interchange (EDI) for rapid data dissemination, supply chain visibility […]."* (Shakantu *et al.* 2009:82)

Source: Compiled by the researcher

Table 6.5 shows that TLIT practices associate with economic, operational, organisational, environmental, market-related and SC outcomes, which will be discussed in subsequent sections.

6.3.3.2.1 Economic outcomes of TLIT practices for RL

The economic outcomes of TLIT practices include addressing economic barriers, economic benefits, controlling costs, profitability and reducing asset requirements. Like Internet and web-based IT (see 6.3.2), TLIT for RL can *address economic barriers* in RL by avoiding high costs, investment and financial risks of developing, implementing and using special/new technologies for RL. Consequently, through the strategic integration/combination of TLIT with other IT (ERP and web-based systems) and utilisation of TLIT (such as EDI, ERP and WMS) for RL, organisations can avoid additional costs and investments for training, software and hardware.

Furthermore, TLIT strategies related to the strategic utilisation of (1) a TMS for RL can bring *economic benefits* (e.g. better route planning can save costs), (2) a WMS for RL can *control RL cost* and, (3) a LIMS can improve *profitability*, which can associate with the operational outcomes of

controlling product returns and integrating RL and FL processes (section 6.3.3.2.2). Finally, through the strategic integration and combination of TLIT with other IT for RL (such as Internet-based ERP or EDI) *asset requirements* can be *reduced,* emphasising a reduction in investment requirements for RL.

Essentially, although TLIT involves investment and cost requirements (see section 6.3.3.1), organisations can avoid higher investments and costs of new or specialised IT for RL, demonstrating the importance of performing a cost-benefit analysis for IT practices in RL.

6.3.3.2.2 Operational outcomes of TLIT practices for RL

The operational outcomes of TLIT include (1) improving forecasting, visibility and tracking, (2) improving control of product returns, (3) reducing manual operations, (4) increasing RL process speed and efficiency, (5) facilitating and support RL processes and activities, and (6) facilitating RL and FL integration. Like general and Internet/web-based IT, organisations can *improve forecasting, visibility* and *tracking* through several TLIT practices. For instance, through the strategic development and utilisation of ERP and/or MRP systems, organisations can improve product return forecasting and enhance visibility. Additionally, through the strategic utilisation of EDI, organisations can enhance product return visibility and improve returned product tracking.

Similarly, through the strategic utilisation of a WMS and management involvement (organisational requirement), organisations can track product returns in and out of the facility. Moreover, utilising a WMS for RL can *improve control* of *product returns,* emphasising the economic outcome of improving control of RL costs (section 6.3.3.2.1). Evidently, TLIT practices can address the operational barriers in RL related to a lack of forecasting and visibility, and product return uncertainties and in RL processes (see section 2.3.2).

Organisations can *reduce manual operations* in RL through the strategic utilisation of EDI for RL by keeping unnecessary manual RL processes (such as return request, gatekeeping and processing) in an electronic format. Consequently, strategically utilising TLIT, like EDI and POS, for RL can *increase RL process speed* and *efficiency.*

Several TLIT practices can *facilitate* and *support RL processes* and *activities,* including the (1) TLIT strategies associated with the strategic utilisation of EDI, ERP, WMS, LIMS and MRP for RL, (2) operational requirement of computer hardware, (3) organisational requirement of staff/manual input, and (4) market-related requirement of consumer input. Particularly, return information input by

consumers and utilising ERP for RL can facilitate return request and gatekeeping (return authorisation) processes in RL. Similarly, utilising a WMS (with a computer and staff/manual input) for RL can help with gatekeeping and product return validation (e.g. the return information from consumer input match the actual condition of the returned product) during inspection/sorting (see section 5.5).

Furthermore, utilising ERP, WMS and MRP systems for RL can facilitate disposition processes and activities through decision-making, product tracking and information support. Moreover, utilising ERP and LIMS for RL can coordinate RL activities and *facilitate RL* and *FL integration*, which demonstrates the role of TLIT in facility and location practices (e.g. combined facilities for RL and FL) (see section 6.8.3).

6.3.3.2.3 Organisational outcomes of TLIT practices for RL

The organisational outcomes of TLIT practices in RL include (1) a successful RL program, (2) enhancing and facilitating RLM, (3) facilitating decision-making, (4) facilitating information management, (5) facilitating internal information sharing and communication, and (6) facilitating CFI, RPA and facility/location practices. Particularly, organisations can establish a *successful RL program* through the strategic utilisation of EDI for RL and investment (economic) requirements. Additionally, *RLM* can be *enhanced* and *facilitated* through the strategic utilisation of EDI and development, redesign and utilisation of ERP and APS for RL, demonstrating the importance of TLIT practices to manage consumer returns.

Several TLIT practices, including the TLIT strategies of utilising ERP, WMS, LIMS and APS for RL and the SC requirement of ERP suppliers, can *facilitate decision-making* in RL. Moreover, utilising ERP and WMS for RL can *facilitate information management* in RL, for example, ERP can record and provide product return data and a WMS can update product return data. Additionally, strategically combining TLIT with other IT (e.g. ERP and web-based systems) and utilising ERP, WMS and POS for RL, can *facilitate internal information sharing* and *communication.* For example, a WMS can communicate the disposition option of the returned product (e.g. return to inventory) to operational staff (in the warehouse), and the POS can communicate information about the returned product to different departments (e.g. head office) in the organisation.

Subsequently, utilising TLIT (such as an ERP) for RL can *facilitate CFI*, establishing a link between TLIT and CFI practices to manage consumer returns. Additionally, the TLIT strategies of utilising EDI and ordering systems for RL can *facilitate* with *RPA practices.* For example, utilising the order

system for RL can help retailers to identify return abusers (e.g. consumers that return products with every order) and implement preventative measures (e.g. closing return abuser accounts) (see section 6.9.3). Finally, strategically utilising APS for RL can *facilitate facility/location practices* related to designing RL networks, confirming the link between TLIT practices and facility/location practices in RL (section 6.3.3.2.2).

6.3.3.2.4 Environmental and market-related outcomes of TLIT practices for RL

Like general IT (section 6.3.1.2), TLIT practices involve *environmental outcomes* that associate with environmental benefits, waste reduction and environmental performance. Specifically, strategically utilising TMS for RL can bring e*nvironmental benefits,* which may associate with reducing return transportation by coordinating FL and RL transportation. Similarly, strategically utilising LIMS for RL enables RL and FL integration, which can *reduce waste.* Lastly, strategically utilising EDI for RL can *improve environmental performance,* which associates with the organisational outcome of facilitating RPA practices by reducing product returns (section 6.3.3.2.3).

The *market-related outcomes* of TLIT practices include (1) providing market trend information, (2) improving consumer experience, (3) reducing consumer uncertainty, (4) improving consumer responsiveness, and (5) facilitating consumer information sharing and communication. Specifically, strategically utilising POS for RL can *provide market trend information,* which may help organisations to achieve other market-related benefits like a competitive advantage and satisfying consumer demands. Additionally, strategically combining TLIT, like POS, EDI and inventory management systems, can *improve consumer experience* through consumer-friendly RL procedures and processes (e.g. easy return request and product return status updates).

Moreover, strategically utilising EDI for RL can *reduce consumer uncertainties* in the RL process and *improve consumer responsiveness,* implying that TLIT for RL may improve consumer service and satisfaction. Finally, TLIT practices, including (1) strategically utilising EDI and ERP, (2) strategically integrating and combining TLIT with other IT (such as a web-based ERP), and (3) consumer return information input (market-related requirement), can *facilitate consumer information sharing* and *communication,* which can contribute to CI practices in RL (see section 6.4.2).

6.3.3.2.5 SC outcomes of TLIT practices for RL

Several SC outcomes associate with TLIT practices in RL, including (1) facilitating SC innovation, (2) successful and efficient RSC, (3) facilitating SCI and SC coordination, (4) improving SC

information sharing and communication, and (5) improving SC visibility. Particularly, strategically utilising TLIT, like LIMS, for RL can help organisations improve products and services in the SC (based on RL information), which in turn can *facilitate SC innovation.*

The TLIT strategies related to combining TLIT (such as ERP and POS) and utilising EDI for RL can ensure a *successful* and *efficient RSC,* demonstrating that all SC parties can benefit from utilising TLIT for RL. Furthermore, TLIT practices, like strategically utilising EDI and ERP for RL (strategies) and allocating IT staff (like computer experts) (organisational requirement), can *facilitate SCI* and *SC coordination,* which reemphasise the important link between IT and SCI practices (also see sections 6.3.1.2 and 6.3.2.2).

Accordingly, *SC information sharing* and *communication* can be *improved* through the TLIT strategies of integrating TLIT with other IT (e.g. web-based ERP) and utilising EDI, ERP, WMS, LIMS and MRP for RL, emphasising the importance of establishing SC relationships for TLIT (SC requirement) (section 6.3.3.1.2). Finally, strategically utilising TLIT, like EDI, for RL can *enhance SC visibility*, which emphasise the operational outcomes of TLIT related to product return forecasting, visibility and tracking (section 6.3.3.2.2).

Essentially, TLIT practices in RL can provide various economic, operational, organisational, environmental, market-related and SC benefits, contributing to the effective RLM of consumer returns. In the next section, a description and conceptual framework of TLIT practices in RL will be presented and analysed.

6.3.3.3 Description and conceptual framework of TLIT practices to manage consumer returns

Based on the findings, presented in section 6.3.3, TLIT practices can be important for the management of consumer returns, and will be described as follows:

> TLIT practices for the management of consumer returns involve (1) TLIT strategies, including prioritising TLIT practices, strategic integration and customisation of TLIT systems, strategic integration and customisation of TLIT and other IT, strategic development, implementation and utilisation of EDI for RL, strategic development, redesign and utilisation of an existing ERP for RL, strategic development, customisation and utilisation of a WMS for RL, strategic utilisation of a TMS, LIMS, POS and ordering systems for RL, strategic implementation of a CRM system for RL, strategic development, redesign and utilisation of an existing APS system for RL, and strategic utilisation of a MRP system for RL, and (2) TLIT requirements, including economic requirements (investment, financial obligation and costs), operational requirements (high transaction volume and computer hardware), organisational requirements (management and IT staff involvement, staff training and staff/manual input), market-related requirement (consumer information input), and SC requirements (SC relationships and TLIT suppliers).
>
> The TLIT strategies and requirements can result in several outcomes, including (1) economic outcomes (address economic barriers, economic benefits, control RL cost, profitability and reduce asset requirements), (2) operational outcomes (improve forecasting, visibility and tracking, improve product return control, reduce manual operations, increase RL process speed and efficiency, facilitate and support RL processes and activities,

and integrate RL and FL), (3) organisational outcomes (successful RL program, enhance and facilitate RLM, facilitate decision-making, information management, and internal information sharing and communication, and facilitate CFI, RPA and facilitate facility/location practices), (4) environmental outcomes (environmental benefits, reduce waste, and improve environmental performance), (5) market-related outcomes (market trend information, improve consumer experience, reduce consumer uncertainty, improve consumer responsiveness and facilitate consumer information sharing and communication), and (6) SC outcomes (facilitate SC innovation, successful and efficient RSC, facilitate SCI and coordination, and improve SC information sharing, communication and visibility).

Figure 6.7 provides a conceptual framework of TLIT practices, which includes the TLIT strategies, requirements and outcomes to manage consumer returns.

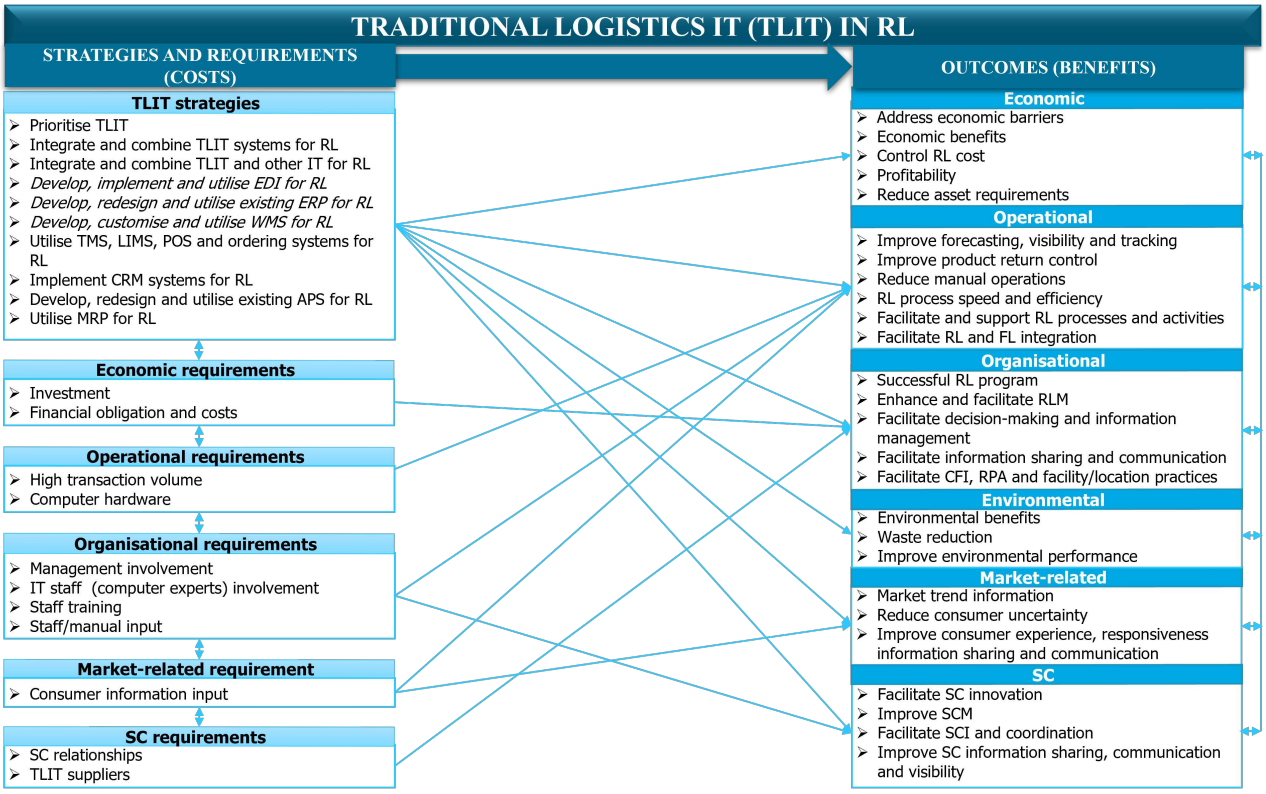

Figure 6.7 Conceptual framework of TLIT practices to manage consumer returns
Source: Compiled by researcher

Figure 6.7 illustrates the links between the strategies, requirements and outcomes of TLIT practices in RL, demonstrating a cost and benefit relationship. For example, the TLIT strategy of utilising a WMS for RL can link with investment and costs (economic requirements), computer hardware (operational requirement) and staff/manual input (organisational requirement). Similarly, the TLIT strategy of developing and utilising ERP for RL can link with consumer information input (market-related requirement) and TLIT (ERP) suppliers (SC requirement).

Regarding the links between the strategies, requirements and outcomes of TLIT, the framework demonstrates that TLIT strategies can be the most significant practice category, linking with all the TLIT outcomes, including economic, operational, organisational, environmental, market-related and

SC outcomes. In contrast, the economic, operational and SC requirements can be the least significant TLIT practice categories, contributing to limited outcomes. Nevertheless, the economic requirements of investment and costs can be important for developing and utilising TLIT for RL, contributing indirectly to all outcome categories.

In terms of the outcomes, operational outcomes can be the most significant outcome category (associated with most of the practice categories), which means that TLIT practices can be the most beneficial for organisations that experience operational challenges or problems in RL. In contrast, the environmental outcomes can be the least significant outcome category (only associated with TLIT strategies), meaning that TLIT practices may be less important for organisations that seek numerous environmental benefits through RL practices.

Finally, the framework shows that the TLIT outcome categories can be linked, for example, improving RL cost control (economic outcome) can link with improving product return control (operational outcome), and integrating RL and FL (operational outcome) can link with facilitating facility/location practices (organisational outcome). Similarly, improving forecasting, visibility and tracking (operational outcomes) can link with reducing consumer uncertainty (market-related outcome) and improving SC visibility (SC outcome).

Essentially, the links between the TLIT strategies, requirements and outcomes demonstrate the importance of a holistic approach to the management of consumer returns, meaning that organisations must carefully consider and analyse the costs (strategies and requirements) and benefits (outcomes) before implementing and using TLIT for the effective management of consumer returns.

In the next section, barcode and RFID as IT practices in RL will be presented and explored.

6.3.4 Barcode and RFID IT practices to manage consumer returns

In this section the use of barcode and radio frequency identification (RFID) information technology (hereafter barcode/RFID IT) to manage consumer returns will be explored. Like general IT practices, barcode/RFID covered 29% of the IT practices discussed in the QCA of RL literature (see Figure 6.4). Barcode/RFID IT practices can be distinguished from other IT practices (Internet/web and TLIT) using labels/tags and scanning/radio devices. However, like other IT practices, the categories associated with barcode/RFID IT practices include strategies, requirements and outcomes, which will be discussed in subsequent sections, and concluded with a description and conceptual framework to manage consumer returns.

6.3.2.1 Strategies and requirements of barcode/RFID IT practices in RL

Barcode and RFID IT practices include barcode/RFID strategies, and barcode/RFID requirements, including economic, operational, organisational, environmental market-related and supply chain requirements. Table 6.6 provides an overview of the findings related to the *strategies* and *requirements* of *barcode/RFID IT practices* to manage consumer returns, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.6 Findings related to the strategies and requirements of barcode/RFID to manage consumer returns

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
Strategies	***Develop an RFID strategy***	None	• *"The RFID strategy helps the players achieve […] coordination […]."* (Nativi & Lee, 2012:376) • *"[…] use of RFID information-sharing strategy […]."* (Nativi & Lee, 2012:373)
	Strategic considerations	Vijayan *et al.* (2014:12)	• *"Issues also have arisen with some products—such as liquids or packages with metal caps—reflecting energy and blocking the RF tag's reading […]."* (Kabir, 2013:97) • *"[…] high value, low volume goods (e.g. high-tech consumer electronics) will benefit more from RFID than those with lower value, high-volume goods (e.g. consumer products) […] the greater […] order fulfillment complexity in the warehouse (e.g. value-added services, product returns), the greater the opportunity to gain benefits from adopting RFID."* (Jayaraman *et al.* 2008:424) • *"[…] implement information technology such as RFID, careful considerations must be taken to understand the complexity […] of the system in order to attain high economic benefits."* (Nativi & Lee, 2012:373) • *"[…] retailers are also more likely to use barcodes […] and radio frequency to enhance their reverse logistics management."* (Jayaraman *et al.* 2008:414) • *"[…] the category identification of pharmaceutical products […] through RFID system […]."* (Kongar *et al.* 2015:53) • *"[…] RFID […] is beginning to deliver significant cost reductions in retailers, automotive, pharmaceutical, and personal computer supply-chain processes."* (Jayaraman *et al.* 2008:418) • *"Cost is a major consideration here, as implementing RFID is not inexpensive."* (Kumar *et al.* 2009:197) • *"[…] for RFID over Barcode. […] must be viewed in light of the acquisition, installation, training, system integration and the maintenance costs of RFID. These costs vary across industries and between specific warehousing environments."* (Jayaraman *et al.* 2008:422) • *"The benefit of using RFID is more pronounced when a distribution channel has to handle customer returns."* (Jayaraman *et al.* 2008:424)
	Perform cost-benefit analyses for barcode/RFID IT	None	• *"[…] the processing costs and labour utilisation rates […] rises for the traditional barcode technology environment. Conversely, […] labour cost, under the RFID setting, was less […] the lower labour utilisation rates suggest that there may be several hidden advantages regarding direct labour requirements for RFID over Barcode. These results, however, must be viewed in light of the acquisition, installation, training, system integration and the maintenance costs of RFID."* (Jayaraman *et al.* 2008:422) • *"The cost of implementing barcode/RFID of information system includes the cost of hardware, software, […] However, long term cost savings would be beneficial for implementation throughout the whole company."* (Lee & Lam, 2012:593)
	Benefit-driven strategy	Nativi and Lee (2012:373)	• *"The use of RFID technology solved some long-standing issues […] allowing cost minimization [sic] while leading to more economically viable solutions."* (Kongar *et al.* 2015:56) • *"[…] the benefits of RFID implementation stemmed from the ability to automatically keep track of the number […] and quantity of such new and returned goods at key areas of the warehouse is of immense value to the warehouse managers."* (Jayaraman *et al.* 2008:420)

If […] partner to implement RFID on a single system, this would benefit all."* (Kumar *et al.* 2009:199)
	SC collaboration	Kongar *et al.* (2015:57)	• *"[…] to be most effective in the use of RFID, all players in the supply chain must work collaboratively […]."* (Kumar *et al.* 2009:197)
	Software suppliers and consultants	None	• *A third-party software supplier […] with more sophisticated […] bar-coding […]."* (Bernon & Cullen, 2007:49) • *"[…] implementing barcode/RFID […] includes the cost of […] consultancy service […]."* (Lee & Lam, 2012:593)

Source: Compiled by the researcher

Table 6.6 shows that barcode/RFID IT practices include several strategies and requirements, which will be discussed in subsequent sections.

6.3.2.1.1 Strategies of barcode/RFID IT practices in RL

The barcode/RFID IT practices in RL involve several strategies, including (1) developing an RFID strategy, (2) strategic considerations for barcode/RFID IT, (3) performing cost-benefit analyses for barcode/RFID IT, (4) benefit-driven strategies, (5) strategic procurement or development of state-of-the-art barcode/RFID IT, (6) strategic combination of barcode, RFID and other IT for RL, (7) strategic development of an IT infrastructure, (8) strategic development of a database or data matrix, (9) strategic creation, installation and utilisation of labels and tags, (10) strategic installation and utilisation of scanner/readers and computer hardware, (11) strategic utilisation of software for barcode/RFID IT, and (12) strategic implementation and utilisation of barcode/RFID IT for RL.

Unique to barcode/RFID IT, organisations must start with the *development of an RFID strategy* that focus on SC integration (SCI) and information sharing internally and externally. Consequently, RFID must benefit the organisation and the RSC to manage consumer returns effectively. Nevertheless, several *strategic considerations* can be important for efficient and effective use barcode/RFID IT for RL. Specifically, organisations must consider the types of products, order and IT complexity, business and industry types, return volume, type of returns, and costs before implementing barcode/RFID IT for RL. In terms of the *types of products*, organisations must consider the packaging and characteristics of the products (like metals and liquids), which may interrupt/block RFID reading and signals. Additionally, higher value products (e.g. high-tech computers, TVs, and appliances) may be more suitable for RFID than lower value products (e.g. clothing and consumables), which may be more suitable for barcode IT. Furthermore, RFID may be more suitable for complex *orders*, which may result in more complex returns. Moreover, organisations must recognise and understand the *complexity* of RFID IT since appropriate implementation and utilisation of RFID may require skilled staff, suitable space, and appropriate equipment and infrastructure (see section 6.3.2.1.2).

In terms of the *business* and *industry types*, retailers generally use barcode and RFID IT, and pharmaceutical, automotive and high-tech industries generally use RFID IT, emphasising the appropriateness of using RFID for higher valued products. Additionally, RFID IT may be more beneficial for lower *return volumes*, which can relate to the product/industry type, for example, higher valued products (such as a new model car) associate with better quality that lowers the likelihood of returns. Nevertheless, organisations must consider the types of returns since barcode/RFID IT may be more beneficial for consumer returns, emphasising that retailers can benefit the most from using barcode/RFID IT. Finally, organisations must consider the *costs* of barcode/RFID IT since purchasing, implementation and utilisation costs can be high (see section 6.3.2.1.2).

Accordingly, organisations must *perform cost-benefit analyses* for barcode/RFID IT, which can include trade-offs between (or comparison of) barcode and RFID IT and cost-benefit trade-offs for utilising barcode/RFID IT in RL. For instance, barcode IT involves higher processing costs and labour requirements/costs than RFID, which means that RFID may be more beneficial for the efficiency of RL processes (speed with fewer human error) than barcode IT. Additionally, organisations must compare the overall costs/expenses and potential long-term benefits of barcode/RFID IT for RL, emphasising the importance of strategically considering barcode/RFID costs and understanding the complexity and appropriateness of barcode/RFID IT. Evidently,

organisations need to develop a *benefit-driven strategy* for barcode/RFID IT, focusing on the long-term benefits and the value of implementing barcode/RFID IT to manage consumer returns.

Based on the considerations and cost-benefit analyses of barcode/RFID IT, organisations can *strategically procure* or *develop state-of-the-art barcode/RFID IT* for RL. Additionally, organisations may choose to *strategically combine* or *integrate barcode, RFID* and *other IT,* for example, Internet and RFID, barcode IT with RFID tags, and TLIT (e.g. ERP and WMS) and RFID.

However, organisations must *strategically develop* and *utilise* an *IT infrastructure,* and a *database / data matrix* to effectively utilise barcode/RFID IT in RL. Furthermore, barcode/RFID IT uniquely requires *strategic creation, installation* and *utilisation* of *labels/tags,* and *strategic installation* and *utilisation* of *scanners/readers, computer hardware* and special *software.* For example, organisations must create and attach barcode labels to products, use barcode scanners to read the barcoded labels and use relevant computer hardware and software for information input, storing, processing, managing and output for effective utilisation of barcode IT.

Similarly, for RFID IT, organisations must attach tags to products/packages, install RFID readers at strategic locations in the facility and/or on equipment to read the RFID tags, and utilise RFID software to process information. Essentially, organisations can *strategically implement* and *utilise barcode/RFID* IT for RL after developing barcode/RFID strategies, considering factors that can impact the use of barcode/RFID in RL, performing a cost-benefit analysis, procuring or developing barcode/RFID IT, establishing an IT infrastructure and databases, and installing labels/tags, scanners/readers, and computer hardware and software.

6.3.2.1.2 Requirements of barcode/RFID IT in RL

Relating to the strategies of barcode/RFID IT, several requirements, including economic, operational infrastructure, organisational and SC requirements, associate with barcode/RFID IT practices in RL. Specifically, the *economic requirements* of barcode/RFID IT include investments, costs and financial obligations, which relate to the strategic considerations of costs, cost-benefit analysis, development of an IT infrastructure, and procurement, development, implementation and utilisation of barcode/RFID IT (section 6.3.2.1.1).

Evidently, organisations need to *invest* in an IT infrastructure, and in the procurement, development and installation of barcode/RFID labels/tags, scanners/readers, computer hardware and software, which involve several costs and expenses. For example, organisations must fulfil *financial*

obligations and incur purchasing (acquisition) costs, processing and labour costs (especially for barcodes), tagging/labelling costs, maintenance costs, computer hardware and software costs (including costs of upgrades), training costs and consultancy *costs* for barcode/RFID.

The *operational* and *infrastructure requirements* of barcode/RFID IT include *facilities, equipment* and *network structures*. For instance, the installation of RFID readers requires dedicated areas in a facility and handling equipment (e.g. forklifts), which emphasise the strategic considerations related to the cost and complexity of RFID and strategic installation of readers/scanner (section 6.3.2.1.1). Additionally, facilities and network structures can be important for utilising barcode/RFID IT in RL and sharing product return across facilities/locations, emphasising the development of an RFID strategy that focuses on internal and external information sharing. Consequently, facility/location practices in RL (see section 6.8) can be important for the effective utilisation of barcode/RFID IT to manage consumer returns.

The *organisational requirements* of barcode/RFID IT practices include organisation-wide implementation, management involvement, and staff involvement, compliance and training. *Organisation-wide implementation* of barcode/RFID IT can be important for realising optimum benefits and justifying high costs of procuring, installing, using and maintaining barcode/RFID IT, which emphasises the strategic importance of performing a cost-benefit analysis and developing benefit-driven strategies for barcode/RFID IT in RL (see section 6.3.2.1.1). Additionally, *management involvement* can be important for the effective implementation and utilisation of barcode/RFID IT, and for realising the outcomes/benefits of barcode/RFID IT practices to manage consumer returns.

On the one hand, *staff involvement* can be important for utilising barcode IT in RL processes, for example, staff scanning barcode labels of returned products in the receiving area. On the other hand, *staff compliance* can be important for implementing and utilising RFID IT for RL processes, for example, staff accepting the adoption and use of RFID readers, in the receiving area, instead of manual scanning devices used with barcode IT. Evidently, staff involvement versus staff compliance emphasises the importance of performing a cost-benefit analysis, comparing the costs of higher labour utilisation for barcode IT with the benefits of lower labour requirements for RFID IT, while paying attention to the total costs of procuring, implementing and utilising barcode and RFID (see section 6.3.2.1.1). Nevertheless, both barcode and RFID IT requires *staff training,* which not only emphasises the staff involvement of barcode IT and complexity of RFID (strategic consideration) but also the training cost requirements of barcode/RFID IT in RL.

Barcode/RFID IT involve several *SC requirements*, including SC-wide implementation, SC collaboration, and software suppliers and consultants. Particularly, RFID in RL requires *SC-wide implementation*, which means that SC parties must utilise the same IT infrastructure and collectively implement and utilise a single RFID IT, emphasising the development of an RFID strategy that focuses on SCI (section 6.3.2.1.1). Consequently, RFID requires *SC collaboration*, indicating that a lack of SCI (SC barrier) in RL (see section 2.3.4) can hamper the effectiveness of RFID to manage consumer returns. Finally, barcode/RFID requires *software providers* and *consultants*, which emphasise the strategic importance of utilising appropriate software for barcode/RFID, the complexity of RFID (strategic consideration) and cost requirements (e.g. training and consultancy fees) of barcode/RFID.

Essentially, barcode/RFID practices in RL represent a strong association between the barcode/RFID strategies and barcode/RFID requirements, which can contribute to several outcomes discussed in the next section.

6.3.2.2 Outcomes of barcode/RFID IT practices in RL

The outcomes of barcode/RFID IT practices can be described as the benefits of incorporating barcode/RFID strategies and requirements to manage consumer returns. The outcomes of barcode/RFID practices in RL include (1) economic, (2) operational (3) organisational (4) environmental, (5) market-related and (6) SC outcomes. Table 6.7 provides an overview of the findings related to the *outcomes of barcode/RFID IT* to manage consumer returns, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.7 Findings related to the outcomes of barcode/RFID IT practices to manage consumer returns

CATEGORY	SUB-CATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
Economic outcomes	***Address economic barriers***	None	• *"Firms tend to use a variety of complex and compound information systems due to […] high switching costs (e.g., employees' limited skills and high training costs, software and hardware investments, possibilities of new installation failure, etc.). The IT types most frequently cited are […] bar code […] systems […]."* (Olorunniwo & Li, 2011:7) • *"With the wide adoption of RFID technology and technological advancements, cost […] -related challenges are expected to be overcome soon."* (Kongar *et al.* 2015:63)
	Economic benefits and performance	None	• *"The RFID strategy helps the players achieve higher volumes […] volume increase and coordination will thereby increase overall economic performances."* (Nativi & Lee, 2012:376) • *"[…] implement information technology such as RFID, careful considerations must be taken to understand the complexity […] of the system in order to attain high economic benefits."* (Nativi & Lee, 2012:373) • *"The use of RFID technology solved some long-standing issues […] allowing cost minimization [sic] while leading to more economically viable solutions."* (Kongar *et al.* 2015:56) • *"RFID […] provide a high impact on the economic performance […]."* (Nativi & Lee, 2012:374)
	Cost effective	None	• *"By investing in wireless technology for the reverse logistics process, such as radio frequency identification technology (RFID), an organisation can handle its reverse flow more cost-effectively."* (Badenhorst, 2013:4)

CATEGORY	SUB-CATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
	Reduce costs	None	• *"The RFID strategy helps […] lower holding costs […]."* (Nativi & Lee, 2012:376) • *"[…] RFID […] is beginning to deliver significant cost reductions in retailers, automotive, pharmaceutical, and personal computer supply-chain processes."* (Jayaraman *et al.* 2008:418) • *"[…] implementing barcode/RFID […] includes the cost of hardware, software, consultancy service and training. However, long term cost savings would be beneficial for implementation throughout the whole company."* (Lee & Lam, 2012:593) • *"The RFID readers will proper identify the total amount of inventory; therefore, reducing […] inventory cost."* (Nativi & Lee, 2012:374) • *"RFID/barcode information system can […] reduce excess inventory and holding cost […]."* (Lee & Lam, 2012:593) • *"[…] RFID technology can also help […] accurate inventory information decreases the overall costs by facilitating the internal activities of diverse supply chain members involved in the reverse logistics process […]."* (Kongar *et al.* 2015:62)
Operational outcomes	***Address IT barriers in RL***	None	• *"A third-party software supplier […] with more sophisticated […] bar-coding, ensured the availability of real-time information systems relating to returned products*." (Bernon & Cullen, 2007:49)
	Improve forecasting and visibility of product returns	None	• *"[…] RFID real time data can be obtained, which […] also helps to […] forecast the demand."* (Kumar *et al.* 2009:196) • *"Similar to 2D data matrix barcodes, RFID tags provide a real-time data visibility […]."* (Kongar *et al.* 2015:53) • *"RFID technology installed in their warehouses […] RFID tags are placed in the inventories (e.g., pallets) and RFID readers are located in the warehouses […] the players will have enhanced ''visibility'' […] since they will monitor continuously their inventory levels in real-time."* (Nativi & Lee, 2012:371)
	Facilitate identification, tracking and tracing of product returns	Barker and Zabinsky (2008:253) Kinobe *et al.* (2015:91) Narayana *et al.* (2014:394)	• *"The cost of implementing barcode/RFID […] includes the cost of hardware, software, consultancy service and training. However, long term cost savings would be beneficial for implementation throughout the whole company […] to track the movement of goods for the whole supply chain […]."* (Lee & Lam, 2012:593) • *"[…] combining technologies such as barcodes […] tracking […] of goods in transit or within warehouse […]."* (Sharif *et al.* 2012:2522) • *"RFID-based IT infrastructure […] provide […] visibility by tracking and tracing […] products at item-level throughout the RL operations."* (Kongar *et al.* 2015:63) • *"[…] attaching a two-dimensional bar code or other device that uniquely identifies a unit of the product so it can be tracked […]."* (Kabir, 2013:97) • *"RFID tags are […] the most efficient way to uniquely identify products […]."* (Han *et al.* 2010:1077) • *"RFID readers can also now be mounted on the forklift vehicle to help workers to rapidly locate goods […] with less effort."* (Jayaraman *et al.* 2008:418) • *"[…] using barcodes […] for the purpose of tracking and tracing the returned products."* (Ravi & Shankar, 2015:890) • *"RFID-based solution for tracking inventory is implemented, the initial costs would include the cost of setting up the infrastructure for reading the RFID tags."* (Jayaraman *et al.* 2008:414) • *"Managers need to keep track of shipments and receipts […] to minimise any error in this process, remote readers can be installed […] to keep track of inventory […] by RFID […]."* (Jayaraman *et al.* 2008:420)
	Facilitate and support RL processes and activities	Barker and Zabinsk (2008:253)	• *"Commercial technologies that may be used to support RL, such as radiofrequency identification […]."* (Huscroft *et al.* 2013a:233) • *"[…] designated collection points can be handled with […] RFID […]."* (Kongar *et al.* 2015:53) • *"[…] the receiving dock when shipments arrive from […] customer returns is the need for personnel at the warehouse to check the number of cases in the shipment against what appears in the documentation. This is […] done by scanning the barcode labels on the cases. After the implementation of RFID, tags will be affixed to cases […] Checking at the receiving dock will then be done by readers […] that can automatically scan the RFID tags."* (Jayaraman *et al.* 2008:419-420) • *"[…] developing RFID-based applications that use a reader to 'lock' the tag at the checkout […] If the item is eventually returned, then the tag can be used to determine the product's validity. Source: Compiled by the researcher

Table 6.7 shows that barcode/RFID practices in RL associate with economic, operational, organisational, environmental, social, market-related and SC outcomes, which will be discussed in subsequent sections.

6.3.2.2.1 Economic outcomes of barcode/RFID IT practices in RL

The economic outcomes of barcode/RFID practices include (1) addressing economic barriers, (2) economic benefits and performance, (3) cost effectiveness and (4) reducing costs. Like other IT practices (Internet/web and TLIT), barcode/RFID can *address economic barriers* in RL (like high costs and investment requirements) (see section 2.3.1). Particularly, organisations can utilise barcode IT for both FL and RL operations, avoiding high investment and costs of developing, implementing and using special/new technologies for RL. Additionally, implementing RFID can address cost-

related challenges in RL, which may associate with improved visibility and efficiency in RL processes (see section 6.3.2.2.2).

Moreover, organisations can realise *economic benefits* and improve *economic performance* through the barcode/RFID strategies related to (1) developing an RFID strategy that focuses on SCI, (2) considering the complexity of RFID, (3) focussing on a benefit-driven strategy for RFID, and (4) implementing and using RFID for RL. Consequently, organisations can enhance the *cost-effectiveness* of RL processes by investing in RFID IT (economic requirement), emphasising the importance of performing a cost-benefit analysis for barcode/RFID IT in RL (see section 6.3.2.1.1).

Finally, organisations can *reduce costs* through several barcode/RFID IT practices, including the (1) barcode/RFID strategies of developing an RFID strategy, considering business/industry type for RFID, performing a cost-benefit analysis, focusing on benefit-driven strategies, installing and utilising RFID readers, computer hardware and software, and implementing and utilising barcode/RFID IT for RL, and (2) barcode/RFID requirements of costs (economic), organisation-wide implementation of RFID and staff training (organisational), and consultancy service (SC). Particularly, developing an RFID strategy, installing and using RFID readers and utilising barcode/RFID IT for RL can reduce inventory costs, which demonstrates important operational outcomes related to demonstrating the operational benefits related to inventory management and control (see section 6.3.2.2.2).

Essentially, despite the investment and costs requirements of barcode/RFID IT (section 6.3.2.1.2), organisations can obtain many cost-related benefits for adopting barcode/RFID IT practices, which demonstrates the importance of performing a cost-benefit analysis and focussing on a benefit-driven barcode/RFID strategy for the effective management of consumer returns.

6.3.2.2.2 Operational outcomes of barcode/RFID IT practices in RL

Several operational outcomes associate with barcode/RFID IT practices, including (1) addressing IT barriers in RL, (2) improving forecasting and visibility of product returns, (3) facilitating identification, tracking and tracing of product returns, (4) facilitating and support RL processes and activities, (5) improving RL process speed and efficiency, (6) reducing manual operations and operational errors, (7) facilitating operations management, and (8) improving inventory management and control.

Like general IT and Internet/web-based IT practices (sections 6.3.1 and 6.3.2), barcode/RFID IT practices can *address IT barriers in RL* (such as a lack of information systems for RL) (section 2.3.2). Particularly, organisations can procure state-of-the-art barcode IT (strategy) through software service suppliers (SC requirement) to provide appropriate IT for consumer returns, demonstrating a link between IT and outsourcing practices in RL (see section 6.5).

Additionally, organisations can *improve forecasting* and *visibility* of *product returns* through barcode/RFID strategies, like developing a data matrix for barcode IT, installing and utilising RFID tags and readers, and implementing and utilising RFID IT, and operational/infrastructure requirements, like utilising facilities for RFID installation. Accordingly, several barcode/RFID IT practices *facilitate product return identification, tracking* and *tracing,* including the (1) barcode/RFID strategies of a cost-benefit analysis, benefit-driven strategies, combining barcode and other IT, developing and using an IT infrastructure, installing and using labels, tags, readers, computer hardware and software, and implementing and using barcode/RFID IT for RL, and (2) barcode/RFID requirements of costs (e.g. installation, consultancy and training costs) (economic), equipment and facilities (operational/infrastructure), organisation-wide implementation, management involvement and staff training (organisational), and consultancy service (SC).

Similarly, various barcode/RFID practices can *facilitate* and *support RL processes* and *activities*, including the (1) barcode/RFID strategies of strategic considerations (type of returns), benefit-driven strategies, developing and using an IT infrastructure and database, installing and using labels/tags and scanners/readers, and developing, implementing and using barcode/RFID IT for RL, and (2) barcode/RFID requirements of facilities (operational and infrastructure) and staff involvement and compliance (organisational). For example, developing, implementing and utilising RFID (including installing tags/readers) in a warehouse can facilitate and support product returns receiving (e.g. automatic check-in of products), inspection/sorting and validation (e.g. confirming the accuracy of consumer return information), processing (e.g. consumer receives appropriate credit), disposition (e.g. support efficient repair) and resale/redistribution.

Evidently, barcode/RFID practices, including the strategic development of an IT database, installation of labels and tags, and utilisation of barcode/RFID IT for RL, can *improve RL process speed* and *efficiency.* Additionally, organisations can *reduce manual operations* and *operational errors* through barcode/RFID practices that mostly involve RFID-specific strategies and requirements, including (1) strategic considerations (costs and industry of RFID), (2) installing RFID readers, (3) procuring, implementing and using RFID IT for RL (strategies), (4) costs (economic requirement), (5) facilities

(operational/infrastructure requirement), and (5) management involvement and staff training (organisational requirements). Consequently, reducing manual operations through RFID emphasises labour utilisation (staff involvement versus staff compliance) as the main difference between barcode and RFID IT, demonstrating the importance of performing a cost-benefit analysis for barcode/RFID practices in RL (see section 6.3.2.1).

Furthermore, developing an IT database for RFID and implementing and utilising RFID (strategies) can *facilitate operations management* through enhanced visibility and information sharing in a facility. Finally, organisations can *improve inventory management* and *control* through (1) barcode/RFID strategies related to benefit-driven strategies, combining/integrating barcode/RFID with other IT (e.g. Internet and RFID), using an IT database, installing and using RFID tags and readers, implementing and using barcode/RFID IT, and (2) barcode/RFID requirements related to facilities (operational/infrastructure) and management involvement (organisational).

Essentially, improvements in forecasting, visibility, tracking/tracing, RL process efficiency and inventory management, emphasise the importance of barcode/RFID IT for reducing inventory costs (section 6.3.2.2.1) and addressing economic and operational barriers in RL.

6.3.2.2.3 Organisational outcomes of barcode/RFID IT practices in RL

The organisational outcomes of barcode/RFID IT practices in RL, include (1) facilitating RL development and implementation, (2) a successful RL program, (3) enhancing RL performance, (4) enhancing RLM, (5) improving information management, (6) facilitating internal information sharing, (7) facilitating performance measurement (PM) practices and return prevention and avoidance (RPA) practices, and (8) facilitating facility/location practices.

Through the strategic procurement, implementation and utilisation of state-of-the-art RFID IT (strategy), organisations can *facilitate RL development* and *implementation,* implying that RFID IT can address organisational barriers in RL (such as a lack of awareness and management inattention) that hamper successful implementation of RL (see section 2.3.3). Similarly, organisations can establish a *successful RL program* through the strategic procurement, implementation and utilisation of state-of-the-art barcode IT for RL. Additionally, organisations can *enhance RL performance* through the strategic development and use of an IT infrastructure for RFID, emphasising economic performance improvements through RFID (see section 6.3.2.2.1).

More importantly, through the strategic consideration of the business type (retailers) and utilisation of barcode/RFID IT for RL (barcode/RFID IT strategies), organisations can *enhance RLM*, demonstrating the importance of barcode/RFID IT practices for managing consumer returns. Furthermore, organisations can *improve information management* through (1) barcode/RFID IT strategies related to installing and utilising tags and scanners/readers, and implementing and utilising barcode/RFID IT, and (2) barcode/RFID IT requirements related to facilities and network structures (operational/infrastructure). For example, utilising RFID readers in a facility can retrieve and record product return data on the system and utilising a RFID tags and network structures can provide information about the returned product, regardless of its condition and life-cycle stage.

Subsequently, barcode/RFID IT practices, like strategic installation and utilisation of tags and scanners/readers, and utilisation of barcode/RFID IT for RL, can *facilitate internal information sharing*, implying that barcode/RFID IT may facilitate CFI practices in RL (section 6.4.3). Nevertheless, barcode/RFID IT can directly facilitate other practices in RL, including PM (section 6.7), RPA (section 6.9.3) and facility/location practices (section 6.8).

Particularly, through the strategic implementation and utilisation of RFID IT for RL, organisations can *facilitate PM practices* by measuring product returns over an extended period (e.g. three years) and implementing improvement initiatives. Likewise, utilising RFID IT for RL can *facilitate RPA practices* by identifying and preventing fraudulent returns (like counterfeit returns). Finally, barcode/RFID IT practices can *facilitate facility/location practices* in RL. For example, the barcode/RFID strategies of (1) creating a data matrix and utilising barcode IT for RL can facilitate network design and control, and (2) utilising RFID IT for RL (strategy) can facilitate strategic decisions of optimal location for product returns (e.g. centralised versus decentralised location).

6.3.2.2.4 Environmental and market-related outcomes of barcode/RFID IT practices in RL

Like general IT and TLIT practices (sections 6.3.1 and 6.3.3), barcode/RFID IT practices can lead to the *environmental outcome* in RL. Particularly, organisations can achieve *environmental benefits* by developing an RFID strategy that focusses on information sharing (with SC parties) and implementing and using RFID for RL. Moreover, barcode/RFID IT practices involve several *market-related outcomes*, including (1) a competitive advantage, (2) meeting consumer demands/needs and increasing responsiveness, (3) improving consumer experience, and (4) improving customer service.

Specifically, organisations can obtain a *competitive advantage* by implementing and utilising RFID IT for RL, which may associate with enhanced economic performance (economic outcome), efficient

RL processes (operational outcome), and enhanced RL performance and management (organisational outcomes) (sections 6.3.2.2.1, 6.3.2.2.2 and 6.3.2.2.3). Additionally, organisations can *meet consumer needs/demands* and *improve consumer responsiveness* by strategically combining barcode and RFID IT for RL, demonstrating the importance of implementing barcode/RFID IT to manage consumer returns.

Relating to the support of RL processes/activities and the reduction of manual RL operations (operational outcomes), organisations can *improve consumer experience* through the strategic implementation of RFID tags and readers, and development, implementation and utilisation of RFID IT for RL. For example, utilising RFID tags and readers for RL can reduce the hassle of providing documentation (like proof of purchase) to return a product. Subsequently, organisations can *improve* overall *customer service* levels through the strategic utilisation of barcode/RFID for RL, which relates to the operational outcomes of barcode/RFID practices (such as improved forecasting and inventory management) (section 6.3.2.2.2).

6.3.2.2.5 SC outcomes of barcode/RFID IT practices in RL

Numerous SC outcomes associate with barcode/RFID practices, including (1) improving (R)SCM, (2) facilitating SCI, coordination and collaboration, (3) improving SC information sharing and communication, and (4) enhancing SC responsiveness, visibility and forecasting. Particularly, the strategic implementation and utilisation of RFID IT for RL and SC-wide implementation of RFID (SC requirement) can *improve* (R)SCM. Additionally, developing an RFID strategy, installing RFID tags, utilising RFID for RL (strategies), and utilising network structures (operational/infrastructure requirement) can *facilitate SCI, coordination* and *collaboration.*

Moreover, several barcode/RFID practices, including the (1) barcode/RFID strategies of developing an RFID strategy, developing and using an IT infrastructure and database, installing and using RFID tags and readers, and implementing and using barcode/RFID IT, and (2) barcode/RFID requirements of facilities and networks(operational/infrastructure), SC-wide implementation and SC collaboration, can *improve SC information sharing* and *communication.*

Similarly, various barcode/RFID IT practices can *enhance SC responsiveness, visibility* and *forecasting,* including the (1) barcode/RFID strategies of an RFID strategy, a cost-benefit analysis, benefit-driven strategies, installing labels, tags and readers, and implementing and using barcode/RFID IT for RL, and (2) barcode/RFID requirements of costs (economic), facilities and networks (operational/infrastructure), and (8) SC-wide implementation (SC). Evidently, the SC

outcomes of barcode/RFID IT practices demonstrates the importance of IT in RL for addressing SC barriers (section 2.3.4) and supporting effective SCI practices (section 6.4.1) in RL.

Essentially, barcode/RFID practices can be important for addressing economic, operational, organisational and SC barriers in RL (see section 2.3), and providing various economic, operational, organisational, environmental, market-related and SC benefits for the effective management of consumer returns.

In the next section, a description and conceptual framework of barcode/RFID IT in RL will be presented and analysed.

6.3.2.3 Description and conceptual framework of barcode/RFID IT practices to manage consumer returns

Based on the findings, presented in section 6.3.4, barcode/RFID IT practices can be important for the management of consumer returns, and will be described as follows:

> Barcode/RFID IT for the management of consumer returns involve (1) barcode/RFID IT strategies, including an RFID strategy, strategic considerations, a cost-benefit analyses, benefit-driven strategies, strategic procurement or development of state-of-the-art barcode/RFID IT, combination of barcode, RFID and other IT for RL, development of an IT infrastructure, database or data matrix, creation, installation and utilisation of labels and tags, installation and utilisation of scanner/readers, computer hardware and software, implementation and utilisation of barcode/RFID IT for RL, and (2) barcode/RFID IT requirements, including economic requirements (investment, financial obligation and costs), operational/infrastructure requirements (facilities, equipment and network structures), organisational requirements (organisation-wide implementation, management and staff involvement, staff compliance and training), and SC requirements (SC-wide implementation, SC collaboration, and software suppliers and consultants).
>
> The barcode/RFID IT strategies and requirements can result in several outcomes, including (1) economic outcomes (address economic barriers, economic benefits and performance, cost effectiveness and reduce costs), (2) operational outcomes (address IT barriers, improve forecasting and visibility, identify, track and trace product returns, facilitate and support RL processes, improve RL process speed and efficiency, reduce manual operations and errors, facilitate operations management, and improve inventory management and control), (3) organisational outcomes (facilitate RL development and implementation, successful RL program, enhance RL performance and RLM, improve information management, facilitate internal information sharing, and facilitate PM, RPA and facility/location practices), (4) environmental outcome (environmental benefits), (5) market-related outcomes (competitive advantage, meet consumer needs/demands, and improve consumer responsiveness, consumer experience and service), and (6) SC outcomes (improve (R)SCM, facilitate SCI, coordination and collaboration, improve SC information sharing and communication, and enhance SC responsiveness, visibility and forecasting).

Figure 6.8 provides a conceptual framework of barcode/RFID IT practices, which includes the barcode/RFID IT strategies, requirements and outcomes to manage consumer returns. Particularly, the framework illustrates the links between the strategies, requirements and outcomes of barcode/RFID in RL, demonstrating a cost and benefit relationship. For example, the links between barcode/RFID IT strategies and requirements can be demonstrated by the economic requirement of costs, which links with the barcode/RFID strategies of strategic considerations, cost-benefit analysis,

IT infrastructure, installation and use of labels, tags, scanners/readers, computer hardware and software, and procurement/development, implementation and use of barcode/RFID for RL, and other requirements, including facilities/equipment (operational/infrastructure), organisations-wide implementation and staff training (organisational) and consultants (SC) requirements.

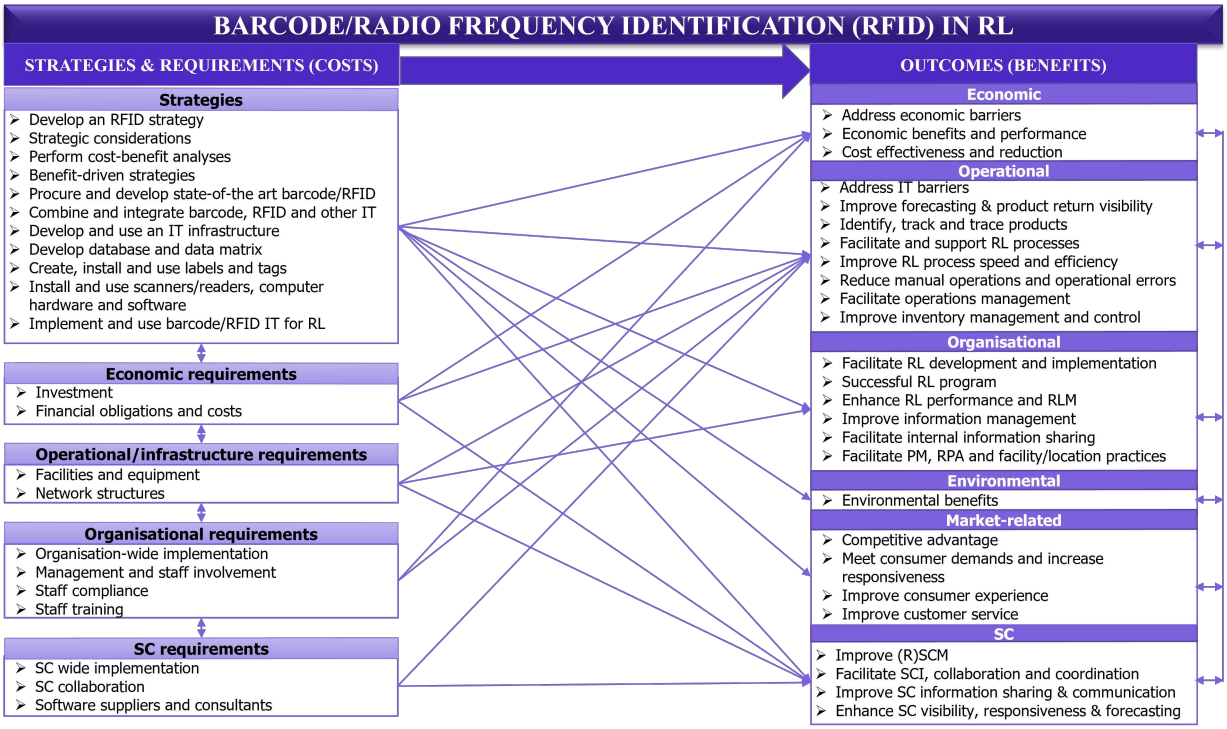

Figure 6.8 Conceptual framework of barcode/RFID IT practices to manage consumer returns
Source: Compiled by researcher

Regarding the links between barcode/RFID IT strategies, requirements and outcomes, the framework demonstrates that barcode/RFID IT strategies can be the most significant practice category, linking with all the barcode/RFID IT outcomes, including economic, operational, organisational, environmental, market-related and SC outcomes. Therefore, organisations must pay attention to the barcode/RFID strategies to achieve optimum results to manage consumer returns.

From the barcode/RFID requirements, economic requirements (especially costs) and operational/infrastructure requirements (especially facilities) contribute to the most outcomes (three categories each) and organisational and SC requirements to the least outcomes (two categories each). Nevertheless, collectively the barcode/RFID requirements contribute to most of the outcome categories, including economic, operational, organisational and SC outcomes.

Regarding the outcomes of barcode/RFID IT practices, operational (first) and SC (second) can be the most significant outcomes (associated with most of the practice categories), which means that barcode/RFID IT practices can be the most beneficial for organisations that experience operational and SC barriers and problems in RL. In contrast, the environmental and market-related outcomes can

be the least significant outcomes, meaning that barcode/RFID IT practices may be less important for organisations that seek environmental and market-related benefits through RL practices.

Finally, the framework shows that the barcode/RFID IT outcome categories can be linked, for example, a competitive advantage (market-related outcome) can link with economic performance (economic outcome), efficient RL processes (operational outcome), enhanced RL performance and RLM (organisational outcomes). Additionally, the operational outcome of improvements in forecasting, visibility and tracking can link with cost reductions (economic outcome), internal information sharing (organisational outcomes), meeting consumer demands and increasing responsiveness (market-related outcomes), and SC information sharing, visibility, forecasting and responsiveness (SC outcomes).

Essentially, the links between the barcode/RFID IT strategies, requirements and outcomes demonstrate the importance of a holistic approach to the management of consumer returns, meaning that organisations must carefully consider and analyse the costs (strategies and requirements) and benefits (outcomes) before implementing barcode/RFID IT for the effective management of consumer returns. In the next section, RL specific technology as the final IT practice category, will be discussed and explored.

6.3.3 RL information technology (RLIT) practices to manage consumer returns

RL information technology (RLIT) can be described as rarely used (Ravi & Shankar, 2015:890), underdeveloped and complex (Kongar *et al.* 2015:53, 56), which explains the lack of findings in the QCA of RL literature (see Figure 6.4). In this study, RLIT represents a (1) specific solution for managing RL processes and practices, (2) customised/tailored IT created for RL, (3) software/IT used for specific RL processes (such as return authorisation software), and (4) software/system to manage consumer returns. Despite the limited findings, RLIT practices included the same main categories of strategies, requirements and outcomes, which will be presented and discussed in the rest of this section.

Table 6.8 provides an overview of the findings related to the *RLIT practices to manage consumer returns*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

SC outcomes	***Facilitate SC information sharing and communication***	Shaik and Abdul-Kader (2014:97)	• *“[…] IT could be incorporated into the reverse supply chain by building a RL IT infrastructure […] that facilitate the entry of return flow data […].”* (Biehl *et al.* 2007:466) • *“[…] information transparency in an RL information system improves information sharing through the entire supply chain […].”* (Lambert *et al.* 2011:572)

Source: Compiled by the researcher

In the subsequent sections these categories of RLIT practices, presented in Table 6.8, will be discussed and concluded with a description and conceptual framework of RLIT to manage consumer returns.

6.3.3.1 Strategies of RLIT practices in RL

RLIT practices in RL involve several strategies, including (1) prioritising RLIT, (2) strategic considerations, (3) performing a cost-benefit analysis, (4) strategic identification, creation, development and procurement of RLIT, (5) strategic development of RLIT innovative capabilities, (6) strategic development of a RLIT infrastructure, (7) strategic development and implementation of an integrative, transparent and coordinated RLIT, (8) strategic combination and integration of RLIT with other IT, (9) strategic implementation and utilisation of product return and RL process related IT, (10) strategic implementation and utilisation of RLM IT systems, (11) strategic utilisation of hardware and software for RL, and (12) strategic implementation and utilisation of a modern and flexible RLIT.

Like general IT and TLIT (sections 6.3.1 and 6.3.3), organisations can benefit from *prioritising RLIT* to manage consumer returns. However, before adopting/implementing RLIT organisations need to *strategically consider* the costs and several requirements of RLIT (see section 6.3.3.2), product return volume, type of RL activities and number of users (internal staff). Consequently, organisations must *perform a cost-benefit analysis,* which involves identifying the requirements (costs) and outcomes (benefits) of RLIT implementation to manage consumer returns.

Based on the considerations and cost-benefit analysis, organisations can *strategically identify, create, develop* and/or *procure RLIT* to effectively support the RLM of consumer returns. Moreover, organisations must *strategically develop RLIT innovative capabilities* and *a RLIT infrastructure,* indicating that effective RLIT development and implementation requires tangible and intangible resources. Additionally, like general IT (see section 6.3.1), organisations must *strategically develop* and *implement an integrative, transparent and coordinated RLIT,* indicating that the RLIT must be capable of integrating and communicating with other SC parties.

Like other IT practices, organisations can *strategically combine* and *integrate RLIT* with *other IT,* for example, combining RLIT with the Internet or integrating a RLIT with an ERP system. Furthermore, depending on the RL processes and practices, organisations can *strategically implement* and *utilise* specific RLIT systems, including *product return* and *RL process related IT* (such as return software,

return tracking system or product recovery IT) and *RLM IT systems* (such as a returns management system).

Regardless of the type of RLIT, organisations must *strategically utilise hardware* and *software* for RLIT, which emphasise the importance of considering the costs and requirements of RLIT. Finally, organisations must *strategically implement* and *utilise a modern* and *flexible RLIT* for the effective management of consumer returns.

6.3.3.2 Requirements of RLIT practices in RL

The requirements of RLIT practices in RL include economic, operational, organisational and SC requirements. Like other IT practices, RLIT involves the *economic requirements* of investments, financial obligations and costs. However, the *investment requirements* and *financial obligations* may be more significant for RLIT since organisations must not only invest in a new IT that can only be used for RL but also in other requirements, like training of staff. Moreover, RLIT entails various *costs* for hardware, software, office equipment and space, IT support and 3P service provider, which emphasise the importance of the RLIT strategies of considering costs, performing a cost-benefit analysis and utilising software and hardware for RLIT (see section 6.3.3.1) and other requirements of RLIT.

The *operational requirements* of RLIT involves *facilities, office space* and *furniture*, which forms part of the strategic considerations and high cost of RLIT. The *organisational requirements* of RLIT involves organisational commitment, management involvement, IT support and staff training. Relating to the prioritisation of RLIT and high investment requirements, *organisational commitment* can be important for RLIT implementation, which means that organisational barriers in RL (e.g. lack of top management support and commitment) can hamper the adoption of RLIT to manage consumer returns.

Additionally, *management involvement* can be important for the investment, procurement and effective utilisation of RLIT to manage consumer returns. Like general IT and TLIT (sections 6.3.1 and 6.3.3), *IT support* can be important for development, software and maintenance of RLIT, emphasising the cost and operational (office space and furniture) requirements of RLIT. Additionally, RLIT requires *staff training*, which demonstrates the importance of considering the number of RLIT users (see section 6.3.3.1) and the investment requirements of RLIT.

Finally, the *SC requirements* of RLIT includes SCI, 3P service providers and partnerships with 3PRL providers. Particularly, organisations must focus on *SCI* practices for the effective utilisation of RLIT, which emphasise the importance of implementing an integrative, transparent and coordinated RLIT (section 6.3.3.1). Furthermore, *3P service providers* (such as Internet service providers) can be important for combining RLIT with other IT, like the Internet or a web-based system, adding to the RLIT cost requirements. Alternatively, organisations can develop *partnerships* with *3PRL providers* to gain access to RLIT, demonstrating the importance of developing innovative capabilities for RLIT (RLIT strategy) and other requirements (like investment and organisational commitment) that may hamper RLIT adoption and implementation.

In the next section, the outcomes of RLIT will be discussed, which may mitigate the strategies and requirements (costs) of RLIT.

6.3.3.3 Outcomes of RLIT practices in RL

The outcomes of RLIT practices, including economic, operational, organisational, environmental, market-related and SC outcomes (see Table 6.8), can be described as the benefits of incorporating RLIT strategies and requirements to manage consumer returns. These outcomes will be briefly described in subsequent sections.

6.3.3.3.1 Economic outcomes of RLIT practices in RL

The economic outcomes of RLIT practices include economic performance and cost effectiveness, reducing costs and profitability. Particularly, organisations can improve *economic performance* and *cost effectiveness* through the strategic development of innovative capabilities for RLIT and implementation and use of RLIT (strategies) to manage consumer returns. Additionally, organisations can *reduce costs* (e.g. return handling and labour costs) through the RLIT strategies of developing innovative capabilities, identifying and creating RLIT and combining RLIT with other IT (e.g. a web based RLIT) and the SC requirement of using 3P service providers, which points to the operational benefits of RLIT (section 6.3.3.3.2).

Finally, organisations can improve *profitability* through the investment (economic requirement) and use of RLM IT (RLIT strategy) and management involvement (organisational requirement), showing the strategic significance of adopting RLIT to manage consumer returns. Essentially, the economic outcomes of RLIT practices may mitigate the economic requirements (investments and costs) of

RLIT, which demonstrates the importance of performing a cost-benefit analysis for RLIT (see section 6.3.3.1).

6.3.3.3.2 Operational outcomes of RLIT practices in RL

Several operational outcomes associate with RLIT practices, including (1) addressing operational barriers in RL, (2) improving forecasting, visibility and tracking of product returns, (3) addressing IT barriers in RL, (4) reducing human errors and manual operations, (5) improving RL process speed, flexibility and efficiency, (6) facilitating and support RL processes, and (7) facilitating inventory management and control.

Specifically, RLIT practices, like utilising product return and RLM IT for RL (strategies), can *address operational barriers* in RL, which involves limited forecasting and visibility, product return problems, IT and infrastructure (developmental) barriers. Accordingly, organisations can *improve forecasting, visibility* and *tracking* of *product returns,* through the RLIT strategies of developing a RLIT infrastructure, implementing an integrative RLIT, combining RLIT with other IT (e.g. web-based IT) and utilising product return IT, and the SC requirement of partnering with 3PRL providers.

Furthermore, organisations can *address IT barriers in RL* (such as a lack of appropriate IT for RL) (section 2.3.2), through the implementation of a flexible RLIT (strategy). Consequently, organisations can *reduce human errors* and *manual operations* through RLIT practices, including combining RLIT with other IT, utilising product return IT (strategies) and using 3P service providers (SC requirement), which emphasise the economic outcome of labour cost reductions (section 6.3.3.3.1). Additionally, several RLIT practices can *improve RL process speed*, *flexibility* and *efficiency,* for instance, combining RLIT with web-based IT (strategy) and using 3P service providers (SC requirement) can increase RL process speed, partnering with 3PRL providers (SC requirement) can increase RL process flexibility, and investing (economic requirement) and implementing modern RLIT (strategy) can improve RL process efficiency.

Similarly, various RLIT practices can *facilitate* and *support RL processes,* including the (1) RLIT strategies of developing innovative RLIT capabilities, identifying, creating, procuring and implementing modern RLIT, combining RLIT with other IT, utilising software for RLIT, and using product return and RLM IT (RLIT types) for RL, and (2) RLIT requirements of organisational commitment, IT support (organisational requirements), using 3P service providers and partnering with 3PRL providers (SC requirements). Evidently, RLIT practices can facilitate and support pre-receipt RL processes, including a consumer return request, gatekeeping, collection and transportation

(see chapter 4), and post-receipt RL processes, including processing, inspection, sorting and disposition (see chapter 5), demonstrating the importance of RLIT for the effective management of consumer returns.

Finally, organisations can *improve inventory management* and *control* by combining RLIT with other IT (like an ERP), implementing and utilising RL process specific IT (strategies) and utilising a facility for RLIT (operational requirement), implying that RLIT can facilitate with the operational management of consumer product returns.

6.3.3.3.3 Organisational and environmental outcomes of RLIT practices in RL

The *organisational outcomes* of RLIT practices in RL, include (1) addressing organisational barriers, (2) enhancing RL design, innovation and capabilities, (3) improving RL performance, and (4) improving RLM and information management. Particularly, organisations can *address organisational barriers in RL* (such as lack of attention and commitment to RL) (see section 2.3.3) by prioritising, developing and investing in RLIT practices, which emphasise the significance of organisational commitment (organisational requirement) for the effective utilisation of RLIT (see section 6.3.3.2).

Although RLIT involves the development of innovative capabilities, organisations can *enhance RL design*, *innovation* and *capabilities* through the RLIT practices of developing a RLIT infrastructure, developing and implementing RLIT, using RLM IT (strategies) and management involvement (organisational requirement), which demonstrates the importance of a cost-benefit analysis for RLIT (section 6.3.3.1).

Furthermore, organisations can *improve RL performance* through the RLIT strategies of developing innovative capabilities and implementing a coordinated RLIT, emphasising economic performance improvement (economic outcome) and RL process speed, efficiency and support (operational outcomes) (see sections 6.3.3.3.1 and 6.3.3.3.2). Similarly, organisations can *improve RLM* and *information management* by developing and implementing a coordinated RLIT, using product return IT (e.g. return tracking IT) (RLIT strategies) and partnering with 3PRL providers (SC requirement), demonstrating the value of RLIT practices for the effective management of consumer returns.

Finally, like other IT practices (e.g. general IT, TLIT and barcode/RFID IT), RLIT can be beneficial for the environment, involving an *environmental outcome*. Particularly, implementing and using RLIT for RL can lead to *environmental protection,* which serves as one of the drivers to manage consumer returns (see section 2.3). Consequently, RLIT not only addresses barriers to RL

implementation (such as operational and organisational barriers) but also contributes to the drivers of effective RLM.

6.3.3.3.4 Market-related and SC outcomes of RLIT practices in RL

The *market-related outcomes* of RLIT practices include a competitive advantage, meeting consumer needs and improving customer service. Specifically, organisations can obtain a *competitive advantage* by identifying, creating, procuring, implementing and utilising a modern RLIT for RL (strategy) and being committed to RL (organisational requirement). Evidently, using outdated or inappropriate IT for RL can hamper an organisation's competitiveness in the market, reiterating the importance of a cost-benefit analysis for RLIT (see section 6.3.3.1).

Organisations can *meet consumer needs* by strategically utilising RLM IT (e.g. returns management system) for RL and involving management (organisational requirement), emphasising the RLIT operational outcome of increased RL process flexibility (section 6.3.3.3.2). Similarly, organisations can *improve customer service* levels by developing innovative RLIT capabilities, utilising RLM IT for RL (RLIT strategies), investing in RLIT (economic requirement) and involving management (organisational requirement), which demonstrates the importance of RLIT to manage consumer returns.

Finally, the *SC outcomes* of RLIT practices involve information sharing and communication. Specifically, organisations can *improve SC information sharing* and *communication* by developing a RLIT infrastructure and developing and implementing an integrative and transparent RLIT, emphasising the importance of SCI as a SC requirement for RLIT (see section 6.3.3.2).

In the next section, a description and conceptual framework of RLIT in RL will be presented and analysed.

6.3.3.4 Description and conceptual framework of RLIT practices to manage consumer returns

Based on the findings, presented in section 6.3.3, RLIT practices can be important for the management of consumer returns, and will be described as follows:

> RLIT practices for the management of consumer returns involve (1) RLIT strategies, including prioritising RLIT, strategic considerations, a cost-benefit analyses, identification, creation, development and procurement of RLIT, development of innovative capabilities, development of a RLIT infrastructure, development and implementation of an integrative, transparent and coordinated RLIT, combination and integration of RLIT with other IT, implementation and utilisation of product return and RL process related IT and RLM IT systems, utilisation of hardware and software for RL, and implementation and utilisation of a modern and flexible RLIT, and (2) RLIT requirements, including economic requirements (investment, financial obligation and costs), operational requirements (facilities, office space and furniture), organisational requirements (organisational

commitment, management involvement, IT staff support, and staff training), and SC requirements (SCI, 3P software suppliers and 3PRL providers).

The RLIT strategies and requirements can result in several outcomes, including (1) economic outcomes (economic performance, cost effectiveness, reduce costs and profitability), (2) operational outcomes (address operational barriers, improve forecasting, visibility and tracking of product returns, address IT barriers, reduce human error and manual operations, improve RL process speed, flexibility and efficiency, facilitate and support RL processes, and improve inventory management and control), (3) organisational outcomes (address organisational barriers, improve RL design, innovation and capabilities, and improve RL performance, RLM and information management), (4) environmental outcome (environmental protection), (5) market-related outcomes (competitive advantage, meet consumer needs and improve customer service), and (6) SC outcomes (improve SC information sharing and communication).

Figure 6.9 provides a conceptual framework of RLIT, which includes the RLIT strategies, requirements and outcomes to manage consumer returns.

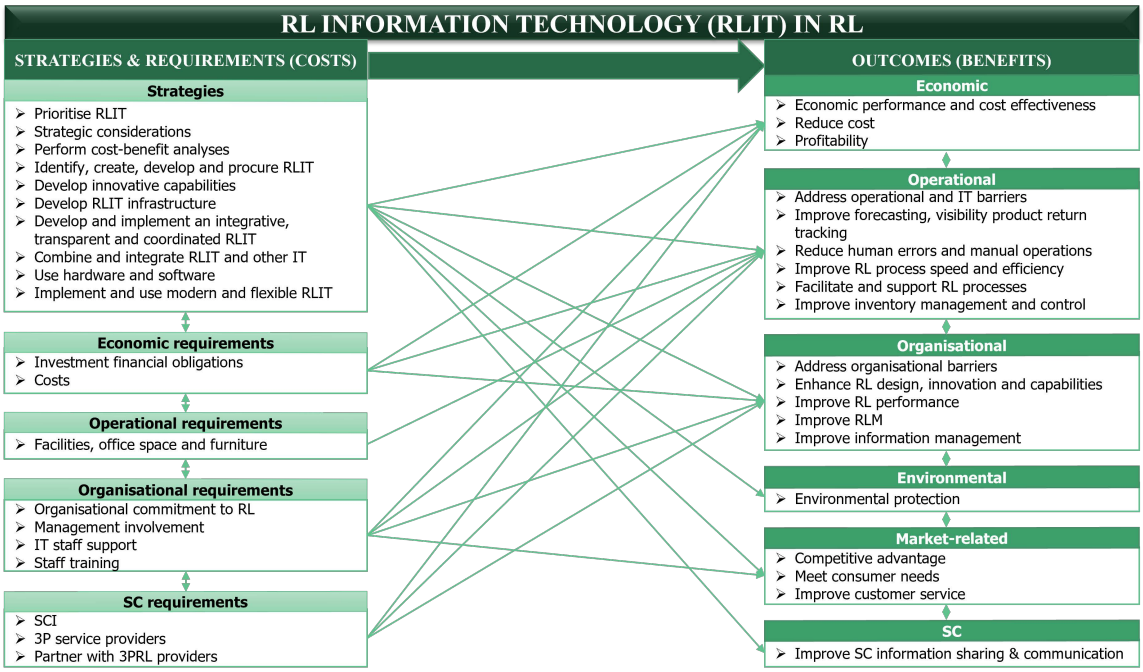

Figure 6.9 Conceptual framework of RLIT practices to manage consumer returns
Source: Compiled by researcher

Figure 6.9 illustrates the links between the strategies, requirements and outcomes of RLIT in RL, demonstrating a cost and benefit relationship. For instance, the links between RLIT strategies and requirements can be demonstrated by the economic requirement of costs, which links with the RLIT strategies of strategic considerations, cost-benefit analysis, RLIT infrastructure, procuring RLIT and using hardware and software for RLIT, and other requirements, including office space and furniture (operational), IT staff support and staff training (organisational), and 3P service provider (SC) requirements.

Regarding the links between RLIT strategies, requirements and outcomes, the framework demonstrates that RLIT strategies can be the most significant practice category, linking with all the RLIT outcomes, including economic, operational, organisational, environmental, market-related and

SC outcomes. Therefore, organisations must pay attention to the RLIT strategies to achieve optimum results to manage consumer returns. From the RLIT requirements, organisational requirements contribute to the most outcome categories (four) and operational requirements to the least outcome categories (one), which means that organisations must focus on the organisational requirements for effective RLM.

Regarding the outcomes of RLIT practices, operational outcomes can be the most significant outcome category (associated with most of the practice categories), which means that RLIT practices can be the most beneficial for organisations that experience operational barriers and problems in RL. In contrast, the environmental and SC outcomes can be the least significant outcomes (only linked with the RLIT strategies), meaning that RLIT practices may be less important for organisations that seek environmental and SC benefits through RL practices.

Finally, the framework shows that the RLIT outcomes can be linked, for example, improvement in visibility, reduction in manual operations and RL process flexibility, efficiency and support (operational outcomes) can link with economic performance and cost reduction (economic outcomes), improvements in RL performance, RLM and information management (organisational outcomes), environmental protection (environmental outcome), meeting consumer needs and improvement of customer service (market-related outcomes), and improvement in SC sharing and communication (SC outcomes).

Essentially, the links between the RLIT strategies, requirements and outcomes demonstrate the importance of a holistic approach to the management of consumer returns, meaning that organisations must carefully consider and analyse the costs (strategies and requirements) and benefits (outcomes) before implementing RLIT for the effective management of consumer returns.

In the next section, a conceptual framework and summary of findings for IT practices (discussed in section 6.3) to manage consumer returns will be presented and described.

6.3.4 Conceptual framework and summary of findings for IT practices to manage consumer returns

This section provides a conceptual framework and summary of findings for IT practices to manage consumer returns. The findings presented in section 6.3 showed that all IT practices can be important for the management of consumer returns. Figure 6.10 provides a conceptual framework for IT practices to manage consumer returns.

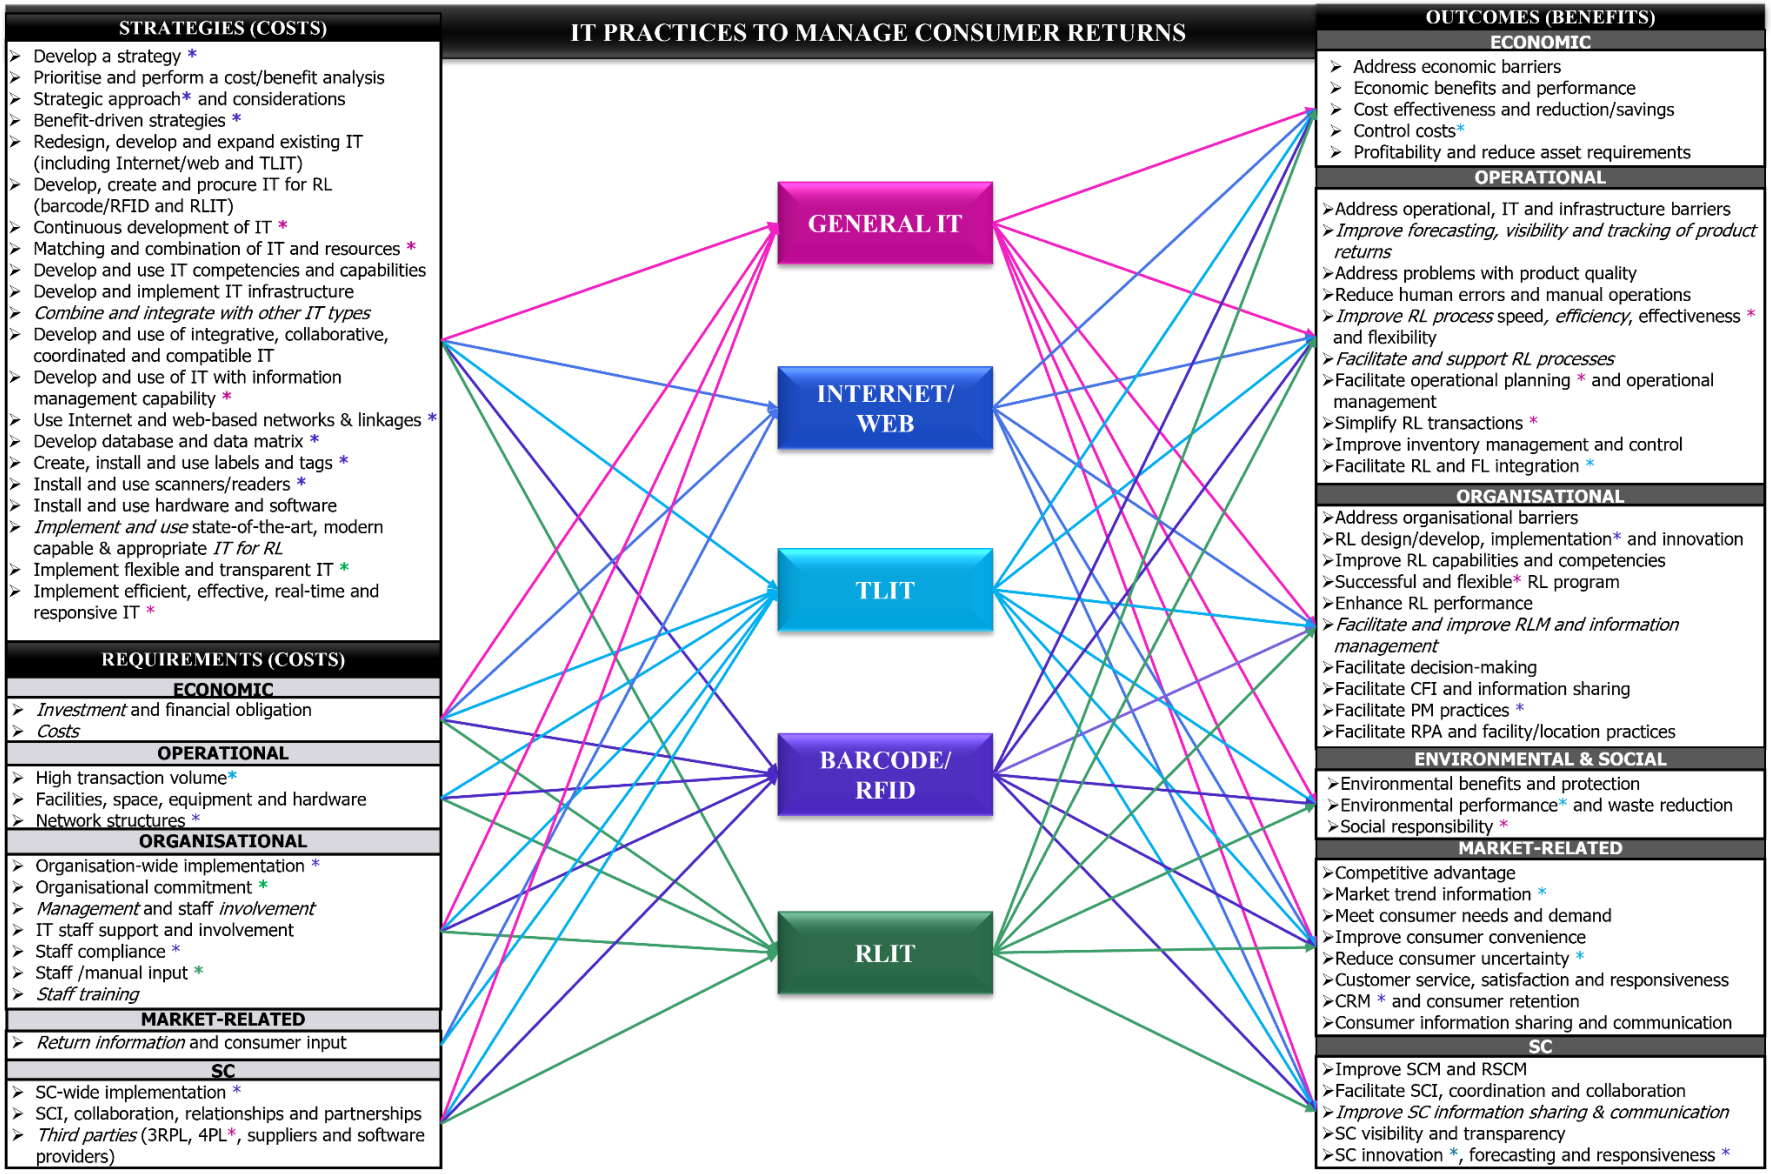

Figure 6.10 Conceptual framework of IT practices to manage consumer returns
Source: Compiled by the researcher

Specifically, Figure 6.10 illustrates a summary of the findings related to the IT practices, including general IT, Internet/web-based IT, TLIT, barcode/RFID IT and RLIT practices, focusing on the combined strategies and requirements (costs) and outcomes (benefits) as well as the relationship between the costs, IT types and benefits. Furthermore, *the most significant* (all IT types linked to the) strategies, requirements and outcomes of IT practices are emphasised through *italics*, while *unique requirements and outcomes* (only applicable to a single practice) are emphasised with a *coloured asterisk* (*) (linked to the practice colour). The strategies, requirements and outcomes without italics and asterisks can be associated with at least two IT practices.

Based on Figure 6.10 and the discussions given in section 6.3, Table 6.9 provides a summary of the findings and managerial implications for IT practices to manage consumer returns.

Table 6.9 Summary of findings and managerial implications for IT practices to manage consumer returns

CATEGORY	KEY FINDINGS	MANAGERIAL IMPLICATIONS
Strategies	• All IT types, including general IT, Internet/web, TLIT, barcode/RFID and RLIT involve strategies • All IT types can be combined and integrated with other IT types to be implemented and used for RL • All IT types (except Internet/web) must be prioritised in RL • General IT, barcode/RFID and RLIT involve strategic considerations, a cost-benefit analysis, IT infrastructure and implementation and use of state-of-the-art/modern IT • General IT, Internet/web and RLIT involve development of capabilities or competencies and development and use of integrative, coordinated/collaborative and compatible IT • TLIT, barcode/RFID and RLIT involve hardware and software • Internet/web and TLIT involve redesign, development and expansion of existing IT for RL • Barcode/RFID and RLIT involve creation, development and procurement of IT for RL • Only general IT involves strategies related continuous development of IT, combining and matching IT with resources, development and use of IT with information management capability and implementation of efficient, effective, real-time and responsive IT • Only Internet/web-based IT involves strategies related to a strategic approach to the use of Internet and web-based networks and linkages • Only barcode/RFID IT involves strategies related to benefit-driven strategies, development of database and data matrix, and the creation, installation and use of labels/tags and readers/scanners • Only RLIT involves the strategy related to implementation and use of flexible and transparent IT	• For effective IT practices in RL, organisations must focus on IT strategies • For any type of IT in RL, organisations must focus on the strategies related to combining and integrating with other IT types and implementing and using IT for RL • Organisation must prioritise IT practices (except Internet/web) in RL • For general IT, barcode/RFID and RLIT strategies, organisations must focus on strategic considerations, cost-benefit analysis and implementing and using state-of-the-art/modern IT for RL • For general IT, Internet/web and RLIT strategies, organisations must focus on developing capabilities/competencies, and developing and using integrative, coordinated/collaborative and compatible IT • For TLIT, barcode/RFID and RLIT strategies, organisations must focus on installing and using hardware and software • For Internet/web and TLIT strategies, organisations must focus on the redesign, development and expansion of existing IT for RL • For barcode/RFID and RLIT strategies, organisations must focus on the creation, development and procurement of IT for RL • For general IT strategies, organisations must focus on continuous development of IT, combining and matching IT with resources, develop, implement and use efficient, effective, real-time and responsive IT with information management capability • For Internet/web-based IT strategies, organisations must develop a strategic approach and focus on using Internet and web-based networks and linkages • For barcode/RFID IT strategies, organisations must focus on benefit-driven strategies, developing a database or data matrix, and the creation, installation and use of labels/tags and readers/scanners • For RLIT strategies, organisations must focus on implementing flexible and transparent RLIT
Requirements	• All IT types involve *economic requirements*, including investment and costs with some form of financial obligation • TLIT, barcode/RFID and RLIT involve *operational requirements*, especially facilities, space and equipment • All IT types (except Internet/web) involve *organisational requirements*, including management involvement, staff training and a form of staff involvement (IT staff and general staff) • Internet/web and TLIT involve the *market-related requirement* of consumer return information and input • All IT types (except Internet/web) involve *SC requirements*, including third parties (3PRL, suppliers or software providers), and some forms of relationship and SCI (collaboration and partnerships) • Only TLIT involve the operational requirement of high volume and the organisational requirement of staff/manual input • Only barcode/RFID involve the operational requirement of network structures, the organisational requirement of organisation-wide implementation and the SC requirement of	• For effective IT practices in RL, organisations must be willing to invest and incur costs • Organisations must focus on operational requirements related to facilities/space and equipment for TLIT, barcode/RFID and RLIT practices • Organisations must involve management, train staff and involve IT and/or general staff for effective IT practices (except Internet/web) • For Internet/web and TLIT, organisations must focus on obtaining consumer return information • Organisations must focus on external relationships with third party providers and suppliers and some form of SCI, including collaboration and partnerships for effective IT practices (except Internet/web) • For TLIT, organisations must focus on transaction volume and staff/manual input • For barcode/RFID, organisations must focus on network structures and organisation- and SC-wide implementation • Organisations must commit to RL for effective RLIT practices • Organisations can consider 4PLs for general IT practices in RL

	SC-wide implementation • Only RLIT involves the organisational requirement of organisational commitment • Only general IT involves the SC requirement of 4PL providers	
Outcomes	• All IT practices involve benefits for RLM • All IT practices involve *economic outcomes*, but uniquely, TLIT can control costs • All IT practices (except RLIT) involve the economic outcome of addressing economic barriers in RL • All IT practices (except TLIT) involve the economic outcomes cost effectiveness, savings and reduction • General IT, TLIT and barcode/RFID practices involve the economic outcome of economic benefits • General IT, barcode/RFID and RLIT involve the economic outcome of enhancing economic performance • General IT, TLIT, and RLIT practices involve the economic outcome of profitability • Internet/web and TLIT practices involve the economic outcome of reducing asset requirements • All IT practices involve *operational outcomes*, including improvements in product return forecasting, visibility, and tracking, RL process efficiency, and facilitate/support RL processes, but uniquely, general IT improve RL process effectiveness, facilitate operational planning and simplifies RL transactions and TLIT facilitates RL/FL integration • General IT, Internet/web and RLIT practices involve the operational outcomes of addressing operational barriers in RL, including problems with product quality, and increase RL flexibility • All IT practices (except TLIT) involve the operational outcome of addressing IT barriers in RL • All IT practices (except general IT) involve the operational outcome of increasing RL process speed • All IT practices (except Internet/web) involve the operational outcomes of improving product return or inventory control • Internet/web, barcode/RFID and RLIT practices involve the operational outcomes of reducing operational errors and inconsistencies • TLIT, barcode/RFID and RLIT practices involve the operational outcome of reducing manual operations • General IT, barcode/RFID and RLIT practices can facilitate inventory management • All IT practices involve *organisational outcomes*, including facilitating and improving RLM and information management, but uniquely, general IT can increase RL program flexibility and barcode/RFID can facilitate RL implementation and performance management (PM) • All IT practices (except TLIT) involve the organisational outcome of enhancing RL performance • General IT, barcode/RFID and RLIT practices involve the organisational outcome of addressing organisational barriers in RL • General IT, TLIT and barcode/RFID practices involve the organisational outcomes of a successful RL program, and facilitating internal information sharing and facility/location practices • Barcode/RFID and RLIT practices involve the organisational outcome of facilitating RL design and development • General IT and RLIT practices involve the organisational outcomes of facilitating RL innovation and increasing RL capabilities and competencies • General IT and TLIT practices involve the organisational outcomes of facilitating decision-making and CFI practices • TLIT and barcode/RFID practices involve the organisational outcome of facilitating RPA practices • All IT practices (except Internet/web) involve *environmental outcomes*, but uniquely, TLIT can improve environmental performance • General IT, TLIT and barcode/RFID practices involve the environmental outcome of environmental benefits • General IT and TLIT involve the environmental outcome of reducing waste • General IT and RLIT practices involve the environmental outcome of environmental protection • Only general IT involves the *social outcome* of social responsibility (CSR) • All IT practices involve *market-related outcomes*, but uniquely, TLIT can provide market trend information and reduce	• Organisations that experience economic barriers in RL can consider all IT practices (except for RLIT) • Organisations that experience high RL costs and cost ineffectiveness can consider all IT practices (except TILT) • To control RL costs, organisations can consider TLIT practices • Organisations that seek economic benefits in RL can consider general IT, TLIT and barcode/RFID practices • To enhance economic performance in RL, organisations can consider general IT, barcode/RFID and RLIT practices • Organisations that seek higher profitability in RL can consider general IT, TLIT and RLIT practices • To reduce asset requirements in RL, organisations can consider Internet/web and TLIT practices • Organisations can implement all IT practices to improve product return forecasting, visibility and tracking, improve RL process efficiency and facilitate/support RL processes • Organisation can implement general IT practices to improve RL process effectiveness, facilitate operational planning and simplify RL transactions • To facilitate RL/FL integration, organisations can consider TLIT • Organisations that experience operational barriers in RL, including problems with product return quality, can consider general IT, Internet/web and RLIT practices • Organisations can consider general IT, Internet/web and RLIT practices for a flexible RL process • Organisations that experience IT barriers in RL can consider all IT practices (except TLIT) • For speedy RL processes, organisations can consider all IT practices (except general IT) • Organisations can implement all IT practices (except Internet/web) to improve product return or inventory control • To reduce operational errors and inconsistencies, organisations can consider Internet/web, barcode/RFID and RLIT practices • Organisations can implement TLIT, barcode/RFID and RLIT practices to reduce manual operations • Organisations can implement all IT practices to facilitate and improve RLM and information management • For a flexible RL program, organisations can implement general IT practices • Organisations can consider barcode/RFID practices to implement RL and facilitate PM • For greater RL performance, organisations can consider all IT practices (except TLIT) • Organisations that experience organisational barriers in RL can implement general IT, barcode/RFID and RLIT practices • For a successful RL program, organisations can consider general IT, TLIT and barcode/RFID practices • For internal information sharing and communication problems, organisations can consider general IT, TLIT and barcode/RFID • Organisations can consider general IT, TLIT and barcode/RFID practices to facilitate facility/location practices in RL • To design or develop effective RL, organisations can consider barcode/RFID and RLIT practices • For RL innovation, capabilities and competencies, organisations can consider general IT and RLIT practices • Organisations can consider general IT and TLIT to facilitate decision-making in RL • Organisations that experience problems with internal integration (CFI) can consider general IT and TLIT practices • Organisations that seek to reduce or avoid product returns can consider TLIT and barcode/RFID practices • Organisations can implement all IT practices (except Internet/web) for various environmental benefits • Organisations that seek to improve environmental performance can consider TLIT • For greater environmental benefits, organisations can consider general IT, TLIT and barcode/RFID practices • To reduce waste, organisations can consider general IT and TLIT • For environmental protection, organisations can consider general IT and RLIT practices • Organisations that seek social benefits, like CSR, in RL can consider general IT practices • Organisations can implement TLIT to access market trend information and reduce consumer uncertainty

	consumer uncertainty and general IT can facilitate CRM (managing consumer relationships) • All IT practices (except TLIT) involve the market-related outcomes of meeting consumer needs/demands and improving customer service • General IT, barcode/RFID and RLIT practices involve the market-related outcome of providing a competitive advantage • General IT, Internet/web and TLIT practices involve the market-related outcomes of facilitating consumer information sharing and communication • TLIT and barcode/RFID practices involve the market-related outcomes of improving consumer experience and responsiveness • General IT and Internet/web practices involve the market-related outcomes of improving consumer/customer satisfaction • All IT practices involve *SC outcomes*, including SC information sharing and communication, but uniquely, TLIT can facilitate SC innovation and barcode/RFID can improve SC forecasting and responsiveness • All IT practices (except RLIT) involve the SC outcomes of facilitating SCI and SC cooperation, and enhancing SC visibility • General IT, Internet/web and barcode/RFID practices involve the SC outcomes of facilitating SCM and SC collaboration • TLIT and barcode/RFID involve the SC outcomes of facilitating and improving reverse supply chain management (RSCM)	• For effective CRM, organisations can consider general IT practices • To meet consumer needs/demands and improve consumer/customer service, organisations can consider all IT practices (except TLIT) • To achieve a competitive advantage, organisations can consider general IT, barcode/RFID and RLIT practices • For consumer information sharing and communication problems, organisations can implement general IT, Internet/web and TLIT practices • To improve consumer experience and responsiveness, organisations can consider TLIT and barcode/RFID practices • Organisations can consider general IT and Internet/web practices to improve consumer satisfaction • Organisations that experience SC information sharing and communication challenges in RL, can consider all IT practices • To improve SC innovation, organisations can consider TLIT practices • To improve SC forecasting and responsiveness, organisations can consider barcode/RFID practices • Organisations that experience SCI and coordination barriers in RL can consider all IT practices (except RLIT) • For better SC visibility in RL, organisations can implement all IT practices (except RLIT) • For greater SCM and SC collaboration in RL, organisations can consider general IT, Internet/web and barcode/RFID practices • For better RSCM, organisations can consider TLIT and barcode/RFID • Organisations that experience various economic, operational, organisational, market-related and SC challenges in RL can consider all IT practices • Organisations that experience various economic, operational, organisational, environmental, social, market-related and SC challenges in RL can implement general IT practices • Organisations with specific RL problems and inefficiencies in consumer returns can implement the relevant IT practices that can address the specific RL problems

Source: Compiled by the researcher

Table 6.9 provides an in-depth understanding into the value of IT practices to manage consumer returns. Essentially, the findings show that general IT, Internet/web, TLIT, barcode/RFID, RLIT practices can be important for the management of consumer returns, but before implementing a specific IT system in RL a strategy/cost-benefit analysis must be performed. The importance of IT systems as a RL practice, will further be explored in the interviews with industry experts (chapter 8).

In the next section, integration practices to manage consumer returns will be presented, discussed and analysed.

6.4 INTEGRATION PRACTICES TO MANAGE CONSUMER RETURNS

The integrations RL practices mainly involve the internal and external relationships needed for effective management of consumer returns. The external relationships involve supply chain integration (SCI) and consumer integration (CI), while the internal relationships involve cross-functional integration (CFI). According to According to Bernon *et al.* (2011:495), Soltany *et al.* (2018:780) and Dapiran and Kam (2017:831) poor internal and external integration can be detrimental to the RL performance of retailers. Evidently, to effectively manage consumer returns, organisations must implement integration practices in RL.

Figure 6.**11** provides a distribution of these mentioned integration categories based on the results of the QCA of RL literature (see Appendix C.4).

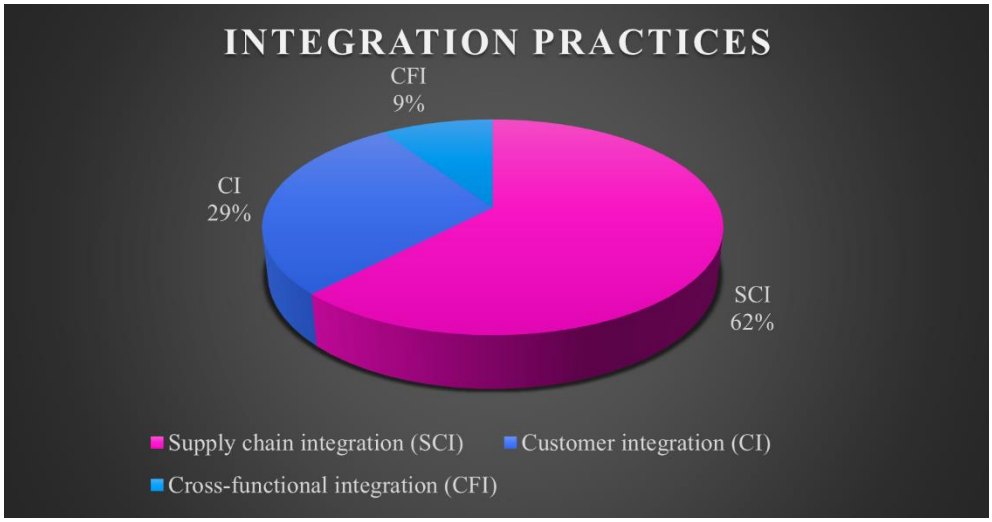

Figure 6.11 Distribution of integration practices in RL
Source: Compiled by the researcher

Figure 6.**11** shows that from the integration practices, SCI (62%) received the most attention in RL literature (from the QCA), while CI (29%) received moderate attention in RL literature. In contrast, CFI (9%) received the least attention, demonstrating a gap in RL literature. Consequently, RL literature focuses significantly on external relationships, meaning that these practices may be regarded as more important to manage consumer returns. Nevertheless, internal integration can be just as important, as Janse *et al.* (2010:508) explained that collaboration on all levels, including different departments within the organisation, is important to manage consumer returns. In fact, Asham and Rahman (2021:21) explains that internal integration is the starting point for effective external integration with SC parties.

In the subsequent sections the main integration categories will be discussed and analysed. The section concludes with a conceptual framework and summary of findings for integration practices to manage consumer returns.

6.4.1 Supply chain integration (SCI) to manage consumer returns

In this study SCI was identified as an umbrella term for the RL practices related to SC relationships, including collaboration, coordination, information sharing between SC partners and other strategic sharing initiatives, which can be viewed as critical for effective RLM. Consequently, SCI can be described as an important RL practice that involves the establishment of SC relationships between RL parties needed for a successful undertaking of RL (Agarwal *et al.* 2016:8).

Based on the findings (identified from the QCA of RL literature) SCI practices in RL involve (1) strategies of SCI, (2) requirements of SCI and (3) outcomes of SCI, which will be presented and discussed in subsequent sections. This section will conclude with a conceptual framework of SCI practices to manage consumer returns.

6.4.1.1 Strategies and requirements of SCI practices

SCI practices involve (1) several strategies, including general SCI strategies, strategic relationships, and strategic integration and sharing initiatives, and (2) few requirements, including economic, IT, operational, infrastructure and organisational requirements, which can contribute to the effective management of consumer returns. Table 6.10 provides an overview of the findings related to the *strategies and requirements of SCI* practices to manage consumer returns, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.10 Findings related to the strategies and requirements of SCI practices to manage consumer returns

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
General strategies in SCI	***Strategic approach***	None	• *"[…] integrated supply chain approach is taken to the management of returns […]."* (Bernon & Cullen, 2007:46) • *"[…] joint management (or collaborative) approach will likely be used […]."* (Lau & Wang, 2009:460) • *"[…] a life-cycle approach for products and materials is important […] for […] all members of the supply chain."* (Sarkis *et al.* 2010:347)
	Prioritise SCI practices	None	• *"[…] organisations can implement a variety of first-priority practices, such as […] sharing information with supply chain partners."* (Badenhorst, 2016:9)
	Strategic considerations	Kannan, (2009:399) Kannan *et al.* (2009:28)	• *"When companies consider implementing reverse logistics, they should also study the ability of their business partners and their reputations. High flexibility and capability of the partners are required because high variability exists in reverse flow."* (Ho *et al.* 2012:42) • *"[…] one critical issue that the supply chain nodes must consider is to be able to share information to support any decision level (strategic, tactical and operational) […]."* (Hernández *et al.* 2011:83) • *"3PLs are playing an increasing role in supporting such integrated supply chain management using sophisticated information systems and dedicated equipments."* (Ko & Evans, 2007:364) • *"[…] 4PLs have become logical alternatives for business process outsourcing by providing […] integration across multiple enterprises."* (Mukhopadhyay & Setaputra, 2006:718)
	Perform cost-benefit analyses	None	• *"It is critical for managers to take stock of the high costs involved in the reverse supply chain and realise that many of these costs can be mitigated through […] collaboration with supply chain partners."* (Jayaraman *et al.* 2008:424)
	Benefit driven strategies	None	• *"[…] collaborative […] approach will likely be used when reverse logistics is regarded as a source of long-term profit."* (Lau & Wang, 2009:460)
	Strategic definition of SCI	None	• *"[…] companies stated the need to define, a priori, collaborative objectives, scope, responsibilities, sharing of risk, and reward."* (Li & Olorunniwo, 2008:384)
	Strategic attainment of RL commitment and support from SC parties	Guarnieri *et al.* (2015:216) Khor *et al.* (2016:104)	• *"All supply channel members must be committed to the RL process."* (Sarkis *et al.* 2010:347) • *"The performance of supply chains rests […] with the disparity in the degree of resource commitment among supply-chain parties […] for the development of an RL programme.* (Sharif *et al.* 2012:2519) • *"[…] support from business partners is crucial for any company when considering the implementation of reverse logistics."* (Ho *et al.* 2012:42)
	Strategic negotiations	None	• *"[…] vendor agreements need to be strategically negotiated—not just accepted blindly Supplier agreements […] for each element of the RL process, and how the credit reconciliation process will function."* (Rogers *et al.* 2013:44) • *"[…] bargaining power is a factor key to the profit of participants in a reverse supply chain negotiation […]."* (Sheu & Gao, 2014:324) • *"The manufacturer and the retailer should negotiate a mechanism to let both of them reveal the information truthfully."* (Chen, 2011:485)
	Strategic development and utilisation of contracts	Hsu *et al.* (2009:525)	• *"Contract terms and conditions with suppliers are one of the most important factors for RL implementation."* (Agrawal *et al.* 2016d:20) • *"Contracts once enacted enforce the legal obligation of parties within the relationship."* (Breen, 2006:545) • *"Contracts are used in both relationships; between businesses, which dictates expected performance […]."* (Breen, 2006:545)
	Strategic communication in the SC	de Oliveira *et al.* (2012:1604) Huscroft *et al.* (2013b:316) Lhafiane *et al.* (2015b:397)	• *"Communication can be seen as a critical partnership attribute in supply chain alliances […] and a source of risk if communication is lacking."* (Breen, 2006:546) • *"Communication is essential to coordinating transactions and interactions […]."* (Huscroft *et al.* 2013a:238)

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
	Strategic collaboration in the SC	Hernández *et al.* (2011:83) Janse *et al.* (2010:508) Jayaraman *et al.* (2008:424) Morgan *et al.* (2016:304) Olorunniwo and Li (2010:454, 460) Prakash and Barua (2015:602) Ruiz-Benitez and Muriel (2014:574)	• *"Trading partners need to look at how they can work in a more collaborative way to achieve mutual benefit."* (Bernon *et al.* 2011:495) • *"Collaboration with a third-party software provider […] related to returned products."* (Bernon & Cullen, 2007:54) • *There is a need for collaborative initiatives in the supply chain and amongst retailers […]."* (Abraham, 2011:225) • *"[…] collaboration could extend to working with competitors."* (Bernon & Cullen, 2007:51)
	Strategic cooperation and coordination in the SC	Ho *et al.* (2012:39) Huscroft *et al.* (2013b:319) Ruiz-Benitez and Muriel (2014:574) Sarkis *et al.* (2010:348) Xiao *et al.* (2010:171) Xie and Breen (2014:457)	• *"Successful reverse logistics requires the whole-hearted participation of all the parties in the supply chain […]."* (Lau & Wang, 2009:459) • *"The successful RL implementation needs […] coordination & cooperation from supply chain partners."* (Prakash & Barua, 2015:600) • *"Reverse logistics requires supply chain members to coordinate […]."* (Vahabzadeh *et al.* 2015:335)
	Strategic collaboration, cooperation and coordination in the RSC	Prakash and Barua (2015:603) Jayaraman *et al.* (2008:424) Olorunniwo and Li (2010:455)	• *"Strategic collaboration with reverse chain partners […] Company should engage with reverse chain partners […]."* (Agarwal *et al.* 2016:3) • *"The ability to collaborate with various players in the reverse chain is as important as in the forward supply chain."* (Li & Olorunniwo, 2008:384) • *"[…] cooperation between reverse supply chain members […] provides complementary synergism."* (Sheu & Gao, 2014:324) • *"[…] managers should place efforts on the integration and coordination of the reverse supply chain […]."* (Bouzon *et al.* 2016:192)
	Strategic utilisation of incentives	None	• *"Some incentives to coordinate […] the supply chain […]."* (Ruiz-Benitez & Muriel, 2014:574) • *"[…] using appropriate incentives and […] to establish long-term partnering for mutual benefits."* (Das, 2012:1439)
	Strategic development of SC transparency, trust and loyalty	Shaik and Abdul-Kader (2014:97)	• *"[…] requires transparency and openness from both manufacturer and retailer […]."* (Mafakheri & Nasiri, 2013:193) • *"[…] collaborative process management requires building trust […]."* (Olorunniwo & Li, 2010:460) • *"[…] trust and efficient information sharing with business partners are essential for business success."* (Ho *et al.* 2012:42) • *"Loyalty and trust within a customer–supplier relationship are needed […] to promote a nurturing partnership."* (Breen, 2006:535)
	Strategic SCRM	None	• *"[…] supplier relationship management form the critical links in the supply chain and returns management […]."* (Janse *et al.* 2010:511)
	Strategic development of PM for SCI	None	• *"Performance measure […] Relationships […] Maintain long term relations and alliances among RL partners."* (Shaik & Abdul-Kader, 2012:30)
	Strategic review, assessment and maintenance of SCI practices	None	• *"Strategies involved […] reviewing and revising the status of their collaboration periodically."* (Li & Olorunniwo, 2008:384) • *"[…] reviewing relationship progress between businesses […]."* (Breen, 2006:546) • *"[…] companies have to maintain collaborative relations with both upstream and downstream members involved in reverse logistics programs."* (Ravi & Shankar, 2015:883)
Forms of strategic SC relationships	***SC consortiums***	Kilic *et al.* (2015:130)	• *"[…] joint consortium may be one of the options for handling returns […], for example common collection centre […]."* (Agrawal *et al.* 2016d:21)
	SC agreements and arrangements	Hazen *et al.* (2015:167) Jack *et al.* (2010:233)	• *"Establishing formal agreements […] providing a complete logistics solution related to the returns flows of goods […]."* (Genchev, 2009:143) • *"[…] vendor agreements need to be strategically negotiated—not just accepted blindly Supplier agreements […] for each element of the RL process […]."* (Rogers *et al.* 2013:44) • *"Retailers have contractual agreements with manufacturers regarding the collection of returned products."* (Das, 2012:1441) • *"[…] information sharing arrangements with partners were rated good or very good, indicating the level of importance placed on this aspect as a strategic competitive tool."* (Li & Olorunniwo, 2008:384)
	Contractual relationships	Breen (2006:545) Flygansvær *et al.* (2008:8) Xu *et al.* (2015:89)	• *"[…] retailer develops contractual relationships in order to promote partnerships that are oriented towards effective reverse logistics […] Formal contracts outline the goals, responsibilities and benefits of the supply chain partner relationship."* (Jack *et al.* 2010:233)
	Strategic long-term relationships	Ho *et al.* (2012:42) Olorunniwo and Li (2010:457)	• *"[…] building a strategic and long-term relationship, sharing information and risks, understanding the processes of other players and collaborating with each other, firms reap benefits."* (Yoo, 2014:151)
	Strategic partnerships	Ho *et al.* (2012:42) Olorunniwo and Li (2010:460) Sheu and Gao (2014:314) Vlachos (2016:4)	• *"[…] strategic partnerships between suppliers and buyers in supply chains, which are important in mutual relationship."* (Guarnieri *et al.* 2015:216) • *"Strategic partnerships with supply chain partners […]."* (Janse *et al.* 2010:507) • *"The key partners include payment service providers, technology providers and logistics providers. They are critical to the success of both retailers, and hence significant effort is devoted to creating a close partnership including frequent contacts, links through automated services and personal relationship assistants."* (Beh *et al.* 2016:11)

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
	Strategic alliances	Breen (2006:546) Zhou and Zhou (2015:59)	• *"A strategic alliance allows a company to take advantage of what it does well and enables it to seek partners who have strengths in other areas."* (Agrawal & Choudhary, 2014:20) • *"Alliances: collaboration with suppliers and customer related to equipment, vehicles, warehouses, information technology, exchange of information, co-development of new services or products, exchange of knowledge."* (Guarnieri *et al.* 2015:217)

	IT Infrastructure	None	• *"[…] if almost all members in the supply chain adapt the barcode system for information management, the remaining members will be pressured to develop the technology and infrastructure for integration."* (Ho *et al.* 2012:43) • *"[…] the lack of […] infrastructure and technology may be an obstacle to collaboration."* (Lau & Wang, 2009:459) • *"Information exchange […] to which data is accessible to partner firms through mutually agreed exchange infrastructure."* (Olorunniwo & Li, 2010:455)
	Compatible IT	Olorunniwo and Li (2010:454)	• *"[…] systems compatibility between specific supply chain partners can be difficult to arrange, but is nonetheless necessary for effective and efficient operation."* (Huscroft *et al.* 2013a:232)
Organisational requirements	***Management involvement***	None	• *"It is critical for managers to take stock of the high costs involved in the reverse supply chain and realise that many of these costs can be mitigated through […] collaboration with supply chain partners."* (Jayaraman *et al.* 2008:424) • *"[…] managers should place efforts on the integration and coordination of the reverse supply chain to attain shared responsibility for the returned product […]."* (Bouzon *et al.* 2016:192) • *"The ultimate goal of any RL manager is to eventually reach a relationship stage with strategic business partners that involve […] collaborative process management."* (Olorunniwo & Li, 2010:460) • *"Efficient leadership is needed to provide clear vision and value to reverse logistics programs and should demonstrate commitment to the reverse logistics activities by integrating all the members of the supply chain."* (Ravi & Shankar, 2015:887)
	Organisational commitment to RL	None	• *"[…] for staff to recognise and appreciate the internal commitment to providing a reverse logistics function as part of the wider supply chain, hence, engendering trust among supply-chain participants […]."* (Sharif *et al.* 2012:2523)
	CFI	Bernon *et al.* (2016:600)	• *"Inter-firm coordination and collaboration is almost impossible if not preceded by intra-firm coordination through information sharing."* (Olorunniwo & Li, 2010:456)

Source: Compiled by the researcher

Table 6.10 shows that SCI includes several strategies and requirements, which will be discussed in subsequent sections.

6.4.1.1.1 General strategies of SCI practices in RL

The general strategies of SCI in RL include (1) strategic approaches, (2) prioritising SCI practices, (3) strategic considerations, (4) performing cost-benefit analyses, (5) benefit-driven strategies, (6) strategic definition of SCI, (7) strategic attainment of RL commitment and support from SC parties, (8) strategic negotiations, (9) strategic development and utilisation of contracts, (10) strategic communication, collaboration, cooperation and coordination in the SC, (11) strategic collaboration, cooperation and coordination in the RSC, (12) strategic utilisation of incentives, (13) strategic development of SC transparency, trust and loyalty, (14) strategic SC relationship management, (15) strategic development of performance measurement (PM) for SCI, and (16) strategic review, assessment and maintenance of SCI.

SCI strategies must be initiated by developing and adopting a *strategic approach* for SCI, which can include an integrated SC approach, a collaborative approach and a life-cycle approach. Evidently, organisations must develop an approach that focus on long-term SC relationships to not only manage consumer returns effectively but also extend the life cycle of returned products. Like IT practices, *SCI practices* must be *prioritised* to manage consumer returns, which means that organisations must engage in information sharing and focus on developing SC relationships.

Certain *strategic considerations* can also be important for SCI, for instance, organisations must consider partnership selection before initiating SCI initiatives. Specifically, organisations need to consider SC partner capabilities, reputation, flexibility and willingness to share information, which can be important for managing consumer returns effectively. The SC partner capabilities may relate to IT capability, RL capability, RL expertise, RL infrastructure or even established relationships with other organising with strong RL capabilities (e.g. 3PRL providers). Evidently, organisations can consider outsourcing RL to third parties (e.g. 3PLs or 4PLs) for effective SCI. Additionally, third parties can facilitate with the IT requirements in SCI (see section 6.4.1.1.4), which can equally be important for effective SCI practices (such as information sharing).

Furthermore, like IT practices, organisations must *perform cost-benefit analyses* to recognise and identify RL costs as well as the benefits of SCI to mitigate high RL costs. However, organisations may also consider SCI practices (strategies and requirements) as the costs and the SCI outcomes as the benefits, which may demonstrate the significance of SCI to manage consumer returns. Consequently, SCI must involve *benefit-driven strategies,* which focus on long-term profitability and other benefits needed for adopting SCI practices.

Developing SCI strategies means that organisations must *strategically define SCI,* which may involve defining a strategic SC relationship (section 6.4.1.1.2) and sharing initiatives (section 6.4.1.1.3), like SC goals and objectives, party responsibilities, shared risks and shared profits/rewards. Additionally, organisations need to strategically *attain RL commitment* and *support* from *SC parties,* demonstrating that a lack of commitment and support in RL extend organisational (internal) barriers (see section 2.3.3) to include SC (external) barriers to effective RLM.

Strategic negotiations can be important in developing effective SC agreements and relationships. For instance, suppliers and retailers can negotiate every stage of the RL process, specifying the supplier responsibilities (such as dealing with defective and warranty returns, and providing credits/refunds or repairs) and retailer responsibilities (such as collecting defective products, inspecting and testing products, identifying disposition options and engaging with consumers). Nevertheless, strategic negotiations must involve bargaining power and transparency (sharing truthful information), ensuring that both parties' benefit from the agreement (e.g. enhanced profitability for both parties). Subsequently, *strategic development* and *utilisation* of *contracts* can be important for managing SC relationships. Evidently, organisations can develop contracts with partners that include the terms and conditions for dealing with consumers returns, enforcing RL responsibilities and specifying shared benefits, demonstrating the importance of defining SCI and negotiating effectively.

Additional strategies needed for effective SCI include strategic communication, collaboration, cooperation and coordination in the SC. Specifically, *strategic communication* can be important for other SCI strategies, like negotiations, SC coordination and SC relationships. In fact, a lack of communication can be source of risk for all SC parties and hamper effective information sharing, which can be detrimental to effective and efficient RLM. Likewise, *strategic collaboration* can be critical for SCI and form the basis of developing strategic collaborative relationships (see section 6.4.1.1.2). Consequently, organisations must start with collaborative initiatives, like collaborating with SC parties (such as suppliers and 3PL providers) and competitors (e.g. other retailers), for effective SCI. *Strategic cooperation* and *coordination* as elements of SCI mean that all SC parties must fully participate and engage in RL processes and practices for effective RL, demonstrating the importance of attaining RL commitment and support in the SC.

Strategic collaboration, *cooperation* and *coordination* in the *RSC* can be equally important for effective SCI in RL. Consequently, organisations must apply the same strategies of the forward SC to the RSC, collaborating, cooperating and coordinating with RSC partners (e.g. third-party buyers and recovery specialist, and 3PRL providers) (also see section 5.6). Accordingly, organisations can benefit from the *strategic utilisation* of *incentives* to encourage (R)SC partners to engage in collaborative and coordinative efforts and promote long-term relationships to manage consumer returns.

Part of the SCI strategies must be the continued development and maintenance of relationship initiatives. Particularly, *strategic development* of *transparency*, *trust* and *loyalty* between SC parties, involving openness, honesty and truthfulness, can be essential for maintaining and nurturing strategic relationships. Likewise, *strategic SC relationship management* can be important for managing SC relationships for effective RLM.

Furthermore, organisations must *strategically develop PM* in SCI to measure the effectiveness of the strategic relationships to manage consumer returns. Therefore, PM practices in RL can form an important part of SCI strategies in RL. Similarly, organisations must *strategically review*, *assess* and *maintain* SCI practices, which can include periodically reviewing and assessing collaborative efforts and SC relationships, and maintaining preestablished SCI strategies related to collaboration, coordination and cooperation.

6.4.1.1.2 Forms of strategic SC relationships in RL

Table 6.10 shows that the forms of strategic relationships in SCI can range from basic agreements to more complex strategic alliances and collaborative relationships. Evidently, the forms of strategic SC relationships in RL can include (1) SC consortiums, (2) SC agreements and arrangements, (3) contractual relationships, (4) strategic long-term relationships, (5) strategic partnerships, (6) strategic alliances, and (7) strategic collaborative relationships.

The more basic relationship formations in SCI, include consortiums, agreements and contractual relationships. *SC consortiums* (or joint consortiums) can be a basic from of a SC relationship, which involves sharing of RL processes and resources. Examples of joint consortiums can be several retailers sharing collection centres for consumer returns, emphasising the importance of collaborative initiatives with competitors (see section 6.4.1.2). While consortiums involve sharing of resources for RL between competitors, *agreements* and *arrangements* involve relationships between suppliers and retailers, which can be used as a competitive tool. Agreements relate to strategic negotiations (standard SCI strategy) to establish the responsibility of the supplier and the retailer in dealing with consumer returns, which can be bound through contracts. Arrangements can include information sharing between SC partners, which can be critical for effective RL processes and practices (see section 6.4.1.2).

Although agreements can be captured in contracts, SCI can also involve *contractual relationships*, which relates to the strategic utilisation of contracts to manage consumer returns. Therefore, organisations, like retailers, can focus on developing contractual relationships with other SC partners (like suppliers and 3PL providers), which involve terms and conditions, legal obligations, RL responsibilities and mutual benefits. For example, a retailer can develop a contractual relationship with

a 3PL provider for the collection and transportation of consumer product returns and with a supplier for the repairs of defective product returns.

More complex strategic relationships in RL can include strategic long-term relationships, partnerships, alliances and collaborative relationships. A *strategic long-term relationship* may be more appropriate for established parties in a mature SC since it involves sharing of information and risks, understanding each party's RL processes and collaboration. *Strategic partnerships* can be formed between suppliers and retailers and between retailers and other parties (such as IT providers and 3PL providers), extending basic SC agreements and contractual relationships. Strategic partnerships in RL involves more effort and commitment through frequent communication, integrated systems for information sharing and appointing staff to manage the relationship.

Strategic alliances can be more complex than strategic partnerships that involve active seeking of partners with strong capabilities to manage consumer returns effectively, emphasising the importance of strategic considerations in SCI (section 6.4.1.1.1). Like strategic partnerships, alliances include collaboration between SC parties but extend integrated systems and frequent communication to include strategic sharing of infrastructure (e.g. equipment and facilities), IT, information and knowledge, and collaborative development products and services for effective RLM.

Finally, *strategic collaborative relationships* can be described as the most complex form of SC relationships, involving multiple SC parties that work collaboratively together to improve the overall RLM of the SC. Strategic collaborative relationships can involve strategic integration and sharing initiatives, like integration of RL processes, common goals, joint information sharing, joint planning, joint meetings, joint PM, and sharing risks and rewards (see section 6.4.1.1.3). Regardless of the types of strategic integration and sharing initiatives, strategic collaborative relationships require several strategic management initiatives for the effective management of consumer returns.

6.4.1.1.3 Strategic integration and sharing initiatives for SCI practices in RL

As mentioned in the preceding discussion of relationship strategies, SCI in RL can involve strategic integration and sharing initiatives (see Table 6.10), which form part of strategic relationships to manage consumer returns. Particularly, strategic integration and sharing for SCI in RL include (1) implementing an integrated RL strategic plan, (2) strategic alignment of interest, (3) strategic development, integration and standardisation of RL processes, (4) strategic sharing of goals and objectives, (5) joint meetings, planning, problem solving and PM, (6) strategic sharing of knowledge, (7) strategic integration and sharing of information and IT, (8) strategic sharing of resources, (9)

strategic sharing of infrastructure and facilities, (10) strategic sharing of responsibilities, (11) strategic sharing of costs, risks, profits and rewards, and (12) strategic implementation of integrated SCM.

For effective strategic sharing and integrative initiatives, organisations can *implement an integrated RL strategic plan* for SCI, which means that organisations need to align RL goals, strategies, practices and processes. An integrated RL strategic plan can be implemented for less complex SC relationships (such as contractual relationships) but can be utilised for the development of more complex relationships, like strategic long-term relationships or partnerships.

Strategic alignment of *interest* associates with strategic collaboration and contracts, which means that SC parties move away from self-interests towards common interests to improve the RLM of consumer returns. Furthermore, *strategic integration* and *standardisation* of *RL processes* associate with collaborative relationships, in which, collaborating SC partners use the same RL processes and practices across the SC. Integrating and standardising RL processes requires other SCI strategies, like strategic development of trust and loyalty (general SCI strategy), integrated strategic RL plans and strategic sharing of goals.

Evidently, *strategic sharing* of *goals* and *objectives* can be important in collaborative relationships, not only involving setting joint goals (e.g. effective RLM) but also actively working towards achieving shared goals (e.g. implementing practices to achieve effective RLM). *Joint meetings* can be appropriate for any strategic initiative in SCI, including general SCI strategies, like negotiations, communication and cooperation, and strategic relationships like, SC agreements, contractual relationships, strategic partnerships, alliance and collaborative relationships, and other strategic sharing initiatives, like knowledge and information sharing.

Other management activities that can be strategically shared between SC partners involve joint planning, problem solving and PM, emphasising the implementation of an integrated strategic plan in RL and the general strategy of developing PM for SCI (section 6.4.1.1.1). Consequently, *joint planning, joint problem solving* and *joint PM* indicates that SC partners can operate as one entity to develop, implement, measure and manage RL processes effectively.

Strategic knowledge sharing can include the development of knowledge sharing programmes aimed at sharing RL knowledge between SC parties, indicating more complex strategic relationships, like strategic partnerships, alliances and collaborative relationships. In contrast, *strategic integration* and *sharing of information* can be important for any form of SCI, including general SCI strategies of negotiation, communication, development of transparency, trust and loyalty and implementation of integrated SCM (section 6.4.1.1.1) and various forms of strategic SC relationships (section 6.4.1.1.2).

Strategic information sharing can involve timely and accurate information sharing between SC parties on consumer demand, RL processes and activities, RL performance and RL costs, which can be important for the management of consumer returns.

Relating to integration and sharing of information, *strategic integration* and *sharing of IT* means that SC partners can choose to integrate IT systems or share and utilise the same IT, which can be critical for effective RLM. This confirms the importance of the IT practices relating to developing and implementing integrative IT for RL to benefit all SC parties (see section 6.3.1). Equally important for effective RLM can be *strategic sharing* of *resources*, which involve SC partners combining resources (such as finance, human and knowledge resources) for RL processes and practices. *Strategic sharing* of *infrastructure* and *facilities* for RL can be important for certain strategic relationships, including joint consortiums (e.g. several retailers using the same facility to process consumer returns) and collaborative relationships (e.g. sharing equipment, vehicles and facilities).

Strategic sharing of *responsibilities* can associate with the general SCI strategies of negotiation and utilisation of contracts (section 6.4.1.1.1), strategic relationships, like SC agreements, contractual relationships and collaborative relationships (section 6.4.1.1.2). Responsibilities may relate to the knowledge and competency of the SC parties in the relationship, for example, the 3PL provider being responsible for collection and transportation, the retailer being responsible for receiving, inspection, sorting, processing and basic disposition (e.g. direct reuse) and the supplier being responsible for product recovery (e.g. repair and refurbishment of used/damaged products). Alternatively, sharing responsibilities can involve sharing RL processes in which all SC parties in the relationship work collaboratively to perform specific RL processes. For example, a multichannel retailer can be responsible for in-store return collection, the 3PL provider for the pick-up collection from the consumer, and the manufacturer for the collection of warranty and defective consumer returns.

Relating to strategic sharing of IT, resources, and infrastructure can be *strategic sharing of costs* in RL. For instance, retailers using the same facility for RL can share rent and utility costs and SC parties using the same IT for RL can share the costs of procuring, implementing and maintaining the IT system, which may help addressing economic barriers (e.g. high costs) in RL (see section 2.3.1).

Strategic sharing of *risk*, *profits* and *rewards* associate with complex strategic SC relationships, like strategic long-term relationships, partnerships, alliances and collaborative relationships. Strategic sharing of risk can associate with sharing knowledge, information and costs, while strategic sharing of rewards and profits can associate with the outcomes of SCI, demonstrating the importance of performing a cost-benefit analysis in SCI (see section 6.4.1.1.1). The potential rewards and profits that

can be expected from strategic relationships and initiatives will be explored in the outcomes of SCI practices in RL (section 6.4.1.2).

Finally, organisations can *strategically implement integrated SCM*, ensuring that all SC parties participate in SCI and that all shared plans, goals, practices, processes and resources can contribute to the effective RLM of consumer returns.

6.4.1.1.4 Requirements of SCI practices in RL

Table 6.10 shows that the requirements of SCI practices in RL include economic, IT, and organisational requirements. The *economic requirement* of SCI involves costs of strategic relationships (such as TCO) and RL costs, emphasising the importance of performing a cost-benefit analysis (general SCI strategy) and strategic sharing of costs in SCI (sections 6.4.1.1.1 and 6.4.1.1.3).

The *IT requirements* of SCI include IT competency, utilising IT, IT infrastructure and compatible IT, demonstrating the important link between SCI and IT practices to manage consumer returns. Specifically, organisations can combine IT practices, like developing an *IT competency*, with SCI practices, like collaboration, to produce complex resources for the effective management of consumer returns. Additionally, *utilisation of IT*, like Internet/web-based IT, EDI and barcode/RFID IT, can be critical for SCI strategies like strategic communication, development of transparency and trust, strategic integration and sharing of information and IT (sections 6.4.1.1.1 and 6.4.1.1.3). Moreover, IT can facilitate capturing and storage of SC relationship data (such as contract details) and promote collaborative efforts needed to manage consumer returns (e.g. RFID implementation requires collaboration).

Likewise, the importance of an *IT infrastructure* in RL can encourage the adoption of SCI practices by all members of the SC and facilitate key elements of SCI including, communication, collaboration, coordination, transparency, integrated SCM, and strategic integration and sharing initiatives. Lastly, *compatible IT* can be important for more basic SC relationships, involving integration and sharing of information between SC parties through separate IT in RL. Consequently, a lack of IT in RL can hamper effective implementation of SCI practices, demonstrating the importance of a holistic approach to manage consumer returns.

Finally, the *organisational requirements* of SCI in RL include management involvement, organisational commitment to RL and CFI (internal integration). *Management involvement* can be important for the development and realisation of several SCI strategies, including performing a cost-benefit analysis for SCI, focussing efforts on strategic collaboration, coordination and cooperation in the (R)SC, seeking the development of strategic relationships (e.g. strategic partnerships and alliances)

and sharing of RL responsibilities (strategic sharing initiative), as well as for understanding high RSC costs.

Additionally, managers can be responsible for demonstrating commitment to RL, which can be important for attaining the SCI requirement of *organisational commitment to RL*. Consequently, without organisational commitment to RL, attaining RL support and commitment from SC parties (general SCI strategy) (section 6.4.1.1.1) would be futile. Similarly, *CFI* practices can be important for SCI since the inability to share information, knowledge and resources internally (between departments) can hamper effective external integration and sharing efforts between SC parties.

Essentially, SCI practices can involve several other RL practices, including IT (section 6.3), CFI (section 6.4.3), RL outsourcing (section 6.5), PM in RL (section 6.7) and management and staff practices (section 6.9.5), demonstrating the importance of a holistic approach to the effective management of RL. In the next section, the outcomes of the SCI strategies and requirements will be explored.

6.4.1.2 Outcomes of SCI practices in RL

The outcomes of SCI practices can be described as the results of incorporating the strategies and requirements of SCI needed for effective RLM of consumer returns. Like the strategies and the requirements, the outcomes (benefits) of SCI were divided into categories, namely economic outcomes, operational outcomes (related to RL processes), organisational outcomes, environmental outcomes, market-related outcomes and SC outcomes. Table 6.11 provides an overview of the findings related to the *outcomes of SCI* practices to manage consumer returns, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.11 Findings related to outcomes of SCI practices to manage consumer returns

CATEGORY	SUB-CATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
Economic outcomes	***Address economic barriers in RL***	None	• *"[…] collaboration allows for investment in assets specific to reverse logistics […]."* (Vlachos, 2016:4) • *"It is critical for managers to take stock of the high costs involved in the reverse supply chain and realise that many of these costs can be mitigated through […] collaboration with supply chain partners."* (Jayaraman *et al.* 2008:424) • *"[…] one of the key cost drivers of retail reverse logistics is poor integration between the various interfaces that exist between internal and external organisational actors."* (Bernon *et al.* 2011:495)
	Economic benefits and asset recovery	None	• *"Collaborations between supply chain partners may help to realise financially beneficial […] options."* (Beh *et al.* 2016:23) • *"Collaboration with supply chain partners helps […] maximize [sic] asset recovery."* (Partida, 2011:63)
	Reduce investment and asset requirements	None	• *"Joint consortium […] is being used by many companies reducing their investments […]."* (Agrawal *et al.* 2016d:21) • *"Joint consortium may help […] in reduced investment for joint reprocessing/recycling facilities."* (Agrawal *et al.* 2016d:25) • *"Owing to high asset value […] of RL processes, firms must develop RL related capabilities: […] sharing information, and collaborating with partners."* (Olorunniwo & Li, 2010:454)

CATEGORY	SUB-CATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
	Economies of scale	Kilic *et al.* (2015:130)	• *"[…] managers should place efforts on the integration and coordination of the reverse supply chain to attain shared responsibility for the returned product, augmenting scale gains […]."* (Bouzon *et al.* 2016:192) • *"Joint consortium […] such kind of business model, for example common collection centre […] economies of scale can be achieved."* (Agrawal *et al.* 2016d:21)
	Cost reduction and savings	Jayaraman *et al.* (2008:416, 424)	• *"If an integrated supply chain approach is taken to the management of returns, the opportunity for companies to reduce these associated logistics costs could be in the order of 20–40% […]."* (Bernon & Cullen, 2007:46) • *"[…] cost savings should be achieved by considering a collaborative process in this reverse logistics model for supply chains."* (Hernández *et al.* 2011:109) • *"[…] managers should place efforts on the integration and coordination of the reverse supply chain to […] lowering RL costs."* (Bouzon *et al.* 2016:192) • *"Joint consortium […] is being used by many companies reducing their […] operational costs. […] exploring such kind of business model, for example common collection centre for all used cellular phones may reduce collection cost […]."* (Agrawal *et al.* 2016d:21) • *"RL alliance is very likely to facilitate a reduction in RL operational costs […]."* (Sheu & Gao, 2014:314) • *"Due to the significant costs of establishing and maintaining such a recovery network, collaborative planning […] for a joint take-back system is often advisable."* (Schultmann *et al.* 2006:1035) • *"Such information exchange enhances operational efficiency in RL […], which can in turn lead to cost reductions […]."* (Olorunniwo & Li, 2010:456) • *"Collaboration may also extend to companies operating shared services. An example could be the shared collection of returns for all retailers […] to reduce transport cost."* (Bernon & Cullen, 2007:54)
	Profitability	Kim and Goyal (2011:2535) Lee and Rhee (2007:216) Li and Olorunniwo (2008:385) Partida (2011:63)	• *"[…] integrated supply chain approach […] enhance the profitability of retailers […]."* (Bernon & Cullen, 2007:55) • *"[…] in a reverse supply chain negotiation framework […] increased bargaining power in negotiations ensures increased profits."* (Sheu & Gao, 2014:324) • *"[…] a cooperative reverse supply chain can […] create new profit sources […]."* (Sheu & Gao, 2014:324) • *"[…] RL […] profitability is influenced by the efficiency achieved through coordination and integration."* (Sarkis *et al.* 2010:348) • *"Collaborations between supply chain partners […] may offer insights into the potential of second-life retailing in reverse logistics in creating new markets and profitable operations.* (Beh *et al.* 2016:23)
Operational outcomes	***Address operational barriers***	Huscroft *et al.* (2013a:232)	• *"[…] the operational barriers in reverse logistics included problems with product quality, limited forecasting and visibility, inadequate information and technology systems and developmental barriers. The practices that were identified for overcoming these barriers included […] collaborating and sharing information with supply chain partners."* (Badenhorst, 2016:10) • *"[…] collaborative, technology-enabled engagements should assist in addressing the growing problem of product returns."* (Morgan *et al.* 2016:295)
	Address forecast and visibility problems	None	• *"To address issues with limited forecasting and visibility in reverse logistics, organisations can implement a variety of first-priority practices, such as […] sharing information with supply chain partners."* (Badenhorst, 2016:9)
	Address IT barriers in RL	None	• *"Collaboration with a third-party software provider provided real-time information systems related to returned products."* (Bernon & Cullen, 2007:51) • *"To overcome the barrier of inadequate information technology systems, organisations can […] collaborate and share information with supply partners."* (Badenhorst, 2016:9)
	Facilitate product return tracking	Ho *et al.* (2012:42)	• *"For tracking to be most effective in the use of RFID, all players in the supply chain must work collaboratively and utilize [sic] the same system and processes […]."* (Kumar *et al.* 2009:197) • *"Such information exchange enhances operational efficiency in RL […] and product tracking […]."* (Olorunniwo & Li, 2010:456)
	Reduce uncertainties of product returns	None	• *"[…] collaboration […] specific to reverse logistics which reduces uncertainty."* (Vlachos, 2016:4) • *"All parties involved in the supply chain must be able to effectively relay accurate and timely information to each other; this information exchange mitigates some of the issues stemming from infrequent and unstable demands in the reverse process.* (Huscroft *et al.* 2013a:232)
	Facilitate and support RL processes	Olorunniwo and Li (2010:456)	• *"Successful cooperation with its supplier can smooth a product return process […]."* (Sharif *et al.* 2012:2527) • *"Collaboration through electronic media would enable fast, effective, efficient and timely communication that would facilitate […] RL activities."* (Prakash & Barua, 2015:603) • *"[…] having contractual arrangements in place with key suppliers and vendors […] are required to handle these returns."* (Jack *et al.* 2010:242) • *"The key partners […] are critical to the success of both retailer […] These partners perform a key role in facilitating reverse logistics […]."* (Beh *et al.* 2016:11) • *"[…] when collaboration is done in the presence of an IT competency, increased information sharing can improve the firm's ability to handle returns."* (Morgan *et al.* 2016:305)
	Improve RL process speed, efficiency and effectiveness	Olorunniwo and Li (2010:456)	• *"[…] RL […] collection, sorting, and processing […] efficiency achieved through coordination and integration."* (Sarkis *et al.* 2010:348) • *"[…] intra-organizational [sic] collaboration facilitates enhanced levels of RL processing effectiveness."* (Huscroft *et al.* 2013a:238) • *"Retailers and manufacturers can collaborate to streamline the collection and sorting process as well."* (Jayaraman *et al.* 2008:416) • *"[…] to reduce the delay in processing an RMA, the suppliers could collaborate with the retailers."* (Jayaraman *et al.* 2008:417) • *"[…] collaborative arrangements to manage final product dispositioning effectively."* (Bernon &

Source: Compiled by the researcher

Table 6.11 shows that SCI practices in RL associate with economic, operational, organisational, environmental, social, market-related and SC outcomes, which will be discussed in subsequent sections.

6.4.1.2.1 Economic outcomes of SCI practices in RL

The economic outcomes of SCI practices include (1) addressing economic barriers, (2) economic benefits and asset recovery, (3) reducing investment and asset requirements, (4) economies of scale, (4) cost savings and reduction, and (5) profitability. Like IT practices (section 6.3), SCI practices can *address economic barriers* in RL (like high financial investments and RL costs) (see section 2.3.1). Particularly, organisations can mitigate high financial investments through the general SCI strategy of collaboration, and high RL costs through a cost-benefit analysis (general strategies), strategic collaborative relationships (form of strategic SC relationship), management involvement and CFI (organisational requirements), emphasising strategic sharing initiatives of costs, infrastructure, IT and resources (section 6.4.1.1.3).

Furthermore, organisations can realise *economic benefits* and improve *asset recovery* through strategic collaborative relationships and *reduce investment* and *asset requirements* through strategic SC relationships, like consortiums and collaborative relationships, and strategic sharing of information. For example, sharing facilities in a joint consortium means that organisations can pool resources into one facility instead of investing into a new facility. Additionally, organisations can achieve *economies of scale* in RL through strategic reverse SC (RSC) coordination (general strategy), SC consortiums (strategic SC relationship), strategic sharing of infrastructure/facilities and responsibilities (strategic sharing initiatives), and management involvement (organisational requirement).

Various SCI practices can *reduce* or *save costs* in RL, including the (1) general SCI strategies of a strategic approach (integrated SCM), strategic collaboration in the SC and strategic coordination in the RSC, (2) SC relationships of SC consortiums, strategic alliances and strategic collaborative relationships, (3) strategic sharing initiatives of joint planning, and sharing of information, facilities and responsibilities, and (4) organisational requirement of management involvement. Particularly, an integrated SC approach can reduce total RL costs, consortiums and strategic alliances can reduce RL operational costs, and collaborative relationships, sharing facilities (such as collection centres) and sharing responsibilities (such as collection) can reduce RL collection and transport costs.

Finally, *profitability* can be enhanced through general SCI strategies, including a strategic integrated SC approach, negotiations, SC coordination and RSC cooperation, and strategic collaborative relationships, which demonstrate the importance of performing a cost-benefit analysis for SCI. Essentially, organisations with financial challenges in RL can benefit from the implementation of SCI practices for the effective management of consumer returns.

6.4.1.2.2 Operational outcomes of SCI practices in RL

Several operational outcomes associate with SCI, including (1) addressing operational barriers, (2) addressing forecasting and visibility problems, (3) addressing IT barriers in RL, (4) facilitating product return tracking, (5) reduce uncertainties of product returns, (6) facilitating and supporting RL processes and activities, (7) improving RL process speed, efficiency and effectiveness, and (8) operational efficiency and inventory control.

Specifically, *operational barriers*, including problems with product returns (e.g. uncertainties in quality, quantity and timing) and a lack of IT and infrastructure, can be *addressed* through strategic collaborative relationships, strategic information sharing, and utilisation of IT (requirement). Evidently, organisations can *address forecasting* and *visibility problems* in product returns by prioritising SCI (general strategy), engaging in strategic collaborative relationships and sharing information with SC

partners. Similarly, *IT barriers* in RL can be *addressed* through strategic collaboration (general strategy), strategic collaborative relationships and strategic information sharing, which emphasise the strategic integration and sharing initiatives related to integrated IT systems or shared IT systems in SC relationships (see section 6.4.1.1.3).

Moreover, *product return tracking* can be *facilitated* through strategic collaborative relationships, strategic sharing and integration of information and IT, and utilisation of IT (requirement), emphasising the importance of SCI for improved visibility of product returns. Consequently, organisations can *reduce product return uncertainties* through SCI practices, including strategic collaboration (general strategy) and strategic information sharing (such as timely and accurate information).

Several SCI practices can *facilitate* and *support RL processes*, including (1) general SCI strategies related to utilisations of contracts, communication, cooperation and collaboration, (2) strategic SC relationships, like SC agreements and partnerships, (3) strategic information sharing, and (4) IT requirements related to IT competency and IT utilisation. Likewise, various SCI practices can *improve* the *speed*, *efficiency* and *effectives* of *RL processes*, including (1) general SCI strategies related to cooperation and collaboration, (2) strategic SC relationships, like SC agreements, contractual relationships and strategic partnerships, (3) strategic sharing and integration initiatives, like sharing information, resources, infrastructure/facilities and responsibilities, and implementing integrated SCM, and (4) the IT requirement of compatible IT.

Particularly, SC coordination, collaboration, information sharing, strategic partnerships and compatible IT can be important for speedy, efficient and effective return processing. Additionally, SC coordination and collaboration can enhance the speed and efficiency of collection and sorting processes, SC collaboration and SC arrangements can enhance the effectiveness of product disposition, and strategic sharing of resources can enhance the speed of redistribution.

Finally, organisations can enhance *operational efficiency* through strategic communication, cooperation (general SCI strategies) and strategic information sharing, which can lead to better *inventory control*. Essentially, SCI practices can be critical for organisations that experience operational barriers and inefficiencies in the RL processes of consumer returns.

6.4.1.2.3 Organisational outcomes of SCI practices in RL

Several *organisational outcomes* can associate with SCI practices, including (1) facilitating RL planning, design and development, (2) successful RL implementation, (3) successful RL function, (4) focussing on core competencies, (5) enhancing RL competencies, (6) facilitating RL innovation, (7)

enhancing RL performance, (8) facilitating and improving RLM, (9) facilitating decision-making, (10) facilitating information management, and (11) facilitating RPA practices.

Particularly, SCI strategies, like strategic cooperation and collaboration in the RSC (general strategy), strategic collaborative relationships, strategic joint meetings and strategic sharing of resources, can *facilitate RL planning, design* and *development.* Furthermore, organisations can *successfully implement RL* through (1) general SCI strategies, like strategic considerations (e.g. appropriate and capable partners), attaining RL support from SC partners, utilising contracts, SC cooperation, coordination and collaboration, and developing SC trust, (2) strategic long-term relationships and (3) strategic integration and sharing of information. Consequently, a *successful RL function* can be realised through strategic cooperation and collaboration, strategic development of trust, strategic long-term relationships and strategic information sharing.

Furthermore, strategic alliances (SC relationship form) enable organisations to *focus* on their *core competencies.* However, organisations that seek to enhance *RL competencies* can consider SC collaboration (general strategy) or combining collaboration with IT competency (IT requirement). Moreover, strategic collaborative relationships can *facilitate RL innovation,* which can relate to the marketing-related outcomes of obtaining a competitive advantage and developing new markets (see section 6.4.1.2.4).

Additionally, the SCI strategies related to utilisation of contracts, communication, cooperation and collaboration in the SC, cooperation in the RSC (general strategies), alignment of interest and information sharing (strategic sharing initiatives) can *enhance RL performance*, which emphasise the operational outcomes related to RL process speed, efficiency and effectiveness (section 6.4.1.2.2). Moreover, organisations can *facilitate* and *improve RLM* through the (1) general SCI strategies related to utilisation of contracts, communication, collaboration, coordination and SC relationship management, (2) strategic SC relationships of SC arrangements, partnerships and collaborative relationships, and (3) strategic integration and sharing initiatives related to integration of RL processes and IT, cost sharing and the implementation of integrated SCM.

Additionally, strategic considerations (e.g. capabilities of partners), strategic collaboration and strategic information sharing between SC parties can *facilitate RL decision-making,* including strategic, tactical and operational decisions, which can add to the effective RLM of consumer returns. Moreover, strategic collaboration (general strategy), strategic collaborative relationships, and IT requirements, like IT systems and infrastructure, can *facilitate information management* in RL, emphasising the important link between IT practices and SCI practices.

Finally, SCI practices, including the (1) general SCI strategies of an integrated SC approach and SC cooperation, (2) strategic partnerships or collaborative relationships, (3) strategic information sharing, and (4) utilisation of IT (such as EDI) (IT requirement), can *facilitate RPA* (return prevention and avoidance) practices in RL (section 6.9.3). For example, cooperating with suppliers, a retailer may direct certain consumer returns (such as warranty and defects) directly to the supplier, which enables the retailer to reduce and avoid unnecessary consumer returns.

6.4.1.2.4 Environmental and market-related outcomes of SCI practices in RL

The *environmental outcomes* of SCI practices relate to environmental sustainability and increasing environmental responsibility. Particularly, adopting an integrated SC approach (strategic approach) enables *environmental sustainability*, and strategic utilisation of contracts and strategic cooperation in the RSC (general SCI strategies), can *increase environment responsibility*. For example, contracts can stipulate that SC parties implement environmentally responsible RL policies, which can enhance the environmental performance of the entire SC.

The *market-related outcomes* of SCI practices can include (1) competitiveness / competitive advantage, (2) market development and growth, (3) increasing sales, (4) identifying and meeting consumer demands/needs and (4) improving consumer service and satisfaction. Particularly, organisations can obtain *competitiveness* or a *competitive advantage* through several SCI practices, including strategic SC collaboration and RSC cooperation (general strategies), SC arrangements, strategic partnerships and alliances (strategic SC relationships), strategic information sharing, and IT competency (combine with collaboration) and utilisation (IT requirements).

Furthermore, strategic collaborative initiatives (general strategy) and SC agreements (relationship strategy) can enable *market development* and *growth* (of secondary markets), and strategic information sharing can *increase sales*, emphasising the economic outcome of profitability (see section 6.4.1.2.1). Additionally, organisations can *meet consumer* (or market) *demand/needs* through strategic communication, collaboration and information sharing between SC parties.

Likewise, strategic communication and strategic integration and sharing of information in the SC can *improve consumer service* and *satisfaction*, emphasising the RL process and operational efficiency outcomes of SCI (section 6.4.1.2.2). Consequently, the market-related outcomes demonstrate the importance of SCI for the effective and efficient RLM of consumer returns.

6.4.1.2.5 SC outcomes of SCI practices in RL

Several SC outcomes can associate with SCI practices, including (1) addressing SC barriers, (2) SC benefits, (3) facilitating SC relationships, (4) improving SC coordination, (5) enhancing SC collaboration, (6) improving SC communication, (7) facilitating SC information sharing, (8) enhancing SC trust, and (9) enhancing SC visibility and predictability.

Particularly, SCI requirements can *address SC barriers* in RL, for instance, a lack of SC collaboration and integration (see section 2.3.4) can be address through IT utilisation and infrastructure (IT requirements), and CFI (organisational requirement). Additionally, strategic collaboration in the SC (general SCI strategy) and utilisation of IT (requirement) can bring *SC benefits*, including enhanced operational efficiency of the entire SC and benefits for the RSC. Furthermore, SCI strategies, including communication, utilising incentives, developing of PM for SCI (general strategies), and implementing integrated RL strategic plans (strategic integration initiative), can *facilitate SC relationships* (such as strategic long-term relationships, partnerships and alliances).

Although SC coordination, collaboration, communication, information sharing and trust form part of the SCI strategies, various SCI practices can facilitate and improve the key strategic elements of SCI. Specifically, *SC coordination* can be *improved* through the strategic utilisation of contracts, communication, collaboration and incentives (general SCI strategies), utilisation of IT (requirement), and cross-functional integration (CFI) (organisational requirement). Additionally, strategic sharing of information and CFI can *enhance SC collaboration*, emphasising the importance of internal and external information sharing in RL. *SC communication* can be *improved* through strategic utilisation of contracts, SC collaboration, development of loyalty and trust (general strategies), and utilisation of IT (requirement) for SCI.

Additionally, *SC information sharing* can be *facilitated* through the (1) general SCI strategies of collaboration in the (R)SC, (2) strategic collaborative relationships, and (3) strategic integration and sharing initiatives of integrated RL processes and IT sharing. Moreover, SCI practices can *enhance SC trust*, including strategic partnerships, strategic information sharing and organisational commitment to RL (organisational requirement), demonstrating the importance of attaining RL commitment and support from SC partners (see section 6.4.1.1.1).

Finally, several SCI strategies can *enhance SC visibility* and *predictability*, including the (1) general SCI strategies of collaboration, trust and loyalty in the SC, (2) strategic SC relationship of partnerships, and (3) strategic integration and sharing initiatives of integrated RL processes, information sharing and integrated IT. Enhancing SC visibility and predictability emphasise the operational outcomes related to

addressing operational barriers (such as a lack of visibility and forecasting in RL), product return tracking and reducing product return uncertainty (section 6.4.1.2.2), demonstrating that SCI can provide operational excellence both internally (within the organisation) and externally (within the SC).

Essentially, SCI practices can address economic, operational, and SC barriers in RL (see section 2.3) and provide several economic, operational, organisational, environmental, market-related and SC benefits, which can contribute to the effective RLM of consumer returns.

In the next section, a description and conceptual framework of SCI practices will be presented and analysed.

6.4.1.3 Description and conceptual framework of SCI practices to manage consumer returns

Based on the findings presented in section 6.4.1, SCI practices can be important for the management of consumer returns, and will be described as follows:

> SCI practices for the management of consumer returns involve (1) general SCI strategies, including strategic approaches, prioritising SCI practices, strategic considerations, cost-benefit analyses, benefit-driven strategies, strategic definition of SCI, attainment of commitment and support from SC parties, negotiations, development and utilisation of contracts, communication, collaboration, cooperation and coordination in the SC, collaboration, cooperation and coordination in the RSC, utilisation of incentives, development of transparency, trust and loyalty, SC relationship management, development of PM for SCI, and review, assess and maintain SC practices, (2) forms of strategic SC relationships, including SC consortiums, agreements and arrangements, contractual relationships, strategic long-term relationships, partnerships, alliances and collaborative relationships, (3) strategic integration and sharing initiatives, including implementing an integrated strategic plan for RL, strategic alignment of interest, integration and standardisation of RL processes, strategic sharing goals and objectives, joint meetings, planning, problem solving and PM, sharing of knowledge, integration and sharing of information and IT, sharing of resources, infrastructure/facilities, responsibilities, costs, risks and rewards, and implementation of integrated SCM, and (4) SCI requirements, including economic requirement (costs), IT requirements (IT competency, utilise IT, IT infrastructure and compatible IT) and organisational requirements (management involvement, organisational commitment to RL and CFI).
>
> The SCI strategies and requirements can result in several outcomes, including (1) economic outcomes (address economic barriers, economic benefits and asset recovery, reduce investment and asset requirements, economies of scale, cost savings/reduction and profitability), (2) operational outcomes (address operational, forecasting, visibility and IT barriers, facilitate product tracking, reduce product return uncertainty, facilitate/support RL processes, improve RL process speed, efficiency and effectiveness, operational efficiency and inventory control), (3) organisational outcomes (facilitate RL design, design and development, successful RL implementation and function, focus on core competencies, enhance RL competencies, facilitate RL innovation, enhance RL performance, facilitate and improve RLM, and facilitate decision-making, information management and RPA), (4) environmental outcomes (sustainability and environmental responsibility), (5) market-related outcomes (competitiveness/ competitive advantage, market development and growth, increase sales, identify and meet consumer needs/demands, and improve consumer service and satisfaction), and (6) SC outcomes (address SC barriers, SC benefits, enhance SC relationships, improve SC coordination, enhance SC collaboration, improve communication, facilitate information sharing, and enhance SC trust, visibility and predictability).

Figure 6.12 provides a conceptual framework of SCI practices, which includes the SCI strategies, requirements and outcomes to manage consumer returns.

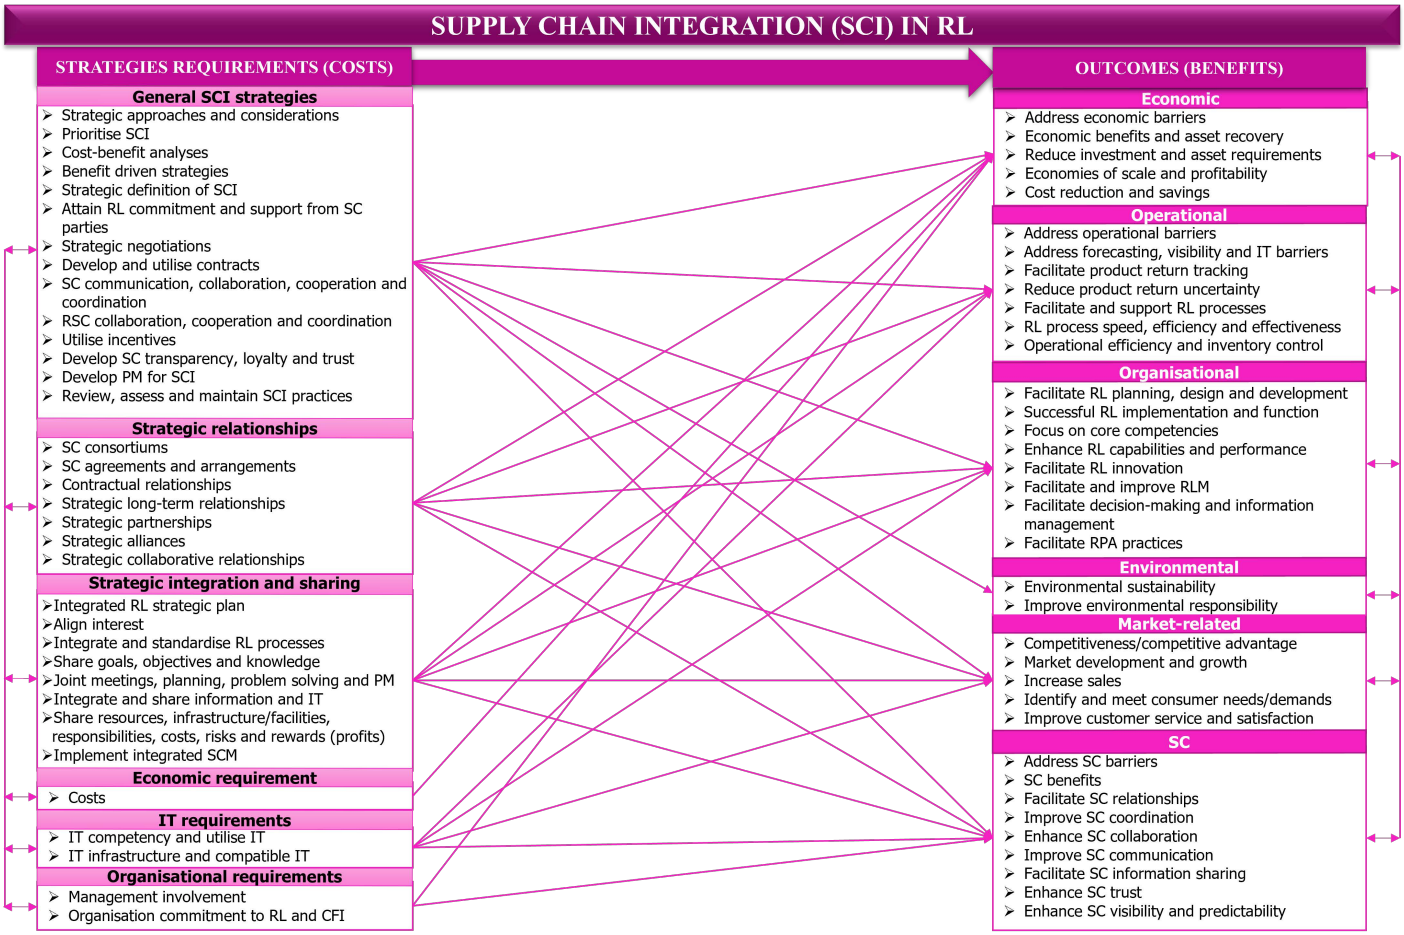

Figure 6.12 Conceptual framework of SCI practices to manage consumer returns
Source: Compiled by researcher

Figure 6.12 illustrates the links between the strategies, requirements and outcomes of SCI, demonstrating a cost and benefit relationship. For example, the links between SCI strategies and requirements can be demonstrated by the organisational requirement of management involvement, which links with general SCI strategies (such as performing cost-benefit analyses and (R)SC collaboration, coordination and cooperation), strategic relationships (such as strategic partnerships and alliances) and strategic sharing initiatives (sharing of RL responsibilities), and the economic requirement of cost. Similarly, the IT requirement of utilising IT for SCI, links with general SCI strategies (such as contracts, strategic communication, collaboration, development of transparency and trust), and strategic integration and sharing of information and IT.

Regarding the links between SCI strategies, requirements and outcomes, the framework demonstrates that general SCI strategies can be the most significant practice category, linking with all the SCI outcomes, including economic, operational, organisational, environmental, market-related and SC outcomes. Therefore, organisations must pay attention to general SCI strategies to achieve optimum results to manage consumer returns. From the SCI requirements, IT requirements contribute to the most outcome categories (four out of six), while the economic requirement contributes only to one outcome category.

Regarding the outcomes of SCI practices, economic and SC outcomes can be the most significant (associated with most of the practice categories), which means that SCI practices can be the most beneficial for organisations that experience economic and SC barriers and problems in RL. However, organisations with operational, organisational and market-related barriers can also benefit from SCI practices. In contrast, the environmental outcomes can be the least significant category, meaning that SCI practices may be less important for organisations that seek environmental benefits through RL practices.

Finally, the framework shows that the SCI outcome categories can be linked, for example, the operational outcome of RL process speed, efficiency and effectiveness can link with cost reduction/savings (economic outcome), enhanced RL performance (organisational outcome), increased consumer service (market-related outcome) and the SC benefit of improved operational efficiency (SC outcome).

Essentially, the links between the SCI strategies, requirements and outcomes demonstrate the importance of a holistic approach to the management of consumer returns, meaning that organisations must carefully consider and analyse the costs (strategies and requirements) and benefits (outcomes) of SCI for the effective management of consumer returns. In the next section, using CI as an integration RL practice to manage consumer returns will be explored.

6.4.2 Consumer[18] integration (CI) practices to manage consumer returns

Since the RL process starts with the consumer (Ravi & Shankar, 2015:890) the ability to satisfy consumers in the return process can be critical for the success of any organisation (Huscroft *et al.* 2013b:315). Despite being labelled as a critical practice, Bernon *et al.* (2011:497) indicated that limited RL research focuses on consumer integration (CI), which corresponds with the findings of this study (see Figure 6.**11**).

Like SCI practices, this study used CI practices in RL as an umbrella term for consumer relationship management, consumer-centric policies, processes, services and support initiatives, communication and information sharing with consumers, which can be important for the effective management of consumer returns. Therefore, CI represent RL practices that focusses on developing relationships with consumers and implementing RL strategies, processes and practices that can be positive for both the

[18] RL literature often regards the terms consumer and customer as synonyms. Since this study focuses on consumer returns the term consumer is used throughout.

organisation (e.g. profits and increase sales) and consumers (e.g. positive return experience and satisfaction).

Based on the findings (identified from the QCA of RL literature) CI practices in RL involves (1) strategies and requirements of CI and (2) outcomes of CI, which will be presented and discussed in subsequent sections, and concluded with a description and conceptual framework of CI practices to manage consumer returns.

6.4.2.1 Strategies and requirements of CI practices

CI practices involve CI strategies and a few requirements, including economic, IT, operational, organisational and SC requirements, which can contribute to the effective RLM of consumer returns. Table 6.12 provides an overview of the findings related to the *strategies* and *requirements* of *CI* practices to manage consumer returns, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.12 Findings related to the strategies and requirements of CI practices to manage consumer returns

CATEGORY	SUB-CATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
CI strategies	***Strategic approach***	None	• *"[…] a life-cycle approach for products and materials is important and should include learning and knowledge-sharing programs for customers […]."* (Sarkis *et al.* 2010:347)
	Prioritise CI	None	• *"Educating the customer about the importance of accurate returns claims became a priority."* (Genchev, 2009:144)
	Strategic considerations	Genchev (2009:147) Yan *et al.* (2012:256) Xu *et al.* (2015:88)	• *"LSPs can provide value-added activities to enhance the buyer-seller relationships through improved customer service/satisfaction."* (Yuan *et al.* 2016:188) • *"[…] having a formalized [sic] process may complement […] customers […] coordination."* (Huscroft *et al.* 2013b:318) • *"[…] returns service and related logistics issues and be flexible to provide money back for any returns or replace the product depending on customers' demand."* (Ahsan & Rahman, 2016:628) • *"[…] the retailer needs to carefully consider a trade-off incurred by the return policy."* (Yoo *et al.* 2014:106) • *"[…] a lenient return policy is accompanied by a product with high quality."* (Li *et al.* 2013:458) • *"[…] a lenient return policy also leads to increased returns and high return cost […]."* (Li *et al.* 2013:456) • *"When a lenient return policy is in effect […] the retailer clearly prefers popular products; they have lower demand variability and they are less likely to be returned."* (Alptekinoğlu, & Grasas, 2014:885)
	Perform cost-benefit analyses for CI practices	Janakiraman *et al.* (2015:233) Mukhopadhyay and Setaputra (2011:5319) Wang *et al.* (2007:351) Yoo *et al.* (2014:106)	• *"[…] liberal return policies, which serve as a pervasive sales tool but cause costs […] A cost-versus-benefit analysis should help determine an appropriate balance."* (Olorunniwo & Li, 2011:7) • *"[…] though it likely costs more in the short run for a firm to have a lenient product return policy, in the long run, retailers and managers can use information from each customer's product return […] for […] long-term relationship growth and […] profitability."* (Petersen & Kumar, 2009:49) • *"[…] though retailers incur costs […] rather than pass them on to the consumer, as the subsequent loyalty and enhanced relationship value maybe more than enough to offset these costs."* (Griffis *et al.* 2012:291) • *"[…] providing consumers with a variety of means to support their returns may lead to […] increased sales for the retailers; however, it requires an efficient returns process to keep costs down."* (De Leeuw *et al.* 2016:725)
	Strategic development of customer service elements	None	• *"[…] critical service determinants of product returns are […] communication support service for customer, money back for any type of returns, customer support access, user-friendly interaction, and product replacement."* (Ahsan & Rahman, 2016:606) • *"[…] customer service dimension and the speed at which customers receive a credit from a returned product […]."* (Bernon *et al.* 2016:599)

	Strategic design of a return service system	None	• *"[…] designing an effective returns service system managers must emphasise on the […] service category and be flexible to give money back for any returns or replace the product depending on customers' demand."* (Ahsan & Rahman, 2016:625)
	Strategic development and implementation of consumer-centric return policies	Alptekinoğlu and Grasas (2014:885) Asdecker (2015:2) Bokade and Raut (2013:44) De Leeuw *et al.* (2016:711) Griffis *et al.* (2012:291) Hong *et al.* (2008:177) Li and Olorunniwo (2008:385) Mukhopadhyay and Setaputra (2006:717) Petersen and Kumar (2009:49) Tiwari (2013:242) Wang *et al.* (2007:351)	• *"[…] lenient return policies, which are policies that facilitate returns by not only allowing refunds, exchanges, and merchandise credits, but also by imposing minimal restrictions on consumers making returns."* (Bonifield *et al.* 2010:1059) • *"[…] retailer's strategy is to […] offering more lenient monetary and/or lower effort return-policies may be more effective […]."* (Janakiraman *et al.* 2015:233) • *"[…] the retailer can implement two strategies: either a lower refund with a long return deadline, or a generous refund with a short return deadline. Both improve consumer satisfaction and reduce potential returns."* (Xu *et al.* 2015:93) • *"[…] a lenient return policy, such as a full refund policy and an additional return compensation policy […]."* (Li *et al.* 2013:457)
	Strategic development and implementation of consumer-centric RL processes	Ahsan and Rahma, (2016:624, 625) Bower and Maxham (2012:121) Mollenkopf *et al.* (2007:242)	• *"In order for the customers to be fully satisfied with the returns outcome, the process has to be robust and customer-focused."* (Li & Olorunniwo, 2008:382) • *"Speeding up the process can be done by providing consumer-friendly returns processes that are easy to execute for consumers."* (De Leeuw *et al.* 2016:723) • *"[…] liberal policy implies that it is easy to receive authorisation (and credit) for returns. […]."* (Hong *et al.* 2008:177)
	Strategic utilisation of RL for CI	None	• *"[…] offering easy returns methods […] are important aspects of providing good customer service […]."* (De Leeuw *et al.* 2016:719) • *"[…] retailers and managers can use information from each customer's product return […] as a tool for realizing [sic] long-term relationship growth […]."* (Petersen & Kumar, 2009:49) • *"Gate keeping […] is the first step towards collaboration that occurs at the customer-retailer interface when the product is returned."* (Jayaraman *et al.* 2008:416) • *"[…] speed at which customers receive a credit from a returned product […] processed."* (Bernon *et al.* 2011:495) • *"[…] proper disposal of products can create substantial customer loyalty […]."* (Agrawal & Choudhary, 2014:20)
	Strategic development and implementation of consumer service and support initiatives	Bernon *et al.* (2011:495) Mazahir *et al.* (2011:94) Ravi and Shankar (2015:884) Yuan *et al.* (2016:188)	• *"Customer support: involves […] established customer service levels […]."* (Huscroft *et al.* 2013b:309) • *"Customer relationships […] a membership card system that rewards purchasers' loyalty […] a superior service experience […] by providing access to personal sales assistants."* (Beh *et al.* 2016:18) • *"[…] providing consumers with a variety of means to support their returns […]."* (De Leeuw *et al.* 2016:725) • *"An efficient communications support service is necessary to provide acknowledgement of returns claim […]."* (Ahsan & Rahman, 2016:625)
	Strategic development of consumer education and training initiatives	Stock and Mulki (2009:53)	• *"Educating the customer about the importance of accurate returns claims became a priority."* (Genchev, 2009:144) • *"[…] should include learning and knowledge-sharing programs for customers, […]."* (Sarkis *et al.* 2010:347)
	Strategic attainment of consumer input and participation	Agrawal and Choudhary (2014:20) Dixit and Badgaiyan (2016:125) Xie and Breen (2014:457)	• *"Engage customers […] of a reverse logistics program, customer input is crucial."* (Genchev, 2009:147) • *"[…] managers should involve clients and customers in the reverse process […]."* (Bouzon *et al.* 2016:193) • *"Successful reverse logistics requires the whole-hearted participation of […] end-users."* (Lau & Wang, 2009:459)
	Strategic communication and information sharing with consumers	Ahsan and Rahman (2016:624, 628) Huscroft *et al.* (2013b:316) Yuan *et al.* (2016:188)	• *"Permanent contact with customers is recommended to reduce uncertainty […]."* (García-Rodríguez *et al.* 2013:588) • *"[…] the value of reverse logistics is communicated clearly to customers […]."* (Genchev, 2009:143) • *"[…] providing customers with adequate information about the returns process are important aspects of providing good customer service […]."* (De Leeuw *et al.* 2016:719) • *"[…] involve […] customers in the reverse process […] by sharing information […]."* (Bouzon *et al.* 2016:193)
	Strategic interaction with consumers	Vlachos (2016:16)	• *"[…] consumers prefer to connect with others through social media, therefore firms may also explore the possible use of social media and social groups to engage consumers."* (Dixit & Badgaiyan, 2016:125) • *"[…] good and healthy interactions with the customers are essential for successful reverse logistics programs."* (Ravi & Shankar, 2015:884) • *"Friendly interaction could be in the form of listening to the customer, giving time to air out their issues, and ensuring all returns issues are answered in a friendly/apologetic manner."* (Ahsan & Rahman, 2016:610) • *"Maintaining timely interaction and communication throughout the returns process is considered a critical […]."* (Ahsan & Rahman, 2016:628) • *"[…] reduce this uncertainty through improved service levels and better co-ordination with the end users."* (Mazahir *et al.* 2011:94)

	Strategic implementation of CRM and CSM	None	• *"Customer relationship management […] form the critical links in […] returns management […]."* (Janse *et al.* 2010:511) • *"A strong relationship with the customer is important; if possible, the integration with the customer should be as high as possible."* (Östlin *et al.* 2008:345) • *"[…] customer service management […] in the reverse logistics and returns process […]."* (Kumar *et al.* 2009:195)
	Strategic development of PM for CI	None	• *"Customer support: involves […] established customer support metrics."* (Huscroft *et al.* 2013b:309) • *"[…] measures aimed at reducing returns […] which were connected to the retail-customer interface."* (Bernon *et al.* 2011:497)?
	Strategic implementation of CI	None	• *"[…] integration between the customer and retailer as mechanism for managing returns […] was a critical area for managing down return levels."* (Bernon *et al.* 2011:497) • *"[…] strong relationship with the customer […] the integration with the customer should be as high as possible."* (Östlin *et al.* 2008:345)
Economic requirements	***Costs and expenses***	DSe Leeuw *et al.* (2016:717) Janakiraman *et al.* (2015:233) Olorunniwo & Li, (2011:7) Petersen and Kumar, (2009:49) Yan *et al.* (2012:256) Yoo *et al.* (2014:106)	• *"Liberal returns policies will have a significant effect on the cost of reverse logistics […]."* (Bokade & Raut, 2013:44) • *"[…] reducing consumer costs and decreasing the hurdles associated with returns can increase the repurchases […]."* (Bower & Maxham, 2012:121) • *"[…] to a customer's return situation, the manner in which customers are compensated for problems […]."* (Mollenkopf *et al.* 2007:242) • *"[…] be flexible to give money back for any returns […]."* (Ahsan & Rahman, 2016:625) • *"[…] full money back […] that retailers must emphasise upon to resolve customer returns."* (Ahsan & Rahman, 2016:628) • *"[…] the lenient return policy, the e-tailer provides […] pays for return postage, does not charge a restocking fee, and issues refunds […]."* (Bonifield *et al.* 2010:1061) • *"A convenient returns policy […] is a costly activity due to additional rent fees or construction costs; transportation costs and inventory holding costs."* (Wang *et al.* 2007:351) • *"[…] though retailers incur costs […] rather than pass them on to the consumer, as the subsequent loyalty and enhanced relationship value […]."* (Griffis *et al.* 2012:291)
IT requirements	***Utilise IT***	None	• *"[…] implementation of this interactive and easy to-use online tool […] improved relationships with customers […]."* (Genchev, 2009:145) • *"[…] accessibility of knowledgeable customer service representatives […] through online chats) during the return process […]."* (Mollenkopf *et al.* 2007:242)
	Appropriate IT	None	• *A capable IS allows a firm to cooperate and share information with its customers* (Sharif *et al.* 2012:2527)
Operational requirement	***Efficient RL process***	None	• *"[…] returns may lead to loyalty and, thus, increased sales for the retailers; however, it requires an efficient returns process […]."* (De Leeuw *et al.* 2016:725)
Organisational requirements	***Top management support***	None	• *"Top management support […] is needed to […] effectively managing relationships with […] customers."* (Huscroft *et al.* 2013b:315)
	Management involvement	None	• *"[…] though it likely costs more in the short run for a firm to have a lenient product return policy, in the long run, […] managers can use information from each customer's product return […] for […] long-term relationship growth and […] profitability."* (Petersen & Kumar, 2009:49) • *"[…] for designing an effective returns service system managers must emphasise on the interactive fairness service category […]."* (Ahsan & Rahman, 2016:625) • *"[…] initiation of a reverse logistics program, customer input is crucial. Managers in charge of developing and implementing the program […]."* (Genchev, 2009:147) • *"[…] managers should involve […] customers in the reverse process, in order to bring stability to the reverse flow […]."* (Bouzon *et al.* 2016:193)
	Knowledgeable or trained staff	None	• *"[…] accessibility of knowledgeable customer service representatives (live or through online chats) during the return process […]."* (Mollenkopf *et al.* 2007:242) • *"Training […] personnel was considered as a key dimension […] to provide support to customers […]."* (Bernon *et al.* 2011:497)
	RL expertise	None	• *"[…] generous return policy, therefore, involves both a cost […] and an expertise in handling the reverse flow […]."* (Mukhopadhyay & Setaputra, 2006:717)
	RC in RL	None	• *"Resource commitments to reverse logistics […] to develop lasting linkages with customers […]."* (Hsu *et al.* 2016:95)
SC requirement	***Efficient reverse SC (RSC)***	None	• *"Customers do respond to companies' behaviors [sic] […] Efficient reverse supply chains can mean happier customers […]."* (Agrawal & Choudhary, 2014:20)

Source: Compiled by the researcher

Table 6.12 shows that CI includes several strategies and requirements, which will be discussed in subsequent sections.

6.4.2.1.1 Strategies of CI practices in RL

The strategies of CI in RL include (1) a strategic approach, (2) prioritising CI practices, (3) strategic considerations, (4) performing cost-benefit analyses, (5) strategic development of customer service

elements, (6) strategic design of a return service system, (7) strategic development and implementation of consumer-centric return policies and RL processes, (8) strategic utilisation of RL for CI, (9) strategic development and implementation of consumer service and support, and consumer education and training initiatives, (10) strategic attainment of consumer input and participation, (11) strategic communication, information sharing and interaction with consumers, (12) strategic implementation of customer relationship/service management (CRM and CSM), (13) strategic development of PM for CI, and (14) strategic implementation of CI.

Like SCI (section 6.4.1.1), CI strategies must be initiated by developing and adopting a *strategic approach* that drive effective CI practices. For example, organisations can adopt a life-cycle approach for managing consumer returns, focussing on education and engagement initiatives to inform consumers on the importance of RL. Based on the strategic approach, organisations must *prioritise CI practices* to manage consumer returns, for example, prioritising consumer education programmes for effective return initiation (request) from consumers.

Several *strategic considerations* can be important for effective CI practices in RL. Specifically, organisations need to consider (1) RL outsourcing, (2) formalisation of RL, (3) consumer demand (such as service expectations) and (4) the implications of consumer-centric return policies and processes. For instance, organisations can consider other RL practices, like RL outsourcing and formalisation [part of strategic planning and procedure (SPP) practices], to facilitate CI practices (e.g. coordination and relationship management). Additionally, for lenient return policies, organisations must consider product quality and demand, and higher return rates and RL costs.

Subsequently, *performing cost-benefit analyses* can be an important strategy for CI practices. For example, organisations can perform cost-benefit analyses for (1) a lenient return policy, identifying costs (such as high short-term RL costs) and potential benefits (such as profitability, increase sales, and improve consumer loyalty and relationships), and (2) consumer support initiatives, identifying costs (such as high costs or RL expertise and efficient RL processes) and potential benefits (such as increase sales and consumer retention). Consequently, organisations must identify the strategies and requirements of CI (see section 6.4.2.1.2) as the costs, and the potential outcomes of CI practices as the benefits (see section 6.4.2.2).

Based on the outcomes of the strategic considerations and cost-benefit analyses, organisations can *strategically develop customer service elements*, which can include definitions for the CI practices organisations aim to implement for the effective management of consumer returns. For example, a retailer that aims to implement a lenient return policy and consumer support initiatives for may define communication support, friendly interaction, efficient RL processes and customer compensation

initiatives, like free returns and fast refunds, as service elements. Furthermore, organisations can *strategically design return service systems* that reflects the consumer demand (strategic considerations) and developed customer service elements (such as effective communication, speedy RL processes and quick refunds).

Accordingly, organisations can *strategically develop* and *implement consumer-centric return policies* for effective CI practices in RL. Several degrees of consumer-centric return policies can be developed and implemented, including a (1) full-lenient return policy, with no or limited return restrictions (such as free returns, easy returns and long return duration), (2) monetary-lenient return policy (such as a full-refund or full-compensation policy), (3) hassle-free return policy (limited effort required, like no proof of purchase or authorisation needed), and (4) time-lenient return policy (such as 90-day returns). Consequently, organisations must develop an appropriate return policy based on the strategic considerations, cost-benefit analysis and established customer service elements.

Similarly, organisations need to *strategically develop* and *implement consumer-centric RL processes* that complements the established consumer service elements and consumer-centric return policy. For example, a hassle-free return policy must be complimented with a flexible, quick and easy return process, or a monetary-lenient return policy must be complimented with efficient return processing (issuing fast refunds or exchanges). Therefore, for effective CI all stages of the RL process from the customer return request, gatekeeping, collection, transportation, receiving, processing, inspection/sorting, disposition to the redistribution process must be consumer-focussed (aimed at satisfying consumers).

Evidently, organisations can *strategically utilise RL* for effective *CI* practices. For example, organisations can (1) offer easy return options for good customer service, (2) use the customer return request (CRR) process to obtain information for CRM, (3) use the gatekeeping process to effectively engage with the consumer (e.g. responding favourable to the CRR), (4) use return processing to issue speedy refunds, and (4) use effective disposition to develop loyalty from environmentally conscious consumers (see chapters 4 and 5).

Linking with the established consumer service elements for CI, organisations can *strategically develop* and *implement consumer service* and *support initiatives* for effective CI practices in RL. For example, implementing initiatives that focus on improving consumer service and support levels by establishing effective communication platforms, using membership cards or point systems (e.g. consumers can keep purchase points for product returns), and providing customer service assistants to engage with and support consumers in the return process.

Additionally, the *strategic development* of *consumer education* and *training initiatives* can be important for effective CI practices in RL. For example, educating consumers on the importance of completing return forms accurately to avoid delays or additional charges in the return process can benefit both the organisation and consumer in the RL process. Moreover, *strategic attainment of consumer input* and *participation* through active engagement with consumers can be valuable in implementing a consumer-centric RL process, enhancing consumer service and promoting CI in RL.

Like SCI practices, *strategic communication* and *information sharing* with *consumers* can be important for developing lasting relationships. Additionally, communication and information sharing can reduce uncertainty in the RL process and complement other CI strategies, like customer support/service initiatives, education, and consumer input and participation. Similarly, *strategic consumer interaction* and *coordination* can promote consumer relationships and CI, which can be essential for effective RLM of consumer returns. For example, organisations can use popular social media platforms (e.g. Facebook or Twitter) to engage with consumers, which can be viewed as a more personal interaction. Additionally, being responsive, interacting in a friendly manner and listening to consumers about product return related issues can reduce frustration, uncertainty and dissatisfaction in the RL process.

Subsequently, organisations can use the CI strategies for the *strategic implementation* of *CRM* and *CSM*, which can be important for the maintenance and management of consumer relationships and CI practices. Additionally, like SCI (section 6.4.1.1), organisations must *strategically develop PM* for *CI* to measure, review and possibly implement improvement initiatives for maintaining successful CI practices in RL. Consequently, PM practices in RL can be important for managing external relationships with SC parties and consumers. Finally, organisations can *strategically implement CI* as an overall RL strategy to not only develop sustainable relationships with consumers but also for the effective management of consumer returns.

6.4.2.1.2 Requirements of CI practices in RL

The requirements of CI practices in RL include economic, IT, operational, organisational and SC requirements. The *economic requirements* of CI involve *costs* and *expenses* related to CI strategies, including developing and implementing consumer-centric RL policies and processes and other consumer support and service initiatives. Particularly, for effective CI, organisations must be willing to pay for RL costs, compensate consumers for expenses related to product return problems (such as a full refund), and incur additional expenses related to lenient return policies (such as facility, transportation, handling and inventory carrying costs). Essentially, CI practices can be expensive and can increase RL costs, demonstrating the importance of performing cost-benefit analyses for CI.

The *IT requirements* of CI involve IT utilisation and appropriate IT for CI practices, emphasising the link between integration and IT practices (see section 6.3). For instance, organisations can *utilise* Internet or web-based *IT* (such as online return and communication platform) to support, communicate and share information with consumers in the RL process. Consequently, organisations must implement *appropriate IT*, capable of supporting CI strategies, including consumer support and service initiatives, and consumer input, participation, communication, information sharing and interaction (see section 6.4.2.1.1).

Although CI strategies involve the development of consumer-centric RL processes, the *operational requirement* of CI involves efficient RL processes. Therefore, organisations must implement various RL practices, like IT and SCI (see sections 6.3 and 6.4.1), to establish *efficient RL processes* to support CI practices. Consequently, inefficient RL processes may hamper the organisation's ability to respond quickly to the customer return request (CRR), causing delays in gatekeeping (e.g. issuing quick authorisation), collection (e.g. slow pickup), processing (e.g. slow refunds/credits), inspection (e.g. slow verification and testing) and disposition (e.g. slow repairs or replacements).

CI in RL involves several *organisational requirements*, including (1) top management support, (2) management involvement, (3) RL expertise, (4) knowledgeable or trained staff, and (5) RC in RL. *Top management support* can be critical for the effective implementation of RL processes and practices, including CI practices (see section 6.9.5.2). Consequently, a lack of top management support can hamper effective implementation of CI practices to manage consumer returns.

Likewise, *management involvement* can be critical for several CI strategies, including (1) performing a cost-benefit analysis, (2) developing consumer service elements, (3) designing a return service system, (4) developing and implementing consumer-centric RL policies and processes, (5) utilising RL processes for CI, (6) attaining consumer input and participation, and (7) managing consumer relationships. Furthermore, CI requires *RL expertise* to not only support consumer-centric RL processes but also establish efficient RL processes (operational requirement) for effective CI in RL. Similarly, *knowledgeable* and *trained staff* must be available to support consumers in the RL process, emphasising the CI strategy of providing access to personal assistants as a consumer service and support initiative (see section 6.4.2.1.1). Evidently, CI requires *RC* (resource commitment) *in RL*, which may involve financial resources (to manage RL costs), infrastructure and IT resources, human resources (e.g. managerial skills and trained staff) and RL process resources (e.g. RL expertise) (see section 6.9.1).

Finally, like the operational requirement of an efficient RL process, the *SC requirement* for CI involves an *efficient reverse SC (RSC)*, which means that all (R)SC parties must collaborate and cooperate to improve the RSC (see section 6.4.1.2).

Essentially, for effective CI in RL, organisations must consider and/or implement several RL practices, including IT (section 6.3), SCI (section 6.4.1), RL outsourcing (section 6.5), PM (section 6.7), RC (section 6.9.1), SPP (formalisation) (section 6.9.4), and management and staff practices (section 6.9.5). In the next section, the outcomes of CI practices to manage consumer returns will be explored.

6.4.2.2 Outcomes of CI practices

The outcomes of CI practices can be described as the benefits of incorporating CI strategies and requirements as a RL practice for the effective management of consumer returns. The outcomes of CI practices in RL include (1) economic, (2) operational (3) organisational (4) environmental, (5) social and (6) market-related outcomes.

Table 6.13 provides an overview of the findings related to the *outcomes of CI* practices to manage consumer returns, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.13 Findings related to outcomes of CI practices to manage consumer returns

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
Economic outcomes	***Economic benefits***	None	• *"[…] the liberal policies on product return will turn out to an increase in customer satisfaction and will gain a cost advantage."* (Bokade & Raut, 2013:44)
	Cost reduction and control	None	• *"Educating the customer about the importance of accurate returns claims became a priority […] was related to cost reduction implications for returns handling, not only for WCC, but even more importantly for the customer as well."* (Genchev, 2009:144) • *"[…] providing consumers with a variety of means to support their returns may lead to […] increased sales for the retailers; however, it requires an efficient returns process to keep costs down."* (De Leeuw *et al.* 2016:725) • *"A capable IS allows a firm to cooperate and share information with its customers with […] low costs."* (Sharif *et al.* 2012:2527)
	Profitability	De Leeuw *et al.* (2016:717) Yan *et al.* (2012:256)	• *"[…] that though it likely costs more in the short run for a firm to have a lenient product return policy, in the long run, retailers and managers can use information from each customer's product return […] as a tool for […] profitability."* (Petersen & Kumar, 2009:49) • *"A convenient returns policy may trigger more demand, thus leading to higher profit; however, designing a returns policy is […] costly […]."* (Wang *et al.* 2007:351) • *"[…] the voice of the customer is the most important aspect […]and the goodwill developed through reverse logistics and proper disposal of products can create substantial customer loyalty. Efficient reverse supply chains can mean […] higher profits."* (Agrawal & Choudhary, 2014:20)
Operational outcomes	***Improve visibility***	None	• *"The enhanced communication between WCC and customers results in increased visibility […] of reverse logistics […]."* (Genchev, 2009:143)
	Reduce product return uncertainty	None	• *"[…] reduce this uncertainty through improved service levels and better co-ordination with the end users."* (Mazahir *et al.* 2011:94) • *"Permanent contact with customers is recommended to reduce uncertainty as to the quantity of products […]."* (García-Rodríguez *et al.* 2013:588)
	Support RL processes	None	• *"An efficient communications support service is necessary to provide acknowledgement of returns claim, decision outcome and claim tracking or feedback."* (Ahsan & Rahman, 2016:627) • *"Communicating with customers […] to coordinate the return is key to the RL process […]."* (Huscroft *et al.* 2013b:316) • *"[…] managers should involve […] customers in the reverse process, in order to bring stability to the reverse flow by sharing information […]."* (Bouzon *et al.* 2016:193)
	Improve RL process speed and effectiveness	None	• *"Speeding up the process can be done by providing consumer-friendly returns processes that are easy to execute for consumers."* (De Leeuw *et al.* 2016:723) • *"Managers in charge […] must account for clients' expectations and requirements […]*

			customers' input be vital in providing complete solutions from initiation to disposition of returned products […].” (Genchev, 2009:147)
Organisational outcomes	***Facilitate RL implementation***	None	• *“Engage customers […] initiation of a reverse logistics program, customer input is crucial. Managers in charge of developing and implementing the program must account for clients' expectations and requirements.”* (Genchev, 2009:147)
	Successful RL function	Xie and Breen (2014:457)	• *“Successful reverse logistics requires the whole-hearted participation of all the parties in the supply chain […] including […] end-users.”* (Lau & Wang, 2009:459) • *“[…] good and healthy interactions with the customers are essential for successful reverse logistics programs.”* (Ravi & Shankar, 2015:884)
	Enhance RL performance	None	• *“Customer support: involves issues such as effectively and efficiently […] achieving established customer support metrics.* (Huscroft *et al.* 2013b:309) • *“[…] management realized [sic] that unless the value of reverse logistics is communicated clearly to customers […] improving program performance can be problematic.”* (Genchev, 2009:143)
	Enhance RLM	None	• *“[…] for RL management is to improve customer service […].”* (Yuan *et al.* 2016:188) • *“Customer Satisfaction […] the voice of the customer is the most important aspect of reverse logistics management.”* (Agrawal & Choudhary, 2014:20) • *“Maintaining timely interaction and communication throughout the returns process is considered a critical aspect of effective return management.”* (Ahsan & Rahman, 2016:628) • *Customer relationship management […] form the critical links in the supply chain and returns management is coordinated by them.”* (Janse *et al.* 2010:511) • *“[…] integration between the customer and retailer as mechanism for managing returns.”* (Bernon *et al.* 2011:497)
	Facilitate return prevention and avoidance (RPA) practices	None	• *“[…] the retailer can implement two strategies: either a lower refund with a long return deadline, or a generous refund with a short return deadline. Both […] reduce potential returns.”* (Xu *et al.* 2015:93) • *“A considerable level of returns could be reduced through improved customer service routines and clearer product information […].”* (Bernon *et al.* 2011:495) • *“Through proper interaction with the customer, retailers can come to recognise the root causes of return and other related returns issues which could be solved […].”* (Agrawal & Choudhary, 2014:20) • *“[…] integration between the customer and retailer as mechanism for managing returns […] was a critical area for managing down return levels.”* (Bernon *et al.* 2011:497)
Environmental and social outcomes	***Environmental protection***	None	• *“[…] consumers may not be aware […] that they can participate in environment protection by participating in reverse logistics programs […].”* (Dixit & Badgaiyan, 2016:124)
	Environmental responsibility	None	• *“They can also take a step further and engage consumers to increase their awareness on […] environmental responsibility […].”* (Vlachos, 2016:16)
	Social responsibility	None	• *“They can also take a step further and engage consumers to increase their awareness on social […] responsibility […].”* (Vlachos, 2016:16)
	Enhance corporate/brand image	Tiwari (2013:242)	• *“[…] liberal return policies have become a […] major component of the corporate image for many firms in […] business-to-consumer markets.”* (Gonçalves & Silva, 2016:71) • *“[…] engage consumers […] which can have a direct influence on their brand image.”* (Vlachos, 2016:16)
Market-related outcomes	***Competitive advantage and sustainable business***	Li and Olorunniwo (2008:385) Yoo (2014:146)	• *“[…] offer liberal return policies […] developing a service-based competitive advantage which puts pressure on competitors to do the same.”* (Jack *et al.* 2010:232) • *“Customer relationships […] operates a membership card system that rewards purchasers' loyalty in an effort to enhance business sustainability.”* (Beh *et al.* 2016:18)
	Increase sales and demand	Asdecker (2015:2) Mukhopadhyay and Setaputra (2006:717) Wang *et al.* (2007:351) Yan *et al.* (2012:256)	• *“[…] lenient return policies […] increases purchase […] despite the substantial expense associated with product returns […].”* (Janakiraman *et al.* 2015:233) • *“Being flexible in accepting returns and providing consumers with a variety of means to support their returns may lead […] increased sales for the retailers […].”* (De Leeuw *et al.* 2016:725) • *“Offering free returns increases repurchasing […].”* (De Leeuw *et al.* 2016:717) • *“[…] returns may lead to loyalty and, thus, increased sales for the retailers; however, it requires an efficient returns process […].”* (De Leeuw *et al.* 2016:725) • *“The more lenient the return policy, the higher the demand. However, a lenient return policy also leads to increased returns and high return cost.”* (Li *et al.* 2013:456)
	Improve customer service and responsiveness	Bernon *et al.* (2016:599)	• *“[…] critical service determinants of product returns are related to communication support service for customer, money back for any type of returns, customer support access, user-friendly interaction, and product replacement.”* (Ahsan & Rahman, 2016:606) • *“[…] being flexible with returns authorizations [sic], offering easy returns methods and providing customers with adequate information about the returns process are important aspects of providing good customer service […].”* (De Leeuw *et al.* 2016:719) • *“Customer support: involves issues such as effectively and efficiently meeting established customer service levels […].”* (Huscroft *et al.* 2013b:309) • *“[…] offers a superior service experience to its customers, e.g. by providing access to personal sales assistants.”* (Beh *et al.* 2016:18) • *“[…] to improve customer service through […] exchanging information […].”* (Yuan *et al.* 2016:188) • *A capable IS allows a firm to cooperate and share information with its customers with high accuracy, fast response time […].”* (Sharif *et al.* 2012:2527)
	Increase consumer satisfaction	De Leeuw *et al.* (2016:711)	• *“[…] the liberal policies on product return will turn out to an increase in customer satisfaction […].”* (Bokade & Raut, 2013:44) • *“[…] the retailer can implement two strategies: either a lower refund with a long return deadline, or a generous refund with a short return deadline. Both improve consumer satisfaction […].”* (Xu *et al.* 2015:93) • *“In order for the customers to be fully satisfied with the returns outcome, the process has to be robust and customer-focused.”* (Li & Olorunniwo, 2008:382)

			• *"Offering free returns increases […] consumer satisfaction and revenue for the retailers."* (De Leeuw *et al.* 2016:717) • *"Efficient reverse supply chains can mean happier customers […]."* (Agrawal & Choudhary, 2014:20)
	Enable consumer retention	None	• *"[…] reducing consumer costs and decreasing the hurdles associated with returns can increase the repurchases to retailers and result in long-term benefits."* (Bower & Maxham, 2012:121) • *"[…] liberal returns policies as critical to retaining consumers […]."* (Jack *et al.* 2010:228) • *"[…] communication support is a prime opportunity for retailers to recapture their customers."* (Ahsan & Rahman, 2016:628) • *"[…] proper interaction with the customer, retailers can come to recognise the root causes of return and other related returns issues which could be solved promptly for customer retention."* (Ahsan & Rahman, 2016:628)
	Enhance consumer loyalty, trust and commitment	None	• *"[…] though retailers incur costs […] rather than pass them on to the consumer, as the subsequent loyalty and enhanced relationship value maybe more than enough to offset these costs."* (Griffis *et al.* 2012:291) • *"[…] developing customer loyalty through liberal returns […]."* (Griffis *et al.* 2012:283) • *"[…] the voice of the customer is the most important aspect […] and the goodwill developed through reverse logistics and proper disposal of products can create substantial customer loyalty."* (Agrawal & Choudhary, 2014:20) • *"Being flexible in accepting returns and providing consumers with a variety of means to support their returns may lead to loyalty […]."* (De Leeuw *et al.* 2016:725) • *"The ability to respond promptly and appropriately to a customer's return situation, the manner in which customers are compensated for problems, and the accessibility of knowledgeable customer service representatives (live or through online chats) during the return process all have a strong influence on a customer's perceived value of the returns offering, which in turn affects the customer's loyalty intentions."* (Mollenkopf *et al.* 2007:242) • *"One common way of building trust and increasing the likelihood of ordering is the establishment of liberal return policies."* (Asdecker, 2015:2) • *"[…] to gain consumers attention and commitment, their participation in […] could be of utmost importance […]."* (Dixit & Badgaiyan, 2016:125)
	Enhance customer relationship management (CRM)	Griffis *et al.* (2012:291)	• *"[…] that though it likely costs more in the short run for a firm to have a lenient product return policy, in the long run, retailers and managers can use information from each customer's product return […] for realizing [sic] long-term relationship growth […]."* (Petersen & Kumar, 2009:49) • *"Retailer emphasis on training customers […] can help in improving customer relations […]."* (Stock & Mulki, 2009:53) • *"[…] strong relationship with the customer […] the integration with the customer should be as high as possible."* (Östlin *et al.* 2008:345) • *"[…] implementation of this interactive and easy to-use online tool […] improved relationships with customers […]."* (Genchev, 2009:145) • *"Top management support […] is needed to […] effectively managing relationships with […] customers."* (Huscroft *et al.* 2013b:315)
	Enhance CI	None	• *"LSPs can provide value-added activities to enhance the buyer-seller relationships through improved customer service/satisfaction."* (Yuan *et al.* 2016:188) • *"[…] having a formalized [sic] process may complement […] customers […] coordination."* (Huscroft *et al.* 2013b:318) • *"Gate keeping […] is first step towards collaboration that occurs at the customer-retailer interface when the product is returned."* (Jayaraman *et al.* 2008:416) • *"A capable IS allows a firm to cooperate and share information with its customers with high accuracy […]."* (Sharif *et al.* 2012:2527) • *"Resource commitments to reverse logistics […] to develop lasting linkages with customers […]."* (Hsu *et al.* 2016:95)

Source: Compiled by the researcher

Table 6.13 shows that CI practices involve several outcomes, including economic, operational, organisational, environmental, social and market-related outcomes, which will be discussed in subsequent sections.

6.4.2.2.1 Economic outcomes of CI practices in RL

The economic outcomes of CI practices involve economic benefits, cost reductions and control, and profitability, which can mitigate some of the economic requirements of CI (section 6.4.2.1.2). Particularly, *economic benefits* may be achieved through the CI strategy of developing and implementing consumer-centric return policies. Consequently, despite the high costs of a lenient return

policy, cost advantages can be expected due to increased consumer satisfaction, demonstrating the importance of performing a cost-benefit analysis for CI practices.

Additionally, *cost reduction* and *control* can be realised through (1) CI strategies, including prioritising CI, cost-benefit analysis, consumer support and education initiatives, and consumer information sharing, (2) appropriate IT (requirement), and (3) efficient RL processes (operational requirement). For example, prioritising education initiatives in RL, like educating consumers on the importance of completing an accurate return request, can reduce unnecessary handling costs that may be incurred due to inaccurate return information.

Similarly, *profitability* can be increased through the (1) CI strategies of performing a cost-benefit analysis, implementing consumer-centric return policies, using RL processes for CI and attaining consumer input, (2) economic requirements related to costs of lenient return policies, (3) organisational requirement of management involvement, and (4) SC requirement of an efficient RSC. Consequently, although organisations may experience initial short-term costs and expenses, CI practices (such as implementing lenient return policies) can increase demand/sales and improve profitability that positively impacts the bottom line.

Essentially, the economic outcomes of CI associates with the market-related outcomes of CI (section 6.4.2.2.5), including higher demand, increase sales, consumer satisfaction and loyalty, which demonstrates the importance of CI practices for the efficient RLM of consumer returns.

6.4.2.2.2 Operational outcomes of CI practices in RL

The operational outcomes of CI practice in RL can include (1) improving visibility, (2) reducing product return uncertainty, (3) supporting RL processes and (4) improving RL process speed and effectiveness. Consequently, unlike IT and SCI (see sections 6.3 and 6.4.1), CI practices associate with limited operational outcomes, implying that CI practices may be less appropriate for organisations that experience operational barriers in RL. Nevertheless, the CI strategies of communicating with consumers, consumer service initiatives and consumer interaction can *improve visibility* and *reduce uncertainty* in the quality and quantity of *product returns*, which can mitigate the operational barriers (such as lack of visibility and uncertainty in quantity of product returns) in RL (see section 2.3.2).

Additionally, consumer service and support initiatives, consumer input, effective communication and information sharing with consumers (CI strategies), and management involvement (organisational requirement) can *support RL processes*. For example, effective communication and consumer support facilitate CRR (acknowledge the return request), gatekeeping (authorisation of returns) and processing (providing feedback on the refund status) processes.

Finally, the CI practices of implementing consumer-centric RL processes, attaining consumer input (strategies) and management involvement (organisational requirement) can *improve RL process speed* and *effectiveness*. Therefore, implementing RL processes that aim to satisfy consumers and managers attaining consumer input regarding their expectations/requirements (in the return process) may improve the overall efficiency and effectiveness of RL processes.

6.4.2.2.3 Organisational outcomes of CI practices in RL

The organisational outcomes of CI practices in RL can include (1) facilitating RL implementation, (2) successful RL function, (3) enhancing RL performance, (4) enhancing RLM and (5) facilitating RPA (return prevention and avoidance) practices. Particularly, attaining consumer input (before implementing RL), interacting with consumers (CI strategies) and management involvement (organisational requirement) can *facilitate RL implementation,* ensuring that organisations implement consumer-centric RL processes and practices. Additionally, consumer participation and effective interaction with consumers (CI strategies) can be important for a *successful RL function,* emphasising the importance of consumers in RL.

Furthermore, strategic development of consumer support initiatives, strategic communication, strategic development of PM (metrics) for CI (strategies), and management involvement (organisational requirement) can *enhance RL performance*, reemphasising the link between CI and PM practices in RL (see section 6.4.2.1). Several CI strategies can *enhance RLM,* including consumer service and support initiatives, attaining consumer input and participation, communicating and sharing information with consumers, consumer interaction, implementation of CRM and implementation of CI, emphasising the importance of CI for the effective management of consumer returns.

Finally, the CI strategies of consumer-centric return policies, consumer service and support initiatives, consumer interaction and implementing CI can *facilitate RPA* practices in RL (section 6.9.3). For example, through proper communication and interaction with consumers, organisations can identify the root causes of product returns (e.g. breakage due to poor packaging and handling) and implement preventative measures (e.g. improved packaging) to avoid future returns.

6.4.2.2.4 Environmental and social outcomes of CI practices in RL

The *environmental outcomes* of CI practices in RL involve environmental protection and environmental responsibility, which can be achieved by attaining consumer participation and interaction (CI strategies). For example, organisations can engage with consumers to create awareness on the importance of RL for the environment, implying that CI practices can contribute to the environmental drivers and benefits of RL (see section 2.3.1.3).

The *social outcomes* of CI practices in RL involve social responsibility and corporate/brand image. Like the environmental outcomes, attaining consumer participation and interaction can demonstrate *social responsibility,* which can further drive organisations to implement and effectively manage RL. Moreover, organisations can *enhance* their *corporate* or *brand image,* especially, through the CI strategies related to consumer-centric return policies and consumer interactions. Evidently, CI practices can link with the corporate social responsibility (CSR) driver in RL (see section 2.3.1.4), emphasising the importance of CI practices for RL implementation (organisational outcome) (section 6.4.2.2.3).

6.4.2.2.5 Market-related outcomes of CI practices in RL

Although CI practices associate with limited economic, operational and organisational outcomes (in comparison to IT and SCI), various market-related outcomes can be realised through CI practices, including (1) competitive advantage and sustainable business, (2) increasing sales and demand, (3) improving customer service and responsiveness, (4) increasing consumer satisfaction, (5) enabling consumer retention, (6) enhancing consumer loyalty, trust and commitment, (7) enhancing CRM, and (8) enhancing CI.

Organisations can gain *competitive advantages* and enhance *business sustainability* through consumer-centric return policies and consumer support and service initiatives (e.g. keeping purchased reward points for returned products). Subsequently, organisations can *increase sales* and *demand* through CI practices, including (1) CI strategies related to strategic considerations (e.g. impact of lenient return policy), cost-benefit analyses, consumer-centric return policy, utilising RL for CI and consumer service and support initiatives, (2) economic requirements of costs and expenses, and (3) the operational requirement of efficient RL processes. Consequently, an increase in sales/demand can enhance profitability (see section 6.4.2.2.1), mitigating the costs and expenses of CI practices.

Several CI practices can *improve customer service* in RL, including the (1) CI strategies of developing customer service elements, consumer centric return policies and processes, utilising RL processes, customer service and support initiatives, and communicating and sharing information with consumers, and (2) the economic requirement of costs (e.g. full refund). Moreover, *responsiveness* can be *improved* through the IT requirement of appropriate IT for CI practices, emphasising the importance of IT for effective integration practices in RL.

Subsequently, organisations can *increase consumer satisfaction* through CI practices, like performing a cost-benefit analysis, consumer-centric return policies and processes, using RL for CI (strategies), costs (economic requirement) and an efficient RSC (SC requirement). Additionally, *consumer retention* can be realised through cost-benefit analyses, consumer-centric return policies and processes, using RL for

CI, consumer support initiatives, communication, interaction (CI strategies) and reducing consumer costs (economic requirement).

Likewise, several CI practices can *enhance consumer loyalty, trust* and *commitment*, including the (1) CI strategies of performing cost-benefit analyses, consumer-centric return policies and processes, using RL for CI, consumer support and service initiatives, attaining consumer input and participation, and (2) CI requirements of incurring costs (economic requirement), utilising IT for CI (IT requirement), and trained or knowledgeable staff (organisational requirement).

Consequently, organisations can *enhance CRM* through various CI practices, including the (1) CI strategies related to cost-benefit analyses, consumer-centric return policies and processes, using RL for CI, consumer education initiatives and CI implementation, and (2) CI requirements of costs (economic requirement), utilising IT for CI (IT requirement), top management support and management involvement (organisational requirements).

Finally, certain CI practices can further *enhance CI* in RL, like the strategic considerations related RL outsourcing and formalisation, utilising RL processes (e.g. gatekeeping that promote collaboration) (strategies), utilising IT (requirement) and RC in RL (organisational requirement), emphasising the importance of implementing various RL practices for the effective management of consumer returns.

Essentially, based on the findings presented in section 6.4.2.2, the most significant CI practices for the effective management of consumer returns, involve strategic development of consumer-centric return policies and attainment of consumer input and participation. However, performing a cost-benefit analysis, using RL processes for CI and incurring costs can also lead to several benefits, which reemphasise the importance of considering the costs (strategies and requirements) and benefits (outcomes) for the effective management of consumer returns.

In the next section, a description and conceptual framework of CI practices in RL will be presented and analysed.

6.4.2.3 Description and conceptual framework of CI practices to manage consumer returns

Based on the findings presented in section 6.4.2, CI practices can be important for the management of consumer returns, and will be described as follows:

> CI practices for the management of consumer returns involve (1) CI strategies, including a strategic approach, prioritisation of CI, strategic considerations, cost-benefit analyses, development of customer service elements, design of a return service system, development and implementation of consumer-centric return policies and RL processes, utilisation of RL for CI, development and implementation of consumer service, support, education and training initiatives, attainment of consumer input and participation, consumer communication, information sharing and interaction, implementation of CRM and CSM, development of PM, and implementation of CI, and (2) CI requirements, including economic requirements (costs and expenses), IT requirements (utilise IT and appropriate IT), an operational requirement (efficient RL process), organisational requirements (top management support,

management involvement, RL expertise, knowledgeable or trained staff, and RC) and a SC requirement (efficient RSC).

The CI strategies and requirements can result in several outcomes, including (1) economic outcomes (economic benefits, cost reduction and control, and profitability), (2) operational outcomes (improve visibility, reduce product return uncertainty, support RL processes and RL process speed and effectiveness), (3) organisational outcomes (facilitate RL implementation, successful RL function, enhance RL performance and RLM, and facilitate RPA practices), (4) environmental outcomes (environmental protection and responsibility), (5) social outcomes (social responsibility and enhance corporate/brand image), and (6) market-related outcomes (competitive advantage and sustainable business, increase sales/demand, improve customer service and responsiveness, increase consumer satisfaction, enable consumer retention, enhance consumer loyalty, trust and commitment, and enhance CRM and CI).

Figure 6.13 provides a conceptual framework of CI practices, which includes the CI strategies, requirements and outcomes to manage consumer returns.

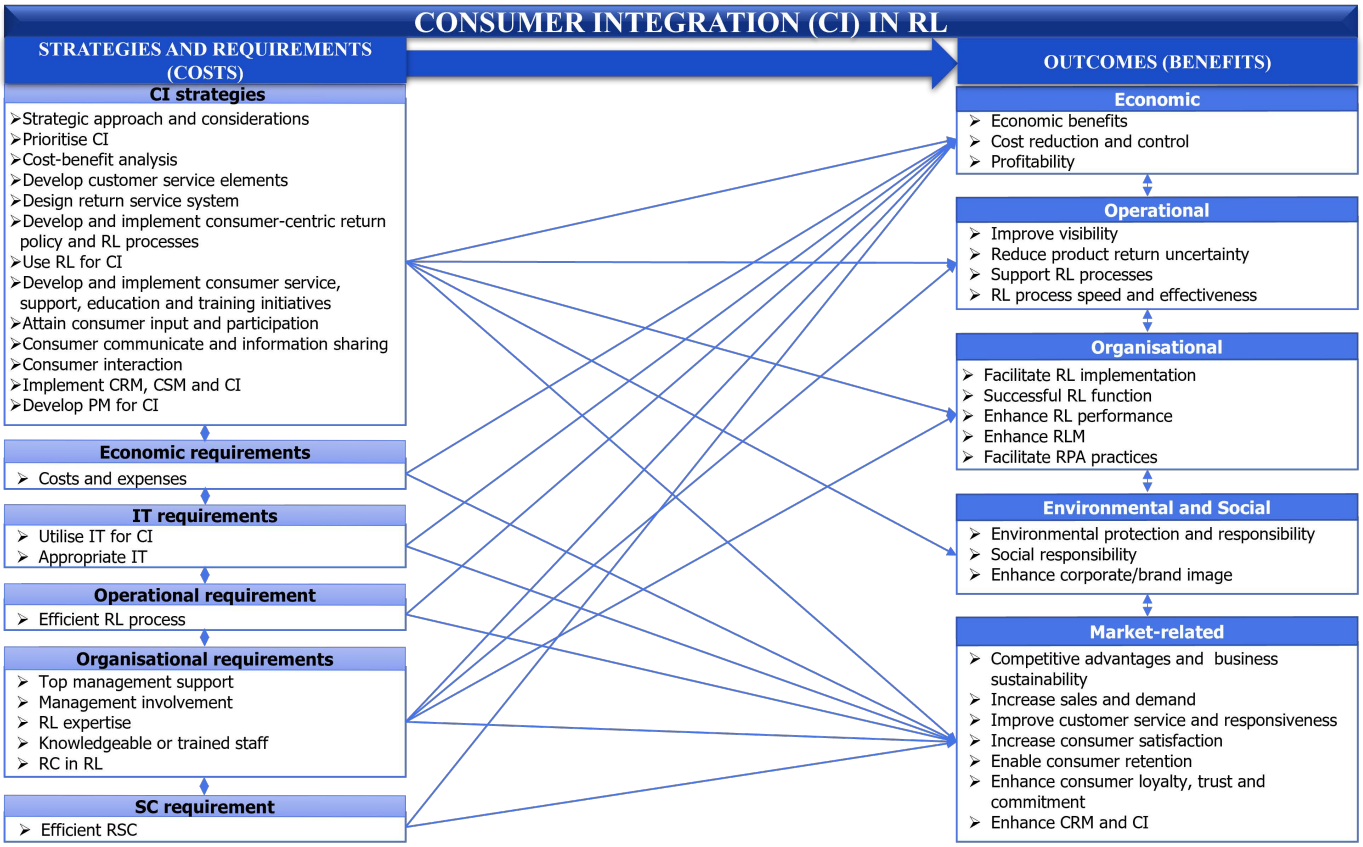

Figure 6.13 Conceptual framework of CI practices to manage consumer returns
Source: Compiled by researcher

Figure 6.13 illustrates the links between the strategies, requirements and outcomes of CI practices, demonstrating a cost and benefit relationship. For example, the links between CI strategies and requirements can be demonstrated by the CI strategies of a cost-benefit analysis and consumer-centric return policies, which links with the economic requirements of costs, IT requirement of utilising IT, the operational requirement of efficient RL processes, organisational requirements of top management commitment and management involvement and the SC requirement of an efficient RSC.

Regarding the links between CI strategies, requirements and outcomes, the framework demonstrates that CI strategies can be the most significant practice category, linking with all the CI outcomes, including economic, operational, organisational, environmental, social and market-related outcomes.

Therefore, organisations must pay attention to CI strategies to achieve optimum results to manage consumer returns. From the CI requirements, organisational requirements contribute to the most outcome categories (four out of five), demonstrating that human resources and commitment can be important for effective CI in RL.

From the outcomes of CI practices, economic and market-related outcomes can be the most significant (associated with all the practice categories), which emphasise the significance of performing a cost-benefit analysis for CI in RL. Consequently, organisations that experience economic challenges (e.g. profitability problems) and market-related challenges (e.g. limited sales, and poor customer service, satisfaction and retention) can benefit from implementing CI practices. In contrast, the environmental and social outcomes can be the least significant categories, meaning that CI practices may be less important for organisations that seek environmental and social benefits through RL practices.

Finally, the framework shows that the CI outcome categories can be linked, for example, the (1) market-related outcome of increased sales can link with the economic outcome of profitability, (2) environmental and social outcomes (RL drivers) can link with the organisational outcome of RL implementation, and (3) operational outcomes of RL process speed and effectiveness can link with the organisational outcome of enhanced RL performance.

Essentially, the links between the CI strategies, requirements and outcomes demonstrate the importance of a holistic approach to the management of consumer returns, meaning that organisations must carefully consider and analyse the costs (strategies and requirements) and benefits (outcomes) of CI for the effective management of consumer returns.

In the next section, cross-functional integration (CFI) as a RL integration practice to manage consumer returns will be explored.

6.4.3 Cross-functional integrations (CFI) practices to manage consumer returns

Up to this point of the integration practices, the focus was on external relationships between SC parties and consumers in RL, which are critical for the RLM of consumer returns. However, due to the interdisciplinary and cross-functional nature of RL (Dowlatshahi, 2010b:4200), cross-functional integration (CFI) between organisational functions (departments) is equally important for the RLM of consumer returns (Asham & Rahman 2021: 21; Hjort *et al.* 2019:784). Despite the need for CFI in RL, limited RL literature (from the QCA) focus on CFI as a RL practice to manage consumer returns, showing a gap in literature. Nevertheless, like other integration practices, the CFI practice categories included (1) CFI strategies and requirements and (2) CFI outcomes, which will be presented and discussed in the rest of this section.

Table 6.14 provides an overview of the findings related to *CFI practices* to manage consumer returns, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.14 Findings related to CFI practices to manage consumer returns

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
CFI strategies	***Strategic approach***	None	• *"Functional integration […] a more integrated and aligned approach to managing returns […]."* (Bernon *et al.* 2011:496)
	Strategic identification of functions in RL	Dowlatshahi (2010b:4200) (Hazen *et al.* 2015:160)	• *"Mapping out the reverse logistics program and identifying the different departments directly or indirectly involved in returns handling […]."* (Genchev, 2009:148) • *"[…] RL activities cuts across several functional areas such as marketing, operations, logistics, distribution and transportation. Other areas such as finance and accounting, customer services, quality and reliability, purchasing and design/engineering could also become heavily involved in the RL process."* (Dowlatshahi, 2012:1265)
	Strategic assignment of functional roles and responsibilities in RL	Genchev *et al.* (2011:255) (Hernández *et al.* 2011:84)	• *"Clear responsibilities must be assigned to accounting, sales, finance, marketing, etc. regarding […] the reverse logistics program."* (Genchev, 2009:148) • *"[…] firms assign the return task to functional areas based on the type of returns. For instance, product rejection is assigned to the quality department, whereas after-sales or service department handles product warranty."* (Shaharudin *et al.*, 2015:222)
	Strategic establishment of cross-functional teams	None	• *"[…] a cross-functional team should be established […]."* (Dowlatshahi, 2010a:1376) • *"[…] functions are involved in the reverse logistics process and often have members on the cross-functional teams: • procurement; • manufacturing; • finance and accounting; • sales and marketing; and • customer service."* (Partida, 2011:63)
	Strategic development of functional relationships	None	• *"The relationship between marketing and RL is a prime illustration of the cross-functional impact of RL."* (Genchev *et al.* 2011:245)
	Strategic collaboration, cooperation and coordination between functions	Hernández *et al.* (2011:84) Huscroft *et al.* (2013a:238) Lee and Lam (2012:596) Olorunniwo and Li (2010:456) Prakash and Barua, (2015:603)	• *"Company should persuade collaboration between various departments […]."* (Agarwal *et al.* 2016:3) • *"Managing reverse logistics is not the activity of just one department […] collaboration of all relevant departments (from research and development to finance/tax) […] is fundamental […]."* (Janse *et al.* 2010:508) • *"[…] managers should ensure frequent […] cooperation and collaboration among logistics, production and marketing to improve RL efficiency."* (Huang & Yang, 2014:635) • *"[…] internal coordination between marketing and procurement functions with logistics […]."* (Bernon *et al.* 2011:495)
	Strategic communication between functions	Huang and Yang, (2014:635) Lee and Lam (2012:596)	• *"[…] the value of reverse logistics is communicated clearly […] internally to the different departments involved […]."* (Genchev, 2009:143) • *"[…] it is critical for marketing managers to liaise with their logistics counterparts to ensure effective processes […]."* (Hazen *et al.* 2015:160)
	Strategic knowledge sharing between functions	None	• *"[…] exchanging their ideas and knowledge to create an innovative tool […] During internalization [sic], knowledge of the product return is shared […]."* (Ramírez, 2012:1138)
	Strategic information sharing between functions	None	• *"Finance and accounting departments must be informed in real time of any customer/ supplier returns-related requirements […]."* (Genchev *et al.* 2011:255) • *"[…] the organization [sic] to incorporate and share information on returns easily throughout the firm."* (Ramírez, 2012:1138)
	Strategic implementation of CFI	Huang and Yang (2014:620)	• *"Reverse logistics requires integration of various business functions […]."* (Khor & Udin, 2012:4) • *"Functional integration […] to managing returns was needed."* (Bernon *et al.* 2011:496)
IT requirement	***Utilise IT for CFI***	None	• *"Intranet provides link within the intra-departmental heads and logistics managers for dealing with reverse logistics operations."* (Ravi, 2014:300) • *IS facilitated internal […] communication, allowing more coordination […]."* (Sharif *et al.* 2012:2523) • *"ERP is an information system integrating all facets of an organization [sic] on a common database."* (Olorunniwo & Li, 2011:5)
Operational requirement	***Forward logistics (FL) and RL integration***	None	• *The incorporation of reverse logistics operations within the logistics effort of a firm should be the first step in the process of corporate-wide integration.* (Genchev, 2009:148)
Organisational requirements	***Top management support in RL***	None	• *"Stronger senior management support for […] better coordination among the different departments involved in handling returns […]."* (Genchev, 2009:143) • *"[…] best-practice organizations […] senior management support with cross-functional teams […] in the reverse logistics process […]."* (Partida, 2011:63)
	Management involvement	None	• *"[…] managers should ensure frequent communication, cooperation and collaboration among logistics, production and marketing […]."* (Huang & Yang, 2014:635) • *"[…] management realized [sic] that unless the value of reverse logistics is communicated […] to the different departments involved, improving program performance can be problematic."* (Genchev, 2009:143)
	PM practices in RL	None	• *"Appropriate metrics can help to shape communication and coordination across functions. For instance, reverse logistics metrics might help to […] inform marketing professionals with regard to supplier selection and retention."* (Hazen *et al.* 2015:160)

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
Economic outcomes	***Facilitate FM and control***	None	• *"[…] the problem of control and managing financial aspects of aftermarket logistics. Frequent communication, co-operation and collaboration between logistics and financial department can resolve the problem […]."* (Lee & Lam, 2012:596)
	Reduce RL costs	None	• *"[…] internal coordination between marketing and procurement functions with […] input from the logistics function, the cost of returns could be significantly lowered […]."* (Bernon *et al.* 2011:495) • *"[…] one of the key cost drivers of retail reverse logistics is poor integration between the various interfaces that exist between internal […] organisational actors."* (Bernon *et al.* 2011:495)
	Maximise value recovery	None	• *"Reverse logistics requires integration of various business functions […] to maximize the value of recoverables."* (Khor & Udin, 2012:4)
Operational outcomes	***Reduce product return uncertainty***	None	• *As the quality of the returned product is not uniform […] Frequent communication, co-operation and collaboration between logistics and financial department can resolve the problem […]."* (Lee & Lam, 2012:596)
	Improve RL process efficiency and effectiveness	None	• *"[…] managers should ensure frequent communication, cooperation and collaboration among logistics, production and marketing to improve RL efficiency."* (Huang & Yang, 2014:635) • *"[…] inter- and intra-organizational [sic] collaboration facilitates enhanced levels of RL processing effectiveness […]."* (Huscroft *et al.* 2013a:238) • *"[…] exchanging their ideas and knowledge […] and share information on returns easily throughout the firm to improve reverse logistics processes."* (Ramírez, 2012:1138) • *"[…] it is critical for marketing managers to liaise with their logistics counterparts to ensure effective processes and […] reverse logistics activities […]."* (Hazen *et al.* 2015:160)
	Enhance operational performance	None	• *"[…] internal cross-functional processes […] that affect […] operational performance."* (Bernon *et al.* 2016:600)
Organisational outcomes	***Enhance RL innovation and capabilities***	None	• *"[…] exchanging their ideas and knowledge to create an innovative tool that can be used for efficient management of returns."* (Ramírez, 2012:1138) • *"[…] another way for a firm to develop innovative capabilities is to increase cross-functional integration […]in the RL context […]."* (Huang & Yang, 2014:620)
	Improve RL program efficiency and effectiveness	None	• *"[…] identifying the different departments directly or indirectly involved in returns handling can prove to be a valuable initiative. Clear responsibilities must be assigned to accounting, sales, finance, marketing, etc. regarding increasing the efficiency and effectiveness of the reverse logistics program."* (Genchev, 2009:148)
	Enhance RL performance	None	• *"[…] management realized [sic] […] the value of reverse logistics is communicated clearly […] to the different departments involved, improving program performance […]."* (Genchev, 2009:143)
	Facilitate and improve RLM	None	• *"Functional integration […] that a more integrated and aligned approach to managing returns was needed."* (Bernon *et al.* 2011:496) • *"In order to manage the process well, some firms assign the return task to functional areas based on the type of returns."* (Shaharudin *et al.* 2015:222) • *"Managing reverse logistics is not the activity of just one department […] collaboration of all relevant departments (from research and development to finance/tax) […] is fundamental in realising improvements."* (Janse *et al.* 2010:508) • *"[…] exchanging their ideas and knowledge […] that can be used for efficient management of returns."* (Ramírez, 2012:1138) • *"Intranet provides link within the intra-departmental heads and logistics managers for dealing with reverse logistics operations."* (Ravi, 2014:300)
	Facilitate RL decision-making	None	• *"[…] a cross-functional team should be established in order to make crucial and ongoing decisions regarding RL opportunities."* (Dowlatshahi, 2010a:1376) • *"[…] to incorporate and share information on returns easily throughout the firm. […] During internalization [sic], knowledge of the product return is shared and understood by people with no background in handling product returns, thereby improving decision-making."* (Ramírez, 2012:1138)
	Facilitate internal communication and coordination	None	• *IS facilitated internal […] communication, allowing more coordination […]."* (Sharif *et al.* 2012:2523) • *"Stronger senior management support for […] better coordination among the different departments involved in handling returns […]."* (Genchev, 2009:143) • *"Appropriate metrics can help to shape communication and coordination across functions."* (Hazen *et al.* 2015:160)
	Enhance CFI	None	• *"The incorporation of reverse logistics operations within the logistics effort of a firm should be the first step in the process of corporate-wide integration."* (Genchev, 2009:148)
	Facilitate RPA	None	• *"Poor internal coordination between marketing and procurement functions with logistics were found to lead to significant levels of returns. For example, the terms contained within the customer returns policy should be based on an understanding of the impact to the business as a whole."* (Bernon *et al.* 2011:495)
Market-related outcomes	***Meet customer needs***	None	• *"[…] a cross-functional team should be established […] regarding RL opportunities […] the team determines that the needs of the customer can be reasonably met […]."* (Dowlatshahi, 2010a:1376)
	Increase consumer service, satisfaction and sales	None	• *"[…] internal cross-functional […] practices that affect customer service […]."* (Bernon *et al.* 2016:600) • *"Stronger senior management support for […] better coordination among the different departments involved in handling returns are all justified by increased customer*

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
			satisfaction, resulting in more business." (Genchev, 2009:143) • *"[…] it is critical for marketing managers to liaise with their logistics counterparts to ensure effective processes and customer satisfaction."* (Hazen *et al.* 2015:160)
SC outcomes	***Facilitate SCI practices***	Bernon *et al.* (2016:600)	• *"Inter-firm coordination and collaboration is almost impossible if not preceded by intra-firm coordination through information sharing."* (Olorunniwo & Li, 2010:456)

Source: Compiled by the researcher

In the subsequent sections these categories of CFI practices, presented in Table 6.14, will be discussed and concluded with a description and conceptual framework of CFI practices to manage consumer returns.

6.4.3.1 Strategies of CFI practices in RL

The CFI strategies can be viewed as organisational actions to enhance and implement CFI practices in RL, and include (1) a strategic approach, (2) strategic identification of functions in RL, (3) strategic assignment of functional roles and responsibilities in RL, (4) strategic establishment of cross-functional teams, (5) strategic development of functional relationships, (6) strategic collaboration, cooperation and coordination between functions, (7) strategic communication between functions, (8) strategic knowledge sharing between functions, (9) strategic information sharing between functions, and (10) strategic implementation of CFI.

Like SCI and CI (sections 6.4.1 and 6.4.2), CFI strategies must start with a *strategic approach* to guide the development and implementation of CFI practices to manage consumer returns. Particularly, organisations must adopt an internal integrated approach, which means that various organisational functions must integrate to manage consumer returns. Accordingly, *strategic identification* of *functions* in *RL* can be important for effective CFI. Depending on the organisational structure, the possible functions that may be directly and indirectly involved in RL include marketing, customer service, finance, operations and logistics (including distribution and transportation), quality, after-sales, purchasing/procurement and design/engineering,

Furthermore, organisations must *strategically assign functional roles* and *responsibilities* in *RL*, which demonstrate the importance of CFI in RL. For example, the RL roles and responsibilities of the (1) customer service function can be handling the customer return request (CRR) and gatekeeping processes, (2) logistics and operations function can be collection, transport, receiving, sorting, processing of replacements and exchanges, and return to stock disposition and redistribution, (3) finance/accounting function can be processing of consumer refunds/credits and supplier credit, (4) quality function can be inspection, testing and verification, and (5) after-sales function can be product recovery (e.g. repair) and return to the supplier disposition.

Subsequently, organisations must *strategically establish cross-functional teams* that consist of individual representatives from the different functions involved in RL. For example, a cross-functional team for RL can include the customer service manager, logistics manager, accounting officer, quality manager, marketing manager, after-sales manager and a procurement officer. Consequently, the cross-functional teams can be utilised for the *strategic development* of *functional relationships,* which can be important for maintaining effective CFI practices in RL.

Furthermore, effective CFI practices in RL rely on *strategic collaboration, cooperation* and *coordination* between functions, meaning that the functional departments involved in RL must work collectively to manage consumer returns effectively. Subsequently, *strategic communication* between functions can be important for developing functional relationships and supporting functional collaborative efforts in RL.

Like SCI (section 6.4.2.1), CFI strategies involve strategic sharing initiatives, like knowledge and information sharing between functions, which can be for effective RLM. For instance, functions can *strategically share knowledge* and ideas (e.g. brainstorming sessions) on improving RL processes and practices to manage consumer returns. Additionally, functions can *strategically share information* on the status of a consumer product return, for example, logistics informing finance about the outcomes of consumer returns for accurate return processing (e.g. issue refunds to consumers).

Finally, organisations can *strategically implement CFI* as an overall RL strategy to maintain cross-functional relationships in RL, promoting effective collaboration, cooperation, coordination, communication and strategic sharing between functions for the effective management of consumer returns. In the next section, the requirements of CFI in RL will be discussed.

6.4.3.2 Requirements of CFI practices in RL

CFI practices in RL involves a few requirements, which include IT, operational and organisational requirements (see Table 6.14). The *IT requirement* involves the *utilisation of IT* for CFI, which emphasise the importance of communication and information sharing as part of CFI strategies. Specifically, organisations can use internal systems, like an Intranet, or TLIT, like ERP systems, to facilitate CFI initiatives, reemphasising the important link between integration and IT practices for effective RLM of consumer returns.

The *operational requirement* for CFI relates to integrated facility/location practices, which involve forward logistics (FL) and RL integration (see section 6.8.3). Accordingly, effective CFI may require combining RL and FL as one function because logistics can be viewed as a traditional function that may involve preestablished functional integration or may be more favourable as a functional unit for

CFI. Since RL involves several organisational barriers, like management inattention, resistance to change and lack of internal coordination (see section 2.3.3), integrating RL and FL may be the only solution for effective CFI practices in RL.

Finally, the *organisational requirements* for CFI include top management support, management involvement and PM in RL. Evidently, like CI practices (section 6.4.2.1), *top management support* can be important for the development and implementation CFI practices. Moreover, *management involvement* can be critical for driving cross-functional efforts, like collaboration, coordination and communication between functions, and communicating the importance of RL, which may address the resistance to change and lack of internal coordination barriers in RL.

Although SCI and CI practices involve PM as strategies, successful CFI practices need *PM practices* in RL. Consequently, developing and implementing metrics for RL can be important for CFI practices (such as facilitating coordination and communication between functions), emphasising the importance of a holistic approach to the RLM of consumer returns.

Essentially, like SCI and CI practices, organisations must implement several RL practices for successful CFI, including IT (section 6.3), PM (section 6.7), (combined) facility/location practices (section 6.8.3), and management and staff practices (section 6.9.5). In the next section, the outcomes of CFI practices to manage consumer returns will be discussed.

6.4.3.3 Outcomes of CFI practices in RL

Table 6.14 shows that CFI practices involve several outcomes, including economic, operational, organisational, market-related and SC outcomes, which can be important for the effective management of consumer returns.

The *economic outcomes* of CFI involve facilitating financial management (FM) and control, reducing RL costs and maximising value recovery. Particularly, organisations can *improve FM* and *control* in RL through the CFI strategies of collaboration, cooperation and communication between functions (such as finance and logistics), indicating that CFI can be important for effective FM practices in RL (see section 6.9.2). Similarly, *RL costs* can be *reduced* through the CFI strategies of coordination between functions (e.g. logistics, marketing and procurement) and implementation of CFI, implying that CFI practices can address the economic barrier of high RL costs (see section 2.3.1). Lastly, implementing CFI in RL (strategy) can *maximise value recovery*, demonstrating a potential link between CFI and disposition practices (aimed at maximum value recovery) (see section 6.6).

The *operational outcomes* of CFI involve (1) reducing product return uncertainty, (2) improving RL process efficiency and effectiveness, and (3) enhancing operational performance. Like the economic

outcome of improved FM and control, *product return uncertainty* can be *reduced* through the CFI strategies of collaboration and communication between functions and the CFI organisational requirement of management involvement, which indicates that CFI practices can address the operational barriers in RL (see section 2.3.2). Moreover, strategic collaboration, communication, knowledge sharing and information sharing between functions can *improve RL process efficiency* and *effectiveness*. Evidently, implementing CFI in RL (strategy) can enhance the *operational performance* of the RL process, which can be important for managing consumer returns effectively.

Several *organisational outcomes* associate with CFI practices, including (1) enhancing RL innovation and capabilities, (2) improving RL program efficiency and effectiveness, (3) enhancing RL performance, (4) facilitating and improving RLM, (5) facilitating RL decision-making, (6) facilitating internal communication and coordination, (7) enhancing CFI, and (8) facilitating return prevention and avoidance (RPA) practices. Particularly, knowledge sharing between functions and implementing CFI (CFI strategies) can *enhance RL innovation* and *capabilities*, which can be important for continuous improvement initiatives in RLM. Moreover, the CFI strategies of identifying functions and assigning functional roles and responsibilities in RL can *improve RL program efficiency* and *effectiveness*, emphasising the operational outcome related to RL process efficiency and effectiveness. Similarly, CFI practices related to communication (CFI strategy) and management involvement (organisational requirement) can *enhance RL performance*, which emphasise the operational performance outcome of CFI.

Several CFI practices can *facilitate* and *improve RLM*, including the (1) CFI strategies of adopting a strategic (internal integrated) approach, assigning RL roles and responsibilities to functions, collaborating and knowledge sharing between functions, and implementing CFI, and (2) IT requirement of utilising IT systems (e.g. Intranet) for CFI. Additionally, the CFI strategies of establishing cross-functional teams and knowledge and information sharing between functions can *facilitate RL decision-making*, which can further contribute to the effective RLM of consumer returns.

Several CFI practices can contribute to outcomes related to CFI initiatives, for example, utilising IT systems (IT requirement), management involvement and PM in RL (organisational requirements) can enhance *internal coordination* and *communication*. Likewise, the operational requirement of integrating RL with FL can *facilitate CFI*, reemphasising the importance of implementing various RL practices for effective RLM. Consequently, effective CFI practices, like strategic coordination between functions, can *facilitate RPA* practices in RL, emphasising the important link between integration practices and RPA practices (also see sections 6.4.1.2 and 6.4.2.2).

Although limited, the *market-related outcomes* of CFI, including meeting consumer needs and improving consumer service, satisfaction and sales, can be important for the effective management of

consumer returns. Specifically, the strategic establishment of cross-functional teams for RL means that more focus can be placed on *meeting consumer needs*. Consequently, departments that may be less focussed on the consumer (e.g. finance and procurement) can be motivated through cross-functional teams to consider the needs of consumers. Additionally, strategic implementation of CFI (strategy) can *increase customer service*, and strategic coordination and communication between functions (CFI strategies), top management support and management involvement (organisational requirement) can *increase customer satisfaction,* which can result in more business and an *increase in sales.*

Finally, CFI practices involve the *SC outcome* of *facilitating SCI practices,* which emphasise the impact of internal integration on the effectiveness of external integration. Consequently, CFI strategies, like coordination and information sharing between functions, can facilitate SCI strategies of SC collaboration and coordination (also see section 6.4.1).

Essentially, CFI practices can provide several economic, operational, organisational, market-related and SC benefits, which can be important for the effective management of consumer returns. In the next section, a description and conceptual framework of CFI in RL will be presented and analysed.

6.4.3.4 Description and conceptual framework of CFI practices to manage consumer returns

Based on the findings presented in section 6.4.3, CFI practices can be important for the management of consumer returns, and will be described as follows:

> CFI practices for the management of consumer returns involve (1) CFI strategies, including a strategic approach, identification of functions in RL, assignment of functional roles and responsibilities in RL, establishment of cross-functional teams, development of functional relationships, strategic collaboration, cooperation, communication, knowledge sharing and information sharing between functions, and strategic implementation of CFI, and (2) CFI requirements, including IT requirement (utilise IT for CFI), operational requirement (RL and FL integration), and organisational requirements (top management support, management involvement and PM practices). The CFI strategies and requirements can result in several outcomes, including (1) economic outcomes (facilitate FM and control, RL cost reductions and maximise value recovery), (2) operational outcomes (reduce product return uncertainty, improve RL process efficiency and effectiveness and enhance operational performance), (3) organisational outcomes (enhance RL innovation and capabilities, improve RL program efficiency and effectiveness, enhance RL performance, facilitate and improve RLM, facilitate RL decision-making, internal communication and coordination, enhance CFI and facilitate RPA), (4) market-related outcomes (meet consumer needs and increase consumer service, satisfaction and sales), and (5) SC outcomes (facilitate SCI).

Figure 6.14 provides a conceptual framework of CFI practices, which includes the CFI strategies, requirements and outcomes to manage consumer returns. Specifically, Figure 6.14 illustrates the links between the strategies, requirements and outcomes of CFI, demonstrating a cost and benefit relationship. For example, the links between CFI strategies and requirements can be demonstrated by the CFI strategy of communication between functions, which links with the IT requirement (utilise IT) and organisational requirements (management involvement and PM in RL). Similarly, the CFI strategy of CFI implementation links with the operational requirement of FL and RL integration), and the CFI

strategy of establishing cross-functional teams links with the organisational requirement of top management support.

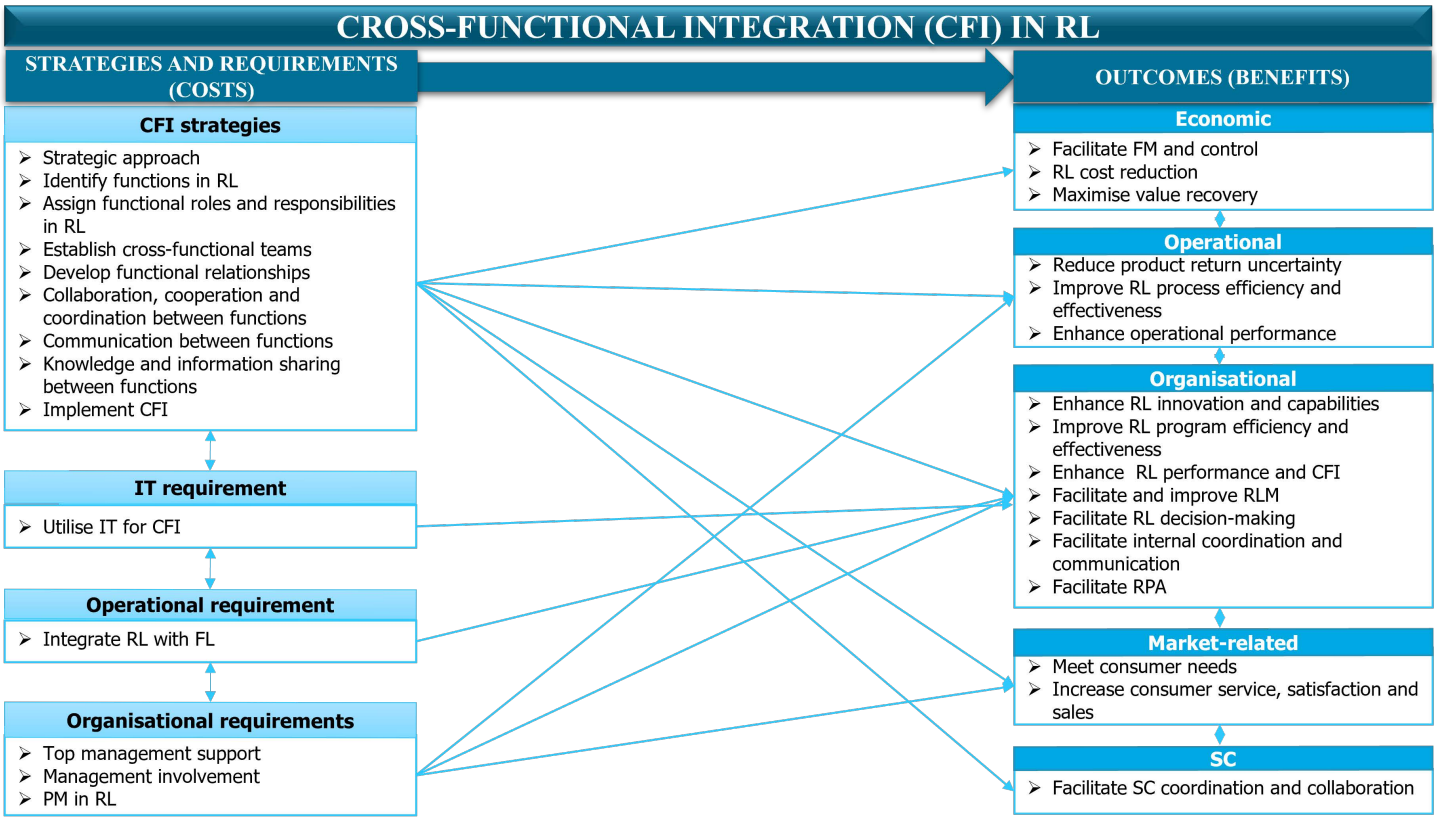

Figure 6.14 Conceptual framework of CFI practices to manage consumer returns
Source: Compiled by researcher

Regarding the links between CFI strategies, requirements and outcomes, the framework demonstrates that CFI strategies can be the most significant practice category, linking with all the CFI outcomes, including economic, operational, organisational, market-related and SC outcomes. Therefore, organisations must pay attention to CFI strategies to achieve optimum results to manage consumer returns. From the CFI requirements, the organisational requirements contribute to the most outcome categories (three out of five), while the IT and operational requirements respectively contribute to only one outcome category.

In terms of the outcomes of CFI practices, organisational outcomes can be the most significant outcome category (associated with all practice categories), which means that CFI practices can be the most beneficial for organisations that seek organisational benefits through RL practices. In contrast, the economic and SC outcomes can be the least significant categories (only associated with CFI strategies), meaning that CFI practices may be less important for organisations that experience economic and SC barriers in RL.

Finally, the framework shows that the CFI outcome categories can be linked, for example, the operational outcome of RL process efficiency and effectiveness can link with cost reduction/savings

(economic outcome), RL program efficiency and effectiveness (organisational outcome) and increased consumer service (market-related outcome). Additionally, the organisational outcome of internal coordination and communication can link with the SC outcome of SCI.

Essentially, the links between the CFI strategies, requirements and outcomes demonstrate the importance of a holistic approach to the management of consumer returns, meaning that organisations must carefully consider and analyse the costs (strategies and requirements) and benefits (outcomes) of CFI for the effective management of consumer returns.

In the next section, a conceptual framework and summary of findings for integration practices (discussed in section 6.4) to manage consumer returns will be presented and described.

6.4.4 Conceptual framework and summary of findings for integration practices to manage consumer returns

This section provides a conceptual framework and summary of the findings for integration practices to manage consumer returns. The findings presented in section 6.4. showed that all the integration practices, including supply chain integration (SCI), consumer integration (CI) and cross-functional integration (CFI) can be important for the management of consumer returns.

Figure 6.15 provides a conceptual framework for integration practices to manage consumer returns. Specifically, the conceptual framework illustrates a summary of the findings related to the integration practices, including SCI, CI and CFI, focusing on the combined strategies, requirements and outcomes, as well as the relationship between the strategies and requirements (costs), integration types and the outcomes (benefits). Furthermore, the strategies, requirements and outcomes that associate with all integration practices are emphasised through *italics*, and the unique strategies, requirements and outcomes (only applicable to a single practice) are emphasised with a coloured asterisk* (linked to the practice colour). The strategies, requirements and outcomes without italics and asterisks associate with two integration practices.

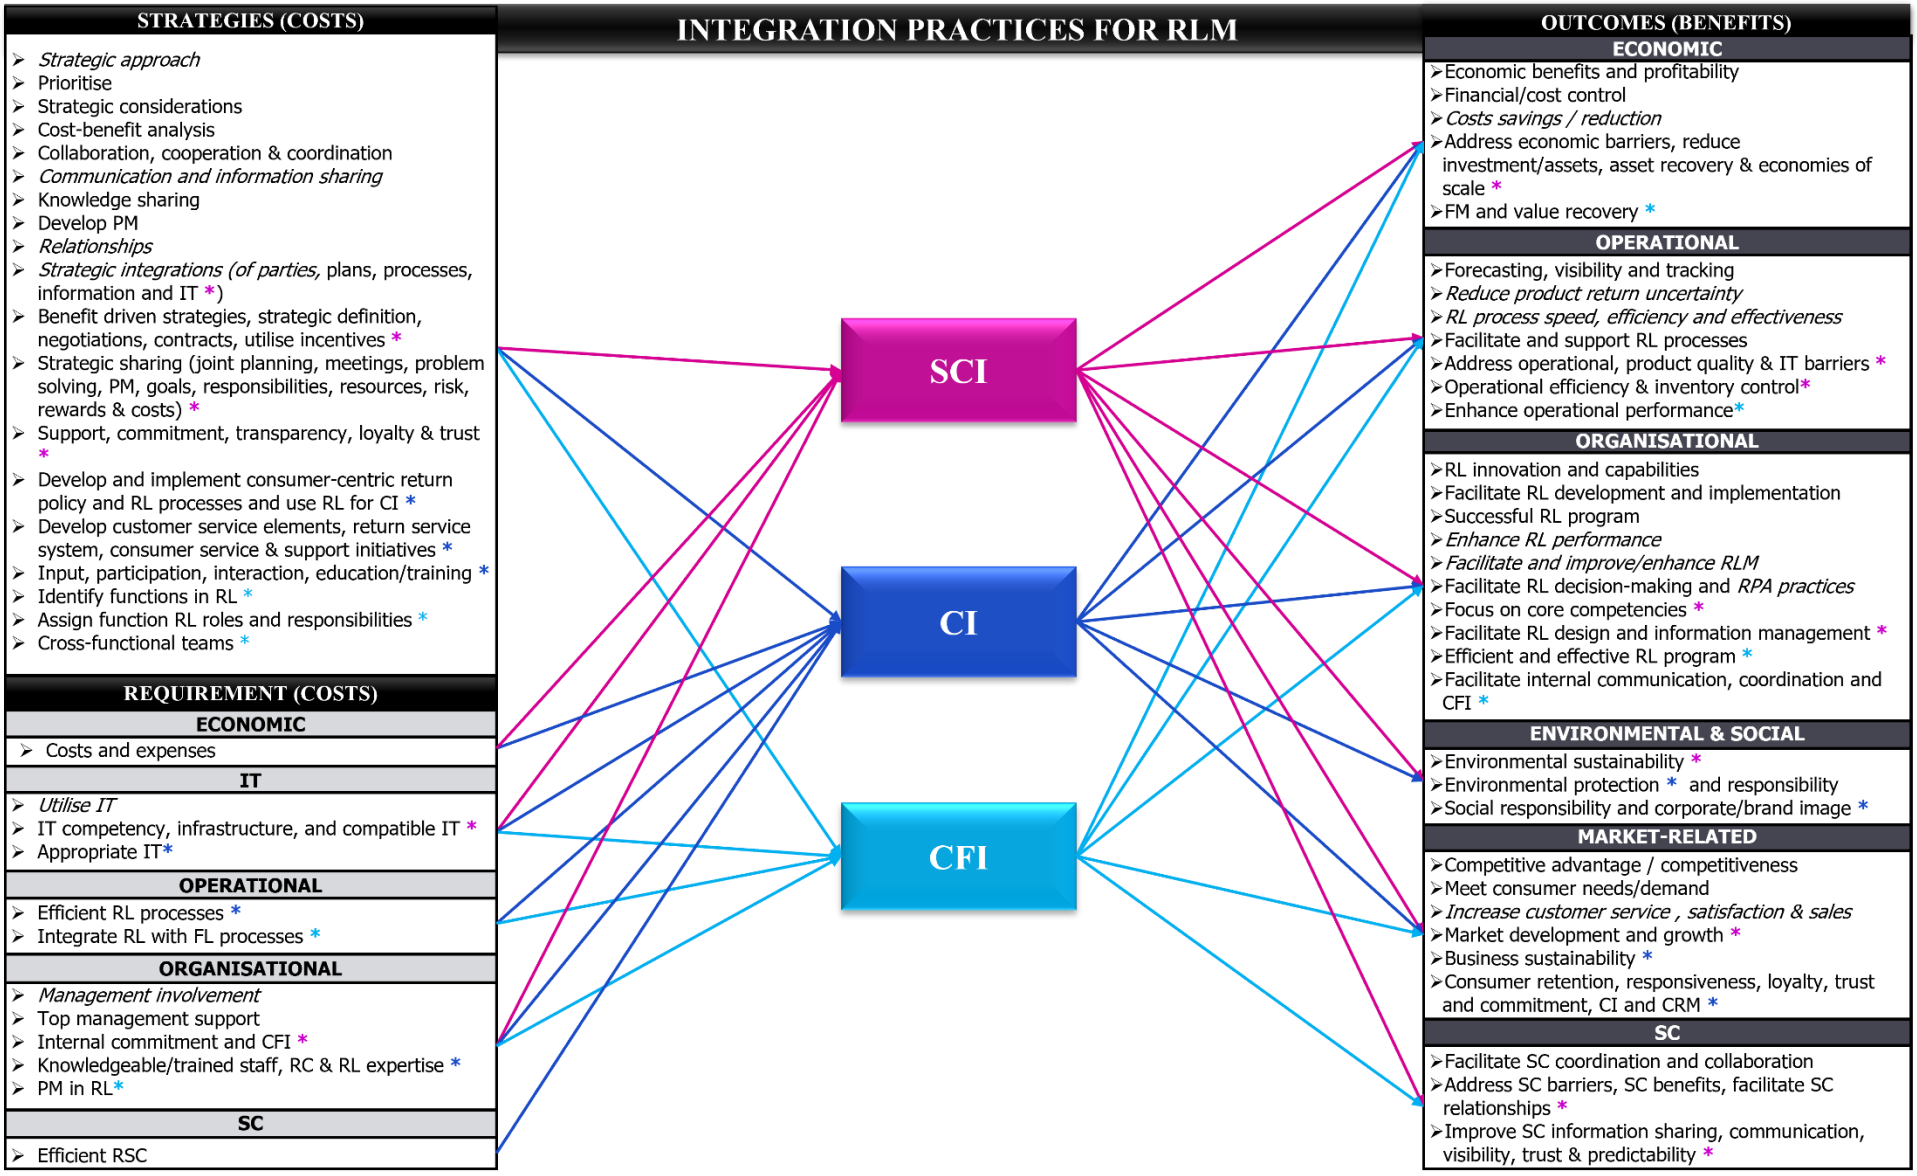

Figure 6.15 Conceptual framework of integration practices to manage consumer returns
Source: Compiled by the researcher

Based on Figure 6.15 and the discussions given in section 6.4, Table 6.15 provides a summary of the findings and managerial implications for the integration practices to manage consumer returns.

Table 6.15 Summary of findings and managerial implications for integration practices to manage consumer returns

CATEGORY	KEY FINDINGS	MANAGERIAL IMPLICATIONS
Strategies	•All integration practices, including SCI, CI and CFI involve strategies •All integration practices involve strategies related to strategic approach, information-sharing, communication, relationships and integrations •SCI and CI practices must be prioritised for RL •SCI and CI practices involve strategic considerations, cost-benefit analyses and development of PM •SCI and CFI practices involve strategic collaboration, cooperation, coordination, knowledge sharing and information sharing •Only SCI practices involve benefit-driven strategies, strategic commitment and support, negotiations, contracts, transparency, loyalty, trust and incentives •Only SCI practice strategic sharing and integration initiatives related to plans, processes, goals, problem solving, meetings, PM, resources (including infrastructure and IT), responsibilities, costs, risk, profits and SCM •Only CI practices involve strategies related to consumer-centric return policies and process, using RL, customer service elements, return service systems, customer service, support, education and training initiatives, consumer input, participation and interaction •Only CFI practices involve strategies related to identifying functions in RL, assigning functional roles and responsibilities in RL and cross-functional teams	•For successful integrations in RL, organisations must focus on integration strategies •For any type of integration in RL, organisations must focus on adopting strategic approaches, relationship development and management, information sharing, communication and strategic integrations •Organisations must focus on prioritising external integrations (SCI and CI) to manage consumer returns •For effective external integrations (SCI and CI) strategies, organisations must focus on strategic considerations, performing cost-benefit analyses and developing PM •For effective SCI and CFI strategies, organisations must focus on collaboration, cooperation, coordination, knowledge sharing and information sharing initiatives •For SCI strategies, organisations must focus on benefit-driven strategies, strategic commitment and support, negotiations, contracts, transparency, loyalty, trust, incentives, and strategic sharing and integration initiatives •For CI strategies, organisations must focus on consumer-centric return policies and processes, using RL, customer service elements, return service systems, customer service, support, education and training initiatives, consumer input, participation and interaction •For CFI strategies, organisations must focus on identifying functions in RL, assigning functional roles and responsibilities in RL and implementing cross-functional teams
Requirements	•CI practices associate with all requirements, including economic, IT, operational, organisational and SC requirements •SCI and CI practices involve *economic requirements* related to costs and expenses •All integration practices include *IT requirements*, including IT utilisation, but uniquely SCI requires IT competency, infrastructure and compatible IT, and CI requires appropriate IT •CI and CFI practices involve *operational requirements*, but uniquely CI requires efficient RL processes and CFI requires integration of RL and FL processes •All integration practices include the *organisational requirement* of management involvement, but uniquely SCI requires internal commitment and CFI, CI requires trained and knowledgeable staff, resource commitment (RC) and RL expertise, and CFI requires PM in RL •CI and CFI practices involve the organisational requirement of top management support •Only CI practices involve the *SC requirement* of efficient RSC	•Before implementing CI practices to manage consumer returns, organisations must consider various economic, IT, operational, organisational and SC requirements •For effective external integrations (SCI and CI) organisations must recognise and incur costs •For effective internal and external integrations, organisations must utilise IT and implement appropriate IT practices •Organisations must focus on operational requirements of efficient RL processes for CI practices and FL/RL integration for CFI practices •Organisations must involve management for successful internal (CFI) and external (SCI and CI) integrations •Successful CI and CFI requires top management support •For successful SCI practices organisations must implement CFI practices •For successful CI practices, organisations must train or allocate knowledgeable staff, commit resources and attain RL expertise •For successful CFI practices, organisations must implement PM practices •For successful CI practices, organisations must establish an efficient RC
Outcomes	•All integration practices involve benefits to manage consumer returns •Apart from social benefits, SCI include all outcome (benefit) categories, including economic, operational, organisational, environmental, market-related and SC •All integration practices involve *economic outcomes*, especially, in terms of cost savings, but uniquely, SCI can address economic barriers, reduce investment/assets, asset recovery and economies of scale, and CFI can facilitate FM in RL and value recovery •SCI and CI practices involve the economic outcomes of economic benefits and profitability •CI and CFI practices involve the economic outcome of cost control •All integration practices involve *operational outcomes*, including reducing product return uncertainty and improving RL process speed, efficiency and effectiveness, but uniquely, SCI can address operational, product quality and IT barriers and improve operational efficiency and inventory control, and CFI can enhance operational performance •SCI and CI practices involve the operational outcomes of improving product return forecasting, visibility and tracking, and facilitating and supporting RL processes •All integration types provide *organisational outcomes*, especially, improving RL performance and RLM, and facilitating RPA, but	•Organisations that experience various economic, operational, organisational, environmental, market-related and SC challenges in RL can consider implementing SCI practices •Organisations that seek to reduce costs in RL can consider integration practices in RL •Organisations that experience economic barriers and high asset/investment requirements in RL can consider SCI practices •For economies of scale and asset recovery organisations can consider SCI practices •Organisations that experience FM challenges in RL can consider CFI practices •To maximise recovery value, organisations can implement CFI •Organisations that seek economic benefits and profitability must focus on external integrations (SCI and CI) in RL •To control RL costs, organisations can consider CI and CFI practices •To reduce product return uncertainty, organisations can consider implementing SCI, CI and CFI practices •Organisations that seek to improve RL process speed, efficiency and effectiveness can implement integration practices •Organisations that experience operational barriers, including product quality and IT barriers, in RL must consider implementing SCI practices •To enhance operational performance, organisations can consider internal integration (CFI) practices •To improve product return forecasting, visibility and tracking and

	uniquely, SCI can enable focus on core competencies, and facilitate RL design and information management, and CFI can improve RL program efficiency and effectiveness and facilitate internal coordination, communication and integration •SCI and CI practices involve the organisational outcomes of facilitating RL development and implementation and ensuring a successful RL program •SCI and CFI involve the organisational outcomes of enhancing RL innovation and capabilities and facilitating RL decision-making •SCI and CI practices involve *environmental outcomes*, especially, environmental responsibility, but uniquely, SCI can enhance environmental sustainability and CI can result in environmental protection •Only CI can result in the *social outcomes* of social responsibility (CSR) and corporate/brand image •All integration practices involve *market-related outcomes*, especially, increasing customer service, satisfaction and sales, but uniquely, SCI can facilitate market development and growth, and CI can enhance business sustainability, consumer retention, responsiveness, loyalty, trust and commitment, CI and CRM •SCI and CI practices involve the market-related outcomes of a competitive advantage or competitiveness •SCI and CFI practices involve the market-related outcome of meeting consumer needs •SCI and CFI practices involve *SC outcomes*, especially, improvements in SC coordination and collaboration •SCI provide many SC benefits in RL, including addressing SC barriers, realising SC benefits, facilitating SC relationships and improving SC information sharing, communication, visibility, trust and predictability	support RL processes, organisations can consider external integration (SCI and CI) practices •Organisations can implement integration practices to enhance RL performance, facilitate and improve RLM and facilitate RPA •Organisations can consider SCI practices to focus on core competencies and facilitate RL design and information management •Organisations can consider CFI practices to improve RL program efficiency and effectiveness and facilitate internal communication, coordination and integration •For RL development and implementation and a successful RL program, organisations can consider external integration (SCI and CI) practices •For effective RL innovation, capabilities and decision-making, organisations can consider SCI and CFI practices •Organisations that seek to demonstrate environmental responsibility can consider external integrations (SCI and CI) in RL •To enhance environmental sustainability organisations can implement SCI practices •For environmental protection, organisations can consider CI practices •Organisations that seek to demonstrate CSR and enhance corporate/brand image can consider implementing CI •To increase consumer service, satisfaction and sales, organisations can consider implementing integration practices in RL •For market development and growth, organisations can implement SCI practices •Organisations that seek to enhance business sustainability, consumer retention, responsiveness, loyalty, trust, commitment, CI and CRM can implement CI practices in RL •To achieve a competitive advantage, organisations can consider implementing external integration (SCI and CI) practices in RL •To meet consumer needs/demands, organisations can consider SCI and CFI practices •For SC coordination and collaboration, organisations can implement SCI and CFI practices •Organisations that experience SC barriers in RL can implement SCI practices •Organisations that seek SC benefits, including improvements in SC relationships, information sharing, communication, visibility, trust and predictability, in RL can implement SCI •Organisations with specific RL problems and inefficiencies in consumer returns can implement the relevant integration practices to address the specific RL problems and inefficiencies

Source: Compiled by the researcher

Based on Figure 6.15 and the discussions given in section 6.4, Table 6.15 provides a summary of the findings and managerial implications for the integration practices to manage consumer returns.

Table 6.15 provides an in-depth understanding into the value of integration practices to manage consumer returns. Essentially, the findings show that SCI, CI and CFI practices can be important for the management of consumer returns, but before implementing a specific integration practice in RL a cost-benefit analysis must be performed. The importance of integration practices in RL, will further be explored in the interviews with industry experts (chapter 8).

In the next section, outsourcing/insourcing practices in RL will be presented, discussed and analysed.

6.5 RL INSOURCING AND OUTSOURCING PRACTICES TO MANAGE CONSUMER RETURNS

RL insourcing and outsourcing [hereafter in/outsourcing] as RL practices involve keeping RL inhouse versus outsourcing RL to third parties. Figure 6.16 provides a distribution of in/outsourcing practices based on the results of the QCA of RL literature (see Appendix C.4).

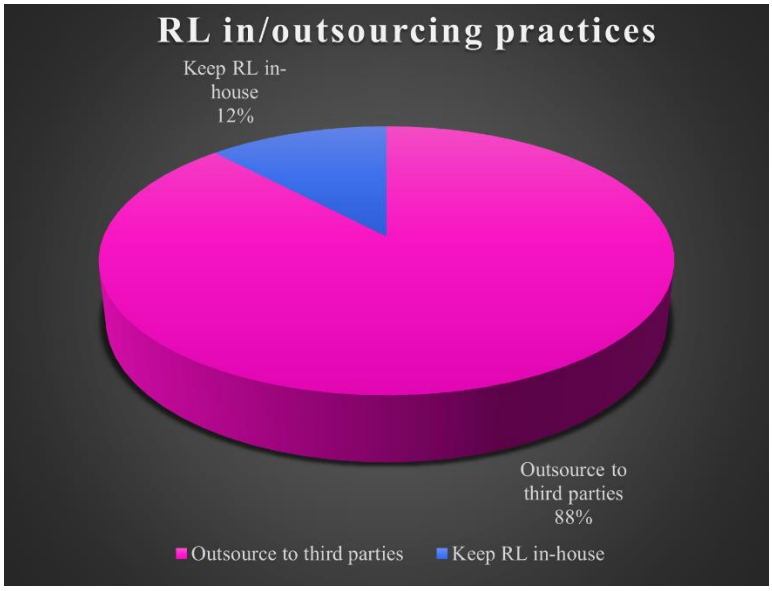

Figure 6.16 Distribution of in/outsourcing RL practices
Source: Compiled by the researcher

Figure 6.16 shows that outsourcing RL to third parties (88%) dominates RL literature (from the QCA), while insourcing RL (or keeping RL inhouse) covers a mere 12%. This finding confirms Janse *et al.* (2010:508), claiming that few publications in RL focus on insourcing of RL. Consequently, RL literature focusses significantly on outsourcing, indicating that outsourcing can be an important practice to manage consumer returns. Wang, Dang *et al.* (2021:1) confirmed this by claiming that outsourcing to third-party RL (3PRL) providers can be one of the most important RLM strategies in online retailing. Additionally, due to the complexity of consumer return processes, organisations lacking good knowledge of RL processes prefer partial or full RL outsourcing to third-party RL (3PRL) providers (Wang, Dang *et al.* 2021:2).

Alternatively, as Janse *et al.* (2010:508) and Stock and Mulki (2009:51) suggest outsourcing of RL is widely discussed in literature and in business case studies (or other industry articles) but findings suggest that most organisations prefer to keep RL inhouse. Additionally, few studies in RL literature focus on the negative impact of RL outsourcing (Agrawal *et al.* 2015:88). Therefore, the lack of literature of insourcing means that organisations rather need to focus on other RL practices for effective RLM, while being aware of the strategies and opportunities that outsourcing of RL can bring.

Nevertheless, certain degrees of RL in/outsourcing exist, which includes a (1) full insourcing strategy, meaning that the organisation performs all RL processes inhouse, (2) partial in/outsourcing, meaning that the organisation can choose to outsource some RL process(es) to third parties (3Ps) (e.g. collection, transportation and disposition), while keeping the remainder RL processes inhouse (e.g. inspection, sorting and processing), and (3) full outsource strategy, meaning that the organisation outsource all RL processes to 3Ps (Agrawal *et al.* 2016c:48; Prajapati *et al.* 2021:2398).

Since limited QCA findings of RL literature focused on RL insourcing, RL in/outsourcing was combined as a strategy that either supports full outsourcing, partial outsourcing/inhouse or full insourcing. Like IT and integration practices, RL in/outsourcing involves strategies, requirements and outcomes, which will be discussed and analysed in subsequent sections. The section concludes with a description, conceptual framework and summary of findings for RL in/outsourcing practices to manage consumer returns.

6.5.1 Strategies and requirements of RL in/outsourcing practices

RL in/outsourcing practices consist of (1) RL in/outsourcing strategies, including strategic considerations and analyses for RL in/outsourcing decisions and strategic decisions and strategies for RL outsourcing, and (2) RL in/outsourcing requirements, including economic, IT, operational and infrastructure, organisational and SC requirements. These strategies and requirements of RL in/outsourcing can contribute to the outcomes of RL in/outsourcing, discussed in section 6.5.2. Table 6.16 provides an overview of the findings related to the *strategies* and *requirements* of *RL in/outsourcing practices* to manage consumer returns, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.16 Findings related to strategies and requirements of RL in/outsourcing to manage consumer returns

Table 6.16 shows that RL in/outsourcing practices includes several strategies and requirements, which will be discussed in subsequent sections.

6.5.1.1 Strategic considerations and analyses for RL in/outsourcing decisions

Before implementing RL in/outsourcing practices, organisations must strategically identify and determine the viability of RL in/outsourcing through several strategic considerations and analyses. In terms of the strategic considerations, organisations can consider economic, operational, organisational and external factors for effective RL in/outsourcing decisions. Part of the considerations can be the identification of potential reasons for RL in/outsourcing, which may direct organisations to the most appropriate alternatives.

The *economic considerations* for RL in/outsourcing involve, profitability, investment, costs and economies of scale. The profitability relates to the core competency and strategic plan of the organisation that favours RL insourcing. More specifically, organisations may choose to insource RL if they view RL as a source of long-term profit, which can be achieved through several RL practices that enhances profitability (e.g. IT, integration, disposition, RC and FM practices). Nevertheless, RL implementation involves high investment and costs (see section 2.3.1) that may motivate organisations to consider RL outsourcing, avoiding large capital investments. Additionally, organisations must consider economies of scales, relating to return volume (operational consideration). For instance, organisations with lower return volumes may find economies of scale difficult to achieve, favouring RL outsourcing.

The *operational considerations* and *reasons* for RL in/outsourcing involve return volume, facility/network capacity and operational capability, uncertainty and complexity of RL, and RL operational requirements. Return volume can be an important for economic and operational considerations for effective RL in/outsourcing decisions. For instance, organisations with high return volume may consider RL insourcing to benefit from disposition (recovery) processes and practices and scale benefits, while organisations with lower return volume may consider RL outsourcing to focus on core capabilities and attain scale benefits.

In terms of facility/network capacity and operational capability, organisations with limited facility space for RL, a lack of a distribution network (e.g. one warehouse without adequate transportation) and operational capability constraints can consider RL outsourcing. Additionally, the operational barriers in RL (see section 2.3.2) can motivate organisations to consider RL outsourcing to 3Ps with the operational capabilities to deal with product return uncertainties and complex RL processes. Moreover,

the operational requirements of RL involve specialised IT, infrastructure, facilities and equipment (also see section 6.5.1.3) that organisation must consider for effective RL in/outsourcing decisions.

The *organisational considerations* for RL in/outsourcing decisions include organisational strategies, core competency and expertise, resources, risk, control, and market strategies. Regarding the organisational strategies, organisations that require an independent RL function can consider RL insourcing, while organisations unwilling to adopt/implement RL strategies and functions can consider RL outsourcing. Additionally, organisations that view RL as a core function with high RL competency and expertise can consider RL insourcing, while organisations that view RL as a secondary business/function with limited RL competency and expertise can consider RL outsourcing. Similarly, organisations that seek to develop intangible resources (e.g. RL capabilities and expertise) and commit organisational resources (e.g. skilled managers and staff) for RL can consider RL insourcing, while organisations unwilling to commit or lack resources for RL (such as smaller organisations) can consider RL outsourcing, emphasising the importance of the operational considerations related to IT, infrastructure, facilities and equipment.

In terms of risk and control, organisations interested in receiving valuable market information from consumer product returns and controlling the RL function can consider RL insourcing. Alternatively, organisations interested in avoiding financial, operational and management risks in RL (see section 2.3) and less concerned with functional control can consider RL outsourcing. The market strategies involve competitive and market expansion considerations, which relates organisational capabilities and resources. For instance, organisations interested in utilising RL capabilities and resources as a competitive differentiation can consider RL insourcing. Alternatively, smaller organisations with limited resources seeking to increase competitiveness and expanding markets (e.g. secondary markets for recovered products) can consider RL outsourcing.

Finally, the *external considerations* for RL in/outsourcing relates to RL drivers, including environmental, government, social responsibility and consumer requirement drivers (see section 2.3). Particularly, organisations seeking to use RL to only observe environmental laws, comply with governmental legislation or demonstrate social responsibility can consider RL outsourcing. Additionally, organisations can consider consumer requirements (e.g. consumer-friendly product return processes) (see section 2.3.1.3) to determine the appropriateness of RL in/outsourcing.

Based on the strategic considerations for RL in/outsourcing decisions, organisations can perform *strategic analyses* (or assessments), including (1) organisational (internal) analysis, (2) cost-benefit analysis, (3) core competency assessment, and (4) market analysis, for effective RL in/outsourcing

decisions. Specifically, based on the economic, operational and organisational considerations for RL in/outsourcing an *organisational/internal analysis* must be performed, which involves analysing various organisational perspectives and examining internal resources and capabilities in RL and comparing the capabilities with external 3P organisations or competitors. Additionally, organisations can compare RL with FL operations to identify possible inefficiency or shortages, benchmarking internal RL capabilities against FL capabilities. Consequently, organisations must recognise and understand the importance of RL and the requirements for effective RLM, ensuring an accurate organisational analysis for effective RL in/outsourcing decisions.

Like IT and integration, RL in/outsourcing strategies involve *cost-benefit analyses*, exploring the advantages and disadvantages of RL in/outsourcing. For instance, organisations can perform cost-benefit analyses related to profitability (e.g. more profitable to keep RL inhouse), financial justification, costs of outsourcing versus insourcing (e.g. costs of outsourcing lower than insourcing) and RL cost problems (e.g. difficult to manage RL costs favour outsourcing), emphasising the importance of economic considerations for RL in/outsourcing decisions.

Relating to the strategic considerations and internal and cost-benefit analyses, a *core competency assessment* involves identifying the activities that form part of the organisation's core business. Organisations can perform core competency assessments for the overall RL function and for specific RL processes (e.g. collection, transportation, inspection and disposition), which may help subsequent strategic decisions for RL outsourcing (e.g. degree of outsourcing, type of RL processes and type of 3Ps) (see section 6.5.1.2). The core competency assessment in RL can be performed by exploring several questions related to degree of specialisation required (e.g. RL skills), impact on consumer perceptions, market potential and competitive factors, relating to the organisational considerations for RL in/outsourcing. Consequently, the outcomes of the core competency assessments can help organisations determine the most suitable RL in/outsourcing alternative for the effective management of consumer returns.

Finally, organisations must perform a *market analysis*, which involves assessing the availability of 3Ps in the market, before deciding between RL in/outsourcing. For instance, if RL falls outside the core competency of an organisation, outsourcing the entire RL process can only be viable if specialised 3Ps exist in the market to perform RL processes and practices effectively. Consequently, organisations must review and compare the 3P types and available RL services to determine the feasibility of outsourcing all or some parts of the RL process, which can facilitate with effective strategic decisions for RL outsourcing (section 6.5.1.2).

Essentially, organisations must establish a holistic approach by considering various economic, operational, organisational and external factors and performing several strategic analyses for appropriate RL in/outsourcing decisions.

6.5.1.2 Strategic decisions and strategies for RL outsourcing practices

While the strategic considerations and analyses focused on deciding between RL in/outsourcing, the strategic decisions and strategies for RL outsourcing can be implemented once an organisation decided to adopt *RL outsourcing* (either fully or partly) as a RL practice. Evidently, organisations that choose RL insourcing, need to explore and implement other RL strategies and practices, like IT, integration, disposition, PM, facility/location, RC, FM, RPA, SPP and management and staff practices for the effective management of consumer returns. In contrast, organisations that choose to outsource RL must implement several strategies for RL outsourcing, including (1) a strategic approach, (2) prioritising RL outsourcing strategies, (3) developing an outsourcing strategy, (4) strategic decisions on the degree of outsourcing, (5) strategic decisions on the type of RL process and services to outsourcing, (6) strategic decisions on the type of 3Ps, (7) strategic selection of 3Ps, (8) strategic development of terms, and (9) strategic development of PM for 3Ps.

Like IT and integration practices (sections 6.3 and 6.4), RL outsourcing strategies must be based on a *strategic approach*, which can guide the implementation of appropriate outsourcing strategies. For example, organisations may adopt a partial outsourcing approach that form the basis for the strategic decisions on the degree of outsourcing, type of RL activities/processes and type of 3Ps. Similarly, organisations must *prioritise RL outsourcing strategies*, ensuring effective implementation of RL outsourcing practices. For example, organisations can decide to prioritise strategic decisions related to the type of RL process/activity to outsource and/or prioritise strategic assessment and selection of the most suitable 3P partner. Consequently, based on the strategic approach and prioritised RL outsourcing strategies, organisations can develop an appropriate *RL outsourcing strategy* for the effective management of consumer returns.

As part of the RL outsourcing strategy, organisations must *strategically decide* on the *degree* of *RL outsourcing*, which can include partial, full or phased RL outsourcing. Particularly, organisations may use the initial core competency assessment (section 6.5.1.1) to determine the degree of RL outsourcing. Additionally, if the organisation outsources certain FL processes, then outsourcing similar RL processes (such as transportation) might be a viable option. Alternatively, the organisation may consider outsourcing in a phased manner, before committing to a full outsourcing strategy.

Linking with the degree of outsourcing, the *strategic decisions* on the *type* of *RL processes* and *services* to *outsource* can be based on strategic analyses for RL in/outsourcing. For example, if the core competency assessment showed that the organisation lacks product disposition skills (e.g. repair or refurbishment) the organisation may choose to outsource RL disposition processes. Accordingly, organisations may choose to outsource some or all RL processes, including collection, transportation, receiving, processing, inspection, sorting, disposition and redistribution, based on the outcomes of the core-competency assessments. Similarly, organisations that lacks service capabilities for effective RLM may choose to outsource customer services, IT, warehouse, transportation and returns management services.

The final *strategic decision* involves the *type of 3Ps* based on the degree and type of RL process/services decisions. For instance, organisations that seek partial outsourcing of one or two RL processes/services can choose 3Ps that specialise in that specific RL process(es)/services. For example, a transportation provider or courier for RL collection and transportation, a 3P software provider for IT, a 3P facility provider for warehousing solutions, or a refurbishing or repair service provider (RSP) for product recovery. Alternatively, organisations interested in full RL outsourcing solutions can consider 3PL, 3PRL (third-party RL provider) and 4PL providers.

Subsequently, with the strategic decisions in mind, organisations must *strategically select 3P partners,* which can be initiated by identifying selection criteria, like proximity/location, service offering, service costs, responsiveness to RL complexity, RL process and RLM capabilities, resources, reputation and reliability. Consequently, organisations may select a reputable and dependable 3P close in proximity, offering affordable bundled RL solutions, with optimal RL strategies (or practices), RL capabilities and resources (e.g. IT, infrastructure, equipment and staff) for the effective management of consumer returns.

Once selected, the organisation needs to *strategically develop terms* to manage the outsourcing relationship, for example, compiling a contract that sets the expectations and responsibilities of each party, types of services, costs, communication, timeframe and termination details. Finally, organisations must *strategically develop PM* to monitor the selected outsourcing partner's performance, which may involve economic, operational, organisational, environmental, market-related and SC performance (see section 6.7). Consequently, PM practices in RL can also be important for organisations that adopt RL outsourcing as a strategy, maintaining the effective RLM of consumer returns.

6.5.1.3 Requirements of RL in/outsourcing practices

Relating to the RL in/outsourcing strategies, RL in/outsourcing requirements involve economic, IT, operational/infrastructure, organisational and SC requirements. The *economic requirements* of RL in/outsourcing involve investment and cost requirements, which must be considered before making informed RL in/outsourcing decisions. On the one hand, organisations that choose RL insourcing must be willing to *invest* in RL infrastructure and resources and incur RL implementation and running/operational *costs.* On the other hand, organisations that choose to outsource RL can avoid investment, implementation and running costs but must pay outsourcing costs, which relates to the services offered by the 3P, like information costs, RL process costs (e.g. collection, transport, inspection and disposition costs) and administration costs. Evidently, the economic requirements demonstrate the importance of the RL in/outsourcing strategies related to economic considerations and cost-benefit analyses (section 6.5.1.1) and RL outsourcing strategies related to strategic decisions and selection of appropriate 3Ps (section 6.5.1.2).

The *IT requirements* for RL in/outsourcing relate to the IT practices of *appropriate* and *customised IT* to manage consumer returns. Like the economic requirements, IT requirements relate to strategic considerations for RL in/outsourcing and the strategic decisions and selection of 3Ps for RL outsourcing. Consequently, organisations that choose to keep RL inhouse must be willing to implement and use appropriate IT for effective RLM, emphasising the strategic importance of operational considerations for RL in/outsourcing decisions (section 6.5.1.1). Alternatively, organisations can choose 3Ps, like 3PLs or 3PRLs, with appropriate and customised IT solutions, emphasising the importance of strategic decisions related to the type of 3Ps and selection of 3Ps based on IT capabilities and resources (section 6.5.1.2).

Similarly, the *operational* and *infrastructure requirements* of RL in/outsourcing, relate to strategic (operational) considerations for RL in/outsourcing decisions and strategic decisions and selection of 3Ps for RL outsourcing, focussing on facilities, equipment and infrastructure. Evidently, organisations that choose RL insourcing must own, operate and maintain facilities and special equipment for effective RL operations/processes, emphasising the economic requirements of investment and costs of RL insourcing. Consequently, organisations unwilling or unable to invest, own and operate appropriate facilities, equipment and infrastructure can choose 3P partners with the appropriate facilities, transportation, materials handling equipment and infrastructure to manage consumer returns.

The *organisational requirements* of RL in/outsourcing include RL implementation, internal communication, management involvement, skilled management and staff, and staff training. *RL*

implementation can be an important requirement for organisations that adopted a RL insourcing strategy without a pre-established RL function, emphasising the economic requirement of RL implementation costs in RL insourcing. Similarly, *internal communication* between functions can be an important requirement for RL insourcing, which demonstrates the importance of implementing IT and integration (CFI) practices for an effective RL insourcing strategy. Like IT and integration practices (sections 6.3 and 6.4), *management involvement* can be important for the implementation and execution of RL practice strategies. Particularly, for RL in/outsourcing managers must be involved in strategic considerations and analyses for effective RL in/outsourcing decisions and the prioritisation of RL outsourcing strategies (like selecting appropriate 3Ps).

Skilled management and *staff* associate with human resource requirements in RL, which can be important for the RL in/outsourcing strategies related to organisational considerations, organisational analysis and core competency assessment (see section 6.5.1.1), as well as the RL outsourcing strategy related to 3P capabilities and resources as selection criteria. Subsequently, organisations that lack skilled human resources but prefer RL insourcing must *train staff* for effective RLM, linking RL insourcing practices with RC and management and staff practices (sections 6.9.1 and 6.9.5). Alternatively, organisations can choose RL outsourcing to avoid staff training requirements but must select 3Ps with effective staff training programmes for the effective management of consumer returns, reemphasising the strategic importance of selecting 3Ps based on RL capabilities, resources and strategies (see section 6.5.1.2).

Finally, the *SC requirements* of SC relationships and SCI practices associate with RL outsourcing, which can be important for the success of the outsourcing relationship. Particularly, *SC relationships* in RL outsourcing can involve strategic partnerships, SC arrangements and contractual relationships, which emphasise the strategic importance of developing terms for effective outsourcing relationship management (see section 6.5.1.2). Moreover, RL outsourcing requires *SCI practices*, involving joint management, information sharing, communication, cooperation and collaboration, indicating that organisations must also select 3Ps capable of. Evidently, organisations that choose RL outsourcing must still implement SCI practices for the effective management of consumer returns.

Essentially, RL in/outsourcing practices require a holistic approach, linking strategic considerations and analyses for RL in/outsourcing decisions, strategic decisions and strategies for RL outsourcing and RL in/outsourcing requirements, which can contribute to several outcomes discussed in the next section.

6.5.2 Outcomes of RL in/outsourcing practices

The outcomes of RL in/outsourcing practices can be described as the benefits of implementing RL in/outsourcing strategies and requirements for the effective management of consumer returns. The outcomes of RL in/outsourcing practices include (1) economic, (2) operational, (3) organisational (4) environmental, (5) social, (6) market-related and (7) SC outcomes. Table 6.17 provides an overview of the findings related to the *outcomes of RL in/outsourcing practices*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.17 Findings related to outcomes of RL in/outsourcing practices to manage consumer returns

Source: Compiled by the researcher

Table 6.17 shows that RL in/outsourcing practices associate with economic, operational, organisational, environmental, social, market-related and SC outcomes, which will be discussed in subsequent sections.

6.5.2.1 Economic outcomes of RL in/outsourcing practices

The economic outcomes of RL in/outsourcing practices involve (1) reducing investment, asset and capital requirements and risks, (2) economies of scale benefits, (3) cost efficiency and effectiveness, (4) cost savings/reductions, (5) profitability, and (6) cost and asset recovery.

Organisations can *reduce investment, asset* and *capital requirements* and financial *risks* through the strategic considerations of economic (e.g. investment) and organisational (e.g. transfer risks) factors, favouring the adoption of a RL outsourcing strategy. Similarly, *economies of scale benefits* relate to organisations that choose RL outsourcing based on the economic and operational considerations of economies of scale and return volume (RL in/outsourcing strategies). Moreover, organisations can gain scale benefits through the development and adoption of a RL outsourcing strategy, strategic decision of appropriate 3Ps, like 3PRL, 3PL and 4PL providers, and the SC requirement of SCI practices (e.g. collaboration and integration between organisations and 3P partners).

Linking with economies of scale benefits, *cost efficiencies* and *effectiveness* associate with choosing RL outsourcing through the strategic consideration of economies of scale (economic) and strategic decision to utilise 3PRL providers, which emphasise the importance of return volume (operational consideration) for effective RL in/outsourcing decisions (see section 6.5.1.1).

Cost savings/reductions can be achieved through the adoption of RL insourcing and RL outsourcing strategies. For instance, organisations can realise long-term cost savings (e.g. operational, transportation and inventory costs) by adopting RL insourcing practices, including (1) RL insourcing strategies related to the considerations of return volume (operational), organisational strategies and resources (organisational), and (2) RL insourcing requirements related to investment (economic), equipment (operational), RL implementation and skilled management/staff (organisational).

Additionally, organisations can expect cost savings through the adoption of several RL outsourcing practices, including (1) the strategic considerations of economies of scale (economic), organisational size and risks (organisational) and environmental drivers (external), (2) strategic decisions on the degree of outsourcing, type of RL processes/services and type of 3Ps (e.g. 3P facility, 3PRL and 3PL providers), (3) strategic selection of appropriate 3Ps based on service costs, RL strategies and resources, (4) purchasing costs requirement (economic), (5) equipment and infrastructure requirements (operational/infrastructure), and staff training requirements (organisational). Consequently, the costs savings related to RL in/outsourcing demonstrates the importance of performing cost-benefit analysis for effective RL in/outsourcing decisions (see section 6.5.1.1).

Likewise, *profitability* can be realised through the adoption of either RL insourcing or outsourcing practices. Particularly, higher profitability can be achieved by organisations that strategically consider profits (economic consideration) and subsequently adopt RL insourcing practices, emphasising the market-related outcomes (e.g. corporate image and customer service) of RL insourcing (section 6.5.2.4). In terms of RL outsourcing, organisations can improve profitability through the strategic consideration of economies of scale (economic) and strategic decisions and selection of appropriate 3Ps (e.g. 3PRL or 3PL providers) that specialise in RL, reemphasising the importance of performing cost-benefit analysis for appropriate RL in/outsourcing decisions.

Finally, *cost* and *asset recovery* can be realised through the RL outsourcing strategies of strategic decisions on the type of RL processes (e.g. disposition) and 3Ps (e.g. 3P recovery specialist), and strategic selection of appropriate 3Ps based on RL capabilities, demonstrating a link between RL outsourcing and RL disposition practices (see section 6.6). Consequently, organisations that experience economic barriers in RL may benefit from implementing RL in/outsourcing practices for the cost-effective RLM of consumer returns.

6.5.2.2 Operational outcomes of RL in/outsourcing practices

The operational outcomes of RL in/outsourcing practices include (1) addressing operational barriers and risks, (2) addressing IT barriers, (3) addressing infrastructure barriers, (4) reducing product return uncertainty, (5) improving product return visibility, (6) improving RL process flexibility, (7) improving RL process speed and efficiency, (8) facilitating and simplifying RL processes, (9) facilitating operational planning, (10) improving operational efficiency, and (11) facilitating RL/FL integration.

Operational barriers and risks relate to problems with product returns (uncertainties), IT and infrastructure problems, and inventory, forecasting, consumer demand and technology risks (see section 2.3.2), which can be addressed through RL outsourcing practices. Specifically, *operational barriers* and related *risks* in RL can be addressed through RL outsourcing practices related to the (1) strategic considerations of RL complexities, uncertainties, IT, infrastructure (operational) and risks (organisational), (2) strategic decision on the type of 3Ps, like 3PRL providers, (3) strategic selection of 3P partner based on RL expertise and resources, and (4) IT requirement of appropriate IT for RL.

Moreover, organisations can *address IT barriers*, like limited access to state-of-the-art IT, lack of IT capabilities and lack of real-time IT, through several RL outsourcing practices, including the (1) strategic consideration of IT (operational), (2) strategic decisions on the type of RL services (e.g. IT management) and 3Ps (e.g. 3P software, 3PRL and 3PL providers), (3) strategic selection of a 3P

partners based on RL capabilities and resources, (4) IT requirement of appropriate IT, and (5) SC requirement of SCI (such as collaboration). Similarly, organisations can *address infrastructure barriers* by implementing/adopting RL outsourcing practices relating to the (1) strategic consideration of infrastructure (operational), (2) strategic decisions on the type of 3Ps (such as 3PRL and 3PL providers), (3) strategic selection of a 3P partners based on RL capabilities and resources, and (4) infrastructure requirements.

Likewise, organisations can *reduce product return uncertainties* by choosing RL outsourcing based on the strategic considerations of RL complexity and uncertainty (operational), strategically deciding on the type of 3P (such as 3PRL and 4PL providers) and implementing SCI and collaboration practices (SC requirements). Moreover, organisations can *improve product return visibility* through the strategic decision and selection of appropriate 3PL providers and *improve RL process flexibility* by adopting an outsourcing (strategic) approach and strategically deciding on 3PRL providers as the 3P type (RL outsourcing strategies).

Several RL outsourcing practices can *improve RL process speed* and *efficiency*, including (1) strategic considerations of IT, infrastructure (operational), core competency and resources (organisational), (2) developing an outsourcing strategy, (3) strategic decisions on the type of 3Ps, like 3P software, 3PRL and 3PL providers, (4) strategic selection of a 3P partners based on RL capabilities and resources, and (5) IT, infrastructure and SC relationship requirements. Consequently, through the RL in/outsourcing decisions-making strategies of organisational/internal analysis and core competency assessments (see section 6.5.1.1), organisations can recognise that they lack the necessary resources, capabilities and competencies for RL, and implement RL outsourcing practices for greater RL process efficiencies.

Furthermore, organisations can *facilitate* and *simplify RL processes* through several RL outsourcing practices, including (1) strategic considerations of RL complexity and uncertainties (operational), and resources (organisational), (2) strategic decisions related to the degree of RL outsourcing (e.g. partial or full RL outsourcing), types of RL processes/services and types of 3Ps (e.g. 3PRL and 3PL providers), (3) strategic selection of appropriate 3P partners based on service offerings and costs, (4) economic requirement of outsourcing (purchasing) costs, and (5) SC requirement of communication (SCI practice). Additionally, RL outsourcing practices, like strategic decisions and selection of appropriate 3PL providers (based on RL capabilities and resources), and the IT requirement of appropriate IT, can *facilitate operational planning.*

In contrast to the abovementioned operational outcomes, RL insourcing and RL outsourcing practices can *improve operational efficiency.* For instance, organisations that adopt RL insourcing can improve

operational efficiency through the strategic organisational consideration of resources and requirements of investment (economic), equipment (operational) and skilled staff (organisational). Alternatively, organisations that adopt RL outsourcing can improve operational efficiency through the strategic organisational consideration of resources, strategic decisions on the type of 3Ps (e.g. 3PRL or 3PL providers) and strategic selection of 3P partners based on RL resources, which demonstrates the importance of RC practices in RL (see section 6.9.1).

Finally, like TLIT practices (section 6.3.3), RL insourcing practices, including facility, equipment (operational), internal communication, skilled management/staff and staff training (organisational) requirements, can *facilitate RL/FL integration*, linking RL insourcing and facility/location practices (see section 6.8).

Essentially, organisations that experience various operational barriers, product return problems, RL processes inefficiencies and complexities and operational planning problems can consider implementing RL outsourcing practices. Alternatively, organisations with limited operational problems, except for operational inefficiencies and lack of RL/FL integration, can benefit from RL insourcing.

6.5.2.3 Organisational outcomes of RL in/outsourcing practices

Organisational outcomes of RL in/outsourcing include (1) facilitating RL implementation, (2) improving RL expertise, experience and capabilities, (3) focussing on core competencies, (4) enhancing and facilitating RLM, (5) facilitating information management, (6) strategic control, (7) facilitating RC, and (8) facilitating facility/location practices.

Organisations can *facilitate RL implementation* through the RL outsourcing strategies of strategic organisational considerations of size and capability, strategic decisions on the degree of outsourcing and strategic decisions on the type of 3Ps, like 3PRL and 3PL providers. Evidently, the RL implementation outcome demonstrates the importance of performing an organisational/internal analysis and core competency assessments for RL in/outsourcing decisions as well as the organisational requirement of RL implementation for RL insourcing.

Both RL insourcing and outsourcing practices can *improve RL expertise, experience* and *capabilities.* For instance, organisations can gain expertise, experience and capabilities through the RL insourcing practices of strategic organisational consideration of resources, investment (economic requirement), equipment (operational requirement) and trained/skilled staff (organisational requirements). Nevertheless, organisations unable or unwilling to implement these RL insourcing practices can gain RL expertise, experience and capabilities by adopting RL outsourcing strategies, like developing an

outsourcing strategy, strategic decisions on the type of 3Ps (e.g. 3PRL and 3PL providers) and strategic selection of a 3P partner based on RL expertise (see section 6.5.1.2).

Focussing on core competencies can be a significant advantage for organisations that choose to outsource RL. Specifically, organisations that (1) implement RL in/outsourcing strategies related to organisational consideration of core competency, external consideration of the environment, organisational/internal analysis and core competency assessments, (2) develop an outsourcing strategy, and (3) make strategic decisions on the degree of outsourcing (e.g. outsourcing only non-core processes) and type of 3Ps (such as 3PRL providers), can realise the benefit of focussing on core competencies. Nevertheless, RL outsourcing can result in a loss of control (strategic consideration) (see section 6.5.1.1), which organisations can address through the SC requirement of SC relationships (e.g. strategic partnerships) to gain *strategic control*, demonstrating the importance of SCI practices for effective RL outsourcing.

Several RL outsourcing practices can *enhance* and *facilitate RLM*, including (1) strategic considerations of costs (economic), RL complexity, IT and infrastructure (operational), (2) developing a RL outsourcing strategy, (3) strategic decision on the type of 3Ps (such as 3PRL, 3PL and 4PL providers), (4) strategic selection of a 3P partner based on RL capabilities and resources, (5) economic requirements of cost and investment, (6) IT and infrastructure requirements, and (7) SC requirement of SC relationships. Consequently, RL outsourcing can be an important practice for the effective management of consumer returns.

Nevertheless, both RL insourcing practices, like the strategic organisational consideration of information risk (e.g. losing valuable market information) and organisational requirement of internal communication, and RL outsourcing practices, like the SC requirements of SC relationships and SCI practices, can *facilitate information management.*

Similarly, RL in/outsourcing can *facilitate RC,* for instance, organisations that choose RL insourcing based on the strategic organisational consideration of resources can develop intangible resources, and organisations that choose RL outsourcing based on the strategic considerations of core competency, resources (organisational) and the environment (external) can focus resources on core competencies, emphasising the importance of organisational/internal analysis and core competency assessments for effective RL in/outsourcing decisions. Other RL outsourcing strategies that can facilitate RC (e.g. human and infrastructure resources) include strategic decisions on the type 3Ps (such as 3PL and 4PL providers) and strategic selection of a 3P partner based on resources, emphasising the infrastructure and organisational (e.g. skilled staff) requirements of RL in/outsourcing.

Finally, several RL outsourcing practices can *facilitate facility/location practices*, including (1) adopting RL outsourcing based on the strategic considerations of costs, investments (economic), facilities and network capacity (operational), (2) strategic decisions on the type RL services (e.g. facilities), (3) strategic decisions on the type of 3Ps (such as 3PL providers), (4) strategic selection of a 3P partner based on RL capabilities and resources, and (5) the operational/infrastructure requirements of facilities and infrastructure for RL. For example, RL outsourcing to 3PL providers can facilitate with location strategies (e.g. centralisation and decentralisation), effective utilisation of facility space for RL processes and strategic decisions related to expansion of current facilities versus the establishment of new facilities (see section 6.8). Despite the role of RL outsourcing in facility/location practices, the operational outcome of RL/FL integration (section 6.5.2.2) implies that RL insourcing may facilitate combine facility/location practices (see section 6.8.3).

Essentially, organisations that experience organisational challenges (e.g. RL implementation problems, problems with core competencies, strategic control and ineffective RLM) and ineffective facility/location practices can implement RL outsourcing practices. Alternatively, organisations seeking to improve RL expertise, experience and capabilities, information management and RC can implement RL in/outsourcing practices, which can facilitate with the effective RLM of consumer returns.

6.5.2.4 Environmental, social and market-related outcomes of RL in/outsourcing practices

The *environmental outcomes* of RL in/outsourcing involves environmental protection and compliance with environmental laws. In terms of *environmental protection*, organisations can through the RL in/outsourcing strategy of organisational/internal analysis identify inefficiencies in the RL process adopt RL outsourcing to improve environmental protection. Moreover, organisations can *comply with environmental laws* by choosing RL outsourcing through the strategic considerations of the environment and governmental legislation (external) and strategic decisions on the type of 3Ps, like 3PL providers, reducing the risk of non-compliance. Consequently, RL outsourcing can be an important practice for environmental sustainability, which can be important for the green image of organisations.

The *social outcome* of RL in/outsourcing involves corporate image, which organisations can improve either through the RL insourcing practices of the strategic organisational consideration of resources and economic requirement of costs (e.g. set-up and running costs), or through the RL outsourcing strategy of strategic decisions on the type of 3Ps, like 3PRL providers.

Several *market-related outcomes* associate with RL in/outsourcing, including (1) competitive advantage and competitiveness, (2) market expansion and growth, (3) increasing consumer satisfaction, (4) improving consumer service and responsiveness, (5) enhancing consumer loyalty and retention, and (6) improving consumer relationships. Like the social outcome of corporate image, *competitive advantage* and *competitiveness* can be attained through several RL in/outsourcing practices. In terms of RL insourcing, organisations can obtain a competitive advantage through strategic organisational consideration of resources, economic requirement of costs, operational requirement of equipment and the organisational requirement of skilled staff. For RL outsourcing, organisations can become more competitive through strategic organisational considerations of core competency, resources and competition, organisational/internal analysis, core competency assessments, and strategic decisions on the type of 3Ps (such as 3PRL and 3PL providers).

In contrast, organisations may *expand* or *grow markets* only through the adoption of RL outsourcing strategies related to the strategic organisational consideration of market expansion and strategic decisions on the type of 3Ps (such as 3PRL and 3PL providers). Moreover, organisations can *increase consumer satisfaction* by choosing RL outsourcing through the strategic organisational consideration of core business, emphasising the importance of performing organisational/internal analysis and core competency assessments for appropriate RL in/outsourcing decisions.

Like the corporate image and competitive advantage outcomes, *consumer service* and *responsiveness* can be *improved* through RL insourcing and RL outsourcing practices. For instance, organisations that adopt RL insourcing can improve consumer service through the economic requirement of high RL operational costs, emphasising the importance of performing a cost-benefit analysis for RL in/outsourcing decisions (see section 6.5.1.1). Alternatively, organisations can improve consumer service and responsiveness through the RL outsourcing practices of (1) strategic decisions on the type of 3Ps (e.g. 3PRL and 3PL providers), (2) strategic selection of a 3P partner-based RL strategies, capabilities and resources, and (3) skilled staff or effective staff training programmes (organisational requirements).

Nevertheless, organisations can only *enhance consumer loyalty* and *retention* through the adoption of RL insourcing practices related to the strategic consideration of return volume (operational) and organisational requirement of RL implementation, demonstrating the strategic importance of implementing RL practices for the effective management of consumer returns. Finally, organisations can *improve consumer relationships* through the adoption of RL outsourcing strategies, including the strategic decisions on the type of RL services (such as value-added activities), strategic decisions on the type of 3Ps (such as 3PL providers) and strategic selection of a 3P partner based on service offerings.

Consequently, both RL insourcing and outsourcing practices can result in market-related benefits, showing the importance of developing an appropriate RL in/outsourcing strategy for the effective management of consumer returns.

6.5.2.5 SC outcomes of RL in/outsourcing practices

Like environmental outcomes (section 6.5.2.4), the SC outcomes, including (1) improving SC relationships and communication, (2) facilitating SCM and SCI, (3) improving SC collaboration, and (4) improving SC visibility, transparency and efficiency, only associate with RL outsourcing practices. This implies that organisations deciding to adopt RL insourcing practices must focus on implementing SCI practices to attain similar SC outcomes (see section 6.4.1), discussed in subsequent paragraphs.

Organisations can *improve supply chain relationships* and *communication* through the RL outsourcing practices of adopting a strategic outsourcing approach, strategic decisions on the type of 3Ps (like 3PRL and 3PL providers), and the SC requirement of SCI practices (such as strategic sharing of management and information). Additionally, RL outsourcing practices of strategic decisions on the type of 3Ps (such as 3PL and 4PL providers), IT requirement of appropriate IT and operational requirement of equipment can *facilitate SCM* and *SCI,* emphasising the importance of selecting 3Ps based on RL capabilities and resources.

Moreover, strategic decisions on the types of 3Ps (such as 3PRL providers) can *improve SC collaboration,* demonstrating the importance of RL outsourcing practices for effective SCI practices. Finally, organisations can *improve SC visibility, transparency and efficiency* through the strategic decisions on the types of 3Ps, like 3PRL, 3PL and 4PL providers, and the IT requirement of appropriate IT for RL, which demonstrate important links between RL outsourcing, SCI and IT practices.

Although RL outsourcing associates with all the outcomes, including economic, operational, organisational, environmental, market-related and SC outcomes, organisations can still adopt RL insourcing and achieve similar outcomes through the implementation of other RL practices, like IT, integration, disposition, PM, facility/location, RC, FM, RPA, SPP and management and staff practices. Essentially, RL in/outsourcing practices can be important for the effective management of consumer returns.

In the next section, RL in/outsourcing practices will be concluded with a description, conceptual framework and summary of the findings for RL in/outsourcing to manage consumer returns.

6.5.3 Description, conceptual framework and summary of findings for RL in/outsourcing practices to manage consumer returns

Since RL in/outsourcing practices were combined as one practice category, a single description, conceptual framework and summary of findings will be provided in this section. Based on the findings presented in section 6.5, RL in/outsourcing practices can be important for the management of consumer returns, and will be described as follows:

> RL in/outsourcing practices for the management of consumer returns involve (1) strategic considerations and analyses for RL in/outsourcing decisions, including economic, operational, organisational and external considerations, organisational/internal analysis, cost-benefit analysis, core competency assessments and market analysis, (2) strategic decisions and strategies for RL outsourcing, including a strategic approach, prioritising RL outsourcing strategies, developing an outsourcing strategy, decisions on the degree of outsourcing, type of RL process/services and type of 3Ps, selection of 3P partners, development of terms and PM for 3Ps, (3) RL in/outsourcing requirements, including economic requirements (investment and costs), IT requirements (appropriate and customised IT), operational and infrastructure requirements (facilities, equipment and infrastructure), organisational requirements (RL implementation, internal communication, management involvement, skilled manage/staff and staff training), and SC requirements (SC relationships and SCI practices).
>
> The RL in/outsourcing strategies and requirements can result in several outcomes, including (1) economic outcomes (reduce investment, capital and asset requirements and risks, economies of scale, cost efficiency and effectiveness, cost savings/reductions, profitability, and cost and asset recovery), (2) operational outcomes (address operational barriers and risks, address IT and infrastructure barriers, reduce product return uncertainty, improve product return visibility, improve RL process flexibility, RL process speed and efficiency, facilitate and simplify RL processes, facilitate operational planning, improve operational efficiency, and facilitate RL/FL integration), (3) organisational outcomes (facilitate RL implementation, improve RL expertise, experience and capabilities, focus on core competencies, strategic control, enhance and facilitate RLM, facilitate information management, improve RC, and facilitate facility/location practices), (4) environmental outcomes (environmental protection and compliance with environmental laws), (5) social and market-related outcomes (improve corporate image, competitive advantage and competitiveness, market expansion and growth, increase consumer satisfaction, improve consumer service and responsiveness, enhance consumer loyalty and retention, and improve consumer relationships), and (6) SC outcomes (improve SC relationships and communication, facilitate SCM and SCI, improve SC collaboration, and improve SC visibility, transparency and efficiency).

Figure 6.17 provides a conceptual framework of RL in/outsourcing practices to manage consumer returns.

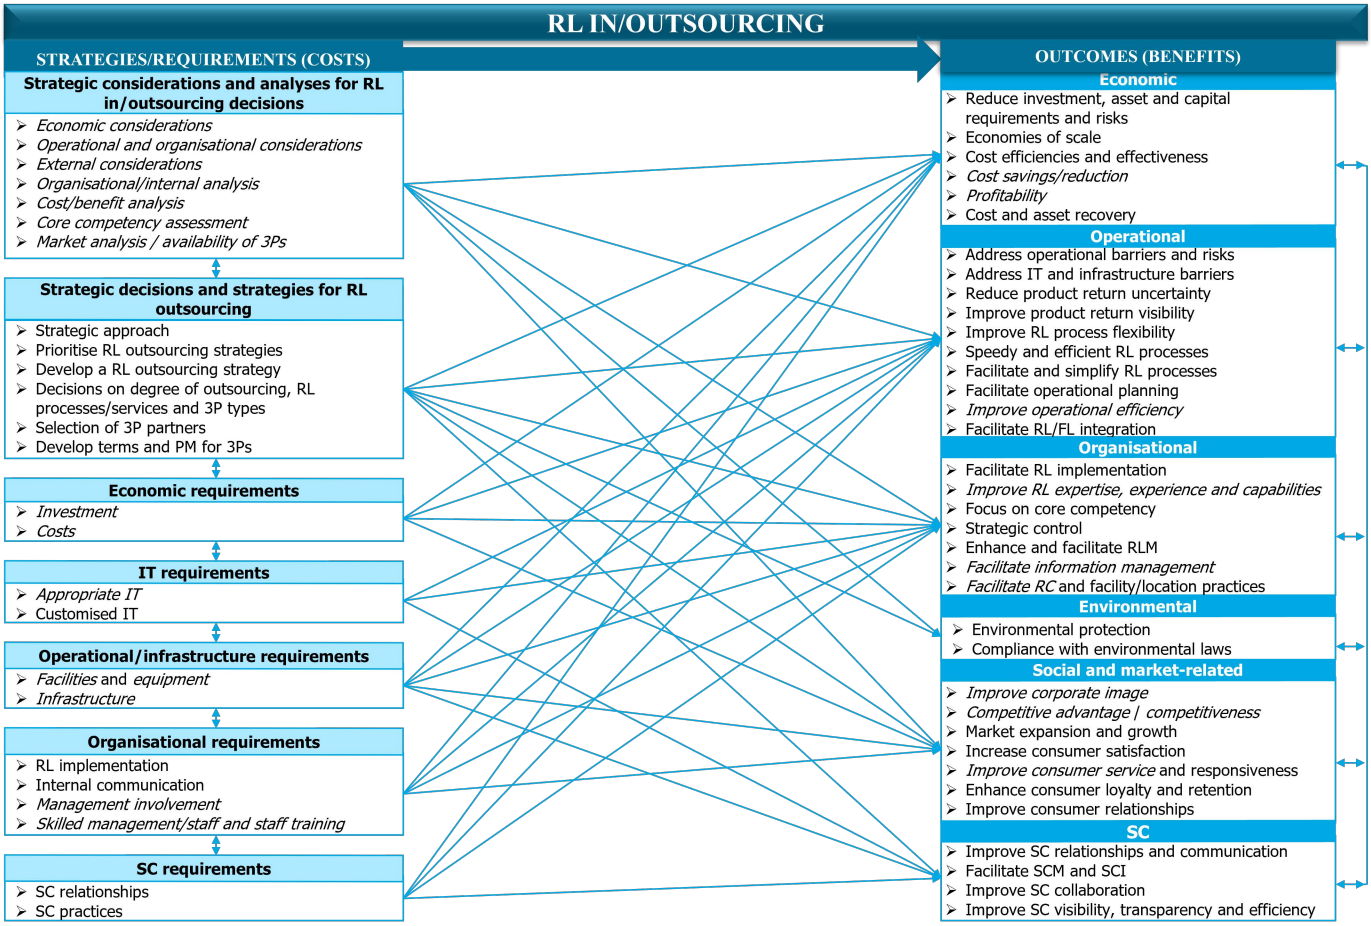

Figure 6.17 Conceptual framework of RL in/outsourcing practices to manage consumer returns
Source: Compiled by researcher

Figure 6.17 demonstrates the links between the RL in/outsourcing strategies, requirements and outcomes as well as the strategies, requirements and outcomes associated with both RL insourcing and RL outsourcing practices (emphasised through *italics*). The links between the RL in/outsourcing strategies and requirements can be demonstrated by strategic operational (e.g. networks, IT, infrastructure) and organisational considerations (e.g. resources), which links with the strategic decisions and selection of appropriate 3Ps (based on resources) (RL outsourcing strategies), economic requirements (e.g. investment and cost), IT requirements, operational/infrastructure requirements (facilities, equipment and infrastructure) and organisational requirements (e.g. skilled management/staff and staff training). Additionally, the RL outsourcing strategies of selecting appropriate 3Ps (based on reputation and reliability) and development of terms link with the SC requirements of SC relationships and SCI practices.

Regarding the links between RL in/outsourcing strategies, requirements and outcomes, the framework demonstrates that the strategic decisions and strategies for RL outsourcing can be the most significant practice category, linking with all the outcomes, including economic, operational, organisational, environmental, market-related and SC outcomes. Consequently, organisations must pay attention to RL

outsourcing-specific strategies to achieve optimum results to manage consumer returns. Nevertheless, all practice categories can contribute to various outcomes, demonstrating the importance of a holistic approach to the implementation of RL in/outsourcing practices.

Regarding the outcomes of RL in/outsourcing practices, operational and organisational outcomes can be the most significant (associated with most of the practice categories), which means that RL in/outsourcing practices can be the most beneficial for organisations that experience operational and organisational challenges in RL. However, organisations with economic and market-related barriers can also benefit from RL in/outsourcing practices. In contrast, the environmental outcomes can be the least significant category, meaning that RL in/outsourcing practices may be less important for organisations that seek environmental benefits through RL practices.

Finally, the framework shows that the RL in/outsourcing outcome categories can be linked, for example, the market-related outcome of corporate image can link with profitability (economic) and environmental compliance outcomes, and the operational outcome of addressing IT barriers can link with information management (organisational) and SCI (SC) outcomes.

Based on Figure 6.17 and the discussions given in section 6.5, Table 6.18 provides a summary of the findings and managerial implications for RL in/outsourcing to manage consumer returns.

Table 6.18 Summary of findings and managerial implications for RL in/outsourcing to manage consumer returns

CATEGORY	KEY FINDINGS	MANAGERIAL IMPLICATIONS
Strategies and requirements	•RL insourcing and outsourcing involves strategic considerations, including economic, operational, organisational and external considerations, organisational/internal analysis, cost-benefit analysis, core competency assessments and market analysis. •RL outsourcing uniquely involves a strategic approach, prioritisation of outsourcing strategies, developing an outsourcing strategy, strategic decisions on the degree of outsourcing, types of RL processes/service and types of 3Ps, strategic selection of 3P partners, development of terms and PM for 3Ps •RL insourcing and outsourcing involves the economic requirements of investments and costs, IT requirement of appropriate IT, operational requirements of facilities, equipment and infrastructure, and organisational requirements of management involvement, skilled management/staff and staff training •RL insourcing uniquely involves the organisational requirements of RL implementation and internal communication •RL outsourcing uniquely involves the SC requirements of SC relationships and SCI practices	•Before choosing between RL in/outsourcing, organisations must consider economic, operational, organisational and external factors, and perform internal and external feasibility assessments •For successful RL outsourcing, organisations must adopt a strategic approach, prioritise outsourcing strategies, make strategic decisions on the degree of outsourcing, type of RL process/services and type of 3Ps, select appropriate 3P partners, develop terms and PM for 3Ps •For effective RL in/outsourcing, organisations must incur costs, utilise appropriate IT, facilities and equipment, involve management, produce skilled management/staff and/or train staff •For effective RL insourcing, organisations must focus on RL implementation and internal communication •For effective RL outsourcing, organisations must focus on SC relationships and SCI practices
Outcomes	•RL in/outsourcing practices involve benefits to manage consumer returns •RL outsourcing practices include all outcome categories, including economic, operational, organisational, environmental, market-related and SC	•Organisations that experience various economic, operational, organisational, environmental, market-related and SC challenges in RL can consider implementing RL outsourcing practices •Organisations that experience high RL costs and profitability issues can consider RL in/outsourcing practices

	• RL in/outsourcing practices involve the economic outcomes of cost savings/reduction and profitability, but uniquely, RL outsourcing can reduce investment, capital and asset requirements and risks, enable economies of scale, and cost and asset recovery • RL in/outsourcing practices involve the operational outcome of operational efficiency, but uniquely, RL outsourcing can address operational barriers and risk, IT barriers and infrastructure barriers, reduce product return uncertainty, improve product visibility and RL process flexibility, speed and efficiency, facilitate and simplify RL processes and facilitate operational planning, and RL insourcing facilitate RL/FL integration • RL in/outsourcing practices involve the organisational outcomes of RL expertise, experience and capabilities, information management and RC, but uniquely, RL outsourcing can facilitate RL implementation, enable focus on core competencies and strategic control, enhance/facilitate RLM and facilitate facility/location practices • Only RL outsourcing practices can result in the environmental outcomes of environmental protection and compliance with environmental laws • RL in/outsourcing practices involve the social and market-related outcomes of corporate image, competitive advantage/competitiveness and consumer service, but uniquely, RL insourcing can increase customer satisfaction and enhance consumer loyalty and retention, and RL outsourcing can expand/grow markets and improve consumer responsiveness and relationships • Only RL outsourcing practices involve the SC outcomes of SC relationships, communication, SCM, SCI, collaboration, visibility and transparency	• Organisations that seek to reduce investment, capital and asset requirements and risk can consider implementing RL outsourcing practices • For economies of scale and cost/asset recovery organisations can consider RL outsourcing practices • Organisations that experience operational inefficiencies operations can consider implementing RL in/outsourcing practices • Organisations that experience operational barriers and risks, including IT barriers, infrastructure barriers, product return uncertainties and visibility problems, in RL can consider implementing RL outsourcing practices • Organisations that seek to improve RL process flexibility, speed and efficiency, facilitate and simplify RL processes and improve operational planning can consider implementing RL outsourcing practices • Organisations can consider RL insourcing practices to facilitate RL/FL integration • Organisations can implement RL in/outsourcing practices to improve RL expertise, experience and capabilities, and facilitate information management and RC • Organisations that experience RL implementation, core competency, strategic control and RLM challenges can consider implementing RL outsourcing practices • Organisations can implement RL outsourcing practices to facilitate facility/location practices • For environmental protection and legislative compliance, organisations can implement RL outsourcing practices • Organisations that seek to improve corporate image, competitive advantage/competitiveness and consumer service can consider implementing RL in/outsourcing practices • For greater consumer satisfaction, loyalty and retention, organisations can implement RL insourcing practices • Organisations can implement RL outsourcing practices to expand/grow markets and improve consumer responsiveness and relationships • Organisations can implement RL outsourcing practices to facilitate SCI practices • Organisations with specific RL problems and inefficiencies in consumer returns can implement the relevant RL in/outsourcing practices to address the specific RL problems and inefficiencies

Source: Compiled by the researcher

Table 6.18 provides an in-depth understanding into the value of RL in/outsourcing practices to manage consumer returns. Essentially, the findings show that RL insourcing and outsourcing can be important for the management of consumer returns, but before implementing RL in/outsourcing practices a cost-benefit analysis must be performed. RL outsourcing/insourcing practices will further be explored in the interviews with industry experts (chapter 8).

In the next section, disposition practices in RL will be presented, discussed and analysed.

6.6 RL DISPOSITION PRACTICES TO MANAGE CONSUMER RETURNS

A key factor of any RLM strategy involves the identification of various options for the disposition of product returns and to select the options that can result in the ultimate benefits for the organisation (Stock & Mulki, 2009:49). Additionally, Hazen *et al.* (2012:264) mentioned that RL disposition decision-making can be strategic in nature, making factors that impact disposition decisions important to manage consumer returns. Consequently, RL disposition practices include all the disposition strategies, requirements and disposition decisions factors needed to choose the most appropriate

disposition options for beneficial outcomes. Although the disposition process as part of the RL process was extensively discussed in section 5.6, more emphasis will be placed on the strategic aspects of disposition and disposition decision making as part of RL practices.

Figure 6.3 showed that disposition is the third highest RL practice discussed in the QCA of RL literature (see Appendix C5 – for the quantitative results), implying that disposition practices can be important for the management of consumer returns. Based on the findings (identified from the QCA of RL literature) disposition as a RL practice involve (1) the strategies and requirements of RL disposition, (2) RL disposition decision factors and (3) the outcomes of RL disposition practices, which will be presented and discussed in subsequent sections. This section concludes with a description, conceptual framework and summary of findings for RL disposition practices to manage consumer returns.

6.6.1 Strategies and requirements of RL disposition practices

RL disposition practices consist of (1) general disposition strategies and strategic understanding and analysis for disposition decisions[19], and (2) RL disposition requirements, including economic, operational, organisational and economic requirements, which can result in several outcomes for the effective management of consumer returns. Additionally, the disposition practices can be important for the RL disposition decision factors (see section 6.6.2), which can help organisations make optimal disposition decisions.

Table 6.19 provides an overview of the findings related to the *strategies and requirements of RL disposition practices* to manage consumer returns, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.19 Findings related to strategies and requirements of disposition practices to manage consumer returns

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
General disposition strategies	***Strategic attainment of organisation-wide commitment***	None	• *"[…] organisation-wide commitment to product recovery activities."* (Khor *et al.* 2016:98)
	Strategic preparation for disposition strategy implementation	None	• *"[…] reverse logistics managers should first be guided by overall corporate or organizational goals. Is the organization's primary objective financial? Is the organization more service/operational focused? […] The answers to these questions can provide direction to the implementation process."* (Skinner *et al.* 2008:533-534)
	Define disposition process	None	• *"[…] clearly defined process for assigning the correct disposition routes for products was essential."* (Bernon *et al.* 2011:492)

[19] Disposition strategies must be developed and implemented interchangeably and not chronologically as presented and discussed in section 6.6.1.

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
	Strategic approach for disposition decisions	None	• *"A reactive approach entails simply abiding by regulations as they are implemented whereas a proactive approach entails anticipating and staying ahead of regulation. A value-seeking approach entails initiating environmentally-friendly activities (such as recycling) […] Determining which of the above approaches to follow can affect a firm's decision as to when, how, and why it will implement a given RL disposition activity."* (Hazen *et al.* 2012:262) • *"Product recovery is an environmentally conscious approach […] aims at recovering the residual value of used products to minimize [sic] the amount of waste sent to landfills."* (Sasikumar *et al.* 2010:1224)
	Strategic considerations	Agrawal *et al.* (2016b:93) Agrawal *et al.* (2016d:944)	• *"Careful considerations are required when selecting product disposition options […]."* (Khor & Udin, 2012:4) • *"Because this decision should be made in accordance with a firm's current policies, market position and objectives, we propose that the RL disposition decision requires great consideration."* (Hazen *et al.* 2012:245)
	Benefit-driven disposition options and decisions	Agarwal *et al.* (2016:3) Gobbi (2011:772) Janse *et al.* (2010:502) Kumar and Putnam (2008:312) Lambert *et al.* (2011:563) Sasikumar *et al.* (2010:1224) Stock and Mulki (2009:49) Ye *et al.* (2013:134)	• *"Regardless of the disposition option chosen, firms must be able to derive benefits from product disposition activities."* (Khor *et al.* 2016:97) • *"[…] it is strategically sound for an enterprise to focus on the components that have substantial economic value at the time of their recovery."* (Xanthopoulos & Iakovou, 2009:1705) • *"Recaptured value is the major source of direct revenue generation from RL implementation. Higher recapturing value motivates the management for RL implementation […]."* (Agrawal *et al.* 2016d:24) • *"The disposition decision seeks to maximize [sic] the benefit generated by a given set of returned products."* (Ferguson *et al.* 2011:776)
	Strategic development of an appropriate disposition system	Abraham (2011:219)	• *"Being aware of […] environmental safety and product take back policy, every organization [sic] develops its own disposal system […] This area cannot be ignored if implementation of an RL system is to be successful."* (Lambert *et al.* 2011:563) • *"[…] a recovery system is required for controlling the returned products […]."* (Eskandarpour *et al.* 2014:1394)
	Strategic establishment of disposition rules and policies	Niknejad and Petrovic (2014:152)	• *"A detailed set of disposition rules can improve an organization's [sic] asset recovery […]."* (Partida, 2011:63) • *"[…] setting RL disposition policy, […] of an RL disposition decision […]."* (Hazen *et al.* 2012:259)
	Develop reuse strategies and practices	None	• *"Implementing policies […] could serve as a further incentive in the reuse […]."* (Matar *et al.* 2014:329) • *"[…] reuse practices […] design for RL […] improve operations performance and financial performance substantially, but also enhance social performance."* (Lai *et al.* 2013:113)
	Develop product recovery strategies and practices	Baenas *et al.* (2011:169) Hahler and Fleischmann, (2013:2) Khor and Udin (2012:13) Mahapatra *et al.* (2013:52)	• *"Product recovery management is a subset of reverse logistics, where all used and discarded products, components and materials are managed efficiently."* (Sasikumar & Kannan, 2008a:155) • *"[…] reverse logistics product disposition […] represents product recovery strategies which are industry and product-specific […]."* (Khor & Udin, 2013:73) • *"[…] adopts a refurbishing strategy might have more stringent requirements for the condition of the product upon customer return."* (Skinner *et al.* 2008:521) • *"A well thought through refurbishment process that enabled significant cash recovery after taking into account the costs of the reverse logistics process."* (Bernon & Cullen, 2007:50) • *"[…] a retailer might prefer repair […] strategy, in order to minimize [sic] potential revenue losses."* (Ni *et al.* 2014:313) • *"Repair only policies are cost effective […]."* (Niknejad & Petrovic, 2014:152)
	Develop secondary market strategies and practices	Hazen *et al.* (2012:259)	• *"A company needs to have a well thought-out plan, complete with a network of secondary market partners […]."* (Rogers *et al.* 2013:46) • *"[…] secondary market strategy is a complicated problem. It includes a myriad of variables and potential dispositions options. Additionally, it includes factors such as loss of control over the product, brand value erosion, product life cycle, and market cannibalization, to name just a few issues."* (Rogers *et al.* 2012:114) • *"[…] needs to find an appropriate secondary market that will speed up the time in which some value can be gained from the inventory […]."* (Rogers *et al.* 2013:43) • *"[…] product remarketing allows firms to generate new revenues […] during asset recovery and promote growth."* (Khor *et al.* 2016:97)
	Develop other recovery strategies and practices	None	• *"The objective of asset recovery is to recover as much of the economic and ecological value as reasonably possible, […]."* (Agrawal & Choudhary, 2014:19) • *Reverse logistics product disposition consists of […] asset recovery activities […]."* (Khor & Udin, 2012:4) • *"[…] energy recovery […] of used products has very good economic benefits […]."* (Yu & Solvang, 2016:12)
	Strategic development and linking of disposition strategies	Skinner *et al.* (2008:522)	• *"The best-practice organizations [sic] have also established formal disposition strategies closely tied to broader reverse logistics strategies."* (Partida, 2011:63) • *"The disposition strategy that the organization [sic] adopts is going to be*

CATEGORY	SUBCATEGORY	SUPPORTING SOURCES	KEY QUOTATIONS
	and RL strategies/policies		*correlated with its returns policy."* (Skinner *et al.* 2008:521)
	Strategic establishment and implementation of a formal disposition strategy	Rogers *et al.* (2013:46)	• *"The best-practice organizations [sic] have also established formal disposition strategies […]."* (Partida, 2011:63) • *"[…] disposition activities is [sic] promising when they are accompanied by well-planned strategies […]."* (Khor *et al.* 2016:97) • *"[…] having a disposition strategy that is an integral part of the overall reverse logistics strategy […]."* (Partida, 2011:62) • *"[…] firms may succeed by implementing disposition strategies […]."* (Skinner *et al.* 2008:534)
Strategic understanding and analyses for disposition decisions	***Strategic understanding of economic factors***	Skinner *et al.* (2008:523) (Jayaraman *et al.* (2006:984)	• *"[…] decision-makers […] must also be able to recognize potential financial gains […] on opportunities to reuse operational products, recondition damaged or used products, or recover valuable materials […]."* (Hazen *et al.* 2012:248) • *"Firms should take the time to thoroughly consider each alternative's ability to generate profits."* (Hazen *et al.* 2012:259) • *"[…] refurbishment process that enabled significant cash recovery after taking into account the costs of the reverse logistics process."* (Bernon & Cullen, 2007:50) • *"[…] key costs that must be evaluated when determining which RL disposition to pursue […] a wide variety of costs associated with RL must be considered […]."* (Hazen *et al.* 2012:258)
	Strategic understanding of disposition option factors	Mukhopadhyay and Setaputra (2011:5317) Ponce-cueto *et al.* (2011:111) Rogers *et al.* (2012:108) Zhou *et al.* (2007:66)	• *"[…] decision-maker(s) should then gain an understanding of the RL disposition alternatives of reuse, product upgrade, material recovery, and waste management."* (Hazen *et al.* 2012:265) • *"The recovery option determines the phases of the recovery process […]."* (Gobbi, 2011:788) • *"[…] there are several options available, each of which can impact costs, inventory levels, and returns processing time."* (Hall *et al.* 2013:775) • *"Low recovery value and high investments require higher processing volume to make it economically viable."* (Agrawal *et al.* 2015:84) • *"Repair only policies are cost effective for very high quantities of returns."* (Niknejad & Petrovic, 2014:152) • *"Knowing numbers of returned products available for disposition at a particular point of time is very important for disposition decision-making."* (Agrawal *et al.* 2016b:99)
	Strategic understanding of organisational factors	Lambert *et al.* (2011:563) Skinner *et al.* (2008:533-534)	• *"Those in the firm who are charged with making disposition decisions must be aware of the firm's policy […] to ensure that their decisions are congruent with existing policies and programs."* (Hazen *et al.* 2012:262) • *"[…] it may be of upmost importance to control costs. In this case, costs would be the most heavily weighted component in the disposition decision. Alternatively, organizations [sic] may be looking to expand their operations or delve into new businesses. In these cases, lack of existing supply chain capabilities may not be a highly important consideration."* (Hazen *et al.* 2012:263) • *"The disposition decision-maker must be aware of his or her firm's existing […] capabilities as well as the resources required to properly conduct a given disposition alternative."* (Hazen *et al.* 2012:261) • *"[…] the decision-maker must understand what is required to fill those gaps and whether or not the firm is prepared for and/or willing to commit the additional required resources. Otherwise, other disposition alternatives may provide a better option for the firm."* (Hazen *et al.* 2012:261)
	Strategic understanding of market-related factors	None	• *"[…] identifying […] and enhancing understanding of known customer behaviors [sic] such as these may bolster practitioners' understanding of how the RL disposition decision affects customers […] Firms should understand who their customers are, what they value, and what they are willing to pay for in the marketplace."* (Hazen *et al.* 2012:259) • *"[…] market conditions are generally concerned with the competitive forces in the marketplace […] variables such as market size and number of competing firms are considerations […]."* (Hazen *et al.* 2012:259) • *"It is considered from the competitive perspective. Source: Compiled by the researcher

Table 6.19 shows that RL disposition practices include several strategies and requirements, which will be discussed in subsequent.

6.6.1.1 General RL disposition strategies

The general RL disposition strategies practices involve (1) strategic attainment of organisation-wide commitment to RL disposition practices, (2) strategic preparation for disposition strategy implementation, (3) defining the disposition process, (4) strategic approach and considerations, (5) benefit-driven disposition decisions, (6) strategic development of an appropriate disposition system, (7) strategic establishment of disposition rules and policies, (8) developing reuse, product recovery, secondary market and other strategies and practices, (9) strategic development and linking of disposition strategies and RL strategies/policies, and (10) strategic establishment and implementation of a formal disposition strategy.

The effective implementation of disposition strategies can start with the *strategic attainment* of *organisation-wide commitment* to RL disposition practices. Consequently, RL disposition practices must be supported by all parties in the organisation, implying that cross-functional integration (CFI) and management and staff practices (see sections 6.4.3 and 6.9.5) can play an important role in effectively managing the disposition process. Moreover, *strategic preparation* for *disposition strategy implementation* can be critical for successful disposition practices. Particularly, managers must be guided by organisational goals (such as financial or service-orientated goals) and strategies to implement effective disposition strategies.

Furthermore, organisations must *define* the *disposition process* adopt a *strategic approach* for *disposition decisions*, which can set the stage for effective disposition decisions. Strategic approaches that organisations can adopt for disposition decisions can include reactive, proactive, value-adding and environmentally conscience approaches, which can influence the appropriate disposition decision factors (such as costs, environment and regulations) (see section 6.6.2).

Similarly, organisations must *strategically consider* factors that can influence disposition decisions, linking with the disposition strategies related to strategic understanding and analysis of economic, disposition option and operational, organisational, market-related and external factors. Nevertheless, organisations need to focus on *benefit-driven disposition options* and *decisions*, implying that the RL disposition outcomes (see section 6.6.3) must be considered for the development of effective disposition strategies. For instance, the organisation must ensure that the disposition decisions and option result in maximum recovery value to obtain economic benefits (such as cost savings and revenue).

Additionally, organisations must strategically *develop* an *appropriate disposition system* based on the strategic understanding of environmental impact/laws (strategy related to disposition decisions), which can be important for implementing a successful disposition strategy. Furthermore, organisations can *strategically establish disposition rules* and *policies*, which can contribute to improved disposition decision-making and effective disposition practices.

Before a disposition strategy can be formally implemented, organisations must develop disposition option strategies and practices, including reuse, product recovery, secondary markets and/or other recovery strategies and practices. *Developing reuse strategies* and *practices* can encourage decision-makers (e.g. managers) to choose the direct reuse option (see section 5.6.2), leading to several benefits (such as economic, operational and social benefits) (see section 6.6.3). Similarly, *developing product recovery strategies* and *practices*, can lead to effective product recovery management (PRM) initiatives to successfully manage used/damaged/defective consumer product returns. A product recovery strategy must be based on RL disposition requirements (section 6.6.1.3) and disposition decision factors (such as costs, product or industry) (section 6.6.2), demonstrating the importance of a holistic approach to the implementation of effective disposition strategies. A product recovery strategy can contain specific strategies for product recovery options. For example, the organisation can create a refurbishment strategy or a repair strategy, which, like reuse strategies, can lead to economic and other benefits.

Developing secondary market strategies and *practices* must involve well-developed plans based on the strategic understanding of market-related factors (see section 6.6.1.2) and other potential risks (e.g. loss of control, brand value and market cannibalisation). Additionally, organisations must identify appropriate secondary markets (e.g. distant overseas markets, online marketplaces or factory shops) (see section 5.6.5.1) and potential secondary market partners (e.g. jobbers and brokers) (see section 5.6.5.3), which can be critical for effective remarketing of used/recovered products.

Other recovery strategies or practices can include asset recovery strategies (e.g. used equipment) and energy recovery strategies (e.g. incineration) that may lead to economic benefits. Essentially, any type of disposition option requires a strategy, ensuring that organisations plan for RL disposition and implement a comprehensive disposition strategy for optimal disposition decision-making.

Before implementing a formal disposition strategy, the organisation must strategically *develop* and *link disposition strategies* and *RL strategies/policies*. Accordingly, the disposition strategy must be developed to form part of the broader RL strategy and be in line with the return policy because the type of product returns can influence the disposition decisions (see section 6.6.2). For example, if the return policy stipulates that all warranty returns must be returned to the manufacturer, the disposition decision will be "ship to the vendor" (see section 5.6.5.2).

Finally, the organisation can *establish* and *implement* a *formal disposition strategy*, ensuring that organisations can obtain value from consumer product returns to counteract high RL costs, investments and resources (see sections 6.6.1.3 and 6.9) needed for the effective management of consumer returns.

6.6.1.2 Strategic understanding and analyses for RL disposition decisions

Strategic understanding and analysis for disposition decisions can be critical for effective implementation of RL disposition strategies (section 6.6.1.1), which must be implemented to identify appropriate RL disposition decision factors (section 6.6.2) for effective disposition decision-making. Consequently, organisations must understand several factors, including economic, disposition option, organisational, market-related and external factors, and perform analyses, including cost-benefit analyses, assessment and ranking of disposition options, market analyses and other external analyses.

Strategic understanding of economic factors involves understanding costs and profits prior to considering the RL disposition decision cost factors (section 6.6.2). Particularly, the disposition decision-maker and planner (such as the RL manager) must consider and evaluate RL costs and the profit potential associated with each disposition option for an informed disposition decision. Additionally, understanding of economic factors can facilitate with cost-benefit analyses and strategic assessment and ranking of disposition options.

Relating to the understanding of costs and profits, *strategic understanding of disposition option factors* can be important for accurate disposition decisions. Particularly, the decision-maker must understand the (1) categories and phases of disposition options (e.g. reuse, product recovery, material recovery and waste management), (2) the impact of each disposition option on costs, inventory levels and disposition processing time, and (3) return volume appropriate for disposition options (e.g. repair requires high

return volumes). Apart from being important for accurate disposition decisions, strategic understanding of disposition option factors can be important for other disposition strategies, including strategic considerations, development of appropriate disposition option strategies (e.g. reuse or product recovery strategies) (see section 6.6.1.1), cost-benefit analysis and ranking of disposition options.

Strategic understanding of organisational factors involves organisational strategies, policies, capabilities and resources. Particularly, decision-makers must understand organisational strategies/policies, ensuring that disposition decisions correspond with and complement organisational strategies. For example, a financial or cost-containment objective might be better suited for more cost-effective disposition options (e.g. sell to third party buyers), while a customer service-orientated objective might be better suited for more service-orientated disposition options (e.g. repair and refurbishment), emphasising the importance of understanding economic and disposition option factors.

Furthermore, understanding the capabilities and resources of the organisation can be important since certain disposition options require specific capabilities and resources that the organisation may lack (also see section 6.6.1.3). Consequently, if the organisation lacks the necessary capabilities and/or resources, the decision-maker must know the willingness of the organisation to obtain the necessary capabilities or resources.

Strategic understanding of market-related factors involves consumers, market conditions and competition, and secondary markets. Specifically, decision-makers must understand consumer behaviour (e.g. knowing consumers and consumer demand) and consider the potential impact of disposition decisions on consumers. Additionally, the decision-maker must understand market conditions and size, which involves identifying the number of competitors in the market and the type of disposition activities and strategies performed by competitors. Understanding competitors may expose market saturation for specific recovered products, which may impact the profitability of the organisation. Similarly, the decision-maker must understand secondary markets to avoid potential brand cannibalisation, which emphasise the importance of developing and implementing secondary market strategies (section 6.6.1.1).

Equally important for effective disposition decisions can be *strategic understanding of external factors*, which involve the environment, regulation and SC. Particularly, decision-makers must understand the environmental impact of disposition alternatives, existing/pending laws and regulations (e.g. Consumer protection Act (CPA) of South Africa) and the impact of disposition decisions on regulation. Moreover, the disposition decision-maker must understand the SC for recovered products, which includes

understanding of the SC structure, the different SC parties involved in the SC and the relationships between the parties.

Regarding the strategic analysis for effective disposition decisions, performing a *cost-benefit analysis* can be important to determine the feasibility of each option. For example, a cost-benefit analysis can be performed for a specific disposition option, like repair, comparing the investment and cost requirements of repair with potential repair option outcomes (such as cost savings and customer satisfaction). Evidently, if the costs/requirements out-weigh the outcomes, the disposition option might be too costly for effective RL disposition practices, emphasising benefit-driven disposition decisions and options (see section 6.6.1.1). Alternatively, organisations may need to explore other alternatives, like RL outsourcing practices to perform disposition options cost-effectively (see section 6.6.1.3). Essentially, performing a cost-benefit analysis demonstrates the importance of understanding the economic, disposition option and organisational factors (e.g. cost containment goal) for effective disposition decision making.

Based on the strategic understanding of economic, disposition and organisational factors and the outcomes of the cost-benefit analyses, organisations can *strategically assess* and *rank* the *disposition options* for effective disposition decisions-making. In practice a standard disposition option hierarchy associate with the most value-producing and least resource-demanding options, which follow reuse, product recovery (e.g. repair and refurbishment), material recovery (e.g. recycling) and waste management (e.g. dispose in a landfill). However, disposition option assessment and ranking must correspond with organisational goals and strategies, which can not only form a foundation for developing different disposition option strategies (see section 6.6.1.1) but also facilitate disposition decision-makers with appropriate disposition decisions.

Associating with the understanding of market-related factors, performing a *market analysis* involves evaluating and measuring market-based implications of disposition decisions. Organisations can use SWOT or gap analyses to identify the feasibility of entering in new markets or using existing markets to sell recovered products. Additionally, market analysis can be important for other disposition strategies, including the development of disposition policies and secondary market strategies (section 6.6.1.1).

Finally, *other external analyses* can be performed, including a (1) situational analysis to identify the implications of disposition decisions on the environment (e.g. laws/regulations) and (2) industry analysis and/or country analysis (for multi-national organisations) to identify the appropriateness of the disposition decision for the industry and country.

6.6.1.3 Requirements of RL disposition practices

Since the RL disposition practices mostly consist of disposition strategies and disposition decision factors, limited economic, operational, organisational and environmental requirements associate with RL disposition practices.

The *economic requirements* of RL disposition practices involve *investments, expenditure* and *costs* that associate with product recovery activities and RL processes. Consequently, investment, expenditures and costs requirements can be important for developing appropriate disposition option strategies (section 6.6.1.1), strategic understanding of economic and disposition option factors, cost-benefit analyses and strategic assessment and ranking of disposition options (see section 6.6.1.2).

The *operational requirements* of RL disposition practices involve RL process requirements and efficient disposition processes. Particularly, effective disposition practices must be supported by effective and efficient *RL processes,* including collection, inspection and sorting. For example, inspection involves product condition identification and pre-disposition decisions, and sorting involves classification of products according to product condition and potential disposition options (see section 5.5), which can be critical for effective disposition decisions. Similarly, *efficient* and *speedy disposition processes* can support the effective implementation of disposition strategies for maximum value recovery, emphasising the importance of implementing benefit-driven disposition strategies (see section 6.6.1.1).

The *organisational requirements* of RL disposition practices include (1) management involvement, (2) RL in/outsourcing practices and (3) RC practices. Like other RL practices (e.g. IT, integration and RL in/outsourcing), *management involvement* can be important for the development and implementation of strategies. For instance, in RL disposition practices managers must be involved in the (1) strategic preparation and implementation of disposition strategies (section 6.6.1.1), (2) strategic understanding of economic, disposition option, organisational, market-related and external factors, (3) performing cost-benefit analyses (or any other analyses) (see section 6.6.1.2), and (4) identifying disposition decisions factors for effective disposition decisions (see section 6.6.2).

RL in/outsourcing practices can play a role in disposition option strategies, for example, some disposition options strategies may be viable but too complex or costly to perform inhouse, requiring the adoption of RL outsourcing practices. Evidently, the potential for outsourcing RL disposition, demonstrates the importance of understanding economic, disposition option, market and SC (external) factors for effective disposition decisions (also see section 6.6.1.2).

Likewise, effective RL disposition requires appropriate *RC (resource commitment)* in RL, which not only emphasise the economic requirement of investment but also the importance of understanding organisational factors (such as resources) for effective disposition decisions (see section 6.6.1.2). Consequently, several RL practices can be important for RL disposition practices, which reemphasise the importance of a holistic approach to the RLM of consumer returns.

Finally, unique to RL disposition practices can be the *environmental requirement* of *environmental regulation,* which must be present to enhances the organisation's environmental performance through RL disposition options. Consequently, in absence of environmental regulations, organisations may only demonstrate a commitment to the environment without environmental compliance and performance benefits, making environmental factors and benefits less important for RL disposition.

In the next section, RL *disposition decision factors* that associate with the disposition strategies and requirements, will be explored.

6.6.2 RL disposition decisions factors

RL disposition decision factors include economic, operational, organisational, product-related, environmental and social, market-related, SC and other external factors. The disposition decision factors can be important for making accurate disposition decisions for the effective management of consumer returns but requires strategic understanding and analyses of economic, disposition, organisational, market-related and other external factors (discussed in section 6.6.1.3).

Table 6.20 provides an overview of the findings related to the *RL disposition decision factors*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.20 Findings related to the RL disposition decision considerations and factors to manage consumer returns

	Development of country	None	• *"[…] incineration is a costly venture and thus not suited for developing countries."* (Kinobe *et al.* 2015:82)
	International factors	None	• *"[…] a specific disposition method choice. […] for international markets and for supply chains that cross national borders and experience the impacts of culture, tariffs, quotas, etc."* (Skinner *et al.* 2008:534)

Source: Compiled by the researcher

Table 6.20 shows the RL disposition decision factors, including economic, operational, organisational, product related, environmental and social, market-related, SC and other external factors, which will be discussed in subsequent sections.

6.6.2.1 Economic factors in RL disposition decisions

The economic factors in RL disposition decisions involve (1) economic benefits, (2) recovery value, (3) recovered product price, (4) costs, and (5) profitability.

Associating with the strategy of benefit-driven disposition decisions and options (see section 6.6.1.1), the organisation (or disposition decision-maker) can focus on the economic benefits to choose between disposition options. Likewise, the *recovery value* of each disposition option and product can influence disposition decisions, which associate with disposition decision strategies of cost-benefit analyses and strategic assessment and ranking of disposition options (see section 6.6.1.2). For example, if the organisation seeks the highest recovery value, then the reuse option can be considered as the highest ranked disposition option in terms of recovery value.

Similarly, the *recovered product price* can be an important disposition decision factor since the selling price of the recovered product can demonstrate the feasibility of the disposition option. Consequently, the recovered product price must be sufficient to cover the expenses, investment and resources associated with each option (see section 6.6.1.3), emphasising the importance of understanding the costs and profitability of each disposition option (economic factors) for effective disposition decisions (see section 6.6.1.2).

Costs can be an important disposition decision factor that associate with the strategic understanding of economic factors (such as costs) and organisational factors (such as goals and strategies) and the economic requirements of cost (section 6.6.1.3). For example, different costs of disposition options can be an important factor for organisations aiming to control and minimise costs, which means that disposition decision makers must choose the most economically viable option.

Similarly, *profitability* as a disposition factor associates with the strategic understanding of profitability of each disposition option (as an economic factor) and assessment/ranking of disposition options (section 6.6.1.2). For instance, the organisation must determine the potential profitability of each disposition option and then based on the assessment choose the disposition option with the highest profit potential, leading to a benefit-driven disposition option strategies (see section 6.6.1.1).

Essentially, the economic factors that influence RL disposition decisions demonstrate the importance of understanding economic and organisational factors before making disposition decisions and highlight the economic outcomes associated with effective disposition decisions (see section 6.6.3).

6.6.2.2 Operational factors in RL disposition decisions

The operational factors in RL disposition decisions involve disposition complexity, disposition speed and return quantity/volume. In some cases, organisations may consider the *complexity* of *disposition* options as a factor that can influence disposition decisions. For instance, the organisation may find the refurbishment option as too complex and may consider repair or selling to a third party.

Additionally, *disposition speed* can be important because of the operational requirement of a speedy and efficient disposition process (see section 6.6.1.3). Therefore, if the repair option can be performed quicker and more efficiently than the refurbishment option, then the organisation may choose the repair option. The *return quantity* or *volume* as a disposition decision factor relates to the understanding of disposition options (e.g. volume requirements). For instance, the repair disposition requires high return volumes to be economically feasible, which means that organisations with lower return volumes need to choose an alternative disposition option (e.g. refurbishment or sell on secondary markets).

Essentially, the operational disposition decision factors demonstrate the importance of developing appropriate disposition option strategies (see section 6.6.1.1) and understanding different disposition options for effective disposition decisions (section 6.6.1.2).

6.6.2.3 Organisational factors in RL disposition decisions

The organisational factors in RL disposition decisions, including organisational objectives, policies, capabilities and resources relate to the disposition strategies (section 6.6.1.1), strategic understanding of organisational factors (section 6.6.1.2) and the organisational requirements of RL disposition practices (section 6.6.1.3). For instance, disposition decisions must be made in accordance with *organisational objectives* and *policies,* which demonstrates the importance of understanding the organisational objectives and policies (organisational factors) and linking of the disposition strategy with other RL strategies and policies for accurate disposition decisions.

Similarly, disposition decisions depend on the organisation's *capabilities,* which requires an understanding of organisational capabilities (organisational factors) before informed disposition decision-making. Evidently, if the organisation lacks capabilities in repair and refurbishment operations, other options might be more feasible, demonstrating the strategic importance of understanding/knowing the different disposition options (section 6.6.1.2).

Finally, *resources* can influence disposition decisions since certain disposition options (such as repair) require certain resources (e.g. repair specialists and testing equipment), which demonstrate the importance of understanding organisational factors, like resource availability and willingness of the organisation to commit resources, emphasising organisational requirement of RC (section 6.6.1.3), Essentially, if an organisation is unwilling to commit resources and/or lacks resources for repair or refurbishment, other options, like destroy or sell to third parties, may be more appropriate.

6.6.2.4 Product-related factors in RL disposition decisions

RL disposition decisions involve several product-related factors, including (1) type of product and product characteristics, (2) product return quality and condition, (3) product value, (4) type of product returns, (5) product life cycle or maturity and (6) product control.

The *type of product* and *product characteristics* means that the nature of the product may exclude one or more disposition option. For example, a perishable product may only be suitable for the destroy option or products that contain recyclable materials may be suitable for recycling. Similarly, products

that can be disassembled may be suitable for repair and refurbishment options, which may involve parts replacement (see section 5.6).

The *product condition* and *quality* relate to the condition and quality of the product at the time of return. For instance, a product return in a new/unused condition can be appropriate for the reuse option or in a damaged/defective condition can be appropriate repair and refurbishment. Similarly, the quality of the returned product can point to the appropriate disposition option, for example, a high quality returned product may be suitable for repair and refurbishment, while low quality returned products may be suitable for recycling.

Nevertheless, product characteristics and condition (factors) can be more important than quality, for example, a lower quality product in a new/unused condition can still be reused and resold instead of recycled. The product condition and quality factors can be considered in the ranking of disposition options (section 6.6.1.2) and implementation of appropriate disposition strategies (section 6.6.1.1).

Linking with the recovery value (economic factor) (section 6.6.2.1) and product-related factor of product quality, *product value* of used products can influence disposition decisions. For example, low value used products may be more appropriate for destroy than for repair and refurbishment. Product value as a disposition decision factor can associate with developing a recovery strategy, which means that products with lower value might be excluded from the disposition strategy because less effort must be applied to lower value products.

Associating with product condition factor and strategic linking of disposition strategies and return policies (see section 6.6.1.1), *type of returns* can influence disposition decisions. For example, a service or warranty returns require repair or return to the manufacturer (vendor) and new/unused returns (due to buyers' remorse or a change in mind) require direct reuse and resale (also see sections 4.3 and 5.6).

Product life cycle or *maturity* can influence disposition decisions and can relate to the abovementioned product-related factors of product condition, product characteristics and type of returns. For example, a product at the end of its lifecycle, might be in a used condition, classified as obsolete and associate with end-of-use (EoU) consumer returns (see section 4.3), which means that it may be uneconomical to repair/refurbish the product for resale on the secondary markets. Finally, *product control* can influence disposition and must be considered in developing a secondary market strategy (see section 6.6.1.1), demonstrating the importance of the disposition decision strategies of understanding market-related factors and performing market analyses (section 6.6.1.2).

6.6.2.5 Environmental and social factors in RL disposition decisions

Like economic, operational and organisational factors, the environmental factors, including environmental impact, benefits, policy, restrictions and regulations, requires strategic understanding of several factors for effective disposition decisions (section 6.6.1.2).

For instance, strategic understanding of external factors like the environment can be important for informed disposition decision-making related to *environmental impact* and *benefits*. Similarly, the *environmental policy* of the organisation can influence disposition decisions, which relate to understanding of organisational factors (like organisational policies) for accurate disposition decision-making. For example, the organisation's environmental policy may stipulate that all used product returns must be repaired or resold on secondary markets to avoid negative impact on the environment, emphasising the importance of linking disposition strategies with organisational policies (see section 6.6.1.1).

Environmental restrictions can motivate organisations to choose environmentally friendly options (such as reuse) and avoid high environmental penalty cost for certain disposition options (such as higher landfill costs), emphasising the importance of understanding economic and disposition option for effective disposition decision-making (section 6.6.1.2). Similarly, *environmental regulations* can influence disposition decisions, which, like the environmental policy of the organisation, may stipulate that all used product returns must be repaired or recycled. The influence of environmental regulations demonstrates the importance of understanding external factors (like regulations) for disposition decisions since a failure in understanding laws may lead to choosing a disposition option that falls outside regulations (such as landfill disposal).

Finally, the *social factor* of CSR can influence disposition decisions, which relates to the consumer pressures and corporate citizenship drivers of RLM (see section 2.3.4.1). Consequently, organisations may choose disposition options that demonstrates a commitment to the society, for example, donating product returns to charity, demonstrating the social outcomes of RL disposition practices (section 6.6.3.4).

6.6.2.6 Market-related factors in RL disposition decisions

The market-related factors in RL disposition decisions involve (1) market value and proposition, (2) market position, size and measures, (3) market conditions and competition, (4) market cannibalisation, (5) customer service objectives, (6) consumer behaviour and demand, (7) availability of buyers / saleability, and (8) supply of recoverable products.

Market value and *proposition* factors associate with other disposition decision factors, like recovery value, recovered product price, product condition and quality, and product value (see sections 6.6.2.1 and 6.6.2.2). For instance, the market proposition of the organisation can be to resell higher value used products on secondary markets, which means that the organisation must choose disposition options (such as repair and refurbishment) that result in higher value and higher quality recovered products.

The *market position, size* and *measures* of the organisation can influence disposition decisions, which demonstrates the importance of understanding market-related factors and performing market analyses (e.g. SWOT and gap analyses) for effective disposition decisions (section 6.6.1.2). Likewise, *market conditions* and *competition* can be important disposition decision factors that associate with strategic understanding and market analysis of market-related factors (like competition). For example, if the market involves competitive forces for selling repaired cell phones the organisation must choose options like refurbishment or selling to third party buyers, or if the market lacks competition, smooth market entry can allow the organisation to choose repair cell phones for profit.

Market cannibalisation associates with developing a secondary market strategy (see section 6.6.1.1) and strategic understanding secondary markets (market-related factor) for effective disposition decisions (section 6.6.1.2). For example, if the risk of market cannibalisation is high in local secondary markets, the organisation can choose distant (offshore) secondary markets as the best disposition alternative.

Associating with the strategic understanding organisational factors (e.g. objectives) (section 6.6.1.2), the *customer service objectives* of organisations can influence disposition decisions. For example, if the customer service objective of the organisation entails responsiveness, disposition options associated with responsiveness (such as refurbishment) can be chosen. Nevertheless, *consumer behaviour* and *demand* can be equally important disposition decision factors, associating with strategic understanding of market-related factors (such as consumers). For instance, consumers may be environmentally conscious, which can create a demand for refurbished or repaired products. Accordingly, the organisation will choose to repair or refurbish returned products to satisfy consumer demands.

Availability of *buyers* or *saleability* of recovered products can influence disposition decisions, which emphasise the importance of performing a market analysis for effective disposition decision-making (section 6.6.1.2). For example, if the organisation determines that the market lacks third-party buyers (such as jobbers and salvage dealers) or second consumers (see section 5.6.5), certain disposition options, like reuse, repair and refurbishment, may be impractical, which means that the organisation must choose other disposition alternatives (such as destroy or recycling).

Finally, *supply of recoverable products* as a disposition decision factor associates with the strategic understanding of return volume for disposition options (see section 6.6.1.2). For instance, organisations that lack sufficient supply of recoverable or reusable products must avoid selecting disposition options with high volume requirements (such as repair) and instead select disposition options (e.g. sell as scrap or destroy) with lower volume requirements.

Essentially, market-related factors can be critical for effective disposition decision-making, which demonstrates the importance of careful consideration of disposition decisions and alternatives while developing a disposition strategy (section 6.6.1.1).

6.6.2.7 SC and external factors in RL disposition decisions

The *SC factors* that influence disposition decisions include (1) supplier agreements, (2) manufacturer preferences, (3) relationships and power and (4) product ownership. A *supplier agreement* involves an agreement between a retailer and a supplier/manufacturer that can influence disposition of product returns. For example, the supplier agreement stipulates that all defective consumer product returns can be returned by the retailer, which means that the retailer can choose to "return to the vendor" disposition option, instead of choosing repair or refurbishment.

Similarly, *manufacturer preferences* can influence disposition decisions of retailers, for example, an OEM concerned with brand management may require that all defective/damaged consumer product returns must be returned by the retailer, emphasising the influence of product return type (product-related factor) on disposition decisions (see section 6.6.2.4). Additionally, SC *relationships* and *power* can influence disposition decisions, for instance, large and powerful retailers may be in the position to return all consumer returns to less-powerful smaller manufacturers/suppliers (return to the vendor option). Lastly, *product ownership* may also play are role in disposition decisions since the product owner (e.g. third-party seller) may choose the disposition decision, influencing the disposition decision-making of the seller (like the retailer). Essentially, the SC disposition decision factors demonstrate the strategic importance of understanding the SC (external factor) for effective disposition decision making (see section 6.6.1.2).

Several *external factors* can influence disposition decisions, including (1) governmental regulation, (2) stakeholder needs, (3) type of industry, (4) development of a country and (5) international factors. Like environmental laws, *governmental regulation* can be import in disposition decision-making since governments may impose certain laws or restrictions on some disposition options (such as disposal), motivating organisations to develop product recovery strategies (see section 6.6.1.1). Subsequently, the

governmental regulation disposition factor demonstrates the importance of understanding governmental regulations and laws as external factors for effective disposition decisions (see section 6.6.1.2).

Like the consumer demand disposition decision factor (section 6.6.2.6), *stakeholder needs* can influence disposition decisions. For example, society may expect that organisations donate products to charity or recycle products instead of disposal, or investors may expect that organisations choose disposition options with the highest profitability. Consequently, organisations may need to identify the most important stakeholders and their needs for effective disposition decisions.

Like the type of product (product-related factor) (section 6.6.2.4), the *type of industry* can influence disposition decisions. For instance, in the fashion industry product disposition options can be limited to donate to charity and resell on the secondary markets or in the pharmaceutical industry disposition can be limited to destroy or incineration. Evidently, the impact of industry on disposition decisions demonstrates the importance of conducting an industry analysis (see section 6.6.1.2) before disposition decision-making.

Similarly, *development of a country* can influence disposition decisions since some countries may lack the skills and resources to perform expensive disposition options. For example, incineration of products may be too costly in developing countries, emphasising the strategic importance of conducting a country analysis (section 6.6.1.2). Finally, *international factors*, like culture, labour, tariffs and taxes, can influence disposition decisions of multi-national organisations and can form part of other RL disposition factors, like market conditions, competition, consumer behaviour, demand, and other external factors (like legislation and country development).

Essentially, all the factors that can influence disposition decisions demonstrate the importance of RL disposition practices and the strategies and requirements needed for effective disposition decision-making. In the next section, the outcomes (benefits) of RL disposition practices, will be explored.

6.6.3 Outcomes of RL disposition practices

The outcomes of RL disposition practices relate to the specific benefits associated with the RL disposition practice strategies and requirements, and optimum disposition decisions based on the RL disposition decision factors. The outcomes of RL disposition practices include (1) economic, (2) operational, (3) organisational (4) environmental and social, and (5) market-related and SC outcomes. Table 6.21 provides an overview of the findings related to the *outcomes of RL disposition practices*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.21 Findings related to outcomes of RL disposition practices to manage consumer returns

			positive operational responsiveness can result." (Skinner *et al.* 2008:534)
	Increase bargaining power	None	• *"When taking into account the option to refurbish and resell consumer returns, the retailer will strengthen its bargaining position with its supplier […]."* (Reimann, 2016:52)

Source: Compiled by the researcher

Table 6.21 shows that RL disposition practices associate with economic, operational, organisational, environmental, social, market-related and SC outcomes, which will be discussed in subsequent sections.

6.6.3.1 Economic outcomes of RL disposition practices

The economic outcomes of RL disposition practices involve (1) economic benefits and performance, (2) cost efficiency and effectiveness, (3) cost savings/reductions, (4) revenue and profitability, and (5) cost/value recovery.

Economic benefits and *performance* associate with developing disposition option strategies, including reuse strategies and other recovery strategies, like energy recovery, which shows the importance of implementing different strategies for each disposition option (section 6.6.1.1). Moreover, *cost efficiency* and *effectiveness* can be expected through disposition option strategies, like reuse and repair (part of recovery strategies), strategic understanding of different disposition options (e.g. volume requirements), capital expenditure (economic requirement) and committing resources (organisational requirement), demonstrating the importance of cost-benefit analysis for disposition practices (section 6.6.1.2).

Similarly, *cost savings / reductions* (such as inventory, storage, labour, transport, handling and disposal costs) can be achieved through disposition practices that involve (1) benefit-driven disposition practices (e.g. focus on reclaiming maximum value), (2) developing reuse strategies, (3) establishing disposition rules, (4) implementing a formal disposition strategy, (5) performing a cost-benefit analysis and (6) investment (economic) requirements, showing the strategic importance of effective RL disposition practices.

Revenue and *profitability* can be classified as significant economic outcomes of RL disposition practices, which like the cost efficiency and effectiveness outcome, associate with disposition strategies and economic requirements. Particularly, organisations can increase revenue and profitability through the (1) general disposition strategies of benefit-driven disposition options and decisions and developing a well-planned disposition strategy that includes product recovery (e.g. repair strategy), secondary market and asset recovery strategies, (2) strategic understanding of economic factors (e.g. profits),

disposition options, organisational factors (e.g. cost containment objective) and market-related factors (e.g. secondary markets), and (3) economic requirement of capital expenditure. Evidently, the implementation of various RL disposition practices can enhance profitability, indicating that organisations must prioritise disposition practices to improve their bottom-line.

Finally, like the above-mentioned economic outcomes, *cost/value recovery* can be realised through various RL disposition practices, including (1) general disposition strategies related to benefit-driven disposition options, establishing disposition rules, developing secondary market and product recovery strategies and establishing a formal disposition strategy, (2) strategic understanding and analysis for disposition decisions related to economic factors and assessment and ranking of disposition options, and (3) disposition requirements related to costs (economic requirement), RL process requirements (e.g. collection), efficient/speedy disposition processes (operational requirements) and RC (organisational requirement).

Essentially, several economic benefits can associate with RL disposition practices, but organisations must implement various disposition strategies and requirements, reaffirming the importance of RL disposition practices for the effective management of consumer returns.

6.6.3.2 Operational outcomes of RL disposition practices

The operational outcomes of RL disposition practices include (1) improving operational performance, (2) improving RL process speed, efficiency and effectiveness, (3) reducing inventory levels, and (4) improving product return control. Organisations can *improve operational performance* through the development of reuse strategies, which demonstrates the importance of developing distinct strategies for the different disposition options.

Additionally, through secondary market strategies, a formal disposition strategy (general strategies) and RC (organisational requirement), organisations can improve the *speed*, *efficiency* and *effectiveness* of *RL processes.* For example, implementing secondary market strategies (e.g. identifying market partners) can ensure efficient disposition, and a formal disposition strategy and resources can provide speedy feedback on return authorisation (gatekeeping) and enable speedy processing (e.g. fast refund). Evidently, despite the operational requirements of RL processes and efficient/speedy processes, specific disposition practices can improve the overall efficiency and effectiveness of RL processes, demonstrating the value of performing a cost-benefit analysis for effective disposition practices.

Associating with cost savings (such as inventory carrying costs) (see section 6.6.3.1), organisations can *reduce inventory levels* through the strategic establishment of disposition rules, strategic development

and linking of disposition strategies with RL strategies and strategic implementation of a formal disposition, demonstrating the importance of general disposition strategies (section 6.6.1.1). Finally, developing an appropriate disposition system (general disposition strategy) can improve *product return control*, which can be important for managing consumer product returns.

6.6.3.3 Organisational outcomes of RL disposition practices

The organisational outcomes of RL disposition practices include (1) facilitating RL implementation, (2) improving RL capabilities, (3) improving RL performance, and (5) reducing resource requirements.

Several RL disposition practices can *facilitate RL implementation*, including the (1) benefit-driven disposition options/decisions (e.g. focus on profits and maximum value recovery), (2) establishment of a disposition system (general disposition strategies), (3) strategic understanding of external factors (such as the environment and government regulations), (4) strategic assessment and ranking of disposition options (according to recovery value), and (5) management involvement (organisational requirement). Consequently, RL disposition practices can address RL implementation barriers, like economic barriers and risks (see section 2.3.1) and organisational barriers (such as lack of awareness of RL benefits) (see section 2.3.3), which can enhance the RLM of consumer returns.

Organisations can *improve RL capabilities* through the RC (organisational) requirement for effective RL disposition strategies. Likewise, organisations can *improve RL performance* through the investment in resources (economic requirement) and RC (organisational requirement), demonstrating the importance of RC practices in the RLM of consumer returns (see section 6.9.1).

Nevertheless, the disposition strategy of assessing and ranking disposition options (e.g. high ranking for the least resource-demanding option) can *reduce resource requirements*, emphasising the economic advantages of effective disposition strategies (see section 6.6.3.1). Essentially, RL disposition practices can help organisations to improve RLM of consumer returns through several organisational advantages.

6.6.3.4 Environmental and social outcomes of RL disposition practices

The *environmental outcomes* of RL disposition practices include (1) improving environmental performance, (2) environmental protection and (3) reducing waste. In the presence of environmental regulations (environmental requirement), organisations can *improve environmental performance* by establishing disposition option strategies (such as reuse or recovery strategies).

Additionally, organisations can *protect* the *environment* through the strategic assessment and ranking of disposition options (e.g. lower ranking for the least green option) and development of reuse strategies and practices, which emphasise the importance of reuse as the highest priority disposition option (see sections 5.6.2 and 6.6.1.2). Moreover, organisations can *reduce waste* through the general disposition strategies of adopting a strategic approach (environmentally conscious approach), benefit-driven disposition options, and developing recovery strategies, including product recovery, asset recovery and energy recovery strategies, emphasising the positive impact of effective RL disposition strategies on the environment.

In terms of *social outcomes*, RL disposition practices can improve corporate image, social performance and promote job creation. Particularly, *corporate image* and *social performance* can be *improved* through the general disposition strategy of developing reuse strategies and practices, emphasising the importance of ranking reuse as the most beneficial disposition option (see section 6.6.1.2). Additionally, disposition practices that entail recycling initiatives can facilitate *job creation,* demonstrating the importance conducting a country analysis and considering the development of a country as part of the disposition decisions strategies (see section 6.6.1.3). Essentially, RL disposition practices can provide benefits beyond the organisation, and can be regarded as sustainable practices that contribute to the environment and society.

6.6.3.5 Market-related and SC outcomes of RL disposition practices

The *market-related outcomes* of RL disposition include (1) brand protection and avoiding market cannibalisation, (2) market growth and sales increase, (3) improving consumer satisfaction and relationships, and (4) improving consumer service and responsiveness.

Particularly, organisations can ensure *brand protection* and *avoid market cannibalisation* by developing secondary marketing strategies (e.g. identify appropriate secondary markets and partners), emphasising the importance of understanding market-related factors and performing a market analysis before disposition decision-making (see section 6.6.1.2).

Associating with the economic outcomes of profitability (section 6.6.3.1), organisations can expect *market growth* and *sales increase* by developing several disposition option strategies, including a repair (recovery) strategy, secondary market strategy (e.g. remarketing practices) and asset recovery strategy (general disposition strategies), as well as financial investment in recovery (economic requirement). Evidently, the market growth and sales increase outcomes demonstrate the value of performing cost-benefit analysis for effective disposition practices (see section 6.6.1.2)

Moreover, organisations can *improve customer satisfaction* and *relationships* by implementing disposition strategies, performing cost-benefit analyses for effective disposition decisions, investing in recovery activities (such as repair) (economic requirement) and committing resources (organisational requirement), emphasising the strategic importance of understanding the economic and disposition option factors (such costs of disposition options) for effective RL disposition (see section 6.6.1.2). Similarly, organisations can *improve consumer service* and *responsiveness* by strategically preparing for disposition strategy implementation (e.g. guide by the goals of the organisations) (see section 6.6.1.1) and committing resources (organisational requirement), emphasising the important link between disposition and RC practices for the effective management of consumer returns.

Finally, the *SC outcome* relates to effective negotiations (part of SCI strategies) (see section 6.4.1), which involve bargaining power. Particularly, organisations (such as retailers) can *increase* their *bargaining power* with suppliers by developing reuse and product recovery strategies (general disposition strategies), emphasising the impact of supplier agreements on disposition decisions (see section 6.6.2.7). Consequently, RL disposition practices may facilitate SCI practices, which emphasise the importance of implementing various practices to manage consumer returns.

Essentially, RL disposition practices can result in various benefits, with the most significant involving sustainability in terms of profits and sales, RL performance, the environment and society. In the next section, RL disposition practices will be concluded with a description, conceptual framework and summary of findings for RL disposition practices to manage consumer returns.

6.6.4 Description, conceptual framework and summary of findings for RL disposition practices to manage consumer returns

Like RL in/outsourcing, RL disposition practices contain a single description, conceptual framework and summary of findings. Based on the findings presented in section 6.6, RL disposition practices can be important for the management of consumer returns, and will be described as follows:

> RL disposition practices for the management of consumer returns involve (1) general disposition strategies, including organisation-wide commitment, preparation for disposition strategy implementation, defining the disposition process, strategic approach and considerations, benefit-driven disposition strategies, developing an appropriate disposition system, establishing disposition rules and policies, developing reuse, product recovery, secondary market and other strategies and practices, developing and linking of disposition strategies and RL strategies/policies, and establishing and implementing a formal disposition strategy, (2) strategic understanding and analyses for RL disposition decisions, including the understanding of economic, disposition option, organisational, market-related and external factors, and performing cost-benefit analyses, assessment and ranking of disposition options, market analyses and other external situation, country and industry analyses, (3) RL disposition requirements, including economic requirements (investment, expenditure and costs), operational requirements (RL process requirements and a speedy/efficient disposition process), organisational requirements (management involvement, RL in/outsourcing and RC practices), and an environmental requirement (environmental regulation).

Based on the RL disposition practices, disposition decision factors for effective RL disposition decisions must be considered, including (1) economic factors (economic benefits, recovery value, recovered product price, costs and profitability), (2) operational factors (disposition complexity, disposition speed and return volume/quantity), (3) organisational factors (organisational policies and objectives, capabilities and resources), (4) product-related factors (type of product, product characteristics, product return condition and quality, product value, type of product returns, product lifecycle and product control), (5) environmental and social factors (environmental impact, benefits, policy, restrictions, regulation and CSR), (6) market-related factors (market position, size, value, proposition, conditions, competition and cannibalisation, and customer service objectives, consumer behaviour and demand, availability of buyers / saleability and supply of recoverable products), (7) SC factors (supplier agreements, manufacturer preferences, SC relationship and power, and product ownership), and (8) other external factors (government regulations, stakeholder needs, type of industry, development of a country and international factors).

The RL disposition strategies, practices and factors for effective disposition decisions, can result in several outcomes, including (1) economic outcomes (economic benefits and performance, cost efficiency and effectiveness, cost savings/reductions, revenue and profitability, and cost/value recovery), (2) operational outcomes (improve operational performance, RL process speed, efficiency and effectiveness, reduce inventory and improve product return control), (3) organisational outcomes (facilitate RL implementation, improve RL capabilities and performance, and reduce resource requirements), (4) environmental and social outcomes (improve environmental performance, environmental protection, reduce waste, improve corporate image and social performance and promote job creation), (5) market-related outcomes (brand protection, avoid market cannibalisation, market growth and sales increase, improve consumer satisfaction and relationships and increase consumer service and responsiveness), and (6) a SC outcome (increase bargaining power).

Figure 6.18 provides a conceptual framework of RL disposition practices to manage consumer returns, including the links between RL disposition decision factors, strategies, requirements and outcomes, which can result in an optimum RL disposition strategy for the effective management of consumer returns. The RL disposition practices (strategies and requirements) associated with the most disposition decision factors are emphasised with a blue dot•, and the practices that associate with the most disposition outcomes (benefits) are emphasised with a red dot•. The most significant disposition decision factors and outcomes (associated with the most RL disposition practices) are emphasised with *italics*, which will be elaborated upon in Table 6.22.The links between the RL disposition decision factors and RL disposition practices (strategies and requirements) can be demonstrated by the organisational disposition decision factor of resources, which links with the development of appropriate disposition option strategies (general strategy), strategic understanding of organisational factors (such as resources and capabilities) and RC (organisational requirement). Similarly, the disposition strategy related to the strategic understanding of disposition option factors can link with the economic, operational, organisational, product-related, environmental and market-related disposition option factors.

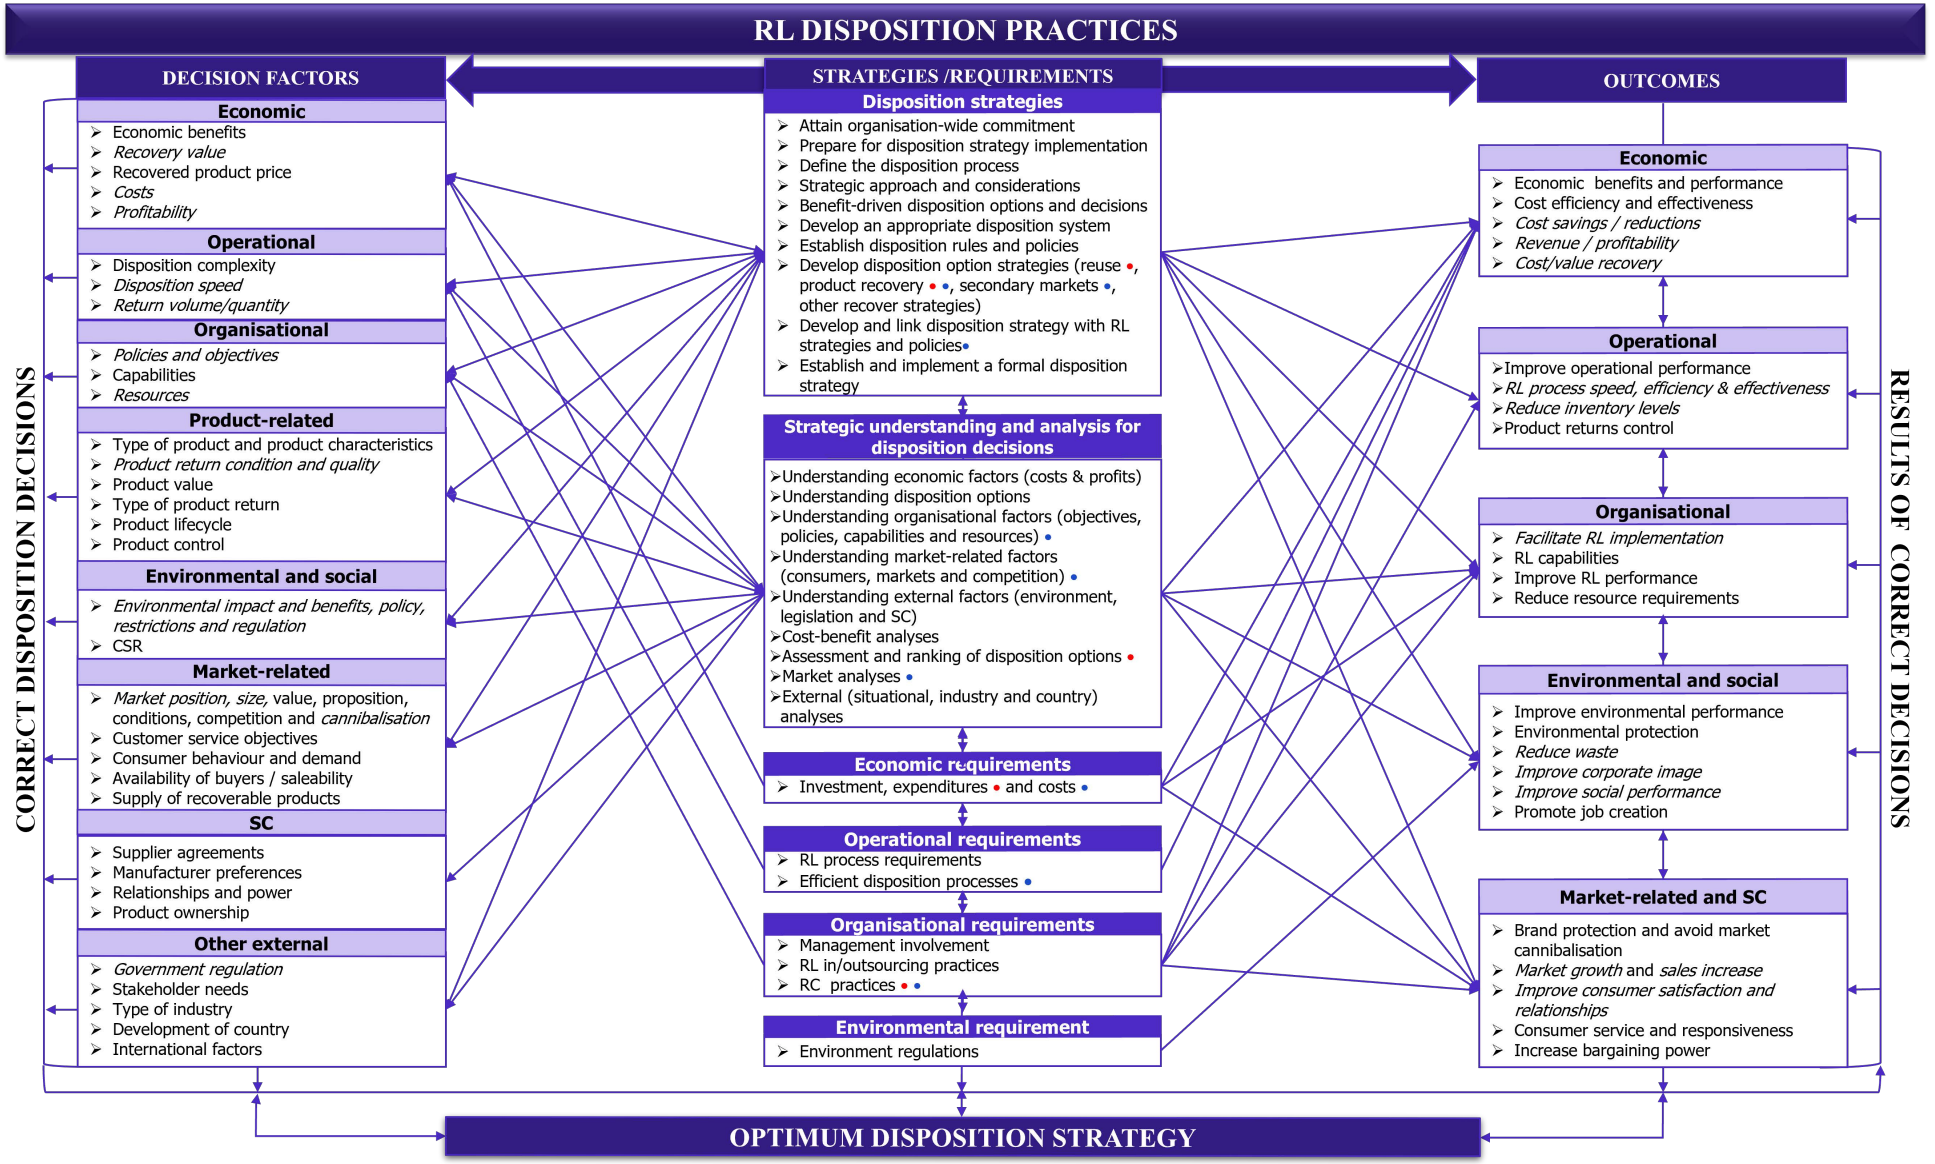

Figure 6.18 Conceptual framework of RL disposition practices to manage consumer returns
Source: Compiled by researcher

The links between the RL disposition strategies and requirements can be demonstrated by the general disposition strategies related to developing disposition options strategies, which can link with the strategic understanding of disposition options, strategic assessment and ranking of disposition options, economic requirements (e.g. investment and cost), operational requirements (e.g. RL process requirements), organisational requirements (e.g. RL in/outsourcing and RC practices), and environmental requirement of environmental regulation. The framework also shows that the RL disposition outcome categories can be linked, for example, the operational outcome of improving RL process speed and efficiency can link with cost recovery (economic), RL performance (organisational), environmental performance, and consumer service and responsiveness (market-related) outcomes. Finally, the framework shows that disposition decision factors, general disposition strategies, strategic understanding and analysis for disposition decisions and various RL disposition requirements can contribute to the implementation of an optimum disposition strategy, which can result in various benefits for the effective management of consumer returns.

Since RL disposition practices represent one concept, the summary of findings will be presented differently from the practice categories (e.g. integrations) that consist of sub-categories (e.g. SCI, CI and CFI). Evidently, the summary of findings and managerial implications will focus on the most significant strategies, requirements, disposition factors and outcomes.

Based on Figure 6.18 and the discussions given in section 6.6, Table 6.22 provides a summary of the findings and managerial implications for RL disposition practices to manage consumer returns.

Table 6.22 Summary of findings and managerial implications for RL disposition practices to manage consumer returns

CATEGORY	KEY FINDINGS	MANAGERIAL IMPLICATIONS
Strategies	•RL disposition involves general disposition strategies and strategies for disposition decision-making •General RL disposition strategies involve organisation-wide commitment, preparation for disposition strategy implementation, defining the disposition process, strategic approach and considerations, benefit-driven disposition strategies, developing an appropriate disposition system, establishing disposition rules and policies, developing reuse, product recovery, secondary market and other strategies and practices, developing and linking of disposition strategies and RL strategies/policies, and establishing and implementing a formal disposition strategy •Strategic understanding and analysis for disposition decision strategies involve understanding of the economic, disposition option, organisational, market-related and external factors, and performing cost-benefit analyses, assessment and ranking of disposition options, market analyses and other external situation, country and industry analyses •The disposition decision strategies related to the strategic understanding and analysis associate with all the disposition decision factors •General disposition decision strategies associate with all the outcomes, including economic, operational, organisational, environmental, social, market-related and SC outcomes •From the general disposition strategies, developing product recovery and secondary market strategies, and linking disposition strategies with RL strategies/policies associate with the most	•For general disposition strategies managers must attain organisation wide commitment, prepare for strategy implementation, define the disposition process, adopt a strategic approach, strategically consider disposition options and decisions, establish benefit-driven strategies, develop and establish disposition system, rules and policies, develop various disposition option strategies, link disposition strategies with RL strategies and policies and formally implement a disposition strategy •For effective disposition decisions, the decision-maker/manager must strategically understand economic, disposition option, organisational, market-related and external factors and perform various analysis, including cost-benefit analyses, assessment and ranking of disposition options, market analyses and analyses of other external situations, countries and industries •Organisations must especially focus on developing product recovery and secondary market strategies and link disposition strategies with RL strategies/policies for effective disposition decisions •Managers/decision-makers must especially focus on understanding market-related and organisational-related factors for effective disposition decisions •Managers must perform a market analysis for effective disposition decisions •Organisations that seek various economic, operational, organisational, environmental, social, market-related and SC benefits must implement general disposition strategies •Organisations must especially focus on developing reuse and product recovery strategies for effective and beneficial RL disposition

	disposition decision factors •From the disposition decision strategies related to strategic understanding, understanding market-related factors and organisational factors associate with the most disposition decision factors •From the disposition decision strategies related to strategic analysis, market analysis associates with the most disposition decision factors •From the general disposition strategies, developing reuse and product recovery strategies associate with the most disposition outcomes •From the disposition decision strategies related to strategic analysis, assessment and ranking of disposition options associate with the most disposition outcomes •The least significant disposition strategies, with no impact on decision factors and outcomes, include attain organisation-wide implementation and define disposition process	•Organisations must especially focus on assessing and ranking of disposition options for effective and beneficial RL disposition
Requirements	•RL disposition practices involve economic, operational, organisational and environmental requirements •Only the economic requirement of costs, operational requirement of an efficient/speed disposition process, and organisational requirement of resources associate with disposition decision factors •From requirements, the organisational requirement of RC and economic requirements of investment and expenditures associate with the most disposition outcomes •From the requirements, only the environmental requirement of environmental regulation associates with the environmental outcomes •The least significant requirement, with no impact on disposition decisions include the organisational requirement of RL in/outsourcing practices	•For effective disposition decisions, the manager/decision-maker must focus on cost, the disposition process and resource requirements •Organisations must focus on investment and expenditures, and resource commitment as RL disposition requirements to achieve optimum benefits •Organisations require environmental regulations for environmental benefits
Decision factors	•RL disposition involves several factors, including economic, operational, organisational, product-related, environmental and social, market-related, SC and external factors, which can influence disposition decisions •The economic, operational and organisational factors associate with the most RL disposition practice categories •The most significant RL disposition decision factors (associating with the most strategies and requirements) for effective disposition decisions include the economic factors of recovery value, costs and profitability •From the operational factors, disposition speed and return volume associate with the most RL disposition practices •From the organisational factors, organisational policies/objectives and resources associate with the most RL disposition practices •From the product-related factors, product return quality and condition associate with the most RL disposition practices •From the market-related factors, market position, size, measure and cannibalisation associate with the most RL disposition practices •From the external factors, government regulation associates the most with RL disposition practices •The environmental and SC factors equally associate with RL disposition practices •The social factor of CSR associates with no RL disposition practices •The least significant disposition decision factors, with no association to RL disposition practices, include disposition complexity, product life cycle, CSR, market value and proposition, availability of buyers, stakeholder needs and international factors	•Organisations can consider economic, operational, organisational, product-related, environmental and social, market-related, SC and external factors for disposition decision-making •Organisations must especially focus on economic, operational and organisational factors for effective disposition decisions •Organisations must especially focus on recovery value, costs and profitability factors for effective disposition decisions •For effective operational-related disposition decisions, organisations can focus on disposition speed and return volume as disposition decision factors •For effective organisational-related disposition decisions, organisations can focus on organisational policies, objectives and resources as disposition decision factors •For effective product-related disposition decisions, organisations can focus on product return quality and condition as disposition decision factors •For effective market-related disposition decisions, organisations can focus on market position, size, measure and cannibalisation as disposition decision factors •For effective external-related disposition decisions, organisations can focus on government regulation as a disposition decision factor •For effective environmental-related disposition decisions, organisations can focus on environmental impact, benefits, policies, restrictions and regulation as disposition decision factors •For effective SC-related disposition decisions, organisations can focus on supplier agreements, manufacturer preference, SC relationships, power and product ownership
Outcomes	•RL disposition practices involve economic, operational, organisational, environmental and social, market-related and SC benefits •The most significant outcomes of RL disposition practices involve economic outcomes, including cost savings, profitability and cost/value recovery, followed by organisational and market-related outcomes •The most significant economic outcome of RL disposition practices involves cost/value recovery •The most significant operational outcomes of RL disposition practices involve speedy, efficient and effective RL processes and lower inventory levels •The most significant organisational outcome of RL disposition practices involves RL implementation	•Organisations that seek economic, operational, organisational, environmental, social, market-related and SC benefits in RL can implement RL disposition practices •Organisations that experience economic, organisational and market-related challenges in RL, can consider RL disposition practices •Organisations that seek cost-savings and higher profitability in RL can consider RL disposition practices •Organisations that seek cost/value recovery in RL can implement RL disposition practices •Organisations that experience operational challenges related to inefficient/slow RL processes and high inventory levels can consider RL disposition practices •Organisations that experience RL implementation challenges can consider RL disposition practices

	• The most significant environmental outcome of RL disposition practices involves waste reduction • The most significant social outcome of RL disposition practices involves corporate image and social performance • The most significant market-related outcomes of RL disposition practices involve market growth and sales increase and consumer satisfaction and relationships • The SC outcome of bargaining power associate with a couple of RL disposition practices	• Organisations that seek to reduce waste can implement RL disposition practices • Organisations that seek to improve corporate image and social performance can consider RL disposition practices • Organisations that seek market growth and sales increase can consider RL disposition practices • Organisations that seek to improve consumer satisfaction and relationships can consider RL disposition practices • Organisations that seek to increase bargaining power in SC relationships can consider RL disposition practices • For the effective management of consumer returns, organisations can identify/implement/consider RL disposition strategies, requirements, disposition decision factors and outcomes to develop an optimum disposition strategy.

Source: Compiled by the researcher

Table 6.22 provides an in-depth understanding into the value of RL disposition practices as part of the RL practices for consumer returns. Organisations can identify specific RL disposition strategies, requirements, decision factors and outcomes to implement an optimum disposition strategy, which can contribute to the effective management of consumer returns. RL disposition practices will further be explored in the interviews with industry experts (chapter 8).

In the next section, PM practices to manage consumer returns will be explored, analysed and discussed.

6.7 PERFORMANCE MEASUREMENT (PM) PRACTICES TO MANAGE CONSUMER RETURNS

Organisational performance involves a boundary-spanning measure to analyse the outcomes of organisational strategy, which can be critical to the success of the organisation. Nevertheless, every organisational function (e.g. marketing, finance, logistics and operations) needs distinct performance measures due to different aims and interests, which, likewise, applies to RL (Khor & Udin, 2012:7). Performance measurement (PM) in RL can be defined as a process of quantifying RL efficiency and effectiveness (Dhib *et al.* 2016:372), which can enable organisations to improve overall RL performance.

Like all business functions, PM in RL can be an important practice for the successful management of consumer returns (Shaik & Abdul-Kader, 2014:102). In fact, a lack of PM in RL was identified as one of the organisational barriers to effective RLM (see section 2.3.3), which further emphasises the importance of PM as a RL practice. Despite this importance, limited literature focuses on PM strategies and systems needed to manage and improve RL performance (Bernon *et al.* 2011:499; Shaik & Abdul-Kader, 2012:23). In the QCA of RL literature, PM in RL was discussed to a moderate extent (sixth highest practice) (see Figure 6.3), confirming that more research could be conducted on measuring RL performance.

Based on the findings (identified from the QCA of RL literature) PM practices in RL involve the (1) strategies and requirements of PM, (2) measures and metrics for RL and (3) outcomes of PM practices in RL, which will be presented and discussed in subsequent sections, and concluded with a description, conceptual framework and summary of findings to manage consumer returns.

6.7.1 Strategies and requirements of PM practices in RL

The strategies and requirements of PM practices in RL involve the strategic practices, methods, and requirements, including strategies of PM, economic, IT and organisational requirements, which can contribute to effective PM in RL important to manage consumer returns. Additionally, these strategies and requirements closely relate to the PM elements for RL, which can help organisations to identify perspectives, objectives and measures needed to implement an appropriate PM framework for RL (see section 6.7.2).

Table 6.27 provides an overview of the findings related to the *strategies and requirements of PM practices in RL*, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.23 Findings related to strategies and requirements of PM practices to manage consumer returns

Table 6.27 indicates the strategies and requirements of PM practices needed to manage consumer returns, which will be discussed in subsequent sections.

6.7.1.1 Strategies of PM practices in RL

PM practices in RL involve several strategies, including (1) strategic approaches to PM, (2) strategic understanding of PM, (3) strategic considerations for PM, (4) performing a cost-benefit analysis, (5) strategic establishment of teams for PM, (6) strategic use of existing and standard PM frameworks/models and measures, (7) strategic benchmarking, (8) developing a strategic PM

framework and system for RL that involves the strategic identification, development and establishment of performance perspectives, objectives, and appropriate key performance indicators (KPIs) and metrics, (9) strategic establishment of standardised PM, (10) strategic linking in PM, (11) strategic implementation of PM, (12) performance monitoring and reviews, (13) creating feedback mechanisms and use performance data, (14) strategic development of a reward system, and (15) strategic evaluation and analyses performance results, which organisations can use to effectively measure and manage RL performance.

The *strategic approaches* to PM in RL include integrated, holistic and RL-specific approaches, meaning that organisations must develop an integrated PM framework from a holistic perspective (covering various elements that span across functions) that specifically applies to RL. These approaches can help organisations to develop a comprehensive and appropriate PM framework to manage consumer returns. Additionally, organisations must *strategically understand* overall *RL performance* for the effective development, linking and implementation of PM in RL.

Furthermore, before developing a PM framework for RL, organisations need to *strategically consider* the potential impact of PM on parties involved in RL processes and the factors that can influence PM in RL. Consequently, organisations must consider the potential impact of the PM framework on internal staff/departments and external parties, like consumers and SC partners involved in the RL process. Additionally, organisations must consider the factors that can influence the development of a PM framework in RL, which includes (1) type of products, (2) technology, (3) characteristics of consumers and markets, (4) type of industry, and (5) organisational strategies, processes and capabilities. For example, understanding and focussing on customers can be important for developing service-related performance measures. Evidently, organisations need complete information of the business environment before an effective PM framework in RL can be developed.

Similarly, like other RL practices (such as outsourcing/insourcing and disposition practices), organisations need to *perform a cost-benefit analysis,* determining the benefits versus the cost of implementing a PM framework for RL. Such a cost-benefit analyses can be possible by identifying the strategies, requirements, elements and outcomes of PM in RL, which will be discussed in subsequent sections. Furthermore, organisations must *strategically establish teams* for *PM* before developing a PM framework for RL. Consequently, PM in RL requires *team involvement,* meaning that several departments and/or staff members must provide input into the development of performance measures for RL, emphasising the importance of a holistic approach to PM in RL.

In terms of developing a PM framework or system for RL, organisations can start with the *strategic use of existing and standard PM frameworks/models and measures.* Some key PM frameworks that can be used as a starting point for measuring RL performance, include Supply Chain Operation Reference (SCOR), Balanced Score Card (BSC), Quality Management Excellence Model (EFQM), and Global Supply Chain Framework (GSCF). Additionally, organisations can consider applying standard measures/metrics used for measuring FL and SC performance, for example, cycle time, productivity and efficiency measures, as a basis for PM in RL.

Nevertheless, due to the difference between RL and traditional FL and SC processes and practices, organisations need to identify performance measures specifically for RL. Organisations can start with *strategic benchmarking* of RL, which can help organisations to develop performance measures that match industry or business standards. For instance, identifying the standard RL performance measures used by other online retailers, can help with the strategic development of appropriate PM framework for RL. *Developing a strategic PM framework* and *system for RL* means that organisations must consider various elements of PM framework for RL, including perspectives (key strategic areas for RL PM), objectives, and measures (KPIs and metrics) needed to achieve PM outcomes.

Consequently, in developing the PM framework and system for RL, organisations need to *strategically identify performance perspectives,* relating to the visions, missions and strategies of the organisation. However, organisations can identify the perspectives by using standard PM frameworks (like BSC) as guidelines. Examples of performance perspectives can include finance, operations, innovation, stakeholders, environment and social perspectives. Establishing the PM perspectives can guide organisations in the *strategic development of performance objectives,* which can be placed in the same categories as the perspectives. For example, financial, operational, organisational, environment and social objectives. PM objectives can be regarded as strategic statements of the outcomes (e.g. to reduce RL costs and maximise operational efficiency) that organisations aim to achieve through the implementation of a PM framework in RL.

Both the PM perspectives and objectives can guide organisations in the *strategic identification* and *establishment of appropriate KPIs and metrics* for PM in RL. Although KPIs (factors to determine/monitor success) and metrics (measurement tools) can be different, this study combines KPIs and metrics as performance measures that organisations can use to measure and improve RL performance. As mentioned earlier, organisations can use established FL (forward logistics) measures as a starting point but needs to develop appropriate measures for RL, which can be important for successful RLM. Additionally, organisations need numerous measures that focus on all areas of RL (such as economics, operations, organisational, environmental, market-related, social and SC).

Moreover, organisations must *strategically establish standardised PM,* which means that the performance measures created for RL must be used as a standard across the organisation. For example, an online retailer with several warehouses across South Africa must use the same PM for RL processes and activities. The PM perspectives, objectives and measures (PM elements) as part of the PM framework for RL, will be discussed in section 6.7.2.

Another important aspect that organisations must keep in mind while developing a PM framework for RL involves *strategic linking in PM.* Organisations need to ensure that the measures (KPIs and metrics) link with the overall strategy and goals of the organisation as well as link with the desired outcomes of PM in RL. Essentially, all the PM elements of the PM framework for RL must be linked and integrated with organisational vision, mission, strategy and aims, which emphasise the importance of an integrated approach to PM in RL. Once organisations developed an appropriate PM framework for RL, the PM framework must be *strategically implemented* to evaluate RL performance.

Consequently, *performance monitoring* and *reviews* must be conducted regularly, which can be operational-level reviews or organisational- or strategic-level reviews. Operational-level reviews can focus on RL process performance that can be conducted on a short-term basis (e.g. quarterly) and strategic-level reviews can be conducted if any changes in organisational strategies or the business environment takes place. Performance monitoring and reviews can be important for adjustments to the PM framework ensuring that the PM elements (objectives and measures) remain appropriate in an ever-changing business environment.

A PM strategy must also involve the *creation of feedback mechanisms,* like employee and consumer surveys (conducted quarterly or yearly), and *use of performance data* (e.g. staff performance data), which can be important for continuous improvement of RL processes and practices. Additionally, organisations can *strategically develop a reward system* based on staff performance data, providing incentives and compensation for excellent RL performance.

Finally, organisations need to *strategically evaluate* and *analyse performance results* to determine actual RL performance, which can be done through quantitative methods of analysis (e.g. line chart showing trends over time) by means of feedback, staff performance, financial and non-financial data.

Essentially, the PM strategies can be regarded as methods and best practices for PM in RL, needed for the successful RLM of consumer returns.

6.7.1.2 Requirements of PM practices in RL

Since PM practices mainly focus on PM strategies and PM elements (sections 6.7.1.1 and 6.7.2) the requirements of PM practices are limited to economic, IT and organisational requirements.

The *economic requirement* of PM practices in RL relates to the financial impact of RL. Since RL involves economic barriers that impacts the financial performance of the organisation (see section 2.3.1), establishing measures to identify the *financial impact of RL* can be critical. Consequently, organisations must identify and incorporate various economic performance measures (discussed in section 6.7.2) to measure RL performance from a financial viewpoint.

The *IT requirement* of PM practices in RL relates to RFID as part of the IT practices in RL. Particularly, organisations can *use RFID IT* for PM in RL since RFID IT can facilitate with long-term product return measurements (also see section 6.3.4). The link between PM and RFID practices demonstrates the importance of a holistic approach to the management of consumer returns.

The *organisational requirements* of PM practices in RL, includes (1) focussing on continuous improvements, (2) RL goals in strategic plans, (3) RL commitment and (4) management involvement. Organisations must *focus on continuous improvement* in RL, including improvement in RL strategies, processes, infrastructure and capabilities, to meet the objectives set during the development of the PM framework and system for RL (see section 6.7.1.1). However, for an effective PM framework for RL, organisations must be *committed to RL* and include *RL goals/objectives* in the *strategic plans* of the organisation, emphasising the significance of the organisational barriers of a lack of RL commitment and strategic planning in RL (see section 6.7.1.1). Finally, *management involvement* can be critical for effective PM strategies in RL. Particularly, RL managers (or logistics and SC managers) must be involved in the strategic considerations for PM, the cost-benefit analysis for PM practices and the development of appropriate performance measures for RL.

In the next section, the PM elements as part of the PM framework to manage consumer returns will be analysed and discussed.

6.7.2 PM elements for RL to manage consumer returns

The PM elements for RL relates to the PM strategy of developing a PM framework that involves identifying and developing PM perspectives, objectives/goals, KPIs and metrics for RL that can be used for measuring overall RL performance (see section 6.7.1). The PM elements identified from the QCA of RL literature were categorised as follows: economic elements, operational and product return

elements, organisational and resource-related elements, environmental elements, social elements, market-related elements and SC elements. Table 6.24 provides an overview of the findings related to the *PM elements for RL* to manage consumer returns, including the categories, subcategories, supporting sources for the subcategories and key quotations that support both the subcategories and the discussion of the findings.

Table 6.24 Findings related to the PM elements for RL to manage consumer returns
